Data and Automation

Increase the impact of your cross-enterprise workflows by connecting any application or data. Connect people, processes, and apps to enhance the value of your ServiceNow investment.

Workflow Data Fabric brings automation, low-code, and AI efficiency to your workflows, all on the same platform. Workflow Data Fabric runs on the ServiceNow AI Platform®, a single system of action for the enterprise.

Automate and connect anything to ServiceNow. Unify your approach to automation with a complete set of capabilities that include insights and oversight, all on a single platform.

Integration Hub Automate integration tasks and develop custom integrations.	**Integration Hub Remote Process Sync** Create one-way or bidirectional integrations among multiple ServiceNow instances	**Robotic Process Automation (RPA) Hub** Emulate user actions and eliminate mundane and repetitive human activities.
Automation Center  Govern your end-to-end multi-vendor automation life cycles from one place.	**Imports** Import data from external systems.	**Exports** Export data from an instance to an external file.

Workflow Data Fabric products and features

The following table lists the products and features that are available in Workflow Data Fabric.

Workflow Data Fabric products and features

Product name	Description
App Engine Studio	App Engine Studio (AES) is a guided, low-code tool for developing rich web applications to store information, automate business processes, and solve business problems. Work that was once assigned to administrators can now be delegated to employees with little to no training using AES.
Automation Center	Automation Center application governs your end-to-end multi-vendor automation life cycles from one place. By using real-time dashboards, you can

Workflow Data Fabric products and features (continued)

Product name	Description
	manage and measure the health of the automation and prevent automation failures across multiple vendors.
Boomi	Boomi supports full lifecycle API management, including governance, analytics, and API security. ServiceNow has partnered with Boomi to deliver Boomi API Management, a cloud-based platform that enables customers to discover, manage, secure, and monetize their APIs. Boomi provides documentation though their own portal, and customers requesting support with Boomi API Management will contact the Boomi support through their standard channels. To get started, see the Boomi API Management listing on the ServiceNow Store, which includes information about entitlements and required plugins, as well as a link to the Boomi API Management documentation.
Classic Orchestration	ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance. See Classic Orchestration for more information.
Conversational Spokes	Now Assist in Conversational Spokes application to utilize the conversational ability of Integration Hub Spoke actions. Perform business actions through conversational interface like Now Assist and unlock the interactive conversational experience to automate your business workflows.
Document Intelligence	Document Intelligence (DocIntel) is an AI solution that enables any organization to automate and accelerate the process of extracting data from documents. That data can easily be integrated into larger automation workflows to save time and resources.
Exports	Exports enable you to push data from an instance to an external file. To dynamically export data from a script or web service, export data from the URL.
Imports	Imports enable administrators to import data from various data sources, and then map that data into ServiceNow tables. You can automate data import tasks from a new design environment using Integration Hub.
Integration Hub	Automate integration tasks using ServiceNow components for ServiceNow® Workflow Studio, or develop custom integrations. A separate subscription is required.
Integration Hub Remote Process Sync	Integration Hub Remote Process Sync enables you to set up one-way or bidirectional integrations among multiple ServiceNow instances, so that your process flows stay in sync.
Process Mining	Process Mining helps analysts and process owners quickly analyze and optimize their business processes.
External Content Connectors	The External Content Connectors ServiceNow® Store application enables AI Search applications to search content and metadata from supported external data repositories, such as Atlassian Confluence Cloud and Microsoft SharePoint Online.
Robotic Process Automation (RPA) Hub	Robotic Process Automation (RPA) Hub enables end-to-end automation for your organization. With a combination of UI interactions and element-based automations that interact between the various business applications, you can emulate user actions and eliminate mundane and repetitive human activities.

Workflow Data Fabric products and features (continued)

Product name	Description
Stream Connect	Connect your Apache Kafka environment to your ServiceNow instance with Stream Connect for Apache Kafka.
Workflow Data Fabric Hub	Power AI agents and enrich workflows on the ServiceNow AI Platform with real-time data from across the enterprise using ServiceNow® Workflow Data Fabric Hub.

Related ServiceNow applications and features

Instance Data Replication

ServiceNow® Instance Data Replication (IDR) copies data updates from one instance, called the producer instance, to one or more other instances called the consumer instances. IDR enables you to maintain consistent data across different instances. For example, you can synchronize data between different organizations in your company or even between different companies with separate instances.

Inbound email actions

Define an inbound email action to script how the system responds to an inbound email.

Workflow Studio

Integrate workflow authoring, configuring, and monitoring into a single page experience. Consolidate playbooks, flows, actions, decision tables, and integrations into one design environment.

Building actions

Actions automate a repeatable task or operation within a flow. Flows run actions by passing them data as inputs. Actions run a sequence of steps to complete the task, and pass data to the flow as outputs.

Workflow Data Fabric Credits

Workflow Data Fabric Credits let you monitor and track Workflow Data Fabric product usage through a dashboard showing credit usage, usage measurements, and thresholds that trigger alerts.

For more information about Workflow Data Fabric benefits, the workflow for the solution, and requirements for integrating the solution, see Accelerating and automating your repetitive tasks by using Workflow Data Fabric.

Exploring Workflow Data Fabric Credits

Workflow Data Fabric lets organizations connect, manage, and automate their data workflows across different systems, through various product solutions.

Workflow Data Fabric Credits measure the usage of Workflow Data Fabric subscriptions. Each credit represents a unit of consumption under a unified meter. For example, depending on the underlying product a credit can represent a record, an API call, a megabyte of data throughput, or a minute of runtime.

For more information about Workflow Data Fabric products, meters, and reproducibility, see the Fabric Credits - WDF Products and Meter Sources to trace and reproduce [KB2276348] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about Workflow Data Fabric Credits, see the Count of Workflow Data Fabric Credits consumed in the last 367 Days [KB2239792] article in the Now Support Knowledge Base.

Configure Workflow Data Fabric Credits

You must have Workflow Data Fabric license to use Workflow Data Fabric Credits.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the WDF Tokenization application (sn_wdf_token) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Measuring usage

Credit usage is measured for each account. The number of credits you use for a feature is determined by the terms of the Workflow Data Fabric license.

Credit measurements

Measurement category	Description
Transactions	Measured in API calls, assets, records, or transactions.
Data volume	Measured in MB/GB.
Usage	Measured in runtime.

Usage Dashboard

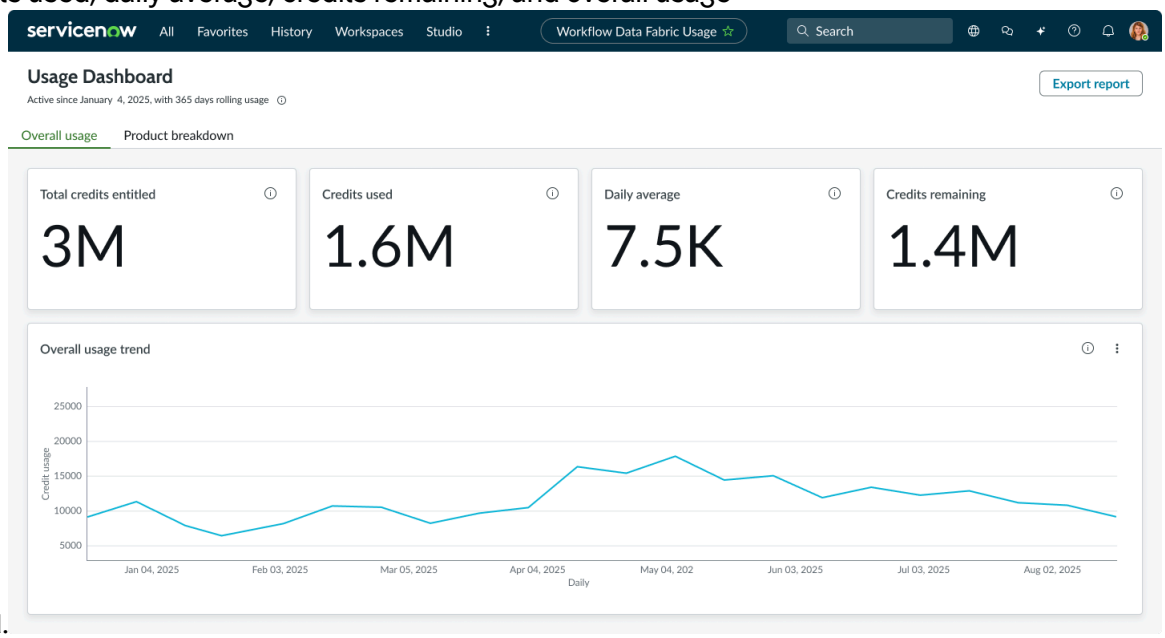
The Usage Dashboard shows credit usage, usage measurements, and thresholds that trigger alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the Usage Dashboard by navigating to **All** > *Workflow Data Fabric* **Usage** > **Usage Dashboard**. The Credit Dashboard has two tabs: **Overall usage** and **Product breakdown**.

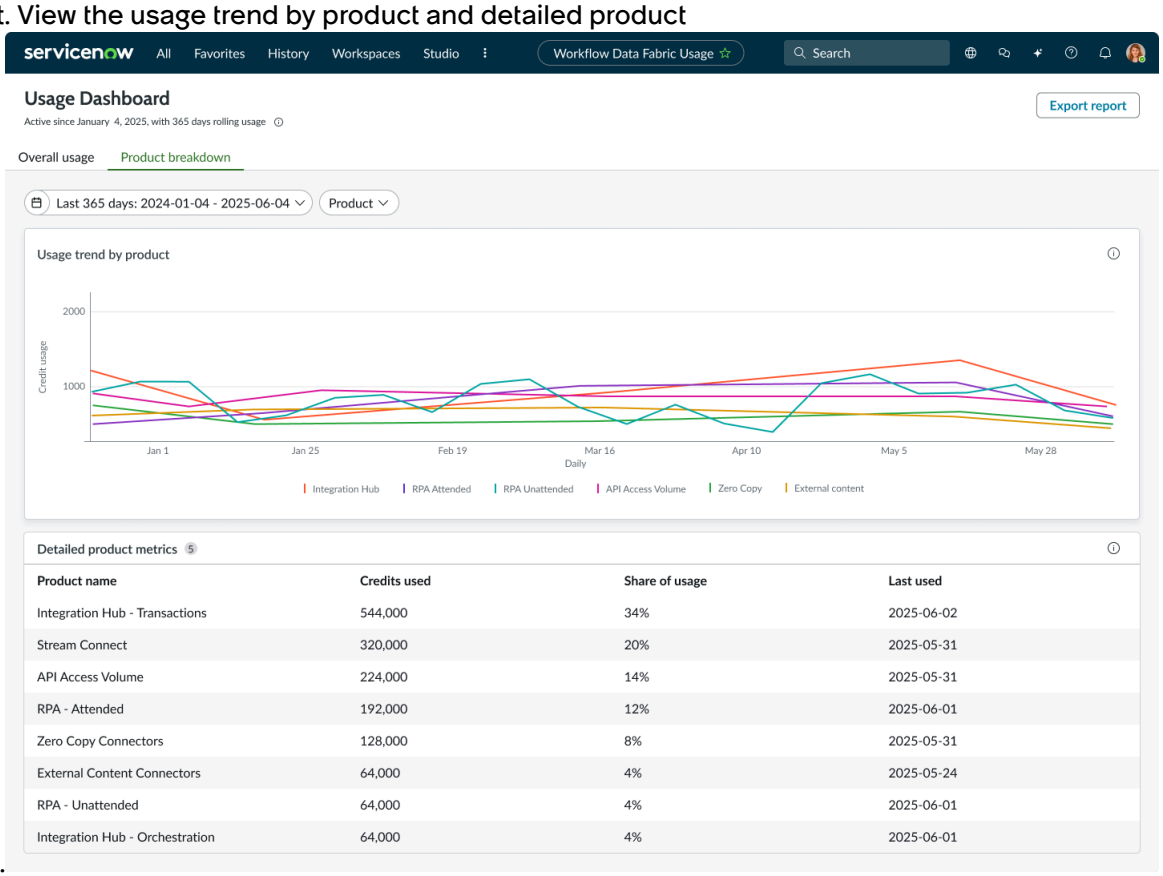
Overall usage tab

Provides a detailed analysis of credit usage with specific KPIs and a usage trend chart. View data by total credits entitled, credits used, daily average, credits remaining, and overall usage trend.



Product breakdown tab

Provides an overview of credit usage by product. You can filter the data that is displayed by date range and selected product. View the usage trend by product and detailed product metrics.



Product name	Credits used	Share of usage	Last used
Integration Hub - Transactions	544,000	34%	2025-06-02
Stream Connect	320,000	20%	2025-05-31
API Access Volume	224,000	14%	2025-05-31
RPA - Attended	192,000	12%	2025-06-01
Zero Copy Connectors	128,000	8%	2025-05-31
External Content Connectors	64,000	4%	2025-05-24
RPA - Unattended	64,000	4%	2025-06-01
Integration Hub - Orchestration	64,000	4%	2025-06-01

Accelerating and automating your repetitive tasks by using Workflow Data Fabric

Reduce the time that you spend on repetitive tasks and deliver services faster through an automated workflow in Workflow Data Fabric. You can automate the data extraction from your documents with the Document Intelligence application, automate your data validation with third-party APIs with the Integration Hub application, and automate your legacy systems with the RPA Hub application all within a single workspace.

Using the combined benefits of the solution

Get these benefits by using different applications through the solution:

- Automate document data extraction.
- Create and extend processes by using low-code, no-code API integration.
- Automate repetitive and legacy processes to deliver services faster.
- Reduce the time that you spend on repetitive tasks and improve your productivity.
- Realize the value of automation to the organization through Automation Center workspace.

Workflow for the solution

Let's consider a scenario of how an employee and an agent use an automation engine and its various products to set up a direct deposit service. The employee, who had recently changed bank accounts, wants to update their direct deposit information. A direct deposit service is used to set up a new bank account for payroll, through an automated process. In this automated process, the following applications are used:

- Document Intelligence
- Integration Hub
- RPA Hub
- Automation Center

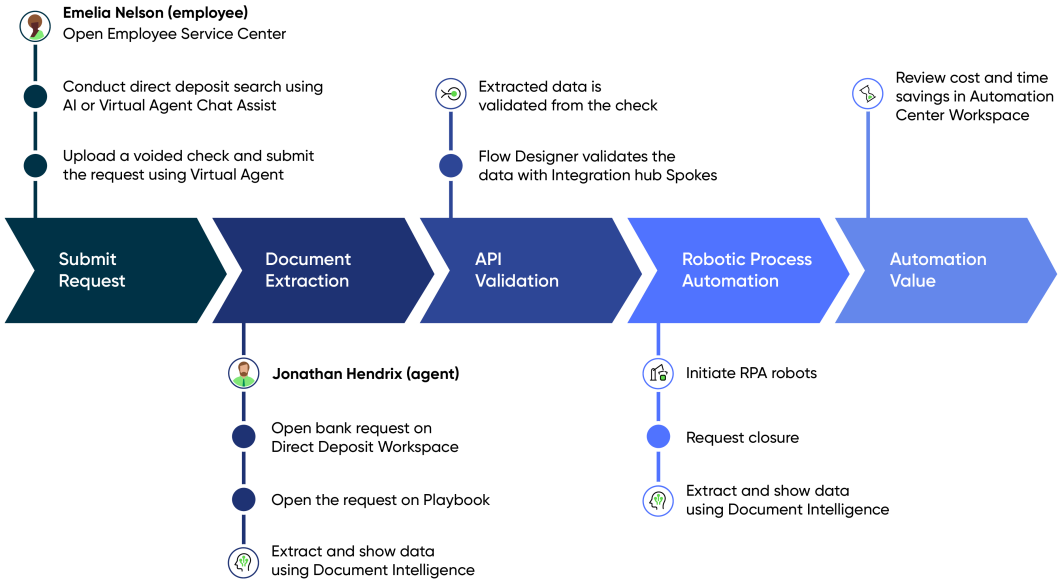
These applications together enable the employee and agent to get complete visibility into the direct deposit workflow.

The direct deposit request from the employee is divided into three stages. The stages are to extract the data, validate the data, and update the payroll system.

The following diagram shows the workflow for the solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow for the solution



The workflow for this solution is

1. An employee visits the Employee Center portal and searches for the Direct Deposit form through AI Search or Virtual Agent chat assistant.

   Employee Center is a central portal where employees can find out the latest updates from your organization. For more information, see Employee Center.

2. The employee uploads a void check and submits the request.
3. The request comes into the Direct Deposit Workspace that uses a playbook to navigate the complex process in a guided process.
4. In the back end, Document Intelligence analyzes the attached check data, extracts the data, and displays it so that the agent can review it.

   Document Intelligence knows which fields to extract. When the model is trained over time, the value has a higher confidence score that is determined by the AI in Document Intelligence. The agent or the automation team can set a score to meet their threshold requirements.

   For more information about Document Intelligence, see Document Intelligence.

5. An agent navigates to the Direct Deposit Workspace, opens the direct deposit request, and reviews the data that was extracted from the employee's check. As the agent completes the review, the information is automatically updated on the form.
6. The extraction stage completes and the validation stage starts. An agent can view this process in the playbook.
7. By using Integration Hub, a third-party integration validates the extracted data from the check. The extracted values are sent through an API for validation using Integration Hub spoke actions. This flow is completed by using Workflow Studio with the power of the Integration Hub spokes. The flow hits an external end point, fetches the data, and compares this data against the system data to validate the bank details. On a successful validation, the direct deposit form is updated with any relevant notes.

   For more information about Workflow Studio, see Workflow Studio. For more information about Integration Hub, see Integration Hub.

8. The data validation stage completes and the payroll system update stage begins.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirements for integrating the solution

Your administrators can integrate the solution by doing the following actions:

1. Activate the Integration Hub plugins. For more information, see Request an Integration Hub plugin and Integration Hub plugins.
2. Install the Employee Center application and configure the Employee Center Portal. For more information, see Install Employee Center and Employee Center admin configurations.
3. Install and set up the Document Intelligence application. For more information, see Install Document Intelligence and Set up Document Intelligence.
4. Install the RPA Hub application. For more information, see Install Robotic Process Automation (RPA) Hub.
5. Install the Automation Center application. For more information, see Install Automation Center.
6. Activate a spoke. For more information, see Integration Hub available spokes.
7. Build spokes using Spoke Generator. For more information, see Building spokes using Spoke Generator.

Automation Center

Use the ServiceNow® Automation Center application to govern your end-to-end multi-vendor automation life cycles from one place. By using real-time dashboards, you can manage and measure the health of the automation and prevent automation failures across multiple vendors.

In the Automation Center application dashboard, you can view real-time metrics and analytics.

Automation Center integrates with ServiceNow® Robotic Process Automation (RPA) Hub, ServiceNow® flows, and any third-party applications.

Integration with ServiceNow® flows

Automation Center integrates with ServiceNow® flows enabling you to track any ServiceNow® flow as automations. For more information, see Track ServiceNow flows and actions as automations.

Integration with ServiceNow® Robotic Process Automation (RPA) Hub

Automation Center provides an integration with the ServiceNow® RPA Hub application. This integration enables you to integrate ServiceNow robots and bot processes. For more information about RPA Hub, see Robotic Process Automation (RPA) Hub.

Integration with Document Intelligence

Automation Center integrates with Document Intelligence enabling you to get the Document Intelligence data into ServiceNow® instance. You can analyze the data from Document Intelligence using Automation Center. For more information, see Document Intelligence.

Integration with UiPath

Automation Center integrates with UiPath enabling you to get the UiPath data into ServiceNow® instance via UiPath spoke. You can analyze the data from UiPath using Automation Center. For more information, see Configuring UiPath with Automation Center.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration with third-party vendors

Automation Center integrates with third-party vendors enabling you to get their data into ServiceNow® instance. You can do that using *Automation Center* API.

Automation Center API

The *Automation Center* API enables you to create and update processes, robots, and execution jobs. For more information, see Automation Center API.

Integration with Requirement Intake Diagram

Automation Center integrates with Requirement Intake Diagram enabling you to create automations from intake diagrams. For more information, see Requirement Intake Diagram.

Exploring Automation Center

Learn about the Automation Center application key features, architecture, and workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key features

- Discover, prioritize, and manage automation requests from different sources through the full life cycle in Automation Center workspace.
- Oversee and optimize automation performance versus business goals across multiple vendors.
- Monitor and manage the health of the automation and prevent automation failures across multiple vendors.

Explore the following topics to learn more about Automation Center architecture and Workspace.

Automation Center architecture

Learn about the Automation Center architecture.

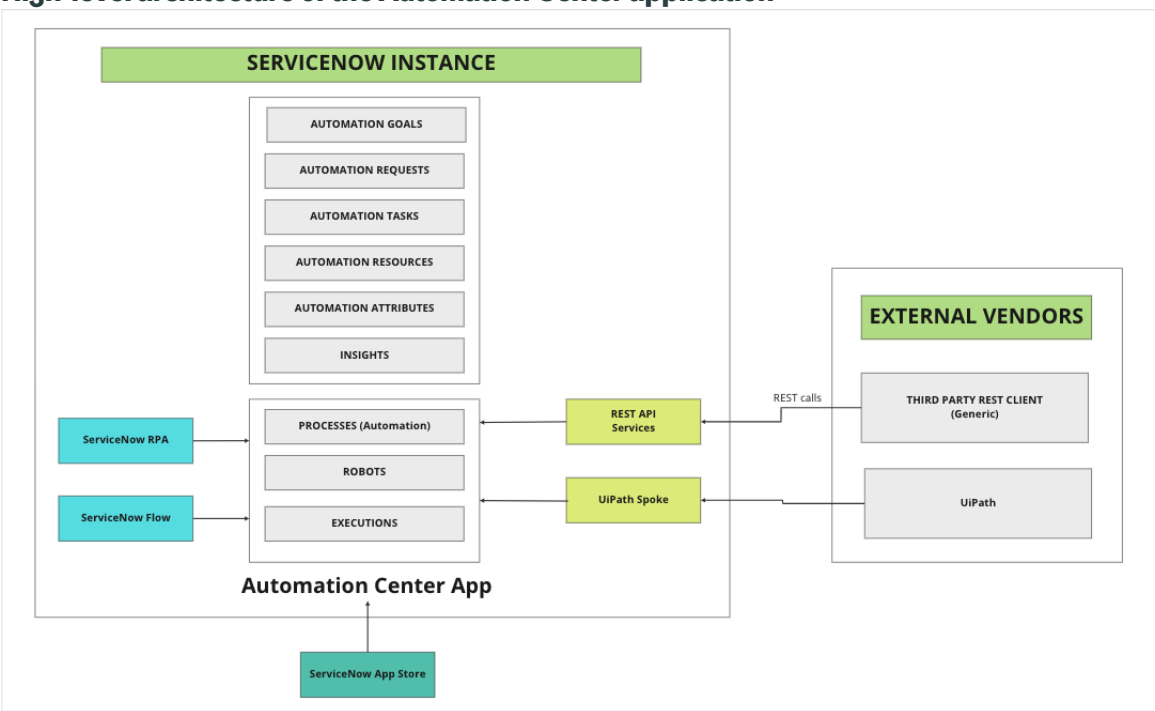
High-level architecture

Various components make up the architecture of the Automation Center application:

- You install the Automation Center application from the ServiceNow Store.
- Automation Center is a scoped application in the ServiceNow instance. It's the command and control center for managing the automation goals, requests, tasks, resources, attributes, insights, automation, robots, and executions.
- The automations, robots, and executions are populated from various sources such as ServiceNow® RPA Hub via flow and external vendors via REST calls.

The following diagram shows the high-level architecture of the Automation Center application.

High-level architecture of the Automation Center application



Automation Center Workspace

Automation Center Workspace provides an overall view of the performance and value of the KPIs for existing automations, executions, and new automation requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow® Automation Center Workspace is a web-based platform with three dashboards: Overview, Executions, and Value.

- The Overview dashboard includes the basic score cards, lists, and reports. It's the default landing page of the Automation Center Workspace.
- The Executions dashboard enables you to manage the health of automations in one central place.
- The Value dashboard provides summary information about the states of business goals and automations.

Automation Center Overview dashboard

The Automation Center Workspace landing page is the Overview dashboard, which contains basic score cards, lists, and reports.

You can access the Overview dashboard in either of two ways:

- By navigating to **All** > **Automation Center** > **Automation Center Home** > **Overview**.
- By navigating to **Workspaces** > **Automation Center Workspace** > **Overview**.

Active automations

Active automations provides details of all the active automations from different sources and their business criticality. You can filter the data to view information within a specific date range, for a specific automation, or for a specific department. After you set the filter, the results will be displayed only for the specified filter. If you don't set any filter, then data for all active automations is displayed.

The Active automations section provides reports with the following details in the form of chart.

Active automations

Section	Description
Deployed automations by business criticality	This chart displays data about all active automations. It also provides details about the business criticality of each of the automation. This helps you in understanding how many automations are highly critical and how many aren't. Executions summaries by source	Automation Center supports data from several sources, such as ServiceNow Flow, ServiceNow RPA, and other third-party sources. This chart provides execution summary details of all active automations along with their sources. This information helps you in evaluating from which sources

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
	you're getting data and how many automations from each of the sources are active. Robotic Process Automation (RPA) by source	This chart displays the automations for all RPAs grouped by sources. The graph gives details of the time lines when the RPA data was sent to Automation Center. Automations by ServiceNow Flow	This chart provides details of the ServiceNow flow automations with the time lines. Document Intelligence (DocIntel)	This chart provides details of the Document Intelligence automations with the time lines. Top 10 applications used	This graph provides a vertical bar report of the top 10 business applications used. For more information on associating business

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
	applications to your automations, see Business application relationship with CIs for application information.

Spokes & Transactions

Spokes & Transactions section provides details about the spokes and the transactions that are available on your instance.

Note:
To view the data in the Spokes & Transactions section, you need to have the sn_ac.automation_technical_user or sn_ac.automation_admin role.

Spokes & Transactions

Section	Description
Total entitled spokes	Displays the number of spokes that you are entitled and installed in your instance.
Installed spokes	Displays the number of spokes that are installed in your instance.
Configured spokes	Displays the number of spokes for which connections are configured in your instance. Total entitled transactions	Displays the number of transactions that are available for use. Consumed transactions	Displays the number of transactions that you have used. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spokes & Transactions (continued)

Section	Description
Applications with most transactions	Displays the applications (scope applications) with most transactions. You can filter the results for specific time period. By default, the last one month's data is displayed. Spokes with most transactions	Displays the spokes with most transactions. You can filter the results for specific time period. By default, the last one month's data is displayed.

Future automations

The Future automations section provides details about all active automations that are planned for the future.

You can filter the data by department. If no department is selected, the data is displayed for all departments.

Future automations

Section	Description
New requests	Displays all automation requests that are in the New state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Future automations (continued)

Section	Description
Requests by intake source	Displays all automation requests grouped by intake source, such as Web, Process Mining, or Service Request.
Requests to be deployed	Displays the automation requests ready to be deployed. Most recent requests	Lists the automation requests sorted from most recent to oldest. 
Automation Center Executions dashboard

The Automation Center Executions dashboard helps you manage the health of automations in one central place. You can also import automation metrics and data from third-party providers regardless of the technology used.

Executions refer to the times each automation runs.

You can access the Executions dashboard in either of two ways:

- By navigating to **All** > **Automation Center** > **Automation Center Home** and then selecting the **Executions** tab.
- By navigating to **Workspaces** > **Automation Center Workspace** > **Executions**.

Executions dashboard details

The Executions dashboard provides the details about the automation executions in the form of charts and tables. These charts give an overview of the entire execution process.

You can filter all data that is displayed on this page using the four filters available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Department
- Automation
- Source
- Application

If you don’t specify any filter, then all available data is displayed.

Note:
To view the Automation incidents, Automation changes, and Business application changes widgets, in addition to the Automation Center roles you need to have the itil or sn_incident_read and sn_change_read roles.

Execution summary

Section	Description
Execution summary by state	This chart displays the execution status of automations in different states. This information helps in understanding the status of the automations.
Automation incidents	This chart provides information about any incidents that have a direct impact on the automations. For example, if five automations are on hold, this chart lets you know about those five automations. This information enables you to manage the automations better.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution summary (continued)

Section	Description
	Automation changes	This chart focuses on any change that has a direct impact on the automations. Business application changes	This chart provides information about any change to the business applications that are associated with the automations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution summary (continued)

Section	Description
	Execution state over time	This chart provides information about the state of the executions for a time period. There's a date range filter for this chart. If you select a date range, the data is limited to the selected date range, or else the default date range is selected, which is last one week. Execution summary	This chart displays the number of executions and their respective states sorted by automation name. 
Transaction summary

The Transaction summary section displays execution details of the spokes for the last 24 hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution summary

Section	Description
Active applications	Displays the number of active applications running in your instance for the last 24 hours. Actions in use	Displays the number of actions that are used in your instance in the last 24 hours. Total transactions	Displays the total number of transactions in your instance in the last 24 hours. In progress and failed transactions by flow	Displays all the in progress and failed transactions by flow in your instance in the last 24 hours. Flow execution status trends	Displays the flow execution trend for all states in your instance in the last 24 hours. 
Insights panel

The Insights panel provides information about insights, which draw your attention to any issues within Automation Center. You can fix the issues or choose to ignore them. If you delay fixing issues, some automations might not behave as expected.

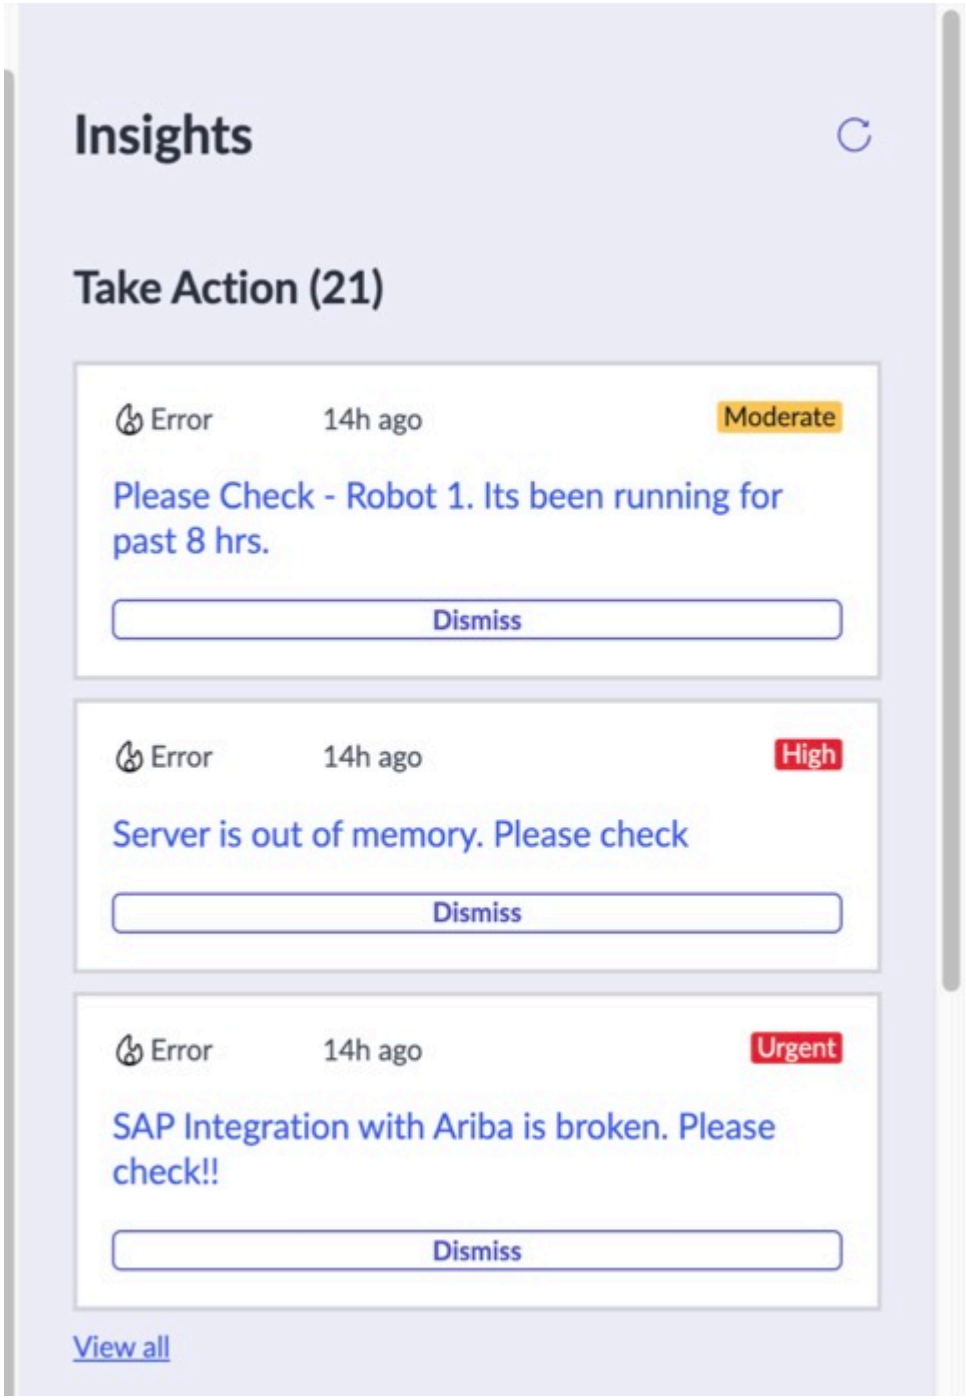
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insights example



Automation Center Value dashboard

The Automation Center Value dashboard provides summary information about the states of goals and automations along with the actual and estimated cost and time saved for all active and future automations.

All widgets under the following sections are available only if the you have the sn_ac.automation_technical_user role:

- Goals chart
- Number of deployed automations under Active automations
- Future automations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access all other widgets in the Active automations section, you must associate a domain configuration with a data collection job. For more information see https://www.servicenow.com/docs/bundle/yokohama-now-intelligence/page/use/performance-analytics/task/associate-domain-config-dc-job.html.

You can access the Value dashboard in either of two ways:

- By navigating to **All** > **Automation Center** > **Automation Center Home** and then selecting the **Value** tab.
- By navigating to **Workspaces** > **Automation Center Workspace** > **Value**.

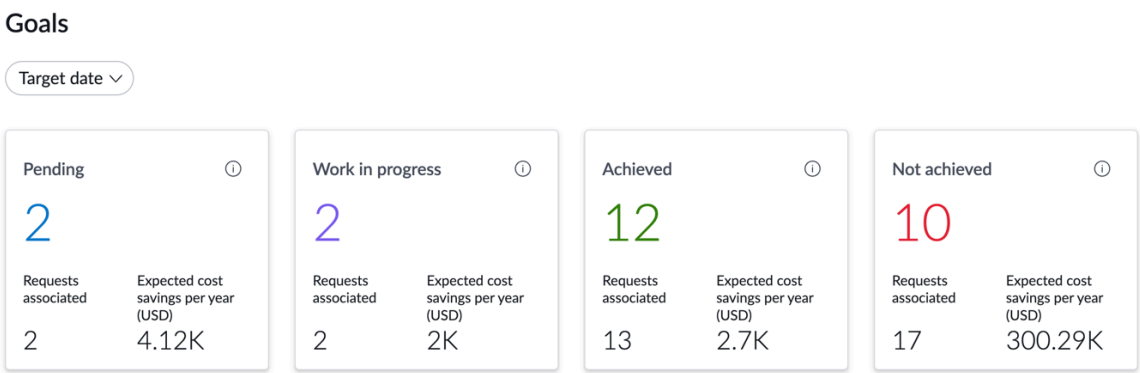
Goals chart

The Goals chart displays the summary of automation goals categorized by their state along with the estimated cost saved per year.

For information about automation goals, see Create an automation goal.

By default, the Goals chart provides details of all automation goals with associated active automation requests for the day you're viewing the data.

Use the **Target date** drop-down list to view goals for a specific period. When you select the **Target date** filter, you can view the calendar of the current and the next month. Date filters are available for Custom range, Last 12 months, Last 6 months, and so on.



Active automations

The Active automations chart displays data for active automations. You can filter the data by date, department, and automation. If no filter is set, the data is displayed for all the data.

Active automations

Section	Description
Total cost saved	This chart displays the total cost saved for the selected date range, department, and automation. **Note:** Selecting the Total cost saved widget opens the Analytics Hub KPI Details widget in a new tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
	Total time saved	his chart displays the total time saved for the selected date range, department, and automation. **Note:** Selecting the Total time saved widget opens the Analytics Hub KPI Details widget in a new tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
	Number of deployed automations	This chart displays the total number of deployed automations for the selected date range, department, and automation. It also compares the data with the previous cycle. The previous cycle has the same duration as the current cycle. For example, if the current cycle is January 1, 2021, to March 31, 2021, the previous cycle would be October 1, 2020, to December 31, 2020. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
Average process success rate	This chart displays the average process success rate for the selected date range, department, and automation. The success rate is calculated from the total executions within the selected date range that have the states Complete, Error, and canceled divided by the executions that completed with no errors. It also compares the data with the previous cycle. The previous cycle has the same duration as the current cycle. For example, if the current cycle is January 1, 2021, to March 31, 2021, then the previous cycle would be October 1, 2020, to December 31, 2020. Automation performance by sources	This chart displays automation performance by sources, such as ServiceNow RPA, flows, and other third-party automation vendors for the selected date range, department, and automation. **Note:** You can get data for a maximum of 20 sources. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
Total cost saved by department	This chart displays the cost savings per run per department for the selected date range. Total time saved by department	This chart displays the time savings per run per department for the selected date range.

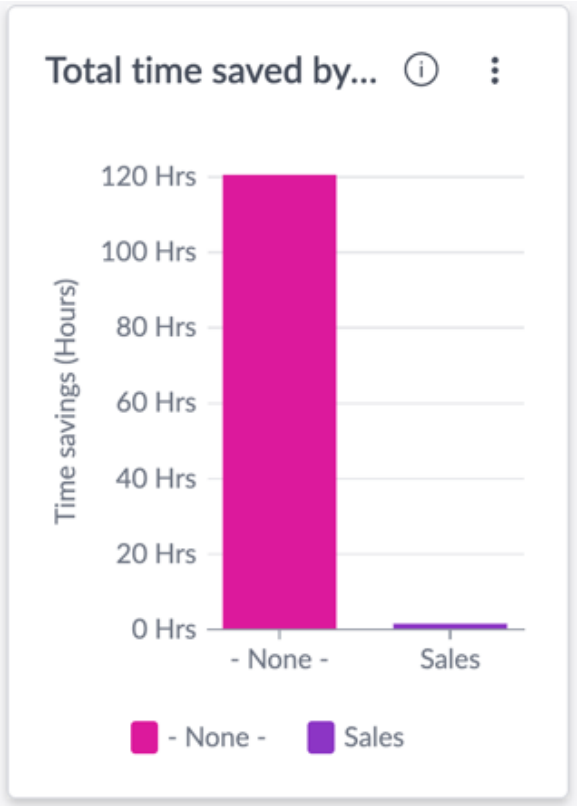
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
	


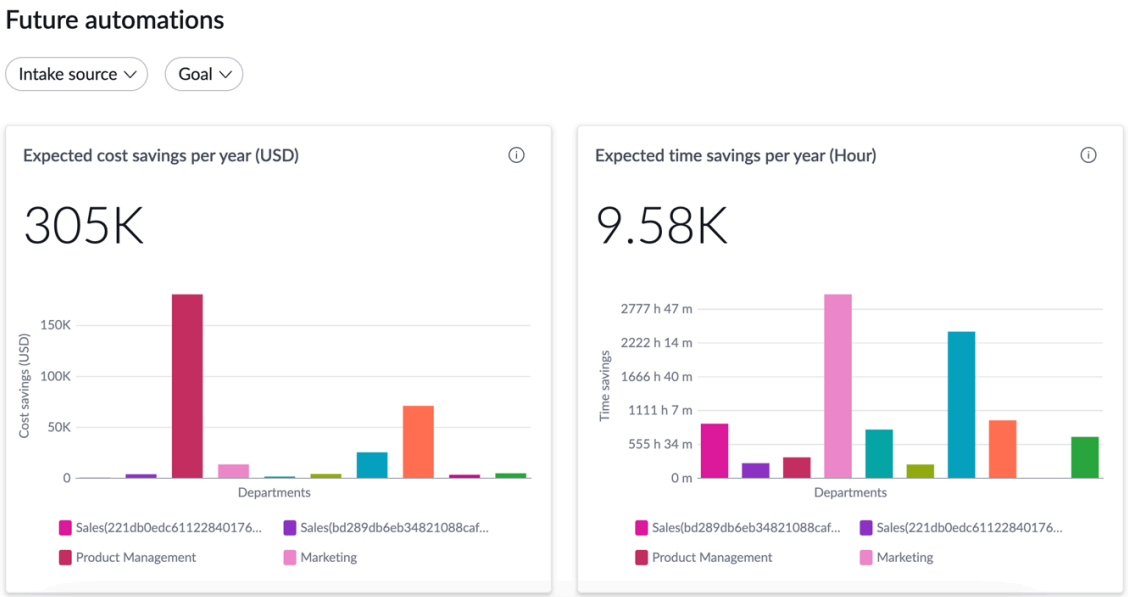
Note:
A lag in the Performance Analytics data collection could cause a delay in the date that is displayed in the Analytics Hub.

Future automations

The Future automations section displays the estimated cost savings and time savings of future requests per year.

Use the **Intake source** and **Goal** filters to limit your results to a specific intake source or goal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Automation Center Kanban board

The Automation Center Kanban board provides an easy access to view and manage automation requests and automation tasks.

The Automation Center Kanban board provides the following benefits:

- Viewing all automation requests and automation tasks of all states in one place.
- Ease of updating the state of an automation request or automation task.

Manage automation requests

Manage all automation requests from one location from the Request Board in the Automation Center Kanban board.

Before you begin
Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

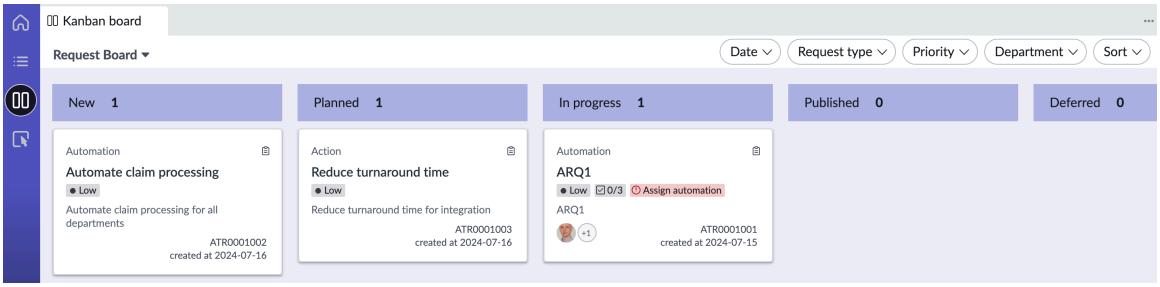
Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Kanban board icon .
   The Kanban board is displayed with the Request Board in view. You can view all the available automation requests with their states.

Note:
A maximum of 200 automation requests are available on the Request Board. This value can be changed only by someone with the sn_ac.automation_admin or sn_ac.automation_technical_user role.

Also, anyone with the sn_ac.automation_admin or sn_ac.automation_technical_user role can reorder different states (columns) on the Request Board to set the lifecycle or process flow direction according to their requirement by editing the vtb_board table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. You can do multiple actions on the Request Board.

- Filter the automation requests to match your need.

  Filter the automation requests based on the following:

  - **Date**: Select any date range to view automation requests created during that period.
  - **Request type**: Select the type of request you want to view. You can choose to view automation requests, action requests, or review requests.
  - **Priority**: Select one or more priority values to view automation requests with those priority value.
  - **Department**: Select one or more departments to view automation requests that belong to the selected departments.

- Sort the automation requests for ease of use.

  Select **Name**, **Priority**, or **Score** from the **Sort by** field.

  Select **Ascending** or **Descending** from the **Sort Direction** field.

  The automation requests are sorted based on the selected sorting options.

- Change the state of an automation request.

  To move an automation request from one state to another, drag the card to the required state column.

  When you don’t follow the happy path, error messages are displayed and you're guided to fix the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a sorting is applied, the automation request card is placed according to the sorting. If no sorting is applied, the automation request card is placed based on the creation date.

- Create a task from the automation request card.

  a. Select the task icon ( ) from the automation task card.

  The Contextual Task Board for the automation request is displayed.

  b. Select the **Add Task** icon.

  The **Create New Automation Task** form is displayed. For more information, see Automation task form.

  Verify that the associated automation request is either in the **Planned** or **In Progress** state.

- View if an automation request has a task assigned to it. If yes, then how many tasks have been completed.
- View if an automation request has automations associated with it.

Manage automation tasks

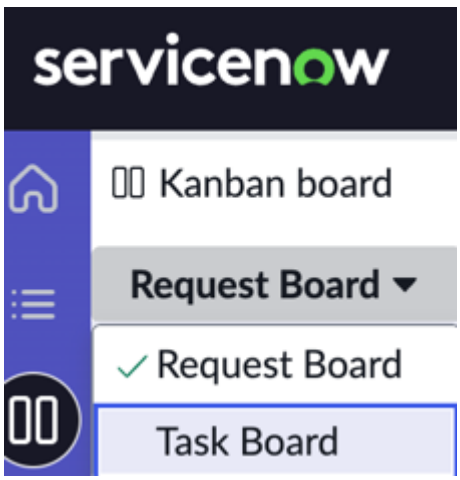
Manage all tasks associated with the automation requests from one location from the Task Board in the Automation Center Kanban board.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Kanban board icon .
   The Kanban board is displayed with the Request Board in view.
3. Select **Task Board** from the list view.

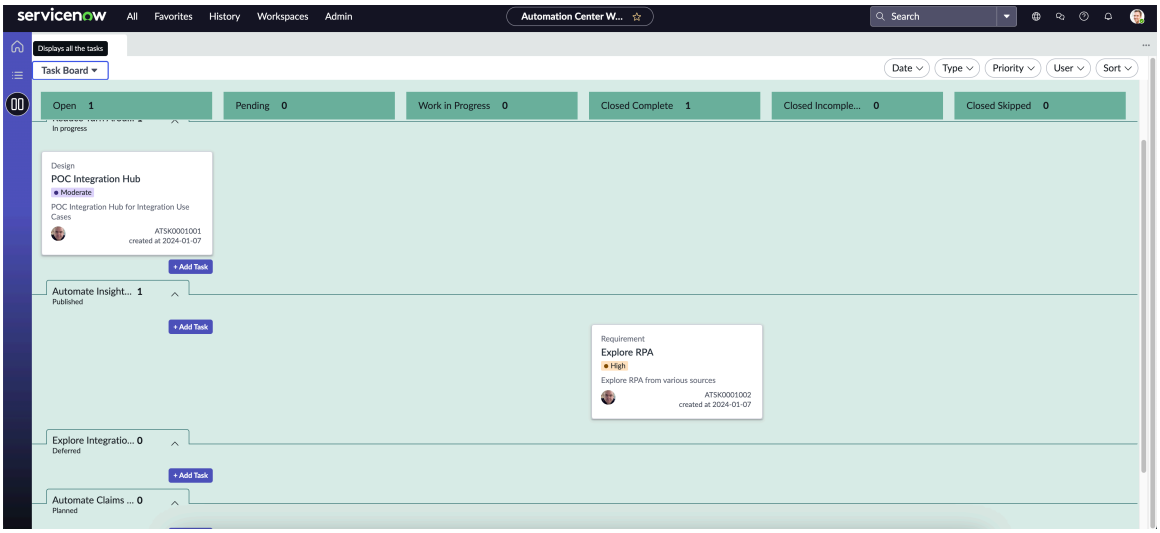


The Task Board is displayed with all available tasks and their states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
A maximum of 2000 tasks are available on the Task Board. This value can be changed only by the System Administrator.

Also, anyone with the sn_ac.automation_admin or sn_ac.automation_technical_user role can reorder different states (columns) on the Task Board to set the lifecycle or process flow direction according to their requirement by editing the vtb_board table.



4. You can do multiple actions on the Task Board.

   - Filter the tasks to match your need.

     Filter the tasks based on the following:

     - **Date**: Select any date range to view tasks created during that period.
     - **Type**: Select one or more types of tasks to view tasks that belong to the selected types.
     - **Priority**: Select one or more priority values to view tasks with those priority values.
     - **User**: Select one or more users to view tasks assigned to only those users. Only users who have been assigned a task are available for selection.

   - Sort the tasks for ease of use.

     Select **Name**, **Priority**, or **Score** from the **Sort by** field.

     Select **Ascending** or **Descending** from the **Sort Direction** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The tasks are sorted based on the selected sorting options.

- Change the state of a task.

  To move a task from one state to another, drag the card to the required state column.

  If a sorting is applied, the task card is placed according to the sorting. If no sorting is applied, the task card is placed based on the creation date.

- Create a task from the automation task card.

  Select the **Add Task** icon.

  The **Create New Automation Task** form is displayed. For more information, see Automation task form.

  Verify that the associated automation request is either in the **Planned** or **In Progress** state.

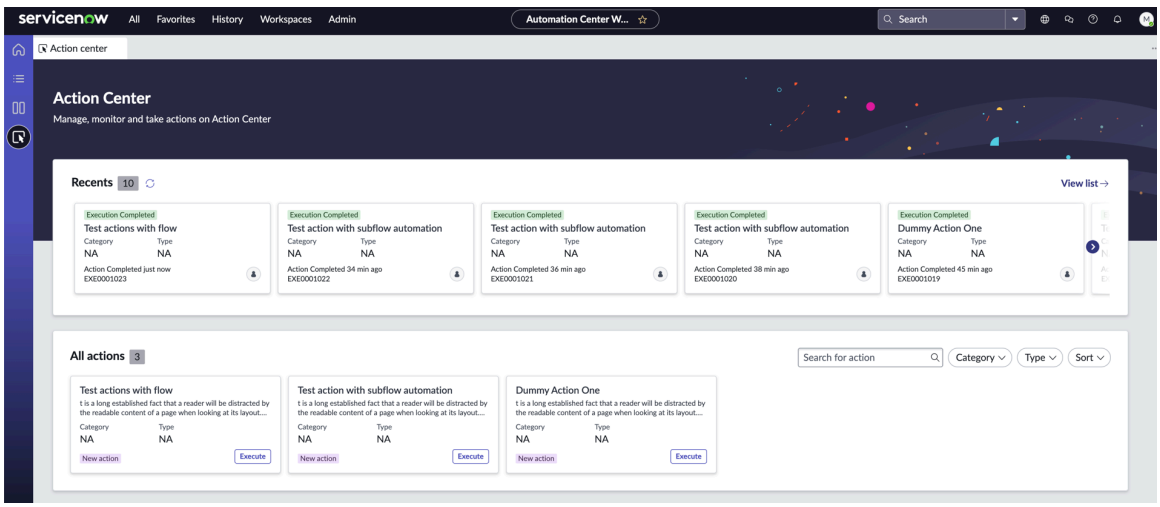
Action Center

Action Center provides an easy way to fix repeated issues that cause automations to fail in Automation Center.

> **Note:**
> In Action Center, the domain data from both global and current session domains is displayed.

Action Center provides the following benefits:

- Manage and execute actions to solve issues that cause automations to fail.
- Fix common repeated issues without any dependence on the administrator.
- Business users can initiate actions to fix issues directly from Action Center without navigating to other technology platforms, such as Workflow Studio, ServiceNow® Robotic Process Automation, or UiPath.



For detailed information, see Working with actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection Manager

Connection Manager enables you to add data from a third-party tool into Automation Center tables by correctly mapping and testing the data import.

Note:
In Connection Manager, only current session's domain data is displayed.

Connection Manager helps you to add data from a third-party tool into Automation Center tables efficiently and in a few clicks.

For detailed information, see Working with Connection Manager.

Configuring Automation Center

You can plan and configure an Automation Center implementation in your organization.

Install Automation Center

If you have the admin role, you can install the Automation Center application (sn_ac). The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Automation Center application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Automation Center:

- Plugins
- Store applications
- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Automation Center.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Automation Center application (sn_ac) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you're displayed.
3. Select a version from the list and select **Install**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

What to do next

The data in Automation Center Value dashboard is derived from the Performance Analytics (PA) tables. The PA jobs are scheduled to run at a specific time in the day. If you want to view the data immediately after the installation and before the scheduled run, then you have to manually run the PA jobs.

Configuring automation summary execution

Configure the execution summary of automation to specify how automation data is aggregated and presented on the Automation Center dashboard.

You can import and configure data from various sources, such as RPA, ServiceNow flows, Document Intelligence (DocIntel), and others to view in the Automation Center dashboard.

Earlier, for data of different data sources different types of summarization was required. It was time-consuming. However, now there's a generic way to make updates to automation summary execution for data from different sources.

Note:
The summary execution table displays data about executions of the automations for the domain where they are created and not where they are executed. For example, if an automation is created in the parent domain and executed in the child domain, it will display the data in the parent domain. You cannot see this execution data in the child domain.

Create automation source type

Define the kind of source type that you want to import and use in Automation Center.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Administration** > **Automation Center** > **Automation Source Type**.
   The Automation source types page is displayed with a list of existing automation source types.
2. Select **New**.
   The Automation source types page is displayed.
3. Provide a name and description.
4. Select **Submit**.
   The Automation source types page is displayed with the newly created automation source type along with the other automation source types.

What to do next

Create automation source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create automation source

Associate a data source for the selected source type.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Admininstration** > **Automation Center** > **Automation Source Type**.
   The Automation source types page is displayed with a list of existing automation source types.
2. Select the source type for which you want to create a source.
   The Automation source type page is displayed with the details of the source type.
3. Select **New** in the Automation Sources section.
   The Automation Source form is displayed.
4. On the form, fill in the fields.

Automation Source form

Field	Description
Name	Display name of the automation source. This name is displayed in the Automation Center dashboard.
Application	The associated application or the application scope in which the source is being created, such as Automation Center or RPA Hub. This is auto-populated.
Source Type	The source type for which you are creating the source. You can edit this field if required.
Internal name	Automation source internal name. You can edit this field. Ensure that there are no spaces when you enter a value. This field is auto-generated.
Description	Description of the automation source.

5. Select **Submit**.

Note:
One automation source type can have multiple sources associated with it.

What to do next

Configure execution summary

Configure execution summary

Configure the execution summary with the appropriate conditions.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Administration** > **Automation Center** > **Automation Sources**.
   The Automation sources page is displayed with a list of existing automation sources.
2. Select the source for which you want to configure the execution summary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Automation source page is displayed with the details of the source.

3. Select **New** in the Execution Summary Configurations section.
   The Execution summary configuration form is displayed.
4. On the form, fill in the fields.

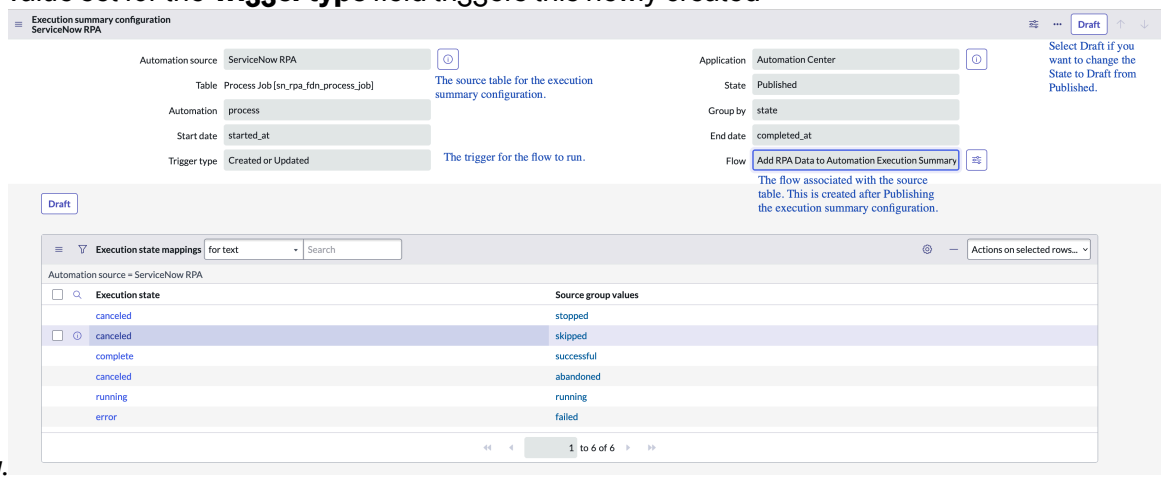
Execution summary configuration form

Field	Description
Automation source	The automation source that you've selected. This field is auto-populated.
Application	The associated application or the application scope in which the source is being created, such as Automation Center or RPA Hub. This field is auto-populated.
Table	The table from where you must import data.
State	The state of the execution summary configuration. This field is auto-populated.
Automation	The automation field from the selected table.
Group by	A field from the chosen table that you want to use to group the records.
Start date	Start time of the summary configuration.
End date	End time of the summary configuration.
Trigger type	An action that triggers the flow. The following values are available for trigger: ○ Created: Every time a record in the source table is created. ○ Updated: Every time a record in the source table is updated. ○ Created or Updated: Every time a record in the source table is created or updated. ○ Daily: Scheduled to run daily. ○ Weekly: Scheduled to run weekly. ○ Run once: Scheduled to run only once. ○ Monthly: Scheduled to run monthly. These triggers can be set in the associated flow.

5. Select **Submit**.
   You're taken to the previous page. When an execution summary configuration is created, a flow is automatically created to match the configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The value set for the **Trigger type** field triggers this newly created flow.



6. Select the summary configuration in the Execution Summary Configurations section.

> **Note:**
> One automation source can have only one execution summary configuration.

7. Select **Update**.

> **Note:**
> If you want to change the state of the execution summary from **Published** to **Draft**, select **Draft** at the top right of the page.

What to do next

Create execution state mapping

Create execution state mapping

Define the mapping for the source and target tables for the configuration to work as expected.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Automation Sources**.
   The Automation sources page is displayed with a list of existing automation sources.
2. Select the source for which you want to create the execution state mapping.
3. Select the execution summary configuration for which you want to create the execution state mapping.
4. Select **New** in the Execution state mappings section.
   The Execute state mapping page is displayed.
5. On the form, fill in the fields:

Execute state mapping form

Field	Description
Execution state	Options for the **State** field of the Automation Execution Summary table. The following values are available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Canceled ○ Complete ○ Error ○ Queued ○ Running
Application	The associated application or the application scope in which the source is being created, such as Automation Center or RPA Hub. This field is auto-populated.
Source group values	Options for the "group by" field of the source.
Automation source	Name of the automation source that you've selected for this execution state mapping.

6. Select **Submit**.
   You're taken to the Execution summary configuration page.
7. Select **Publish**.

Result
The automation summary execution configuration is complete.

Track ServiceNow flows and actions as automations

Track ServiceNow flows and actions as automations so you can view summary and detailed information of the flows and actions in the Automation Center Workspace.

This video show you how to perform the following procedure. This video show you how to track ServiceNow flows and actions as automations

Before you begin
Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure
1. Navigate to **All** > **Automation Center** > **Administration** > **Automation Tracker**.
2. On the Automation Tracker page, select **New**.
3. On the form, specify the flow or action that you want to track as automation.
4. Select **Submit**.

Result
Refresh the Automation Trackers list to view the newly created automations.

Configuring UiPath with Automation Center

Easily view and analyze UiPath data from Automation Center.

You can view and analyze UiPath data in Automation Center using the `Automation Center` API and UiPath spoke. However, using UiPath spoke is more efficient and less time-consuming.

Before configuring UiPath with Automation Center, you must install the UiPath spoke on your instance. For more details, see UiPath spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After the UiPath spoke is installed, the following two options are available:

- UiPath Webhook Registries
- UiPath WebHook Routing Policies

If an issue occurs while processing the UiPath data, an error message along with the actual payload is inserted as a record in the Import Error Log [sn_ac_import_error_log] table.

Note:
The number of days the error records will be stored in the table is defined in the Automation Center purge system property (sn_ac.purge_automation_data_in_days).

Create UiPath webhook registry

Create UiPath webhook registries to establish a connection between UiPath and Automation Center.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **UiPath** > **UiPath Webhook Registries**.
2. On the UiPath Webhook Registries form, select **New**.
3. On the form, fill in the fields.
4. Select **Submit**.
   The record is created.
5. Open the record, select **Generate Callback URL** and **Secret**.
6. Copy the URL and secret and paste it in the Webhook section of the UiPath Orchestrator.
7. In the UiPath Orchestrator interface, select the events that you want to track.
   Currently, only **Job**, **Robot**, and **Process** events are supported.
8. Select **Submit**.

Result
The connection is set between UiPath and Automation Center. Whenever you send UiPath data to the instance, it happens via the URL provided. UiPath spoke validates the secret and accepts the data.

Set UiPath WebHook routing policies

Set the UiPath WebHook routing policies to enable the data to get populated in the ServiceNow tables, and then used by Automation Center.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **UiPath** > **UiPath WebHook Routing Policies**.
2. Turn the **Active** flag for the routing policy to **True**.
   When UiPath data comes to the ServiceNow instance, these routing policies take care of triggering the corresponding flows to store data in ServiceNow tables. By default, the flag is set to **False**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tracking third-party automations

Track any third-party automations in Automation Center.

In Automation Center you can track any third-party automations. You can do that by using the `Automation Center` API.

For more information, see Automation Center API .

Customize the layout for an automation request form

Change the layout of the automation request form from the Service Catalog to meet the requirements of your organization requirements.

Before you begin

Role required: sn_ac.automation_admin

About this task

In this task, you can change the layout of the automation request form generated by navigating to **All** > **Automation Center** > **Build** > **Submit an Automation Request**.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Modify catalog for Automation Request**.
2. **Optional:** On the form, if Global is the current application, select **here** in **To edit this record click here**.
3. Make the required changes.
   For example, in the Variables related list, if you want to change the **Process Name** field to **Process**, double-click the **Process Name** field, make changes, and then select **Save**.
4. Select **Update**.

Set Automation Center Properties

You must set the properties to define the default settings that are required for Automation Center.

Before you begin

Role required: admin

You must be in the same scope in which the record exists.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Automation Properties**.
2. **Optional:** If the form isn't editable, ensure that the Application scope you are in is same as the one where the record is.
   If the form isn't editable, a message is displayed. Follow the message to change the Application scope.
3. On the form, fill in the fields.
   For a description of the field values, see Automation Center properties.
4. Select **Save**.

Configuring the Recommended Actions application with Automation Center

Configuring the Recommended Actions application to work with Automation Center enables you to reuse an existing request or plan your automation request based on an existing request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring the Recommended Actions application with Automation Center involves the following tasks:

Install Recommended Actions application

Install the Recommended Actions application to use its capabilities.

Before you begin

Role required: admin

Procedure

1. Find the#ServiceNow Recommended Actions application in store.
   Available in store with name - **Recommended Actions** and **Recommended Actions - Advanced**. You must install **Recommended Actions - Advanced** to get ML capabilities.
2. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
3. Select **Install**.

Set the Recommended Actions application system properties

Set the system properties for the Recommended Actions application to view the recommendations in the contextual panel of the Automation Center Workspace.

Before you begin

Note:
In the recommendations list, only automations that are in Published and In-maintenance state are displayed and automation requests in all states except Publish state are displayed.

Role required: admin

Procedure

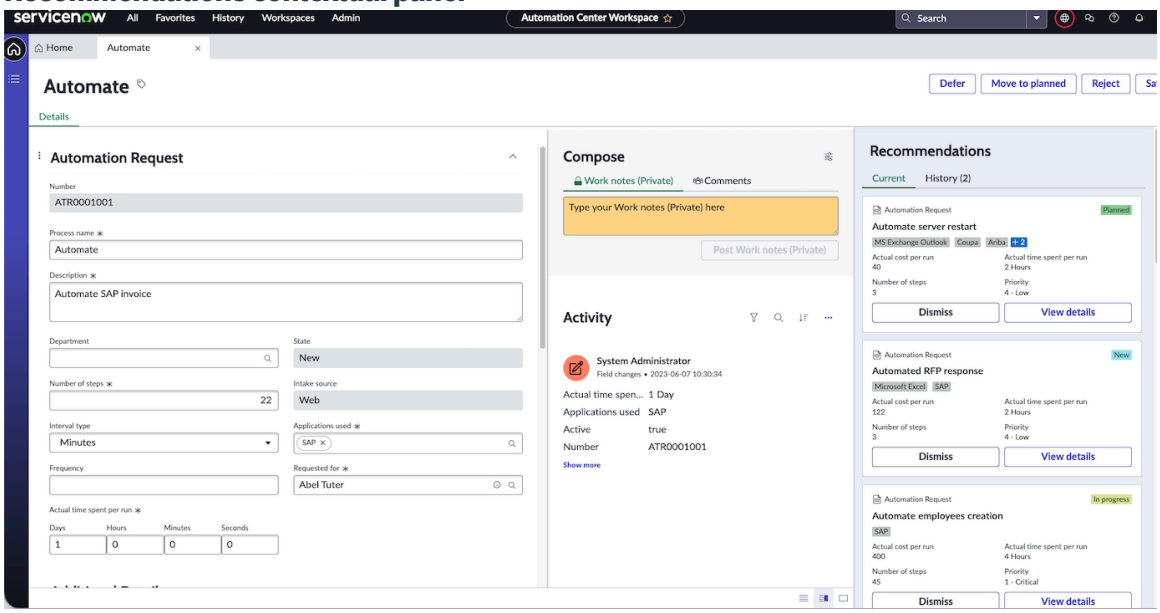
Set the system property, **sn_ac.use_recommended_actions**, to **True**.

Result

The Recommendations contextual panel is displayed in the Automation Center Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendations contextual panel



- Recommendations will be displayed in the contextual panel of the automation request record.
- Select **Dismiss** to remove the recommendation from the list.
- Select **View details** to view the details of the recommendation.
- If more than three applications are used for an automation request, then three are listed, and the rest are displayed as numbers. When you select **View details**, you can see all the applications used.
- All other details of the recommended automations and automation requests, such as state, actual cost, and actual time are also displayed.

Select option for Recommended Actions application

There are two options for the Recommended Actions application: String-based and ML-based. These options decide the kind of data that you get for your search. It displays data about automations in all states except the **Published** state.

Before you begin

Install the Recommended Actions application. For more information, see Install Recommended Actions application.

Recommended Actions searches for matching string in **Process name**, **Description**, and **Applications used** fields of the Automation requests form, and **Automation name**, **Description**, and **Source** in the Automation Attribute table.

- String-based: Searches for the exact string in the same order as in the search criteria.

  This is a good option if you want to use short phrases or single words as your search criteria. By default, this option is enabled.

- ML-based: This is helpful if you have too much data and your search criteria is long. To use the ML-based recommendations, you need at least 10 records in Automation Center.

Role required: sn_ac.automation_technical_user and sn_nb_action.next_best_action_author

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Recommended Actions** > **Recommendations**.
2. Mark the **Active** flag to **true** for the required options.

> **Note:**
> To identify the options, check the names. The names that have **ML** appended at the end are for ML-based recommendations.

3. If you have chosen ML-based option, then perform the following steps:
   a. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution** > **Definition**.
   b. Open **Automation request process name similarity** and **Automation attribute automation name** separately.
   c. Select **Update & Retrain** for each one of them.
   After selecting **Update & Retrain**, the training will start in the scheduler. After it's complete, it displays **Solution complete**.

Working with ServiceNow Spotlight feature

Use the ServiceNow Spotlight feature to auto-calculate automation request scores. Scores define the execution priority of the automation request. The higher the score, the higher the priority of the automation request.

Configuration Settings for ServiceNow Spotlight

To use the ServiceNow Spotlight feature, set the configuration settings.

If ServiceNow Spotlight and Automation Center are installed, you get the following system properties, scheduled job, and Spotlight group:

- System properties: sn_ac.use.spotlight.score.for.requests, sn_ac.use.spotlight.group.for.requests

  For detailed description of the system properties, see Automation Center properties.

- Scheduled job: **Automation Center: Copy spotlight score into request**

  For detailed description, see Components installed with Automation Center.

- Spotlight Group: If ServiceNow Spotlight is enabled, you have the Spotlight group named "Automation request group" with default Spotlight criteria set up.

  ```
  /spotlight_groups.do?sys_id=e037711dc3a11110995486d91840dd03
  ```

  If you need a different criteria than the default criteria to set your execution priority, then you can customize the criteria to meet your requirements and create a new Spotlight group. For more information, see Create a Spotlight group

  For details about the default Spotlight criteria, see Default ServiceNow Spotlight Criteria.

Default ServiceNow Spotlight Criteria

ServiceNow Spotlight is available with default criteria. Each field provides a score based on the default criteria.

The default ServiceNow Spotlight criteria are given in the following tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actual cost per run

Criteria	Score
Greater than 5000	500
Greater than 2500, and less than 5000	150
Greater than 0, and less than 2500	30

Users benefited

Criteria	Score
Greater than 500	500
Greater than 250, and less than 500	60
Greater than 0, and less than 250	25

Priority

Criteria	Score
Critical	1500
High	800
Moderate	45
Low	20

Manual steps (%)

Criteria	Score
76%-100%	150
51%-75%	100
26%-50%	80
1%-25%	40

Business criticality declared

Criteria	Score
1-most critical	750
2-somewhat critical	450
3-ess critical	80
4-not critical	20

Working with ServiceNow Spotlight

Use the spotlight feature to auto-calculate the score of an automation request.

ServiceNow Spotlight calculates scores when an automation request is created or updated. It's calculated only when the automation request is in the **New** or **Deferred** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If there's any special need to have a different score than the auto-computed score, you can manually update the **Score** field. When you do that:

- The flag **Score manually altered** is turned on.
- The Spotlight score is computed and calculated in the **Score auto calculated** field.

You can switch over to using computed score by emptying the **Score** field or setting it to 0. After you save the request record, the system will populate the Spotlight score (if any) in the **Score** field.

Set up ServiceNow Spotlight

Set up ServiceNow Spotlight to start using and getting the benefits of this feature. The Spotlight feature automatically calculates the execution priority of the automation requests.

Before you begin

Install ServiceNow® Spotlight. For more information, see the ServiceNow Spotlight documentation.

Role required: admin, pa_spotlight

Procedure

1. Turn on the usage of ServiceNow Spotlight by setting the system property, *sn_ac.use.spotlight.score.for.requests*, to **True**.
   /sys_properties.do?sys_id=2df8d6a3c3651110995486d91840dd65
2. If there are existing automation requests, execute the fix script: Initial setup of Automation Request Rank.
   /sys_script_fix_list.do?sysparm_query=nameLIKEsetup%20of%20automation%20request

   Note:
   At the end of this step, ideally there should be no records in this URL: /sn_ac_automation_request_list.do?sysparm_query=rankISNOTEMPTY%5EstateNOT%20IN3000%2C6000
3. Execute the Spotlight group: **Automation request group**.
   To do so, select the **Execute Now** button in the Spotlight group page. This action populates the Spotlights related list at the bottom of that Spotlight group page. /spotlight_groups.do?sys_id=e037711dc3a11110995486d91840dd03
4. Copy the initially computed scores to the requests using the scheduled script execution: **Automation Center: Copy spotlight score into request**.
   To do so, select the **Execute Now** button in the Scheduled Script Execution page. /sysauto_script.do?sys_id=d361d79dc3a11110995486d91840dd37

Applying Common Service Data Model guidelines to Automation Center

Apply Common Service Data Model (CSDM) to Automation Center.

CSDM is the data framework that you follow when you set up ServiceNow products and applications. You adhere to the CSDM guidelines when you define configuration items (CIs) and relationships between CIs in the CMDB. This process ensures that your data resides in the appropriate CMDB tables for maximum value from your ServiceNow AI Platform applications.

CSDM is the data model standard for all products that use the Configuration Management Database (CMDB).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The CSDM guidelines ensure unified data access for ServiceNow AI Platform products.
- The CSDM gives you clear direct prescriptive guidelines for service modeling within the CMDB.
- CSDM terms and definitions ensure consistent and accurate service reporting.
- The CSDM data model supports multiple configuration strategies and includes guidelines for using base-system tables and relationships.
- You can use the CMDB query builder to create reports showing CMDB configuration items (CIs) and their relationships.

For more information, see Common Service Data Model.

Automation Center product view

Use the ServiceNow® Automation Center application to govern your end-to-end multi-vendor automation life cycles from one place. By using real-time dashboards, you can manage and measure the health of the automation and prevent automation failures across multiple vendors.

- Discover, prioritize, and manage automation requests from different sources through the full life cycle in Automation Center workspace.
- Oversee and optimize automation performance versus business goals across multiple vendors.
- Monitor and manage the health of the automation and prevent automation failures across multiple vendors.

Automation Center and CSDM tables

Automation Center uses CSDM tables. Several ServiceNow products benefit from and add value to Automation Center.

CSDM tables used by Automation Center

- cmdb_ci: Stores all automations before they are displayed in the Automation Center dashboard.
- cmdb_ci_automation: Stores automations from cmdb_ci_flow_automation, cmdb_ci_base_rpa_process, and cmdb_ci_rpa_process.
- cmdb_ci_flow_automation: Stores flows that are tracked as automations.
- cmdb_ci_base_rpa_process: Stores third-party Robotic Process Automation data.
- cmdb_ci_rpa_process: Stores ServiceNow Robotic Process Automation data.
- cmdb_ci_base_rpa_robot: Stores third-party robot data.
- cmdb_ci_rpa_robot: Stores ServiceNow robot data.

Products that add value to Automation Center

When you use Automation Center with any of the following ServiceNow products, you increase the value you get from Automation Center:

- Robotic Process Automation
- Integration Hub
- Document Intelligence

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation Center use cases

Automation Center enables you to manage your automations from one central place.

You can create automations in the following ways:

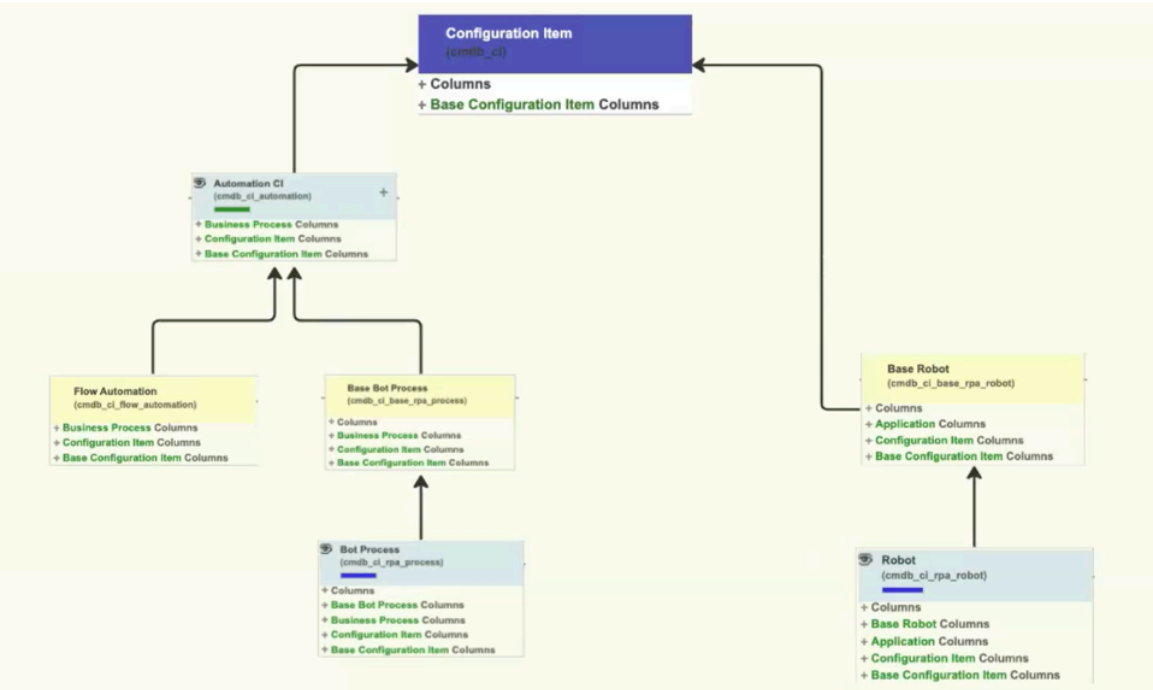
- Using Automation Center.
- Using ServiceNow flows as automations.
- Using third-party automations.

All automations irrespective of where they're created are stored in the cmdb_ci table before being displayed in the Automation Center dashboard.

When flows are tracked as automations, the data is populated in the cmdb_ci_flow_automation table. From the cmdb_ci_flow_automation table, it's reflected in the cmdb_ci_automation table. This data is then reflected in the automation_attribute table. The automation field in the automation_attribute table is referenced in the cmdb_ci table. It is from here that the data is displayed in the Automation Center dashboard.

ServiceNow Robotic Process Automation data is populated in the cmdb_ci_rpa_process table. All third-party Robotic Process Automation data is stored in the cmdb_ci_base_rpa_process table. The data from these two tables is then reflected in the automation_attribute table. The automation field in the automation_attribute table is referenced in the cmdb_ci table. It is from here that the data is displayed in the Automation Center dashboard.

ServiceNow robot data is populated in the cmdb_ci_rpa_robot table. All third-party robot data is stored in the cmdb_ci_base_rpa_robot table. The data from these two tables is then reflected in the automation_attribute table. The automation field in the automation_attribute table is referenced in the cmdb_ci table. It is from here that the data is displayed in the Automation Center dashboard.



Using Automation Center

If you're an automation business user, technical user, or administrator, you can use the Automation Center application to create an automation task, resource, insight rule, and insight trigger. You can also move an automation request to different life cycle stages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Working with automations

Create automations to automatically streamline your business processes, reduce the time that you spend on manual activities, and reduce your costs.

You can create automation goals, automation requests, and the tasks associated with them.

Create an automation goal

Create an automation goal to manage the progress and estimate the outcomes of an automation request. One goal can be associated with multiple automation requests. But an automation request can be associated with only one goal.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Automation Goals**.
4. Select **New**.
5. On the form, fill in the fields.
   For a description of the field values, see Automation goal form.
6. Select **Save**.

Related topics

Creating an automation request

Reinstate an automation goal

Reinstate an already achieved automation goal to restore and alter the scope of the automation.

Before you begin

Create an automation goal. For more information, see Create an automation goal.

Verify that the state of the automation goal is **Achieved**.

Role required: sn_ac.automation_business_user

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Automation Goals**.
4. Open an achieved automation goal that you want to reinstate.
5. Select **Reinstate**.
6. In the **Target date** field, specify the target date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you don't specify the target date and save the form, then when the goal is moved to the **Achieved** state, the target date is automatically set to one day later than the start date.

7. Select **Save**.

Creating an automation request

An automation request helps you to automatically streamline your business processes, reduce the time that you spend on manual activities, and reduce your costs.

You can create an automation request in three ways. You can create a request by using the ServiceNow® Service Catalog, from Automation Center, or from Process Mining Workspace.

Submit an automation request from Service Catalog

Submit an automation request using the ServiceNow® Service Catalog form to automate your business processes to streamline, reduce time spent on manual activities, and reduce costs.

Before you begin

(Optional) Create an automation goal. For more information, see Create an automation goal.

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Submit an Automation Request**.
2. On the form, fill in the fields.
   For a description of the field values, see Submit an Automation Request form.
3. Select **Submit**.

Note:
Any automation request created from Service portal is visible from the **Requests** tab of the Service portal as well as from Automation Center.

What to do next

Move the automation request to **Planned** state. For more information, see Move an automation request to the planned state.

- Create an automation resource

Create an automation request from Process Mining Workspace

Create an automation request from the Process Mining Workspace, which is outside of the Automation Center. If you have installed Process Mining and Automation Center, then you can create an automation request from the Process Mining Workspace.

Before you begin
(Optional) Create an automation goal. For more information, see Create an automation goal.

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

Navigate to **Workspaces** > **Process Mining Workspace**.
For more information, see the Process Mining documentation.

What to do next
Move the automation request to the planned state. For more information, see Move an automation request to the planned state.

Create an automation task

Create an automation task to effectively manage the activities associated with the automation request. However, this is an optional step.

Before you begin
Create an automation request. For more information, see Creating an automation request.

Verify that the associated automation request is either in the **Planned** or **In Progress** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

There are five types of automation tasks:

- Requirement
- Design
- Development
- Quality engineering
- Sign off

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to create and associate an automation task to.
5. On the **Automation Task** tab, select **New**.
6. On the form, fill in the fields.
   For a description of the field values, see Automation task form.
7. Select **Save**.
8. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

What to do next

Create an automation resource for the automation task. For more information, see Create an automation resource.

Related topics

Automation task form

Create an automation resource

Create an automation resource

Create an automation resource to associate a resource to an automation task. However, this is an optional step.

Before you begin

Note:
From the Washington DC release, this feature is deprecated.

Create an automation task. For more information, see Create an automation task.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

An automation resource is the person who is assigned to work on the automation task. One automation task can be associated with multiple automation resources.

Automation resource types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Development
- Quality engineering
- Product management

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Tasks**.
4. Open the automation task that you want to create and associate an automation resource.
5. On the **Automation Resources** tab, select **New**.
6. On the form, fill in the fields.
   For a description of the field values, see Automation resource form.
7. Select **Save**.

What to do next

(Optional) Create an automation goal. For more information, see Create an automation goal.

Related topics

Automation resource form

Move an automation request to the planned state

After creating an automation request, move it to the **Planned** state before you work on it or create associated automation tasks or resources.

Before you begin

Create an automation request. For more information, see Creating an automation request.

Verify that the state of the automation request is **New**.

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to move to the Planned state.
5. In the form header, select **Move to Planned**.

Result

After you move an automation request to the Planned state, it's ready for you to work on.

Move an automation request to the In progress state

As you begin the development for the automation request, move it to the **In progress** state. This state notifies anyone using Automation Center that the work for the automation is in progress.

Before you begin

Create an automation request. For more information, see Creating an automation request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify that the state of the automation request is **Planned**.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to move to the In-progress state.
5. In the form header, select **Move to In progress**.

What to do next

Update the **Automation** field in the automation request form. This field is visible only when the state of the automation request is **In progress**. For more information, see Automation request form from Automation Center.

Defer an automation request

Defer an automation request from Automation Center if the priority of the request has changed and it is not urgent anymore.

Before you begin

Create an automation request. For more information, see Creating an automation request.

Verify that the state of the automation request is either **New** or **In Progress**.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

Deferring an automation request is one of the life-cycle stages of an automation request.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to defer.
5. In the form header, select **Defer**.

> **Warning:**
> After you move an automation request to the Defer state, you can't change or delete the entries on the Automation request form, associated automation tasks, and resources.

What to do next

You can move the automation request to Planned state or reject the automation request. For more information, see Move an automation request to the planned state and Reject an automation request.

Reject an automation request

Reject an automation request from Automation Center if it's a duplicate of an existing automation or if it doesn't meet the required criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Create an automation request. For more information, see Creating an automation request.

After you reject an automation request, the life cycle of the automation request ends.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task
Rejecting an automation request is one of the life-cycle stages of an automation request.

Procedure
1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to reject.
5. In the form header, select **Reject**.

> **Warning:**
> After you move an automation request to the Rejected state, you can't change or delete the entries on the Automation request form, associated automation tasks, and resources.

Result
The Rejected state is the end state of a request. There are no operations possible after that state.

Publish an automation request

Publish an automation request from Automation Center to make the request ready for execution.

Before you begin
Create an automation request. For more information, see Creating an automation request.

To publish an automation request, the associated automation tasks must be in one of the following states:

- **Closed complete**
- **Closed incomplete**
- **Closed skipped**

Verify that the state of the automation request is **In progress**, and map the required Automation CI records whose life-cycle stage status is **Published**. An automation CI record has details about an automation.

For details about mapping an automation request with automation CI record, see Map automations with automation request.

For all ServiceNow RPAs, an Automation CI record is available. For more details, see the RPA documentation.

For third-party RPAs, there are two scenarios:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For historical data of process and robot, you must manually create records in the corresponding CMDB Base Process table (cmdb_ci_base-rpa_process) and CMBD Base Robot table (cmdb_ci_base_robot).

- For data of process and robot created after installing Automation Center, you must configure Rest API and send the process, robot, and execution details via Rest API and the records are created in the corresponding tables.

For further details, contact ServiceNow Customer Support.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to publish.
5. In the form header, select **Publish**.

> **Warning:**
> After you publish an automation request, you can't change or delete the entries in the automation request form, associated automation tasks, or resources.

Result

After you publish an automation request, the automation is ready for execution, which is the last stage in the automation request life cycle.

Map automations with automation request

Map automations in Published state with an automation request to publish the automation request.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

> **Note:**
> The cost saved and time saved values for an automation are calculated by moving average method. The moving average is controlled by the *sn_ac.savings_averaging_window* system property. For more information, see Automation Center properties.

Procedure

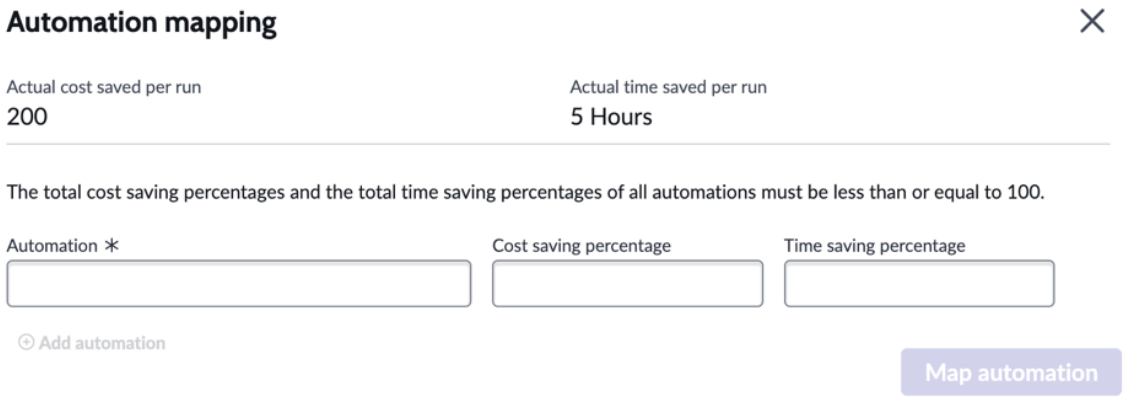
1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.

> **Note:**
> Ensure that the automation request is in In Progress state.

4. Select the **Automation Mappings** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Map automation**.
   The Automation mapping window is displayed.



6. Provide the details.

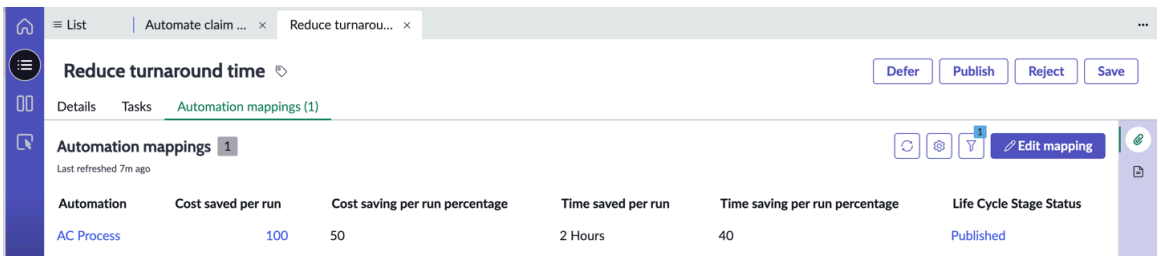
Field	Description
Automation	Double-click to select an automation from the available list. For publishing an automation request, you must have at least one automation mapped to the request. Also, the mapped automations must be in the Published state.
Cost saving percentage	Specify the percentage of the cost that this automation saves for the automation request. If the actual cost saved per run is $200, and this automation saves 50%, then this automation saves $100.
Time saving percentage	Specify the percentage of the time that this automation saves for the automation request. If the actual time saved per run is 4 hours, and this automation saves 50%, then this automation saves 2 hours.

Note:

The total cost saving percentages and the total time saving percentages of all automations must be less than or equal to 100.

You can edit the cost and time savings percentage manually from the form view of the automation attribute record.

However, if the cost and time saved per run are manually updated, the **Cost saving percentage** and **Time saving percentage** fields in the Automation Mapping form are empty and non-editable. Also, the moving average is not calculated for the edited automation.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:

In the automation request, the actual cost saved per run was specified as $200 and the actual time saved per run was specified as 5 hours.

In the mapping, the Cost saving percentage was specified as 50% and the Time saving percentage was specified as 40%.

The values for the mapping are auto-calculated based on the input provided as shown in the Automation mappings screenshot.

7. **Optional:** Select **Add automation** to add multiple automations.
8. Select **Map automation**.
   The automation is mapped.
9. **Optional:** Select – beside a row, and select **Map automation** to delete the mapped automation.

   Note:
   You can't delete the first automation that you have mapped.

10. **Optional:** After creating the mapping, select **Edit mapping** to edit the existing mappings or add new mappings.

Update an automation attribute

Update an automation attribute to include the automation source and time savings information. This information is available in the Automation Center Value dashboard for analysis.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin.

About this task

When you create an automation request from Automation Center, you already provide the cost-saved and time-saved values. That information is displayed in the Automation Center Value dashboard. If required, you can update the values.

When data is sent from ServiceNow RPA and flows or any third-party vendor, the cost-saved and time-saved fields must be updated manually.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Automation Attributes**.
4. Select an automation attribute that you want to update, and then select **Edit**.
5. On the form, fill in the fields.

   Note:
   Only **Cost saved per run** and **Time saved per run** fields can be updated. The other fields are auto-generated.

© 2026 ServiceNow, Inc. All rights reserved.

Automation attribute form

Field	Description
Automation	Associated automation.
Cost saved per run	Cost saved after each run of the automation.
Published Date	Published date of the associated automation. You can edit this auto-generated field.
Source	Associated automation source.
Time saved per run	Time saved after each run of the automation.

6. Select **Update**.

Enable granular integration for automations

Enable granular integration for automations to capture cost saved and time saved at the transaction level. This feature makes the total cost-saved and total time-saved data analysis effective.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin.

Important:
This feature is available only for those automations that have ServiceNow® Robotic Process Automation version 10.0.0 and later.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Automation Attributes**.
4. Select the link on the **Class** column for an automation with the source name as **ServiceNow RPA**.
   The details section is displayed.
5. From the ellipses on the right top, select **Enable Granular Integration**.

   A confirmation message is displayed.

6. Select **Enable Granular Integration** on the confirmation window.
   You're automatically taken to the **Granular Integration** tab.
7. Select **Add queues**.
   A window is displayed enabling you to add queues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Provide the details.

Field	Description
RPA Work Queue	Select a queue from the list. If you don't see any queue in the list, you must add queues to the Bot Process. **a.** Navigate to **All** > **Automation center** > **Monitor** > **All Bot Processes**. **b.** Select the automation for which you're enabling the granular integration. **c.** Add queues from the **Related Links** section.
Cost saved per item	Specify the cost that is saved per work item.
Time saved per item	Specify the time that is saved per work item.

9. **Optional:** Select **Add queues** to add multiple queues.
10. Select **Map queues**.
    The queues are mapped for the automation and the granular integration is enabled. From the next execution after 24 hours, the data is displayed in the **Active automations** widget in the **Overview** dashboard. Granular data ensures that the cost-saved and time-saved data is displayed at item level making it more accurate.

    The data of the granular integration can be seen in the Automation Transaction Summary table.
11. **Optional:** Select – beside a row to delete the mapped queue.

> **Note:**
> You can't delete the first queue that you have mapped.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. **Optional:** To disable granular integration, from the ellipses on the right top, select **Disable Granular Integration**.
    The queue remains, however, granular data integration isn't used to calculate the time and cost saved.

Manage and review automation executions

Manage and review your automation executions, including their states, so that you can make sure that they are on track.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Monitor**, select **Automation Executions**.
4. Open the automation execution that you want to view.
5. Review the information on the Automation Executions page.

Review the bot processes

Review a list of available bot processes in Automation Center, so that you can make sure that they are on track.

Before you begin

Roles required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin.

In addition to the Automation Center roles, you will also need the Robotic Process Automation (RPA) roles. For more information on RPA roles, see Components installed with RPA Hub.

About this task

A bot process is a configuration of the robot.

You can't create a bot process.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Monitor**, select **All Bot Processes**.
4. Open the bot process that you want to view.
5. Review the information on the bot process page.

View the available robots

View a list of available robots in Automation Center for reference purpose.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

In addition to the Automation Center roles, you will also need the Robotic Process Automation (RPA) roles. For more information on RPA roles, see Components installed with RPA Hub.

About this task
A robot is a software agent that runs a bot process.

You can't create a robot.

Procedure
1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Monitor**, select **All Robots**.
4. Open the robot that you want to view.
5. Review the information on the robot page.

Create an insight rule

Create an insight rule to generate custom insights for an automation business process.

Before you begin
This task must be performed in the classic environment.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task
When an insight rule is processed, it generates an insight. Insights appear on the Insights widget in the Executions dashboard of Automation Center Workspace.

Procedure
1. Navigate to **All** > **Automation Center** > **Administration** > **Insight Rules**.
2. Select **New**.
3. On the form, fill in the fields.
4. Select **Submit**.

Related topics
Insight rule form

Create an insight trigger

Create an active insight trigger so that you can run the related insight rule.

Before you begin
This task must be performed in the classic environment.

Create an insight rule. For more information, see Create an insight rule.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When an insight rule is processed, it generates an insight. Insights appear on the Insights widget in the Executions dashboard of Automation Center Workspace.

An insight trigger activates the associated insight rule to run.

An insight rule doesn't run unless it's mapped to an insight trigger.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Insight Rules**.
2. Open the insight rule for which you want to create and associate an insight trigger to.
3. On the **Automation Insight Triggers** tab, select **New**.
4. **Optional:** If the **New** button is unavailable, ensure that the Application scope you are in is same as the one where the record is.
   A message is displayed if the **New** button is unavailable. Follow the message to change the Application scope.
5. Select the appropriate type of insight trigger that you want to create:
   - Map to an existing business rule
   - Map to a new scheduled script
   - Map to an existing scheduled job

Map an insight rule to an existing business rule

Map an insight rule to an existing business rule to define the type of insight trigger. This insight trigger activates the associated insight rule to run.

Before you begin

This task must be performed in the classic environment.

Create an insight rule. For more information, see Create an insight rule.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

When an insight rule is processed, it generates an insight. Insights appear on the Insights widget in the Executions dashboard of Automation Center Workspace.

An insight trigger activates the associated insight rule to run.

An insight rule does not run unless it is mapped to an insight trigger.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Insight Rules**.
2. Open the insight rule that you want to create and associate an insight trigger to.
3. On the **Automation Insight Triggers** tab, select **New**.
4. Select **Map to an existing business rule**.
5. On the form, fill in the fields.

Automation CRUD Trigger form

Field	Description
Name	Name of the insight trigger.
Active	Option for ensuring the use of the insight trigger.
Business rule	Applicable business rule that is required to trigger the insight rule. The mapped business rule script field must contain the `new sn_ac.ACInsightTriggerUtil(current, previous).raiseInsightByBR(<Business Rule SysId>);` API to trigger the insight rule.
Application	Application that is associated with the insight trigger.
Automation insight rule	Associated automation insight rule.

6. Select **Submit**.

Map an insight rule to a new scheduled script

Map an insight rule to a new scheduled script to define the type of insight trigger. This insight trigger activates the associated insight rule to run.

Before you begin

This task must be performed in the classic environment.

Create an insight rule. For more information, see Create an insight rule.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

When an insight rule is processed, it generates an insight. Insights appear on the Insights widget in the Executions dashboard of Automation Center Workspace.

An insight trigger activates the associated insight rule to run.

An insight rule does not run unless it is mapped to an insight trigger.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Insight Rules**.
2. Open the insight rule that you want to create and associate an insight trigger to.
3. On the **Automation Insight Triggers** tab, select **New**.
4. Select **Map to a new scheduled script**.
5. On the form, fill in the fields.
6. Select **Submit**.

Working with actions

Create actions to fix issues that cause automations to fail.

You can create action requests and actions.

Creating an action request

An action request helps you to automatically solve issues that cause automations to fail, improving efficiency and saving time and cost.

You can create an action request in two ways. You can create a request by using the ServiceNow® Service Catalog or from Automation Center.

Submit an action request from Service Catalog

Submit an action request using the ServiceNow® Service Catalog form to request for actions to resolve issues causing your automations to fail.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Submit an Automation Request**.
2. On the form, fill in the fields.
   For a description of the field values, see Submit an Automation Request form.
3. Select **Submit**.

Create an action request from Automation Center

Create an action request from Automation Center to request for actions to resolve issues causing your automations to fail.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **All Automation Requests**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the field values, see Automation request form from Automation Center.
4. Select **Submit**.
5. Complete the additional fields on the form, depending on your role.
6. Select **Update**.

Creating an action

Create an action to empower users to fix issues automatically.

As a technical user or system administrator, you must create actions based on user requests.

If a user faces an issue due to which an automation is frequently failing, the user will create an action request. Based on the action request, you need to create an action.

Create a flow, subflow, or action in Workflow Studio

Create a flow in Workflow Studio to automate fixing repeated issues that cause automations to fail in Automation Center.

Before you begin

Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

Navigate to **All** > **Process Automation** > **Workflow Studio**.
For detailed information, see Create a flow in Workflow Studio.

Important:
The flow, subflow, or action that you create must be client-callible. Create an ACL that can call this flow. This flow must be published.

What to do next

Create an action category

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an action category

Create an action category to associate with an action. Action categories help users to categorize the actions into different categories, which would make selecting categories easier.

Before you begin

Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Action Categories**.
2. Select **New**.
3. On the Action Categories form, fill in the fields.

Action Categories form

Field	Description
Name	An intuitive name for the action category.
Application	Scope of the action category. This is auto-populated. Do not edit this field.
Description	Description of the action category.
Parent	Select an action category if you want to attach the new category with another one.

4. Select **Submit**.

Result

The action category is created.

What to do next

Create an action type

Create an action type

Create an action type to associate with an action category. Action types are a sub-set of action category. They are used for easier identification based on need.

Before you begin

Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation center** > **Build** > **Action Categories**.
2. From the list of action categories, select an action category for which you want to create an action type.
3. Select **New** from the **Action Type** area.
4. On the form, fill in the details.

Field	Description
Name	An intuitive name for the action type.
Application	Scope of the action type. This is auto-populated. Do not edit this field.
Description	Description of the action type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Parent	The action category that you have selected is automatically populated. Do not edit this field.

5. Select **Submit**.

What to do next
Create an action

Create an action

Create an action to view and execute in Action Center to fix issues that cause automations to fail in Automation Center.

Before you begin
Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Actions**.
2. Select **New**.
3. On the Action Details form, fill in the fields.

Action Details form

Field	Description
Number	Unique number that is auto-populated.
Application	Scope of the action.
Name	Intuitive name for the action.
Category	Select an action category that you want to associate with the action.
Type	Select the type of action category that you want to associate with the action.
Action Type	The type of action that is created in Flow designer. The available values are **Flow/Subflow** and **Action**.
Action	The action that you have created in Flow Designer. **Note:** You cannot map one flow, subflow, or action created in Flow Designer to multiple actions in Automation Center.
Active	This is a non-editable field.
Enable concurrent executions	Select this option if you want to execute the same action concurrently in Action Center.
Description	Description of the action.
Execution instructions	Any execution instructions that you want to provide.

4. Select **Submit** to save the action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Activate** only if there are no more changes expected for the associated action.
   If you select **Activate**, you cannot make any other changes to the action configuration, that is the **Action Type** and **Action** fields. The other fields can be updated.

Execute actions in Automation Center

Execute an action to fix common repeated issues efficiently.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Action Center icon ( ) on the left.

   - In the **Recents** section, all actions that have been executed are displayed.
   - You can view all the actions that have been executed by selecting the **View list** button in the **Recents** section.
   - In the **All actions** section, all available actions are displayed. You can search for any action or filter and sort your results.
3. In the **All actions** section, select **Execute** for any available action that you want to run.
   A new page is displayed with additional information.
4. Provide all required information, and select **Run**.
   The action is run and displayed in the **Recents** section.

Manage actions

Manage the actions to set permissions of who can access the actions and view any details or logs of the executed actions.

As an administrator or technical user, you must set permissions of who can access the actions available in Action Center. Setting permissions for actions makes Action Center less cluttered for users. Secondly, it ensures that users have only those actions that they require.

After the actions are executed, you can view the logs to understand details of the executions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create assigned groups

Create assigned groups to limit the availability of the action to a specific group.

Before you begin

Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the Action Center icon ( ) on the left.
3. Select an action.
   The details are displayed
4. Select the **Assigned Groups** tab.
5. Select **New**.
6. Specify the group to which you want to assign permissions to view and execute the action.
7. Select **Save**.

View action logs

View action logs to see details of actions that are executed.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the Lists icon ( ) on the left.
3. Select **Monitor** > **Action Logs**.
4. The logs of all executed actions is displayed.

Working with reviews

Reviews enable you to evaluate automations that have been created.

Create a review request when you want the COE team to review an automation and analyze if the automation is required.

Creating a review request

Review request enable you to review the automations.

You can create an action request in two ways. You can create a request by using the ServiceNow® Service Catalog or from Automation Center.

Submit a review request from Service Catalog

Submit a review request using the ServiceNow® Service Catalog form to request for reviews to review automations.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Submit an Automation Request**.
2. On the form, fill in the fields.
   For a description of the field values, see Submit an Automation Request form.
3. Select **Submit**.

Create a review request from Automation Center

Create a review request from Automation Center to request for reviews to review automations.

Before you begin
Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **All Automation Requests**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the field values, see Automation request form from Automation Center.
4. Select **Submit**.
5. Complete the additional fields on the form, depending on your role.
6. Select **Update**.

Working with Connection Manager

Connection Manager enables you to add data from a third-party tool into Automation Center tables by correctly mapping and testing the data import.

Create an automation source

Create an automation source to start importing data from any third-party tool.

Before you begin
Role required: flow_designer, delegated_developer, sn_ac.automation_technical_user, or sn_ac.automation_admin

About this task
The following steps must be followed in the same order to create an automation source in Automation Center.

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Connection Manager icon ( ) on the left.
3. Select **New source**.
   The Add automation source page is displayed. Perform the following steps in the same order.

Define source for automation

Define the source that you want to add for your automations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Provide details on the **Define source** form.

Define source form

Field	Description
Source name	Provide a unique and intuitive name for your automation source. **Note:** Source name can contain only underscores and alphanumeric characters.
Description	Provide a description that details the purpose of the automation source.
Source type	Provide the name of the source from where you want to import data. For example, ServiceNow® Robotic Process Automation. If you want to create your own source type, select Add source type. On the form, provide a name, select an icon, and then select **Add**. The source type is now available in the list of source types. Select it from the list.

2. Select **Save and continue**.
The **Configure data import** section is displayed with the **Schedule import** section made available to schedule the import of automation data.

Configuring data import

Configure the details of the data import, such as the kind of data, the schedule of the import, and so on.

Perform the following tasks in the same order to configure importing your automation data.

Schedule data import

Schedule the frequency for the data import to ensure that the automation data is updated as required.

Before you begin
Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Define source** tab. For information on defining source, see Define source for automation.

Procedure

1. Provide the details on the form.

- **Daily**: Schedules the data import daily.

  Enter a time when the data must be imported daily.

  You can provide the time in 12-hour format or 24-hour format.

- **Weekly**: Schedules the data import weekly.

  a. Select a day of the week when the data must be imported from the **Select Day** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Enter a time when the data must be imported.

You can provide the time in 12-hour format or 24-hour format.

- **Monthly**: Schedules the data import monthly.

a. Select a specific date of the month when the data must be imported from the **Select Date** list.

b. Enter a time when the data must be imported daily.

You can provide the time in 12-hour format or 24-hour format.

- **Run once**: Schedules the data import only once.

Select the calendar icon on the Select Date field, and select a specific date and time when the data must be imported.

- **Repeat**: Schedules the data import at a custom frequency.

Select a custom frequency for your data import. Use this option if you want to import data in a frequency that does not match to any other frequency provided here, such as weekly, monthly, and so on. For example, you could set the frequency to bi-weekly or once in three months.

a. Provide a value in the **Days** field.

If you provide 20, the data import will happen once every 20 days.

b. Enter a time when the data must be imported.

You can provide the time in 12-hour format or 24-hour format.

2. Select **Save and continue**.
The **Select spoke** section is displayed.

Select a spoke

Choose a spoke to set up a connection. This is an optional step.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

If your spoke isn't already installed, ensure to install it first.

Proceed from the **Schedule data import** section. For information on scheduling data import, see Schedule data import.

Procedure

1. Select a spoke.
You can sort the available spokes alphabetically using the Sort by field. You can search a spoke by name in the Search field.
2. Select **Save and continue**.
If you want to skip this section, select **Skip**.

The **Select action** section is displayed.

Select an action

Select an action suitable for your data import into ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Select a spoke** section. For information on selecting a spoke, see Select a spoke.

Important:

- Only actions that include a REST step and that are active and published are listed.
- Select an action that has the output type as "array.output". Else, the data is not available for import.

Procedure

1. Select an action.
   If you want to create a new action, select **Create action**. For detailed information, see Creating an action.
   - Select a spoke from the **Spoke** list to view only those actions that are associated with the selected spoke.
   - Sort the list alphabetically using the **Sort** field.
   - Search an action by its name from the **Search** field.
2. Select **Save and continue**.
   The **Configure batch import** section is displayed.

Configure batch import for data

Configure batch import of data to specify the pagination method for importing large data sets.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Select an action** section. For information on selecting a spoke, see Select an action.

Procedure

1. Provide the details on the form.

Define source form

Field	Description
Action details	Review input and output details to customize the data flow for your specific needs.
Select output type	Select the output type value from the list. Only actions that have the output type as "array.output" have a value displayed here.
Select batch import method	Select a batch import method. The right batch import method helps to manage data efficiently. Batching can help improve performance, handle errors, and ensure data freshness in large imports. The following batch import methods are available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **None**: Import data in a single request. Select this if you do not want to use the pagination method provided in Automation Center. ○ **Offset**: Import data in batches using an offset value. ○ **Time based**: Import data in batches based on time intervals. ○ **Token based**: Import data in batches using a continuation token.
Generate flow template	Select this button to generate a flow. After the flow is generated, edit it to set up input parameters and pagination for large imports. ○ Establish the necessary input parameters (static or dynamic): For example, when you import automation records from a third-party tool, send a dynamic value such as Automation Status, or a static value such as "Retry Limit = 3". ○ Link pagination for large data sets: For example, if you have 1,000 or more automation records, setup the pagination to process 100 records per page by indicating both the page number and page size.

The flow is generated and you are guided to edit the flow.

2. Select **Continue to edit flow**.

   The Workflow Studio page is displayed.

   Note:
   Edit the flow as per your requirement. For information on editing a flow, see Edit flow in Workflow Studio.

   Do not activate the flow at this point.

3. Select **Verify flow** to verify if the flow is correct.
   This step verifies if the selected action is available in the flow.
4. Select **Save and continue**.
   The **Verify and test** section is displayed.

Edit flow in Workflow Studio

Edit the flow to confirm that the pagination is implemented correctly. This confirms that the data is imported correctly.

There are four batch import methods:

- None
- Offset
- Time based
- Token based

None batch import

Select the none batch import method if you do not want to use the pagination method provided in Automation Center. There is no step required here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Offset-based batch import

Select the offset-based batch import method (pagination method) if you want to import data using a specific start point (offset) and a batch size (limit).

- **Offset**: The starting point for importing data.
- **Total items**: The total number of records that you want to import.
- **Limit**: The number of records to import in each batch.

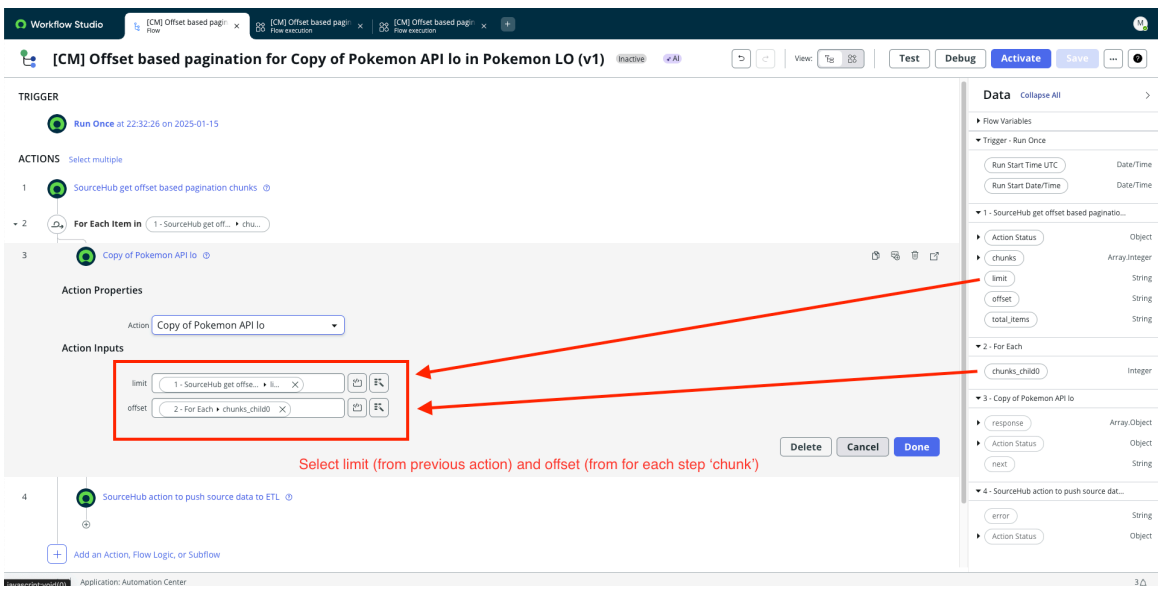
For example: If you set the offset to 20, total items to 200, and limit to 10, then the system will import data in batches of 10 records starting from record 20 and continuing until all 200 records are imported.

Steps to configure

1. In the **SourceHub get offset based pagination chunks** action, specify values for the offset, total items, and limit fields, and then select **Done**.

   After the values are defined, the **chunks_child0** field will be available in the right-hand panel (under **For Each**).

2. For the action you selected during the **Select Action** step, map the limit from **SourceHub get offset based pagination chunks** action and offset values using the **chunks_child0** field output generated by the **SourceHub get offset based pagination chunks** action.



Handling actions that don't support limit and offset

Map the limit and offset values in your action using the output returned by the SourceHub get offset based pagination chunks action.

If your selected action doesn't have predefined parameters for offset-based pagination but includes a filter that can accommodate these parameters, you can do one of the following:

- **Option 1**: Add an action just before your selected action to handle the limit and offset. This action should generate a query that the primary action can use to fetch data.
- **Option 2**: Copy your primary action, modify it to include inputs for limit and offset, and process these inputs to create a query. Pass this query to the filter of your original action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you choose Option 2, ensure that you create a copy of the original action first. After copying, reselect the copied action in the **Select Action** step and regenerate the flow. For information about selecting an action, see Select an action.

3. Select **Done** and **Test**.
4. Follow steps 3 onwards in Configure batch import for data.

Time-based batch import

Select the time-based batch import method if you want to import data for a specific date range.

Steps to configure

1. In the **SourceHub get date based pagination chunks** action, specify the start date and end date, then click **Done**.

   After you values are defined, the **range** field in your right panel is available.

2. For the action you selected during the **Select Action** step, map the start date and end date values using the **range** field output generated by the **SourceHub get date based pagination chunks** action.

   Date format

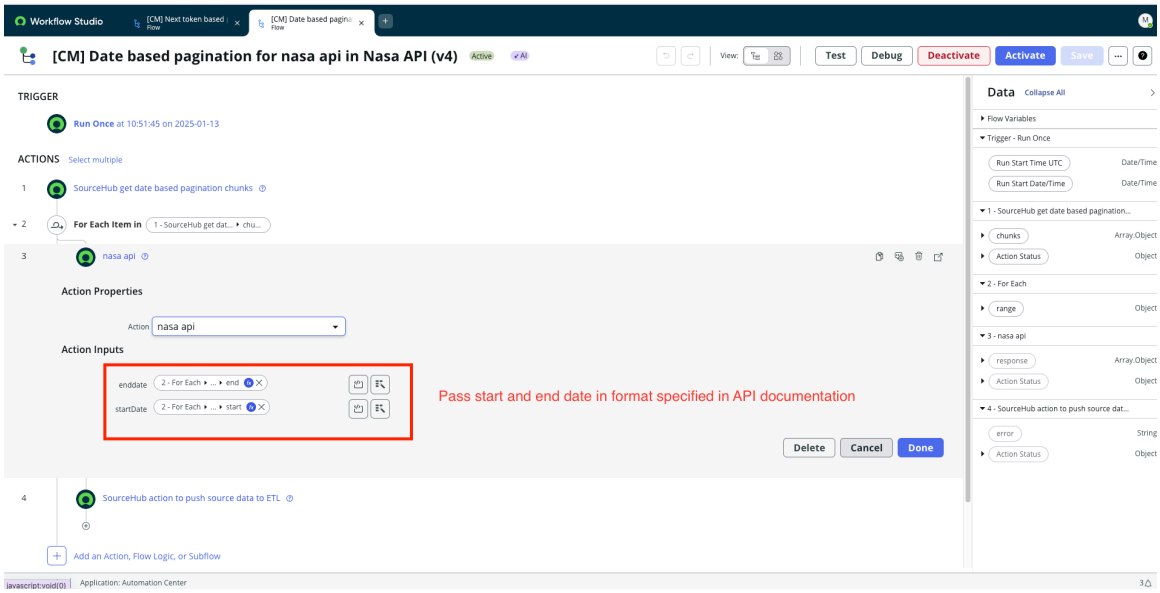
   The Connection Manager uses and returns dates in the format: YYYY:MM:DD:HH:MM:SS. If your Action supports date ranges, the format is automatically applied.

   Handling actions that don't support date ranges

   If your action doesn't automatically support date ranges but includes a filter for custom parameters, you can follow one of these approaches.

   - **Option 1**: Add an action before your selected action to handle the start date and end date. This action should generate a query that your primary action can use to fetch data.
   - **Option 2**: Copy your primary action and modify it to include inputs for start date and end date. Process these inputs within the action to create a query and pass it to the filter of your original action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



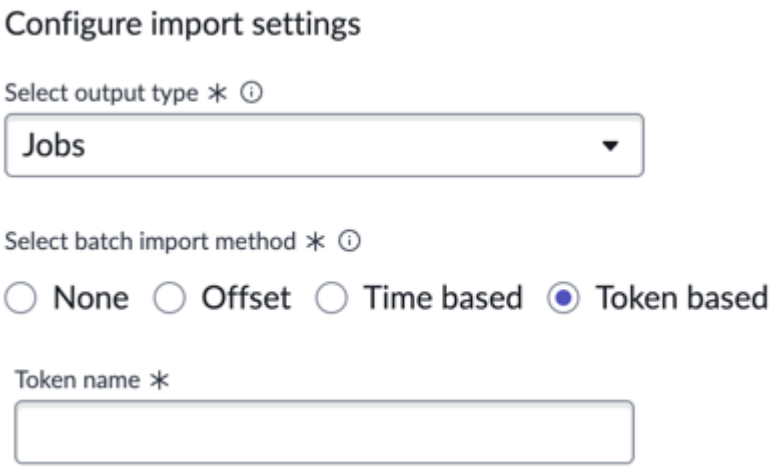
Note:
If you choose Option 2, ensure that you create a copy of the original action first. After copying, reselect the copied action in the **Select Action** step and regenerate the flow. For information about selecting an action, see Select an action.

3. Select **Done** and **Test**.
4. Follow steps 3 onwards in Configure batch import for data.

Token-based batch import

Select the token-based batch import method if you want to import data using a continuation token.

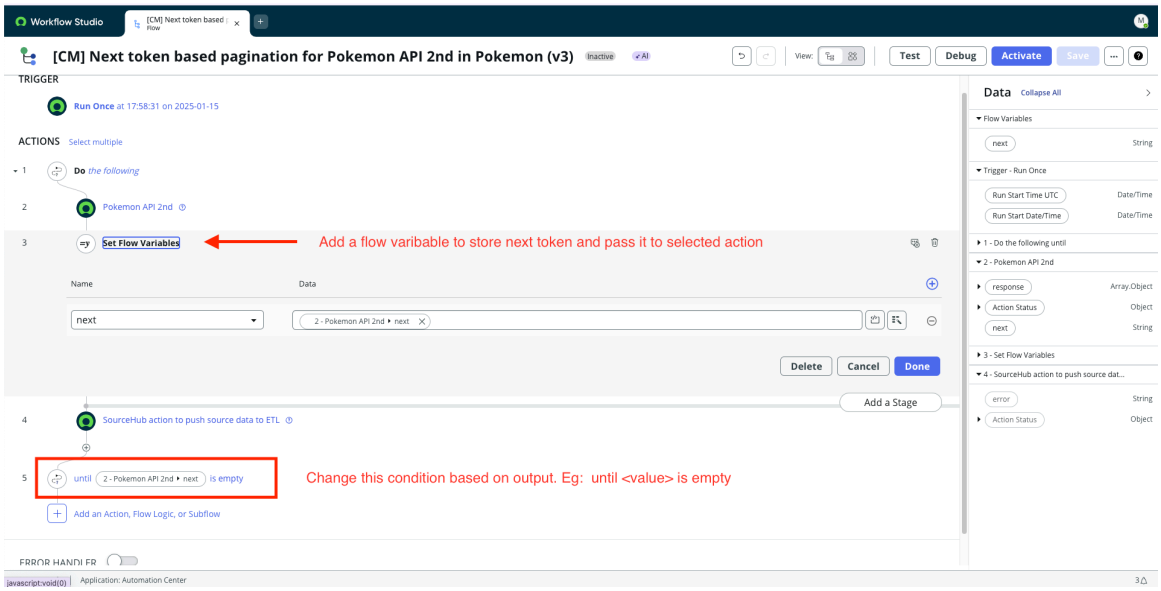
When you select the token-based batch import method on the **Configure batch import** page, you must provide a name for the token. This token represents the continuation value returned by your action (such as, next_url, next_token, or next). Ensure that the token name matches exactly as it is returned from the action, including spelling and capitalization.



Steps to configure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. If the provided token name is correct, the do-while condition will automatically map it. If it remains blank, manually drag the continuation token from your action's output into the condition field of the do-while logic.
2. Add a **Flow Variable** of type string to store the updated value of the token.
3. Save your changes, and click **Done**.
4. Insert a **Set Flow Variable** logic step after your selected action. In this step, set the value of the newly created flow variable to the continuation token returned by your action. Ensure this token matches the one mapped to the do-while condition.



5. Select **Done** and **Test**.
6. Follow steps 3 onwards in Configure batch import for data.

Verify and test

Verify and test all configuration details to ensure that the flow is generated correctly.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Configure batch import for data** section. For information on configuring batch import for data, see Configure batch import for data.

Procedure

1. Review all the details that you have configured for data import, such as scheduling data import, selecting a spoke, selecting an action, and configuring batch import.
   - If you want to change the data import schedule, then from the **Schedule import** section, you must open the flow and make changes in the flow.
   - If you make any changes to the selected spoke or action, you must redo the subsequent tasks.
2. Select **Test connection**.
   If any updates are required for the connection to be valid, you will be guided to do it. If there are any errors in the connection, you can view the log file, fix the issues, and run the test again.
3. Select **Save and continue**.
   The **Align fields** section is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Align source and destination fields

Align the source and destination fields to ensure that the selected output from the selected action align correctly with ServiceNow tables enabling accurate integration of automation data.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin with ihub_import

Proceed from the **Verify and test** section. For information on verifying and testing configuration settings, see Verify and test.

Procedure

1. Drag each source field to map with the destination field.
2. Select **Save and continue**.
   The **Add source values** sub-section of **Align values** section is displayed.

Aligning source and destination values

Align source and destination values for precise data representation in Automation Center.

Add source values

Manually add the status or state values of your automation from the source system.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Align source and destination fields** section. For information on aligning source and destination fields, see Align source and destination fields.

Procedure

1. Provide source values in the **Enter value** field.
2. Select **Add**.
   After one value is added, another field appears for the next value. You can remove a value by select the delete icon (-) beside the value field.
3. Select **Save and continue**.
   The **Map values** section is displayed.

Map source values

Map the source state values with the destination state values.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Add source values** section. For information on aligning source and destination fields, see Add source values.

Procedure

1. Drag each source value to map with the destination value.

> **Note:**
> Values can only be dragged and dropped. Hard coded values are not allowed. Also, one value cannot be mapped to multiple columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **Save and continue**.
   The **Review and activate** section is displayed.

Review and activate automation source

Review all configurations for the automation source, and then activate the automation source.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Map source values** section. For information on aligning source and destination values, see Map source values.

Procedure

1. Review all details and make any edits required.
   If you change the spoke or action, you will need to redo all the subsequent tasks.
2. Select **Activate**.
   The **Automation sources** list is displayed with the newly created automation source.

Manage automation source

You can perform other actions for an automation source after creating it.

Before you begin

Role required: admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Connection Manager icon ( ) on the left.
   A list of available automation sources is displayed.
3. Select options for an automation source to manage the automation source.

   - Select **View details**. A new tab with the automation source is displayed.
   - Select **Import now**. The data is imported immediately.
   - Select **Deactivate source**. The automation source is deactivated.
   - Select **Activate source**. The automation source is activated.
4. Edit an automation source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open an automation source.

b. Select **Edit details**.

You can edit the automation source.

Automation Center reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Automation Center.

Components installed with Automation Center

Several types of components are installed with the activation of Automation Center, including tables, user roles, and scheduled jobs.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application .

Demo data is available for this plugin.

Roles installed

Note:
To view the Robotic Process Automation (RPA) data, RPA roles are required. For more information about RPA roles, see Components installed with RPA Hub .

Role title	Description	Contains roles
Automation admin [sn_ac.automation_admin]	Sets up Automation Center application configurations. Performs all the actions in the Automation Center application. Possesses CRUD access for all tables.	• sn_ac.automation_business_user • sn_ac.automation_technical_user • sn_ac.automation_admin
Automation technical user [sn_ac.automation_technical_user]	Creates automation requests, automation sources, automation tasks, automation resources, automation goals, insight rules, and insight triggers. Modifies automation attributes.	sn_ac.automation_techincal_user
Automation business user [sn_ac.automation_business_user]	Creates automation requests, automation goals, and updates the automation	sn_ac.automation_business_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title	Description	Contains roles
	request life-cycle stages.	

Scheduled jobs installed

Scheduled job	Description
Automation Center: Purge Executions Data	Deletes the data in the Automation Execution table only when the following conditions are met: • Records that were created 'X' days ago. X represents the value defined by the *sn_ac.purge_automation_data_in_days* system property. Users with the automation admin role can modify this property value. The default value of this property is **14**. • Records with a state of **Cancelled**, **Complete**, or **Error**.
Automation Center: Purge Insights Data	Deletes the data in the *sn_ac_insight* system property that was created 'X' days ago. X represents the value defined by the *sn_ac.purge_automation_data_in_days* system property. Users with the automation admin role can modify this property value. The default value provided of this property is **14**.
Automation Center: Copy spotlight score into request	**Note:** Available only if Spotlight is installed and enabled. Copies the spotlight score into the automation request's Score field. The **Schedule | Run to** is set to **On Demand**. It is recommended not to change this setting. **Note:** If you change the default spotlight criteria, then after saving the changes made, you must select the **Execute Now** button in this Spotlight group record to recompute the Spotlight score for the automation request records. And, then you must select the **Execute Now** button on the scheduled job to copy the score.

Tables installed

Table	Description
Automation Request [sn_ac_automation_request]	Contains the details of the automation request.
Automation Task [sn_ac_automation_task]	Contains information of tasks linked to a request.
Automation Goal [sn_sc_automation_goal]	Contains details of goals that can be mapped to multiple requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Base Robot [cmdb_ci_base_rpa_robot]	Contains the details of a software agent that runs a bot process.
Base Bot Process [cmdb_ci_base_rpa_process]	Contains the configuration details of a robot.
Automation Execution [sn_ac_automation_execution]	Stores all execution processes information.
Automation Insight [sn_ac_insight]	Contains alerts data across Automation Center.
Automation Insight rule [sn_ac_insight_rule]	Contains rules that configure insights.
Automation Source [sn_ac_automation_source]	Stores vendor data.
Automation Attribute [sn_ac_ci_attribute]	Stores cost, time, source, and associated automation for processes and robot.
Automation Import [sn_ac_rpa_import]	Temporarily stores data that is imported from the REST API.

Automation Center properties

You can access system properties for Automation Center by navigating to **All** > **Automation Center** > **Administration** > **Automation Properties**.

Automation Center properties

Property	Description
sn_ac.workspace.date.default_num_of_days	Defines the default number of days that data is shown in the Automation Center workspace. • Type: **integer** • Default value: **7**
sn_ac.purge_automation_data_in_days	Defines the number of days to purge automation execution data and automation insights information. • Type: **integer** • Default value: **14**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation Center properties (continued)

Property	Description
sn_ac.reporting_currency	Defines the currency that is used in the Automation Center dashboards and reports. • Type: **integer** • Default value: **USD**
sn_ac.savings_averaging_window	Calculates the moving average for cost and time saved per run. • Type: **integer** • Default value: **4**

ServiceNow® Spotlight properties

Property	Description
sn_ac.use.spotlight.score.for.requests	When turned on (by setting the value to **True**), Spotlight feature is enabled in the Automation Center workspace. • Type: **True/False** • Default value: **True**
sn_ac.use.spotlight.group.for.requests	Stores the spotlight group sys_id to let the system know which spotlight group to use. • Type: **string** • Default value: **e037711dc3a11110995486d91840dd03**

ServiceNow® Recommended Actions properties

Property	Description
sn_ac.use_recommended_actions	When turned on (by setting the value to **True**), Recommended Actions application is enabled in the Automation Center workspace. • Type: **True/False** • Default value: **False**

Submit an Automation Request form

Use the Submit an Automation Request form to create an automation request in Service Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Submit an Automation Request form

Field	Description
What is the request type?	Select the type of request you want to create. • If you are creating an automation request, select **Automation**. Create automation requests when you want to automatically streamline your business processes, reduce the time that you spend on manual activities, and reduce your costs. • If you are creating an action request, select **Action**. Create action requests when you want an automated solution to repeated issues that are causing the automations to fail. • If you are creating a review request, select **Review**. Create a review request when you want the COE team to review an automation and analyze if the automation is required.
Process name	Name of the process.
Provide a brief description of the process	Description of the automation process.
Department	Associated department of the automation request.
How many steps are involved in this process?	A step is considered any individual activity, action, or decision that contributes to the completion of the process.
What is the interval type of the business process execution?	Field that describes if the cadence of the business process execution is by minutes, hourly, daily, weekly, or monthly.
How frequently is the business process executed (for example every 90 minutes or every 2 hours)?	Number of times that the automation process is executed per interval.
Identify all applications/ systems involved in the process	Field used to edit all applications and systems involved in the automation process.
What is the actual time spent per run?	The time that the manual run takes to complete.
Do you perform this process?	Field that shows if the execution is performed by the person submitting this request.
Identify the process owner	Person responsible for designing an effective and efficient process.
Attach relevant files	Relevant documents that you attach to support the automation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation request form from Automation Center

Use the Automation request form to create an automation request, action request, or review request from Automation Center.

Automation request form

Field	Description
Request Type	Select the type of request you want to create. • If you are creating an automation request, select **Automation**. Create automation requests when you want to automatically streamline your business processes, reduce the time that you spend on manual activities, and reduce your costs. • If you are creating an action request, select **Action**. Create action requests when you want an automated solution to repeated issues that are causing the automations to fail. • If you are creating a review request, select **Review**. Create a review request when you want the COE team to review an automation and analyze if the automation is required.
Number	Auto-generated number of the request.
Process name	Name of the process.
Description	Description about the process.
Department	Associated department of the process.
Number of steps	Steps that are involved in the process. A step is an individual activity, action, or decision that contributes to the completion of the process.
Interval type	Interval type of the manual business process execution: • **Minutes**: The process executes every n minutes that you specify in the **Frequency** field. • **Hours**: The process executes every n hours that you specify in the **Frequency** field. • **Days**: The process executes every n days that you specify in the **Frequency** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation request form (continued)

Field	Description
	• **Weeks**: The process executes every n weeks that you specify in the **Frequency** field. • **Months**: The process executes every n months that you specify in the **Frequency** field.
Frequency	Number of times that the manual process must be executed per interval. For example, every 90 minutes or every 2 hours.
Actual time spent per run	Time that the manual process run takes to complete.
State	State of the automation request: • New • Deferred • Rejected • Planned • In progress • Published For more information about these states, see Life-cycle stages of an automation request.
Intake source	Source type of the automation request, which refers to how the automation request is submitted: • **Web** • **Integration** • **Process Mining** **Note:** The default intake source type is **Web**. This field is visible only when you submit the form.
Applications used	Associated business applications of the process. For example, Ariba, Microsoft Excel, or Google Chrome.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation request form (continued)

Field	Description
Requested for	Person responsible for designing an effective and efficient process.
Additional Details	
Actual cost per run	Cost per process execution.
Goal	Desired goal of automating the process.
Priority	Complexity of the business process. Complexity is based on number of processes and applications involved, number of steps required, and human involvement.
Business criticality declared	Criticality of the business process. Criticality is based on your subjective assessment.
Number of users benefited	Number of users who would benefit with this process.
Number of transactions	Expected volume of transactions across the applications or systems.
Score	Execution priority of the request. The higher the score, the higher the priority of the request.
Process managers	Person responsible for the end-to-end execution of the process.
Assignment group	Name of the process group.
Manual steps %	Estimated percentage of steps that require human action to complete the process.
Expected cost savings per year	Cost saved per process at the end of a year.
Expected time savings per year	Time saved per process at the end of a year.
Work notes	Work notes for the process.
Additional comments (Customer visible)	Notes that are visible to the customer.

Automation task form

Use the Automation task form to create an automation task in Automation Center.

Automation task form

Field	Description
Number	Number of the automation task. This number is auto-generated.
Automation request	Associated automation request. This request is auto-generated.
Name	Name of the automation task.
State	State of the automation task:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation task form (continued)

Field	Description
	• **Open** • **Pending** • **Work in progress** • **Closed complete** • **Closed incomplete** • **Closed skipped**
Description	Description of the automation task.
Active	Option for ensuring the use of the automation task.
Priority	Sequence in which an incident or problem must be resolved, based on impact and urgency.
Type	Type of automation task: • **Requirement** • **Design** • **Development** • **Quality engineering** • **Sign off**
Assignment group	Name of the automation task group.
Assigned to	Name of the user assigned to the automation task.

Automation resource form

Use the Automation resource form to create an automation resource to associate a resource to an automation task.

Automation resource form

Field	Description
Number	Number of the automation resource. This field is auto-generated.
User	Name of the user assigned for the automation task.
Active	Option for ensuring the use of the automation resource.
Resource type	Role of the automation resource: • **Development** • **Quality engineering** • **Product management**
Automation task	Associated automation task. This field is auto-generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation resource form (continued)

Field	Description
Automation request	Associated automation request. This field is auto-generated.

Automation execution form

Use the Automation execution form to view an automation execution from Automation Center.

Automation execution form

Field	Description
Number	Number of the automation execution.
Automation execution ID	Identification number of the automation execution.
Automation	Associated automation name.
Robot	Assigned robot that is running this automation.
Triggered by	Trigger mode of the assigned robot.
Start time	Start date and time of the automation execution.
End time	End date and time of the automation execution.
Duration	Time taken to complete the automation.
Cost saved per run	Cost saved after each run of the automation.
Time saved per run	Time saved after each run of the automation.
Source	Associated automation source.
Priority	Priority of the automation execution: • Low • Moderate • Critical
State	State of the automation execution: • Running • Error • Queued • Canceled • Complete
Department	Associated department name.
Message	Any information or error message returned by the robot.

Insight rule form

Use the Insight rule form to create an insight rule from Automation Center.

Insight rule form

Field	Description
Name	Name of the insight rule.
Active	Option to verify the usability of the insight rule. On clearing this option, the notifications won't be generated from this insight rule.
Application	Field that indicates which applications can use this insight rule.
Severity	Priority of the insight rule: • **Urgent** • **High** • **Moderate** • **Low** The default value is set to **Moderate**.
Type	Level of insight rule: • **Info** • **Warning** • **Error**
Message	Custom message that describes the insight. For example, `Time to Cleanup Automation Tasks. The count is {0}.` To configure the variable, such as {0}, see Write a script for an automation message variable. **Note:** To enable localization of this message string, create the sys_ui_message update record. For more information, see Custom translations.
Applies to	Table that the insight rule is applied on. For example, Automation Request [sn_ac_automation_request].
When	Conditions at which the insights are triggered. Select a table from the Applies to list before modifying this field. This field appears only when an entry is selected from the Threshold type list. Select the **Set Condition** field to add a trigger condition. For example, you might want to generate an insight rule when the state of an automation request isn't published. In that case, select **State** from the field list, **is not** from the operator list, and **Published** from the value list.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insight rule form (continued)

Field	Description
	You can use **or** or **and** next to the condition. To add more conditions, select **New condition set**.
Threshold type	Type of threshold: • **Count** • **Percentage**
Threshold Count **Note:** This tab appears only when **Count** is selected from the Threshold type list.	
Operator	Qualifier to trigger insights: • **is** • **less than** • **greater than** • **less than or is** • **greater than or is** This field appears only when **Count** is selected from the Threshold type list.
Value	Value to determine if an insight rule must be triggered based on the qualifier that is selected in the **Operator** field. For example, an insight rule is triggered if a few automation requests get rejected in a day. To set a condition, select **Count** in the Threshold type list, **greater than** in the Operator list, and **10** in the Value list. This field appears only when **Count** is selected from the Threshold type list.
Threshold Percentage **Note:** This tab appears only when **Percentage** is selected from the Threshold type list.	
Percentage of	Denominator value for the resulted rule value.
Operator	Qualifier to trigger insights: • **is** • **less than** • **greater than** • **less than or is** • **greater than or is**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insight rule form (continued)

Field	Description
	This field appears only when **Percentage** is selected from the Threshold type list.
Value	Value to determine if an insight rule must be triggered based on the qualifier that is selected in the **Operator** field. For example, an insight rule is triggered if a few automation requests get rejected in a day. To set a condition, select **Percentage** in the Threshold type list, **greater than** in the Operator list, and **10%** in the Value list. This field appears only when **Percentage** is selected from the Threshold type list.

Automation Scheduled Trigger Execution form

Use the Automation Scheduled Trigger Execution form to define the type of insight trigger and map an insight rule to a new scheduled script in Automation Center.

Automation Scheduled Trigger Execution

Field	Description
Name	Name of the insight trigger.
Active	Option for ensuring the use of the insight trigger.
Application	The associated application or the application scope in which the trigger is being created, such as Automation Center or RPA Hub.
Run	Time interval to use for running the scheduled job: • **Daily**: Runs daily, at a designated time. • **Weekly**: Runs on a weekly basis, at a designated time and day of the week. • **Monthly**: Runs on a monthly basis, at a designated time and day of the month. • **Periodically**: Runs on a designated repeating interval. • **Once**: Runs for a single occurrence only. • **On Demand**: Runs immediately on demand. • **Business Calendar: Entry Start**: Runs on the starting entry dates for the business calendar that you select in the **Business Calendar** field. A scheduled job runs for the starting date of each of the business entries that you defined for the business calendar. For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month. • **Business Calendar: Entry End**: Runs for the ending date for the business calendar that you select in the **Business Calendar** field. This selection runs in

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation Scheduled Trigger Execution (continued)

Field	Description
	the same manner as **Business Calendar: Entry Start**, but for the end dates of the associated business calendar entries. **Note:** When you select **Business Calendar: Entry Start** or **Business Calendar: Entry End**, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. If you select a business calendar and all its business calendar spans are in the past, the job would never run as this is an invalid configuration. To learn more, see the **Offset type** and **Offset** fields. To learn more about creating and using business calendars and defining business calendar entries, see Creating business calendars and Define business calendar entries.
Day	Day on which the scheduled job should run. • If **Run** is set to **Weekly**, select the day of the week. For example, select Wednesday. • If **Run** is set to **Monthly**, select the day of the month. For example, select 25 for the 25th day of the month. This field appears only if you select **Monthly** or **Weekly** in the **Run** field.
Repeat Interval	This field appears only if you select **Periodically** in the **Run** field. Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example: • To run the scheduled job every four days, enter `04` in the **Days** field. • To run it every 26 hours, enter `26` in the **Hours** field. • If it should repeat at an interval of 13:30:25, enter `13` in the **Hours** field, and then enter `30` and `25` in the two unlabeled fields after it.
Time zone	Time zone to use with the **Time** field entry when you specify the time at which the scheduled job should run. Select a time zone entry: • **-None-**: Use the default time zone for the logged-in user who is creating the scheduled job. For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it is the user's assigned time zone, and you enter `16 : 45` into the **Time** field. • **Use System Time Zone**: Use the default system time zone that is specified for the instance in which it runs. For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter `22 : 15` in the **Time** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation Scheduled Trigger Execution (continued)

Field	Description
	• Actual time zone. For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select **US/Eastern**, and enter `13 : 30` in the **Time** field.
Time	Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection that you make in the **Time zone** field determines the time zone for this entry.
Starting	Date and time of the first scheduled job generation. Select the calendar date and time. This field appears only if you select **Periodically** in the **Run** field.
Business Calendar	Business calendar entry that you are using to determine the business calendar start or end date for the scheduled job. This field appears only if you select **Business Entry: Start Date** or **Business Entry: End Date** in the **Time** field.

Automation goal form

Use the Automation goal form to create an automation goal in Automation Center.

Automation goal form

Field	Description
Name	Name of the automation goal.
Start date	Start date of the automation goal.
Target date	Target date of the automation goal.
State	State of the automation goal: • **Pending**: The associated requests are in "New", "Deferred", or "Rejected" state, or there are no associated requests. • **Work in progress**: The associated requests are in "Planned", "In progress", or "Published" state. • **Achieved**: The associated requests are in "Published" or "Rejected" state with at least one request in "Published" state. • **Not achieved**: The target date isn't met for the associated requests, and they are in "New", "Planned", "In progress", or "Published" state.
Owner	Owner of the automation goal.

Life-cycle stages of an automation request

The State transition of an automation request guides you through the stages of its life cycle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation request life-cycle stages

Life-cycle stage status	Description
New	Default value for a new automation request.
Planned	Automation request that is moved to a planned state.
In Progress	Automation request that is picked up and work is in progress.
Published	Automation request that is ready to be active.
Deferred	Automation request that is postponed for a later date.
Rejected	Automation request that is rejected.

Domain separation and Automation Center

Domain separation is supported for Automation Center. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview of domain separation in Automation Center

The goal of Automation Center is to govern the end-to-end multi-vendor life cycle from one place. Domain separation is enabled in all the features.

You should have either a flat hierarchy or a single-tier hierarchy and at least one primary or top-level domain.

To support domain separation for particular widgets in Automation Center, you must install and configure com.snc.pa.domain_support.

Note:
Action Center and Connection Manager encounter challenges due to process separation in flows. In Action Center, the domain data from both global and current session domains is displayed. In Connection Manager, only current session's domain data is displayed.

Important:

- Not all model providers are available for customers with in-country SKUs, and some Now Assist products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some Now Assist products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base . Be sure to check for availability updates in future releases.
- Some Now Assist products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

Exploring Integration Hub

ServiceNow® Integration Hub enables you to build reusable integrations with third-party systems and call them from anywhere in the ServiceNow AI Platform. For example, you can request Integration Hub to call external systems using integration APIs from the Action Designer Script step, run the Script step on the ServiceNow® MID Server, and activate protocol steps like REST, SOAP, and PowerShell.

Inbound and outbound integration

The Integration Hub provides both inbound and outbound integration with third-party applications.

Inbound integration occurs when a flow that you set up on Workflow Studio responds to a conditional and event-driven external webhook from a third-party system and executes. For example, when you create a P1 issue on an issue-tracking application, its external webhook triggers a flow in the ServiceNow instance and an incidence database table is updated in the ServiceNow instance. Here, the webhook is conditional and event-driven.

Outbound integration occurs when the Integration Hub enables execution of third-party APIs as a part of a flow when a specific event occurs in ServiceNow. These integrations, referred to as spokes, are easy to configure and enable you to quickly add powerful actions without the need to write a script. For example, you can post a message and incident details in a Slack channel when a high priority incident is created.

Building integrations

Build reusable integrations with third-party systems and call them from anywhere in the ServiceNow AI Platform.

Create spokes

Build spokes using Spoke Generator to automate integration tasks by creating a sequence of reusable actions to develop custom integrations. For more information, see Building spokes using Spoke Generator.

Use spokes for base system integrations

Using Integration Hub actions in Workflow Studio, you can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Post messages and ServiceNow incident, problem, and change record details to Slack Spoke, or Microsoft Teams Spoke communications channels.
- Synchronize data across multiple production instances using Integration Hub Remote Process Sync.

Create custom integrations

Build custom integrations with Workflow Studio using a REST step or a Script step.

Automate inbound integrations with third-party applications

Set up a flow with external trigger definition on Workflow Studio by selecting base system external trigger definitions, and actions from the spokes or core actions. Then, Set up external trigger endpoints that the third-party application webhooks use to trigger the flow you had set up. Your ServiceNow instance authenticates the webhook before it triggers the flow.

Automate the administration of servers and applications in your network

Use custom actions to delegate Workflow Studio processes to a MID Server in your network. For example, actions that use the PowerShell step or REST step.

Import and stream data

Import data with Integration Hub - Import. Integration Hub - Import enables you to configure, run, and schedule your data imports all through a single simplified interface. It consolidates multiple data integration capabilities into a single environment, eliminating the need to create and manage several forms throughout the platform. Its step-by-step experience guides you through the configuration of data sources, target tables, and data mapping. You can schedule your data imports or run them on demand.

Stream data with Stream Connect for Apache Kafka. Stream Connect links your Kafka environment to your ServiceNow® instance, enabling you to stream data between your instance and your external systems. Stream Connect is integrated with Workflow Studio, so you can build flows that produce and consume Kafka events. Stream Connect also provides several consumers that enable you to stream and process data with scripts or by using your existing RTE or transform map configurations.

Manage connections

Integration Hub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. Integration Hub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about credentials, connections, and aliases.

View and configure your connection and credential aliases with the Connections dashboard. The Connections dashboard enables you to manage multiple connections through a single interface, and provides simplified processes for adding, editing, and configuring connections. With the Connections dashboard, you can view details about an alias and all associated child connections in a single location.

Integration Hub supports multiple connections to a single integration provider. For example, you can have connections to several different Jira environments. In Workflow Studio, you can select which connection you want to use in a flow, and override preset connections for flows, subflows, and actions. When a flow is promoted to production, you can reestablish a connection to each account without needing to modify the flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use your personal credentials to connect to third-party integrations with the Personal Authentication dashboard. View, authenticate, revoke, and renew your personal authentications through a simplified, consolidated interface.

Make outbound REST and SOAP calls through a MID Server using mTLS. Store mTLS credential and certificate information on the instance, in a configuration file, or in an external vault. The MID Server retrieves the credential and certificate information and makes outbound REST and SOAP calls using the mTLS protocol.

Benefits

Integration Hub provides process owners and developers these benefits.

- Consolidates multiple ServiceNow AI Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes and integrations from a single interface.
- Extends Workflow Studio content to integrate business processes with external systems.
- Promotes business process automation by enabling subject matter experts to develop and share spokes with flow designers.
- Provides natural-language-descriptions of integration logic to help non-technical users understand triggers, actions, inputs, and outputs.

Development process

When developing a custom integration, develop all actions for the integration within a scoped application. When deployed to a target instance, these actions are grouped as a spoke in Workflow Studio. Brand the spoke by adding a custom icon to the application record. To learn more about application development, see Build applications.

When developing spokes, flow and action designers typically perform these application development tasks.

1. Create a scoped application on a development instance to build spokes.
2. Publish a test version of the scoped application to the application repository.
3. Deploy the scoped application to a test instance from the application repository.
4. Test the scoped application on the test instance.
5. When working as expected, publish the scoped application in one of the following ways.
    - Publish to the application repository for deployment on production instances.
    - Publish to the ServiceNow Store as an application that customers can request for their environments.
    - Publish to ServiceNow Share to provide content to other customers in the ServiceNow community.

Review Workflow Studio design considerations in the Architecture Overview.

Configuring Integration Hub

Review and select an Integration Hub subscription package. Activate Integration Hub plugins and review usage and transaction details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request Integration Hub

ServiceNow® Integration Hub enables you to build reusable integrations with third-party systems and call them from anywhere in the ServiceNow AI Platform. For example, you can request Integration Hub to call external systems using integration APIs from the Action Designer Script step, run the Script step on the ServiceNow® MID Server, and activate protocol steps like REST, SOAP, and PowerShell.

Integration Hub is available as part of Workflow Data Fabric. For more information, see https://www.servicenow.com/now-platform/workflow-data-fabric.html.

Workflow Studio is a ServiceNow AI Platform feature that enables you to automate processes within a single instance. Without an Integration Hub subscription, you can use base system actions or steps, including the Script step, to manipulate records, send emails, trigger notifications, and perform operations within the instance. Request Integration Hub to automate and create integrations with external systems from the Workflow Studio interface.

You can preview Integration Hub on a Personal Development Instance (PDI).

Integration Hub usage and subscription

Choose a subscription package to build reusable integrations with third-party systems. Review the usage dashboard to determine the number of transactions used within your current subscription, and to view transaction details.

Entitlement to use spokes

The entitlement to download and use ServiceNow developed integrations (or spokes) requires an Integration Hub subscription (Integration Hub overview) or Subscription Product that includes spoke(s).

This spoke entitlement allows customers to download certain spokes from the ServiceNow Store and use the spoke in the production environment.

Protocols and spokes that are available in the Subscription Product are set forth in the then-current applicable Product Documentation. Use of#protocols and spokes #may consume Integration Hub transactions#hat may#equire purchase#of Integration Hub or Workflow Data Fabric subscription#at an additional fee. Customer may use the spoke(s) included in Subscription Product for use cases even beyond the Subscription Product. Integration Hub Transactions are not included in the Subscription Product.

Link to KB article for the actual overview of Spokes in BU products

We have documented the Spoke entitlements available with the specific Subscription Product in a KB Article on Now Support: Spoke entitlement per Subscription Product.

Integration Hub subscription notifications

Integration Hub displays an information message whenever you use a spoke, protocol, entitlement, or feature that requires an Integration Hub subscription. You can use this information to identify possible gaps between your planned Integration Hub usage and your current subscription entitlements.

Subscription notifications do not restrict you from using any Integration Hub spoke, protocol, entitlement, or feature. Unlicensed features may be unavailable on your production instance.

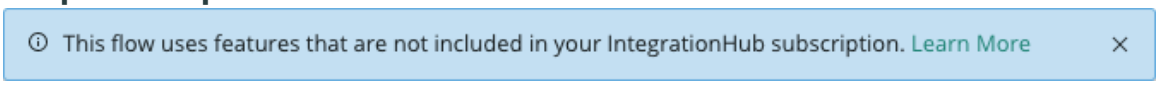
Subscription information available

Your instance attempts to access your Integration Hub subscription information online. When this information is available, the system displays an information message whenever you use

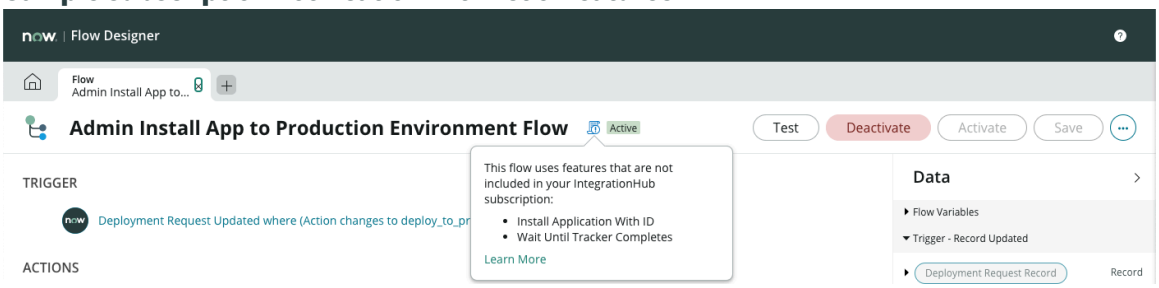
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a feature not included in your subscription. Flows and action titles also display an information icon for further details. Select the information icon to see a list of features not included in your subscription.

Sample subscription notification



Sample subscription notification with list of features



Subscription information unknown

When your instance cannot access your subscription information, it displays generic information messages. Whenever you use a feature that requires an Integration Hub subscription, the system displays a reminder information message. Verify that you have an appropriate Integration Hub subscription for the features you want to use.

Request an Integration Hub plugin

Integration Hub plugins require a separate subscription and must be activated by ServiceNow personnel.

Before you begin
Role required: admin.

About this task
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

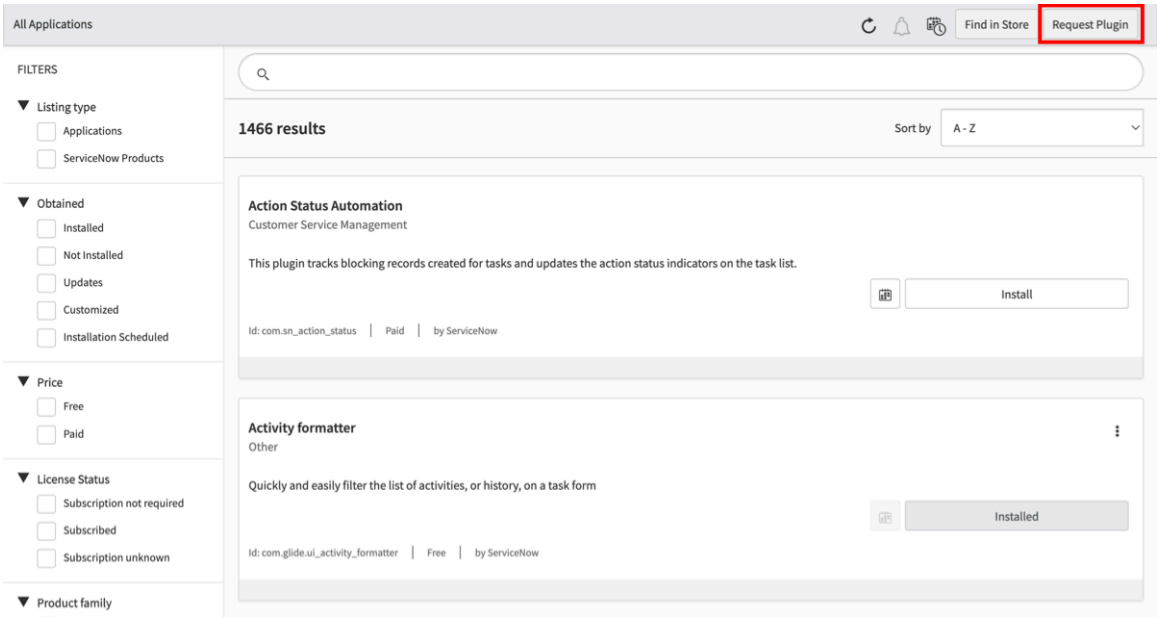
If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

For a list of Integration Hub plugins, see Integration Hub plugins.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

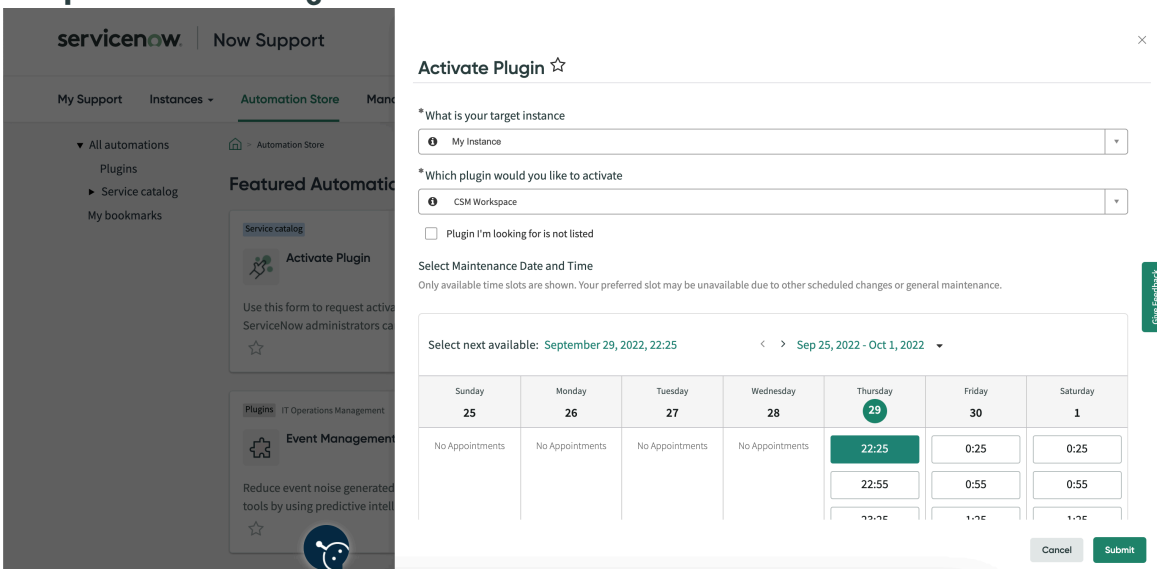
Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Request Integration Hub plugins included in your subscription.

Integration Hub Installer plugins

The following Integration Hub Installer plugins are the main plugins for the Starter, Professional, and Enterprise Integration Hub subscriptions. For a list of what's included in each subscription level, see Legal schedules - IntegrationHub overview.

- ServiceNow IntegrationHub Starter Pack Installer [com.glide.hub.integrations]
- ServiceNow IntegrationHub Standard Pack Installer [com.glide.hub.integrations.standard]
- ServiceNow IntegrationHub Professional Pack Installer [com.glide.hub.integrations.professional]
- ServiceNow IntegrationHub Enterprise Pack Installer [com.glide.hub.integrations.enterprise]

Other ServiceNow Integration Hub plugins

Plugin	Description
ServiceNow IntegrationHub Content - Deprecated [com.glide.hub.integration.content]	Workflow Studio actions to integrate with Slack, HipChat, Microsoft AD, Microsoft Azure, Microsoft Teams, and ServiceNow eBonding
Flow Designer Action Step - Payload Builder [com.glide.hub.action_step.payload]	Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Other ServiceNow Integration Hub plugins (continued)

Plugin	Description
ServiceNow IntegrationHub Action Step - JDBC [com.glide.hub.action_step.jdbc]	Create a reusable action to send SQL commands to a relational database.
ServiceNow IntegrationHub Action Step - REST [com.glide.hub.action_step.rest]	Enables the REST action step in Workflow Studio.
ServiceNow IntegrationHub Action Step - PowerShell [com.glide.hub.action_step.powershell]	Enables the PowerShell action step in Workflow Studio.
ServiceNow IntegrationHub Action Step - SOAP [com.glide.hub.action_step.soap]	Enables the SOAP action step in Workflow Studio.
ServiceNow IntegrationHub Action Step - SSH [com.glide.hub.action_step.ssh]	The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.
ServiceNow IntegrationHub Action Step - XML Parser [com.glide.hub.action_step.xmlparser]	Enables the XML parser action step in Workflow Studio.
ServiceNow IntegrationHub Action Template - Data Stream [com.glide.hub.action_type.datastream]	Send REST, SOAP, or JDBC requests from Workflow Studio to APIs that return a stream of response data larger than 10 MB, or that return paginated results. Parse stream data into a series of complex object outputs and use the data pills in other actions in a flow.
HipChat Spoke for ServiceNow IntegrationHub [com.sn.hipchat.ah]	The HipChat Spoke for ServiceNow IntegrationHub provides actions that a process analyst can use when designing flows. The actions allow them to automate the creation of conversations, add users to a conversation, and send messages to a conversation. **Note:** This integration is deprecated.
Slack Spoke for ServiceNow IntegrationHub [com.sn.slack.ahv2]	The Slack Spoke for ServiceNow IntegrationHub provides actions that a process analyst can use when designing flows. Send messages about incidents and problems to a channel.
Slack Webhooks Spoke for ServiceNow IntegrationHub [com.sn.slack.ah]	Use Slack webhooks to post messages and record details for ServiceNow incidents, problems, and changes to Slack channels.

Other ServiceNow Integration Hub plugins (continued)

Plugin	Description
Microsoft SCCM Spoke for IntegrationHub [com.sn.sccm.spoke]	Provides actions that a process analyst can use to automate the management of user collections, device collections, and application deployments.
Microsoft Teams Spoke for ServiceNow IntegrationHub [com.sn.ms_teams.ah]	Provides actions that a process analyst can use when designing flows to automate sending messages about ServiceNow incident and problem records to a Microsoft Teams channel.
Microsoft Azure AD Spoke for IntegrationHub [com.sn.azure_ad.spoke]	Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.
ServiceNow eBonding Spoke for ServiceNow IntegrationHub [com.glide.sn.ebonding.ah]	The ServiceNow ebonding Spoke for the ServiceNow IntegrationHub provides Actions that enable process analysts to compose flows that help in ebonding with remote ServiceNow instances.
Integration Hub Designer Core [com.glide.ihub.designer.core]	Enables automation of data imports through the Integration Hub - Import environment. Installs with the ServiceNow Integration Hub Action Template - Data Stream [com.glide.hub.action_type.datastream] plugin.
ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer]	Enables the licensed components for working with message-based streaming data in Stream Connect for Apache Kafka. Activating this plugin activates the following plugins. • ServiceNow IntegrationHub Flow Trigger - Kafka [com.glide.hub.flow_trigger.kafka]: Enables the ability to consume a Kafka message for a topic within a flow. • ServiceNow IntegrationHub Action Step - Kafka Producer [com.glide.hub.action_step.kafka]: Enables the ability to produce a Kafka message for a topic within a flow. • ServiceNow Integration Hub Kafka Consumer [com.glide.hub.kafka_consumer]: Provides IntegrationHub components for working with Kafka. • ServiceNow IntegrationHub ETL Consumer - Kafka [com.glide.hub.etl_consumer.kafka]: Enables the ability to consume Kafka messages from a topic using RTE, a transform map, or a script. • ServiceNow Stream Connect Replication - Kafka [com.glide.hub.stream_connect.replication.kafka]: Enables support for replicating Stream Connect topics via a MID Server with a customer Kafka cluster.

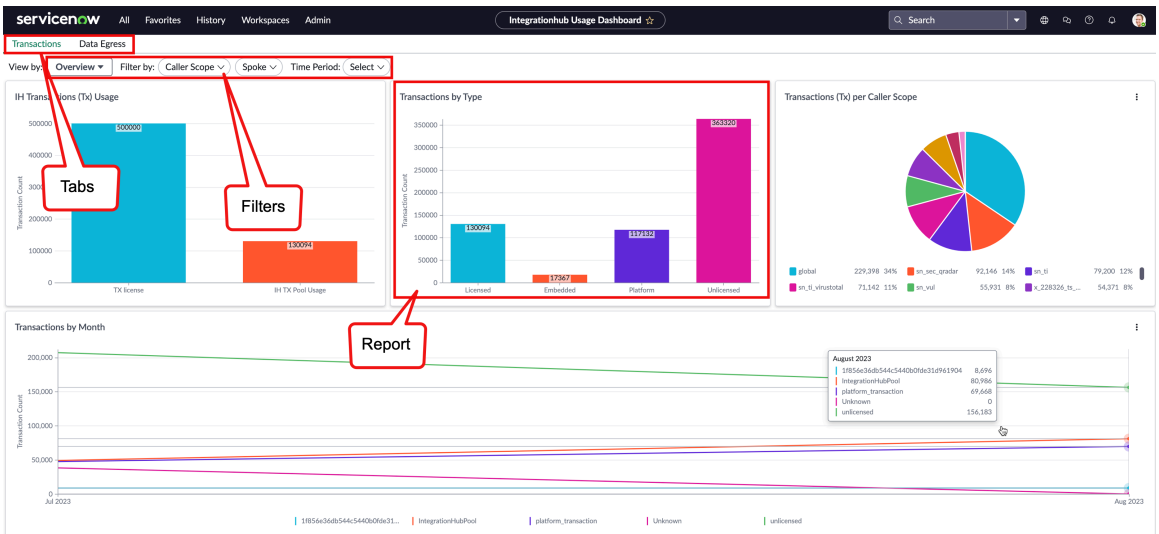
Other ServiceNow Integration Hub plugins (continued)

Plugin	Description
	• ServiceNow Integration Hub Stream Connect Schema [com.glide.hub.stream_connect.schema]: Enables importing and creating schemas to send and receive messages in an Apache Avro format.

Integration Hub Usage Dashboard

Get insights on the usage of Integration Hub data from the Integration Hub Usage Dashboard. For example, view the average number of monthly transactions in the last year or the data egress from Integration Hub via REST and SOAP API protocols.

The Integration Hub Usage Dashboard gives insights in the form of reports. Access to the dashboard is role-based. The reports are available under various sections in the **Transactions** and **Data Egress** tabs. You can customize the data that you want to view by using filters or drilling down reports.



Integration Hub Usage Dashboard version

Integration Hub Usage Dashboard v3.0.0 is the latest version.

Sections in the Transactions tab of the Integration Hub Usage Dashboard

The dashboard has these sections:

- Overview: View the usage data on the transactions from various perspectives and, if needed, drill down to view more details. For example, you could view the monthly transactions in the last year.
- Spokes: View the data on the transactions that were performed by the spokes and, if needed, drill down to view more details. For example, you can view the information on which spoke performed the highest number of transactions in the last year.
- Protocols and Features: View the usage data on the various protocols and features that were used to and, if needed, drill down to view more details. For example, you can view the number of transactions that were performed with the REST protocol in the last year.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sections in the Data Egress tab of the Integration Hub Usage Dashboard

The dashboard has these sections. All sections have three common reports: Data Egress, Data Egress by source (API protocols or exports), and Data Egress Trends.

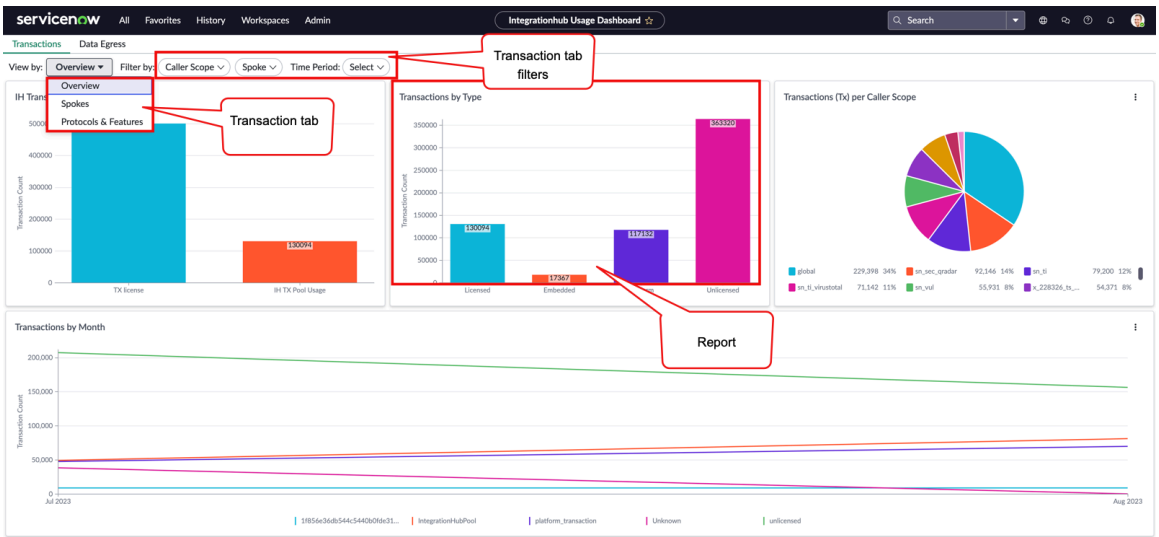
- Overview section: Gives an overview of the total data egress volume, data egress by REST and SOAP protocols, JSON, Export set, and URI from the ServiceNow instance, and the data egress across time periods.
- API section: Gives an overview of the total data egress volume by all sources, data egress by REST or SOAP protocols or JSON data from the ServiceNow instance, and the data egress across time periods.
- Export section: Gives an overview of the total data egress volume by all data export formats, data egress by export formats from the ServiceNow instance, and the data egress across time periods.

Note:

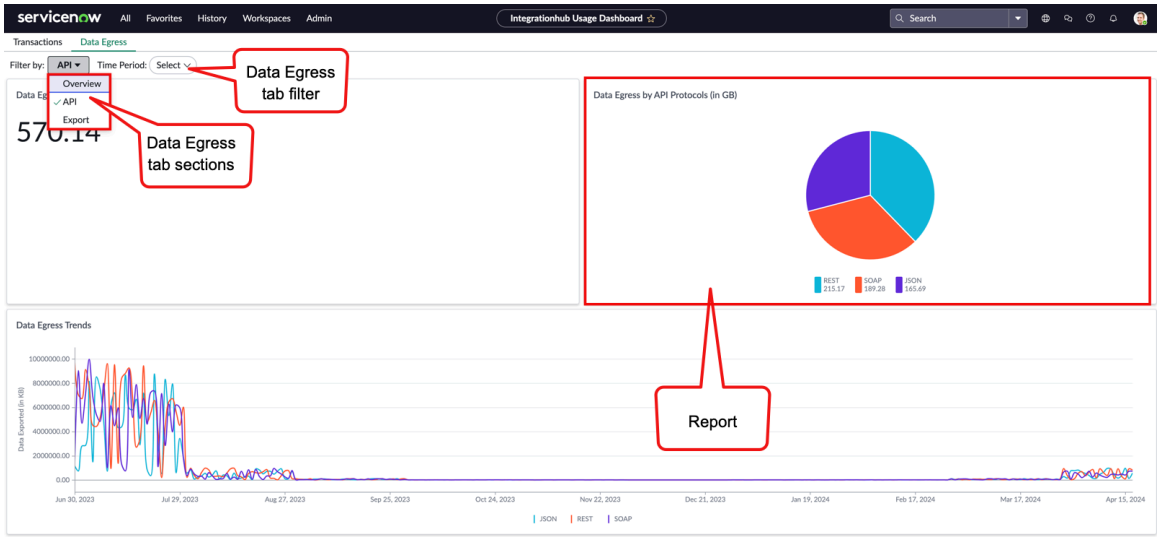
- There's no order in which you must view the reports, set the filters, or customize the columns in the report tables.
- All charts are adjusted to the nearest data metric starting with Bytes.

Data organization in the dashboard

The following images show how data is organized in the dashboard.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Get insights from the Integration Hub Usage Dashboard

Use the Integration Hub Usage Dashboard to get insights on the Integration Hub transactions. For example, you can view which protocol was the most used in the transactions in the last year. You can also use filters and customize the layout and arrangement of the columns in the reports.

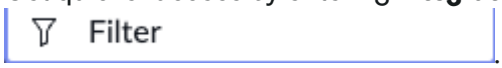
Before you begin

Role required: admin, flow designer, action_designer, usage_admin, or flow_operator

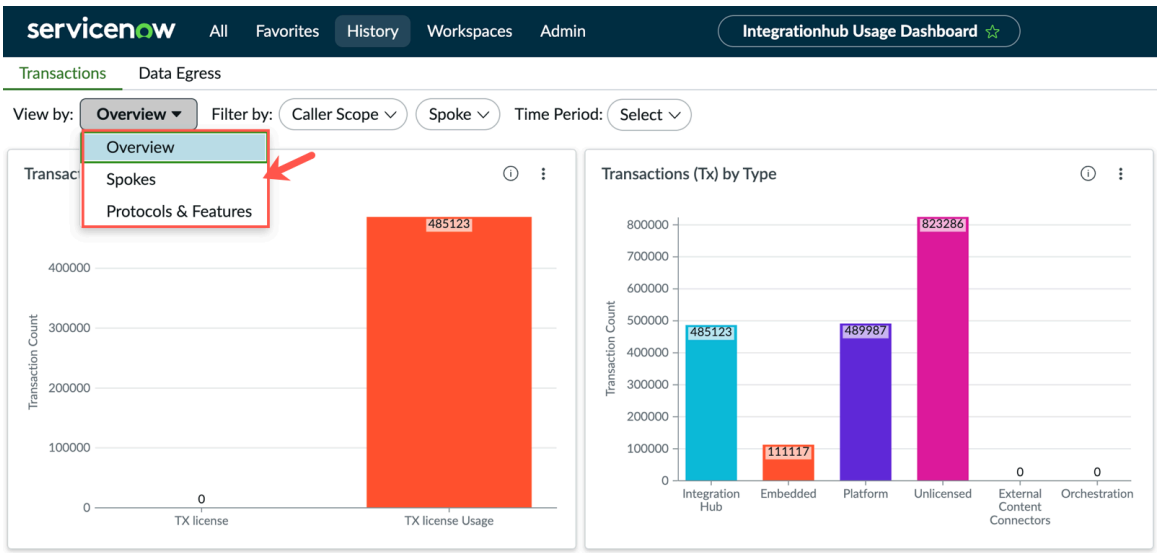
Procedure

1. To access the dashboard, navigate to **All** > **IntegrationHub** > **IntegrationHub Usage**.

Tip:
Get quicker access by entering **Integrationhub usage** in the filter search field



2. To view the reports, select **Spokes** or **Protocols & Features** in the **View by** list.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

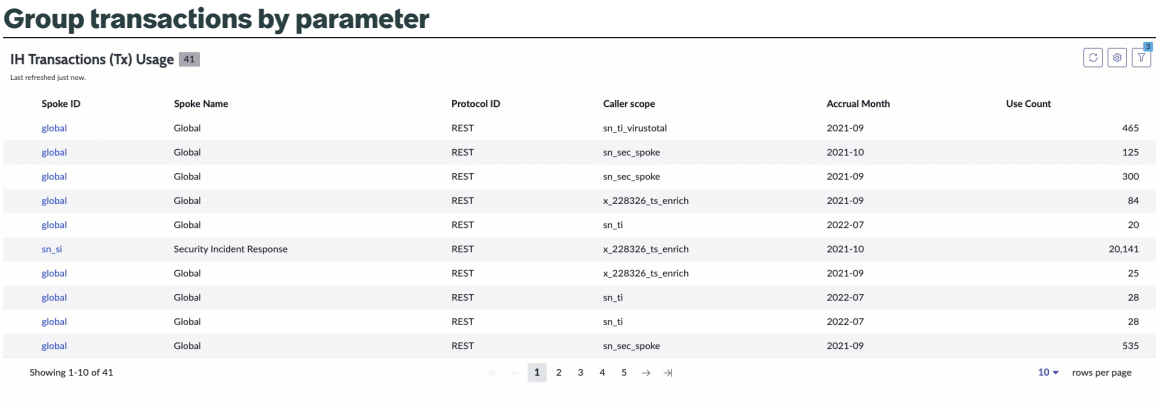
Note:
There's no order in which you must view the reports, set the filters, or customize the columns in the report tables. So, you can complete one or more of the following steps in any order. The Transactions tab is selected by default.

3. **Optional:** To drill down and view more details in a report, select the graph or chart.
4. **Optional:** To group transactions under a common parameter, do the following actions:

   a. Drill down the report.

   b. In the desired column, move the mouse device to the row that contains the parameter and click the group transactions by parameter icon ( ) for the parameter under which you want to group the transactions.

   c. Click **Show Matching**.
   Alternatively, you can view the following animation by opening this topic on a browser.



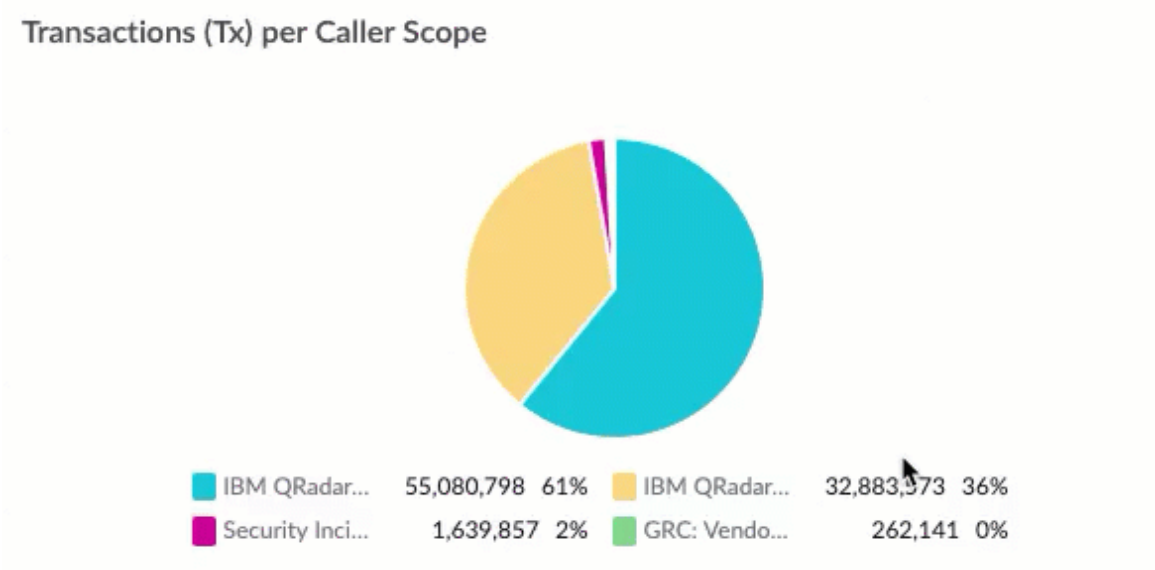
5. **Optional:** To hide or reveal the slices in a pie chart, do the following actions:
   Each slice in a pie chart represents a transaction usage insight. However, it might be difficult to view certain slices because they're obscured by fairly bigger slices.

   a. To hide a slice, click its colored legend.

   b. To reveal the slice back, click the colored legend again.
   Alternatively, you can view the following animation by opening this topic on a browser.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hide or reveal pie chart slices



6. **Optional:** To customize the columns in the report table, do the following actions:
   a. Drill down the report.
   b. Click the column settings icon ( ).
   c. Click **Edit columns**.
   d. In the Available columns section, click the column name.
   e. To include a column, click the include column icon ( ).
   f. To exclude a column from the table, in the Selected columns section, click the remove column icon ( ).
   g. To change the positions of the columns in the report table, in the Selected columns section, click and drag the drag column icon ( ).
   h. To apply the changes, click **OK**.
7. **Optional:** Filter the data in the reports by caller scopes, spokes, and date by doing the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

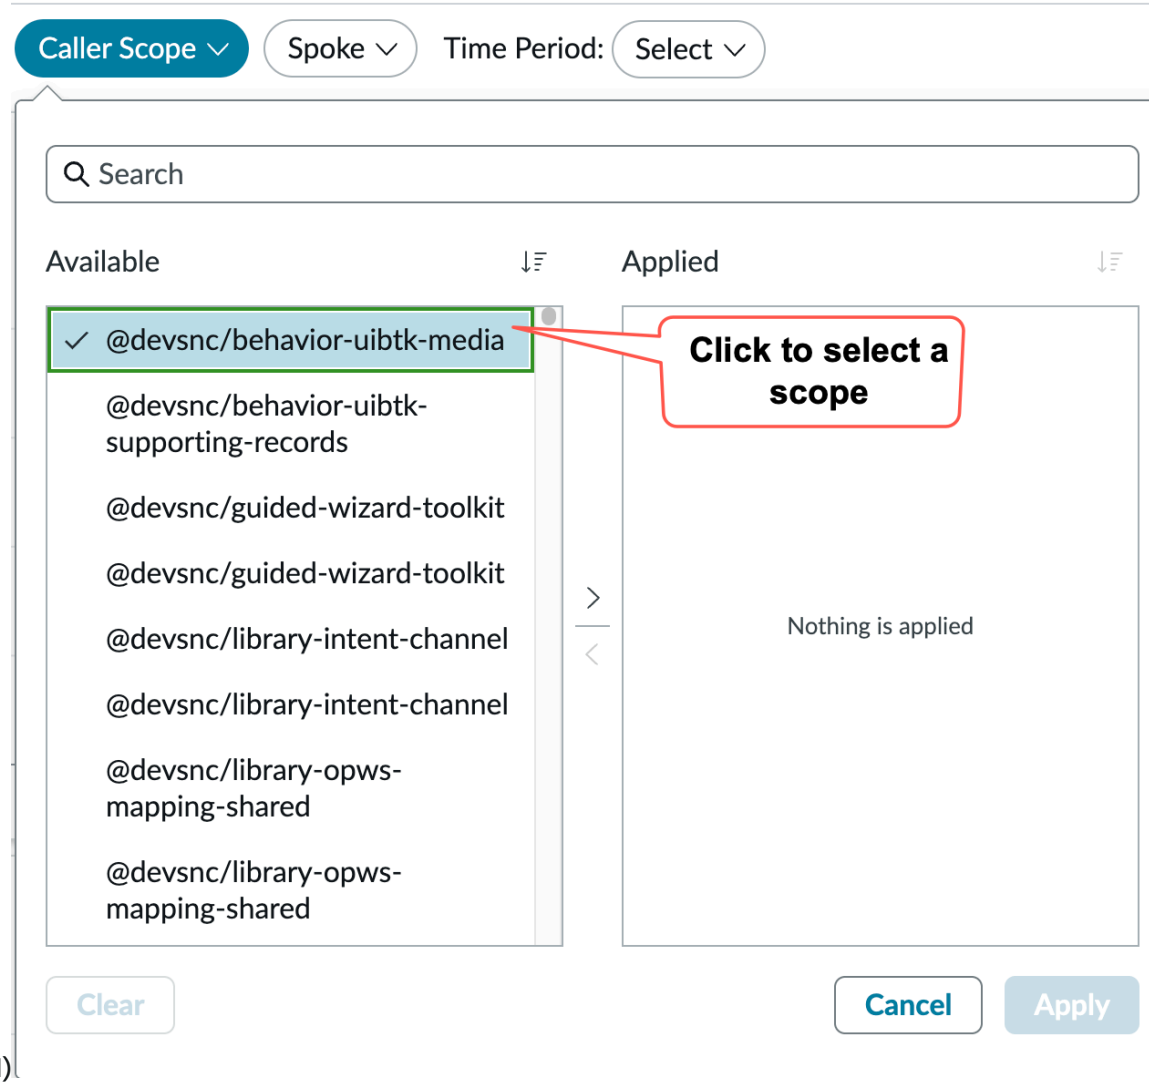
a. To filter by caller scope or spoke, click **Caller Scope** or **Spoke** and then select one or more values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
Select multiple caller scopes or spoke values by doing the following steps.

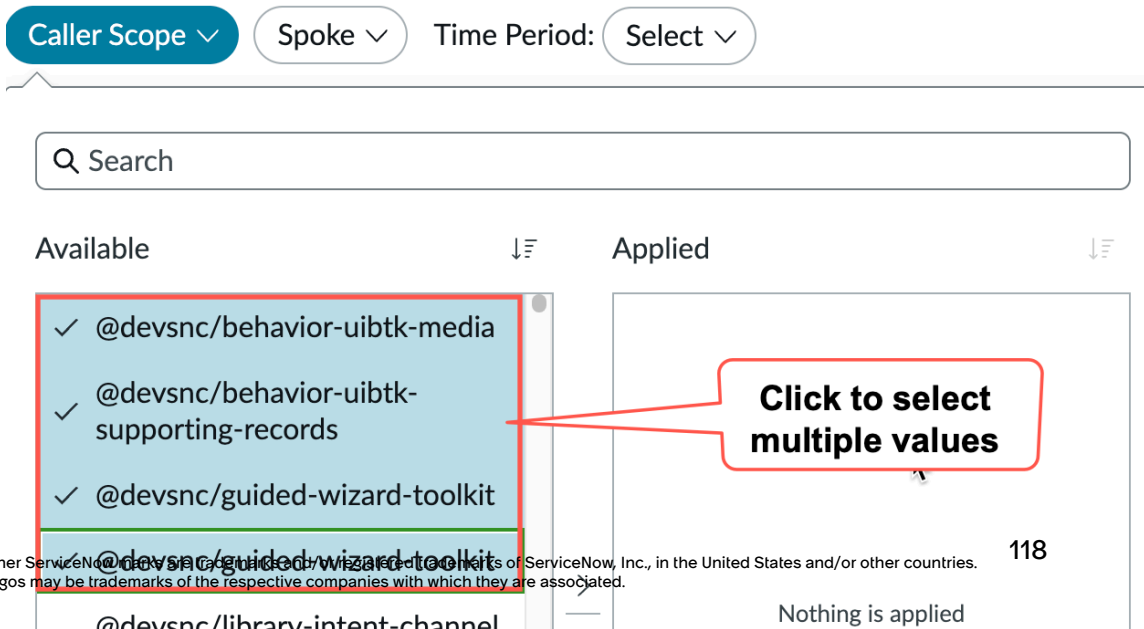
i. Select the **Caller Scope** or **Spoke** filter.

ii. Click to select the first value in the Available list.



(Optional)

iii. Click to select more values.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Click the Move selected items to the To be Applied list icon >

c. Click **Apply**.
The filter is applied.

d. To filter the report data by time period, select the Time Period filter.

e. Select the time period by which you want to filter the data.

f. Click **Apply**.

Transaction reports in Integration Hub Usage Dashboard

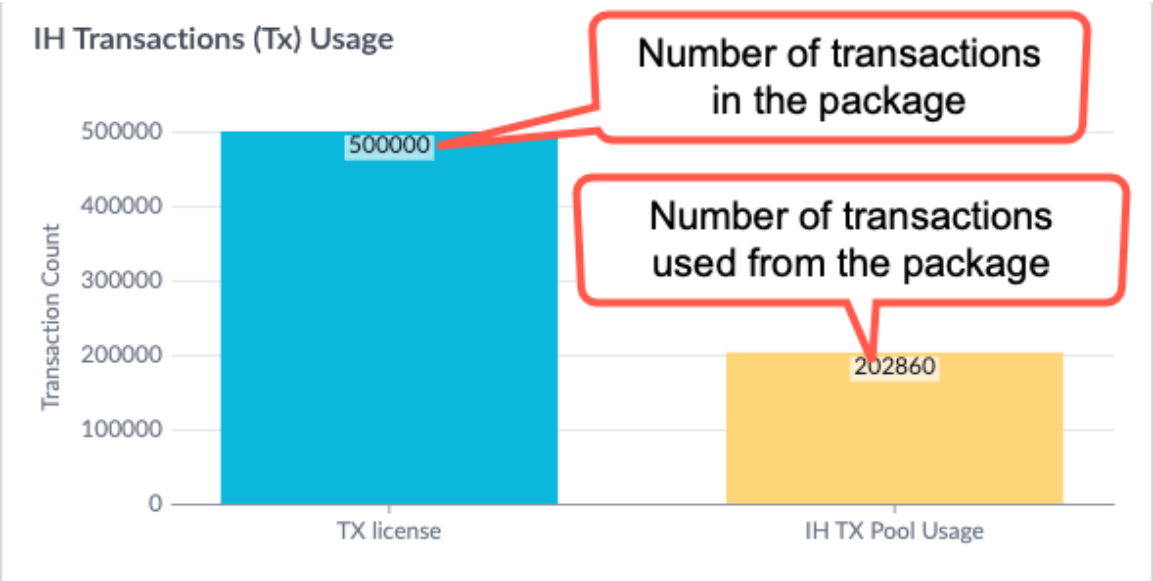
The transaction reports in Integration Hub Usage Dashboard help you to understand the Integration Hub usage transactions.

Overview section reports

IH Transactions (Tx) Usage report

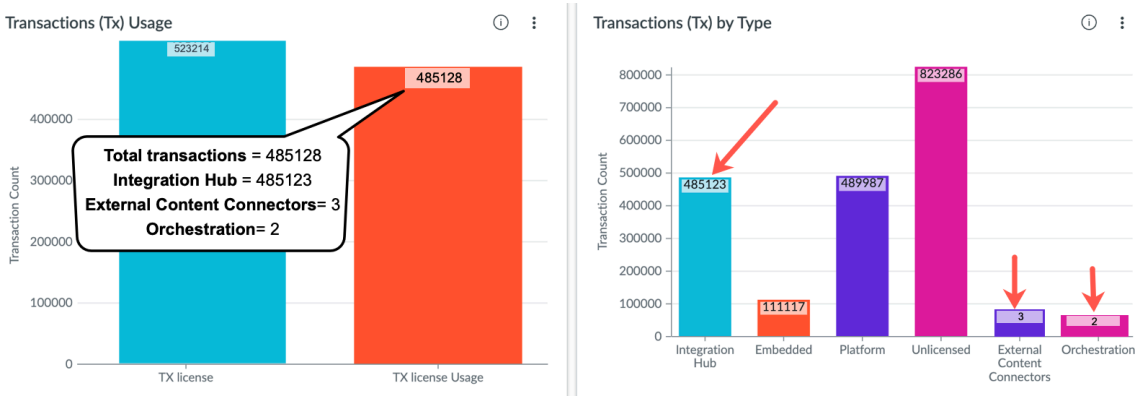
Depending on the package that your organization subscribes to, the Integration Hub subscription packages offer a certain number of transactions per year. See the details about the packages in Integration Hub usage and subscription. With this report, you can learn about the total usage of the Integration Hub transactions versus the subscribed package of transactions in the last year. The following diagram shows what you can learn from viewing the Integration Hub transactions usage.

Integration Hub Transactions (Tx) Usage report

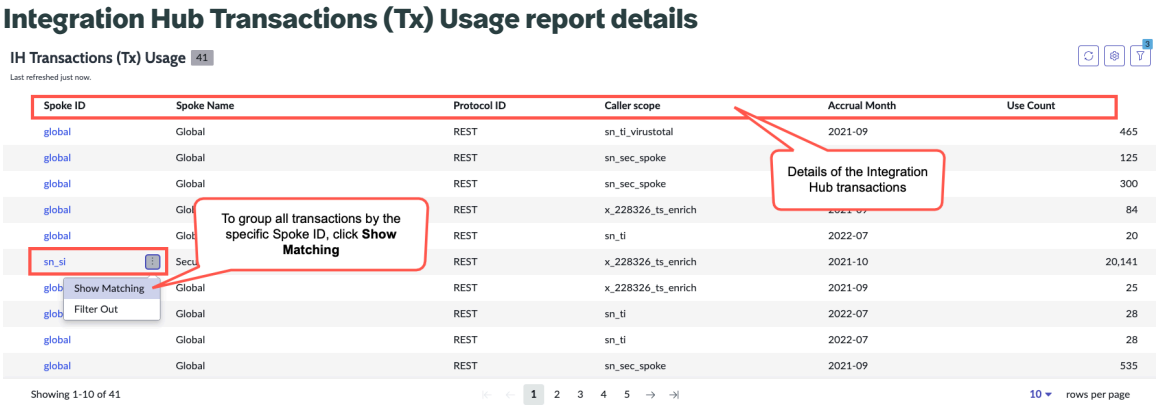


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The number of transactions you have used from the package is the sum of the transactions that you have performed in Integration Hub, External Content Connectors, and Orchestration. The Transactions (Tx) by Type report shows the transactions that you have performed in Integration Hub, External Content Connectors, and Orchestration. See the image.



As shown in the following example, you can click a graph to view more details about the transactions.

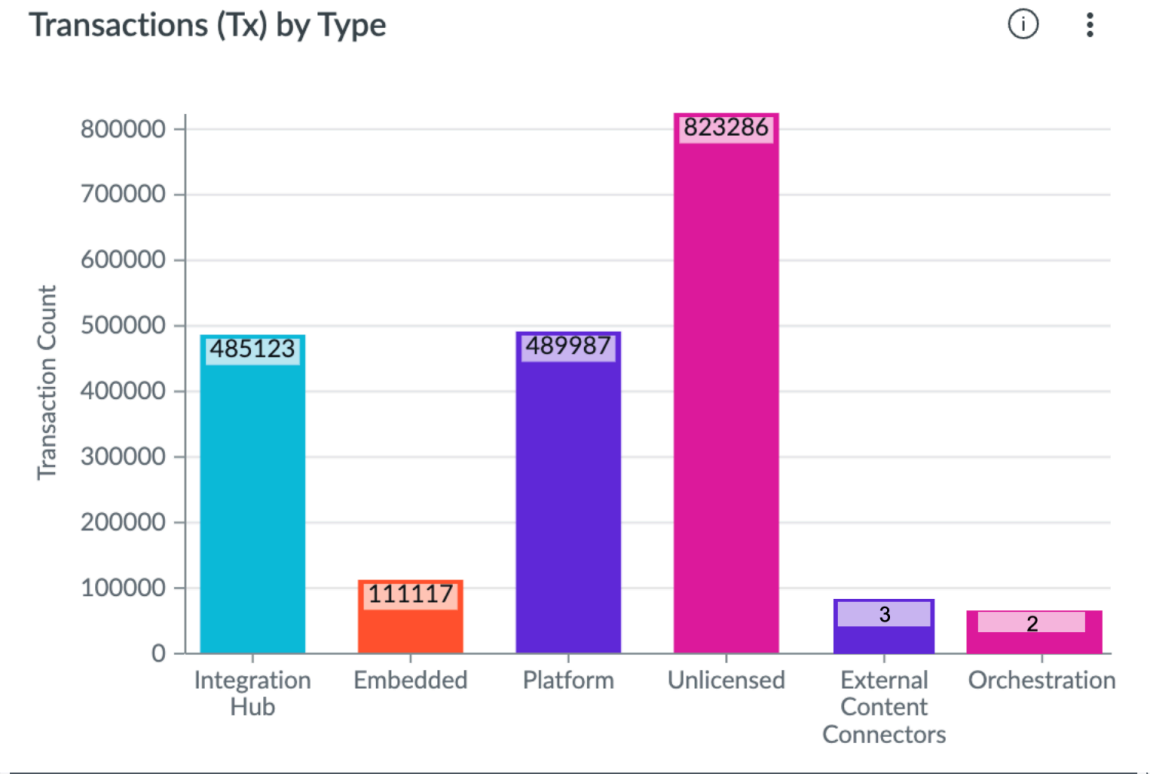


Transactions by Type report

As shown in the following diagram, you can use the Transactions by Type report to view the total transactions by their types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

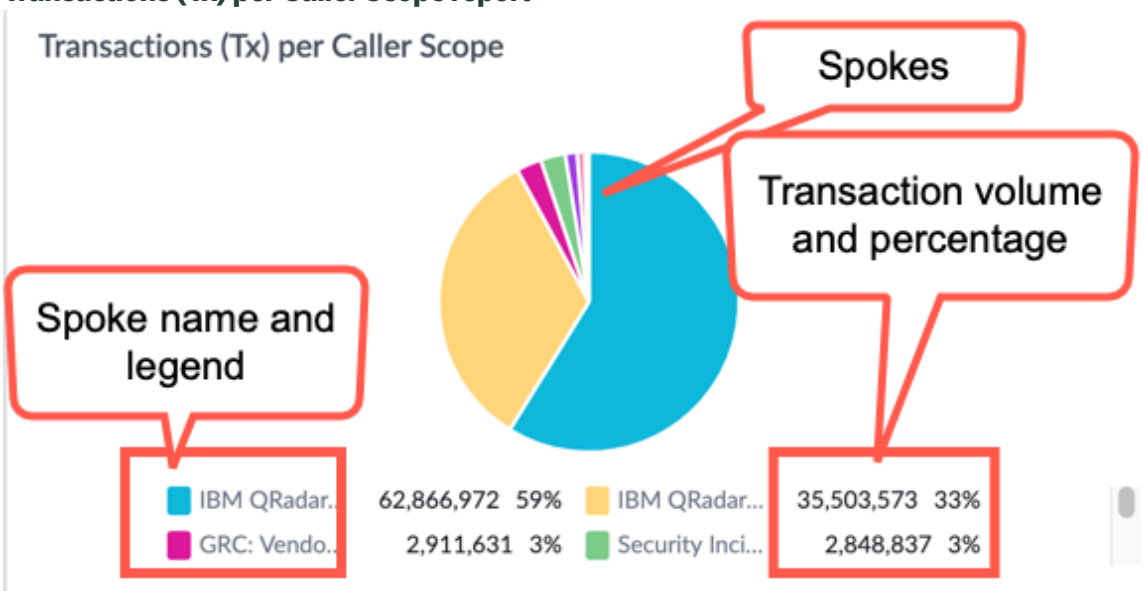
Transactions by Type report



Transactions (Tx) per Caller Scope report

The applications that perform the transactions are known as caller scopes. The Transactions (Tx) per Caller Scope report enables you to view the transactions per caller scope. As shown in the following diagram, you can also drill down and view the transactions that are performed by the spokes that are under different caller scopes.

Transactions (Tx) per Caller Scope report



As shown in the following example, you can click a graph to view more details such as the spoke transactions, what the caller scope of the spoke is, the total transaction count, and more. You can also group the transactions under a specific parameter in the table.

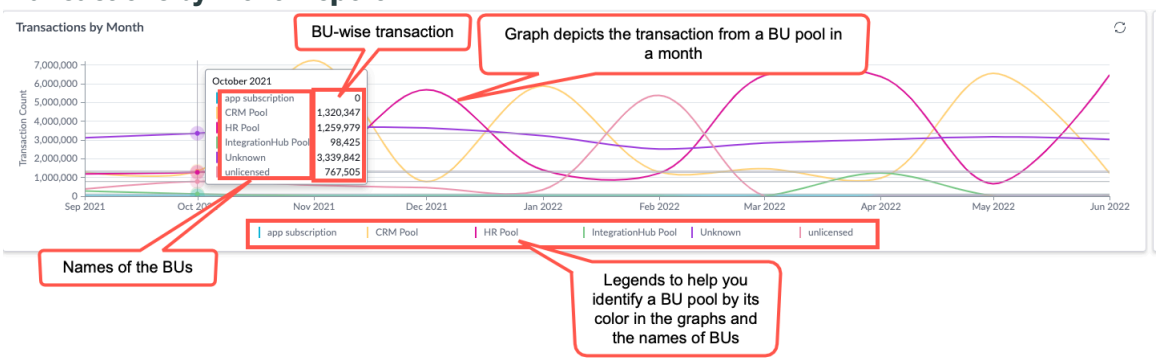
Transactions by Month report

As shown in the following diagram, the Transactions by Month report enables you to view the total transactions that are performed from each business unit and the Integration Hub subscription pool per month.

Transactions by Month report



Tip:

To view the pop-up window that shows the business unit transactions, on the Y-axis, click just above the month that you want to view the report for.

As shown in the following diagram, you can drill down and view more details of the transactions of a business unit pool. On the graph, click the small colored circle that indicates the business unit. For example, you can click the colored circle representing the HR business unit pool icon to see the details of the HR business unit pool.

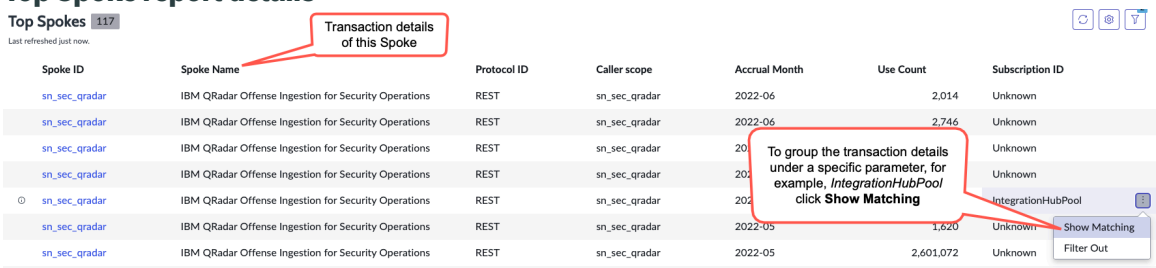
With the Top Spokes report that is shown in the following diagram, you can view the top 10 spokes that performed the largest number of transactions.

Top Spokes report

As shown in the following example, you can drill down and view more details about the transactions that are performed by a specific spoke by clicking the graph that represents the spoke.

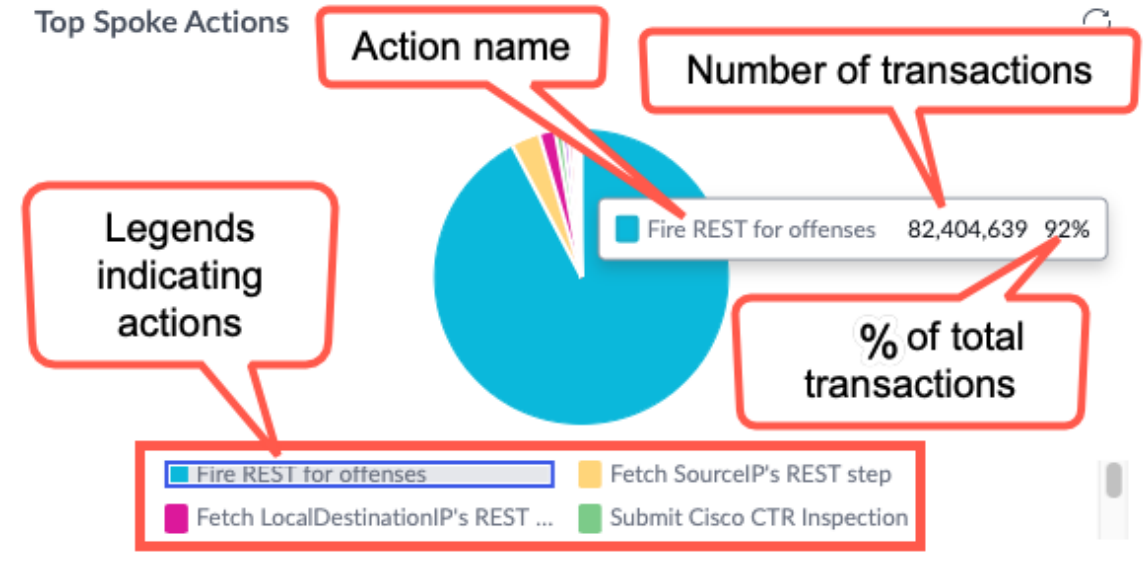
Top Spoke report details



Top Spoke Actions report

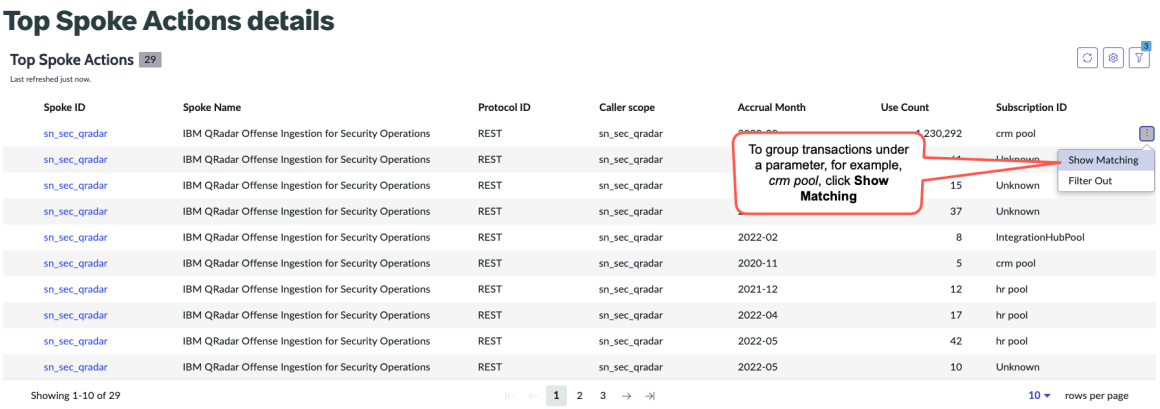
As shown in the following diagram, this report displays the names of the top actions that are performed by spokes. You can also drill down to view more details.

Top Spoke Actions report



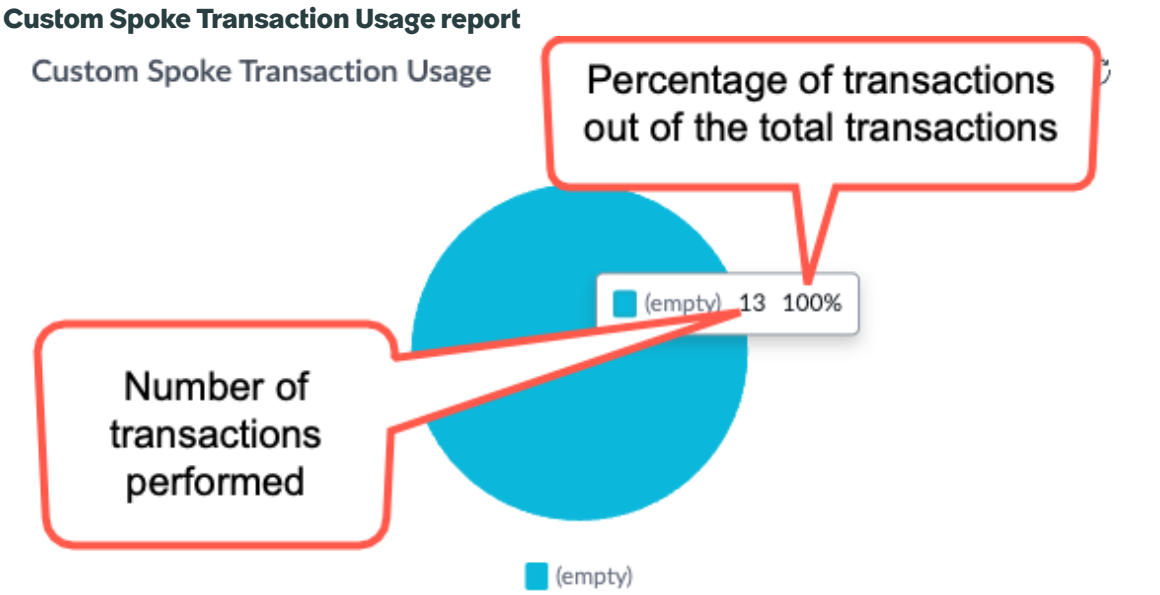
As shown in the following example, you can drill down and view more details of a specific action by clicking the slice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

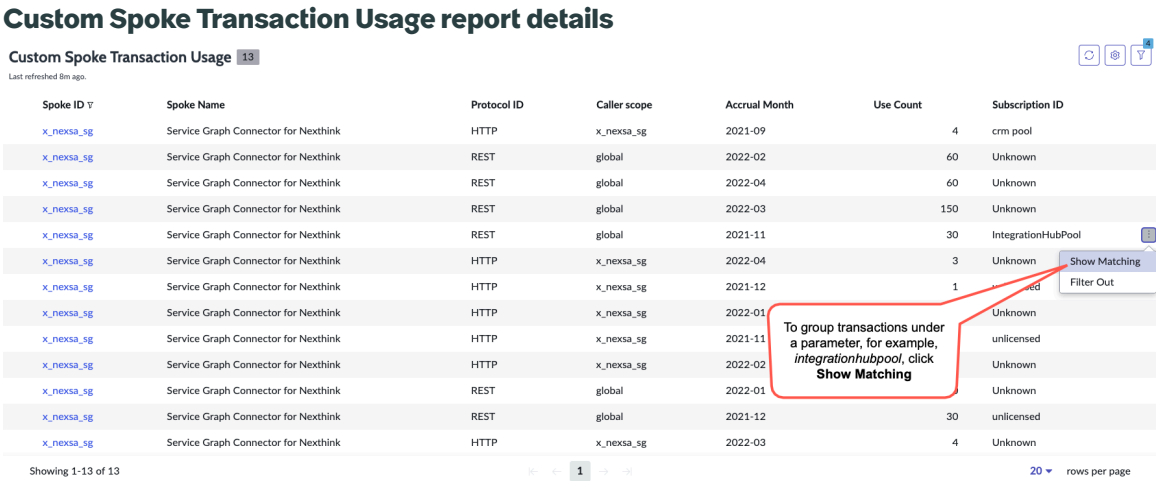


Custom Spoke Transaction Usage report

As shown in the following diagram, you can view the transaction usage by the custom spokes in the Custom Spoke Transaction Usage report. You can also drill down and view the details of the report.



As shown in the following example, you can drill down by clicking the slice.



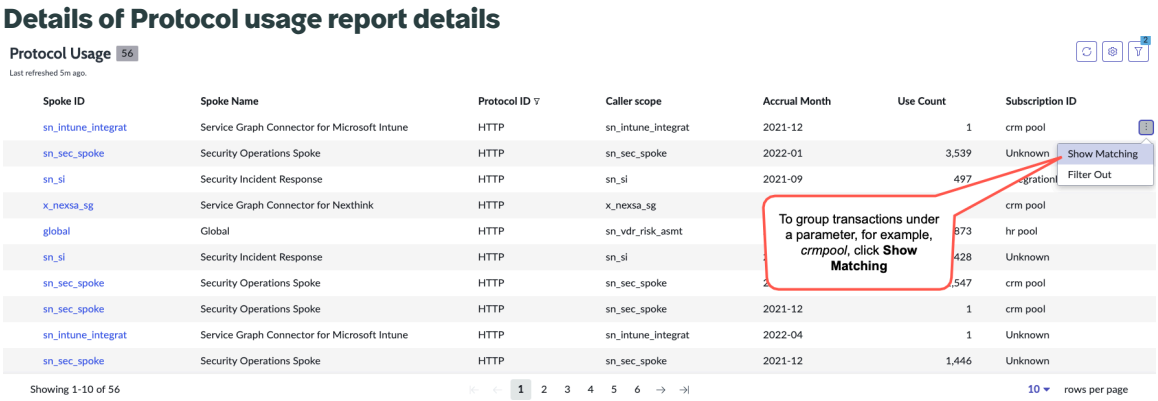
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Protocols and Features reports

Protocol Usage report

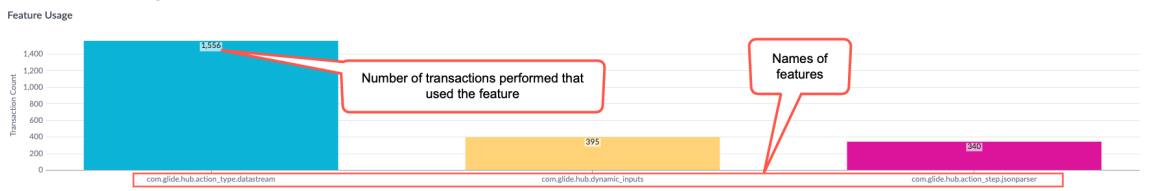
Spokes use different protocols while performing transactions. As shown in the following diagram, you can use the Protocol Usage report to view the usage of the various protocols. You can drill down to view more details.

As shown in the following example, you can drill down and view the details of transactions with a protocol by clicking the graph that represents a protocol.

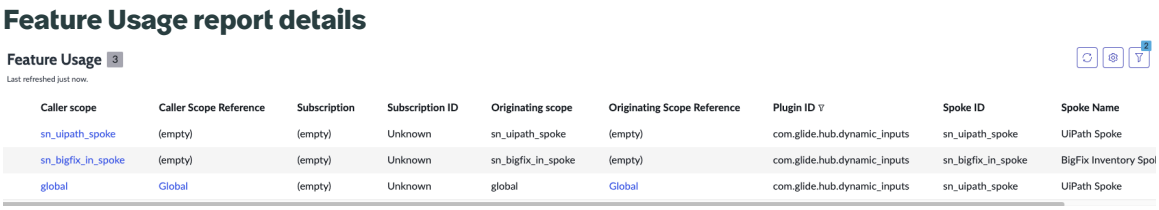


Feature Usage

The Spokes use different features while performing transactions. This report gives the usage of the various features. You can drill down to view more details.



To drill down, click the graph representing a feature.



Data egress reports in the Integration Hub Usage Dashboard

The Data egress reports give insights on data egress from the ServiceNow instance through API protocols or export sets. You can view more information when you select specific records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the reports

Do the following steps.

1. Select the **Data Egress** tab.
2. Select the API or Export section that you want to view from the **Filter by** list.

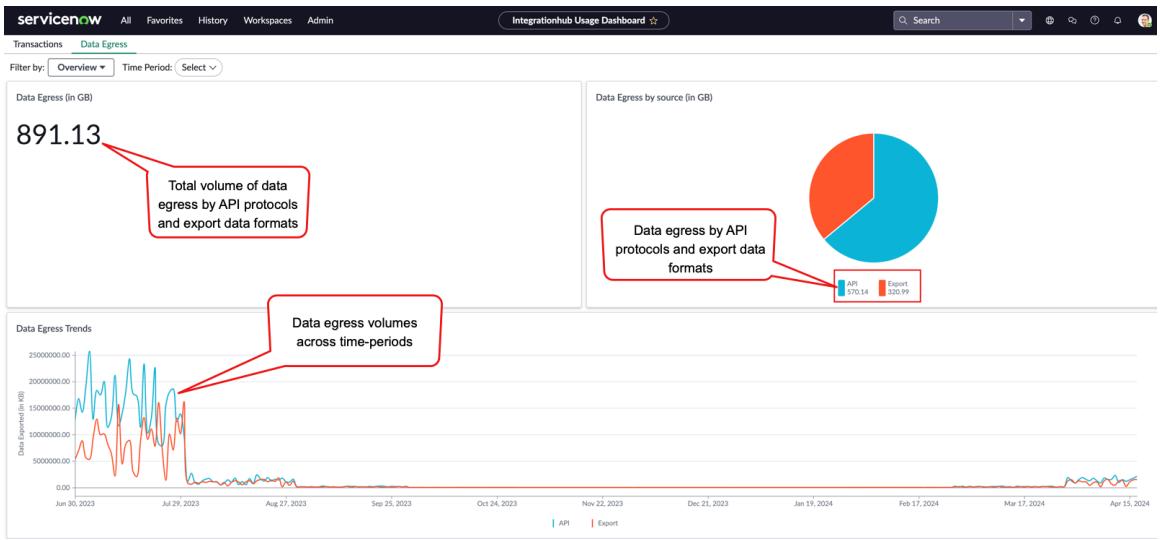
> **Note:**
> The Overview section is selected by default.

Overview section reports

Data Egress: Total volume of data egress by all sources.

Data Egress by source: Data egress volume by API protocols and export.

Data Egress Trends: Trends in data egress across the time period.



> **Note:**
> All charts are adjusted to the nearest data metric starting with Bytes.

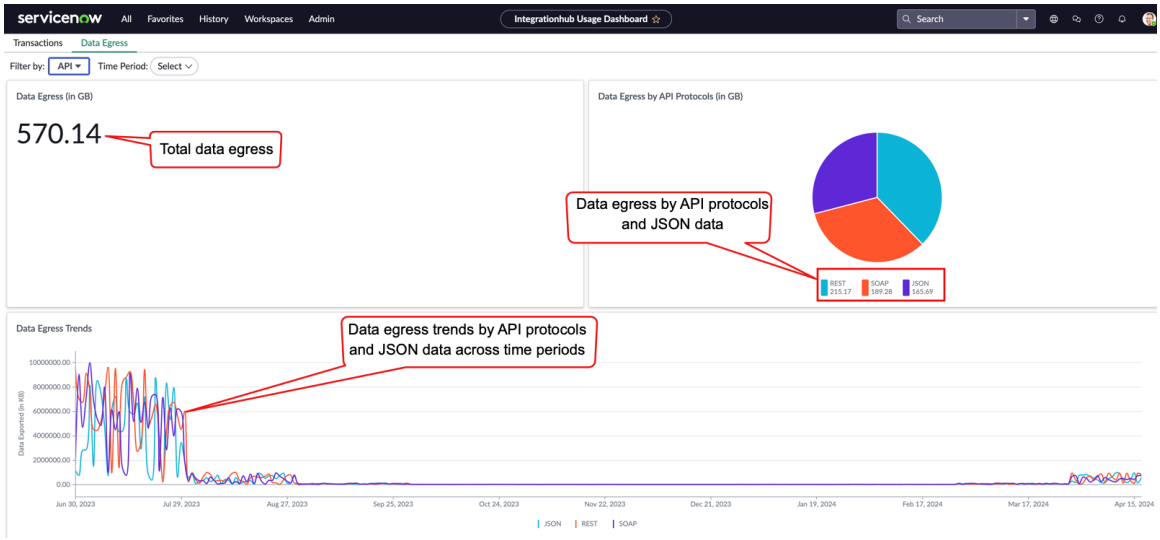
API section reports

Data Egress: Total volume of data egress by all API protocols.

Data Egress by API Protocols: Data egress volume by API protocols.

Data Egress Trends: Trends in data egress across the time period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
All charts are adjusted to the nearest data metric starting with Bytes.

Export section reports

Data Egress: Total volume of data egress by both the export sets and URI.

Data Egress by Exports: Data egress volume by URI.

Data Egress Trends: Trends in data egress across the time period.

Note:
All charts are adjusted to the nearest data metric starting with Bytes.

Important:
The amount of data is mentioned in bytes and the abbreviations are as described in the following table.

Orders of magnitude

Abbreviation	Number	Value
K	Thousand	10^3
M	Million	10^6
B	Billion	10^9
T	Trillion	10^12

That is, if the value displayed is **4.01M**, the amount of data transferred is 4.01 million bytes. In the preceding sample API Data Egress, the data amount of data transferred is 2.01 billion bytes.

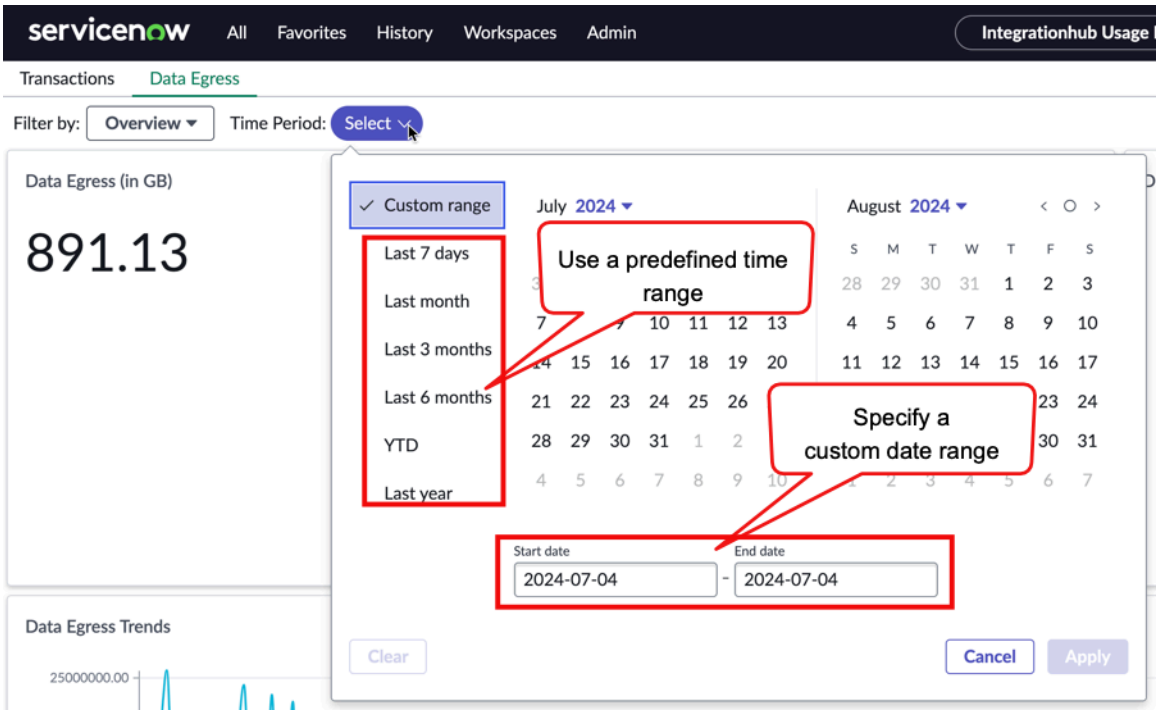
Select the number to access details of the individual data transfers.

View data insights

View different insights on data going out of the ServiceNow instance. For example, view the data egress volume between a period that you specify. Do the actions given in the image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View egress data for a specified time period



Overview of data egress

View the total data egress, and the data egress by API protocols or exports.

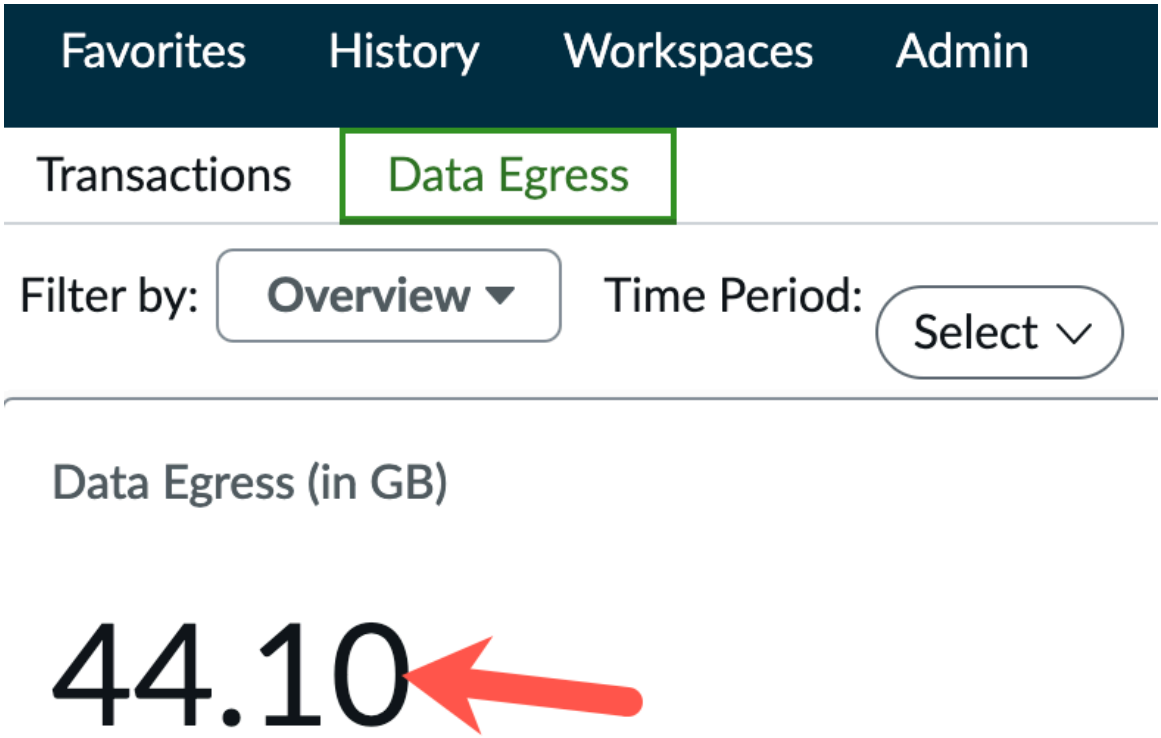
Do the steps.

1. Select the **Data Egress** tab.

   Confirm that in the Filter by list, Overview is selected.

2. Select the data egress volume in the Data Egress report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The data egress by API protocols and exports appear.

View data egress by API protocols or exports on a specified date

Select a date and API protocol or exports and view the data egress by the source you specified on that date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Do the following steps.

1. Select the **Data Egress** tab.

   Confirm that in the Filter by list, Overview is selected.

2. On the Data Egress Trends report, move the pointer to a date and then select the source.

   All records of data egress by the date and source that you specified appears.

View data egress by API protocols

View data egress by JSON, REST, or SOAP protocols, and then select a record from the data to view more information.

Do the steps.

1. Select the **Data Egress** tab.
2. From the Filter by list, select **API**.
3. In the Data Egress by API Protocols report, select an API protocol, for example, REST.

   All records of data egress by the API protocol that you specified appears.

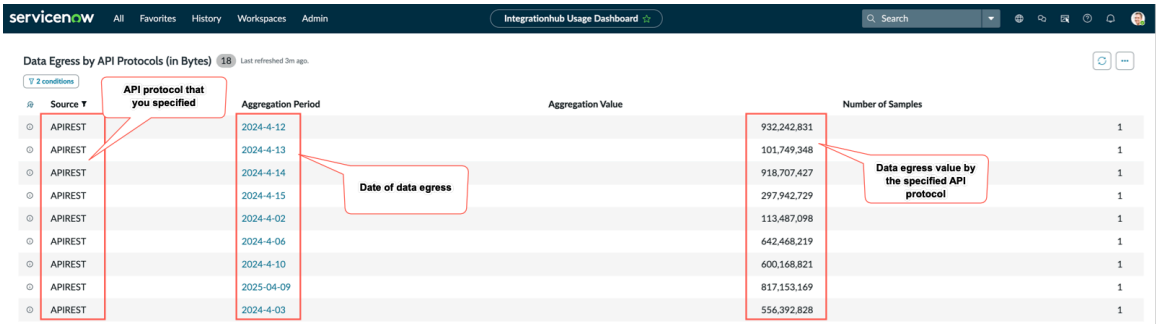
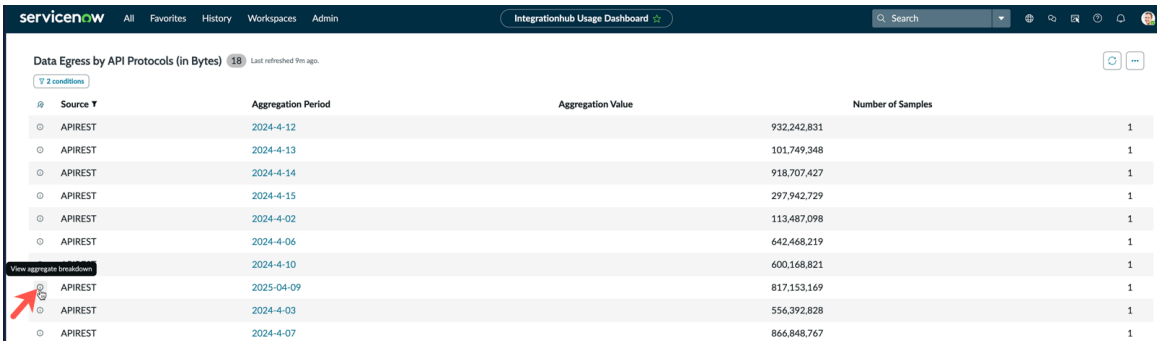
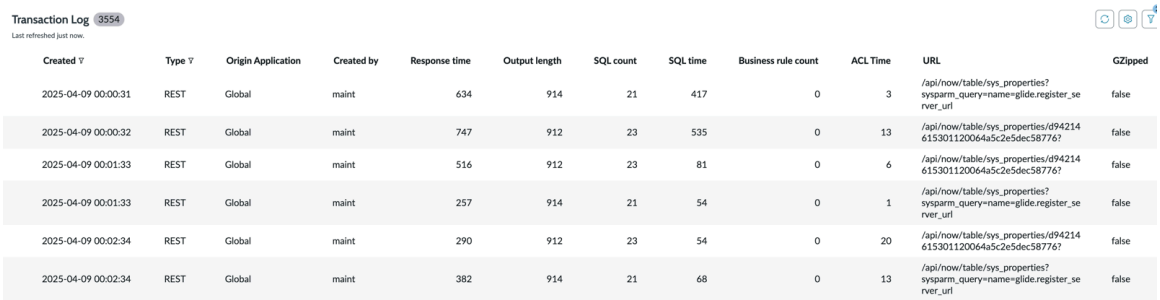
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. To view more data on a specific record, select the View Aggregate Breakdown icon .



The transaction log appears.



View data egress by API protocols on a specified date

Specify a date and view the data egress by JSON, REST, or SOAP protocols on that date. You can select a record from the data to view more information.

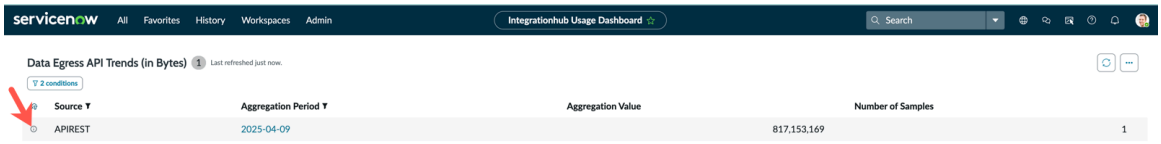
Do the steps.

1. Select the **Data Egress** tab.
2. From the Filter by list, select **API**.
3. Move the pointer to a date on the graph, and select an API protocol.

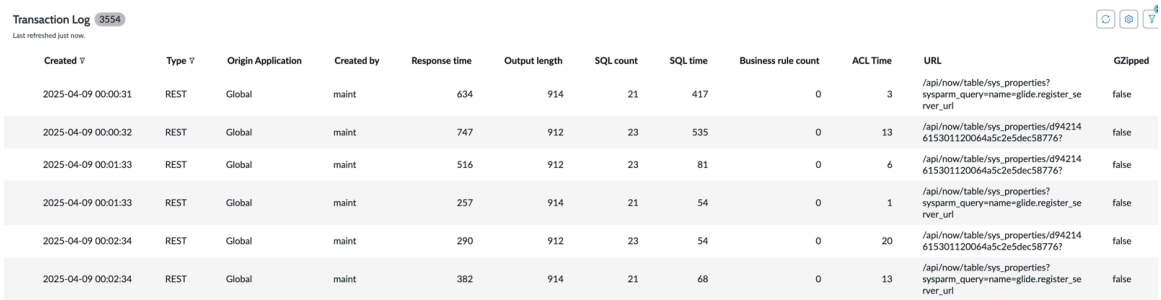
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The data egress by the selected API protocol on the selected date appears.

4. To view more data on a specific record, select the View Aggregate Breakdown icon .



The transaction log appears.



Reports on data egress by export

View information on the data egress from the ServiceNow instance by URI and export sets.

To access the reports, do the steps.

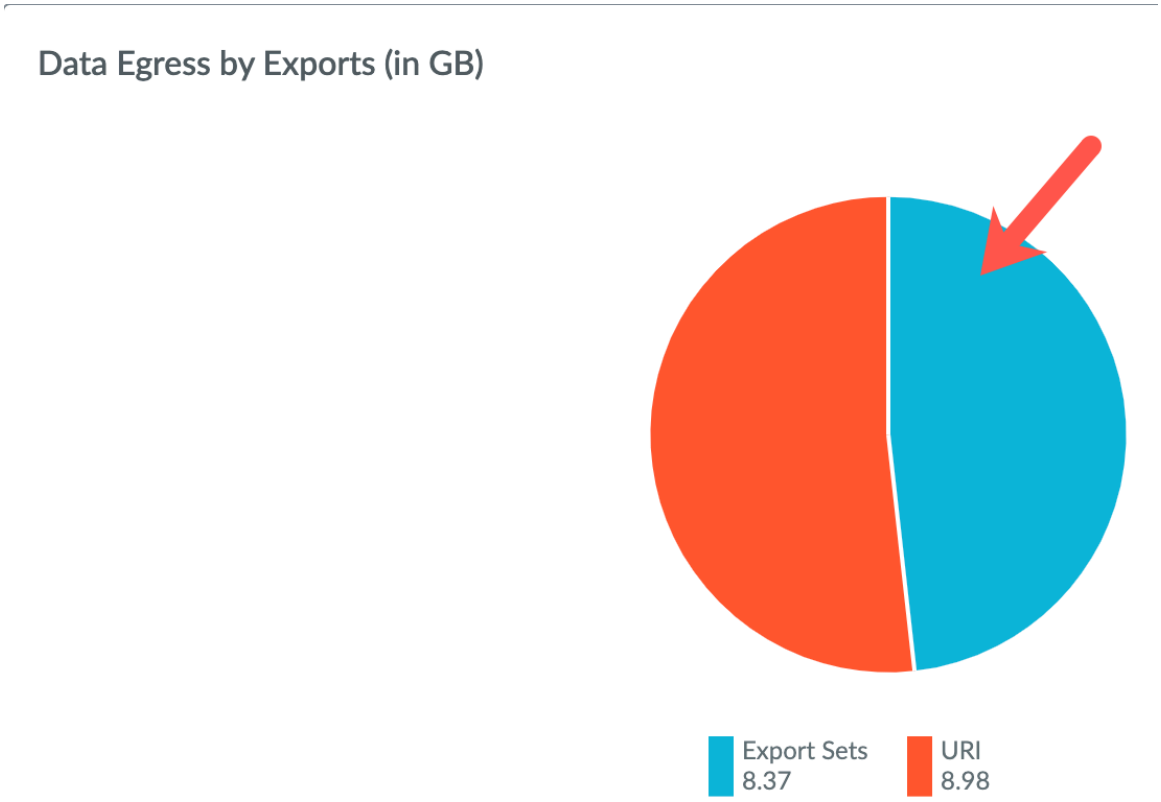
1. Select the **Data Egress** tab.
2. From the Filter by list, select **Export**.

Reports on data egress by export sets or URI

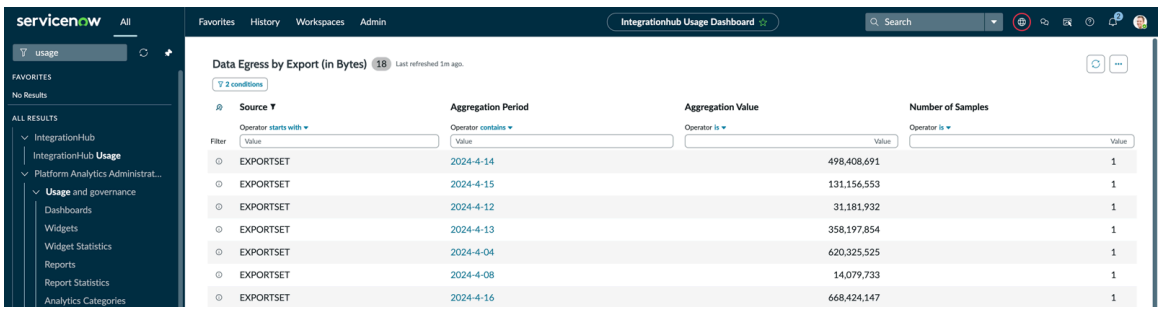
To access the reports on data egress by export sets or URI, do the steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

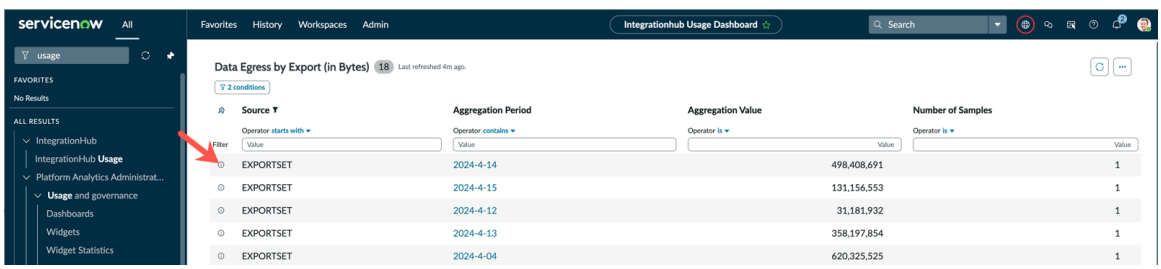
1. On the Data Egress by Exports report pie-chart, select the data export type. For example, export sets.



The date-wise data exports by the source you specified appears.



2. To view more information on an export set on a date, select the View Aggregate Breakdown icon .



The data appears.

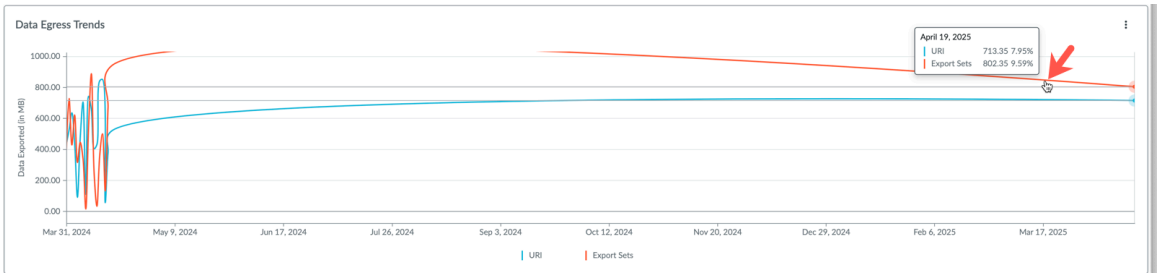
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Date-wise data egress by exports

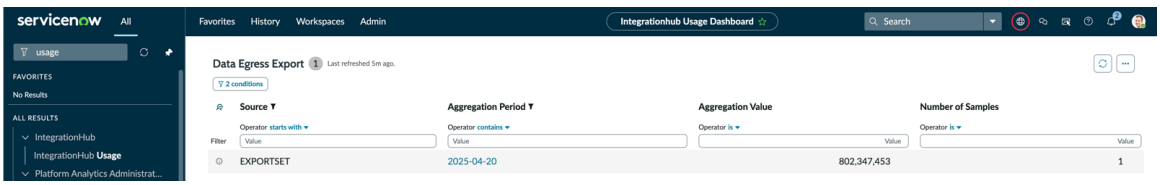
View data egress by exports on a date that you specify.

Do the following steps.

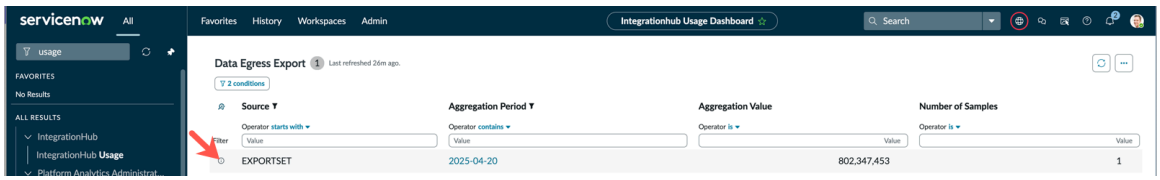
1. On the Data Egress Trends report, move the pointer to a date and then select the export type. For example, move the pointer to April 19, and then select Export Sets.



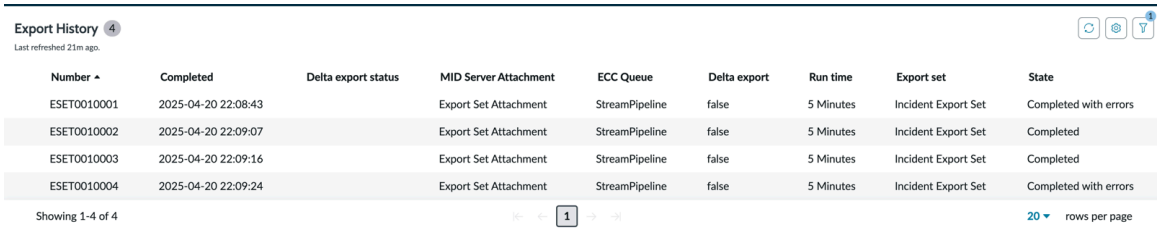
The egress data on the export type and date that you specified appears.



2. To view more data on a specific record, select the View Aggregate Breakdown icon .



The data appears.



Data generation in the reports

Data in the reports are generated from the `data_egress_count` table. View how data is populated in the `data_egress_count`.

Building integrations in Integration Hub

Create integrations with Integration Hub.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub available spokes

Activate spokes to enhance your Workflow Studio experience with integration-specific content. Use prebuilt flows and actions to automate your integrations or create your own integration automation.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note:
For information about which spokes are included with different Integration Hub subscriptions, see Legal schedules - IntegrationHub overview.

Note:

ServiceNow has partnered with Boomi to deliver Boomi API Management, a cloud-based platform that enables customers to discover, manage, secure, and monetize their APIs. Boomi supports full lifecycle API management, including governance, analytics, and API security.

Boomi provides documentation though their own portal, and customers requesting support with Boomi API Management will contact the Boomi support through their standard channels.

To get started, see the Boomi API Management listing on the ServiceNow® Store, which includes information about entitlements and required plugins, as well as a link to the Boomi API Management documentation.

Adobe Experience Platform Spoke

Automate the process of managing datasets and entities in Adobe Experience Platform from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Adobe Experience Platform spoke v2.1.1 is the latest version.

Supported versions

This spoke was built for Adobe Experience Platform released on September 10, 2019, but may be compatible with later versions.

Spoke requirements

- Registered Adobe ID account
- User with developer access
- Details such as API key and client secret

See the Adobe Experience Platform documentation for instructions on creating Adobe ID and adding developer.

Spoke actions

The Adobe Experience Platform spoke provides actions manage datasets and entities when events occur in ServiceNow. Available actions include:

Category	Action	Description
Dataset Management	Get All Data Inlets	Retrieves the details of all data inlets.
	Get All Datasets	Retrieves the details of all datasets.
	Get All Union Schemas	Retrieves the list of all schemas that are part of unions.
Entity Management	Get Entity Information	Retrieves the information of an entity as a dynamic object.
	Load Entity Data	Ingest the information of an entity to Adobe Experience Platform.
Metadata Retrieval	Get Metadata For All Attributes In A Schema	Retrieves all attributes for the selected union schema.
	Get All Sandboxes	Retrieves information about all active sandboxes.
	Get Metadata For All Data Inlets	Retrieves the metadata of all data inlets.
	Get Metadata For All Datasets	Retrieves the metadata of all datasets.
	Get Metadata For All Fields In A Union	Retrieves the metadata of all fields in the selected union.
	Get Metadata For All Identity Fields	Retrieves the metadata of all identity fields or namespaces.
	Get Metadata For All Union Schemas	Retrieves the list of all schemas that are part of unions.
	Get Metadata For All Unions	Retrieves the metadata of all union views.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Metadata For Union Schema	Retrieves schema for the selected fields of a union.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Note:
Two connection and credential alias records are needed for the Adobe Experience Platform spoke; one for data inlet management and batch ingestion, and other for data collection. Each alias should be associated with the respective Adobe Experience Platform API.

For information about setting up the spoke, see Set up Adobe Experience Platform spoke.

Set up Adobe Experience Platform spoke

Integrate your Adobe Experience Platform account with your ServiceNow instance. Create a custom OAuth application in Adobe Experience Platform and authenticate requests from ServiceNow.

Before you begin

- Request Integration Hub subscription
- Activate Adobe Experience Platform spoke
- Role required: admin

About this task

The Adobe Experience Platform spoke can also be set up using the Connection & Credential configuration templates. However, using templates, only one set of alias records can be used at a time.

Attach a Java Key Store certificate to the Adobe Experience Platform spoke

Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Adobe Experience Platform spoke.

Before you begin

- Valid Java KeyStore certificate
- Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

X.509 Certificate form fields

Field	Description
Name	Name to uniquely identify the record. For example, `AEP Certificate`.
Expiration notification	Option to send a notification when the certificate is about to expire.
Notify on expiration	Users to be notified when the certificate expires.
Warn in days to expire	Number of days to send a notification before the certificate expires.
Active	Option to actively use the certificate.
Format	Certificate format. The instance supports the PEM and DER formats.
Type	Type of certificate. Select **Java Key Store**.
Valid from	Date from which the certificate is valid.
Expires	Date on which the certificate expires.
Expires in days	Number of days until the certificate expires.
Key store password	Password associated with the certificate.
Short description	Summary about the certificate.
PEM Certificate	Contents of the X509 certificate.

4. Click the attachments icon ( ) and attach a JKS certificate.
5. Click **Validate Stores/Certificates**.

Result
The JKS certificate is created and attached to the Adobe Experience Platform spoke.

Create a JWT signing key for the Adobe Experience Platform spoke

Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Keys form fields

Field	Description
Name	Name to uniquely identify the JWT signing key. For example, `AEP JWT Keys`.
Signing Keystore	Valid JKS certificate attached in the previous task. For example, `AEP Certificate`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Key Id	Key ID to identify which key is used when multiple keys are used to sign tokens.
Application	Application scope that contains this record. Select Adobe Experience Platform spoke.
Signing Algorithm	Algorithm to sign with the JWT key.
Signing Key Password	Password associated with the signing key.
Active	Option to actively use the certificate.

4. Click **Submit**.

Result
The JWT key is created and assigned to the JKS certificate.

Create a JWT provider for the Adobe Experience Platform spoke

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Provider form fields

Field	Description
Name	Nname to uniquely identify the JWT provider. For example, `AEP JWT Provider`.
Expiry Interval (sec)	Number in seconds to set the lifespan of JWT provider tokens.
Signing Configuration	JWT signing key from the previous step. For example, `AEP JWT Keys`.

4. Right-click the form header, and click **Save**.
   The Standard Claims and Custom Claims related lists are displayed.
5. Enter values for **iss**, **sub**, and **aud** in the Standard Claims related list.
   See the Adobe Experience Platform documentation for instructions.
6. Enter these values in the Custom Claims related list.

Field	Value
Claim Name	https://ims-na1.adobelogin com/s/entdataservices_sdk
Claim Value Type	true|false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Claim Value	true

7. Click **Update**.

Result
The JWT provider is added to your ServiceNow instance.

Register Adobe Experience Platform as OAuth Provider

Use the information generated during Adobe ID account creation and configuration to register Adobe Experience Platform as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `AEP OAuth`.
Client ID	Consumer key you generated during the Adobe ID account configuration.
Client Secret	Consumer secret you generated during the Adobe ID account configuration.
OAuth API Script	Script to customize the request and response. Select **OAuthUtilAEP**.
Default Grant type	Grant type used to establish the token. Select **JWT Bearer**.
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Application	Application scope that contains this record. Select Adobe Experience Platform.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Authorization URL	This field should be left blank.
Token URL	OAuth server token endpoint. Enter `https://ims-na1.adobelogin.com/ims/exchange/jwt/`.
Token Revocation URL	This field should be left blank.
Redirect URL	This field should be left blank.
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.
Send Credentials	Client credentials in the request.

5. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL**.
   - The system populates **OAuth Entity Profile** with **Grant Type** as **JWT Bearer**. For example, **OAuth Entity Profile** is created with default **Name**, **AEP default_profile**
6. Open the record of OAuth Entity Profile.
7. Select the JWT Provider record for **JWT Provider**, for example, `AEP JWT Provider`.
8. Click **Update**.

Result
The instance can request OAuth 2.0 tokens for the spoke.

Note:
When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

Create Credential records for the Adobe Experience Platform

Create Credential records to the Adobe ID account you created. The Adobe Experience Platform spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin

About this task
You must create two credential records; one for data inlet management and batch ingestion, and other for data collection.

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays the message **What type of Credentials would you like to create?**.

3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `AEP` for data inlet management and batch ingestion, and `AEP_Ingestion` for data collection.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile you created when you registered the Salesforce connected app as an OAuth provider. For example, select **AEP OAuth default_profile**.
Applies to	This field isn't applicable.
Order	Order to apply this credential. For example, enter `100`.

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

Result
The credential records for the Adobe Experience Platform spoke is created.

Create Connection records for the Adobe Experience Platform spoke

Create Connection records to your Adobe ID account. The Adobe Experience Platform spoke connection and credential alias uses these connections to perform actions in Adobe Experience Platform.

Before you begin
Role required: admin

About this task
Two connection and credential alias records are available by default; one for data inlet management and batch ingestion, and other for data collection. Perform these steps to associate each alias with the respective Adobe Experience Platform API.

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the required Adobe Experience Platform spoke record.

> **Note:**
> There are two connection and credential records; **AEP** and **AEP_Ingestion**. The **AEP** record is for data inlet management and batch ingestion, and **AEP_Ingestion** is for data collection.

3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter AEP `Platform` for data inlet management and batch ingestion, and AEP `dcs` for data collection.
Credential	Credential record you created for Adobe Experience Platform. For example, select **AEP** and **AEP_Ingestion**.
Connection alias	Alias record associated with this connection.
URL builder	**Note:** Do not select the check box.
Connection URL	Base URL to connect to Adobe Experience Platform. ○ If the connection record is for data inlet management and batch ingestion, enter `https://platform.adobe.io/`. ○ If the connection record is for data collection, enter `https://dcs.adobedc.net`.
Use MID server	This field isn't applicable.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

5. In the**Attributes** tab enter these values.
   - Internal name of the sandbox in **Sandbox**.

     Note:
     Ensure that you provide the internal name of the required sandbox and not its label in **Sandbox**. To obtain the internal name of the required sandbox, use the Get All Sandboxes action.

   - If the connection record is for data inlet management and batch ingestion, enter **API Key** and **Organization ID**.
   - If the connection record is for streaming ingestion, enter **Organization ID**.
6. Right-click the form header and click **Save**.

Result
The Adobe Experience Platform spoke is set up and integrated with the ServiceNow instance.

Adobe Sign Spoke

Automate the process of sending a legal document to an individual or list of recipients for digital signature using Adobe Sign. For example, automate employee onboarding and offboarding, or sending non-disclosure agreements, legal agreements, and statements of work for digital signature. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Adobe Sign spoke v2.9.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for Adobe Sign API version v6, but may be compatible with later versions.

Key features

Adobe Sign spoke enables a flow designer to:

- Automate the process of sending a legal document to an individual or list of recipients for digital signature.
- Copy and customize sample flows for sending transient documents or Adobe Sign library documents for digital signature.
- Discover and synchronize the Adobe Sign documents.
- Pause a flow until an agreement or document is signed. A scripted REST API webhook waits for the recipient to sign the document.
- Use values from a signed document in a flow.
- Manage the life cycle of documents in Adobe Sign from the ServiceNow instance.

Spoke requirements

- Adobe Sign account
- Adobe Sign account admin credentials to perform the required account specific tasks in Adobe Sign
- Adobe Sign group admin credentials to perform the required group specific tasks in Adobe Sign.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Account admin or group admin can add users to the groups. These users can access information specific to their group only.

- Adobe Sign application configured to integrate with ServiceNow
- Adobe Sign application details such as application ID and client secret.
- ServiceNow admin credentials to create and synchronise the required Adobe Sign groups with ServiceNow.

Note:

  - This is the default admin role that is created when the Adobe Sign spoke is activated.
  - ServiceNow admin has access to information about all Adobe Sign groups synchronized with ServiceNow and all tables part of the Adobe Sign spoke.
  - User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. Group users have access to information specific to their Adobe Sign groups only and can view only the group-specific data from the tables that are part of the Adobe Sign spoke.

- Integration Hub subscription

See the Adobe Sign development documentation for instructions on creating and configuring custom applications.

Spoke flows

The Adobe Sign spoke provides sample flows to demonstrate automating the Adobe Sign tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

Flow	Description
Adobe Sign - Send NDA Demo	Sends a statement of work for digital signature using a Adobe Sign library document when a Service Catalog request is created by the **Adobe Sign - Statement of Work Demo** item. Before using this flow, activate the **Adobe Sign - Statement of Work Demo** catalog item.
Adobe Sign - Statement of Work Demo	Sends a non-disclosure agreement for digital signature using a Adobe Sign library document when a Service Catalog request is created by the **Adobe Sign - Statement of Work Demo** item. Before using this flow, activate the **Adobe Sign - Statement of Work Demo** catalog item.

The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering an Adobe Sign spoke sample flow, activate these catalog items.

Catalog item	Description
Adobe Sign - Statement of Work Demo	Sends a statement of work for digital signature using a Adobe Sign library document.
Adobe Sign - Send NDA Demo	Sends a non-disclosure agreement for digital signature using a Adobe Sign library document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Adobe Sign spoke provides a sample subflow to demonstrate automating Adobe Sign tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Documents Per Group. The subflow retrieves documents relevant to an Adobe Sign group and stores them in the AdobeSign Documents table.

Spoke actions

The Adobe Sign spoke provides actions to automate Adobe Sign tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Document Management	Attach Agreement Audit Trail to ServiceNow Record	Downloads the agreement audit trail for the specified agreement from Adobe Sign and attaches it to a ServiceNow record.
	Attach Agreement Document to ServiceNow Record	Downloads the agreement document for the specified agreement from Adobe Sign and attaches it to a ServiceNow record.
	Attach Signed Agreement to a ServiceNow Record	Downloads an Adobe Sign document and attaches it to the relevant ServiceNow agreement record.
	Convert Transient to Library Document	Converts a transient document to a library document. Ensures that the document is available in the library for more than the stipulated transient 7-day purging period.
	Look up Agreement Documents	Retrieves the agreement documents for the specified agreement.
	Look up Agreement ID	Retrieves the agreement ID from the ServiceNow Agreement table.
	Look up Agreements Stream	Retrieves the list of agreements.
	Look up Library Document ID	Retrieves the library document ID from the ServiceNow Documents table.
	Look up Library Documents Stream	Retrieves the list of library documents.
	Set Agreement Field	Creates a list of fields for a draft agreement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Upload Attachment as Transient Document	Uploads an attachment to Adobe Sign as a transient document. The transient document is available for a period of 7 days.
MegaSigns Management	Cancel MegaSigns	Cancels a MegaSigns that are already out for signature.
	Check MegaSigns Status	Checks the status of a MegaSigns record.
	Create Draft MegaSigns	Creates a MegaSigns record in the draft state.
	Download Participants and Merge Fields for Document	Downloads a sample CSV file for a given library document that contains information about the MegaSigns participants and form fields.
	Look up MegaSigns Stream	Retrieves the list of all MegaSigns records.
	Send MegaSigns	Finalises the draft and sends the MegaSigns attachment out for signature.
	Wait for Signature of MegaSigns from Adobe Sign	Waits for the Adobe Sign webhook till all the participants sign or cancel the document.
Signature Management	Add Participant to Agreement	Builds a participant list iteratively over time and adds a participants to the local ServiceNow agreement record.
	Add Participant to Agreement with Email OTP Authentication	Adds a new participant to an agreement and verify their identity using an email one-time password (OTP). The participants will get the OTP in an email and need to enter it before they can sign or approve the document. This extra step keeps your agreements secure by making sure only the right people can access them.
	Add Participant to Agreement with Password Authentication	Adds a new participant to an agreement and verify their identity using a predefined password. The participant must enter the correct password before they can view, sign, or approve the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		document. This extra step keeps your agreements secure by making sure that only the person who knows the password can proceed with the agreement. **Note:** The Scheduler To Remove Participant Password scheduled job when activated will automatically delete the passwords that are stored for the last 30 days. For more information, see Spoke scheduled job section.
	Add Participant to Agreement with Phone Authentication	Adds a new participant to an agreement and verify their identity using a one-time password (OTP) in an SMS. The participants will get the OTP in an SMS to the specified phone number and need to enter it before they can sign or approve the document. This extra step keeps your agreements secure by making sure only the right people can access them.
	Add Participant Reminders to Agreement	Creates one or more reminders for the specified participants associated with the specified agreement.
	Cancel Agreement	Cancels an agreement that has been sent for signature.
	Check Agreement Status	Retrieves the status of an agreement.
	Create Draft Agreement	Creates an agreement in the draft state in Adobe Sign and draft record in the ServiceNow Agreement table.
	Finalize Draft and Send Agreement	Sends a draft agreement to the participant list for a signature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: You need to use the **Create Draft Agreement** and **Set Agreement Field** actions before using this action.
	Look up Agreement Events	Retrieves the events information for the specified agreement.
	Look up Draft Agreement	Retrieves the draft agreement's information and Etag details, which are required while finalising the draft agreement.
	Look up Form Field Value from an Agreement	Retrieves value of the required field from an existing agreement in Adobe Sign.
	Look up Signing URL	Retrieves an embedded signing URL. This is useful for scenarios involving in-person signing.
	Send Agreement	Sends one or more documents, along with its sequence, for signature to one or more participants.
	Update Form Fields and Send Agreement	Allows participants to update or modify the form fields on an agreement before sending it for signature.
	Wait for Signature from Adobe Sign	Waits for the participant to sign or reject the document in Adobe Sign. Then updates the signing status in ServiceNow.
	Wait for Signature from Adobe Sign	Waits for the Adobe Sign webhook until the participant has either signed or rejected the document. Updates the status in the ServiceNow Agreement table.
User Management	Activate a User	Activates an existing user in Adobe Sign.
	Deactivate a User	Deactivates an existing user in Adobe Sign.
	Look up User ID by Email	Retrieves the user ID of an existing user in Adobe Sign.
	Look up Users Stream	Retrieves the list of all users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Webhook Management	Create Webhook	Creates a webhook to notify the signing events in Adobe Sign.
	Look up Webhooks Stream	Retrieves the list of webhooks.
	Remove Webhook	Removes a webhook from Adobe Sign.

Spoke module

The Adobe Sign spoke adds a Adobe Sign module to your ServiceNow instance. The Adobe Sign spoke synchronizes and stores information about groups, documents, and agreements in ServiceNow. The Adobe Sign spoke includes the these tables.

- Agreements [sn_adobesign_spoke_agreement]
- Documents [sn_adobesign_spoke_adobe_sign_documents]
- Groups [sn_adobesign_spoke_adobesign_group_details]
- Client Details [sn_adobesign_spoke_client_details]

Table	Description	Fields
Agreements	Adobe Sign agreements from the synchronized Adobe Sign groups and accounts. Records in the Agreements table are updated with the signing status only when webhook is configured for the Adobe Sign account.	• Name • Agreement ID • Declined Reason • Status • Participants Info • Form Fields Info • Next Signer • Group Name
Documents	Adobe Sign documents from the synchronized Adobe Sign groups and accounts. To synchronize accounts, see Synchronize Adobe Sign with ServiceNow. The Get Documents Per Group subflow retrieves a list of documents in each Adobe Sign group. **Note:** Access to the documents is based on the group user roles.	• Document ID • Document Owner • Document Last Modified • Group • Document Name • Document Type

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description	Fields
Groups	Adobe Sign groups that are synchronized with ServiceNow. Administrator creates groups in the ServiceNow instance and provides the required details to synchronize with Adobe Sign. **Note:** User role is created when an Adobe Sign group is created in the ServiceNow instance. Users with the group-specific role can access the documents and agreements relevant to the Adobe Sign group.	• Group Name • Group ID • Connection Alias
Client Details	Credentials of the Adobe Sign groups that are synchronized with ServiceNow.	• Client ID • Name • Authentication Key
MegaSigns	Adobe Sign MegaSigns from the synchronized Adobe Sign groups and accounts. Records in the MegaSigns table are updated with the signing status only when webhook is configured for the Adobe Sign account.	• Status • Signed Participants • Number of Pending Signatures • Name • MegaSigns ID • Group Name

Spoke scheduled job

To delete the passwords related to Add Participant to Agreement with Password Authentication action which are stored over the last 30 days, you can use the Scheduler To Remove Participant Password scheduled job. You can also change when the scheduler runs.

To set this up, navigate to **All** > **System Definition** > **Scheduled Jobs** > **Scheduler To Remove Participant Password** and activate the scheduled job.

Groups and user roles

Create a group in your ServiceNow instance to synchronize the group with the corresponding group in Adobe Sign.

User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

To run flows and subflows, group users must also have these roles:

- connection_admin
- credential_admin
- flow_designer
- oauth_admin
- script_debugger
- view_changer

Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.

Adobe Acrobat Sign account requirements

The Adobe Sign spoke requires creating a custom app on your Adobe Sign account to generate OAuth 2.0 tokens.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials .

Note:
A connection and credential alias is specific to a group in Adobe Sign.

A sample connection and credential alias is provided for demonstration purpose. ServiceNow admin must create an alias for each Adobe Sign group to synchronize that group with the ServiceNow instance. For example, you can have different connection and credential alias records one for each BU in your organization such as HR, Legal, Finance and so on. For information about setting up the spoke, see Synchronize Adobe Sign group with ServiceNow.

Synchronize Adobe Sign group with ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign to access the group specific documents, and agreements from the Adobe Sign spoke.

Before you begin

- Request Integration Hub subscription
- Activate the Adobe Sign spoke
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
These steps are performed to synchronize only one Adobe Sign group. To synchronize another Adobe Sign group, repeat this process.

Create custom OAuth application in Adobe Sign account

Create a custom OAuth application from your Adobe Sign account to enable OAuth 2.0 authentication with the Adobe Sign spoke.

Before you begin

- Adobe Sign account
- Role required: Adobe Sign admin credentials

About this task
Complete these steps from your Adobe Sign account. See the Adobe Sign development documentation for instructions on creating and configuring custom applications.

Procedure

1. From your Adobe Sign account, create an application.
2. Copy and record the Application ID and Application Secret for later use.
   These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

Result
The custom OAuth application from your Adobe Sign account is created and can be integrated with the ServiceNow instance.

Configure the webhook

Configure the webhook in your Adobe Sign application to enable Adobe Sign to send data to ServiceNow when a participant signs an agreement or document.

Before you begin
Role required: admin

About this task
If the scope of the Adobe Sign application is Account, use the same webhook for all the groups defined within the account scope. If the scope of the Adobe Sign application is Group, you must configure for each group.

Procedure

1. From your Adobe Sign account, create a webhook with these configurations.

   a. Enter the target URL in **URL** in this format: `https://<instance-name>.service-now.com/api/sn_adobesign_spoke/adobesign_webhook`.

   b. Enter `Agreement all events` and `Mega Sign all events` in **Events**.

   c. Select all the required agreement events in **Notification Parameters**.
   See the Adobe Sign development documentation for more information about creating webhooks in your Adobe Sign account.

2. In your ServiceNow instance, add the client details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Adobe Sign Spoke** > **Client Details**.

b. Open the record, **Adobe Sign Client ID**.

c. On the form, fill these values.

Field	Description
Authentication Key	Key to authenticate. Enter UB7E5BXCXY.
Client ID	Application ID created during the Adobe Sign account configuration.

d. Click **Update**.

Result

Webhook is created in your Adobe Sign account and signing events in Adobe Sign are updated in the tables of the Adobe Sign spoke.

Configure a connection for the Adobe Sign spoke

Add and configure a Adobe Sign spoke connection to authenticate ServiceNow requests.

Before you begin

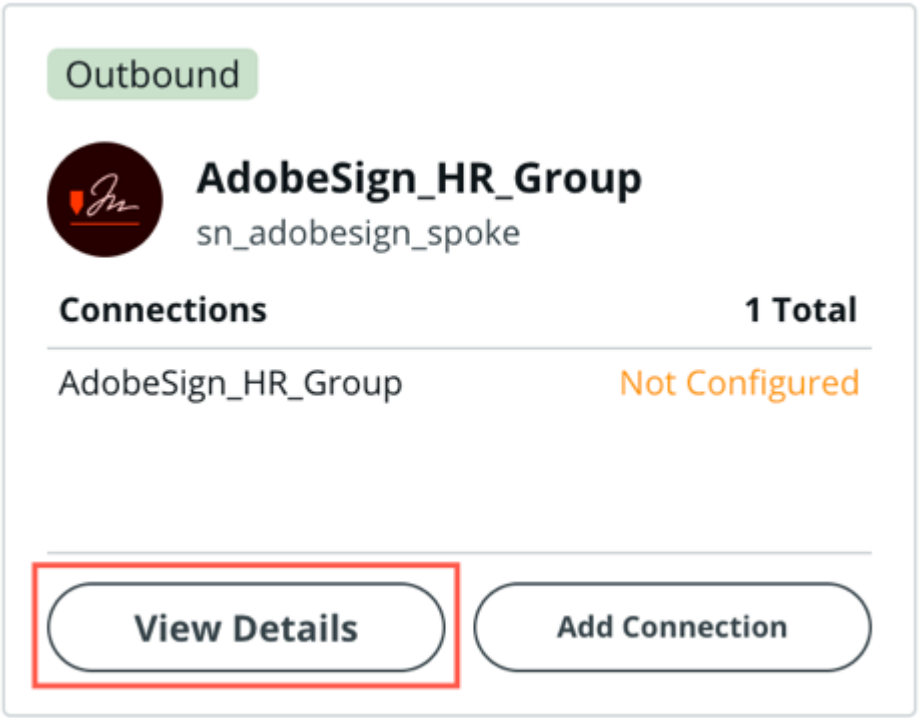
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **AdobeSign_HR_Group** and click **View Details**.

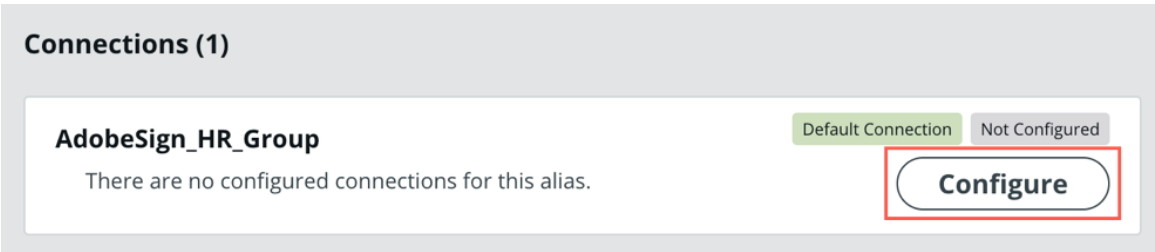
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Adobe Sign spoke, click **View Details**.



- To manage more than one Adobe Sign spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

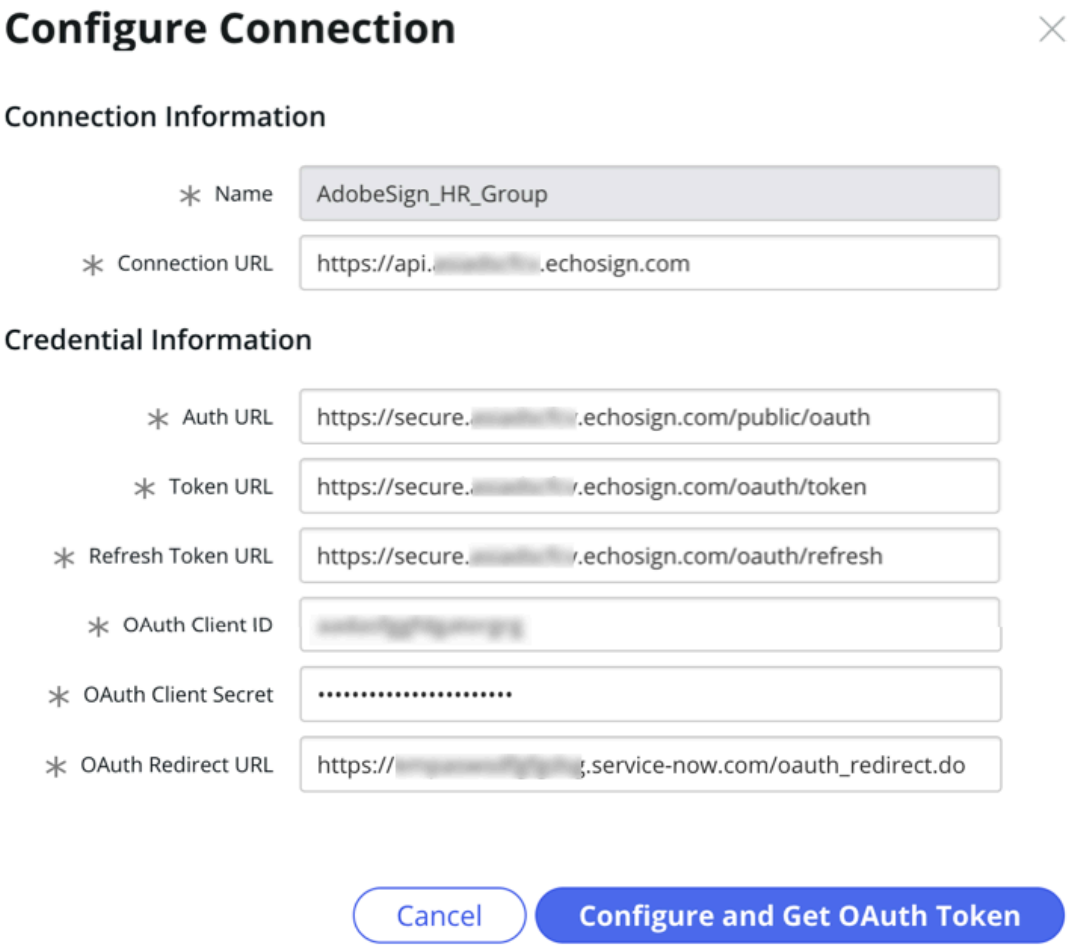


5. On the **Configure Connection** form, fill in the fields:

Field	Description
Connection Information	
Name	Name to uniquely identify the connection record. This is auto-populated.
Connection URL	URL to connection to the Adobe Sign account in this format: `https://api.<region>.echosign.com`.
Credential Information	
Auth URL	OAuth authorization code endpoint. For example, `https://`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`secure.<region>.echosign.com/public/oauth/v2`.
Token URL	OAuth server token endpoint. For example, `https://secure.<region>.echosign.com/oauth/v2/token`.
Refresh Token URL	URL to refresh a token. For example, `https://secure.<region>.echosign.com/oauth/v2/refresh`.
OAuth Client ID	Application ID created during the Adobe Sign account configuration.
OAuth Client Secret	Application Secret created during the Adobe Sign account configuration.
OAuth Redirect URL	OAuth callback endpoint in this format: `https://<ServiceNow-instance-name>.service-now.com/oauth_redirect.do`



6. Click **Configure and Get OAuth Token**.
   The spoke connection is configured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Application Access to ServiceNow tables

Allow Adobe Sign spoke to create group admin user role when an Adobe Sign group is synchronized with ServiceNow tables by configuring the application access of the required ServiceNow tables.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. For each of the following tables, ensure that the **Can read**,**Can create**, and **Can update** options are selected in the Application Access related list.

Label	Name
Role	sys_user_role
Access Control	sys_security_acl
Access Roles	sys_security_acl_role
Application Menu	sys_app_application
Module	sys_app_module

3. Click **Update**.

Result
Application access of the required ServiceNow tables is configured.

Create Adobe Sign group in ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign by creating a record in the AdobeSign Group Details [sn_adobesign_spoke_adobesign_group_details] table.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Adobe Sign Spoke** > **Groups**.
2. Click **New**.
3. On the form, fill in the fields.

AdobeSign Group Details form

Group Name	Name to uniquely identify the Adobe Sign group. For example, `Legal`.
Group ID	Unique ID associated with the record.
Connection Alias	Connection alias created to synchronize the Adobe Sign group with ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The required Adobe Sign group is created in ServiceNow and can be managed from the Adobe Sign spoke.

User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.

Synchronize documents in Adobe Sign group with ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign to access the documents and agreements that are specific to the group, from the Adobe Sign spoke.

Before you begin
Role required: admin

About this task
Ensure that the groups are setup and configured with their respective connection and credential aliases before synchronizing the group documents.

Procedure
1. Navigate to **All** > **Adobe Sign Spoke** > **Documents**.
   The AdobeSign Documents [sn_adobesign_spoke_adobe_sign_documents] table opens.
2. Click the Get Documents related list.

Note:
- If you have logged in as an admin, you can synchronize the documents of all Adobe Sign groups.
- If you have logged in as a group admin, you can synchronize only those documents that are specific to your Adobe Sign groups.

Result
Details of all documents specific to the required Adobe Sign groups are synchronized with ServiceNow.

Activate Adobe Sign spoke catalog items

Trigger events in Adobe Sign when an item is requested in Service Catalog. For example, the Adobe Sign - Statement of Work Demo catalog item triggers a sample flow that sends a Adobe Sign document to a designated recipient.

Before you begin
- Synchronize Adobe Sign group with ServiceNow
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering a sample flow, activate these catalog items.

Catalog item	Description
Adobe Sign - Statement of Work Demo	Sends a statement of work for digital signature using a Adobe Sign library document.
Adobe Sign - Send NDA Demo	Sends a non-disclosure agreement for digital signature using a Adobe Sign library document.

Procedure

1. Navigate to **All** > **Self-Service** > **Service Catalog**.
2. Click the add content icon .
3. Search for and select **Adobe Sign - Statement of Work Demo**.
4. Click **Add here**.
5. Search for and select **Adobe Sign - Send NDA Demo**.
6. Click **Add here**.

Result

When one of these items is requested in the Service Catalog, the associated Adobe Sign spoke sample flow is triggered and necessary actions are performed in Adobe Sign.

Agent Client Collector Spoke

Automate the process of executing commands on agents or configuration items (CI) using the ServiceNow Agent Client Collector spoke. Agent Client Collector framework allows you to execute commands on the systems where it is installed and sends output data to the ServiceNow® instance through the MID Server.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Agent Client Collector spoke v1.1.5 is the latest version.

Supported versions

This spoke was built for Agent Client Collector framework v2.2.0, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ITOM Visibility License (com.snc.itom.vis.license)
- Agent Client Collector Framework v2.2.0 (sn_agent)

Note:
To enable Agent Client Collector to execute commands, ensure that `ACC_ALLOW_LIST=0` for Linux environments or `ACC_ALLOW_LIST=False` for Windows environments.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke requirements

MID Server. For more information, see MID Server.

Spoke subflows

The Agent Client Collector spoke provides sample subflows to demonstrate automating Agent Client Collector framework tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Managing Compliance for Remote Workers	Manages compliance for remote workers and sends an email to the system administrator when one or more specified compliance conditions are violated.
Restart Agent	Verifies the status of an agent and restarts the agent if the status is down.
SNH CyberAttack Detection	Applies SigHealth CyberAttack Detection for Windows server and send an email to the system administrator when a threat is detected.
Install Agent on Linux	Installs Agent Client Collector on a Linux hosts.
Install Agent on Windows	Installs Agent Client Collector framework on multiple windows hosts.

Spoke actions

The Agent Client Collector spoke provides actions to automate Agent Client Collector tasks when events occurs in your ServiceNow instance. Available actions include:

Action	Description
Get Agent Status	Get the status of an agent.
Get Logged on Users	Retrieves the list of all logged-in users and the related metadata for the specified host system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Get Network Statistics	Retrieves the list of all network interfaces and the related metadata for the specified host system.
Get Running Processes	Retrieves the list of all running processes and the related metadata for the specified host system.
Get Running Services	Retrieves the list of all running services in Windows OS and the related data for the specified host system.
Get System Details	Retrieves the hardware and software details of the specified agent.
Restart Agent	Restarts an agent.
Run Command on Agent	Runs a command on a given agent host. **Note:** Use caution while executing commands.
Run Osquery on Agent	Runs the specified Osquery on the specified agent host.
Install Agent on Linux	Installs Agent Client Collector framework on a Linux host.
Install Agent on Windows	Installs Agent Client Collector framework on windows host.

Note:
To use the Install Agent on Linux and Install Agent on Windows spoke actions, navigate to **Agent Client Collector Spoke** > **CIDR Ranges**, create a record to specify the required IP address or range of IP addresses.

For information about setting up the spoke, see Set up the Agent Client Collector spoke.

MID Server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For more information about the MID Server, see MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Agent Client Collector spoke

Integrate the ServiceNow Agent Client Collector framework and Agent Client Collector spoke.

Before you begin

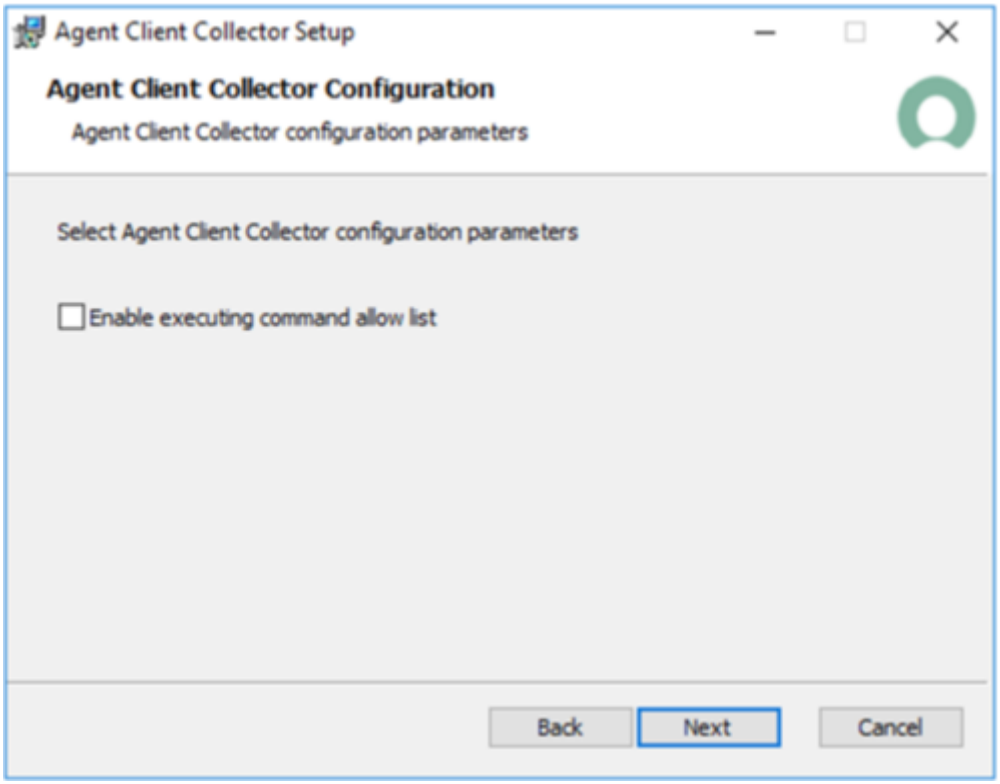
- Request an Integration Hub subscription.
- Activate the Agent Client Collector spoke.
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

1. Install the Agent Client Collector Framework v2.2.0 (sn_agent) plugin and the other dependant plugins. For more information, see Agent Client Collector installation.

Note:
To enable Agent Client Collector to execute commands, ensure that `ACC_ALLOW_LIST=0` for Linux environments or `ACC_ALLOW_LIST=False` for Windows environments. If you are using Windows guided installation, clear the **Enable executing command allow list** check-box. Otherwise, you cannot execute commands using the Agent Client Collector spoke.



2. Installing the MID Server.
3. Configure the websocket server on the MID server.

Aha! Spoke

Manage Aha! accounts using your ServiceNow instance. Analyze data usage for Aha! and reclaim idle accounts.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Aha! spoke v1.8.0 is the latest version.

Spoke requirements

Aha! admin role

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Aha! spoke provides a sample flow, Upsert Aha Ideas to:

- Check if an idea is created in the Aha Ideas [sn_aha_spoke_aha_ideas] table in ServiceNow instance. If an idea record is created, the flow creates the idea record in Aha! and updates the value of auto-generated ID ServiceNow instance.
- Check if an existing idea has been updated and synchronizes the details updates in Aha!.

You can also create a copy of the flow and customize it according to your requirement.

Spoke subflows

The Aha! spoke provides a sample subflow, Process Aha webhooks to create and update records in Aha!, and save the records' information in the Aha Feature [sn_aha_spoke_feature_aha] table.

Spoke actions

The Aha! spoke provides actions to automate Aha! tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Feature Management	Create Feature	Creates features in the specified release.
	Look up Features Associated with Objects Stream	Retrieves information about features within the specified objects.
	Look up Features Stream	Retrieves information about the required features.
	Update Feature	Updates details of the required feature.
Idea Management	Create Idea Vote	Creates an idea vote with the provided details.
	Create Idea	Creates an idea with the provided details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Idea by ID	Retrieves information about the required idea.
	Look up Ideas Associated with Product Stream	Retrieves information about ideas in the specified product.
	Look up Ideas Stream	Retrieves information about the required ideas.
	Look up Ideas Votes Stream	Retrieves information about the required idea endorsements.
	Look up Ideas with String Stream	Retrieves information about the required ideas.
	Update Idea Vote	Updates details of the required idea vote.
	Update Idea	Updates details of the required idea.
Product Management	Create Product	Creates a product.
	Create Task	Creates a task.
	Look up Personas Stream	Retrieves information about the required personas.
	Look up Product by ID	Retrieves information about the specified product.
	Look up Products Stream	Retrieves information about the required products.
	Look up Tasks Associated with Object Stream	Retrieves information about the tasks that are associated with the specified API.
	Look up Tasks Stream	Retrieves information about the tasks.
	Update Product	Updates details of the specified product.
	Update Task	Updates details of the required task.
Release Management	Create Epic	Creates epics in the required release.
	Create Release	Creates a release with the provided details.
	Create Release Phase	Creates a release phase in the specified release.
	Look up Epic Associated with Objects Stream	Retrieves information about the epics that are associated with the specified API.
	Look up Epics Stream	Retrieves information about the required epics.
	Look up Release Phases Stream	Retrieves information about the required release phases.
	Look up Release Phases With Releases Stream	Retrieves information about the releases phases in the specified release.
	Look up Releases Associated with Objects Stream	Retrieves information about the releases that are associated with the specified API.
	Update Epic	Updates details of the required epic.
	Update Release	Updates details of the required release.
	Update Release Phase	Updates details of the required release phase.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Strategy Management	Create Goal	Creates a goal with the provided details.
	Create Initiative	Creates an initiative with the provided details.
	Create Persona	Creates a persona with the provided details.
	Look up Goals Associated with Objects Stream	Retrieves information about the goals that are associated with the specified API.
	Look up Goals Stream	Retrieves information about the required goals.
	Look up Initiatives Associated with Objects Stream	Retrieves information about the initiatives that are associated with the specified API.
	Look up Initiatives Stream	Retrieves information about the required initiatives.
	Update Goal	Updates details of the required goal.
	Update Initiative	Updates details of the required initiative.
	Update Persona	Updates details of the required persona.
User Management	Create Users	Creates a user in the specified product.
	Deactivate User	Deactivates the specified user account.
	Look up User Associated with Product Stream	Retrieves information about the users that are associated with the specified product.
	Look up Users Stream	Retrieves details of all members in an account.
	Update Users	Updates details of the specified user.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Spoke modules

The Aha! spoke adds the Aha! Spoke application to your ServiceNow instance. The Aha! Spoke application includes these modules:

Module	Description
Ideas	Contains details of the idea records and enables users to create ideas. When an idea is created here, the Upsert Aha Ideas flow is triggered. This flow creates an idea record with the provided details in Aha! and updates the value of auto-generated ID in ServiceNow instance. To create ideas from ServiceNow instance: **1.** Navigate to **Aha! Spoke** > **Ideas**. **2.** Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
	3. On the form, provide all the required details except **ID**. Value of **ID** is populated after this record in Aha!. 4. Click **Submit**.
Webhook	
Feature Records	Contains details of the feature records in the Aha Remote Feature [sn_aha_spoke_st_aha_features_remote] table. Once the webhook is set up and configured, the feature records are retrieved from Aha! and saved in the Aha Remote Feature [sn_aha_spoke_st_aha_features_remote] table.
Webhook Registries	Contains details about the webhook registry records.
Webhook Routing Policies	Contains details about the webhook routing policy records. One routing policy is available with the spoke to create and update records in Aha!, and save the records' information in the Aha Feature [sn_aha_spoke_feature_aha] table.
Remote Table	
Features	Contains records about the Aha! features. Data displayed here is retrieved from the Aha Remote Feature [sn_aha_spoke_st_aha_features_remote] table.

Spoke triggers

Use triggers in the Aha! spoke to subscribe to the required events. The endpoint enables webhooks to connect with your ServiceNow instance. You can configure the flows to execute only when the specified trigger conditions are met. The supported events are:

Category	Trigger	Description
Default	Comment Added	Trigger initiates when a comment is added to a feature in Aha! workspace.
	Field Change	Trigger initiates when a field is changed in Aha! workspace.
Feature Management	Feature Created	Trigger initiates when a feature is created in Aha! Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Create an Aha! OAuth2 application and Set up ServiceNow instance for Aha!.

Create an Aha! OAuth2 application

Create an OAuth2 application in the Aha! account so that the application can authenticate access requests to the Aha! server from your ServiceNow instance.

Before you begin

Role required: admin

Ensure that you've signed up as an admin in the Aha! account.

Ensure that you've installed the Aha! spoke plugin.

Procedure

1. Go to OAuth2 Authentication.
2. Log in to the Aha! site using your admin credentials.
3. On the Features board page, click the settings icon ( ).
4. On the Personal settings page, click **Developer**.
5. Click the **OAuth applications** tab.
6. Click **Register OAuth application**.
7. On the Register new OAuth application form, enter `https://instance/oauth_redirect.do` as the Redirect URI, where *instance* is the name of your ServiceNow instance.
8. Click **Create**.
   The **OAuth applications** tab shows Client ID and Client Secret keys.
9. Note down the values in the Client ID and Client Secret fields.

Set up ServiceNow instance for Aha!

Set up your ServiceNow instance to add the Aha! Client ID and Client Secret keys.

Before you begin

- Request an Integration Hub subscription.
- Activate the Aha! spoke.
- ServiceNow Role required: admin

Procedure

1. Log in to your ServiceNow instance.
2. Navigate to **Connection & Credentials** > **Connection & Credentials Aliases**.
   Connection & Credentials Aliases page appears and shows the list of apps.
3. Locate and open the Connection & Credentials record for Aha!.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click the **Create New Connection & Credential** related link.
5. On the Create Connection and add Credential form, fill in the details.

Create Connection and add Credential form

Fields	Descriptions
Connection Name	Name of the integration profile.
Connection URL	Connection URL for Aha!.
OAuth Client ID	OAuth2 key that you received while creating an OAuth2 authentication from the Aha! site.
OAuth Client Secret	OAuth Client Secret key that you received while creating an OAuth2 authentication from the Aha! site.
OAuth Redirect URL	ServiceNow redirect URL.

6. Click **Configure and get OAuth Token** and then click **Authorize**.

Set up a bi-directional webhook for the Aha! spoke

Configure a webhook to subscribe to events in the Aha! account with a ServiceNow callback URL.

Before you begin
Role required: admin

Procedure

1. Generate the webhook callback URL from your ServiceNow instance.
   a. Log in to your ServiceNow instance as an admin.
   b. Navigate to **Aha! Spoke** > **Webhook** > **Webhook Registries**.
   c. Open the record **Aha Webhook**.
   d. Click **Callback URL**.
   Webhook callback URL is generated and displayed.

   e. Copy and record the webhook callback URL.

2. Specify the webhook routing policies in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Log in to your ServiceNow instance as an admin.

b. Navigate to **Aha! Spoke** > **Webhook** > **Webhook Routing Policies**.

c. Open the Aha! webhook routing policy record.

d. Specify **Condition** that must be met.

e. For **Answer**, select the required subflow that must be triggered when the specified condition is met.
In the default routing policy record, the Process Aha webhooks subflow is selected as **Answer**.

f. Click **Update**.

3. Register the webhook callback URL in Aha! account.

a. Log in to your Aha! account as an admin.

b. Navigate to **Settings** > **Account**.

c. Create an activity webhook by clicking **+** beside **Integrations**.

d. Click **+ Activity webhook** in the **Activity webhook** tile.

e. On the form, fill these values.

Field	Description
Hook URL	Webhook callback URL you had copied from the ServiceNow instance.
Selected Activities	Activities or events for which you want to subscribe.

f. Click **Add activity**.

Create a Token

Create a token that will be embedded in the callback URL to Aha!.

Before you begin
Role required: admin

Procedure

1. In the navigation filter, enter `token_verification.list`.
The system displays records in the Token Verifications table.
2. Select **New**.
3. On the form, fill the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Token Verification form

Field	Description
Name	Option to provide a unique name to identify the token. For example, `Aha! Callback URL token`.
Description	Option to provide a description of the token.
Token	Option to provide a unique authentication token. This token is encrypted and embedded in the URL.

4. Select **Submit**.

Create an Aha! Webhook in ServiceNow

Register an Aha! webhook in to notify the app when certain events occur in Aha!.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Aha! Spoke** > **Webhook** > **Webhook Registries.**
2. Select **New**.
3. Fill the form.

Aha! Webhook Registry

Field	Description
Name	Option to uniquely identify the record.
Path	Option to provide the webhook path. Enter `api/sn_aha_spoke/aha_webhook`.
Token	Option to specify the token you had created. See Create a Token.

4. Right-click the form header and click **Save**.
5. Select **Callback URL**.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

Add callback URL to Aha!

Register the webhook callback URL to the Aha! account.

Before you begin
Role required: admin

Procedure

1. Log in to your Aha! account as an admin.
2. Navigate to **Settings** > **Account**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create an activity webhook by clicking **+** beside **Integrations**.
4. Click **+ Activity webhook** in the **Activity webhook** tile.
5. On the form, fill these values.

Field	Description
Hook URL	Webhook callback URL you had copied from the ServiceNow instance.
Selected Activities	Activities or events for which you want to subscribe.

6. Click **Add activity**.

Set webhook routing policy

Create a webhook routing policy and subflow as per your requirement.

Before you begin

Role required: admin

About this task

The default routing policy in the Aha Webhook Decision Policy module triggers the Process Aha webhooks subflow and notifies the ServiceNow app when certain events occur in Aha!. See Aha! Spoke for information about the fields that the default routing policy and subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure

1. Navigate to **All** > **Aha! Spoke** > **Webhook** > **Webhook Routing Policies.**
2. Select **New**.
3. Fill the form.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.
Condition	Conditions to be met when the required events occur in Aha!.
Answer	Subflow that must be triggered when the specified conditions are met. **a.** Click the lookup icon ( ). **b.** Select the required subflow from the **Document** list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.

4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up triggers for the Aha! spoke

Set up triggers for the Aha! spoke for the required events. The endpoint enables webhooks to connect with your ServiceNow instance.

Before you begin
Role required: admin

Configure triggers in ServiceNow instance

Configure endpoint for webhooks in the Aha! that support the token authentication.

Before you begin
Role required: flow_designer and connection_admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Toggle and enable the **Inbound** connections.
4. Locate the **Aha! Spoke** endpoint and click **View Details**.
5. For the **Aha! External Trigger** end point, click **Configure**.
6. Select the user who can trigger the endpoint and click **Activate**.
7. Copy the generated endpoint URL.

Add the endpoint URL in Aha!

Add the endpoint URL that is generated in your ServiceNow instance in the Aha! account to enable webhooks to connect with your ServiceNow instance.

Before you begin
Role required: admin

Procedure

1. Log in to Aha! Workspace as an admin.
2. Click user profile and navigate to **SETTINGS** > **Workspace**.
3. Under **Integrations**, click **+** to add an integration.
4. Under **API**, click **+ Activity webhook**.
5. On the form, for **Hook URL** paste the generated endpoint URL that was generated after you configured triggers in the ServiceNow instance.

   For more information, see Configure triggers in ServiceNow instance.
6. Select the activities and users as per your requirement.

   For the list supported events, see the Spoke triggers section.
7. Select the **Valid certificate**, **Reduce webhook delay**, and **Enable** check boxes.
8. Click **Add activity**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search Spoke

Store data from the required third-party application in the AI Search server through Workflow Studio. Access data through the AI Search portal.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AI Search spoke v2.0.3 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are activated:

- AI Search (com.glide.ais)
- External Content for AI Search (com.glide.ais.external_content)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AI Search spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

Action	Description
Commit Index	Commits queued documents in the batcher and indexes them. Synchronously returns feedback about the indexed content.
Delete Document	Deletes a record from the AI Search content index.
Delete Documents	Deletes all records that use a specified external content schema table from the AI Search content index. You can optionally specify a Glide query to limit the set of documents deleted from the specified schema table.
Get Max File Size	Retrieves the maximum file size which can be ingested into AI Search.
Ingest Document	Ingests properties of the specified document into the batcher. In releases starting with Rome, you can optionally specify security principal access permissions for the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description

	Specify the document's properties as name-value pairs in a JSON object formatted as in the following example:
	`{ "title": "Report 2021-02-26", "author": "Abel Tuter", "url": "http://example.com/reports/2021/02/26/" }`
	You can specify the document's security principal access permissions as name-value pairs in a JSON object formatted as in the following example:
	`{ "everyone": false, "groups.deny": [ "report-users", "hr-users" ], "groups.read": [ "report-admins", "hr-admins" ], "none": false, "users.deny": [ "ad\bow-ruggeri", "don_goodliffe" ], "users.read": [ "ad\beth-anglin", "ad\abel-tuter", "carol.coughlin@sharepoint" ] }`
	For more details on security principal access permissions, see External content access permissions.

Ingest Document Using Download URL	Downloads a document from a URL and ingests it into the batcher. In releases starting with Rome, you can optionally specify security principal access permissions for the document. Add the URL's domain to the AI Search spoke's list of trusted domains before you specify this action's **Download URL** input. For details on modifying the spoke's list of trusted domains, see Set up the AI Search spoke. This action doesn't support authentication session IDs or cookies, so the document URL must allow unauthenticated access. Specify the document's properties as name-value pairs in a JSON object formatted as in the following example: `{ "title": "Report 2021-02-26",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description

	<pre> "author": "Abel Tuter"
	}</pre>
	The document's *url* property is automatically populated with the value of the **Download URL** input.
	
	You can specify the document's security principal access permissions as name-value pairs in a JSON object formatted as in the following example:
	<pre>{
	  "everyone": false,
	  "groups.deny": [
	    "report-users",
	    "hr-users"
	  ],
	  "groups.read": [
	    "report-admins",
	    "hr-admins"
	  ],
	  "none": false,
	  "users.deny": [
	    "ad\bow-ruggeri",
	    "don_goodliffe"
	  ],
	  "users.read": [
	    "ad\beth-anglin",
	    "ad\abel-tuter",
	    "carol.coughlin@sharepoint"
	  ]
	}</pre>
	For more details on security principal access permissions, see External content access permissions.

Initialize Batcher	Initializes a new batcher to queue documents for indexing.
Is AIS Available For Ingestion	Checks whether AI Search is available for ingestion.
Look up Supported File Extensions	Retrieves file extensions supported by AI Search.
Release Batcher	Releases a used batcher from pool.
Update By Query	Updates all the records in the AI Search content index that match the specified query.

See Set up the AI Search spoke for information about setting up the AI Search spoke.

Set up the AI Search spoke

Configure the AI Search spoke to index content from a third-party application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription
- Activate the AI Search spoke
- Role required: admin

Procedure

1. Create an external content schema table.
   To learn more about external content schema tables, see Indexing and searching external content in AI Search.

   a. Navigate to *AI Search* > **Create Schema**.

   b. In the field, provide the name of your schema table.
   For example, `My application schema table`.

   c. Select **Submit**.

2. Create an indexed source for content from your third-party application.
   To learn more about indexed sources, see Indexed sources in AI Search.

   a. Navigate to *AI Search* > **Indexed Sources**.

   b. Select **New**.

   c. On the form, fill these values.

Field	Description
Name	Name to identify the indexed source. For example, `My application indexed source`.
Source	External content schema table that you created for the third-party application. For example, `My application schema table`.
Active	Option to enable the indexed source.

   d. Select **Submit**.

   Note:
   Ensure that the **Type** of the indexed source is **external**.

   You can now use the AI Search spoke actions.

3. Add the third-party application's domain URL to the list of trusted domains.

   a. Navigate to *AI Search* **Spoke** > **Trusted Domains**.

   b. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the form, fill these values.

Field	Description
Name	Name to identify the trusted domain record. For example, `My sample application's trusted domain`.
Domain	URL of the trusted domain. For example, `https://example.com`.

4. Create a search source for your new indexed source.
   To learn more about search sources, see Search sources in AI Search.

   a. Navigate to *AI Search* > **Search Experience** > **Search Sources**.

   b. Select **New**.

   c. On the form, fill these values.

Field	Description
Name	Name to identify the search source. For example, `My application search source`.
Application	Application scope. Select *AI Search* **Spoke**.
Indexed Source	Indexed source that you created for the third-party application. For example, `My application indexed source`.
Conditions	Filter conditions that records must satisfy to be searchable.

   d. Select **Submit**.

5. Create a search profile that includes your new search source.
   For more information about configuring and publishing search profiles, see Search profiles in AI Search.

   a. Navigate to *AI Search* > **Search Experience** > **Search Profiles**.

   b. Select **New**.

   c. Fill in a **Label** value to identify the search profile.
   For example, `My application search profile`.

   d. Right-click the form header and select **Save**.

   e. In the **Search Sources** tab, select **Link Existing**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. In **Search Source**, select the search source that you created for the third-party application. For example, **My application search source**.

g. Select **Submit**.

h. Select **Publish**.

Result
You can now use the AI Search spoke actions to indexed content from the third-party application. To view the indexed content, you can use the Search Preview UI from the Advanced AI Search Management Tools application.

For details on the Search Preview UI, see Search Preview UI for *AI Search*. To learn more about the Advanced AI Search Management Tools application, see Analytics and Reporting Solution for Advanced *AI Search* Management Tools.

Amazon Alexa Spoke

Manage intents, skills, vendors, and slots in your Amazon Alexa account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Amazon Alexa API version v1, but may be compatible with later versions.

Spoke version

Amazon Alexa v1.2.0 is the latest version.

Spoke requirements

Admin access to Amazon Developer Portal and AWS Lambda.

Important security considerations

Be aware of these considerations to securely use Amazon Alexa:

- Amazon stores voice recordings of the Amazon Alexa smart assistant customers forever unless the Amazon Alexa account is configured to delete the recordings. For more information about deleting the voice recordings, see Delete Alexa Voice Recordings Automatically.
- To stop recording conversations, turn the microphone off on the Alexa enabled devices.
- To ensure safety and protect privacy when using Alexa devices, take measures such as, choosing a strong password and using a pin for voice purchases.
- Install or activate only the legitimate skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ensure proper credential management in AWS Lambda when invoking the ServiceNow Rest API.
- Ensure that your AWS Lambda function is accessible to only the required skills by adding the Alexa Skills Kit trigger to the required AWS Lambda function. Using these triggers, you can allow only the required skills to access your AWS Lambda function. For more information, see Configure the trigger for a Lambda function.

  Note:
  Use the AWS Lambda function as an endpoint of your skill. If your are using custom web service, validate the skills. For more information, see Host a Custom Skill as a Web Service.

- You can securely store your sensitive data in the AWS Lambda function using environment variables. For more information, see Using AWS Lambda environment variables.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon Alexa spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Intent Management	Create Intent	Creates an intent for the specified skill and locale.
	Delete Intent	Deletes the specified intent from the specified skill.
	Look up Intents	Lists available intents for the specified skill and locale.
	Update Intent	Updates an intent for the specified skill and locale.
Interaction Model Management	Get Interaction Model	Gets the interaction model schema for the specified skill.
	Look up Interaction Model Versions	Lists the available versions of the interaction model for the specified skill.
	Update Interaction Model	Updates the interaction model for the specified skill and locale.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Skill Management	Create Skill	Submits a skill creation request for the specified Vendor ID.
	Delete Skill	Deletes the specified skill.
	Get Skill	Gets the details for the specified skill.
	Get Skill Status	Gets the status for the specified skill.
	Look up Skills	Lists the skills for the specified Vendor ID.
	Update Skill	Submits a request to update a skill for the specified Vendor ID.
Slot Type Management	Create Slot Type	Creates a slot type for the specified skill in the specified locale.
	Look up Slot Types	Lists available slot types for the specified skill and locale.
	Update Slot Type	Updates the specified slot type for the specified skill and locale.
Vendor Management	Look up Vendors	Lists details of all the available vendors.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon Alexa spoke.

Set up the Amazon Alexa spoke

Integrate the ServiceNow instance and Amazon Alexa account by creating a custom OAuth application in Amazon Alexa to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon Alexa spoke.
- Role required: admin

Create a security profile

Create and register a security profile through the Developer Console to use Login with Amazon on your ServiceNow instance.

Before you begin

Role required: admin.

Procedure

1. Log in to Amazon Developer Portal with admin credentials.
2. Create a security profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about creating a security profile, see Create an LwA Security Profile in Amazon Developer Documentation.

3. Copy and record the values of Client ID and Client Secret for later use.
4. Configure the security profile and specify these values in **Web Settings**:

Field	Value
Allowed Origins	ServiceNow instance URL.
Allowed Return URLs	ServiceNow instance redirect URL in this format: `https://<Instance-Name>.com/oauth_redirect.do`

For more information about configuring the security policy, see Add your Website to your Security Profile in Amazon Developer Documentation.

Configure a connection for Amazon Alexa spoke

Add and configure a Amazon Alexa connection to authenticate ServiceNow requests in the Amazon Alexa spoke.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.
4. Locate the **AmazonAlexa** connection alias and click **View Details**.
5. On the **Connection** form, fill in the fields.

Field	Description
Connection Information	
Connection Name	Name to uniquely identify the record. By default, the name is `AmazonAlexa`.
Connection URL	Base URL to connect to Amazon Alexa. Enter: `https://api.amazonalexa.com`
API Version	Required API version of Amazon Alexa. Enter `v1`.
Credential Information	
OAuth Entity Name	Name to identify the OAuth entity record. For example, `Amazon Alexa OAuth`.
OAuth Client ID	Client ID created during the configuration of the security profile.
OAuth Client Secret	Client Secret created during the configuration of the security profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. Replace `<instance>` with the ServiceNow instance name.

6. Click **Configure and Get OAuth Token**.

Setup webhook for the Amazon Alexa spoke

Authenticate the inbound requests from Amazon Alexa account to your ServiceNow instance by creating a webhook registry.

Before you begin

Role required: admin.

Procedure

1. In the filter navigator, enter `token_verification.list`.
   Records in the Token Verifications [token_verification] table are displayed.
2. Click **New**.
3. On the form, fill these values.

Token Verification form

Field	Description
Name	Name to identify the token record. For example, `Alexa token`.
Description	Brief description of the token.
Token	Value of token. This value is encrypted before it is used.

4. Click **Submit**.
5. Navigate to **Alexa Webhooks** > **Alexa Webhook Registries**.
6. Click **New**.
7. On the form, fill these values.

Alexa Webhook Registry form

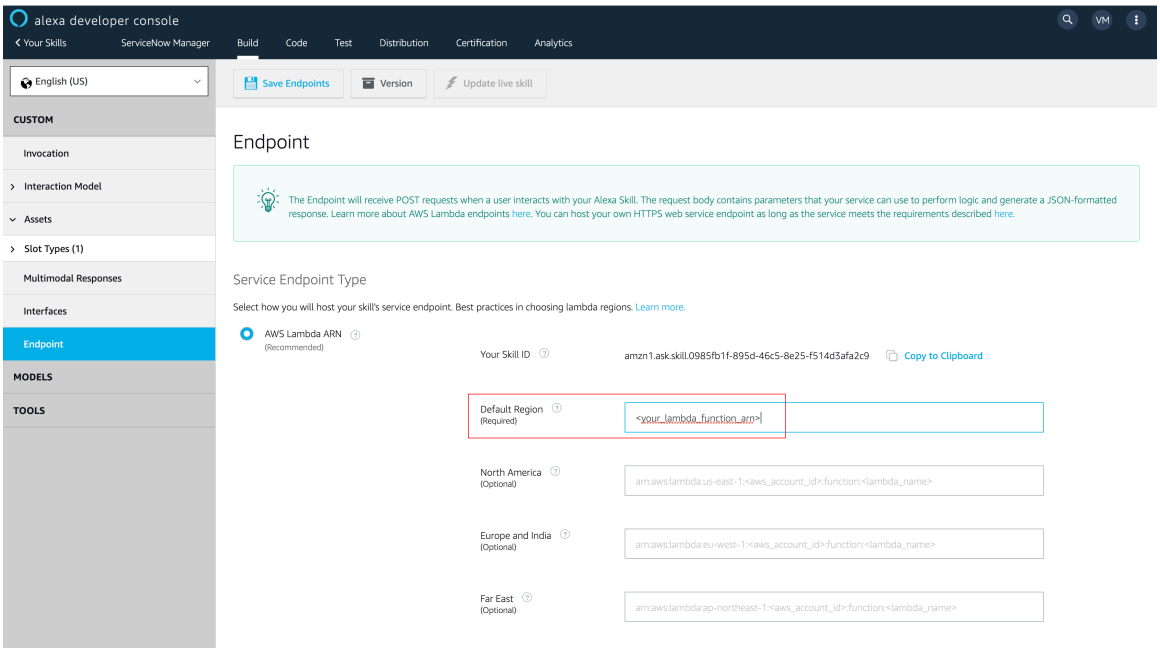
Field	Description
Name	Name to identify the webhook registry record. For example, `Alexa token`.
Description	Brief description of the webhook registry record.
Token	Token you have created. For example, `Alexa token`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Path	Scripted REST endpoint. A default endpoint is available. You can change the default value as per your requirement.

8. Right-click the form header and click **Save**.
9. Click **Callback URL**.
   Webhook Callback URL is displayed in the confirmation message. Copy and record this value.
10. Log in to AWS Management Console.
11. In the AWS Lambda function, specify the Webhook Callback URL and save the changes.

12. Log in to Alexa Developer Console.
13. Navigate to **Build** > **CUSTOM** > **Endpoint** and specify ARN of the AWS Lambda function you had configured.



Amazon CloudWatch Spoke

Integrate ServiceNow instance with Amazon CloudWatch. Manage and monitor your Amazon Web Services (AWS) resources and applications from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Amazon CloudWatch version 2010-08-01, but may be compatible with later versions.

Spoke version

Amazon CloudWatch spoke v1.0.2 is the latest version.

Spoke requirements

User with full access to Amazon CloudWatch account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon CloudWatch Spoke provides actions to automate Amazon Web Services (AWS) resource and application monitoring tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Alarm Management	Create Composite Alarm	Creates a composite alarm.
	Delete Composite Alarm	Deletes the specified alarms.
	Look Up Alarm	Retrieves a list of specified alarms.
	Set Alarm State	Assigns a temporary state to an alarm for testing.
Anomaly Management	Create Anomaly Detector	Creates an anomaly detection model for a CloudWatch metric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Anomaly Detector	Deletes the specified anomaly detection model from an account.
Metric Management	Delete Metric Alarm	Deletes the specified alarms.
	Look up Metric Data	Retrieves different metrics in a single request.
	Upsert Metrics Alarm	Create a new alarm or updates an alarm and associates the alarm with the specified metric, metric math expression, or an anomaly detection model.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Amazon CloudWatch spoke.

Set up the Amazon CloudWatch spoke

Integrate the ServiceNow instance and Amazon CloudWatch by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon CloudWatch spoke.
- Role required: admin

Create a credential record for the Amazon CloudWatch spoke

Create a credential record for the Amazon CloudWatch account. The Amazon CloudWatch Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`

3. Select **AWS Credentials**.
4. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Amazon CloudWatch Cred.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of your AWS account. Access Key ID of the user with full access to Amazon CloudWatch.
Secret Access Key	Secret Access Key of your AWS account. Secret Access Key of the user with full access to Amazon CloudWatch.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonCloudWatchAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.
Credential alias	Credential alias associated with the spoke. `AWS_Cloud_Watch`

5. Right-click the form header and click **Submit**.

Amazon Connect Spoke

Manage and provide customer service across voice, chat, and tasks using your Amazon Connect account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon Connect spoke v1.2.0 is the latest version.

Supported versions

This spoke was built for Amazon Connect API Version 2017-08-08, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- User with full access to Amazon Connect.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon Connect spoke provides actions to automate Amazon Connect tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Contact Flow Management	Create Contact Flow	Creates a contact flow for the specified Amazon Connect instance.
	Get Contact Flow Details	Retrieves details of the specified contact flow.
	Look up Contact Flows	Retrieves a list of contact flows.
	Update Contact Flow Content	Updates content of the specified contact flow.
	Update Contact Flow Name	Updates name of the specified contact flow.
Contact Management	Resume Contact Recording	Resumes recording the call when a contact is being recorded and the recording has been suspended using suspend contact recording. Only voice recordings are supported at this time.
	Start Contact Recording	Starts recording the contact when an agent joins the call. Only voice recordings are supported at this time.
	Start Outbound Voice Contact	Places an outbound call to a contact and initiates the contact flow.
	Stop Contact	Ends the specified contact.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Stop Contact Recording	Stops recording the call. If you use stop contact recording to stop recording an ongoing call, you can't use restart the contact recording. Only voice recordings are supported at this time.
	Suspend Contact Recording	Suspends recording the call when a contact is being recorded.
	Get Contact Attributes	Retrieves the contact attributes for the specified contact.
	Update Contact Attributes	Creates or updates user-defined contact attributes associated with the specified contact.
Instance Management	Create Instance	Initiates an Amazon Connect instance with all the supported channels enabled.
	Delete Instance	Deletes the specified instance.
	Get Instance Details	Retrieves details of the specified instance.
	Look up Hours of Operations	Retrieves a list of hours of operations.
	Look up Instances	Retrieves a list of instances.
	Look up Phone Numbers	Retrieves a list of phone numbers.
	Look up Prompts	Retrieves a list of prompts.
	Look up Queues	Retrieves a list of queues.
	Look up Security Profiles	Retrieves a list of security profiles.
Metric Management	Get Current Metrics Data	Retrieves the real-time metric data from the specified Amazon Connect instance.
	Get Metrics Data	Retrieves historical metric data from the specified Amazon Connect instance. **Note:** • The time must be specified using an interval of 5 minutes, such as 11:00, 11:05, and 11:10, and must be later than the start time timestamp. • The time range between the start and end time must be less than 24 hours.
Routing Policy Management	Associate Routing Profile Queues	Associates a set of queues with a routing profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Routing Profile	Creates a routing profile.
	Disassociate Routing Profile Queues	Disassociates the specified set of queues from a routing profile.
	Get Routing Profile Details	Retrieves details of the specified routing profile.
	Look up Routing Profile Queues	Retrieves a list of routing profile queues.
	Look up Routing Profiles	Retrieves a list of routing profiles.
	Update Routing Profile Concurrency	Updates the specified routing profile concurrency.
	Update Routing Profile Default Outbound Queue	Updates the specified routing profile default outbound queue.
	Update Routing Profile Name	Updates the specified routing profile name.
	Update Routing Profile Queues	Updates the properties associated with a set of queues for a routing profile.
Tag Management	Add Tags to Resource	Associates a set of tags with the specified resource.
	Look up Tags for Resource	Retrieves all tags that are associated with the specified resource.
	Remove Tag from Resource	Removes the association of tag from resource.
User Management	Create User	Creates a user account for the specified Amazon Connect instance.
	Delete User	Deletes the specified user.
	Get User Details	Retrieves details of the specified user.
	Get User Hierarchy Group	Retrieves details of the user hierarchy group.
	Get User Hierarchy Structure	Retrieves details of the user hierarchy structure.
	Look up User Hierarchy Groups	Retrieves a list of user hierarchy groups.
	Look up Users	Retrieves the list of users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update User Hierarchy	Updates the specified user hierarchy.
	Update User Identity Information	Updates the specified user identify information.
	Update User Phone Configuration	Updates details of the specified user phone configuration.
	Update User Routing Profile	Updates the specified user routing profile.
	Update User Security Profiles	Updates details of the specified user security profiles.
	Look up Agent Status	Retrieves a list of agent statuses.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon Connect spoke.

Set up the Amazon Connect spoke

Integrate the ServiceNow instance and Amazon Connect account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon Connect spoke
- Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon Connect**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Amazon Connect Cred`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon Connect.
Secret Access Key	Secret Access Key of the user with full access to Amazon Connect.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Amazon Connect**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result
The credential record the Amazon Connect spoke is created.

Amazon DynamoDB Spoke

Manage streams, tables, and tags in your Amazon DynamoDB database from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon DynamoDB spoke v1.0.1 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for API version 2012-08-10, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon DynamoDB.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The Amazon DynamoDB spoke provides actions to automate Amazon DynamoDB tasks when events occurs in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Stream Management	Disable Stream	Disables the stream for the specified table.
	Enable Stream	Enables the stream for the specified table.
	Get Shard Iterator	Returns a shard iterator. Use the shard iterator in a subsequent Get Records request to read the stream records from the shard.
	Get Stream	Returns information about the specified stream.
	Look up Records	Retrieves the stream records from a given shard.
	Look up Streams	Returns the list of all the streams associated with the current account.
Table Management	Create Backup	Creates a backup for an existing table.
	Create Table	Creates a table in the account.
	Delete Backup	Deletes an existing backup of a table.
	Delete Table	Deletes the specified table.
	Get Backup	Retrieves the details of an existing backup.
	Get Continuous Backup	Retrieves the status of continuous backups and point in time recovery of the specified table.
	Get Table	Retrieves information about the table.
	Look up Backups	Retrieves the list of all the backups associated with the account or backups of the specified table.
	Look up Tables	Retrieves the list of table names.
	Restore Table From Backup	Creates a table from an existing backup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Restore Table To Point In Time	Restores the specified table to the specified point in time within Earliest Restorable Date Time and Latest Restorable Date Time.
	Update Continuous Backup	Enables or disables point in time recovery for the specified table.
	Update Table	Updates the specified table.
Tag Management	Add Tags To DynamoDB Resource	Adds tags to DynamoDB resource.
	Look up Tags Of DynamoDB Resource	Lists the tags of the DynamoDB resource.
	Remove Tags From DynamoDB Resource	Removes the tags from the DynamoDB resource.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Note:
Two Credential aliases are available for the Amazon DynamoDB spoke.

For information about setting up the spoke, see Set up the Amazon DynamoDB spoke.

Set up the Amazon DynamoDB spoke

Integrate the ServiceNow instance and Amazon DynamoDB account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon DynamoDB spoke
- Role required: admin

Create Credential records for the Amazon DynamoDB spoke

Create two Credential records for your Amazon DynamoDB account. The Amazon DynamoDB spoke connection and credential alias uses these credential records to perform actions in your Amazon DynamoDB account.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon DynamoDB**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Amazon DynamoDB Cred`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon DynamoDB.
Secret Access Key	Secret Access Key of the user with full access to Amazon DynamoDB.
Credential alias	Associated Amazon DynamoDB credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Amazon DynamoDB**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.
7. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
8. Open for the record for **Amazon DynamoDB Streams**.
9. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
10. Select **AWS Credentials**.
11. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Amazon DynamoDB Streams Cred`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon DynamoDB.
Secret Access Key	Secret Access Key of the user with full access to Amazon DynamoDB.
Credential alias	Associated Amazon DynamoDB Streams credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Amazon DynamoDB Streams**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
	Note: Users are cautioned against directly modifying the default authentication algorithm.

12. Click **Submit**.

Amazon EBS Spoke

Manage block level storage volumes and snapshots in Amazon EBS from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke version

Amazon EBS spoke v1.0.2 is the latest version.

Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Note:
If you use different API version, ensure that you change the API version in all spoke actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- User with full access to Amazon EC2.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The Amazon EBS spoke provides actions to automate Amazon EBS tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Elastic Block Store Management	Attach Volume	Attaches an EBS volume to a running or stopped instance.
	Create Snapshot	Creates a snapshot of an EBS volume.
	Create Volume	Creates an EBS volume that can be attached to an instance in the same Availability Zone.
	Delete Snapshot	Deletes the specified snapshot.
	Delete Volume	Deletes the specified EBS volume.
	Detach Volume	Detaches an EBS volume from an instance.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon EBS spoke.

Set up the Amazon EBS spoke

Integrate the ServiceNow instance and Amazon EBS account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon EBS spoke
- Role required: admin

Create Credential record for the Amazon EBS spoke

Create Credential record for your Amazon EBS account. The Amazon EBS spoke connection and credential alias uses this credential to perform actions on Amazon EBS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon EBS**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `EBS Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon EC2.
Secret Access Key	Secret Access Key of the user with full access to Amazon EC2.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonEBSAuthAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result
The credential record for the Amazon EBS spoke is created.

Amazon EC2 Spoke

Integrate ServiceNow instance with Amazon Elastic Compute Cloud (EC2). Manage Amazon instances, Amazon Machine Images (AMIs), Key Pairs, and Tags from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Amazon EC2 spoke v1.4.1 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon EC2.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke flows and subflows

This spoke has no flows and subflows.

Available sample conversational subflows

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

Sample conversational subflows

Conversational subflow	Description
Look up Images - Sample	Returns information on the specified images.
Run instances - Sample	Executes the specified instances.

Spoke actions

The Amazon EC2 spoke provides actions to automate Amazon EC2 tasks when events occurs in ServiceNow. Available actions include:

Spoke Actions

Category	Action	Description
Amazon Machine Image Management	Copy Image	Copies an Amazon Machine Image (AMI) from the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke Actions (continued)

Category	Action	Description
		specified source region to the current region.
	Create Image	Creates an Amazon EBS supported AMI from an Amazon EBS supported instance that is either running or stopped.
	Deregister Image	Deregisters the specified AMI.
	List Image Attribute	Retrieves the specified AMI attribute.
	List Images	Retrieves the specified AMIs.
Instance Management	Get Instance Attribute	Retrieves the specified attribute of the specified instance.
	Get Instances Status	Retrieves the status of the specified instance.
	Get Password Data	Retrieves the encrypted administrator password for an active Windows instance.
	List Instance Types	Retrieves the list of all instance types in an AWS region.
	List Instances	Retrieves a list of all instances.
	Monitor Instances	Enables monitoring for all active instances.
	Reboot Instances	Reboots the specified instances.
	Run Instances	Launches the specified number of instances using an AMI.
	Start Instances	Starts the specified instances.
	Stops Instances	Stops the specified instances.
	Terminate Instances	Shutdowns or terminates the specified instances.
	Unmonitor Instances	Disables monitoring for the specified running instances.
	Update Instance Attribute	Updates the specified attribute for the specified instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke Actions (continued)

Category	Action	Description
		Note: You can specify only one attribute at a time. Before you update an attribute, ensure that the instance is stopped.
Key Pair Management	Create Key Pair	Creates a 2048-bit SSH-2 RSA key pair.
	Delete Key Pair	Deletes the specified key pair.
	List Key Pair	Retrieves the specified key pair or a list of all key pairs.
Region and Availability Zone Management	Get Availability Zones	Retrieves the list of availability zones in the specified AWS region.
	List Regions	Retrieves the list of all AWS regions.
Tag Management	Create Tags	Adds or overwrites the specified set of tags from the specified set of resources.
	Delete Tags	Deletes the specified set of tags from the specified set of resources.
	List Tags	Retrieves the list of tags for the specified region.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon EC2 spoke.

Set up the Amazon EC2 spoke

Integrate the ServiceNow instance and Amazon EC2 using AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon EC2 spoke
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Credentials record for the Amazon EC2 spoke

Create Credential records for the Amazon EC2 instance. The Amazon EC2 spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record for Amazon_EC2.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

6. Click **Submit**.

Amazon Elastic Container Service Spoke

Manage clusters, instances, services and so on, in Amazon Elastic Container Service account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon Elastic Container Service spoke v1.0.2 is the latest version.

Supported versions

This spoke was built for Amazon Elastic Container Service API version 2014-11-13, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon Elastic Container Service.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon Elastic Container Service spoke provides actions to automate Amazon Elastic Container Service tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Cluster Management	Create Cluster	Creates an Amazon ECS cluster.
	Delete Cluster	Deletes the specified cluster.
	Look up Cluster	Retrieves the specified cluster.
	Look up Clusters	Retrieves the list of existing clusters.
	Update Cluster Settings	Updates settings of the specified cluster.
Instance Management	Deregister Container Instance	Deregisters an Amazon ECS container instance from the specified cluster.
	Look up Container Instances	Lists Amazon Elastic Container Service container instances.
	Register Container Instance	Registers an EC2 instance into the specified cluster.
Service Management	Create Service	Runs and maintains the desired number of tasks from the specified task definition.
	Delete Service	Deletes a specified service within a cluster.
	Look up Service	Retrieves the specified service running in your cluster.
	Look up Services	Retrieves the services that are running in a specified cluster.
	Update Service	Updates the parameters of a service.
Task Definition Management	Deregister Task Definition	Deletes the specified task set within a service.
	Look up Task Definition	Deregisters the specified task definition by family and revision.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Task Definitions	Deregisters the specified tasks definition by family and revision.
	Register Task Definition	Creates a task set in the specified cluster and service.
Task Management	Create Task Set	Creates a task set in the specified cluster and service.
	Delete Task Set	Deletes the specified task set within a service.
	Look up Task Set	Lists the task sets in the specified cluster and service.
	Run Task	Starts a task using the specified task definition.
	Start Task	Starts a task from the specified task definition on the specified container instance or instances.
	Stop Task	Stops the specified running task.
	Update Task Set	Modifies the specifies task set.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon Elastic Container Service spoke.

Set up the Amazon Elastic Container Service spoke

Integrate the ServiceNow instance and Amazon Elastic Container Service account by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon Elastic Container Service spoke.
- Role required: admin

Create a credential record for the Amazon Elastic Container Service spoke

Create a credential record for the Amazon Elastic Container Service account. The Amazon Elastic Container Service spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`

3. Select **AWS Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill these values.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `Amazon ECS Cred`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon Elastic Container Service.
Secret Access Key	Secret Access Key of the user with full access to Amazon Elastic Container Service.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonECSAuthAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.
Credential alias	Credential alias associated with the spoke.

5. Click **Submit**.

Amazon RDS Spoke

Integrate ServiceNow instance with Amazon Relational Database Service (RDS). Manage the process of performing various operations like set up, operate, and scale on Amazon RDS using this spoke.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon RDS spoke v1.0.5 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported Versions

This spoke was built for API version 2014-09-01 and 2014-10-31, but may be compatible with later versions.

Spoke Requirements

- User with full access to Amazon RDS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Amazon RDS spoke provides actions to automate Amazon RDS tasks when events occurs in ServiceNow. Available actions include:

Spoke Actions

Category	Action	Description
Account Management	List Account Attributes	Retrieves the list of attributes of an account.
	List Certificates	Retrieves the list of certificates of an account.
DB Engines Management	List DB Engines	Retrieves the list of available database (DB) engines.
Default	Generate Random Password	Generates a random password.
DB Instance Management	Create DB Instance	Creates an instance of DB.
	Create DB Instance Read Replica	Creates a read replica of a DB instance.
	Delete DB Instance	Deletes an existing provisioned DB instance. **Note:** When you delete a DB instance, all the automated backups of that instance are also deleted and cannot be recovered.
	List DB Instances	Retrieves the list of provisioned DB instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke Actions (continued)

Category	Action	Description
	List Reserved DB Instances	Retrieves the list of reserved DB instances.
	Promote DB Instance Read Replica	Promotes a read replica of a DB instance to standalone DB instance.
	Reboot DB Instance	Reboots a DB instance.
	Restore DB Instance From DB Snapshot	Creates a DB instance from a DB snapshot.
	Start DB Instance	Starts a DB instance.
	Stop DB Instance	Stops a DB instance.
DB Snapshots Management	Create DB Snapshot	Creates a snapshot of a DB instance.
	Delete DB Snapshot	Deletes a snapshot of a DB instance.
	List DB Snapshots	Retrieves the list of snapshots of a DB instance.
	Update DB Snapshot	Updates a snapshot of a DB instance.
Event Management	Create Event Subscription	Creates an RDS event notification subscription.
	Delete Event Subscription	Deletes an event notification subscription.
	List Event Categories	Retrieves a list of categories for the specified or all event source types.
	List Event Subscriptions	Retrieves a list of all subscription descriptions of a customer account.
	List Events	Retrieves a list of events of the RDS resources.
	Update Event Subscription	Updates an existing event notification subscription.
Groups Management	Create DB Parameter Group	Creates a DB parameter group.
	Create DB Subnet Group	Creates a DB subnet group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke Actions (continued)

Category	Action	Description
		Note: A DB subnet group must contain at least one subnet in at least two Availability Zones (AZ) in the Amazon Web Services (AWS) region.
	Create Option Group	Creates an option group.
	Delete DB Parameter Group	Deletes the specified DB parameter group. **Note:** Before deleting the DB parameter group, ensure that DB parameter group is not associated with any DB instances.
	Delete DB Subnet Group	Deletes a DB subnet group.
	Delete Option Group	Deletes an existing option group.
	List DB Parameter Groups	Retrieves a list of DB parameter groups.
	List DB Subnet Groups	Retrieves a list of DB subnet group descriptions. **Note:** If a DB subnet group name is specified, the list contains descriptions of only the specified DB subnet group.
	List Option Groups	Retrieves a list of option groups.
	Reset DB Parameter Group	Modifies the parameters of a DB parameter group to the engine or system default values.
	Update DB Parameter Group	Updates the parameters of the specified DB parameter group.
	Update DB Subnet Group	Updates an existing DB subnet group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke Actions (continued)

Category	Action	Description
		Note: A DB subnet group must contain at least one subnet in at least twos availability zones (AZs) in the Amazon Web Services (AWS) region.
	Update Option Group	Updates an existing option group.
Logs Management	List DB Log Files	Retrieves a list of all the log files of a DB instance.
	View DB Log File	Displays a part of or an entire specified log file. **Note:** The size of the log file must not exceed 1 MB.
Tags Management	Add Tags To RDS Resource	Adds tags to RDS resource.
	List Tags For RDS Resource	Retrieves a list of tags of RDS resource.
	Remove Tags From RDS Resource	Removes the tags from an RDS resource.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon RDS spoke.

Set up the Amazon RDS spoke

Integrate the ServiceNow instance and Amazon RDS using AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon RDS spoke
- Role required: admin

Create Credentials records for the Amazon RDS spoke

Create Credential records for the Amazon RDS instance. The Amazon RDS spoke connection and credential alias uses these credentials to authorize actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credentials Aliases**.
2. Open for the record for Amazon RDS.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these fields.

6. Click **Submit**.

Amazon Route 53 Spoke

Integrate ServiceNow instance with Amazon Route 53. Manage domain registrations, Domain Name System (DNS) routing, and health checking from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Amazon Route 53 API version 2013-04-01, but may be compatible with later versions.

Spoke version

Amazon Route 53 spoke v1.0.2 is the latest version.

Spoke requirements

- User with full access to Amazon Route 53 account.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon Route 53 Spoke provides actions to automate Amazon Route 53 tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Domain Management	Check Domain Availability	Checks and returns the availability of a domain name. **Note:** If a domain name is in pending state, you must check the availability of the domain name again, until the status is processed
	Get Domain Details	Retrieves detailed information about a specified domain that is associated with the current AWS account.
	Look up Domain Suggestions	Retrieves a list of suggested domain names.
	Look up Domains	Retrieves all the domain names registered with Amazon Route 53 for the current AWS account.
	View Billing	Retrieves all the domain related billing records for the current AWS account for a specified period.
Hosted Zone Management	Create Hosted Zone	Creates a new public or private hosted zone.
	Delete Hosted Zone	Deletes a hosted zone.
	Get Change	Retrieves the current status of a change batch request.
	Get Hosted Zone	Retrieves information about a specified hosted zone.
	Get Hosted Zone Count	Retrieves total number of hosted zones for the account.
	Get Hosted Zone Limit	Retrieves the specified limit for a specified hosted zone.
	Look up Hosted Zones	Retrieves a list of associated public and private hosted zones.
	Look up Hosted	Retrieves a list of the hosted zones in alphabetical order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Zones By Name	
	Update Hosted Zone Comment	Updates the comment for a specified hosted zone.
Record Set Management	Delete GeoLocation Record Set	Deletes a GeoLocation resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Delete Simple Record Set	Deletes a simple resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Delete Weighted Record Set	Deletes a weighted resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Look up Record Sets	Retrieves a list of resource record sets in a specified hosted zone.
	Test DNS Answer	Retrieves the value that Amazon Route 53 returns in response to a DNS request for a specified record name and type.
	Upsert Geolocation Record Set	Creates a GeoLocation resource record set or updates an existing GeoLocation resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Upsert Simple Record Set	Creates a simple reocord set or updates an existing simple resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Upsert Weighted Record Set	Creates a weighted resource record set or updates an existing weighted resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
Tag Management	Add Tags For Domain	Assigns a set of tags to a domain.
	Add Tags For Hosted Zone	Assigns a set of tags to a hosted zone.
	Look up Tags For Domain	Retrieves a list of tags that are associated with the specified domain.
	Look up Tags For Hosted Zone	Retrieves a list of tags that are associated to the specified domain.
	Remove Tags From Domain	Removes tags that are associated to a domain.
	Remove Tags From Hosted Zone	Removes tags that are associated to a hosted zone.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon Route 53 spoke.

Set up the Amazon Route 53 spoke

Integrate the ServiceNow instance and Amazon Route 53 by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon Route 53 spoke
- Role required: admin

Create a credential record for the Amazon Route 53 spoke

Create a credential record for the Amazon Route 53 custom application. The Amazon Route 53 spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **AWS Credentials**.
4. On the form, fill these values.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Amazon Route 53 Cred.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of your AWS account.
Secret Access Key	Secret Access Key of your AWS account.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Amazon Route53**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Users are cautioned against directly modifying the default authentication algorithm.
Credential alias	Credential alias associated with the spoke. **sn_amzn_rout53_spk.AmazonRoute53**

5. Right-click the form header and click **Submit**.

Amazon S3 Spoke

Integrate ServiceNow with Amazon S3. Manage buckets, objects, tags, and related ACLs in Amazon S3 from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon S3 spoke v1.2.1 is the latest version.

Supported version

This spoke was built for API version 2010-03-31, but may be compatible with later versions.

Supported regions

Currently, the spoke does not support the government or federal government regions.

Spoke requirements

- User with full access to Amazon S3.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For information about creating and accessing keys, see the AWS Security Credentials documentation.

Spoke actions

The Amazon S3 spoke provides actions to automate Amazon S3 tasks when events occur in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Bucket Management	Create Bucket	Creates a bucket in Amazon S3.
	Look up Buckets	List Amazon S3 buckets.
Object Management	Copy Object	Copies object from source to destination.
	Delete Object	Deletes specified object from a bucket.
	Look up Objects by Bucket Stream	Lists the objects in the specified Amazon S3 bucket.
	Download S3 Object to ServiceNow Record	Downloads the requested object from Amazon S3 and attaches it to a record in ServiceNow.
	Upload ServiceNow Attachment to S3	Uploads file from the System Attachment Table (sys_attachment) to a specified Amazon S3 bucket.
Permission Management	Create ACL	Create new ACL for a bucket and delete the existing one.
	Look up ACL	Retrieves the ACL details for the requested resource.
Tag Management	Look up Tags	Lists tags of the specified Amazon S3 resource.
	Update Tags	Updates the tags of the specified Amazon S3 resource.

Note:
Spoke actions can be used independently without subscribing to notifications from Amazon S3.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon S3 spoke.

Set up the Amazon S3 spoke

Use Amazon S3 as file storage in place of attachments in ServiceNow. Adds Amazon S3 storage to your ServiceNow instance and enables users to reference Amazon S3 files in ServiceNow records.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon S3 spoke
- Role required: admin

Create Credential record for the Amazon S3 spoke

Create Credential record for your AWS account. The Create a credential record for the Amazon S3 spoke to enable the spoke to connect to the Amazon S3 host. After connecting, the spoke can perform various actions on Amazon S3.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Create the AWS access key ID and the secret access key. For more information, see create secret access key and key ID from AWS CLI.

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the alias record for **Amazon S3**.
3. From the **Credentials** tab, click **New**.
4. Select AWS Credentials.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `S3 Credentials`.
Active	Select **Active** to use the credential record.
Access Key ID	Access Key ID of your AWS account.
Secret Access Key	Secret Access Key of your AWS account.
Credential alias	`sn_amazon_s3_spokeAmazon S3`
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Amazon S3**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

Note:
To create the Access key ID and secret access key, log into the AWS console. From your account menu, select **My Security Credentials**.

6. Click **Submit**.

Result

The credential record for the Amazon S3 spoke is created.

Amazon SNS Spoke

Integrate ServiceNow with Amazon SNS. Manage topics and subscriptions, and delegate roles in Amazon SNS from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon SNS spoke spoke v1.1.0 is the latest version.

Supported version

This spoke was built for API version 2010-03-31, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon SNS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For information about creating and accessing keys, see the AWS Security Credentials documentation.

Spoke subflows

The Amazon SNS spoke provides a sample subflow to demonstrate automating Amazon SNS tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Amazon SNS Subscription. The subflow receives three types of messages; Notification, Subscription Confirmation, and Unsubscribe Confirmation. This subflow is triggered when you configure your ServiceNow instance to receive events from Amazon SNS. For more information about the required configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Note:
Spoke subflow can be used independently to subscribe for notifications from Amazon SNS. For more information about the configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Spoke actions

The Amazon SNS spoke provides actions to automate Amazon SNS tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Permission Management	Add Permission	Adds a statement to a topic's access control policy and grants access for the specified AWS accounts for the specified actions.
	Remove Permission	Removes a statement from a topic's access control policy and revokes access for the specified AWS accounts for the specified actions.
Subscription Management	Confirm Subscription	Verifies intent of endpoint owner to receive messages by validating the token sent to the endpoint through an earlier Subscribe action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Subscription	Creates a subscription on a topic.
	Delete Subscription	Deletes a subscription on a topic.
	Get Subscription Attributes	Retrieves all properties of a subscription.
	List Subscriptions	Retrieves a list of all subscriptions to a specific region. **Note:** In your flow, use the Get Subscription Attributes action before this action to populate the required records.
	List Subscriptions By Topic	Retrieves a list of the subscriptions to a specific topic. **Note:** In your flow, use the Get Subscription Attributes action before this action to populate the required records.
	Set Subscription Attributes	Enables a subscription owner to set an attribute of the subscription to a new value.
Topics Management	Create Topic	Creates a topic for which notifications can be published.
	Delete Topic	Deletes a topic and all its subscriptions.
	Get Topic Attributes	Retrieves all properties of a topic. Topic properties retrieved may differ based on the authorization of the user.
	List Topics	Retrieves a list of the requester's topics. **Note:** In your flow, use the Get Topic Attributes action before this action to populate the required records.
	Publish Batch Messages to Topic	Sends batch messages to an Amazon SNS topic.
	Publish Message to Topic	Sends a message to an Amazon SNS topic.
	Set Topic Delivery Policy	Enables a topic owner to set a delivery policy of the topic to a new value.
	Set Topic Display Name	Enables a topic owner to set a display name of the topic to a new value.

Note: Spoke actions can be used independently without subscribing to notifications from Amazon SNS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke module

The Amazon SNS spoke adds an AWS Configurations module to your ServiceNow instance. If you want receive events at your ServiceNow instance from Amazon SNS, you must specify the subflow internal name here. For more information about the required configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon SNS spoke.

Set up the Amazon SNS spoke

Integrate the ServiceNow instance and Amazon SNS using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon SNS spoke
- Role required: admin

About this task

To receive events at your ServiceNow instance from Amazon SNS, see Receive events at your ServiceNow instance from Amazon SNS. Spoke set up described here enables you to use spoke subflow and actions.

Create Credential record for the Amazon SNS spoke

Create Credential record for your AWS account. The Amazon SNS spoke uses this credential to perform actions on Amazon SNS.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon SNS**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `SNS Credentials`.
Active	Option to actively use the credential record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Access Key ID	Access Key ID of your AWS account.
Secret Access Key	Secret Access Key of your AWS account.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **SNS Algorithm**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result
The credential record for the Amazon SNS spoke is created.

Receive events at your ServiceNow instance from Amazon SNS

Receive events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) from Amazon SNS at your ServiceNow instance.

Before you begin
- Request an Integration Hub subscription
- Activate the Amazon SNS spoke
- Role required: admin

About this task
You can receive events at your ServiceNow instance from Amazon SNS even without setting up the Amazon SNS spoke. To set up the Amazon SNS spoke and use the spoke actions, see Set up the Amazon SNS spoke.

Create secret for the Amazon SNS spoke

Create a client secret to authorize requests from Amazon SNS.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **System Definition** > **Scripts - Background**.
2. Enter this command in the **Run script (JavaScript executed on server)** text field:
   ```
   gs.info(GlideSecureRandomUtil.getSecureRandomString(32));
   ```
3. Click **Run Script**.
4. Copy and record the generated value for later use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a record in AWS Configurations

Create a record in AWS Configurations to authorise requests from Amazon SNS spoke.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **AWS Configuration** > **All Configurations**.
2. Click **New**.
3. On the form, fill in the fields.

AWS Configurations form

Field	Description
Property Value	Internal name of the Amazon SNS Subscription subflow. For example, `amazon_sns_subscription`. **Note:** The Amazon SNS Subscription subflow is a sample subflow. You must create a copy of this subflow and use it to customize event management as per your requirement. In this case, specify the internal name of the customized subflow.
Property Name	Name to identify the record.
Client Secret	Client Secret generated by the script. For information about generating Client Secret see, Create secret for the Amazon SNS spoke.

4. Right-click the form header and click **Save**.
5. Right-click the form header and click **Copy sys_id**. Record this value for later use.

Record the Base API path of the Amazon SNS spoke

Record the Base API path of the Amazon SNS spoke to authorise requests from Amazon SNS.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
2. Open the record for **Amazon SNS**.
3. Copy and record the value of **Base API path** for later use.

Create topic

Use the Create Topic spoke action to create a topic in Amazon SNS for your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin.

Procedure

1. In Workflow Studio, create a flow and include the Create Topic spoke action.
   For information about creating flows in Workflow Studio, see Building flows.
2. Customize flow to provide these values as inputs to the Create Topic spoke action:

Field	Description
Region	AWS geographic area where the infrastructure is housed.
Topic Name	Name to identify the topic.

3. Test the flow and check the **Executions** tab to ensure that flow is executed as expected.

Create subscription

Use the Create Subscription spoke action to create subscription in Amazon SNS for your ServiceNow instance.

Before you begin
Role required: admin.

Procedure

1. In Workflow Studio, create a flow and include the Create Subscription spoke action.
   For information about creating flows in Workflow Studio, see Building flows.
2. Customize flow to provide these values as inputs to the Create Subscription spoke action:

Field	Description
Region	AWS geographic area where the infrastructure is housed.
Topic ARN	ARN to uniquely identify the required topic. Subscriptions are created for this topic.
Protocol	**HTTPS**
Endpoint	Endpoint URL in this format: `https://<servicenow-instance>.service-now.com/<base-api-path>/<aws-configuration-sys_id>/<client-secret>`. **Note:** For information about obtaining the required values, see Record the Base API path of the Amazon SNS spoke, Create a record in AWS Configurations, and Create secret for the Amazon SNS spoke.

3. Test the flow.
   The flow internally triggers the default Amazon SNS Subscription subflow.
4. In the **Executions** tab, open the record associated with the subflow execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure that you check the execution details of the default Amazon SNS Subscription subflow, not the flow you had created.

5. In the Execution Details page, click **RUNTIME VALUE**.
6. Copy and record the value of Token for later use.
   This confirmation token is needed to Confirm subscription.

Note:
Ensure that you use the confirmation token to Confirm subscription within its validity period.

Result
Subscription for the required topic in Amazon SNS for your ServiceNow instance is created.

Confirm subscription

Use the Confirm Subscription spoke action to confirm subscription in Amazon SNS for your ServiceNow instance.

Before you begin
Role required: admin.

Procedure

1. In Workflow Studio, create a copy of the default Amazon SNS Subscription subflow.
   For information about using subflows in Workflow Studio, see Building subflows.
2. In Workflow Studio, create a flow that includes the copy of the default subflow.
   For information about creating flows in Workflow Studio, see Building flows.
3. Customize the subflow to include the Confirm Subscription spoke action.
4. Customize subflow to provide these values as inputs to the Confirm Subscription spoke action:

Field	Description
Region	AWS geographic area where the infrastructure is housed.
Topic ARN	ARN to uniquely identify the required topic. Subscriptions are created for this topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token	Confirmation token generated after creating subscription. See Create subscription, for more information. **Note:** Ensure that you use the confirmation token to confirm subscription within its validity period.

5. Test the flow and check the **Executions** tab to ensure that flow is executed as expected.

Result
The Amazon SNS subscription for your ServiceNow instance is confirmed.

Customize event management

Customize the management of events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) you receive for your ServiceNow instance from Amazon SNS.

Before you begin
Role required: admin.

Procedure

1. In Workflow Studio, create a copy of the default subflow, Amazon SNS Subscription and customize the subflow as per your requirement.
   For more information about creating subflows, see Building subflows.
2. Copy and record the internal name of the customized subflow.
3. Navigate to **AWS Configuration** > **All Configurations**.
4. Open the record you had created to receive events.
   In this record, the internal name of the default Amazon SNS Subscription subflow is specified in **Property Value**.
5. Update this record by replacing the internal name of default subflow with the internal name of the customized subflow in **Property Value**.

   Note:
   Use the same **Client Secret**.

Result
The event management is customized as per your requirement.

Amazon SQS Spoke

Amazon SQS spoke automates various actions on the Amazon SQS based on a trigger in your ServiceNow instance. Set up a flow in the Workflow Studio using the actions and automate tasks on Amazon SQS. For example, you can set up a flow that automates sending messages to a queue.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon SQS spoke v1.0.1

is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow Integration Hub Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke actions

The Amazon SQS provides actions to automate tasks on the simple queue services when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Message Management	Change Visibility for Message	Changes the visibility of a message from a queue. You specify inputs such as the queue URL and the visibility timeout and the action returns the status of the execution.
	Change Visibility for Messages	Changes the visibility of up to 10 messages from a queue. You provide inputs such as the queue URL and the request that comprises the messages' list and the action returns the list of messages and the status of the action.
	Delete Message	Deletes a message from a queue. You provide the queue URL and the receipt handle and the action returns the status of the execution.
	Delete Messages	Deletes up to 10 messages from a queue. You provide the queue URL and the receipt handle and the action returns the status of the execution.
	Receive Message	Retrieves up to 10 messages from a queue. You provide the queue URL and the number of messages as inputs and the action returns the list of messages and the status of the execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Send Message	Delivers a message to a queue. You provide inputs such as the queue URL and the message and the action returns outputs such as sequence number and message ID.
	Send Messages	Sends up to 10 messages to a queue. You provide inputs such as the queue URL and the message and the action returns outputs such as sequence number and message ID. **Note:** You can send messages with size up to 256 KB.
Permission Management	Add Permission	Adds a permission to a queue for a principal. You provide inputs such as the queue URL and the permission label and the action returns the status of the execution.
	Remove Permission	Revokes permissions in the queue policy that matches a label. You provide inputs such as the queue URL and the permission label and the action returns the status of the execution.
Queue Management	Create FIFO Queue	Creates a FIFO queue. You can provide inputs such as region and queue name and the action returns the new queue URL and the status of the execution.
	Create Standard Queue	Creates a standard queue. You can specify inputs such as region and the queue name and the action returns the queue name and the status of the execution.
	Delete Queue	Deletes a queue. You can provide the queue URL and the action returns the estatus of the execution.
	Look up Queue Attributes	Retrieves the attributes of a queue. You can specify the queue URL and the action returns the queue attributes.
	Look up Queue URL	Retrieves the URL of the specified queue. You can specify inputs such as the region and queue name and the action returns the queue URL.
	Look up Queues Stream	Retrieves a list of queues in a region. You provide inputs such as region and page size and the action returns the details.
	Purge Queue	Deletes the messages in a queue. You specify the queue URL and the action returns the execution status code.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

To learn to set up the spoke, see Set up Amazon SQS spoke.

Set up Amazon SQS spoke

Set up outbound integration between your ServiceNow instance and Amazon SQS (Simple Queue Service). The integration enables automation of actions in Amazon SQS when an event

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

occurs on your ServiceNow instance. For example, you can automate actions such as creating a standard queue or sending a message to a queue.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon SQS spoke.
- Ensure that you have access to the Amazon Web Services (AWS) account to create access keys and secure access keys.
- Role required: admin

Set up credential record for Amazon SQS

Create a credential record on your ServiceNow instance for accessing the Amazon AWS.

Before you begin

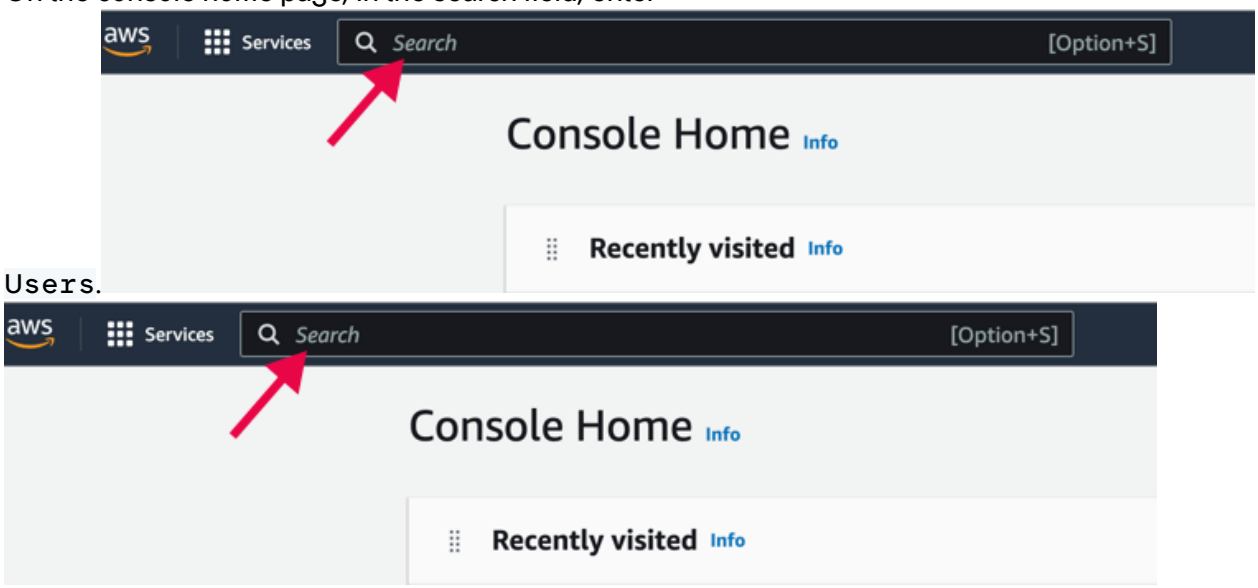
- Request an Integration Hub subscription.
- Activate the Amazon SQS spoke plugin.
- Ensure that you have access to the Amazon Web Services(AWS) account to create access keys and secure access keys.
- Role required: admin

Procedure

1. Create an access key and a secure access key in the Amazon AWS.

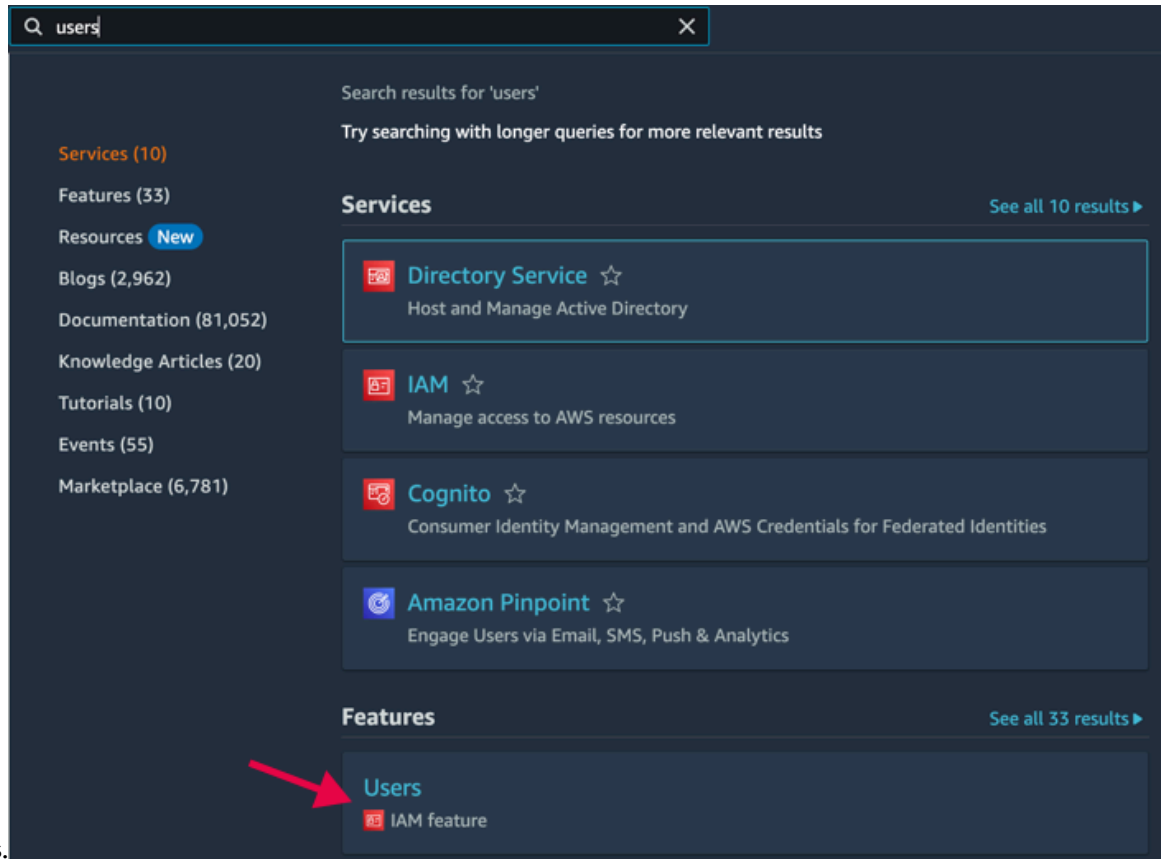
   a. Log in to Amazon Web Services.

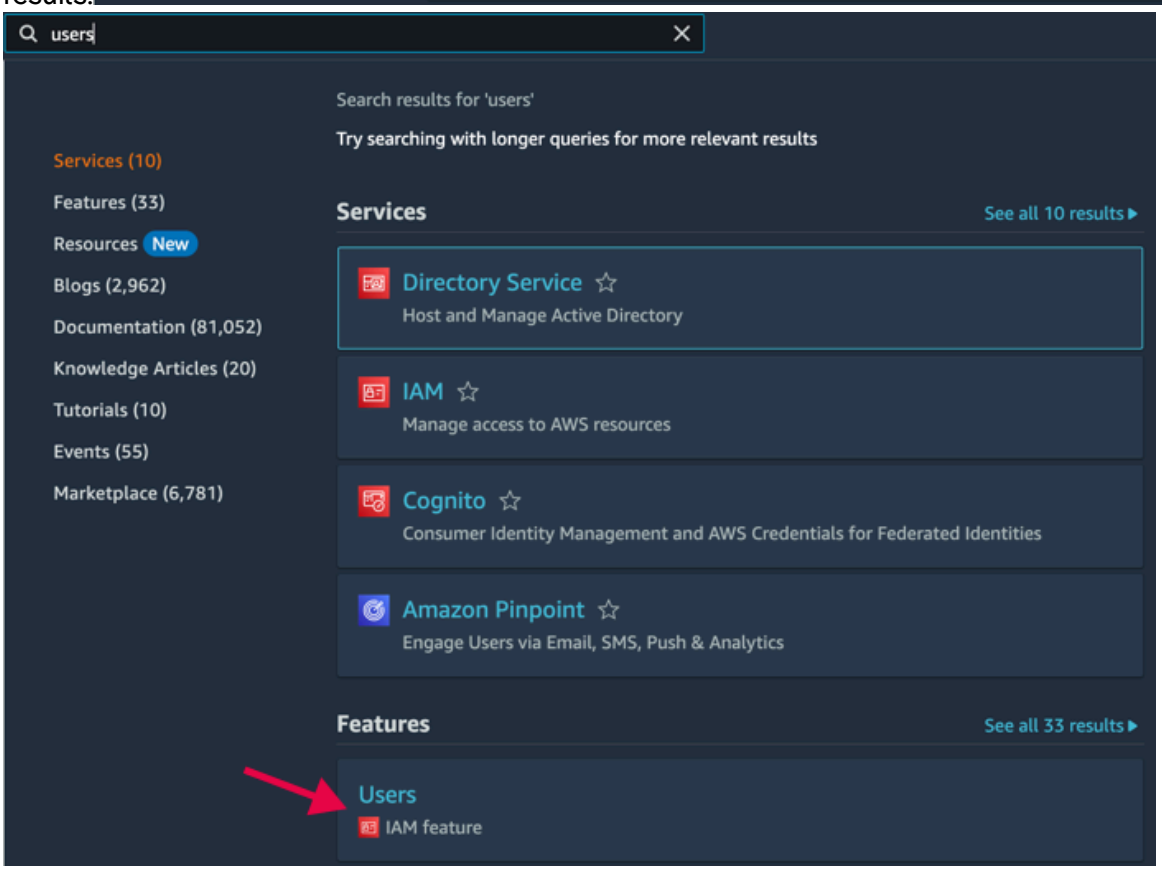
   b. On the console home page, in the search field, enter `Users`.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select Users from the search results.

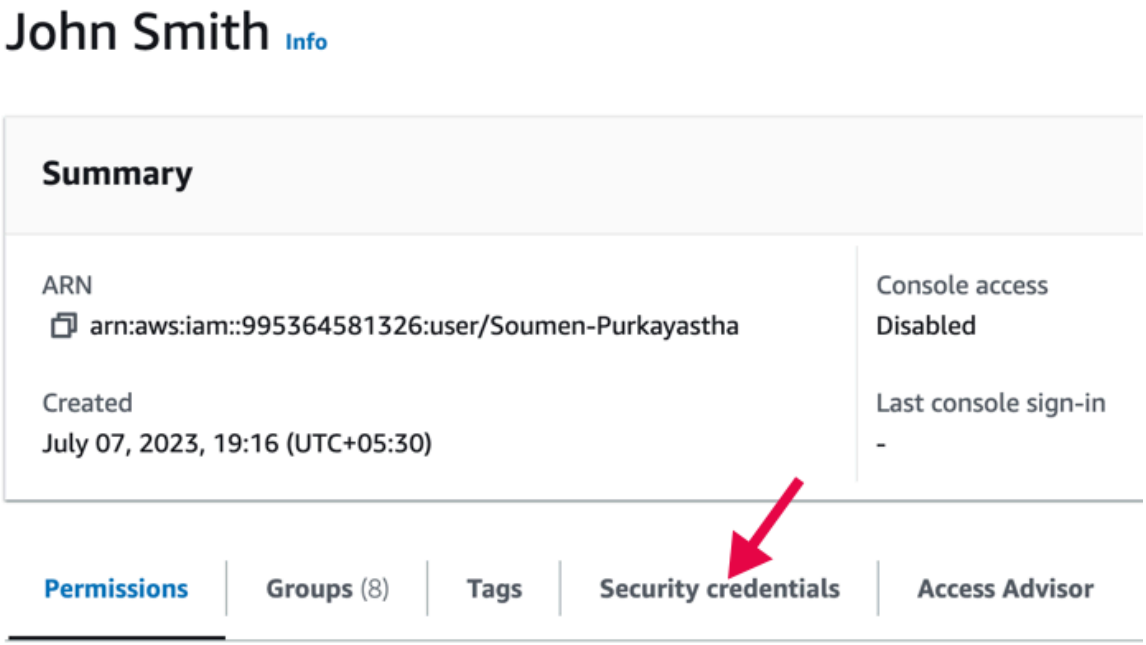




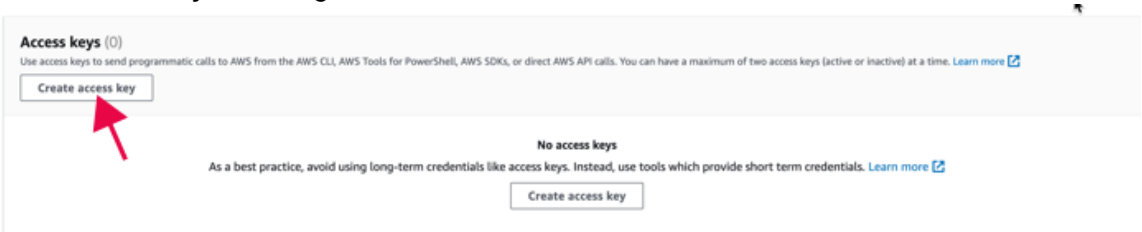
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the Users field, enter the user name under which you want to create the access and secret access keys or select a user name under the User name column.

e. Select the Security credentials tab.

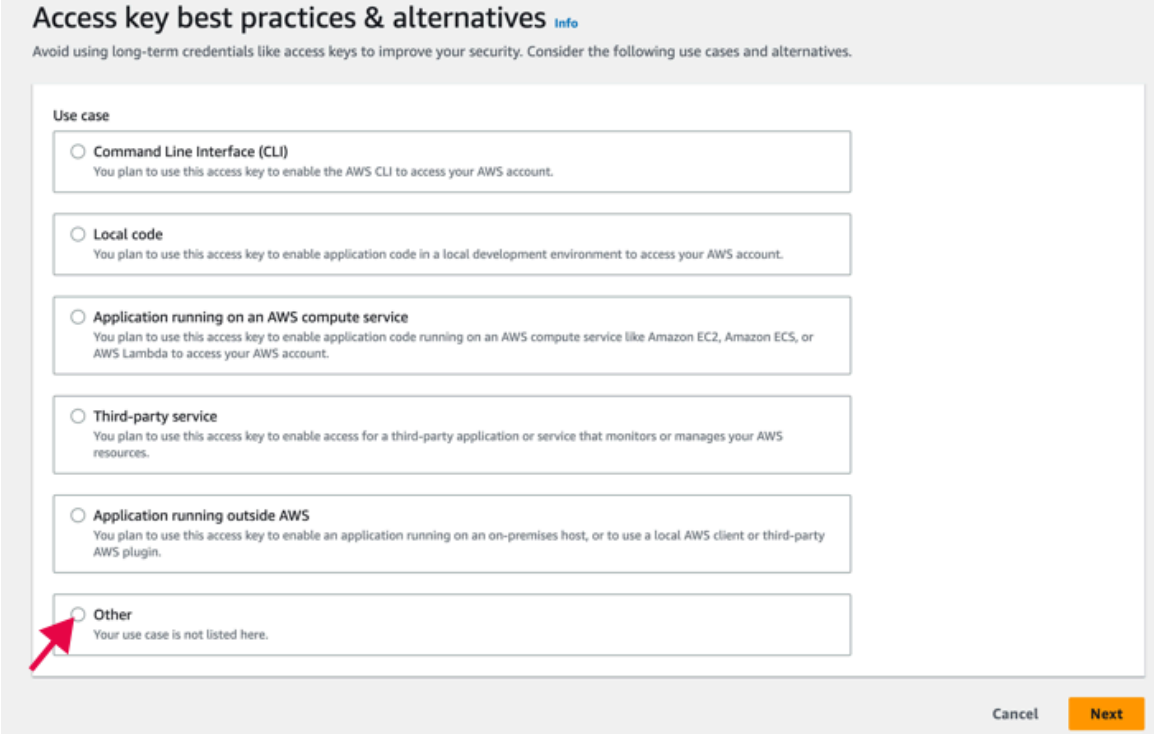


f. Under the Access keys heading, select **Create access key**.



g. Under the Access key best practices & alternatives heading, select Other.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

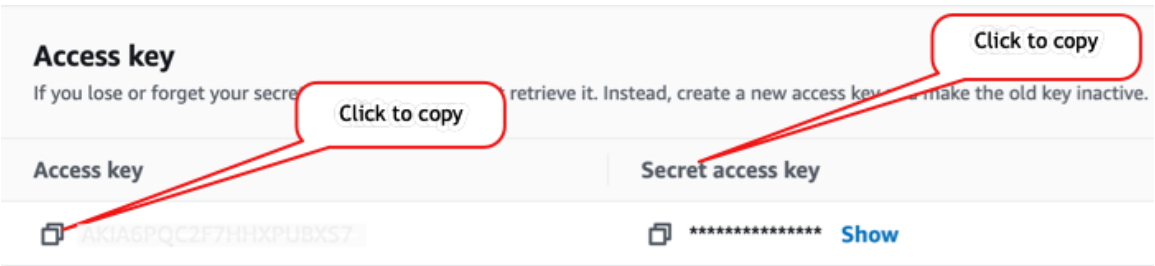


h. Select **Next**.

i. **Optional:** In the Description tag value field, enter a custom tag that describes the access key.

j. Select **Create access key**.

k. Copy the access key and the secret access key, and store at a secure place.
The credential record you set up on your ServiceNow instance requires the access and secret access keys.



l. To view the secret access key, select **Show**.

m. Select **Done**.

2. Create the credential record.

a. Log in to your ServiceNow instance.

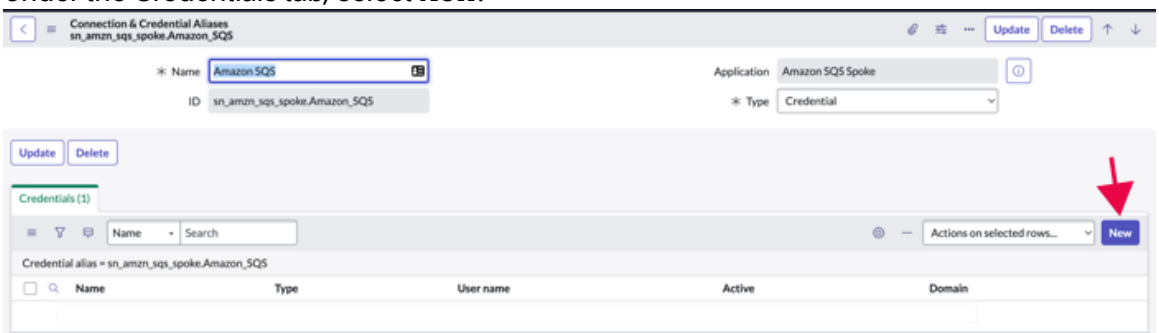
b. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.

c. Select the Amazon SQS connection and credential alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alias becomes available as a base system component when you install the Amazon SQS spoke plugin.

d. Under the Credentials tab, select **New**.



e. Under the heading What type of Credentials would you like to create?, select AWS Credentials.

f. Fill the form.

AWS credentials

Field	Description
Name	Custom name of the credential record.
Active	If the field is selected, you can use this record to access the Amazon SQS.
Access Key ID	Enter the access key you had generated on Amazon AWS.
Secret Access Key	Enter the secret access key you had generated on Amazon AWS.
Authentication Algorithm	Algorithm used to authenticate credential record. To select the algorithm, select and from the list, select Amazon SQS.

g. Select **Submit**.

Amazon VPC Spoke

Provision a logically isolated section of the AWS cloud using Amazon VPC and launch the required AWS resources in a virtual network, from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Amazon VPC spoke v1.0.3 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Note:
If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to Amazon VPC.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke subflows

The Amazon VPC spoke provides sample subflows to demonstrate automating Amazon VPC tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Delete Subnet	Deletes the specified subnet. Before you delete the subnet, you must terminate all the running instances in the subnet.
Delete VPC	Deletes the specified VPC. Before you delete the VPC, you must terminate all the associated instances.

Spoke actions

The Amazon VPC spoke provides actions to automate Amazon VPC tasks when events occur in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Network & Security Group Management	Add Egress Rules To A Security Group	Adds the specified egress rules to a security group.
	Add Ingress Rules To A Security Group	Adds the specified ingress rules to a security group.
	Create Security Group	Creates a security group.
	Delete Egress Rules From Security Group	Removes the specified egress rules from security group. Values must match the existing rule's values exactly.
	Delete Ingress Rules From Security Group	Adds the specified ingress rules to a security group.
	Delete Security Group	Deletes a security group.
	List Security Groups	Lists the specified security groups or all of your security groups.
	Lookup Security Group	Retrieves the specified security group.
Virtual Private Cloud Management	Create Subnet	Creates a subnet in an existing VPC.
	Create VPC	Creates a VPC with the specified IPv4 CIDR block and can optionally request an IPv6 CIDR block for the VPC.
	Delete NAT Gateway	Deletes the specified NAT gateway. Deleting a NAT gateway disassociates its Elastic IP address, but does not release it.
	Delete Route Table	Deletes the specified route table. You must disassociate the route table from any subnets before you can delete it.
	Delete Subnet	Deletes the specified subnet. You must terminate all running instances in the subnet before you can delete the subnet.
	Delete VPC	Deletes the specified VPC. You must detach or delete all gateways and resources that are associated with the VPC before you can delete it or use Delete VPC subflow.
	Delete VPC Peering Connection	Deletes a VPC peering connection. Either the owner of the requester VPC or the owner of the accepter VPC can delete the VPC peering connection if it's in the active state.
	Detach Internet Gateway	Detaches an internet gateway from a VPC, disabling connectivity between the internet and the VPC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Detach Route Table	Disassociates a subnet from a route table.
	List Internet Gateways	Retrieves the details of the required internet gateways.
	List NAT Gateways	Retrieves the details of the required NAT gateways.
	List Route Tables	Retrieves the details of the required route tables.
	List Subnets	Retrieves the details of the required subnets in an existing VPC.
	List VPC Peering Connections	Retrieves the details of the required VPC peering connections.
Virtual Private Network Management	Detach VPN Gateway	Detaches a virtual private gateway from a VPC.
	List VPN Gateways	Retrieves the details of the required virtual private gateways.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon VPC spoke.

Set up the Amazon VPC spoke

Integrate the ServiceNow instance and Amazon VPC using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon VPC spoke.
- Role required: admin.

Create Credential record for the Amazon VPC spoke

Create Credential record for your Amazon VPC account. The Amazon VPC spoke connection and credential alias uses this credential to perform actions on Amazon VPC.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon VPC**.
3. From the **Credentials** tab, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays the message `What type of Credentials would you like to create?`.

4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `VPC Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon VPC.
Secret Access Key	Secret Access Key of the user with full access to Amazon VPC.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonVPCAuthAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result
The credential record the Amazon VPC spoke is created.

Ansible Spoke

Integrate your ServiceNow instance with Ansible Tower. Automate Ansible Tower tasks when events occur in ServiceNow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Ansible spoke v2.2.9 is the latest version.

Supported version

This spoke was built for Ansible Tower v2, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- Ansible Tower
- If you are using custom OAuth application:
  - Ansible Tower administrator credentials to create a custom application
  - Application information such as Client ID and Client Secret
- If you are using basic authentication, credentials of the user with System Administrator role to log in to Ansible Tower. To configure the basic authentication, see Configure a REST message with basic auth

Spoke actions

The Ansible spoke provides actions to automate Ansible Tower tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Adhoc Command Management	Look up Status From Ad-Hoc Command by ID	Retrieves the run status from the ad-hoc command.
	Run An Ad-Hoc Command	Runs an ad-hoc command on the target devices.
Credential Management	Look up Credential Details Stream	Retrieves the list of credentials from the Ansible Tower environment.
	Look up Credentials Details by ID	Retrieves details of the required credential in the Ansible Tower environment.
Credential Type Management	Look up Credential Type Details by ID	Retrieves details of the required credential type in the Ansible Tower environment.
	Look up Credential Type Details Stream	Retrieves the list of credentials in the Ansible Tower environment.
Inventory Management	Look up Hosts From Inventory by ID	Lists hosts from the inventory in Ansible Tower environment.
	Look up Instance Groups From Inventory by ID	Lists instance groups from inventory.
	Look up Inventory Details by ID	Retrieves details of the required inventory from Ansible Tower.
	Look up Inventory Details Stream	Retrieves inventory details from Ansible Tower.
Inventory Script Management	Look up Inventory Script Details Stream	Retrieves the list of inventory scripts from Ansible Tower.
	Look up Inventory Scripts Details by ID	Retrieves details of the required inventory script from Ansible Tower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Inventory Source Management	Look up Inventory Source Details by ID	Retrieves details of the required inventory source from Ansible Tower.
	Look up Inventory Source Details Stream	Retrieves inventory source details stream from Ansible Tower.
Job Management	Cancel Job	Cancels the required job in the Ansible Tower environment.
	Look up Job Details by ID	Retrieves details of the specific job in the Ansible Tower environment.
	Look up Job Details Stream	Retrieves the list of job details.
	Look up Jobs Stream	Retrieves the list of jobs.
	Relaunch Job	Relaunches job in the Ansible Tower environment.
	Schedule Job	Schedules a job.
Metadata Retrieval	Get Credentials	Retrieves credentials in the Ansible Tower environment.
	Get Inventories	Retrieves inventories in the Ansible Tower environment.
	Get Projects	Retrieves projects in the Ansible Tower environment.
	Get Additional Input Fields	Retrieves list of fields that can be used as a dynamic template or dynamic object.
	Get Entity Data	Retrieves data from the required entity.
Organization Management	Look up Organization Details by ID	Retrieves details of the required organization from Ansible Tower.
	Look up Organization Stream	Retrieves details of organizations from Ansible Tower.
Project Management	Look up Project Details by ID	Retrieves details of the required project from Ansible Tower.
	Look up Projects Stream	Retrieves details of projects from Ansible Tower.
Record Management	Create Record	Creates a record in the Ansible Tower environment.
	Delete Record	Deletes the required record in the Ansible Tower environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Record	Updates details of the required record in the Ansible Tower environment.
Role Management	Look up Role Details by ID	Retrieves details of the required role in Ansible Tower environment.
	Look up Roles Stream	Retrieves details of the roles in the Ansible Tower environment.
	Look up Teams by Role Stream	Retrieves details of the teams associated with the required role.
	Look up Users by Role Stream	Retrieves details of the users with the required role.
Team Management	Look up Team Details by ID	Retrieves details of the required team.
	Look up Teams Stream	Retrieves details of the teams in the Ansible Tower environment.
Template Management	Create Job Template	Creates a job template.
	Launch Job Template	Launches a job template.
	Look up Job Templates Stream	Retrieves the list of job templates.
User Management	Associate User to Organization	Associates or disassociates the required user to an organization.
	Associate User to Team	Associates or disassociates the required user to a team.
	Create User	Creates a user in the Ansible Tower environment.
	Delete User	Deletes user in the Ansible Tower environment.
	Look up User Details by ID	Retrieves details of the required user from Ansible Tower.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Ansible spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Ansible spoke

Integrate your ServiceNow instance and Ansible Tower to automate Ansible spoke actions. For example, you can create a flow that retrieves a list of credentials from the Ansible Tower environment.

Before you begin

- Request an Integration Hub subscription.
- Activate the Ansible spoke.
- Role required: admin.

Create an OAuth application in the Ansible Tower

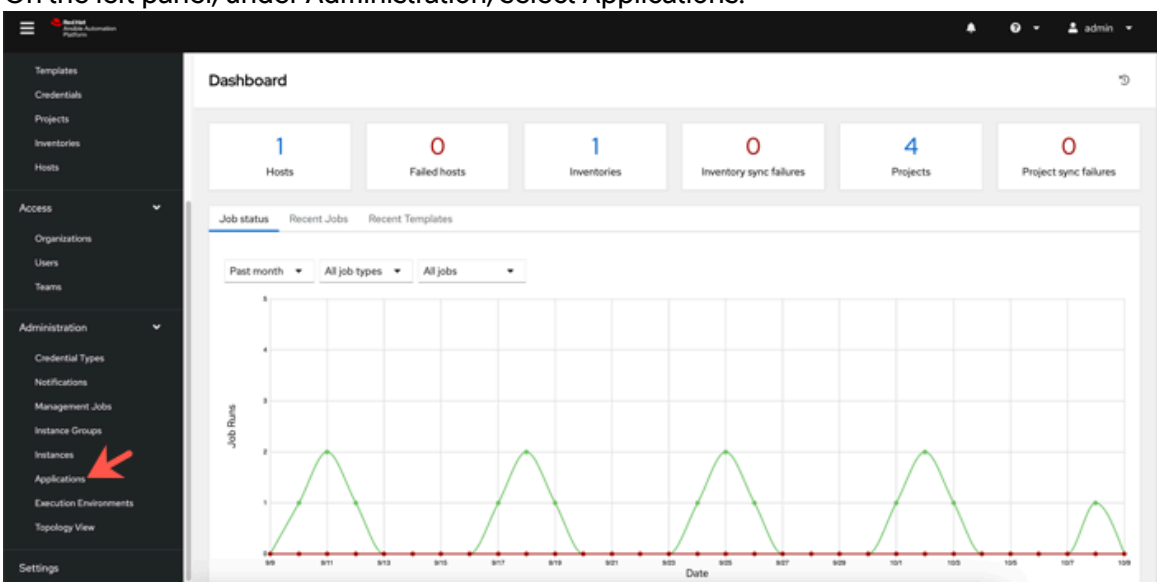
Create an OAuth application on the Ansible Tower to have the connection requests from your ServiceNow instance authenticated by the OAuth application.

Before you begin

Role required: admin
Ensure that you have the administrator's access to the Ansible Tower instance.

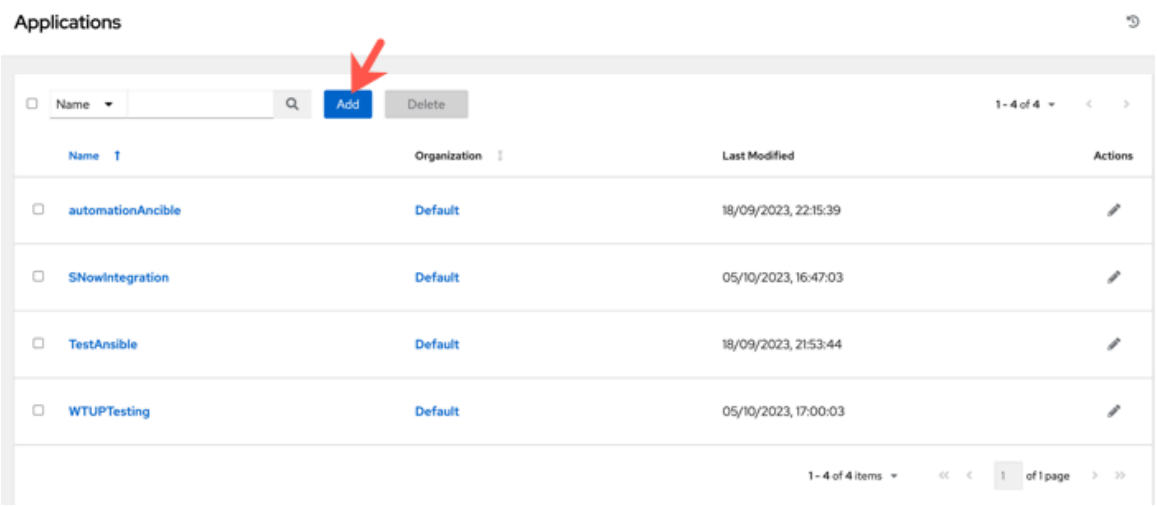
Procedure

1. Log in to the Ansible Tower application instance.
2. On the left panel, under Administration, select Applications.



3. On the Applications page, select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

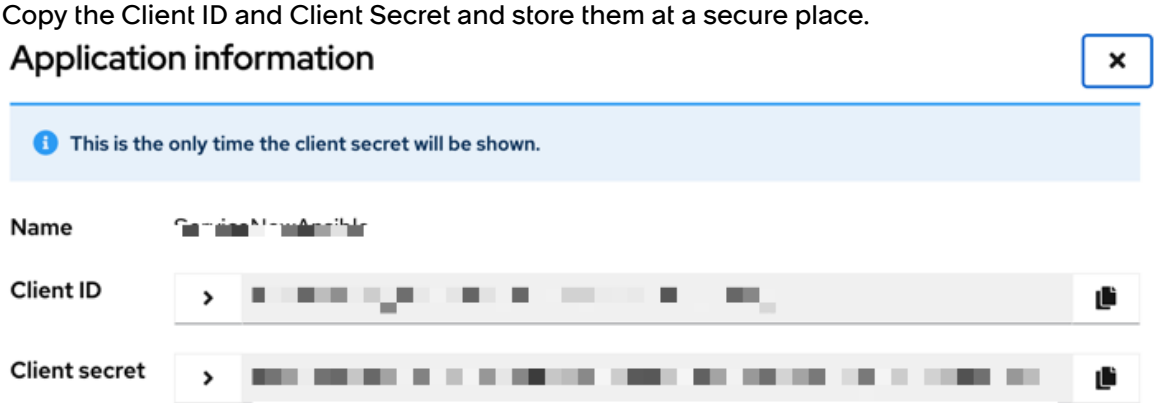


4. Fill the form.

Create a New Application

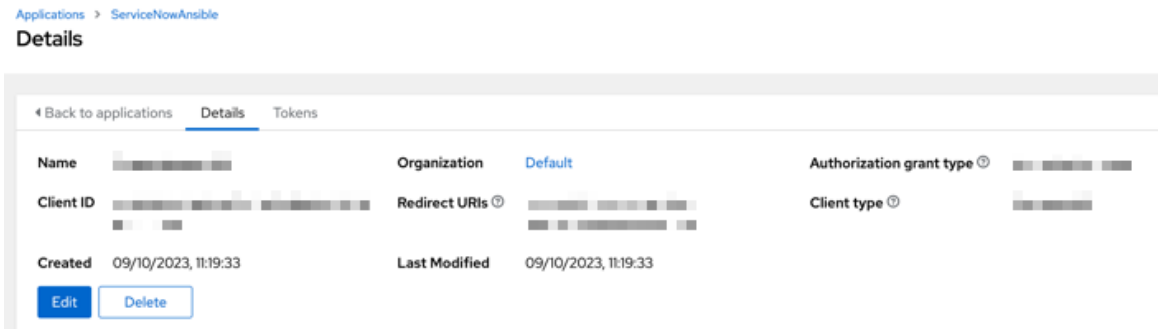
Field	Description
Name	Unique name of the OAuth application.
Description	Description of the application. This field is optional.
Organization	Organization the OAuth application is associated with.
Authorization grant type	The basis of the OAuth application granting access to the client. The basis could be an authorization code given to the client or a resource-owner password.
Redirect URIs	Redirect the URI to the client after access is granted. Enter the redirect URI in the format `https://<instance name>.service.now.com/api/sn_ansible_spoke/ansible_oauth_redirect`.
Client type	Type of client that requests authentication from the OAuth application.

5. Select **Save**.
6. Copy the Client ID and Client Secret and store them at a secure place.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You've created the OAuth application.



Set up the Ansible spoke connection record

Create the connection record that contains the information that enables your ServiceNow instance to send an authentication request to the Ansible Tower instance and get an OAuth token.

Before you begin

Role required: admin

Ensure you have set up an OAuth application on the Ansible Tower instance.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select Connections.
3. Turn on the Outbound tab.
4. In the Search all connections field, enter `AnsibleTowerAlias`.
5. On the AnsibleTowerAlias card, select **View Details**.
6. Select **Configure**.
7. Fill the form.

Configure Connection

Field	Description
Connection Name	Name of the connection established with the Ansible Tower instance. The first connection's default name is automatically assigned to match the name specified in the Connections and Credentials form on the Connection & Credential Aliases page. To provide your custom name, create a connection record by selecting **Add Connection**.
Connection URL	The URL your ServiceNow instance uses to connect to the Ansible Tower instance.
Credential Name	Name of the credential record that you created for Ansible on your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application Registry Name	Name of the application registry record that you created for Ansible on your ServiceNow instance.
OAuth Client ID	The client ID that you had generated while you set up the OAuth application.
OAuth Client Secret	The client secret that you had generated while you set up the OAuth application.
Oauth Entity Profile Name	Name of the OAuth application that you created on the Ansible Tower instance.
Authorization URL	The URL that the client uses to request access to the Ansible Tower instance. The URL format is `https://<ansible-tower-instancename>.com/api/o/authorize`.
Token URL	The URL that the client uses to request a token to access the Ansible Tower instance. The URL format is `https://<ansible-tower-instance-name>.com/api/o/token`.
OAuth Redirect URL	The redirect URL that the OAuth application uses to redirect to your ServiceNow instance. The URL must be in the format `https://<your instance name>.service-now.com/api/sn_ansible_spoke/ansible_oauth_redirect`.

8. Select **Configure and Get OAuth Token**.
   The OAuth application authenticates the connection request and provides a temporary token to access the Ansible Tower instance.

Asana Spoke

The Asana spoke provides actions to view and analyze meaningful usage data for Asana software subscriptions based on stories created by the user. Use this data to determine which licenses are stale so that you can reclaim these licenses and realize potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Asana spoke v1.0.2 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

Asana account with an Admin role.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream Inputs (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses if used outside the spoke implementation.

Spoke actions

The Asana spoke provides actions to automate Asana tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Workspace Management	Look up Workspaces	Retrieves details of all workspaces.
	Get Workspaces (metadata)	Retrieves the list of the workspaces for the user. This action is used to create dynamic choices for the input **Workspace** in other spoke actions.
Task Management	Look up Workspaces Tasks	Retrieves list of all workspace tasks.
	Look up Stories Stream	Retrieves details of the stories.
User Management	Look up Users Stream	Retrieves details of all users.
	Remove User from Workspace	Removes a user from a workspace.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Asana spoke

Configure the Asana spoke to integrate your ServiceNow instance with the Asana instance. The integration enables you to set up a flow and, when a trigger occurs, automate actions on the Asana instance. For example, set a trigger that triggers a flow every day at 13:00 to get the meta data about a workspace.

Before you begin

- Request an Integration Hub subscription.
- Activate the Asana spoke.
- Access to the Asana developer's console.
- Role required: admin

Set up an OAuth application

Set up an OAuth application on the Asana developer's console to generate the client ID and secret that you use to set up the Asana spoke connection record later.

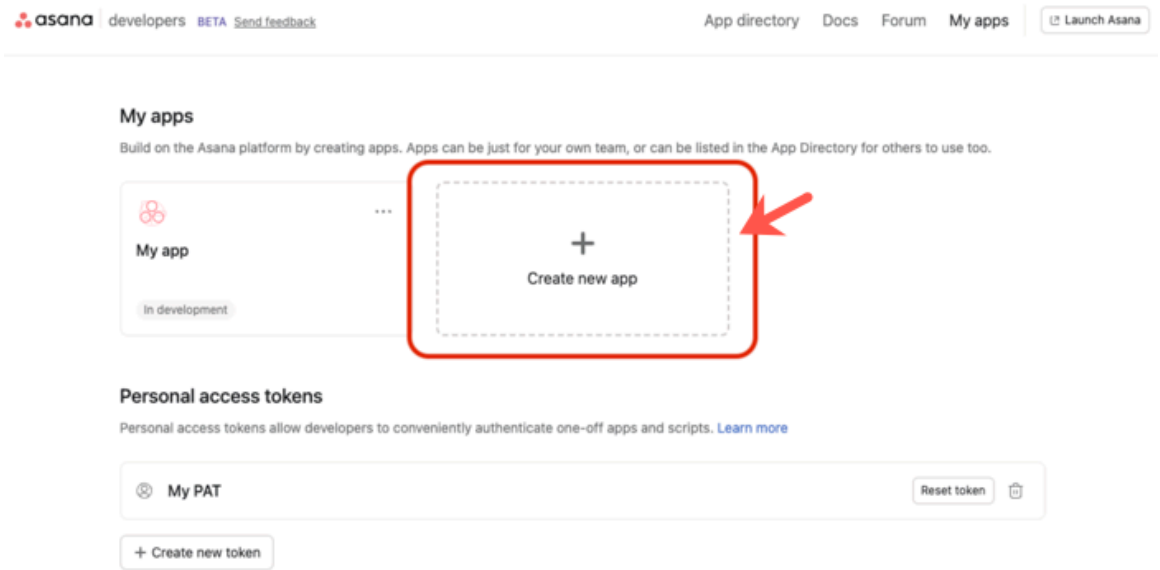
Before you begin

Role required: admin

Access to the Asana developer's console.

Procedure

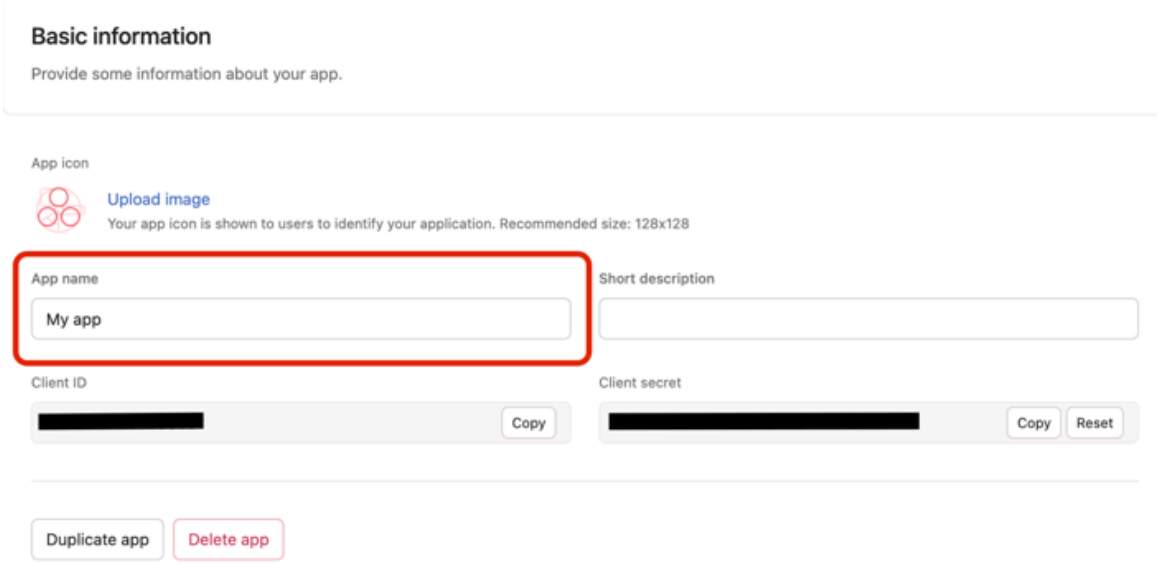
1. Log in to the Asana developer's console.
2. Under My apps, select **Create new app**.



3. Enter a name of the app.

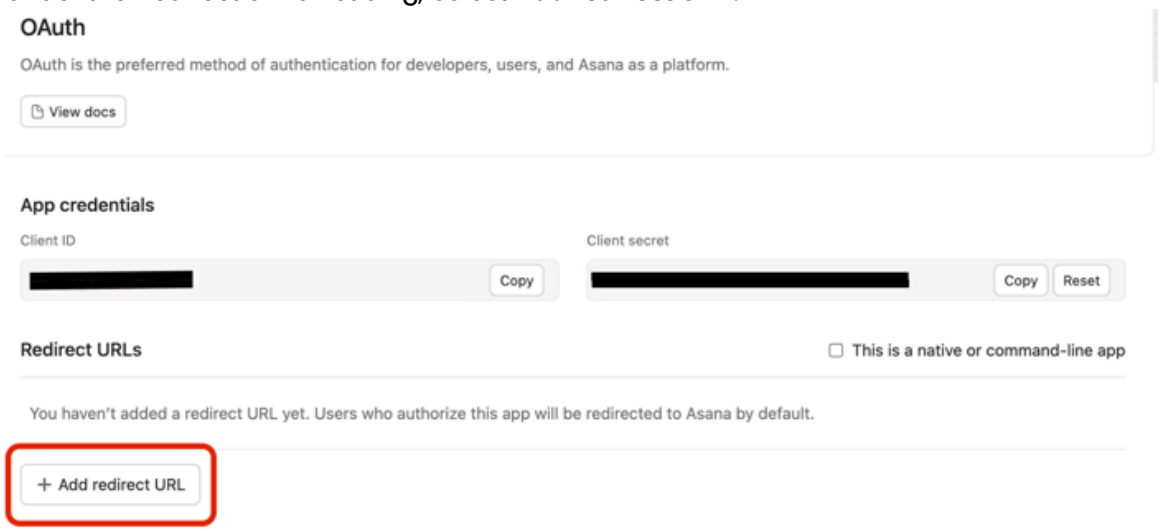
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can change the app name as many times as needed. To change the name, go to the Basic information tab on the left



panel.

4. From the Client ID and Client secret fields, copy the respective values and store them securely.
5. Under the Redirect URLs heading, select **Add redirect URL**.



6. Enter the redirect URL in the format `https://<your instance name>.service-now.com/oauth_redirect.do`.
   You've created the OAuth app and generated the details required to create a connection record for the Asana spoke.

Create a connection record

Create a connection record with all the details needed to integrate your ServiceNow instance to the Asana instance. When your ServiceNow instance requests a connection, the OAuth app you had set up authenticates the request based on the details in the connection record.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select Connections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Turn on the Outbound tab.
4. In the Search all connections field, enter `Asana`.
5. On the Asana card, select **View Details**.
6. Select **Configure**.
7. Fill the form.

Configure Connection

Field	Description
Connection Name	Name of the connection established with the Asana instance. The first connection's default name is automatically assigned to match the name specified in the Connections and Credentials form on the Connection & Credential Aliases page. To provide your custom name, create a connection record by selecting **Add Connection**.
Connection URL	The URL your ServiceNow instance uses to connect to the Asana instance.
OAuth Client ID	The client ID that you had generated while you set up the OAuth application.
OAuth Client Secret	The client secret that you had generated while you set up the OAuth application.
OAuth Redirect URL	The redirect URL that the OAuth application uses to redirect to your ServiceNow instance. The URL must be in the format `https://<your instance name>.service-now.com/oauth_redirect.do`.

8. Select **Configure and Get OAuth Token**.
   The OAuth application authenticates the connection request and provides a temporary token to access the Asana instance.

Register an Asana OAuth application

Register the Asana OAuth application to access the Asana API 1.0 and to receive a Client ID and Client secret.

Before you begin

Asana Role required: admin

- The Asana Integration Hub spoke must be active. For more information, see Asana Spoke.

Procedure

1. Log in to your Asana account.
2. Select the user's profile icon on the top-right corner.
3. Select **My Settings**.
4. Select the **Apps** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the **Manage Developers App** link at the bottom to navigate to the developer console window.
6. Select **+ Create new app**.
7. On the **Create new app** page, provide a name for your application.
8. Select the **I agree to API terms and conditions** check box.
9. Select **Create app**.
10. **Optional:** Provide basic information about your application.
11. Select **OAuth** in the left-pane.
12. Copy the Client ID and Client secret for later use.
13. In the **Redirect URLs** field, select **+ Add redirect URL**.
14. Enter `https://<instance>.service-now.com/oauth_redirect.do` where <instance> is the name of your ServiceNow instance.

Atlassian Administration Spoke

The Atlassian Administration spoke provides actions to view and analyze meaningful usage data for Atlassian Administration subscriptions. The spoke downloads subscription information and usage, pulls group details, and removes users from a group.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Atlassian Administration v1, but may be compatible with later versions.

Spoke requirements

- Atlassian Administration account
- Atlassian Administration Role required: Organization admin
- API Key to authenticate the ServiceNow instance.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Spoke subflows

The Atlassian Administration spoke provides sample subflows to demonstrate automating Atlassian Administration tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Pull Atlassian Group Details	This subflow retrieves all Group Details from Atlassian Administration such as group product and site details.

Spoke actions

The Atlassian Administration spoke provides actions to automate Atlassian Administration tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Group Management	Look up Organization Groups Stream	Retrieves information about groups, users, and roles assignments.
User Management	Look up Organization Users Stream	Retrieves information about users, groups, and product last access.
	Remove User from Group	Removes given user from a group in the Atlassian Administration instance.

Spoke module

The Atlassian Administration spoke adds the Atlassian Administration application to your instance and includes these modules:

Module	Description
Groups	Contains data related to groups.
Product and Site Details	Contains data related to product and site.
Group Product Site Role Details	Contains data related to site roles for product groups.

Spoke user roles

The Atlassian Administration spoke provides these user roles to control access to data:

User role	Description
Atlassian Admin (sn_atlassian_spoke.atlassian_admin)	Creates connections for the Atlassian Administration application.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an Atlassian Administration API Key

Create an Atlassian Administration API Key to authenticate ServiceNow requests.

Before you begin

Role required: Organization admin

Procedure

1. Log in to Atlassian Administration with your admin credentials.
2. Select your organization if you have more than one.
3. Select **Settings** > **API keys**.
4. Select **Create API key**.
5. On the Create an API key page, provide a name to identify the API key and the expiration date in the **Expires on** field.

   Note:
   By default, the key expires in one week from the creation date. If you'd like to modify the expiration date, select a new date in the **Expires on** field. You must select a date within one year of the creation date.

6. Select **Create** to save the API key.
7. Copy the values for your Organization ID and API key.

   Note:
   Save these values to use them later.

8. Select **Done**.
   The key appears in your list of API keys. You can also revoke the API by selecting **Revoke** from the Actions column.

Set up the Atlassian Administration spoke

Integrate the ServiceNow instance and Atlassian Administration by using an API key to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Atlassian Administration spoke.
- Create an Atlassian Administration API key.
- Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record for **Atlassian Administration** alias.
3. From the Related Links section, select **Create New Connection & Credential**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection and Credential

Field	Description
Connection information	
Name	Name of the Atlassian Administration connection.
Connection URL	URL for the connection. This field is automatically set to `https://api.atlassian.com`.
Organization ID	Atlassian Administration Organization ID that you find while creating an Atlassian Administration API Key.
Credential information	
API Key	The API Key that you find while creating an Atlassian Administration API Key.

5. Select **Create**.

Automation Anywhere Spoke

Manage workflows and robotics processes in Automation Anywhere instance from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Automation Anywhere spoke v1.2.1 is the latest version

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Automation Anywhere spoke provides actions to automate Automation Anywhere tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Bot Management	Deploy Bot	Deploys a bot in the bot runner devices.
	Get Bot	Retrieves details of the specific bot.
	Look up Bots	Retrieves information about all the bots.
Device Management	Get Device Details	Retrieves details of the specific device.
	Look up Devices	Retrieves details of all the devices.
	Look up Pool	Retrieves details of the specified pool.
Folder Management	Get Folder	Retrieves details of the requested folder.
	Look up Folders	Retrieves information about all the folders.
Queue Management	Look up Queues Stream	Retrieves all queues for the Enterprise Control Room.
	Look up Work Items in Queue	Retrieves details of all the work items in a queue.
User Management	Look up User	Retrieves details of the requested user.
	Look up Users Stream	Retrieves details of all the users.

Note:
Only users with bot runner or admin role can execute the spoke actions.

Spoke module

The Automation Anywhere spoke adds the Automation Anywhere application to your instance and includes the Authentication module. In this module, you should provide details in the default credential record to authentication the ServiceNow requests. See Create a Credential record for the Automation Anywhere spoke for more information.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Automation Anywhere spoke.

Set up the Automation Anywhere spoke

Integrate ServiceNow and Automation Anywhere instances by using the Automation Anywhere credential record to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Automation Anywhere spoke.
- Role required: admin.

Create a Credential record for the Automation Anywhere spoke

Create a credential record for the Automation Anywhere instance. The Automation Anywhere spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Automation Anywhere** > **Authentications**.
2. Open the record, **Automation Anywhere Credential**.
3. On the form, fill these values.

Field	Description
Name	Default name of the credential record. **Note:** Users are cautioned against modifying the default credential name.
User Name	Credentials to log in to your Automation Anywhere instance.
Password	
Credential alias	Default credential alias available along with the Automation Anywhere spoke. For example, select **sn_autoanywher_spk.Automation_Anywhere**.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Automation Anywhere**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.
Connection URL	URL to connect to your Automation Anywhere instance.
Dedicated Integration User	Option to specify if you are using a dedicated user for the purpose of integrating Automation Anywhere and ServiceNow instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ The dedicated user mentioned here, should be used only for the purpose of integrating Automation Anywhere with ServiceNow. ○ If you aren't using a dedicate user, the ServiceNow instance makes 2 or 3 API calls to execute an action. ○ If you are using a dedicated user, the ServiceNow instance makes only one API call to execute an action.

4. Right-click the form header and click **Save**.
5. Click **Get Token**.

Note:
This step is applicable when you select the **Dedicated Integration User** check box.

The confirmation message, `Token retrieval successful` is displayed.

AWS Certificate Manager Spoke

Manage certificates in AWS Certificate Manager account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AWS Certificate Manager spoke v1.0.1 is the latest version.

Supported versions

This spoke was built for AWS Certificate Manager API version 2015-12-08, but may be compatible with later versions.

Spoke requirements

- User with full access to AWS Certificate Manager.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AWS Certificate Manager spoke provides actions to automate AWS Certificate Manager tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Certificate Management	Delete Certificate	Deletes a certificate and its associated private key.
	Get Certificate	Retrieves an Amazon-issued certificate and its certificate chain.
	Get Certificate Details	Retrieves detailed metadata about the specified ACM certificate.
	Import Certificate	Imports a certificate to AWS Certificate Manager (ACM) to use with services that are integrated with ACM.
	Look up Certificates	Retrieves a list of certificate ARNs and domain names.
	Request Certificate	Requests an ACM certificate for use with other AWS services.
	Resend Validation Email	Resends the email that requests domain ownership validation.
	Update Certificate Option	Updates details of the specified certificate.
Tag Management	Add Tags To Certificate	Associates a set of tags with the required certificate.
	Look up Tags For Certificate	Retrieves all tags that are associated with the specified certificate.
	Remove Tags From Certificate	Removes the association of tags from certificate.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS Certificate Manager spoke.

Set up the AWS Certificate Manager spoke

Integrate the ServiceNow instance and AWS Certificate Manager by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS Certificate Manager spoke.
- Role required: admin.

Create a credential record for the AWS Certificate Manager spoke

Create a credential record for the AWS Certificate Manager account. The AWS Certificate Manager spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **AWS Credentials**.
4. On the form, fill these values.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Cred.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS Certificate Manager.
Secret Access Key	Secret Access Key of the user with full access to AWS Certificate Manager.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AWS Certificate Manager**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential alias	Credential alias associated with the spoke.

5. Click **Save**.
   The AWS Certificate Manager spoke is set up and you can start using the spoke actions in your flows.

AWS CloudFormation Spoke

Model and provision AWS resources in your cloud environment using AWS CloudFormation from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for AWS CloudFormation API version 2010-05-15, but may be compatible with later versions.

Spoke version

AWS CloudFormation spoke v1.1.4 is the latest version.

Spoke requirements

- User with full access to AWS CloudFormation.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AWS CloudFormation spoke provides actions to automate AWS CloudFormation tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Change Set Management	Create Change Set	Creates a list of changes that will be applied to a stack so that you can review the changes before executing them.
	Delete Change Set	Deletes the specified change set.
	Execute Change Set	Updates the stack using the input information that was provided when the specified change set was created.
	Get Change Set	Returns the details of the specified change set.
	Look up Change Sets	Returns basic information of each active change set for a stack.
Stack Management	Cancel Update Stack	Cancels an update on the specified stack.
	Continue Update Rollback	For the specified stack that is in the UPDATE_ROLLBACK_FAILED state, continues rolling the state back to the UPDATE_ROLLBACK_COMPLETE state.
	Create Stack	Creates a stack as specified in the template.
	Delete Stack	Deletes the specified stack.
	Get Stack Policy	Returns the stack policy for a specified stack.
	Get Template	Returns the template body for a specified stack.
	Look up Stack Events	Returns all stack related events for a specified stack in reverse chronological order.
	Look up Stack Set Operation Stream	Returns the summary of information for the operations performed on a stack set.
	Look up Stack Set	Returns the summary of information for the results of a stack set operation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Operation Result Stream	
	Look up Stack Resources	Returns details of all resources of the specified stack.
	Look up Stacks	Returns the details for the specified stack.
	Set Stack Policy	Sets policy for the specified stack.
	Update Stack	Updates the specified stack.
	Validate Template	Validates a specified template. AWS CloudFormation initially verifies if the template is a valid JSON. If it is not a valid JSON, AWS CloudFormation verifies if the template is a valid YAML. If both these checks fail, AWS CloudFormation returns a template validation error.
Stack Set Management	Create Stack Instance	Creates stack instances for the specified accounts, within the specified regions.
	Create Stack Set	Creates Stack set in the specified region.
	Delete Stack Instance	Deletes stack instances for the specified accounts, in the specified regions.
	Delete Stack Set	Deletes the specified Stack set.
	Get Stack Set	Returns the details of the specified stack set.
	Look up Stack Instances	Returns information about stack instances that are associated with the specified stack set.
	Look up Stack Sets	Returns summary information about all the stack sets or the stack sets with the specified Status.
	Update Stack Set	Updates the specified stack set and associated stack instances in the specified accounts and Regions.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS CloudFormation spoke.

Set up the AWS CloudFormation spoke

Integrate the ServiceNow instance and AWS CloudFormation using AWS credential to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS CloudFormation spoke.
- Role required: admin.

Create Credential record for the AWS CloudFormation spoke

Create Credential record for your AWS CloudFormation account. The AWS CloudFormation spoke connection and credential alias uses this credential to perform actions in AWS CloudFormation.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon VPC**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `CloudFormation Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS CloudFormation.
Secret Access Key	Secret Access Key of the user with full access to AWS CloudFormation.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AWS_CloudFormation**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result

The credential record the AWS CloudFormation spoke is created.

AWS Elastic Beanstalk Spoke

AWS Elastic Beanstalk enables you to quickly deploy and manage applications in the Amazon AWS Cloud. Elastic Beanstalk reduces management complexity without restricting choice or

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

control. When you upload your application, Elastic Beanstalk automatically handles capacity provisioning, load balancing, scaling, and application health monitoring.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AWS Elastic Beanstalk spoke v1.0.3 is the latest version.

Supported versions

AWS Elastic Beanstalk API version 2010-12-01.

Spoke subflows

There are no subflows provided with the AWS Elastic Beanstalk spoke.

Spoke actions

The AWS Elastic Beanstalk spoke provides actions to perform Elastic Beanstalk tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Account Management	Look Up Account Attributes	Retrieves attributes related to AWS Elastic Beanstalk that is associated with the calling AWS account.
Application Management	Check DNS Availability	Checks if the specified CNAME is available.
	Create application	Creates an application that has one configuration template name default and no application versions.
	Create Application Version	Creates an application version for the specified application.
	Create Configuration Template	Creates an AWS Elastic Beanstalk configuration template, associated with a specific Elastic Beanstalk application.
	Delete Application	Deletes the specified application along with all associated versions and configurations.
	Delete Application Version	Deletes the specified version from the specified application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Configuration Template	Deletes the specified application along with all associated versions and configurations.
	Look Up Application Versions	Retrieves the descriptions of existing applications.
	Look up Applications	Retrieves the descriptions of existing applications.
	Update Application	Updates the specified application to have the specified properties.
	Update Application Version	Updates the specified application version to have the specified properties.
	Update Configuration Template	Updates the specified configuration template to have the specified properties or configuration option values.
Environment Management	Create Environment	Launches an AWS Elastic Beanstalk environment for the specified application.
	Create Storage Location	Creates a bucket in Amazon S3 to store application versions, logs, and other files used by Elastic Beanstalk environments.
	Get Environment Health	Lists the overall health information of the specified environment.
	Look up Available Solution Stacks	Lists the available solution stack names.
	Look up Environment Resources	Lists AWS resources for the specified environment.
	Look up Environments	Retrieves the information about the existing environments.
	Look Up Instances Health	Retrieves the descriptions of existing applications.
	Restart App Server	Restarts the application container server running on each Amazon EC2 instance in the environment.
	Swap Environment CNAMEs	Swaps the CNAMEs of two environments.
	Terminate Environment	Terminates the specified environment.
	Update Environment	Updates the specified environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AWS Elastic Beanstalk account requirements

The AWS Elastic Beanstalk spoke requires a credential that you create in the Amazon Web Services Management Console.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Create a credential record for the AWS Elastic Beanstalk spoke.

Set up the AWS Elastic Beanstalk spoke

Create a credential record to integrate AWS Elastic Beanstalk with ServiceNow.

Before you begin

Role required: admin

Create an access key

Create an access key in Amazon Web Services to authorize actions.

Before you begin

Role required: admin

Procedure

1. Log in to AWS Management Console.
2. From the menu under your user name, select **My Security Credentials**.
3. Click **Create access key**.
4. Copy the access key ID and the secret access key to a text file.
   You can only show the secret access key once, but you can delete and create keys if necessary. For more information, see Create new access keys for an IAM user in AWS documentation.

Create a credential record for the AWS Elastic Beanstalk spoke

Create a credential record to integrate AWS Elastic Beanstalk with ServiceNow. The AWS Elastic Beanstalk connection and credential aliases use these credentials to authorize actions. Once connected, Elastic Beanstalk uses basic authentication to authenticate ServiceNow requests.

Before you begin

To set up the AWS Elastic Beanstalk spoke, you must be able to configure security credentials in Amazon Web Services and have a ServiceNow admin role.

- Request an Integration Hub subscription.
- Activate the AWS Elastic Beanstalk spoke spoke.
- Role required: admin.

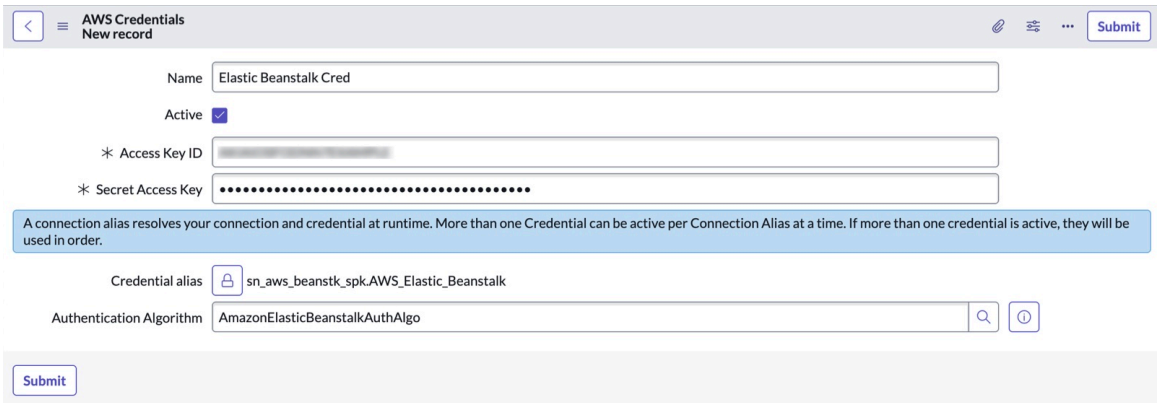
Procedure

1. Navigate to **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record **AWS_Elastic_Beanstalk**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Description
Name	Name to identify the credential record. For example, `Elastic Beanstalk Cred`.
Access Key ID	Access key ID you created in AWS Management Console. For more information, see Create an access key.
Secret Access Key	Secret access key you created in AWS Management Console. For more information, see Create an access key.
Authentication Algorithm	Select **AmazonElasticBeanstalkAuthAlgo**.



6. Click **Submit**.

Result

The AWS Elastic Beanstalk spoke is set up and integrated with the ServiceNow instance.

AWS Elastic Load Balancing Spoke

Manage load balancers, tags, and target groups in AWS account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

AWS Elastic Load Balancing spoke v1.0.1 is the latest version.

Supported versions

This spoke was built for AWS Elastic Load Balancing API version 2012-06-01.

Spoke requirements

- User with full access to AWS Elastic Load Balancing.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AWS Elastic Load Balancing spoke provides actions to automate AWS Elastic Load Balancing tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Elastic Load Balancer Management	Create Load Balancer	Creates an application load balancer or network load balancer.
	Create Load Balancer Listener	Creates a listener for the specified application load balancer or network load balancer.
	Delete Load Balancer	Deletes the specified application load balancer or network load balancer.
	Delete Load Balancer Listener	Deletes the specified listener.
	Get Account Limits	Lists the Elastic Load Balancing resource limits for the AWS account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Load Balancer Attributes	Lists the attributes for the specified application load balancer or network load balancer.
	Look up Listeners	Retrieves list of the specified listeners for the specified application load balancer or network load balancer.
	Look up Load Balancers	Retrieves list of the specified load balancers or all the load balancers.
	Look up SSL Policies	Lists all policies used for SSL negotiation.
	Update Load Balancer Attributes	Updates the specified attributes of the specified application load balancer or network load balancer.
Tag Management	Add Tags	Adds the specified tags to the specified Elastic Load Balancing resource.
	Delete Tags	Removes the specified tags from the specified Elastic Load Balancing resource.
	Look up Tags	Retrieves list of the tags for the specified resources.
Target Group Management	Create Target Group	Creates a target group.
	Deregister Target	Deregisters the specified targets from the specified target group.
	Get Target Group Attributes	Lists the attributes for the specified target group.
	Get Target Health	Lists the health of the targets.
	Look up Target Groups	Retrieves details of the specified target groups or all of your target groups.
	Register Target	Registers the specified targets with the specified target group.
	Update Target Group	Updates the health checks used for evaluating the health state of the targets in the specified target group.
	Update Target Group Attribute	Updates the specified attributes of the specified target group.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS Elastic Load Balancing spoke.

Set up the AWS Elastic Load Balancing spoke

Integrate the ServiceNow instance and AWS Elastic Load Balancing account using AWS credential to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS Elastic Load Balancing spoke.
- Role required: admin.

Create Credential record for the AWS Elastic Load Balancing spoke

Create credential record for the AWS Elastic Load Balancing account. The AWS Elastic Load Balancing spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record, **AWS_Elastic_Load_Balancing**.
3. In the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Elastic Load Balancing Cred`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS Elastic Load Balancing.
Secret Access Key	Secret Access Key of the user with full access to AWS Elastic Load Balancing.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonElasticLoadBalancingAuthAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Right-click the form header and click **Submit**.

AWS IAM Spoke

Integrate ServiceNow instance with AWS IAM to manage access to AWS services and resources securely. Manage groups, policies, and roles in AWS IAM from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AWS IAM spoke v1.1.0 is the latest version.

Supported version

This spoke was built for API version 2010-05-08, but may be compatible with later versions.

Note:
If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to IAM.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see AWS Identity and Access Management Documentation site.

Spoke subflows

The Jenkins spoke provides sample subflows to demonstrate automating AWS IAM tasks. Available subflows are:

Subflow	Description
Delete Group	Deletes the specified AWS IAM group.
Delete User	Deletes the specified AWS IAM user.
Delete Policy	Deletes the specified policy from the AWS IAM account.

Spoke actions

The AWS IAM spoke provides actions to automate AWS IAM tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Group Management	Add User to Group	Adds user to a group in AWS IAM.
	Create Group	Creates a group in AWS IAM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Group	Deletes a group in AWS IAM.
	Look up Group	Searches for the required group in AWS IAM.
	Look up Group Users	Lists all the users in the required group.
	Remove User from Group	Removes a user from a group in AWS IAM.
Group Policy Management	Attach Inline Policy in Group	Adds or updates an inline policy document embedded in the specified IAM group.
	Attach Policy to Group	Attaches the specified managed policy to the required IAM group.
	Detach Inline Policy from Group	Deletes the specified inline policy from the specified AWS IAM group
	Detach Policy from Group	Detaches the specified managed policy from the required IAM group.
	Look up Attached Group Policies	Retrieves the list of all policies attached to the IAM group.
	Look up Group Policies	Retrieves all the inline policies of the specified group. If none exists, the operation returns an empty list
Policy Management	Create Policy	Creates managed policy in the specified IAM group.
	Delete Policy	Deletes specified Policy from AWS IAM.
	Detach Policy from Roles	Detaches the specified managed policy from the specified IAM Role.
	Look up Entities for Policy	Lists all entities (Users, Group, and Roles) attached to this policy.
User Management	Create User	Creates a user in AWS IAM.
	Deactivate MFA Device	Deactivates the required MFA device attached to a user.
	Delete Access Key for User	Deletes the access key of the AWS IAM user.
	Delete Login Profile	Deletes the password for the specified IAM user, which terminates the user's ability to access AWS services through the AWS Management Console.
	Delete Service Specific Credential	Deletes the required service-specific credential.
	Delete Signing Certificate	Deletes a signing certificate associated with the specified IAM user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete SSH Public Key	Deletes the specified SSH public key.
	Delete User	Deletes the required IAM User.
	Delete Virtual MFA Device by User	Deletes the specified Virtual MFA device.
	Detach Policy from User	Detaches the specified managed policy from the specified IAM role.
	Look up User	Searches for the required user in the AWS IAM.
	Look up Access Keys by User	Lists the access key of the AWS IAM user.
	Look up Groups for User	Retrieves the list of all the groups, a particular user belongs to.
	Look up Inline User Policies	Retrieves all the inline policies of the specified IAM user. If none exists, the operation returns an empty list.
	Look up MFA Devices by User	Retrieves information about the MFA services associated with the specified IAM user. If none exists, the operation returns an empty list.
	Look up Service Specific Credentials	Retrieves information about the service-specific credentials associated with the specified IAM user.
	Look up Signing Certificates by User	Retrieves information about the signing certificates associated with the specified IAM user. If none exists, the operation returns an empty list.
	Look up SSH Public Keys by User	Retrieves information about the SSH public keys associated with the specified IAM user. If none exists, the operation returns an empty list.
User Policy Management	Attach Policy to User	Attaches the specified managed policy to the specified user.
	Delete Inline User Policy	Deletes an inline policy attached to the user.
	Look up Attached User Policies	Retrieves all the attached policies of the user.
Role Management	Look up Roles	Retrieves list of all roles.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS IAM spoke.

Set up the AWS IAM spoke

Integrate the ServiceNow instance and AWS IAM using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS IAM spoke.
- Role required: admin.

Create Credential record for the AWS IAM spoke

Create Credential record for your AWS IAM account. The AWS IAM spoke connection and credential alias uses this credential to perform actions on AWS IAM.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **AWS IAM**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `AWS Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to IAM.
Secret Access Key	Secret Access Key of the user with full access to IAM.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AWS IAM Auth Algo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The credential record the AWS IAM spoke is created.

AWS Lambda Spoke

Manage alias and function in AWS Lambda from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AWS Lambda spoke v1.1.3 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- AWS IAM Spoke (sn_aws_iam_spoke)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported version

This spoke was built for API version 2010-05-08, but may be compatible with later versions.

Note:
If you use different API version, ensure that you change the API version in all spoke actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- User with full access to Lambda.

  Note:
  The AWSLambdaFullAccess IAM policy must be assigned to the user. See Identity-based IAM policies for AWS Lambda for more information about the IAM policy.

- Access Key ID and Secret Access Key of the user as obtained in the IAM Console. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The AWS Lambda spoke provides actions to automate AWS Lambda tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Alias Management	Create Function Alias	Creates an alias for the specified function.
	Delete Function Alias	Deletes the specified alias of the function.
	Get Function Alias Details	Retrieves the details of the specified function alias.
	List Function Aliases	Retrieves the list of all aliases for the specified function.
	Update Function Alias	Updates settings of the specified alias.
Function Management	Add Permission	Grants an AWS service or another account permission to use the specified AWS Lambda function.
	Create Function	Creates a function in AWS Lambda.
	Delete Function	Deletes the specified AWS Lambda function or function version.
	Get Function Details	Retrieves details of the specified AWS Lambda function or function version.
	Invoke Function	Invokes the specified AWS Lambda function.
	List Functions	Retrieves list of all AWS Lambda functions in a region
	Update Function Code	Updates code of the specified AWS Lambda function.
	Update Function Configuration	Updates configuration of the specified AWS Lambda function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS Lambda spoke.

Set up the AWS Lambda spoke

Integrate the ServiceNow instance and AWS Lambda account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS IAM Spoke.
- Activate the AWS Lambda spoke.
- Role required: admin.

Create a credential record for the AWS Lambda spoke

Create a credential record for your AWS Lambda account. The AWS Lambda spoke connection and credential alias uses this credential to perform actions on AWS Lambda.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record, **AWS_Lambda**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Lambda Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS Lambda.
Secret Access Key	Secret Access Key of the user with full access to AWS Lambda.
Credential alias	Associated credential records of the AWS IAM spoke and AWS Lambda spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
	Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AWS IAM Auth Algo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result
The credential record the AWS Lambda spoke is created.

AWS OpsWorks Spoke

Manage elastic load balancers, instances, relational database services, and others in AWS OpsWorks account from the ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for AWS OpsWorks API version 2013-02-18, but may be compatible with later versions.

Spoke requirements

- User with full access to AWS OpsWorks
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke version

AWS OpsWorks spoke v1.0.2 is the latest version.

Spoke actions

The AWS OpsWorks spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Elastic Load Balancer Management	Attach Elastic Load Balancer	Attaches an Elastic Load Balancer to a specified layer.
	Detach Elastic Load Balancer	Detaches a specified Elastic Load Balancing instance from its layer.
	Look up Elastic Load Balancers	Retrieves information about Elastic Load Balancers of the specified stack ID.
Instance Management	Create Instance	Creates an instance in the specified stack.
	Delete Instance	Deletes the specified instance.
	Look up Instances	Retrieves the list of instances for the specified stack ID.
	Start Instance	Starts the specified instance.
	Start Stack Instances	Starts instances of the specified stack.
	Stop Instance	Stops the specified instance.
	Stop Stack Instances	Stops instances of the specified stack.
Relational Database Service Management	Deregister RDS DB Instance	Deregisters an Amazon RDS instance.
	Look up RDS DB Instances	Retrieves the list of Amazon RDS instances.
	Register RDS DB Instance	Registers an Amazon RDS instance with a stack.
Stack Management	Delete App	Deletes a specified app.
	Delete Layer	Deletes the specified layer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Stack Summary	Retrieves information of the specified stack ID.
	Get User Profile	Retrieves information about the user profile.
	Look up Apps	Retrieves information about the apps in the specified stack ID.
	Look up Deployments	Retrieves information about the deployments in the specified stack ID.
	Look up Layers	Retrieves list of the layers in the specified stack ID.
	Look up Permissions	Retrieves information about the permissions for the specified stack ID or IAM user.
	Look up Stacks	Retrieves list of information of the specified stack ID.
Tag Management	Add Tags	Adds tags for the specified resource.
	Delete Tags	Deletes tags of the specified resource.
	Look up Tags	Retrieves list of tags for the specified resource.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS OpsWorks spoke.

Set up the AWS OpsWorks spoke

Integrate the ServiceNow instance and AWS OpsWorks account by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS OpsWorks spoke.
- Role required: admin.

Create a credential record for the AWS OpsWorks spoke

Create a credential record for the AWS OpsWorks account. The AWS OpsWorks spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays this message: `What type of Credentials would you like to create?`

3. Select **AWS Credentials**.
4. On the form, fill these values.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `AWS OpsWork Credential`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS OpsWorks.
Secret Access Key	Secret Access Key of the user with full access to AWS OpsWorks.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonOpsWorkAuthAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.
Credential alias	Credential alias associated with the AWS OpsWorks spoke.

5. Right-click the form header and click **Submit**.

AWS Translate Spoke

Integrate your ServiceNow instance with AWS Translate to detect languages in the text and translate text to the required language.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported version

This spoke was built for AWS Translate API version 2017-07-01 and AWS Comprehend version 2017-11-27, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If you use different API version, ensure that you change the API version in all spoke actions.
- The current version of the AWS Translate spoke is not compatible with dynamic translation.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke requirements

- User with full access to AWS Translate.
- Access Key ID and Secret Access Key of the user. Record these values for later use. For more information, see Create an access key.

For more information about creating user and providing the required access, see AWS Identity and Access Management Documentation site.

Spoke flow

The AWS Translate spoke provides a sample flow, Translate Short Description when Incident is Created to demonstrate translating the short description to Spanish when an incident is created. You can customize the sample flow as per your requirement by creating a copy of it in the required scope.

Spoke actions

The AWS Translate spoke provides actions to automate translating tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Language Management	Detect Dominant Language	Detects the language of text using AWS Comprehend service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: Provide the text for which you want to detect the dominant language in the action input **Text**. The output is a JSON string that contains an array of the detected languages. One of the elements in the array is **Score**. This is a decimal number and its value is between 0 and 1. When the action is executed, the Languages Detected action output may not display any runtime value. However, the output data pill still holds the response data and can be used in the subsequent actions in the flow or subflow. Translate Management	Translate Text	Translates text from the source language to the target language using AWS Translate service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: • For **Source Language** and **Target Language**, input values can't be selected until a valid input value is provided for **Region**. • If you select **Auto** from the **Source Language** list, the AWS Translate API uses the AWS Comprehend service to automatically detect the language. In this case, you must provide the region that supports Amazon Comprehend. Else, the request returns an error indicating the auto-detect is not supported.

Note:
The actions have **Region** as an input. To retrieve the list of available regions, use the List Regions action from the Amazon EC2 Spoke.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS Translate spoke.

Set up the AWS Translate spoke

Integrate the ServiceNow instance and AWS Translate using the AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS Translate spoke.
- Role required: admin.

Create an access key

Create an access key for the required user in the AWS Management Console to authenticate requests from the ServiceNow® instance.

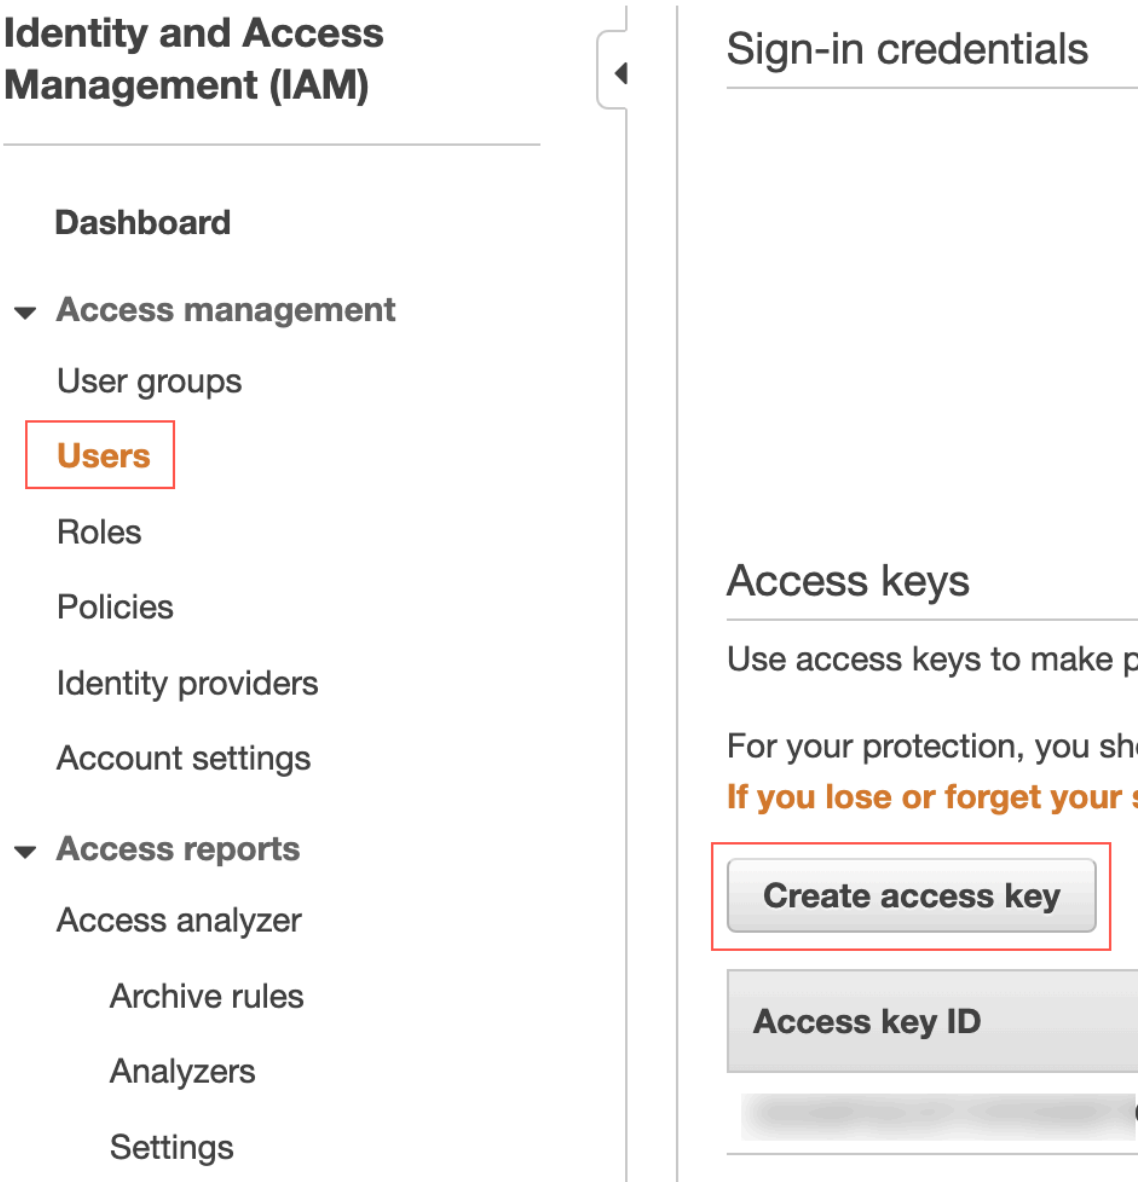
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to the AWS Management Console and open the IAM console.
2. In the navigation pane, click **Users**.
3. Click the required user record for which you want to create or manage the access keys.

   Note:
   Ensure that the user has admin access to AWS Translate.

4. Click the **Security credentials** tab.
5. Under **Access keys**, click **Create access key**.



The access key is created.

6. Click **Download .csv file** to save the access key ID and secret access key to a CSV file and record them for later use.
   For more information, see Managing access keys (console).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create credential record

Create Credential record for the AWS Translate spoke. The AWS Translate spoke uses this credential to perform actions on AWS Translate.

Procedure

1. Navigate to **Integration Hub** > **Connection & Credential Aliases**.
2. Open the record, **AWS Translate**.
3. In the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Description
Name	Name to identify the credential record.
Access key ID	Access key ID you had copied from the AWS Management Console.
Secret Access Key	Secret access key you had copied from the AWS Management Console.
Authentication algorithm	Authentication algorithm to authenticate the web services. Select **AWS Translate Authentication Algorithm**.

6. Click **Submit**.

Result

The credential record for the AWS Translate spoke is created.

BigFix Inventory Spoke

Manage hardware, software, and licenses in BigFix Inventory from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

BigFix Inventory spoke v1.5.4 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Streaming (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - Get Connection Info (com.glide.hub.action_step.get_connection_info)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for BigFix Inventory version 9.2.16.0, but may be compatible with later versions.

Spoke requirements

BigFix Inventory Management account.

Spoke flow

The BigFix Inventory spoke provides a sample flow, Configure End of Support Date for Software Component to demonstrate setting the end of support date for software component when the Set Software Support End Date service catalog request is created. You can customize the sample flow as per your requirement by creating a copy of it in the required scope.

Spoke subflow

The BigFix Inventory spoke provides a sample subflow, Send an Email Notification for BigFix Inventory Report to demonstrate sending an email notification with the received BigFix Inventory report attachment. To customize the sample subflow, copy it to the required application scope.

Spoke remote table

ServiceNow provides a sample remote table that you can use to connect to BigFix Inventory, and view, pull, and manipulate data from the BigFix Inventory. The name of the sample remote table is Computers. You can create custom remote tables based on the sample remote table. To access the remote table, on your instance, navigate to **All** > **BigFix Inventory Spoke** > **Software Inventories** > **Remote Table**, and then select **Computers**.

For more information on remote tables, see Remote tables.

Spoke actions

The BigFix Inventory spoke provides actions to automate BigFix Inventory tasks when events occur in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Hardware Management	Look up BIOS Details by Computer ID	Retrieves the BIOS details of a computer.
	Look up BIOS Details Stream	Retrieves the list of BIOS Details of the scanned systems
	Look up Computer Hardware Fields by Computer ID	Retrieves list of logical partitions associated with a computer.
	Look up Hardware Inventories Stream	Lists summary information about hardware records in the BigFix Inventory system.
	Look up IP Addresses by Computer ID	Retrieves the list of IP addresses associated with a computer.
	Look up IP Addresses Stream	Retrieves the list of IP address details of the computers in the Infrastructure.
	Look up Logical Partitions by Computer ID	Retrieves the list of logical partitions associated with a computer.
	Look up Logical Partitions Stream	Retrieves the list of logical partition details of the computers in the infrastructure.
	Look up Memory Details by Computer ID	Retrieves the memory details of a computer.
	Look up Memory Details Stream	Retrieves the list of system memory details of the scanned systems.
	Look up Network Adapters by Computer ID	Retrieves the list of network adapters associated with a computer.
	Look up Network Adapters Stream	Retrieves the list of network adapters.
	Look up Operating System Details by Computer ID	Retrieves the operating system details of a computer.
	Look up Operating System Details Stream	Retrieves details of the operating system of the scanned computers.
	Look up Physical Partition Details by Computer ID	Retrieves list of physical partitions associated with a computer.
	Look up Physical Partitions Stream	Retrieves the list of physical partitions of the scanned computers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Processor Details by Computer ID	Retrieves the operating system details of a computer.
	Look up Processor Details Stream	Retrieves the details of all active physical processors.
	Look up Shared Disks Stream	Lists shared disks in BigFix Inventory.
	Look up Storage Devices by Computer ID	Retrieves list of the physical partitions associated with a computer.
	Look up Storage Devices Stream	Retrieves the list of storage devices of the scanned systems.
License Management	Look up License Metric Utilizations Stream	Retrieves utilization data for licenses in BigFix Inventory.
Software Management	Look up Cluster Information Stream	Lists clusters in the BigFix Inventory system.
	Look up IBM Product Release by Product ID	Retrieves the list of releases associated with an IBM software product.
	Look up IBM Product Release Instances by Release ID	Retrieves the list of instances associated with an IBM software product release.
	Look up IBM Product Release Instances Stream	Retrieves the list of Instances associated with the specified software product release.
	Look up IBM Product Releases Stream	Retrieves the list of releases associated with the specified software product.
	Look up IBM Software Products Stream	Retrieves the list of IBM software product details installed in the infrastructure.
	Look up License Usages Stream	Lists peak license usage over the last 90 days.
	Look up Software Components Stream	Lists software components in BigFix Inventory.
	Look up Software Inventories Stream	Lists installed software in the infrastructure scanned by BigFix Inventory.
	Look up VM Managers	Lists VM managers in the BigFix Inventory system.
	Set End of Support Date for Software Component	Configures the End of Support Date for software component.

For information about setting up the spoke, see Set up the BigFix Inventory spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke modules

The BigFix Inventory spoke provides the BigFix Inventory Spoke application that has these modules:

Field	Description
Software Inventories	Displays details of all software inventories.
Remote Table	
Computers	Displays details of all computers in the BigFix Inventory. When users navigates to this module, the system retrieves this data and displays it for a duration of 5 minutes. After this duration, the data is deleted.

Spoke user role

The BigFix Inventory spoke the bigfix_admin (sn_bigfix_in_spoke.bigfix_admin) role. Users with this role can access the BigFix Inventory Spoke application.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the BigFix Inventory spoke

Integrate the ServiceNow instance and the BigFix Inventory using an API key for authenticating ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the BigFix Inventory spoke.
- BigFix Inventory administrator access to the BigFix Inventory portal.
- Role required: admin.

Generate an API key

Generate an API key that enables your ServiceNow instance to request access to the BigFix Inventory instance.

Before you begin

BigFix Inventory requirements:

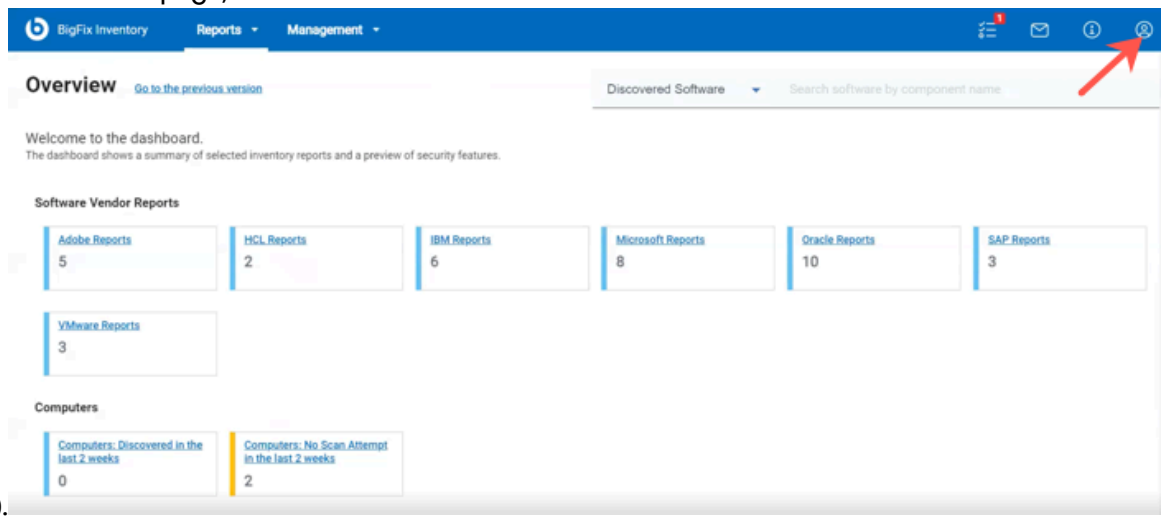
- BigFix Inventory account
- Role required: BigFix Inventory administrator

Complete these steps from your BigFix Inventory environment. For more information on installation and configuration, see BigFix V9.5 Inventory Documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

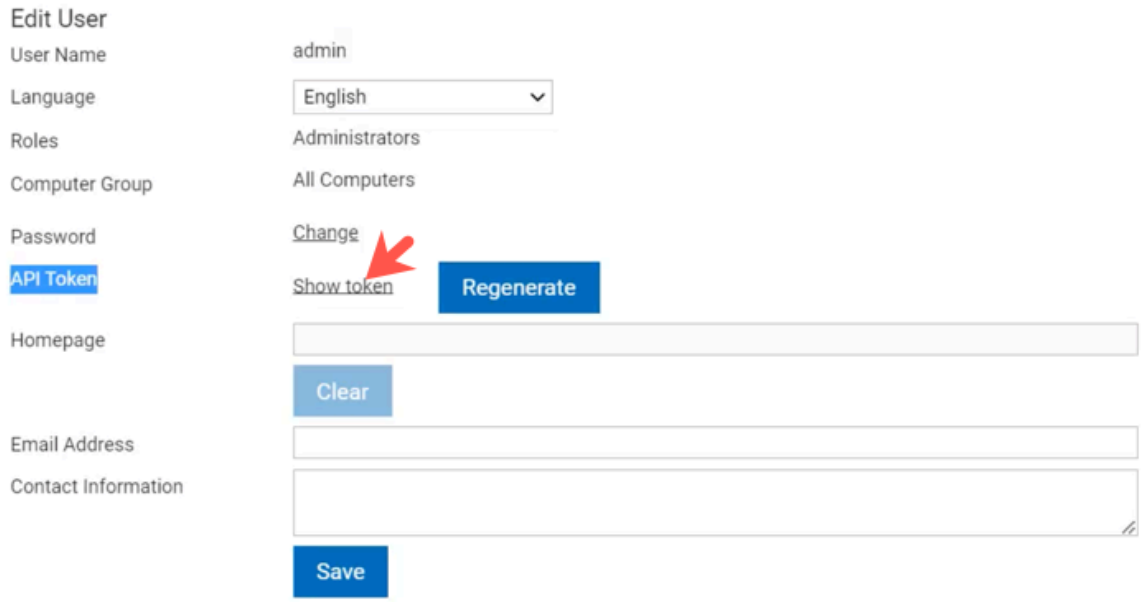
Procedure

1. Log in to your BigFix Inventory portal.
2. On the Overview page, select the Profile icon



( ).

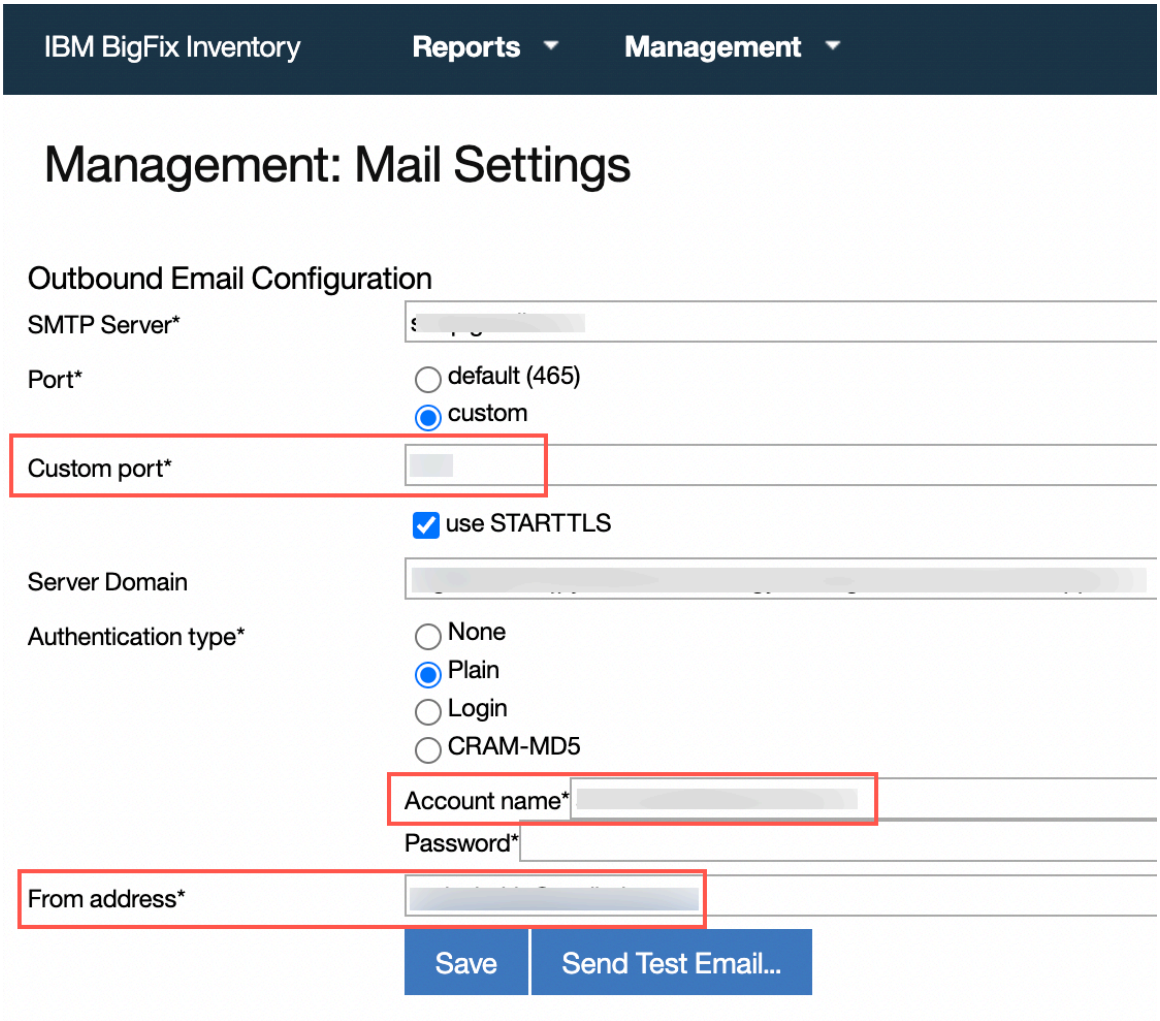
3. Select Profile.
4. On the Edit User page, select the Show token link in the API Token



field.

5. Copy the API token and store at a secure place.
6. Navigate to **Management** > **Configuration** > **Mail Setting**.
7. Configure the mail settings.

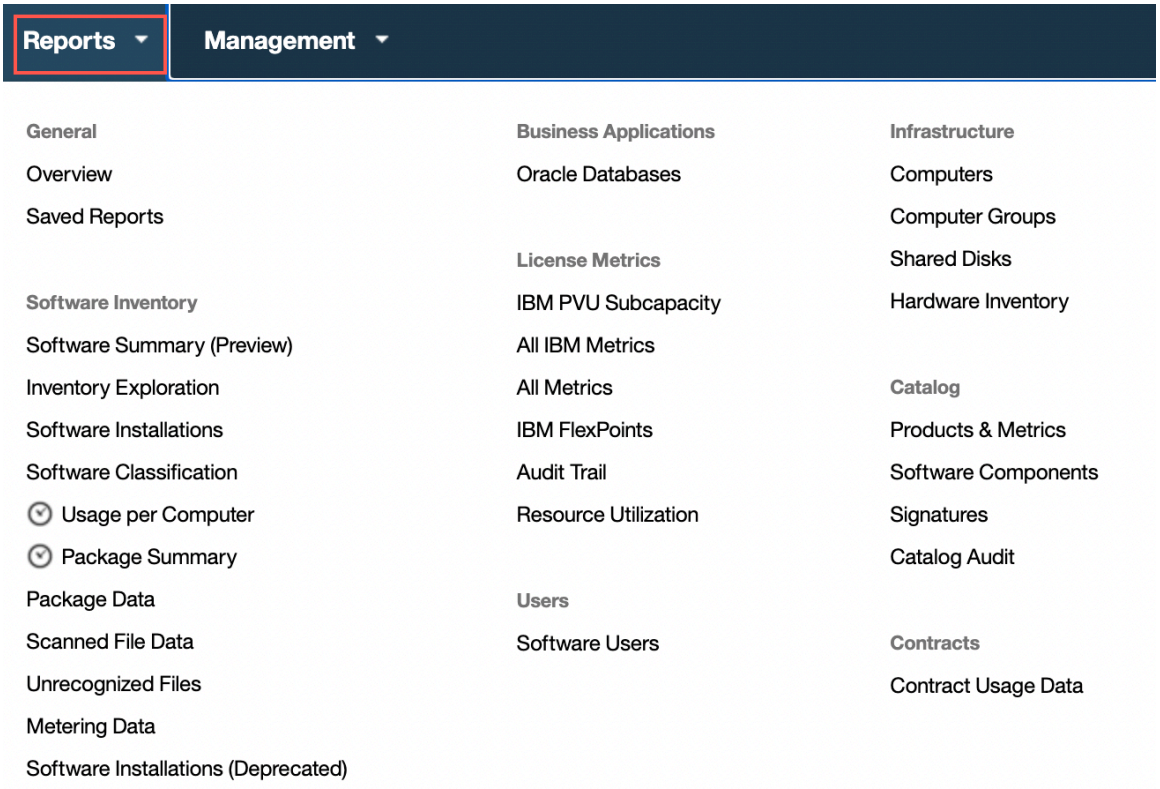
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



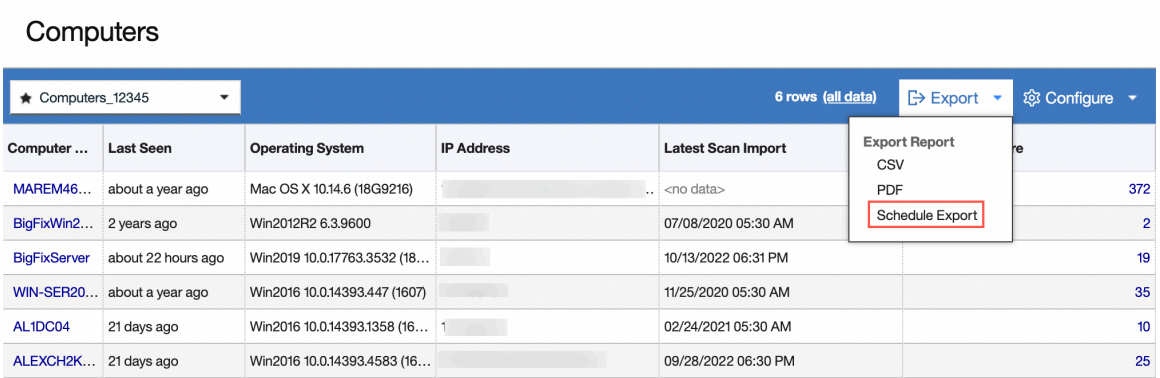
8. Schedule exports of the required reports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to the required report under **Reports**, for example, **Computers**.

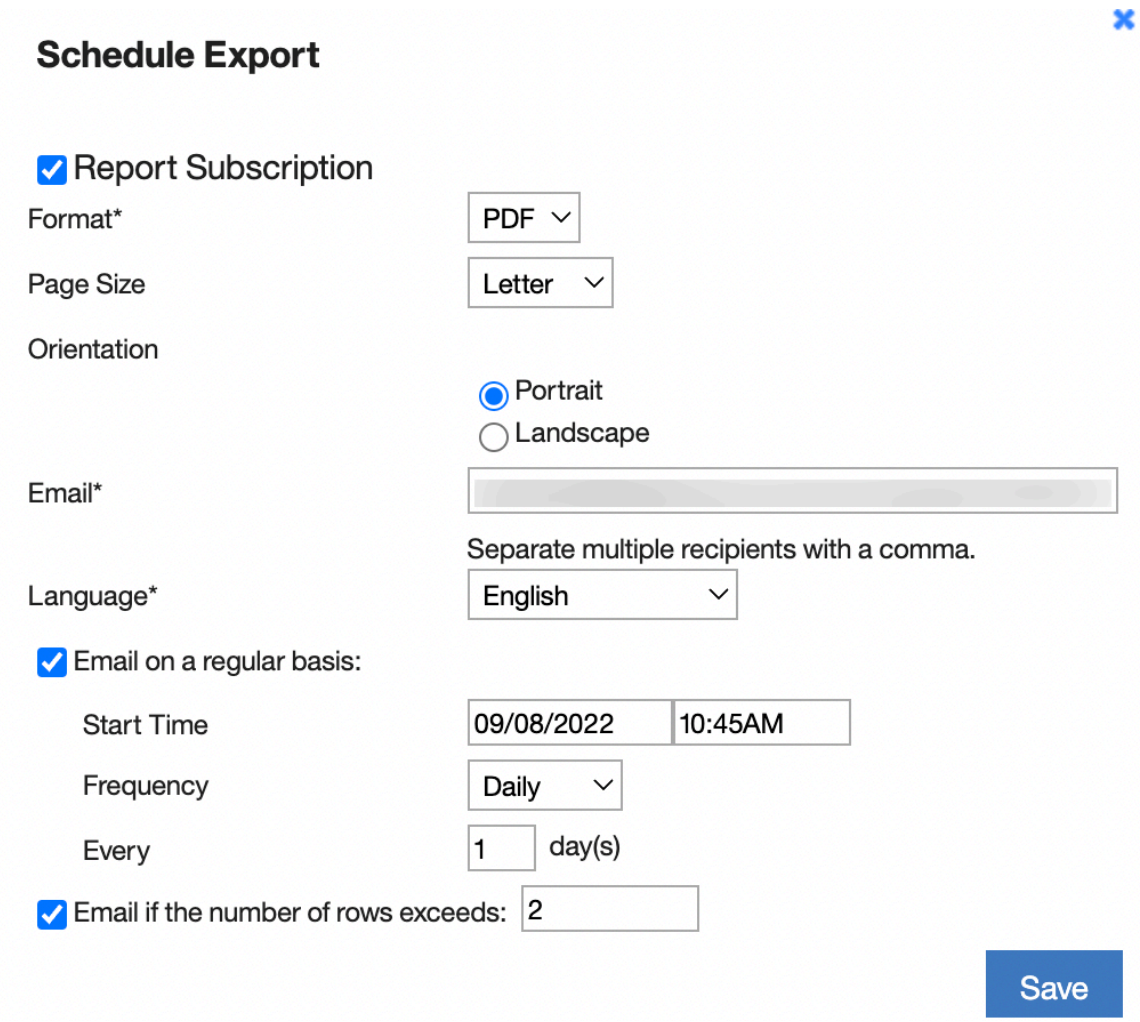


b. Select **Schedule Export**.



c. On the form, specify the ServiceNow instance email address to which the report must be sent and the frequency and time at which the report must be emailed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Save the configurations.

Configure the connection and credential record

Configure the connection and credential record that contains the information to request access to the BigFix Inventory instance.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select Connections.
3. Turn on the Outbound tab.
4. In the Search all connections field, enter `BigFix Inventory`.
5. On the BigFix_Inventory card, select **View Details**.
6. Select **Configure**.
7. Fill the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Connection

Field	Description
Connection Name	Name of the connection established with the BigFix Inventory instance. The first connection's default name is automatically assigned to match the name specified in the Connections and Credentials form on the Connection & Credential Aliases page. To provide your custom name, create a connection record by selecting **Add Connection**.
Connection URL	The URL your ServiceNow instance uses to connect to the BigFix Inventory instance.
API Key	The key that your ServiceNow instance requires to access the BigFix Inventory instance. Enter the API key that you had generated in the BigFix Inventory portal. To learn how to generate an API key, see Generate an API key.

8. Select **Configure Connection**.
   The connection and credential record is created.

Blue Prism Spoke

Manage jobs and processes in Blue Prism environment from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Blue Prism spoke v1.0.2 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Workflow Studio - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow Integration Hub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow Integration Hub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for Blue Prism Process Dispatch Framework version 2.6, but may be compatible with later versions.

Spoke Requirements

Blue Prism account.

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Blue Prism spoke provides actions to automate Blue Prism tasks when events occur in ServiceNow. Available actions include:

Spoke actions

Category	Action	Description
Job Management	Get Job Status	Retrieves the status of the specified job.
	List Job Outputs	Retrieves the list of outputs of a job associated with the specified session ID.
	Start Job	Executes a job with the specified inputs on the Blue Prism environment.
Process Management	Get Process Parameters	Retrieves the list of parameters for the specified process on the Blue Prism environment.
	List Processes	Retrieves the list of processes on the Blue Prism environment.
Utilities	Generate Collection Inputs	Creates a formatted string of the collection type. This formatted string is used as input for the Start Job action.

For information about setting up the spoke, see Set up the Blue Prism spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server requirements

To use these actions, your instance must have a MID Server set up and configured to use SOAP. For more information about running actions on the MID Server, see Integration steps. For more information about the MID Server, see MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Blue Prism spoke

Integrate your ServiceNow instance with the Blue Prism server to have the requests from your ServiceNow instance authenticated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Blue Prism spoke.
- Role required: admin.

Configure Blue Prism application

Configure the Dispatch Framework and Process info utilities in your Blue Prism environment to enable integration with ServiceNow.

Before you begin

Blue Prism Digital Exchange account.

Role required: admin.

Procedure

1. Log in to Blue Prism Digital Exchange.
2. Click **Link to Asset** of Dispatch Framework utility.
   You're redirected to the Dispatch Framework repository on GitHub.
3. Complete the steps mentioned in the Blue Prism Process Dispatch Framework User Guide.
4. Click **Link to Asset** of Process Info utility.
   You're redirected to the Process Info repository on GitHub.
5. Complete the steps mentioned in the Blue Prism Process Info VBO User Guide.
   Your Blue Prism environment is ready for integration with your ServiceNow instance.

Create Connection and Credential record for Blue Prism ProcessInfo

Create a connection and credential record to enable your ServiceNow instance to connect to the Blue Prism ProcessInfo utility. The record is a single form that contains all the information needed to connect to the Blue Prism ProcessInfo utility every time.

Before you begin

Role required: admin.

Procedure

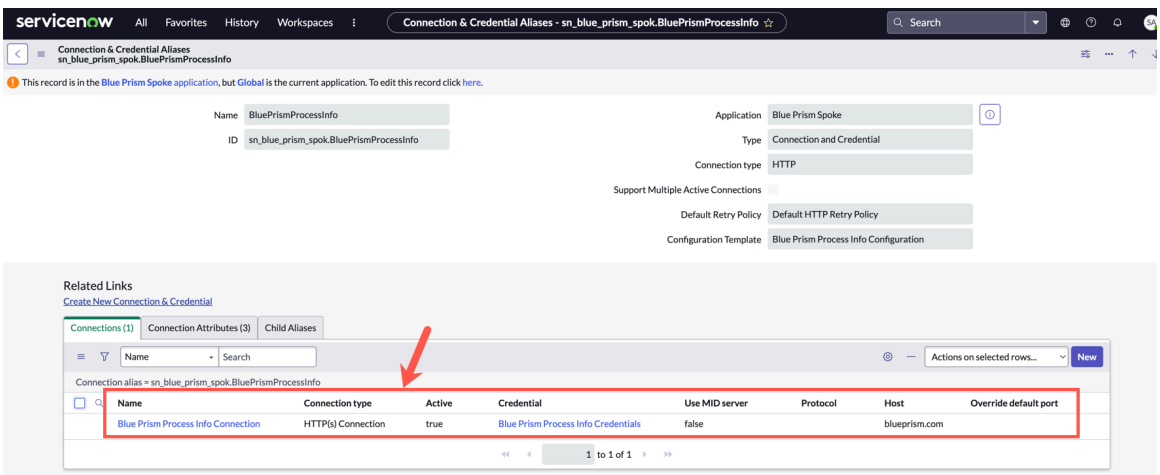
1. Navigate to **All** > **Connections & Credentials** > **Connection and Credential Aliases**.
2. Open the record for **BluePrismProcessInfo**.
3. From the **Related Links** section, Click **Create New Connection & Credential**.
4. On the form, fill these fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Name	Name of the connection. Default value is `Blue Prism Process Info Connection`.
Connection URL	URL used to connect to the connection to the Blue Prism environment.
Database Credential Name	Credential name of the database. Default value is `DB Read User`.
Database Server Address	Database server address in the Blue Prism environment.
Database Name	Name of the database. Default value is `BluePrism`.
Credential Name	Blue Prism Process Info Credentials.
User Name	User name that the Blue Prism Process Info server authenticates.
Password	Password that the Blue Prism Process Info server authenticates.

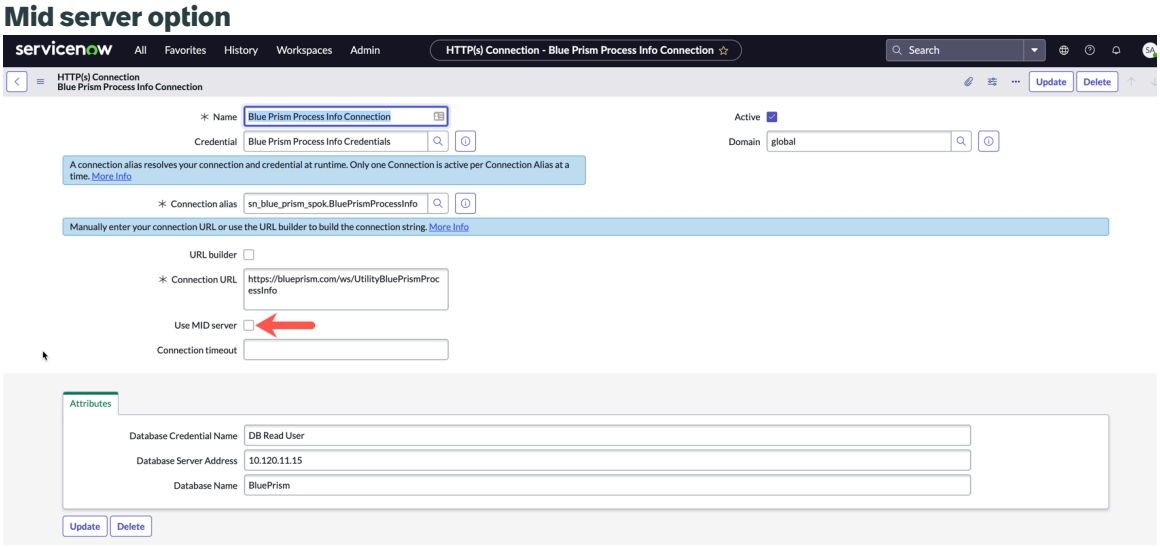
5. Click **Create**.
   A new connection and credential record is created in the Connections tab. This is the default record unless you create another record and set that as default.

Default connection and credential record created



6. Click to open the record.
7. Enable the **Use MID server** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Create Connection and Credential record for Blue Prism Process Dispatcher

Create a connection and credential record to enable your instance to connect to the Blue Prism Process Dispatcher utility. The record is a single form that contains all the information needed to connect to the Blue Prism ProcessInfo utility every time.

Before you begin

Role required: admin.

Procedure

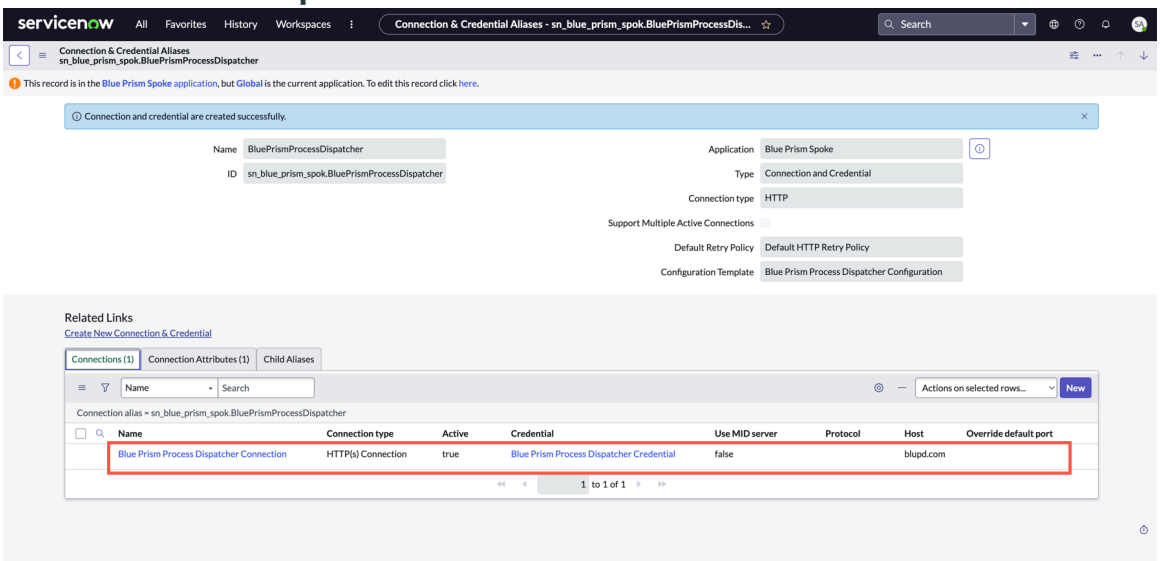
1. Navigate to **All** > **Connections & Credentials** > **Connection and Credential Aliases**.
2. Open the record for **BluePrismProcessDispatcher**.
3. From the **Related Links** section, click **Create New Connection & Credential**.
4. On the form, fill these fields:

Field	Description
Connection Name	Name of the connection. Default value is `Blue Prism Process Dispatcher Connection`.
Connection URL	URL used to connect to the Blue Prism environment.
Runtime Credential Name	Credential with runtime access configured in the Blue Prism environment.
Credential Name	Name of the credential. Default value is `Blue Prism Process Dispatcher Credentials`.
User Name	User name that the Blue Prism Process Dispatcher server authenticates.
Password	Password that the Blue Prism Process Dispatcher server authenticates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Create**.
   A new connection and credential record is created in the Connections tab. This is the default record unless you create another record and set that as default.

Blue Prism Process Dispatcher connection and credential record



6. Click to open the record.
7. Enable the **Use MID server** option.

   To set up the MID Server for this spoke, see Set up MID Server for a spoke.

BMC Remedy Spoke

Manage change requests, incidents, problems, and other records in BMC Remedy from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

BMC Remedy spoke v1.4.1 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for BMC Remedy AR server version 19.08, but may be compatible with later versions.

Spoke flows

The BMC Remedy spoke provides the Look up Record sample flow to demonstrate retrieving the details of records based on last modified date. To customize the sample flow, copy it to the required application scope.

Spoke subflows

The BMC Remedy spoke provides the Get Incident Request ID sample subflow to demonstrate retrieving the Request IDs of the specified incident numbers. To customize the sample subflow, copy it to the required application scope.

Spoke actions

The BMC Remedy spoke provides actions to perform BMC Remedy tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Change Management	Create Change	Creates a change request in BMC Remedy.
CMDB Management	Get Class Attributes	Retrieves class attributes schema from BMC Remedy.
	Get Classes	Retrieves the list of all non-abstract classes in the BMC Remedy CMDB.
	Get Datasets	Retrieves the list of all datasets in BMC Remedy CMDB.
	Get Namespace	Retrieves the list of all namespaces in BMC Remedy CMDB.
	Look up CMDB Data	Get All Incidents all CMDB data for specified dataset, namespace, and class from BMC Remedy.
Incident Management	Create Incident	Creates an incident in BMC Remedy.
	Get All Incidents	Retrieves details of all incidents from BMC Remedy.
	Update Attachment	Updates the attachment of the required incident in BMC Remedy.
	Get Incident By Number	Retrieves details of the specified incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Metadata Retrieval	Get All Objects	Retrieves name and label of all objects in BMC Remedy.
	Alias Selector	Validates the given alias specific to the BMC Remedy spoke and retrieves the alias if it is valid.
	Get Change Form Fields	Retrieves the list of fields in the Change Interface form table.
	Get Change Status	Retrieves the list of all statuses in the BMC Remedy Change Management.
	Get Change Timing	Retrieves the list of all change timings in BMC Remedy Change Management.
	Get Creatable Fields	Retrieves the list of creatable fields in a required standard or custom BMC Remedy table.
	Get Creatable Objects	Retrieves the list of creatable objects in BMC Remedy.
	Get Impact	Retrieves the list of all impacts in the BMC Remedy.
	Get Incident Form Fields	Retrieves the list of fields in the Incident Interface form table.
	Get Incident Status	Retrieves the list of all statuses in BMC Remedy Incident Management.
	Get Investigation Driver	Retrieves the list of all investigation drivers in BMC Remedy Problem Management.
	Get Object Schema	Retrieves schema of the specified object in BMC Remedy.
	Get Problem Form Fields	Retrieves the list of fields in the Problem Interface form table.
	Get Problem Status	Retrieves the list of all statuses in BMC Remedy Problem Management.
	Get Queryable Fields	Retrieves the list of updatable fields in a required standard or custom BMC Remedy table.
	Get Reported Source	Retrieves the list of all reported sources in BMC Remedy Incident Management.
	Get Risk Level	Retrieves the list of all risk levels in BMC Remedy Change Management.
	Get Service Type	Retrieves the list of all service types in BMC Remedy Incident object.
	Get Token	Generates access token for BMC Remedy.
	Get Updatable Fields	Retrieves the list of updatable fields in the required standard or custom BMC Remedy table.
	Get Urgency	Retrieves the list of all urgencies in BMC Remedy.
Problem Management	Create Problem	Creates a problem in BMC Remedy.
Record Management	Create Record	Creates record of the required type in BMC Remedy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Record Details By ID	Retrieves details of the specified record.
	Look up Record	Looks up a record in BMC Remedy based on the query fields.
	Update Record	Updates details of the specified record in BMC Remedy.
Service Request Management	Create Service Request	Creates a service request in BMC Remedy.
	Get Service Request Form Fields	Retrieves the list of fields in the Service Request Interface form table.
	Get Service Request Status	Retrieves the list of all status in the BMC Remedy Service Request management.

Spoke modules

The BMC Remedy spoke adds a BMC Remedy application to your instance and includes these modules:

Module	Description
Credentials	Credential records for the BMC Remedy spoke can be accessed here.
Objects	Information about the objects in BMC Remedy can be accessed here. You can also create an object that can be used in your flows. See Create a BMC Remedy object in your ServiceNow instance for information about creating an object.

Spoke user roles

The Remedy_Admin (sn_bmcremedy_spoke.Remedy_Admin) is available when the BMC Remedy spoke is installed. Users with role can view and create objects in the Objects module.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Two aliases are available when you install the BMC Remedy spoke; one alias is of the **Connection and Credential** type and the other alias is of the **Credential** type. For information about setting up the spoke, see Set up the BMC Remedy spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the BMC Remedy alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the BMC Remedy spoke

Integrate the ServiceNow instance and BMC Remedy by using Remedy credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the BMC Remedy spoke.
- Role required: admin.

Note:
Ensure that you perform these steps in the **BMC Remedy Spoke** application scope only.

Create Credential record for the BMC Remedy spoke

Create Credential records for your BMC Remedy application. The BMC Remedy spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record for the **BMC Remedy spoke** whose **Type** is **Credential**, for example, `BMCRemedy_Credential`.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **Remedy Credential**.
5. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, `Remedy Cred`.
Active	Option to actively use the credential record.
User name	User name of the BMC Remedy user. **Note:** Administrator user isn't necessary. However, ensure that the BMC Remedy user has permissions to perform the required change, incident, and problem management actions.
Password	Password of the BMC Remedy user's account.
Credential alias	Credential alias record associated with this record.
Token Status	Status of the BMC Remedy token. Select **Active**.
Applies to	MID Servers that can use this credential record.
MID servers	Specific MID Servers that can use this credential record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
	Note: This field appears only when **Specific MID servers** is selected from **Applies to**.

6. Right-click the form header and click **Save**.

Result
The credential record the BMC Remedy spoke is created.

Create Connection record for the BMC Remedy spoke

Create Connection record for your BMC Remedy application. The BMC Remedy spoke connection and credential alias uses this connection to perform actions in BMC Remedy.

Before you begin
Role required: admin.

Procedure
1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record of **BMC Remedy spoke** whose **Type** is **Connection and Credential**, for example, `BMCRemedy`.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `BMC Remedy Connection`.
Credential	Credential record you created for BMC Remedy. For example, select **Remedy Cred**.
Connection alias	Connection alias associated with this record.
URL builder	Option to manually enter the connection URL or use system to build the URL based on the inputs.
Connection URL	URL to launch the BMC Remedy application. For example, `http://<bmc-remedy-localhost>:8008/api`
Use MID server	Option to use a MID Server.
Capabilities	Capability of the MID Server. This field appears only when the **Use MID server** option is selected.
MID Application	Option to use a MID Server. This field appears only when the **Use MID server** option is selected.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

5. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The connection record the BMC Remedy spoke is created.

Create a BMC Remedy object in your ServiceNow instance

Manage other objects in BMC Remedy from your ServiceNow instance by creating the required object.

Before you begin
Role required: admin or Remedy_Admin

About this task
By default, the BMC Remedy spoke supports the change request, incident, and problem objects. To manage other objects, such as Product Catalog, create an object in your ServiceNow instance.

Procedure

1. Navigate to **All** > **BMC Remedy Spoke** > **Objects**.
2. Click **New**.
3. On the form, fill these fields.

BMC Remedy Objects form

Field	Description
Name	Name of the required form. This value is unique to each object. For example, the form value for Product Catalog is PCT : `Product Catalog`.
Label	Label name to identify the record.
Creatable	Option to create records in the object. Select the option to create records and use the object in your flows.

4. Click **Submit**.

Box Spoke

Move attachments to Box where they can be managed as shared documents.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Box spoke v3.6.0 is the latest version.

Supported versions

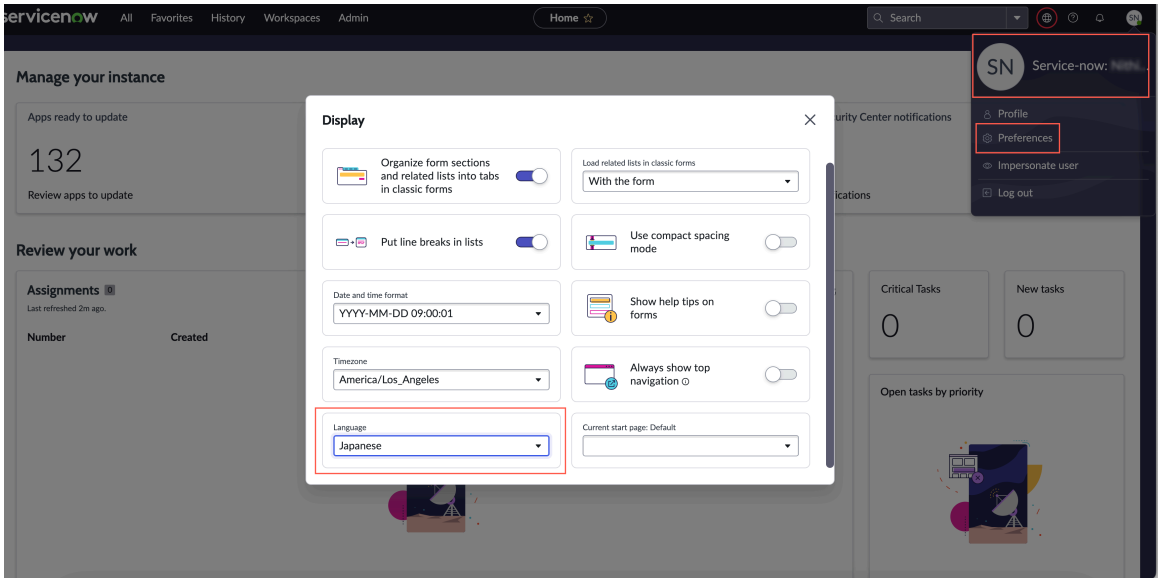
API version v2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

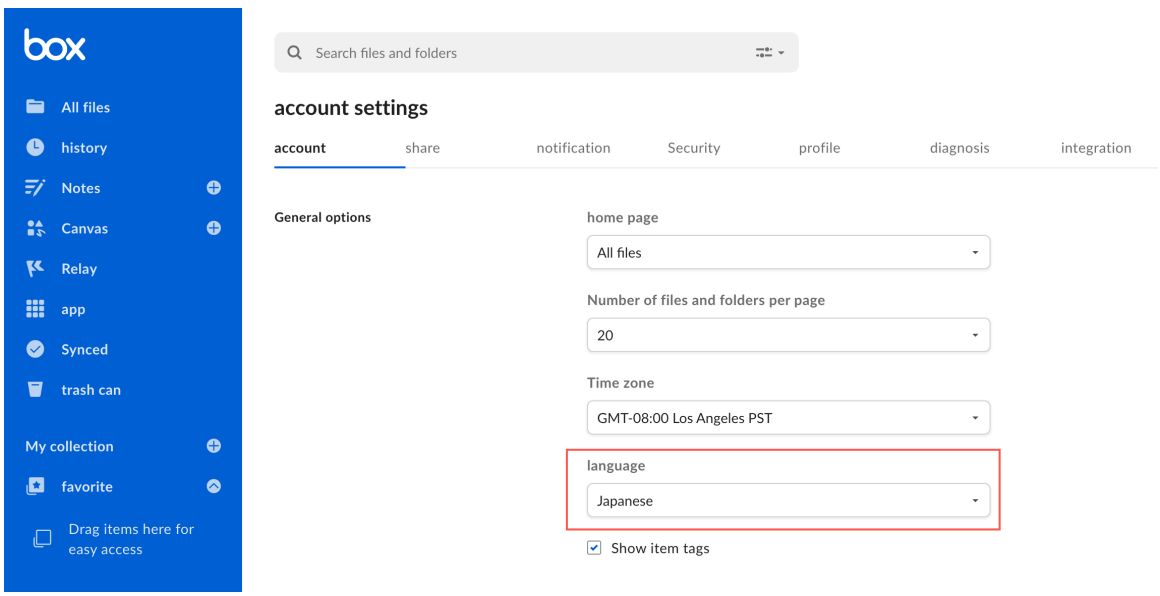
Spoke requirements

Ensure that same languages are selected in your ServiceNow instance and Box account.

- In your ServiceNow instance, select the required language by navigating to **User Profile** > **Preferences** > **Display**.



- In your Box account, select the required language by navigating to **Account Settings** > **Account** > **General Options**.



Spoke flows

The Box spoke provides sample flows in the draft state to demonstrate automating Box tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
Move Attachment when created to Box	Moves attachment files from ServiceNow to Box when a new attachment record is added. Updates the trigger record with a shared link to the moved attachment file on Box.
On-boarding user	Creates a user in Box when you create a ServiceNow user in the **Box User** group.

Spoke actions

The Box spoke provides actions to automate Box tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Box AI Management	Ask Question	Sends a prompt to the supported AI models using the provided context and returns a brief answer focused on the user's question.
	Extract Metadata Freeform	Sends a context#aware request to supported AI models and extracts metadata as structured key#value pairs.
	Look up AI Agent Default Configuration	Retrieves the default configuration settings for the specified AI agent.
Box Hub Management	Look up Box Hub Info by ID	Retrieves details for a Box Hub using the specified Hub ID.
	Look up Box Hub Items Stream	Retrieves all items associated with the specified Box Hub.
	Look up Box Hubs Stream	Retrieves all Box Hubs available to the requesting user based on the Box credentials used to generate the access token.
Document Management	Add Metadata to File	Stores the provided attributes information by adding it as metadata for Box files.
	Attach Box File to Record	Copies a file from Box and attaches it to the specified ServiceNow record.
	Lookup File ID	Retrieves the ID of the specified file in Box.
	Move Owned Item	Moves all items owned by the specified user in Box to the specified folder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Remove File	Removes the specified file from Box.
	Search Content Stream	Searches for files, folders, web links, and shared files across the user's content or across the entire enterprise.
	Upload File	Uploads the specified file to Box.
	Look up Archives Stream	Retrieves all available archives from the Box application.
Document Sharing	Add Collaborator	Grants a user or group a specified level of access to a particular file or folder. Collaborators have one of these access levels. • Co-Owner • Editor • Previewer • Preview Uploader • Uploader • Viewer • Viewer Uploader
	Create Shared Link	Create a direct and read-only link to a file or folder in Box.
	Look up Folder Collaborators By ID	Retrieves all the collaborators associated to the specified folder ID.
	Remove Collaborator	Removes the specified collaboration from a file or folder in Box.
File Management	Look up File Information	Retrieves detailed information for the specified file.
Folder Management	Create Folder	Creates a folder in Box on behalf of the specified Box user account.
	Delete Folder	Deletes the specified folder in Box.
	Lookup Folder ID	Retrieves the ID of the specified folder in Box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: Items added to Box require 10 minutes to become accessible. For example, if one action creates a folder, a Lookup Folder ID action won't return results until after 10 minutes have passed.
	Look up Folder Information	Retrieves details for the specified folder.
	Look up Folder Items Stream	Retrieves all items within the specified folder, including files, subfolders, and web links.
Group Management	Create Group	Creates a group in Box with the specified invitation preferences.
	Delete Group	Deletes the specified group in Box.
	Update Group	Updates the specified group in Box with the specified preferences.
Legal Hold Management	Assign Legal Hold Policy	Assigns a legal hold policy to a file, file version, folder, or user.
	Create Legal Hold Policy	Creates a legal hold policy.
	Look up All Legal Hold Policies Stream	Retrieves a list of legal hold policies of an enterprise.
	Look up Legal Hold Policy Assignment by ID	Retrieves a legal hold policy assignment for the specified ID.
	Look up Legal Hold Policy Assignments Stream	Retrieves a list of items assigned to a legal hold policy.
	Look up Legal Hold Policy by ID	Retrieves a legal hold policy for the specified ID.
	Remove Legal Hold Policy	Deletes an existing legal hold policy.
	Unassign Legal Hold Policy	Removes the assignment of an item to a legal hold.
	Update Legal Hold Policy	Updates a legal hold policy.
Metadata Management	Look up Metadata Instance on File By File ID	Retrieves the metadata instance of the file with the specified file ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Metadata Instance on File by Scope and Template Key	Retrieves the metadata instance of a folder with the specified scope and template key.
	Look up Metadata Instance on Folder By Folder ID	Retrieves all the metadata of the folder with the specified folder ID. **Note:** Don't use this action on a root folder that has a folder ID value as zero.
	Look up Metadata Instance on Folder by Scope and Template Key	Retrieves all the metadata of a folder with the specified scope and template key.
	Query Files or Folders by Metadata Stream	Searches for files or folders using SQL-like syntax and returns the matching results.
Retention Policy Management	Assign Retention Policy	Assigns a retention policy to an item.
	Create Retention Policy	Creates a retention policy.
	Look up Retention Policies	Retrieves all the retention policies of an enterprise.
	Look up Retention Policy Assignment By ID	Retrieves the retention policy with the specified ID.
	Look up Retention Policy Assignments Stream	Returns a list of all retention policy assignments associated with a specified retention policy.
	Look up Retention Policy by ID	Retrieves the retention policy with the specified ID.
	Update Retention Policy	Updates a retention policy.
User Management	Add User to Group	Adds the specified user to the specified group in Box.
	Create User	Creates a user account in Box.
	Delete User	Deletes the specified user in Box.
	Disable User	Sets the status of the specified user in Box to inactive.
	Enable User	sets the status of the specified user in Box to active.
	Lookup User ID	Retrieves the ID of the specified user in Box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update User	Updates the specified user in Box with the specified role changes.
Webhook Management	Create Webhook	Creates a webhook.
	Look up Webhook By ID	Retrieves the webhook with the specified ID.
	Look up Webhooks Stream	Retrieves all the defined webhooks for the specified application.
	Remove Webhook	Removes a webhook.
	Update Webhook	Updates a webhook.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Box user management AI agent	Manages user management tasks (that is, adds a user to group, enables a user, create user, delete user, update user, look up user ID, disable user) in Box.
Box folder management AI agent	Manages folder management tasks (that is, create a folder, look up the folder ID, delete a folder) in Box.
Box document sharing AI agent	Manages document sharing tasks (that is, remove a collaborator, add a collaborator, create a shared link, look up the folder collaborators by ID) in Box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
Box group management AI agent	Manages group management tasks (that is, update a group, create a group, delete a group) in Box.
Box metadata management AI agent	Manages metadata retrieval tasks (that is, look up a metadata instance on a file by scope and template key, look up a metadata instance on a folder by folder ID, look up a metadata instance on a folder by scope and template key, look up a metadata instance on a file by file ID) in Box.
Box retention policy management AI agent	Manages retention policy management tasks (that is, update a retention policy, look up a retention policies stream, look up a retention policy assignment by id, look up a retention policy by id, look up a retention policy assignments stream) in Box.
Box document management AI agent	Manages document management tasks (that is, remove a file, attach a box file to a record, upload a file, move an owned item, search a content stream, look up a file ID, add metadata to a file) in Box.
Box legal hold management AI agent	Manages legal hold management tasks (that is, create a legal hold policy, look up a legal hold policy assignment by ID, update a legal hold policy, look up all legal hold policies stream, look up a legal hold policy by ID, unassign a legal hold policy, remove a legal hold policy, look up a legal hold policy assignments stream) in Box.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke triggers

ServiceNow supports specific events on Box that create triggers. You must first configure a flow with a supported trigger definition. When an event, for example, a push request, occurs on the Box, it sends the payload via a webhook to the ServiceNow instance. After that, the flow that you configured is triggered at the ServiceNow instance to automate a workflow. The supported events are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Trigger	Description
File Management	File Downloaded	Flow is triggered when a file is downloaded.
	File Locked	Flow is triggered when a file is locked.
	File Moved	Flow is triggered when a file is moved.
	File Renamed	Flow is triggered when a file is renamed.
	File Unlocked	Flow is triggered when a file is unlocked.
	File Uploaded	Flow is triggered when a file is uploaded.
Folder Management	Folder Created	Flow is triggered when a folder is created.
	Folder Downloaded	Flow is triggered when a folder is downloaded.
	Folder Moved	Flow is triggered when a folder is moved.
	Folder Renamed	Flow is triggered when a folder is renamed.

For information about setting up the triggers for the Box spoke, see Set up triggers for the Box spoke. For more information about inbound integration, see Conditional and event-driven inbound integration.

Spoke user roles

The following user roles are available with the spoke:

- Policy User (sn_box_spoke.box_policies_user): Users with this role have access only to **Retention Policies** module.
- Legal Hold Policy User (sn_box_spoke.legal_hold_policy_user): Users with this role have access only to the **Legal Hold Policies** module.
- Box Webhook Registry User (sn_box_spoke.box_webhook_registry_user): Users with this role have access only to the **Box Webhook Registry** module.

Box spoke module

Bi-directional webhooks can be set up to be notified about the required events. A webhook registry defines the conditions that must be met to notify the ServiceNow app. These conditions are based on the events in Box that you want to be notified about. When the conditions are met, the specified trigger name triggers the associated subflow, which in turn automates the Box tasks.

Webhooks require separate setup and can be used independently without using the spoke actions. The Box spoke adds the Box Spoke application to your instance and includes the following modules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Box module

Module	Description
Box Webhook Registry	Create and view the Box webhooks in ServiceNow.
Legal Hold Policies	View the list of available Box legal policies.
Retention Policies	View the list of available Box retention policies.

Box account requirements

The Box spoke requires creating a custom app on your Box account to generate OAuth 2.0 tokens. See Create an OAuth application.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the following alias records to authorize actions.

Connection & Credential alias	Description	Connection alias requirements
Box	Connection to the Box Collaboration and File Management APIs.	• Connection type: HTTP • Connection URL: https://api.box.com
Box Upload	Connection to the Box upload service.	• Connection type: HTTP • Connection URL: https://upload.box.com

To use the spoke connection aliases, create an associated Connection record and an associated Credential record for each alias. For information about setting up the spoke, see Set up the Box spoke.

Set up the Box spoke

Integrate your ServiceNow instance and the Box APIs to automate the Box spoke actions. For example, you can set up a flow that removes a file in your Box account. When you set up the Box spoke, this flow is automated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Box spoke.
- Access to Box developer's console.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an OAuth application

Create a custom OAuth application from your Box account to enable OAuth 2.0 authentication with the Box spoke.

Before you begin

Box requirements:

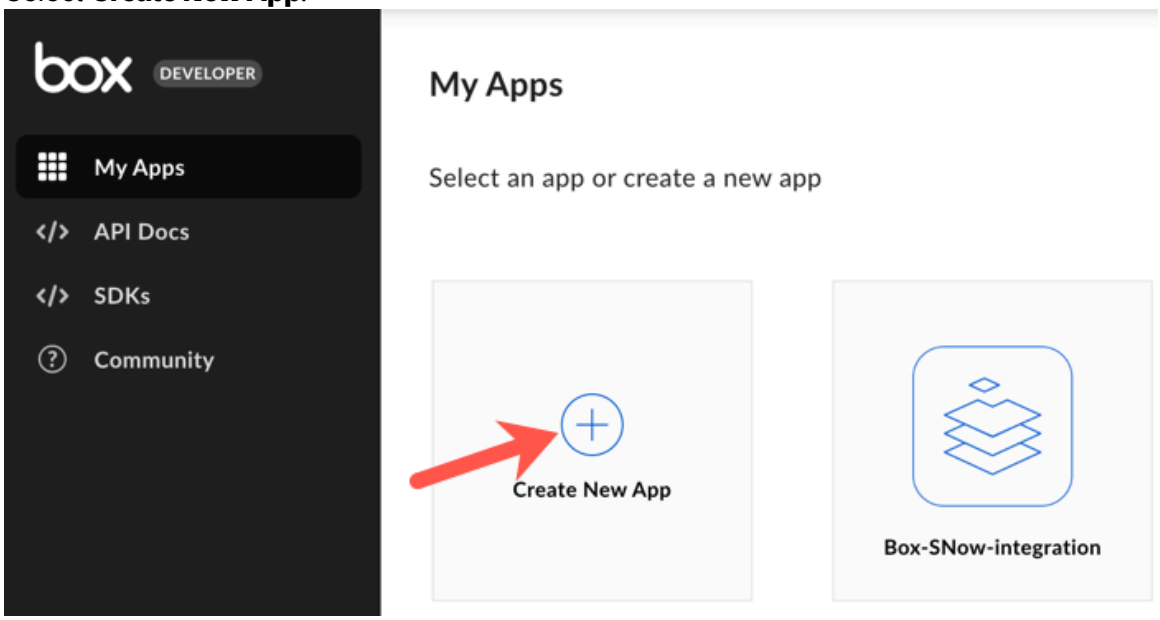
- Box account
- Box administrator credentials
- Role required: admin

About this task

Complete these steps from your Box account. See the Box Developer Portal documentation for instructions on creating and configuring custom applications.

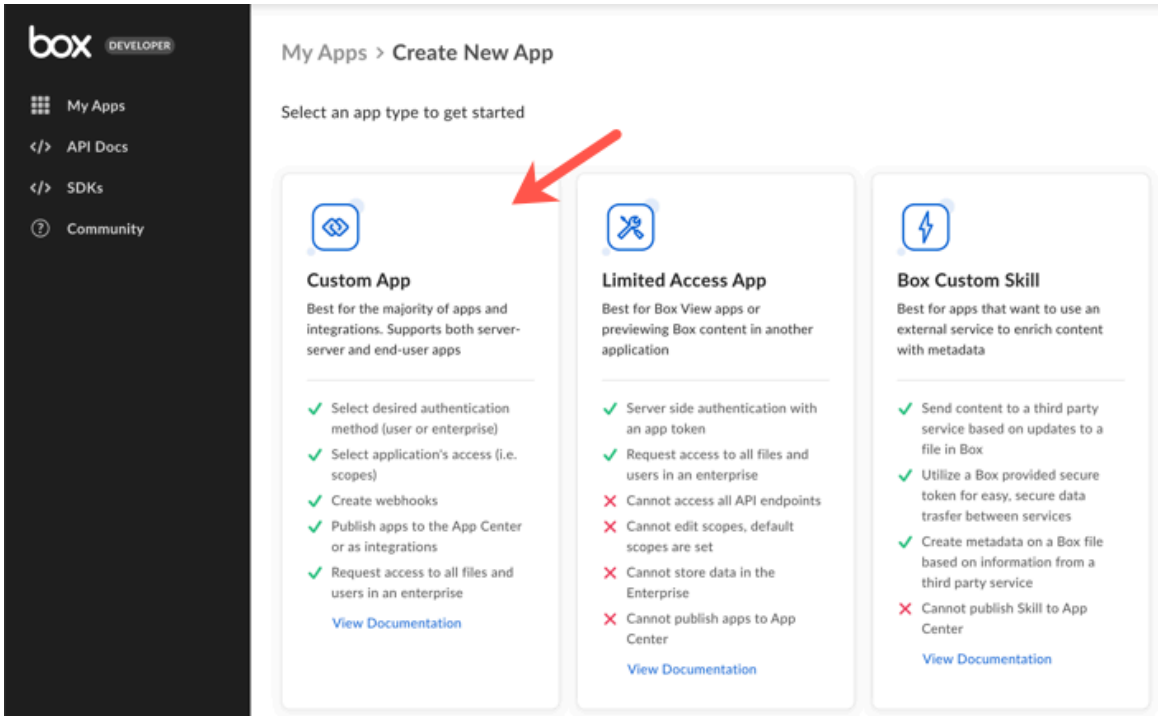
Procedure

1. Log in to the Box developer's console.
2. Select **Create New App**.



3. Select **Custom App**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Complete the form.

Field	Value
App Name	`Box App`
Description (optional)	Leave this field empty
Purpose	Select**Custom Portal**

5. Select **Next**.
   The Create a Custom App modal appears.
6. Select **User Authentication (OAuth 2.0)**.
7. To confirm, select **Create App**.
   You are in your application's configuration settings.
8. In the OAuth 2.0 Credentials section, copy the Client ID and Client Secret.

   You need this information to register the application as a third-party OAuth provider on your ServiceNow instance.
9. In the Application Scopes section, enable the scope permissions you want to support.

Application Scopes	Use for
Read and write all files and folders stored in Box	Document management, document sharing, and folder management actions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Scopes	Use for
Manage users	User management actions
Manage groups	Group management actions
Manage enterprise properties	Document sharing, group management, and user management actions
Manage webhooks	Configuring V2 webhooks
Manage AI	Interact with Box AI actions

10. Select **Save Changes**.

Configure a connection record for the Box spoke

Add and configure a Box connection to authenticate ServiceNow requests in a Box spoke.

Before you begin

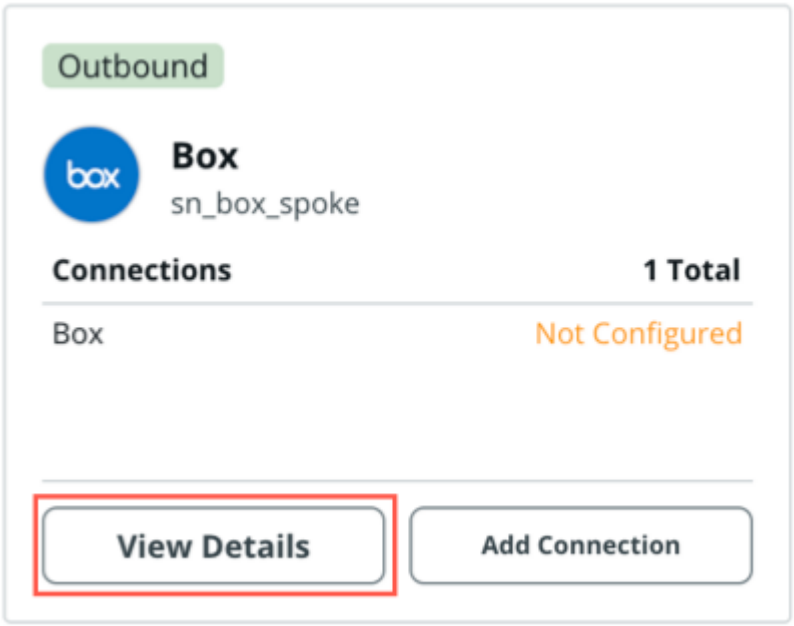
Role required: admin

Procedure

1. In your ServiceNow instance, navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Box** and click **View Details**.

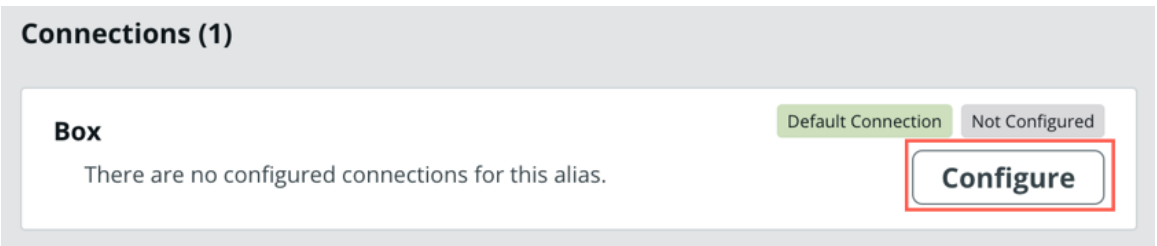
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Box spoke, click **View Details**.



- To manage more than one Box spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

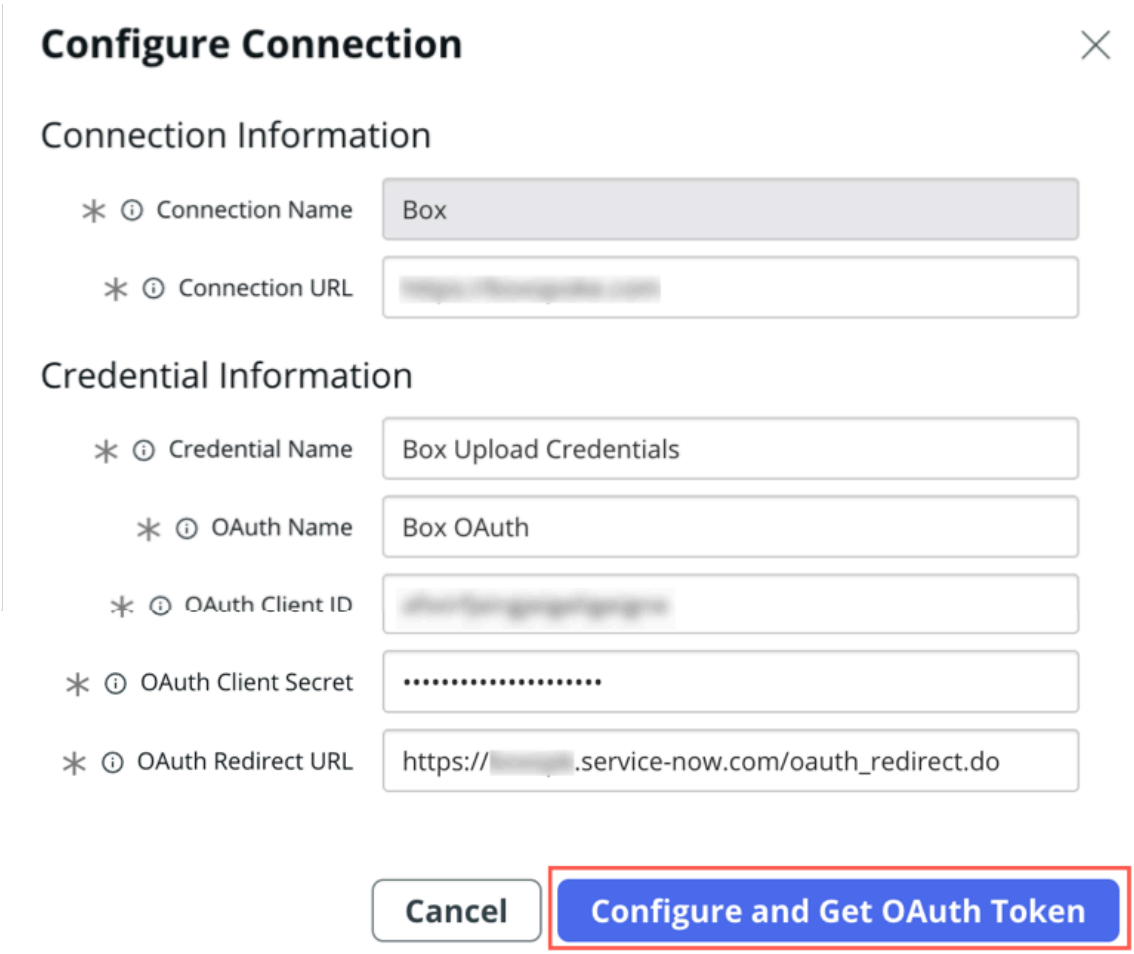


5. On the form, fill these values.

Field	Value
Connection Name	`Box`.
Connection URL	The instance URL in this format:`<provider-domain-name>.net`.
Credential Name	`Box Upload Credentials`.
OAuth Name	`Box OAuth`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
OAuth Client ID	The application client ID. For more information, see Create an OAuth application.
OAuth Client Secret	The application client secret. For more information, see Create an OAuth application.
OAuth Redirect URL	The URL in this format: `https://<ServiceNow-instance-name>.service-now.com/oauth_redirect.do`. Replace `<ServiceNow-instance-name>` with your ServiceNow instance name.



6. Click **Configure Connection**.

Result
The spoke connection is configured and ready to be used.

Note:
OAuth tokens expire after 30 days. An administrator can regenerate the spoke OAuth token every 30 days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Regenerate Box OAuth token

Regenerate the Box OAuth token when it expires. The Box spoke OAuth token expires every thirty days.

Before you begin
Role required: admin

Procedure

1. In your ServiceNow instance, navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the **Connections** tab.
3. Search for the **Box** connection alias.
4. Select **View Details**.
5. Select **Get OAuth Token** for the connection.

Result
The Box spoke receives a new OAuth access token. It expires in 30 days.

Integrate ServiceNow instance with JWT Bearer grant type

Set up an OAuth provider with the JWT Bearer grant type to integrate your ServiceNow instance with Box.

Before you begin
Role required: admin

Procedure

1. Do the steps at the Box end.
   a. Sign Up for Box Developer Account.
   b. On the Developer Console, select **Custom App** .
   c. Confirm that the authentication method is OAuth 2.0 with JWT (Server Authentication).
   d. Enter a unique name for the app and create the app.
   e. View the app.
   f. On OAuth 2.0 Credentials, copy the Client ID and Client Secret.
   g. Create a new keystore and export a public key from that into BOX.
   h. Note the enterpriseID under the App Settings.
   i. Navigate to **My apps** > **<App Name>** > **General** > **Submit for Authorization**.
   j. Select your account name on the top of the Admin Console.
   k. In your account, create a folder and upload a text file.
2. Do the steps at the ServiceNow instance end.
   a. Navigate to **System Definition** > **Certificates** > **New** > **Type** > **Storepass**.
   b. Attach the keystore certificate.
   c. Configure a JWT signing key by navigating to **System OAuth** > **JWT Keys** > **New**.
   d. Create OAuth application registry entry by navigating to **System OAuth** > **Application Registry** > **New** > **Connect to a third party OAuth Provider** > **Default Grant type (JWT Bearer)**.
   e. Under the OAuth entity profile (oauth_entity_profile) associate the created 'jwt provider'.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Create a REST message.

g. In the REST Message, select **Get OAuth token** to get the access token.

h. Go to the 'Default GET' method and click on 'Test'.

i. An the BOX end, share the folder and file.

Set up a bi-directional webhook for the Box spoke

Configure a webhook to subscribe to Box with a ServiceNow callback URL.

Before you begin

- Request an Integration Hub subscription.
- Activate the Box spoke.
- Role required: admin.

Add an endpoint URL in a Box account

Specify an endpoint URL in your Box account to create a webhook for Box spoke.

Before you begin

Role required: admin

Procedure

1. Log in to the Box developer's console.
2. Create an app according to your requirements.

   For more information about app creation, see Create an OAuth application.

3. Generate a primary Key and secondary Key for your app and record the values.

   a. In **My Apps**, select the application.
   You are in your application's **General Settings**.

   b. Navigate to **Webhooks**.

   c. Select **Manage Signature Keys**.

   d. In the Primary Key section, select **Generate Key**.

   e. In the Secondary Key section, select **Generate Key**.

   f. Copy and save both key values for later.

4. Navigate to the **Webhooks** section.
5. To create a V1 webhook, select **Create Webhook** and select **V1**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Complete the fields.

Field	Value
Name	`Update Chatter feed`
Description	`Automatically updates your Chatter feed when a change occurs`
Event Type	Enable at least one option
Endpoint URL	The endpoint URL of the ServiceNow instance in the following format: `https://<instance-name>.service-now.com/api/sn_box_spoke/box_spoke_webhook_endpoints/webhook_endpoint`
Payload format	Select the appropriate payload data format
Callback Parameters	Select **add callback parameter** to configure any GET or POST methods

b. Select **Save Webhoook**.

6. To create a V2 webhook, select **Create Webhook** and select **V2**.

> **Note:**
> To create a V2 webhook, you must enable **Manage webhooks** in the **Configuration** settings. For more information, see Create an OAuth application.

a. For the URL Address, enter the endpoint URL of the ServiceNow instance in the following format: `https://<instance-name>.service-now.com/api/sn_box_spoke/box_spoke_webhook_endpoints/webhook_endpoint`.

b. For The type of item to trigger a webhook, select **Choose an item**.

c. Select the webhook configured file or folders.

d. To confirm select **Choose**.
A list of configured webhook triggers display in the **Create a Webhook** page.

e. Enable the appropriate GET and POST methods for each trigger.

f. To confirm, select **Create Webhook**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The endpoint URL is added in your Box account. You can create webhook registries and subflows according to your requirements.

Register a Box webhook in ServiceNow

Create a Box webhook registry in ServiceNow to notify the ServiceNow app when certain events occur in your Box account.

Before you begin
Role required: admin.

Procedure
1. In your ServiceNow, navigate to **All** > **Box** > **Box Webhook Registry**.
2. Select **New**.
3. Fill in the fields.

Field	Value
Name	Optionally, name the webhook registry
Trigger Name	Select the appropriate event trigger
Primary Key	The primary key that you generated in Add an endpoint URL in a Box account
Flow Name	The flow that occurs when the event triggers
Secondary Key	The secondary key that you generated in Add an endpoint URL in a Box account
Description	Optionally, describe the purpose of the record

4. To confirm, select **Submit**.

Result
The Box webhook is registered in your ServiceNow instance.

Set up triggers for the Box spoke

Set up the trigger to generate the secret and callback URL on your ServiceNow instance.

Before you begin
- Request an Integration Hub subscription.
- Activate and set up the Box spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure secret and callback URL in Box

Set the secret and callback URL to enable Box to securely send webhooks to your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Log in to the Box account.
2. Create a custom application.
   a. Click **Dev Console**.
   b. Under **My Platform Apps**, click **Create Platform App**.
   c. Click **Custom App**.
   d. On the Create a Custom App form, provide app details.
      Provide a name for **App Name** and select **Custom Portal** for **Purpose**.
   e. Click **Next**.
   f. Select **Server Authentication (with JWT)** for **Authentication Method** and click **Create App**.
      The custom application is created and the **Configuration** tab is displayed.
   g. Copy the value of **Client ID** from the **Configuration** tab.
3. Authorize the custom application.
   a. Navigate to the **Admin console** from the Box account homepage.
   b. Click **Integrations**.
   c. Under the **Platform Apps Manager**, click **Server Authentication App**.
   d. Click **Add Platform App**, paste the value of **Client ID**, and click **Next**.
      The custom application details are displayed.
   e. Click **Authorize**.
4. Provide the required application scopes to the custom application.
   a. In the **Configuration** tab, for **Application Scopes** select the **Write all files and folders stored in Box**, **Manage signature requests**, **Manage webhooks**, and **Enable integrations** options.
   b. Click **Save Changes**.
5. Generate primary key for the custom application.
   a. In the **Webhooks** tab, click **Manage Signature Keys**.
   b. Under **Primary Key**, click **Generate Key**.
   c. Click **Copy** to copy the value of **Primary Key** and record it for later use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Create a webhook for the custom application and add ServiceNow endpoint URL.

   a. In the **Webhooks** tab, click **Create Webhook** and select **V2**.

   b. For **URL Address** under **Configuration**, enter ServiceNow endpoint URL in this format: `https://<ServiceNow-Instance-Name>.service-now.com/api/sn_box_spoke/box_external_trigger?X-SkipCookieAuthentication=true`.

   c. For **Content Type**, select either file or folder as per your requirement. Flow events differ based on the selected **Content Type**.

   d. Select the required triggers that are associated with the selected **Content Type**.

   e. Click **Create Webhook**.

Activate the trigger definition on ServiceNow instance for the Box spoke

Activate the trigger definition to generate the secret and callback URL on your ServiceNow instance for the Box spoke.

Before you begin

Role required: flow_designer and connection_admin.

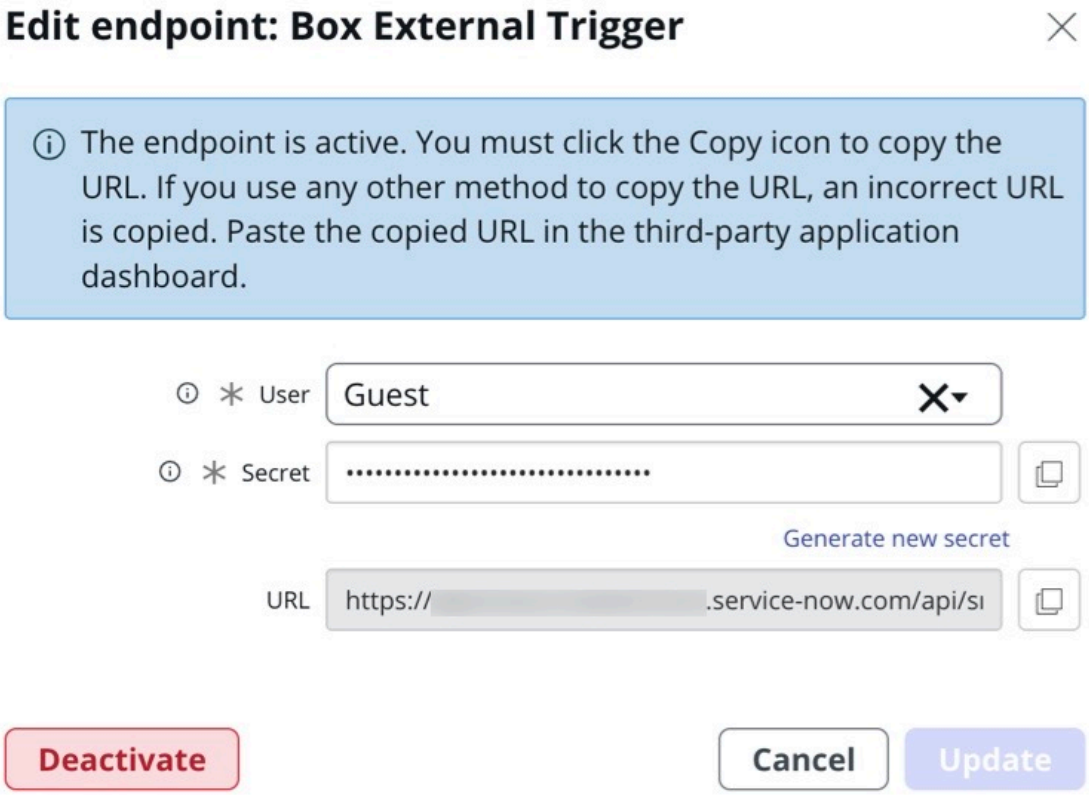
About this task

Box uses the secret and callback URL to securely send the payload to the ServiceNow instance. The ServiceNow instance verifies the secret that Box sends and accepts the payload.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Toggle and enable the **Inbound** tab.
4. Locate the **Box Spoke** card and select **View Details**.
5. Select **Configure**.
6. In the **User** field, select the user name on whose behalf the inbound session or flow is triggered.
7. In the **Secret** field, paste the value of **Primary Key** that was generated in the Box account. The secret is used to sign the payload of the webhook.
8. Select **Activate**.
   The callback URL is generated in the URL field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Close the window.

Calendly Spoke

The Calendly spoke provides actions to view and analyze meaningful usage data for Calendly software subscriptions. Analyze usage for a Calendly account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Calendly spoke v1.3.1 is the latest version.

Spoke requirements

- Organization owner or admin role in Calendly
- LastPass Enterprise admin account

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Calendly spoke provides actions to automate Calendly tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Event Management	Cancel Event	Cancels the specified event.
	Look up Event	Retrieves the details of a specified event.
	Look up Scheduled Events Stream	Retrieves details about all scheduled events within an organization.
User Management	Invite User to Organization	Invites the specified user to the organization.
	Look up Organization	Retrieves the URI of the organization that the authenticated user currently belongs to.
	Look up Organization Members Stream	Retrieves details about all members within an organization.
	Look up User	Retrieves the details of the specified user.
	Remove User from Organization	Deletes a user's organization membership.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Calendly spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Calendly spoke

Set up an outbound integration between your ServiceNow instance and the Calendly APIs by creating an OAuth application in Calendly and a connection and credential record on your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Calendly spoke.
- Ensure that you have a Calendly account.
- Role required: admin.

About this task

After setting the outbound integration, you can set up a flow on the Workflow Studio using the Calendly spoke actions and automate tasks in Calendly. For example, you can set up a flow that cancels an event on Calendly. The connection and credentials record contains the credentials to establish a connection with the Calendly APIs before you automate the tasks on Calendly. The OAuth application authenticates the connection request from your ServiceNow instance.

Set up an OAuth application in Calendly

Set up an OAuth application that authenticates requests from your ServiceNow instance.

Before you begin

Role required: Calendly organization owner or admin

Procedure

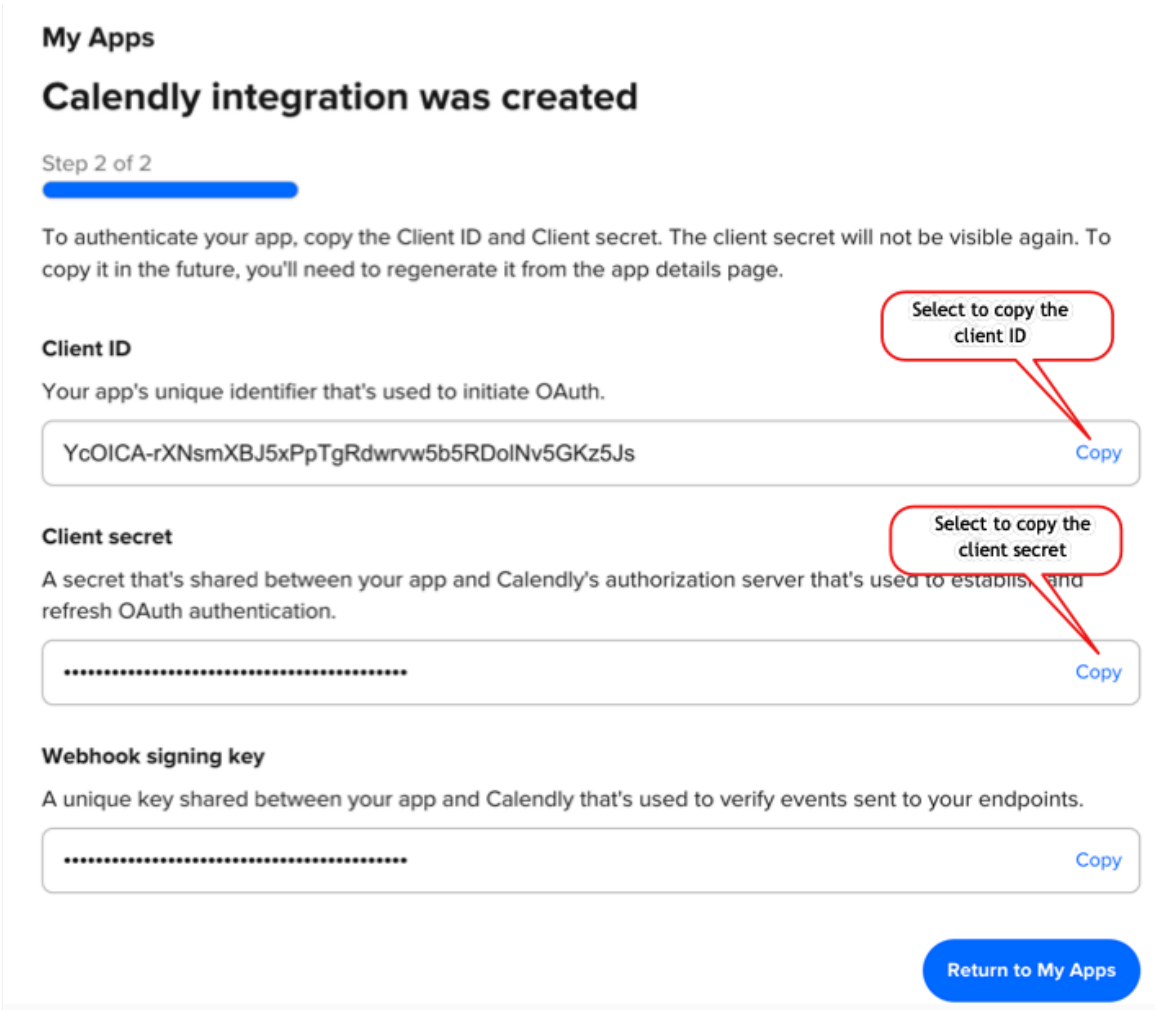
1. Go to https://developer.calendly.com/ .
2. Log in to the developer portal.
3. Select **+ Create new app**.
4. Fill the form.

Calendly OAuth app

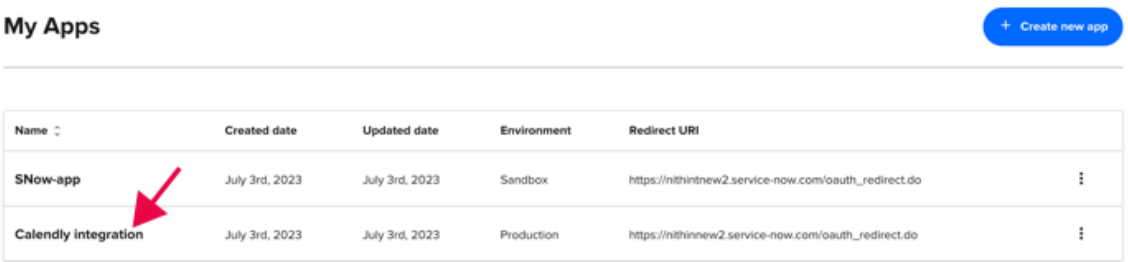
Field	Description	Mandatory?
Name of app	Custom name of the OAuth application.	Yes
Kind of app	Type of application the OAuth app will support. Select **Web**.	Yes
Environment type	Type of environment in which the OAuth app will be deployed.	Yes
Redirect URI	The URL of your ServiceNow instance.	Yes

5. Select **Save & Continue**.
   The client ID and client secret that you use in the connection and credentials record are generated.
6. To copy the client ID, select **Copy**.
7. To copy the client secret, select **Copy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Select **Return to My Apps**.
   The OAuth app is created.



Create a connection and credential record

Create a connection and credential record that contains the details required to access the Calendly APIs.

Before you begin

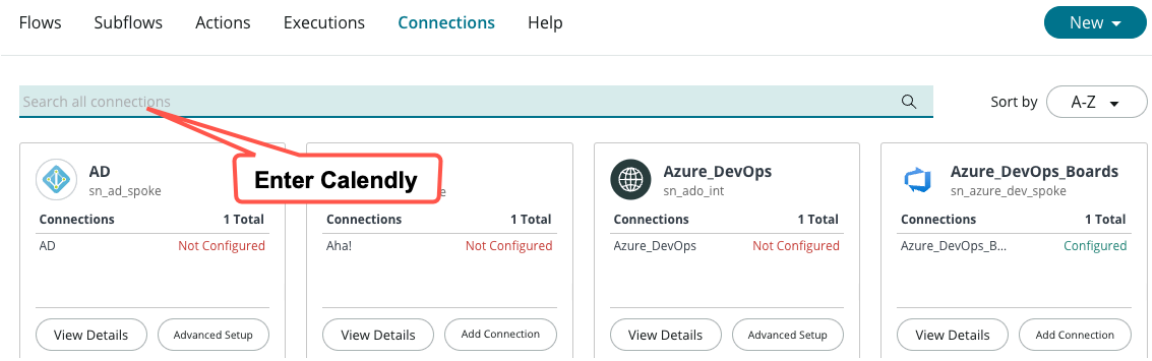
Role required: ServiceNow admin

Procedure

1. Log in to your ServiceNow instance.
2. Navigate to **Process Automation** > **Workflow Studio**.
3. Select **Integrations**.

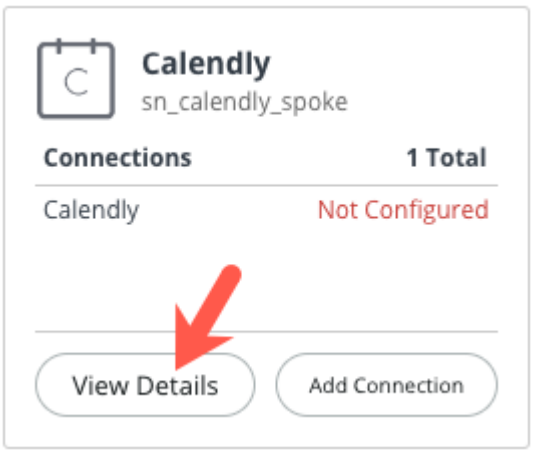
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Search all connections field, enter `Calendly`.

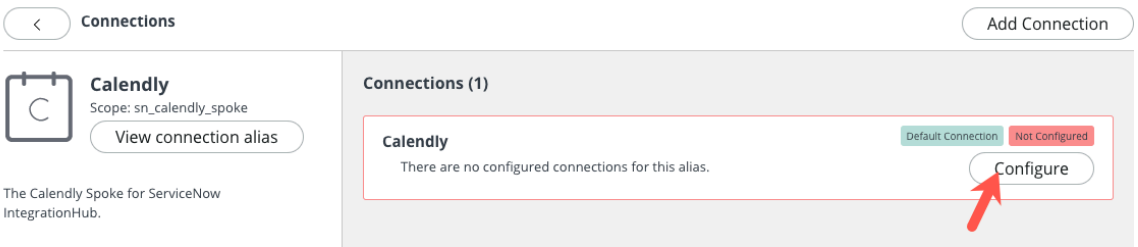


The **Outbound** tab is enabled by default. Confirm that the **Outbound** tab is enabled already.

5. On the Calendly card, select **View Details**.



6. Select **Configure**.



7. Fill the form.

Create Connection and Credential dialog box

Field	Description
Connection Name	Name of the connection. **Note:** The first and default connection name is read-only. To provide a custom name, create a connection by selecting **Add Connection**.
Connection URL	Base URL for the Calendly Application Programming Interface (API). This field is automatically set to `https://api.calendly.com`.
OAuth Client ID	Client ID that you had generated on the Calendly developers portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	To learn how to generate a client ID, see Set up an OAuth application in Calendly.
OAuth Client Secret	Client ID that you had generated on the Calendly developers portal. To learn how to generate a client secret, see Set up an OAuth application in Calendly.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on your instance name.

8. Select **Configure and Get OAuth Token**.
9. Select **Connect to Calendly**.
   The OAuth refresh token becomes available.

10. To get the OAuth token, select **Get OAuth Token**.

> **Important:**
> To get the OAuth token, log in to https://calendly.com/app/login with your licensed account credentials.

Cisco Webex Meetings Spoke

Manage users of the Cisco Webex Meetings application. Get a list of all users, view user activity, and deactivate user accounts.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Cisco Webex Meetings spoke v2.3.3 is the latest version.

Supported versions

Webex Meetings XML API

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Cisco Webex Meetings spoke provides actions to automate Webex tasks when events occur in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Training Management	Look up Trainings Stream	Retrieves details of all scheduled training sessions.
Support Session Management	Look up Support Sessions Stream	Retrieves details of the previously hosted support sessions.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Webex Meetings account requirements

The Cisco Webex Meetings spoke requires creating a custom app in Cisco DevNet to generate OAuth 2.0 tokens. See Create a Webex OAuth application in Cisco DevNet.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Webex alias record to authorize actions. For information about setting up the spoke, see Set up Cisco Webex Meetings spoke.

Set up Cisco Webex Meetings spoke

Integrate your ServiceNow instance and the Cisco Webex Meetings application by creating a custom OAuth application in Cisco DevNet to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Cisco Webex Meetings spoke.
- Role required: admin.

Create a Webex OAuth application in Cisco DevNet

Create a custom OAuth application in Cisco DevNet to enable OAuth 2.0 authentication with the Cisco Webex Meetings spoke.

Before you begin

Webex Meetings requirements:

- Webex Meetings account
- Role required: Webex Meetings administrator

Procedure

1. Navigate to https://developer.webex.com/ and log in.
2. Click on your profile icon and select **My Webex Apps**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Create a New App**.
4. Click **Create an Integration**.
5. On the form, fill in the fields.

Field	Value
Integration name	Name of the integration as it appears in Webex. For example, ServiceNow integration.
Icon	Icon that displays in Webex. Upload your own icon and select from the available default icons.
App Hub Description	Short description about the integration.
Redirect URI(s)	`https://<instance-name>.service-now.com/oauth_redirect.do`, where `<instance-name>` is the name of your ServiceNow instance
Scope	Webex Meetings application scope permissions you want the application to support. **Note:** Select the **admin_schedule_read scope** for the integration.

6. Click **Add Integration**.
   After the integration is successfully created, the values of **Client ID** and **Client Secret** are displayed.
7. Record the client ID and client secret to register the application as a third-party OAuth provider on your ServiceNow instance.

Configure a connection for Cisco Webex Meetings spoke

Add and configure a Cisco Webex Meetings connection to authenticate ServiceNow requests in the Cisco Webex Meetings spoke.

Before you begin

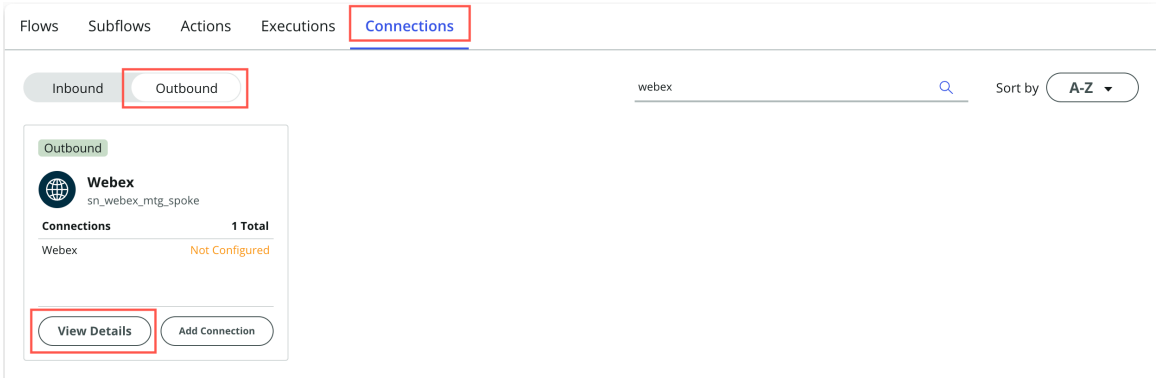
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the **Webex** connection alias and click **View Details**.

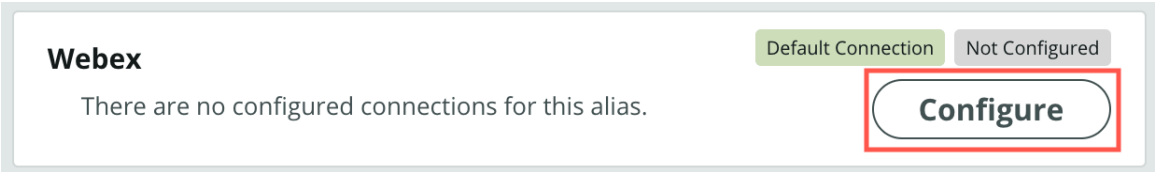
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Cisco Webex Meetings spoke, click **View Details**.



- To manage more than one Cisco Webex Meetings spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

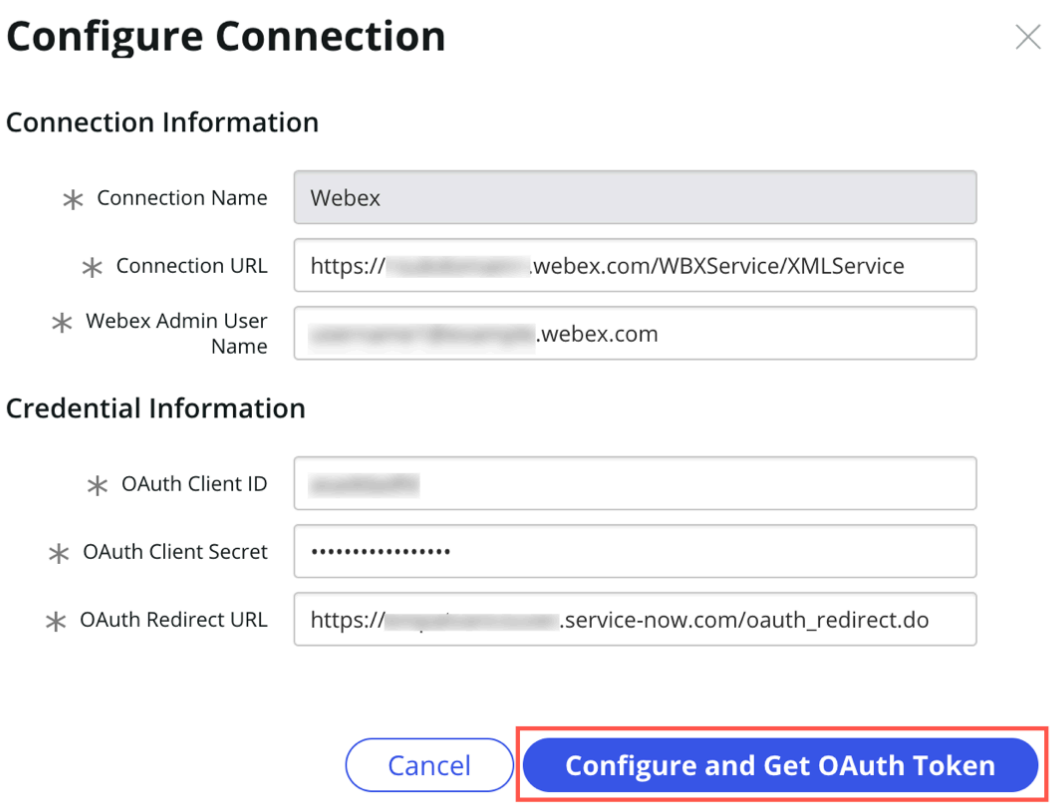


5. On the form, fill in the fields.

Connection form

Field	Description
Connection Information	
Connection URL	`https://<site>.webex.com/WBXService/XMLService`, where *`site`* is the name of your Webex site.
Webex Admin User Name	User name for the Webex administrator account.
Credential Information	
OAuth Client ID	Client ID you created during the Webex app configuration.
OAuth Client Secret	Client Secret you created during the Webex app configuration.
OAuth Redirect URL	`https://<instance-name>.service-now.com/oauth_redirect.do`, where *`instance-name`* is the name of your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Configure and Get OAuth Token**.

Result
The spoke is configured and ready to be used.

Cisco Webex Teams Spoke

Manage Cisco Webex Teams from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Cisco Webex Teams spoke v2.3.6 is the latest version.

Supported versions

This spoke was built for Cisco Webex Teams v1, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

Cisco Webex Teams account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Cisco Webex Teams Spoke provides actions to automate Cisco Web Teams tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Membership Management	Create Membership	Creates membership and adds a member to a space using the specified email address. You can choose to make the member as the moderator of the space.
	Delete Membership	Removes membership from a space for the specified member.
	Get Membership	Retrieves details for a space membership.
	Look up Membership	Retrieves a list of all space memberships.
	Update Membership	Updates details of a space membership.
Message Management	Delete Message	Deletes the specified message.
	Get Message Details	Retrieves details of the specified message.
	Look up Direct Messages	Retrieves a list of messages in a direct space.
	Look up Messages	Retrieves all messages in a space.
	Post Direct Message	Posts a plain text or rich text message to a the specified email address. A file can be specified as an attachment to the message optionally.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Post Message to Space	Posts a plain text or rich text message to the specified space. A file can be specified as an attachment to the message optionally.
Space Management	Create Space	Creates a space.
	Delete Space	Deletes the specified space.
	Get Space Details	Retrieves details of the specified space.
	Look up Spaces	Retrieves details of the spaces to which the authenticated user belongs.
	Update Space	Updates details of the specified space.
Event Management	Look up Events Stream	Retrieves all events in an organization.
People Management	Update Person	Updates details of a person.
	Delete Person	Deletes details of the specified person.
	Look up Person Details	Retrieves details of a person.
	Look up People Stream	Retrieves all people in an organization.
Organization Management	Look up Organizations	Retrieves all organizations visible to the authenticated user.
Meeting Management	Look up Meetings Stream	Retrieves a list of meetings.
License Management	Look up Licenses	Retrieves all licenses for an organization. If the organization ID is not specified, the default is the authenticated user's organization.
	Look up Roles	Retrieves all authenticated user roles.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

You can use OAuth 2.0 or the custom Cisco Webex Credentials to authenticate requests. For information about setting up the spoke, see Set up the Cisco Webex Teams spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Cisco Webex Teams spoke

Integrate the ServiceNow instance and Cisco Webex Teams by creating a custom OAuth application in Cisco Webex Teams or using the custom Cisco Webex Credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Cisco Webex Teams spoke.
- Role required: admin.

You can choose to use either OAuth 2.0 or the custom credentials, Cisco Webex Credentials, for authentication.

Register Cisco Webex Teams as an OAuth provider

Use the information generated during the Cisco Webex Teams application configuration to register Cisco Webex Teams as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays this message: `What kind of OAuth application?`.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

Application Registries form

Field	Description
Name	Name to uniquely identify the record. For example, enter: `Cisco Webex Teams OAuth`
Client ID	Client ID created during the Cisco Webex Teams application configuration.
Client Secret	Client Secret created during the Cisco Webex Teams application configuration.
Authorization URL	OAuth authorization code endpoint. Enter: `https://webexapis.com/v1/authorize`
Token URL	OAuth server token endpoint. Enter: `https://webexapis.com/v1/access_token`
Token Revocation URL	OAuth server token revocation endpoint.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`
OAuth API Script	Script to customize the request and response. Select **OauthCiscoWebexTeamsUtils**.

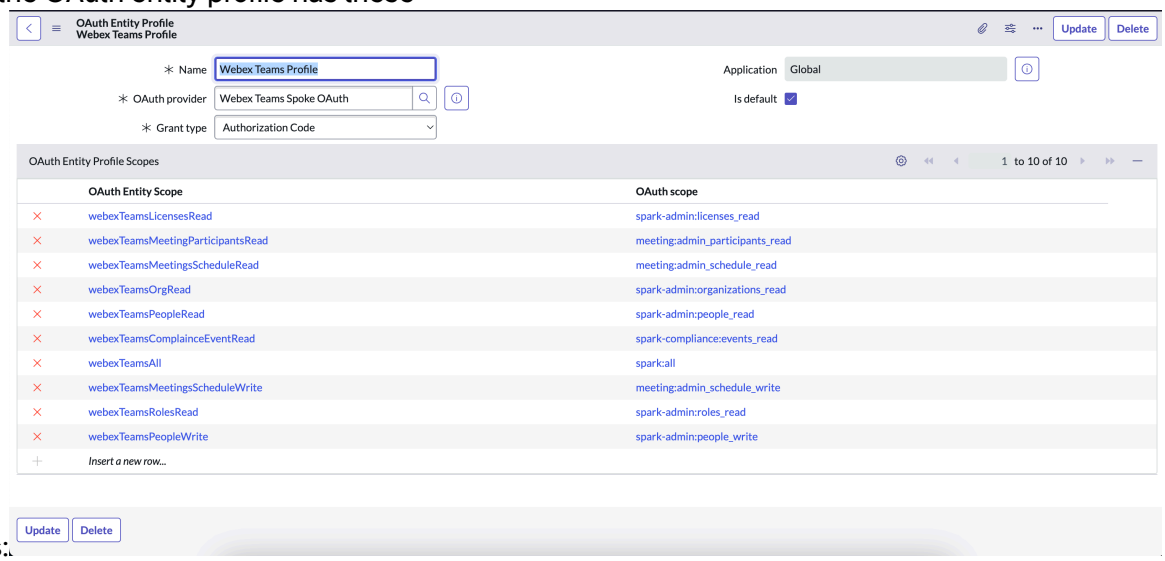
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Logo URL	URL that contains an image to use as the application logo.
Default Grant Type	Grant type used to establish the token. Select **Authorization Code**.
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.

5. Right-click the form header, and click **Save**.

What to do next

Ensure that the OAuth entity profile has these permissions:



Create a OAuth credential record for the Cisco Webex Teams Spoke

Create a credential record for the Cisco Webex Teams account. The Cisco Webex Teams Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays this message: `What type of Credentials would you like to create?`

3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Cisco Webex Teams Cred.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of Cisco Webex Teams as an OAuth provider. For example, Cisco Webex Teams OAuth Profile.
Applies to	Option to specify if the credential applies to all MID Servers in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use this credential in the **MID servers** field.
Order	Order to apply this credential. For example, `100`.
Credential alias	Credential alias associated with the spoke.

5. Right-click the form header and click **Submit**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

Create a connection and credential alias record for the Cisco Webex Teams Spoke

Create a credential record for the Cisco Webex Teams account. The Cisco Webex Teams Spoke connection and credential alias uses these credentials to authorize actions.

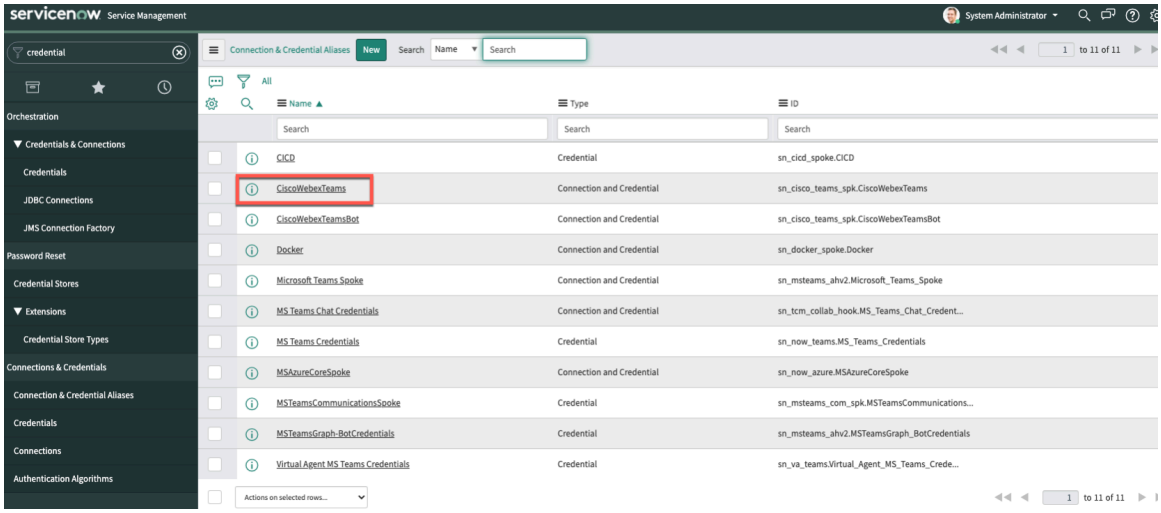
Before you begin

Role required: admin.

Procedure

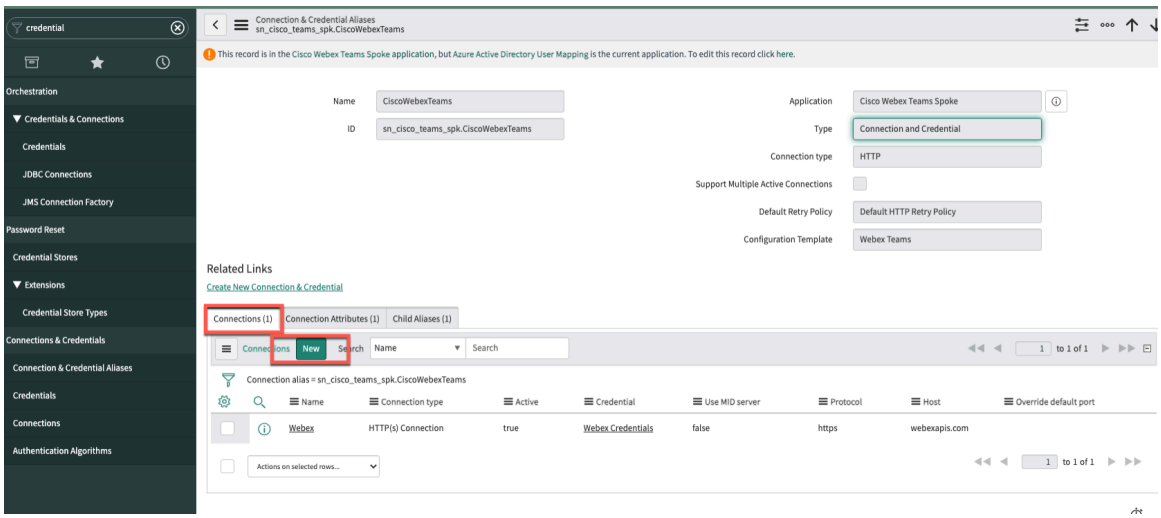
1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the **CiscoWebexTeams** record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The **CiscoWebexTeams** Connection & Credential Aliases display.

3. Click **New** under **Connections** tab.

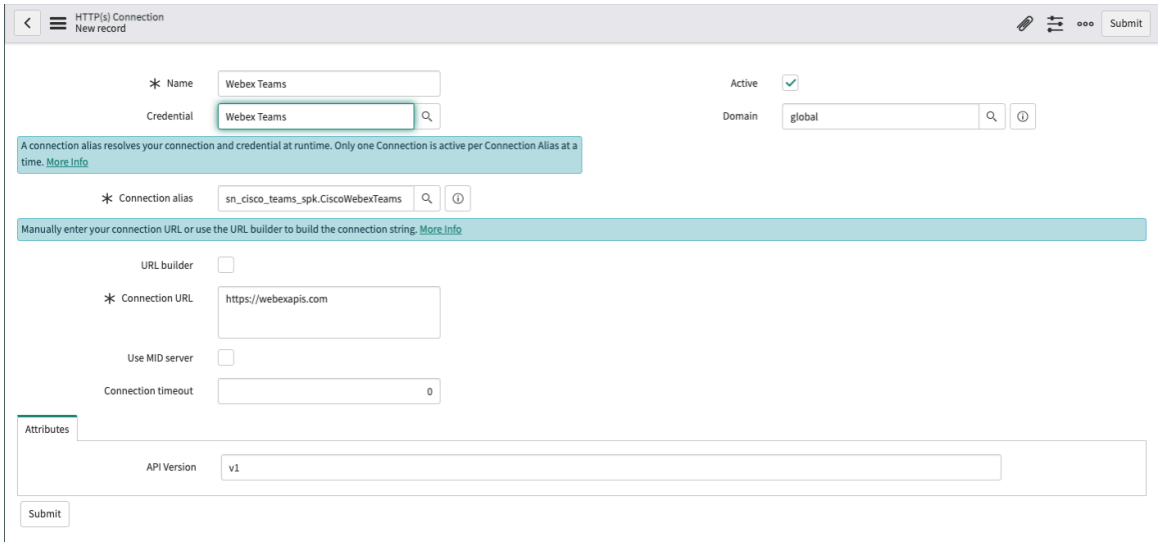


4. On the form, fill these values.

Connection & Credential for Cisco Webex Teams

Field	Description
Name	Name for the HTTPS connection record for Cisco Webex Teams spoke
Credentials	Name of the credential created for Cisco Webex Teams spoke Provide the value ceated in “Create a OAuth credential record for the Cisco Webex Teams spoke”.
Connection URL	Option to provide the connection URL. Provide the value as https://webexapis.com

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Right-click the form header and click **Submit**.

Create a Connection & Credentials alias for Visa Spoke

Create a connection record for your . The Visa spoke connection and credential aliases use these connections to perform actions in .

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for .
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `<Application-Name> Connection`.
Credential	Credential record created for Visa spoke. For example, `<Application-Name> Cred`.
Connection alias	Alias record associated with this connection.
Host	Fully qualified domain name of the target host where the server is installed. For example, `<host>.<domain>.com`.
Connection URL	Base URL to connect to . Enter:
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use MID server	Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.

5. Click **Submit**.

Confluence Cloud Spoke

The Confluence Cloud spoke provides actions to manage groups, group members, and search content in your Confluence Atlassian account.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Confluence Cloud spoke v2.0.1 is the latest version.

Supported versions

This spoke was built for the Confluence Cloud REST API.

Spoke requirements

- Atlassian site admin account
- OAuth 2.0 application and OAuth 2.0 token

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Confluence Cloud spoke provides actions to automate Confluence Cloud tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Account Management	Look up Accessible Resources	Retrieves sites with scopes that are granted by the OAuth token.
Content Management	Look up Pages Stream	Retrieves a list of pages in a Confluence space. Inputs: • Page size: Limit number of pages returned per request. • Query (Optional): Use query input to filter status of pages (for example, `status=archived`). Values include: current, archived, deleted, and trashed.
	Look up Spaces Stream	Retrieves a list of Confluence spaces. Inputs: Page size. Number of Space entries expected to be fetched per page.
	Search Content	Retrieves the list of content based on the provided query.
Group Management	Look up Groups	Retrieves all groups in the Atlassian account, including default groups.
	Look up Members By Group ID	Retrieves all active users within the specified group.
	Remove Member From Group By Group ID	Removes a user from the specified group.
User Management	Look up Group Memberships For User	Retrieves information about the groups that the user is a member of.
	Report Personal Data	Reports a user's personal data for the specified apps.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Spoke module

The Confluence Cloud spoke adds the Confluence Cloud application to your instance and includes these modules:

Module	Description
Confluence Groups	Enables you to specify the groups that have access to Confluence products. By specifying these groups, you can manage the users within only these groups using the Confluence Cloud spoke.

Data accessed through these spoke modules is stored in these tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description	Fields
Confluence Groups	Displays the list of groups that have access to Confluence products.	• Group Name • Group ID

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Confluence Cloud spoke.

Set up the Confluence Cloud spoke

Integrate the ServiceNow instance and Confluence Cloud by creating a custom OAuth 2.0 application in Confluence Cloud to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Confluence Cloud spoke.
- Atlassian role required: site admin
- Role required: admin.

Option 1: Using OAuth authentication (Authorization Code grant type) connection

Add and configure a Confluence Cloud connection to authenticate ServiceNow requests in Confluence Cloud spoke.

Before you begin

Role required: admin

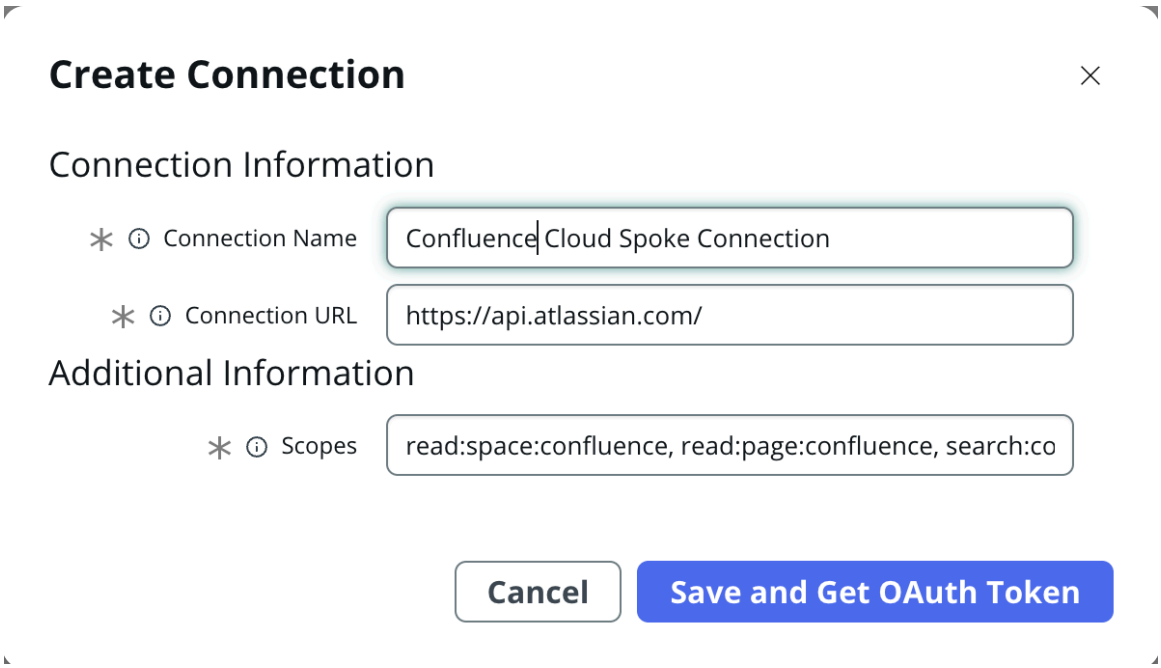
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.
4. Locate the **Confluence Cloud** connection alias and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Confluence Cloud spoke, click **View Details**.
   - To manage more than one Confluence Cloud spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.
5. On the **Connection** form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Name	Name to uniquely identify the connection. For example, `Confluence Cloud Spoke Connection`.
Connection URL	URL of the Atlassian API endpoint: `https://api.atlassian.com/`.
Scopes	By default, these scopes are provided: `ace:confluence, read:page:confluence, search:confluence, read:confluence-groups, write:confluence-groups, read:confluence-user, read:me, read:account, offline_access`. You can modify the scopes as per your requirement.



6. Click **Save and Get OAuth Token**.

Option 2: Using OAuth authentication (Client Credentials grant type)

Integrate the ServiceNow instance with your Confluence Cloud account using OAuth to authenticate ServiceNow requests.

Before you begin

Important:
Apps that collect API tokens to create individual 3LO apps don't comply with Atlassian security requirements for cloud apps and Atlassian acceptable use policy.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.

Create a Confluence Cloud OAuth 2.0 (3LO) application

Create a Confluence Cloud OAuth 2.0 (3LO) application to enable access to the Confluence Cloud API.

Before you begin

Role required: Atlassian site admin.

Procedure

1. From a web browser, open the Atlassian Developer portal.
2. Log in to your site admin account.
3. On the page header of the portal, click your profile icon and then select **Developer console**.
   The My apps page of the Atlassian Developer Console opens.
4. Click the **Create app** menu and then select **OAuth 2.0 (3LO) integration**.
   The Create a new OAuth 2.0 (3LO) integration page opens.
5. Enter a name for the OAuth 2.0 (3LO) application in the **Name** field.
6. Select the **I agree to be bound by Atlassian's developer terms** check box and then click **Create**.
   The overview and settings for your newly created app open.
7. Configure authorization settings for your application.
   a. From the left navigation pane, select **Authorization**.
   b. Click **Configure** for the OAuth 2.0 (3LO) authorization type.
      The OAuth 2.0 authorization code grants (3LO) for apps page opens.
   c. In the **Callback URL** field, enter the URL of the OAuth provider that users are redirected to after authentication.
      Enter `https://instance.service-now.com/oauth_redirect.do`, where <*instance*> is the name of your ServiceNow instance.
   d. Click **Save changes**.
8. Configure API scopes for your application.
   API scopes specify the level of access that the application has to the Atlassian APIs.
   a. From the left navigation pane, select **Permissions**.
   b. From the list of available APIs, locate the Confluence API and then click **Add**.
      The **Add** action button automatically changes to the **Configure** action button.
   c. Click **Configure**.
      The Confluence API page opens.
   d. Add the following scopes for the Confluence API:
      - Search Confluence content and space summaries
      - Read user groups
      - Create, remove and update user groups
      - Read user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Retrieve the client ID and client secret that are assigned to your application.

   a. From the left navigation pane, select **Settings**.

   b. In the Authentication details section, copy the values in the **Client ID** and **Secret** fields. Save them in a secure location for later use.

Add Confluence groups

Specify the groups that have access to Confluence products so that you can manage the users within only these groups using the Confluence Cloud spoke.

Before you begin

ServiceNow role required: admin

Role required: Atlassian site admin

Procedure

1. From a web browser, open the Atlassian Administration portal.
2. Log in to your site admin account.
3. Navigate to **SITE SETTINGS** > **Product access**.
4. In the Confluence section, view the list of groups that have access to Confluence products. Take note of this information for later use.
5. Return to your ServiceNow instance and navigate to **Confluence Cloud** > **Confluence Groups**.
6. On the Confluence Groups form, click the **Add Groups** related link.
   The Add Confluence Groups dialog box opens.
7. In the Available list, select the groups that have access to Confluence products.

   Tip:
   The Available list includes all groups that are associated with your Atlassian account. Select only the groups that have access to Confluence products.

8. Click the right arrow button to move the groups from the Available list to the Selected list.
9. Click **OK**.

Create a connection record for the Confluence Cloud spoke

Create a connection record for the Confluence Cloud account. The connection and credential alias uses this connection to perform actions in Confluence Cloud.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the alias record for **Confluence Cloud** that shipped with the spoke.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Confluence Cloud OAuth Connection`.
Credential	Select the credential record created for Confluence Cloud. For example, select **Confluence Cloud client credential cred**.
Connection URL	Enter the URL of the Atlassian API endpoint: `https://api.atlassian.com/`.

5. Click **Submit**.
   The Confluence Cloud spoke is configured to use OAuth 2.0 Client Credentials via the service account.

Create credential record for the Confluence Cloud spoke

Create a credential record for the Confluence Cloud account. The Confluence Cloud spoke connection and credential alias uses this credential to authorize actions.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the credential record for the Confluence Cloud spoke. For example, `Confluence Cloud client credential cred`.
OAuth Entity Profile	Select the OAuth entity profile record that was created when the application registry record is configured. For more information, seeCreate an application registry record.

5. Right-click the form header and click **Save**.
6. Click the **Get OAuth Token** related link.

Create an application registry record

Create an application registry record to configure OAuth 2.0 authentication for the Confluence Cloud spoke. The record stores the client credentials and scopes required to authorize Confluence Cloud spoke actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message `What kind of OAuth application?`.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the application registry record. For example, `Confluence Cloud Client Credentials OAuth`.
Client ID	Client ID generated when the OAuth 2.0 integration was created in Atlassian Developer console.
Client Secret	Client secret generated when the OAuth 2.0 integration was created in Atlassian Developer console.
Default Grant type	Grant type used to establish the token. Select **Client Credentials**.
Token URL	OAuth server token endpoint. Enter: `https://auth.atlassian.com/oauth/token`.
Token Revocation URL	OAuth server token revocation endpoint. Enter: `https://auth.atlassian.com/oauth/token`.
Active	Select the check box.

5. In the **OAuth Entity Scopes** tab, create this entity scope record.

Name	OAuth scope
Confluence Cloud scopes	`ace:confluence read:page:confluence search:confluence read:confluence-groups write:confluence-groups read:confluence-user read:me read:account offline_access`

6. Right-click the form header and click **Save**.
   The record is saved and a OAuth Entity Profile record is created under the **OAuth Entity Profiles** tab.
7. Click the **OAuth Entity Profiles** tab and open the default profile record.
8. Verify these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Grant type** is set to **Client Credentials**.
- Scope records previously created are listed under the **OAuth Entity Profile Scopes** related list.

9. Click **Update**.

Confluent Kafka REST Proxy Spoke

Integrates your ServiceNow instances with the Kafka cluster through Confluent Kafka REST Proxy API.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Confluent REST Proxy API v2.

Spoke dependencies

If you're having trouble installing the app, ensure that the dependent plugin, ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime) is installed.

Note:
The plugin is a licensable feature and requires appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Confluent Kafka REST Proxy spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Action	Description
Assign Consumer Instance to Topic Partition	Assigns a list of partitions to this consumer manually.
Commit Consumer Offsets	Commits a list of offsets for the consumer. When the post body is empty, all the records that have been fetched by the consumer instance are committed.
Create a Consumer Instance within a Consumer Group	Creates a consumer instance within Kafka consumer group.
Delete Consumer Instance	Destroys the consumer instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Get Kafka Partition Details For A Topic	Retrieves partition details for a Kafka topic.
Get Messages	Retrieves messages from a Kafka topic.
Publish Message	Produces messages to a Kafka topic.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Confluent Kafka REST Proxy spoke.

Set up the Confluent Kafka REST Proxy spoke

Integrate Confluent Kafka REST proxy with your ServiceNow instance using basic authentication.

Before you begin

- Request an Integration Hub subscription.
- Activate the Confluent Kafka REST Proxy spoke.
- Role required: admin.

Note:
This procedure outlines steps to set up Confluent Kafka REST Proxy spoke using basic authentication. However, based on your customisations, you can also set up the spoke using ay other HTTP authentication mechanism that is currently supported by the ServiceNow Platform.

Procedure

1. Create a credential record for the Confluent Kafka REST Proxy spoke.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.

   c. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.

   d. Enter these values.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `Kafka spoke Credentials`.
User name	User name to connect to the Confluent Kafka REST Proxy API endpoint.
Password	Password to connect to the Confluent Kafka REST Proxy API endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Active	Option to actively use the record.
Order	Order to apply this credential. For example, enter `100`.

e. Click **Submit**.

2. Create a connection record for the Confluent Kafka REST Proxy spoke.

a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

b. Open for the record, **Kafka REST** .

c. From the **Connections** tab, click **New**.
The system displays a blank HTTP(s) Connection form.

d. Enter these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Kafka spoke Connection`.
Credential	Credential record you created for the Confluent Kafka REST Proxy spoke. For example, select **Kafka spoke Credentials**.
Connection URL	URL to connect to the Confluent Kafka REST Proxy API.

e. Click **Submit**.

Continuous Integration and Continuous Delivery (CICD) Spoke

Build a Continuous Integration and Continuation Delivery (CICD) pipeline for your ServiceNow instances. You can automate publishing and installing applications from an application repository, activating plugins, running ATF test suites, and running an instance scan.

CICD spoke application

The CICD spoke application is installed by default from the Orlando upgrade onward.

Spoke version

Continuous Integration and Continuous Delivery (CICD) spoke v1.0.11 is the latest version.

Supported versions

Continuous Integration and Continuous Delivery (CICD) REST API version 1.0.0, which is a ServiceNow AI Platform feature active by default.

Spoke flows

This spoke has no sample flows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Continuous Integration and Continuous Delivery (CICD) spoke provides sample subflows in the draft state to demonstrate automating CICD tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Activate Plugin	Activate a plugin by ID on the specified instance URL.
Apply Changes From Source Control With ID	Apply remote changes from source control to an application by its Sys ID.
Apply Changes From Source Control With Scope	Apply remote changes from source control to an application by its scope name.
ATF Suite Start With ID	Start a test suite by its Sys ID on the specified instance URL. Return the test suite execution results.
ATF Suite Start With Name	Start a test suite by its name on the specified instance URL. Return the test suite execution results.
Batch Install	Given a Batch Plan in JSON format, install multiple packages (applications, customizations to store applications, and plugins) together in a single batch operation. Example JSON: `{ "applications": [{ "id": "syd_id_abcefghi", "type": "application", "load_demo_data": false, "requested_version": "1.0.2", "notes": "User specific text to describe this application install" }, { "id": "syd_id_defabcde", "type": "application", "requested_version": "1.0.0", "requested_customization_version": "2.0.7", "notes": "Customization for CSM App1" }, { "id": "com.glide.some.plugin", "type": "plugin", "load_demo_data": true, "notes": "Plugin related notes" }], "rollback_on_failure": true }`
Batch Results	Given the sys_id of a result object, view the installation status of each package along with entire batch plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Batch Rollback	With a rollback ID, roll back the installation(s) of package(s) installed as a single batch.
Get Instance Scan Results	Return Instance Scan execution results by progress ID. Scan_results always return but scan_finding results display only if present.
Import Application from Source Control	Import Application from Source Control using repository URL on the given instance.
Instance Scan Execute Full Scan	Start full Instance Scan on specified instance URL. Scan runs with all active checks.
Instance Scan Execute Point Scan	Start Instance Scan on specified instance starting from a particular table and record (the table and sys_ID). Target is scanned using all relevant and applicable checks.
Instance Scan Execute Suite Scan	Start full Instance Scan on specified instance URL using a specific suite of checks.
Instance Scan Execute Suite Scan on one or more scoped apps	Start Instance Scan on specified scoped apps using checks from a specified suite ID.
Instance Scan Execute Suite Scan on one or more update sets	Start Instance Scan on the specified update sets using checks from a specified suite ID.
Install Application With ID	Install an application by its Sys ID from the application repository.
Install Application With Scope	Install an application by its scope name from the application repository.
Publish Application With ID	Publish an application by its Sys ID to the application repository.
Publish Application With Scope	Publish an application by its scope name to the application repository.
Rollback Application With ID	Roll back an application by its Sys ID. Confirm the rollback version number matches the specified version number or produce an error.
Rollback Application With Scope	Roll back an application by its scope name. Confirm the rollback version number matches the specified version number or produce an error.
Rollback Plugin	Roll back a plugin by ID on the specified instance URL to the last installed version.
Wait Until Tracker Completes	Wait for a tracker to complete its progress on the specified instance URL and return the results.

Spoke actions

The Continuous Integration and Continuous Delivery (CICD) spoke provides actions to automate CICD tasks when events occurs in the ServiceNow AI Platform. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Application Repo	Install Application With ID	Install an application by its Sys ID from the application repository.
	Install Application With Scope	Install an application by its scope name from the application repository.
	Publish Application With ID	Publish an application by its Sys ID to the application repository.
	Publish Application With Scope	Publish an application by its scope name to the application repository.
	Rollback Application With ID	Rollback an application by its Sys ID. Confirm the rollback version number matches the specified version number or produce an error.
	Rollback Application With Scope	Roll back an application by its scope name. Confirm the rollback version number matches the specified version number or produce an error.
ATF	ATF Get Suite Results	Return the test suite execution results by Sys ID.
	Get Execution Tracker Progress	Return tracker progress information by Sys ID.
	Start ATF Suite With ID	Start a test suite by its Sys ID on the specified instance URL.
	Start ATF Suite With Name	Start a test suite by its name on the specified instance URL.
Batch Install	Batch Install	Install multiple applications at once
	Batch Results	View installation status of each package along with entire batch plan.
	Batch Rollback	With a rollback ID, roll back the installation(s) of package(s) installed as a single batch.
Instance Scan	Get Instance Scan Results	Return Instance Scan execution results by progress ID. Scan_results always display but scan_finding results display only if present.
	Instance Scan Execute Full Scan	Return Instance Scan execution results by progress ID. Scan_results always return but scan_finding results display only if present.
	Instance Scan Execute Point Scan	Start full Instance Scan on specified instance URL. Scan runs with all active checks.
	Instance Scan Execute Suite Scan	Start Instance Scan on specified instance starting from a particular table and record (the table and sys_ID). Target is scanned using all relevant and applicable checks.
	Instance Scan Execute Suite Scan on one or more scoped apps	Start full Instance Scan on specified instance URL using a specific suite of checks.
	Instance Scan Execute Suite Scan	Start Instance Scan on specified scoped apps using checks from a specified suite ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	on one or more update sets	
Plugin	Activate Plugin	Activate a plugin by ID on the specified instance URL.
	Rollback Plugin	Rollback a plugin by ID on the specified instance URL to the last installed version.
Source Control	Apply Changes From Source Control With ID	Apply remote changes from source control to an application by its Sys ID.
	Apply Changes From Source Control With Scope	Apply remote changes from source control to an application by its scope name.
	Import Application from Source Control	Import Application from Source Control using repository URL on the given instance.

CICD account requirements

The Continuous Integration and Continuous Delivery (CICD) spoke requires creating basic authorization credentials. The user credentials must have either the admin or sn_cicd.sys_ci_automation roles to authorize CICD actions and flows.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the CICD alias record to authorize actions on local and remote instances. For information about setting up the spoke, see Set up the Continuous Integration and Continuous Delivery (CICD) spoke.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the CICD alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Continuous Integration and Continuous Delivery (CICD) spoke

Use basic authentication to authenticate CICD REST API calls on a ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Continuous Integration and Continuous Delivery (CICD) spoke.
- Role required: admin or sn_cicd.sys_ci_automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Credential records for the Continuous Integration and Continuous Delivery (CICD) spoke

Create Credential records to the ServiceNow instance. The Continuous Integration and Continuous Delivery (CICD) spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `CICD Credentials`.
User name	The ServiceNow instance user name that authorizes and runs spoke actions and flows. This user must have either the admin or sn_cicd.sys_ci_automation roles.
Password	The password for the ServiceNow instance user.
Active	Enable
Order	Select the order to apply this credential. For example, enter `100`.

5. Click **Submit**.

Create Connection records for the Continuous Integration and Continuous Delivery (CICD) spoke

Create Connection records to your ServiceNow instance. The Continuous Integration and Continuous Delivery (CICD) spoke connection and credential alias uses these connections to perform actions on your ServiceNow instance.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **CICD**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP or HTTPS Connection form.
4. Enter these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `CICD Connection`.
Credential	Select the Credential record you created for CICD. For example, select **CICD Credentials**.
Connection URL	The URL of the ServiceNow instance on which the spoke runs actions and flows.

5. Click **Submit**.

Cornerstone Spoke

Manage employee records, approvals, and employee learning in your Cornerstone instance from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Cornerstone spoke v1.4 is the latest version.

Supported versions

This spoke was built for Cornerstone version v2, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke flows

The Cornerstone spoke provides a sample flow in the draft state to demonstrate automating the Cornerstone tasks. The sample flow, Cornerstone - Pull Todos Details, retrieves the list of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Todos for the required user. Ensure that this user is added to your ServiceNow instance. The retrieved records can be accessed by navigating to the TO DO Lists module in the Cornerstone application of your instance.

To customize the sample flow, copy it to a new application scope.

Spoke subflows

The Cornerstone spoke provides sample subflows in the draft state to demonstrate automating Cornerstone tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Cornerstone - Get Certificate Transcript Details	Retrieves the certificate information of the required employee.
Cornerstone - Get Transcripts	Retrieves the transcript information of the required employee.
Cornerstone - Remove Dangling To Do	Deletes the dangling Todo records. Some of the retrieved Certificate records may not have values set for the **Status** and **Launch URL** fields. The Cornerstone - Remove Dangling To Do action deletes such todo records.

Spoke actions

The Cornerstone spoke provides actions to automate Cornerstone tasks when events occurs in ServiceNow. Available actions include:

Category	Action	Description	Permission Required	OAuth 2.0 Scope
Core Management	Look up Approval Details Stream	Retrieves information about the pending approvals.	Request Items - View, Manage Employee Relationships	approval:read
	Look up Organizational Units Stream	Retrieves the list of organization units based on organization unit type.	No permission required.	ou:read
	Global Search Stream	Searches for the required people, training, certification, and so on.	No permission required.	globalsearch:read
Employee Management	Create Employee	Creates an employee record and retrieves core employee data from Cornerstone.	Employee API - Edit	No OAuth scope required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permission Required	OAuth 2.0 Scope
	Get Custom Fields For Employee Stream	Retrieves custom fields for an employee from Cornerstone.	Employee API - View/View - Constrainable	No OAuth scope required.
	Look up Employees Stream	Retrieves core data of the required employees in Cornerstone.	Employee API - View/View - Constrainable	No OAuth scope required.
	Update Employee	Updates details of the required employee in Cornerstone.	Employee API -Edit	No OAuth scope required.
Learning Management	Look up Approvals Stream	Retrieves the pending approvals of the manager or approver.	No permission required.	approval:read
	Look up Assigned Trainings	Retrieves details of the trainings assigned to a user.	No permission required.	transcript:read
	Look up Catalog Search Stream	Retrieves details of the required training.	Course Catalog - View	training:read
	Look up Certification Transcripts Stream	Retrieves certification transcript information of the required user.	No permission required.	certification:read
	Look up Inbox Items	Retrieves all items in the required user's inbox as shown on the welcome page.	No permission required.	inbox:read
	Look up Learning Object	Retrieves the learning objects from Cornerstone. The supported learning object types are, Curriculum, Event, Session, Material, Test, Video, and Online Course.	No permission required.	training:read
	Look up Sessions Stream	Retrieves details of the upcoming sessions.	No permission required.	transcript:read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permission Required	OAuth 2.0 Scope
	Look up Suggested Trainings Stream	Retrieves details of the required and suggested learning objects that have been added to user's transcripts.	No permission required.	transcript:read
	Look up Tasks	Retrieves all the incomplete tasks assigned to the user.	No permission required.	task:read
	Look up Transcripts Stream	Retrieves the transcript records of the required user.	No permission required.	transcript:read
	Create Assignment	Creates a standard assignment.	Assignment Tool-Standard/ Email Settings-View/Bypass User Payment	learningassignment:create
	Look up Assignment Details	Looks up assignment details based on Assignment ID.	Assignment Tool - Standard	learningassignment:read
Reporting on Learning Module Management	Look up Tasks From Reporting Data Stream	Retrieves the main view to get training form user tasks.	Reporting API	Reporting API
	Look up Trainings From Reporting Stream	Retrieves the main view to get training data.	Reporting API	Reporting API
	Look up Transcripts From Data Exporter Data Stream	Retrieves the main view to get all user transcript related data.	transcript_core	Reporting API
	Look up Training Local From Reporting Data Stream	Retrieves the main view to get the training's local data.	Reporting API	Reporting API

Spoke module

The Cornerstone spoke adds a Cornerstone application to your ServiceNow instance. The Cornerstone application has the TO DO Lists module. List of Todos that the sample flow, Cornerstone - Pull Todos Details, retrieves for the specified user, can be accessed here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cornerstone spoke account requirements

If you want to use the default settings and permissions provided along with the spoke, you can install the ServiceNow tile on the Cornerstone Marketplace. For more information about registering an application, see Register an OAuth Application in Cornerstone Online Help. Record the generated Client ID and Client Secret for later use.

If you want to configure and customise the spoke as per your requirement and provide additional permissions, register an OAuth 2.0 application in your Cornerstone account to generate OAuth 2.0 tokens for the Cornerstone spoke. For more information, see API Management in the Cornerstone online help . Record the generated Client ID and Client Secret for later use.

Connection and credential alias requirements

Integration hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Cornerstone spoke.

Set up the Cornerstone spoke

Integrate your Cornerstone application with your ServiceNow instance. Register an OAuth application in Cornerstone and authenticate requests from ServiceNow.

Before you begin

- Request an Integration Hub subscription.
- Activate the Cornerstone spoke.
- Role required: admin.

Register an application in the Cornerstone instance

Register an application in the Cornerstone instance and record the generated Client ID and Client Secret for later use.

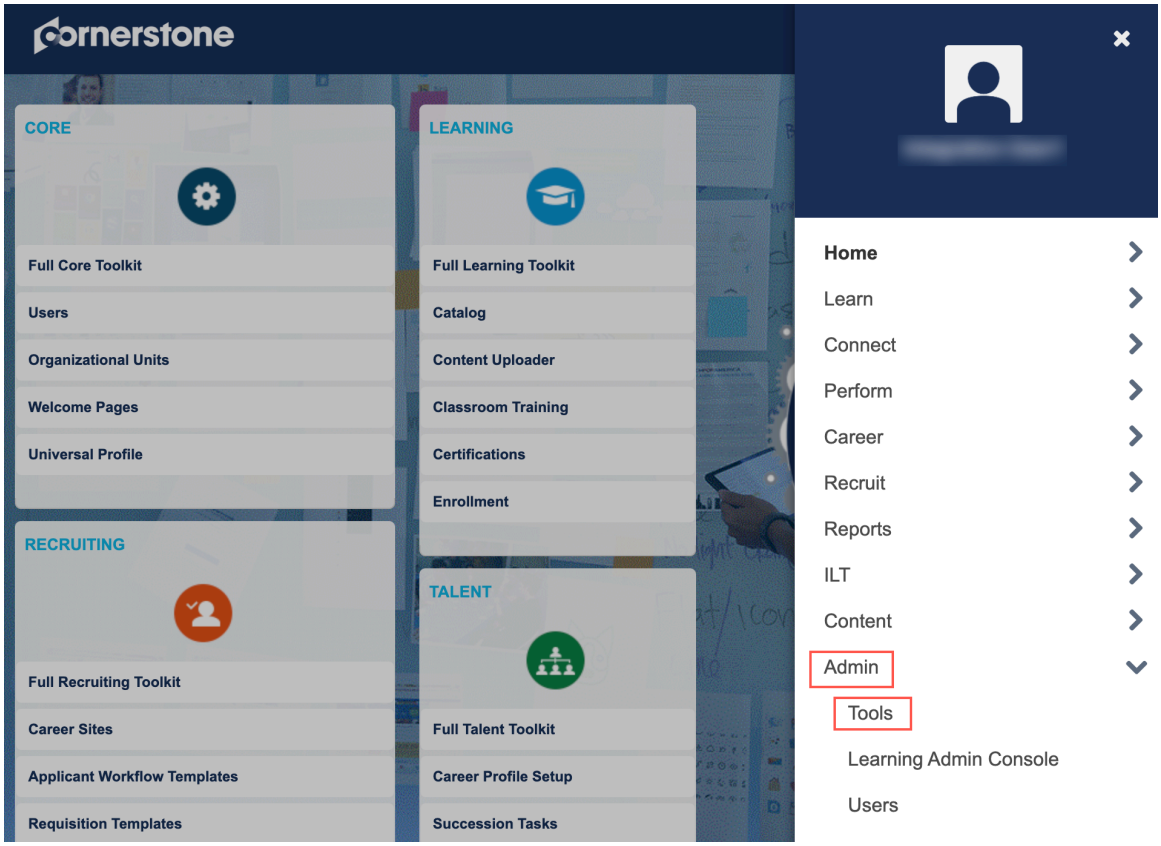
Before you begin

Role required: admin

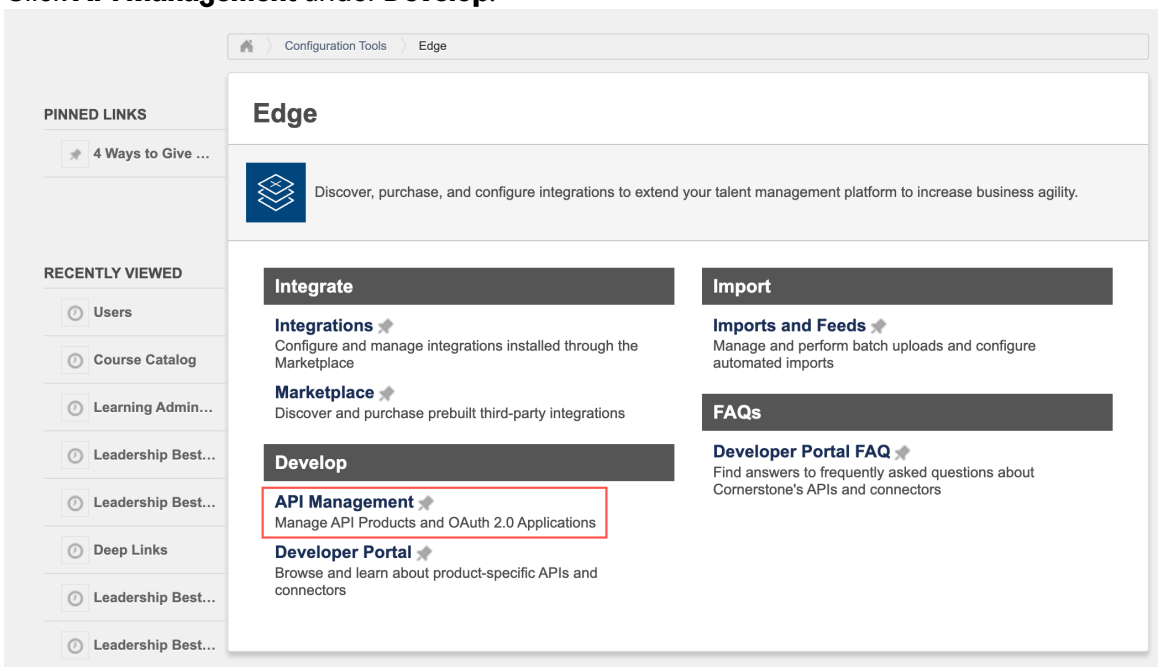
Procedure

1. Log in to the Cornerstone instance as an admin.
2. Navigate to **Admin** > **Tools**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Click **EDGE**.
4. Click **API Management** under **Develop**.



The API Management window is displayed in a new browser tab.

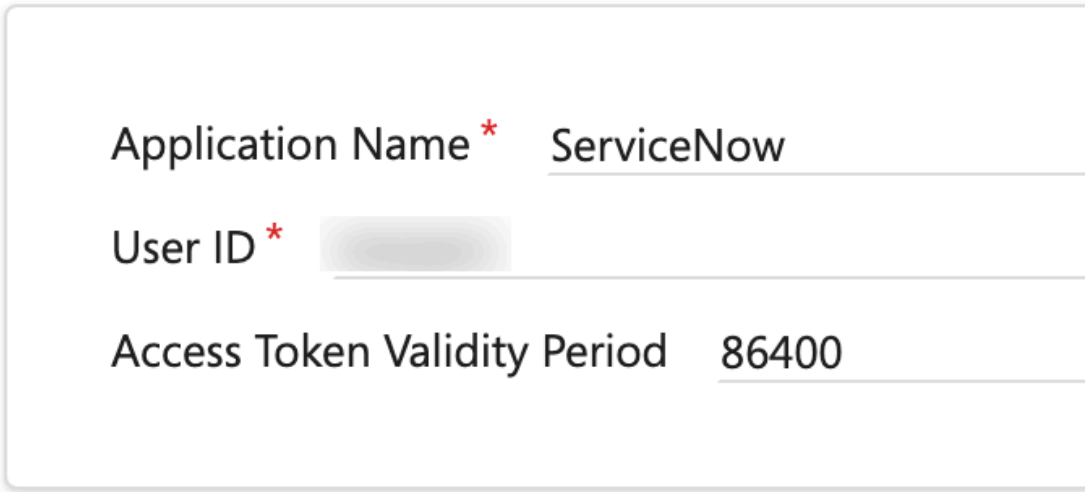
5. Click the **Manage OAuth 2.0 Applications**.
6. Click **+ Register New Application**.
7. On the form, fill the values.

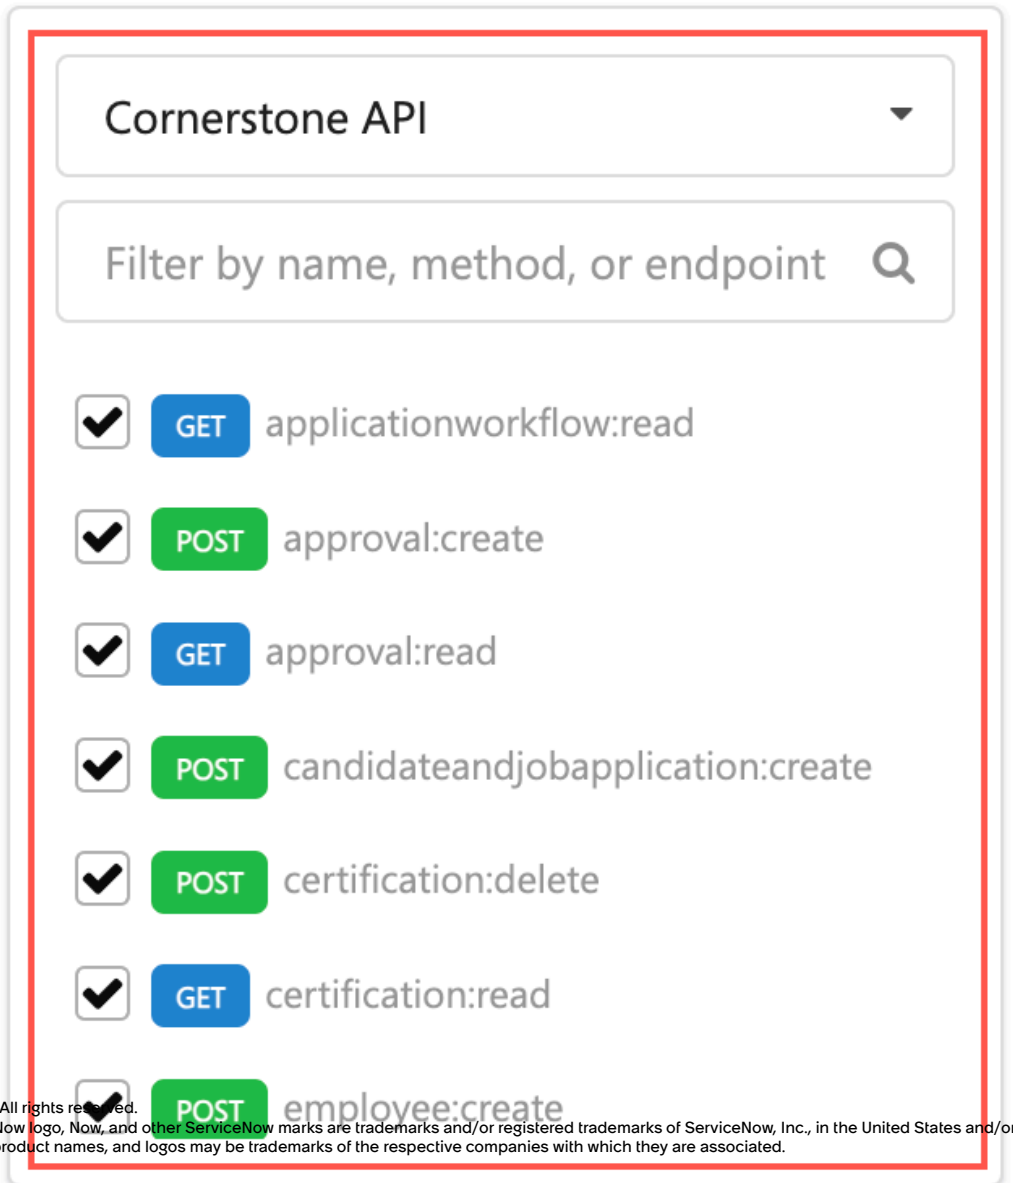
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application Name	Name to identify the application.
User ID	User ID for an active user account in your Cornerstone portal.

8. Select the scopes as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Click **Register Application**.
   The values of Client ID and Client Secret are generated. Copy and record these values for later use.

Configure connection for the Cornerstone spoke

Add and configure a Cornerstone connection to authenticate ServiceNow requests in Cornerstone spoke.

Before you begin
Role required: admin.

Procedure

1. Navigate to **Process Automation** > **Flow Designer**.
2. Click the **Connections** tab.
3. Locate the **Cornerstone** connection alias in the outbound connections.
4. Click **View Details**.

   Note:
   Don't click **Add Connection**.

5. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.
6. On the form, fill in the fields.

Configuration form

Field	Description
Connection Name	Name to identify the connection record.
Connection URL	URL of the Cornerstone instance.
Base URL	URL of the Cornerstone instance.
OAuth Entity Name	Name to identify the application registry record.
OAuth Client ID	Client ID created during the application configuration in Cornerstone.
OAuth Client Secret	Client Secret created during the application configuration in Cornerstone.
Token URL	OAuth server token endpoint. For example, `https://<Cornerstone-Instance>.com/services/api/oauth2/token`.

7. Click **Configure and Get OAuth Token**.

Result
The spoke connection is configured and ready to be used.

Coupa Spoke

Manage business spend and automate approval, contract, inventory, purchase order, requisition, supplier, and user management in Coupa from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Coupa spoke v4.15 is the latest version.

Supported versions

This spoke was built for Coupa version stable_v4.2.0, but may be compatible with later versions.

Spoke requirements

Create an API key in your Coupa instance and record the API key for later use. See Coupa documentation for information about creating API key.

Spoke user roles

The following user roles are available with the spoke:

- Coupa Admin (sn_coupa_spoke.Coupa Admin): Users with this role have access to both, **My Current Approvals** and **Contracts** modules.
- Coupa Approval User (sn_coupa_spoke.Coupa Approval User): Users with this role have access only to the **My Current Approvals** module
- Coupa Contract User (sn_coupa_spoke.Coupa Contract User): Users with this role have access only to the **Contracts** module.

Spoke module

The Coupa spoke adds a Coupa application to your ServiceNow instance. The Coupa application supports Coupa Approval User and Coupa Contract User roles. You can access the Coupa application from the ServiceNow instance on your Now Mobile app.

Note:
Make sure that Coupa Login attribute and the user ID of ServiceNow instance match before using the **My Current Approvals** module.

The Coupa application has the following modules.

Module	Description
My Current Approvals	Displays the list of approvals in Coupa for a user.
Contracts	Displays a list of contracts in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available sample conversational subflows

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

Sample conversational subflows

Conversational subflow	Description
Look up Suppliers - Sample	Retrieves the specified supplier in Coupa using the Coupa query.
Look up Purchase Orders - Sample	Retrieves the specified purchase order in Coupa using the Coupa query.
Look up Contracts - Sample	Retrieves the specified contract records in Coupa using the Coupa query.
Look up Receipts - Sample	Retrieves the specified receipts in Coupa using the Coupa query.
Look up Invoices - Sample	Retrieves details of the specified invoices in Coupa.
Look up Approvals - Sample	Retrieves details of approvals in Coupa.
Look up Requisitions - Sample	Retrieves the specified requisitions in Coupa using the Coupa query.

Spoke actions

The Coupa spoke provides actions to automate approval, contract, inventory, invoice, catalog item, purchase order, requisition, supplier, and user management when events occur in ServiceNow. Available actions include:

Category	Action	Description
Approval Management	Approve Approval Request	Approves the required approval request in Coupa.
	Look up Approval Details by Approval ID	Retrieves the details of the required approval in Coupa.
	Look up Approval	Looks up an approval record in Coupa using the Coupa query.
	Look up Approval By Requisition ID	Looks up the required approval record in Coupa using its Requisition ID.
	Look up Approvals Stream	Retrieves details of approvals in Coupa.
	Reject Approval Request	Rejects the required approval request in Coupa.
Catalog Management	Create Item	Creates an item in Coupa.
Contract Management	Create Contract	Creates contract with the provided details in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Contracts Stream	Looks up the required contract records in Coupa using the Coupa query.
Primary Data Management	Look up Addresses Stream	Retrieves the address details from Coupa.
	Look up Conversion Rates Stream	Retrieves details of the conversion rates in Coupa.
	Look up Currencies Stream	Retrieves details of currencies in Coupa.
	Look up Legal Entities Stream	Retrieves details of the legal entities in Coupa.
	Lookup Cost Centers Stream	Retrieves details of the cost centers in Coupa.
	Look up Advanced Shipment Notices Stream After Updated Date	Retrieves details of advance shipment notices after filtering by the specified updated at field in Coupa.
	Look up Advance Shipment Notice by Purchase Order Line ID	Retrieves details of the advance shipment notice for the specified purchase order line ID.
	Look up Advanced Shipment Notices by Purchase Order Line ID Stream	Retrieves details of all advance shipment notices for the specified purchase order line ID. **Note:** This is a data stream action.
Inventory Management	Create Goods Receipt	Creates a goods receipt record in Coupa.
	Create Receipt	Creates a receipt in Coupa. **Note:** Ensure that description has the exact item name. When you want to access the item name in a flow, use the description data pill.
	Get Receipt Fields	Retrieves the list of fields in the Coupa Receipts table. **Note:** This is a metadata action and doesn't make an API call to Coupa.
	Look up Advanced Shipment Notices After Updated Date	Retrieves the details of the advance shipment notices after the updated date in Coupa.
	Look up Advance Shipment Notice By Purchase Order Line ID	Look up an advance shipment notice by purchase order line ID in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Receipt	Looks up the required receipt in Coupa using the Coupa query.
	Look up Receipt Details by Receipt ID	Retrieves details of the required receipt.
	Look up Receipts Stream	Looks up the required receipts in Coupa using the Coupa query.
	Void Receipt	Makes the required receipt void.
Invoice Management	Create Invoice	Creates an invoice with the provided details in Coupa.
	Update Invoice	Updates the details of the specified invoice in Coupa.
	Void Invoice	Makes the required invoice void.
	Look up Invoices Stream	Retrieves details of the required invoices in Coupa.
	Look up Invoice Payments Details Stream	Retrieves information about the required invoice payment details in Coupa.
Item Management	Look up Items Stream	Looks up the required items in Coupa using the Coupa query.
	Look up Item	Looks up the required item in Coupa using the Coupa query.
Purchase Order Management	Cancel Purchase Order	Cancels the required purchase order in Coupa.
	Close Purchase Order	Closes the required purchase order in Coupa.
	Create Fixed Assets	Creates fixed assets with the specified details in Coupa.
	Create Purchase Order	Creates a purchase order in Coupa.
	Look up PO Line by Line ID	Retrieves details of a purchase order line in Coupa.
	Look up Purchase Order	Looks up the required purchase order in Coupa using the Coupa query.
	Look up Purchase Orders Stream	Looks up the details of the purchase orders in Coupa that you specify using the Coupa query.
	Revise Purchase Order	Revises or updates the purchase order in Coupa.
	Update Purchase Order Status in Coupa	Updates status of the required purchase order in Coupa.
Requisition Management	Create Draft Requisition	Creates a requisition in Coupa with its status as Draft.
	Create Requisition	Creates a requisition with the status as Pending Approval or Pending Buyer Action.
	Get Requisition Fields	Retrieves the list of fields in the Coupa Requisitions table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: This is a metadata action and doesn't make an API call to Coupa.
	Look up Requisition	Looks up the required requisition in Coupa using the Coupa query.
	Look up Requisitions Stream	Looks up the required requisitions in Coupa using the Coupa query.
	Update Requisition	Updates an existing requisition in Coupa.
Sourcing Management	Award Purchase	Awards a purchase in Coupa. To award a purchase, you can specify the quote request ID and the quote supplier ID as inputs.
	Create Sourcing Event	Creates a sourcing event in Coupa.
	Look up Sourcing Quote Response Stream	Looks up the quote response in Coupa based on the quote request ID that you specify. You can also specify other criteria such as the limit of records that the response returns, and the offset.
	Look up Sourcing Events Stream	Retrieves details of the required sourcing event in Coupa.
Supplier Management	Look up Supplier	Looks up the required supplier in Coupa using the Coupa query.
	Create Supplier	Creates a supplier in Coupa.
	Deactivate Supplier	Deactivates the specified supplier in Coupa.
	Update Supplier	Updates details of the specified supplier in Coupa.
	Look up Product Catalogs Stream	Retrieves the product catalogs in Coupa.
	Look up Suppliers Stream	Retrieves list of suppliers in Coupa using the query.
	Look up Suppliers Payment Stream	Retrieves details of the required supplier payments in Coupa.
User Management	Look up User	Looks up the required user in Coupa using the Coupa query.
	Look up Users Stream	Looks up the required users in Coupa using the Coupa query.
	Reset User Password	Resets password of the required user in Coupa.

Note:
Remote tables are created when the Coupa spoke is activated. Users are cautioned against directly modifying schema or inserting data in these tables.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Coupa sourcing management AI agent	Manages sourcing data (that is, looks up sourcing event streams, creates new sourcing events) in Coupa.
Coupa approval management AI agent	Manages approvals (that is, looks up approvals, retrieves approval details) in Coupa.
Coupa requisition management AI agent	Manages requisition (that is, looks up operations to retrieve requisition data) in Coupa.
Coupa purchase order management AI agent	Manages purchase orders (that is, closes purchase orders, retrieves detailed purchase order information, and creates fixed assets) in Coupa.
Coupa invoice management AI agent	Manages invoices (that is, creates invoices, retrieves invoice details, and queries payment details) in Coupa.
Coupa inventory management AI agent	Manages inventories (that is, looks up receipt details, manages advanced shipment notices, and creates goods receipts) in Coupa.
Coupa supplier management AI agent	Manages supplier information (that is, creates, retrieves supplier and product catalog information) in Coupa.
Coupa item management AI agent	Manages items (that is, look up items and retrieve item streams) in Coupa.
Coupa primary data management AI agent	Manages primary data (that is, looks up conversion rates, cost centers, currencies, and legal entities) in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
Coupa user management AI agent	Manages users (that is, reset user passwords, look up individual user details, and retrieve streams of user data) in Coupa.
Coupa catalog management AI agent	Creates a catalog item in Coupa.
Coupa contract management AI agent	Manages contracts (that is, looks up or creates a contract) in Coupa.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Coupa spoke

Integrate the ServiceNow instance and Coupa by creating a custom OAuth application in Coupa to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Coupa spoke.

Note:
If you are upgrading to version 4.0.0 from the previous versions (3.0.3 and earlier) of the spoke, see this KB article: KB0550471.

- Role required: admin.

Configure a connection for Coupa spoke

Add and configure a Coupa connection to authenticate ServiceNow requests in Coupa spoke.

Before you begin

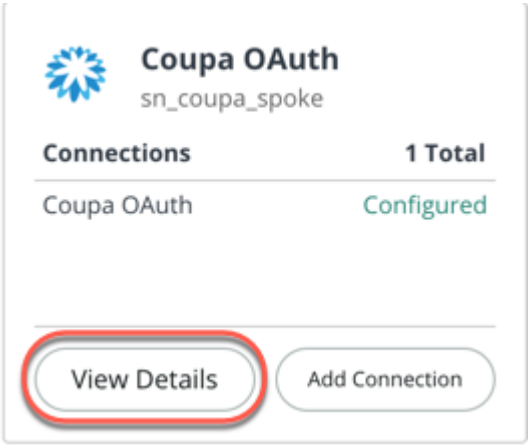
Role required: admin

Procedure

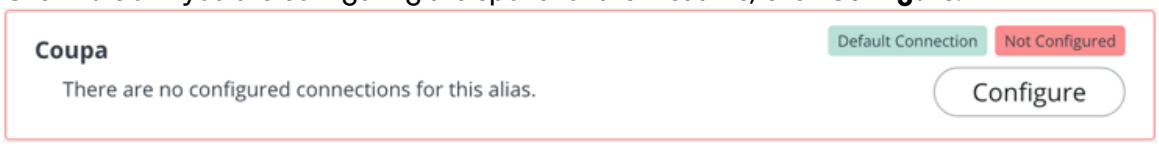
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select **Integrations**.
3. Locate the **Coupa OAuth** connection alias and click **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Don't click **Add Connection**.



4. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.



5. On the form, fill in the fields.

Configuration form

Field	Description
Name (Connection)	Name to uniquely identify the connection. For example, `Coupa spoke connnection`.
Connection URL	URL to make a connection to Coupa. ○ For customer instances, use this format: `https://{organization_name}.coupahost.com` ○ For partner and demo instances, use this format: `https://{organization_name}.coupacloud.com`
Name (Credential)	Name to uniquely identify the credential. For example, `Coupa spoke credential`.
Token URL	URL used to generate OAuth token. Use this format:`https://<connection_url>/oauth2/token`
OAuth Client ID	Identifier (Client ID) generated in Coupa.
OAuth Client Secret	Secret (Client Secret) generated in Coupa.

6. Click **Configure and Get OAuth Token**.

Result
The spoke connection is configured and ready to be used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Craft spoke

Manage alerts and retrieve company information from Craft from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Craft spoke v1.0.0 is the latest version.

Supported versions

This spoke was built for Craft version v1, but may be compatible with later versions.

Spoke requirements

Craft account

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Remote Tables (com.glide.script.vtable)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Craft spoke provides sample flows to demonstrate automating the Craft tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Create Incident if Company is not Active	Fetches company data using the required fragments aliases. If the company is not active, an incident with a description and a short description is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Craft spoke provides actions to automate Craft tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Alert Management	Look up Alerts Stream	Retrieves the list of alerts from Craft.
Company Data Management	Look up Added Companies Stream	Retrieves the list of added companies from Craft.
	Look up Company Data	Retrieves the company information for the specified details.
	Look up Company Details by Name.	Retrieves the company information for the specified company name.

Spoke module

The Craft spoke adds the Craft Spoke application to your instance and includes these modules:

Module	Description
Craft Alerts	Lists the alerts that are retrieved from the Import Craft Alerts import.
Query Fragments	Lists all the query data about the company such as company name, company ID and so on.

Data accessed through these spoke modules is displayed in these Remote tables:

Note:
When you open a remote table, the actions you've set up run in the background to fetch information from Craft. This information displays in the table. When you close the remote table, the information is deleted.

Table	Description
Recently added companies	Retrieves the list of companies that were activated in the last 7 days.
Recent Craft alerts	Runs the remote Recent Craft Alerts remote definition in the background and retrieves the list of all alerts. **Note:** You can customize the alert filter by modifying the script in the Recent Craft Alerts remote definition.

Import set

The Craft spoke adds this Import in the integrations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import	Description
Import Craft Alerts	Retrieves the alerts from Craft and stores them in the Crafts Alerts table.

Set up the Craft spoke

Integrate the ServiceNow instance and Craft spoke by using the basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Craft spoke.
- Role required: admin.

Configure a connection for Craft spoke

Add and configure a Craft spoke connection to authenticate ServiceNow requests.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio.**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **sn_craft_spoke** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Azure DevOps Boards spoke, click **View Details**.

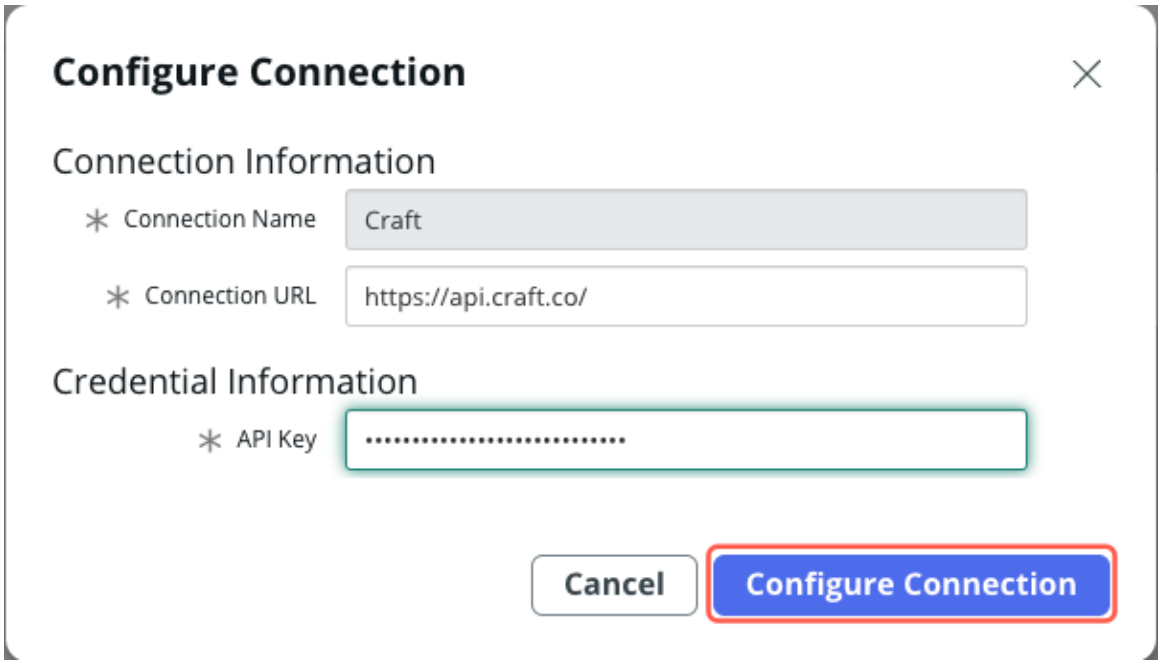
   - To manage more than one Azure DevOps Boards spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Configure Connection** form, fill in the fields.

Field	Description
Connection name	Name to uniquely identify the connection record. For example, `Craft connection`.
Connection URL	URL of the Craft instance. For example, enter the URL in this format: `https://api.craft.co/`
API Key	API key from your Craft account.



6. Click **Configure Connection**.

Result
The spoke connection is configured and ready to be used.

Credly spoke

Credly integration helps employees prove, manage, and showcase their skills more effectively, addressing common issues related to skill verification, visibility, recognition, and career development.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Credly spoke v1.0.0 is the latest version.

Supported versions

This spoke was built for yokohama, and is compatible with later Washington DC and Xanadu versions.

Key features

Credly enables a flow designer to:

- Sync employee badges
- Accept/reject badges

Spoke requirements

A valid Credly account

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed: Credentials core

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Credly provides sample flows to demonstrate automating the Talent Development Core tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Credly event processing	Fetches employee badges to sync from Credly.

Spoke subflows

The Credly spoke provides sample subflows to demonstrate automating Talent Development Core tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Process credly event	Processes the credly event that was triggered.

Spoke actions

The Credly provides actions to automate Talent Development Core tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Retrieving information	Process event information	Retrieves the event process information.
	Gen organization name	Retrieves the employee's organization name.
	Get event details	Retrieves the event details.
	Get employee data	Retrieves the employee data.

Spoke module

Data accessed through these spoke modules is stored in these tables:

Table	Description
Credly Event Log	Retrieves the list of events that were created.

Spoke user roles

The Credly provides these user roles to control access to data:

User role	Description
Admin	Role that is authorized to sync employee badges.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Credly spoke

Integrate the ServiceNow instance and Credly by creating a custom OAuth application in Credly to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Credly spoke.
- Role required: admin

Create a connection record for Credly spoke

Create a connection record for your Credly spoke. The Credly connection and credential aliases use these connections to perform actions in Credly.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for **Credly**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `<Credly spoke> Connection`.
Credential	Credential record created for Credly. For example, `<Credly spoke> Cred`.
Connection alias	Alias record associated with this connection.
URL builder	Option to use the URL builder to build the connection string.
Connection URL	Base URL to connect to **Credly**. Enter:
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.
Use MID server	Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.
Attributes	
Organization ID	The ID of the employee's organization in Credly.

5. Select **Submit**.

CrowdStrike Spoke

Manage licenses for CrowdStrike Falcon protection suite by fetching details of devices with active Falcon sensors installed and checking license compliance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

CrowdStrike spoke v1.1.0 is the latest version.

Spoke requirements

CrowdStrike account with a Falcon administrator role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require appropriate licenses when used outside the spoke implementation.

Spoke actions

The CrowdStrike spoke provides actions to automate CrowdStrike tasks when events occur in your ServiceNow instance.

Category	Action	Description
Host Management	Look up Active Hosts	Retrieves all active hosts. Active hosts are the hosts on which the last_seen date is greater than the date provided in the **Active Since** field.
	Look up Host Details	Retrieves details of the hosts for the Device IDs passed in the **Host IDs** field.
Sensor Management	Look up Hourly Sensor Usage	Retrieves a daily breakdown of your Customer Identification (CID) average hourly sensor usage by sensor category. **Note:** The usage data is retrieved up to two days prior to the current date.
	Look up Weekly Sensor Usage	Retrieves a daily breakdown of your CID average weekly sensor usage by sensor category. **Note:** The usage data is retrieved up to two days prior to the current date.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Register a CrowdStrike OAuth application

Register the CrowdStrike OAuth application to access the CrowdStrike API and to receive a Client ID and Client secret.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The CrowdStrike Integration Hub spoke must be active. For more information, see CrowdStrike spoke.

Role required: CrowdStrike Falcon administrator

Important:

- To use the Sensor Usage APIs, your API client must be assigned the Sensor usage scope with read permissions.
- To use the Look up Hourly Sensor Usage and Look up Weekly Sensor Usage actions, contact your account team to enable the following feature flags:
  - Hourly usage data feature flag: This flag must be enabled for your Customer Identification (CID) to view hourly usage data.
  - Aggregated usage data feature flag: This flag must be enabled to get aggregated usage data in multi-CID (non-Flight Control) accounts.

Procedure

1. Log in to Falcon using your admin credentials.
2. Navigate to **Support** > **API Clients and Keys**.
3. Select **Add new API Client**.
4. Provide the client name and description.
5. Select the appropriate check boxes for the following scopes:
   - To use the Look up Active Hosts and Look up Host Details actions, select the **Read** check box for the **Hosts** scope.
   - To use the Look up Hourly Sensor Usage and Look up Weekly Sensor Usage actions, select the **Read** check box for the **Sensor usage** scope
   - To use all the supported actions, select the **Read** check box for both **Hosts** and **Sensor usage** scopes.
6. Select **ADD**.
   The API client created screen is displayed.
7. Copy the Client ID and Client secret for later use.

Create a CrowdStrike connection

Create a connection between your CrowdStrike applications and your ServiceNow instance so that your instance can retrieve user data from your applications.

Before you begin

ServiceNow Role required: admin

Procedure

1. Log in to your ServiceNow instance.
2. Navigate to **Connection & Credentials** > **Connection & Credentials Aliases**.
3. Locate your CrowdStrike connection and select **Create New Connection & Credential**.
4. In the dialog box, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection and Credential dialog box

Field	Value
Connection Information	
Connection Name	Name of the CrowdStrike connection. This field populates automatically.
Connection URL	URL for the connection. This field is automatically set to `https://api.crowdstrike.com`. Each CrowdStrike cloud has a different base URL. Use the base URL that corresponds to the cloud where your integration is hosted. ○ **US-1**: `https://api.crowdstrike.com` ○ **US-2**: `https://api.us-2.crowdstrike.com` ○ **EU-1**: `https://api.eu-1.crowdstrike.com` ○ **US-GOV-1**: `https://api.laggar.gcw.crowdstrike.com` ○ **US-GOV-2**: `https://api.us-gov-2.crowdstrike.mil`
Credential Information	
OAuth Client ID	Client ID that you generated while configuring the CrowdStrike API settings.
OAuth Client Secret	Client Secret that you generated while configuring the CrowdStrike API settings.
OAuth Redirect URL	`https://<instance name>/oauth_redirect.do`, where the instance name is the name of your ServiceNow instance.

5. Select **Create and Get OAuth Token**.
   The OAuth token is generated successfully.

Databricks Spoke

Retrieves details of warehouses, tables, schemas, and catalogs, and executes SQL statements in Databricks from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for these versions of Databricks, but may be compatible with later versions:

Action category	Databricks version
Unity Catalog Management	API version 2.1
SQL Management	API version 2.0

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Databricks spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Look up Catalogs	Retrieves list of all catalogs.
Look up Schemas	Retrieves list of all schemas from a specific catalog.
Look up Tables	Retrieves list of all tables from a specific schema in a catalog.
Sample - Execute Databricks SQL Statement	Executes a SQL statement on Databricks and returns the result columns and data array.

Spoke actions

The Databricks spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
SQL Management	Execute SQL Statement	Executes the provided SQL statement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Execution Status	Retrieves the execution status of a SQL statement.
	Look up Result Chunk by Index	Retrieves a specific chunk of the result set for a SQL statement by chunk index. **Note:** If the data you want to retrieve is more than 5MB, modify the default value of the system property *glide.pf.rest.response_payload_max_size* and increase it as per your requirement.
	Look up Warehouses Stream	Retrieves a list of SQL warehouses.
Unity Catalog Management	Look up Catalogs	Retrieves details of the required number of catalogs. **Note:** To retrieve list of all catalogs, use the Look up Catalogs subflow.
	Look up Schemas	Retrieves details of the required number of schemas from a specific catalog. **Note:** To retrieve list of all schemas from a specific catalog, use the Look up Schemas subflow.
	Look up Tables	Retrieves details of the required number of tables from a specific schema in a catalog. **Note:** To retrieve list of all tables from a specific schema in a catalog, use the Look up Tables subflow.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Databricks spoke

Integrate your ServiceNow instance and the Databricks workspace by using an OAuth secret to authenticate the ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Databricks spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an OAuth secret in Databricks workspace

Create an OAuth secret in Databricks workspace to authenticate the ServiceNow requests.

Before you begin

Role required: admin

Procedure

1. Log in to the Databricks workspace as an admin.
2. Click the user icon and click **Settings**.
3. Under **Workspace admin**, click **Identity and access**.
4. On the Identity and access page, for **Service principals** click **Manage**.
5. On the Service principals page, click **Add service principal**.
6. On the Add service principal form, click **Add new**.
7. On the Add service principal form, select the **Databricks Managed** option and for **Service principal name**, enter a name to identify the record.
8. Click **Add**.
   Service principal is added to the workspace and the list of service principals records is displayed.
9. Click and open the service principal record you have created.
10. Click the **Secrets** tab.
11. Under **OAuth secrets**, click **Generate secret**.
12. On the Generate OAuth secret form, for **Lifetime (days)** enter the required number of days the secret should be valid for.
13. Click **Generate**.
    The values of **Secret** and **Client ID** are generated.
14. Copy the values of **Secret** and **Client ID** for later use and click **Done**.
15. **Optional:** Click the **Permissions** tab.
16. **Optional:** Click **Grant access**.
17. **Optional:** On the Grant access to others form, select **User, Group or Service principal** and **Permission** as per your requirement and click **Save**.

Configure a connection for the Databricks spoke

Configure a connection to your Databricks workspace. The Databricks spoke connection and credential aliases use these connections to perform actions in the Databricks workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Databricks** and click **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Databricks spoke, click **View Details**.

- To manage more than one Databricks spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

5. On the form, fill in these fields:

Field	Value required
Connection Information	
Name	Auto-generated name to identify the connection record.
Connection URL	URL of the Databricks workspace.
Credential Information	
OAuth Client ID	Client ID you created in the Databricks workspace.
OAuth Client Secret	Key value you created in the Databricks workspace.
OAuth Redirect URL	Redirect URL of your ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`.

6. Click **Configure and Get OAuth Token**.

Docker Spoke

Lookup Docker data from your ServiceNow instance. Automate changes in the Docker engine when an event occurs in ServiceNow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Docker spoke v2.3.4 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

Community Edition version 18.09.0.

Spoke actions

The Docker spoke provides actions to automate Docker tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Images Management	Create An Image	Creates an image in the Docker instance.
	List Images	Lists images from the Docker instance.
	Remove An Image	Removes an image from the Docker instance.
	Search Images	Searches for images on Docker Hub.
Services Management	Create A Service	Creates a service in the Docker instance. Services are tasks run on a swarm.
	Delete A Service	Deletes a service from the Docker instance.
	Inspect A Service	Returns detailed information about a service in the Docker instance.
	Update A Service	Updates a service to the swarm on the docker instance.
	List Services	Returns a list of services from the Docker instance.
Containers Management	Create A Container	Creates a container in the Docker instance.
	Inspect A Container	Inspects a container in the Docker instance.
	Kill A Container	Kills a container in the Docker instance.
	List Containers	Lists containers in the Docker instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Pause A Container	Suspends all processes in a container on the Docker instance.
	Remove A Container	Removes a container from the Docker instance.
	Rename A Container	Renames a container in the Docker instance.
	Restart A Container	Restarts a container in the Docker instance.
	Start A Container	Starts a container in the Docker instance.
	Stop A Container	Stop a container in the Docker instance.
	Unpause A Container	Unpauses a container in the Docker instance.
	Update A Container	Updates a container in the Docker instance with the provided values.
	Wait for A Container	Blocks all processes until a container stops, then returns the exit code for the container on the Docker instance.
Executions Management	Create An Exec Instance	Creates an exec instance in Docker, through which you can run a new command in a running container. To execute a command in a container, create and start an exec instance.
	Inspect An Exec Instance	Inspects an exec instance in Docker.
	Start An Exec Instance	Starts an exec instance in Docker, through which you can run a new command in a running container.
Networks Management	Create A Network	Creates a network on the Docker instance.
	Inspect A Network	Returns detailed information about a network in the Docker instance.
	List Networks	Returns a list of networks from the Docker instance.
	Remove A Network	Removes a network from the Docker instance.
Volumes Management	Create A Volume	Creates a volume in Docker.
	Inspect A Volume	Returns detailed information about a volume in Docker.
	List Volumes	Returns a list of volumes from Docker.
	Remove A Volume	Removes a volume from the Docker instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Swarm Management	Delete A Node	Deletes a node from the Docker instance.
	Initialize A New Swarm	Initializes a new Docker swarm. A swarm is a group of machines running Docker joined into a cluster.
	Inspect Swarm	Returns detailed information about a Docker swarm.
	Join An Existing Swarm	Joins a node to a swarm as a manager or worker node based on the Docker token.
	Leave A Swarm	Removes a Docker instance from a swarm.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Docker alias record to authorize actions. To use the spoke connection alias, create an associated Connection record. This spoke does not require a credential record. For information about setting up the spoke, see Configure a connection for Docker spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Docker alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Docker spoke

Integrate the ServiceNow instance and Docker spoke by using the Docker Connection and Credential alias to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Docker spoke.
- Role required: admin.

Configure a connection for Docker spoke

Add and configure a Docker connection to authenticate ServiceNow requests in Docker spoke.

Before you begin

Role required: admin

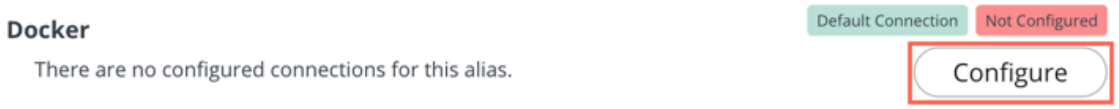
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the **Docker** connection alias and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Docker spoke, click **View Details**.

   - To manage more than one Docker spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

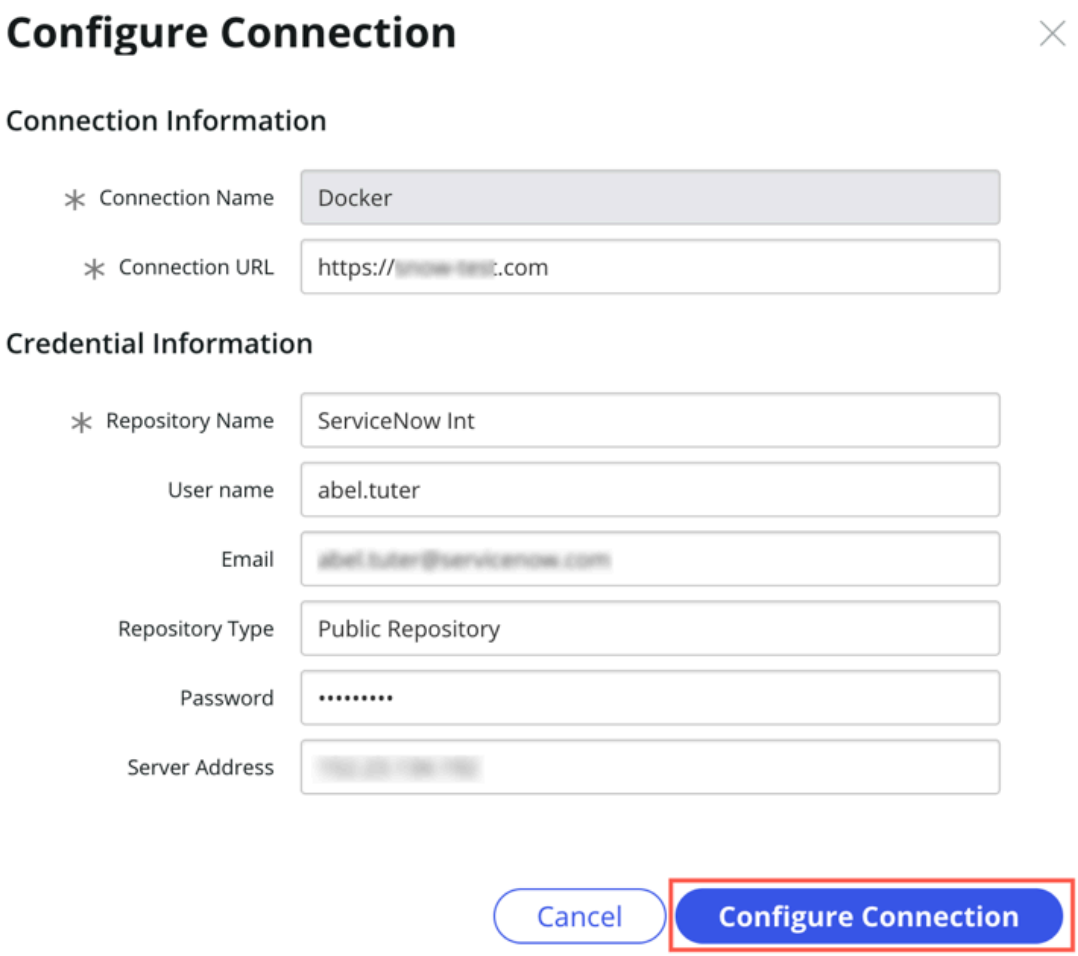


5. On the Configure Connection form, fill in the fields.

Connection Name	Name to uniquely identify the connection record. For example, `Docker connection`.
Connection URL	IP address and port of the host server where Docker is installed. The format of the URL should be: `https://<ip_address>:<port_number>` or `https://<provider-domain-name>.com`.
Repository Name	Name of the repository.
User name	User name of your Docker account.
Email	Email address used in your Docker account.
Repository Type	Type of the Docker repository.
Password	Password of your Docker account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Server Address	IP address of the host server where Docker is installed.



6. Click **Configure Connection**.

Result
The spoke connection is configured and ready to be used.

Docusign eSignature Spoke

Automate the process of sending a document to an individual or list of recipients for digital signature using Docusign eSignature. For example, automate employee onboarding and offboarding, or send non-disclosure agreements, legal agreements, and statements of work. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Docusign eSignature spoke v4.3.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Compatible versions

This spoke was built for Docusign eSignature API version v2 or v2.1, but may be compatible with later versions.

Key features

Docusign eSignature spoke enables a flow designer to:

- Automate the process of sending a document from a ServiceNow attachment or Docusign eSignature template to an individual or recipient list for digital signature.
- Discover and synchronize Docusign eSignature accounts and templates in ServiceNow.
  - Retrieve a list of accounts and associated templates from Docusign eSignature and then insert or update them as records in the Accounts [sn_docusign_spoke_accounts] and Templates [sn_docusign_spoke_docusign_templates] tables using the Get Accounts subflow.
  - Retrieve templates associated with a specified Docusign eSignature account and then insert or update them as records in the Templates [sn_docusign_spoke_docusign_templates] table using the Get Templates Per Account subflow.
- Copy and customize sample flows for sending templates and on-demand document requests.
- Pause a flow until a document is signed. A scripted REST API webhook waits for the recipient to sign the document.
- Use values from a signed document in a flow.
- Attach a completed Docusign eSignature document to a ServiceNow record for auditing purposes.
- Manage envelopes and users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- Docusign eSignature account
- Docusign eSignature administrator credentials
- Docusign eSignature application configured to integrate with ServiceNow
- Docusign eSignature application details such as client ID, integrator key, secret keys, and RSA keypairs
- ServiceNow IntegrationHub subscription

> **Note:**
> Ensure that you have activated the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin.

See the Docusign Developer Center documentation for instructions on creating and configuring custom applications.

Spoke flows

The Docusign eSignature spoke provides sample flows to demonstrate automating Docusign tasks. Use Docusign eSignature spoke actions to automate any tasks desired by your organization. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Send a Document for Digital Signature	Sends a document to Docusign for a digital signature when a Service Catalog request is created by the **Send a Document for Digital Signature** item. Before using this flow, activate the **Send a Document for Digital Signature** catalog item.
Send employment offer to candidate using Docusign template	Sends a Docusign envelope to a user using a template. For example, use this flow to send a job offer to a candidate. Before using this flow, activate the **Demonstrate Template - Send Job Offer to Candidate** catalog item.

The Docusign eSignature spoke adds catalog items for use with the Docusign eSignature spoke sample flows. Before triggering a Docusign eSignature spoke sample flow, activate these catalog items.

Catalog item	Description
Send a Document for Digital Signature	Sends a document for digital signature in Docusign.
Demonstrate Template - Send Job Offer to Candidate	Sends a job offer using a Docusign template.

Spoke subflows

The Docusign eSignature spoke provides sample subflows to demonstrate automating Docusign tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Subflow	Description
Envelope Management	Attach Docusign Envelope To ServiceNow Record	Attaches all the documents in an envelope to a ServiceNow record.
	Get & Set Docusign Field Data	Processes a list of catalog item variables and updates a draft envelope with each variable value.
User Management	Create User	Creates a user including the permission profile and group memberships.
	Update User	Updates a user including the permission profile and group memberships.
Templates Management	Get Templates Per Account	Retrieves templates from a Docusign account and stores them in the Templates table.
Default	Docusign Webhook Sample Subflow	Retrieves the recipient details for the specified envelope.
Account Management	Get Accounts	Retrieves Docusign Accounts and Templates related to every account and store them in Accounts and Templates table respectively.

Spoke actions

The Docusign eSignature spoke provides actions to automate Docusign tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Account Management	Look up Account Signature Providers	Retrieves a list of signature providers that the specified account can use.
	Look up Accounts by Alias	Retrieves accounts associated with the spoke Connection and Credential alias record.
	Look up Role ID	Retrieves the roles ID for the specified role name.
Bulk Envelopes Management	Create Bulk Send List	Creates a bulk send list.
	Create Bulk Send Request	Creates a bulk send request based on an existing bulk send list using an envelope or template.
	Create Bulk Send Test Request	Creates a bulk send test request for testing compatibility with the existing envelope or template.
	Delete Bulk Send List	Deletes the specified bulk send list.
	Look up Bulk Send Batch	Retrieves the envelopes from the specified bulk send batch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Envelopes Stream	
	Look up Bulk Send Batch Status	Retrieves the general status of the specified bulk send batch such as number of successes, number pending, number of errors and so on.
	Look up Bulk Send Batches Stream	Retrieves the information of the bulk send batches.
	Look up Bulk Send List	Retrieves the specified bulk send list.
	Look up Bulk Send Lists	Retrieves a list of the bulk send lists.
	Update Bulk Send Batch Action	Performs a bulk action (resend, correct or void) on the specified bulk send batch.
	Update Bulk Send Batch Status	Updates the name of the specified bulk send batch.
	Update Bulk Send List	Updates the specified bulk send list.
Document Signature	Look up Embedded Signing URL	Creates a signing URL that is embedded into an application. User can sign the document without leaving the application. **Note:** Signing URL is active for 300 seconds and can be sent to one recipient at a time.
	Look up Embedded Signing URL Inline	Retrieves a URL which enables you to embed the recipient view of the on Docusign.
Document Management	Add Document to Envelope	Adds documents to envelope.
	Attach Combined Document to ServiceNow Record	Attaches Docusign documents to a ServiceNow record.
	Attach Docusign	Retrieves a signed Docusign document and attaches it to a ServiceNow record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Document to ServiceNow Record	
	Look up Document ID by Name	Retrieves the document ID from an envelope using the specified document name.
	Look up Documents in an Envelope	Returns a list of documents with an ID and name in the given Docusign envelope.
	Replace Document in an Envelope	Replaces documents to envelope.
Envelope Management	Add Recipient to Envelope	Adds the specified recipient to the specified envelope. **Note:** • Recipient ID used in this action is associated with the envelope and is different from the Recipient ID used in the Get All Template Fields action. • Administrator enters a numeric value for this Recipient ID.
	Add Recipients to Envelope	Adds the specified recipients to the specified envelope.
	Attach Docusign Certificate To ServiceNow Record	Attaches a Docusign certificate to a ServiceNow record.
	Cancel Envelope	Cancels an in-process envelope.
	Create Draft Envelope from Template	Creates a draft envelope from an existing Docusign template.
	Create Envelope from Composite Template	Creates an envelope from an existing composite template.
	Look up Field ID	Retrieves the ID of the specified field from the specified draft envelope.
	Look up Field Value	Retrieves the value of the specified field from the specified envelope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Fields	Retrieves the list of fields associated to a document in a draft envelope.
	Look up Recipient ID by Role Name	Retrieves the recipient ID of the specified role name from the specified envelope.
	Look up Recipients in an Envelope	Returns a list of recipients with a Recipient ID and Role Name in the given Docusign envelope.
	Remove Recipient from Envelope	Deletes a recipient from a Docusign envelope.
	Send Adhoc Signature Request to User	Sends a Docusign document associated with the specified ServiceNow record to the specified recipient for signature.
	Send Adhoc Signature Request To Users - Inline	Sends one or more uploaded documents from a ServiceNow record to multiple recipients.
	Send Envelope	Sends an envelope to the specified recipients. **Note:** All recipient details must be provided before sending an envelope.
	Resend Envelop	Send a reminder to recipients who are currently the pending signers.
	Lock Envelop	Locks the specified envelope and sets the time until the lock expires to prevent other users or recipients from changing the envelope.
	Unlock Envelope	Unlocks the specified locked envelope.
	Set Field Value	Sets the value of the specified field in the specified draft envelope.
	Set Field Values	Assigns the values of multiple fields associated to a document in a draft envelope.
	Wait for Signature from Docusign	Pauses a flow until the specified document has been signed or rejected. Returns the status of the document to the flow for further processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Remove Recipient from Envelope	Deletes a recipient from an envelope. Prior to using this action, Create Draft Envelope from Template action should be used to generate a draft Envelope.
	Upsert Recipients for Envelope	Updates or adds recipients to the envelope. If a recipient with the specified recipient ID already exists, their information will be updated; otherwise, a new recipient will be created with the provided details. Prior to using this action, Create Draft Envelope from Template action will be used to generate a draft Envelope.
Group Management	Add User To Group	Adds user from a group.
	Look up Group ID	Retrieves a group ID for the specified role name.
	Remove User From Group	Removes the specified user from a group.
Template Management	Look up Templates Per Account	Retrieves the templates associated with the specified Docusign account.
	Look up Template Fields	Retrieves all fields in a template that is defined for a recipient. **Note:** • Recipient ID used in this action is associated with the template and is different from the Recipient ID used in the Add Recipient to Envelope action. • Value of the Recipient ID is a unique system-generated number.
	Look up Template Recipients	Retrieves all recipients defined for a template.
User Management	Create User	Creates a Docusign user with the specified user details.
	Look up User Detail	Retrieves details for a user.
	Update User	Updates the specified user.
	Delete User	Deletes the specified Docusign user.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Docusign eSignature account management AI agent	Manages account management (that is, looks up accounts by alias, retrieves role IDs and identifies account signature providers) in Docusign.
Docusign eSignature envelope management AI agent	Manages envelope management (that is, sendS signature requests, manages envelope statuses, and attaches DocuSign data to ServiceNow records) in Docusign.
Docusign eSignature templates management AI agent	Manages template management (that is, retrieves recipient details, accesses template fields, and fetches template names per account) in Docusign.
Docusign eSignature bulk envelopes management AI agent	Manages bulk envelope management tasks (that is, updates and looks up bulk send batch statuses, manages bulk send lists, create bulk send requests) in Docusign.
Docusign eSignature user management AI agent	Manages user management (that is, creates, updates, deletes, and retrieves user details) in Docusign.
Docusign eSignature group management AI agent	Manages group management (that is, looks up group IDs, adds users to groups, and removes users from groups) in Docusign.
Docusign eSignature document management AI agent	Manages document management tasks (that is, attaches documents, manages envelopes, and retrieves document details) in Docusign.
Docusign eSignature document signature AI agent	Manages document signature tasks (that is, looks up embedded signing URL, and looks up embedded signing URL inline) in Docusign.

Looking for an AI agent?

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke module

The Docusign eSignature spoke adds a Docusign module to your ServiceNow instance. The Docusign eSignature spoke synchronizes and stores templates and envelopes in ServiceNow. The Docusign eSignature spoke includes these tables and records.

Table/Record	Description
Connection Aliases	The Docusign connection alias.
Scheduled Job	The Get Accounts & Templates scheduled job that synchronizes templates and envelopes with your Docusign account.
Accounts	Docusign accounts synchronized with your ServiceNow instance. To synchronize accounts, see Synchronize Docusign with ServiceNow. The Get Accounts subflow retrieves a list of accounts and associated templates from Docusign and then inserts or updates them as records in the Accounts [sn_docusign_spoke_accounts] and Templates [sn_docusign_spoke_docusign_templates] tables.
Templates	Docusign templates from synchronized Docusign accounts. The Get Templates Per Account subflow retrieves templates associated with a specified Docusign account and then inserts or updates them as records in the Templates [sn_docusign_spoke_docusign_templates] table.
Envelopes	Docusign envelopes from synchronized Docusign accounts. Records in the Envelopes table are updated only when webhook is configured for the Docusign account.
DocuSign Webhook Answer Subflows	List of webhook answer subflows.

The Docusign eSignature spoke tables include these fields.

Table	Fields
Accounts [sn_docusign_spoke_accounts]	• Account ID • Account Name • Description • Email

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Fields
	• Alias • Display Name
Templates [sn_docusign_spoke_docusign_templates]	• Account • Template ID • Name • Description • Last Modified • Display Name
Envelopes [sn_docusign_spoke_envelopes]	• Account • ID • Status • Signed Date • Declined Reason • Display name • Embedded Signing • Signed Date Time Zone • Template

Spoke triggers

ServiceNow supports specific events on Docusign that create triggers. You must first configure a flow with a supported trigger definition. When an event, for example, a push request, occurs on the Docusign, it sends the payload via a webhook to the ServiceNow instance. After that, the flow that you configured is triggered at the ServiceNow instance to automate a workflow. The supported events are:

Category	Trigger	Definition
Envelope Management	Envelope Completed	Trigger is initiated when an envelope has been completed by all the recipients. Configure the flow to execute only when the specified trigger conditions are met.
	Envelope Declined	Trigger is initiated when an envelope has been declined by one of the recipients. Configure the flow to execute only when the specified trigger conditions are met.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Trigger	Definition
	Envelope Deleted	Trigger is initiated when a sent envelope is deleted. Configure the flow to execute only when the specified trigger conditions are met.
	Envelope Delivered	Trigger is initiated when all recipients have opened the envelope through the Docusign signing website. Configure the flow to execute only when the specified trigger conditions are met.
	Envelope Sent	Trigger is initiated when an envelope is sent to recipient. Configure the flow to execute only when the specified trigger conditions are met.
	Envelope Voided	Trigger is initiated when an envelope has been voided by the sender or has expired. Configure the flow to execute only when the specified trigger conditions are met.
Recipient Management	Recipient Completed	Trigger is initiated when the recipient has completed their actions for the envelope. Configure the flow to execute only when the specified trigger conditions are met.
	Recipient Declined	Trigger is initiated when the recipient declines to sign the document(s) in the envelope. Configure the flow to execute only when the specified trigger conditions are met.
	Recipient Delivered	Trigger is initiated when the recipient has viewed the document(s) in an envelope through the Docusign signing web site. Configure the flow to execute only when the specified trigger conditions are met.
	Recipient Sent	Trigger is initiated when an email notification is sent to the recipient signifying that it is their turn to sign an envelope. Configure the flow to execute only when the specified trigger conditions are met.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the triggers for the Docusign eSignature spoke, see Set up triggers for the Docusign eSignature spoke. For more information about inbound integration, see Conditional and event-driven inbound integration.

Docusign account requirements

The Docusign eSignature spoke requires configuring your Docusign account to generate an OAuth 2.0 JWT Bearer Grant token.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Docusign Connection & Credential Alias record to authorize actions.

Important:

- You can choose to set up the Docusign spoke using authorization code grant or JWT grant.
  - Use Authorization Code Grant if your integration uses a browser or client to make requests to a web server.
  - Use JWT Grant if each user of your integration will use a single system account to log in.

  For more information about when to chose either of the setup methods, see Choose OAuth Type in Docusign Developer documentation.
- Your company may have a Docusign account for each department that uses Docusign. To use multiple accounts with this spoke, create a child alias for each account. Also, ensure that you override the base alias with the child alias in your flows. At runtime, the system identifies the child alias associated with the account and sends the correct connection and credential information in the request.
  - For more information about child alias and overriding the base alias, see Supporting multiple connections.
  - For information about setting up multiple accounts, see Create child aliases for additional Docusign accounts.

  If your company only has one account, you can use the default **Docusign** alias provided with the spoke and proceed to setting up the Docusign spoke using authorization code grant or JWT grant.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Docusign alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up Docusign eSignature spoke using authorization code grant

Integrate the ServiceNow instance and Docusign eSignature spoke by using Authorization Code to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Docusign eSignature spoke.
- Role required: admin

Important:
If you are setting up Docusign eSignature spoke using authorization code grant, you need not set up the spoke using JWT grant.

Configure the Docusign account

Configure a custom OAuth application from your Docusign account to enable authentication with the Docusign eSignature spoke.

About this task

Complete these steps from your Docusign account. See the Docusign Developer Center documentation for instructions on creating and configuring custom applications. Docusign uses a scripted webhook to send signed document data to ServiceNow instance. This enables flow designers to pause a flow until a document is signed, and use document data in the flow.

Before you begin

Docusign requirements:

- Docusign account
- Docusign app configured to integrate with ServiceNow
- Role required: Docusign administrator

Procedure

1. Log in to the Docusign account as an admin.
2. From your Docusign account, register your application.

   Note:
   Ensure that you select the **Authorization Code Grant** option for **User Application**.

3. Generate an integrator key and secret key.
4. Record the values of integrator key and secret key to register the app as a third-party OAuth provider on your ServiceNow instance.
   You need these values when you Configure the connection for Docusign eSignature spoke.
5. Add the ServiceNow OAuth Redirect URL in your Docusign account.

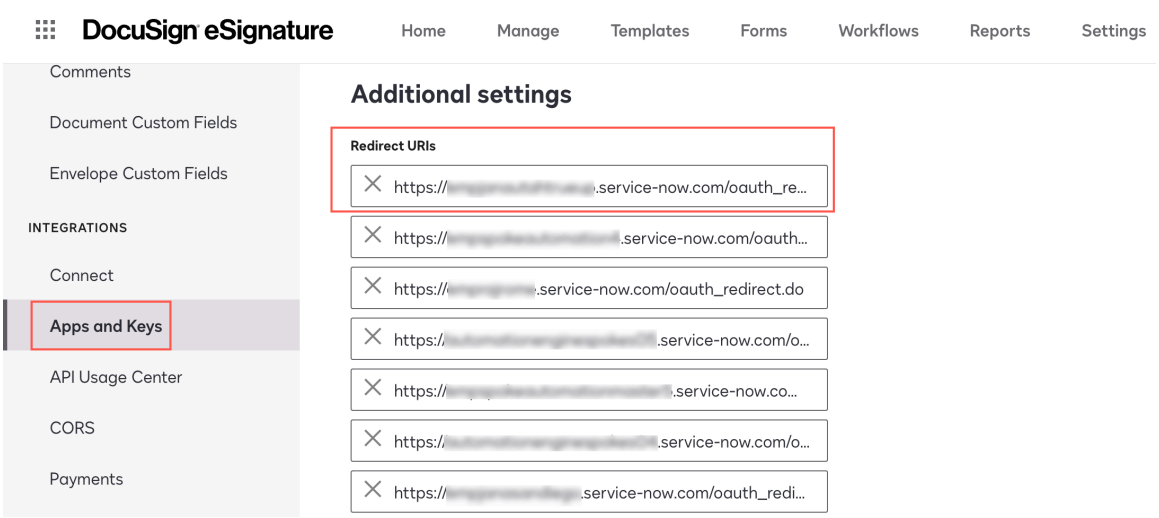
   a. Navigate to **Integrations** > **App and Keys**.

   b. Under **Apps and Integration Keys**,find the required app.

   c. For the required app, click the **Actions** drop-down list and click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

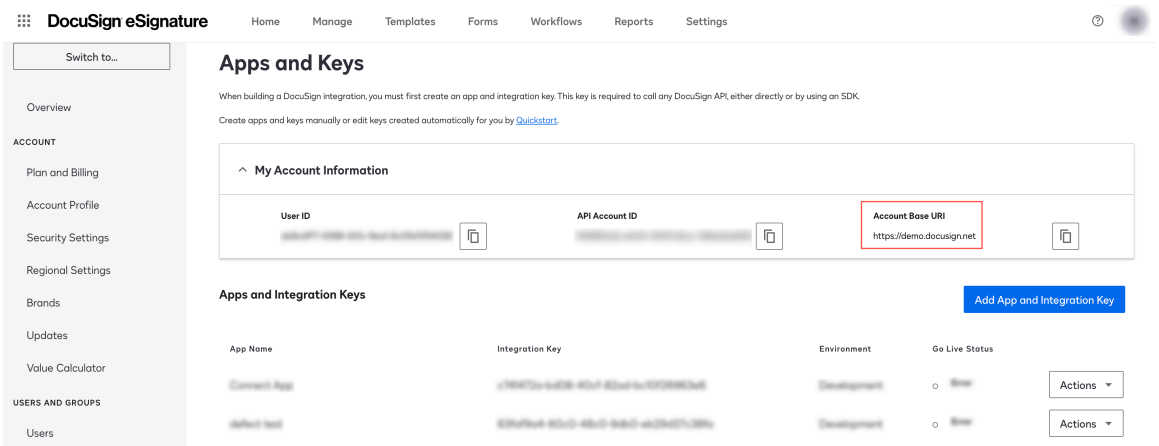
d. Under **Additional settings**, click **Add URI** and add the OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`.



6. Obtain the value of **Account Base URI** from the Docusign account.

a. Navigate to **Integrations** > **App and Keys**.

b. Under **My Account Information**, you can find the value of the **Account Base URI**.



c. Copy and record this value for later use.

Configure the connection for Docusign eSignature spoke

Integrate the ServiceNow instance and Docusign account instance using authorization code grant to authenticate ServiceNow requests.

Before you begin

Role required: admin

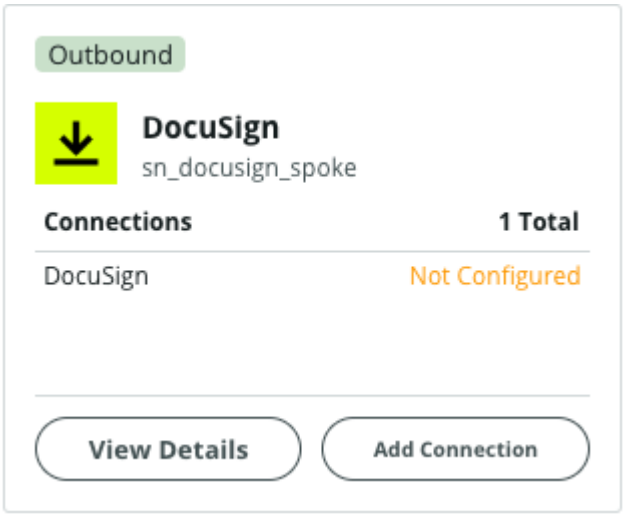
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.

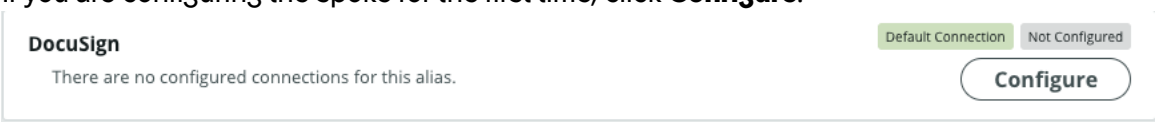
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Locate the alias for Docusign and click **View Details**.

> **Note:**
> Don't click Add Connection.



5. If you are configuring the spoke for the first time, click **Configure**.



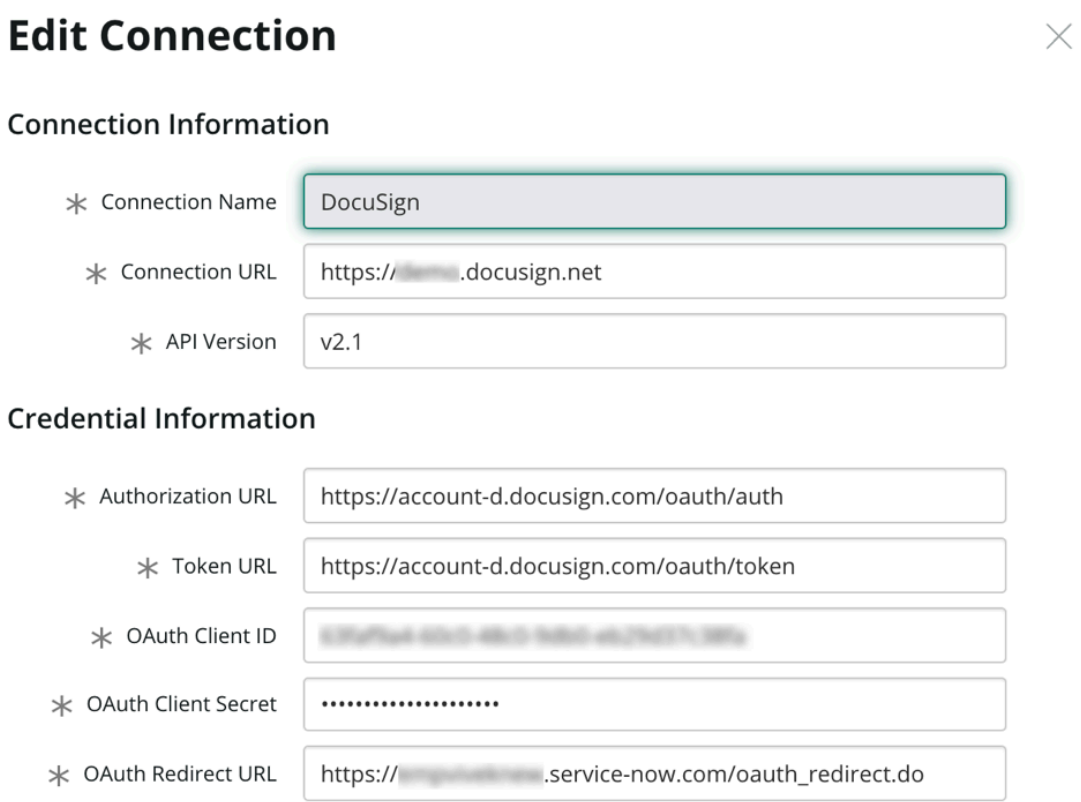
6. On the Configure Connection form, fill in the fields.

Configure Connection form

Field	Description
Connection Name	Unique name to identify the connection.
Connection URL	**Account Base URI** to connect to Docusign environment. This value can be obtained from your Docusign account. For more information see, Configure the Docusign account.
API Version	Docusign API version. The default value is v2.1.
Authorization URL	Docusign authorization URL. ○ For developer sandbox environment, enter `https://account-d.docusign.com/oauth/auth`. ○ For live production system, enter `https://account.docusign.com/oauth/auth`.
Token URL	URL from which the ServiceNow instance obtains the access token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ For developer sandbox environment, enter `https://account-d.docusign.com/oauth/token`. ○ For live production system, enter `https://account.docusign.com/oauth/token`. For more information see, Post Go-Live and User Info Endpoint Reference in the Docusign Developer Center documentation.
OAuth Client ID	Integrator key of your Docusign account.
OAuth Client Secret	Secret key (client secret) of your Docusign account.
OAuth Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. **Note:** Ensure that you add this URL in your Docusign account. For more information see, Configure the Docusign account.



7. Click **Configure and Get OAuth Token**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up Docusign eSignature spoke using JWT grant

Integrate the ServiceNow instance and Docusign by using JWT grant to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Docusign eSignature spoke.
- Role required: admin.

Important:
If you are setting up Docusign eSignature spoke using JWT grant, you need not set up the spoke using authorization code grant.

Configure Docusign account

Create a custom OAuth application from your Docusign account to enable OAuth 2.0 authentication with the Docusign eSignature spoke.

Before you begin

Docusign requirements:

- Docusign account
- Docusign app configured to integrate with ServiceNow
- Role required: Docusign administrator

About this task

Complete these steps from your Docusign account. See the Docusign Developer Center documentation for instructions on creating and configuring custom applications. Docusign uses a scripted webhook to send signed document data to ServiceNow instance. This enables flow designers to pause a flow until a document is signed, and use document data in the flow.

Procedure

1. From your Docusign account, register your application.
2. Generate an integrator key and secret key.
3. Record the values of integrator key and secret key to register the app as a third-party OAuth provider on your ServiceNow instance.
   You need these values when you Register Docusign as OAuth Provider
4. Click **ADD RSA KEYPAIR** and record the **Keypair ID**, **Public Key**, and **Private Key**.
5. Add the ServiceNow OAuth Redirect URL in your Docusign account.

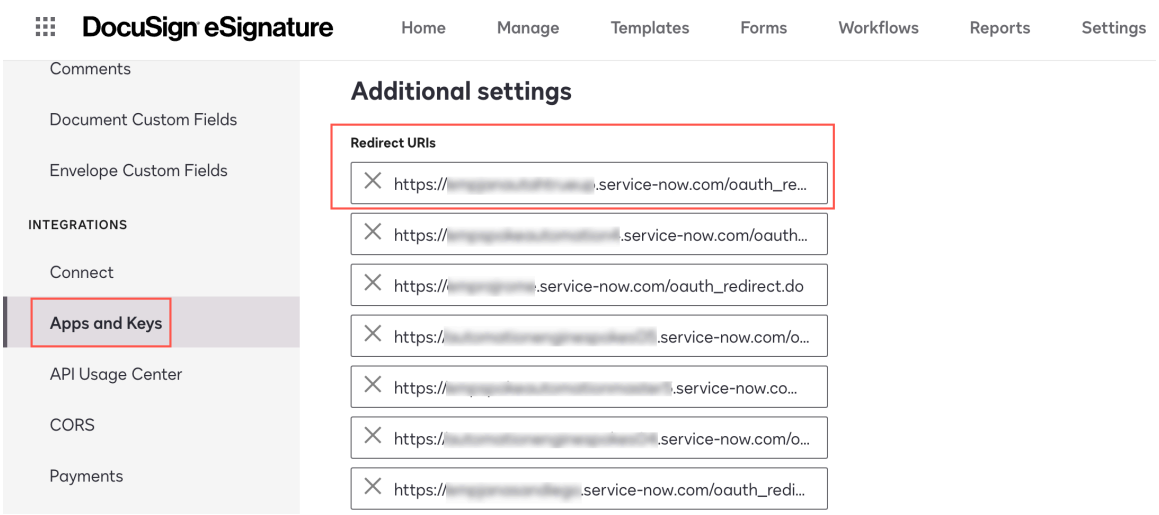
   a. Navigate to **Integrations** > **App and Keys**.

   b. Under **Apps and Integration Keys**,find the required app.

   c. For the required app, click the **Actions** drop-down list and click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

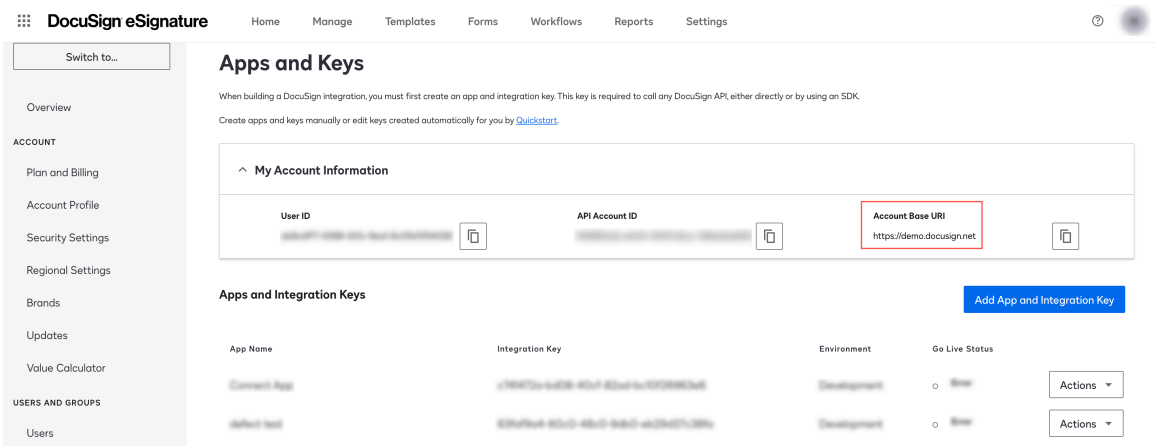
d. Under **Additional settings**, click **Add URI** and add the OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`.



6. Obtain the value of **Account Base URI** from the Docusign account.

a. Navigate to **Integrations** > **App and Keys**.

b. Under **My Account Information**, you can find the value of the **Account Base URI**.



c. Copy and record this value for later use.

Generate the JKS certificate

Generate a JKS certificate for the JWT authentication of the Docusign eSignature spoke.

Before you begin

Role required: admin

Procedure

1. Open the text editor for code such as, Sublime Text.
2. Create a new file.
3. Paste the Private Key you had earlier generated from your Docusign integrator app. For more information, see Configure Docusign account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure that you include both beginning and ending of the private key.

4. Save the file with the .key extension, for example, `privatekey.key`.
5. Open terminal and navigate to the directory where you saved the file with the `.key` extension.
6. Create a CA signed certificate using your private key by executing the command:

```
openssl req -new -x509 -key <file-name>.key -out
 <certificate-name>.pem -days 1095
```

System prompts you to provide required details such as Country Name, Province Name and so on.

7. Enter the required details.
8. Create PKCS 12 file using your private key and CA signed certificate by executing the command:

```
openssl pkcs12 -export -in <certificate-name>.pem -inkey
 <file-name>.key -certfile <certificate-name>.pem -out
 <PKCS-12-file-name>.p12
```

System prompts you to provide a password.

9. Provide the export password.
10. Create the JKS file by executing this command:

```
keytool -importkeystore -srckeystore
 <PKCS-12-file-name>.p12 -srcstoretype pkcs12 -destkeystore
 <JKS-certificate-filename>.jks -deststoretype JKS
```

System prompts you to provide a password.

11. Provide the destination and source keystore passwords.

Attach a Java Key Store certificate to the Docusign eSignature spoke

Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Docusign eSignature spoke.

Before you begin

- Ensure the availability of a valid Java KeyStore certificate
- Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. Complete the form.

X.509 Certificate form fields

Field	Description
Name	Enter a name to uniquely identify the record. For example, `Docusign Certificate`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Notify on expiration	Define users to be notified when the certificate expires.
Warn in days to expire	Enter the number of days to send a notification before the certificate expires.
Active	Enable
Type	Select **Java Key Store**.
Expires in days	Enter the number of days until the certificate expires.
Key store password	Enter a password associated with the certificate.
Short description	Enter a summary about the certificate.

4. Click the attachments icon ( ) and attach a JKS certificate.
5. Click **Validate Stores/Certificates**.

Create a JWT signing key for the Docusign eSignature spoke

Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Keys**.
2. Click **New**.
3. Complete the form.

JWT Keys form fields

Field	Description
Name	Enter a name to uniquely identify the JWT signing key. For example, `Docusign JWT Keys`.
Signing Keystore	Select the valid JKS certificate attached in the previous task. For example, `Docusign Certificate`.
Key Id	Enter a key Id to identify which key is used when multiple keys are used to sign tokens.
Signing Algorithm	Select an algorithm to sign with the JWT key.
Signing Key Password	Enter a password associated with the signing key.
Active	Enable.

4. Click **Submit**.

Create a JWT provider for the Docusign eSignature spoke

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Provider form fields

Field	Description
Name	Enter a name to uniquely identify the JWT provider. For example, `Docusign JWT Provider`.
Expiry Interval (sec)	Enter a number in seconds to set the lifespan of JWT provider tokens.
Signing Configuration	Select a JWT signing key. For example, `Docusign JWT Keys`.

4. Right-click the form header, and click **Save**.
   The Standard Claims and Custom Claims related lists display.
5. On the same page of the JWT provider record, enter values for **iss**, **sub**, and **aud** in the **Standard Claims** related list.

Claim	Value
iss	`<your_integration_key>`
sub	`<your_user_ID>`
aud	`account-d.docusign.com`

For more information, see How to get an access token with JWT Grant in Docusign Developer Center.

6. Insert a record in the **Custom Claims** related list and complete the form.

Custom Claims related list fields

Field	Value
Claim Name	scope
Claim Value Type	string
Claim Value	signature impersonation

7. Click **Update**.

Register Docusign as OAuth Provider

Use the information generated during Docusign account configuration to register Docusign as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. Complete the form.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `Docusign OAuth`.
Client ID	Enter the integrator key you generated during the Docusign account configuration.
Client Secret	Enter the client secret you generated during the Docusign account configuration.
Default Grant type	Select **JWT Bearer**.
Authorization URL	○ For developer sandbox environment, enter `https://account-d.docusign.com/oauth/auth`. ○ For live production system, enter `https://account.docusign.com/oauth/auth`.
Token URL	○ For developer sandbox environment, enter `https://account-d.docusign.com/oauth/token`. ○ For live production system, enter `https://account.docusign.com/oauth/token`. For more information see, Post Go-Live and User Info Endpoint Reference in the Docusign Developer Center documentation.

5. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL**.
   - The system populates **OAuth Entity Profile** with **Grant Type** as **JWT Bearer**. For example, **OAuth Entity Profile** is created with default **Name**, **Docusign OAuth default_profile**
6. Insert a record in the **OAuth Entity Scopes** related list and fill the values.

OAuth Entity Scopes related list fields

Field	Value
Name	scope
OAuth Scope	signature impersonation

7. Copy the value from **Redirect URL**.
8. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Login to your Docusign account to edit the configuration of your custom Docusign application. See the Docusign Developer Center for instructions.
10. Paste the Redirect URL value into the Redirect URI for your custom Docusign application. For example, paste `https://instance.service-now.com/oauth_redirect.do`

Result
The instance can request OAuth 2.0 tokens for the spoke.

Note:
When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

Obtain consent

Obtain explicit consent for the ServiceNow application from Docusign.

Role required: admin

Obtain consent for an organization administrator

See Docusign Developer documentation (Admin consent for internal applications) for instructions to obtain consent for an organization administrator.

Create Credential records for the Docusign eSignature spoke

Create Credential records to the Docusign custom OAuth application you created during Docusign account configuration. The Docusign spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Fill these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `Docusign Credentials`.
Active	Enable
OAuth Entity Profile	Select the OAuth profile you created when you registered the custom Docusign application as an OAuth provider. For example, select **Docusign OAuth default_profile**.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Select the order to apply this credential. For example, enter `100`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

Create Connection records for the Docusign eSignature spoke

Create Connection records to your Docusign account. The Docusign spoke connection and credential alias uses these connections to perform actions in DocuSsign.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Docusign**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Docusign Connection`.
Credential	Select the Credential record you created for Docusign. For example, select **Docusign Credentials**.
Connection URL	○ For demo environment, enter `https://demo.docusign.net`. ○ For live production system, enter the Base URI such as `na2.docusign.net` or `eu.docusign.net`. For instructions on obtaining the base URI, see Post Go-Live and User Info Endpoint Reference in the Docusign Developer Center documentation.

5. Click **Submit**.

What to do next

Synchronize ServiceNow with Docusign to access Docusign accounts, templates, and envelopes from the Docusign spoke. See Synchronize Docusign with ServiceNow.

Create child aliases for additional Docusign accounts

Create a child connection alias under the base alias for each account if your Docusign implementation includes multiple Docusign accounts.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Docusign** > **Connection Aliases**.
2. Select **New**.
3. In the **Name** field, add a descriptive name for the account, for example, `Docusign HR account`.
4. Save the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up triggers for the Docusign eSignature spoke

Set up the trigger to generate the callback URL on your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the Docusign eSignature spoke.
- Role required: admin.

Enable system property for client credentials grant type

Create or enable the glide.oauth.inbound.client.credential.grant_type.enabled system property to use the OAuth client credentials grant type for inbound integrations from the Docusign OAuth client to ServiceNow instance.

Before you begin

Role required: admin

About this task

For more information about client credentials grant type, see Client Credentials.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the `glide.oauth.inbound.client.credential.grant_type.enabled` system property.
3. Open the record.
4. For **Value**, enter `true`.
5. Right-click the form header and click **Save**.

Create an application registry to authenticate the inbound calls

Create an application registry in the ServiceNow instance to authenticate the inbound calls.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
3. Select **Create an OAuth API endpoint for external clients**.
4. On the form, fill in the fields.

Application Registries form

Field	Description
Name	Name to identify the application registry record. For example, `Docusign External Trigger`.
OAuth Application User	User role to which the OAuth token flow is mapped.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Important: By default, this field is not displayed on the Application Registries form. Configure the form layout to see the field on the form. For information about configuring the form layout, see Configuring the form layout.

5. Right-click the form header and click **Save**.
   Application registry record is created and value of **Client Secret** is generated.

   Copy and record the values of **Client ID** and **Client Secret** for later use.

Activate the trigger definition on ServiceNow instance

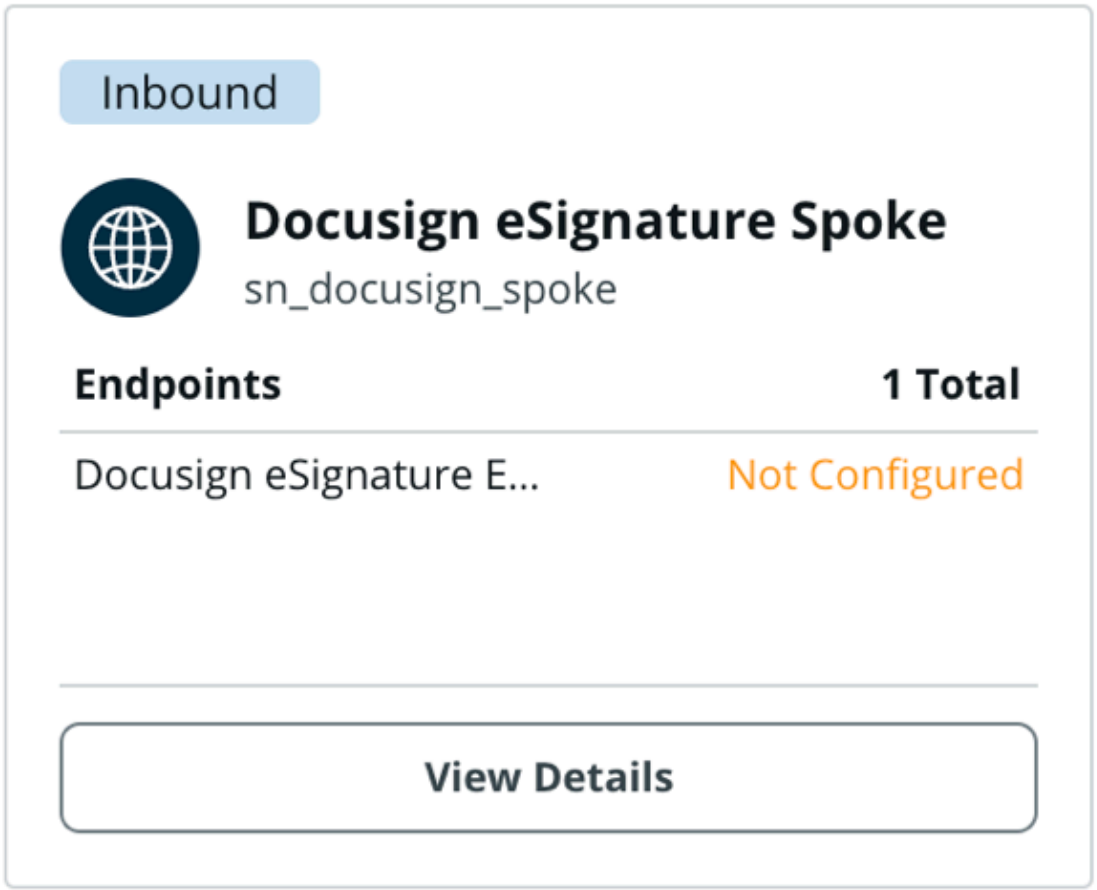
Activate the trigger definition to generate the callback URL on your ServiceNow instance.

Before you begin
Role required: flow_designer and connection_admin.

About this task
Docusign uses the callback URL to securely send the payload to the ServiceNow instance.

Procedure
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Toggle and enable the **Inbound** tab.
4. Locate the **Docusign eSignature Spoke** card and select **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

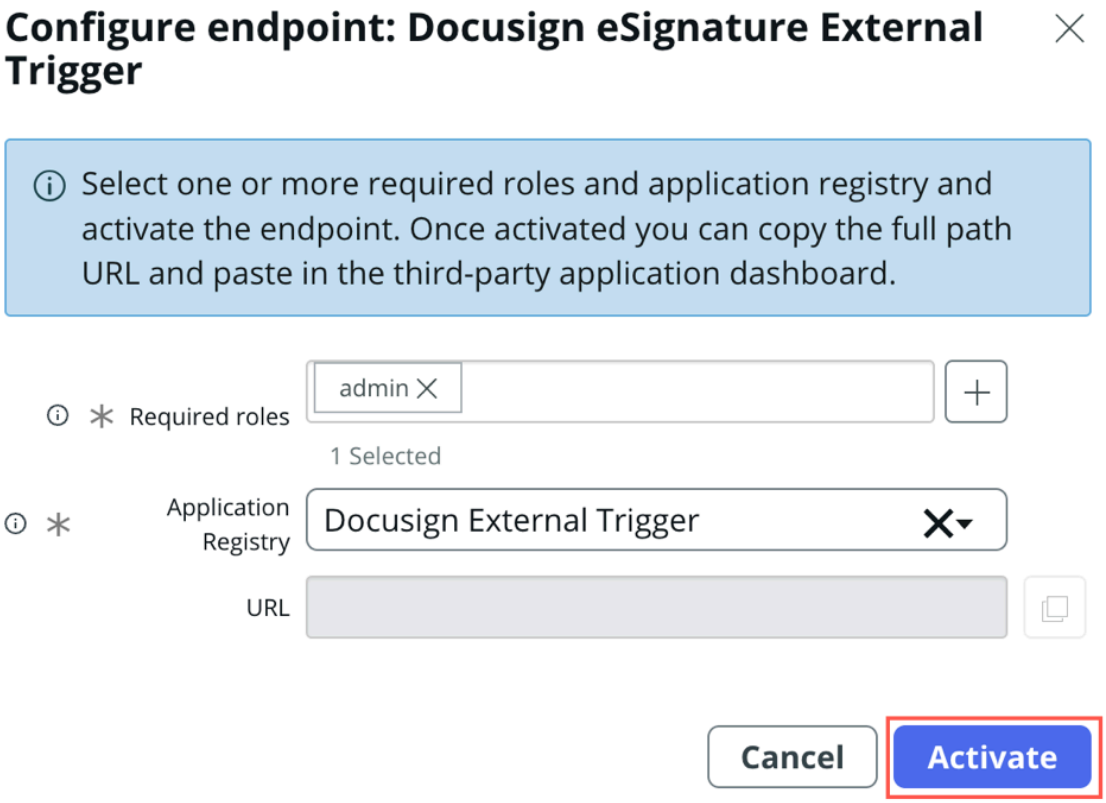


5. Select **Configure**.

6. On the form, fill these values.

Field	Description
Required roles	Roles using which the flow will be triggered. For example, select **admin**.
Application Registry	Select the application registry you had created to authenticate inbound calls. For example, select **Docusign External Trigger**.

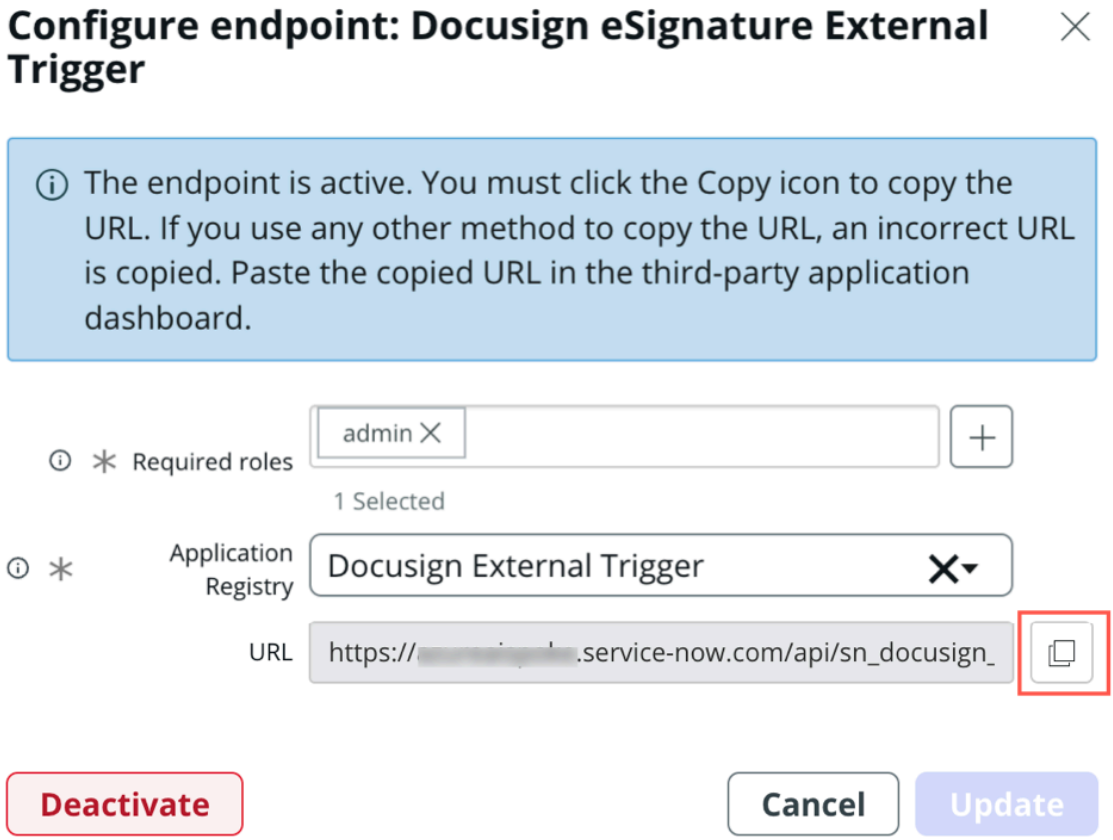
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Click **Activate**.
The endpoint is activated and the value of **URL** is generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Copy and record the value of **URL** for later use.



Add configuration in Docusign account

Add a custom configuration in the Docusign account to send real-time data updates to the ServiceNow instance.

Before you begin

Role required: admin

Procedure

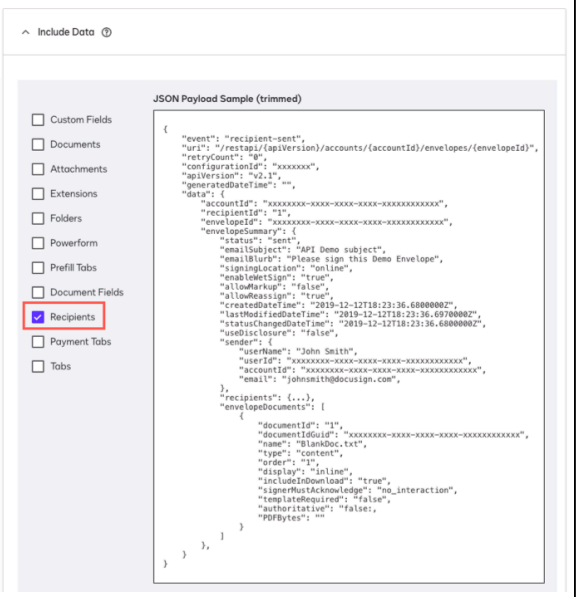
1. Log in to the Docusign account as an admin.
2. Click **Admin**.
3. Navigate to **Integrations** > **Connect**.
4. Under **Configurations**, click **Add Configuration** and select **Custom**.
5. On the form, fill in the values.

Field	Description
Name	Name to identify the custom configuration record.
URL to Publish	Enter the URL that is generated when you activated the trigger definition in this format: `https://<ServiceNow-instance-name>.service-`

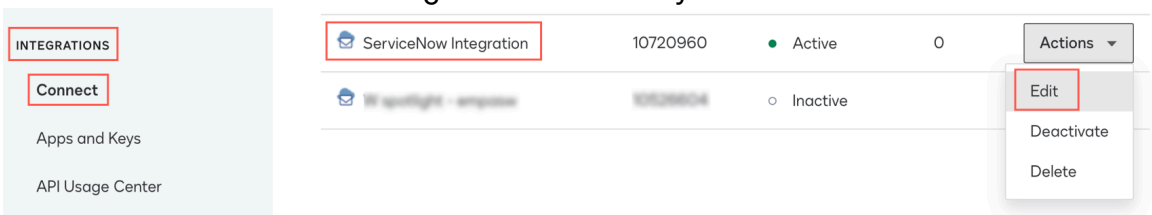
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`now.com/api/sn_docusign_spoke/docusign_esignature_external_trigger`. For more information, Activate the trigger definition on ServiceNow instance.
Data Format	Ensure that you select **REST v2.1**.
Event Message Delivery Mode	Select **Send Individual Messages (SIM)**.
Trigger Events	Expand **Envelope and Recipients** and select these events: ○ Envelope Sent ○ Envelope Delivered ○ Envelope Signed/Completed ○ Envelope Declined ○ Envelope Voided ○ Envelope Deleted ○ Recipient Sent ○ Recipient Auto Responded ○ Recipient Delivered ○ Recipient Signed/Completed ○ Recipient Declined  Under **Include Data**, select the **Recipients** option. Select other options as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	


6. Under **Integration and Security Settings**, select the **Include OAuth (Recommended)** check box.
7. Click **Add Configuration**.
   The custom configuration record is created.
8. Click **Actions** for the custom configuration record that you created and select **Edit**.



9. Under **Integration and Security Settings**, click **Manage OAuth**.
   The **OAuth 2.0** tab is displayed.
10. Enter the values of Client ID and Client Secret.
    These values are created when you create application registry record in ServiceNow instance. For more information, see Create an application registry to authenticate the inbound calls.
11. Enter **Authorization Server URL** in this format: `https://<ServiceNow-instance-name>.service-now.com/oauth_token.do`.
12. Click **Save**.

What to do next

Create flows in Workflow Studio using these triggers as per your requirement. For more information, see Create a flow with an external trigger.

Set up a bi-directional webhook for the Docusign eSignature spoke

Configure the webhook in your Docusign account to enable Docusign to send data to ServiceNow when a recipient signs a document.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Connect a custom configuration to enable your Docusign application to share events and data with your ServiceNow instance.

   a. Log in to your Docusign account as an admin.

   b. In the admin dashboard, navigate to **Integrations** > **Connect**.

   c. Click **Add Configuration**.
   A list of the configuration types is displayed.

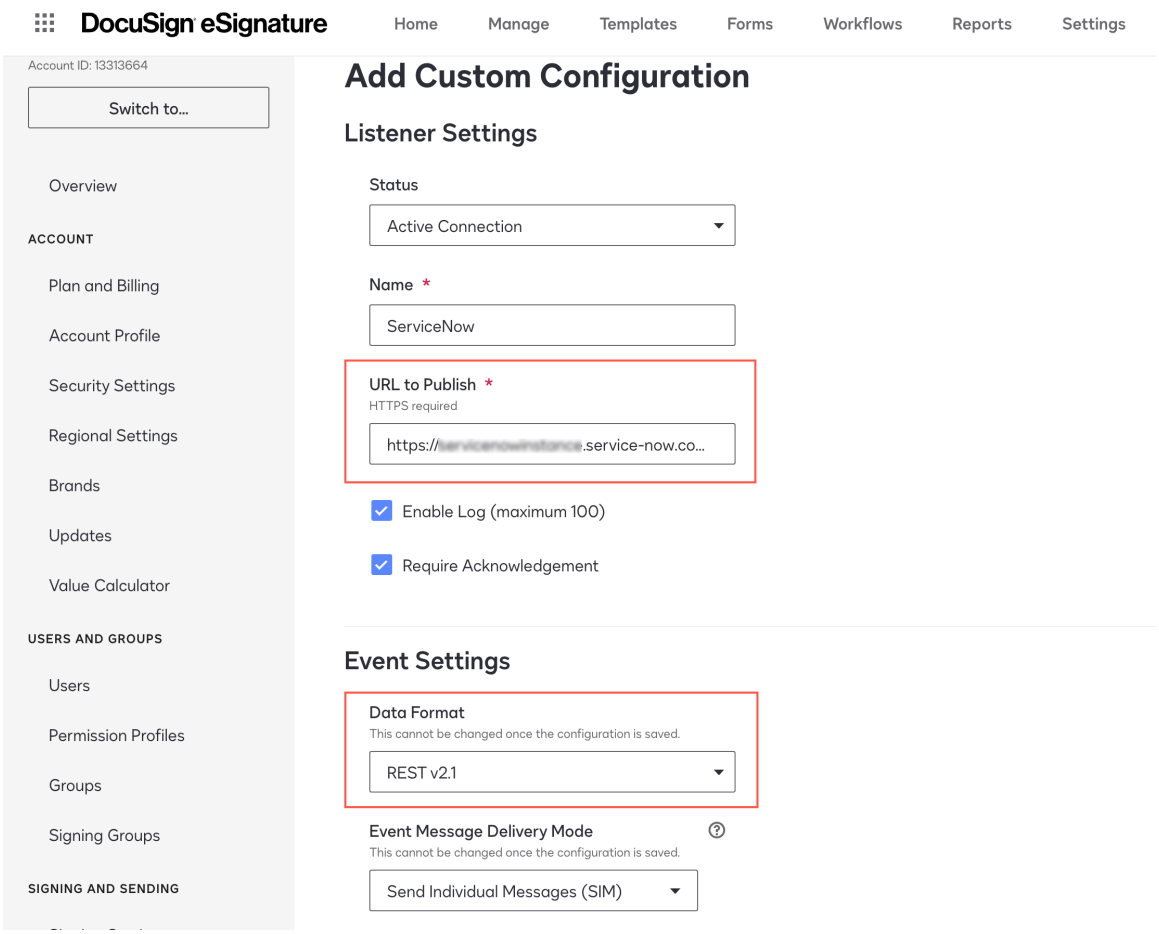
   d. Select **Custom**.

   e. On the form, fill these values.

Field	Description
Name	Name to identify the custom configuration.
URL to Publish	Add your ServiceNow instance URL in this format: ▪ Under **Event Settings**, if you select **Data Format** as **Legacy**, enter `https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook` ▪ Under **Event Settings**, if you select **Data Format** as **REST v2.1**, enter, `https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook_rest`
Data Format	Select either **Legacy** or **REST v2.1**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

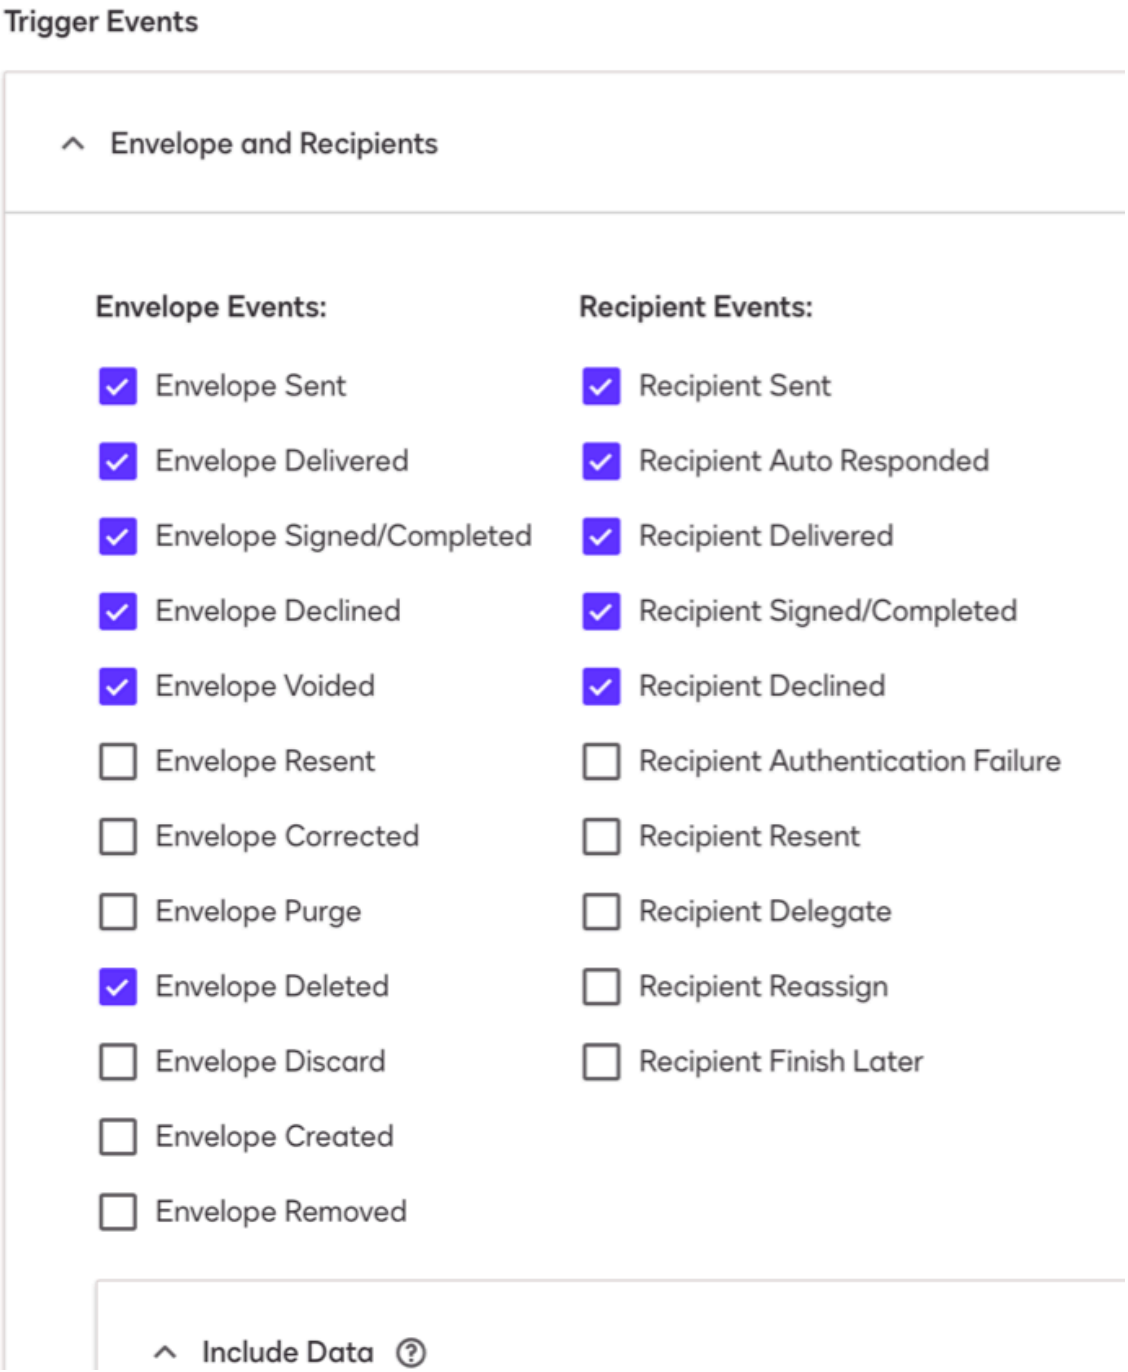
Field	Description
	Note: Ensure that this selection matches is accordance with the URL you provided in **URL to Publish**.



2. Under **Trigger Events**, enable Docusign to share envelope events with ServiceNow by selecting these events:

   - Envelope Sent
   - Envelope Delivered
   - Envelope Signed/Completed
   - Envelope Declined
   - Envelope Voided
   - Envelope Deleted
   - Recipient Sent
   - Recipient Auto Responded
   - Recipient Delivered
   - Recipient Signed/Completed
   - Recipient Declined

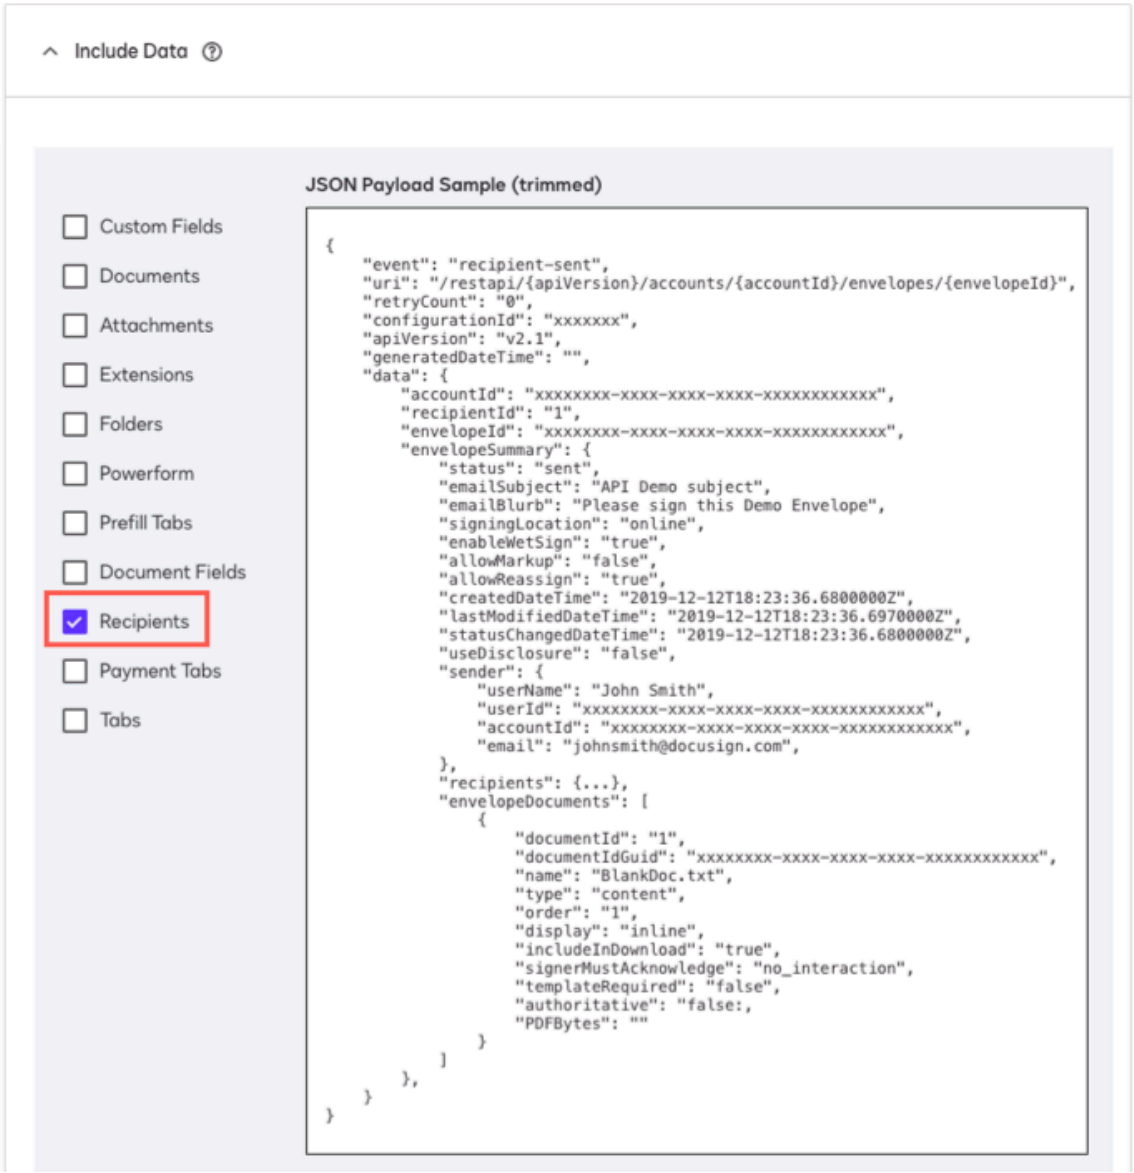
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Under **Include Data**, select the **Recipients** option.

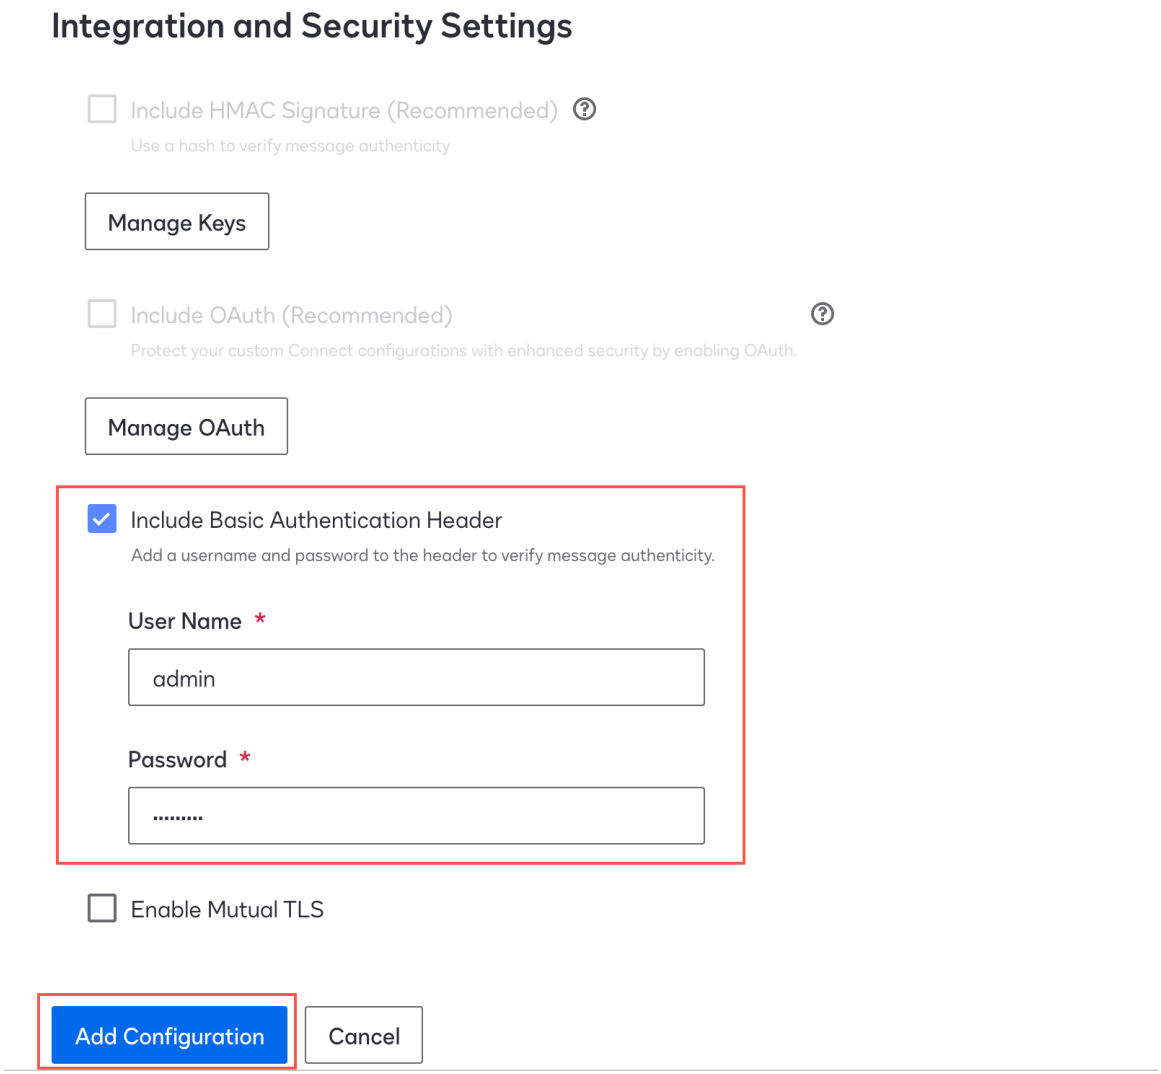
   Select other options as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the **Include basic authorization** option in the header and provide your ServiceNow instance credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Add Configuration**.

Synchronize Docusign with ServiceNow

Synchronize ServiceNow with Docusign to access Docusign accounts, templates, and envelopes from the Docusign spoke.

Before you begin

Role required: admin

- Request IntegrationHub subscription
- Activate Docusign spoke
- Set up Docusign eSignature spoke using JWT grant

About this task

Schedule a job to synchronize Docusign with your ServiceNow instance daily, or synchronize data as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Schedule a job to synchronize Docusign data with your ServiceNow instance.

   a. Navigate to **Docusign** > **Scheduled Job**.
   The Get Accounts & Templates scheduled job opens.

   b. Select **Active**.

   The Docusign eSignature spoke synchronizes accounts, templates, and envelopes daily.
2. Synchronize Docusign data as needed with a UI action.

   a. Navigate to **Docusign** > **Accounts**.
   The Accounts [sn_docusign_spoke_accounts] table opens.

   b. Click the **Get Accounts** related link.

   The system synchronizes all accounts linked through an OAuth Credential record and populates the Templates and Envelopes tables with Docusign data. Use template and envelope records when constructing flows.

Activate Docusign eSignature spoke catalog items

Trigger events in Docusign when an item is requested in the Service Catalog. For example, The Send a Document for Digital Signature catalog item triggers a sample flow that sends a Docusign document to a designated recipient.

Before you begin

- Request IntegrationHub subscription
- Activate Docusign eSignature spoke
- Activate the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin
- Role required: admin

About this task

The Docusign eSignature spoke adds catalog items for use with the Docusign eSignature spoke sample flows. Before triggering a Docusign eSignature spoke sample flow, activate these catalog items.

Catalog item	Description
Send a Document for Digital Signature	Sends a document for digital signature in Docusign.
Demonstrate Template - Send Job Offer to Candidate	Sends a job offer using a Docusign template.

Procedure

1. Navigate to **All** > **Service Catalog** > **Maintain Items**.
2. Search for and select **Send a Document for Digital Signature**.
3. Click **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Open the record, **Send a Document for Digital Signature**.
5. In the **Process Engine** tab, select **Send a Document for Digital Signature** for **Flow**.
6. Search for and select **Send employment offer to candidate using DocuSign template**.
7. Click **Activate**.
8. Open the record, **Send employment offer to candidate using DocuSign template**.
9. In the **Process Engine** tab, select **Send employment offer to candidate using DocuSign template** for **Flow**.

Result
When one of these items is requested in the Service Catalog, the associated Docusign eSignature spoke sample flow triggers and performs actions in DocuSign.

Change the Docusign API version

By default, the Docusign spoke sends REST API requests to Docusign API v2. For forward compatibility and to take advantage of Docusign's newer API, you can update a connection attribute to send API requests to Docusign API v2.1.

Before you begin
Role required: admin

About this task
To understand the difference between the two APIs, see the Docusign Developer site.

Procedure
1. Navigate to **All** > **Docusign** > **Connection Aliases**.
2. Open the connection alias that you want to update the version for.
   Only requests sent using this alias use the new API version. For example, if you want to update the API version for all requests and your implementation uses multiple connection aliases, you must update each connection alias.
3. In the **Connection Attributes** related list, add or edit the **API Version** record.

Field	Value
Type	String
Label	API Version
Column name	api_version
Default value	v2.1

4. Save or submit the record.

Result
When the Docusign spoke makes an API request, it uses the API version designated in the connection attribute **Default value** field.

How to automate on-demand signing requests

Send Docusign on-demand signing requests using information in your ServiceNow instance by creating flows in Flow Designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request Integration Hub subscription
- Activate Docusign spoke
- Role required: admin
- Set up Docusign eSignature spoke using JWT grant or Set up Docusign eSignature spoke using authorization code grant

About this task

Note:
Customize flows in Flow Designer based on your requirements.

Procedure

1. In Workflow Studio, create a flow.
2. Specify **TRIGGER** to initiate the flow.
3. Specify one of the following actions to be performed during the flow:
   - **Send Adhoc Signature Request To User**
   - **Send Adhoc Signature Request To Users - Inline**
4. **Optional:** To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from Docusign** action.
5. Perform one of the following set of actions:
   - To send an embedded signing URL, select **Use Embedded Signing**, and **Embedded Signing Recipient [User]**.
   - To send a document for signing, provide details regarding Docusign account, PDF document, recipient, email, and envelope expiry.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

How to automate signing requests using templates

Send Docusign signing requests using Docusign templates and information in your ServiceNow instance by creating flows in Flow Designer. For example, `Send employee offer`.

Before you begin

Role required: admin

- Request Integration Hub subscription
- Activate Docusign eSignature spoke
- Set up Docusign eSignature spoke using JWT grant or Set up Docusign eSignature spoke using authorization code grant

About this task

Note:
Customize flows based on your requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In Docusign, create document templates and specify recipient roles, for example, `Candidate` and `Manager`.
   The system retrieves other recipient details such as name and email, when the flow is triggered.
2. In Workflow Studio, create a new flow.
3. Specify **TRIGGER** to initiate the flow.
4. Specify one of the following actions to be performed during the flow and provide recipient details:
   - **Create Draft Envelope from Template**
   - **Get Recipient ID by Role Name**
   - **Add Recipient to Envelope**
   - **Get Recipient ID by Role Name**
   - **Add Recipient to Envelope**
   - **Get Field ID**
   - **Set Field Value**
   - **Send Envelope**
   - **Get Field Value**
5. **Optional:** Pause the flow until the specified document is signed or rejected by selecting the **Wait for Signature from Docusign** action.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

How to separate Docusign account data

Restrict access to Docusign data based on a user's role. For example, your company may have one Docusign account used by the HR team and another used by the Legal team. To keep the data separate between these two accounts, you can create a role for each account and add it to the accounts record.

Before you begin

- Request Integration Hub subscription
- Activate Docusign eSignature spoke
- Create child aliases for additional Docusign accounts
- Set up Docusign eSignature spoke using JWT grant or Set up Docusign eSignature spoke using authorization code grant
- Role required: admin.

Procedure

1. Create a role for each Docusign account that you want to restrict access to.

   a. Navigate to **System Security** > **Users and Groups** > **Roles**.

   b. In the Roles [sys_user_role] table, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Check that the value of the **Application** field is **Docusign Spoke**.
If a different scope is listed, change the scope to **Docusign Spoke**.

d. In the **Suffix** field, add a name to indicate the account that the role is for, for example, `Legal`.

e. Save the record.

f. Note the name of the role you just created.
For example, **sn_docusign_spoke.legal**.

2. Add the role to the associated account in the accounts table.
   a. Navigate to **Docusign** > **Accounts**.
   b. Open the account record that you want to restrict access to.
   c. In the **Role** field, add the associated role.
   d. Select **Update**.
3. Grant the role to the desired users.
   a. Navigate to **System Security** > **Users and Groups** > **Users**.
   b. Open the record for the user that you want to provide access.
   c. Add the role that you created to the Roles related list.

Result
Only users with the designated role have access to Docusign data associated with the account.

Dropbox Business Spoke

Use Dropbox Business as file storage in place of attachments in ServiceNow. This spoke adds Dropbox storage to your ServiceNow instance and enables users to reference Dropbox files in ServiceNow records.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Dropbox Business spoke v1.0.4 is the latest version.

Supported versions

API version v2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Dropbox Business spoke provides sample subflows in the draft state to demonstrate automating Dropbox tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Flow	Description
Process File Changes	Subflow to process file changes in Dropbox.
Process Team Member Changes	Subflow to process team member changes in Dropbox.

Spoke actions

The Dropbox Business spoke provides actions to perform Dropbox tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
File and Folder Management	Copy Dropbox File To Attachment	Copies a Dropbox file and attaches it to a ServiceNow record. If a ServiceNow incident record is supplied as input, the specified record is attached to it.
	Copy File or Folder	Creates a copy of the specified Dropbox file or folder in Dropbox.
	Create Folder	Creates a folder at the specified path in Dropbox.
	Delete File Or Folder	Deletes a file or folder at the specified path in Dropbox.
	Get File Changes - Webhook	Retrieves the file changes noticed in Dropbox.
	Look up Folder	Looks up the contents of a Dropbox folder and returns an object containing information about the folder
	Update Latest Cursor	Updates the latest cursor value for the corresponding team in the Team Details table.
	Upload Attachment to Dropbox	Copies a ServiceNow attachment to a Dropbox folder. It copies to the specified folder. To change the file name during the copy, use the optional file name.
User Management	Add Users To Group	Adds users to a specified group
	Add Users To Team	Adds users to a specified team.
	Get Admin Details	Retrieves details of the administrator account used to generate the access token.
	Get Current Account	Retrieves information about the current account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Team Members Info	Retrieves information on specified team members. Returns profile and role details.
	Look up Groups in Team	Lists all the groups in the team. Output includes group IDs, number of members, group name, and the role of users who manage the group.
	Look up Users in Group	Lists all the members in the specific group. Returns user profile data and role in the group.
	Look up Users in Team	List all the members in the team. Returns user profile data, membership type, and role.
	Remove User From Team	Removes user from a team. Options include user retains files, and access to team shares, keeps email account and unrestricted team shares, and to delete relevant data.
	Remove Users From Group	Removes one or more users from an existing group.

Dropbox Business spoke account requirements

The Dropbox Business spoke requires a custom app that you create in Dropbox Business.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Dropbox Business spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Dropbox alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server .

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up Dropbox Business spoke

Set up an outbound integration between a ServiceNow instance and a Dropbox Business application by setting up the connection and credential records.

Before you begin

- Request an Integration Hub subscription.
- Activate the Dropbox Business spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up the Dropbox Business spoke, includes actions in the Dropbox app console, in the ServiceNow AI Platform® user interface, and in the Workflow Studio. Setup is easier if you keep each of these pages open in separate tabs.

About this task

You must set up three connection and credential records for Team Management, File Access, and Content alias, in that order. The connection and credential forms contain the OAuth 2.0 credentials needed to establish a connection with the Dropbox business application. Before setting up the form, you must configure the data it needs by setting up an OAuth 2.0 authentication at the Dropbox Business application end. You must also ensure that you've already set up the alias and application registries.

Set up OAuth 2.0 authentication

Set up an OAuth 2.0 authentication between the Dropbox Business application and the ServiceNow instance by setting up a custom Dropbox Business application.

Before you begin

OAuth 2.0 setup requirements:

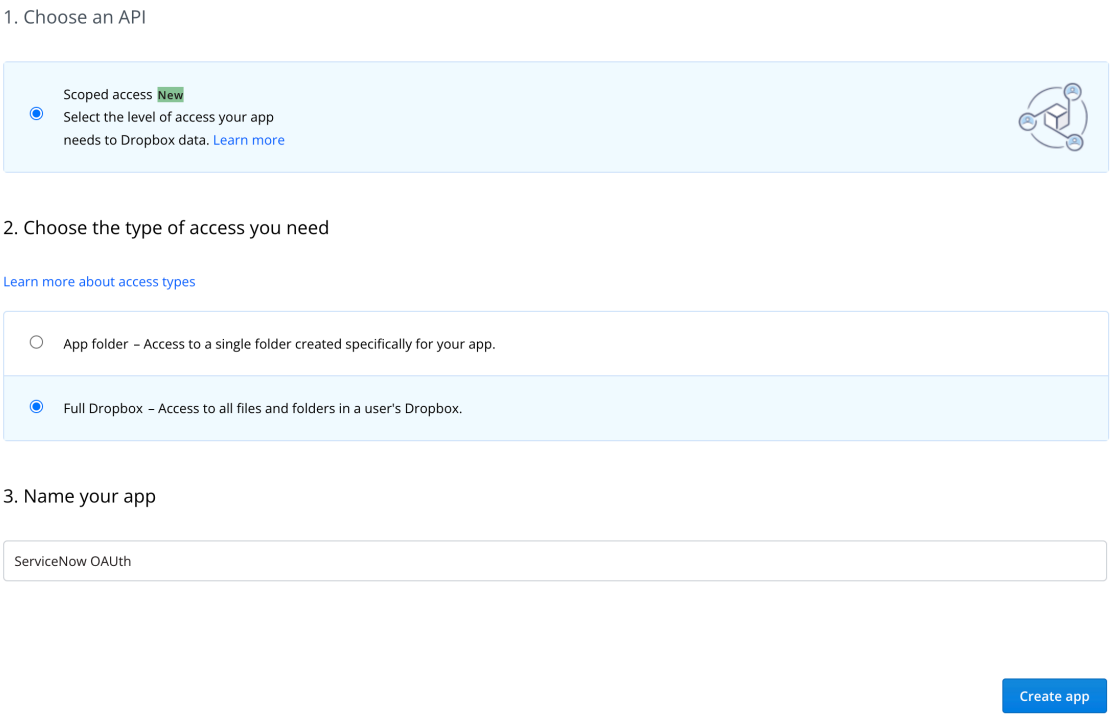
- A Dropbox Business account.
- Role required: team admin.

About this task

This procedure creates a custom application on the Dropbox Business account. The application provides the OAuth 2.0 credentials necessary to set up the connection and credential records for all three Dropbox Business aliases. For more information on setting up applications, see https://www.dropbox.com/developers/documentation.

Procedure

1. Log in to the Dropbox Professional My apps console, https://www.dropbox.com/developers/apps.
2. Select **Create app**.
3. On the Create a new app on the DBX Platform page, do the following



actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

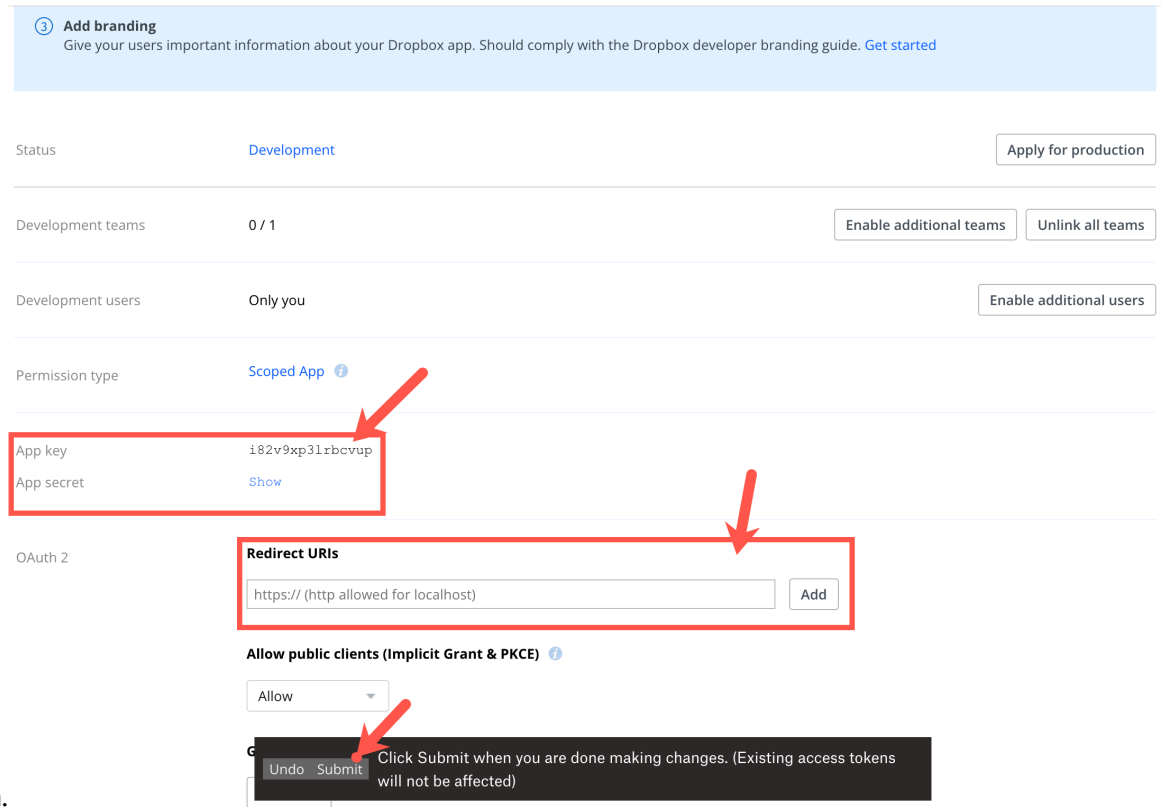
a. Under Choose an API, select Scoped access.

b. Under Choose the type of access that you need, select the appropriate access type.

c. Under Name your app, enter a custom name for the application.

d. Select **Create app**.
The custom application is created.

4. To set up the OAuth 2.0 application, do the following steps under the **Settings** tab of the custom application.



a. Copy and store the value under the App key.
Use the App key value in the Client ID field of the application registry on the ServiceNow instance.

b. Select Show under the App secret and then copy and store the value.

> **Tip:**
> You need both the App key and App secret values when you set up the application registries on the ServiceNow instance.

c. In the Redirect URIs field, enter the ServiceNow instance URL in the format https://instancename/oauth_redirect.do.

> **Note:**
> You can add multiple URIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Optional: To add a redirect URI, select **Add** and then enter the ServiceNow instance URL.

e. Select **Submit**.

All three connection and credential records for the Dropbox Business application use the same App secret, App key, and Redirect URI that you set up in this step.

What to do next

Create Connection and Credential records for the Dropbox Business Team Management alias

Create Connection and Credential records for the Dropbox Business Team Management alias

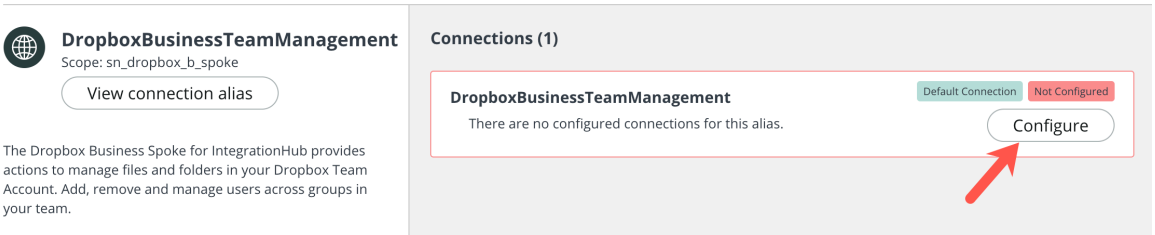
Create connection records to a Dropbox Business account. A connection alias resolves your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the Connections tab.
3. In the Search all connections field, enter `Dropbox`.
4. On the DropboxBusinessTeamManagement tile, select **View Details**.
5. Select **Configure**.



6. In the Configure Connection form, fill the details.

Configure connection

Field	Description
Connection Name	Name of the connection between the Dropbox Business application and the ServiceNow instance. **Note:** The default and read-only name is DropboxBusinessTeamManagement. To provide a custom name, create another connection and credential record.
Connection URL	The URL to connect to the Dropbox Business account. The URL is https://api.dropboxapi.com.
API Version	The version of the API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential Name	The custom name of the credential to access the Dropbox Business account.
OAuth Entity Name	The custom name of the OAuth entity that you created in the Dropbox Business account.
OAuth Client ID	The client ID that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Client Secret	The client secret that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Redirect URL	The redirect URI that you had provided in the Dropbox business application.

7. Select **Configure and Get OAuth Token**.
   A temporary OAuth token is generated.

What to do next
Create Connection and Credential records for the Dropbox Business File Access alias

Create Connection and Credential records for the Dropbox Business File Access alias

Create connection records to a Dropbox Business account for the DropboxBusinessFileAccess alias. Connection aliases resolve your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the Connections tab.
3. In the Search all connections field, enter `Dropbox`.
4. On the DropboxBusinessFileAccess tile, select **View Details**.
5. Select

   Configure.
6. In the Configure Connection form, fill the details.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure connection

Field	Description
Connection Name	Name of the connection between the Dropbox Business application and the ServiceNow instance. **Note:** The default and read-only name is DropboxBusinessFileAccess. To provide a custom name, create another connection and credential record.
Connection URL	The URL to connect to the Dropbox Business account. The URL is https://api.dropboxapi.com.
API Version	The version of the API.
Credential Name	The custom name of the credential to access the Dropbox Business account.
OAuth Entity Name	The custom name of the OAuth entity that you created in the Dropbox Business account.
OAuth Client ID	The client ID that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Client Secret	The client secret that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Redirect URL	The redirect URI that you had provided in the Dropbox business application.

7. Select **Configure and Get OAuth Token**.
   A temporary OAuth token is generated.

What to do next

Create Connection and Credential records for the Dropbox Content alias

Create Connection and Credential records for the Dropbox Content alias

Create connection records to a Dropbox Business account for the DropboxBusinessContent alias. Connection aliases resolve your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

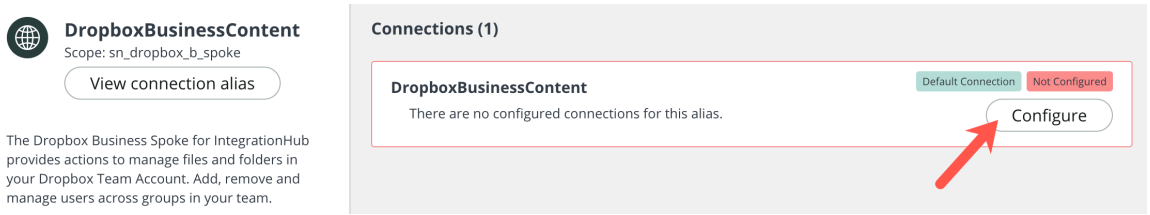
Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the Connections tab.
3. In the Search all connections field, enter `Dropbox`.
4. On the DropboxBusinessContent tile, select **View Details**.
5. Select **Configure**.



6. In the Configure Connection form, fill the details.

Configure connection

Field	Description
Connection Name	Name of the connection between the Dropbox Business application and the ServiceNow instance. **Note:** The default and read-only name is DropboxBusinessContent. To provide a custom name, create another connection and credential record.
Connection URL	The URL to connect to the Dropbox Business account. The URL is https://api.dropboxapi.com.
API Version	The version of the API.
Credential Name	The custom name of the credential to access the Dropbox Business account.
OAuth Entity Name	The custom name of the OAuth entity that you created in the Dropbox Business account.
OAuth Client ID	The client ID that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Client Secret	The client secret that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Redirect URL	The redirect URI that you had provided in the Dropbox business application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Configure and Get OAuth Token**.
   A temporary OAuth token is generated.

Result
The Dropbox Business spoke is set up and integrated with the ServiceNow instance.

Dun and Bradstreet DirectPlus Spoke

Manage comprehensive business data and analytics tasks in your Dun and Bradstreet account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Dun and Bradstreet DirectPlus spoke v1.0.0 is the latest version.

Supported versions

This spoke was built for Dun and Bradstreet DirectPlus v1, but may be compatible with later versions.

Spoke requirements

Dun and Bradstreet Direct+ account

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Workflow Studio - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke flows

The Dun and Bradstreet DirectPlus spoke provides sample flows to demonstrate automating the Dun and Bradstreet DirectPlus tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Look up Companies	Retrieves the supplier information and verifies if the supplier is in good business standing before creating a new supplier in the downstream system.

Spoke actions

The Dun and Bradstreet DirectPlus spoke provides actions to automate data and analytics tasks tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Data Block Management	Look up Data Blocks by Duns Number	Retrieves information about the specified data block for the specified D-U-N-S (Data Universal Numbering System) number.
Profile Management	Look up Industry Detailed Profile	Retrieves detailed information about the requested industry, including industry indicators, challenges, financials, and industry forecast.
Report Management	Look up Company Report	Retrieves the Dun and Bradstreet(D&B)'s Business Information Report and Comprehensive Report that can be used for determining a company's profitability, stability, viability, and payment performance to evaluate the risk for both new or existing business relationships. **Note:** PDF reports are not available for all markets, including Canada. For better global coverage, use the HTML format of the report.
Search Management	Look up Company Typeahead Search	Retrieves the company records based on search term and other additional attributes of the company. **Note:** This action returns the top 25 matched results.
	Look up Identity Resolution Cleanse Match	Retrieves the best matches for provided search parameters using Dun & Bradstreet proprietary algorithms. **Note:** For Multi-Process, this action returns only one result. For a nationwide search in US, this action returns a maximum 100 results. In all other scenarios, this action returns the top 25 matched results.

Spoke module

The Dun and Bradstreet DirectPlus spoke adds the Dun and Bradstreet DirectPlus spoke application to your instance and includes these modules:

Module	Description
Companies	Lists all the available companies records.

Set up the Dun and Bradstreet DirectPlus spoke

Integrate the ServiceNow instance and Dun and Bradstreet Direct+ by using the client ID and client secret credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate Dun and Bradstreet DirectPlus spoke.
- Role required: admin

Configure a connection for Dun and Bradstreet DirectPlus spoke

Add and configure a Dun and Bradstreet DirectPlus connection to authenticate ServiceNow requests.

Before you begin

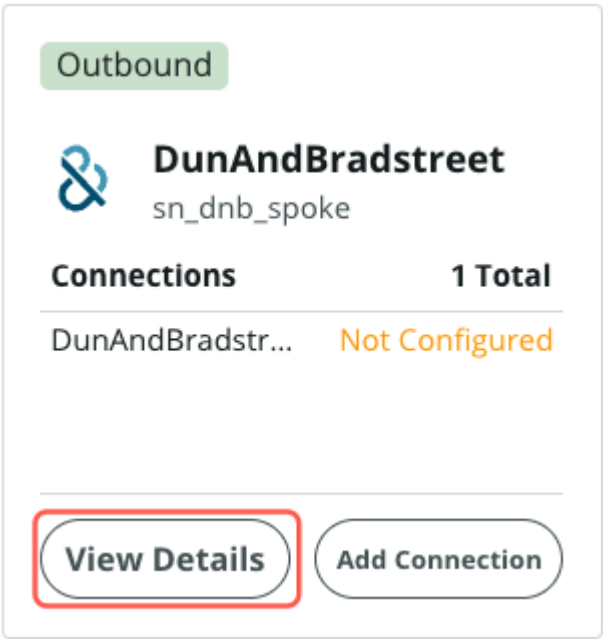
- Get the client ID and client secret of your Dun and Bradstreet account from the account administrator.
- Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **DunAndBradstreet** and click **View Details**.

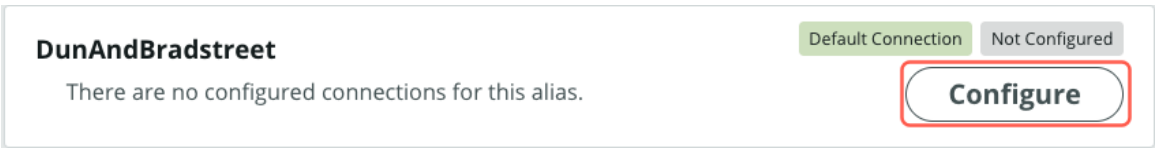
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Dun and Bradstreet DirectPlus spoke, click **View Details**.



- To manage more than one Dun and Bradstreet DirectPlus connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

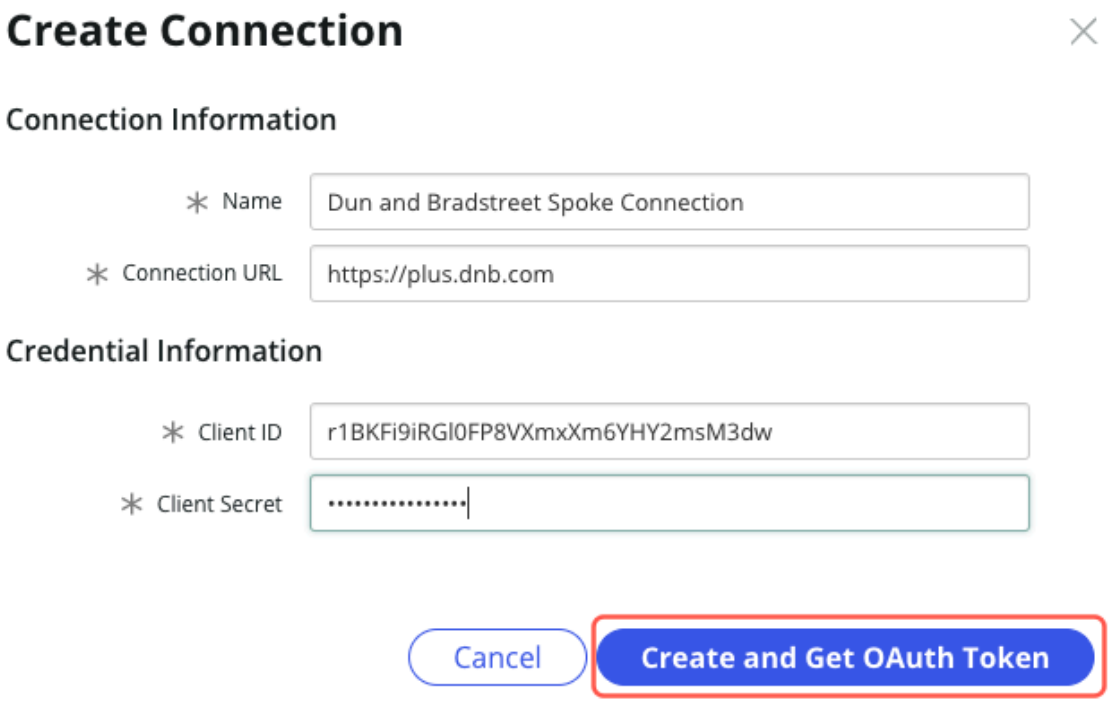
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



5. On the **Configure Connection** form, fill in the fields:

Field	Description
Name	Name to uniquely identify the connection record. For example, `Dun and Bradstreet Directplus connection`
Connection URL	URL of the Dun and Bradstree Direct+ instance. Enter `https://plus.dnb.com`.
Client ID	Client ID of your Dun and Bradstreet DirectPlus account.
Client Secret	Client secret of your Dun and Bradstreet DirectPlus account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Configure Configure and Get OAuth Token**.

Result
The spoke connection is configured and ready to be used.

Ethoca spoke

Integrate ServiceNow instance with your Ethoca account to manage card dispute resolution and prevent fraud. By using this spoke, you can access detailed merchant information and subscription control, view digital receipts, and manage their disputes.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Subscription information

This spoke requires a subscription. Contact your ServiceNow account manager or sales representative for subscription details. For more information, see Legal schedules - IntegrationHub overview

Spoke version

Ethoca spoke v3.0.0 is the latest version.

Supported versions

This spoke was built for Consumer Clarity and Issuer Alerts Management .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key features

- Streamlines dispute resolution processes
- Facilitates collaboration between issuers and participating merchants through Ethoca Alerts during the dispute lifecycle
- Resolves cases at the pre-dispute stage, benefiting both issuers and cardholders
- Reduces the occurrence of disputes and chargebacks

Spoke requirements

Ethoca configuration details such as, certificate, key alias, consumer key, and keystore password.

Spoke dependencies

Ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)

Note:
If used outside the spoke implementation, some of these plugins are licensable features and need appropriate licenses.

Spoke actions

The Ethoca spoke provides actions to obtain enriched merchant and transaction information. Available actions include:

Category	Action	Description
Consumer Clarity	Look up Consumer Clarity	Enables cardholders to view their credit card transactions with clear merchant information and transaction details.
Issuer Alerts Management	Create Transaction Alert	Submits a batch of transactions (confirmed fraud or customer disputes) to Ethoca. These transactions are processed and delivered to merchants as alerts.
	Look up Transaction Alert Status by Batch	Returns the processing status of previously submitted transaction requests.
	Look up Alert Status	Provides the status of the alert delivered to the merchant.
	Look up Alert Outcome by Batch Stream	Retrieves a list of alerts and their outcomes based on the Batch ID provided by the Submit Batch endpoint or Ethoca Notification Callback. Results are paginated with up to 50 alerts per request and a maximum of 1000 alerts per batch. **Note:** To enable the Look up Alert Outcome by Batch Stream action, install the ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream) plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Ethoca spoke

Set up Ethoca spoke

Integrate the ServiceNow instance with the Ethoca account using the using the OAuth protocol (version 1.0a) for the Consumer Clairty category and using Basic Auth credentials for the Issuers Alert Management category to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Ethoca spoke.
- Role required: admin.

For the Consumer Clarity category

Integrate the ServiceNow instance with the Ethoca account in the Consumer Clarity category using the OAuth protocol (version 1.0a) to securely authorize and authenticate ServiceNow requests.

Follow these steps:

- Attach a Ethoca certificate
- Create credential records
- Create connection records

Attach a Ethoca certificate

Use the certificate generated during the Ethoca account configuration to sign the request and payloads.

Before you begin

- Valid Ethoca certificate
- Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. On the form, fill in the fields:

X.509 Certificate form fields

Field	Description
Name	Enter a name to identify the certificate.
Type	Type of the certificate. Select `PKCS12 Key Store`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Notify on expiration	Select the list of users to be notified when the certificate expires.
Warn in days to expire	Enter the number of days when a notification is sent to users before a certificate expires.
Key store password	Password to access the certificate. Use the destination keystore password specified when creating the certificate.
Active	Option to make the client certificate active.
Short description	Short description of the user client certificate.

4. Click the manage attachments icon ( ) and attach a Ethoca certificate.
5. Click **Validate Stores/Certificates** to validate the certificate.
6. Click **Submit**.

Create credential records

Create a credential record for your Ethoca account. The Ethoca spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **Ethoca Credential**.
   A blank Ethoca Credential form displays.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, `Ethoca Credentials`.
Active	Enable
Key alias	Key alias associated with the Ethoca account.
Keystore password	Password associated with the certificate.
Consumer key	Consumer key that you generated during the Ethoca configuration.
Certificate	Select the newly created Ethoca certificate.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Ethoca**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
	Note: Users are cautioned against directly modifying the default authentication algorithm.

5. Click **Submit**.

Create connection records

Create a connection record for your Ethoca account. The Ethoca spoke connection and credential aliases use these connections to perform actions in Ethoca.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open for the record for **Ethoca**.
3. On the **Connections** tab, click **New**.
4. On the form, fill these values.

Field	Value required
Connection URL	Base URL to connect to your Ethoca instance. Enter: `https://sandbox.api.ethocaweb.com/ethoca` .
Credential	Credential record that you created for Ethoca. For example, `Ethoca Credentials`.

5. Right-click the form header and click **Save**.

For the Issuer Alerts Management category

Integrate the ServiceNow instance with the Ethoca account in the Issuer Alerts Management category using Basic Auth credentials to authenticate ServiceNow requests.

Follow these steps:

- Create basic auth credentials
- Create connection records

Create basic auth credentials

Create credentials to access a ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Basic Auth Credentials**.
4. On the form, fill in the fields.

Field	Description
Name	Unique name to identify the credential record. For example, `Ethoca Alerts Credentials`
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to actively use the credential record. Select the option.
Order	The order (sequence) in which the platform tries this credential while it attempts to log in to devices. Default value: `100`.

5. Select **Submit**.

Create connection records

Create a connection record for your Ethoca account. The Ethoca spoke connection and credential aliases use these connections to perform actions in Ethoca Alerts.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open for the record for **Ethoca Alerts**.
3. On the **Connections** tab, click **New**.
4. Fill the form.

Configure Connection

Field	Description
Connection Name	Name of the connection established with the Ethoca instance. The first connection's default name is automatically assigned to match the name specified in the Connections and Credentials form on the Connection & Credential Aliases page.
Credential	Credential record you that created for Ethoca Alerts. For example, `Ethoca Alerts Credentials`.
Connection URL	Base URL to connect to your Ethoca instance. Enter: `https://sandbox.ethocaweb.com/ethoca-rest`.

5. Right-click the form header and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Equifax Spoke

Integrate the ServiceNow instance with the Equifax spoke to access important information about the credit history for a customer, fraud alerts, digital identity verification, transaction screening, and other relevant data.

Subscription information

This spoke requires a subscription. Contact your ServiceNow account manager or sales representative for subscription details. For more information, see Legal schedules - IntegrationHub overview

Supported versions

Equifax spoke v1.0.0 supports Equifax OneView - 1.0.2212 (Consumer API).

Key features

Equifax spoke enables a flow designer to do the following tasks:

- Access customer information, such as the credit history for a customer, the credit score for a customer, and fraud alerts.
- Evaluate a customer's creditworthiness to make lending decisions faster.
- Verify customer identities to ensure that you have accurate information.

Spoke actions

The Equifax spoke provides actions (under the Equifax Credit Report category) to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Equifax Credit Report	Look up One View Credit Report	Provides the JSON response that gives the credit history of the customer.
	Look up One View Credit Report by Request ID	Provides the PDF report of the credit history for the customer.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Equifax spoke.

Set up Equifax spoke

Integrate the ServiceNow instance and Equifax spoke by using basic Auth or OAuth 2.0 authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Equifax spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ensure that the dependent plugins are activated.
- Role required: admin.

Register Equifax as an OAuth provider

Use the information generated during the application configuration to register Equifax as an OAuth provider. OAuth provider registration enables the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

- Role required: admin
- Client ID and client secret generated from configuration of the third-party Equifax application

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
   The system displays this message: `What kind of OAuth application?`.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

Application Registries form

Field	Description
Name	Name to uniquely identify the record. For example, enter: `Equifax OAuth`
Client ID	<Client ID> created during the Equifax account configuration.
Client Secret	<Client Secret> created during the Equifax account configuration.
Authorization URL	OAuth Server's authorization code flow endpoint. Required only for Authorization Code grant type.
Token URL	OAuth Server's token endpoint. For example, `xxx.equifax.com`.
Token Revocation URL	OAuth server token revocation endpoint.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`
OAuth API Script	Script to customize the request and response.
Logo URL	URL that contains an image to use as the application logo.
Default Grant Type	Grant type used to establish the token. Select **Client Credentials**.
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 1430 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.
Send credentials	Option for whether or how to send authentication information identifying the application and its authorized users to the OAuth server. Select **In Request Body**.

5. On the form header, select **Submit**.

Create OAuth 2.0 credential record for the Equifax spoke

Create credential records to the Equifax custom OAuth application you created during Equifax account configuration. The Equifax spoke connection and credential aliases use these credentials to authorize actions in Equifax application.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `Equifax OAuth2.0 API Credentials`.
Active	Enable
OAuth Entity Profile	Select the OAuth profile you created when you registered the custom *Equifax* application as an OAuth provider. For example, select *Equifax* **OAuth default profile**.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Select the order to apply this credential. For example, enter `100`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Submit**.
6. To generate the OAuth token, select the **Get OAuth Token** related link.

Create connection record for the Equifax spoke

Create a connection record for your Equifax application with the credential aliases provided. You need to select the credential record to the Equifax custom OAuth application you created during Equifax account configuration.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, for example, *Equifax*.
3. From the **Connections** tab, select **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, *Equifax* Connection.
Credential	Basic Auth or OAuth 2.0 credential record created for *Equifax*. For example, *Equifax* OAuth2.0 API Credentials.
Connection alias	Alias record associated with this connection. For example, sn_equifax_spoke.Equifax
Connection URL	Base URL to connect to *Equifax*.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

5. Select **Submit**.

Get Equifax OAuth token

Generate the Equifax access token.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select the Equifax spoke OAuth Credential record.

   Example
   For example, select **Equifax OAuth2.0 Credentials**.
3. From Related Links, select **Get OAuth Token**.

F5 BIG-IP Spoke

Manage servers and pools in the F5 BIG-IP system.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported version

BIG-IP 13.1.0.

Spoke version

F5 BIG-IP spoke v1.3.0 is the latest version.

Spoke flows

The F5 BIG-IP spoke provides sample flows in the draft state to demonstrate automating F5 tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Local Traffic Management Using F5 Big-IP	Creates a virtual server, associates it to a pool, and adds pool member in the BIG-IP system from a ServiceNow Service Catalog request.

Spoke subflows

The F5 BIG-IP spoke provides sample subflows to demonstrate automating F5 tasks. Available sample subflows include:

Flow	Description
F5 Server - Pool Management	Creates a pool in the BIG-IP system and manages it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The F5 BIG-IP spoke provides actions to automate F5 tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Pool Management	Create Pool	Creates a pool in the BIG-IP system.
	Add Pool Member	Creates a pool member in the BIG-IP system.
	Check Pool	Checks pool health in BIG-IP system. Returns whether the pool is available, unavailable, offline, or if the status is unknown.
	Delete Pool	Deletes a pool from the BIG-IP system.
	Disable Pool Member	Disables a pool member in the BIG-IP system.
	Enable Pool Member	Enables a pool member of a specified pool in the BIG-IP system.
	Get Pool Members	Retrieves the list of members of a specified pool from the BIG-IP system.
	Remove Pool Member	Deletes a pool member in the BIG-IP system.
Server Management	Add Profile to Virtual Server	Adds a profile to a virtual server in the BIG-IP system. Profiles enable you to control network traffic. For example, you can enable HTTP connections to the virtual server.
	Create Virtual Server	Creates a virtual server in the BIG-IP system.
	Delete Virtual Server	Deletes a virtual server from the BIG-IP system.
	Update Virtual Server	Updates virtual server attributes in the BIG-IP system.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
F5 BIG-IP pool management AI agent	Manages (that is, adds a pool member, fetches pool members, disable a pool member, removes a pool member, creates a pool, deletes a pool, verifies a pool) pools in BIG-IP system.
F5 BIG-IP server management AI agent	Manages (that is, adds a profile to virtual server, deletes a virtual server, updates a virtual server, creates a virtual server) servers in BIG-IP system.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses this alias record to authorize actions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection & Credential alias	Description	Connection alias requirements
F5_BIG_IP	Connection to the F5 BIG-IP system.	• Connection type: HTTP • Connection URL: URL of the host machine where the F5 server is installed.

To use the spoke connection alias, create an associated Connection record and an associated Credential record. For information about setting up the spoke, see Configure a connection for the F5 BIG-IP spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the F5 BIG-IP alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Configure a connection for the F5 BIG-IP spoke

Integrate the ServiceNow instance and F5 using basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the F5 BIG-IP spoke.
- Role required: admin.

Procedure

1. Navigate to **Process Automation** > **Flow Designer**.
2. Click the **Connections** tab.
3. Locate the **F5_BIG_IP** connection alias and click **View Details**.
4. Click **Edit**.
5. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to identify the F5 BIG-IP connection alias record.
Connection URL	URL of the host machine where the F5 BIG-IP server is installed.
User name	Your F5 BIG-IP user name.
Password	Your F5 BIG-IP user name.

6. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.

First Advantage Spoke

Manage and track the background verifications of candidates using First Advantage from your ServiceNow instance. Manage users, accounts, candidates, invites, and orders in First Advantage from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

First Advantage spoke v1.8.0 is the latest version.

Supported versions

This spoke was built for First Advantage API version v1.1, but may be compatible with later versions.

Spoke requirements

- First Advantage account
- API key

  Note:
  Contact the First Advantage team to obtain the API key.

- Account ID

  Note:
  Contact the First Advantage team to obtain the Account ID.

Spoke flows

The First Advantage spoke provides sample flows to demonstrate automating the First Advantage tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
First Advantage - Candidate Background Verification using Invite	Initiates background check of the candidate using invite. Sends a request to the candidate to complete an application. For information about creating a case, see Create a case in First Advantage from ServiceNow.
First Advantage - Candidate Background Verification using Order	Initiates background check of the candidate using order. An order record is created and request to provide essential details is sent to the candidate. For information about creating a case, see Create a case in First Advantage from ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
First Advantage - (Order As) Candidate Background Verification using Order	Initiates background check of the candidate using order and places order on behalf of the required user.
First Advantage - (Order As) Candidate Background Verification using Invite	Initiates background check of the candidate using invite and places order on behalf of the required user.

Spoke subflows

The First Advantage spoke provides a sample subflow to demonstrate automating First Advantage tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Packages. The subflow retrieves packages in First Advantage and stores the details in the Packages table.

Spoke actions

The First Advantage spoke provides actions manage accounts, candidates, invites, orders, and users when events occur in ServiceNow. Available actions include:

Category	Action	Description
Account Management	Get Account Details	Retrieves details of the First Advantage account.
	Get Account Packages	Retrieves the details of all the packages in an account.
	Get Account Profiles	Retrieves the details of all profiles in an account.
	Get Account Users	Retrieves the details of all users in an account.
Candidate Management	Create New Candidate	Creates a candidate profile for background verification.
	Get Candidate By Candidate ID	Retrieves the details of the required candidate.
	Get Documents For A Specific Candidate	Retrieves the documents associated with the required candidate.
	Get Monitoring Product Details For A Specific Candidate	Retrieves the details of the monitoring product for the required candidate.
	Update Candidate Details	Updates the details of a candidate profile.
Invite Management	Create Invite	Create an invite for the candidate to fill the application.
	Get Invite Status By Applicant ID	Retrieves the latest status of the invite for the required applicant.
	Get Invite View Link By Application ID	Retrieves a secure link to access the profile that the candidate must complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Order Management	Create Order	Creates a First Advantage screening order.
	Get Order Report By Order ID	Retrieves the completed order report for the required order.
	Get Order Status By Order ID	Retrieves the latest order status for the required order.
User Management	Activate User	Activates the required user.
	Create User	Creates a user profile.
	Deactivate User	Deactivates the required user.
	Update User Password	Updates the password of the required user.
	Update User Profile	Updates information in the profile of the required user.

Spoke module

The First Advantage spoke adds a First Advantage spoke module to your ServiceNow instance. The First Advantage spoke synchronizes and stores information about First Advantage cases, tasks, employee tasks, order tasks, and packages.

The First Advantage spoke includes these modules:

Module	Description
Accounts	Enables you to view the details of all accounts available in First Advantage. To view the account details, you must set up the spoke and synchronise the accounts.
FADV Webhook Client Details	Enables you to set up First Advantage webhook by providing key for the First Advantage webhook client.
Create New First Advantage Case	Enables you to initiate the background check of the required candidate using invite or order from ServiceNow.
First Advantage Cases	Enables you to view list of all First Advantage cases created using invite and order.
Packages	Enables you to view the details of all packages available in First Advantage. To view the package details, you must set up the spoke and synchronise the packages.
Order Tasks	Enables you to view list of all First Advantage order records.
Employee Tasks	Enables you to view list of all First Advantage cases created using invite.

The First Advantage spoke includes the these tables:

- First Advantage Task [sn_fadv_spoke_first_advantage_task]
- First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Packages [sn_fadv_spoke_packages]
- FADV Webhook Client Details [sn_fadv_spoke_webhook_client_details]

Table	Description
First Advantage Task	Details of all the First Advantage order records.
First Advantage Employee Task	Details of all the First Advantage invite records.
Packages	First Advantage packages that are synchronized with ServiceNow®.
FADV Webhook Client Details	Client details to set up the First Advantage webhook.

Spoke user roles

- First Advantage admin
- First Advantage user

Only users with the First Advantage admin role can view the **FADV Webhook Client Details** module.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the First Advantage spoke.

Set up the First Advantage spoke

Integrate the ServiceNow instance with your First Advantage account using an API key to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the First Advantage spoke.
- Role required: admin.

Create Connection record for the First Advantage spoke

Create a connection record to integrate your ServiceNow instance and the First Advantage server. Your ServiceNow instance uses this connection record to perform the First Advantage spoke actions.

Before you begin

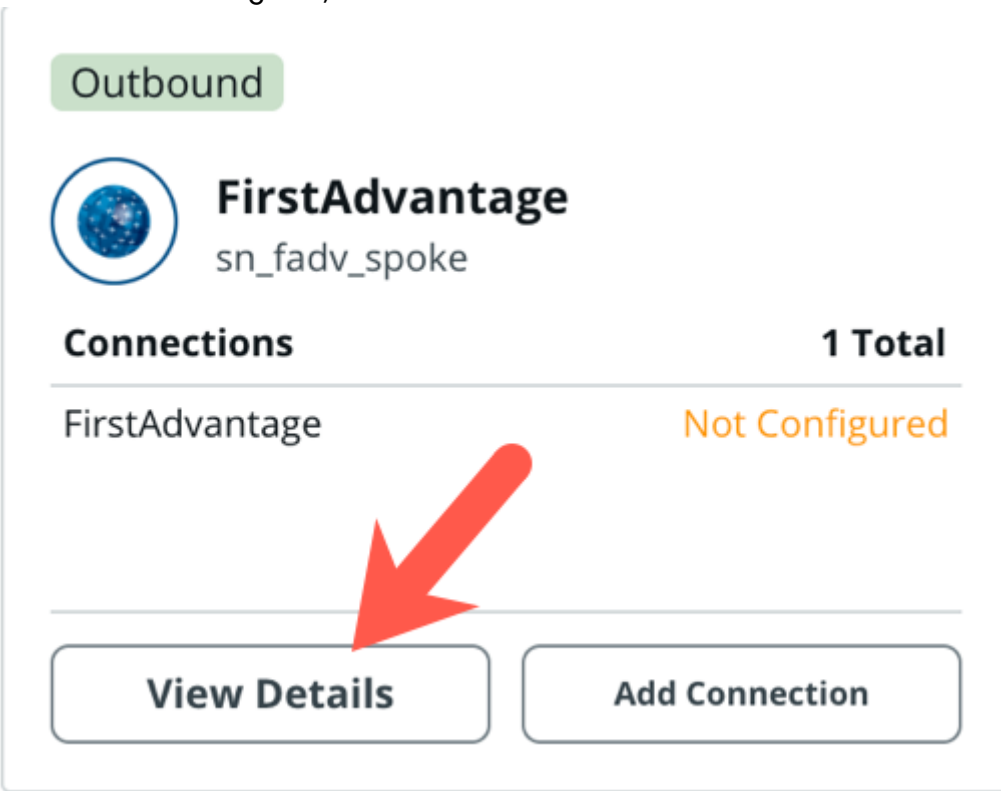
Role required: admin.

Acquire the API key from the First Advantage server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select **Integrations**.
3. Select the **Connections** tab.
4. In the Search all connections field, enter `First Advantage`.
   Confirm that the **Outbound** tab is selected.
5. On the FirstAdvantage tile, select **View Details**.



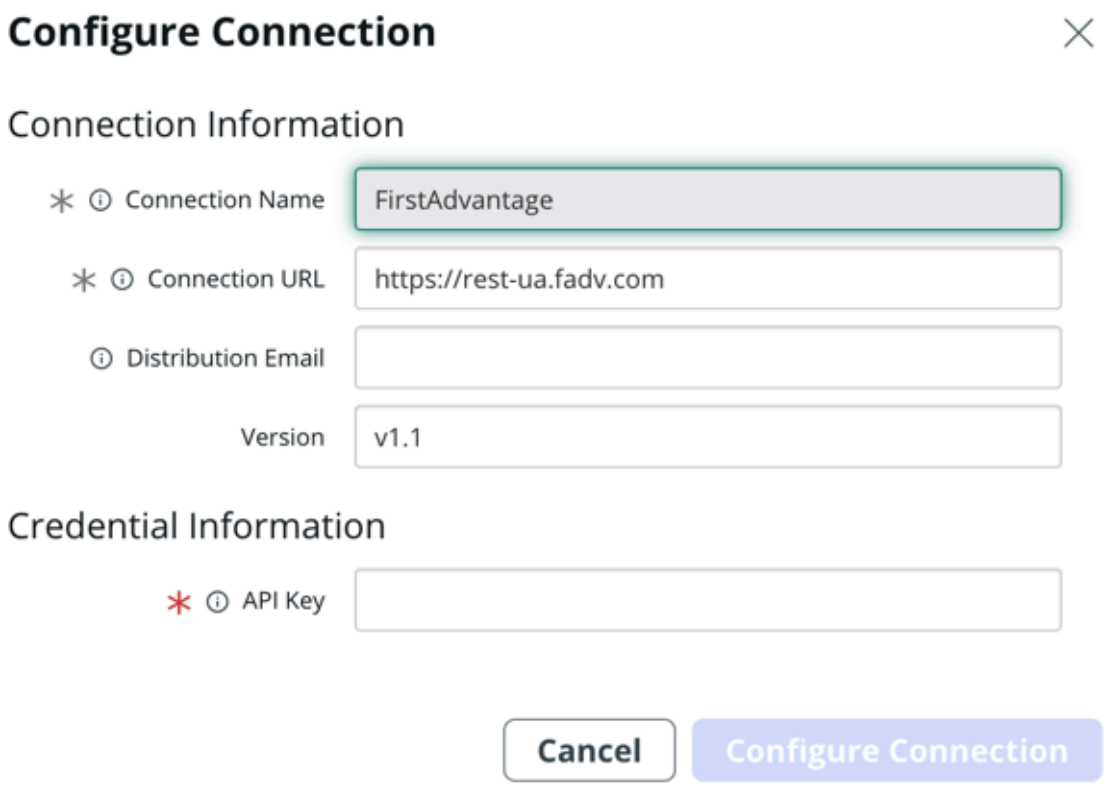
6. Select **Configure**.
7. Fill the form.

First Advantage spoke connection form

Field	Description
Connection Name	Name of the connection. The default and read-only name of the first record is the same as that of the connection alias. You can provide a different name when you create a connection record by clicking **Add Connection**.
Connection URL	Option to provide the connection URL to the First Advantage server. The URL is https://rest-ua.fadv.com.
Distribution Email	Option to provide a distribution email ID.
Version	Option to provide the version of the API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
API Key	Option to enter the API key that the First Advantage server uses to authenticate access requests.



8. Select **Configure Connection**.
   The connection record is configured.

Create First Advantage states in your ServiceNow instance

Create First Advantage states to be displayed in the **State** list in your ServiceNow instance.

Before you begin
Role required: admin

Create the Draft, Ready, and In Progress states

Create the Draft, Ready, and In Progress states in the Task [task] table.

Before you begin
Role required: admin.

Procedure

1. In the Filter navigator, enter `sys_choice.list`.
   The records in the Choice [sys_choice] table are displayed.
2. Click **New**.
3. On the form, fill these values and create three records for the Draft state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record 1 - Draft state

Field	Value
Table	Task [task]
Element	state
Label	Draft
Value	137

Note:

- Ensure that you provide the exact numbers in the **Value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
- Ensure that the record is created in the **Global** application.

4. Click **Submit**.
5. Similarly, create records for the Ready and In Progress states.

Record 2 - Ready state

Field	Value
Table	Task [task]
Element	state
Label	Ready
Value	173

Record 3 - In Progress state

Field	Value
Table	Task [task]
Element	state
Label	In Progress
Value	181

Note:

- Ensure that you provide the exact numbers in the **Value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
- Ensure that the record is created in the **Global** application.

Result
The Draft, Ready, and In Progress states are created in the Task [task] table

Create the Complete and Cancelled states

Create the Complete and Cancelled states in the First Advantage Task [sn_fadv_spoke_first_advantage_task] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **Order Tasks**.
2. Click **New**.

   Note:
   Ensure that the record is created in the **First Advantage** application.

3. Right-click **State** and click **Configure Choices**.
4. Perform these steps to create the Cancelled state:

   a. Enter `Cancelled` in **New item text**.

   b. Enter `149` in **Numeric value**.

   Note:
   Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c. Click **Add**.

   d. Click **Save**.

5. Perform these steps to create the Complete state:

   a. Enter `Complete` in **New item text**.

   b. Enter `127` in **Numeric value**.

   Note:
   Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c. Click **Add**.

   d. Click **Save**.

Result
The Complete and Cancelled states are created in the First Advantage Task [sn_fadv_spoke_first_advantage_task] table.

Create the Complete - Success and Complete - Deal Broken states

Create the Complete - Success and Complete - Deal Broken states in the First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table] table.

Before you begin
Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **Employee Task**.
2. Click **New**.

   Note:
   Ensure that the record is created in the **First Advantage** application.

3. Right-click **State** and click **Configure Choices**.
4. Perform these steps to create the Cancelled state:

   a. Enter `Complete - Success` in **New item text**.

   b. Enter `161` in **Numeric value**.

   Note:
   Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c. Click **Add**.

   d. Click **Save**.

5. Perform these steps to create the Complete state:

   a. Enter `Complete - Deal Broken` in **New item text**.

   b. Enter `117` in **Numeric value**.

   Note:
   Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c. Click **Add**.

   d. Click **Save**.

Result

The Complete - Success and Complete - Deal Broken states are created in the First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table] table.

Set up First Advantage webhooks

Receive invite and order event updates at your ServiceNow instance by setting up the webhooks.

Before you begin

Role required: admin

Create authorization key for the First Advantage spoke

Create a authorization key to authorise requests from Jenkins.

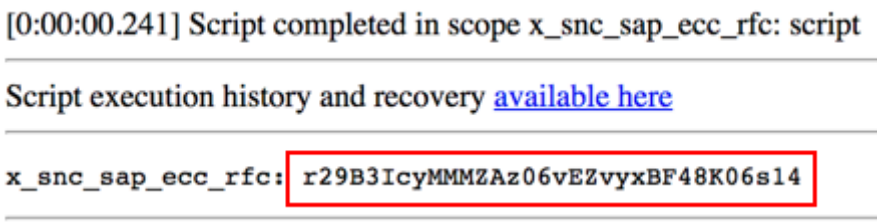
Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Scripts - Background**.
2. Enter this command in the **Run script (JavaScript executed on server)** text field:
   `gs.info(GlideSecureRandomUtil.getSecureRandomString(32));`
3. Click **Run Script**.
4. Copy and record the generated value for later use.



Provide key in your ServiceNow instance

Set up the First Advantage webhook by providing key for the First Advantage webhook client.

Before you begin

- Create authorization key for the First Advantage spoke and record the value.
- Role required: admin

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **FADV Webhook Client Details**.
2. Click **New**.
3. On the form, fill these values.

Field	Description
Name	Name to uniquely identify the record.
Authorization Key	Authorization key you had generated. For more information, see Create authorization key for the First Advantage spoke.

4. Click **Submit**.

Access API endpoints

Access the API endpoint for the invite and order events and share the required details with First Advantage to set up the webhooks.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Web Services** > **Scripted REST APIs**.
2. Open the record for the First Advantage spoke, for example, **First Advantage Webhook**.
3. In the **Resources** tab:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the record for the invite event, for example, **Invite Status**.

b. Copy and record the path provided in **Resource path**, for example, `/api/sn_fadv_spoke/fadv/invite_status`.

c. Open the record for the order event, for example, **Order Status**.

d. Copy and record the path provided in **Resource path**, for example, `/api/sn_fadv_spoke/fadv/order_status`.

What to do next

Contact First Advantage to setup webhooks for your ServiceNow instance. For this, share these details with First Advantage:

- Custom header in this format: `fadvKey <authorization-key>`.

Note:

- Ensure that the custom header is in this format only. The spoke flows will not be triggered if there is any change.
- Provide the same key you had earlier provided in **First Advantage Spoke** > **FADV Webhook Client Details**.
- Use the same case as mentioned here: `fadvKey`.

- API endpoint for the invite events in this format: `<ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/invite_status`
- API endpoint for the order events in this format: `<ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/order_status`

Synchronise First Advantage accounts and packages with ServiceNow

Store the details of the First Advantage accounts and packages by synchronizing First Advantage accounts and packages with ServiceNow.

Before you begin

Role required: First Advantage admin

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **Accounts**.
2. Click **New**.
3. On the form, fill in the values.

Account form

Field	Description
Primary Account	Option to specify that the account is a primary account. Select the check box.
Account ID	ID of the primary account.
Account Name	Name of the primary account.

4. Click **Submit**.
   The primary account is created and the record is displayed.
5. Navigate to **First Advantage Spoke** > **Accounts**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click the **Get Accounts** related list.
7. Navigate to **First Advantage Spoke** > **Packages**.
8. Click the **Get Packages** related link.

Result
The First Advantage account and package details are retrieved.

> **Note:**
> Only users with the FADV admin role can synchronize the account and package details. Users with FADV user role can only view the retrieved details.

Create a case in First Advantage from ServiceNow

Initiate the background check of the required candidate using invite or order from ServiceNow.

Before you begin

- Set up the First Advantage spoke
- Synchronise First Advantage accounts and packages with ServiceNow
- Create users in the User [sys_user] table. Background check can be performed only for these users.
- Role required: First Advantage admin or First Advantage user

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **Create New First Advantage Case**.
   Form to provide the First Advantage case details is displayed.
2. On the form, fill these values.

Field	Description
Use Distribution Email for getting invite email from First Advantage	Option to send invitation email to all users in the distribution email.
Select User	User in the User [sys_user] table.
First Name	First name of the selected user. The value is auto-populated based on the user selected in **Select User**.
Last Name	Last name of the selected user. The value is auto-populated based on the user selected in **Select User**.
Email	Email address of the selected user. The value is auto-populated based on the user selected in **Select User**.
Select An Account	First Advantage account to perform the background check.
Select A Package	First Advantage package to perform the background check.
Short Description	Brief description about the background check.
Agent Name	Agent to perform the background check.
Send Invite link	Option to send an invite email. When selected, a request to complete an application is sent to the candidate through an invite email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If this option isn't selected, an order email is sent to the user. An order record is created and request to provide essential details is sent to the candidate. **Note:** ○ When the **Send Invite link** option is selected, an order is created only after the candidate has filled the application form. ○ When the **Send Invite link** option isn't selected, an order is immediately created. Events updates can be accessed in your ServiceNow instance .
Use "Order As"	Option to place order on behalf of the required user.
Email (Order As)	Email ID of the required user. This field is available only when the **Use "Order As"** check box is selected.
Account ID (Order As)	Account ID of the required user. This field is available only when the **Use "Order As"** check box is selected.
User ID (Order As)	User ID of the required user. This field is available only when the **Use "Order As"** check box is selected.

3. Click **Submit**.
   A First Advantage task is created in your ServiceNow instance with **State** as **Draft**. The case can be accessed by navigating to **First Advantage Spoke** > **First Advantage Cases**.

Initiate background verification in First Advantage from ServiceNow using invite

Initiate background verification of the required candidate by sending a request to complete an application through an invite email.

Before you begin

- Create a case in First Advantage from ServiceNow

  Note:
  Ensure that the **Send Invite link** option is selected and the **Use "Order As"** option isn't selected.

- Role required: First Advantage admin or First Advantage user

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **First Advantage Cases**.
2. Search for the required task.
3. Ensure that the **Send Invite link** option is selected and the **Use "Order As"** option isn't selected.
4. Change the **State** of the task from **Draft** to **Ready**.
   - The First Advantage - Candidate Background Verification using Invite flow is triggered.
   - **State** is changed to **In Progress**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Employee Tasks** tab, a record is created and its details such as **Number**, **Invite ID** and so on, are populated. Open the record to access details such as **Invite URL**, **Candidate ID**, and so on. Also, real-time updates are displayed here.

  Note:
  The **Employee Tasks** tab displays all the invite records created for the user.

- In the **Order History** tab, a record is created and its details such as **Number**, **Short Description** and so on, are populated.

  Note:
  The **Order History** tab displays all the order records created for the user.

- Real-time updates and System Administrator events are displayed in the **Order Details** tab.

  Note:
  Order ID is populated only after the invite is executed successfully. For example, **Order ID** isn't populated if the candidate has declined to complete the application form.

- An invite email is sent to the candidate.

Result

After accessing the invite email, candidate can either complete the application form or decline. If candidate fills and submits the application form,First Advantage approves, cancels, or rejects the task after performing the background verification.

- The status and all other details can be accessed in real-time by navigating to **First Advantage Spoke** > **Employee Tasks**.
- Guest events are displayed in the respective First Advantage Employee Task record.

Note:

- You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.
- If the candidate has declined the request for background verification, the Order record isn't created for the task.

Initiate background verification in First Advantage from ServiceNow using order

Initiate background verification of the required candidate by sending an email requesting for the essential information.

Before you begin

- Create a case in First Advantage from ServiceNow

  Note:
  Ensure that the **Send Invite link** and **Use "Order As"** options aren't selected.

- Role required: First Advantage admin or First Advantage user

About this task

An order is initiated when First Advantage has all basic information about the candidate and requires only some essential sensitive information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **First Advantage Cases**.
2. Search for the required task.
3. Ensure that the **Send Invite link** and **Use "Order As"** options aren't selected.
4. Change the **State** of the task from **Draft** to **Ready**.
   - The First Advantage - Candidate Background Verification using Order flow is triggered.
   - **State** is changed to **In Progress**.
   - In the **Order History** tab, a record is created and its details such as **Order ID**, **Number**, **Short Description** and so on, are populated.
   - Real-time updates and System Administrator events are displayed in the **Order Details** tab.

     Note:
     The **Order History** tab displays all the order records created for the user.

   - An order email is sent to the candidate.

Result

A mail is sent to candidate requesting only the sensitive information. Real-time updates and guest events are displayed in the **Order Details** tab. First Advantage approves, cancels, or rejects the task after performing the background verification.

Note:
You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.

Initiate background verification in First Advantage from ServiceNow using invite on behalf of another user

Initiate background verification of the required candidate by sending a request on behalf of another user to complete an application through an invite email.

Before you begin

- Create a case in First Advantage from ServiceNow

  Note:
  Ensure that the **Send Invite link** and **Use "Order As"** options are selected.

- Role required: First Advantage admin or First Advantage user

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **First Advantage Cases**.
2. Search for the required task.
3. Ensure that the **Send Invite link** and **Use "Order As"** options are selected.
4. Change the **State** of the task from **Draft** to **Ready**.
   - The First Advantage - Candidate Background Verification using Invite flow is triggered.
   - **State** is changed to **In Progress**.
   - In the **Employee Tasks** tab, a record is created and its details such as **Number**, **Invite ID** and so on, are populated. Open the record to access details such as **Invite URL**, **Candidate ID**, and so on. Also, real-time updates are displayed here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **Employee Tasks** tab displays all the invite records created for the user.

- In the **Order History** tab, a record is created and its details such as **Number**, **Short Description** and so on, are populated.

  Note:
  The **Order History** tab displays all the order records created for the user.

- Real-time updates and System Administrator events are displayed in the **Order Details** tab.

  Note:
  Order ID is populated only after the invite is executed successfully. For example, **Order ID** isn't populated if the candidate has declined to complete the application form.

- An invite email is sent to the candidate.

Result

After accessing the invite email, candidate can either complete the application form or decline. If candidate fills and submits the application form, First Advantage approves, cancels, or rejects the task after performing the background verification.

- The status and all other details can be accessed in real-time by navigating to **First Advantage Spoke** > **Employee Tasks**.
- Guest events are displayed in the respective First Advantage Employee Task record.

Note:

- You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.
- If the candidate has declined the request for background verification, the Order record isn't created for the task.

Initiate background verification in First Advantage from ServiceNow using order

Initiate background verification of the required candidate by sending an email requesting for the essential information on behalf of the required user.

Before you begin

- Create a case in First Advantage from ServiceNow

  Note:
  Ensure that the **Send Invite link** option isn't selected and the **Use "Order As"** option is selected.

- Role required: First Advantage admin or First Advantage user

About this task

An order is initiated when First Advantage has all basic information about the candidate and requires only some essential sensitive information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **First Advantage Cases**.
2. Search for the required task.
3. Ensure the **Send Invite link** option isn't selected and the **Use "Order As"** option is selected.
4. Change the **State** of the task from **Draft** to **Ready**.
   - The First Advantage - Candidate Background Verification using Order flow is triggered.
   - **State** is changed to **In Progress**.
   - In the **Order History** tab, a record is created and its details such as **Order ID**, **Number**, **Short Description** and so on, are populated.
   - Real-time updates and System Administrator events are displayed in the **Order Details** tab.

     Note:
     The **Order History** tab displays all the order records created for the user.

   - An order email is sent to the candidate.

Result

A mail is sent to candidate requesting only the sensitive information. Real-time updates and guest events are displayed in the **Order Details** tab. First Advantage approves, cancels, or rejects the task after performing the background verification.

Note:
You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.

FRISS Spoke

Integrate a ServiceNow instance with your FRISS account to leverage the fraud detection capabilities for claims and to detect fraud early in the claims process.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Subscription information

This spoke requires a subscription. Contact your ServiceNow account manager or sales representative for subscription details. For more information, see Legal schedules - IntegrationHub overview

Supported versions

This spoke was built for FRISS API version v 2.0 but may be compatible with later versions.

Key features

FRISS spoke enables a flow designer to do the following:

- Integrate with the FRISS API for Claims to save the scores returned by FRISS into the relevant claim data object.
- Detect fraud as you manage your claims cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Get real-time scores of your claims data at different stages of the claims process.
- Use the user interface for portfolio monitoring.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:

- Some of these plugins may require the appropriate licensing if used outside the spoke implementation.
- The flow actions input parameter is provided for you to use. For more information on the sample input data structure and data types used in an array and object, see Complex data.

Spoke actions

The FRISS spoke provides actions that trigger FRISS Trust automation in response to events that occur within your ServiceNow instance. These actions are classified under the Claim Fraud Management category. Available actions include:

Action	Description
Look up History Stream by Claim ID	Retrieves all the screening results by the Claim ID.
Look up Fraud Indicator Score by Screening ID	Retrieves the fraud score, which has been calculated by FRISS, for a claim that has been identified by a screening ID.
Look up Screening ID	Sends a request to calculate a FRISS score for a claim and returns unique ID called screening ID.
Delete History by Claim ID	Deletes the screening that is associated with a Claim ID.
Delete History by Screening ID	Deletes the screening by the identifier of a screening by FRISS.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For more information about setting up the FRISS spoke, see Set up the FRISS spoke.

Set up the FRISS spoke

You can integrate a ServiceNow instance and FRISS account by using the API key and Tenant ID to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the FRISS spoke.
- Contact the FRISS support team and obtain the connection URL to connect to your FRISS account.
- Role required: admin.

Procedure

1. Create a credential record for the FRISS spoke in your ServiceNow instance:

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Select **New**.
   The system displays the message **What type of Credentials would you like to create?**

   c. Select **API Key Credentials**.
   An empty API Key Credentials form is displayed.

   d. On the form, fill in the fields.

   API Key Credentials form

Field	Description
Name	Name to identify the record. For example, enter `FRISS Spoke Credential`.
Active	Option to actively use the credential record.
API Key	FRISS token in this format: `<Value of ID+key>`.
Applies to	Option that is not applicable to this spoke.
Order	Order to apply this credential. For example, enter `100`.

   e. Select **Submit**.

2. Create a connection record for the FRISS spoke in your ServiceNow instance:

   a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

   b. Open the FRISS record.

   c. From the **Connections** tab, select **New**.
   The system displays an empty HTTP(s) Connection form.

   d. On the form, fill in these fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP(s) Connection form

Field	Description
Name	Name to identify the connection record. For example, enter `FRISS`.
Credential	Credential record that you created for FRISS. For example, select **FRISS Spoke Credential**.
Connection URL	Connection URL to connect to FRISS account.
Attributes	Subsequent calls that you can authorize to the FRISS API. To authorize calls, use the following two parameters: ▪ **tenant_id**: An identifier of the tenant, as defined in the FRISS Identity. This identifier is provided to you by FRISS. ▪ **api_version**: The API version key that was retrieved from the FRISS Identity by the earlier request. **Note:** This API version key is short-lived, so each time it expires, you must generate a new one.

e. Select **Submit**.

GitHub Spoke

Manage distributed version control and source code in GitHub from your ServiceNow instance. Create flows in ServiceNow to manage collaborative features such as tracking bugs, feature requests, tasks and so on, for projects in GitHub. View and analyze meaningful usage data for GitHub Enterprise Cloud and GitHub Enterprise Server software subscriptions so that you can reclaim stale licenses.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

GitHub spoke v3.5.2 is the latest version.

Supported versions

This spoke was built for GitHub API version v3, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- GitHub account
- User with admin credentials
- Token to authenticate the ServiceNow instance

See the GitHub documentation for instructions on creating a GitHub account and generating a token.

GitHub Webhooks module

Bi-directional webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in GitHub for which you want to be notified about. When the conditions are met, the routing policy triggers the associated subflow, which in turn automates the GitHub tasks.

The bi-directional webhooks require separate setup and can be used independently without using the spoke actions. By default, the GitHub Webhooks application is available in the GitHub spoke and has the following modules:

- GitHub Webhook Registries
- GitHub WebHook Routing Policies

Use the GitHub Webhook Registries module to assign a token and provide the API path. You must generate a Callback URL here and provide this URL in GitHub. A default routing policy is provided in the GitHub WebHook Routing Policies module. The default routing policy supports these GitHub fields:

Supported GitHub fields		
Action	Project Card Creator	Ref
Base Ref	Project Card Note	Ref Type
Commit Comment Body	Project Card Previous Note	Release Assets
Commit Comment Created At	Project Card Updated At	Release Author
Commit Comment Path	Project Column Created At	Release Body
Commit Comment Updated At	Project Column Name	Release Created At
Commit Comment User	Project Column Previous Name	Release Draft
Force Push	Project Column Updated At	Release Name
GitHub Instance URL	Project Created At	Release Published At
Issue Assigned To	Project Name	Release Tag Name
Issue Assignees	Project Previous Body	Release Target Commits
Issue Body	Project Previous Name	Repository Archived
Issue Closed At	Project State	Repository Created At

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported GitHub fields		
Issue Comment	Project Updated At	Repository Description
Issue Comment Count	Pull Request Assigned To	Repository inactive
Issue Comment Created At	Pull Request Assignees	Repository Full Name
Issue Comment Updated At	Pull Request Body	Repository Has Issues
Issue Created At	Pull Request Closed At	Repository Has Projects
Issue Labeled To	Pull Request Comment Count	Repository Import Status
Issue Labels	Pull Request Created At	Repository License
Issue Locked	Pull Request Draft	Repository Open Issues Count
Issue Milestone	Pull Request Labeled To	Repository Owner
Issue Previous Body	Pull Request Labels	Repository Private
Issue Previous Comment	Pull Request Locked	Repository Pushed At
Issue Previous Milestone	Pull Request Mergeable	Repository Starred At
Issue Previous Title	Pull Request Merged	Repository Updated At
Issue Previously Assigned To	Pull Request Merged At	Repository Vulnerability Alert Affected Range
Issue Previously Labeled To	Pull Request Milestone	Repository Vulnerability Alert External Identifier
Issue State	Pull Request Previous Body	Repository Vulnerability Alert Fixed In
Issue Title	Pull Request Previous Title	Repository Vulnerability Alert Package Name
Issue Updated At	Pull Request Previously Assigned To	Security Advisory Description
Issue User	Pull Request Previously Labeled To	Security Advisory ID
Milestone Closed At	Pull Request Rebaseable	Security Advisory Published At
Milestone Created At	Pull Request Review Body	Security Advisory Severity
Milestone Creator	Pull Request Review Comment	Security Advisory Summary
Milestone Description	Pull Request Review Comment Count	Security Advisory Updated At
Milestone Due On	Pull Request Review Comment Created At	Security Advisory Withdrawn At
Milestone State	Pull Request Review Comment File Path	Sender login
Milestone Title	Pull Request Review Comment Previous Comment	Status Commit Message

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported GitHub fields		
Milestone Updated At	Pull Request Review Comment Updated At	Status Context
Organization Description	Pull Request Review Previous Body	Status Created At
Organization Login	Pull Request Review State	Status Description
Pre-Release	Pull Request State	Status Name
Project Body	Pull Request Title	Status State
Project Card Archived	Pull Request Updated At	Status Updated At
Project Card Created At	Pull Request User	Webhook Event

To use other conditions in the routing policy, create a routing policy in the GitHub WebHook Routing Policies module and specify conditions according to your requirement. See Set up bi-directional webhook for the GitHub spoke for information regarding setting up and configuring the webhooks.

Spoke triggers

ServiceNow supports specific events on GitHub that create triggers. You must first configure a flow with a supported trigger definition. When an event, for example, a push request, occurs on the GitHub, it sends the payload via a webhook to the ServiceNow instance. After that, the flow that you configured is triggered at the ServiceNow instance to automate a workflow. The supported events are:

Category	Trigger	Description
Branch Management	Branch Created	Flow is triggered when you create a branch on GitHub.
Repository Management	Pull Request Opened	Flow is triggered when you initiate a new pull request on GitHub.
	Pull Request Edited	Flow is triggered when you update a pull request on GitHub.
	Pull Request Closed	Flow is triggered when you close a pull request on GitHub.
	Pull Request Assigned	Flow is triggered when you assign a pull request to a user on GitHub.
	Pull Request Reopened	Flow is triggered when you reopen a pull request on GitHub.
	Repository Fork	Flow is triggered when you fork a repository on GitHub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Trigger	Description
	Repository Push	Flow is triggered when you push to a repository on GitHub.
Release Management	Release Created	Flow is triggered when the details of a release are created on GitHub.
	Release Edited	Flow is triggered when the details of a release are updated on GitHub.
	Release Deleted	Flow is triggered when a release is removed on GitHub.
	Release Released	Flow is triggered when a release is released on GitHub.

For information about setting up the triggers for the GitHub spoke, see Activate the trigger definition on ServiceNow instance. For more information about inbound integration, see Conditional and event-driven inbound integration.

Spoke subflows

The GitHub spoke provides a sample subflow to handle various GitHub webhook events. Available sample subflows are:

Spoke subflows

Subflow	Description	Supported GitHub Event
Process GitHub Branch and Tag Webhook Events	Handles branch and tag webhook events.	Branch and Tag
Process GitHub Commit Webhook Events	Handles commit webhook events.	Commit
Process GitHub Issue Webhook Events	Handles issue webhook events.	Issue
Process GitHub Milestone Webhook Events	Handles milestone webhook events.	Milestone
Process GitHub Project Webhook Events	Handles project webhook events.	Project
Process GitHub Pull Request Webhook Events	Handles pull request webhook events.	Pull Request

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows (continued)

Subflow	Description	Supported GitHub Event
Process GitHub Push Webhook Events	Handles push request webhook events.	Push Request
Process GitHub Release Webhook Events	Handles release webhook events.	Release
Process GitHub Repository Webhook Events	Handles repository webhook events.	Repository
Process GitHub Security Webhook Events	Handles security webhook events.	Security
Process GitHub Webhook Events	Handles all GitHub webhook events.	**Note:** This subflow handles all GitHub events. You can customize this subflow to handle other GitHub webhook events that are not supported by default.

To create subflows to handle other GitHub webhook events or handle the supported GitHub webhook events differently, customize the Process GitHub Webhook Events subflow. For this, you must a create a copy of the subflow, parse the payload, and customize the subflow according to your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must confirm that the subflows are configured to avoid infinite loops.

Note:

- You must configure webhooks to use the spoke subflow. See Set up bi-directional webhook for the GitHub spoke for information regarding setting up and configuring the webhook.
- The sample subflows run as a user by default. It can be configured to run as a system.
- GitHub spoke supports application/json payload. Configure the GitHub webhook accordingly. See the GitHub Developer documentation for instructions on creating and configuring a webhook.

Spoke actions

The GitHub spoke provides actions manage branches, issues, repositories, and source code when events occur in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Branch Management	Create Branch	Creates a branch in GitHub based on a specific commit SHA.
	Delete Branch	Deletes a branch from the GitHub repository.
	Look up Branch	Retrieves the details of a branch in the GitHub repository.
	Look up Branch Protection	Retrieves the restriction details of the required branch.
	Look up Branches	Retrieves the list of all branches in a repository.
	Remove Branch Protection	Removes protection on the required branch.
	Update Branch Protection	Updates protection on the required branch.
Issue Management	Create Comment on Issue	Creates comment on a required issue.
	Create Issue	Creates issue for the required repository.
	Delete Comment on Issue	Deletes comment on a required issue.
	Lock Issue	Locks the required issue. This limits the conversation to collaborators only.
	Look Up Comments on Issue Stream	Retrieves the list of comments on an issue.
	Look Up Issues Stream	Retrieves the list of issues for a repository.
	Unlock Issue	Unlocks the required issue. This opens conversation to all users.
	Update Comment on Issue	Updates a comment on an issue.
	Update Issue	Updates the details of the required issue.
Metadata Retrieval	Look up Fields by Action	Retrieves the list of fields for an action filter in the GitHub Fields table.
	Look up Branches Metadata	Retrieves metadata of the branches.
	Look up Issues Metadata	Retrieves metadata of the issues.
	Look up Milestones Metadata	Retrieves metadata of the milestones.
	Look up Pull Requests Metadata	Retrieves metadata of the pull requests.
Organization Management	Look up Organization Plan	Retrieves the plan name of an organization.
	Look up Organization Members Stream	Retrieves the list of all members within an organization.
	Look up Organization Repositories Stream	Retrieves the list of all repositories within an organization.
	Remove Organization Member	Removes a user from an organization.
	Look up Organization Events Stream	Retrieves the list of events in an organization based on the provided look back date.
	Look up Organization Outside Collaborators Stream	Retrieves the list of all Outside Collaborators within an organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Remove Organization Outside Collaborator	Removes an outside collaborator from an organization.
	Look up Organization Pending Outside Collaborators Stream	Retrieves a list of pending collaborators within a repository.
	Look up Organization Invitations Stream	Retrieves a list of invitations within an organization.
	Look up Organization Audit Log Stream	Retrieves a list of organization audit log events for a specified look-back date.
Repository Management	Add Collaborator	Adds collaborator to the required repository.
	Delete Repository	Deletes a repository from GitHub.
	Create Comment on Pull Request	Create review comments on a pull request.
	Create Milestone	Creates milestone for the required repository.
	Create Pull Request	Creates a pull request for a repository.
	Create Reply on Pull Request Review Comment	Creates reply to a review comment for a pull request.
	Create Repository	Creates a repository in GitHub.
	Delete Comment on Pull Request	Deletes review comment on a pull request.
	Delete Milestone	Deletes milestone from the required repository.
	Look up Comments on Pull Request Stream	Retrieves the list of all review comments on a pull request.
	Look up Milestones Stream	Retrieves the list of all milestones in a repository.
	Look up Repository Events Stream	Retrieves the list of events across a repository.
	Look Up Pull Requests Stream	Retrieves the details of pull requests for a repository.
	Look Up Repositories Stream	Retrieves the details of repositories based on a specific user or organization.
	Look up Repository Details	Retrieves the details of the specified repository.
	Merge Pull Request	Merges the pull request to a repository.
	Remove Collaborator	Removes collaborator from a repository.
	Update Comment on Pull Request	Updates review comments provided for a pull request.
	Update Milestone	Updates the details of a milestone in a repository.
	Update Pull Request	Updates the details of a pull request in a repository.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Repository	Updates the details of a repository in GitHub.
Source Code Management	Create Comment on Commit	Creates a comment for the required commit using its SHA.
	Create or update a file	Creates a file or updates an existing file in a repository.
	Look up Comments by Commit ID Stream	Retrieves comments provided for a single commit.
	Look up Commit Information By ID	Retrieves the contents of the required commit reference.
	Look up File Content	Retrieves the contents of a file in a repository. **Note:** This action supports files with file size up to 1 MB.
	Look up Commits on a Repository	Retrieves the details of all commits made on a repository.
User Management	Look up All Users for Enterprise Server	Retrieves the list of all GitHub Enterprise Server users.
	Look up Organizations for the Authenticated User Stream	Retrieves the list of organizations that the logged-in user is a member of.
	Suspend User	Suspends a GitHub user account.
	Look up Authenticated User	Retrieves information about the authenticated user.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
GitHub branch management AI agent	Manages and maintains the GitHub branches. Also, retrieves information about the GitHub branches.
GitHub issue management AI agent	Manages and automates GitHub-related tasks in Integration Hub.
GitHub repository management AI agent	Manages the GitHub repositories by handling the repository operations, pull requests, comments on pull request and milestones.
GitHub source code management AI agent	Manages source code and handles the repository files, commits, and comments.
GitHub Code Automation AI Agent	Manages code changes and GitHub operations from your ServiceNow instance. This agent interprets your requests, asks clarifying questions, and analyzes context to deliver well-integrated code updates. It also performs GitHub tasks such as creating branches, committing changes, and opening pull requests.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke modules

The GitHub spoke adds these modules to your ServiceNow instance.

Module	Description
GitHub Owner	Displays the GitHub owner records that you had created.
GitHub Repositories	Displays the details of the GitHub repositories associated with the GitHub owners.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the GitHub spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the GitHub spoke

Integrate your ServiceNow instance with the GitHub and GitHub Enterprise Server to automate flows and perform actions on GitHub and GitHub Enterprise Server. For example, create a flow that creates a branch on GitHub and retrieves its details.

https://player.vimeo.com/video/958553772?badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

- Request an Integration Hub subscription.
- Activate the GitHub spoke.
- An account with GitHub to create personal access tokens.
- If you are using GitHub Enterprise server, an account to create personal access tokens.
- Role required: admin.

Procedure

1. Generate a personal access token in GitHub account.

   a. Log in to https://github.com/.

   b. On the dashboard, select your profile icon.

   
   c. Select **Settings**.

   d. In the Settings page, on the left panel, select **Developer settings**.

   e. In the Developer settings page, on the left panel, navigate to **Personal access tokens** > **Tokens (classic)**.

   f. Select **Generate new token** > **Generate new token (classic)**.

   g. In **Note**, enter a description or purpose of the personal access token.

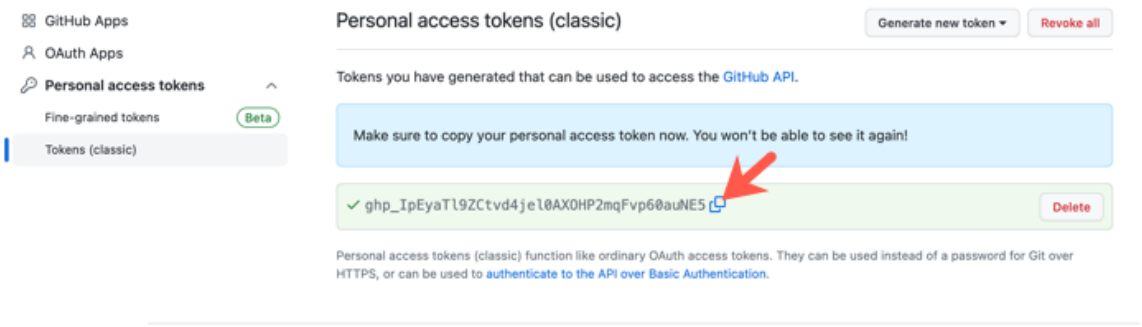
   h. In **Expiration**, set the expiry period of the token or select No expiration.

   i. Under the **Select scopes** heading, select the scopes that define the access for the personal access token you're generating.

   j. Select **Generate token**.
   The personal access token is generated.

   k. To copy the personal access token, select the copy button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Important:
Keep the personal access token at a secure place. You'll need it when you create a connection record for GitHub.

2. Configure the connection record that connects your ServiceNow instance with GitHub.

   a. Log in to your ServiceNow.

   b. Navigate to **All** > **Process Automation** > **Workflow Studio**.

   c. Click the **Integrations** tab.

   d. Under **Connections**, toggle and enable the **Outbound** connections.

   e. Locate the **GitHub** connection alias and click **View Details**.
   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

   f. On the form, fill the details.

Configure Connection form

Field	Description
Connection Name	Name of the connection. **Note:** The default and read-only name of the first connection record is **GitHub**.
Connection URL	URL to connect to GitHub. Enter https://api.github.com.
Use Mid Server	▪ Enter `1` if your ServiceNow instance requires a MID Server to connect with GitHub. ▪ Enter `0` if your ServiceNow instance does not require a MID Server to connect with GitHub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Important: To enable this option, you must already have a MID Server set up on your instance. See MID Server for detailed instructions.
API Key	Personal access token that you had generated on GitHub.

g. Select **Create Connection**.
The GitHub connection record is created.

3. If you are using GitHub Enterprise server, configure the **GitHub Server** connection.

Important:
Generate a personal access token on the GitHub Enterprise server.

To learn to generate a personal access token on the GitHub Enterprise server, see Integrate with GitHub Enterprise Server.

a. Select the GitHub Server connection card.

b. Select **View Details**.

c. Fill the form.

Configure Connection form

Field	Description
Connection Name	The name of the connection. **Note:** The default and read-only name of the first connection record is GitHub Server. To create a connection with your custom name, select **Add Connection** and fill the form.
Connection URL	URL of your GitHub instance.
Use Mid Server	▪ Enter 1 if your ServiceNow instance requires a MID Server to connect with the GitHub Enterprise server. ▪ Enter 0 if your ServiceNow instance does not require a MID Server to connect with the GitHub Enterprise server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Important: To enable this option, you must already have a MID Server set up on your instance. See MID Server for detailed instructions.
API Key	Personal access token that you had generated on the GitHub Enterprise Server.

d. Select **Create Connection**.
The GitHub Enterprise Server connection record is configured.

Set up bi-directional webhook for the GitHub spoke

Configure webhook to subscribe to GitHub with a ServiceNow callback URL.

https://player.vimeo.com/video/1125629681?h=17672b2593&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

- Request Integration Hub subscription
- Activate the GitHub spoke
- Role required: admin

Register GitHub webhook in ServiceNow

Register a GitHub in ServiceNow to notify the ServiceNow app when certain events occur in GitHub.

Before you begin

Role required: admin

Procedure

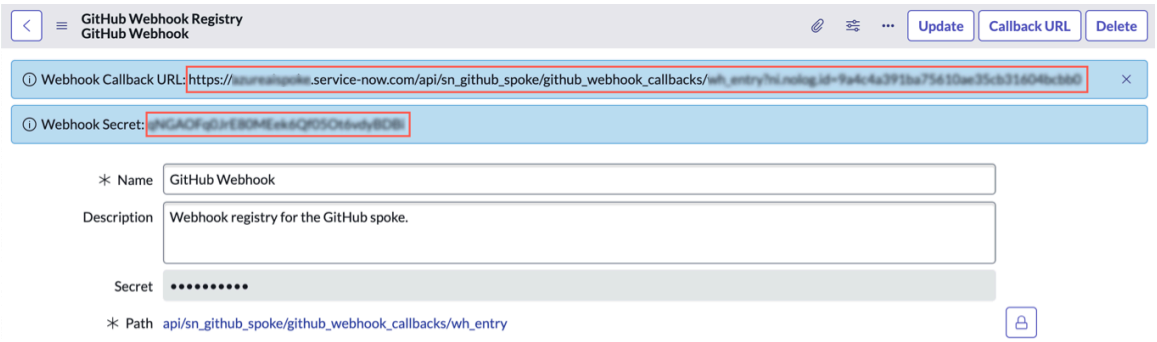
1. Navigate to **All** > **GitHub Webhooks** > **GitHub Webhook Registries**.
2. Click **New**.
3. On the form, fill in the fields.

GitHub Webhook Registry form

Field	Description
Name	Unique name to identify the record. For example, `GitHub webhook`.
Description	Description of the record.

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.
The system displays the **Webhook Callback URL** and **Webhook Secret**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Copy and record the values of **Webhook Callback URL** and **Webhook Secret**.

Result
The GitHub webhook is registered in your ServiceNow instance.

Add Callback URL in GitHub

Provide Webhook Callback URL in GitHub account to create webhook.

Before you begin
Role required: admin

Procedure

1. Log in to your GitHub account.
2. Navigate to the required repository.
3. Select **Settings**.
4. On the left panel, select, **Webhooks**.
5. Select **Add Webhook**.
6. Enter Webhook Callback URL in **Payload URL** and Secret in **Secret**.

   See the GitHub Developer documentation for instructions on creating and configuring a webhook.

> **Note:**
> GitHub spoke supports **application/json** payload. Configure the GitHub webhook accordingly. See the GitHub Developer documentation for instructions on creating and configuring a webhook.

Result
The Callback URL is added in the GitHub account. You can create routing policies and subflows as per your requirement. See Customize a bi-directional webhook for information regarding creating new routing policies and subflows.

Customize bi-directional webhook in the GitHub spoke

Create webhook routing policy and subflow as per your requirement in the GitHub spoke.

Before you begin
Role required: admin

About this task
The default routing policy in the GitHub WebHook Routing Policies modules triggers the relevant GitHub subflow and notifies the ServiceNow app when certain events occur in GitHub. See

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GitHub Spoke for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click **Subflows**.
3. Create a copy of the required subflow.
4. Customize the required subflow as per your requirement and publish it.
   See Building subflows for more information about creating and using subflows and GitHub Spoke for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support.
5. Navigate to **GitHub Webhooks** > **GitHub WebHook Routing Policies**.
6. Click **New**.
7. On the form, fill in the fields.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. Default answer is applicable when the conditions are not met.
Condition	Conditions to be met when the required events occur in GitHub. See GitHub Spoke for information about the supported fields.
Answer	Subflow that has to be triggered when the specified conditions are met. **a.** Click the Lookup icon. **b.** Select the required subflow from the **Document:** list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.

8. Click **Submit**.

Note:
These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Result
Routing policy and subflow are created.

Set up triggers for the GitHub spoke

Set up the trigger to generate the secret and callback URL on your ServiceNow instance.

https://player.vimeo.com/video/1122004833?h=f5acab7f7a&badge=0&autopause=0&player_id=0&app_id=58479

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the GitHub spoke.
- Role required: admin.

Activate the trigger definition on ServiceNow instance

Activate the trigger definition to generate the secret and callback URL on your ServiceNow instance.

Before you begin

Role required: flow_designer and connection_admin.

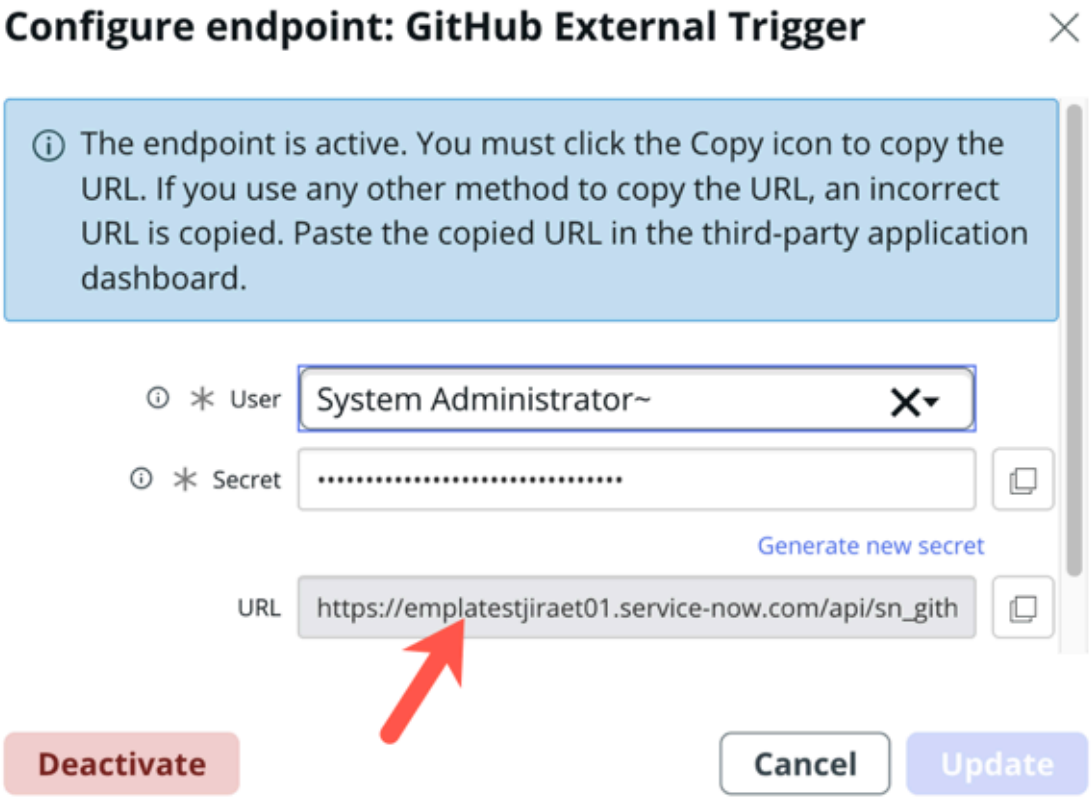
About this task

GitHub uses the secret and callback URL to securely send the payload to the ServiceNow instance. The ServiceNow instance verifies the secret that GitHub sends and accepts the payload.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Toggle and enable the **Inbound** tab.
4. Locate the GitHub Spoke card and select **View Details**.
5. Select **Configure**.
6. In the User field, select the user name on whose behalf the inbound session or flow is triggered.
7. Select **Generate secret** to generate the secret.
   The secret is used to sign the payload of the webhook. You must configure the secret on GitHub.
   The secret is generated on the Secret field.
8. Select **Activate**.
   The callback URL is generated in the URL field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Copy the values of **Secret** and **URL** for later use.
10. Close the window.

What to do next

Configure secret and callback URL on GitHub

Configure secret and callback URL on GitHub

Set the secret and callback URL to enable GitHub to securely send webhooks to your ServiceNow instance.

Before you begin

Role required: Admin

Procedure

1. Log in to the GitHub account.
2. Navigate to the required repository.
3. Select **Settings**.
4. On the left panel, select, **Webhooks**.
5. Select **Add Webhook**.
6. Fill the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Webhook trigger

Field	Description
Payload URL *	Option to provide GitHub the payload URL that GitHub uses to send the payload via the webhook. Enter the URL that you have generated while activating the trigger. See Activate the trigger definition on ServiceNow instance.
Content type *	Option to select the payload content format. Select **application/json**.
Secret	Option to provide the secret that the ServiceNow verifies when it receives the webhook from GitHub. Enter the secret that you have generated while activating the trigger. See Activate the trigger definition on ServiceNow instance.
Which events would you like to trigger this webhook?	Option to specify the event that triggers the webhook. Choose from the following options. ○ Just the push event: Triggers the webhook when there's a push event on GitHub. ○ Send me everything: Triggers webhooks whenever an event occurs. ○ Let me select individual events: Triggers the webhook when you specify an event.

7. Select **Add Webhook**.

GitLab Spoke

Manage the DevOps lifecycle in GitLab from your ServiceNow instance. Create flows in ServiceNow to manage branches, groups, issues, merge requests, projects, and source code in GitLab.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

GitLab spoke v2.4.0 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compatible versions

This spoke was built for GitLab API version v4, but may be compatible with later versions.

Spoke requirements

- GitLab account
- An application in GitLab configured to integrate with ServiceNow
- **Application ID** and **Secret** of the GitLab application

See the https://docs.gitlab.com/ee/integration/oauth_provider.html documentation for instructions on creating and configuring applications.

Spoke actions

The GitLab spoke provides actions to automate GitLab tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Branch Management	Compare Branches Tags or Commits	Compares branches, tags, or commits.
	Create Branch	Creates a branch in the required project.
	Delete Branch	Deletes the required branch from a project.
	Delete Merged Branches	Deletes the required merged branch from a project.
	Look up Branch	Retrieves the details of the required branch.
	Look up Branches Stream	Retrieves a list of branches and the branch details in a project.
	Protect Branch	Protects a branch in a project with access levels.
	Unprotect Branch	Unprotects a branch in a project with access levels.
Group Management	Add User To A Group	Adds user to a GitLab group.
	Remove User From A Group	Removes user from a GitLab group.
Issue Management	Create Issue	Creates an issue in the required project.
	Create Issue Note	Creates an issue note for the required issue.
	Delete Issue Note	Deletes an issue note for the required issue.
	Look up Issue Notes Stream	Retrieves all issue notes in an issue.
	Look up Issues Stream	Retrieves a list of issues and issue details.
	Update Issue	Updates details of the required issue.
	Update Issue Note	Updates an issue note in a project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Merge Request Management	Accept Merge Request	Approves a merge request in GitLab.
	Create Merge Request	Creates a merge request in GitLab.
	Create Merge Request Note	Creates a note for the required merge request.
	Delete Merge Request Note	Deletes a note for the required merge request.
	Look up all Merge Requests Stream	Retrieves the list of merge requests in a project.
	Look up Merge Request Notes	Retrieves the list of merge request notes in a project.
	Update Merge Request	Updates details of the required merge request.
	Update Merge Request Note	Updates details of the required merge request note.
Package Management	Delete Package File	Deletes a package file from the project package registry.
	Delete Project Package	Deletes a package from the project package registry.
	Delete Registry Repository	Removes a registry repository from a project.
	Delete Registry Repository Tags	Removes registry repository tags in a batch from a project.
	Look up Details of a Registry	Retrieves details of a registry repository for a specified project.
	Look up Package Files Stream	Retrieves list of package files of a single package.
	Look up Packages within Group Stream	Retrieves a list of project packages and package details at the group level.
	Look up Packages within Project Stream	Retrieves a list of project packages and package details.
	Look up Project Package	Retrieves the details of the specified package for a specified project.
	Look up Registry Repositories	Retrieves a list of registry repositories for a specified project.
Pipeline Management	Look up Project Pipeline by ID	Retrieves the details of a specified pipeline for a specified project.
	Look up Project Pipeline Jobs Stream	Retrieves the list of jobs in a project pipeline.
	Look up Project Pipeline Test Report	Retrieves the test report of the specified pipeline for the specified project.
	Look up Project Pipelines Stream	Retrieves the list of pipelines in a project.
Project Hook Management	Create Project Hook	Creates a hook to a project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Project Hook	Removes a hook from a project.
	Look up Project Hook	Retrieves details of a specified hook in a project.
	Look up Project Hooks	Retrieves details of all the hooks in a project.
	Update Project Hook	Updates details of a hook for a specified project.
Project Management	Add User To A Project	Adds user to a project in GitLab.
	Archive Project	Archives a project in GitLab.
	Create Milestone	Creates milestone in a GitLab project.
	Create Project	Creates a project in GitLab.
	Delete Milestone	Deletes milestone in a GitLab project.
	Delete Project	Deletes a project in GitLab.
	Look up Milestones Stream	Retrieves the details of the milestones GitLab.
	Look up Project	Retrieves details of the specified project.
	Look up Project Jobs Stream	Retrieves the project jobs details.
	Look up Projects Stream	Retrieves the details of the projects.
	Remove User from a Project	Removes user from a project in GitLab.
	Share Project With Group	Shares a project with a group in GitLab.
	Unarchive Project	Unarchives a project in GitLab.
	Unshare Project With Group	Unshares a project with a group in GitLab.
	Update Milestone	Updates details of a milestone in a project.
	Update Project	Updates details of a project.
Source Code Management	Get Commit	Retrieves a details of a commit in GitLab.
	Add New File To Repository	Adds a file to a repository in GitLab.
Token Management	Look up Personal Access Tokens	Retrieves a list of personal access tokens.
	Revoke Personal Access Token	Revokes a personal access token.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
GitLab pipeline management AI agent	Manages pipeline tasks (that is, looks up project pipelines by ID, retrieves pipeline test reports, streams project pipeline jobs and streams project pipeline data) in GitLab.
GitLab branch management AI agent	Manages branch management (that is, compare branches, tags, or commits, creates and deletes branches, manages branch protection, and looks up branch details or streams) in GitLab.
GitLab merge request management AI agent	Manages merge requests (creates, updates, accepts, and deletes merge request notes, and retrieves information about merge request notes) in GitLab.
GitLab package management AI agent	Manages package management (that is, deletes project packages, manages registry repositories, and performs detailed lookups for packages and files) in GitLab.
GitLab token management AI agent	Manages token management (that is, looks up and revokes personal access tokens) in GitLab.
GitLab issue management AI agent	Manages issue management tasks (that is, creates, updates, and manages issues and the related notes) in GitLab.
GitLab project management AI agent	Manages project management tasks (that is, creates, updates, and deletes projects and milestones, manages user and group access, and retrieves project and milestone streams) in GitLab.
GitLab source code management AI agent	Manages source code tasks (that is, looks up commit difference, adds new file to repository, and looks up commit by project ID) in GitLab.
GitLab group management AI agent	Manages user-group tasks (that is, adds and removes users from groups) in GitLab.

Looking for an AI agent?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke flows

The GitLab spoke provides sample flows to demonstrate automating the GitLab tasks. To customize a sample flow, copy it to a new application scope.

Flow	Description
Archive projects older than 6 months	Archives the projects which are inactive for the last six months.

Spoke subflows

The GitLab spoke provides sample flows to demonstrate automating the GitLab tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflows	Description
Process GitLab Deployment Webhook Events	Processes deployment webhooks in GitLab.
Process GitLab Job Webhook Events	Processes job webhook events in GitLab.
Process GitLab Merge Request Webhook Events	Processes merge request webhook events in GitLab.
Process GitLab Pipeline Webhook Events	Processes pipeline webhook events in GitLab.
Process GitLab Push Webhook Events	Processes push webhook events in GitLab.

Spoke webhooks

Bi-directional webhooks can be setup to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in GitLab for which you wish to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the GitLab tasks.

The bi-directional webhooks requires separate setup and can be used independently without using the spoke actions. By default, the GitLab Webhooks application is available in the GitLab spoke and has the following modules:

Webhook	Description
GitLab Webhook Registries	Displays the list of available webhook registries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Webhook	Description
GitLab Webhook Routing Policies	Displays the list of available webhook routing policies.

Spoke module

The GitLab spoke provides Gitlab Token Management application that includes the Gitlab Token Managements module. You should record here to authenticate requests from your ServiceNow instance.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the GitLab spoke.

Set up the GitLab spoke

Integrate your ServiceNow instance and the GitLab by creating a custom OAuth application in the GitLab.

Before you begin

- Request an Integration Hub subscription.
- Activate the GitLab spoke.
- Create an account with GitLab at https://gitlab.com/users/sign_in.
- Role required: admin.

Add GitLab token

Add GitLab token to authenticate requests from your ServiceNow instance.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **GitLab Token Management** > **GitLab Token Managements**.
2. Click **New**.
3. On the form, fill these values.

Gitlab Token Management form

Field	Description
Secret	Secret created during the GitLab application configuration.
Name	Name to identify the record.
OAuth Entity Profile	Leave the field empty. System auto-assigns the default entity profile after the connection is configured.

4. Right-click the form header and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Generate Secure Token**.
   Value of the generated secure token is displayed.
6. Copy and record the value of the secure token for later use.
7. Click **Update**.

Create OAuth application in GitLab account

Create a custom OAuth application from your GitLab account to enable OAuth 2.0 authentication with the GitLab spoke.

Before you begin

- GitLab account
- Role required: GitLab admin.

About this task

Complete these steps from your GitLab account. See the GitLab documentation for instructions on creating and configuring applications.

Procedure

1. From your GitLab account, create an application.
2. Enter ServiceNow instance URL in **Redirect URI**.
   The format of the redirect URL is: `https://<instance-name>.service-now.com/api/sn_gitlab_spoke/gitlab_oauth_redirect/oauth?secureToken=<Secure-Token>`.

   Replace **<Instance-Name>** with the name of your ServiceNow instance and replace **<Secure-Token>** with the secure token you had generated in the ServiceNow instance.
3. Copy and record the **Application Id** and **Secret** for later use.
   These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

Result

The custom OAuth application from your GitLab account is created and can be integrated with the ServiceNow instance.

Configure a connection for the GitLab spoke

Add and configure a GitLab connection to authenticate ServiceNow requests in GitLab spoke.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.
4. Locate the **GitLab** connection alias and click **View Details**.
5. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.
6. On the **Connection** form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Name	Name to uniquely identify the connection.
Connection URL	Enter `https://gitlab.com/api`. **Note:** If you have installed GitLab on an on-premise server, enter the URL in this format: `https://<gitlab-hosted-instance>.com/api`
OAuth Entity Name	Name to identify the OAuth entity record.
OAuth Client ID	Application ID created during the GitLab application configuration.
OAuth Client Secret	Secret created during the GitLab application configuration.
OAuth Redirect URL	OAuth callback endpoint. The format of the redirect URL is: `https://<instance-name>.service-now.com/api/sn_gitlab_spoke/gitlab_oauth_redirect/oauth?secureToken=<Secure-Token>`. Replace **<Instance-Name>** with the name of your ServiceNow instance and replace **<Secure-Token>** with the secure token you had generated in the ServiceNow instance.

7. Click **Configure and Get OAuth Token**.

Set up bi-directional webhook for the GitLab spoke

Configure a webhook to subscribe to GitLab with a ServiceNow callback URL.

Before you begin

- Request Integration Hub subscription
- Activate the GitLab spoke
- Role required: admin

Register GitLab webhook in ServiceNow instance

Register GitLab in ServiceNow to notify the ServiceNow app when certain events occur in GitLab.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **GitLab Webhooks** > **GitLab Webhook Registries**.
2. To retrieve the existing webhooks GitLab account, click **Get All Webhooks**.
3. To create a webhook, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields:

Fields	Description
Name	Name of the webhook. For example, `Job webhook`.
Description	Description of the record.
Project ID	Unique identifier of the project for which the webhook should be created.
Trigger and SSL	Events in the projects you want to subscribe to. When one of these events occurs, the webhook is triggered.

5. Click the **Generate Secret Token** related link.
   The secret token is generated and displayed. Also, the date on which the secret expires is populated in **Secret Expires**.

   Note:
   The secret is regenerated and updated every 30 days. This secret is also updated in GitLab.

6. Right-click the form header and click **Save**.
7. Click **Create Webhook**.
   The webhook is created in GitLab and its ID is populated in **Webhook ID**.

What to do next
To update details of the webhooks or change the subscribed events, click **Update Webhook**.

Customize a bi-directional webhook in the GitLab spoke

Create webhook routing policy and subflow as per your requirement in the GitLab spoke.

Before you begin
Role required: admin

About this task
The default routing policy in the GitLab WebHook Routing Policies modules triggers the relevant GitLab subflow and notifies the ServiceNow app when certain events occur in GitLab. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure
1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Click **Subflows**.
3. Create a copy of the required subflow.
4. Customize the required subflow as per your requirement and publish it.
   See Building subflows for more information about creating and using subflows and GitLab spoke for information about the GitLab fields that the default routing policy supports and the GitLab events that the subflows support.
5. Navigate to **All** > **GitLab Webhooks** > **GitLab Webhook Routing Policies**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Five routing policies are available along with the spoke. You can configure them as per your requirement or create a routing policy.

6. To create a routing policy, click **New**.
7. On the form, fill in the fields.

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. Default answer is applicable when the conditions are not met. **a.** Click the Lookup icon. **b.** Select the required subflow from the **Document:** list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.
Condition	Conditions to be met when the required events occur in GitLab.
Answer	Subflow that has to be triggered when the specified conditions are met.

8. Click **Submit**.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Result
Routing policy and subflow are created.

Gmail Spoke

Set up an outbound integration between the ServiceNow instance and the Google APIs.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

API version v1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Gmail spoke v1.3.3 is the latest version.

Spoke subflows

The Gmail spoke provides sample subflows in the draft state to demonstrate automating Gmail tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Move a ServiceNow attachment to Gmail	Copies an attachment from ServiceNow to Gmail.

Spoke actions

The Gmail spoke provides actions to automate Gmail tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Label Management	Add Label to Email	Add a label to an email.
	Create New Label	Create a label in your Gmail account.
	Lookup Label ID By Name	Retrieve details of a specified Label ID.
	Remove Label From Email	Remove the specified label from an email.
Email Management	Add Attachment To ServiceNow Record	Add an attachment from an email in your Gmail account to a ServiceNow record.
	Get Email Details	Retrieve details of a specified email.
	Look Up Emails	Retrieve details of specified emails.
	Reply To Email	Send a reply to an email.
	Send Email	Send email from your Gmail account to specified recipients.
	Delete Email	Delete the specified email.
	Undelete Email	Retrieve the specified email from the Bin.

Gmail spoke account requirements

The Gmail spoke requires a custom app that you create in the Google Developers Console.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Gmail spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Gmail alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Gmail spoke

Set up an outbound integration between the ServiceNow instance and the Google APIs.

Before you begin

- Request an Integration Hub subscription.
- Install the Gmail spoke plugin on the ServiceNow instance.
- Role required: admin.

About this task

To establish an outbound integration, you must complete these steps.

- Set up an OAuth 2.0 client ID
- Configure a connection for the Gmail spoke

Set up an OAuth 2.0 client ID

Create a custom OAuth application to enable OAuth 2.0 authentication of the ServiceNow by the Google APIs.

Before you begin

Google Tasks integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. You can only register one email address per domain in G Suite.
- A Google G Suite or Gmail login created with the domain.

Role required: admin.

Procedure

1. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select **OAuth consent screen**.
3. Enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **Web application**.
7. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and select **Create**.
8. Copy the Client ID and the Client Secret to a text file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a connection for the Gmail spoke

Configure the Gmail connection record to establish a connection between the ServiceNow instance and the Google APIs.

Before you begin

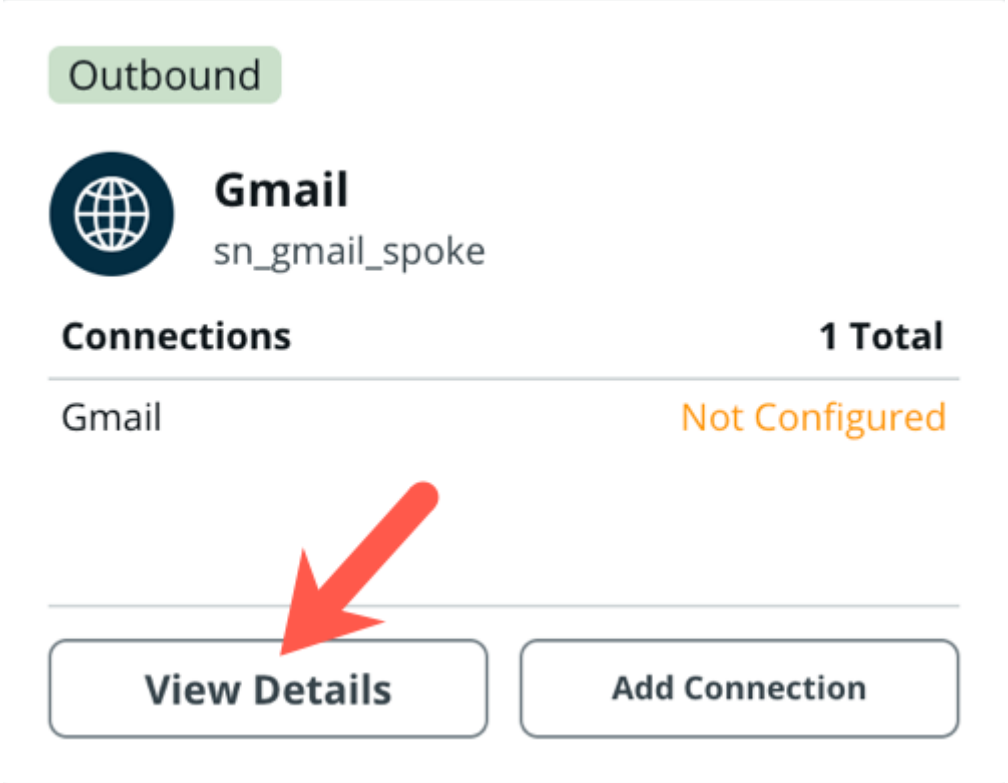
Role required: admin.

About this task

The connection and credentials contain the details such as the client ID, client secret, and the redirect URL that the Google Workspace must authenticate the ServiceNow instance.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Select the **Connections** tab.
4. In the Search all connections field, enter `Gmail`.
5. Select **View Details**.



6. Select **Configure**.

7. Fill the form with the details given in the table.

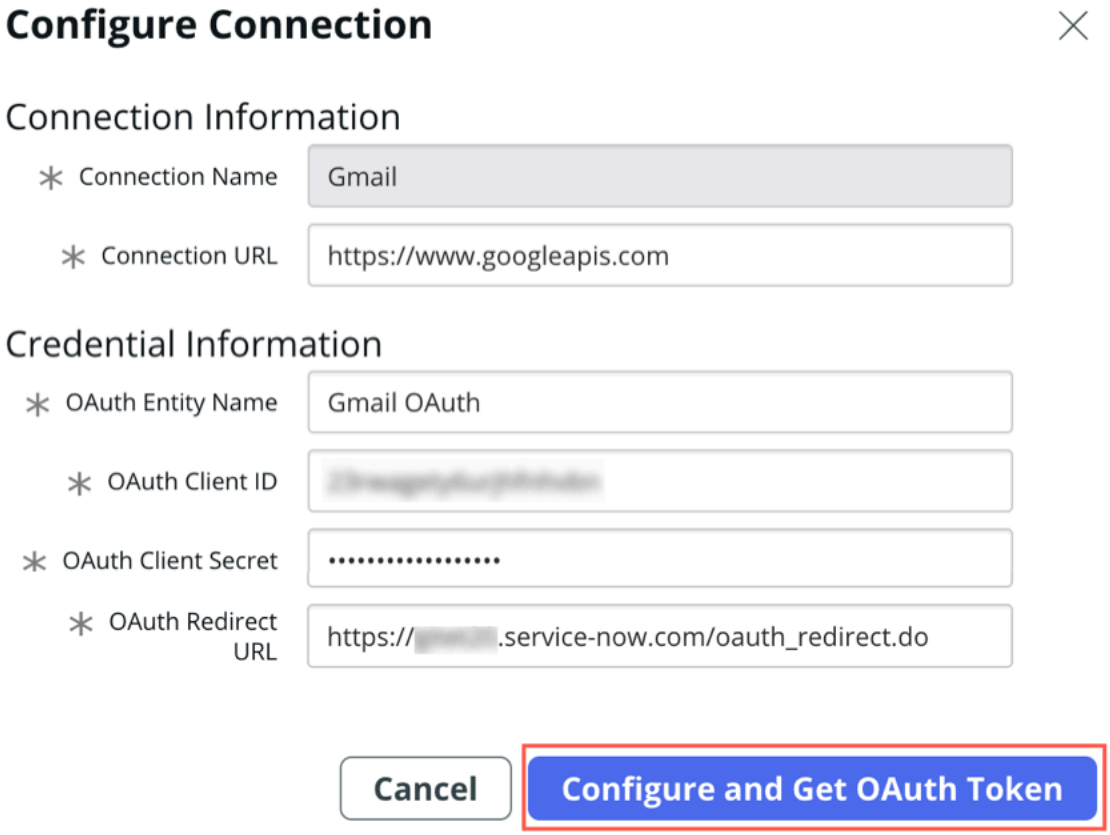
Configure connection form

Field	Description
Connection Name	Name of the connection between the Google Workspace and the ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The default name is Gmail and it's read-only. However, you can provide custom names when you set up more connection and credential records after this record.
Connection URL	Enter the URL `https://www.googleapis.com` **Note:** Make sure that you don't include spaces before or after this URL. If there are spaces, the connection fails. .
OAuth Entity Name	Name to identity the OAuth entity record.
OAuth Client ID	The OAuth client ID generated when you created the OAuth client ID.
OAuth Client Secret	The OAuth client secret generated when you created the OAuth client ID.
OAuth Redirect URL	The OAuth redirect URL. It must be in the format: `https://<instance-name>.service-now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Select **Configure and Get OAuth Token**.
   You must log into Gmail after the OAuth token is issued.

Google Calendar Spoke

Use ServiceNow to create and update events and attendees in Google Calendar.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Calendar spoke v2.6.1 is the latest version.

Supported versions

API version v1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Google Calendar spoke provides actions to perform Google Calendar tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Attendee Management	Add Attendees To Event	Updates an event by adding to the list of attendees. Values you specify replace the existing values. Fields that you don't specify in the request do not change.
	Remove Attendees From Event	Updates an event by removing specified attendees. Values you specify replace the existing values. Fields that you don't specify in the request do not change.
Event Management	Create Event	Creates an event on the specified calendar.
	Update Event	Edit event information. Values you specify replace the existing values. Fields that you don't specify in the request do not change.
	Look up Event By ID	Retrieves details of the specified event.
	Delete Event	Removes a specified event from a calendar.
	Look up Events Stream	Retrieves events on a specified calendar based on start time, end time, or search terms.
	Look up Events by Calendar ID	Retrieves events on the specified calendar.
	Look up Free or Busy Schedules	Retrieves the free or busy information for the specified set of calendars.
	Move Event	Moves the specified event to another calendar.
Access Control List Management	Create Access Control List	Creates an access control rule.
	Delete Access Control List	Deletes the specified access control rule.
	Look up Access Control List by Calendar ID	Retrieves details of the required access control rule.
	Look up Access Control List Stream	Retrieves the rules in the access control list for the calendar.
	Update Access Control List	Updates details of the required access control rule.
Calendar List Management	Add Calendar to Calendar List	Inserts an existing calendar into the user's calendar list.
	Delete Calendar from Calendar List	Removes a calendar from the user's calendar list.
	Look up Calendar from	Retrieves calendar from the user's calendar list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Calendar List by ID	
	Look up Calendars from Calendar List Stream	Retrieves calendars on the user's calendar list.
	Update Calendar from Calendar List	Updates an existing calendar on the user's calendar list.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agents	Description
Google Calendar event manager AI agent	Manages event manager tasks (that is, look up an event by an event ID, look up an events stream, look up busy slots by a calendar ID, move an event, create an event, look up events by a calendar ID, delete an event, update an event) in Google Calendar.
Google Calendar list manager AI agent	Manages calendar list tasks (that is, delete a calendar from a calendar list, look up a calendar from a calendar list by an ID, look up calendars from a calendar list stream) in Google Calendar.
Google Calendar access control list manager AI agent	Manages access control list tasks (that is, update an access control list, delete an access control list, look up an access control list stream, look up an access control list by a calendar ID) in Google Calendar.
Google Calendar metadata manager AI agent	Retrieves time zones metadata (that is, look up time zones metadata) from Google Calendar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke module

The Google Calendar spoke adds a Google Calendars module to your ServiceNow instance. The Google Calendars module displays the details of the calendar lists.

Google Calendar Online account requirements

The Google Calendar spoke requires a custom app that you create in Google G Suite.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Calendar spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Google Calendar alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Google Calendar spoke

Set up an outbound integration between your ServiceNow instance and the Google Calendar Application Programming Interfaces (API) by setting up a connection and credential record.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Calendar spoke.
- Ensure that you have a Google Workspace account.
- Ensure that you have a domain and an email address related with the domain. For example, www.mydomain.com and jane-admin@mydomain.com.

  Note:
  you can only register one email address per domain in Google Workspace.

- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create OAuth application on Google Calendar

Create an OAuth application on the Google Calendar that authenticates requests to access the Google Calendar APIs from your ServiceNow instance. After successful authentication, you can generate an OAuth token that your ServiceNow can use to access the Google Calendar APIs.

Before you begin

Google Calendar spoke integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in Google Workspace.
- Google Workspace login credentials created with the same domain.

Role required: admin.

Procedure

1. Log in to https://console.developers.google.com with your Google Workspace credentials.
2. Create a project on Google Workspace.
   The project provides the OAuth application and the permissions to access the Google Calendar APIs from your ServiceNow instance.

   a. Select the button.

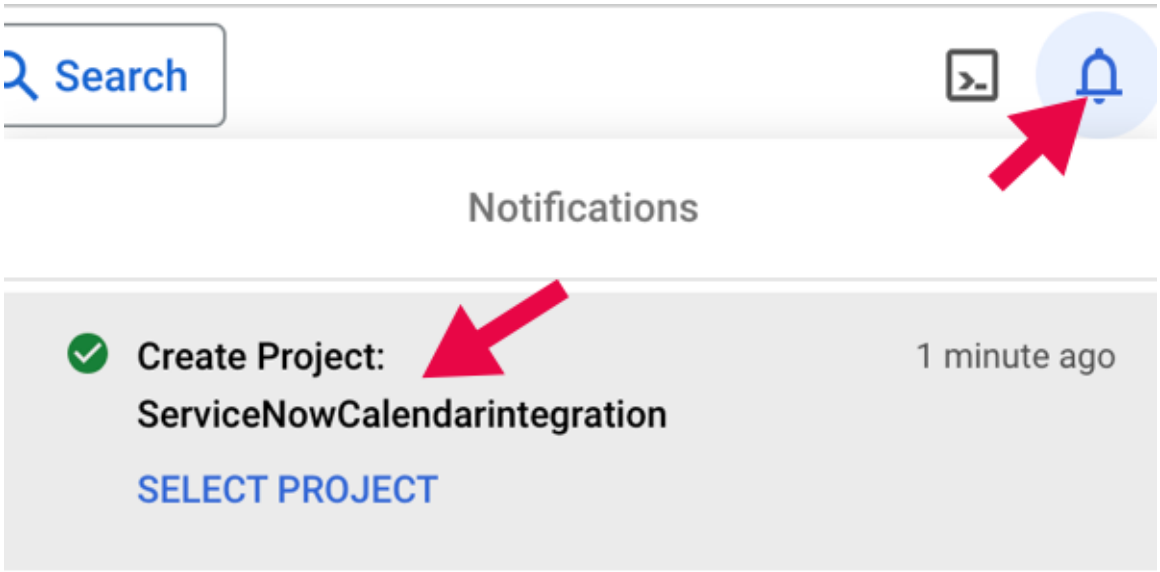
   b. On the Select a Project window, select **NEW PROJECT**.

   c. In the Project name field, enter a unique name for the project.

   d. In the Location field, select BROWSE to select an organization.

   e. Select **CREATE**.
   The Notifications window confirms that the project is created.

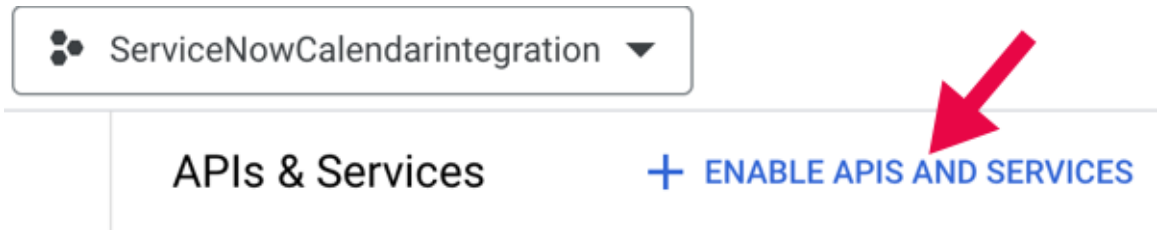
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



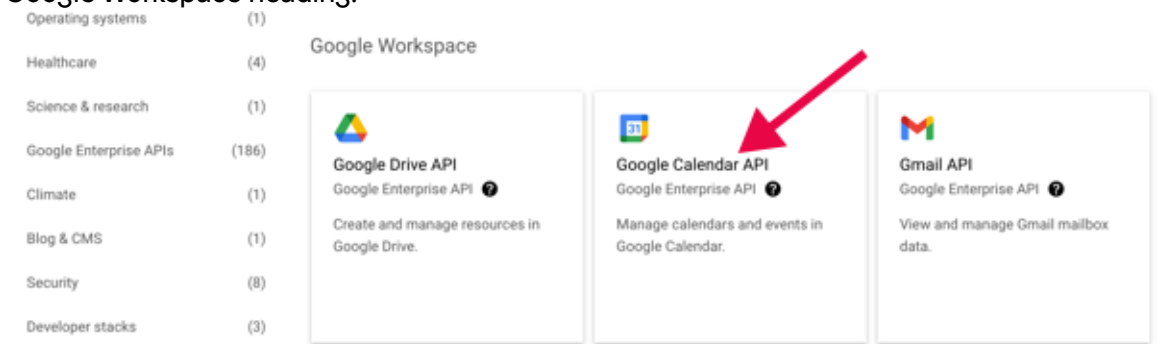
f. Select SELECT PROJECT.

3. Enable the Google Calendar API permissions.

a. Select **+ ENABLE APIS AND SERVICES**.



b. On the Welcome to the API Library page, navigate to the Google calendar API card under the Google Workspace heading.

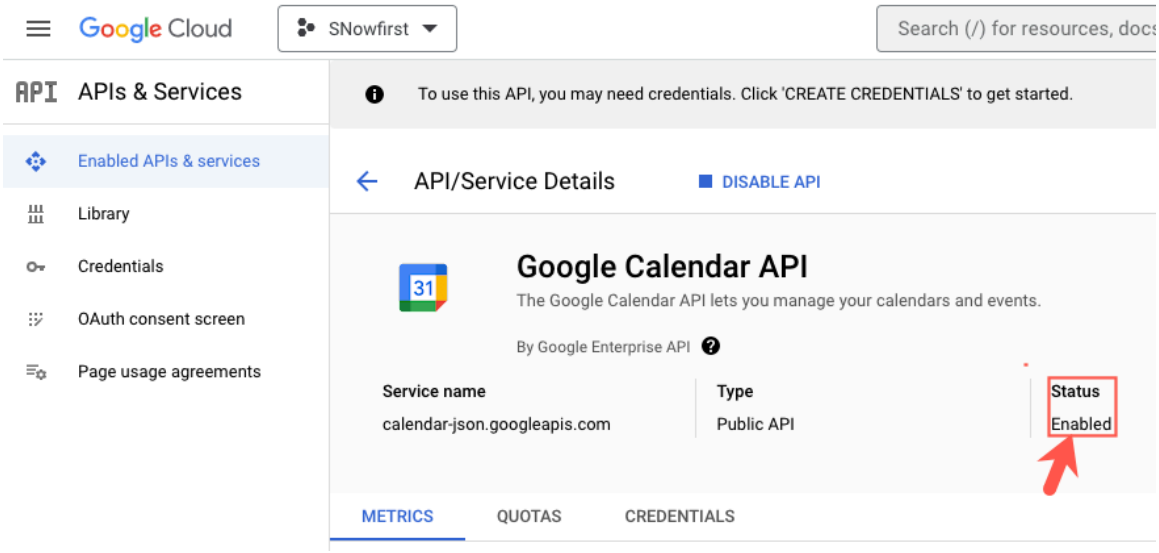


c. Select **Google Calendar API**.

d. Select **ENABLE**.

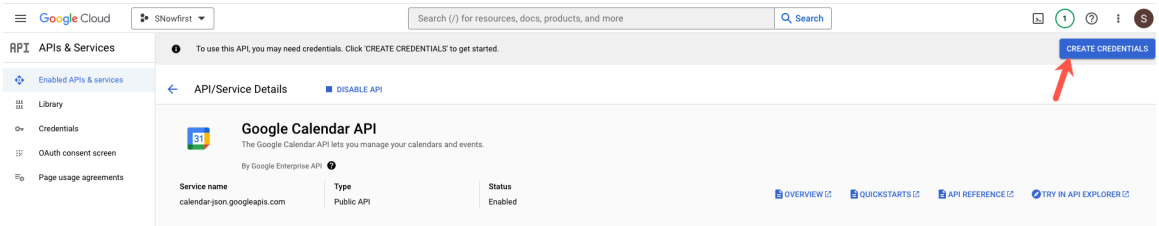
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Google calendar API is enabled on your project.



4. Create the credentials that the connection and credential form will store.

a. Select **CREATE CREDENTIALS**.



b. Fill the form.

Google Calendar API credentials

Select an API	Name of the API that your ServiceNow instance accesses. **Note:** Ensure that the Google Calendar API option is chosen.
What data will you be accessing? *	Type of data that your ServiceNow instance accesses from the Google Calendar application. **Tip:** To create an OAuth application, select User data.

c. Select **NEXT**.

d. In the OAuth Consent Screen section, fill the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth Consent Screen form

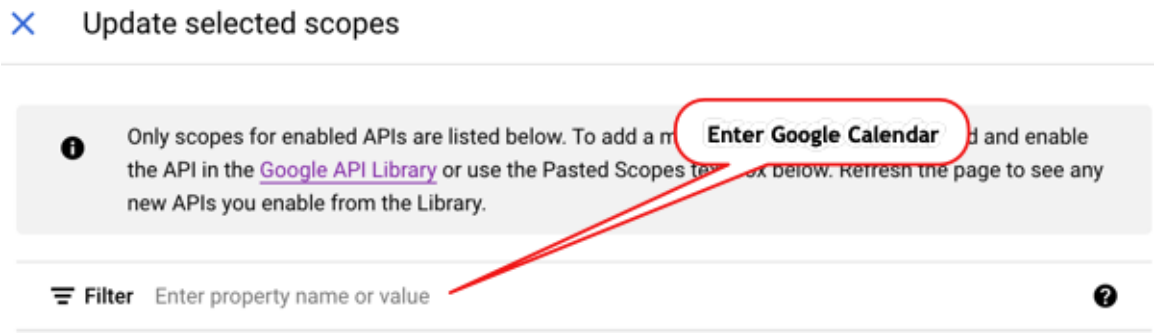
Field	Description	Mandatory?
App name	Custom name of the OAuth app.	Yes
User support email	Users of the OAuth app can send their queries on consent to this email.	Yes
App logo	Logo of the OAuth app,	No
Developer contact information	Google uses this email ID to inform you about any changes to the project.	Yes

e. Select **SAVE AND CONTINUE**.

5. **Optional:** Specify the permissions to access specific Google Calendar API.

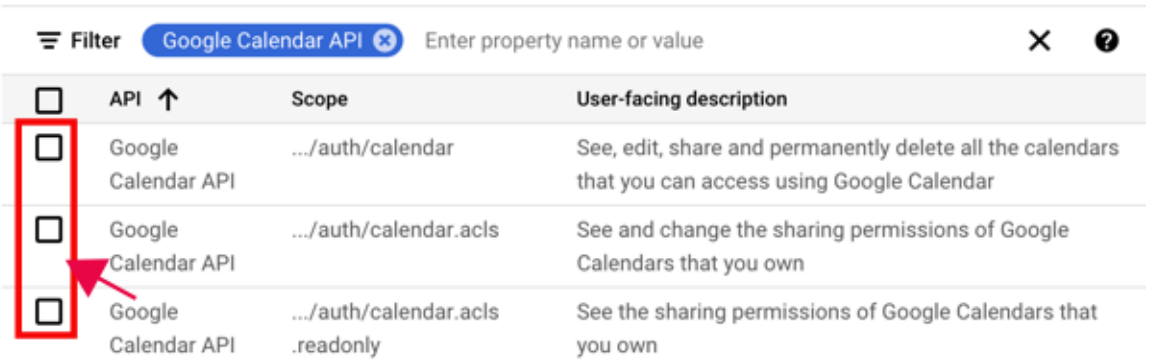
a. Under the SCOPES heading, select **ADD OR REMOVE SCOPES**.

b. In the Update selected scopes window, enter `Google Calendar` in the Enter property name or value field.



c. From the list, select Google Calendar API.

d. Select the required APIs from the list.



e. Select **UPDATE**.

6. Generate the OAuth Client ID and related details.
You must enter the OAuth Client ID and related details in the connection and credential form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

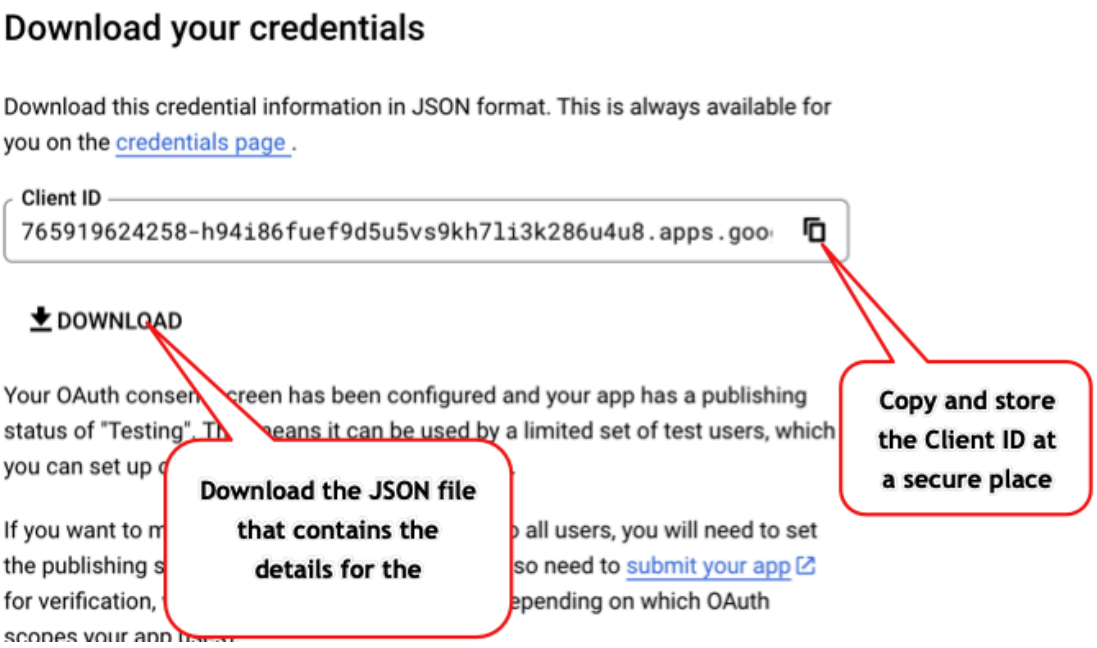
a. In the Application type field, select `Web application`.

b. In the Name field, enter a custom name for the application.

c. To add a redirect URL, under the Authorised redirect URIs heading, select **+ ADD URI**.

d. Enter the URL of your ServiceNow instance.

e. Select **CREATE**.
The credentials for the OAuth application are created, as shown in the image.



7. Select **DONE**.

Create Connection and Credential record for the Google Calendar spoke

Create a connection and credential record that enables your ServiceNow instance to integrate with the Google Calendar Application Programming Interface (API).

Before you begin

Role required: admin.

About this task

The connection and credential record includes the details that you had set up when you created the OAuth app. See Create OAuth application on Google Calendar.

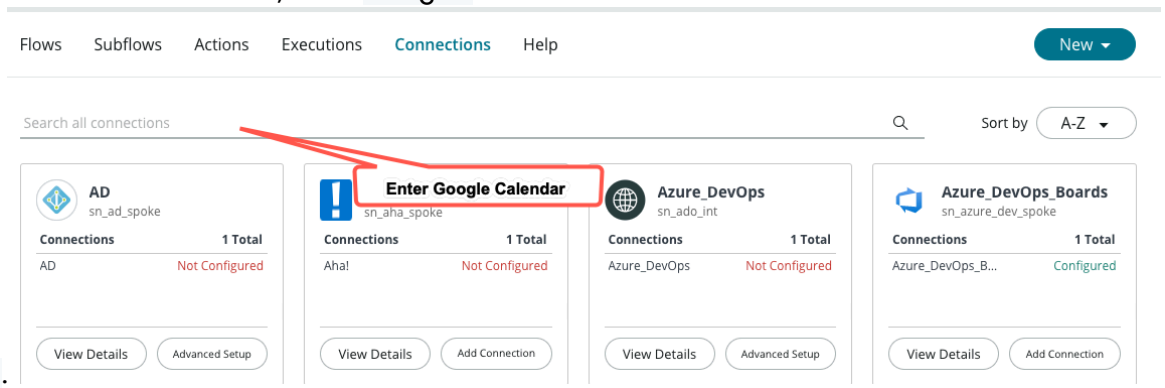
Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.

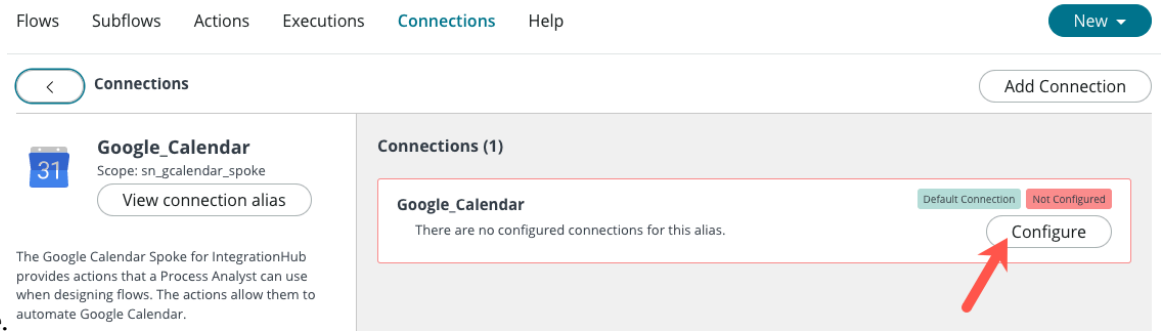
2. Select Connections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Search all connections field, enter `Google Calendar`.



4. On the Google_Calendar card, click **View Details**.
5. Click **Configure**.



6. Fill the details in the form.

Google Calendar connection and credentials form

Field	Description
Connection Name	Name of the connection with the Google Calendar API. **Note:** The first and default connection name is Google_Calendar which is read-only. To provide a custom name to the connection, create a connection by selecting **Add Connection**.
Connection URL	The URL to the Google Calendar APIs. Enter `https://googleapis.com`.
API Version	Version of the Google Calendar APIs that your ServiceNow instance accesses. Enter `V3`.
OAuth Client ID	The ID of the client that accesses the OAuth app you had created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Tip: You can find the OAuth Client ID in the JSON file you had downloaded while creating the OAuth app. See Create OAuth application on Google Calendar.
OAuth Client Secret	The secret that your ServiceNow instance uses to prove its identity to the OAuth app. **Tip:** You can find the OAuth Client secret in the JSON file you had downloaded while creating the OAuth app. See Create OAuth application on Google Calendar.
OAuth Redirect URL	The redirect URL to the application after the OAuth app authenticates the request from your ServiceNow instance. **Tip:** You can find the OAuth Redirect URL in the JSON file you had downloaded while creating the OAuth app. See Create OAuth application on Google Calendar.
OAuth Authorization URL	The URL provided by the OAuth service provider that your ServiceNow instance can use to initiate the OAuth authorization process. **Tip:** You can find the OAuth Authorization URL in the JSON file you had downloaded while creating the OAuth app.
OAuth Token URL	The URL provided by an OAuth service provider that your ServiceNow instance can use to exchange an authorization code for an access token. **Tip:** You can find the OAuth Authorization URL in the JSON file you had downloaded while creating the OAuth app.

7. Select **Configure and Get OAuth Token**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Log in to Google Workspace and get the OAuth Token.
   The connection and credential record is created.

Google Chat spoke

Manage communication within your Google Chat spaces directly from your ServiceNow instance using Google Chat spoke. Create flows in your ServiceNow instance to manage media, members, messages, and spaces in Google Chat.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Chat spoke v1.2.0 is the latest spoke version.

Supported versions

This spoke was built for Google Chat API v1, but may be compatible with later versions.

Spoke requirements

- Google Chat API access
- Google Cloud console access

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Chat spoke provides actions to automate Google Chat tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
Media Management	Download Media	Downloads the uploaded media from Google Chat and attaches to the specified incident record. This action does not download the media uploaded to Google Drive.	• https://www.googleapis.com/auth/chat.messages.readonly • https://www.googleapis.com/auth/chat.messages
Member Management	Add Current Application to Space	Adds the current calling application to the specified space.	• https://www.googleapis.com/auth/chat.memberships.app • https://www.googleapis.com/auth/chat.memberships
	Add Member to Space	Adds the specified member to the specified space.	https://www.googleapis.com/auth/chat.memberships
	Look up Space Member	Retrieves details of the specified member for the specified space.	• https://www.googleapis.com/auth/chat.memberships.readonly • https://www.googleapis.com/auth/chat.memberships
	Look up Space Members Stream	Retrieves members of the specified space to which you have access.	• https://www.googleapis.com/auth/chat.memberships.readonly • https://www.googleapis.com/auth/chat.memberships
	Remove Current Application from Space	Removes the current calling application from the specified space.	• https://www.googleapis.com/auth/chat.memberships.app • https://www.googleapis.com/auth/chat.memberships
	Remove Member from Space	Removes the specified member from the specified space.	https://www.googleapis.com/auth/chat.memberships

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
Message Management	Create Message Thread	Creates a message thread in the specified space.	• https://www.googleapis.com/auth/chat.messages.create • https://www.googleapis.com/auth/chat.messages
	Delete Message	Deletes the specified message from the specified space. All the threaded replies of the message are also deleted.	https://www.googleapis.com/auth/chat.messages
	Look up Message	Retrieves details about the specified message from the specified space.	• https://www.googleapis.com/auth/chat.messages.readonly • https://www.googleapis.com/auth/chat.messages
	Look up Messages Stream	Retrieves messages from the specified space in which you are a member.	• https://www.googleapis.com/auth/chat.messages.readonly • https://www.googleapis.com/auth/chat.messages
	Send Message to Thread	Creates a message in the specified thread of the specified space.	https://www.googleapis.com/auth/chat.messages
Space Management	Create Space	Creates a named space in Google Chat.	• https://www.googleapis.com/auth/chat.spaces.create • https://www.googleapis.com/auth/chat.spaces
	Delete Space	Deletes the specified Google Chat space.	https://www.googleapis.com/auth/chat.delete
	Look up Space	Retrieves information about the specified Google Chat space.	• https://www.googleapis.com/auth/chat.spaces.readonly • https://www.googleapis.com/auth/chat.spaces

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
	Look up Spaces Stream	Retrieves a stream of Google Chat spaces in which you are a member.	• https://www.googleapis.com/auth/chat.spaces.readonly • https://www.googleapis.com/auth/chat.spaces
	Update Space	Updates the specified Google Chat space.	https://www.googleapis.com/auth/chat.spaces

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Google Chat member management AI agent	Performs actions for managing members(adds current application to a space, removes current application from a space, adds member to a space, removes member from a space, look up a space member) in Google Chat.
Google Chat space management AI agent	Performs actions for managing(looks up a space, deletes a space, creates a space, updates a space) spaces in Google Chat.
Google Chat message management AI agent	Performs actions for managing(deletes a message, creates a message thread, looks up a message, sends a message to thread) messages in Google Chat.

Looking for an AI agent?

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Set up the Google Chat spoke

Integrate the ServiceNow instance and Google Chat by creating a custom OAuth application in Google Cloud console to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Chat spoke.
- Role required: admin.

Create OAuth credentials in Google Cloud console for Google Chat spoke

Create credentials in Google Cloud console account to enable OAuth 2.0 authentication with the Google Chat spoke.

About this task

Complete these steps from the Google Cloud console.

Before you begin

- Create a Google Chat application. For more information, see Develop Google Chat apps and Google Apps Script Chat app quickstart.
- Role required: none

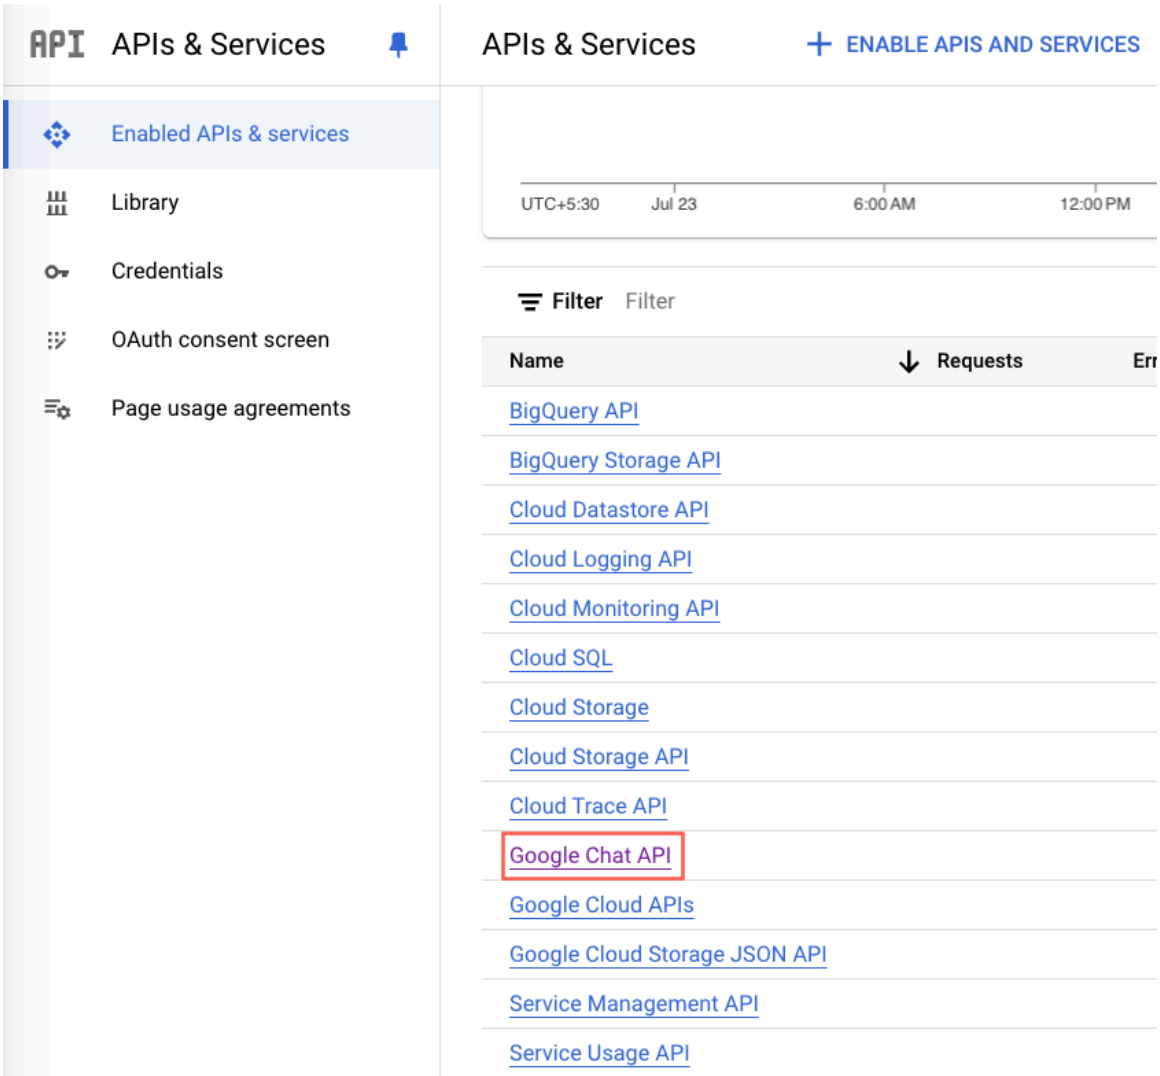
Procedure

1. In the Google Cloud console, navigate to **Main menu** > **IAM & Admin** > **Create a Project**.
   You can also directly go to https://console.cloud.google.com/projectcreate
2. Enter a descriptive name for your project in the **Project Name** field.

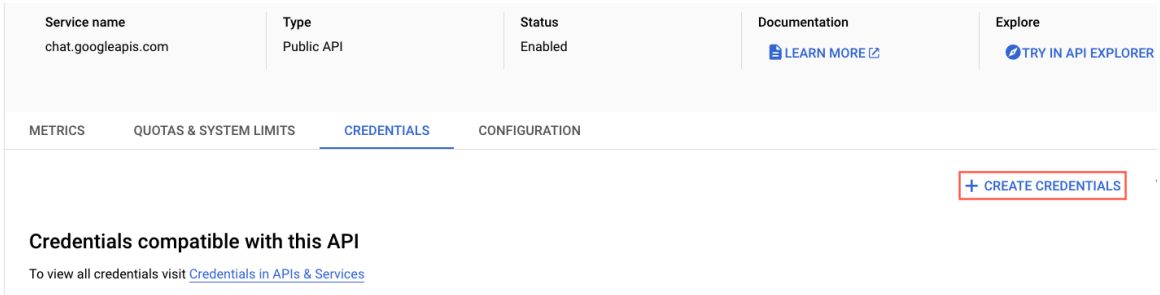
   Note:
   The project ID can't be changed after the project is created, so choose an ID that meets your needs for the lifetime of the project.

3. After creating a Google Chat app, get the deployment ID of the app and record it.
   You need to provide the deployment ID for connection configuration. For more information, see Find a deployment ID.
4. Navigate to **Navigation Menu** > **APIs & Services** > **Enabled APIs & Services**.
5. Select **Google Chat API** from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click on the **CREDENTIALS** tab.
7. Click on **+ CREATE CREDENTIALS** and select **OAuth client ID.**

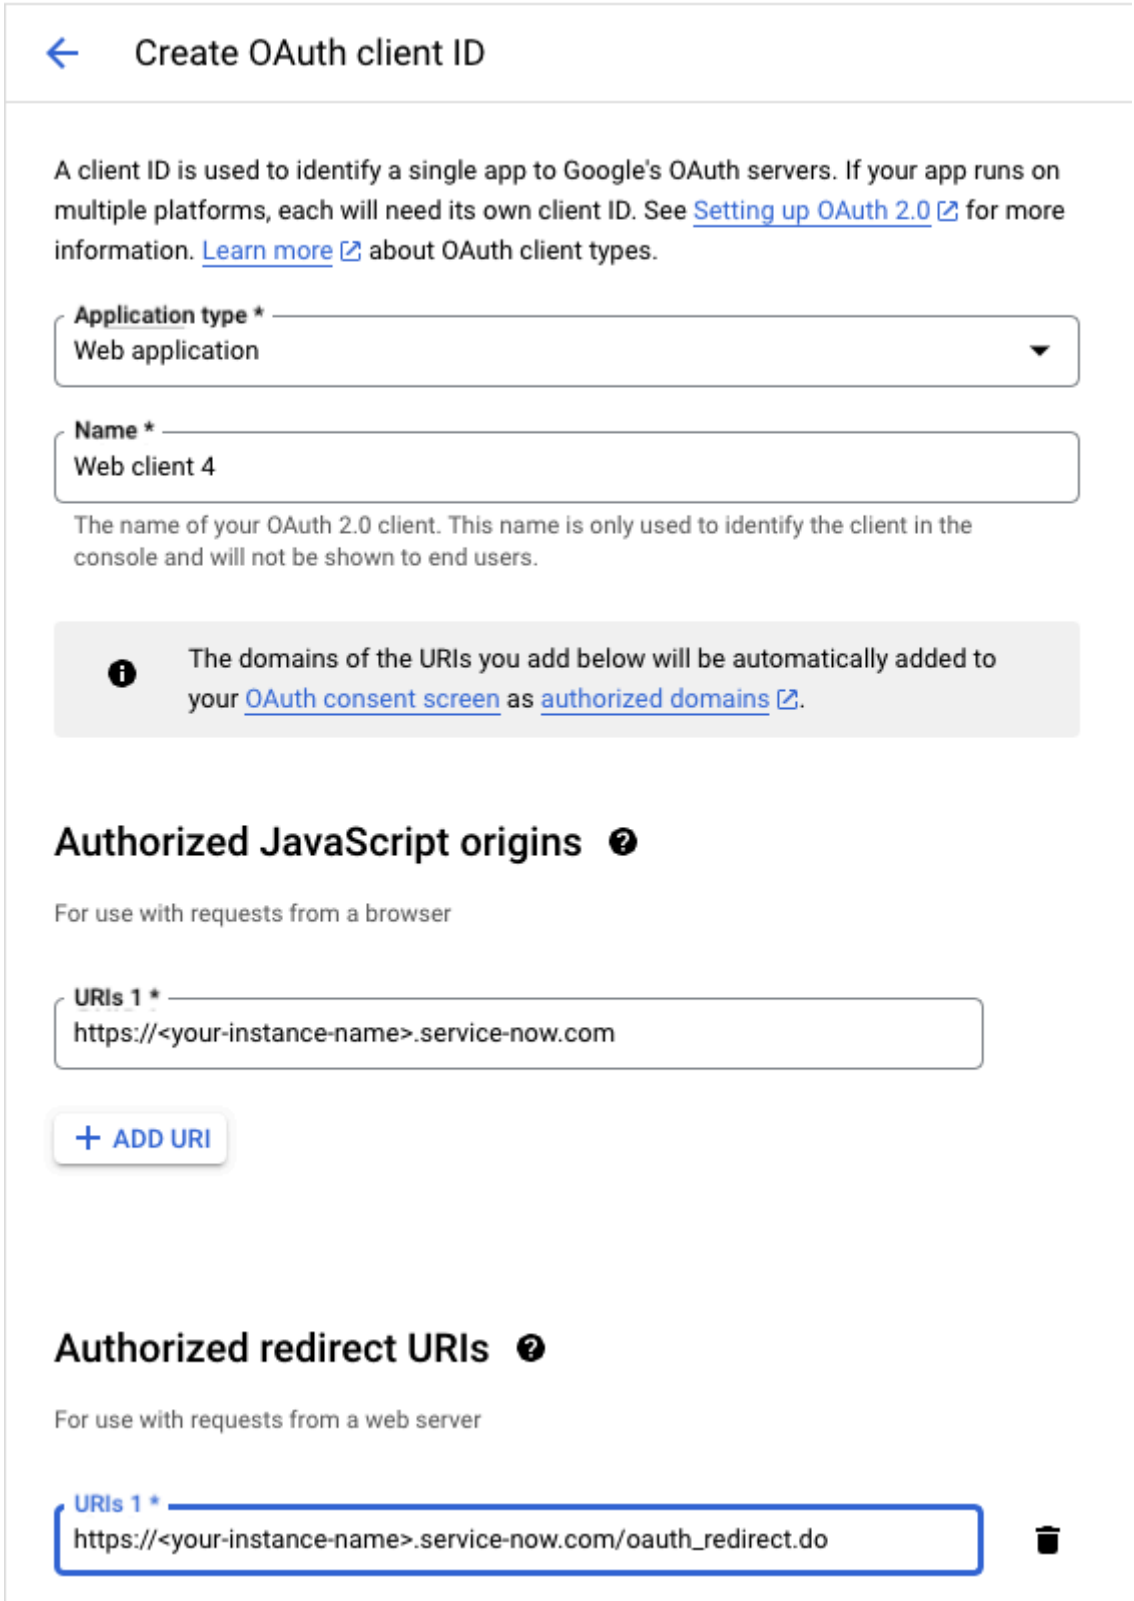


8. On the **Create OAuth client ID** form, fill in the fields.

Field	Description
Application	Select Web application from the list.
Name	Enter a unique name to identify the OAuth 2.0 client.
Authorized JavaScript origins URI	Enter the URI of your ServiceNow instance. For example, `https://<your-instance-name>.servicen-now.com`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Authorized redirect URIs	Enter the redirect URI of your ServiceNow instance. For example, `https://<your-instance-name>.servicenow.com/oauth_redirect.do`



9. Click **CREATE**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

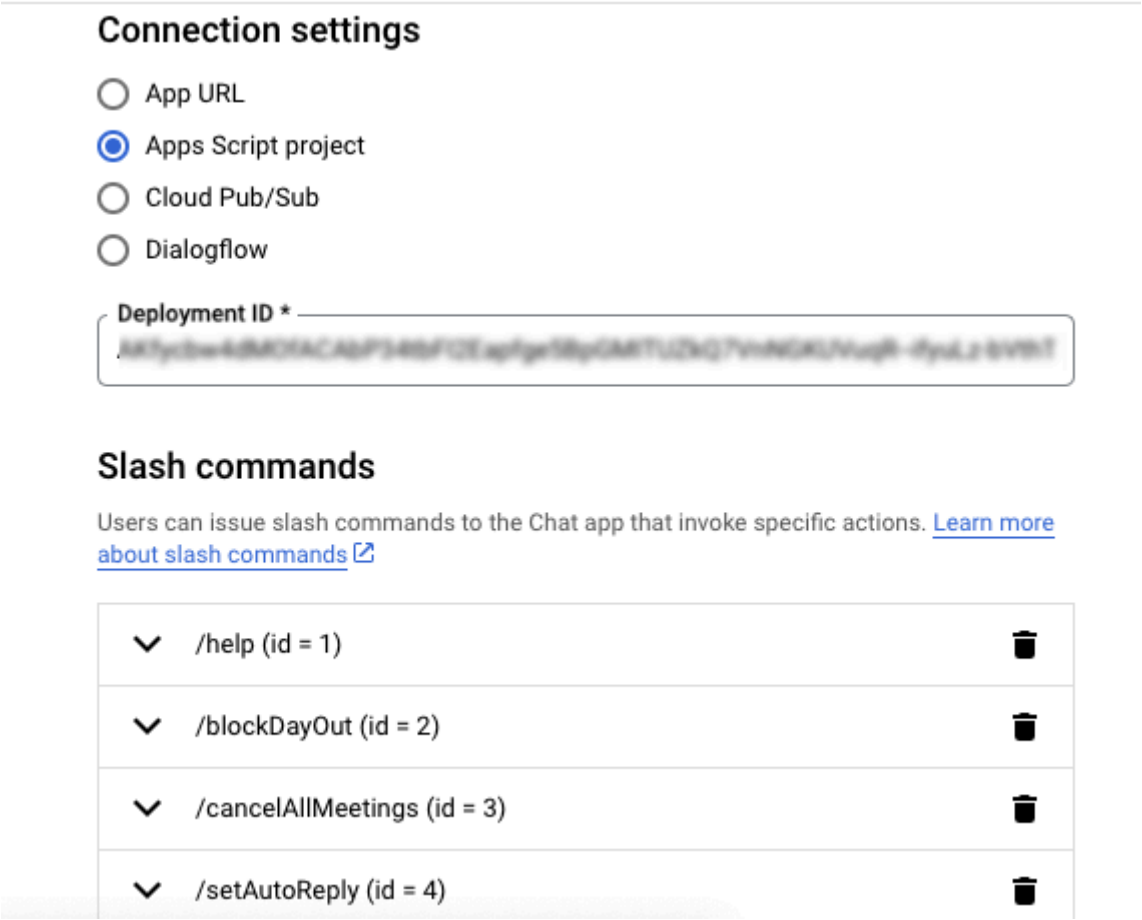
An OAuth client is created with client ID and client secret. Record the client ID and client secret.

10. Click on the **CONFIGURATION** tab and fill in the fields.

Field	Description
App name	Enter a name for your application.
Avatar URL	Specify an HTTPS URL for your app's avatar image.
Description	Enter a description for your application.

11. In **Connection** settings, specify the deployment ID of the Google Chat app from Step 4 in the **Deployment ID** field.

Note:
If you have created any Slash commands while creating the app, specify them.



12. Save the configuration of your app in Google Cloud console.

Configure a connection for Google Chat spoke

Add and configure a Docker connection to authenticate ServiceNow requests in Docker spoke.

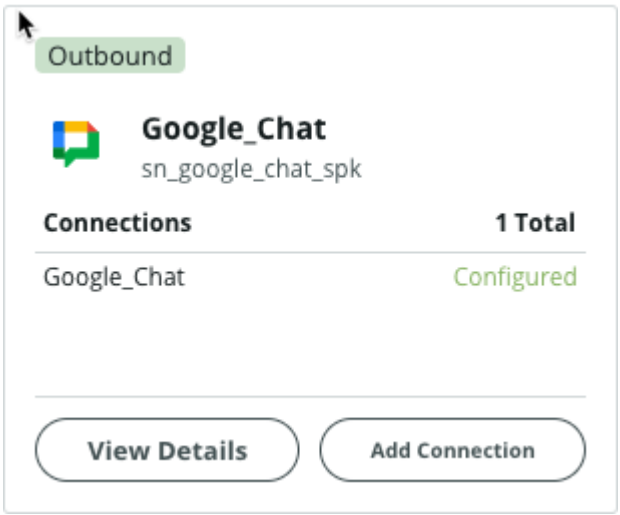
Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

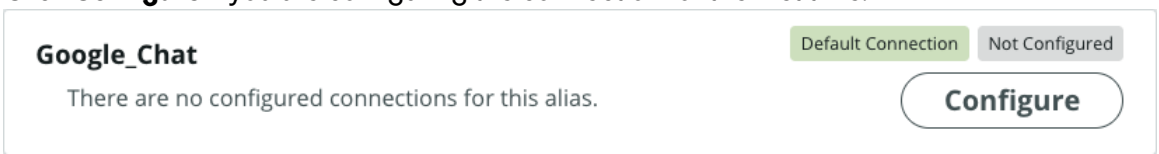
Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Click the **Connections** tab.
3. Locate the alias for **Google_Chat** and and click **View Details**.

Note:
Don't click**Add Connection**.



4. Click **Configure** if you are configuring the connection for the first time.



5. On the **Configure Connection** form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection record.
Connection URL	URL to Google Chat APIs. Enter `https://chat.googleapis.com`
API Version	Google Chat API version. Enter `v1`.
OAuth Client ID	OAuth client ID of Google Chat app in Google Cloud console.
OAuth Client Secret	OAuth client secret of Google Chat app in Google Cloud console.
OAuth Redirect URL	OAuth redirect URL of your ServiceNow instance. Enter in this format`https://<your-instance-name>.service-now.com/oauth_redirect.do`

6. Click **Configure and Get OAuth Token**.
   You will be redirected to Google accounts login page.
7. Enter your Google Chat API credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
An OAuth token is generated and configured for the Google Chat spoke.

Google Cloud Datastore Spoke

Manage the NoSQL database services in Google Cloud Datastore from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Datastore spoke v1.0.2 is the latest version.

Supported versions

This spoke was built for Google Cloud Datastore v1, but may be compatible with later versions.

Spoke requirements

Google Cloud Datastore account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

IntegrationHub (com.glide.hub.integrations)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud Datastore spoke provides actions to automate Google Cloud Datastore tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Entity Management	Entity Export	Exports a copy of all or a subset of entities from Google Cloud Datastore to another storage system.
	Entity Import	Imports entities into Google Cloud Datastore.
Index Management	Create Index	Creates the specified index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Index	Deletes an existing index.
	Get Index	Gets an index.
	Look up Index	Retrieves the list of indexes that match the specified filters.
Operation Management	Cancel Operation	Starts asynchronous cancellation on a long-running operation.
	Delete Operation	Deletes a long-running operation.
	Get Operation	Gets the latest state of a long-running operation.
	Look up Operation	Retrieves the list of operations that match the specified filter in the request.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Cloud Datastore spoke.

Set up the Google Cloud Datastore spoke

Integrate the ServiceNow instance and Google Cloud Datastore spoke using Google Cloud Platform credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Datastore spoke.
- Role required: admin.

Create a custom application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Datastore spoke.

Before you begin

Role required: admin

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application by navigating to https://console.cloud.google.com/.
2. Create a project with your administrator credentials, and open the project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **OAuth client ID**.
7. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   The OAuth client window shows your client ID and client secret.
8. Copy these two values to a text file so that you can use them when you Register Google Cloud Datastore as an OAuth provider.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

Register Google Cloud Datastore as an OAuth provider

Register G suite as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud Datastore**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Datastore application.
Client Secret	Client Secret of the Google Cloud Datastore application.
OAuth API Script	**OAuthGoogleDatastoreUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud Datastore spoke

Create a credential record for the Google Cloud Datastore custom application. The Google Cloud Datastore Spoke connection and credential alias uses this credential to authorize actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

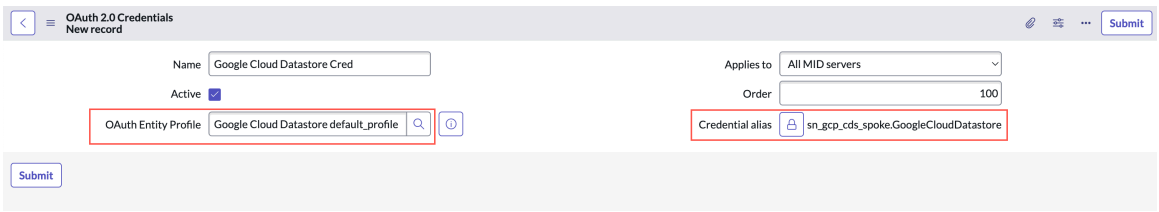
Role required: admin.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudDatastore**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Datastore Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud Datastore default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_cds_spoke.GoogleCloudDatastore** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud DNS Spoke

Manage public zones and private managed DNS zones in using Google Cloud DNS account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

This spoke was built for Google Cloud DNS API version v1, but may be compatible with later versions.

Spoke version

Google Cloud DNS Spoke version is 1.0.2.

Spoke requirements

The Google Cloud DNS spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Google Cloud Virtual Network Spoke
- Google Identity and Access Spoke

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud DNS spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Change Management	Create Change	Updates the resource record set collection.
	Get Change	Retrieves the details of an existing change.
	Look up Changes	Retrieves list of changes to a resource record set collection available with in the specified managed zone.
DNS Key Management	Get DNS Key	Retrieves details about an existing DNS key.
	Look up DNS Keys	Retrieves list of DNS keys to a resource record set collection available with in the specified managed zone.
Managed Zone Management	Create Managed Zone For Private	Creates a managed private zone with private DNS records.
	Create Managed Zone For Public	Creates a managed public zone.
	Delete Managed Zone	Deletes the specified existing managed zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Managed Zone	Retrieves the details of the specified managed zone.
	Look up Managed Zones	Retrieves list of managed zones available in the specified project.
	Update Managed Zone For Private	Updates the details of the specified managed zone.
	Update Managed Zone For Public	Updates the details of the specified managed zone.
Operation Management	Get Operation	Retrieves the details of an existing operation.
	Look up Operations	Retrieves list of operations available with in the specified managed zone.
Policy Management	Create Policy	Creates a policy.
	Delete Policy	Deletes the specified policy.
	Get Policy	Retrieves the details about the specified policy.
	Look up Policies	Retrieves list of policies available with in the specified project.
	Update Policy	Updates details of the specified policy.
Project Management	Get Project	Retrieves the details about the specified project.
Resource Record Set Management	Look up Resource Record Sets	Retrieves list of resource record set collections available with in the specified managed zone.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud DNS spoke.

Set up the Google Cloud DNS spoke

Integrate the ServiceNow instance and Google Cloud DNS account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud DNS spoke.
- Role required: admin.

Create a custom application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud DNS spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin.

About this task
Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure
1. Register a new custom application by navigating to https://console.cloud.google.com/.
2. Create a project with your administrator credentials, and open the project.
3. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **OAuth client ID**.
7. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   The OAuth client window shows your client ID and client secret.
8. Copy these two values to a text file so that you can use them when you Register Google Cloud DNS as an OAuth provider.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

Register Google Cloud DNS as an OAuth provider

Use the information generated during the Google Cloud DNS application configuration to register Google Cloud DNS as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin

Procedure
1. Navigate to **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud DNS**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud DNS application.
Client Secret	Client Secret of the Google Cloud DNS application.
OAuth API Script	**OAuthGoogleCloudDNSUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud DNS spoke

Create a default credential record for the Google Cloud DNS application. The Google Cloud DNS spoke connection and credential alias uses this credential to authorize actions.

Before you begin

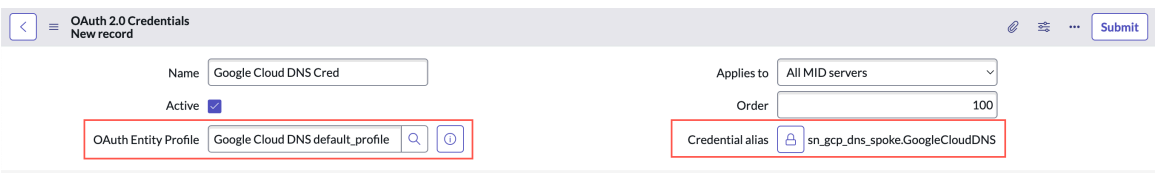
Role required: admin.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudDNS**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud DNS Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud DNS default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_dns_spoke.GoogleCloudDNS** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Functions Spoke

Manage functions that are attached to events, using your Google Cloud Functions account from ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Functions v1.0.3 is the latest version.

Supported versions

This spoke was built for the Google Cloud Functions API version v1, but may be compatible with later versions.

Google Cloud Functions spoke requirements

The Google Cloud Functions spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Google Identity and Access Spoke
- Google Cloud VPC Access Spoke
- Google Cloud Storage Spoke
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud Functions spoke provides actions to automate Google Cloud Functions tasks when events occurs in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Function Management	Create Function For Event	Creates a function for an event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Function For HTTP	Create a function to process an HTTP request.
	Delete Function	Deletes the specified function.
	Generate Download URL	Retrieves details of a signed URL to download source code of the deployed function.
	Generate Upload URL	Retrieves details of a signed URL for uploading source code of the deployed function.
	Get Function	Retrieves information about the specified function.
	Get IAM Policy	Retrieves details of IAM access control policy for a function.
	Look up Functions	Retrieves a list of functions available in the specified location.
	Set IAM Policy	Sets the IAM access control policy for the specified function.
	Update Function	Updates details of the specified function.
Location Management	Look up Locations	Retrieves a list of locations available in the specified project.
Operation Management	Get Operation	Retrieves details of the specified operation.
	Look up Operations	Retrieves the list of operations available in the specified project.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud Functions spoke.

Set up the Google Cloud Functions spoke

Integrate the ServiceNow instance and Google Cloud Functions account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Functions spoke.
- Role required: admin.

Configure the Google Cloud Functions application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Functions spoke.

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Register a new custom application by navigating to https://console.cloud.google.com/ and creating a project with your administrator credentials.
2. Open your new project and, in the APIs & Services menu, select **OAuth consent screen**.
3. Enter the application name, specify the Authorized domain `service-now.com`, and select **Save**.
4. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
5. Select the application type **OAuth client ID**.
6. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and select **Create**.
7. Copy your client ID and client secret from the OAuth client window to a text file so that you can use them when you Register Google Cloud Functions as an OAuth provider.
   The client ID and secret can be accessed in the Google APIs & Services interface. Select **Credentials** and select the OAuth 2.0 client ID name.

Register Google Cloud Functions as an OAuth provider

Use the information generated during the Google Cloud Functions application configuration to register Google Cloud Functions as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud Functions**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Functions application.
Client Secret	Client Secret of the Google Cloud Functions application.
OAuth API Script	**OauthGoogleCloudFunctionsUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a credential record for the Google Cloud Functions spoke

Create a credential record for the Google Cloud Functions application. The Google Cloud Functions spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

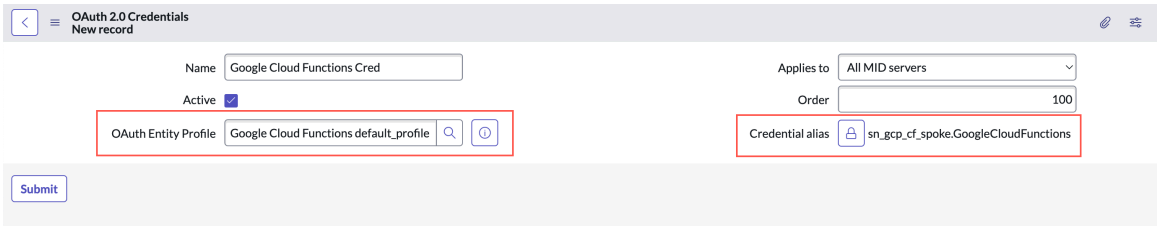
Role required: admin.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudFunctions**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Functions Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud Functions default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_cf_spoke.GoogleCloudFunctions** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Load Balancer Spoke

Manage load balancing of your external or internal Virtual Private Cloud (VPC) network from ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Load Balancer spoke v1.0.1 is the latest version.

Supported versions

This spoke was built for Google Cloud Load Balancer v1, but may be compatible with later versions.

Spoke requirements

Google Cloud Platform (GCP) account with access to Google Compute Engine and Google Virtual Private Network.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- Google Compute Engine spoke (sn_gcompute_spoke)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Google Cloud Load Balancer Spoke provides subflows to automate Google Cloud Load Balancer tasks when events occurs in your ServiceNow instance. Available subflows include:

Categotry	Action	Description
HTTPS Load Balancer Management	Create HTTPS Load Balancer For A New Backend Service	Creates a HTTPS load balancer for a new backend service in the specified project.
	Create HTTPS Load Balancer For An Existing Backend Service	Creates a HTTPS load balancer for an existing backend service in the specified project.
	Delete HTTPS Load Balancer	Deletes the components of the specified load balancer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Categotry	Action	Description
	Look up Components Of HTTPS Load Balancer	Retrieves a list of names of all the components associated with a HTTPS load balancer.
HTTP Load Balancer Management	Create A HTTP Load Balancer For A New Backend Service	Creates a HTTP load balancer for a new backend service in the specified project.
	Create HTTP Load Balancer For An Existing Backend service	Creates a HTTP load balancer for an existing backend service in the specified project.
	Delete HTTP Load Balancer	Deletes the components of a HTTP load balancer.
	Look up Components Of HTTP Load Balancer	Retrieves a list of names of all the components associated with a HTTP load balancer.

Spoke actions

The Google Cloud Load Balancer Spoke provides actions to automate Google Cloud Load Balancer tasks when events occurs in your ServiceNow instance. Available actions include:

Spoke actions

Category	Action	Description
Backend Service Management	Create Backend Service	Creates a backend service.
	Delete Backend Service	Deletes the specified backend service
	Get Backend Service	Retrieves the details of the specified backend service.
	Get Health Of Backend Service	Retrieves the health details of the specified backend service.
	Look up Backend Services	Retrieves a list of all backend services.
	Update Backend Service	Updates the details of the specified backend service.
Global Address Management	Create A Global Address	Creates a global address.
	Delete A Global Address	Deletes the specified global address.
	Get Global Address	Retrieves the details of all the global addresses.
	Look up Global Addresses	Retrieves a list of all global addresses.
Global Forwarding Rule Management	Create Global Forwarding Rule	Creates a global forwarding rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description
	Delete Global Forwarding Rule	Deletes the specified global forwarding rule.
	Get Global Forwarding Rule	Retrieves the details of a global forwarding rule.
	Look up Global Forwarding Rules	Retrieves a list of all global forwarding rules.
	Set Target For Global Forwarding Rule	Assigns target information to the specified global forwarding rule.
HTTP Health Check Management	Create A HTTP Health Check	Creates a HTTP health check.
	Delete A HTTP Health Check	Deletes the specified HTTP health check.
	Get HTTP Health Check	Retrieves the details of the specified HTTP health check.
	Look up HTTP Health Checks	Retrieves a list of all HTTP health checks.
	Update A HTTP Health Check	Updates the details of the specified HTTP health check.
HTTP Load Balancer Management	Get Resource Name	Retrieves the name of the resource from a resource URL.
HTTPS Health Check Management	Create A HTTPS Health Check	Creates a HTTPS health check.
	Delete A HTTPS Health Check	Deletes the specified HTTPS health check.
	Get HTTPS Health Check	Retrieves the details of the specified HTTPS health check.
	Look up HTTPS Health Checks	Retrieves a list of HTTPS health checks.
	Update A HTTPS Health Check	Updates the details of the specified HTTPS health check.
Instance Group Manager Management	Create An Instance Group Manager	Creates an instance group manager.
	Create Instance In Instance Manager Group	Creates an instance in the specified instance group manager.
	Delete An Instance Group Manager	Deletes the specified instance group manager.
	Get Instance Group Manager	Retrieves the details of a specified instance group manager.
	Look up Instance Group Managers	Retrieves a list of managed instance groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description
	Look up Managed Instances In An Instance Group Manager	Retrieves a list of managed instances in a specified managed instance group.
	Resize An Instance Group Manager	Resizes the number of instances in a specified instance group manager.
	Update Instance Template Of An Instance Group Manager	Assigns the details of instance template to the specified instance group manager.
Target HTTP Proxy Management	Create Target HTTP Proxy	Creates a target HTTP proxy.
	Delete Target HTTP Proxy	Deletes the specified target HTTP proxy.
	Get Target HTTP Proxy	Retrieves the details of the specified target HTTP proxy.
	Look up Target HTTP Proxies	Retrieves a list of all target HTTP proxies.
	Update URL Map Of Target HTTP Proxy	Assigns the URL map information to the specified target HTTP proxy.
Target HTTPS Proxy Management	Create Target HTTPS Proxy	Creates a target HTTPS proxy.
	Delete Target HTTPS Proxy	Deletes the specified target HTTPS proxy.
	Get Target HTTPS Proxy	Retrieves the details of the specified target HTTPS proxy.
	Look up Target HTTPS Proxies	Retrieves a list of the target HTTPS proxies.
	Set SSL Certificates To Target HTTPS Proxy	Assigns SSL certificates to the specified target HTTPS proxy.
	Set URL Map To Target HTTPS Proxy	Assigns URL map information to the specified target HTTPS proxy.
URL Map Management	Create URL Map	Creates a URL map.
	Delete URL Map	Deletes the specified URL map.
	Get URL Map	Retrieves the details of the specified URL map.
	Look up URL Maps	Retrieves the details of all URL maps.
	Update URL Map	Updates the details of the URL map.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Cloud Load Balancer Spoke.

Set up the Google Cloud Load Balancer Spoke

Integrate the ServiceNow instance and Google Cloud Load Balancer by creating a custom OAuth application in Google Cloud Storage to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Load Balancer spoke.
- Role required: admin.

Create a custom application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Load Balancer spoke.

Before you begin

Role required: admin

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application by navigating to https://console.cloud.google.com/.
2. Create a project with your administrator credentials, and open the project.
3. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **OAuth client ID**.
7. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   The OAuth client window shows your client ID and client secret.
8. Copy these two values to a text file so that you can use them when you Register Google Cloud Load Balancer as an OAuth provider.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

© 2026 ServiceNow, Inc. All rights reserved.

Register Google Cloud Load Balancer as an OAuth provider

Use the information generated during the Google Cloud Storage application configuration to register Google Cloud Load Balancer as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud Load Balancer**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Load Balancer application.
Client Secret	Client Secret of the Google Cloud Load Balancer application.
OAuth API Script	**OAuthGoogleCloudLoadBalancerUtil** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud Load Balancer Spoke

Create a credential record for the Google Cloud Load Balancer custom application. The Google Cloud Load Balancer Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin.

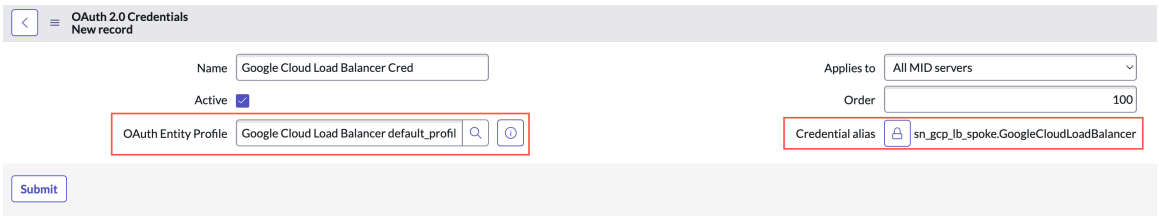
Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudLoadBalancer**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Load Balancer Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud Load Balancer default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_lb_spoke.GoogleCloudLoadBalancer** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Pub Sub Spoke

Manage Google Cloud Pub/Sub messaging service from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Google Cloud Pub Sub v1, but may be compatible with later versions.

Spoke version

Google Cloud Pub Sub spoke v1.0.4 is the latest version.

Spoke requirements

Google Cloud account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- Google Identity And Access Spoke (sn_gcp_id_acc_spk)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Google Cloud Pub Sub Spoke provides sample subflows to demonstrate automating Google Cloud Pub/Sub tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Google PubSub Messages	Receives messages from a sub topic and displays the messages in logs.

Spoke actions

The Google Cloud Pub Sub Spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Snapshot Management	Create Snapshot	Creates a snapshot from the requested subscription.
	Delete Snapshot	Removes the specified existing snapshot.
	Get Snapshot IAM Policy	Retrieves the IAM policy of the snapshot.
	Look up Snapshots	Retrieves a list of existing snapshots.
	Set Snapshot IAM Policy	Assigns the access control policy to the specified snapshot.
	Update Snapshot	Updates an existing snapshot.
Subscription Management	Acknowledge	Acknowledges the messages associated with the acknowledge IDs in the acknowledge request.
	Acknowledge Deadline	Updates the acknowledge deadline in seconds for a specific message.
	Create Pull Subscription	Creates a pull subscription to the specified topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Push Subscription	Creates a push subscription to the specified topic.
	Delete Subscription	Deletes an existing subscription for the specified project.
	Get Subscription	Retrieves the configuration details of the specified subscription.
	Get Subscription IAM Policy	Retrieves the access control policy for the specified subscription.
	Look up Subscriptions	Retrieves a list of subscriptions.
	Pull Messages	Pulls message asynchronously for the specified project.
	Seek Subscription	Seeks an existing subscription to a point in time or to a specified snapshot.
	Set Subscription IAM Policy	Assigns the access control policy to the specified subscription.
	Update Push Configuration	Updates the push configuration for the specified subscription.
	Update Subscription	Updates the specified existing subscription.
Topic Management	Create Topic	Creates a topic with the specified name.
	Delete Topic	Deletes the specified topic.
	Get IAM Policy	Retrieves the specified access control policy of a resource.
	Get Topic	Retrieves the configuration details of the specified topic.
	Look up Topics	Retrieves a list of topics.
	Publish Messages	Adds one or more messages to the specified topic.
	Set IAM Policy	Assigns the access control policy to the specified resource.
	Update Topic	Updates the specified topic.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Cloud Pub Sub Spoke.

Set up the Google Cloud Pub Sub Spoke

Integrate the ServiceNow instance and Google Cloud Pub Sub by creating a custom OAuth application in Google Cloud account to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Pub Sub spoke.
- Role required: admin.

Create a custom application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Pub Sub spoke.

Before you begin

Role required: admin

Procedure

1. Register a new custom application by navigating to https://console.cloud.google.com/.
2. Create a project with your administrator credentials, and open the project.
3. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **OAuth client ID**.
7. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   The OAuth client window shows your client ID and client secret.
8. Copy these two values to a text file so that you can use them when you Register Google Cloud Pub Sub as an OAuth provider.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

Register Google Cloud Pub Sub as an OAuth provider

Use the information generated during the Google Cloud Pub Sub application configuration to register Google Cloud as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin.

Configure the Google Identity and Access Spoke.

Procedure

1. Navigate to **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud Pub Sub**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Pub Sub application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client Secret	Client Secret of the Google Cloud Pub Sub application.
OAuth API Script	**OauthGooglePubSubUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud Pub Sub spoke

Create a credential record for the Google Cloud account. The Google Cloud Pub Sub spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudPubSub**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Pub Sub Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud Pub Sub default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gc_pubsub_spoke.GoogleCloudPubSub** is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud SQL Spoke

Mange provisioning of MySQL and PostgreSQL in Google Cloud SQL from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud SQL spoke v1.0.1 is the latest version.

Supported versions

This spoke was built for Google Cloud SQL v1beta4, but may be compatible with later versions.

Spoke requirements

- Google Cloud Platform account
- Google Identity and Access spoke (sn_gcpcloudsql_spk)

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- • ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- • ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- • ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- • ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- • Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Google Cloud SQL provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description	Required Permission
Back up Run Management:	Create Backup	Creates a backup.	cloudsql.backupRuns.create
	Delete Backup Run	Deletes a backup.	cloudsql.backupRuns.delete
	Get Backup Run	Retrieves details of the backup.	cloudsql.backupRuns.get
	Look up Backup Runs	Retrieves a list of the backup runs.	cloudsql.backupRuns.list
Database Management	Create Database	Creates a database.	cloudsql.databases.create
	Delete Database	Deletes a database.	cloudsql.databases.delete
	Get Database	Retrieves details of the instance.	cloudsql.databases.get
	Look up Databases	Retrieves a list of the databases.	cloudsql.databases.list
	Update Database	Updates a database.	cloudsql.databases.update
Instance Management	Clone Instance	Clones an instance.	cloudsql.instances.clone
	Create Instance	Creates an instance.	cloudsql.instances.create
	Delete Instance	Deletes an instance.	cloudsql.instances.delete
	Get Instance	Retrieves details of the instance.	cloudsql.instances.get
	Look up Instances	Retrieves a list of the instances.	cloudsql.instances.clone
	Restart Instance	Restarts an instance.	cloudsql.instances.restart
	Update Instance	Updates an instance.	cloudsql.instances.update
Operations	Get Operation	Retrieves details of the operation.	N/A
	Look up Operations	Retrieves a list of the operations.	N/A
Tiers	Look up Tiers	Retrieves a list of the tiers.	N/A
User Management	Create User	Creates a user.	cloudsql.users.create
	Delete User	Deletes a user.	cloudsql.users.delete

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Permission
	Look up User	Retrieves a list of the users.	cloudsql.users.list
	Update User	Updates a user.	cloudsql.users.update

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud SQL spoke.

Set up the Google Cloud SQL spoke

Integrate the ServiceNow instance and Google Cloud SQL spoke using Google Cloud Platform credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud SQL spoke.
- Role required: admin.

Configure the Google Cloud SQL application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud SQL spoke.

Before you begin

Google Identity and Access integration requirements:

- Google Cloud SQL account.
- Role required: admin.

About this task

Complete these steps from the Google Cloud Platform.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your Google Cloud Platform administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the APIs & Services menu, select **Credentials**.

b. Select **Create OAuth client ID** from the **Create credentials** list.

4. Select the application type **Web application**.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. Copy your client ID and client secret to a text file so that you can use them when you register Google Cloud SQL as an OAuth provider.

> **Tip:**
> You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register Google Cloud SQL as an OAuth provider

Use the information generated during Google Cloud SQL account configuration to register the Google Cloud SQL application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. In ServiceNow instance, navigate to **System OAuth** > **Application Registry**.
2. Open the record, **Google Cloud SQL**.
3. On the form, fill these fields:

Field	Description
Client ID	Client ID of the Google Cloud SQL application.
Client Secret	Client Secret you generated when you create the application.
OAuth API Script	Script to customize the request and response. Select `OAuthGCPSQLUtil`.
Default Grant type	Grant type used to establish the token. Select **Authorization Code**.
Authorization URL	OAuth authorization code endpoint. Enter `https://accounts.google.com/o/oauth2/v2/auth`.
Token URL	OAuth server token endpoint. Enter `https://oauth2.googleapis.com/token`.
Redirect URL	URL of the ServiceNow instance in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

4. Right-click the form header, and click **Save**.
The system validates the OAuth credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a credential record for the Google Cloud SQL spoke

Create a credential record to connect the Google Cloud custom application you created during account configuration. The Google Cloud SQL spoke connection and credential aliases use these credentials to authorize actions.

Before you begin

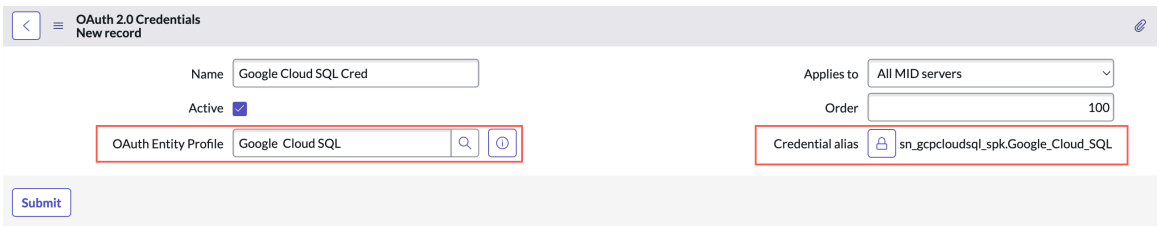
Role required: admin

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **Google_Cloud_SQL**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud SQL Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud SQL**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcpcloudsql_spk.Google_Cloud_SQL** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Storage Spoke

Manage storage and retrieval of data in Google Cloud from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Storage spoke v1.1.1 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Google Cloud Storage account requirements

The Google Cloud Storage spoke requires a custom app that you create in Google Cloud Platform.s

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke subflows

The Google Cloud Storage spoke provides sample subflows to demonstrate automating Google Cloud Storage tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Move An Object	Moves an object from the source bucket to destination bucket.
Rename An Object	Renames the specified object.

Spoke actions

The Google Cloud Storage spoke provides actions to automate Google Cloud Storage when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
Bucket Access Control Management	Create/Update Bucket Access Control	Creates or updates a bucket access control.	• storage.buckets.get • storage.buckets.getIamPolicy • storage.buckets.setIamPolicy • storage.buckets.update
	Delete Bucket Access Control	Deletes the specified bucket access control.	• storage.buckets.get • storage.buckets.getIamPolicy • storage.buckets.setIamPolicy • storage.buckets.update
	List All Bucket Access Controls	Retrieves the list of all bucket access controls.	• storage.buckets.get • storage.buckets.getIamPolicy
Bucket Management	Create Bucket	Creates a bucket in Google Cloud Storage.	storage.buckets.create
	Delete A Bucket	Deletes the specified bucket in Google Cloud Storage.	storage.buckets.delete
	Get Bucket Details	Retrieves details of the specified bucket in Google Cloud Storage.	• storage.buckets.get • storage.buckets.getIamPolicy
	Get Bucket Labels	Retrieves labels of the specified bucket in Google Cloud Storage.	• storage.buckets.get • storage.buckets.getIamPolicy
	Get IAM Policy	Retrieves IAM policy of the specified bucket in Google Cloud Storage.	storage.buckets.getIamPolicy
	List All Buckets	Retrieves details of all buckets in Google Cloud Storage.	• storage.buckets.list • storage.buckets.getIamPolicy
	Update Bucket Details	Updates details of the specified bucket in Google Cloud Storage.	• storage.buckets.update • storage.buckets.setIamPolicy
	Update Bucket IAM Policy	Updates IAM policy of the specified bucket in Google Cloud Storage.	storage.buckets.setIamPolicy
Object Access Control Management	Create/Update Object Access Control	Creates or updates a object access control.	• storage.objects.get • storage.objects.getIamPolicy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
			• storage.objects.setIamPolicy • storage.objects.update
	Delete Object Access Control	Deletes the specified object access control.	• storage.objects.get • storage.objects.getIamPolicy • storage.objects.setIamPolicy • storage.objects.update
	List All Object Access Controls	Retrieves the list of all object access controls.	• storage.objects.get • storage.objects.getIamPolicy
Object Management	Copy Object	Copies an object from one bucket to another bucket.	• storage.objects.create (for the destination bucket) • storage.objects.delete (for the destination bucket) • storage.objects.get (for the source bucket)
	Delete An Object	Deletes an object in a bucket.	storage.objects.delete
	Download Object To ServiceNow	Downloads the specified object to ServiceNow.	• storage.objects.get • storage.objects.getIamPolicy
	Get Object Details	Retrieves the details of the specified object.	• storage.objects.get • storage.objects.getIamPolicy
	List All Objects	Retrieves list of all objects in the specified bucket.	• storage.objects.list • storage.objects.getIamPolicy
	Rewrite An Object	Rewrites an object from the source bucket to destination bucket.	• storage.objects.create (for the destination bucket) • storage.objects.delete (for the destination bucket) • storage.objects.get (for the source bucket)
	Update Object Details In A Bucket	Updates details of the specified object in a bucket.	• storage.objects.update • storage.objects.setIamPolicy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
	Update Object Storage Class	Updates storage class of the specified object.	• storage.objects.update • storage.objects.setIamPolicy
	Upload An Object	Uploads an object to the specified bucket.	• storage.objects.create • storage.objects.delete

For more information about the required permissions, see IAM permissions reference.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Google Cloud Storage object management AI agent	Manages object management tasks (that is, object management, storage class updates, and object transfers) in Google Cloud Storage.
Google Cloud Storage object access control management AI agent	Manages object access control management tasks (that is, object access controls, deletes, lists, and creates or updates access control settings) in Google Cloud Storage.
Google Cloud Storage bucket management AI agent	Manages bucket management (that is, creates, updates, and deletes buckets, retrieves bucket details, manages IAM policies, lists all available buckets) in Google Cloud Storage.
Google Cloud Storage bucket access AI agent	Manages bucket access (that is, bucket access controls, create or update bucket access controls, and delete bucket access controls) in Google Cloud Storage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud Storage spoke.

Set up the Google Cloud Storage spoke

Integrate the ServiceNow instance and Google Cloud Storage spoke by using G Suite credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Storage spoke.
- Access to Google Cloud Platform.
- Role required: admin.

Configure the Google Cloud Storage application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Storage spoke.

Before you begin
Role required: admin.

About this task
Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.cloud.google.com.
   b. Create a project with your administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Specify the Authorized domain `service-now.com`.

d. Click **Save**.

3. Create the credentials.

a. From the APIs & Services menu, select **Credentials**.

b. Select **Create OAuth client ID** from the **Create credentials** list.

4. Select the application type **Web application**.

5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.

6. Copy your client ID and client secret to a text file so that you can use them when you Register Google Cloud Storage as an OAuth provider.

Tip:
You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register Google Cloud Storage as an OAuth provider

Use the information generated during Google Cloud Storage account configuration to register the Google Cloud Storage application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **System OAuth** > **Application Registry**.

2. Open for the record, **Google Cloud Storage**.

3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Storage application.
Client Secret	Client Secret of the Google Cloud Storage application.
OAuth API Script	**OAuthGoogleCloudStorageUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a credential for the Google Cloud Storage spoke

Create a credential record to connect the Google Cloud Storage custom OAuth application you created during account configuration. The Google Cloud Storage spoke connection and credential aliases use these credentials to authorize actions.

Before you begin

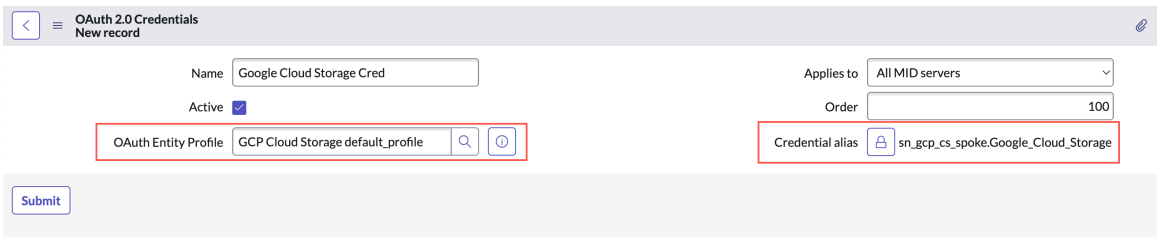
Role required: admin.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **Google_Cloud_Storage**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Storage Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **GCP Cloud Storage default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_cs_spoke.Google_Cloud_Storage** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Translator Service Spoke

Provides subflows and actions to dynamically translate the user-entered text, and to detect the language of the text using the Google translation service.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subscription

This spoke requires one of the following subscriptions:

- Any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.
- Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

See the Google Cloud Translator Service Spoke in ServiceNow Store.

Supported versions

Google Translate API version v3.

Scope of the spoke in the Dynamic Translation framework

To use Google Cloud Translator Service spoke in the Dynamic Translation framework, ensure that the spoke is installed in ServiceNow Store and the Dynamic Translation plugin is active. For more information, see Dynamic Translation.

Spoke flows

This spoke has no sample flows.

Spoke subflows

The Google Cloud Translator Service spoke provides subflows in the Published state to integrate with the Google translation service. These subflows can be used as part of other subflows and flows.

Subflow	Description
Detect Language	Contains a set of inputs, actions, and outputs to detect the language of the input text.
Translate Text To Multiple Languages	Contains a set of inputs, actions, and outputs to translate the input text to multiple languages.

Spoke actions

The Google Cloud Translator Service spoke provides actions to integrate with the Google translation service. Available actions include:

Action	Description
Detect Language	Detects the language of the input text.
Translate Text To Single Language	Translates the input text to a single language.
Translate Text To Multiple Languages	Translates the input text to multiple languages.

Google account requirements

The Google Cloud Translator Service spoke requires configuring your Google Cloud account to generate an OAuth 2.0 JWT Bearer Grant token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the GoogleTranslation alias record (sn_google_trans.GoogleTranslation) to authorize actions. For information about setting up the spoke, see Set up the Google Cloud Translator Service spoke.

Set up the Google Cloud Translator Service spoke

Integrate your Google account with your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Translator Service spoke.
- Create a service account on Google Cloud, generate a service account key of JSON type and download it. For information on creating the service account key, see the Google documentation.
- Enable the Cloud Translation API service. For information on enabling a service, see the Google documentation.
- Role required: admin

Create a Java KeyStore certificate

Encrypt the security certificates obtained from Google by creating a Java KeyStore (JKS) file.

Before you begin

- Role required: admin
- Download a JSON file containing the service account key from Google. For information on downloading the JSON file, see the Google documentation. Following is a sample JSON file:

```
{
  "type": "service_account",
  "project_id": "primeval-nectar-242610",

-google-trans-v3%40primeval-nectar-242610.iam.gserviceaccount.c
om"
}
```

Procedure

1. In the JSON file, perform the following for the `private_key` value.
   a. Unescape the `\n` characters.

      Tip:
      To unescape characters in a JSON file, you can parse a JSON string into a JavaScript object.

   b. Store the private key in a file with .pem extension.
2. In the JSON file, perform the following for the `client_x509_cert_url` value.
   a. Open the link specified for `client_x509_cert_url`.
   b. Unescape the `\n` characters for the certificate associated with the private_key_id mentioned in the JSON file.
   c. Store the certificate value in a file with .pem extension.
3. Use the openssl command to create a PKCS 12 file using the recently created private key and certificate files.

```
openssl pkcs12 -export -in [path to certificate] -inkey
 [path to private key] -certfile [path to certificate ] -out
 testkeystore.p12
```

For example, if certificate.pem is the certficate and privatekey.pem is the private key:

```
openssl pkcs12 -export -in certificate.pem -inkey
 privatekey.pem -certfile certificate.pem -out testkeystore.p12
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A PKCS 12 file, testkeystore.p12, is created.

4. Specify an export password or source keystore password.

Note:
You should specify this password when creating a JWT key for Google Cloud Translator Service spoke.

5. Use the keytool command to create a JKS file from the PKCS 12 file.

```
keytool -importkeystore -srckeystore testkeystore.p12
 -srcstoretype pkcs12 -destkeystore wso2carbon.jks
 -deststoretype JKS
```

Note:
testKeyStore.p12 is the PKCS 12 file and wso2carbon.jks is the JKS file.

6. Specify a destination keystore password.

Note:
You should specify this password when attaching a JKS certificate to Google Cloud Translator Service spoke.

Attach a Java KeyStore certificate to Google Cloud Translator Service spoke

Enable the JWT client authentication by attaching a valid Java KeyStore (JKS) certificate to Google Cloud Translator Service spoke.

Before you begin

- Role required: admin
- Valid Java KeyStore certificate

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. On the form, fill in the fields.

X.509 Certificate form fields

Field	Description
Name	Identifier of the certificate.
Notify on expiration	Users to be notified when the certificate expires.
Warn in days to expire	Number of days to send a notification before the certificate expires.
Active	Option to activate the certificate.
Type	Type of the certificate. Select **Java Key Store**.
Expires in days	Number of days until the certificate expires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Key store password	Password to access the certificate. Use the destination keystore password specified when creating the JKS certificate. For more information on this password, see Create a Java KeyStore certificate.
Short description	Summary about the certificate.

4. Click the manage attachments icon ( ) and attach a JKS certificate.
5. To validate the JKS certificate, click **Validate Stores/Certificates**.
6. Click **Submit**.

Create a JWT signing key for Google Cloud Translator Service spoke

Assign a JSON Web Token (JWT) signing key to your Java KeyStore certificate.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Keys form fields

Field	Description
Name	Identifier of the JWT signing key.
Signing Keystore	Valid JKS certificate for which you want to assign the key.
Key Id	Key ID to identify which key is used when multiple keys are used to sign tokens.
Signing Algorithm	Algorithm to sign with the key.
Signing Key Password	Password associated with the key. Use the export password or the source keystore password specified when creating the JKS certificate. For more information on this password, see Create a Java KeyStore certificate.
Active	Option to activate the key.

4. Click **Submit**.

Create a JWT provider for Google Cloud Translator Service spoke

Add a JSON Web Token (JWT) provider to Google Cloud Translator Service spoke.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Provider form fields

Field	Description
Name	Identifier of the JWT provider.
Expiry Interval (sec)	Number of seconds that indicate the lifespan of the JWT provider token. Specify `3600`.
Signing Configuration	JWT signing key.

4. Right-click the form header, and click **Save**.
5. In the Standard Claims related list, enter the values for these claims.

Claim

Claim name	Claim value
aud	https://www.googleapis.com/oauth2/v4/token
iss	*`client_email`* value from the JSON file.

6. In the Custom Claims related list, create the **scope** claim and enter its value as `https://www.googleapis.com/auth/cloud-translation`.
7. Click **Update**.

Configure the credential for the GoogleTranslation alias

Authorize actions of Google Cloud Translator Service spoke by configuring the Google OAuth 2.0 credential.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select the Google OAuth 2.0 credential.
3. Open the record specified in the **OAuth Entity Profile** field.
4. In the **JWT Provider** field, specify the JWT provider that you want to use.
5. Click **Update**.
6. To verify if an OAuth Access token is generated to connect to Google's translation services, click the **Get OAuth Token** related link of the Google OAuth 2.0 credential.

Configure the connection attributes for the GoogleTranslation alias

Connect to the Google's translation service by configuring the Google connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: connection_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections**.
2. Open for the record for **Google**.
3. In the Attributes related list of the HTTP(S) Connection form, fill in the fields.

HTTP(S) Connection form fields

Field	Value required
location	Location of the customer. If the value is not specified when creating an account on Google Cloud, then specify `global`.
project_id	Identifier of a project. Specify the *`project_id`* value from the JSON file.
version	API version that the related spokes are built for. The default value is `v3beta1`. Because Google now supports the v3 version, you can override this value as `v3`.

4. Right-click the form header and click **Save**.

Google Cloud Virtual Network Spoke

Manage firewall, network, subnetwork, and IP address in Google Cloud Virtual Network from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Virtual Network spoke v1.0.4 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Google Persistent Disk Spoke (sn_gpdisk_spoke)
- Google Compute Engine Spoke (sn_gcompute_spoke)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Google Cloud Virtual Network account requirements

The Google Cloud Virtual Network spoke requires a custom app that you create in the Google Cloud Platform.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions

The Google Cloud Virtual Network spoke provides actions to automate Google Cloud Virtual Network when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

Category	Action	Description	Permissions required
Address Management	Create IP Address For Region	Creates an address resource in the specified project by using the data included in the request.	compute.addresses.create
	Delete IP Address	Deletes the specified address resource.	compute.addresses.delete
	Get IP Address	Retrieves details of the specified address resource.	compute.addresses.get
Firewall Management	Create Firewall For Egress	Creates a firewall for egress rule in the specified project.	compute.firewalls.create
	Create Firewall For Ingress	Creates a firewall for an ingress rule in the specified project.	compute.firewalls.create
	Delete Firewall	Deletes the specified firewall.	compute.firewalls.delete
	Get Firewall	Retrieves details of the specified firewall.	compute.firewalls.get
	Update Firewall For Egress	Updates a firewall for the egress rule in the specified project.	compute.firewalls.update

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions required
	Update Firewall For Ingress	Updates a firewall for the ingress rule in the specified project.	compute.firewalls.update
Metadata Retrieval Management	List Addresses	Retrieves a list of addresses contained within the specified region.	compute.addresses.list
	List Firewalls	Retrieves a list of firewalls available to the specified project.	compute.firewalls.list
	List Networks	Retrieves a list of networks available to the specified project.	compute.networks.list
	List Subnetworks	Retrieves a list of subnetworks available to the specified project.	compute.subnetworks.list
Network Management	Create Network	Creates a network in the specified project.	compute.networks.create
	Delete Network	Deletes the specified network.	compute.networks.delete
	Get Network	Retrieves details of the specified network.	compute.networks.get
Subnetwork Management	Create Subnetwork	Creates a subnetwork in the specified project.	compute.subnetworks.create
	Delete Subnetwork	Deletes the specified subnetwork.	compute.subnetworks.delete
	Expand IP CIDR Range	Expands the IP CIDR range of the subnetwork to a specified value.	compute.subnetworks.expandIpCidrRange
	Get IAM Policy	Retrieves details of the access control policy for a resource.	compute.subnetworks.getIamPolicy
	Get Subnetwork	Retrieves details of the specified subnetwork.	compute.subnetworks.get
	Set IAM Policy	Sets the access control policy on the specified resource.	compute.subnetworks.setIamPolicy

For more information about the required permissions, see IAM permissions reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud Virtual Network spoke.

Set up the Google Cloud Virtual Network spoke

Integrate the ServiceNow instance and Google Cloud Virtual Network spoke by using OAuth 2.0 credentials to authenticate ServiceNow requests.

Before you begin

- Request Integration Hub subscription.
- Activate and set up the Google Compute Engine Spoke.
- Activate the Google Cloud Virtual Network spoke.
- Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Open the record for the Google Compute Engine spoke, for example, `Google Compute Cred`.
3. For **Credential alias**, select the Connection and Credential alias record of the Google Cloud Virtual Network spoke.
4. Right-click the form header and click **Save**.
5. Click **Get OAuth Token**.

Google Cloud VPC Access Spoke

Manage connector and operations in your Google Cloud VPC Access account from ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

The current Google Cloud VPC Access spoke version is 1.0.1.

Supported versions

This spoke was built for the Google Cloud VPC Access API version v1, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Google Cloud VPC Access spoke requirements

The Google Cloud VPC Access spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Google Identity and Access Spoke
- Google Cloud Virtual Network Spoke
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud VPC Access spoke provides actions to automate Google Cloud VPC Access tasks when events occurs in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Connector Management	Create Connector	Creates a connector in the specified project.
	Delete Connector	Deletes the specified VPC Access connector.
	Get Connector	Retrieves the specified VPC Access connector.
	Look up Connectors	Retrieves the list of VPC Access connectors available in the specified location.
Location Management	Look up Locations	Retrieves the list of locations available in the specified project.
Operation Management	Get Operation	Retrieves details of the specified operation.
	Look up Operations	Retrieves a list of operations available with in the specified location.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Set up the Google Cloud VPC Access spoke.

Set up the Google Cloud VPC Access spoke

Integrate the ServiceNow instance and Google Cloud VPC Access account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud VPC Access spoke.
- Role required: admin.

Configure the Google Cloud VPC Access application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud VPC Access spoke.

Before you begin

- Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.
- Role required: admin.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
4. Select the application type **OAuth client ID**.
5. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. Copy your client ID and client secret to a text file so that you can use them when you register Google Cloud VPC Access as an OAuth provider.

Tip:
You can always access the client ID and secret in the Google APIs & Services interfaceby clicking **Credentials** and selecting the OAuth 2.0 client ID name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register Google Cloud VPC Access as an OAuth provider

Use the information generated during the Google Cloud VPC Access application configuration to register Google Cloud VPC Access as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud VPC Access**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud VPC Access application.
Client Secret	Client Secret of the Google Cloud VPC Access application.
OAuth API Script	**OAuthGoogleVPCAccessUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud VPC Access spoke

Create a credential record for the Google Cloud VPC Access application. The Google Cloud VPC Access spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

- Register Google Cloud VPC Access as an OAuth provider
- Role required: admin

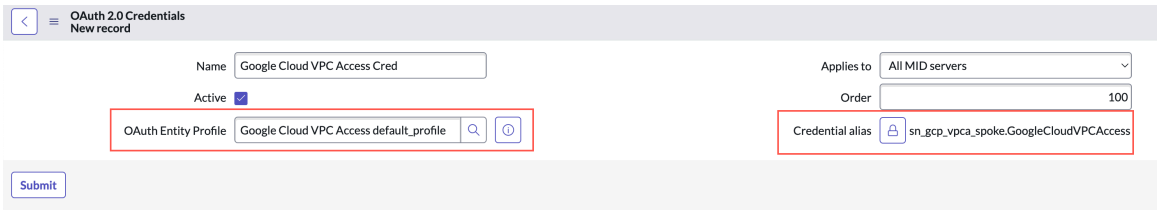
Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudVPCAccess**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud VPC Access Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud VPC Access default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_vpca_spoke.GoogleCloudVPCAccess** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Compute Engine Spoke

Launch and manage virtual machines in Google Compute Engine spoke from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Compute Engine spoke v1.0.5 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Complex Object (com.glide.cobject)
- Google Persistent Disk Spoke (sn_gpdisk_spoke)
- Google Cloud Virtual Network Spoke (sn_gcp_vpc_spoke)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Google Compute Engine spoke account requirements

The Google Compute Engine spoke requires a custom app that you create in Google Cloud Platform.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions

The Google Compute Engine spoke provides actions to automate Google Compute Engine when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

Category	Action	Description	Permissions Required
Instance Template Management	Create Instance Template	Creates an instance template.	compute.instanceTemplates.create
	Create Instance Template From Instance	Creates an instance template from instance.	compute.instanceTemplates.create
	Delete Instance Templates	Deletes the specified instance template.	compute.instanceTemplates.delete
	Get Instance Template	Retrieves details of the specified instance template.	compute.instanceTemplates.get
Machine Types Management	Get Machine Type By Zone	Retrieves details of the specified machine type by zone.	compute.machineTypes.get
Metadata Retrieval Management	List Instance Templates	Retrieves a list of instance templates available to the specified project.	compute.instanceTemplates.list
	List Machine Types By Zone	Retrieves a list of machine types available to the specified project.	compute.machineTypes.list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
	List Regions	Retrieves a list of regions available to the specified project.	compute.regions.list
	List VM Instances By Zone	Retrieves a list of VM instances available to the specified project.	compute.instances.list
	List Zones	Retrieves a list of zones available to the specified project.	compute.zones.list
Region Management	Get Region	Retrieves the specified region resource.	compute.regions.get
VM Instance Management	Attach Disk	Attaches an existing Disk resource to an instance.	compute.instances.attachDisk
	Create Instance	Creates an instance resource in the specified project.	compute.instances.create
	Delete Instance	Deletes the specified instance.	compute.instances.delete
	Detach Disk	Detaches a disk from an instance.	compute.instances.detachDisk
	Get IAM Policy	Retrieves the access control policy for a resource.	compute.instances.getIamPolicy
	Get Instance By Zone	Retrieves the specified Instance by zone.	compute.instances.get
	Reset Instance	Performs a reset on instance.	compute.instances.reset
	Set IAM Policy	Sets the access control policy on the specified resource.	compute.instances.setIamPolicy
	Set Labels On Instance	Sets labels on an instance.	compute.instances.setLabels
	Set Tags On Instance	Sets tags for the specified instance.	compute.instances.setTags
	Start Instance	Starts an instance.	compute.instances.start
	Stop Instance	Stops an instance.	compute.instances.stop
Zone Management	Get Zone	Retrieves information about the specified zone.	compute.zones.get

For more information about the required permissions, see IAM permissions reference.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Compute Engine spoke.

Set up the Google Compute Engine spoke

Integrate the ServiceNow instance and Google Compute Engine spoke by using OAuth 2.0 credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Compute Engine spoke.
- Access to Google Cloud Platform.
- Role required: admin.

Note:
This procedure outlines steps to configure the custom app using OAuth. You can also configure the custom app using Service Account associated with JWT tokens. For more information about setting up the spoke using JWT tokens, see Choosing an Authentication Method - Service accounts and Set up OAuth provider with JWT Bearer grant type.

Configure the Google Compute Engine application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Compute Engine spoke.

Before you begin
Role required: admin.

About this task
Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
4. Select the application type **Web application**.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Copy your client ID and client secret to a text file so that you can use them when you Register Google Compute Engine as an OAuth provider.

> **Tip:**
> You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register Google Compute Engine as an OAuth provider

Use the information generated during Google Compute Engine account configuration to register the Google Compute Engine application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. In ServiceNow, navigate to **System OAuth** > **Application Registry**.
2. Open the record for **Google Compute Engine**.
3. Fill these values in the Application Registries form:

Field	Value required
Name	Name to uniquely identify the record, for example `Google Compute Engine`.
Client ID	Client ID of the Google Compute Engine application you created in G Suite.
Client Secret	Client Secret you generated when you created the application in G Suite.
OAuth API Script	Script to customize the request and response. Select `OAuthGoogleComputeUtil`
Default Grant type	Grant type used to establish the token. Select **Authorization Code**.
Authorization URL	OAuth authorization code endpoint. Enter `https://accounts.google.com/o/oauth2/v2/auth`.
Token URL	OAuth server token endpoint. Enter `https://oauth2.googleapis.com/token`.
Redirect URL	URL of the ServiceNow instance in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

4. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

Create a credential record for the Google Compute Engine spoke

Create a credential record to connect the Google Compute Engine custom OAuth application you created during account configuration. The Google Compute Engine spoke connection and credential aliases use these credentials to authorize actions.

Before you begin

Role required: admin.

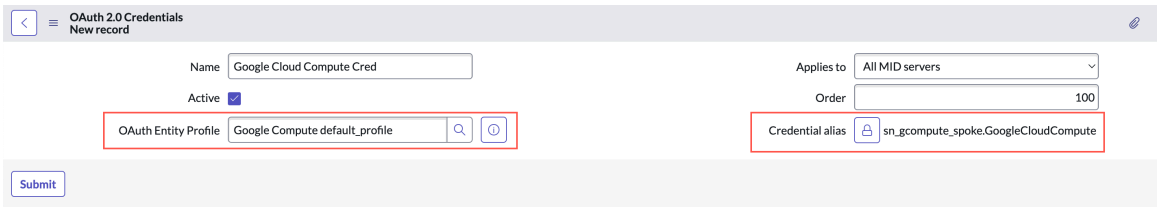
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudCompute**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Compute Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Compute default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcompute_spoke.GoogleCloudCompute** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Directory Spoke

Manage groups, members, and users in Google Directory from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Note:

- In this version, the alias type is changed to the **Connection and Credential**. The alias type supports multiple connections.
- If you're upgrading to Google Directory spoke v1.1.2, you must reconfigure the alias record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Google Directory spoke v1.5.2 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Google Directory account requirements

The Google Directory spoke requires a custom app that you create in the Google Developers Console.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke subflows

The Google Directory spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope. These webhook subflows perform specific tasks when webhooks execute user resource changes in the Google Directory. Available sample subflows include:

Subflow	Description
Create Google Directory User Webhook Subflow	When you update the details of a user in the Google Directory, a webhook notifies your ServiceNow instance. Now, when you execute the `Create Directory User Webhook Subflow`, it creates a subscription and an entry to the `Google Directory Webhook Registries table`. **Note:** To execute the subflow, you must provide the webhook URL that ServiceNow exposes for incoming webhooks in the Test Subflow window. The webhook URL format is `https://<instance-name>.service-now.com/api/sn_googledir_spoke/google_directory_webhook_callbacks/wh_entry`.
Process Google Directory User	Processes Google Directory webhooks when user details are updated in the Google directory. The Google Directory provides sample subflows to demonstrate automating Google Directory webhook flows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Webhook Subflow	

Spoke actions

The Google Directory spoke provides actions to automate Google Directory when events occur in ServiceNow. Available actions include:

Category	Action	Description
Group Management	Create Group	Creates a group.
	Delete Group	Deletes a group.
	Look up Group Details by Group Email or ID	Retrieves details of the specified groups based on group email or ID.
	Look up All Groups Stream	Retrieves the details of all groups.
	Look up Groups Stream by Filtering Criteria	Retrieves details of the specified groups based on the provided filter criteria.
	Update Group Details	Updates details of the specified group.
Member Management	Add Member To A Group	Adds member to the specified group.
	Check Membership of a Group	Checks if the given user is a member of the group email or ID.
	Look up Member Details from a Group	Retrieves the details of the required member in the specified group.
	Look up Members of a Group by Group Email or ID	Retrieves the details of all member in the specified group.
	Remove Member from a Group	Removes the specified member from a group.
	Update Member	Updates details of the specified member in a group.
User Management	Create User	Creates a user.
	Delete User	Deletes the specified user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Generate Random Password	Generates a random password with the specified length.
	Grant Admin To User	Grants admin privileges to the specified user.
	Look up All Users Stream by Customer ID	Retrieves a paginated list of all users in a domain, including deleted users if *showDeleted* is set to `true`.
	Look up User Details by User Email or ID	Retrieves details of the given user.
	Look up Users Stream by Filtering Criteria	Searches for users matching the filter criteria. This action accepts the query parameter which is a search query combining one or more search clauses.
	Reactivate User	Reactivates the specified user. **Note:** Exercise caution while using this action, as it may affect the other user's account.
	Reset User Password	Resets the password of the user. **Note:** Exercise caution while using this action, as it may affect the other user's account. By default, the **Force Change Password** option is enabled and the user is forced to change the password on the first login.
	Revoke Admin from User	Revokes the admin privileges of the specified user.
	Suspend User	Suspends the specified user. **Note:** Exercise caution while using this action, as it may affect the other user's account.
	Update User Details	Updates details of the specified user.
Webhook Management	Create Subscription Channel	Creates a subscription channel that watches for changes in the users list.
	Stop Subscription Channel	Stops watching resources through the given channel before the expiry of the subscription.
Schema Management	Look up Schema by ID	Retrieves details of the specified schema.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up schemas	Retrieves details of all schemas for a customer.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Directory spoke.

Set up the Google Directory spoke

Integrate the ServiceNow instance and Google Directory spoke by using G Suite credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Directory spoke.
- Role required: admin.

Configure the Google Directory application

Create a custom OAuth application from your Google G Suit account to enable OAuth 2.0 authentication with the Google Directory spoke.

Before you begin

Google Directory integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

Role required: admin.

About this task

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your G Suite administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Specify the Authorized domain `service-now.com`.

d. Click **Save**.

3. Create the credentials.

a. From the APIs & Services menu, select **Credentials**.

b. Select **Create OAuth client ID** from the **Create credentials** list.

4. Select the application type **Web application**.

5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
The OAuth client window shows your client ID and client secret.

6. Copy these two values to a text file so that you can use them when you add the Google Directory connection in ServiceNow instance.

Tip:
You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Add Google Directory connection in ServiceNow instance

Add the Google Directory connection in Workflow Studio to configure the Google Directory spoke.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.

2. Click the **Connections** tab.

3. Toggle and enable the **Outbound** connections.

4. Locate the **Google Directory** connection alias and click **View Details**.

- To configure the default connection and credential alias record that is shipped along with the Google Directory spoke, click **View Details**.
- To manage more than one Google Directory spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

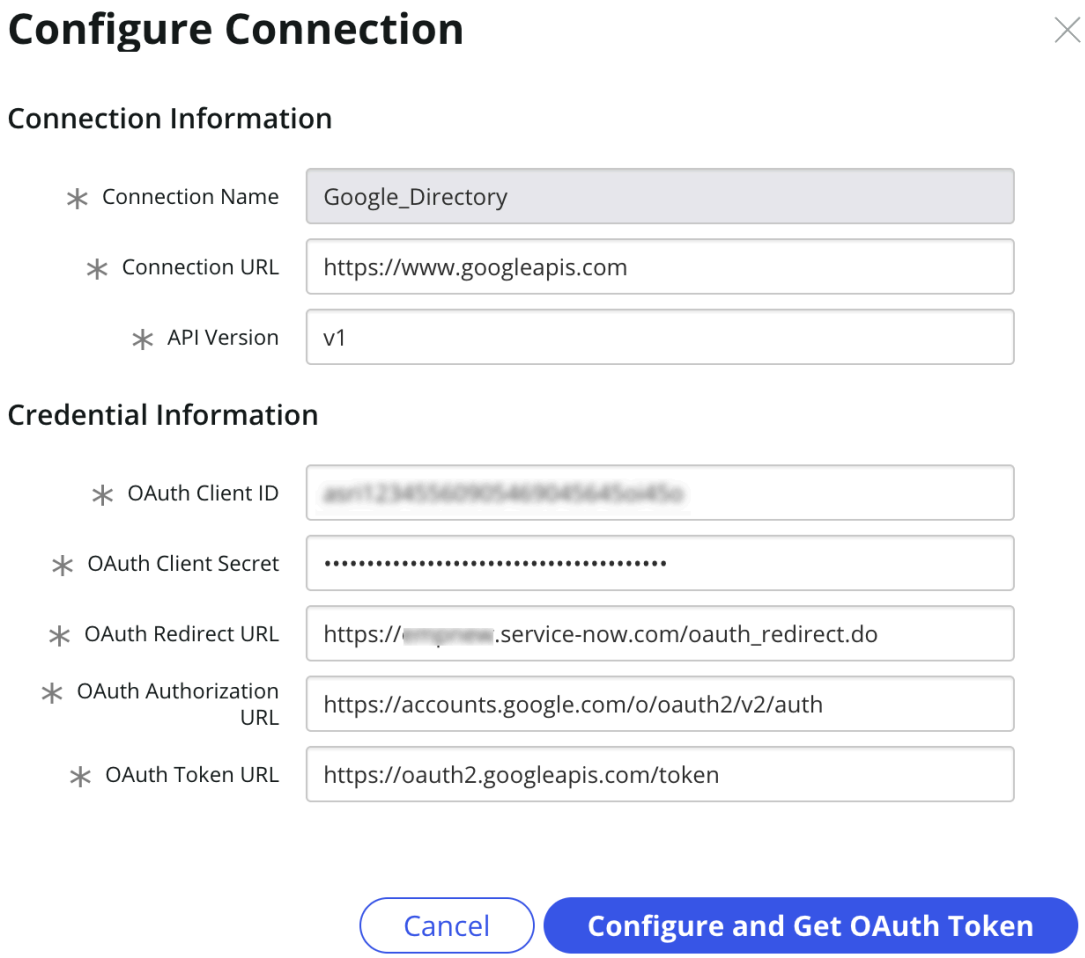
5. On the form, fill these values.

Configure Connection form

Field	Description
Connection URL	URL to connect to Google Directory. Enter `https://googleapis.com`.
Credential Name	Name to identify the credential record. For example, `Google Directory Cred`.
OAuth Name	Name to identify the OAuth record. For example, `Google_Directory OAuth`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Client ID	Client ID of your Google app.
OAuth Client Secret	Client Secret of your Google app.
OAuth Redirect URL	Redirect URL provided in your Google app. This value is auto-populated.
OAuth Authorization URL	OAuth authorization code endpoint. Enter `https://accounts.google.com/o/oauth2/v2/auth`.
OAuth Token URL	Token URL. Enter `https://oauth2.googleapis.com/token`.



6. Click **Configure and Get OAuth Token**.
7. In the pop-up window, click **Allow**.
   The OAuth Access token is generated for the Google Directory spoke.

Set up a bi-directional webhook for the Google Directory spoke

Create a webhook routing policy and subflow according to your requirement.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The default routing policy in the Google Directory WebHook Routing Policies module triggers the Process Google Directory User Webhook Subflow and notifies the ServiceNow app when certain events occur in the Google Directory. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure

1. Navigate to **All** > **Flow Designer**.
2. Select Subflows.
3. In the name field, enter `Process Google Directory User Webhook Subflow` and press **Enter**.
4. Select the subflow.
5. On the Process Google Directory User Webhook Subflow page, select the More Actions Menu icon ( ).
6. Select **Copy Subflow**.
7. Customize the subflow according to your requirement and publish it.
8. In the filter field, enter `Google Directory Webhook Routing Policies`.
9. Select **New**.
10. Fill the form.

Decision form

Field	Description
Label	A unique label to identify the routing policy.
Application	The application is set to Global.
Order	The order in which the request is processed.
Answer	Subflow that must be triggered when the specified conditions are met.
Default answer	Option to specify if the answer is the default answer.
Condition	Conditions to be met when the required events occur in the Google Directory.

11. Select **Submit**.

Google Docs Spoke

Manage documents in Google Docs from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Google Docs spoke v1.3.0 is the latest version.

Supported versions

This spoke was built for Google Docs v1, but may be compatible with later versions.

Spoke requirements

Google Cloud account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Docs spoke provides actions to automate Google Docs tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Document Management	Create Document	Creates a document in Google Docs.
	Create Footer	Creates a footer in the specified document.
	Create Header	Creates a header in the specified document.
	Get Document Details	Retrieves the structure of the specified document as a JSON object.
	Search Text in Document	Searches for the required document based on the search text or content.
	Update Document	Updates the content of a document with the provided HTML content.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Google Docs document management AI agent	Manage documents (that is, create document, create header or footer, get document details, search text in document) in Google Docs.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Docs.

Set up the Google Docs

Integrate the ServiceNow instance and Google Docs by creating a custom OAuth application in G Suite credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Docs spoke.
- Role required: admin.

Configure Google Docs application

Create a custom OAuth application from your G Suite account to enable OAuth 2.0 authentication with the Google Docs spoke.

Before you begin

- A Google G Suite or login created with the domain
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Complete these steps from your Google G Suite account. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your G Suite administrator credentials.
   c. Open the project.
2. Set the Authorized domain.
   a. From the **APIs & Services** menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Search for the Google Docs API and enable it.
4. Create the OAuyth client ID.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
5. Select the application type **Web application**.
6. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   This redirect URI must match the **Redirect URL** you provide when you configure a connection for the Google Docs spoke.
7. The OAuth client window shows your client ID and client secret.

   Copy these two values to a text file so that you can use them when you configure a connection for the Google Docs spoke.

Tip:

You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and select the OAuth 2.0 client ID name.

Configure a connection for the Google Docs spoke

Add and configure a Google Docs connection to authenticate ServiceNow requests in Google Docs spoke.

Before you begin

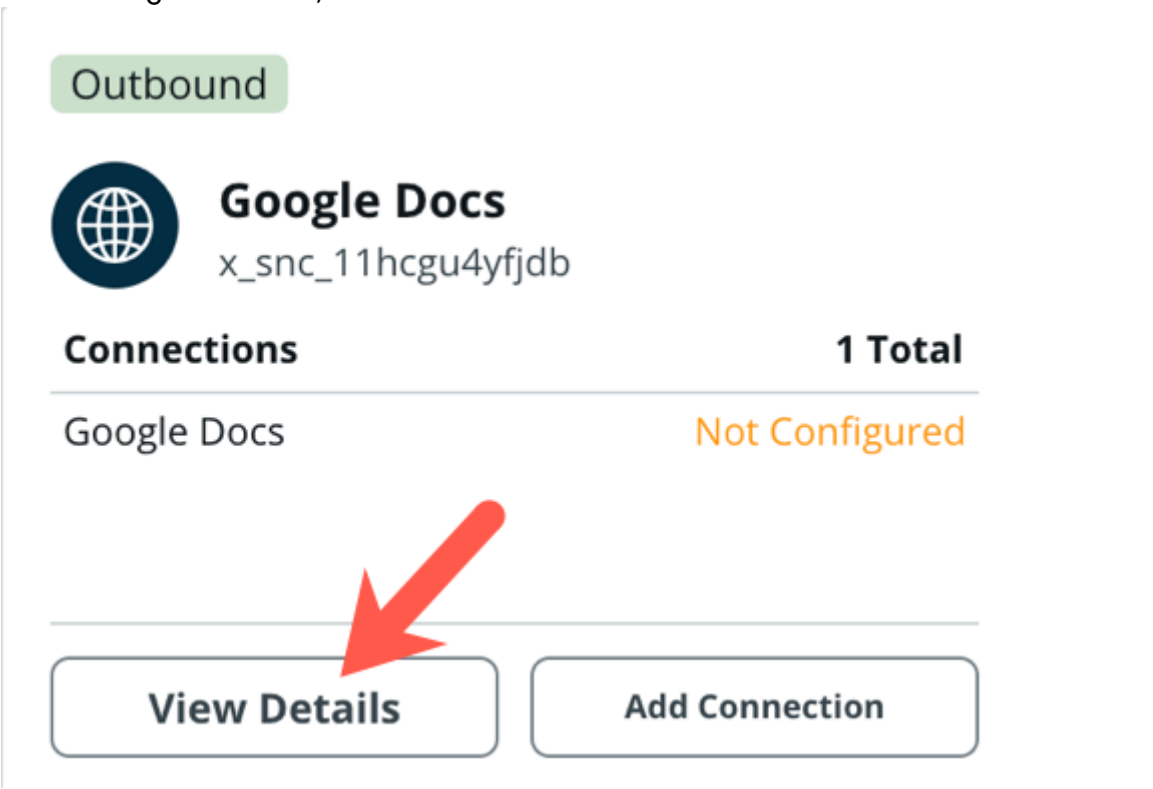
- Configure Google Docs application
- Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Select the **Connections** tab.
4. In the Search all connections field, enter `Google Docs`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the Google Docs card, select **View Details**.



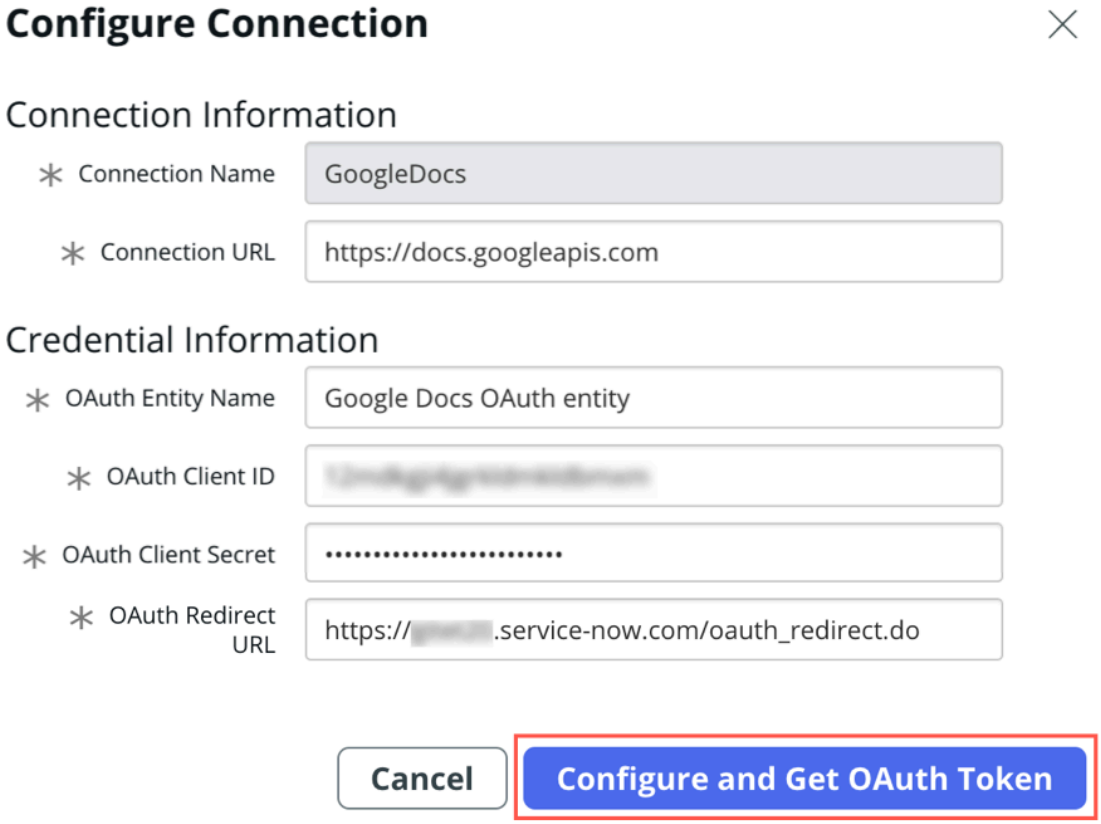
6. Select **Configure**.

7. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, `Google Docs Connection`.
Connection URL	Connection URL for the spoke. Enter `https://www.googleapis.com/`
OAuth Entity Name	Name to identify the OAuth entity record. For example, `Google Docs entity`.
OAuth Client ID	Client ID generated while creating the application in G suite.
OAuth Client Secret	Client secret generated while creating the application in G suite.
OAuth Redirect URL	Redirect URL of your ServiceNow instance in this format: `https://<instance_name>.service-now.com/oauth_redirect.do`.

8. Click **Configure and Get OAuth Token**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Log in to Google to get the OAuth token.

Result
The spoke connection is configured and ready to be used.

Google Drive Spoke

Use Google Drive as file storage in place of attachments in ServiceNow. Adds Google Drive storage to your ServiceNow instance and enables users to reference Google Drive files in ServiceNow records.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Drive spoke v2.3.0 is the latest version.

Supported versions

API version v3.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke actions

The Google Drive spoke provides actions to perform Google Drive tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
File and Folder Management	Copy Attachment to Drive	Copies a ServiceNow attachment to a Google Drive folder. It either copies to the root drive of the current account or to the specified folder. To change the file name during the copy, use the optional file name.
	Copy Doc File to Attachment	Copies a file Google Drive and attaches it to a ServiceNow record.
	Copy File	Creates a copy of a Google Drive File and applies any metadata updates like a change in file name, file description, parent folder location, if file is starred, or shared by users with writer permissions.
	Copy Drive File To Attachment	Copies a drive file to a ServiceNow attachment. If a ServiceNow record is supplied as input, the record should be attached to it.
	Copy File Revision as Attachment	Copies the revision ID of a file ID to any record on the ServiceNow instance.
	Create Folder	Creates a Google Drive folder that can be nested within other folders.
	Delete Drive File Or Folder	Permanently deletes a drive file or folder owned by the Google Drive account user without moving it to the trash. To delete folders the user must be the owner of folder and its contents
	Delete File Revision	Deletes a revision to a file.
	Look up Files and Folders Stream	Retrieves the list of files and folders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up File Revisions Stream	Retrieves the list of all revisions to a file.
	Look up File	Retrieves the metadata information from a file ID.
	Look up Files Stream	Retrieves a list of Google Drive files based on the given search parameters.
	Look up Folders Stream	Retrieves a list of Google Drive folders based on the given search parameters.
	Update Attachment To Drive	Updates the contents of a file, but maintains the previous versions and metadata. This action only updates the content of the Google Drive file. It does not update metadata.
	Update File Or Folder Metadata	Updates the metadata on a file or folder. This can be a file name change, change to the file description, a move to a new parent folder, a change in starred status, or a change to sharing permissions.
	Look up Files or Folders by Name	Retrieves the details of the files or folders including ID for the specified file name or folder name.
Permission Management	Create File or Folder Permission	Adds a permission to a given user, group, domain, or anyone for a file or folder. If User or Group is selected, the email address is required for those users and groups. If Domain is selected, the domain name is required. If Anyone is selected, then anyone has permissions to the file or folder.
	Delete File Or Folder Permission	Removes a permission to a given user, group, domain, or anyone for a file or folder.
	Look up Permissions Stream	Retrieves the list of files or shared drives permissions.
	Transfer Ownership Of All User Data	Transfers the ownership of data from one user to another within a domain. All previous permissions of old owner are removed and new owner permissions are created for new user.
	Update File Or Folder Permission	Updates a given permission by updating the role.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agents	Description
Google Drive permission manager AI agent	Manages file or folder permissions(create file or folder permission, transfer ownership of all user data, update file or folder permission, delete file or folder permission) in Google Drive.
Google Drive file and folder manager AI agent	Manages files and folders(copy doc file to attachment, copy file revision as attachment, delete file or folder, update attachment to drive, copy drive file to attachment, copy attachment to drive, copy file, delete file revision, create folder, look up files or folders by name, update file or folder metadata, look up file) in Google Drive.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Google Drive Online account requirements

The Google Drive spoke requires a custom app that you create in Google Drive Enterprise or Google G Suite.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Google Drive spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Google Drive alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up Google Drive spoke

Integrate a ServiceNow instance and Google Drive spoke by using Google Drive credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Drive spoke.
- Role required: admin.

Configure Google Drive application

Create a custom OAuth application from your Google Drive account to enable OAuth 2.0 authentication with the Google Drive spoke.

Before you begin

Google Drive integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in GSuite or Google Drive.
- A Google G Suite or Google Drive login created with the domain.
- A Google Drive account.

Role required: admin.

About this task

Complete these steps from your Google G Suite or Google Drive account. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Log in to the G Suite portal, https://gsuite.google.com/, with your domain email credentials.
2. Enter your business name, the number of employees, and your country, and click **Next**.
3. Enter the administrator contact name, email address and business phone number, and click **Next**.
4. Enter the domain associated with this spoke.
5. Provide the user name and password for your domain.
6. Add users to the G Suite account.
7. Verify your domain and email address.
   Users must create their own logins by navigating to the Google documentation.
8. Register a new custom application.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your G Suite administrator credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Search for the Google Drive API and enable it.
10. Create a Credentials application and save the Client ID and Client secret.
    The Client Secret is only displayed in plain text for a short time. Copy the Client ID and the Client Secret to a text file so that you can use them when you Configure the Google Drive connection.

Configure the Google Drive connection

Use the information generated during Google Drive account configuration to register the Google Drive application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin.

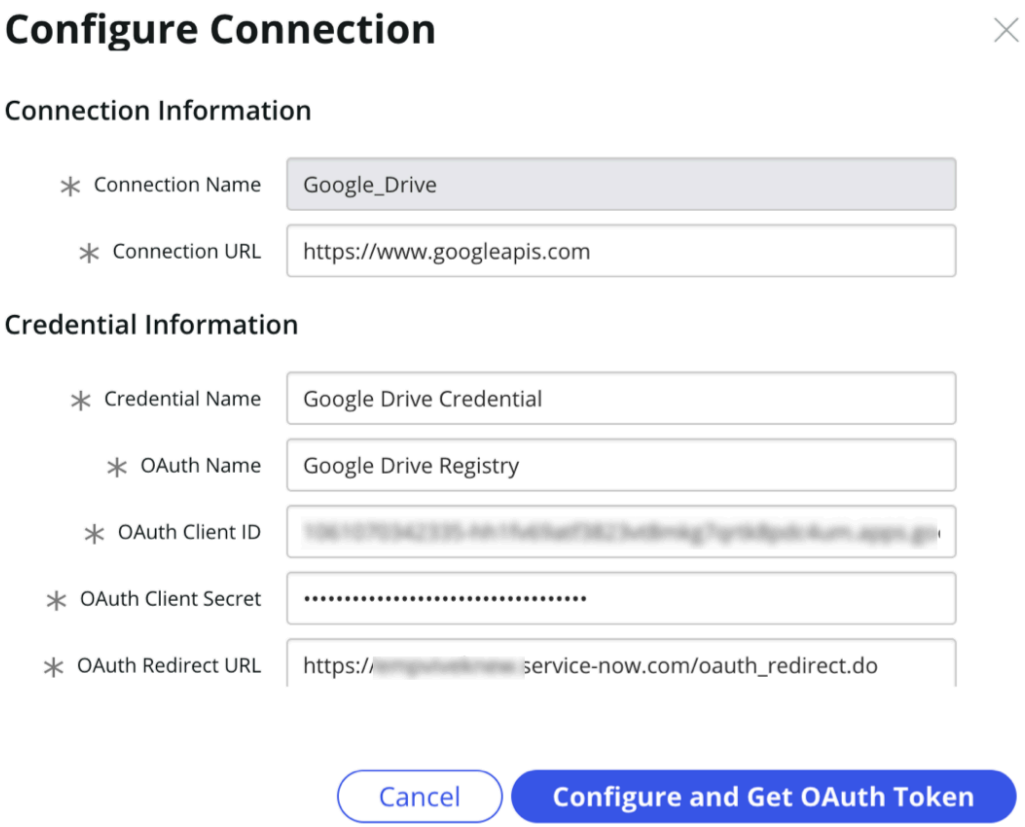
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Connections** tab.
3. Toggle and enable the **Outbound** connections.
4. Locate the **Google Drive** connection alias and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Google Drive spoke, click **View Details**.
   - To manage more than one Google Drive spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.
5. On the form, fill in the fields.

Field	Description
Connection Information	
Connection Name	Name to identify the connection record.
Connection URL	Enter the URL `https://www.googleapis.com/`.
Credential Information	
Credential Name	Name to identify the credential record.
OAuth Name	Name to identify the application registry record.
OAuth Client ID	Client ID of the Google Drive application you created in G Suite.
OAuth Client Secret	Client Secret you generated when you created the application in G Suite.
OAuth Redirect URL	ServiceNow instance URL in this format: `https://<Instance-Name>.service-now.com/oauth_redirect.do`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Configure and Get OAuth Token**.

Google Identity and Access Spoke

Manage folders, projects, roles, and service accounts in Google Identity and Access Management and Google Resource Manager.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Identity and Access spoke v1.1.1 is the latest version.

Supported Versions

This spoke was built for API version v2 only Folder Management category and v1 for other categories, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke requirements

Google Cloud Platform account.

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Google Identity and Access spoke provides actions to automate Google Identity and Access Management and Google Resource Manager tasks when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available actions include:

Spoke actions

Category	Action	Description	Required Permission
Folder Management	Create Folder	Creates a folder.	resourcemanager.folders.create
	Delete Folder	Deletes a folder.	resourcemanager.folders.delete
	Look up Child Folder	Retrieves the information of a child folder.	resourcemanager.folders.get
	Look up Folders	Retrieves the list of folders.	resourcemanager.folders.list
	Rename Folder	Renames the specified folder.	resourcemanager.folders.update
	Restore Folder	Restores the specified folder.	resourcemanager.folders.undelete
Organization Management	Look up Organization by Organization ID	Retrieves details of the specified organization.	resourcemanager.organizations.get
Project Management	Create Project	Creates a project.	resourcemanager.projects.create
	Delete Project	Deletes the specified project.	resourcemanager.projects.delete

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description	Required Permission
	Look up Project by Project ID	Retrieves details of the specified project.	resourcemanager.projects.get
	Look up Projects	Retrieves the list of projects.	resourcemanager.projects.list
	Look up Projects Stream	Retrieves the list of projects as a complex object.	resourcemanager.projects.list
	Rename Project	Renames the specified project.	resourcemanager.projects.update
	Restore Project	Restores the specified project.	resourcemanager.projects.undelete
Role Management	Create Role For Organization	Creates a custom role for an organization.	iam.roles.create
	Create Role For Project	Creates a custom role for the specified project.	iam.roles.create
	Delete Role For Organization	Deletes a custom role for the specified organization.	iam.roles.delete
	Delete Role For Project	Deletes a custom role for the specified project.	iam.roles.delete
	Look up Role for Organization	Retrieves details of the custom role for the specified organization.	iam.roles.get
	Look up Role For Project	Retrieves details of the custom role for the specified project.	iam.roles.get
	Look up Roles in Organization by Organization ID	Retrieves the list of custom roles for the specified organization.	iam.roles.list
	Look up Roles in Organization Stream	Retrieves the list of custom roles for the specified organization as a complex object.	iam.roles.list
	Look up Roles in Project by Project ID	Retrieves the list of custom roles for the specified project.	iam.roles.list
	Look up Roles in Project Stream	Retrieves the list of custom roles in given project ID.	iam.roles.list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description	Required Permission
	Restore Role For Organization	Restores the specified custom role for an organization.	iam.roles.undelete
	Restore Role For Project	Restores the specified custom role for a project.	iam.roles.undelete
Service Account Management	Look up Service Account	Retrieves the details of the specified service account.	iam.serviceAccounts.get
	Look up Service Accounts by Project ID	Retrieves the list of service accounts in a project.	iam.serviceAccounts.list

For more information about the required permissions, see IAM permissions reference.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Identity and Access Spoke.

Set up the Google Identity and Access Spoke

Integrate the ServiceNow instance and Google Identity and Access spoke by using Google Cloud Platform credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Identity and Access spoke.
- Role required: admin.

Configure the Google Identity and Access application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Identity and Access spoke.

Before you begin

Google Identity and Access integration requirements:

- Google Cloud Platform account.
- Role required: admin.

About this task

Complete these steps from the Google Cloud Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your Google Cloud Platform administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
4. Select the application type **Web application**.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. Copy your client ID and client secret to a text file so that you can use them when you Register Google Identity and Access as an OAuth provider.

Tip:
You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register Google Identity and Access as an OAuth provider

Use the information generated during Google Identity and Access account configuration to register the Google Identity and Access application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. In ServiceNow instance, navigate to **System OAuth** > **Application Registry**.
2. Open the record, **Google cloud platform**.
3. On the form, fill these fields:

Field	Description
Name	Name to uniquely identify the record, for example `Google Identity and Access`.
Client ID	Client ID of the Google Identity and Access application.
Client Secret	Client Secret you generated when you create the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth API Script	Script to customize the request and response. Select `OAuthGoogleIAMUtil`.
Default Grant type	Grant type used to establish the token. Select **Authorization Code**.
Authorization URL	OAuth authorization code endpoint. Enter `https://accounts.google.com/o/oauth2/v2/auth`.
Token URL	OAuth server token endpoint. Enter `https://oauth2.googleapis.com/token`.
Redirect URL	URL of the ServiceNow instance in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

4. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

Create Credential record for the Google Identity and Access spoke

Create Credential records to connect the Google Identity and Access custom OAuth application you created during account configuration. The Google Identity and Access spoke connection and credential aliases use these credentials to authorize actions.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, `GCPIAM Cred`.
4. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Identity and Access service as an OAuth provider.
5. Click **Get Oauth Token**.

Google Meet Spoke

Set up a flow and complete various actions on Google Meet after integrating your ServiceNow instance with the Google Meet account. For example, you can set up a meeting space or end an active conference as part of the flow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Meet spoke v1.2.1 is the latest spoke version.

Supported versions

This spoke was built for Google Meet API v2, but may be compatible with later versions.

Spoke requirements

- Google Meet API access
- Google Meet Cloud console access

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Meet provides actions to automate Google Meet tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description	Required Scopes (at least one scope is required)
Conference Management	Look up Conference	Retrieve a details of conference record associated with a specific Google Meet space.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
	Look up Conferences Stream	Retrieves a list of conference records, which can be filtered optionally and limited by a specified page size.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
Space Management	Create Meeting Space (Conversational-ready)	Creates a Google Meet space and shares the link for participants to join and collaborate.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	End Active Conference	Ends the active Google Meet session, disconnecting all participants and concluding the meeting.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Meeting Space	Retrieves conference record details, including the configuration and current conference status for a specific Google Meet space.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Update Meeting Space (Conversational-ready)	Updates the settings of an existing Google Meet space.	https://www.googleapis.com/auth/meetings.space.created
Participant Management	Look up Participant	Retrieves details of a participant in a Google Meet conference.	• https://www.googleapis.com/auth/meetings.space.readonly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
			• https://www.googleapis.com/auth/meetings.space.created
	Look up Participant Session	Retrieves the details of a specific session, including session start and end times, in a Google Meet conference.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Participants Stream	Retrieves a paginated list of participants in a specified Google Meet conference, with optional filtering.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Participant Sessions Stream	Retrieves a paginated stream of sessions for a specific participant in a Google Meet conference.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
Artifacts Management	Look up Recording	Retrieves the details of a Google Meet recording, including its state, timestamps, and Google Drive location.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Recordings Stream	Retrieves a paginated list of recordings for a specific Google Meet conference, including recording status, timestamps, and Google Drive location.	• https://www.googleapis.com/auth/meetings.space.readonly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
			• https://www.googleapis.com/auth/meetings.space.created
	Look up Transcript	Retrieves the details of a Google Meet transcript, including its state, timestamps, and document location in Google Docs.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Transcript Entry	Retrieves a specific transcript entry from a Google Meet conference, including its content, speaker details, and timestamp.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Transcripts Stream	Retrieves a paginated list of transcripts for a specific Google Meet conference, including transcript status, timestamps, and the document location in Google Docs.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Transcript Entries Stream	Retrieves a list of transcript entries for a specific Google Meet conference, including details like participant, transcript text, language, and timestamps.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Google Meet artifacts management AI agent	Automates tasks such as retrieving recordings, transcripts, and other meeting-related data, making it easier to organize and utilize meeting resources effectively.
Google Meet participant management AI agent	Automates tasks such as looking up participant details, retrieving participant session streams, and accessing session-specific information.
Google Meet conference management AI agent	Automates tasks such as look up conference details, retrieve live conference streams, and manage meeting spaces and participants.
Google Meet space management AI agent	Automates tasks such as creating and updating meeting spaces, ending active conferences, and retrieving information about existing meeting spaces.

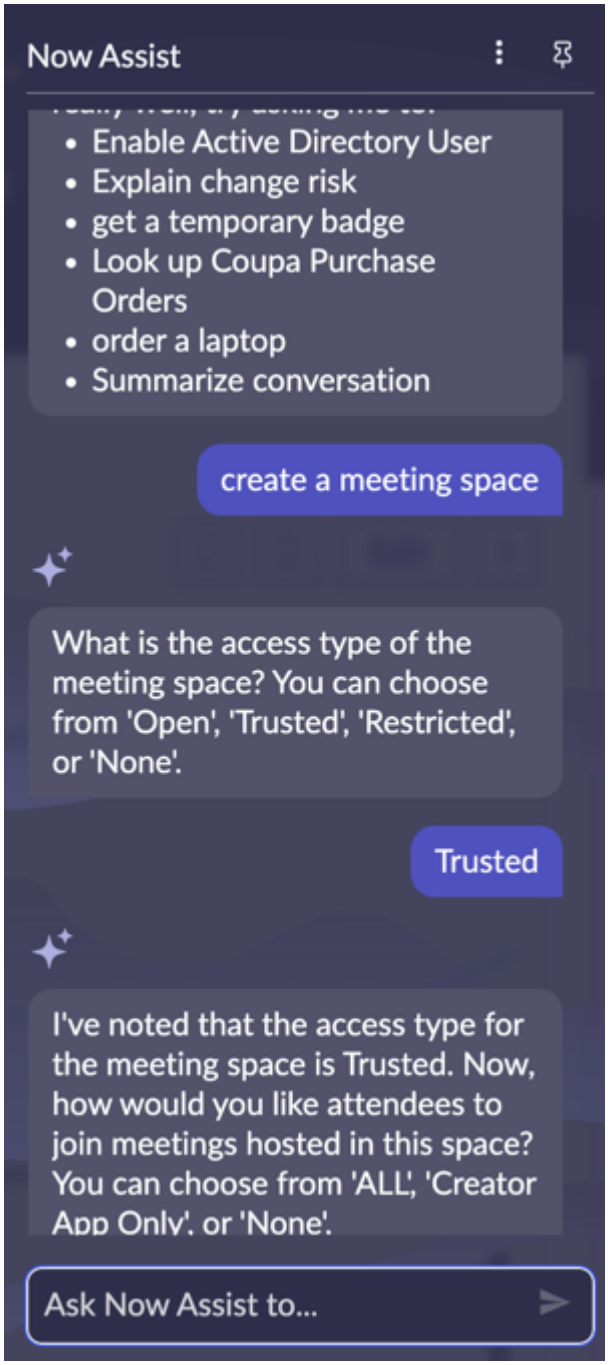
Available conversational actions

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

Supported actions

Action	Usage
Create Meeting Space	In the Ask Now Assist to... field, enter the phrase that asks Now Assist to perform the action and press **Enter**. For example, `Create a meeting space`.
Update Meeting Space	In the Ask Now Assist to... field, enter the phrase that asks Now Assist to perform the action and press **Enter**. For example, `Update a meeting space`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Meet spoke.

Set up the Google Meet spoke

Integrate the ServiceNow instance and Google Meet by creating a custom OAuth application in the Google Cloud console to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Meet spoke.
- Role required: admin.

Create OAuth credentials for Google Meet API

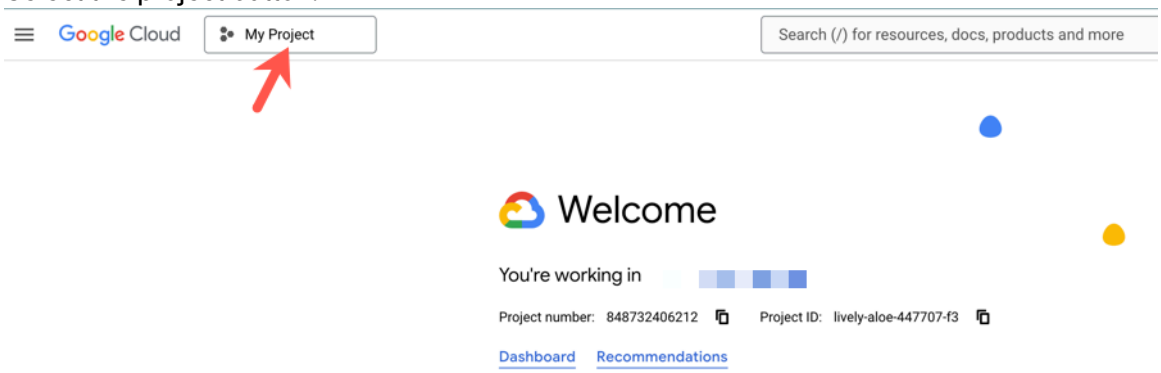
Create OAuth credentials that your ServiceNow instance uses to have its requests for connection authenticated by Google Cloud console.

Before you begin

Role required: admin

Procedure

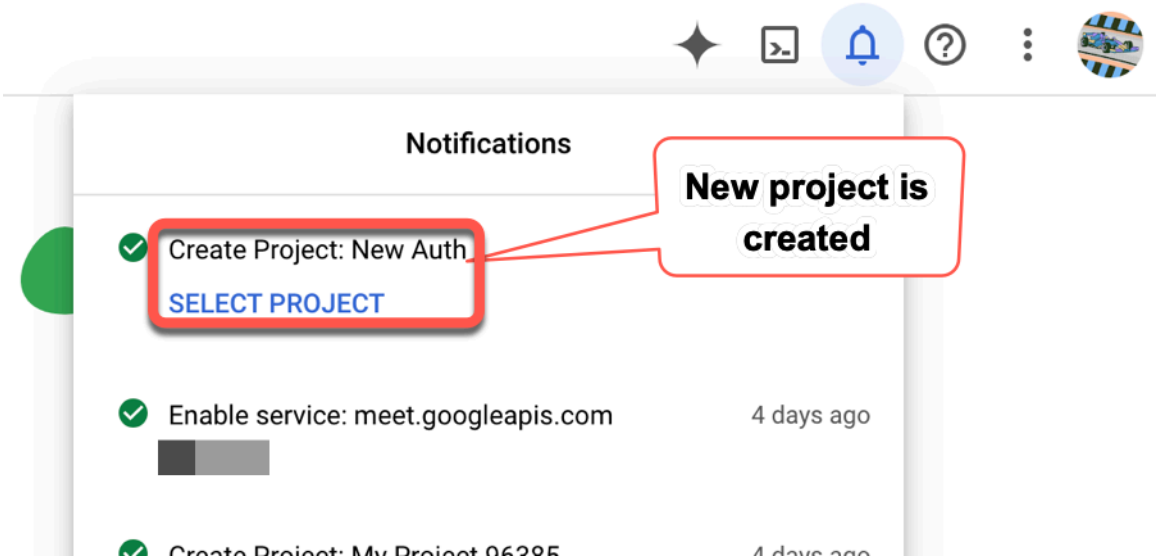
1. Log in to the Google Cloud console.
2. Select the project button.



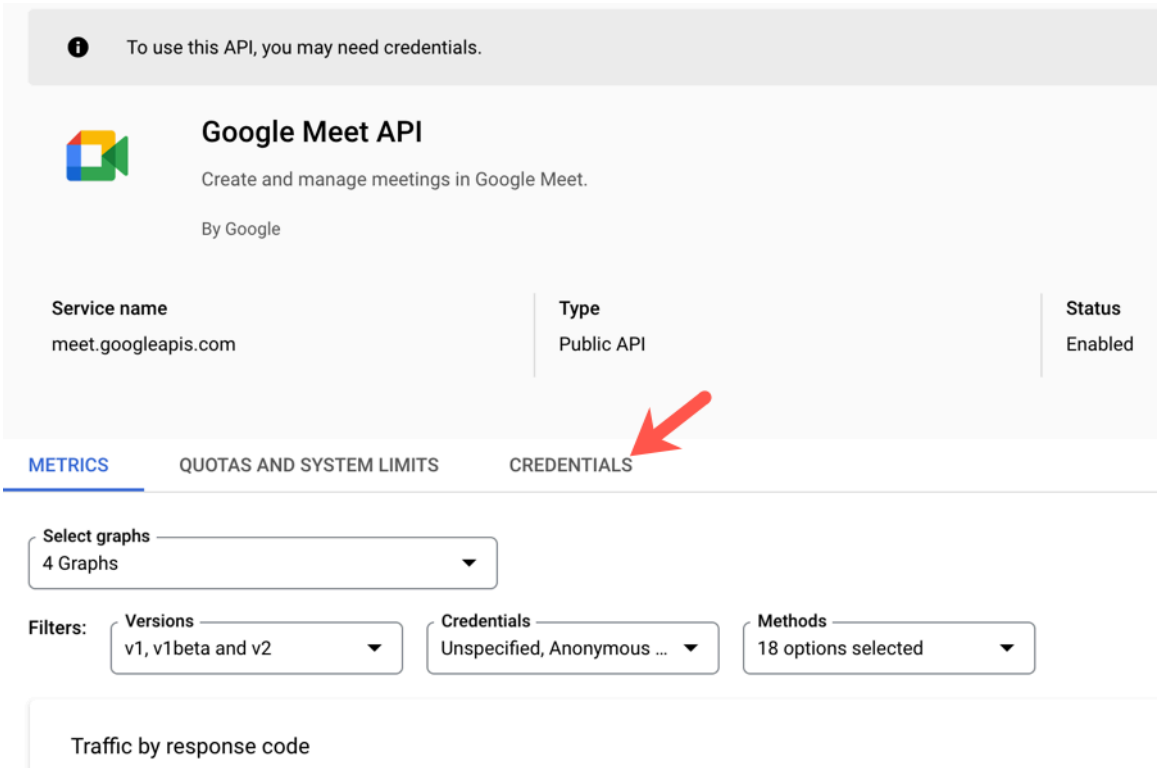
3. On the Select a project window, select **NEW PROJECT**.
4. Set up the new project.
   a. In the Project name field, enter the project name.
   b. In the Location field, select **BROWSE** to select an organization.
   c. Select **CREATE**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notifications show that the project is created.

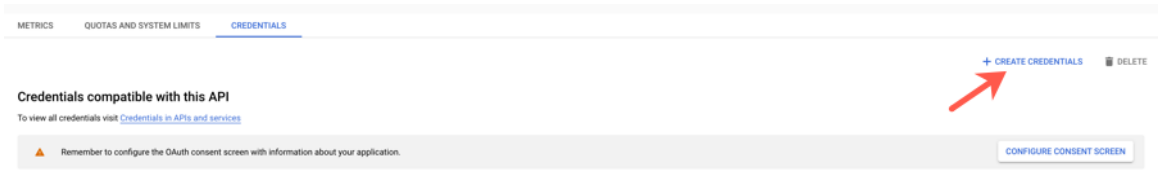


5. Select **SELECT PROJECT**.
6. Navigate to **Navigation Menu** > **APIs & Services** > **Enabled APIs & Services**.
7. Select **+ENABLE APIS AND SERVICES**.
8. In the Search for APIs and services field, enter `Google Meet REST API` and press **Enter**.
9. Select **Google Meet REST API**.
10. Select **ENABLE**.
11. Select the **CREDENTIALS** tab.



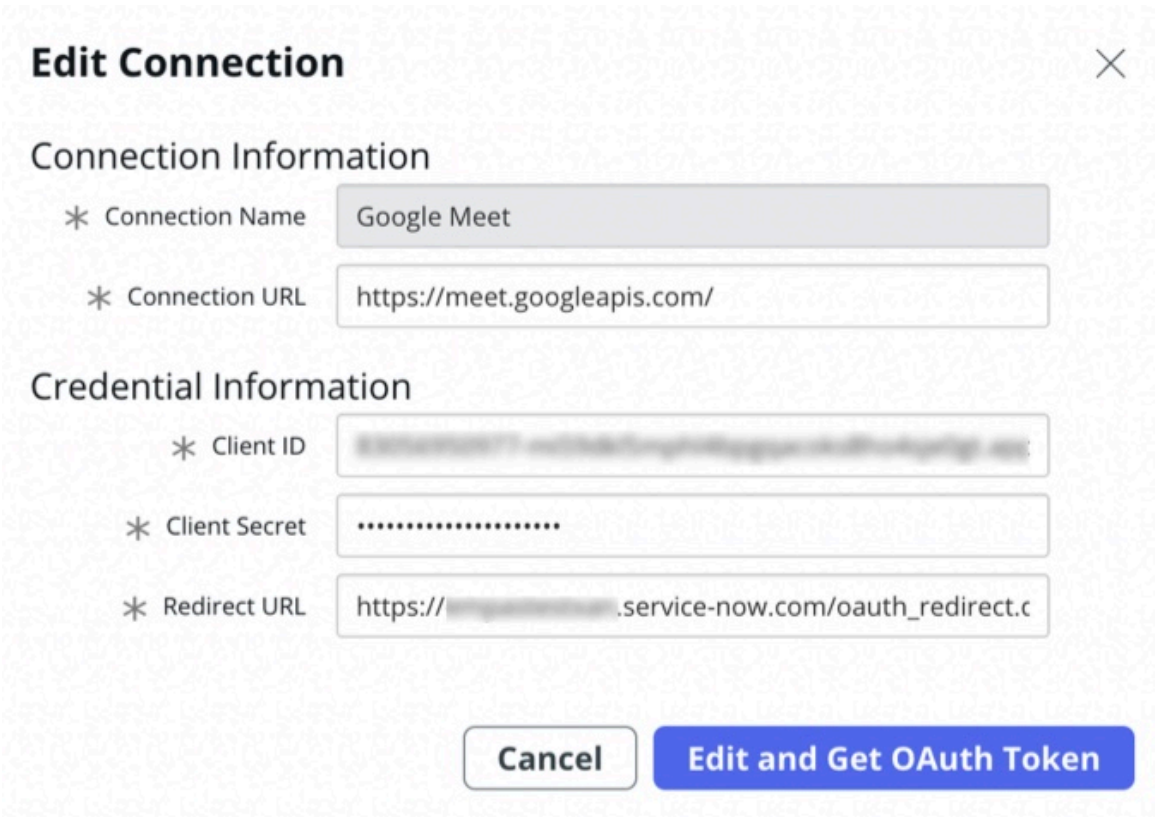
12. Select **+ CREATE CREDENTIALS** and then select **OAuth client ID.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



13. Select **CONFIGURE CONSENT SCREEN**.

> **Note:**
> Refresh token expires in 7 days when a Google Cloud Platform project with an OAuth consent screen is configured for an external user type and its publishing status is **Testing**. To get new OAuth, click **Edit and Get OAuth Token** by navigating to the associated connection.



14. Select **Internal**.
15. Select **CREATE**.
16. Fill the form.

OAuth application details

Field	Description
App name	Option to provide a name of the OAuth application that you're creating.
User support email	Option to provide the email ID that the users of the OAuth application can use to request support.
Developer contact information	Option to provide the email ID of the developer of the OAuth application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1 OAuth consent screen — 2 Scopes — 3 Test users — 4 Summary

OAuth consent screen management is changing. This page has been replaced with a new, easier-to-use experience. The current pages will only be available for a few more days.

GO TO NEW EXPERIENCE

App information

This shows in the consent screen, and helps end users know who you are and contact you

App name *

The name of the app asking for consent

User support email *

For users to contact you with questions about their consent. Learn more

App logo

This is your logo. It helps people to recognise your app and is displayed on the OAuth consent screen.
After you upload a logo, you will need to submit your app for verification unless the app is configured for internal use only or has a publishing status of 'Testing'. Learn more

Logo file to upload BROWSE

Upload an image, not larger than 1 MB on the consent screen that will help users recognise your app. Allowed image formats are JPG, PNG and BMP. Logos should be square and 120px by 120px for the best results.

App domain

To protect you and your users, Google only allows apps using OAuth to use Authorised Domains. The following information will be shown to your users on the consent screen.

Application home page

Provide users a link to your home page

Application privacy policy link

Provide users a link to your public privacy policy

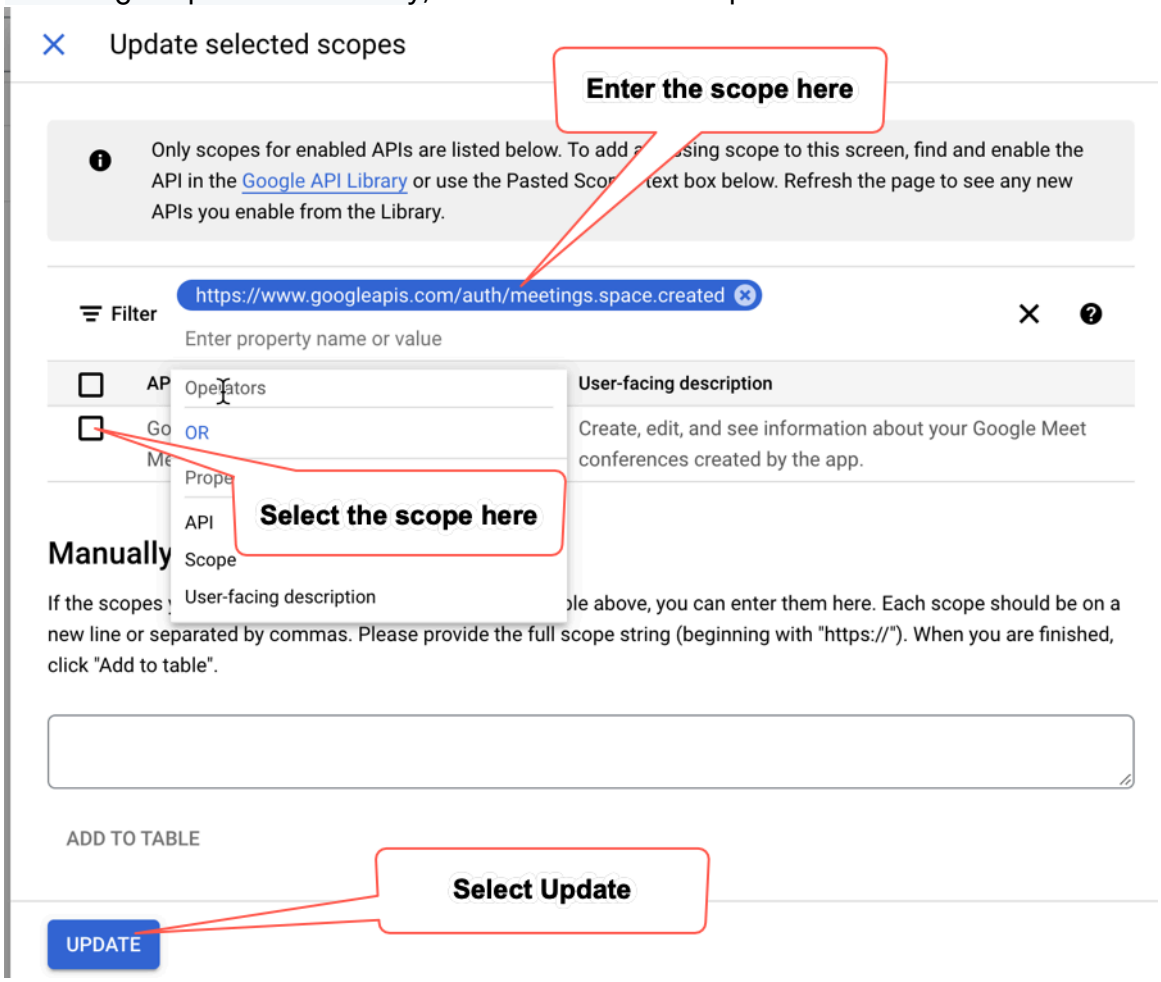
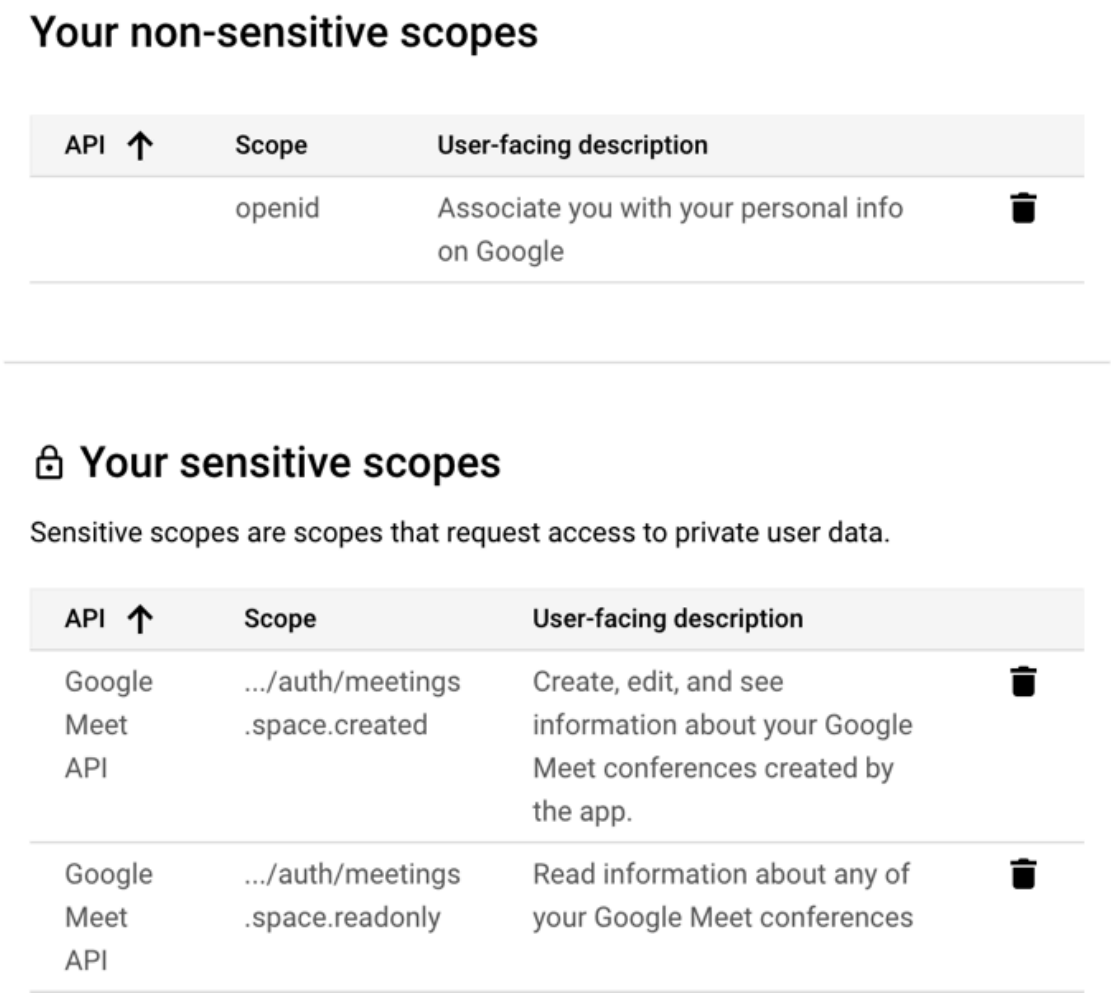
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

17. Select **SAVE AND CONTINUE**.
18. Select **ADD OR REMOVE SCOPES**.
19. In the Filter field, enter the scope `meetings.space.created`, `openid`, and `meetings.space.readonly`, and then select the scope value.



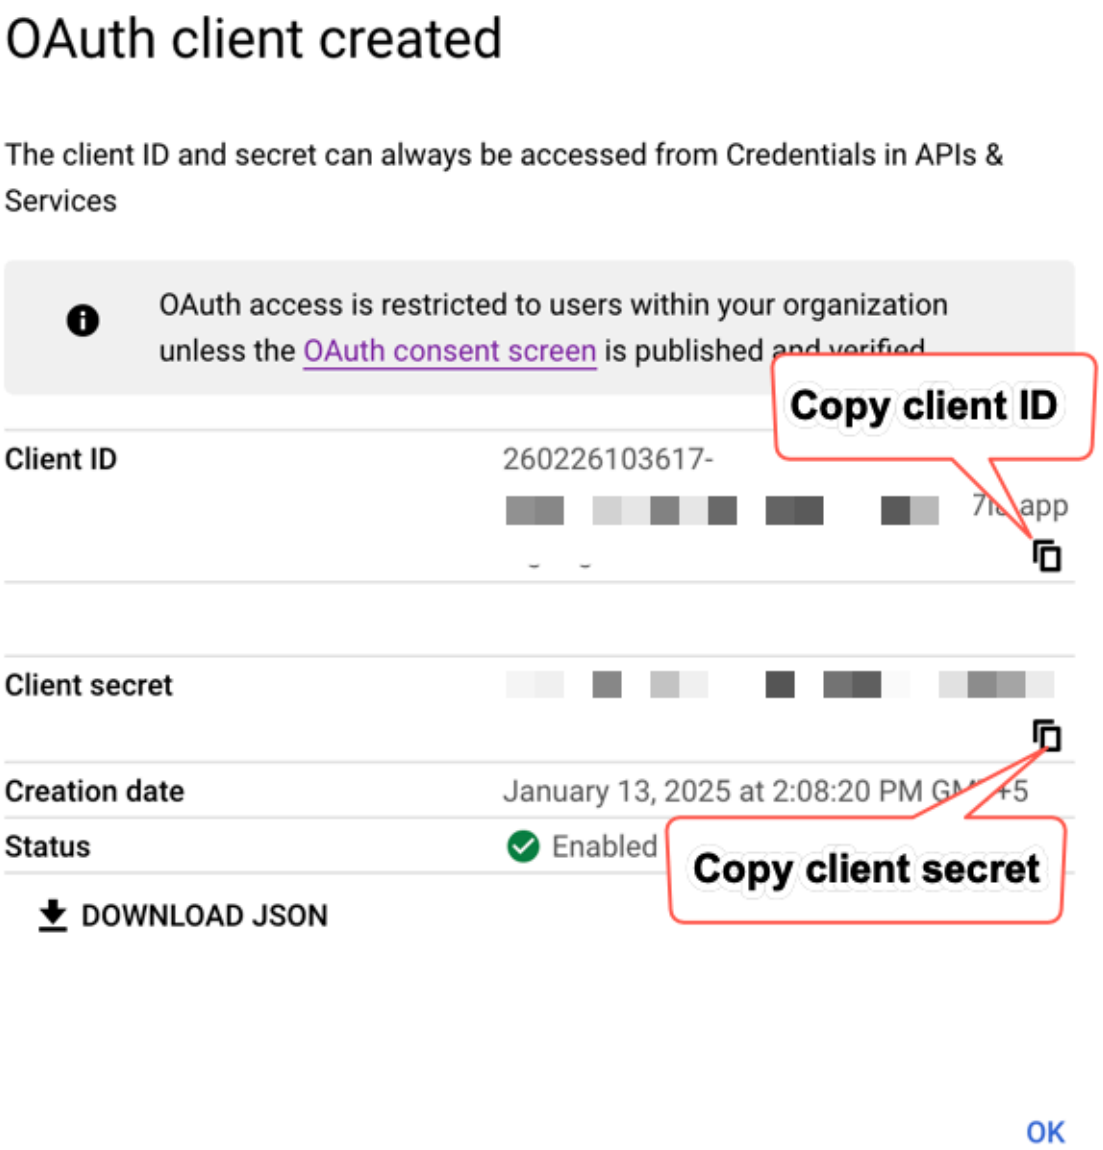
20. Select **UPDATE**.
    The scopes appear under the Your non-sensitive scopes and Your sensitive scopes sections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



21. Select **SAVE AND CONTINUE**.
22. On the left panel, select **Credentials**.
23. Navigate to **+CREATE CREDENTIALS OAuth client ID**.
24. In the Application type field, select **Web application**.
25. In the Name field, enter a name of the application.
26. Under the Authorized redirect URIs, select **+ADD URI**.
27. In the URI1 field, enter the redirect URL in the format `https://<your-instance-name>.service-now.com/oauth_redirect.do`.
28. Select **CREATE**.
29. Copy the client ID and client secret and store at secure place.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



30. Select **OK**.

Configure connection for Google Meet spoke

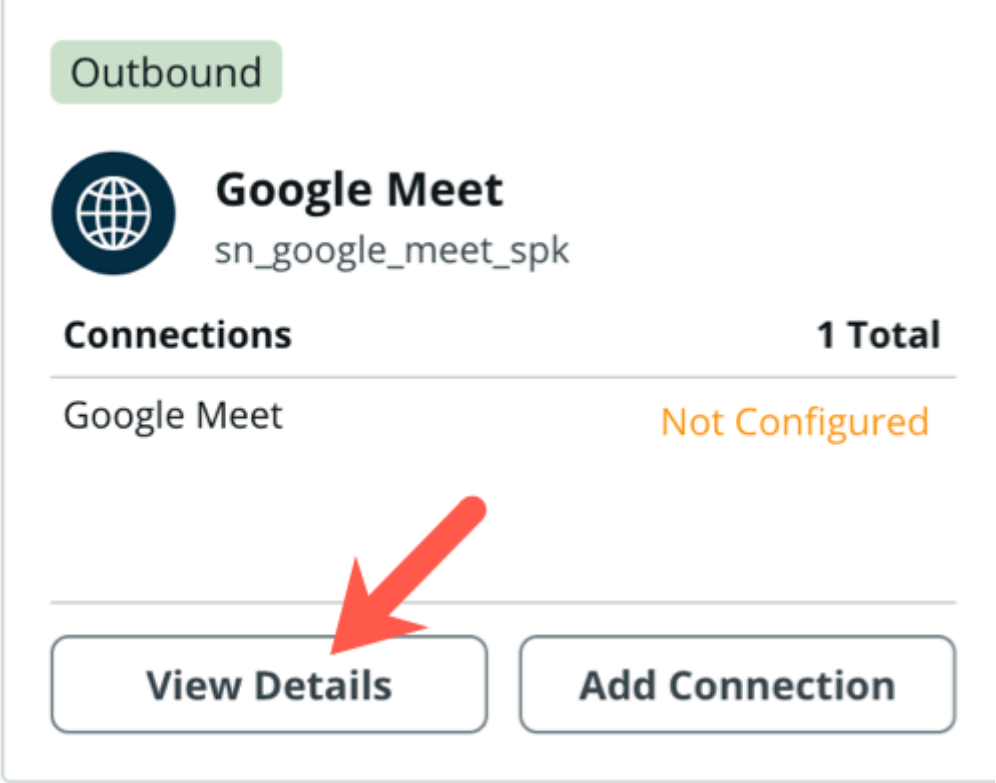
Set up the connection between your ServiceNow instance and the Google Meet APIs.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Confirm that the **Outbound** tab is selected.
4. In the Search all connections field, enter `Google Meet`.
5. On the Google Meet tile, select **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

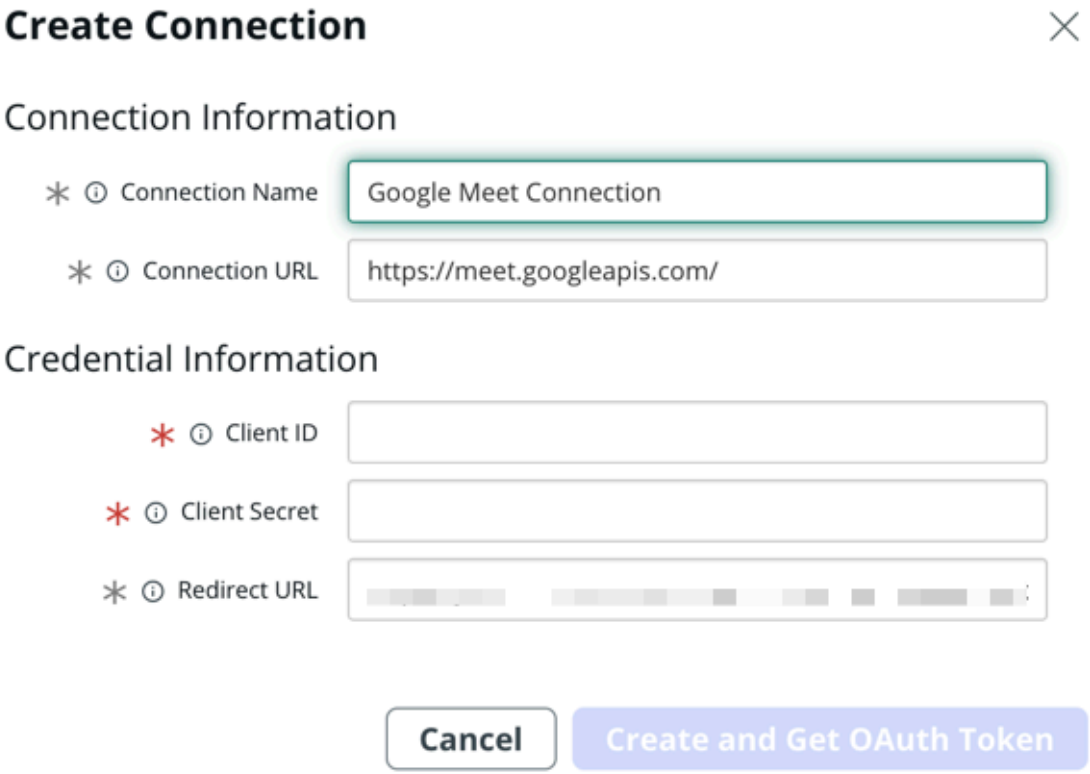


6. Select **Configure**.
7. Fill the form.

Create Connection for Google Meet spoke

Field	Description
Connection name	Name that uniquely identifies the connection record.
Connection URL	URL to Google Meet APIs. Enter `https://meet.googleapis.com`.
Client ID	OAuth client ID of the Google Meet OAuth app that you had created in the Google Cloud console.
Client Secret	OAuth client secret of the Google Meet OAuth app that you had created in the Google Cloud console.
Redirect URL	OAuth redirect URL of your ServiceNow instance. Enter in this format `https://<your-instance-name>.service.now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Select **Create and Get OAuth Token**.
   You must log in to the Google Cloud console to fetch the OAuth token.

Google Persistent Disk Spoke

Manage disks, snapshots, and images in Google Persistent Disk from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Persistent Disk spoke v1.0.2 is the latest version.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Google Cloud Virtual Network Spoke (sn_gcp_vpc_spoke)
- Google Compute Engine Spoke (sn_gcompute_spoke)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Google Persistent Disk account requirements

The Google Persistent Disk spoke requires a custom app that you create in the Google Cloud Platform.

Spoke actions

The Google Persistent Disk spoke provides actions to automate Google Persistent Disk when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

Category	Action	Description	Permissions Required
Disk Management	Create Disk	Creates a persistent disk in the specified project.	compute.disks.create
	Delete Disk	Deletes the specified persistent disk.	compute.disks.delete
	Get Disk	Retrieves details of the specified persistent disk.	compute.disks.get
	Get Disk Type by Zone	Retrieves the details of the specified disk type by zone.	compute.diskTypes.get
	Resize Disk	Resizes the specified persistent disk.	compute.disks.resize
Image Management	Create Image for Disk	Creates an image in the specified project.	compute.images.create
	Create Image for Image	Creates an image in the specified project.	compute.images.create
	Create Image for Snapshot	Creates an image in the specified project.	compute.images.create

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
	Delete Image	Deletes the specified image.	compute.images.delete
	Get Image	Retrieves details of the specified image.	compute.images.get
Metadata Retrieval Management	List Disk Types by Zone	Retrieves a list of disk types available to the specified project.	compute.diskTypes.list
	List Disks	Retrieves a list of persistent disks contained within the specified zone.	compute.disks.list
	List Images	Retrieves the list of images available to the specified project.	compute.images.list
	List Snapshots	Retrieves the list of snapshot resources contained within the specified project.	compute.snapshots.list
Snapshot Management	Create Snapshot	Creates a snapshot of a specified persistent disk.	compute.snapshots.create
	Delete Snapshot	Deletes the specified snapshot resource.	compute.snapshots.delete
	Get Snapshot	Retrieves details of the specified snapshot.	compute.snapshots.get

For more information about the required permissions, see IAM permissions reference.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Persistent Disk spoke.

Set up the Google Persistent Disk spoke

Integrate the ServiceNow instance and Google Persistent Disk spoke by using G Suite credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Persistent Disk spoke.
- Activate and set up the Google Compute Engine Spoke.
- Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Open record for the Google Compute Engine spoke. For example, `Google Compute Cred`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. For **Credential alias**, select the Connection and Credential alias record of the Google Persistent Disk spoke.
4. Right-click the form header and click **Save**.
5. Click **Get Oauth Token**.

Google Sheets Spoke

Manage spreadsheets in Google Sheets from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Sheets spoke v1.0.7 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for Google Sheets v4, but may be compatible with later versions.

Spoke requirements

Google Cloud Platform account.

Spoke actions

The Google Sheets spoke provides actions to automate Google Sheets tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Sheet Management	Add Row	Adds a row with the specified values to a sheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Clear Cells	Clears the values in the sheet for the specified range.
	Copy Sheet	Copies a sheet from a spreadsheet to another spreadsheet.
	Create Sheet	Creates a sheet in the specified spreadsheet.
	Delete Sheet	Deletes a sheet in the spreadsheet.
	Get Cell Values	Retrieves the values in the sheet for the specified range.
	Update Cells	Updates a range of cell values in a sheet.
Spreadsheet Management	Get Spreadsheet Details	Retrieves details about the specified spreadsheet.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Sheet spoke.

Set up the Google Sheet spoke

Set up an outbound integration between your ServiceNow instance and the Google Sheets by setting up a connection and credential record.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Sheets spoke plugin.
- Role required: admin.

About this task

The Google Sheets API authenticates the requests from your ServiceNow instance through an OAuth application. You must Set up OAuth app on Google Sheets API by visiting the https://console.developers.google.com/. The connection and credentials record contains the information the Google Sheets API must authenticate the requests from your ServiceNow instance.

Set up OAuth app on Google Sheets API

Set up an OAuth application on the Google Sheets API to enable authentication of requests from your ServiceNow instance.

Before you begin

- Create a business account on https://console.developers.google.com/
- Create a domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can only register one email address per domain in Google Workspace.

- Role required: admin

Procedure

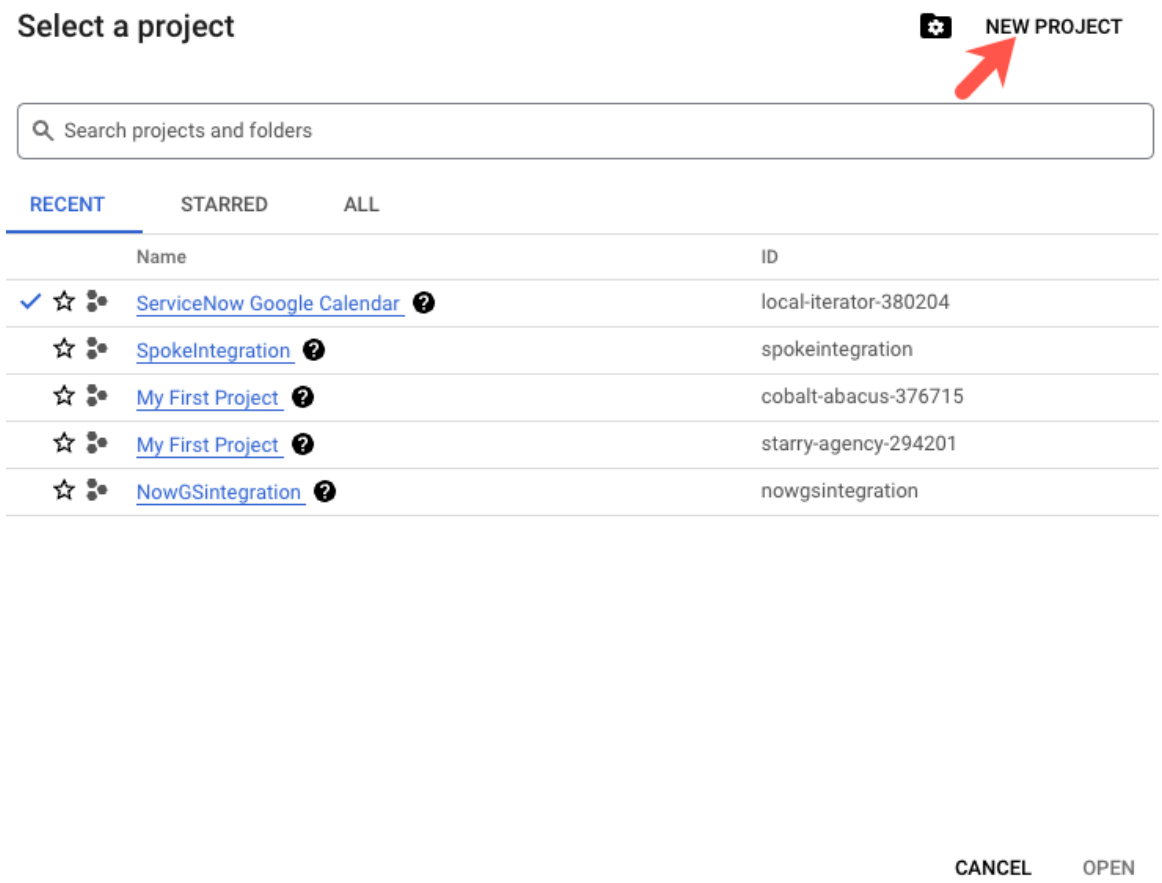
1. Set up a project on the Google Workspace.
   The project includes the details of the OAuth application and the Application Programming Interface (API) permissions, if applicable.

   a. Log in to https://console.developers.google.com/ with the same domain email ID and password as mentioned in the prerequisites.

   b. Select the button.

   c. Select **NEW PROJECT**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

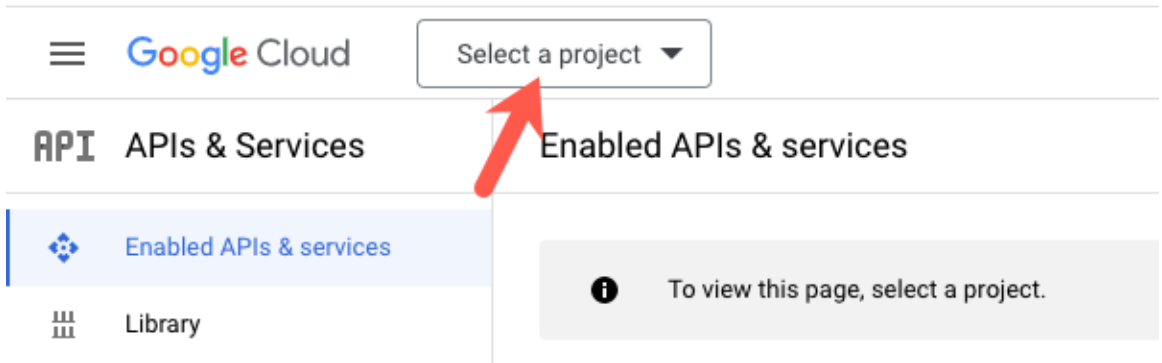


d. In the Project name* field, enter a unique name for the project.

e. In the Location* field, select **BROWSE** to select an organization.

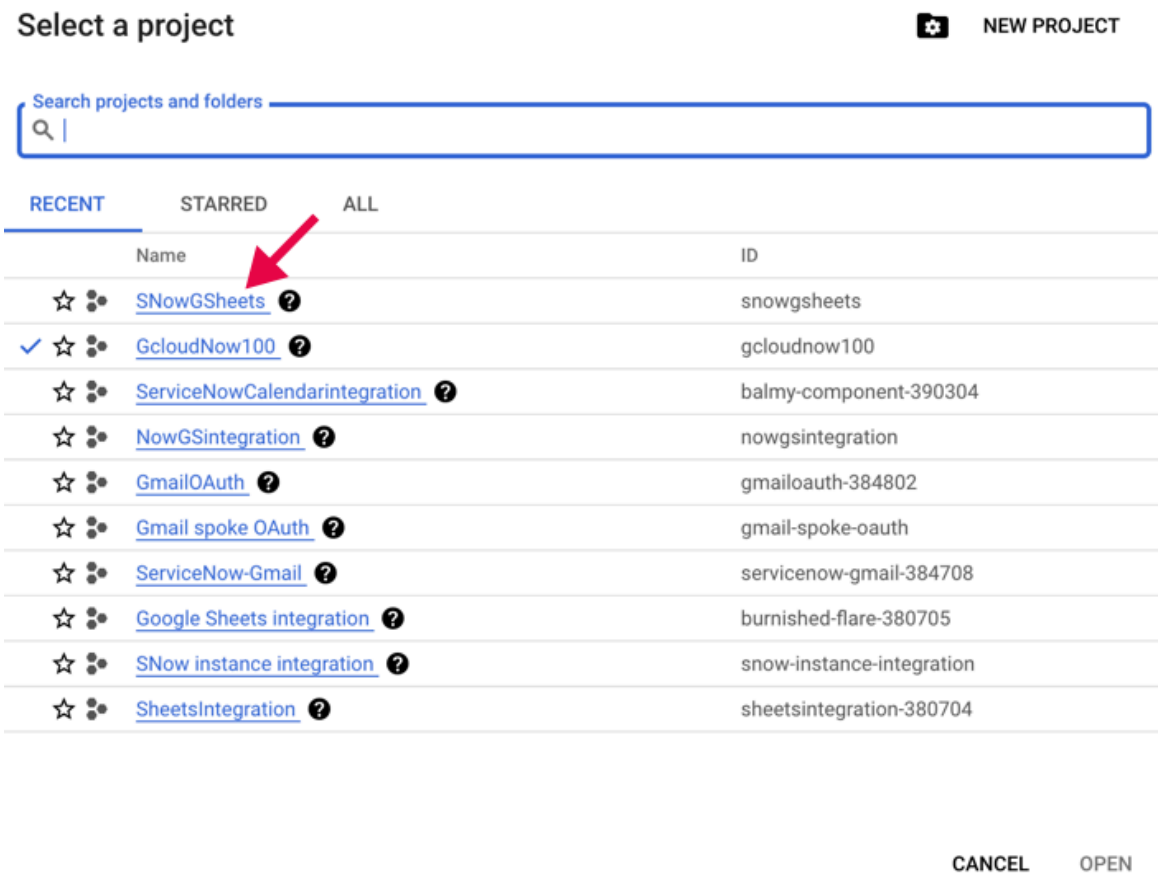
f. Select **CREATE**.
The project is created.

g. Select the button.



2. Select the project that you created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Enable the Google Sheets API.

   a. Click **+ENABLE APIS AND SERVICES**.

   b. On the Welcome to the API Library page, enter `Google Sheets` in the search box.

   c. Press **Enter**.

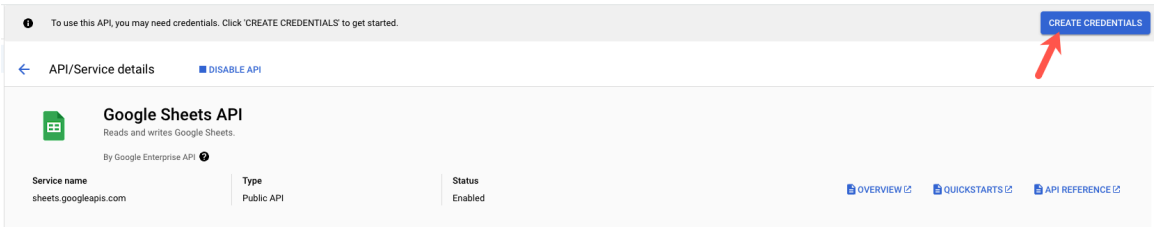
   d. Select the Google Sheets API button.

   e. Select **ENABLE**.
   The Google Sheets APIs are enabled on your project.

4. Create the OAuth app and credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **CREATE CREDENTIALS**.



b. Fill the form.

Google Sheets API credentials

Field	Description
Select an API*	Name of the API for which you're creating the credentials. **Note:** Ensure that you select Google Sheets API.
What data will you be accessing? *	Type of data your ServiceNow will access through the APIs. **Tip:** Select User data.

c. Click **NEXT**.

d. Fill the form.

Google Sheets API credentials

Field	Description	Mandatory?
App name	Name of the OAuth app.	Yes
User support email	Email at which users can send queries to you about their consent.	Yes
Logo file to upload	Logo representing the OAuth app.	No
Developer contact information	Google will contact the developer of the OAuth app if there are any changes to the project.	Yes

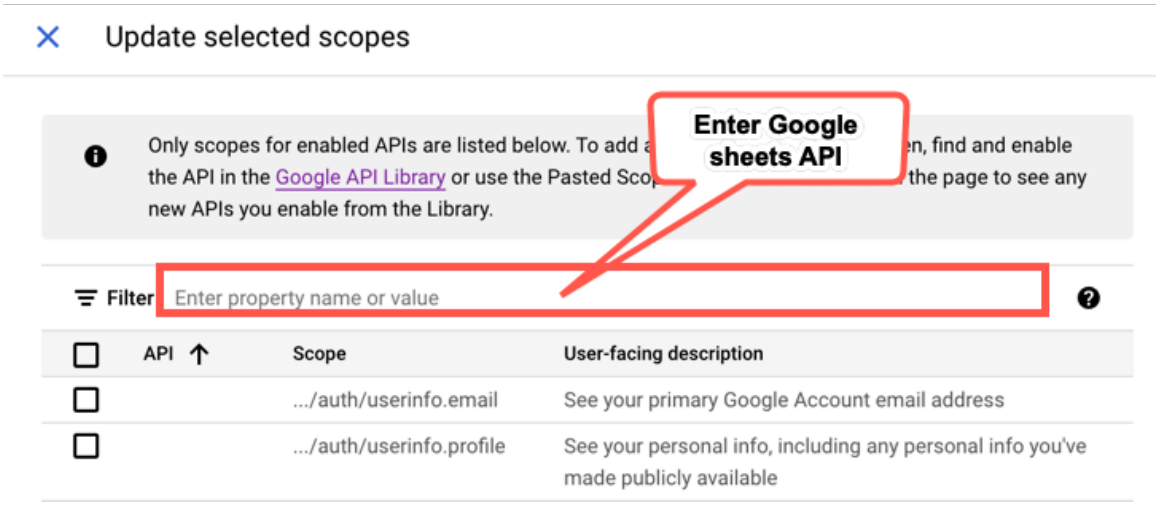
e. Click **SAVE AND CONTINUE**.

5. Optional: Define the API scopes.
API scopes enable you to select specific APIs. For example, /auth/spreadsheets scope enables you to create, edit, or remove spreadsheets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click **ADD OR REMOVE SCOPES**.

b. Enter `Google sheets API`, as shown in the image.



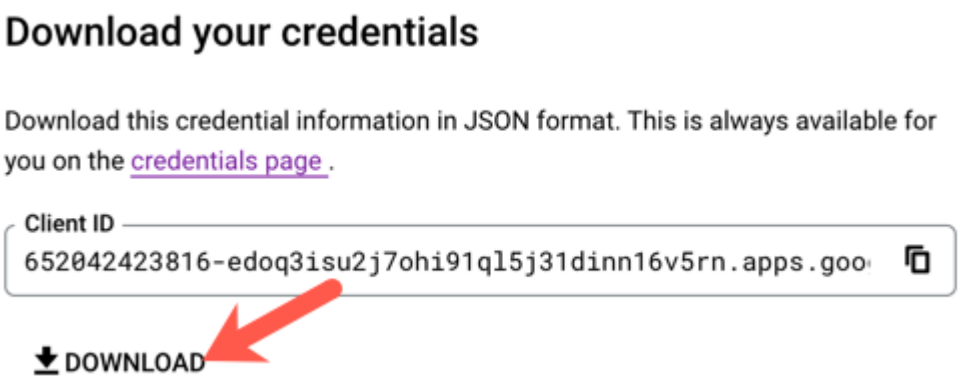
c. Select one or more scopes.

d. Click **UPDATE**.

e. Click **SAVE AND CONTINUE**.

6. Generate OAuth client ID.
   a. From the Application type* list, select `Web application`.
   b. In the Name* field, enter a unique name of the OAuth client.
7. Under the Authorised redirect URIs heading, click **+ ADD URI**.
8. In the URI field, enter the redirect URI in the following format: `https://instance.service-now.com/oauth_redirect.do`.
9. Click **CREATE**.
   The OAuth details are generated in a JSON file.

Tip:
Click DOWNLOAD to download the JSON file for later reference.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Click **DONE**.
    You've created the OAuth application on Google Workspace.

Create Connection and Credential record for Google Sheets spoke

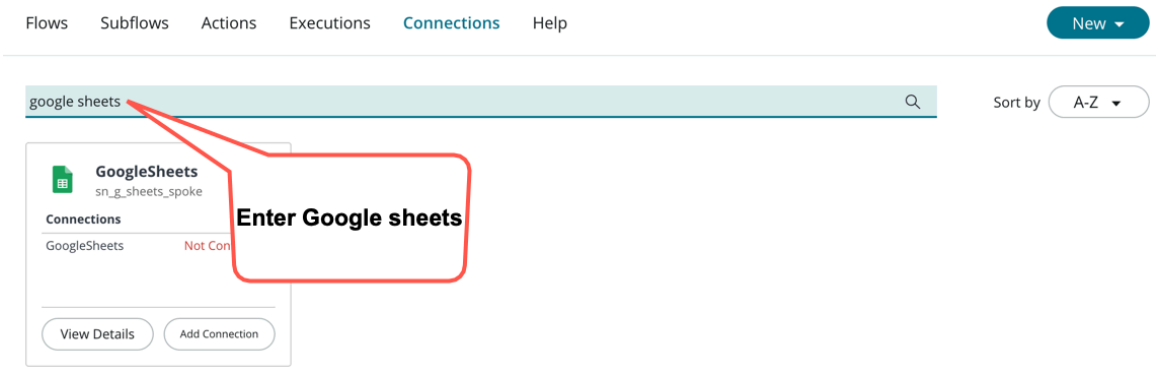
Create a connection and credential record that contains the details required to connect to the Google Sheets Application Programming Interfaces (API) on the Google Workspace.

Before you begin

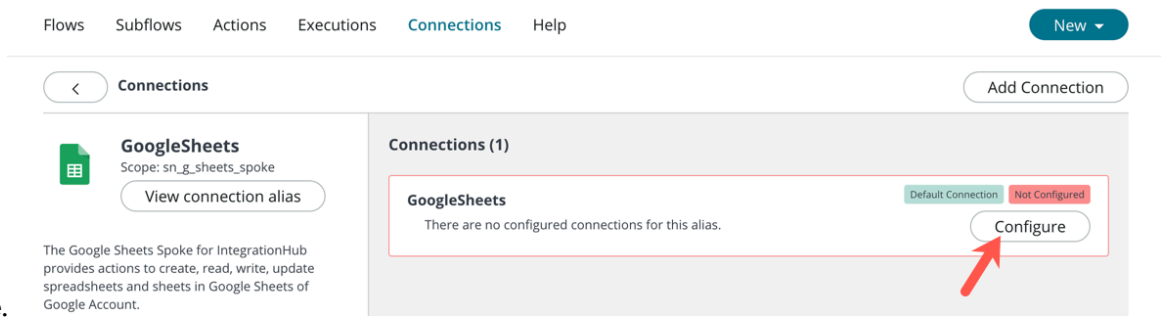
- Create an OAuth application for the Google Sheets APIs in the Google Workspace. To learn how to create an OAuth application, see Set up OAuth app on Google Sheets API.
- Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Click Connections.
3. In the Search all connections field, enter `Google sheets`.



4. On the GoogleSheets card, click **View Details**.
5. Click **Configure**, as shown in the image.



6. Fill the form.

Configure Connection

Field	Description
Connection Name	Name of the connection. **Note:** The field is read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	The URL used for connecting to Google Sheets APIs. This field is automatically set to `https://sheets.googleapis.com/v4/spreadsheets`
Credential Name	Name of the credential. This field is automatically set to `Google Sheets Spoke Credential`.
OAuth Entity Name	Name of the OAuth entity profile. This field is automatically set to `Google Sheets Spoke OAuth`.
OAuth Client ID	Client ID of the Google Sheets application you registered in G Suite.
OAuth Client Secret	Client Secret generated when you registered the application in Google API Console.
OAuth Redirect URL	The redirect URL. The format of the URL is `https://<your-instance>.service-now.com/oauth_redirect.do`

7. Click **Create and Get OAuth Token**.

Google Tasks Spoke

Manage Google tasks and list from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

API version v1.

Spoke version

Google Tasks spoke v1.4.0 is the latest version.

Spoke subflows

The Google Tasks spoke provides sample subflows in the draft state to demonstrate automating Google Tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Move a ServiceNow attachment to Google Tasks	Copies an attachment from ServiceNow to Google Tasks.

Spoke actions

The Google Tasks spoke provides actions to automate Google Tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Task Management	Complete Task	Mark a task complete in a task list.
	Create Task	Create a task in a task list.
	Delete Task	Delete a task from a task list.
	Get Task	Retrieve details of a specified task from a task list.
	Look Up Tasks	Retrieve details of specified tasks from a task list.
	Update Task	Update details of the specified task in a task list.
Task List Management	Create Task List	Create a task list in your Google Tasks account.
	Delete Task List	Delete the specified task list.
	Get All Task Lists	Retrieve the details of all task lists in your Google Tasks account.
	Get Task List	Retrieve details of a specified task list.
	Update Task List	Update details of a specified task list.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
Google Tasks Task Management AI Agents	Manages task management tasks (that is, get a tasklist ID from a tasklist name, delete a task, get a task, update a task, create a task, complete a task) in Google Tasks.
Google Tasks Tasklist Management AI Agents	Manages tasklist management tasks (that is, update a tasklist, delete a tasklist, get a tasklist, create a tasklist, get all tasklists, get a tasklist ID from a tasklist name) in Google Tasks.
Google Tasks AI Agents	Retrieves tasklist ID from a tasklist name from Google Tasks.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Google Tasks spoke account requirements

The Google Tasks spoke requires a custom app that you create in the Google Developers Console.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Tasks spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Google Tasks alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Google Tasks spoke

Integrate the ServiceNow instance and the Google Tasks spoke by using the G Suite credentials to authenticate the ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Tasks spoke.
- Role required: admin.

Set up an OAuth 2.0 Client application

Create a custom OAuth application to enable OAuth 2.0 authentication of the ServiceNow by the Google Workspace.

Before you begin

Google Tasks integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or Gmail login created with the domain.

Role required: admin.

About this task

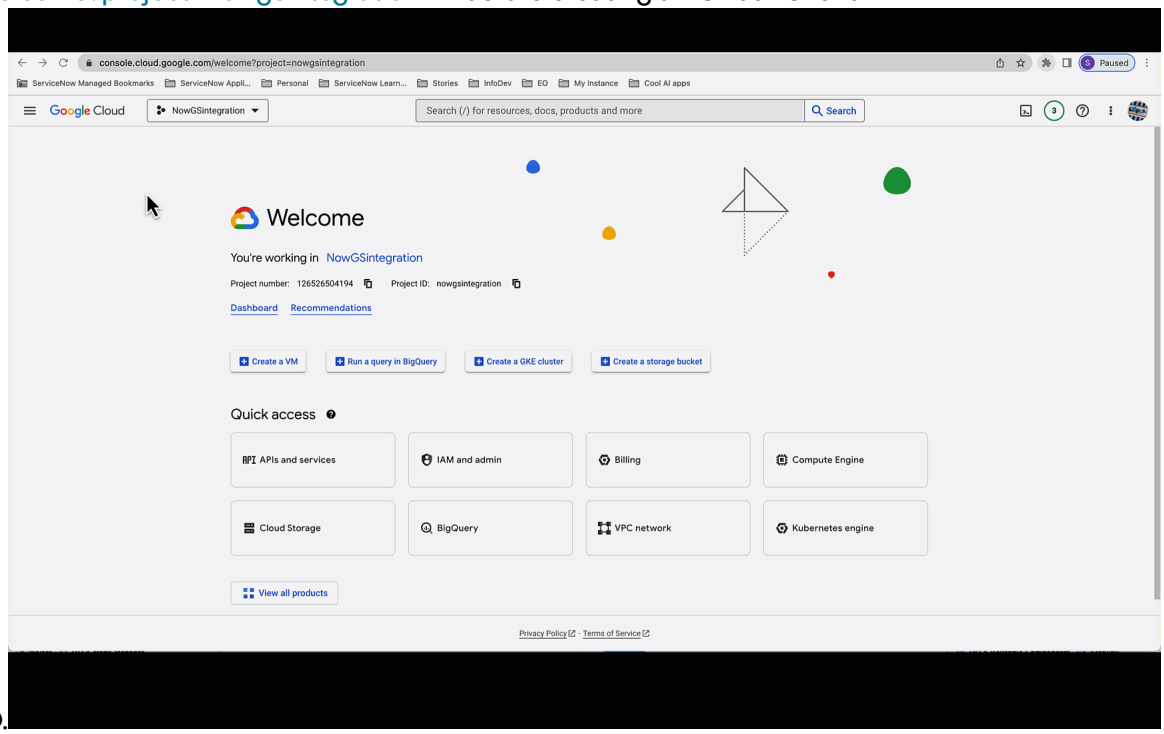
Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select **OAuth consent screen**.
3. Enter the application name, and specify the Authorized domain `service-now.com`.
4. Select **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **Web application**.
7. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and select **Create**.
8. Copy the Client ID and the Client Secret to a text file.
   The animation demonstrates the setting up of OAuth Client ID. You must activate the Google Tasks API on https://console.cloud.google.com/

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

welcome?project=nowgsintegration before creating an OAuth Client ID.



Tip:
Save the JSON file containing the OAuth client details for later reference.

Configure a connection for Google Tasks spoke

Create a connection and credential record to establish a connection between the ServiceNow instance and the Google Workspace.

Before you begin

Role required: admin.

About this task

The connection and credentials contain the details such as the client ID, client secret, and the redirect URL that the Google Workspace must authenticate the ServiceNow instance.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select Integrations.
3. In the Search all connections field, enter `Google Tasks`.
4. On the Google Tasks tile, select **View Details**.
5. Select **Configure**.
6. Fill the form with the details given in the table.

Configure connection form

Field	Description
Connection Name	Name of the connection between the Google Workspace and the ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The default name is Google Tasks and it's read-only. However, you can provide custom names when you set up more connection and credential records after this record.
Connection URL	Enter the URL `https://www.googleapis.com` **Note:** Make sure that you don't include spaces before or after this URL. If there are spaces, the connection fails. .
OAuth Client ID	The OAuth client ID generated when you created the OAuth client ID.
OAuth Client Secret	The OAuth client secret generated when you created the OAuth client ID.
OAuth Redirect URL	The OAuth redirect URL. It must be in the format https://<instance-name.service-now.com>/oauth_redirect.do.

7. Select **Configure and Get OAuth Token**.

GoTo Spoke

The GoTo spoke provides actions to view and analyze meaningful usage data for GoTo software subscriptions. Analyze usage for GoToMeeting, GoToWebinar, and GoToConnect to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

GoTo spoke v2.0.1 is the latest version.

Supported versions

This spoke was built for LogMeIn Admin Center v5.29.0, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

GoTo admin account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The GoTo spoke provides actions to automate GoTo tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Connect Management	Look up Connect Users Stream	Retrieves a list of all users with a GoToConnect license within a GoTo account.
	Look Up User Activity Summary Stream	Retrieves a summary of all user activities, including information about the set of users and their associated metrics.
	Look Up User Activity Details Stream	Retrieves the activity records of the specific user.
License Management	Look Up Licenses	Retrieves a list of all product licenses within a GoTo account.
	Remove User License	Removes a user from a specified product license.
Meeting Management	Get Historical Meeting Report	Reports the meeting history of all organizers within a GoTo account during a given date range.
	Get Upcoming Meeting Report	Reports meetings that are scheduled for all organizers within a GoTo account during a given date range.
User Management	Delete User	Deletes a user from a GoTo account.
	Look up Authenticated User	Retrieves details of the authenticated user, including information about the accounts the user holds.
	Look up Users	Retrieves a list of all users within a GoTo account.
Webinar Management	Get Webinars	Retrieves a list of all webinars for a GoTo account.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the GoTo spoke.

Set up the GoTo spoke

Integrate the ServiceNow instance and GoTo by creating a custom OAuth client in GoTo to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the GoTo spoke.
- GoTo role required: User with a LogMeIn developer account and admin account.
- Role required: admin.

Create a GoTo OAuth client

Create an OAuth client for authenticating GoTo API requests.

Before you begin

Role required: GoTo user with a LogMeIn developer account and admin account.

Procedure

1. From a web browser, open the GoTo Developer Center.
2. Sign in using your LogMeIn developer account.
   If you have not already set up a LogMeIn developer account, see How to login or create a developer account for detailed instructions.
3. From the LogMeIn Developers home page, select the **OAuth Clients** tab.
4. Click **Create a client**.
5. On the Details tab of the form, fill in the client details.

Details tab of Create Client form

Field	Description
Client name	Name of the OAuth client.
Description	Optional description for the OAuth client.
Redirect URLs	Redirect URL of the ServiceNow instance on which you are integrating your GoTo applications. Enter `https://<instance-url>/oauth_redirect.do`, where `<instance-url>` is the URL of your ServiceNow instance.

6. Click **Next**.
7. On the Scopes tab, specify the level of access that the OAuth client has to your GoTo users and applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scopes tab

Field	Description
Profile	OAuth scopes for getting and modifying user information for your authenticated users. The **Get user information** scope is enabled automatically. Select the check box to enable the **Modify user details** scope.
GoToMeeting, GoToWebinar, or GoTo Training	OAuth scope for creating, starting, and modifying sessions for your GoToMeeting, GoToWebinar, and GoTo Training applications. Select the check box to enable this scope. **Note:** The SaaS License Management GoTo integration does not support license management for the GoTo Training application.
GoTo Assist Remote Support or Service Desk	OAuth scope for creating, starting, and modifying sessions for the GoTo Assist Remote Support and Service Desk applications. Leave this check box unselected. **Note:** The SaaS License Management GoTo integration does not support license management for the GoTo Assist applications.
SCIM	OAuth scope for automating user management using the System for Cross-domain Identity Management (SCIM) protocol. Leave this check box unselected.
Admin Center	OAuth scope for managing LogMeIn users through the GoTo Admin Center. Select the check box to enable this scope.
GoToConnect	OAuth scope for initiating phone calls and other telephone services using GoToConnect. If the GoToConnect license is enabled, select these check boxes: ○ Access call history for phone lines in the PBX [cr.v1.read] ○ Retrieve your phone line information [users.v1.lines.read]

8. Click **Save**.
9. On the Credentials tab, copy the values in the **Client ID** and **Client secret** fields. Save them in a secure location for later use.
10. Select the check box to verify that you have stored the client secret.
11. Click **Done**.

Create a GoTo connection

Create a connection between your GoTo applications and your ServiceNow instance.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From your ServiceNow instance, navigate to **Process Automation** > **Flow Designer**.
   The Flow Designer launches in a new tab.
2. Select the **Connections** tab.
3. Click **View Details** for your GoTo connection.
4. From the list of available connections, locate GoTo and then click **Configure**.
   The Configure Connection dialog box opens.
5. In the dialog box, fill in the fields.

Configure Connection dialog box

Field	Description
Connection Name	Name of the GoTo connection. This field populates automatically.
Name	Name of your GoTo credentials. This field populates automatically.
OAuth Client ID	Client ID that is assigned to your GoTo OAuth client.
OAuth Client Secret	Client secret that is assigned to your GoTo OAuth client.
OAuth Redirect URL	Redirect URL of the ServiceNow instance on which you are integrating your GoTo applications. This field populates automatically.

6. Click **Configure and Get OAuth Token**.
   The Authorize App dialog box opens.
7. On the dialog box, click **Allow**.
   The OAuth access token becomes available for authorizing your GoTo connection.
8. If the GoToConnect license is enabled, navigate to the **Connections** tab.
9. Find the connection for GoToConnect and click **View Details**.
10. Click **Get OAuth Token** to generate a token for GoToConnect.

GovNotify Spoke

Use the GovNotify spoke to send emails, texts, and letters based on automation in your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

GovNotify spoke v1.2.0 is the latest version.

Supported versions

This spoke was built for GovNotify API version v2, but may be compatible with later versions.

Spoke flows

The GovNotify spoke provides the sample flow, Send a Text Message to User to demonstrate sending a text message to the specified user. To customize the sample flow, copy it to the required application scope.

Spoke subflows

The GovNotify spoke provides the sample subflow, GovNotify Webhook Callback to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope.

Spoke actions

The GovNotify spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

Action	Description
Look up Notification Status by ID	Retrieves the latest notification by the notification ID.
Look up Notifications	Retrieves up to 250 messages and statuses that is one page.
Send a Letter	Sends a physical notification letter to a recipient.
Send a Text Message	Sends a text message to a recipient.
Send an Email	Sends an email notification to the recipient.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
GovNotify message manager	Manages notifications and messages (that is, send a text message, email, or letter, look up notifications, look up notification status by ID) in GovNotify.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke module

The GovNotify spoke adds the GovNotify Spoke application to your instance and includes these modules:

Module	Description
Client Details	Stores the client record that authenticates the requests.
Credentials	Contains the default credential record of the GovNotify spoke.
Templates	Displays the details of the templates in your GovNotify account.
Text Notifications	Displays the details of sent text messages.
Transactions	Displays the details of all sent messages. The records include transactions for emails, text messages, and letters.
Webhook Decision Answers	Stores the webhook answer record that triggers the required subflow.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the GovNotify spoke.

Set up the GovNotify spoke

Integrate ServiceNow instance and GovNotify account using JWT authentication to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the GovNotify spoke.
- Role required: admin.

Procedure

1. In the GovNotify account, create an API key.

   a. Log in to your GovNotify account as admin.

   b. Navigate to **API integration** and click **API Keys**.

   c. Click **Create an API key**.

   d. On the form, provide a name for the API key and select the required key type.

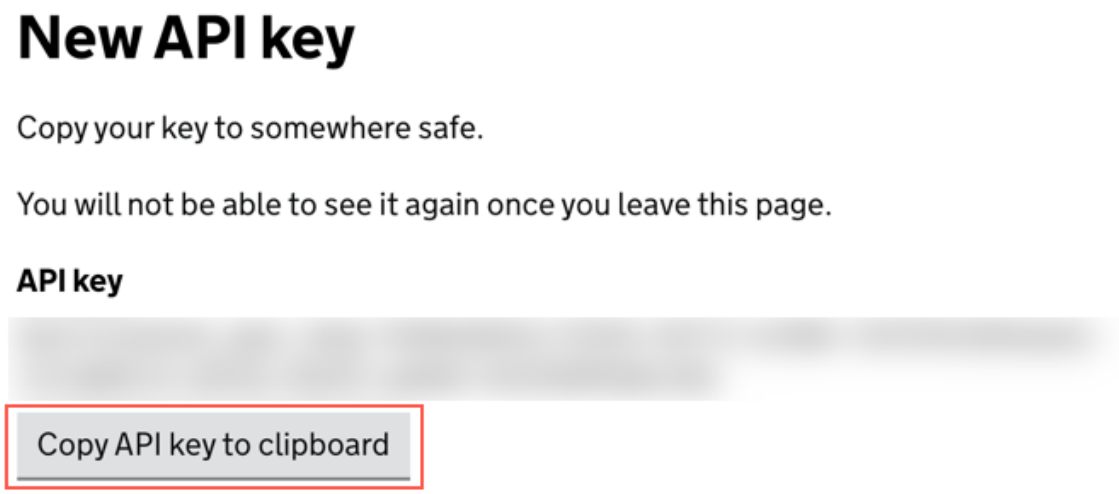
   e. Click **Continue**.
   The API key is displayed in this format: `{key_name}-{iss-uuid}-{secret-key-uuid}`. For example, if the API key is `my_test_key-26785a09-ab16-4eb0-8407-a37497a57506-3d844edf-8d35-48ac-975b-e847b4f122b0`:

   - API key name is: `my_test_key`
   - iss (service id) is: `26785a09-ab16-4eb0-8407-a37497a57506`
   - secret key or signing key is: `3d844edf-8d35-48ac-975b-e847b4f122b0`

   For more information, see Headers in GovNotify REST API documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Click **Copy API key to clipboard** and record the value for later use.



2. Configure the default JWT key record in your ServiceNow instance.
   a. Navigate to **System OAuth** > **JWT Keys**.
   b. Open the record, **GovNotify Key**.
   c. Enter the signing key you had copied from the API key in **Signing key**.
   d. Click **Update**.
3. Configure the default JWT provider record in your ServiceNow instance.
   a. Navigate to **System OAuth** > **JWT Providers**.
   b. Open the record, **GovNotify JWT Provider**.
   c. In the **Standard claims** tab, click the **iss** record.
   d. Enter the iss (service id) value you had copied from the API key in **Claim value**.
   e. Click **Update**.
4. Configure the default credential record in your ServiceNow instance.
   a. Navigate to **GovNotify Spoke** > **Credentials**.
   b. Open the record, **GovNotify Cred**.
   c. For **JWT Provider**, select the JWT provider you had configured.
   d. Click **Update**.
5. Configure the default connection and credential alias record in your ServiceNow instance.
   a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
   b. Open the record, **GovNotify**.
   c. In the **Connections** tab, click **New**.
   d. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP(s) Connection form

Field	Description
Credential	Credential record you had configured. For example, `GovNotify Cred`.
Connection URL	URL to connect to GovNotify account. Enter `https://api.notifications.service.gov.uk`.

e. Click **Submit**.

Set up the webhook for the GovNotify spoke

Configure a webhook to subscribe to GovNotify with a ServiceNow callback URL.

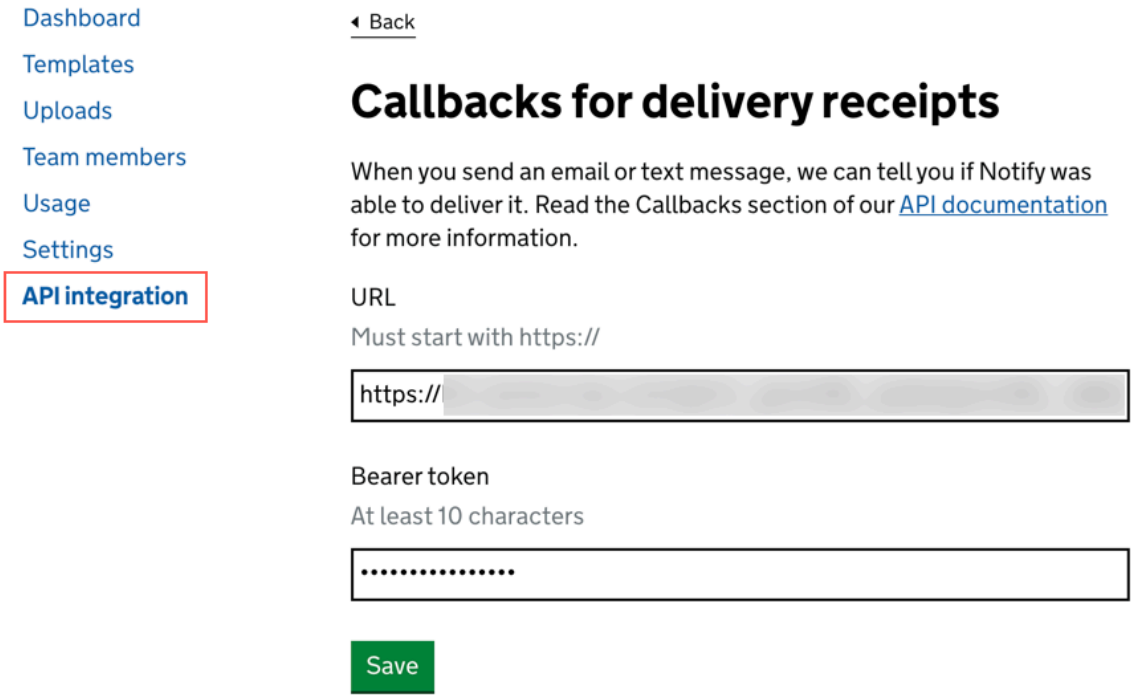
Before you begin

- Set up the GovNotify spoke
- Role required: admin

Procedure

1. Copy the scripted REST API URL for the GovNotify spoke from your ServiceNow instance.
   a. Navigate to **System Web Services** > **Scripted REST APIs**.
   b. Open the record, **GovNotify Callback**.
   c. Copy and record the value of **Base API path** for later use.
2. Add the callback URL in GovNotify account.
   a. Log in to your GovNotify account as admin.
   b. Navigate to **API integration** and click **Callbacks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. On the form, enter these values.

Field	Description
URL	Callback URL in this format: `https://<ServiceNow-instance>.com/<base-api-path>`.
Bearer token	Token to authenticate the request. Enter a token as per your requirement.

d. Click **Save**.

3. Create client record in your ServiceNow instance.

a. Navigate to **GovNotify Spoke** > **Client Details**.

b. Click **New**.

c. On the form, fill these values.

Field	Description
Name	Name to identify the client record.
Authorization Key	Bearer token you had provided in the GovNotify account.

d. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Create webhook answer record in your ServiceNow instance.

   a. Navigate to **GovNotify Spoke** > **Webhook Decision Answers**.

   b. Click **New**.

   c. On the form, fill these values.

Field	Description
Subflow	Subflow that needs to be triggered. Select the default subflow or the subflow you had configured as per your requirement.
Description	Description of the webhook decision answer.

   d. Click **Submit**.

5. Configure the webhook decision policy in your ServiceNow instance.

   a. Navigate to **System Definition** > **Decision Tables**.

   b. Open the record, **GovNotify Webhook Decision Policy**.

   c. In the **Decisions** tab, open the **Default decision** record.

   d. For **Answer**, select the sys_ID of the webhook answer record you had created.

   e. Click **Update**.
   The subflow that is configured in the webhook answer record is triggered when conditions in the webhook decision policy are met.

Gremlin Spoke

Simulate outages and manage attacks using Gremlin instance from your ServiceNow instance.

Important:

Starting with the Yokohama release, Gremlin Spoke is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. Spoke Generator provides the latest experience for this functionality.

For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Gremlin spoke v1.0.3 is the latest version.

Supported versions

This spoke was built for Gremlin version v1, but may be compatible with later versions.

Spoke requirements

- Set up clients as per your requirement.
- Admin access to the Gremlin dashboard.
- Team in your Gremlin account for integration with ServiceNow instance. For more information about creating teams, see Teams.
- Team ID and API Key of the team. Copy and record these value for later use. For more information about accessing these values, see the Signature-based Authentication section.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Gremlin spoke provides actions to automate Gremlin tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Attack Management	Create Attack	Creates an attack on the Gremlin platform.
	Get Attack Details	Retrieves details about an attack.
	Get Attack Executions	Retrieves a list of executions associated with an attack.
	Halt All Attacks	Idempotently halts all active attacks across the Gremlin platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Attacks	Lists all attacks on the Gremlin platform. **Note:** • By default, this action can retrieve data up to 5 MB. You can configure the *glide.pf.rest.response_payload_max_size* property to retrieve data up to 10 MB. If the data in the response is more 10 MB, an error is displayed. • As data up to 10 MB only can be retrieved, you can also specify number of records that should be retrieved in the input field, **Number of records to return**.
Attack Schedule Management	Create Attack Schedule	Creates an attack schedule on the Gremlin platform.
	Delete Attack Schedule	Deletes the specified attach schedule.
	Get Attack Schedule Details	Retrieves details about the specified attack schedule.
	Look up Active Attack Schedules	Lists all the attack schedules on the Gremlin platform.

Note:

- Time zone that is considered in the spoke actions, is same as the time zone of your ServiceNow instance.
- Based on your Gremlin license, if you don't have access to certain Gremlin functionality, you can't use the associated spoke actions in your ServiceNow instance as well.
- For some arguments that take `True` or `False` as input, the actual value that the Gremlin platform considers, might be different from the value you have provided.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Create Connection and Credential record for the Gremlin spoke.

Create Connection and Credential record for the Gremlin spoke

Authorize the Gremlin spoke actions by creating connection and credential record for the application registered in Gremlin. The Gremlin spoke connection and credential alias uses these connections and credentials to authorize actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Gremlin spoke.
- Role required: admin.

Procedure

1. Navigate to **All** > **Connection & Credentials** > **Connection & Credential Alias**.
2. Open the record, **Gremlin**.
3. Click the **Create New Connection & Credential** related link.
4. On the form, fill these values.

Field	Description
Connection Name	Name to identify the connection record. By default, this is `Gremlin Connection`. You may change it as per your requirement.
Connection URL	URL to connect to Gremlin. By default, this is `https://api.gremlin.com`.
API Version	API version of the Gremlin platform. By default, this is `v1`.
Team ID	Team ID of your team.
API Key	API Key of your team.
Credential Name	Name to identify the credential record. By default, this is `Gremlin Credentials`. You may change it as per your requirement.

5. Click **Create**.

Guidewire Spoke

Integrate a ServiceNow instance with your Guidewire account to look up insurance customer and policy information, and manage claims.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Subscription information

This spoke requires a subscription. Contact your ServiceNow account manager or sales representative for subscription details. For more information, see Legal schedules - IntegrationHub overview

Supported versions

This spoke was built for Guidewire application programming interface (API) version Elysian (2022.05) , but may be compatible with later versions. This spoke also supports APIs on Guidewire Cloud InsuranceSuite.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key features

Guidewire spoke application enables a flow designer to build workflows from actions which call the Guidewire InsuranceSuite cloud APIs. These actions can be called from any subflows within the insurance applications which provide real-time integration with Guidewire. Manage ClaimCenter, PolicyCenter, and ContactManager actions that:

- Create, cancel, submit, validate, update, and close claims.
- Manage customer contact details.
- Retrieve policies associated with the customer.
- Delete or change claim details.
- Add notes to claims.

Spoke requirements

Guidewire account

Spoke dependencies

Ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
If used outside the spoke implementation, some of these plugins are licensable features and need appropriate licenses.

Spoke actions

The Guidewire spoke provides actions to trigger Guidewire's cloud InsuranceSuite processes when events happen in your ServiceNow instance. This spoke integrates with most APIs from Guidewire's ContactManager, PolicyCenter, and ClaimCenter relevant to auto and property insurance claims. You can extend and customize the available actions for your business needs.

Note:

- Across all Guidewire actions included in this spoke, only a subset of the fields from Guidewire responses are parsed into the action outputs. This spoke returns the entire Guidewire JSON response.
- Streaming actions retrieve records individually instead of the entire list simultaneously.

Available actions include the following.

Category	Action	Description
Contact Management	Look up Companies in Contacts Stream	Retrieves a stream of company contact records from Guidewire's ContactManager based on search parameters.
	Look up Company Contact from	Retrieves the details of a company contact record using its Contact ID from Guidewire's ContactManager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Contact Manager by Contact ID	
	Look up Contact Manager Typelist	Enumerates the available values for a specific Typelist in ContactManager. The Typelist name is provided in the description of each field that uses a Typelist enumeration.
	Look up Person Contact from Contact Manager by Contact ID	Retrieves the details of a person contact record using its Contact ID from Guidewire's ContactManager.
	Look up Persons in Contacts Stream	Retrieves a list of person contact records from Guidewire's ContactManager based on search parameters.

Category	Action	Description
Policy Management	Bind and Issue Policy Transaction	Initiates validation of data to make coverage become effective, and triggers the creation of a binding document.
	Initiate Policy Cancellation	Begins the cancellation process by selecting the specified policy and providing the necessary information and reason for cancellation.
	Look up Company Account by Account ID	Retrieves information about a company's account, including all of its policies, and other interactions, based on its account ID.
	Look up Company Accounts Stream	Retrieves a stream of all company account records from the Guidewire system that match the input criteria. Information retrieved may include details such as the company's name, contact information, and other relevant information.
	Look up Insurance Policies Stream	Retrieves a list of insurance policies from the Guidewire PolicyCenter application. Retrieved information can include policy numbers, effective dates, expiration dates, coverages, endorsements, and other relevant information.
	Look up Insurance Policy by Policy ID	Retrieves information about an insurance policy based on its policy ID. Information retrieved may include a policy's effective date, expiration date, policy limits, deductibles, endorsements, and other relevant information about provided coverage.
	Look up Person Account by Account ID	Retrieves information about a person's account, including the IDs of all their policies and account details such as First Name, Last Name, and Preferred Currency, based on their account ID.
	Look up Person Accounts Stream	Retrieves a stream of all person account records from the Guidewire system. Retrieved information may include details such as the person's name, contact information, policy details, and other relevant information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Policy Center Typelist	Enumerates the available values for a specific Typelist in PolicyCenter. The Typelist name is provided in the description of each field that uses a Typelist enumeration.
	Look up Policy Contact by Contact ID	Retrieves the details of a policy contact record using its Contact ID from Guidewire's PolicyManager.
	Look up Policy Document Content by Document ID	Retrieves the content of a specific policy document using its unique document ID.
	Look up Policy Document Content by Policy ID Stream	Retrieves the policy content of all documents associated with the specified policy using the policy ID stream.
	Look up Policy Locations by Policy ID	Retrieves a list of physical locations associated with a specified insurance policy, based on the policy ID, returning information such as the mailing address, billing address, and property address.
	Look up Product by Product ID	retrieve information about the specific insurance product, based on the product ID.
	Look up Product Coverables by Line ID Stream	Retrieves information about the coverages and options associated with a specific insurance product line, based on the line ID.
	Look up Product Coverable Coverages on Line by Coverable ID Stream	Retrieves information about the various types of insurance coverage offered by an insurance product, by the ID assigned to each type of coverage within the product.
	Look up Product Coverages by Line ID Stream	Retrieves information about product coverages associated with a specific line ID stream.
	Look up Product Lines by Product ID Stream	Retrieves information about the product lines associated with the specific product, based on the product ID.
	Quote Policy Transaction	Generates a quote for a policy transaction.
	Withdraw Policy Transaction	Cancels or revoke a policy transaction that has been initiated or in progress.

Category	Action	Description
Claim Management	Cancel Draft Claim	Discards the draft claim and removes all information about the draft claim from the ClaimCenter database.
	Close Claim	Updates the status of the claim to "closed" or "settled", and updates any associated financial transactions to reflect the final settlement of the claim.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: In addition to updating the claim status, the "Close claim" action may also involve other related tasks. Tasks could include closing any associated activities or tasks, and generating final reports or documentation related to the claim. The details of this action can vary depending on the Guidewire application being used, as well as the particular business processes and workflows being followed by the insurance company.
	Close Exposure on Claim	Closes the specified exposure, based on the exposure ID.
	Create Check-Sets on Claim	Creates a set of checks and payment transactions for a claim.
	Create Claim Contact	Creates a ClaimContact on the claim.
	Create Document on Claim	Creates a document on the claim.
	Create Draft Auto Claim with additional objects (composite requests)	
	Create Draft Claim	Creates a non-open draft claim with claim ID and claim number in the ClaimCenter database.
	Create Exposure on Claim	Creates an exposure object for tracking potential payments on the given claim.
	Create Fixed Property Incident on Claim	Creates an incident object that captures loss information about a fixed property.
	Create Injury Incident on Claim	Creates an incident object for capturing single-injury loss information on the specified claim.
	Create Minimal Draft Claim	Creates an insurance claim with minimal initial data required for the claim.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Note on Claim	Creates a note on an existing claim or activity.
	Create Reserves on Claim	Creates financial reserves for a claim in the Guidewire ClaimCenter application based on the specified parameters. Parameters could include the type of loss, the severity of the claim, the estimated costs of repair or replacement, and other relevant factors.
	Create Vehicle Incident on Claim	Creates an incident object that captures loss information about a vehicle.
	Delete Check on Claim	Deletes an individual check, subject to business constraints, from the claim.
	Delete Claim Contact	Deletes a Claim Contact from the specified claim.
	Delete Document on Claim	Deletes a document from the claim.
	Delete Exposure on Claim	Deletes an exposure object from the specified claim.
	Delete Fixed Property Incident on Claim	Deletes a fixed property incident object from the specified claim.
	Delete Injury Incident on Claim	Deletes an injury incident object from the specified claim.
	Delete Vehicle Incident on Claim	Deletes a vehicle incident object from the specified claim.
	Look up Claim by Claim ID	Retrieves detailed information about a claim from the ClaimCenter database, based on the claim ID.
	Look up Claim Center Typelist	Enumerates the available values for a specific Typelist in ClaimCenter. The Typelist name is provided in the description of each field that uses a Typelist enumeration.
	Look up Claims Stream	Retrieves claim records based on criteria entered.
	Look up Contacts	Retrieves contact information associated with the claim from the ClaimCenter database, based on the claim ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	on Claim by Claim ID Stream	
	Look up Persons in Contacts Stream	Retrieves a stream of records of information about individuals associated with a specified policy or claim. This action searches the Guidewire system when one or more search criteria, such as an individual's name, email address, phone number, or policy number is specified. This action enables more efficient processing by the requesting system.
	Look up Policy Coverages on Claim by Claim ID Stream	Retrieves the coverage details associated with the insurance policy.
	Look up Policy Locations on Claim by ID Stream	Retrieves the physical locations associated with the insurance policy.
	Look up Policy on Claim by Claim ID	Retrieves the policy information associated with the claim from the ClaimCenter database, based on the claim ID.
	Look up Policy Vehicles on Claim by Claim ID Stream	Retrieves the vehicle risk units associated with an insurance policy.
	Submit Claim	Submits the draft claim as an open claim with an open claim number assigned, and executes automated claim setup, including business rules.
	Update Check on Claim	Updates the status of a check on a claim.
	Update Claim	Updates the details of the claim, which may include the claimant's information, policy details, loss details, and claim status.
	Update Claim Contact	Updates a claim contact for the specified claim.
	Update Claim Using Composite Request	Updates a claim by combining multiple updates into a single composite request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Document on Claim	Enables changing the content of a document associated with a claim, and updates the specified document.
	Update Exposure on Claim	Updates an exposure object, the estimated loss amount/potential payments, on the specified claim.
	Update Fixed Property Incident on Claim	Updates an existing incident associated with a fixed property on the specified insurance claim in Guidewire.
	Update Injury Incident on Claim	Updates an incident injury object for capturing single-injury loss information on the specified claim.
	Update Vehicle Incident on Claim	Updates an existing incident associated with an injury on the specified insurance claim.
	Validate Claim	Checks if the specified claim meets certain criteria or requirements set by the insurer before it can be processed further in Guidewire.
	Validate Exposure	Validates the exposure, based on the exposure ID, and return a response indicating whether the exposure is valid or not.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Guidewire spoke.

Set up the Guidewire spoke

Integrate the ServiceNow instance and Guidewire using basic Auth or OAuth 2.0 authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Guidewire spoke.
- Choose and implement the Guidewire authentication approach appropriate for your application. See the Guidewire documentation for Choosing an authentication flow for details.
- Ensure that the dependent plugins are activated.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register Guidewire as an OAuth provider

Use the information generated during the Guidewire application configuration to register Guidewire as an OAuth provider. OAuth provider registration enables the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

- Role required: admin
- Client ID and client secret generated from configuration of the third-party Guidewire application

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
   The system displays this message: `What kind of OAuth application?`.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

Application Registries form

Field	Description
Name	Name to uniquely identify the record. For example, enter: `Guidewire OAuth`
Client ID	<Client ID> created during the Guidewire account configuration.
Client Secret	<Client Secret> created during the Guidewire account configuration.
Authorization URL	OAuth authorization code endpoint.
Token URL	OAuth server token endpoint.
Token Revocation URL	OAuth server token revocation endpoint.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`
OAuth API Script	Script to customize the request and response.
Logo URL	URL that contains an image to use as the application logo.
Default Grant Type	Grant type used to establish the token..
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.
Send credentials	Option for whether or how to send authentication information identifying the application and its authorized users to the OAuth server.

5. On the form header, select **Submit**.

Create OAuth 2.0 credential record for the Guidewire spoke

Create credential records to the Guidewire custom OAuth application you created during Guidewire account configuration. The Guidewire spoke connection and credential aliases use these credentials to authorize actions in Guidewire application. The Guidewire connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

The following example shows the steps for creating a credential record for Guidewire PolicyCenter, Guidewire ContactManager, or Guidewire ClaimCenter.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `Guidewire OAuth2.0 API Credentials`.
Active	Enable
OAuth Entity Profile	Select the OAuth profile you created when you registered the custom Equifax application as an OAuth provider. For example, select **Equifax OAuth default profile**.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Select the order to apply this credential. For example, enter `100`.

5. Select **Submit**.
6. To generate the OAuth token, select the **Get OAuth Token** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Basic Auth credential record for the Guidewire spoke

Create a Basic Auth credential record for the Guidewire application. The Guidewire connection and credential alias uses these credentials to authorize actions in Guidewire PolicyCenter, Guidewire ContactManager, and Guidewire ClaimCenter.

Before you begin

Role required: admin

The following example shows the steps for creating a basic Auth credential record for Guidewire PolicyCenter, Guidewire ContactManager, and Guidewire ClaimCenter.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select Basic Auth Credentials.
4. On the form, fill in the fields.

Field	Description
Name	Name to uniquely identify the record. For example, Guidewire.
User name	User name to be entered as credential.
Password	Password to be entered as credential.
Active	Option to actively use the credential record. Select the option.
Order	Order that the credentials are used. For example, enter `100`.

5. Right-click the form header and select **Submit**.

Switch between basic Auth and OAuth 2.0 credential

You can choose to switch between implemented basic Auth and OAuth 2.0 authentication based on your event or security needs.

Before you begin

- Role required: admin
- Create Basic Auth credential record for the Guidewire spoke
- Register Guidewire as an OAuth provider

The following example shows the steps for switching from basic auth to OAuth 2.0 for the Guidewire ClaimCenter application.

Procedure

1. Navigate to **AllConnections & CredentialsConnection & Credential Aliases**.
2. Select the Guidewire ClaimCenter record you want to re-configure.
3. From the **Connections** tab, open the existing target connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Credential** field, select the reference lookup icon.
5. Select the credential record.

   - If switching the authentication method from basic auth to OAuth 2.0, select the credential record created during OAuth setup.
   - If switching the authentication method from OAuth 2.0 to basic auth, select the credential record created during basic Auth setup.

6. Save the record.

What to do next

Get Guidewire OAuth token

Create connection record for the Guidewire spoke

Create a connection record for your Guidewire application. The Guidewire connection and credential aliases use these connections to perform actions in Guidewire PolicyCenter, Guidewire ContactManager, and Guidewire ClaimCenter.

Before you begin

Role required: admin

The following example shows the steps for creating a connection record for Guidewire PolicyCenter, Guidewire ContactManager, or Guidewire ClaimCenter.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, for example, **Guidewire ClaimCenter**.
3. From the **Connections** tab, select **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Guidewire Connection`.
Credential	Basic Auth or OAuth 2.0 credential record created for Guidewire. For example, `Guidewire OAuth2.0 API Credentials`.
Connection alias	Alias record associated with this connection.
Connection URL	Base URL to connect to **Guidewire**.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

5. Select **Submit**.

Get Guidewire OAuth token

Generate the Guidewire access token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select the Guidewire spoke OAuth Credential record.

   Example
   For example, select **Guidewire OAuth2.0 Credentials**.
3. From Related Links, select **Get OAuth Token**.

Result
The Guidewire spoke receives a new OAuth access token.

iManage Spoke

Automate document, folder, workspace, and user management while enabling seamless collaboration within iManage. This automation solution facilitates tasks such as creating, downloading, uploading, updating, and removing files on iManage directly from the ServiceNow AI Platform.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

iManage spoke v1.1.0 is the latest version.

Roles

All iManage users are assigned to the predefined Default role. Because the default role is automatically assigned to all users, for security reasons it has limited privileges. The iManage administrator can modify this role's privileges but cannot delete it. Other roles can be created, deleted, or modified as required.

The iManage spoke user [sn_imanage_spk.user] is available when the iManage spoke is installed. The role is required for users accessing iManage external storage.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow® IntegrationHub Action Step — REST (com.glide.hub.action_step.rest)
- ServiceNow® IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow® IntegrationHub Action Template — Data Stream (com.glide.hub.action_type.datastream)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

iManage Work API (REST API v2).

Spoke actions

iManage provides actions to automate the tasks in the following table when events occur in ServiceNow.

Note:
To prevent unauthorised access, make sure that the required users has the least privileges for the spoke actions.

Category	Action	Description
Authentication	Look up Discovery	Retrieves the Customer ID and other details.
User Management	Look up Library Users Stream	Retrieves a list of users from the specific library.
Workspace Management	Look up Workspace Security	Retrieves the default security of the workspace and a list of users and groups who have access to the workspace.
	Look up User Access Permission for Workspace	Retrieves a list of users in the specified library optionally filtered by search criteria.
	Create Workspace	Creates a workspace.
	Delete Workspace	Deletes a specified workspace.
	Look up Library Workspaces Stream	Retrieves a list of the workspaces in the specific library.
	Look up Workspace	Retrieves the workspace profile, and when the list of allowed operations for the Workspace ID is fetched, depending on the request.
	Look up Workspaces	Retrieves a list of all workspaces.
	Create Root Level Workspace Folder	Creates a folder at the root level of the specified workspace.
	Look up User Workspace Operations	Retrieves the operations that the current user is able to perform on the specific workspace.
	Update Workspace	Updates the information of a specified workspace.
	Update Workspace Users and Groups Security	Updates the default security of the specified workspace and the access to the workspace by users and groups.
	Look up Workspace Container Stream	Retrieves the folder structure from a specified template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Folder Management	Delete Folder	Deletes a specified folder.
	Look up Folder Content Stream	Retrieves the content of the specified folder.
	Look up Library Folders Stream	Retrieves a list of folders from the specified library.
	Look up Folder Profile	Retrieves the folder profile of the specified folder ID.
	Look up Folder Security	Retrieves details of the access permission and default security of the specified folder.
	Update Folder Properties	Updates the folder properties with the specified properties.
	Create Subfolders	Creates a folder within the specified folder.
	Look up Folder Path	Retrieves the path of the specified folder.
	Look up Folder Operations	Retrieves the operations that the current user has permission to execute on the specified folder.
	Update Folder Security	Updates the access permissions and default security of a folder.
	Remove Document from Folder	Deletes the specified document from the folder.
Document Management	Delete Document	Deletes the document associated with a document ID.
	Look up Document Operations	Retrieves the set of operations that the current user is able to perform on a document.
	Upload Document To Folder	Uploads a document to a specific folder.
	Look up Document Profile	Retrieves the profile of a specified document.
	Look up Documents	Retrieves documents that match the specified document profile fields.
	Look up Document Versions Stream	Retrieves the profiles of all versions of a document.
	Upload New Document Version	Creates and uploads a new version of the specified document.
	Look up Library Documents Stream	Retrieves all documents that match specified search criteria.
	Download Document with Filename	Downloads and saves a document to a local machine.
	Download Document	Downloads the specific document to the local machine.
	Look up Parent Folders of Specified Documents Stream	Retrieves a list of the direct parent folders of a specified document.
	Promote Document Version	Creates a version of the document from a saved document state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Latest Document Version Number	Retrieves the latest version of a specified document.
	Look up User Access on Document	Retrieves the access permission of a user for the specified document.
	Look up Document Security	Retrieves the access permission and default security for the document associated with the specified document ID.
	Update Document Security	Updates the access permission or default security or both of the document associated with the specified document ID.

iManage online account requirements

The iManage spoke requires an iManage work account and access to the iManage Control Center to generate OAuth 2.0 tokens.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up iManage spoke.

Set up iManage spoke

Integrate a ServiceNow instance and the iManage spoke by using#iManage credentials to authenticate#ServiceNow#equests.

Before you begin

- Request an Integration Hub subscription.
- Activate the iManage spoke.
- Role required: admin.

Request an application with iManage

Request an application with iManage and register it in the iManage Control Center.

Before you begin

You must have an iManage account and tenant administrator credentials.

Role required: admin

Procedure

1. As an iManage Cloud (cloudimanage.com) customer, send an email to appregistration@imanage.com with the following details.
   - Application Name: ServiceNow - External Storage
   - Redirect_Url: `<your-instance>/oauth_redirect.do`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Customers name: Give your Customer name
- Tenant/Customers ID: Give your tenant or customer ID

iManage will review and respond with the Client ID and Secret

2. Once you have the Client ID/ Secret, register your application in iManage Control Center by following the document Adding an application.

Note:

- This integration capability has been validated for iManage cloud. If you want to use it for iManage on-premises, validate that it meets your requirements before using it.
- If you are a iManage on-premises user, follow the document Adding an application package to register your application.

What to do next

Register iManage as OAuth provider.

Register iManage as OAuth provider

Register iManage as an OAuth provider to allow the instance to request OAuth 2.0 tokens.

Before you begin

Note the following requirements:

- Integration Hub subscription.
- iManage access credentials
- The iManage spoke must be activated

Role required: admin

Procedure

1. On your ServiceNow® instance, navigate to **System OAuth** > **Application Registry**.
2. Select **New**.
3. On the page titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. On the form, fill in the fields.

Application Registries form

Field	Description
Name	Unique name to identify the record, for example, `iManage OAuth profile`.
Client ID	Application ID of the iManage application.
Client Secret	The Client Secret you generated when you created the application.
Default Grant type	The value in this field should be **Password**.
Token URL	The value in this field should be `https://cloudimanage.com/auth/oauth2/token`. You might have to unlock the field to enter the value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Redirect URL	The value in this field should be `https://<your-instance>.service-now.com/oauth_redirect.do`. You might have to unlock the field to enter the value.

5. Right-click the form header, and select **Save**.
   The system validates the OAuth credentials.

Result
iManage is registered as an OAuth provider, which enables the instance to request OAuth 2.0 tokens.

What to do next
Integrate the iManage spoke with ServiceNow instance.

Integrate the iManage spoke with ServiceNow instance

Integrate the connection to your iManage account. The iManage spoke connection & credential aliases use these connections to perform actions in iManage.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > *iManage*.
2. Select the **Create New Connection & Credential** related link.
3. On the form, fill in the fields.

Field	Value required
Connection Name	Name to identify the connection. This field is automatically set to iManage spoke connection.
Connection URL	The URL to establish connection with the spoke. This field is automatically set to `https://cloudimanage.com`. Update the default URL to your specific URL required to establish the connection.
OAuth Entity Name	Name of the OAuth entity profile. This field is automatically set to iManage spoke Auth.
OAuth Client ID	Client ID of the iManage application you registered in the registration portal.
OAuth Client Secret	Client Secret generated when you registered the application in the iManage portal.
OAuth Redirect URL	The redirect URL. The format of the URL is https://<your-instance>.service-now.com/oauth_redirect.do.

4. Select **Create and Get OAuth Token**.

Result
The iManage spoke is set up and integrated with your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.

Infoblox Spoke

Automate network management tasks in Infoblox from your ServiceNow instance. For example, register or delete IP addresses on an Infoblox server.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Infoblox spoke v2.0.4 is the latest version.

Supported version

Infoblox versions 2.7, 2.11 and may be compatible with other future API versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Remote Tables plugin (com.glide.script.vtable)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Infoblox spoke provides sample flows in the draft state to automate allocating IP addresses in the Infoblox grid server. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Infoblox Register or Reserve IP in IPAM	Registers or reserves an IP address in Infoblox based on a Service Catalog item request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Infoblox spoke provides sample subflows to register and reserve IP addresses.

Flow	Description
Register AName Record and Get Network Details	Registers an AName record type in the DNS server and retrieves network details such as network options and ID.
Process Inbound Notifications from Infoblox	Receives the inbound notifications from Infoblox and logs the details.

Spoke module

The Infoblox spoke adds the Infoblox application to your instance and includes these modules:

Module	Description
CName Records	Lists all the CName records.
Webhook Registry	Lists all the webhook registries for the spoke.

Spoke actions

The Infoblox spoke provides actions to manage IP addresses and networks in Infoblox from your ServiceNow instance. Available actions include:

Category	Action	Description
DHCP Management	Delete IP Reservation	Deletes IP address range from an Infoblox server.
	Look up IP Address Reservation	Lists IP address reservation in the DHCP server for a given Infoblox network view.
	Reserve IP Address Range	Reserves an IP address range in the Infoblox server.
DNS Management	Add IPs to Host Record	Adds the specified list of IPs to the existing IP addresses in the specified host record.
	Change IPs of Host Record	Replaces the IP addresses of the specified host record with the new list of IPs.
	Create Host Record	Creates a host record in Infoblox.
	Delete DNS Record	Deletes a DNS record in the Grid Server.
	Look up CName Records	Lists CName records present in the Infoblox server.
	Look up DNS Records	Lists DNS records present in the Infoblox server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Host Record by Reference	Retrieves the details of the specified host record.
	Look up Host Records Stream	Retrieves the details of all host records.
	Register AName Record	Registers an AName record type in DNS server. An AName record stores mapping between the fully qualified domain name and the IP address.
	Register CName Record	Registers a CName record in the Infoblox DNS Server. A CName record is an alias to the fully qualified domain name.
	Update AName Record	Updates the properties of the specified AName record.
	Update CName Record	Updates the properties of the specified CName record.
	Update Host Record	Updates the properties of specified host record.
Generic	Create Record	Creates a record in Infoblox for the specified object.
	Delete Record	Deletes the specified record.
	Look up Record by Reference	Retrieves the details of the specified record.
	Look up Records by Criteria Stream	Retrieves the details of all records for the specified schema object.
	Look up Records Stream	Retrieves the details of all records of the specified object type.
	Update Record	Updates a record in Infoblox for the specified object.
IPAM Management	Delete IPAM IP Address Reservation	Deletes an IPAM IP address Reservation in Infoblox.
	Look up IPAM Reservations	Lists the IP addresses within a given Infoblox Server.
	Register IPAM IP Address	Registers the IP addresses within a given Infoblox Server.
	Reserve IPAM IP Addresses	Reserves the IP addresses within a given Infoblox Server.
Metadata Retrieval	Look up Definition of Extensible Attributes	Retrieves the definitions of the extensible attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Object Metadata	Retrieves the list of all supported fields for a given operation for the specified schema object.
	Look up Overall WAPI Metadata	Retrieves the list of all supported objects in the configured API version.
Network Management	Create Network	Creates a network within a given Infoblox Server.
	Delete Network	Deletes a network within a given Infoblox Server.
	Look up Network Details	Retrieves the network details within a given InfoBlox Server.
	Update Network	Updates the network within a given Infoblox Server.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Infoblox alias record to authorize actions.

Connection & Credential alias	Description	Connection alias requirements
Infoblox	Connection to Infoblox server	• Connection type: HTTP • Connection URL: URL of the host machine where the Infoblox server is installed.

To use the spoke connection alias, create an associated Connection record and an associated Credential record. For information about setting up the spoke, see Set up the Infoblox spoke.

MID Server requirements

These actions use REST calls, which must run on a MID Server. Use the connection record associated with the Infoblox alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Infoblox spoke

Integrate the ServiceNow instance and Infoblox using basic authentication to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Infoblox spoke.
- Role required: admin.

Create a Connection and Credential Alias for Infoblox spoke

Create Connection records to your Infoblox account. The Infoblox spoke connection and credential aliases use these connections to perform actions in Infoblox.

Before you begin

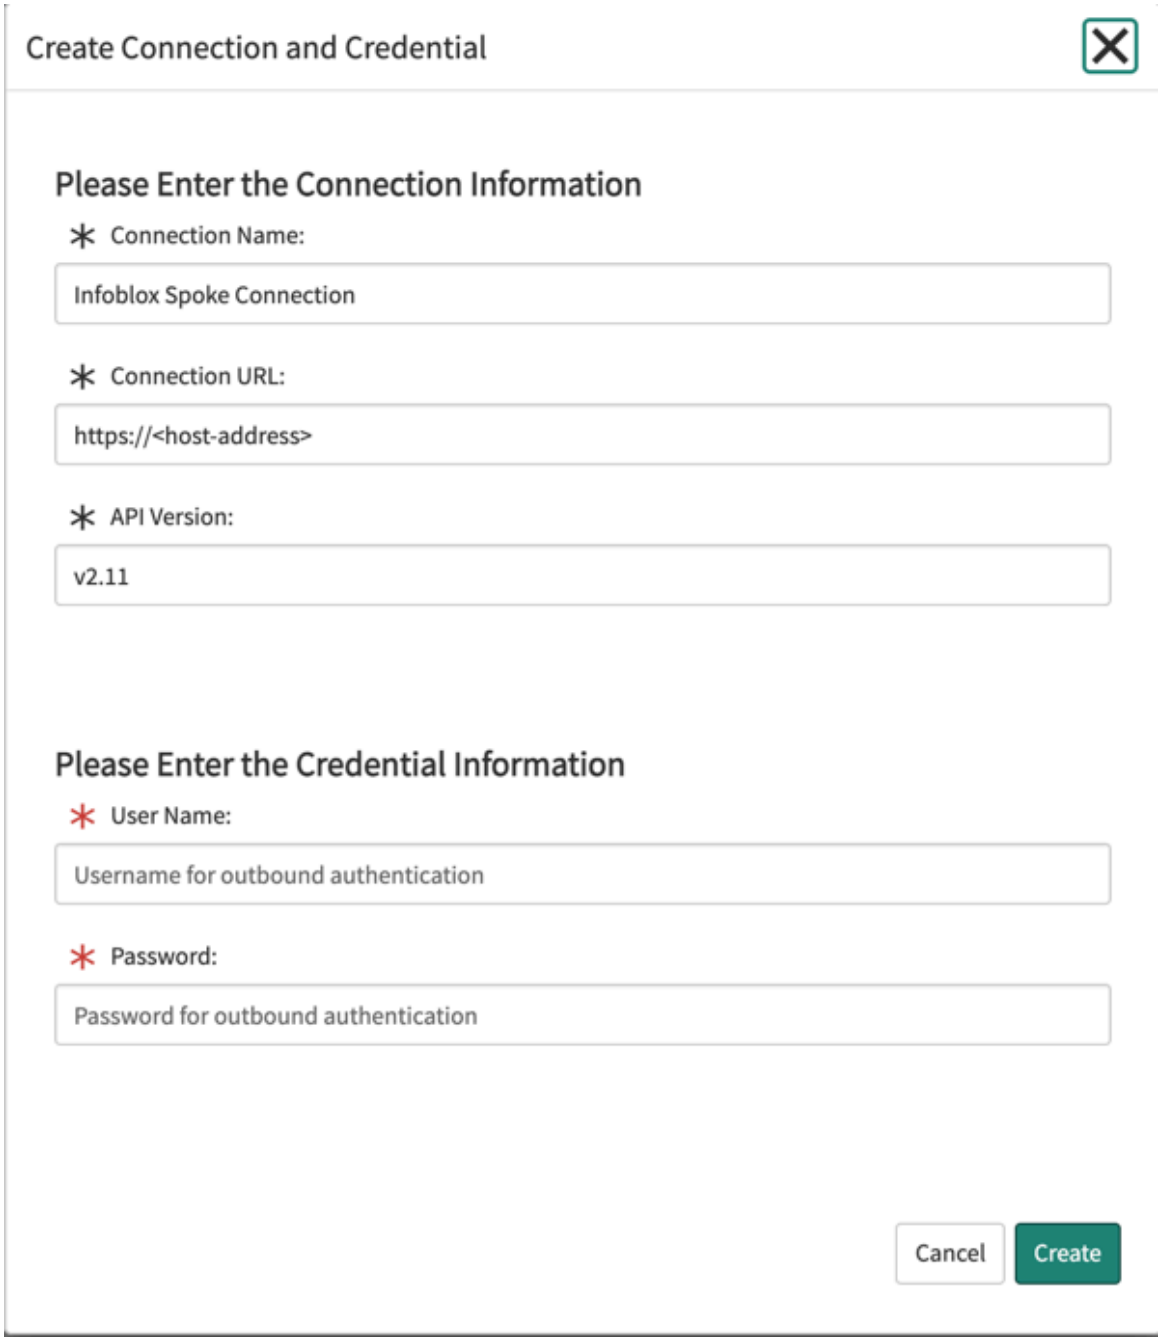
Role required: admin

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the Infoblox record.
3. From the **Related Links** section, click **Create New Connection & Credential**.
4. On the form, fill in these fields:

Field	Description
Connection Name	Unique name to identify the connection. For example, Infoblox Spoke Connection.
Connection URL	Host URL to connect to your Infoblox account.
API Version	API version of Inblox. This field is auto-populated to `v2.11`
User Name	User name of your Infoblox account.
Password	Password of your Infoblox account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Create**.

Set up a bi-directional webhook for the Infoblox spoke

Configure a webhook to subscribe to Infoblox with a ServiceNow callback URL.

Before you begin

- Request an Integration Hub subscription.
- Activate the Infloblox spoke.
- Role required: admin.

Register a Infoblox webhook

Register a Infoblox webhook in a ServiceNow instance to notify the ServiceNow application when certain events occur in Infoblox.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Infoblox spoke** > **Webhook Registry**.
2. Click **New**.
3. On the form, fill in these fields.

Infoblox Webhook Registry

Field	Description
Name	Name to identify the webhook registry. **Note:** The name must be only `Infoblox Webhook Authentication`.
Username	Username specified in the Infoblox outbound endpoint configuration.
Password	Password specified in the Infoblox outbound endpoint configuration.
Description	Description of the webhook registry.
Path	Infoblox webhook path. This is field is auto-populated with `api/sn_infoblox_spoke/infoblox_webhook`.

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

Add callback URL in Infoblox

Specify a webhook callback URL in Infoblox account to create a webhook.

Before you begin

- Register a Infoblox webhook
- Download Infoblox outbound templates from the KB0966373
- Role required: admin

Procedure

1. Log in to your Infoblox account.
2. Create a webhook in your Infoblox account.
   For more information, see KB0966373.
3. Configure a outbound endpoint for your ServiceNow instance.
   For more information about configuring Infoblox outbound endpoints, see About Outbound Templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Configure templates by uploading the templates from the KB0966373 article.

Templates

Template name	Description
Host_Address_IPv4_Insert.txt	Template to configure notifications when a new IPv4 address is added to a host.
Range_IPv4_Insert.txt	Template to configure notifications when a new IPv4 range is added.
Network_Insert.txt	Template to configure notifications when a new IPv4 network is added.
Host_Address_IPv6_Insert.txt	Template to configure notifications when a new IPv6 address is added to a host.

5. Configure notifications rules using the Notification Wizard.

Jack Henry jXchange Spoke

Integrate ServiceNow instance with your Jack Henry jXchange account to access customer and account information.

Important:
Starting with the Utah release, the Financial Services Operations Integration with Jack Henry Associates (JHA) jXchange application has been renamed to Financial Services Operations Integration with Jack Henry jXchange.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Subscription information

This spoke requires a subscription. Contact your ServiceNow account manager or sales representative for subscription details. For more information, see Legal schedules - IntegrationHub overview

Spoke version

The current version of the Jack Henry Associates jXchange spoke is v2.0.1.

Spoke requirements

Ensure that you contact Jack Henry jXchange admin and have these details ready:

- Username of your Jack Henry jXchange account.
- Password of your Jack Henry jXchange account.
- Valid Consumer Name.
- Valid Consumer Product.
- Institute Routing ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Institute Environment.
- SOAP Connection URL.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Integration Hub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Jack Henry jXchange spoke provides sample flows to demonstrate automating tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Look up Transactions Updates	Triggers the Look up Transactions Updates subflow and retrieves the latest transactions updates.
Sample Get Customers Information flow	Retrieves the customer information and logs it.

Spoke subflows

The Jack Henry jXchange spoke provides a sample subflow, Look up Transactions Updates subflow to demonstrate retrieving the latest transactions updates. To customize the sample subflow, copy it to a new application scope.

Spoke actions

The Jack Henry jXchange spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Customer Information Management	Look up Customer Information by ID	Retrieves customer information based on customer identifier.
	Look up Customers Information Stream	Retrieves customer information existing on a service provider.
Financial Account Information Management	Look up Financial Account by Account Details	Retrieve financial account information of a customer by account details existing on a service provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Financial Accounts Stream	Retrieves financial account information of customers existing on a service provider.
	Look up Financial Transactions Stream	Retrieves financial account transactions of an account existing on a service provider.
	Update Financial Account Deposit Balance	Updates deposit balance of a financial account existing on a service provider.

Spoke module

The Jack Henry jXchange spoke adds the Financial Services Operations application to your instance and includes these modules:

Module	Description
Customers	Retrieves and displays the customer data from your Jack Henry jXchange account. When a user navigates to, **JHA** > **Remote Tables** > **Customers**, the Look up Customers Information Stream action is triggered and data is retrieved.
Accounts	Retrieves and displays the account data from your Jack Henry jXchange account. When a user navigates to, **JHA** > **Remote Tables** > **Accounts**, the Look up Financial Accounts Stream action is triggered and data is retrieved.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Jack Henry jXchange spoke.

Set up the Jack Henry jXchange spoke

Integrate ServiceNow and Jack Henry jXchange account by using the Jack Henry jXchange connection and credential record to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Jack Henry jXchange spoke.
- Role required: admin.

Procedure

1. Log in to your ServiceNow instance as an admin.
2. Navigate to **Integration Hub** > **Connections & Credentials** > **Credentials**.
3. Open the record, **JHA**.
4. Click the **Create New Connection & Credential** related link.
5. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Name	Name to identify the connection record.
SOAP Connection URL	SOAP endpoint to connect to the Jack Henry jXchange account. Enter `https://jxdmz.jackhenry.com/jxchange/2008/ServiceGateway/ServiceGateway.svc`.
Valid Consumer Name	Valid consumer name for provider.
Valid Consumer Product	Valid consumer product for provider.
Institute Routing ID	Institute Routing ID for provider.
Institute Environment	Institute Environment for provider.
User Name	User name to authenticate the outbound requests.
Password	Password to authenticate the outbound requests.

6. Click **Create**.
7. Navigate to **Integration Hub** > **SOAP Security Policies**.
8. Open the record, **JHA Security Policy**.
9. For **WS-Security Username Profile**, select the credential record that is created for the Jack Henry jXchange spoke.
10. Click **Update**.

Jamf Spoke

Manage users, mobile devices, groups, and computers in the Jamf account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Jamf spoke v1.4.0 is the latest version.

Supported versions

This spoke was built for Jamf Classic and Pro APIs, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST(com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and need appropriate licenses, if used outside the spoke implementation. For information on the licenses, contact your account manager.

Spoke subflows

The Jamf spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope. Available sample subflows include:

Subflow	Description
Configure Group	Enables a CSD agent to create and configure the target group in Jamf portal.
Create Software Configuration	Enables a CSD Agent to create the software configuration record of the specified Jamf application.
Discover and Store Data	Discovers the data from the Jamf server and updates the records in Application, Group, and Policy tables.
Look up Application Details	Retrieves the additional details for applications and updates the respective records in the application table.
Deploy Application	Adds the provided user or device to the given group in the Jamf Server.
Revoke Application	Removes the provided user or device from the given group in the Jamf Server.
Look up Configuration Data	Retrieves configuration data for the specified requested item or software configuration record.

Note:
These subflows are available only when the Client Software Distribution 2.0 application is installed.

Spoke actions

The Jamf spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Computer Management	Look up Application by ID	Retrieves details of an application by ID in Jamf.
	Look up Applications Stream	Retrieves all the applications.
	Look up Computer by Serial Number	Retrieves details of computer by serial number in Jamf.
	Look up Computers Stream	Retrieves general and hardware details of all the computers.
	Look up Package by ID	Retrieves details of package by ID in Jamf.
	Look up Packages Stream	Retrieves all the packages.
	Look up Policies Stream	Retrieves all the policies.
	Look up Policy by ID	Retrieves details of policy by ID in Jamf.
	Add Computer Group to Mac Application	Adds a target computer group to a Mac application given the current scope of the application.
	Add User Group to Mac Application	Adds a target user group to a Mac application given the current scope of the application.
	Remove Computer Group from Mac Application	Removes a target computer group from a Mac application given the current scope of the application.
Data Management **Note:** These actions are available only when the Client Software Distribution 2.0 application is installed.	Look up Configuration Data	Retrieves the configuration data for the specified requested item or software configuration record.
	Prepare Software Data	Prepares the software data for the specified requested item that can be used for deployment or revocation.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Group Management	Add Computer to Static Group	Adds an existing computer to a static group in Jamf.
	Add Mobile Device to Static Group	Adds an existing mobile device to a static group in Jamf.
	Add User to Static Group	Adds an existing user to a static group in Jamf.
	Create Static Computer Group	Creates a static computer group with the given name on the server.
	Create Static Mobile Device Group	Creates a static mobile device group with the given name on the server.
	Create Static User Group	Creates a static user group with the given name on the server.
	Delete Computer Group	Deletes the given computer group from the server.
	Delete Mobile Device Group	Deletes the given mobile device group from the server.
	Delete User Group	Deletes the given user group from the server.
	Is Computer in Group	Checks if an existing computer is a member of the specified group in Jamf.
	Is Mobile Device in Group	Checks if an existing mobile device is a member of the specified group in Jamf.
	Is User in Group	Checks if an existing user is a member of the specified group in Jamf.
	Look up Computer Group by ID	Retrieves details of computer group by ID in Jamf.
	Look up Computer Groups Stream	Retrieves all the computer groups.
	Look up Target Groups	Retrieves the target group details associated with given application.
	Look up Mobile Device Group by ID	Retrieves details of mobile device group by ID in Jamf.
	Look up Mobile	Retrieves all the mobile device groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Device Groups Stream	
	Look up User Group by ID	Retrieves details of user group by ID in Jamf.
	Look up User Groups Stream	Retrieves all the user groups.
	Remove Computer from Static Group	Remove an existing computer from a static group in Jamf.
	Remove Mobile Device from Static Group	Remove an existing mobile device from a static group in Jamf.
	Remove User from Static Group	Remove an existing user from a static group in Jamf.
Mobile Device Management	Look up Mobile Device Application by ID	Retrieves details of mobile device application by ID from Jamf. **Note:** Configure the system property *com.glide.attachment.max_get_size* to customize the size of attachment that can be retrieved. The default value is 5 MB.
	Look up Mobile Device Applications Stream	Retrieves all the mobile device applications.
	Look up Mobile Device by Serial Number	Retrieves details of mobile device by serial number in Jamf.
	Look up Mobile Devices Stream	Retrieves details of all the mobile devices.
User Management	Look up User by ID	Retrieves details of user by ID in Jamf.
	Look up User by Name	Retrieves details of user by user name in Jamf.
	Look up Users Stream	Retrieves all the users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Software Management	Look up Computer Application Scope	Retrieves scope of a given computer application from the server.
	Look up Mobile Device Application Scope	Retrieves scope of a given mobile device application from the server.
Mobile Device Management	Remove Mobile Device Group from Mobile Device Application	Removes a target mobile device group from a mobile device application given the current scope of the application.
	Add Mobile Device Group to Mobile Device Application	Adds a target mobile device group to a mobile device application given the current scope of the application.
	Add User Group to Mobile Device Application	Adds a target user group to a mobile device application given the current scope of the application.
	Remove Mobile Device Group from Mobile Device Application	Removes a target mobile device group from a mobile device application given the current scope of the application.
	Remove User Group from Mobile Device Application	Removes a target user group from a mobile device application given the current scope of the application.

Spoke module

The Jamf spoke adds the Jamf application to your instance. The application includes these modules and data accessed through the spoke modules is stored in the respective tables:

Module	Description	Table
Applications	Displays the list of applications from the Jamf server.	Application [sn_jamf_spoke_application]
Groups	Displays the list of groups from the Jamf server.	Group [sn_jamf_spoke_group]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description	Table
Configurations	Stores software configuration details for the applications.	Configuration [sn_jamf_spoke_sf_config]
Policies	Displays the list of policies from the Jamf server.	Policy [sn_jamf_spoke_policy]
Server Instances	Stores details of the provider servers.	Server Instance [sn_jamf_spoke_server]

Note:
These modules and tables are available only when the Client Software Distribution 2.0 application is installed.

Another table is Jamf Credential [sn_jamf_spoke_jamf_credential] is available that stores details of the credential records. This table is available along with the Jamf spoke and doesn't require installation of the Client Software Distribution 2.0 application.

Spoke triggers

Use triggers in the Jamf spoke to subscribe to the required events. The endpoint enables webhooks to connect with your ServiceNow instance. You can configure the flows to execute only when the specified trigger conditions are met. The supported events are:

Category	Trigger	Description
Computer Management	Computer Inventory Completed	Trigger initiates when a managed computer submits inventory.
Group Management	Smart Group Computer Membership Change	Trigger initiates when a managed computer joins or leaves the membership of a smart computer group.
Mobile Device Management	Mobile Device Inventory Completed	Trigger initiates when a device completes the Update Inventory MDM command.

For information about setting up the triggers for the Jamf spoke, see Set up triggers for the Jamf spoke. For more information about inbound integration, see Conditional and event-driven inbound integration.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Jamf spoke.

Set up the Jamf spoke

Integrate the ServiceNow instance and Jamf instance using the Jamf credential to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Jamf spoke.
- Role required: admin.

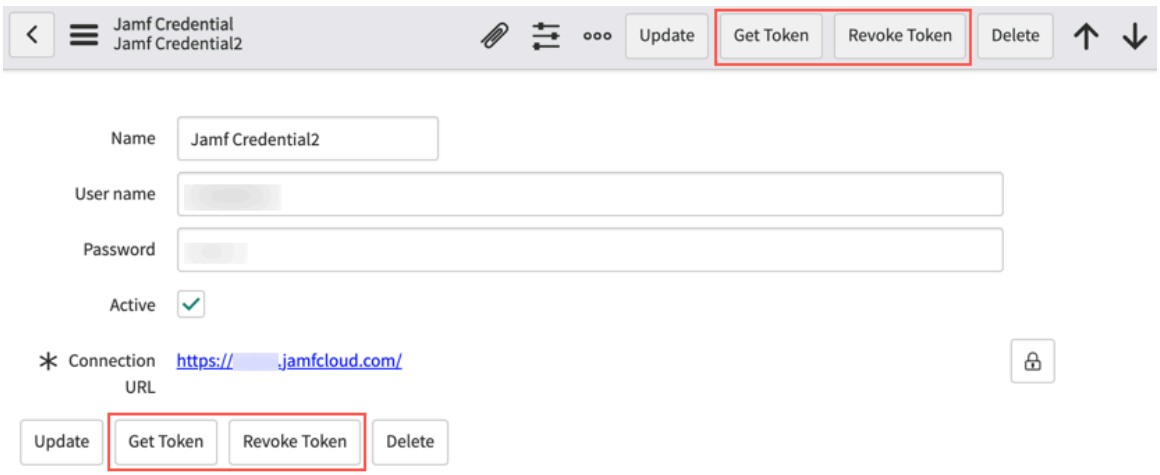
Procedure

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record, **Jamf**.
3. Click the **Create New Connection & Credential** related link.
4. On the form, fill these values.

Field	Description
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to your Jamf instance in this format: `https://<Instance-name>.jamfcloud.com/`.
Credential Name	Name to identify the credential record.
User Name	User name of the Jamf account.
Password	Password of the Jamf account.
Connection URL	Base URL to connect to your Jamf instance in this format: `https://<Instance-name>.jamfcloud.com/`.

5. Click **Create**.

Note:
If required, you can get token and revoke token by creating a new credential record for the default connection ad credential alias record.



Set up triggers for the Jamf spoke

Set up triggers for the Jamf spoke for the required events. The endpoint enables webhooks to connect with your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Configure triggers in ServiceNow instance

Configure endpoint for webhooks in the Jamf that support the token authentication.

Before you begin
Role required: flow_designer and connection_admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Toggle and enable the **Inbound** connections.
4. Locate the **Jamf Spoke** endpoint and click **View Details**.
5. For the **Jamf External Trigger** end point, click **Configure**.
6. Select the user who can trigger the endpoint and click **Activate**.

   The values **Token** and **URL** are generated.
7. Copy the generated endpoint URL for later use.

Create an outbound webhook

Create an outbound webhook in your Jamf Pro cloud instance.

Before you begin
Role required: admin

Procedure

1. Log in to the Jamf cloud account as an admin.
2. Click **Settings**.
3. Click the **Global** tab and click the **Webhooks** tile.
4. Click **+ New**.
5. On the form, fill these values.

Field	Description
Display Name	A display name to identify the webhook.
Webhook URL	URL the webhook should post to. Paste the URL that was generated when you configured triggers in ServiceNow instance. For more information, see Configure triggers in ServiceNow instance.
Authentication Type	Type of authentication required to connect to the webhook. Choose the **Header Authentication** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	When you select **Header Authentication**, another **Header Authentication** field is displayed. Provide the header metadata in JSON format that is used for authentication. For example, enter `{"Authorization":"Bearer eyJhbGciOiJIUzI1NiJ9.eyJhdX", "Date":"Fri, 22 Nov 2024 16:56:32 GMT"}`.
Connection timeout	Connection timeout for the webhook.
Read Timeout	Read timeout for the webhook.
Content Type	Format for sending the webhook information. Select **JSON**.
Webhook Event	Event that will trigger the webhook. Select one of the supported events. For the list of supported events, see the Spoke triggers section.

For more information about configuring the webhook, see Configuring a Webhook in Jamf Learning Hub.

6. Click **Save**.

Jenkins Spoke

Manage builds, users, settings, and jobs on the Jenkins server. Retrieve Jenkins data to use in a flow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

All versions between 1.651.1 and 2.150.3.

Spoke version

Jenkins spoke v2.3.0 is the latest version.

Spoke actions

The Jenkins spoke provides actions to automate the Jenkins tasks when events occur in the ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Build Management	Delete Build	Deletes a build from a Jenkins server job.
	Get All Builds	Retrieves all the builds for a given Jenkins server job. Returns the URL, build number, and class of each build.
	Get Build History	Retrieves a range of build history for a given job from the Jenkins server.
	Get Build Information	Retrieves the build timestamp, build status, and complete build information of a given job from the Jenkins server.
	Get Build Number	Retrieves the build number for a Jenkins server job based on a pre-defined build filter, such as the last successful build.
	Perform a Build	Executes a job on the Jenkins server.
Configuration Management	Create Jenkins Credentials	Creates the Jenkins server credentials.
	Create Node	Creates a node that you can launch with the Java Web Start software. A node is a machine that is part of the Jenkins environment and capable of executing jobs.
	Delete Node	Deletes a node from the Jenkins server.
	Get CSRF Token	Retrieves a CSRF token if your Jenkins server has the "Prevent Cross Site Request Forgery exploits" option enabled. **Note:** If your Jenkins server has CSRF protection enabled, use this action to retrieve a token for use by the rest of the flow. The action outputs the token as a data pill for use in other actions in the flow.
	Get Version	Retrieves the Jenkins server version.
	Restart Jenkins	Restarts the Jenkins server.
	Test Connection	Tests the connection to the Jenkins server.
Job Management	Copy Job	Creates a job by copying an existing Jenkins server job.
	Create Folder	Creates a Jenkins server folder to organize the jobs.
	Create Job	Creates a Jenkins server job from an XML file.
	Delete Folder	Deletes an existing Jenkins server folder.
	Delete Job	Deletes a Jenkins server job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get All Jobs From Folder	Retrieves all the jobs from a given Jenkins server folder. Returns the class and name of each job up to the specified number of levels.
	Get Build timestamp	Retrieves the build timestamp of a specified Jenkins server job.
	Get Console Output	Retrieves the build console output of a Jenkins server job.
	Get Job Configuration	Retrieves the XML configuration for a Jenkins server job.
	Reload Job	Reloads a Jenkins server job.
	Rename Job	Renames a Jenkins server job.
User Management	Create User	Creates a Jenkins server user.
	Delete User	Deletes an existing Jenkins server user.
View Management	Add Job To View	Adds a job to the Jenkins server view. Views are containers to organize jobs. As a Jenkins instance grows, you can create views for appropriate groups and categories. For example, you may want to create a Build view, which only displays the build-specific jobs.
	Create View	Creates a Jenkins server view.
	Delete View	Deletes a Jenkins server view.
	Get All Jobs From View	Retrieves all jobs from a Jenkins server view. Returns the class and the name of the top-level jobs.
	Remove Job From View	Removes a job from a Jenkins server view.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
Jenkins View Management AI Agents	Manages job records and retrieves details of all jobs from a Jenkins server view.
Jenkins Job Management AI Agents	Manages jobs and retrieves details of all the jobs from a given Jenkins server folder.
Jenkins Configuration Management AI Agents	Manages a node from the Jenkins server. Retrieves a CSRF token if your Jenkins server has the "Prevent Cross Site Request Forgery exploits" option enabled.
Jenkins User Management AI Agents	Manages the Jenkins server user recor.ds
Jenkins Build Management AI Agents	Manages a build from a Jenkins server job and retrieves the required build details.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Support for CRSF tokens

If your Jenkins server has the "Prevent Cross Site Request Forgery exploits" option enabled, certain actions require a unique token. Use the Get CSRF Token action to retrieve a token for use by the rest of the flow. The action outputs the token as a data pill for use in other actions in the flow.

Connection and credential requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Jenkins Connection & Credential Alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.

For information about setting up the spoke, see Set up Jenkins spoke.

MID Server requirements

These actions use the REST calls, which must run on a MID Server. Use the connection record associated with the Jenkins alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up Jenkins spoke

Integrate the ServiceNow instance and Jenkins using basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Jenkins spoke.
- Role required: admin.

Create Credential records for the Jenkins spoke

Create Credential records to the Jenkins server. The Jenkins spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `Jenkins Credentials`.
User name	Your Jenkins user name.
Password	Your Jenkins password.
Active	Enable
Order	Select the order to apply this credential. For example, enter `100`.

5. Click **Submit**.

Create Connection records for the Jenkins spoke

Create Connection records to your Jenkins account. The Jenkins spoke connection and credential alias uses these connections to perform actions on Jenkins.

Before you begin

Role required: admin.

Procedure

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Jenkins**.
3. From the **Connections** tab, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays a blank HTTP(s) Connection form.

4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Jenkins Connection`.
Credential	Select the Credential record you created for Jenkins. For example, select **Jenkins Credentials**.
Connection URL	The URL of the host machine where Jenkins is installed.

5. Click **Submit**.

Jenkins v2 Spoke

Manage builds, users, settings, and jobs on the Jenkins server. Retrieve Jenkins data to use in a flow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Jenkins v2 spoke v1.2.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke requirements

The Jenkins v2 spoke v2 requires generating an API token. See Security Hardening: New API token system in Jenkins 2.129+ for more information about the API tokens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

All versions between 2.176.2 to 2.222.1.

Spoke modules

You can configure the Jenkins v2 spoke v2 to receive updates from Jenkins at your ServiceNow instance. In the routing policies, conditions that must be met to receive updates at your ServiceNow instance are defined. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Jenkins tasks. This requires separate setup and can be used independently without using the spoke actions. See Set up a webhook for the Jenkins spoke for information regarding setting up and configuring the webhooks. To use other conditions in the routing policy or customize the default subflows, see Customize a webhook.

Routing policies and subflows support these fields:

- Keywords
- Build Number
- Job Name
- Job Path
- Show Related Fields

By default, the Jenkins v2 application is available in the Jenkins v2 spoke and has these modules:

Module	Description
Webhook Answer Subflows	Details of the webhook authorization key to authorise requests from Jenkins.
Webhook Client Detail	Details about the subflows in Jenkins v2 spoke.

The Jenkins v2 spoke v2 includes these tables:

- Jenkins v2 Webhook Answer Subflow [sn_jenkinsv2_spoke_webhook_answer_subflow]
- Jenkins Webhook Client Details [sn_jenkinsv2_spoke_webhook_client_details]

Spoke subflows

The Jenkins v2 spoke provides sample subflows to demonstrate automating Jenkins tasks. Available sample subflows include:

Subflow	Description
Build Jenkins Job	Receives updates from Jenkins at the ServiceNow instance.
Jenkins Webhook Answer Subflow: Process build information	Builds Jenkins job and retrieves the information. To customize this subflow, create a copy of the subflow and change it as per your requirement.
Build Jenkins Job with Parameters	Builds Jenkins job with the specified parameters and retrieves the information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Jenkins v2 spoke provides actions to automate Jenkins tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Build Management	Delete Build	Deletes a build from a Jenkins server job.
	Get Build ID	Retrieves the Build ID of an executed job from the Jenkins server.
	Get Build Timestamp	Retrieves build timestamp of a given job from the Jenkins server.
	Get Console Output	Retrieves build console output for a given job from Jenkins Server.
	List Builds	Retrieves all the builds for a given job from the Jenkins server.
	Perform Build with Parameters	Executes a job with parameters on the Jenkins server.
	Get Build History	Retrieves a range of build history for a given job from Jenkins Server.
	Get Build Information	Retrieves the build timestamp, build status, and complete build information of a given job from the Jenkins server.
	Get Build Number	Retrieves the build number for a Jenkins server job based on a pre-defined build filter, such as last successful build.
	Perform Build	Executes a job on the Jenkins server.
	Look up Builds by Date Range	Retrieves all the builds between date range for a given job from the Jenkins server.
	Look up Commits by Build	Retrieves the commits of a particular build for a given job from the Jenkins server.
	Look up Stage Nodes by Build	Retrieves information about the Sonar actions, restartable stages, and nodes of all stages of a particular build for a given pipeline job from the Jenkins server.
	Look up Stages by Build	Retrieves the build status, start time, end time, duration, and stages of a particular build for a given pipeline job from the Jenkins server.
	Look up Test Report by Build	Retrieves information about the test summaries, total number of executed tests, passed tests, failed tests, skipped tests, and time taken to execute JUnit tests in a particular build for a given job from the Jenkins server.
Configuration Management	Create Node	Creates a node that you can launch with Java Web Start software. A node is a machine that is part of the Jenkins environment and capable of executing jobs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Node	Deletes a node from the Jenkins server.
	Get Version	Retrieves the Jenkins server version.
	Restart Jenkins	Restarts the Jenkins server.
	Test Connection	Tests the connection to the Jenkins server.
Job Management	Copy Job	Creates a job by copying an existing Jenkins server job.
	Create Folder	Creates a Jenkins server folder to organize jobs.
	Create Job	Creates a Jenkins server job from an XML file.
	Delete Folder	Deletes an existing Jenkins server folder.
	Delete Job	Deletes a Jenkins server job.
	List Jobs By Folder	Retrieves all the jobs for a given folder from the Jenkins server.
	Get Job Configuration	Retrieves the XML configuration for a Jenkins server job.
	Reload Job	Reloads a Jenkins server job.
	Rename Job	Renames a Jenkins server job.
User Management	Create User	Creates a Jenkins server user.
	Delete User	Deletes an existing Jenkins server user.
View Management	Add Job To View	Adds a job to the Jenkins server view. Views are containers to organize jobs. As a Jenkins instance grows, you can create views for appropriate groups and categories. For example, you may want to create a Build view, which only displays build-specific jobs.
	Create View	Creates a Jenkins server view.
	Delete View	Deletes a Jenkins server view.
	List Jobs By View	Retrieves all jobs from a view on the Jenkins server.
	Remove Job From View	Removes a job from a Jenkins server view.

Spoke triggers

Use triggers in the Jenkins spoke to subscribe to the required events. The endpoint enables webhooks to connect with your ServiceNow instance. You can configure the flows to execute only when the specified trigger conditions are met. The supported events are:

Category	Trigger	Description
Build Management	Build Aborted	Trigger initiates when a Jenkins build is aborted.
	Build Failed	Trigger initiates when a Jenkins build fails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Trigger	Description
	Build Success	Trigger initiates when a Jenkins build is successful.
	Build Unstable	Trigger initiates when a Jenkins build is unstable.
Job Management	Pipeline Failed	Trigger initiates when a Jenkins pipeline fails.

Connection and credential requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Jenkins v2 Connection & Credential Alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record. For information about setting up the spoke, see Set up the Jenkins spoke.

MID Server requirements

These actions use REST calls, which must run on a MID Server. Use the connection record associated with the Jenkins alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Jenkins spoke

Integrate the ServiceNow instance and Jenkins using basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Jenkins spoke.
- Role required: admin.

Configure a connection for Jenkins v2 spoke

Add and configure a Jenkins v2 connection to authenticate ServiceNow requests in Jenkins v2 spoke.

Before you begin

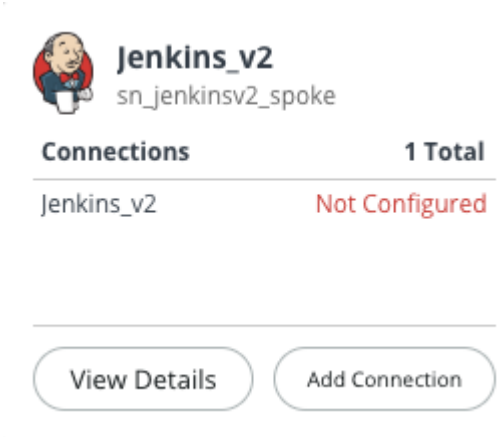
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Jenkins_v2** and click **View Details**.

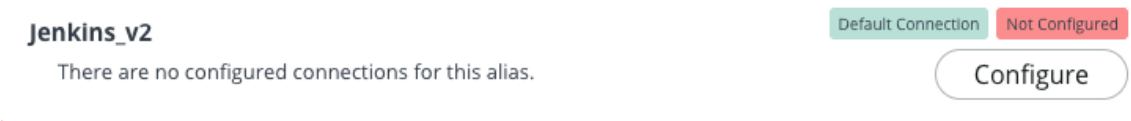
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Jenkins v2 spoke, click **View Details**.



- To manage more than oneJenkins v2 spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

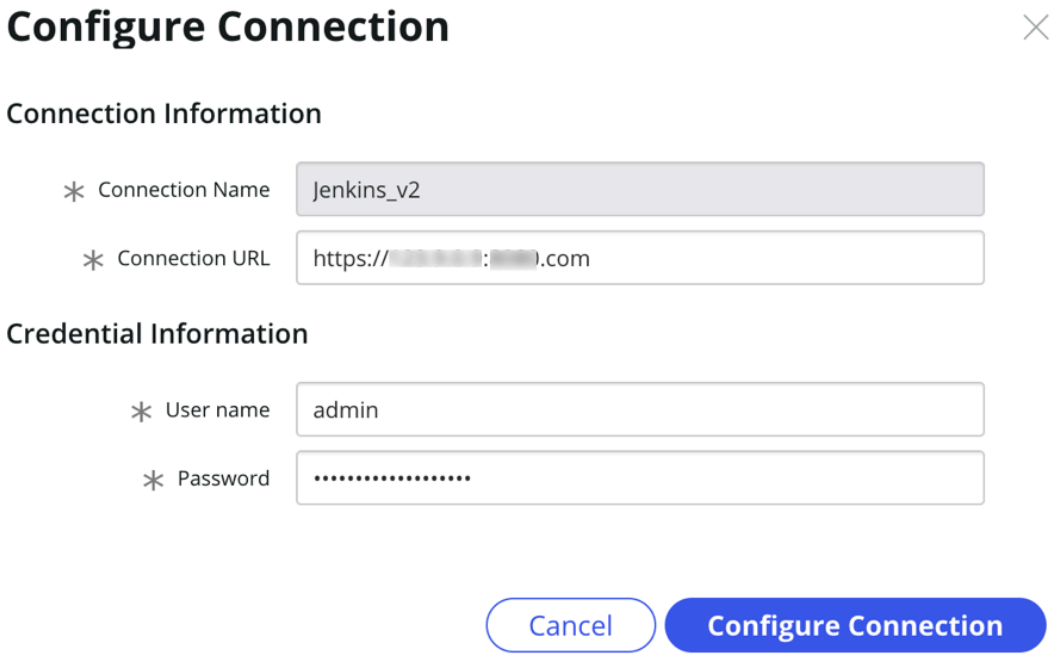
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



5. On the Connection form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection. For example, `Jenkins v2 connection`.
Connection URL	Base URL to connect to Jenkins. The format of URL should be: http://<host_ip_address>:<port>. For example, `http://198.51.100.24:8080`.
User name	User name of your Jenkins account.
Password	API token of your Jenkins account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Create Connection**.
7. Navigate to **All** > **Connections & Credentials** > **Connections**.
8. Open the newly created connection record for Jenkins v2 spoke.
9. From the **Advanced MID Server Configuration** tab, specify the MID Server settings.

Result
The spoke connection is configured and ready to be used.

Set up a webhook for the Jenkins spoke

Set up a webhook application to receive the required updates from Jenkins at your ServiceNow instance.

Before you begin
Role required: admin

Create authorization key for the Jenkins v2 spoke

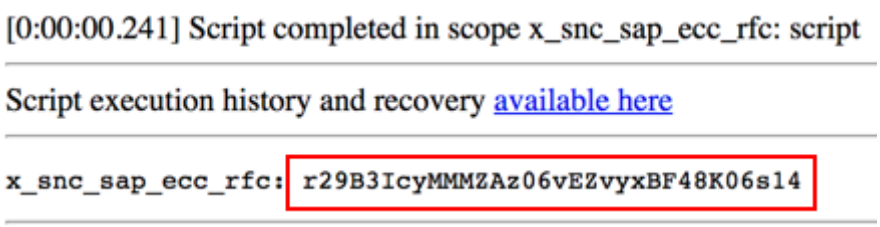
Create a authorization key to authorise requests from Jenkins.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **System Definition** > **Scripts - Background**.
2. Enter this command in the **Run script (JavaScript executed on server)** text field:
```
gs.info(GlideSecureRandomUtil.getSecureRandomString(32));
```
3. Click **Run Script**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Copy and record the generated value for later use.



Provide authorization key for webhook

Authorise requests from Jenkins by providing authorization key for webhook in your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Jenkins v2** > **Webhook Client Details**.
2. Click **New**.
3. On the form, fill these values:

Jenkins Webhook Client Details form

Field	Description
Authorization Key	Authorization key you had generated. See Create authorization key for the Jenkins v2 spoke for more information.
Name	Name to identify the webhook client record.

4. Click **Submit**.

Provide authorization key in Jenkins

Receive updates from Jenkins by providing the authorization key in Jenkins.

Before you begin

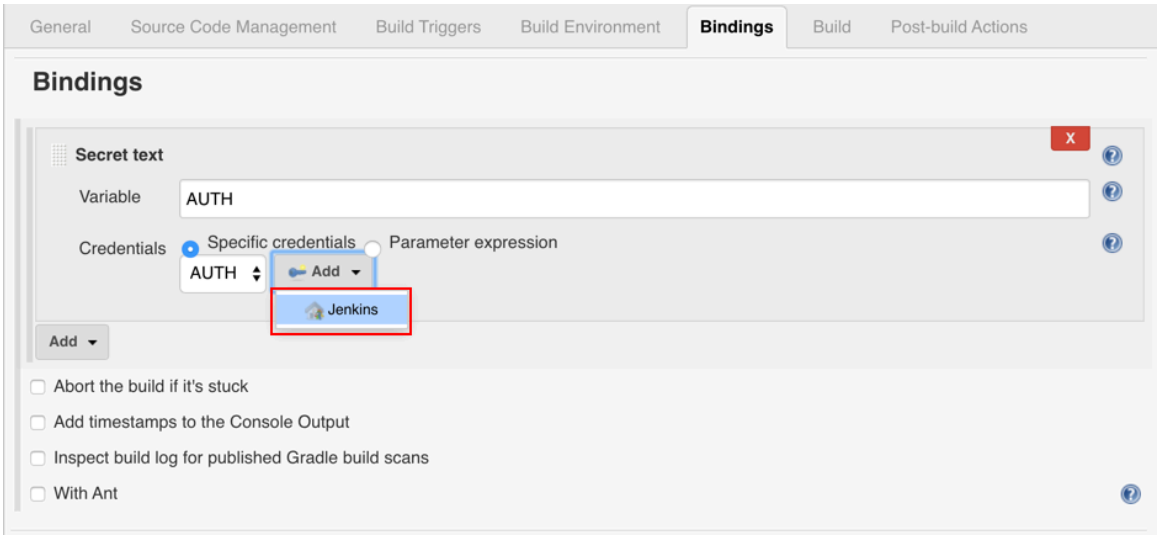
Role required: admin.

Procedure

1. Log in to your Jenkins account.
2. Click and open the job for which you want to configure your webhook.
3. Click **Configure**.
4. In the **Bindings** tab, click **Add** and select **Jenkins**.

   For more information about the using the plugin, see Credentials Binding.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. On the form, fill in the fields.

Jenkins Credential Provider form

Field	Description
Kind	Select **Secret text**.
Secret	Enter authorization key. See Create authorization key for the Jenkins v2 spoke for more information.
ID	Provide unique identifier to identify the record.

6. Click **Add**.
7. In the **Post-build Actions** tab, configure task and specify script to receive updates at your ServiceNow instance.
   - Sample Windows **Script**: `curl "https://<instance-name>.service-now.com/api/sn_jenkinsv2_spoke/jenkins_v2_webhook/build_status" -X POST -H "content-type:application/json" -H "jenkinsKey: %<ID>%" -d "{\"Job_Name\":\"%JOB_NAME%\",\"Job_Path\": \"%JOB_URL%\",\"Build_Number\":\"%BUILD_NUMBER%\"}"`
   - Sample Shell **Script**: `curl "https://<instance-name>.service-now.com/api/sn_jenkinsv2_spoke/jenkins_v2_webhook/build_status" -X POST -H "content-type:application/json" -H "jenkinsKey: ${<ID>}" -d "{\"Job_Name\":\"${JOB_NAME}\",\"Job_Path\":\"${JOB_URL}\", \"Build_Number\":\"${BUILD_NUMBER}\"}"`

Note:
ID in the script is the ID you had provided in the Jenkins Credential Provider form.

For more information about the using the plugin, see Post build task.

8. Click **Apply**.

Provide description to subflow

Provide user friendly descriptions to the subflows in the Jenkins v2 spoke.

Before you begin
Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Jenkins v2** > **Webhook Answer Subflows**.
2. Click **New**.
3. On the form, fill these values:

Field	Description
Description	Description about the subflow.
Subflow	Required subflow in the Jenkins v2 spoke.

4. Click **Submit**.

Provide answers to the decision table

Provide subflows as answers to the conditions mentioned in the decision table. When the specified conditions are met, the associated subflow is triggered.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Decision Tables**.
2. Open the record for the **Jenkins v2 spoke**.
3. In the **Decisions** tab, click **New**.
4. On the form, fill these values:

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.
Condition	Conditions to be met when the required events occur in Jenkins. See Jenkins v2 Spoke for information about the supported fields.
Answer	Subflow that must be triggered when the specified conditions are met. **a.** Click the Lookup icon ( ). **b.** Select the required subflow from the Document list. **Note:** Ensure that the **Table name** is `Jenkins v2 Webhook Answer Subflow [sn_jenkinsv2_spoke_webhook_answer_subflow]`.

5. Click **Submit**.

Customize a webhook

Create a webhook routing policy and customize subflow as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Click **Subflows**.
3. Create a copy of the required default subflow.
4. Customize the Jenkins Webhook Answer Subflow: Process build information subflow as per your requirement and publish it.
   See Building subflows for more information about creating and using subflows and Jenkins v2 Spoke for information about the fields that the routing policies and subflows support.
5. Navigate to **Jenkins v2** > **WebHook Answer Subflows**.
6. Click **New**.
7. On the form, fill in the fields.

Field	Description
Description	Description about the subflow.
Subflow	Required subflow in the Jenkins v2 spoke.

8. Click **Submit**.

Note:
These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

9. Navigate to **System Definition** > **Decision Tables**.
10. Open the record for the **Jenkins v2** spoke.
11. In the **Decisions** tab, click **New**.
12. On the form, fill these fields:

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.
Condition	Conditions to be met when the required events occur in Jenkins. See Jenkins v2 Spoke for information about the supported fields.
Answer	Subflow that must be triggered when the specified conditions are met.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	a. Click the Lookup icon ( ). **b.** Select the required subflow from the Document list. **Note:** Ensure that the **Table name** is `Jenkins v2 Webhook Answer Subflow [sn_jenkinsv2_spoke_webhook_answer_subflow]`.

13. Click **Submit**.

Set up triggers for the Jenkins spoke

Set up triggers for the Jenkins spoke for the required events. The endpoint enables webhooks to connect with your ServiceNow instance.

Before you begin

Role required: admin

Configure triggers in ServiceNow instance

Configure endpoint for webhooks in the Jenkins that support the token authentication.

Before you begin

Role required: flow_designer and connection_admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Toggle and enable the **Inbound** connections.
4. Locate the **JenkinsV2 Spoke** endpoint and click **View Details**.
5. For the **JenkinsV2 External Trigger** end point, click **Configure**.
6. Select the user who can trigger the endpoint and click **Activate**.
7. Copy the generated endpoint URL.

Create a pipeline project in Jenkins

Create a pipeline projects in Jenkins to add the endpoint URL in `Jenkinsfile` that is generated in your ServiceNow instance and enable webhooks to connect with your ServiceNow instance.

Before you begin

- Ensure that you install Jenkin in the local environment.
- Ensure that Maven and GitHub are installed in the Jenkins account.
- Ensure that these plugins are installed in the Jenkins account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Pipeline
- Git plugin
- Git client
- Http request
- Credentials
- Warnings
- Coverage

- In GitHub, generate a classic personal access token and copy the value.

  Ensure that you select the scopes for the personal access token.

  - repo
    - repo:status
    - repo_deployment
    - public_repo
    - repo:invite
    - security_events
  - write:packages
    - read:packages

  For more information about creating a classic personal access token, see Creating a personal access token (classic) in GitHub Docs.

  For the list of supported events, see the Spoke triggers section.

- Role required: admin

Procedure

1. From the Jenkins Dashboard, select **+ New Item**.
2. On the form, enter a name to identify the pipeline and select **Pipeline**.
3. Click **OK**.
   The pipeline is created and its configuration options are displayed.
4. Under **Configure**, click **Pipeline**.
5. On the form, fill these values.

Field	Description
Definition	Select **Pipeline script from SCM**.
SCM	Select **Git**.
Repository URL	Provide GitHub repository URL.
Credentials	Create the GitHub credential record and select it. **a.** Click **+Add**. **b.** Select **Username with password** and click **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	c. For **Username**, enter the GitHub username. **d.** For **Password**, paste the personal access token that is generated in GitHub. **e.** For **ID**, provide a unique ID to identify the credentials. **f.** For **Description**, enter a description for the credentials. **g.** Click **Create**. **h.** Select this record for **Credentials**.
Branch Specifier (blank for 'any')	Specify the required branch.
Script path	Relative location within the checkout of your Pipeline script. **Important:** In `Jenkinsfile`, paste the endpoint URL that was generated after you configured triggers in your ServiceNow instance. For more information, see Configure triggers in ServiceNow instance.

6. Click **Save**.

Jira Service Management Spoke

Automate service management tasks in Jira Service Management from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Jira Service Management spoke v2.0.0 is the latest version.

Spoke requirements

JIRA Service Management account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Integrations - External Authentication Framework (com.glide.external.app)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Jira Service Management spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Metadata	Look up Service Desk IDs (Metadata)	Retrieves the list of all service desk IDs from the specified JIRA instance.
User Management	Report Personal Data	Reports the user's personal data for your apps.
Organization Management	Add Organization to Service Desk	Adds the specified organization ID to the specified service desk instance.
	Add Users to Organization	Adds users to the specified organization.
	Create Organization	Creates an organization account for the specified service management instance.
	Delete Organization	Deletes an organization account from the specified service management instance.
	Look up Organizations	Retrieves the list of organizations in service management instance.
	Look up Users in Organization	Retrieves the list of users in an organization.
	Remove Organization from Service Desk	Removes the specified organization from the specified service desk instance.
	Remove Users from Organization	Removes users from the specified organization.
Request Management	Add Customer Request Participants	Adds customers to request for the specified service desk instance.
	Create Customer Request	Creates customer request for the specified service desk instance.
	Create Customer Request Comment	Creates a customer request comment for the specified service desk instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Temporary Attachment	Creates a temporary attachment for the specified request. **Note:** This action works only for Jira Service Management Cloud.
	Create Temporary File	Creates a temporary file for the specified request.
	Look up Comment Attachment	Retrieves comment attachment for the specified issue ID or issue key. **Note:** This action works only for Jira Service Management Cloud.
	Look up Customer Request Comments	Retrieves the list of customer request comments for the service desk.
	Look up Customer Request Participants	Retrieves the list of request participants related to customer request for the specified service desk instance.
	Look up Customer Request Status History	Retrieves the customer request status history for the specified service desk instance.
	Look up Customer Request Transitions	Retrieves a list of customer request transitions for the specified service desk instance.
	Look up Customer Requests	Retrieves a list of customer request for the specified service desk instance.
	Look up SLA Information	Retrieves the SLA information for the specified service desk instance.
	Look up Subscription Status	Retrieves subscription status for the specified service desk instance. **Note:** This action works only for Jira Service Management Cloud.
	Perform Customer Request Transition	Changes the state of a customer request for the specified service desk instance. **Note:** This action works only for Jira Service Management Cloud.
	Remove Customer Request Participants	Removes a customer request from the specified service desk instance.
	Subscribe Customer Request	Subscribes to a customer request for the specified service desk instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
ServiceDesk Management	Add Customers	Adds the specified users to the service desk.
	Look up Issues in Queue	Retrieves the list of issues in a queue for the specified service desk instance.
	Look up Queue	Retrieves the list of queues specified in service desk instance.
	Look up Request Type Fields	Retrieves the list of request type fields for the specified service desk instance.
	Look up Request Types	Retrieves the list of request types for the specified service desk instance.
	Look up Service Desks	Retrieves the list of all service desk for the specified service management instance from JIRA instance.
	Look up User Account ID	Retrieves the user account ID of user. **Note:** This action works only for Jira Service Management Cloud.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Jira Service Management request management AI agent	Automates and manages workflows in Jira Service Management. Retrieves customer request details, manages participants, handles SLA information, and automates transitions.
Jira Service Management organization management AI agent	Manages organizations, service desk associations, and user lookups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
Jira Service Management service desk management AI agent	Automates and manages tasks within Jira Service Management. Retrieves service desks, request type fields, queues, request types, and issues in queues.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Jira Service Management spoke.

Set up the Jira Service Management spoke

Integrate the ServiceNow instance and Jira Service Management by using the Basic Auth credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Jira Service Management spoke.
- Role required: admin.

Option 1: Using OAuth authentication

Integrate the ServiceNow instance with your Jira Service Management account using OAuth to authenticate ServiceNow requests.

Before you begin

Role required: admin

Obtain the value of Cloud ID

Obtain the value of Cloud ID of the Jira Cloud instance. This value is required during the configuration of the connection record in your ServiceNow instance.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to Atlassian Administration as an admin.
2. Click **Select** against the required organization.
3. From the **Jira Software** product, click **Manage product access**.
   A new window is opened and the URL is in this format: `https://admin.atlassian.com/s/<Cloud-ID>/apps`.
4. Copy the value of the Cloud ID for later use.

Configure a connection for a Jira Service Management spoke

Add and configure a Jira Service Management connection to authenticate ServiceNow requests in a Jira Service Management spoke.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.
4. Locate the **Jira_SM** connection alias and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Jira Service Management spoke, click **View Details**.
   - To manage more than one Jira Service Management spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.
5. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection. For example, `Jira Spoke OAuth basic conn`.
Connection URL	URL of your Jira instance in this format: `https://api.atlassian.com/ex/jira/{cloud-id}/`. Replace `{cloud-id}` with value of the Cloud ID you had obtained previously.
Scopes	By default, these scopes are provided `read:jira-user`, `read:servicedesk-request`, `write:servicedesk-request`, `manage:servicedesk-customer`, `read:jira-work`, `read:me`, `read:account`, `offline_access`. You can modify the scopes as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: After the scopes are modified and saved, whenever you edit the connection record, the scopes are reset to the default scopes.

6. Click **Save and Get OAuth Token**.

Option 2: Using Atlassian API token

Integrate the ServiceNow instance and Jira Service Management by using the Basic Auth credentials to authenticate ServiceNow requests.

Before you begin

Important:
Apps that collect API tokens to create individual 3LO apps don't comply with Atlassian security requirements for cloud apps and Atlassian acceptable use policy.

Role required: admin

Generate an Atlassian account API token

Generate an Atlassian account API token to authenticate requests for spokes associated with an Atlassian account.

Before you begin
Make sure you have an Atlassian account.

Role required: Atlassian administrator credentials

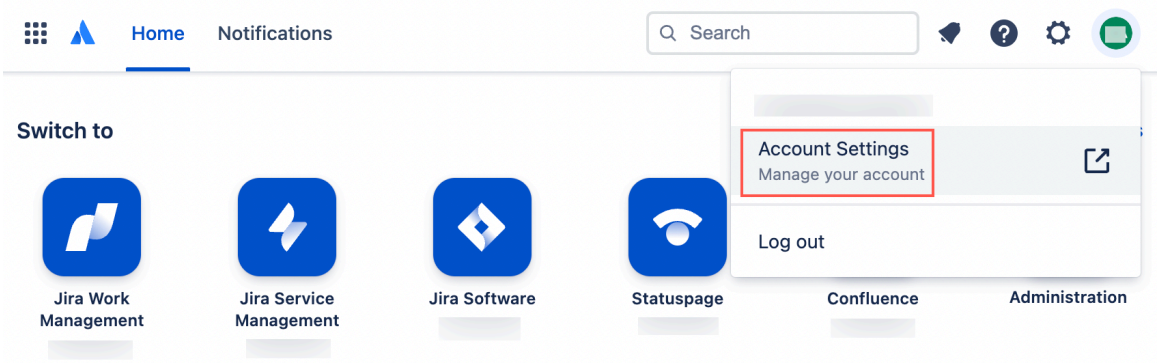
About this task
Complete these steps from your Atlassian account. See the Atlassian Developer portal documentation for instructions on generating your API token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

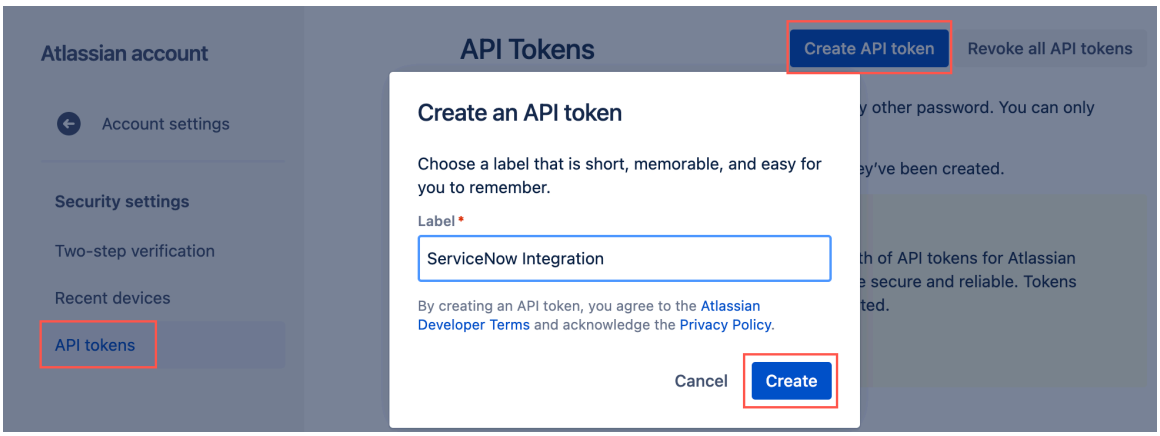
Note:
This procedure is applicable only if you're using the Jira Cloud subscription.

Procedure

1. Log in to Atlassian Start as an admin.
2. Go to your account profile photo and select **Account Settings**.



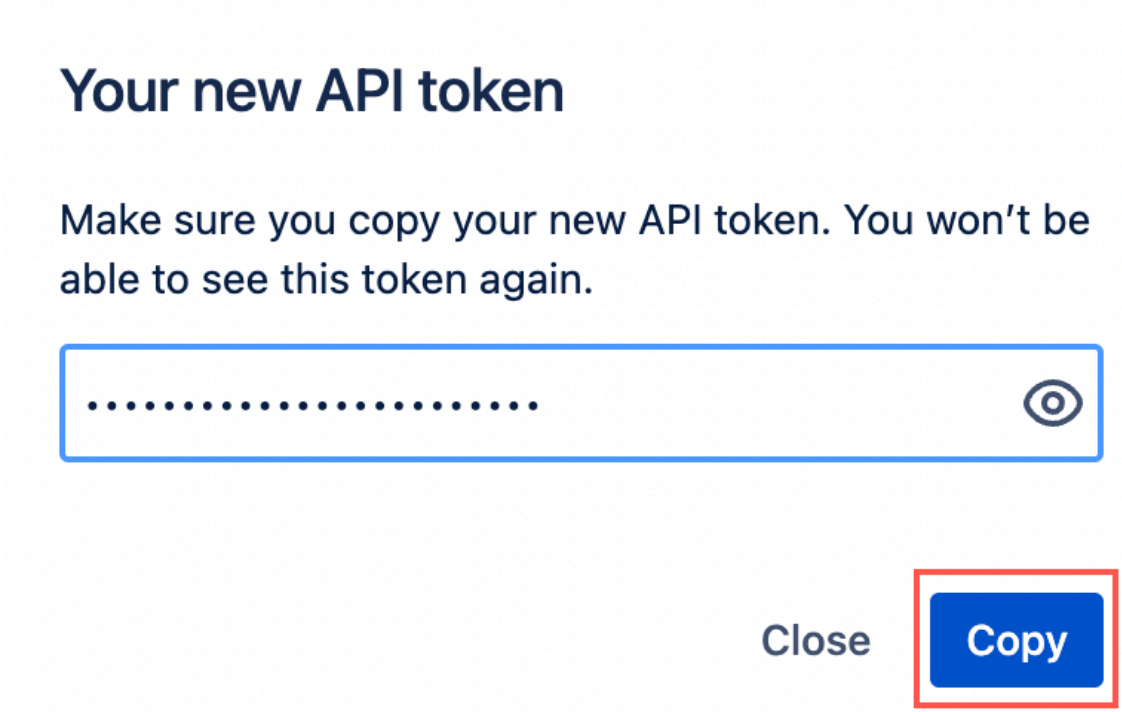
3. Go to **Security**.
4. In the API token section, select **Create and manage API tokens**.
5. Select **API token**.
6. On the form, provide an integration name for the **Label** field.
7. Select **Create**.



The API token is generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select **Copy** and record the value of the API token for later use.



What to do next

Use your API token to configure the cloud connection for a Jira or Jira Service Management spoke.

Create credential record for the Jira Service Management spoke

Create a credential record for the Jira account. The Jira Service Management spoke connection and credential alias uses this credential to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`
3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the credential record for the Jira Service Management spoke. For example, `Jira SM Basic Auth Token cred`.
User name	Enter the email address of the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
API Key	Enter the API token you generated for your Jira Cloud instance.

5. Right-click the form header and click **Save**.

Create a connection record for the Jira Service Management spoke

Create a connection record for the Jira account. The connection and credential alias uses this connection to perform actions in Jira Service Management.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the alias record **Jira_SM** that shipped with the spoke.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click **Submit**.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Jira cloud Basic Auth Token Connection`.
Credential	Select the Credential record created for Jira. For example, select **Jira SM Basic Auth Token cred**.
Connection URL	Enter the URL of your Jira instance in this format: `https://api.atlassian.com/ex/jira/<Cloud-ID>`. For information about obtaining the value of Cloud ID, see Obtain the value of Cloud ID.

5. Click **Submit**.
   The Jira Service Management spoke is configured to use basic credentials via the service account.

Jira Spoke

Manage issues, users, stories, groups, projects, sprints, and webhooks, and look up audit logs in Jira. Retrieve Jira data to use in a flow. Use bi-directional webhooks and subscribe to Jira with a ServiceNow callback URL. Install Now Assist for Integration Hub and start using the available AI agents to perform tasks in your ServiceNow instance. Set up triggers for the required events to enable webhooks to connect with your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Jira spoke v6.0.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Step - Get Connection Info (com.glide.hub.action_step.get_connection_info)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Integrations - External Authentication Framework (com.glide.external.app)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for API version v2, but may be compatible with later versions.

Note:

- If your Jira instance supports another API version, specify the API version in **API Version** in the respective connection record under the Attributes related list. By default, the **API Version** is 2.
- Jira Service Desk isn't supported by the Jira spoke. ServiceNow offers Jira Service Management Spoke to integrate with Jira Service Management that is the new version of Jira Service Desk.

Jira Webhooks module

Bi-directional webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow instance. These conditions are based on the events in Jira that you want to be notified about. When the conditions are met, the routing policy triggers the associated subflow, which in turn automates the Jira tasks.

The bi-directional webhooks require separate setup and can be used independently without using the spoke actions. By default, the Jira Webhooks application is available in the Jira and has the following modules:

- Jira Webhook Registries
- Jira WebHook Routing Policies

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Jira Webhook Registries module to assign a token and provide the API path. You must generate a Callback URL here and provide the URL in Jira. A default routing policy is provided in the Jira WebHook Routing Policies module. The default routing policy supports these fields:

Category	Field
Issue	• Jira instance URL • Webhook Event • Issue Description • Created • Updated • Issue Resolution • Previous Issue Resolution • Issue Summary • Issue Type • Previous Issue Type • Issue Priority • Previous Issue Priority • Issue Status • Previous Issue Status • Issue Status Category • Previous Issue Status Category • Project
Comment	• Jira Instance URL • Webhook Event • Comment • Created • Updated • Issue Summary • Issue Type • Issue Priority • Issue Status • Issue Status Category • Project
Worklog	• Jira Instance URL • Webhook Event • Worklog Time Spent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Field
	• Created • Updated
Attachment	• Jira Instance URL • Webhook Event • Created • Attachment File Name • Attachment Size • Attachment Mime Type
Project	• Jira Instance URL • Webhook Event • Project
Version	• Jira Instance URL • Webhook Event • Version • Version Description • Merged To Version • Merged To Version Description

To use other conditions in the routing policy, create a routing policy in the Jira WebHook Routing Policies module and specify conditions as per your requirement. See Set up a bi-directional webhook for the Jira spoke for information regarding setting up and configuring the webhooks.

Tip:
To set up and use webhooks, you should configure webhook registries, decision tables, and create subflows. For a low-code alternative with less configurations, you can use Spoke triggers.

Spoke subflow

The Jira spoke provides a sample subflow to handle various Jira webhook events. The available sample subflow is Process Jira Webhooks. The Process Jira Webhooks subflow supports these fields:

Category	Field
Issue	• User • Issue • Attachments

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Field
	• Issue Change Log • Project
Comment	• Issue • Project • Comment
Worklog	Worklog
Attachments	Attachment
Project	Project
Version	Version
Webhook Event	
Timestamp	
Payload **Note:** This is the entire Jira payload.	

To customize the default subflow, you must a create a copy of the sample subflow, parse the payload, and customize the subflow as per your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

Note:

- You must configure webhooks to use the spoke subflow. See Set up a bi-directional webhook for the Jira spoke for information regarding setting up and configuring the webhook.
- The sample subflow runs as a user by default. The subflow can be configured to run as system.

Spoke triggers

Use triggers in the Jira spoke to subscribe to the required events. The endpoint enables webhooks to connect with your ServiceNow instance. You can configure the flows to execute only when the specified trigger conditions are met. The supported events are:

Category	Trigger	Description
Board Management	Board Deleted	Trigger is initiated when a board is deleted.
	Board Updated	Trigger is initiated when a board is updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Trigger	Description
	Board Created	Trigger is initiated when a board is created.
Comment Management	Comment Deleted	Trigger is initiated when a comment is deleted.
	Comment Updated	Trigger is initiated when a comment is updated.
	Comment Created	Trigger is initiated when a comment is created.
Issue Managament	Issue Updated	Trigger is initiated when an issue is updated. The events like issue assigned, issue resolved, issue closed, issue reopened, issue moved, and other events that are related to updating an issue come under this webhook event.
	Issue Assigned	Trigger is initiated when an issue gets assigned.
	Issue Deleted	Trigger is initiated when a issue is deleted.
	Issue Created	Trigger is initiated when a issue is created.
Sprint Management	Sprint Updated	Trigger is initiated when a sprint is updated.
	Sprint Deleted	Trigger is initiated when a sprint is deleted.
	Sprint Created	Trigger is initiated when a sprint is created.
	Sprint Closed	Trigger is initiated when a sprint is closed.
	Sprint Started	Trigger is initiated when a sprint is started.

For information about setting up the triggers for the Jira spoke, see Set up triggers for the Jira spoke. For more information about inbound integration, see Conditional and event-driven inbound integration.

Spoke actions

Use actions in the Jira spoke in Workflow Studio to automate Jira tasks when an event occurs in the ServiceNow AI Platform. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Some of the spoke actions from this release onwards don't have the **Connection Alias** input.

  The existing flows in your instance that use actions of the previous versions, continue to work. However, those earlier actions are renamed by adding the `deprecated` suffix and you can't use them from this version onwards.

- Error evaluation capabilities are provided in some of the spoke actions.

Category	Action	Description
Audit Management	Look up Audit Logs Stream	Retrieves login activity for the Jira user subscriptions. **Note:** This action is supported on Jira Server 9 and earlier versions, and Jira Cloud.
	Look up Audit Logs Stream (Server 10+)	Retrieves audit log records from the Jira instance within a specified date range. **Note:** This action is supported on Jira Server 10 and later versions.
Group Management	Add User to Group	Adds given user to a group in Jira.
	Create Group	Creates a group in Jira.
	Look up Groups Stream	Retrieves all groups in the Jira account, including the default groups. **Note:** This action can be used with Jira Cloud subscription only.
	Look up Users by Group Name Stream	Retrieves details of all members in a Jira group.
	Remove Group	Removes the given group from Jira.
	Remove User from Group	Removes the given user from a group in Jira.
Issue Management	Add Comment	Adds a comment to the specified issue in Jira.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Add Watcher	Adds the specified user as a watcher for the specified issue.
	Assign Issue	Assigns the issue in Jira to the user.
	Copy Attachment	Copies the required attachment associated with the ServiceNow record to the required issue in Jira.
	Create Issue	Creates an issue in Jira. Depending on how your organization is using Jira, an issue could represent a software bug, a project task, a help desk ticket, or more. An issue in Jira represents a task in the ServiceNow AI Platform.
	Delete Attachment	Deletes the required attachment in Jira.
	Delete Issue	Deletes an issue in Jira.
	Delete Watcher	Deletes the user as a watcher for the specified issue.
	Do Transition	Transitions an issue in Jira from one state to another.
	Look up Issue Type Statuses by Project	Retrieves details of the statuses in a project.
	Look up Issue	Retrieves the details for an issue.
	Look up Issue Priorities	Retrieves the list of issue priorities and details for individual issue priorities.
	Look up Issues Stream	Retrieves a list of issues matching a JQL query string.
	Look up Sprint Issues Stream	Retrieves the details of all issues for the given sprint.
	Look up Transitions	Retrieves information about all Transitions for a given Issue ID.
	Look up Watchers	Retrieves the list of watchers for the specified issue.
	Update Issue	Updates a set number of fields of an issue in Jira with values passed as input.
Metadata Retrieval	Get Creatable Fields (Metadata)	Retrieves the list of all fields in a required Jira project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Editable Fields (Metadata)	Retrieves the list of all editable fields in a required Jira issue.
	Get Issue Types (Metadata)	Retrieves the list of all issue types in a required Jira project.
Project Management	Create Project	Creates a project in Jira.
	Look up Project	Retrieves details of the specified project by its ID or key.
	Look up Projects	Retrieves details of all projects. **Note:** This action only works for the Jira server.
	Look up Projects Stream	Retrieves details of all projects. **Note:** This action only works for the Jira Cloud.
	Look up Users Assignable to Projects	Retrieves a list of users that can be assigned to issues in one or more projects.
Sprint Management	Create Sprint	Creates a sprint in Jira.
	Delete Sprint	Deletes a sprint in Jira.
	Look up Sprint	Retrieves the details of the required sprint as a complex object.
	Look up Sprints by Board	Retrieves the details of all sprints in the required board.
	Update Sprint	Updates the details of a sprint in Jira.
Story Management	Create Story	Creates a story in the Jira Cloud instance. This is comparable to story in the ServiceNow Agile Development plugin.
	Look up Stories Stream	Retrieves details of all stories.
	Update Story	Updates a set number of fields of a story in Jira Cloud with the provided input values.
User Management	Create User	Creates a user in Jira.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Authenticated User	Retrieves details of the authenticated user account.
	Look up Group Memberships for User	Retrieves details of all groups of a Jira user.
	Look up Users Stream	Retrieves details of all Jira user subscriptions. **Note:** This action can be used with a Jira Cloud subscription only.
	Look up Users Stream by Name	Retrieves a list of users that match the search string. **Note:** This action can be used with a Jira server subscription only.
	Remove User	Removes a user from Jira.
	Report Personal Data	Reports personal data for given accounts to the Jira app.
Utility Actions	Copy Issue Attachment to Record	Copies Attachment from Jira to any record in ServiceNow instance. When you use this action in a subflow, make sure that the Content URL data pill is specified in the Attachment URL field.
	Look up Fields	Retrieves the internal name and other details of the required field label in Jira.
	Look up Issue from Comment	Retrieves the details of the issue by parsing the payload for the specified comment. You can use this action in the Process Jira Webhook subflow for Jira on-prem server when only comment related information is specified without any details about the Jira issue. For example, when only comment information is specified, this action parses the payload and extracts the issue details.
	Look up Latest Attachment on Issue	Retrieves the latest attachment for the specified issue from Jira. You can use

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		this action in a flow or subflow for validation. For example, a subflow adds an additional attachment only when the latest attachment of an issue in Jira isn't as the same specified attachment.
	Look up Latest Comment on Issue	Retrieves the latest comment for the specified issue from Jira. You can use this action in a flow or subflow for validation. For example, a subflow adds an additional comment only when the latest comment of an issue in Jira isn't as the same specified comment.
	Look up Server	Retrieves general information about the current Jira instance.
Webhook Management	Look up Webhooks	Retrieves details of all registered webhooks from the Jira instance.
	Subscribe Webhook	Registers a webhook in the Jira instance.
	Unsubscribe Webhook	Deletes the registered webhook in Jira instance.
	Update Webhook	Updates webhook with the given ID in Jira. **Note:** This action isn't supported when OAuth 2.0 authentication is used.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Jira story management AI agent	Retrieves information about stories in a stream, creates new stories, and updates existing stories.
Jira utility management AI agent	Provides utility actions that can copy issue attachment to record, retrieve the latest attachment and comments on a Jira issue, and retrieve field details using labels. Ensures accurate data retrieval.
Jira user management AI agent	Creates and removes the required user. Retrieves information about users, group memberships, and authenticated user accounts.
Jira audit management AI agent	Manages audit logs and provides actionable insights by automating repetitive tasks.
Jira sprint management AI agent	Deletes sprints, updates sprint details, and retrieves specific sprint information.
Jira project management AI agent	Retrieves project details, creates new projects, retrieves project streams, and identifies users assignable to projects.
Jira group management AI agent	Manages groups by performing actions such as, creating and deleting groups, adding and removing users, retrieving details about groups, retrieving data and updates, and retrieving group members.
Jira issue management AI agent	Manages issues by performing actions such as, deleting issues, managing transitions, handling watchers, and working with attachments. Also, manages transitions, comments, attachments, and watchers.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.

Jira account requirements

The Jira requires generating an API token for Jira using your Jira account.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Jira alias record. To use these actions, you must create a connection record and a credential record and associate them with the Jira alias record.

These actions use REST calls, which can run on an instance. Use the connection record associated with the Jira alias to configure the endpoint against which the actions run.

Set up the Jira spoke for Jira Cloud

Integrate your ServiceNow instance with the Jira Cloud instance to authenticate the requests from ServiceNow.

Before you begin

- Request an Integration Hub subscription.
- Activate the Jira spoke.
- Role required: admin.

About this task

You can set up the Jira spoke for your Jira Cloud instance using basic authentication or OAuth authentication as per your requirement.

Option 1: Using OAuth authentication (Authorization Code grant type)

Integrate the ServiceNow instance with your Jira account using OAuth to authenticate ServiceNow requests.

Before you begin

Role required: admin.

Obtain the value of Cloud ID

Obtain the value of Cloud ID of the Jira Cloud instance. This value is required during the configuration of the connection record in your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Log in to Atlassian Administration as an admin.
2. Click **Select** against the required organization.
3. From the **Jira Software** product, click **Manage product access**.
   A new window is opened and the URL is in this format: `https://admin.atlassian.com/s/<Cloud-ID>/apps`.
4. Copy the value of the Cloud ID for later use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a connection for Jira spoke

Add and configure a Jira connection to authenticate ServiceNow requests in Jira spoke.

Before you begin

Role required: admin

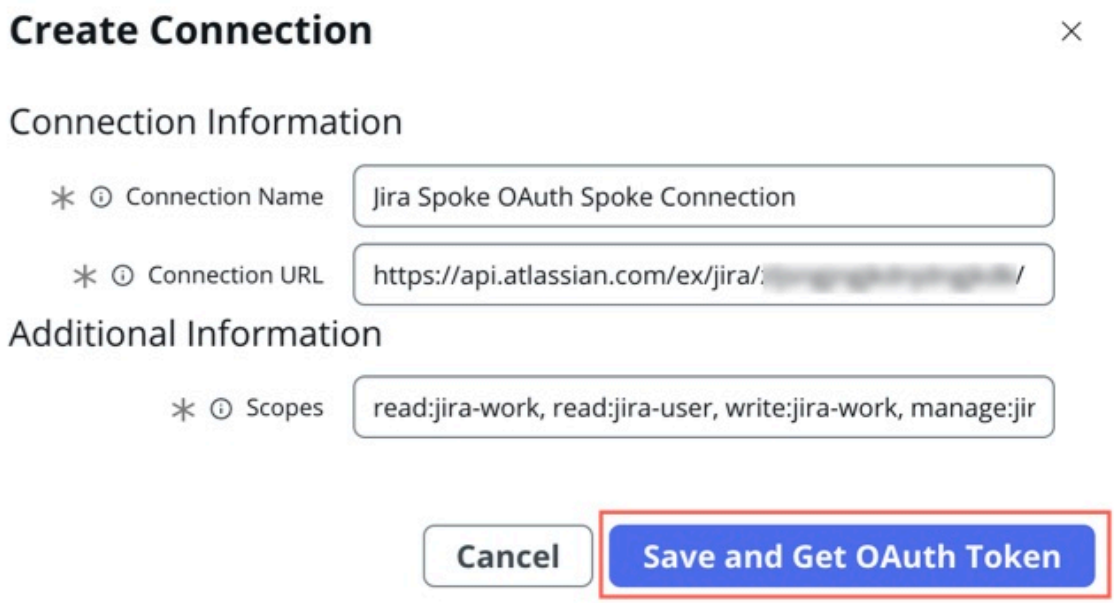
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.
4. Locate the **Jira** connection alias and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Jira spoke, click **View Details**.
   - To manage more than one Jira spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.
5. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection. For example, `Jira Spoke OAuth basic conn`.
Connection URL	URL of your Jira instance in this format: `https://api.atlassian.com/ex/jira/{cloud-id}/`. Replace `{cloud-id}` with value of the Cloud ID you had obtained previously.
Scopes	By default, these scopes are provided `read:jira-work, read:jira-user, write:jira-work, manage:jira-project, manage:jira-configuration, manage:jira-webhook, manage:jira-data-provider, delete:sprint:jira-software, read:sprint:jira-software, write:sprint:jira-software, read:board-scope:jira-software, read:project:jira, read:jql:jira, read:issue-details:jira, read:me, read:account, offline_access`. You can modify the scopes as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Save and Get OAuth Token**.

Option 2: Using OAuth authentication (Client Credentials grant type)

Integrate the ServiceNow instance with your Jira account using OAuth to authenticate ServiceNow requests.

Before you begin

- In your Jira cloud instance, Create OAuth 2.0 credential for service accounts.

  Save the values of **Client ID**, **Client Secret**, and **Cloud ID**. You will need these for configurations in ServiceNow instance.

- Role required: admin.

Create an application registry record

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message `What kind of OAuth application?`.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the application registry record. For example, `Jira Client Credentials OAuth`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client ID	Client ID generated when the OAuth 2.0 integration was created in Atlassian Developer console.
Client Secret	Client secret generated when the OAuth 2.0 integration was created in Atlassian Developer console.
Default Grant type	Grant type used to establish the token. Select **Client Credentials**.
Token URL	OAuth server token endpoint. Enter: `https://auth.atlassian.com/oauth/token`.
Token Revocation URL	OAuth server token revocation endpoint. Enter: `https://auth.atlassian.com/oauth/token`.
Active	Select the check box.

5. In the **OAuth Entity Scopes** tab, create these entity scope records.

Name	OAuth scope
Classic scopes	`manage:jira-configuration manage:jira-project manage:jira-webhook read:jira-work read:jira-user write:jira-work`
Granular Scopes	`delete:sprint:jira-software read:issue-details:jira read:jql:jira read:sprint:jira-software write:sprint:jira-software read:board-scope:jira-software read:project:jira`

6. Right-click the form header and click **Save**.
   The record is saved and a OAuth Entity Profile record under the **OAuth Entity Profiles** tab.
7. Click the **OAuth Entity Profiles** tab and open the default profile record.
8. Verify these values.
   - **Grant type** is set to **Client Credentials**.
   - Scope records previously created are listed under the **OAuth Entity Profile Scopes** related list.
9. Click **Update**.

Create credential record for the Jira spoke

Create a credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the credential record for the Jira spoke. For example, `Jira client credential cred`.
OAuth Entity Profile	Select the OAuth entity profile record that was created when the application registry record is configured. For more information, see Create an application registry record.

5. Right-click the form header and click **Save**.
6. Click the **Get OAuth Token** related link.

Create a connection record for the Jira spoke

Create a connection record for the Jira account. The connection and credential alias uses this connection to perform actions in Jira.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the alias record for **Jira** that shipped with the spoke.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click **Submit**.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Jira cloud OAuth Connection`.
Credential	Select the Credential record created for Jira. For example, select **Jira cloud OAuth credential**.
Connection URL	Enter the URL of your Jira instance in this format: `https://api.atlassian.com/ex/jira/<Cloud-ID>`. For information about obtaining the value of Cloud ID, see Obtain the value of Cloud ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Submit**.
   The Jira spoke is configured to use OAuth 2.0 Client Credentials via the service account.

Option 3: Using basic authentication and API token

Integrate the ServiceNow instance and Jira Cloud instance using an API key to authenticate ServiceNow requests.

Before you begin

Important:
Apps that collect API tokens to create individual 3LO apps don't comply with Atlassian security requirements for cloud apps and Atlassian acceptable use policy.

Role required: admin.

About this task

You can integrate a ServiceNow instance with multiple Jira instances. For this integration, create a connection and credential alias record and a connection record for each Jira instance.

Generate an Atlassian account API token

Generate an Atlassian account API token to authenticate requests for spokes associated with an Atlassian account.

Before you begin

Make sure you have an Atlassian account.

Role required: Atlassian administrator credentials

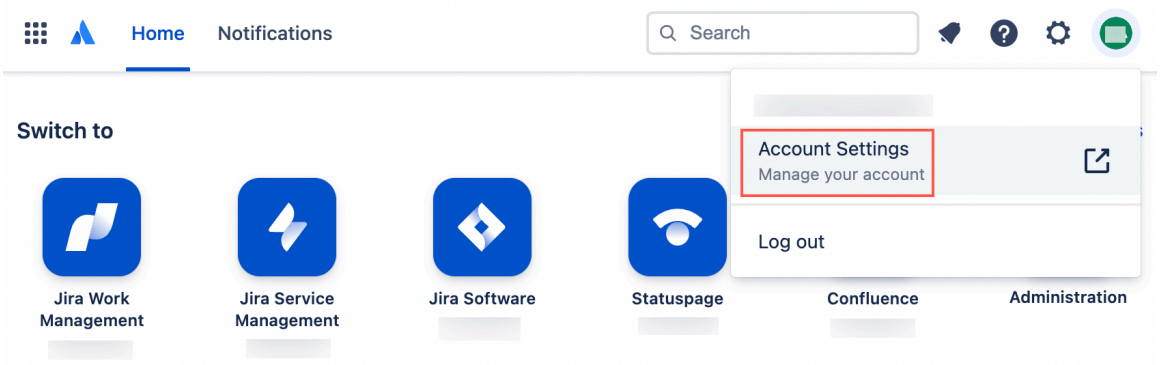
About this task

Complete these steps from your Atlassian account. See the Atlassian Developer portal documentation for instructions on generating your API token.

Note:
This procedure is applicable only if you're using the Jira Cloud subscription.

Procedure

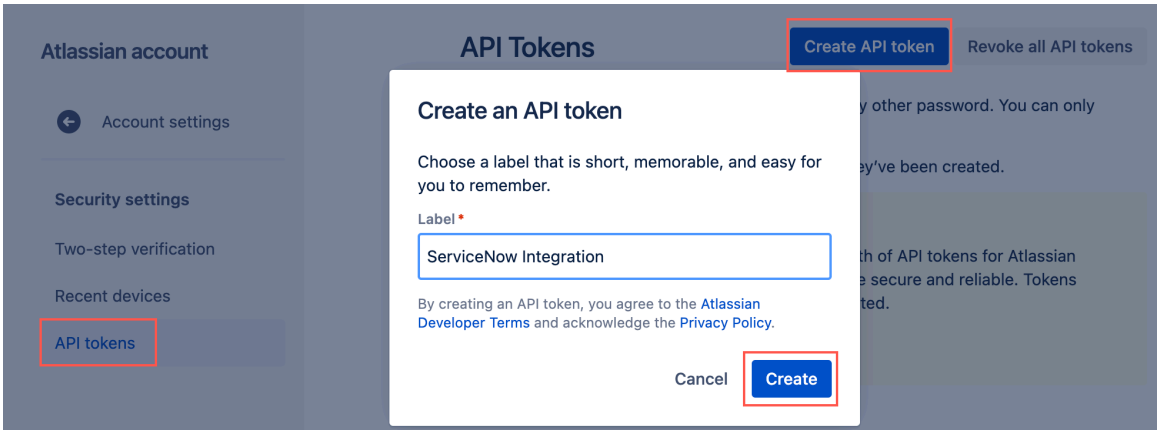
1. Log in to Atlassian Start as an admin.
2. Go to your account profile photo and select **Account Settings**.



3. Go to **Security**.
4. In the API token section, select **Create and manage API tokens**.

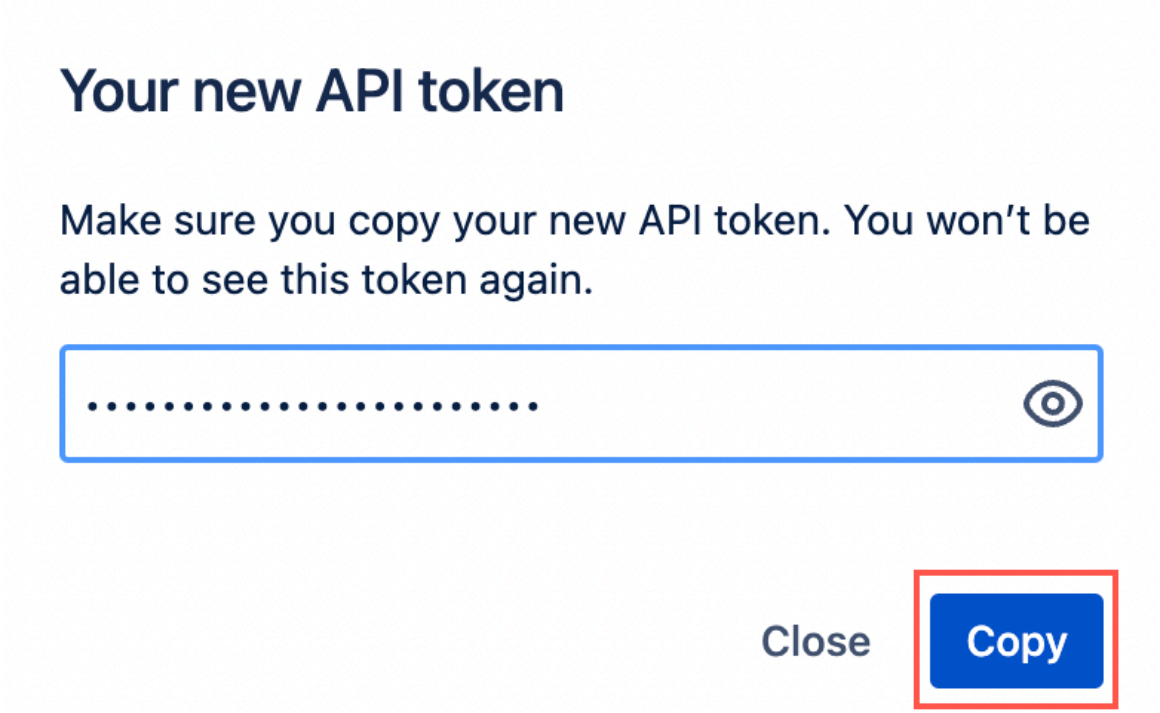
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **API token**.
6. On the form, provide an integration name for the **Label** field.
7. Select **Create**.



The API token is generated.

8. Select **Copy** and record the value of the API token for later use.



What to do next

Use your API token to configure the cloud connection for a Jira or Jira Service Management spoke.

Create credential record for the Jira spoke

Create a credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`
3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the credential record for the Jira spoke. For example, `Jira Cloud Basic Auth Token cred`.
User name	Enter the email address of the user.
API Key	Enter the API token you generated for your Jira Cloud instance.

5. Right-click the form header and click **Save**.

Create a connection record for the Jira spoke

Create a connection record for the Jira account. The connection and credential alias uses this connection to perform actions in Jira.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the alias record for **Jira** that shipped with the spoke.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click **Submit**.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Jira cloud Basic Auth Token Connection`.
Credential	Select the Credential record created for Jira. For example, select **Jira Cloud Basic Auth Token cred**.
Connection URL	Enter the URL of your Jira instance in this format: `https://api.atlassian.com/ex/jira/<Cloud-ID>`. For information about obtaining the value of Cloud ID, see Obtain the value of Cloud ID.

5. Click **Submit**.
   The Jira spoke is configured to use basic credentials via the service account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option 4: Using basic authentication with API token and scopes

Integrate the ServiceNow instance and Jira Cloud instance using an API key with scopes to authenticate ServiceNow requests.

Before you begin

Important:
Apps that collect API tokens to create individual 3LO apps don't comply with Atlassian security requirements for cloud apps and Atlassian acceptable use policy.

Role required: admin.

About this task

You can integrate a ServiceNow instance with multiple Jira instances. For this integration, create a connection and credential alias record and a connection record for each Jira instance.

Generate an Atlassian account API token with scopes

Generate an Atlassian account API token with the required scopes to authenticate requests for spokes associated with an Atlassian account.

Before you begin

Make sure you have an Atlassian account.

Role required: Atlassian administrator credentials

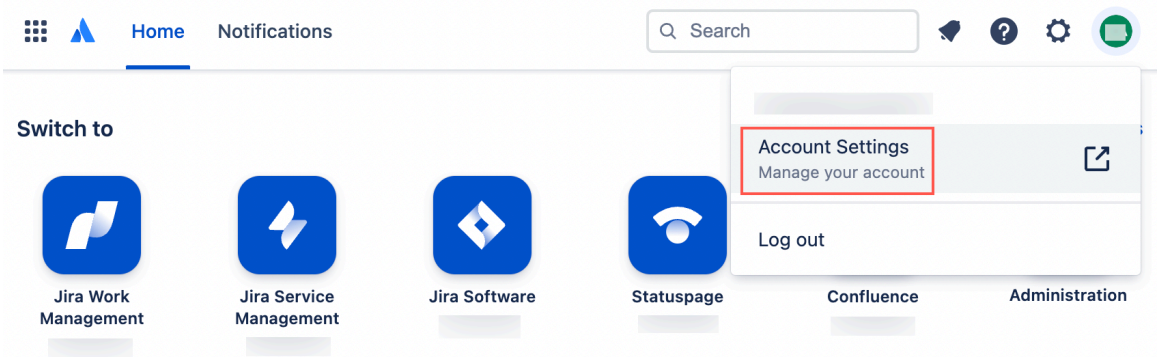
About this task

Complete these steps from your Atlassian account. See the Atlassian Developer portal documentation for instructions on generating your API token.

Note:
This procedure is applicable only if you are using the Jira Cloud subscription.

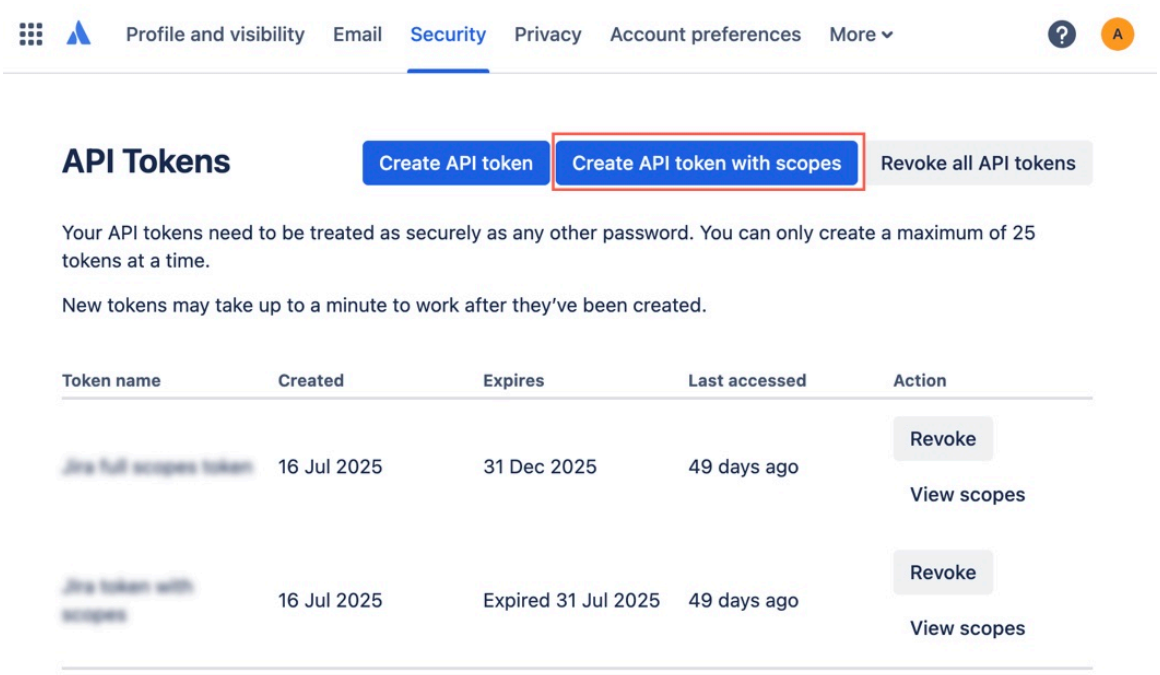
Procedure

1. Log in to Atlassian Start as an admin.
2. Go to your account profile photo and select **Account Settings**.

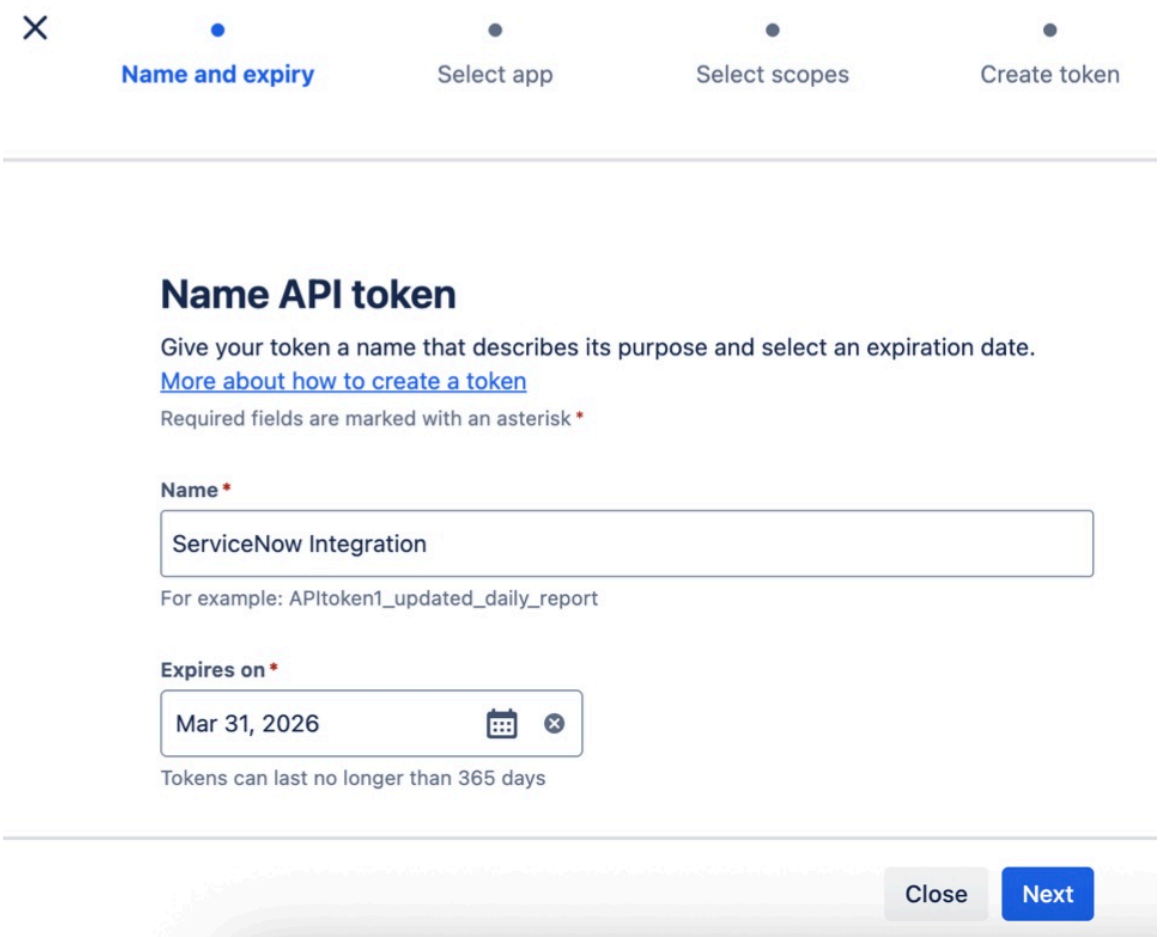


3. Go to **Security**.
4. In the API token section, select **Create and manage API tokens**.
5. Click **Create API token with scopes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

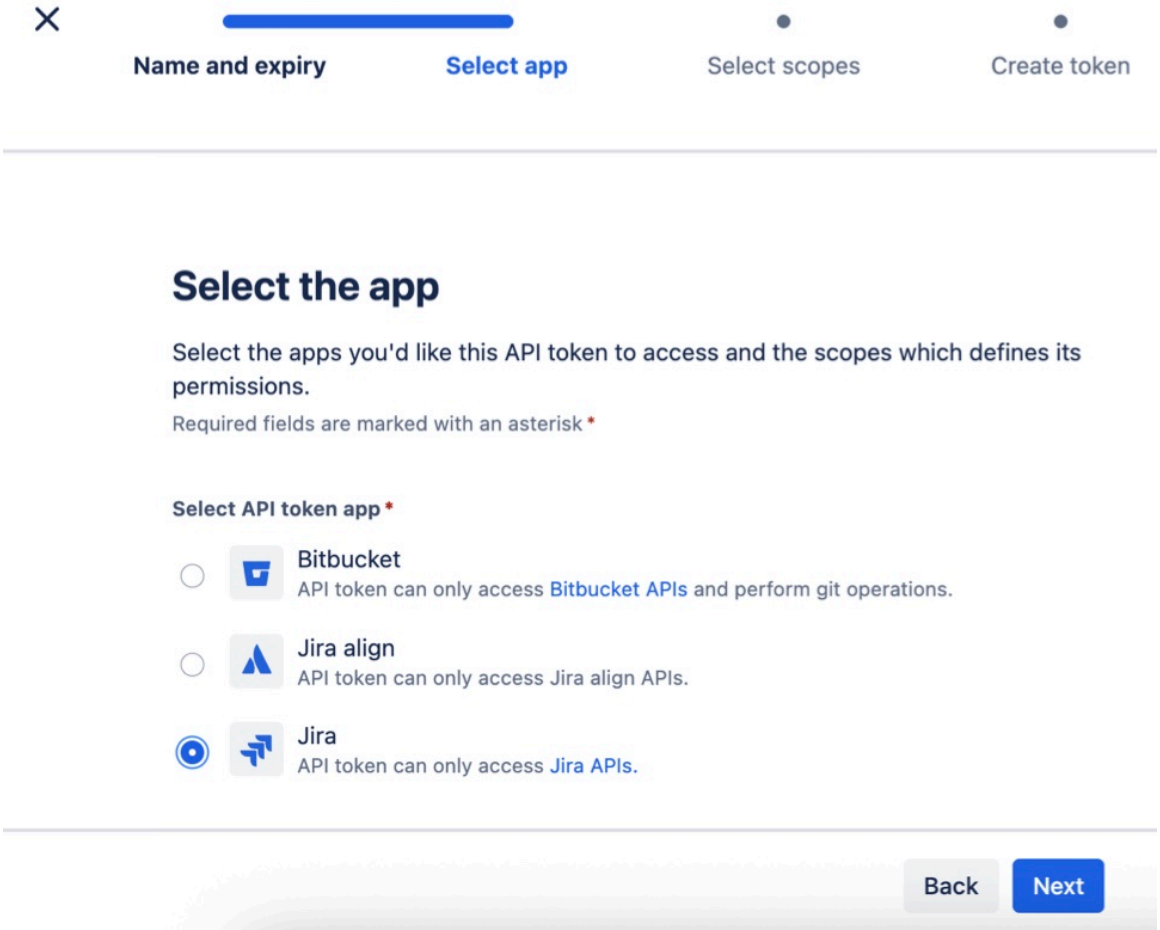


6. On the Name API token form, enter **Name**, select an expiry date for the token, and click **Next**.



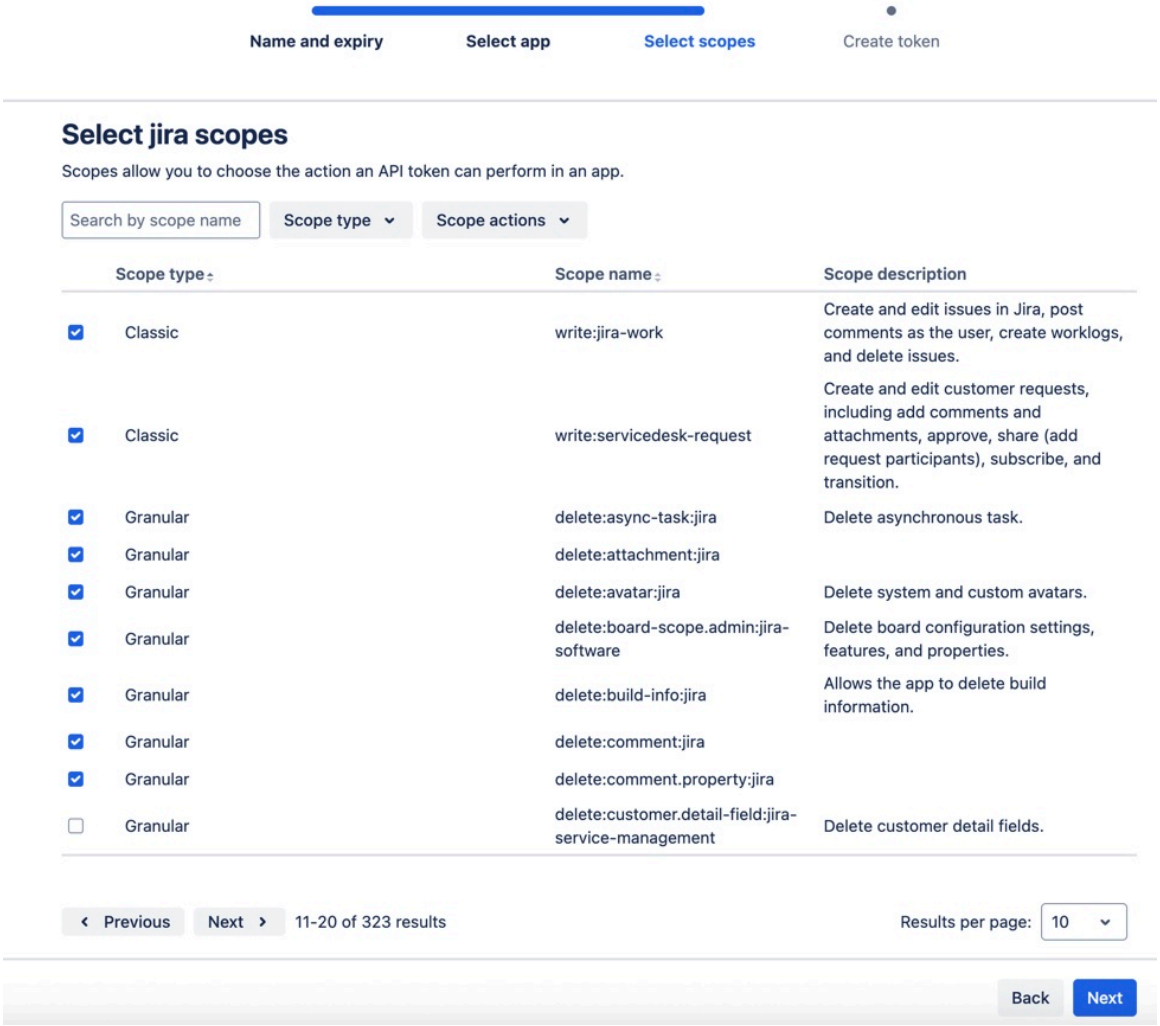
7. On the Select the app form, select **Jira** and click **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. On the Select Jira scopes form, select the required scopes and click **Next**.

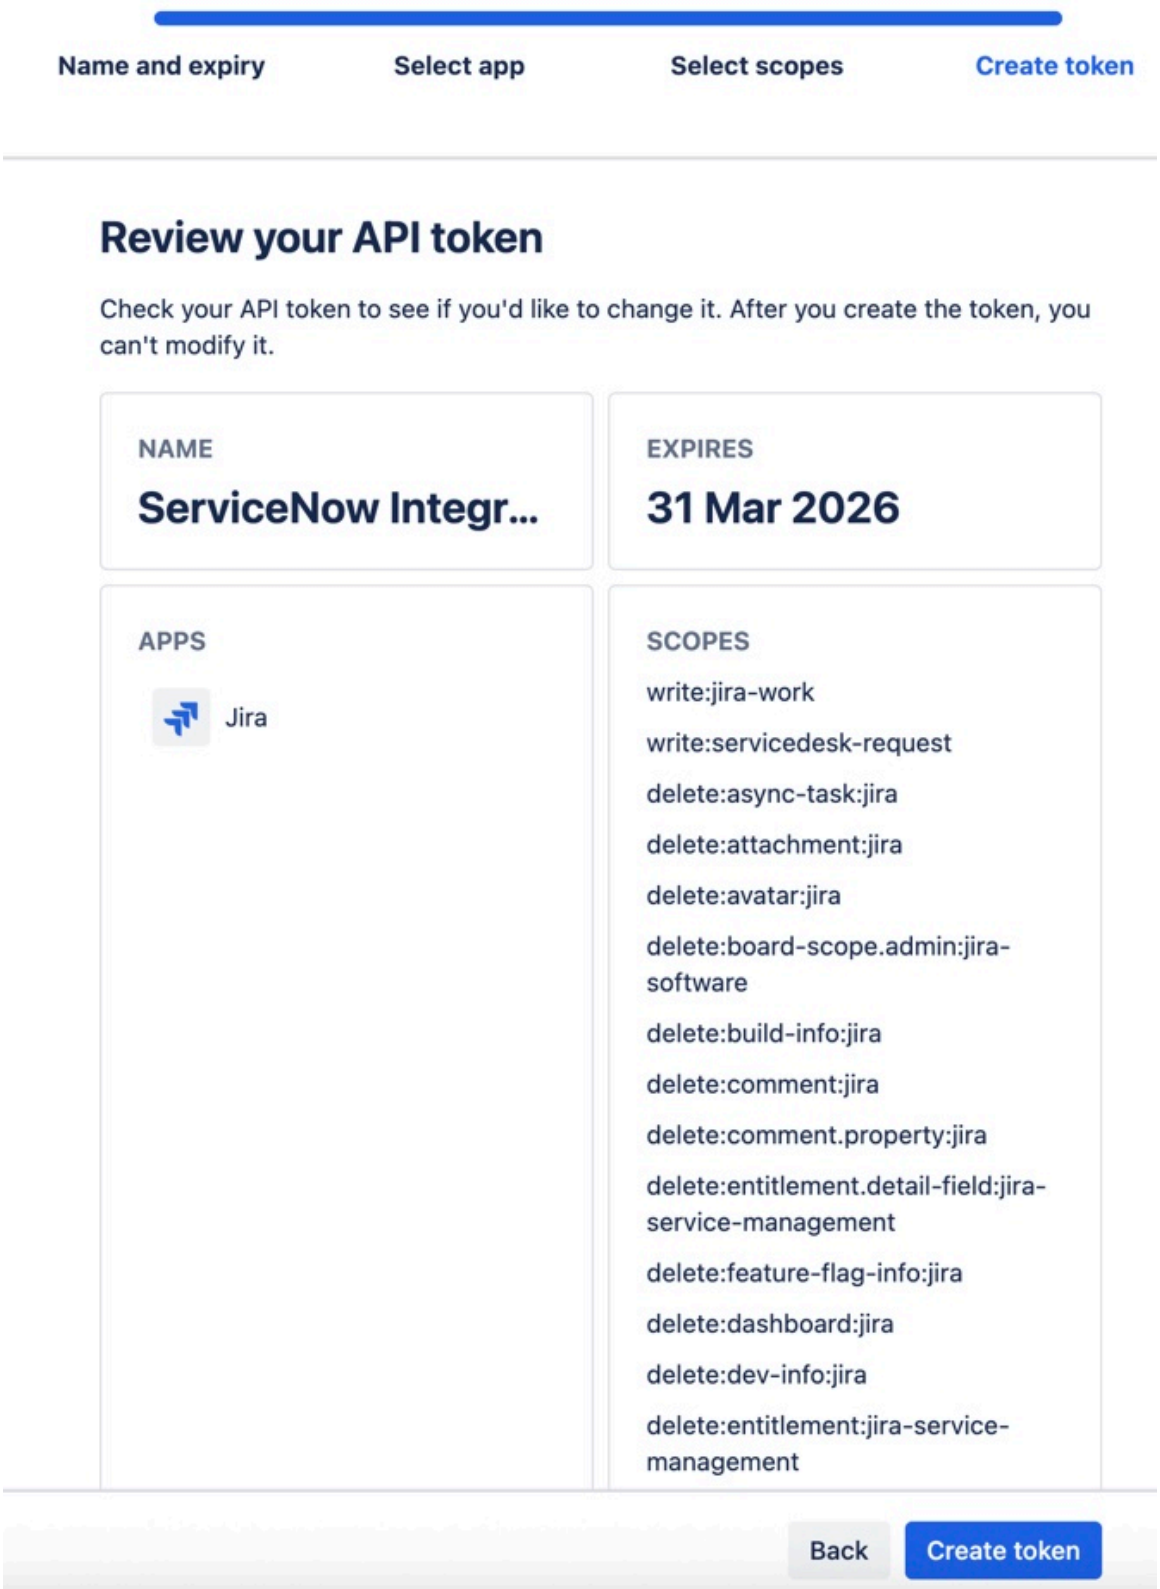
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For details about scopes needed to use the required spoke actions, see Required API token scopes.

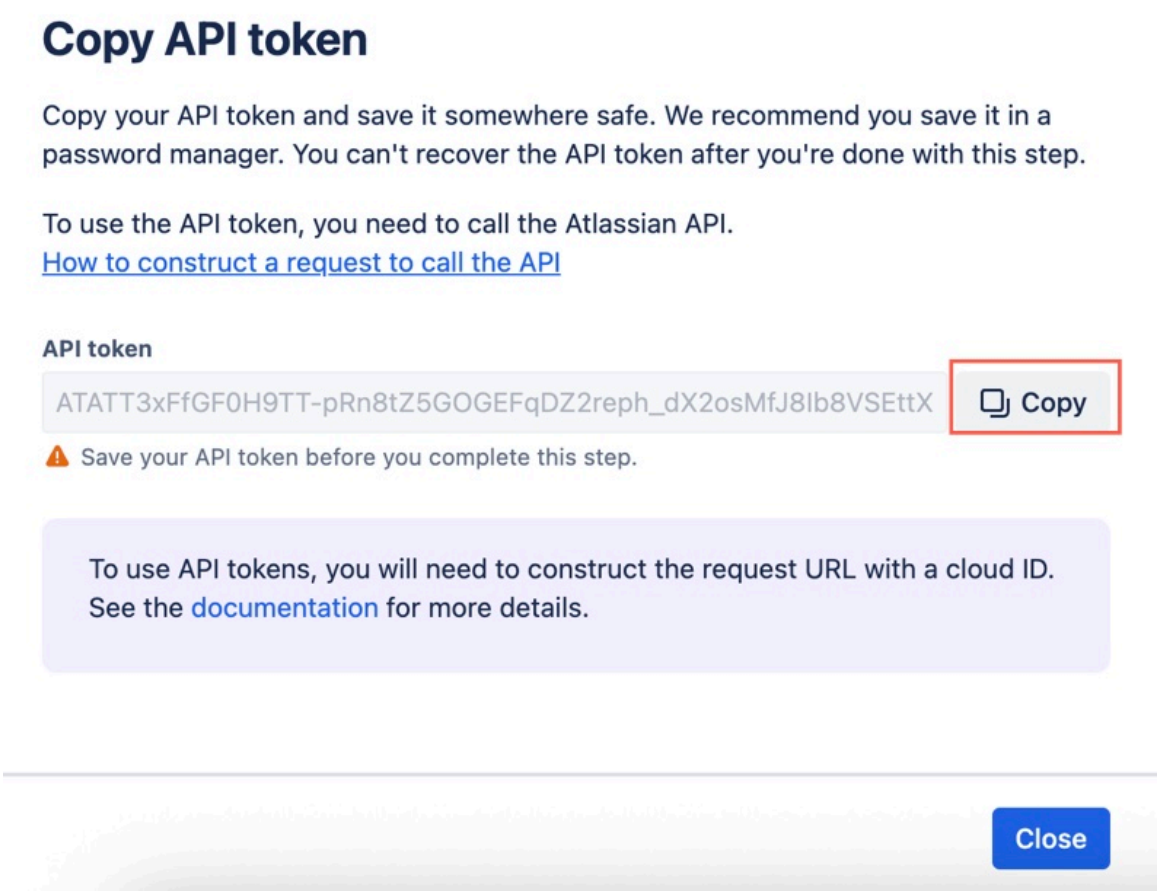
9. Review the API token scopes and click **Create token**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API token is generated and displayed. Copy and record the token value for later use.



Create credential record for the Jira spoke

Create a credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`
3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the credential record for the Jira spoke. For example, `Jira Cloud Basic Auth Token Scopes cred`.
User name	Enter the email address of the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
API Key	Enter the API token you generated for your Jira Cloud instance.

5. Right-click the form header and click **Save**.

Create a connection record for the Jira spoke

Create a connection record for the Jira account. The connection and credential alias uses this connection to perform actions in Jira.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the alias record for **Jira** that shipped with the spoke.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click **Submit**.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Jira cloud Basic Auth Token Scope Conn`.
Credential	Select the Credential record created for Jira. For example, select **Jira Cloud Basic Auth Token Scopes cred**.
Connection URL	Enter the URL of your Jira instance in this format: `https://api.atlassian.com/ex/jira/<Cloud-ID>`. For information about obtaining the value of Cloud ID, see Obtain the value of Cloud ID.

5. Click **Submit**.
   The Jira spoke is configured to use OAuth 2.0 Client Credentials via the service account.

Required API token scopes

API token scopes needed to use the required spoke action are listed here.

These scopes are needed when you set up Jira spoke for Jira Cloud using API token with scope. For more information, see Option 4: Using basic authentication with API token and scopes.

Category	Action	Description	Scope required (Classic)	Scopes required (Granular)
Audit Management	Look up Audit Logs Stream	Retrieves login activity for the AtlassianJira user subscriptions.	manage:jira-configuration	read:audit-log:jira, read:user:jira

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Scope required (Classic)	Scopes required (Granular)
		Note: This action is supported on Jira Server 9 and earlier versions, and Jira Cloud.		
	Look up Audit Logs Stream (Server 10+)	Retrieves audit log records from the Jira instance within a specified date range. **Note:** This action is supported on Jira Server 9 and later versions.	This action is supported only on Jira Server.	
Group Management	Add User to Group	Adds given user to a group in Jira.	manage:jira-configuration	write:group:jira, read:avatar:jira, read:group:jira, read:user:jira
	Create Group	Creates a group in Jira.	manage:jira-configuration	read:group:jira, read:user:jira, write:group:jira, read:avatar:jira
	Look up Groups Stream	Retrieves all groups in the Atlassian account, including the default groups. **Note:** This action can be used with Jira Cloud subscription only.	read:jira-user	read:group:jira
	Look up Users by Group Name Stream	Retrieves details of all members	manage:jira-configuration	read:group:jira, read:user:jira, read:avatar:jira

Category	Action	Description	Scope required (Classic)	Scopes required (Granular)
		subflow adds an additional comment only when the latest comment of an issue in Jira isn't as the same specified comment.		
	Look up Server	Retrieves general information about the current Jira instance.	Any scope	Any scope
Webhook Management	Look up Webhooks	Retrieves details of all registered webhooks from the Jira instance.	Scoped API token is not supported for this action.	
	Subscribe Webhook	Registers a webhook in the Jira instance.	Scoped API token is not supported for this action.	
	Unsubscribe Webhook	Deletes the registered webhook in Jira instance.	Scoped API token is not supported for this action.	
	Update Webhook	Updates webhook with the given ID in Jira. **Note:** This action isn't supported when OAuth 2.0 authentication is used.	Scoped API token is not supported for this action.	

Set up the Jira spoke for Jira Server

Integrate the ServiceNow instance and Jira Server using user name and password to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:

- Starting with the Australia release, instructions for generating and using API tokens have been removed from our documentation to align with Atlassian's Acceptable Use Policy.
- As of February 15, 2024 PT, your Jira Server products reached the end of support. Starting from Jira Software 9.13 and Jira Service Management 5.13, new Jira releases support only Data Center licenses.
- End of life for impacted Data Center products will take place on March 28, 2029 at 23:59 PST. Data Center subscriptions and any associated Marketplace apps will expire on this date, making Data Center products and apps read-only. For more information, see Data Center EOL General Questions.
- Apps that collect API tokens to create individual 3LO apps don't comply with Atlassian security requirements for cloud apps and Atlassian acceptable use policy.

- Request an Integration Hub subscription.
- Activate the Jira spoke.
- Role required: admin.

Option 1: Using user name and password

Integrate the ServiceNow instance and Jira Server using user name and password to authenticate ServiceNow requests.

Before you begin
Role required: admin

Create credential record for the Jira spoke

Create a credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`
3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the credential record for the Jira spoke. For example, `Jira Data Center Basic Cred`.
Username	Username to log in to the Jira Data Center or Jira Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Password to log in to the Jira Data Center or Jira Server.

5. Right-click the form header and click **Save**.

Create a connection record for the Jira spoke

Create a connection record for the Jira account. The connection and credential alias uses this connection to perform actions in Jira.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the alias record for **Jira** that shipped with the spoke.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click **Submit**.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Jira cloud OAuth Connection`.
Credential	Select the Credential record created for Jira. For example, select **Jira Data Center Basic Cred**.
Connection URL	Base URL of the Jira server.

5. Click **Submit**.
   The Jira spoke is configured to use Basic Auth credentials.

Option 2: Using API Token

Integrate the ServiceNow instance and Jira Server using API Token to authenticate ServiceNow requests.

Before you begin

Important:
Apps that collect API tokens to create individual 3LO apps don't comply with Atlassian security requirements for cloud apps and Atlassian acceptable use policy.

Role required: admin

Generate a personal access token

Generate a personal access token from the Jira Server instance.

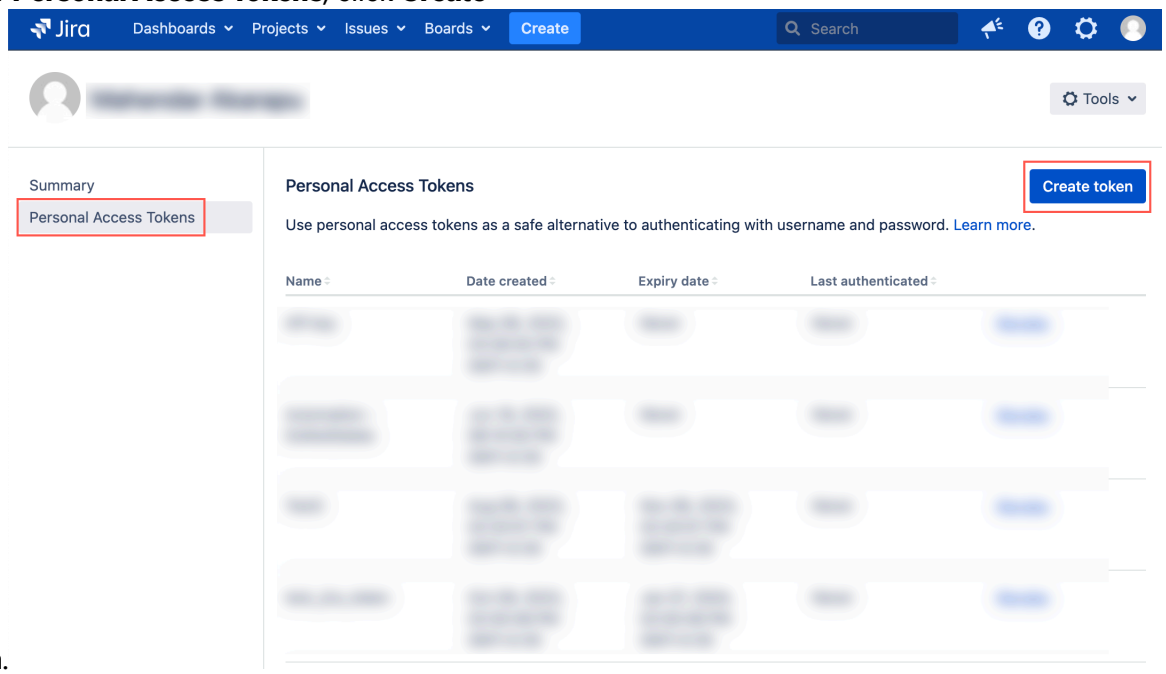
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Access to Jira Server instance.
- Role required: admin

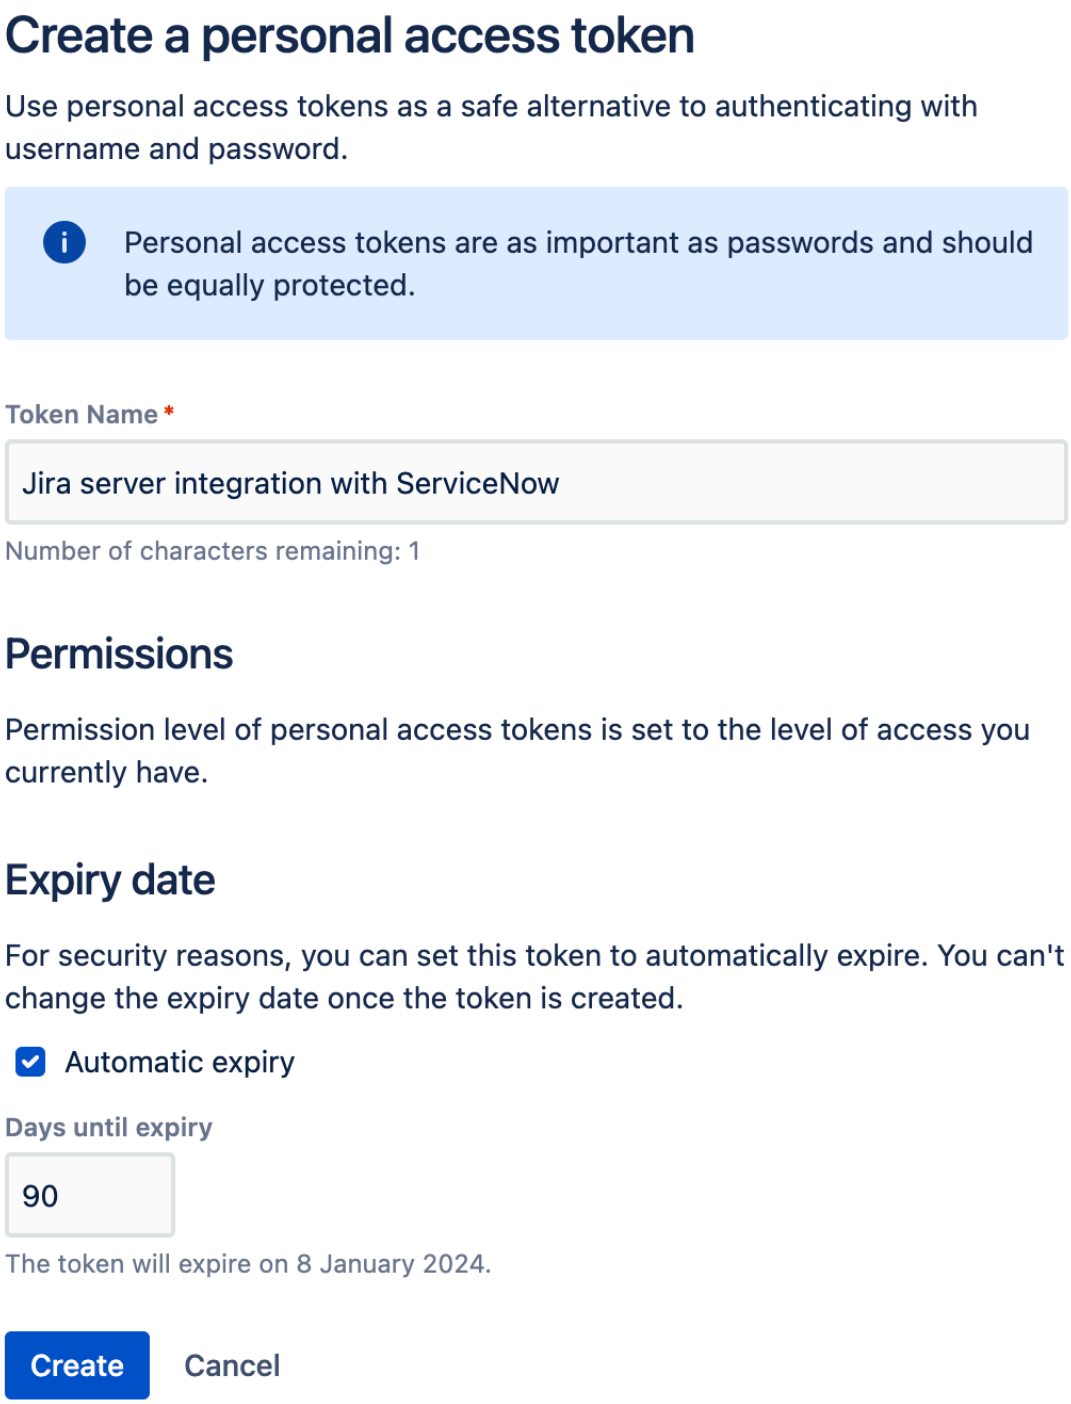
Procedure

1. Log in to the Jira Server instance as an admin.
2. Click the user profile icon and click **Profile**.
3. Under **Personal Access Tokens**, click **Create token**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

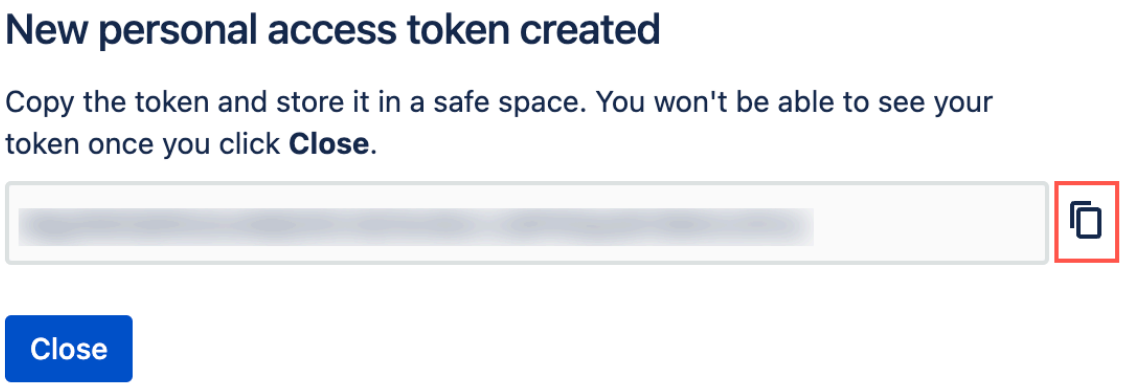
4. On the Create a personal access token form, fill in the required



values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The value of personal access token is generated and displayed. Copy this value for later



use.

Create a credential record for the Jira spoke

Create an API key credential record to authenticate the requests from ServiceNow.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Integration Hub** > **Connection & Credential Aliases** > **Credentials**.
2. Click **New**.
   The system displays the message, `What type of Credentials would you like to create?`
3. Select **API Key Credentials**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the credential record. For example, `Jira Server API Token Cred`.
API Key	Enter value in this format: `Bearer <Personal Access Token>`. `<Personal Access Token>` is the value of personal access token you had created in the Jira system dashboard.

5. Click **Submit**.

Create a connection record for the Jira spoke

Create a connection record for the Jira account. The connection and credential alias uses this connection to perform actions in Jira.

Before you begin
Role required: admin

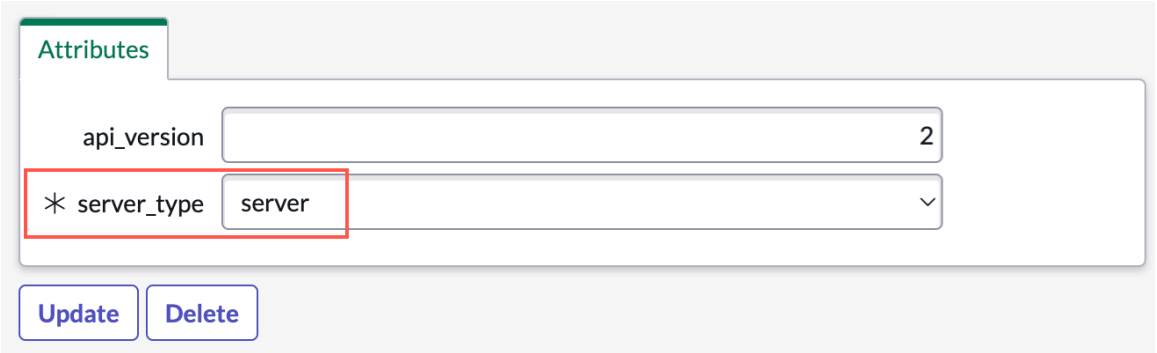
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the alias record for **Jira** that shipped with the spoke.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click **Submit**.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Jira Server API Token Connection`.
Credential	Select the Credential record created for Jira. For example, select **Jira Server API Token Cred**.
Connection URL	Enter the URL of your Jira Server instance.

5. In the Attributes related list, provide these values.
   a. Enter the value `2` for **api_version**.
   b. Enter the value `server` for **server_type**.



6. Click **Submit**.

Set up a bi-directional webhook for the Jira spoke

Configure a webhook to subscribe to Jira with a ServiceNow callback URL.

Before you begin

- Request an Integration Hub subscription
- Activate the Jira spoke
- Role required: admin

Create a token

Create a token to embed in the Jira webhook URL.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the navigation filter, enter `token_verification.list`.
   The system displays records in the Token Verifications table.
2. Click **New**.
3. On the form, fill the fields.

Token Verification form

Field	Description
Name	Unique name to identify the token. For example, `Jira token`.
Description	Description of the token.
Token	Authentication token. This token is used to authenticate incoming webhook requests.

Result
The token created is used to authenticate incoming webhook requests.

Register a Jira webhook in ServiceNow

Register a Jira webhook in ServiceNow to notify the ServiceNow app when certain events occur in Jira.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Jira Webhooks** > **Jira Webhook Registries**.
2. Click **New**.
3. On the form, fill in the fields.

Jira Webhook Registry form

Field	Description
Name	Unique name to identify the record. For example, `Jira webhook`.
Description	Description of the record.
Token	Authentication token. This token is used to authenticate incoming webhook requests.
Path	Jira webhook path. By default, this path is set to `api/sn_jira_spoke/jira_webhook_callbacks/wh_entry`.

4. Right-click the form header and click **Save**.
5. Choose how you want to authenticate callback requests and select one of the either options.

Callback URL Type	Description
Token-based Callback URL	Uses a static token in the URL for simple authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Callback URL Type	Description
HMAC-based Callback URL	Uses Hash-based Message Authentication Code (HMAC) for enhanced security and tamper-proof authentication.

The system displays either the token#based callback URL or the HMAC#based callback URL based on your selection.

6. Copy and record the webhook callback URL.

Result
The Jira webhook is registered in your ServiceNow instance.

Add a callback URL in Jira

Provide a webhook callback URL in yourJira Atlassian account to create a webhook.

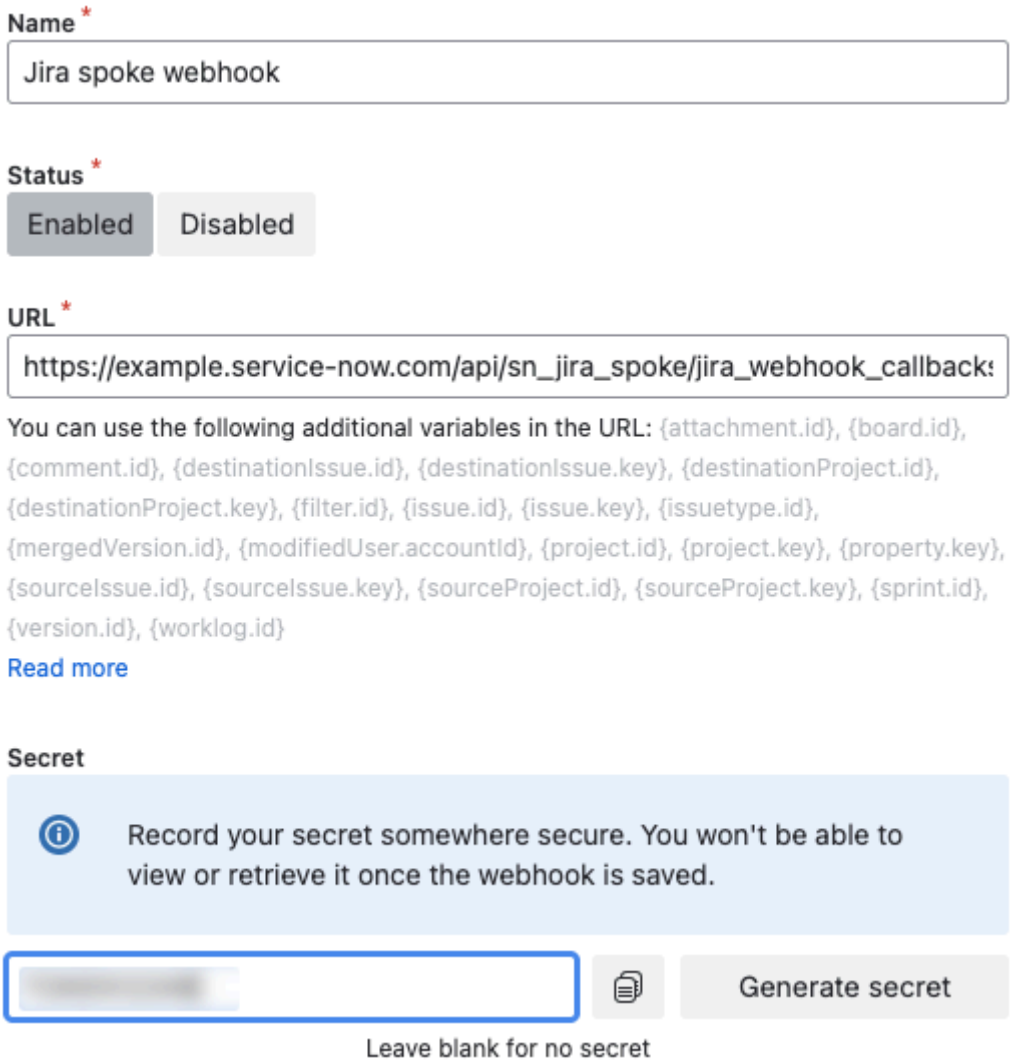
Before you begin
Role required: admin

Procedure

1. Log in to your Jira Atlassian account.
2. Create a webhook in your Atlassian account.
3. Enter the webhook callback URL in the **URL** field.
   See the Atlassian Developer portal documentation for instructions on creating a webhook.

> **Note:**
> If you select an HMAC-based callback URL while registering a webhook, enter the secret token created from your ServiceNow instance in the webhook's **Secret** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the related events that should trigger the webhook.

Result

The callback URL is added in your Jira Atlassian account. You can create routing policies and subflows as per your requirement. See Customize a bi-directional webhook for information regarding the creation of new routing policies and subflows.

Customize a bi-directional webhook

Create a webhook routing policy and subflow as per your requirement.

Before you begin

Role required: admin

About this task

The default routing policy in the Jira WebHook Routing Policies module triggers the Process Jira Webhooks subflow and notifies the ServiceNow app when certain events occur in Jira. See Jira Spoke for information about the fields that the default routing policy and subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Click **Subflows**.
3. Create a copy of the default subflow, Process Jira Webhooks.
4. Customize the subflow as per your requirement and publish it. See Building subflows for more information about creating and using subflows and Jira Spoke for information about the fields that the default routing policy and subflows support.
5. Navigate to **Jira Webhooks** > **Jira WebHook Routing Policies**.
6. Click **New**.
7. On the form, fill in the fields.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met. **a.** Click the lookup icon ( ). **b.** Select the required subflow from the Document list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.
Condition	Conditions to be met when the required events occur in Jira. See Jira webhooks for information about the supported fields.
Answer	Subflow that must be triggered when the specified conditions are met.

8. Click **Submit**.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Result
The routing policy and subflow are created.

Set up triggers for the Jira spoke

Set up triggers for the Jira spoke for the required events. The endpoint enables webhooks to connect with your ServiceNow instance.

https://player.vimeo.com/video/1109174361?h=eeb0b782e1&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin
Role required: admin

Configure triggers in ServiceNow instance

Configure endpoint for webhooks in the Jira that support the token authentication.

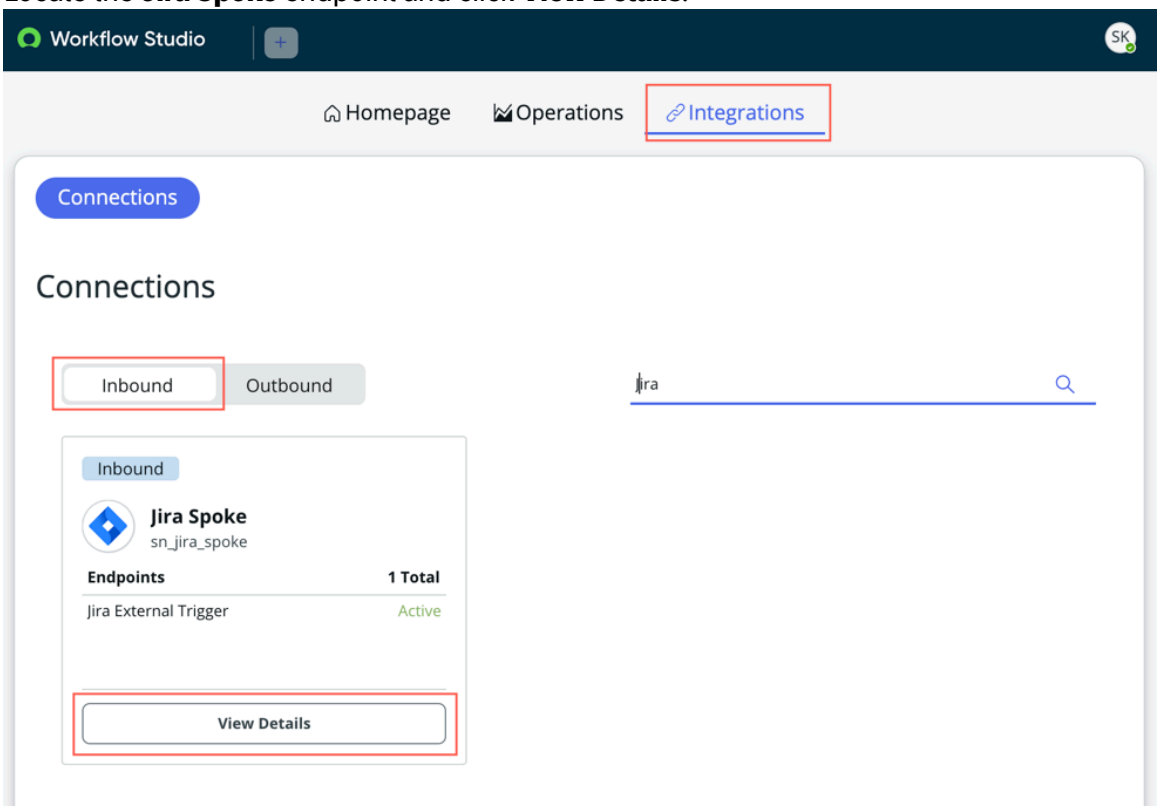
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

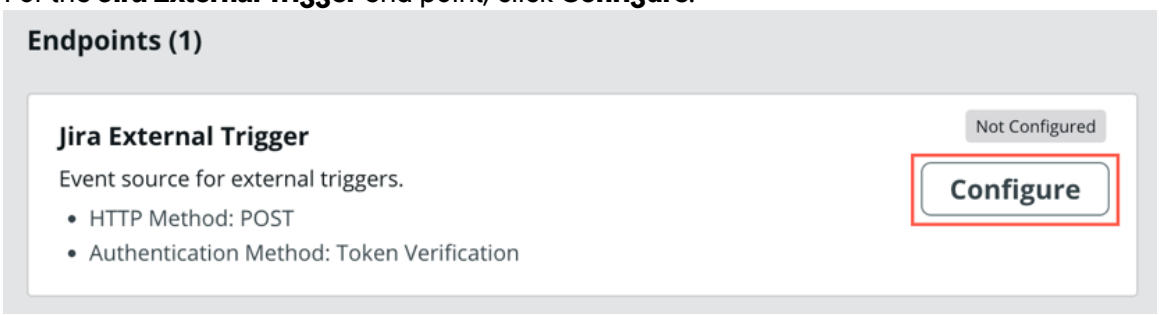
Role required: flow_designer and connection_admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Toggle and enable the **Inbound** connections.
4. Locate the **Jira Spoke** endpoint and click **View Details**.

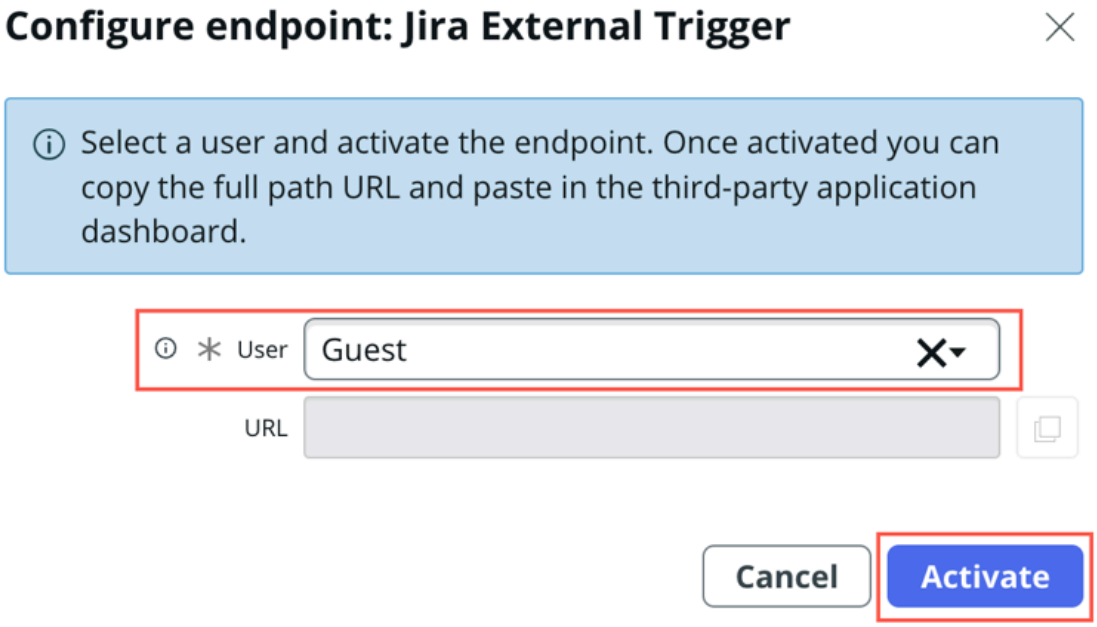


5. For the **Jira External Trigger** end point, click **Configure**.

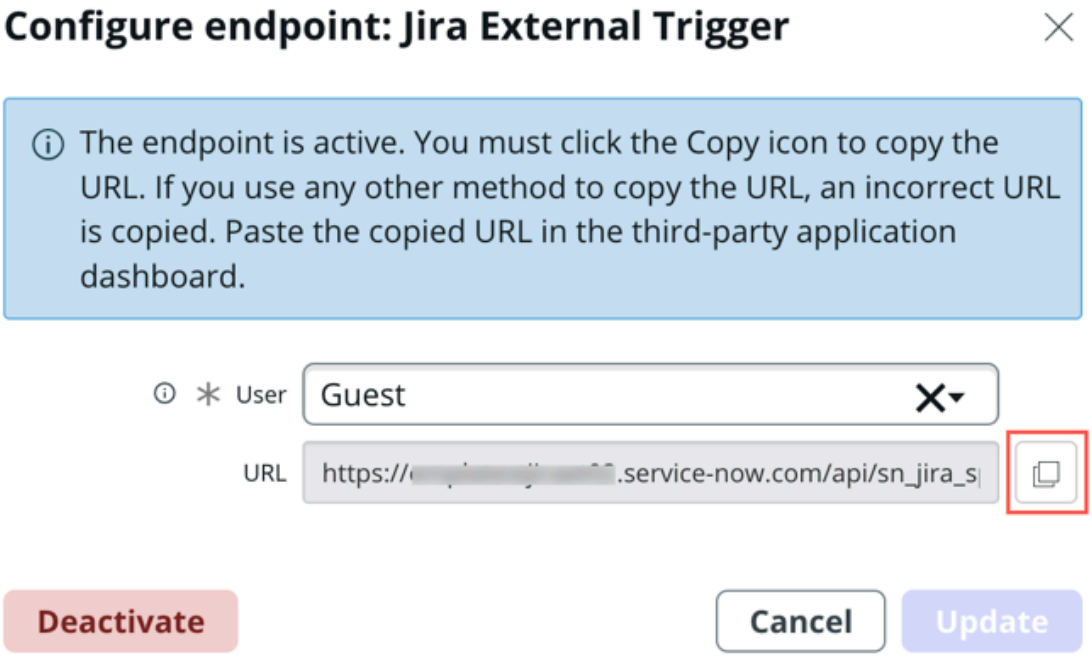


6. Select the user who can trigger the endpoint and click **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Copy the generated endpoint URL.



Add the endpoint URL in Jira

Add the endpoint URL that is generated in your ServiceNow instance in the Jira Atlassian account to enable webhooks to connect with your ServiceNow instance.

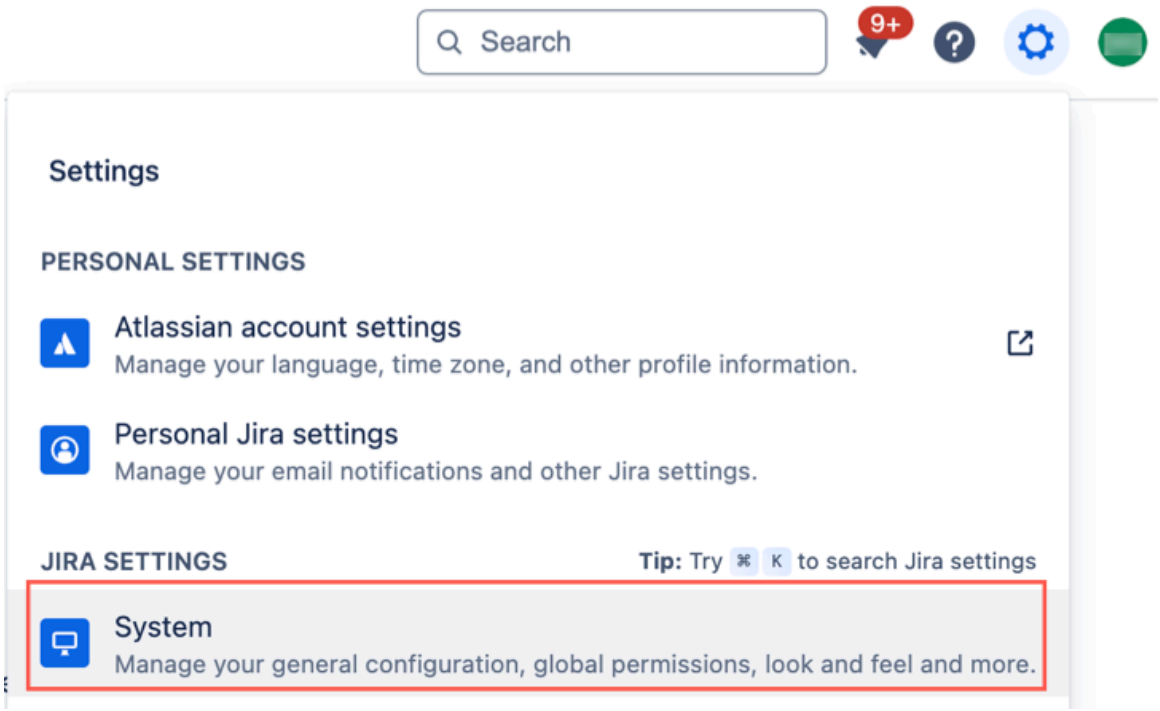
Before you begin
Role required: admin

Procedure

1. Log in to your Jira Atlassian account.

2. Navigate to **JIRA SETTINGS** > **System**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



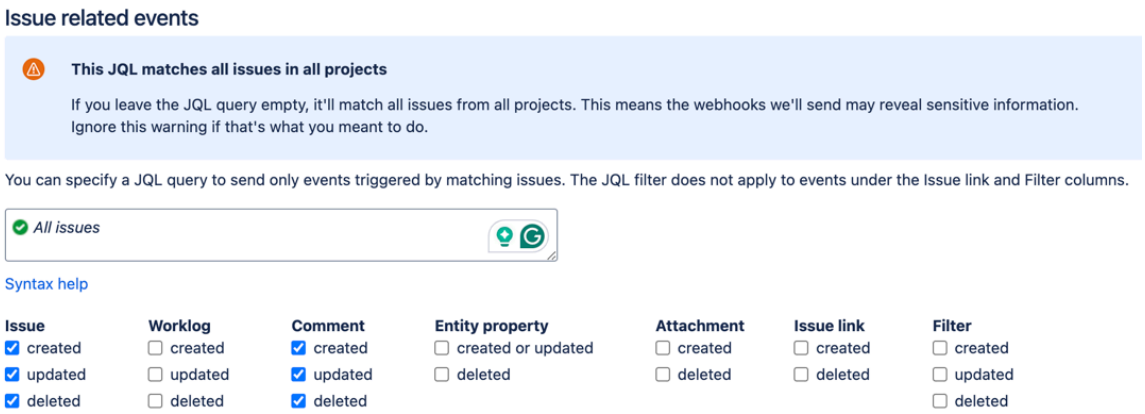
3. Under **Advanced**, click **WebHooks**.
4. Click **+Create a WebHook**.
5. On the form, fill in the values.

Field	Description
Name	Name to identify the webhook.
URL	Paste the generated endpoint URL that was generated after you configured triggers in the ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the supported events as per your requirement.

   For the list of the supported events, see the Spoke triggers section.



7. Click **Create**.

Kubernetes Spoke

Automate changes in Kubernetes when an event occurs in ServiceNow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Kubernetes spoke v1.3.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

API version v1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Kubernetes spoke provides actions to automate Kubernetes tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Endpoint Management	Create Endpoints	Creates an endpoint in the Kubernetes instance.
	Delete Endpoints	Deletes an endpoint from the Kubernetes instance.
Namespace Management	Create Namespace	Creates a namespace in the Kubernetes instance.
	Delete Namespace	Deletes a namespace from the Kubernetes instance.
Node Management	Create Node	Creates a node in the Kubernetes instance.
	Delete Node	Deletes a node in the Kubernetes instance.
	Inspect Node	Inspects a specified node in the Kubernetes instance and returns node information and status.
Pod Management	Create Pod	Creates a Pod in the Kubernetes instance.
	Delete Pod	Deletes a pod from the Kubernetes instance.
	Inspect Pod	Inspects the specified pod in the Kubernetes instance and returns pod information and status.
Secret Management	Create Docker Hub Secret	Creates a secret in the Kubernetes instance.
	Delete Docker Hub Secret	Deletes a Secret from the Kubernetes instance.
Service Management	Create Service	Creates a service on a Kubernetes server.
	Delete Service	Deletes a service from the Kubernetes server.
Volume Management	Create Persistent Volume	Creates a persistent volume in the Kubernetes instance.
	Create Persistent Volume Claim	Creates a Persistent Volume Claim in a Kubernetes instance.
	Delete Persistent Volume	Deletes a persistent volume from the Kubernetes instance.
	Delete Persistent Volume Claim	Deletes a persistent volume claim from the Kubernetes instance.
	Inspect Persistent Volume Claim	Inspects a persistent volume claim in a Kubernetes instance and returns claim information and status.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Kubernetes endpoint management AI agent	Manages (that is, creates or deletes) an endpoint in the Kubernetes instance.
Kubernetes namespace management AI agent	Manages (that is, creates or deletes) a namespace in the Kubernetes instance.
Kubernetes node management AI agent	Manages (that is, creates or deletes) and inspects the specified node in the Kubernetes instance.
Kubernetes pod management AI agent	Manages (that is, creates or deletes) and inspects the specified pod in the Kubernetes instance.
Kubernetes secret management AI agent	Manages (that is, creates or deletes) a secret in the Kubernetes instance.
Kubernetes service management AI agent	Manages (that is, creates or deletes) a service in the Kubernetes instance.
Kubernetes volume management AI agent	• Manages (that is, creates or deletes) a persistent volume. • Manages (that is, creates or deletes) and inspects the specified persistent volume claim.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kubernetes account requirements

The Kubernetes spoke requires generating and configuring your Kubernetes account to use a web API key.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Kubernetes alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record. For information about setting up the spoke, see Set up the Kubernetes spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Kubernetes alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Kubernetes spoke

Integrate the ServiceNow instance and Kubernetes using an API key and certificate to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Kubernetes spoke.
- Role required: admin.

Generate Kubernetes API token and certificate

Generate an access token and a certificate from your Kubernetes account for API key authentication.

Before you begin

Kubernetes requirements:

- Kubernetes account.
- Role required: administrator with credentials on the host machine where Kubernetes is installed.

About this task

Complete these steps from your Kubernetes host machine. See Kubernetes documentation for instructions on generating your API token and client certificate.

Procedure

1. From your Kubernetes host machine, generate an access token to interact with Kubernetes APIs.
   This token does not expire.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Copy and record the access token to create Credential records on your ServiceNow instance.
3. Generate a client certificate to upload to your ServiceNow instance.

Upload Kubernetes client certificate

Upload the Kubernetes client certificate to your ServiceNow instance to authenticate API requests to the Kubernetes host machine.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System LDAP** > **Certificates**.
2. Click **New**.
3. Complete the form and enter the certificate in the **PEM Certificate** field.
   For more information about uploading certificates, see Upload a certificate to an instance.
4. Click **Submit**.

Configure a connection for the Kubernetes spoke

Add and configure the Kubernetes connection to authenticate ServiceNow requests in Kubernetes spoke.

Before you begin

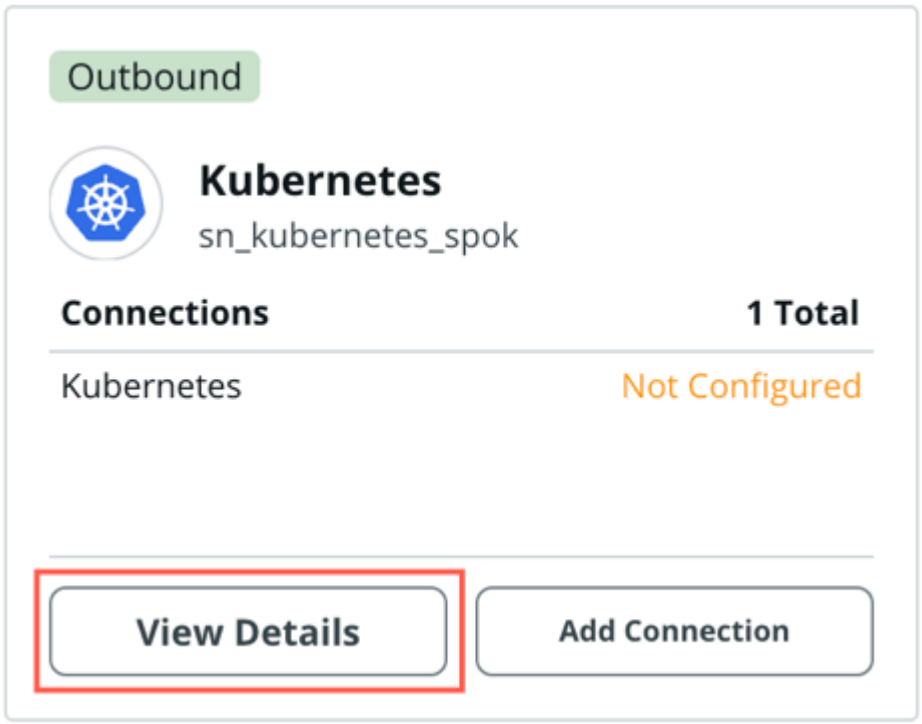
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Kubernetes** and click **View Details**.

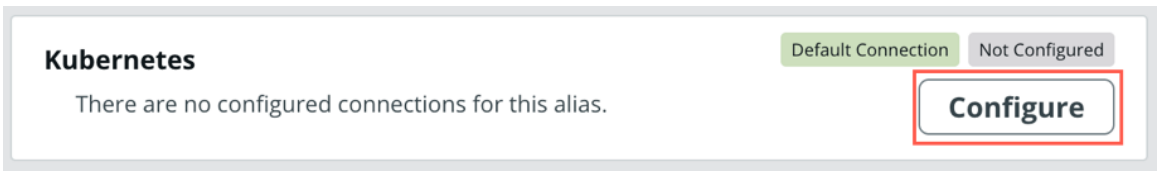
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Kubernetes spoke, click **View Details**.



- To manage more than one Kubernetes spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

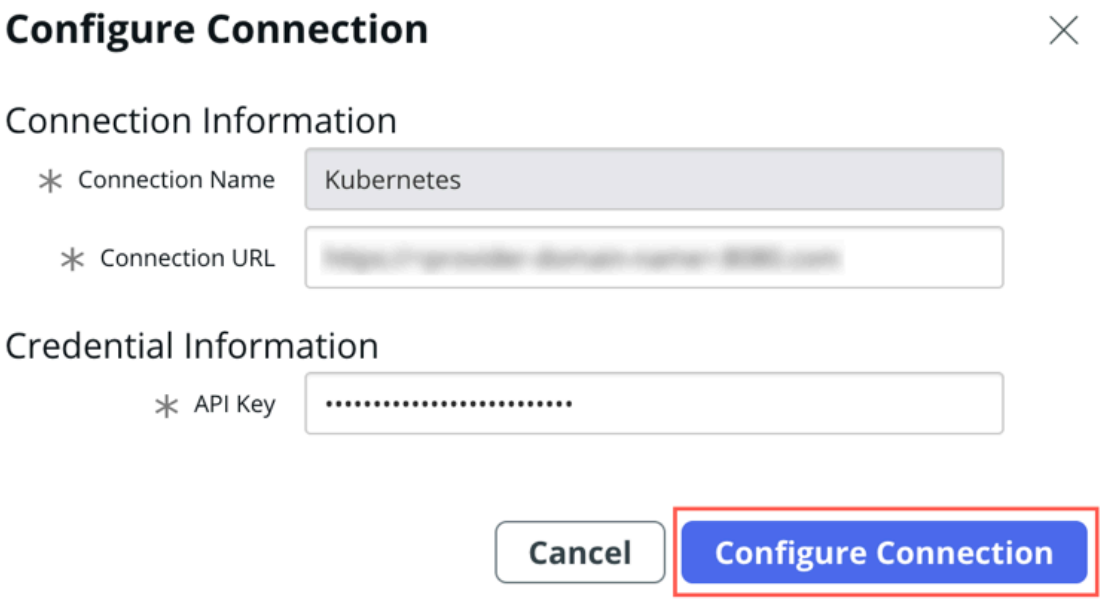
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



5. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to identify the Kubernetes connection alias record.
Connection URL	IP address and port of the host machine where Kubernetes is installed.
API Key	Token you obtained from Kubernetes in this format: `Bearer {access token}`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Configure Connection**.

Result
The spoke connection is configured and ready to be used.

Turn off remote SSL host verification

A system property prevents the Kubernetes spoke from processing Kubernetes responses. Set the *com.glide.communications.httpclient.verify_hostname* system property to false to enable the integration.

Before you begin
Role required: admin.

Procedure

1. Enter `sys_properties.list` in the application navigator.
   The System Properties [sys_properties] table opens.
2. Search for the *com.glide.communications.httpclient.verify_hostname* system property.
3. Set the value to false.

Legal Tracker Spoke

Legal Tracker spoke enables a seamless integration of the Thomson Reuters Legal Tracker application with a ServiceNow® instance to enable legal departments to create matters for Outside Firm and Outside Counsel Engagements and to track spends.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Legal Tracker spoke v1.0.2 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow® IntegrationHub Action Step — REST (com.glide.hub.action_step.rest)
- ServiceNow® IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow® IntegrationHub Action Template — Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

Legal Tracker API (REST API v1)

Spoke actions

Legal Tracker provides actions to automate the tasks in the following table when events occur in your ServiceNow instance.

Note:
To avoid unauthorized access, make sure that the required users have the least privileges for the spoke actions.

Category	Action	Description
User Management	Look up Users Stream	Retrieves all users in the current company.
Company List	Look up Companies Stream	Retrieves a list of companies accessible to current user.
Location Management	Look up Countries Stream	Queries for countries based on an OData filter query.
Data Warehouse Access Management	Look up Organizational units Stream	Retrieves all Organizational units.
	Look up Practice groups Stream	Retrieves all Practice Groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Substantive law Stream	Retrieves all Substantive Laws.
Accounts Payable Data Exchange Management	Look up AP Routes Stream	Retrieves all AP Routes available for user.
Matter Management	Create Matter	Creates a matter record on the Legal Tracker application.
	Look up Matter status	Retrieves the existing status for a matter by the matter ID.
	Look up Matter Budgets	Retrieves information about a matter budget identified by the matter ID, source, firmID, and firmType.
	Look up Matters Stream	Retrieves a list of matters.
	Look up Matter by ID	Retrieves information about a matter by Matter ID.
	Look up Templates	Retrieves a list of matter templates.
	Look up Template Types	Retrieves a list of types for matter template.
	Look up Matter Fields by ID	Retrieves a Matter Field by Field ID.
	Look up Matter Financials	Retrieves the total spending and budget information for a matter in the matter's configured currency.

Spoke user roles

The Legal Tracker Spoke user [sn_legal_trckr_spk.user] is available when the Legal Tracker spoke is installed. The role is required for users accessing Legal Tracker.

Legal Tracker online account requirements

The Legal Tracker spoke requires a Legal Tracker account to generate OAuth 2.0 tokens.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Legal Tracker spoke.

Set up the Legal Tracker spoke

Integrate a ServiceNow instance and the Legal Tracker spoke by using#Legal Tracker credentials to authenticate#ServiceNow#egal requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Legal Tracker spoke.
- Role required: admin.

Register Legal Tracker as an OAuth provider

Register Legal Tracker as an OAuth provider to enable the instance to request OAuth 2.0 tokens.

Before you begin

You must have the following setup to register Legal Tracker OAuth provider:

- Integration Hub subscription
- Legal Tracker access credentials
- The Legal Tracker spoke must be activated

Role required: admin

Procedure

1. On your ServiceNow® instance, navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
3. On the **What kind of OAuth application** page, select **Connect to a third-party OAuth Provider**.
4. On the form, fill in the fields.

Application Registries form

Field	Description
Name	Unique name to identify the record, for example, Legal Tracker OAuth profile.
Client ID	Application ID of the Legal Tracker application.
Client Secret	The Client Secret that you generated when you created the application.
Default Grant type	The value in this field should be **Password**.
Token URL	The value in this field should be **https://api.thomsonreuters.com/auth/oauth2/token**. You might have to unlock the field to enter the value.
Redirect URL	The value in this field should be **https://<your-instance>.service-now.com/oauth_redirect.do**. You might have to unlock the field to enter the value.

5. Right-click in the form header and select **Save**.
   The system validates the OAuth credentials.

Result

Legal Tracker is registered as an OAuth provider, which enables the instance to request OAuth 2.0 tokens.

What to do next

Integrate the Legal Tracker spoke with your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate the Legal Tracker spoke with your ServiceNow instance

Create and integrate the connection to your Legal Tracker account. The Legal Tracker spoke Connection & Credential Aliases use these connections to perform actions in Legal Tracker.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Select **Legal Tracker**.
3. Select the **Create New Connection & Credential** related link.
4. On the form, fill in the fields.

Create Connection and Credential form

Field	Value required
Connection Name	Name to identify the connection. This field is automatically set to the Legal Tracker spoke connection.
Connection URL	The URL to make the connection to the spoke. This field is automatically set to **https://api.thomsonreuters.com**.
Credential Name	Name to identify the credential record. By default, this value is **Legal Tracker Spoke Credential** but you may change it.
OAuth Name	Name of the OAuth entity profile. This field is automatically set to Legal Tracker spoke Auth.
OAuth Client ID	Client ID of the Legal Tracker application you registered in the registration portal.
OAuth Client Secret	Client Secret generated when you registered the application in the Legal Tracker portal.
OAuth Redirect URL	The redirect URL. The format of the URL is https://<your-instance>.service-now.com/oauth_redirect.do.

5. Select **Create and Get OAuth Token**.

Result

The Legal Tracker spoke is set up and integrated with your ServiceNow instance.

Lenovo Spoke

Get the warranty details of your hardware assets from Lenovo.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Lenovo Warranty API v2.5, but may be compatible with later versions.

Spoke requirements

You should have the Client ID provided by Lenovo. If you don’t have one, contact your organization's Lenovo sales or service representative.

Spoke dependencies

The Lenovo spoke doesn't have a dependency on any other plugin.

Spoke actions

The Lenovo spoke provides action to automate downloading asset warranty information when events occur in your ServiceNow instance. Available action is as follows:

Action	Description
Download Asset Warranty	Connect to the Lenovo Warranty API to download asset warranty information.

Note:
For more information on getting asset warranty details from Lenovo, see Integration with Lenovo for asset warranty details.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

To use the actions in the Lenovo spoke, you must create a connection and credential record to authenticate and connect to Lenovo. For more information, see Create a connection and credential for Lenovo spoke

Create a connection and credential for Lenovo spoke

Create a connection and credential for Lenovo to authenticate ServiceNow requests in Lenovo spoke.

Before you begin

- Request an Integration Hub subscription.
- Activate the Lenovo spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connection and Credentials** > **Connection and Credential Aliases**.
2. Select **Lenovo**.
3. From the **Related Links**, select **Create New Connection and Credential**.
4. **Optional:** Change the default connection name for the connection to Lenovo Warranty API in the **Connection name** field.
   By default, this field is set to **Lenovo Connection**.

   Important:
   Don't change the default URL specified in the Connection URL field.

5. In the **Client ID** field, enter the Client ID provided by Lenovo.
6. Select **Create**.

Result
The Lenovo connection is successfully created and listed in the Connections tab.

Looker Spoke

Manage subscriptions for Looker by analyzing usage based on last login time and activity sessions to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Looker spoke v1.0.0 is the latest version.

Spoke requirements

Looker account with an admin role.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream Inputs (com.glide.hub.action_type.datastream)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses if used outside the spoke implementation.

Spoke actions

The Looker spoke provides actions to automate Looker tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Role Management	Look up Roles	Retrieves all roles in an account.
User Management	Look up Users Stream	Retrieves all users in an account.
	Update User	Modifies the specified user's details.
	Delete User	Deletes the specified user and associated records from the account.
	User Inputs - Dynamic	Retrieves the list of fields to be used as dynamic input.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Setting up the Looker spoke.

Setting up the Looker spoke

Integrate the ServiceNow instance and Looker by using Looker credentials to authenticate ServiceNow requests.

Configure Looker API key settings

Configure API key settings to manage and retrieve Looker API keys.

Before you begin

- Request an Integration Hub subscription.
- Activate the Looker spoke.
- Role required: Looker admin.

Procedure

1. Navigate to your Looker (https://<instancename>.looker.com/) instance.
2. Select the gear icon to open Admin settings.
3. Select **Users** > **Open the admin user account**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Edit API3 Keys** under the Profile tab.
5. Select **New API3 Key**.
6. Copy the Client ID and Client secret for later use.

Lucidchart Diagramming Spoke

Use Lucidchart to create architectural diagrams. Integrate your Application Portfolio Management instance with your Lucidchart account to directly access your Lucid diagrams from APM.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Lucidchart Diagramming Spoke version 1.0.

Supported versions

Lucidchart API version 1.0.

Spoke requirements

The Lucidchart Diagramming Spoke requires creating a workspace and custom app on your Lucid account to generate OAuth 2.0 tokens for the Lucidchart Diagramming spoke. See Create OAuth 2.0 Client in Lucidchart and Create a connection and credential alias for the Lucidchart Diagramming spoke.

Spoke actions

The Lucidchart Diagramming Spoke provides **Create Diagram** action to access your Lucid account directly from the ServiceNow® instance and create an architectural diagram.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Create a connection and credential alias for the Lucidchart Diagramming spoke.

Create OAuth 2.0 Client in Lucidchart

Integrate your ServiceNow instance with your Lucidchart account. Create a custom OAuth application in Lucidchart to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Lucidchart account.
- Role required: Lucidchart admin.

About this task

Create a custom OAuth application in your Lucid account to enable the OAuth 2.0 authentication with the Lucidchart Diagramming spoke.

Procedure

1. Log in to your Lucid account (www.lucid.app) using the admin credentials.
2. In the left navigation, click **Admin**.
3. Select **App Integration** > **General**.
4. In the Custom OAuth card, click **Settings**.
   The OAuth 2.0 Clients page is displayed.
5. Enter a name for the client and click **Create OAuth 2.0 Client**.
6. Click **Details** and view the Client ID and Client Secret details.
   The Client ID and Client Secret details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

Result

The custom OAuth application in your Lucid account is created and can be integrated with your ServiceNow instance.

Create a folder structure in Lucidchart

Create a folder structure in the Lucidchart to save the diagrams.

Before you begin

- Lucidchart account.
- Role required: Lucidchart admin.

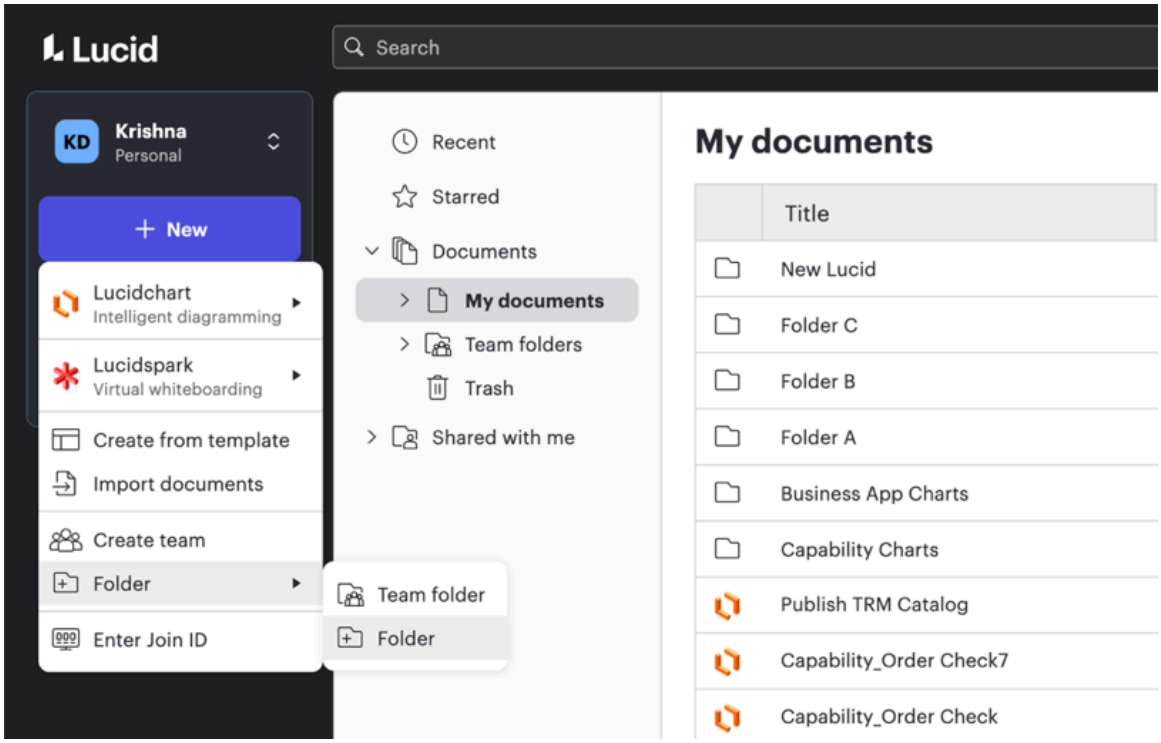
About this task

You must have a folder structure in place in the Lucidchart portal for the Create Diagram UI action to work. If you do not have a folder created in the Lucidchart, follow the below steps to create a folder.

Procedure

1. Navigate to https://lucid.app/documents#/documents%3Ffolder_id=home
2. Log in to your Lucidchart account using the same credentials that you used to create OAuth 2.0 Client.
3. In the left navigation, select **+New** button, then select **Folder**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Enter a name for the folder.
5. Ensure the folder is created under the Documents.

Related topics

Create a Lucidchart diagram for a business application in the EA Workspace

Create a Lucidchart diagram for a business capability in the EA Workspace

Create a connection and credential alias for the Lucidchart Diagramming spoke

Create a connection and credential record for the Lucidchart application. The Lucidchart connection and credential alias uses these credentials to authorize actions.

Before you begin

- Request an Integration Hub subscription.
- Activate the Lucidchart spoke.
- Register your application using Lucid API console and record the client ID and client secret. For more information, see Create OAuth 2.0 Client in Lucidchart.
- Role required: ServiceNow admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the Lucidchart record.
3. Under Related Links section, click **Create New Connection & Credential**.
4. On the pop-up window, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection and Credential pop-up window

Field	Description
Connection Name	Name of the connection. This field is automatically set to **Lucid Spoke Connection**.
Connection URL	The URL used for connecting to Lucid APIs. This field is automatically set to `https://api.lucid.co`.
OAuth Entity Name	Name of the OAuth entity profile. This field is automatically set to **Lucid Credentials**.
OAuth Client ID	Client ID generated when you created the OAuth client application in the Lucid API Console.
OAuth Client Secret	Client Secret generated when you created the OAuth client application in the Lucid API Console.
OAuth Authorization URL	Lucid authorization URL. This field is automatically set to https://lucid.app/oauth2/authorizeUser.
OAuth Token URL	Lucid token URL. This field is automatically set to https://api.lucid.co/oauth2/token.
OAuth Redirect URL	The redirect URL. This field is an auto-generated value. You must copy this URL and paste in the Lucid OAuth Client for the integration. The format of the URL is `https://<your-instance>.service-now.com/oauth_redirect.do`.

5. Click **Create and Get OAuth Token**.

Result

An Application Registry, Connection Record, and Credential record is created in the ServiceNow instance.

Metrikus spoke

Metrikus spoke provides actions to retrieve data from various sensors (such as occupancy sensor, air quality sensor, temperature sensor etc.) that are found at a workplace.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Metrikus spoke - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

This spoke was built for Metrikus Beta v1.0.

Key features

Metrikus Spoke integrates with Flow Designer Integration Hub. It fetches the occupancy sensor data from Metrikus and provides the following:

- Get event data. For example, when an employee enters a meeting room,when an employee occupies a desk).Get occupancy data for Workplace Connectors space records from Metrikus.
- Get occupancy data.
- The occupancy data is used for configuring automatic reservation check in.
- Workplace Service Delivery Location Directory shows Occupancy state for a selected location or space.

Spoke requirements

- Ensure that you have Metrikus login credentials.
- Metrikus provided Client ID and Client Secret key.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime [com.glide.hub.integration.runtime]
- ServiceNow IntegrationHub Action Step - OpenAPI [com.glide.hub.action_step.openapi]
- Metrikus Spoke [com.sn.wsd.metrikus.spoke]

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Metrikus Spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Actions

Actions	Description
Look up Space Tree	Get all the spaces along with the location hierarchy from Metrikus.
Look up Space Occupancy Batches	Gets batches of spaces (for example, 2000) and get occupancy data from Metrikus for all batches to combine and map it.
Look up Latest Desk Occupancy	Gets occupancy data for desks in a batch (for example, 2000.)
Look up Latest Space Occupancy	Gets occupancy data for spaces in a batch (for example, 2000)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions (continued)

Actions	Description
Look up Desks Occupancy Batches	Gets batches of desks (for example, 2000) and get occupancy data to combine and map it with Metrikus Spoke.

Spoke subflows

The Metrikus Spoke provides sample subflows to demonstrate automating Workplace Connectors tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Get All occupancy by Ids	Retrieves occupancy data of both Workplace Connectors spaces and desks.
Get Occupancy by desks by Ids	Retrieves occupancy data of all desks. Invoked by **Get All Occupancy by Ids**sub flow.
Get Occupancy by spaces	Retrieves occupancy of all spaces. Invoked by the **Get All Occupancy by Ids** sub flow.

Spoke user roles

The Metrikus spoke provides the System Administrator user role to control access to data:

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up Metrikus spoke

Integrate the ServiceNow instance and Metrikus Spoke. Create a connection and credential alias in the Metrikus spoke to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Ensure that you have activated the Metrikus Spoke plugin dependencies.
- Activate the Metrikus Spoke plugin (sn_wsd_metrikus_spoke).
- Metrikus Client ID and Client secret key.
- Role required: admin.

Integrate Metrikus with your ServiceNow instance

Create the connection records to your Metrikus account. The Metrikus Spoke connection and credential aliases use these connections to perform actions in Metrikus.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *Integration Hub* > **Connections & Credentials** > *Metrikus*.
2. Select the **Create New Connections & Credential** related link.
3. On the form, fill in the fields:

Enter the Connection Information

Field	Description and value required
Connection Name	Name to identify the connection. This field is automatically set to Metrikus Spoke connection.
Connection URL	The URL to make connection to the spoke. This field is automatically set to https://nextgen-api.metrikus.io.

Enter the Credential Information

Field	Description and value required
Credential Name	Name of the Metrikus Spokec credential. For example, **Metrikus Credential**
Token URL	Token URL address https://nextgen-api.metrikus.io/oauth/token.
OAuth Client ID	Client ID of the Metrikus application to register in the registration portal.
OAuth Client Secret	Client Secret key that is generated while registering the Metrikus application in the Metrikus portal.

4. Select **Create and Get OAuth Token**.

   The Metrikus Spoke is set up and integrated with your ServiceNow® Store instance.

What to do next

Navigate to **All** > *Workplace Connectors* > **Provider Connector Configuration** table. The Workplace Core locations provided in this table are mapped with the external Ids provided by Metrikus. The external IDs provided by Metrikus are transformed to retrieve workplace occupancy data in Workplace Connectors Space Occupancy Data table.

Magnit Spoke

The ServiceNow® Magnit spoke pulls contingent workers from the Magnit application into a ServiceNow instance and creates onboarding tasks for those contingent workers from a ServiceNow instance.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Magnit spoke v1.1.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Magnit spoke actions are used to pull data from a Magnit application into a ServiceNow instance. Available actions include:

Action	Description
Look Up Correlation ID for Delta Pull	Fetches the correlation ID for a delta pull. This action is handled from the Magnit application end.
Look Up Correlation ID for Full Pull	Fetches the correlation ID for a full pull. This action is handled from the Magnit application end.
Look up Contingent Workers Stream	**Look Up Correlation ID for Delta Pull** or **Look Up Correlation ID for Full Pull** is passed through the **Look up Contingent Workers Stream** action to pull full data or partial data.

Script includes installed

These script includes are installed with the Magnit application.

Script includes for Magnit

Script include	Description
MagnitErrorHandler	Error handler script for the Magnit spoke actions. For example, contains an error message that must be displayed when an action fails.
MagnitUtil	Utility functions for the Magnit spoke actions. For example, validating the mandatory inputs.

Edit Magnit OAuth

Automatically create application registry, credentials, and connections by editing the Magnit OAuth form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Magnit spoke.
- Role required: admin.

Note:
A default record of Connection & Credential aliases is available on activating the Magnit spoke.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record for the Magnit spoke.
3. Click the **Create New Connection & Credential** related link.
4. In the Create Connection and Credential record window, fill in the fields:

Field	Description
Connection Name	Name to uniquely identify the connection record.
Connection URL	URL of the Magnit instance.
Credential Name	Name to uniquely identify the credential record.
OAuth Name	Name to identify the application registry record.
OAuth Client ID	Client ID that is received from Magnit.
OAuth Client Secret	Client secret that is received from Magnit.
OAuth Token URL	Token Generation URL

5. Click **Create and Get OAuth Token**.
6. Enter **Username** and **Password**.
7. Click **Get OAuth Token**.

Mastercard Spoke

Integrate ServiceNow instance with your Mastercard account to enable access to Mastercard's API suite, Mastercom and Mastercom Extended, for card dispute resolution. This integration enables you to perform tasks such as searching transactions, creating claims, and processing chargebacks.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Subscription information

This spoke requires a subscription. Contact your ServiceNow account manager or sales representative for subscription details. For more information, see Legal schedules - IntegrationHub overview

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Mastercard Spoke v2.0.1 is the latest version.

Supported version

This spoke was built for Mastercom v6.

Key features

Mastercard Spoke enables a flow designer to build workflows using actions that invoke Mastercom and Mastercom Extended. This includes the ability to:

- Search transactions
- Create claims and chargebacks
- Collaborate with merchants to prevent chargebacks
- Monitor disputes throughout the dispute lifecycle
- Expedite the end-to-end dispute management process
- Manage disputes for cleared Single Message System original transactions with Mastercom Extended

Spoke requirements

Mastercard configuration details such as, certificate, key alias, consumer key, and keystore password.

Spoke dependencies

Ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Mastercard Spoke provides actions to simplify card dispute resolution. Available actions include:

- **Actions with sensitive information** - These actions contain sensitive information in the request and response body. When using Mastercom/Mastercom Extended APIs, it is recommended to use a Tokenization solution. This involves using a request builder to securely create requests and a response parser to handle encrypted API responses.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mastercom actions with sensitive information

Category	Action	Description
Transactions	Look up Authorization Details of Transaction Request Builder	Allows the issuers to look up authorization details for the original transaction involved in the claim after the issuer creates a claim.
	Look up Authorization Details of Transaction Response Parser	
	Look up clearing Details of Transaction Request Builder	Allows the issuers to retrieve clearing details for the original transaction involved in the claim. Acquirers may also use this to retrieve clearing details associated with an original transaction.
	Look up Clearing Details of Transaction Response Parser	
	Look up Transactions Request Builder	Allows the issuers to search for information about an original transaction. An issuer may use this information to take an action on the original transaction, such as creating a claim.
	Look up Transactions Response Parser	
Claims	Look up Claims in a Queue Request Builder	Allows the issuers to retrieve a list of claims in the queue within the date interval request builder.
	Look up Claims in a Queue Response Parser	
	Look up Claim Details by Claim ID Request Builder	Allows the issuers and acquirers to retrieve details for an existing claim, including any cases with which the claim is associated.
	Look up Claim Details by Claim ID Response Parser	

Mastercom Extended actions with sensitive information

Category	Action	Description
Mastercom Extended - Claim Management	Look up Claim Details by ID Request Builder - Extended	Request Builder produces the request payload for this action. Use this endpoint to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		retrieve details for an existing claim.
	Look up Claim Details by ID Response Parser - Extended	Parses the response from the search. Use this endpoint to retrieve details for an existing claim.
	Look up Claim Details Request Builder - Extended	Request Builder produces the request payload for this action. Use this endpoint to retrieve a list of claims.
	Look up Claim Details Response Parser - Extended	Parses the response of the searchClaim. Use this endpoint to retrieve a list of claims.
Mastercom Extended - Transaction Management	Look up Transactions Request Builder - Extended	Request Builder produces the request payload for this action. Use this endpoint to search for transactions.
	Look up Transactions Response Parser - Extended	Parses the response from the search. Use this endpoint to search for transactions.
Mastercom Extended - Case Filing Document Management	Look up Processed Documents by Case ID Request Builder - Extended	Request Builder for Retrieve processed documents associated with cases API. Use this endpoint to retrieve all documents from a case. The documents include any documents attached by any party.
	Look up Processed Documents by Case ID Response Parser - Extended	Parses response of the Retrieve processed documents associated with cases. Use this endpoint to retrieve all documents from a case. The documents include any documents attached by the sender, receiver, or both.
Mastercom Extended - Document Management	Look up Processed Documents by Document Completed ID Request Builder - Extended	Request Builder for Retrieve processed documents API. Use this endpoint to retrieve processed documents.
	Look up Processed Documents by Document Completed ID Response Parser - Extended	Response Parser for Retrieve processed documents API endpoint. Use this endpoint to retrieve processed documents.

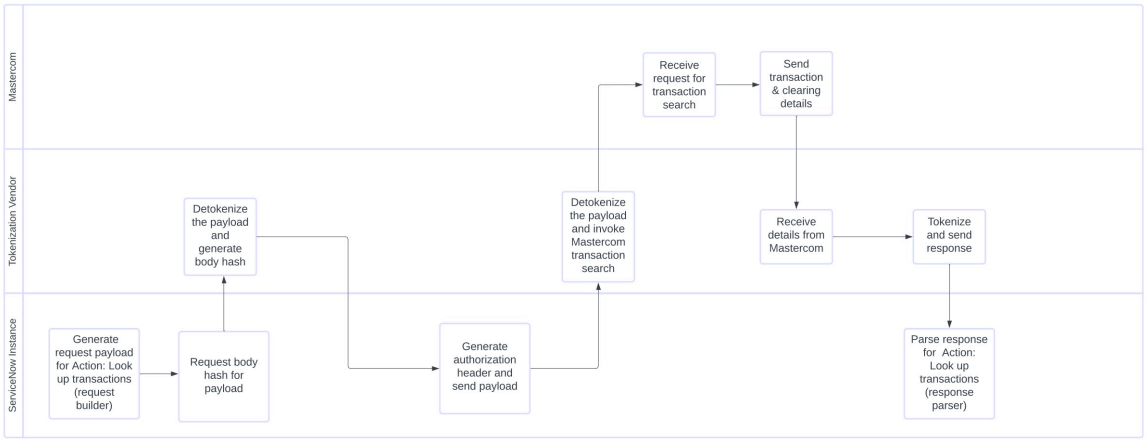
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example illustrates the solution overview when it integrates with a Tokenization solution:



• The sensitive infromation like PAN number from the Card Managment System will be tokenized by the tokenization vendor and stored in ServiceNow

- **Actions with non-sensitive information** - You can directly invoke these Mastercom/Mastercom Extended APIs from your ServiceNow instance.

Mastercom actions with non-sensitive information

Category	Action	Description
Mastercom Chargeback Management	Acknowledge Chargebacks	Acknowledges a chargeback or second representment moves the claim from the Unworked queue to the Worked queue.
	Create Chargeback	Creates chargebacks and second presentments with the option to upload supporting documents.
	Load Data for Chargebacks	Obtains information about a potential first chargeback or second presentment before creating the chargeback.
	Look up Chargeback Documents	Retrieves documents in the required format associated with the chargeback type.
	Look up Chargeback Image Status	Retrieves documents with a status (completed, pending, failed, unavailable, or document not applicable) for chargebacks.
	Look up Status of Chargebacks	Retrieves the status of documents for a specific list of claim IDs and chargeback IDs. **Note:** Issuers and acquirers can send a maximum of 2,000 chargeback IDs in a single request.
	Reverse Chargeback	Reverses an existing chargeback when the issuer or acquirer creates a chargeback in error.
	Update Chargeback	Updates existing chargebacks with memos or documents.
Mastercom Claim Management	Create Claim	e this endpoint to create a claim, which is required before creating a retrieval request or a first chargeback.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Take Action on Existing Claim	e this endpoint to perform operations (reopen or close) on an existing claim.
Mastercom Fraud Management	Create Fraud	Creates a fraud item when the issuer determines that a transaction was fraudulent. **Note:** Mastercom enables issuers to create fraud items in the Fraud and Loss database. However, issuers must use the Fraud and Loss application to make further updates to fraud items.
	Look up Fraud Related Information	e this endpoint to obtain fraud-related information associated with a claim before creating a fraud item for the claim.
Mastercom Queues Management	Look up Queue Names	Retrieves a list of queue names.

Mastercom Extended actions with non-sensitive information

Category	Action	Description
Mastercom Extended - Case Filing Document Management	Attach Document by Case ID - Extended	Use this endpoint to attach a new document to an existing case when the previous document failed to process. Document processing status can be retrieved from the GET /cases/documents/attributes endpoint.
	Look up Statuses for Documents Associated with Cases - Extended	Use this endpoint to retrieve the processing status of documents associated with cases.
Mastercom Extended - Case Filing Management	Create Pre-Arbitration/ Arbitration Case - Extended	Use this endpoint to create a pre-arbitration or arbitration case.
	Look up Case Details by ID - Extended	Use this endpoint to retrieve details for an existing case, providing comprehensive information about the case.
	Update Pre-Arbitration/ Arbitration Case - Extended	Use this endpoint to update or respond to a pre-arbitration or arbitration case.
	Update Pre-Compliance/ Compliance Case - Extended	Use this endpoint to update or respond to a pre-compliance or compliance case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Mastercom Extended - Chargeback Management	Create Chargeback Reversal - Extended	Use this endpoint to reverse existing chargebacks.
Mastercom Extended - Claim Management	Create Claim - Extended	Use this endpoint to create a new claim.
	Create Pre-Compliance/ Compliance Case - Extended	Use this endpoint to create a pre-compliance or compliance case.
Mastercom Extended - Dispute Management	Initiate a Dispute by Claim ID - Extended	Use this endpoint to initiate a dispute. At this time, only creating a chargeback is supported.
Mastercom Extended - Document Management	Attach Documents by Claim ID and Event ID - Extended	Use this endpoint to attach previously uploaded documents to existing dispute events.
	Check Document Details - Extended	Use this endpoint to get the details of documentation attached to their events, including status.
	Upload Documents - Extended	Use this endpoint to upload documents. To see details about file restrictions, refer to the Tutorials and Guides section of the Mastercom Extended API Specifications.
Mastercom Extended - Queue Management	Look up Claims in a Queue by ID Stream - Extended	Use this endpoint to retrieve a list of claims in a queue within a specified date range.
	Look up Queue by ID - Extended	Use this endpoint to retrieve fields within a specific queue.
	Look up Queues Stream - Extended	Use this endpoint to retrieve a list of queues and their fields.
Mastercom Extended - Report Definition Management	Look up Report Fields - Extended	Use this endpoint to retrieve fields within a specific report.
	Look up Report Fields Stream - Extended	Use this endpoint to retrieve a list of reports and their fields.
Mastercom Extended - Report Management	Create a Report - Extended	Use this endpoint to request the creation of report. NOTE: The system requires at least 120 seconds to generate a report.
	Look up Completed Report - Extended	Use this endpoint to retrieve a completed report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Report Status - Extended	Use this endpoint to retrieve the status of a specific report.
	Look up Reports Stream - Extended	Use this endpoint to obtain a report status and reportCompletedId.
Mastercom Extended - Representment Management	Update Representment by Claim ID and Event ID - Extended	Use this endpoint to acknowledge a representment, which moves the claim to the Worked queue. Issuers may take further actions on acknowledged claims.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Mastercard spoke.

Set up Mastercard spoke

Integrate the ServiceNow instance with the Mastercard account using the OAuth protocol (version 1.0a) for secure authorization to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Mastercard spoke.
- Role required: admin.

Attach a Mastercard certificate

Use the certificate generated during the Mastercard account configuration to sign the request and payloads.

Before you begin

- Valid Mastercard certificate
- Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Select **New**.
3. On the form, fill in the fields:

X.509 Certificate form fields

Field	Description
Name	Enter a name to identify the certificate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	Type of the certificate. Select `PKCS12 Key Store`.
Notify on expiration	Select the list of users to be notified when the certificate expires.
Warn in days to expire	Enter the number of days when a notification is sent to users before a certificate expires.
Key store password	Password to access the certificate. Use the destination keystore password specified when creating the certificate.
Active	Option to make the client certificate active.
Short description	Short description of the user client certificate.

4. Select the manage attachments icon ( ) and attach a Mastercard certificate.
5. Select **Validate Stores/Certificates** to validate the certificate.
6. Select **Submit**.

Create a connection record for Mastercard spoke

Create a connection record for your Mastercard account configuration. The Mastercard spoke connection and credential aliases use these connections to perform actions in Mastercard.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open for the record for **Mastercard**.
3. On the **Connections** tab, select **New**.
4. On the form, fill these values.

Field	Value required
Connection URL	Base URL to connect to your Mastercard instance. For example: ○ `https://sandbox.api.mastercard.com` for Mastercom ○ `https://sandbox.dispute.mastercard.com` for Mastercom Extended
Credential	Credential record you that created for Mastercard.

5. Right-click the form header and select **Save**.
6. For Mastercom, ensure that **api_version** is set `V6` in the Attributes related list.

Create a credential record for Mastercard spoke

Create a credential record for your Mastercard account configuration. The Mastercard spoke connection and the credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **Mastercard Credential**.
   A Mastercard Credential form displays.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, `Mastercard Credentials`.
Active	Enable
Key alias	Key alias associated with the Mastercard account.
Keystore password	The password associated with the certificate.
Consumer key	Consumer key that you generated during the Mastercard configuration.
Certificate	Select the newly created Mastercard certificate.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Mastercard**. **Note:** You are cautioned against directly modifying the default authentication algorithm.

5. Select **Submit**.

Microsoft 365 Excel Spoke

Manage Microsoft Office 365 Excel workbooks stored in Microsoft OneDrive from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft 365 Excel spoke v1.0.4 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

This spoke was built for Microsoft Office 365 Excel v1.0, but may be compatible with later versions.

Spoke requirements

- Microsoft Azure Portal account
- Client ID and Client Secret of the application registered in Azure Portal

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft 365 Excel Spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

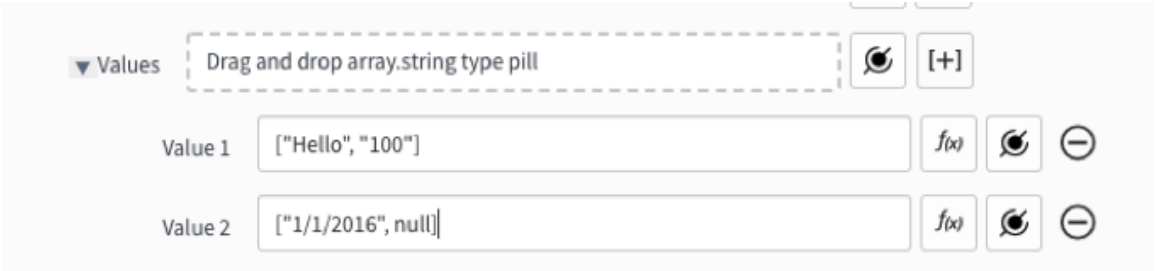
Category	Action	Description
Cell and Range Management	Get Cell Details	Retrieves the properties of the specified cell.
	Get Cells	Retrieves the properties of the selected range of cells.
	Update Cells	Updates the properties of the selected range of cells.
Table Management	Add Rows	Adds one or more rows to the given table.
	Create Table	Adds a table to the worksheet.
	Get Table Cells	Retrieves the properties of the selected range of table cells.
	Get Table Details	Retrieves the properties of the specified table.
	Look up Table Columns	Lists the details of the specified range columns from the selected table.
	Look up Table Rows	Lists the details of the specified range of rows from the selected table.
Workbook Management	Look up Workbooks	Lists all the workbooks in the specified folder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Worksheet Management	Add Worksheet	Adds a worksheet to a workbook.
	Get Used Cells	Retrieves the properties of the specified range of cells in the worksheet.
	Get Worksheet Details	Retrieves the properties of the worksheet.
	Look up Worksheets	Lists all the worksheets in the workbook.
	Update Worksheet	Updates a worksheet of a workbook.

Note:
You must specify the input values for **Update Cells** and **Add Row** actions as shown in the following examples.

Add Row action: The action input, Value 1 corresponds to the first row in your table. The values Hello and 100 correspond to the values of the first and second column

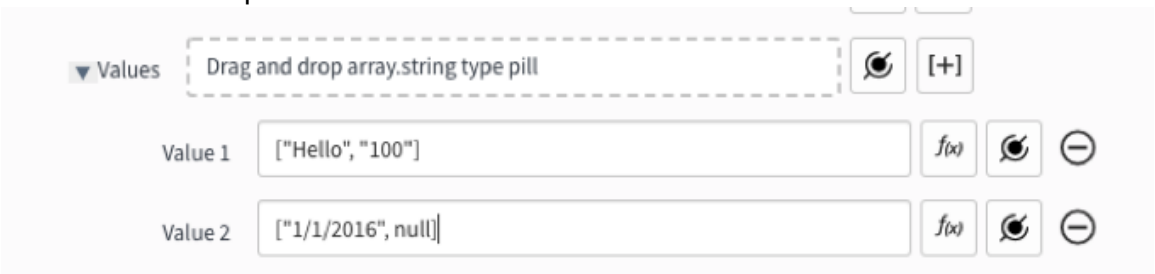


respectively.

```
{
"values" : [["Hello", "100"],["1/1/2016", null]],
"formulas" : [[null, null], [null, "=B1*2"]],
"numberFormat" : [[null,null], ["m-ddd", null]]
}
```

You must provide values in the same format for the action inputs: Formulas, Formulas R1C1, Formulas Local, and Number Format. For more information, see Add Row.

Update Cells action: The action input, Value 1 corresponds to the first row in your range. The values Hello and 100 correspond to the values of the first and second column



respectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
"values" : [["Hello", "100"],["1/1/2016", null]],
"formulas" : [[null, null], [null, "=B1*2"]],
"numberFormat" : [[null,null], ["m-ddd", null]]
}
```

You must provide values in the same format for the action inputs: Formulas, Formulas R1C1, Formulas Local, and Number Format. For more information, see Update Rage.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Microsoft 365 Excel spoke.

Set up the Microsoft 365 Excel spoke

Integrate the ServiceNow instance and Microsoft 365 Excel by using the OAuth credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft 365 Excel spoke.
- Role required: admin.

Create a credential record for the Microsoft 365 Excel spoke

Create a credential record for the Microsoft Azure Portal account. The Microsoft 365 Excel Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

- Register your ServiceNow instance in Microsoft Azure Portal and record the client ID and client secret. Also, add the offline_access, Files.ReadWrite.All, and Files.ReadWrite scopes in the API permissions for the application. For more information, see Quickstart: Register an application with the Microsoft identity platform.

  Note:
  Ensure that the Redirect URI of the instance is in the `https://<instance>.service-now.com/oauth_redirect.do` format.

- Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Connection and Credential Aliases**.
2. Open the **Microsoft_365_Excel** record.
3. Click the **Create New Connection & Credential** related link.
4. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and Credentials form

Field	Description
Connection Name	Name of the connection. This field is automatically set to `Microsoft 365 Excel Spoke Connection` Cred.
Connection URL	The URL used for connecting to Microsoft Office 365 Excel. This field is automatically set to `https://graph.microsoft.com/v1.0`
Credential Name	Name of the credential. This field is automatically set to `Microsoft 365 Excel Spoke Credential`
OAuth Entity Name	Name of the OAuth entity profile. This field is automatically set to `Microsoft 365 Excel Spoke OAuth`
OAuth Client ID	Client ID of the Microsoft Office 365 Excel application you registered in Azure Portal.
OAuth Client Secret	Client Secret that you request for the registered application in Azure Portal.
OAuth Redirect URL	The redirect URL. The format of the URL is `https://<instance>.service-now.com/oauth_redirect.do`

5. Click **Create and Get OAuth Token**.

Microsoft Dynamics 365 Spoke

Use Microsoft Dynamics 365 spoke to manage users and activities in Dynamics 365.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Microsoft Graph: v1.0 and Microsoft Dynamics 365: v9.0, but may be compatible with later versions.

Spoke version

Microsoft Dynamics 365 v1.0.8 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- Ensure that you have Global Administrator and Microsoft Dynamics 365 Administrator role in Microsoft Admin Centre.
- You must create an OAuth 2.0 app in Azure AD and generate the OAuth 2.0 token.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Dynamics 365 spoke provides actions to automate Microsoft Dynamics 365 tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
User Management	Look up Users Stream	Retrieves all users in an organisation.
	Look up Dynamics CRM Users Stream	Retrieves details of all users with access to Microsoft Dynamics CRM system.
	Look up Dynamics Object Schema (Dynamic)	Retrieves the list of fields for the specified entity name to be used as dynamic input.
SKU Management	Look up Subscribed SKUs	Retrieves all subscriptions that an organization has acquired.
Audit Management	Look up Audit Log Stream	Retrieves all audit logs in the system.
Activity Pointer Management	Look up Activity Pointers Stream	Retrieves all the calendar activities performed.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Microsoft Dynamics 365 and Set up Microsoft Azure Active Directory.

This spoke requires the Integration Hub subscription. For details, see Request Integration Hub

Supported versions

This spoke was built for Microsoft Graph: v1.0 and Microsoft 365 Dynamics: v9.0, but may be compatible with later versions.

Spoke requirements

- Ensure that you have Global Administrator and Microsoft Dynamics 365 Administrator role in Microsoft Admin Centre.
- You must create an OAuth 2.0 app in Azure AD and generate the OAuth 2.0 token.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Dynamics 365 spoke provides actions to automate Microsoft 365 tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
User Management	Look up Users Stream	Retrieves all users in an organisation.
SKU Management	Look up Subscribed SKUs	Retrieves all subscriptions that an organization has acquired.
Audit Management	Look up Audit Log Stream	Retrieves all audit logs in the system.
Activity Pointer Management	Look up Activity Pointers Stream	Retrieves all the calendar activities performed.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Microsoft Dynamics 365.

Set up Microsoft Dynamics 365

Set the system-level settings for Microsoft Dynamics 365.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Go to https://admin.powerplatform.microsoft.com/ .
2. Under Environments, select the environment for which you want to pull the dynamics activities.
   The details of the environment that you selected appears.
3. From the top ribbon, click **Settings**.
   The Settings page appears.
4. Click **Audit and logs**.
   Audit settings section appears.
5. Select all of the following check boxes.
   - Start Auditing
   - Log access
   - Read logs
6. Click **Additional Audit Settings**.
7. From the **Settings** list, select Auditing and click **Global Audit Settings**.
8. Select the following check boxes.
   - Start Auditing
   - Audit user access
   - Start Read Audit
   - Common Entities
   - Sales Entities
   - Customer Service Entities
9. Click **Ok**.

Set up Microsoft Azure Active Directory

Set up Microsoft Azure Active Directory (AD).

Before you begin

Role required: Global administrator and Dynamics 365 administrator in Microsoft admin center.

Procedure

1. Open Microsoft Azure App registration page and log in using an admin account.
2. Click **+ New registration**.
   Register an application page appears.
3. In the **Name** field, enter the name of the application that you want to register.
4. Under Supported account types, select an account with the required organizational directory.
5. Click **Register**.
6. Open the application that you registered and go to **Overview** section.
7. Collect the Application (client) ID and Application (tenant) ID.
8. Go to Certificates and Secrets section.
9. Create a new client secret.
10. Collect the client secret key.
    You will need the client secret key while configuring your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Under API Permission, click **+ Add a permission** and select APIs my organization uses.
12. Select Microsoft Graph and add the following Application Permissions.
    - `Organization.Read.All`
    - `User.Read.All`
    - `Offline_access`
13. Select Dynamics CRM and add the following Application Permissions.
    `user_impersonation`
14. Under Grant consent, click **Grant admin consent**.
15. In the Authentication section, under the Redirect URI, enter the redirect URI of the ServiceNow instance.

Microsoft Active Directory Spoke

Create, delete, and manage objects in Microsoft Active Directory, such as users, groups, and computers.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Important:

- Starting with the Vancouver release, Microsoft Active Directory Spoke is being prepared for future deprecation. It is hidden and no longer activated on new instances but will continue to be supported. Microsoft Active Directory v2 Spoke provides the latest experience for this functionality. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.
- This spoke is available as part of the family release. This spoke can be used to handle the computer objects.

Spoke requirements

Confirm that the Active Directory web services (ADWS) is deployed on the server that has Microsoft AD installed. For information on deploying ADWS, see https://learn.microsoft.com/en-us/services-hub/unified/health/remediation-steps-ad/configure-the-active-directory-web-services-adws-to-start-automatically-on-all-servers for information about deploying ADWS.

Since your instance must have a MID Server set up and configured to use the PowerShell, the MID Server must be able to access the ADWS at port 9389.

In the MID Server and Microsoft AD server, run these PowerShell commands to install the Active Directory module:

```
PS> Import-Module ServerManager
PS> Install-WindowsFeature -Name RSAT-AD-PowerShell
```

Spoke flows

The Microsoft Active Directory spoke provides sample flows in the draft state to demonstrate automating Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
User Offboarding	Disables an AD user account and removes the user from any AD groups when a ServiceNow user record is deactivated.
User Onboarding	Creates and enables an AD user account when a ServiceNow user record is activated.

Spoke subflows

This spoke has no sample subflows.

Spoke actions

The Microsoft AD spoke provides actions to automate Microsoft Active Directory tasks when events occur in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Computer Management	Create Computer	Creates a Computer Account in Active Directory.
	Delete Computer	Deletes a computer from Active Directory.
	Disable Computer	Disables a computer account in Active Directory.
	Enable Computer	Enables a computer account in Active Directory.
	Get Computer OU	Gets the Organizational Unit (OU) of a Computer Account.
	Is Computer Enabled	Checks the status of the specified computer account in Active Directory.
	Move Computer to OU	Changes the Organizational Unit (OU) of a Computer Account in Active Directory.
Group Management	Add User To Group	Adds an existing Active Directory user to an Active Directory group.
	Create Group	Creates a group in Active Directory.
	Delete Group	Deletes a group from Active Directory.
	Lookup Group	Gets the details of a given group in Active Directory, including the group category, scope, and distinguished name.
	Remove User From Group	Removes an existing user from a group in Active Directory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Password Management	Change User Password	Changes the user password in AD. The password input must comply with Active Directory password requirements.
	Is User Account Locked	Checks the locked status of the specified user account in Active Directory.
	Reset AD User Password	Resets a user's password in Active Directory.
User Management	Create User	Creates a user with no password in Active Directory. To enable a user to set a password, log in to AD, create a default password for the user, and enable password reset.
	Delete User	Deletes a user from Active Directory.
	Disable User	Disables a user account in Active Directory.
	Enable User	Enables a user account in Active Directory.
	Is User Enabled	Checks the status of a user account in Active Directory.
	Is User In Group	Checks if an existing Active Directory user is a member of an Active Directory group.
	Lookup User	Gets the details of a given user in Active Directory.
	Unlock AD Account	Unlocks a user account in Active Directory.
	Update User	Updates user attributes in Active Directory.
	Update User Home Location	Updates the Home Directory for a User in Active Directory.
Object Management	Create AD Object	Creates an object of any type supported in Active Directory.
	Delete AD Object	Deletes an object of any type from Active Directory.
	Query AD	Queries AD for objects specified by a search filter.
	Update AD Object OU	Changes the Organizational Unit (OU) of an object in Active Directory.
	Update AD Object Expiration	Update the account expiration date of an object in Active Directory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server requirements

To use these actions, your instance must have a MID Server set up and configured to use the PowerShell. For more information about running actions on the MID Server, see Integration steps. For information, see MID Server.

Note:
MID and Microsoft Active Directory must be installed on different servers.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the AD alias record to authorize actions in Microsoft Active Directory.

Connection alias	Description	Connection URL
AD	Connection to Microsoft Active Directory.	The URL of the host machine where Microsoft Active Directory is installed.

For information about setting up the spoke, see Set up Microsoft Active Directory spoke.

Set up Microsoft Active Directory spoke

Integrate the ServiceNow instance and your Microsoft AD account using Windows credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Active Directory spoke.
- Role required: admin.

Create Credential record for the Microsoft AD spoke

Create a Credential record for the Microsoft Active Directory host. The Microsoft AD spoke connection and credential alias uses this credential to authorize actions.

Before you begin

- Request Integration Hub subscription
- Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Windows Credentials**.
   A blank Windows Credentials form displays.
4. Enter these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `AD Credential`.
Active	Enable
User name	Enter a user name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.
Password	Enter the password for the account.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID servers**.
Order	Select the order to apply this credential. For example, enter `100`.

5. Click **Submit**.

Create Connection record for the Microsoft AD spoke

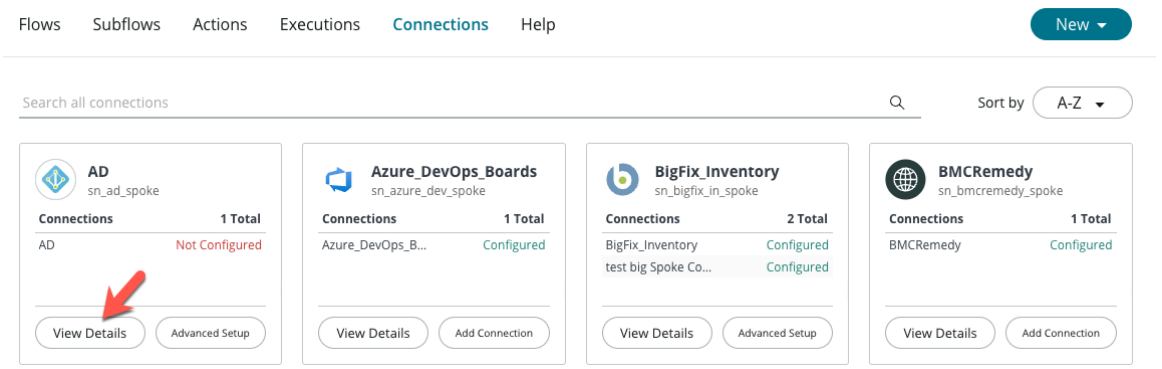
Create a Connection record to your Microsoft Active Directory host machine. The Microsoft AD spoke connection and credential alias uses this connection to perform actions in Microsoft Active Directory.

Before you begin

- Request Integration Hub subscription
- Create Credential record for the Microsoft AD spoke
- Role required: admin

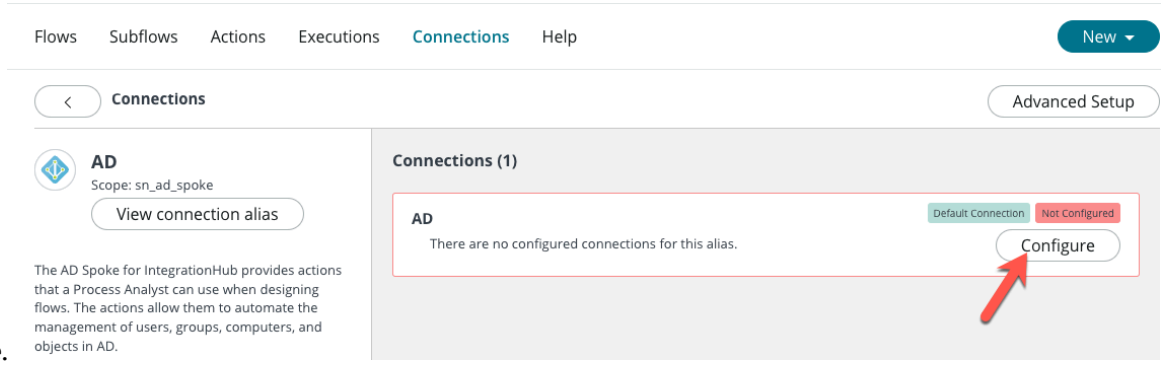
Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Click Connections.
3. On the AD card, click **View Details**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Configure**.



5. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `AD Connection`.
Credential	Select the Credential record you created for Windows Active Directory. For example, select **AD Credential**.
Host	Enter the fully qualified domain name of the target host where Microsoft Active Directory is installed. For example, `<host>.<domain>.com`.
Use MID server	Enable
Override default port	Enter the target port used by the connection. If blank, the system uses the default port.

6. Click **Submit**.

Microsoft Active Directory v2 Spoke

Create, delete, and manage objects in Microsoft Active Directory, such as users, groups, and computers.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Active Directory v2 spoke v2.5.2 is the latest version.

Supported versions

This spoke was built for Microsoft Active Directory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

Ensure that Active Directory Web Services (ADWS) is deployed in the same server where Microsoft Active Directory is installed. The MID server can access the Active Directory Web Services (ADWS) at port 9389. For more information about ADWS deployment, see Microsoft documentation.

In the MID Server and Microsoft Active Directory v2 server, run the following PowerShell commands to install the Active Directory module:

```
PS> Import-Module ServerManager
PS> Install-WindowsFeature -Name RSAT-AD-PowerShell
```

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- IHUB Spoke Util Pack (com.snc.ihub_spoke_util_pack)
- ServiceNow IntegrationHub Action Step - PowerShell (com.glide.hub.action_step.powershell)

Note:
If used outside the spoke implementation, some of these plugins are licensable features and require licenses.

Spoke actions

The Microsoft Active Directory v2 spoke provides actions to automate the tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Group Management	Add Computer to Groups	Adds the computer account to one or more groups in the Active Directory (AD).
	Add Computers to Group	Adds one or more computer accounts to the group in the Active Directory (AD).
	Add User to Groups	Adds a user to one or more groups in the Active Directory (AD).
	Add Users to Group	Adds one or more user accounts to the group in the Active Directory (AD).
	Create Group	Creates the group in the Active Directory (AD).
	Delete Group	Deletes the group from the Active Directory (AD).
	Does Group Exists	Checks whether the group exists in the Active Directory (AD).
	Is User in Group	Checks if an existing user is already a member of a group in the Active Directory (AD).
	Look up Group	Retrieves the group from the Active Directory (AD).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Remove Computer from Groups	Removes the computer account from one or more groups in the Active Directory (AD).
	Remove Computers from Group	Removes one or more computers from the group in the Active Directory (AD).
	Remove User from Groups	Removes a user from one or more groups in the Active Directory (AD).
	Remove Users from Group	Removes one or more users from the group in the Active Directory (AD).
User Authentication	Change User Password	Changes the user's password in the Active Directory (AD). The password has to match the AD password requirements.
	Look up User Password Expiration Details	Retrieves the password expiration details for the user from the Active Directory (AD).
	Generate Random Password	Generates the random password according to the Active Directory (AD) password policy.
	Is User Locked	Checks the locked status of the user account in the Active Directory (AD).
	Reset User Password	Resets the password of the user in the Active Directory (AD).
	Unlock User	Unlocks the user account in the Active Directory (AD).
Computer Management	Create Computer	Creates a computer account in the Active Directory (AD).
	Disable Computer	Disables the computer account in the Active Directory (AD).
	Does Computer Exists	Checks the status of the computer account in the Active Directory.
	Is Computer Disabled	Checks the status of the computer account in the Active Directory (AD).
	Enable Computer	Enables the computer account in the Active Directory (AD).
	Look up Computer	Retrieves a computer account from the Active Directory (AD).
	Update Computer	Updates a computer account in the Active Directory (AD).
	Delete Computer	Deletes a computer account from the Active Directory (AD).
Object Management	Create Object	Creates an object account in the Active Directory (AD).
	Update Object OU	Updates the Organizational Unit (OU) of an object account in the Active Directory (AD).
	Update Object Expiration	Updates the account expiration date of the object account in the Active Directory (AD).
	Look up Object by Filter	Retrieves object accounts based on a search filter in the Active Directory (AD).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Object	Deletes an object account from the Active Directory (AD).
User Management	Delete User	Deletes the user from Active Directory (AD).
	Create User	Creates a user account in the Active Directory (AD) and sets a password. **Note:** From Microsoft Active Directory v2 spoke v2.1.1 onwards, these changes are applicable: • **Sam Account Name** is available in the **Additional Fields** drop-down. • When a user is created, the User Principal Name (UPN) is generated in this format: `<username>@<DNS-domain-name>`.
	Disable User (Conversational -ready)	Disables a user account in Active Directory (AD).
	Does User Exists	Checks whether the user account exists in Active Directory (AD).
	Update User	Updates a user account in the Active Directory (AD).
	Enable User (Conversational -ready)	Enables a user account in Active Directory (AD).
	Look up User (Conversational -ready)	Retrieves a user account from the Active Directory (AD). **Note:** Now Assist for Conversational Spokes plugin is required to use the conversational ability of the action.
	Is User Disabled	Checks if the user account is inactive in Active Directory (AD).
	Get User Additional Fields (Metadata)	Retrieves information from the additional fields in a user account from the Active Directory (AD).

Note:
This spoke isn't tested with a load balancer.

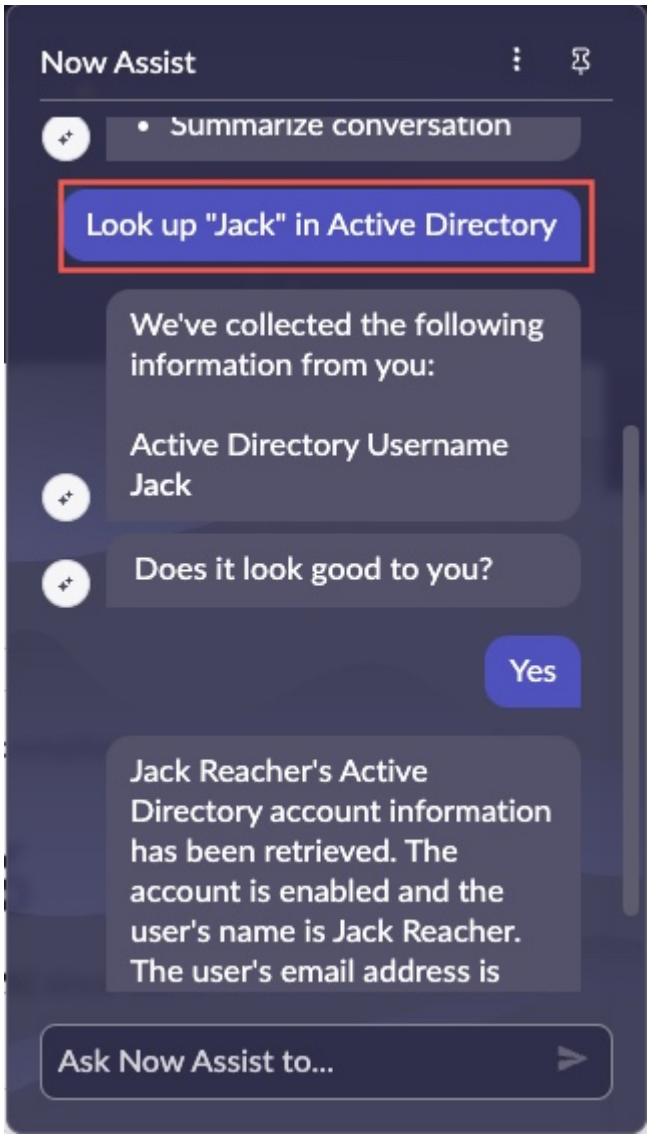
Available conversational actions

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported actions

Action	Usage
Disable User	In the Ask Now Assist to... field, enter the phrase that asks Now Assist to perform the action and press **Enter**. `Disable user "Jack" in Active Directory.`
Enable User	In the Ask Now Assist to... field, enter the phrase that asks Now Assist to perform the action and press **Enter**. For example, `Enable user "Jack" in Active Directory.`
Look up User	In the Ask Now Assist to... field, enter the phrase that asks Now Assist to perform the action and press **Enter**. For example, `Look up user "Jack" in Active Directory.`



Looking for an AI agent?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Microsoft Active Directory object manager	Manages object accounts in the Active Directory (AD) and retrieves their details.
Microsoft Active Directory user authenticator	Manages user accounts and passwords in the Active Directory (AD) and retrieves their details.
Microsoft Active Directory group manager	Manages groups in the Active Directory (AD) and retrieves their details.
Microsoft Active Directory computer manager	Manages computers in the Active Directory (AD) and retrieves their details.
Microsoft Active Directory user manager	Manages users in the Active Directory (AD) and retrieves their details.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Microsoft Active Directory v2 spoke.

MID Server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For more information about the MID Server, see MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Note:
You must install the MID Server and Microsoft Active Directory on different servers.

Set up the Microsoft Active Directory v2 spoke

Integrate the ServiceNow instance and the Microsoft Active Directory v2 spoke by using the Windows credentials to authenticate ServiceNow requests.

https://player.vimeo.com/video/1125628248?h=32aa153007&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Active Directory v2 spoke.
- Role required: admin

Configure a connection record for the Microsoft Active Directory v2 spoke

Configure a connection record to connect to the Microsoft Active Directory v2 spoke host and enable the Microsoft Active Directory v2 spoke connections and credentials alias to authorize actions.

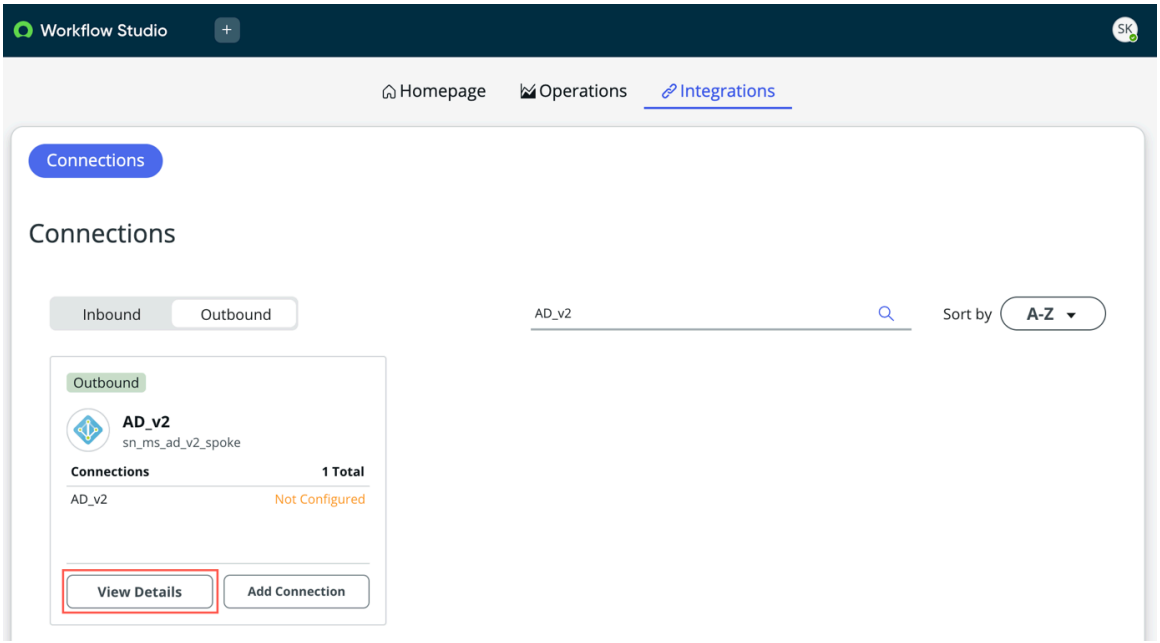
Before you begin

Role required: admin.

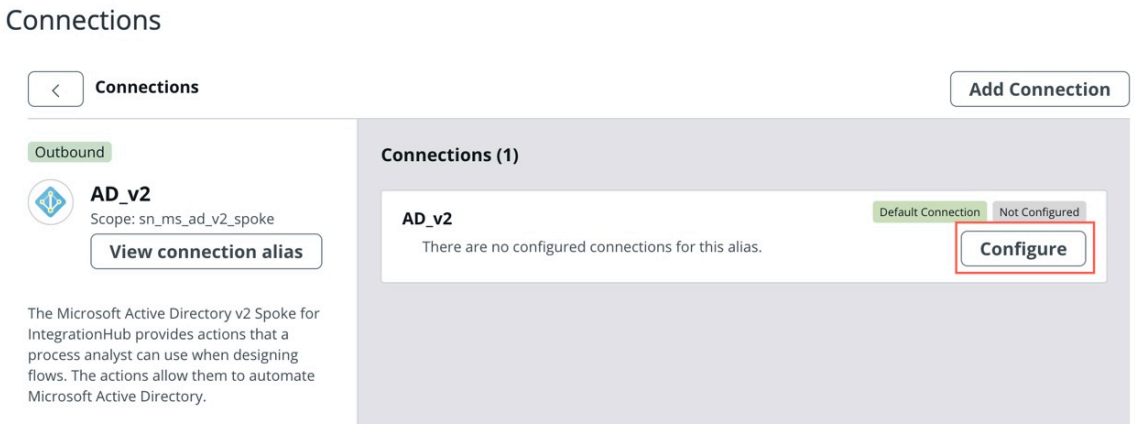
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Click **Connections**.
4. Toggle and enable the **Outbound** connections.
5. Locate the **AD_v2** connection alias and click **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**



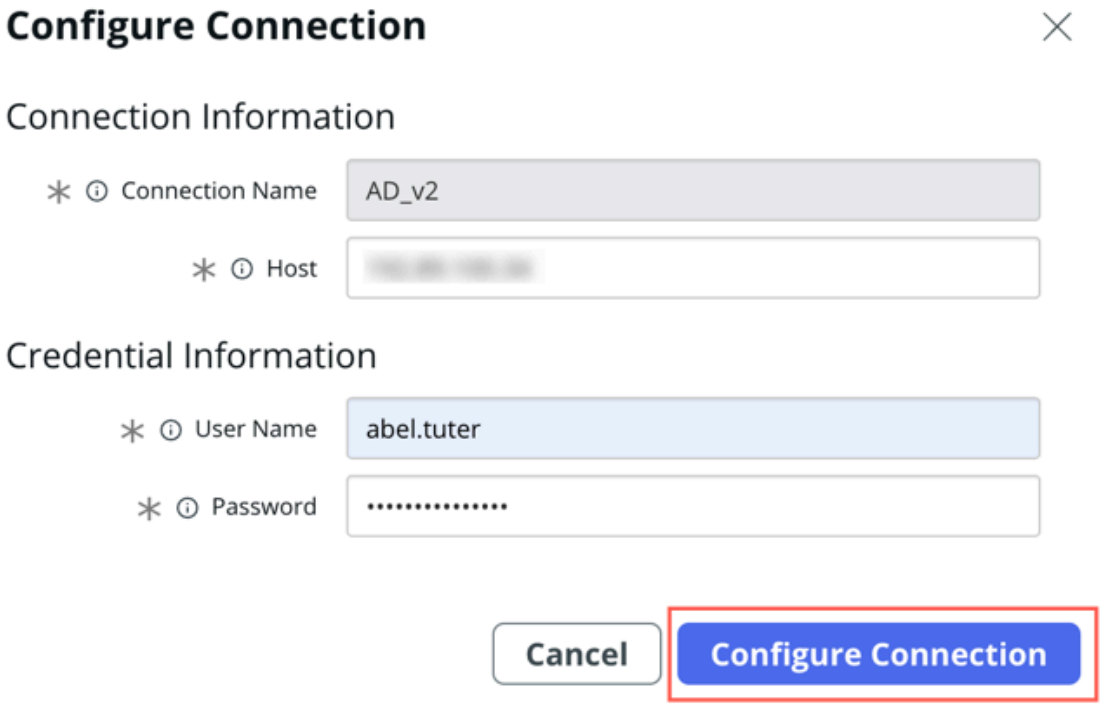
6. Enter the following details in the form.

Create connection form

Field	Information
Connection name	Name to uniquely identify the record.
Host	Fully qualified domain name or IP address of the target host where the Microsoft AD is installed. For example, `<host>.<domain>.com`.
User name	User name with access to the target Windows host.
Password	Password for the account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create connection form



7. Click **Configure Connection**.

What to do next

To use the spoke actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For more information about the MID Server, see MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Note:
You must install the MID Server and Microsoft Active Directory on different servers.

Microsoft Azure Application Insights Spoke

Manage queries, events, and metrics in Microsoft Azure Application Insights account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Azure Application Insights spoke v2.0.0 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

This spoke was built for Microsoft Azure Application Insights API version v1, but may be compatible with later versions.

Spoke requirements

- Register the application in the Microsoft Azure portal and record the access keys and directory IDs. For more information, see Azure Application Insights Search API in Azure Application Insights REST API documentation.
- Add your the redirect URL of your ServiceNow instance in your registered application. The redirect URL must be in this format: `https://<instance>.service-now.com/oauth_redirect.do`. For more information, see Authentication and authorization for Azure Time Series Insights API in Microsoft Docs.
- Create an API key and record the values of API Key and App ID. These values are needed as inputs to the spoke actions. For more information, see Getting your API key and Application ID in Azure Application Insights REST API documentation.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Flow Designer Action Step - Payload Builder (com.glide.hub.action_step.payload)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Azure Application Insights spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Event Management	Look up Event	Gets the data for a single event.
	Look up Events by Type	Executes an OData query for events.
	Look up OData Metadata	Gets the OData EDMX metadata that describes the event data model.
Metric Management	Look up Metric Metadata	Gets that metadata that describes the available metrics.
	Look up Metric	Gets the metric values for a single metric.
	Look up Metrics	Gets the metric values for multiple metrics.
Query Management	Execute Query	Executes an analytics query for data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Query	Executes an analytics query for data.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Azure Application Insights spoke.

Set up the Azure Application Insights spoke

Create a connection alias on your ServiceNow instance. The alias enables your ServiceNow instance to request OAuth tokens from the Microsoft Azure Application Insights and enables the authenticate its requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Azure Application Insights spoke.
- Role required: admin

Register Microsoft Azure Application Insights as an OAuth provider

Create an OAuth application on Microsoft Azure that authenticates requests for OAuth tokens from your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Log in to https://portal.azure.com/.
2. Select **App registrations**.
3. Select **New registration**.
4. Fill the form.

OAuth application details

Field	Description
Name	Name of the OAuth application.
Supported account types	Option to specify who can use the OAuth application that you're creating to access Microsoft Azure Blob Storage.
Redirect URI (optional)	Option to provide the redirect URI. The redirect URI format is https://<instance-name>.service-now.com/oauth_redirect.do. From the Select a platform list, select **Web**.

5. Select **Register**.
   The OAuth application is registered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Copy the values from the following fields under the Essentials heading:
   - Application (client) ID
   - Directory (tenant) ID
7. In the Client credentials field, select **Add a certificate or secret**.
8. Under the Client secrets heading, select **New client secret**.
9. In the Add a client secret window, do the following actions.

   a. In the Description field, enter a description of the client secret.

   b. In the Expires field, enter the expiry period of the client secret.

   c. Select **Add**.
   The client secret is generated.

10. Under the Value heading, copy and store the client secret at a secure place.
    Microsoft Azure Application Insights is registered as an OAuth provider and the information required to set up the connection record is available.

Create a connection alias record

Provide the details in the connection alias form. Your ServiceNow instance uses these details to request OAuth tokens from Microsoft Azure Application Insights.

Before you begin
Role required: admin.

Procedure
1. Log in to your ServiceNow instance.
2. Navigate to **All** > **Process Automation** > **Workflow Studio**.
3. Select **Integrations**.
4. Select **Connections**.
5. In the Search all connections field, search the Microsoft Azure Application Insights connection alias record.

   Note:
   The **Outbound** tab is enabled by default. Or else, toggle to enable it.

6. On the Microsoft Azure Application Insights connection alias tile, select **View Details**.
7. Select **Configure**.
8. Fill the form.

Microsoft Azure Application Insights connection alias

Field	Description
Connection Name	Name of the connection alias record.
Authorization URL	URL that your ServiceNow instance uses to request OAuth tokens from the Microsoft Azure Application Insights. The URL must in the following format: `https://`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`login.microsoftonline.com/{tenant ID}/oauth2/v2.0/authorize`.
Token URL	URL that your ServiceNow instance uses to get the OAuth token. The URL must in the following format: `https://login.microsoftonline.com/{tenant ID}/oauth2/v2.0/token`.
Token Revocation URL	URL that your ServiceNow instance uses to cancel the OAuth token. The URL must in the following format: `https://login.microsoftonline.com/{tenant ID}/oauth2/v2.0/revoke`. **Note:** This field isn't mandatory.
Client ID	Unique ID of the OAuth application that you created on Microsoft Azure Application Insights. The Microsoft Azure Application Insights uses this ID to authenticate your ServiceNow instance requests.
Client Secret	The secret that Microsoft Azure Application Insights uses to authenticate your ServiceNow instance requests. You generate the client secret when you create the OAuth application on Microsoft Azure Application Insights.
Redirect URL	Specific address where the third-party application sends your ServiceNow instance back after the request is authenticated. You must set the redirect URL when you create the OAuth application on Microsoft Azure Application Insights.

9. Select **Configure and Get OAuth Token**.
   You're required to log in to https://portal.azure.com/ before the OAuth token is provided.

   On successful authentication, the request is authenticated and the OAuth token is available.

Microsoft Azure Artifacts Spoke

Manage Microsoft Azure Artifacts from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Azure Artifacts spoke v1.0.3 is the latest version.

Supported versions

This spoke was built for Microsoft Azure Artifacts 6.0-preview.1, but may be compatible with later versions.

Spoke requirements

Azure Devops Account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Azure Artifacts spoke provides actions to automate Microsoft Azure Artifacts tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Artifact Management	Get Package Details	Retrieves details of the specified package.
	Get Package Version Details	Retrieves version details of the specified package.
	Look up Package Versions	Retrieves a list of package versions.
	Look up Packages	Retrieves a list of packages.
Change Tracking Management	Get Feed Change	Retrieves details of the current state of a feed.
	Look up Feed Changes	Retrieves a list of changes of a feed.
	Look up Package Changes	Retrieves a list of packages that changed in a feed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Feed Management	Create Feed	Creates a feed to handle various package types.
	Delete Feed	Removes the feed and all the related packages.
	Get Feed Details	Retrieves the details of the feed.
	Look up Feeds	Retrieves a list of feeds.
	Update Feed	Updates the specified feed.
Metadata Retrieval	Look up Package IDs	Retrieves the metadata of a list of package IDs.
	Look up Package Version IDs	Retrieves the metadata of a list of package version IDs.
	Look up Projects	Retrieves a list of all project within an organization.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Microsoft Azure Artifacts spoke.

Set up the Microsoft Azure Artifacts spoke

Integrate the ServiceNow instance and Microsoft Azure Artifacts using Basic Authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Azure Artifacts spoke.
- Create a Personal Access Token in your Azure Devops account and record it for later use.
- Role required: admin.

Obtain the personal access token

Create and record the personal access tokens in your Microsoft Azure portal. The personal access tokens are required to authenticate ServiceNow requests.

Before you begin

Role required: admin

Procedure

1. Log in to your Azure Artifacts portal as an admin.
2. Navigate to **User Settings** > **Personal access tokens**.
3. Click **New Token**.
4. On the form, fill the required fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Create**.
   The token is displayed.
6. Copy and record the value of token for later use.

Configure a connection for Microsoft Azure Artifacts spoke

Add and configure a Microsoft Azure Artifacts connection to authenticate ServiceNow requests.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **sn_ms_artfcts_spke** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Microsoft Azure Artifacts spoke, click **View Details**.
   - To manage more than one Microsoft Azure Artifacts spoke connection records, you should create a new child alias record by clicking Add Connection. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.
5. On the **Configure Connection** form, fill in the fields:

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, enter `Microsoft Azure Artifacts Connection`.
Connection URL	URL of the Microsoft Azure Artifacts instance. For example, enter the URL in this format: `https://feeds.dev.azure.com/`
Credential Name	Name to uniquely identify the credential record. For example, enter `Microsoft Azure Artifacts Credential`.
User Name	User name to log in to your Azure Artifacts instance.
Password	Personal access token to authenticate Azure Artifacts.

6. Click **Configure Connection**.
   The connection for the Microsoft Azure Artifacts spoke is created.
7. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
8. Open the `Microsoft Azure Artifacts` Connection and Credential type.
9. From the `Connections` tab, open the Credential record which is created from the connection template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Click the lock icon beside the **Credential alias** field.
11. Search for `sn_ms_artfcts_spke.Microsoft_Azure_Project` and select it from the list.
12. Save the record.

Result
The Microsoft Azure Artifacts spoke connection is configured and ready to be used.

Microsoft Azure Automation Spoke

Integrate the ServiceNow instance with the Microsoft Azure Automation. Manage the cloud-based automation and configuration services from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

The Microsoft Azure Automation spoke v2.0.0 is the latest version.

Supported versions

This spoke was built for the Microsoft Azure Automation 2023-11-01 version, but may be compatible with the later versions.

Spoke requirements

Microsoft Azure account.

Spoke dependencies

If you're having trouble installing the app, confirm that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Azure Resource Management spoke (sn_azure_rm_spoke) v2.0.0 is installed and a connection alias is created on your instance.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation. For more information on the licenses, contact your account manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Microsoft Azure Automation spoke provides actions to automate the Microsoft Azure tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Account Management	Create Account	Creates an automation account.
	Delete Account	Deletes an account.
	Look up Account	Retrieves the details of an automation account using the resource group.
	Look up Accounts Stream by Resource Group	Retrieves the list of accounts present under the specified resource group. Page size is fixed to 100 according to Microsoft.
	Look up Accounts Stream by Subscription ID	Retrieves the list of accounts present under the specified subscription ID. Page size is fixed to 100 according to Microsoft.
	Update Account	Updates the details of an automation account.
Job Management	Create Job	Creates a job of the runbook.
	Look up Job	Retrieves the details of a runbook job.
	Look up Job Output	Retrieves the details of an executed job output identified by the job ID.
	Look up Job Schedule	Retrieves the details of a scheduled job.
	Look up Job Schedules Stream	Retrieves the list of scheduled jobs present in an automation account. The page size is fixed to 100 according to Microsoft.
	Look up Jobs Stream	Retrieves the list of runbook jobs present in an automation account. Page size is fixed to 100 according to Microsoft.
	Resume Job	Resumes the job identified by job name.
	Stop Job	Stops the job execution identified by job name.
	Suspend Job	Suspends the job identified by job name.
Job Schedule Management	Create Job Schedule	Creates a schedule for a job execution.
	Delete Job Schedule	Deletes a job schedule.
Runbook Management	Create Runbook	Creates a runbook.
	Delete Runbook	Deletes a runbook.
	Look up Runbook	Retrieves the details of a runbook.
	Look up Runbook Content	Retrieves the content of the a runbook.
	Look up Runbooks Stream	Retrieves the list of runbooks present in an automation account. Page size is fixed to 100 according to Microsoft.
	Update Runbook	Updates the details of a runbook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Schedule Management	Create Schedule	Creates a schedule.
	Delete Schedule	Deletes a schedule.
	Look up Schedule	Retrieves the details of a schedule.
	Look up Schedules Stream	Retrieves the list of schedules present in an automation account. Page size is fixed to 100 according to Microsoft.
	Update Schedule	Updates the details of a schedule.
Software Update Configuration Management	Look up Software Update Configuration Machine Runs Stream	Retrieves the list of software update configuration machine runs present in an automation account. Page size is fixed to 100 according to Microsoft.
	Look up Software Update Configuration Run	Retrieves the details of a software update configuration run.
	Look up Software Update Configuration Runs Stream	Retrieves the list of software update configuration runs present in an automation account. Page size is fixed to 100 according to Microsoft.
State Configuration Management	Compile DSC Configuration	Creates the desired State Configuration compilation job.
	Create DSC Configuration	Creates the desired State Configuration.
	Look up DSC Configuration	Retrieves the details of the Desired State Configuration.
	Look up DSC Configuration Content	Retrieves the content of the Desired State Configuration.
	Look up DSC Configurations Stream	Retrieves the list of DSC Configurations present in an automation account. Page size is fixed to 100 according to Microsoft.
	Look up Nodes Stream	Retrieves the list of Nodes present in an automation account. Page size is fixed to 100 according to Microsoft.
	Update DSC Configuration	Updates the Desired State Configuration.
	Update Node DSC Configuration	Updates the details of desired State Configuration for the specified node(VM).
Watcher Management	Delete Watcher	Deletes the watcher.
	Look up Watchers Stream	Retrieves the list of watchers present in an automation account. Page size is fixed to 100 according to Microsoft.
	Start Watcher	Starts the watcher.
	Stop Watcher	Stops the watcher.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Microsoft Azure Automation Spoke

To execute the actions of the Microsoft Azure Automation Spoke, you must first install and configure the Microsoft Azure Resource Management Spoke. No separate configuration of the Microsoft Azure Automation Spoke is necessary. To view the procedure to set up the Microsoft Azure Resource Management Spoke, see Set up the Microsoft Azure Resource Management spoke.

Microsoft Azure Blob Storage Spoke

Manage Azure blobs and containers from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Azure Blob Storage spoke v2.0.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, confirm that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Step - JSON Parser (com.glide.hub.action_step.jsonparser)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- IHUB Spoke Util Pack (com.snc.ihub_spoke_util_pack)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Supported versions

This spoke was built for API version 2023-11-03, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

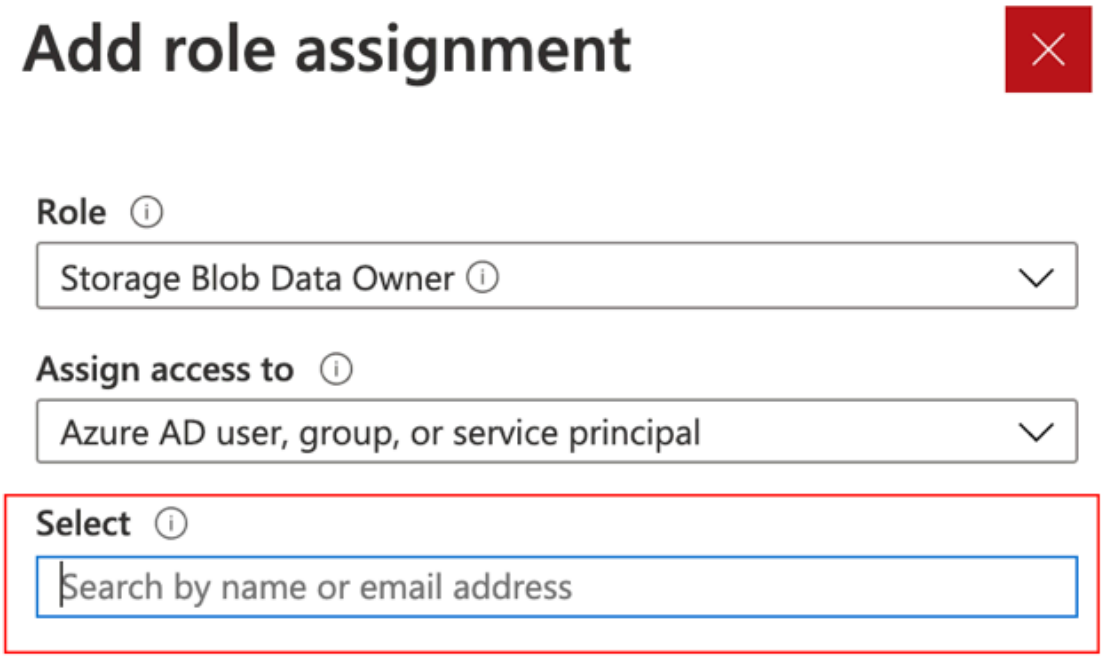
Spoke requirements

- Storage account in your Microsoft Azure portal for integration with your ServiceNow instance.

Note:
Verify that you have the Storage Blob Data Owner role.

To assign the role:

1. Log in to your storage account and navigate to Access Control(IAM).
2. Select the Add a role assignment and select the Storage Blob Data Owner role.
3. Assign access to the required Azure AD user, group, or service principle option. Select the email address of the Azure account and save the changes.



For more information, see Use the Azure portal to assign an Azure role for access to blob and queue data.

- Record and save the access keys and Directory ID for later use.

Spoke subflows

The Azure Blob Storage spoke provides sample subflows to demonstrate automating the Azure Blob Storage tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Subflow	Description
Move Blob	Moves a blob from source container to destination container.
Rename Blob	Renames the specified blob.
Look up Blobs Stream	Retrieves the details of all blobs in a container.
Look up Containers Stream	Retrieves a list of containers under the specified storage account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Azure Blob Storage spoke provides actions to automate Azure Blob Storage tasks when events occur in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Blob Management	Attach Blob to ServiceNow Record	Attaches a blob to the ServiceNow record.
	Copy Blob	Copies a blob from one container to another container.
	Delete Blob	Deletes the specified blob.
	Lease Blob	Creates a lock on a blob for write and delete operations.
	Look up Blob	Retrieves details of the specified blob.
	Look up Blobs	Retrieves details of all blobs in a container.
	Release Lease on Blob	Releases a lock on a blob.
	Snapshot Blob	Creates a snapshot for the specified blob.
	Upload Attachment to Container	Uploads a blob in specified container.
Container Management	Create Container	Creates a container under the specified account.
	Delete Container	Deletes a container.
	Lease Container	Creates a lock on the container for delete operations.
	Look up Container	Retrieves details of the specified container.
	Look up Containers	Retrieves list of the containers under the specified storage account.
	Release Lease on Container	Releases a lock on a container.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Microsoft Azure Blob Storage Spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Microsoft Azure Blob Storage Spoke

Configure the Microsoft Azure Blob Storage connection alias record on your ServiceNow instance. This enables the authentication of connection requests from the ServiceNow instance by the Microsoft Azure portal.

Before you begin

- Request an Integration Hub subscription.
- Activate the Azure Blob Storage spoke.
- Role required: admin.

Register Microsoft Azure Blob Storage as an OAuth provider

Create an OAuth application on Microsoft Azure that authenticates requests for OAuth tokens from your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Log in to https://portal.azure.com/.
2. Select **App registrations**.
3. Select **New registration**.
4. Fill the form.

OAuth application details

Field	Description
Name	Name of the OAuth application.
Supported account types	Option to specify who can use the OAuth application that you're creating to access Microsoft Azure Blob Storage.
Redirect URI (optional)	Option to provide the redirect URI. The redirect URI format is https://<instance-name>.service-now.com/oauth_redirect.do. From the Select a platform list, select **Web**.

5. Select **Register**.
   The OAuth application is registered.
6. Copy the values from the following fields under the Essentials heading:
   - Application (client) ID
   - Directory (tenant) ID
7. In the Client credentials field, select **Add a certificate or secret**.
8. Under the Client secrets heading, select **New client secret**.
9. In the Add a client secret window, do the following actions.
   a. In the Description field, enter a description of the client secret.
   b. In the Expires field, enter the expiry period of the client secret.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Add**.
The client secret is generated.

10. Under the Value heading, copy and store the client secret at a secure place.
11. Add the API permission.

a. On the left panel, select **API permissions**.

b. Select **Add a permission**.

c. On the Request API permissions window, select **Azure Storage**.

d. Select **Delegated permissions**.

e. Under Permissions, select **Access Azure Storage**.

f. Select **Add permissions**.
The permission is added and visible under the API / Permissions name heading.

g. Select **Grant admin consent for ServiceNow**.

h. Select **Yes**.

Microsoft Azure Blob Storage is registered as an OAuth service provider.

Configure a connection to Microsoft Azure

Configure the connection and credential alias record of the Microsoft Azure Blob Storage to send a request for an OAuth token from your ServiceNow instance and have it authenticated by the Microsoft Azure portal. After authentication, an OAuth token is available to your instance to access the Microsoft Azure Blob Storage.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. In the Search all connections field, enter Microsoft Azure Blob Storage.
The **Outbound** tab is enabled by default. If the tab isn't enabled, toggle-select to enable.
4. On the Microsoft Azure Blob Storage tile, select **View Details**.
5. Select **Configure**.
6. Fill the form.

Microsoft Azure Blob Storage connection alias

Field	Description
Connection Name	Name of the connection alias record. The default name of the first connection record

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	is the same as the alias. You can't update the name.
Authorization URL	URL that your ServiceNow instance uses to request OAuth tokens from the Microsoft Azure portal. The URL must in the following format: `https://login.microsoftonline.com/{tenant ID}/oauth2/v2.0/authorize`. Use the tenant ID that you generated when you registered the OAuth application.
Token URL	URL that your ServiceNow instance uses to get the OAuth token. The URL must in the following format: `https://login.microsoftonline.com/{tenant ID}/oauth2/v2.0/token`. Use the tenant ID that you generated when you registered the OAuth application.
Token Revocation URL	URL that your ServiceNow instance uses to cancel the OAuth token. The URL must in the following format: `https://login.microsoftonline.com/{tenant ID}/oauth2/v2.0/revoke`. Use the tenant ID that you generated when you registered the OAuth application. **Note:** This field isn't required.
Client ID	Unique ID of the OAuth application that you created on the Microsoft Azure portal. The Microsoft Azure portal uses this ID to authenticate your ServiceNow instance requests.
Client Secret	The secret that Microsoft Azure portal uses to authenticate your ServiceNow instance requests. You generate the client secret when you create the OAuth application on Microsoft Azure portal.
Redirect URL	Specific address where the third-party application sends your ServiceNow instance back after the request is authenticated. The format of the redirect URL is `https://<instance-name>.service-now.com/oauth_redirect.do`.

7. Select **Configure and Get OAuth Token**.
   You're required to log in to https://portal.azure.com/ before the OAuth token is provided.

   On successful authentication, the request is authenticated and the OAuth token is available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Azure Cosmos DB Spoke

Manage Microsoft Azure Cosmos DB from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Azure Cosmos DB spoke v2.0.0 is the latest version.

Supported versions

This spoke was built for Microsoft Azure Cosmos DB v2, but may be compatible with later versions.

Spoke requirements

Microsoft Azure Portal account.

Spoke dependencies

If you're having trouble installing the app, confirm that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke) v 2.0.0 is installed and a connection alias is created on your instance.
- The connection alias of Microsoft Azure Cosmos DB SAS is configured on your instance.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Azure Cosmos DB Spoke provides actions to automate Microsoft Azure Cosmos DB tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Cassandra Database Management	Create Cassandra Keyspace	Creates a Cassandra keyspace within the specified Subscription ID and Resource Group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Cassandra Keyspace	Deletes the specified Cassandra keyspace within the specified Subscription ID and Resource Group.
	Look up Cassandra Keyspace	Get the details of the specified Cassandra keyspace within the specified Subscription ID and Resource Group.
	Look up Cassandra Keyspace Throughput	Gets the details of the throughput of the specified Cassandra keyspace within the specified Subscription ID and Resource Group.
	Look up Cassandra Keyspaces	Lists all the Cassandra keyspaces in the specified Subscription ID and Resource Group.
	Update Cassandra Keyspace Throughput	Update the throughput of the specified Cassandra keyspace within the specified Subscription ID and Resource Group.
Core SQL Database Management	Create Database	Creates a database under a specified database account.
	Create Permission	Creates a permission in the specified database.
	Create User	Creates the user in a specified database.
	Delete Database	Deletes the specified database information in a specified database account.
	Delete Permission	Deletes the specified permission information of a user.
	Delete User	Deletes the user of the specified database.
	Look up Database	Retrieves the specified database information in a specified database account.
	Look up Databases	Lists all the databases in the specified database account.
	Look up Permission	Retrieves the specified permission information of a user.
	Look up Permissions	Lists all the permissions of the specified database.
	Look up User	Retrieves the specified user information in a specified database.
	Look up Users	Lists all the users of the specified database.
	Replace Permission	Replaces the specified permission.
	Replace User	Replaces the specified user in a specified database by another user.
Database Account Management	Create DB Account	Creates an account in Azure Cosmos DB.
	Delete DB Account	Deletes the specified Cosmos DB account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Enable or Disable Options on DB Account	Updates the details of a specified database account.
	Look up Access Keys	Lists all access keys in the specified Azure Cosmos DB database account.
	Look up Connection Strings	Lists all the connection strings in the specified Azure Cosmos DB account.
	Look up DB Account	Retrieves the DB account for the provided Subscription ID and Resource Group.
	Look up DB Accounts by Resource Group	Retrieves the list of DB accounts for the provided Subscription ID and Resource Group.
	Look up DB Accounts by Subscription ID	Retrieves the list of DB accounts for the provided Subscription ID.
	Look up Usages	Retrieves the most recent data in the specified database account.
	Regenerate Access Key	Regenerates an access key for the specified Azure Cosmos DB account.
	Update Failover Priority	Updates the details of a specified database account.
Mongo Database Management	Create MongoDB Database	Creates the specified MongoDB database within the specified Subscription ID and Resource Group.
	Delete MongoDB Database	Deletes the specified MongoDB database within the specified Subscription ID and Resource Group.
	Look up MongoDB Database	Get the details of the provided MongoDB database within the specified Subscription ID and Resource Group.
	Look up MongoDB Database Throughput	Get the details of the throughput of the provided MongoDB database within the specified Subscription ID and Resource Group.
	Look up MongoDB Databases	Lists all the MongoDB databases within the specified Subscription ID and Resource Group.
	Update MongoDB Database Throughput	Creates a Cassandra keyspace within the specified Subscription ID and Resource Group.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Set up the Microsoft Azure Cosmos DB spoke.

Set up the Microsoft Azure Cosmos DB spoke by fulfilling the following dependencies:

- Install and configure a connection alias of the Microsoft Azure Resource Management Spoke. To view the procedure, see Set up the Microsoft Azure Resource Management spoke.
- Configure a connection alias of the Microsoft Azure Cosmos DB SAS. To view the procedure, see Create a connection alias record for Microsoft Azure Cosmos DB SAS.

Set up the Microsoft Azure Cosmos DB spoke

Integrate the ServiceNow instance and the Microsoft Azure Cosmos DB by installing and configuring the Microsoft Azure Resource Management Spoke connection alias and configuring the Microsoft Azure Cosmos DB SAS connection alias.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Azure Cosmos DB spoke.
- Role required: admin

Create a connection alias record for Microsoft Azure Cosmos DB SAS

Create a connection alias record for the Microsoft Azure Cosmos DB SAS to execute the actions under the Core SQL Database Management category of the Microsoft Azure Cosmos DB spoke.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select **Connections**.
3. In the Search all connections field, enter Microsoft Azure Cosmos DB SAS.
   The **Outbound** tab is active by default. If the tab isn't active, toggle it to activate.
4. On the Microsoft Azure Cosmos DB SAS tile, select **View Details**.
5. Select **Configure**.
6. Fill the form.

Cosmos DB SAS connection alias setup information

Field	Description
Connection name	Name of the connection record.
Credential name	Name of the credential that is used to access the Cosmos DB SAS.
Shared Access Key Name	Name of the shared access key to the Cosmos DB SAS.
Shared Access Key	Shared access key to the Cosmos DB SAS. Generate the key from the Microsoft Azure portal.

7. Select **Create Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Azure DevOps Boards Spoke

Automate the process of managing work items in Azure DevOps Boards from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Azure DevOps Boards spoke v3.1.0 is the latest version.

Supported versions

This spoke was built for Azure DevOps Boards REST API version 4.1 and TFS 2018 Update 3, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- iHub Spoke Util Pack (com.snc.ihub_spoke_util_pack)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke requirements

- Azure DevOps instance
- Personal access tokens (PATs) to authenticate Azure DevOps

See Azure DevOps documentation for information about creating personal access token.

Spoke actions

The Azure DevOps Boards spoke provides actions manage work items when events occur in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Core Process Management	Create Iteration	Creates an Azure DevOps iteration.
	Delete Iteration	Deletes an Azure DevOps iteration by path.
	Delete Team Iteration	Delinks or deletes the iterations from a team.
	Look up Creatable Fields	Get the list of all fields in a required Azure DevOps project.
	Look up Area Paths	Gets all the area paths in a Project.
	Look up Editable Fields	Gets the list of all fields in a required Work Item for editing.
	Look up Area Path of a Team	Get all the area paths of a Team.
	Look up Iteration by Path	Get Iteration by Path.
	Look up Iteration Paths	Get all Iteration Paths in a Project.
	Look up Iteration Paths of a Team	Gets all the iteration paths of a Team.
	Look up Processes	Gets the list of all Azure DevOps Processes.
	Look up Projects Stream	Retrieves the details of all Azure DevOps projects.
	Look up Work Item Revisions Stream	Retrieves the Reporting Work Item Revisions for batch processing.
	Look up Work Item Links Stream	Retrieve Reporting Work Item Links for batch processing.
	Look up Queries by Wiql	Gets the results of the query given its Wiql.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Team Settings	Get Backlog and Default Iterations setting of a team.
	Look up Teams	Get all Teams in a Project.
	Look up Work Item Data by ID	Gets all the data of a Work Item.
	Look up Work Item Relations by ID	Gets all relations of a Work Item.
	Look up Work Item Types	Gets the list of all work item types in a required Azure DevOps project.
	Look up Work Item Type Fields by Process	Gets the list of all fields of a Work Item Type by a process from Azure DevOps.
	Post Iteration to Team	Adds an Azure DevOps iteration to an Azure DevOps team.
	Reporting Work Items Revisions	Adds reporting work-item revisions for batch processing.
	Update Iteration	Updates an Azure DevOps iteration.
	Look up Projects Stream	Retrieves the list of all Azure DevOps projects.
	Get Work Item Types By Process	Retrieves the list of all Work Item types in a required Azure DevOps process.
	Get Work Item Types	Retrieves the list of all Work Item types in a required Azure DevOps project.
	Look up Area by Path	Retrieves the area of a project by its path.
	Look up Area Path of a Team	Gets all the area paths of a Team.
	Look up Area Paths	Get all the area paths in a Project.
	Look up Creatable Fields	Gets the list of all the fields in a required Azure DevOps project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Editable Fields	Gets the list of all fields in a required Work Item for editing.
	Look up Iteration by Path	Gets Iteration by Path.
	Look up Iteration Paths	Gets all the Iteration Paths in a Project.
	Look up Iteration Paths of a Team	Gets all Iteration Paths of a Team.
	Look up Processes	Gets the list of all Azure DevOps Processes.
	Look up Work Items	Retrieves the list of work items.
	Look up Team Settings	Gets the Backlog and Default Iteration settings of a team.
	Look up Teams	Gets all Teams in a Project.
	Look up Work Item Data by ID	Gets all Data of a Work Item.
	Look up Work Item Relations by ID	Gets all relations of a Work Item.
	Look up Work Item Type Fields by Process	Gets the list of all Fields of a Work Item Type by a Process from Azure DevOps.
	Look up Work Item Types	Gets the list of all Work Item types in a required Azure DevOps project.
	Look up Work Item Types by Process	Get the list of all Work Item Types by a Process from Azure DevOps.
	Look up Queries by Wiql	Gets the results of the query given its Wiql.
Work Item Management	Create Link between Work Items	Creates parent-child relationships between the Work Items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Work Item	Creates a new Work Item on your instance of the Azure DevOps cloud. The Work Item can be of a specific Work Item type or custom Work Item type, depending on how your organization has customized Azure DevOps.
	Create Service Hook	Creates a new subscription to an Azure DevOps Service Hook.
	Delete Work Item	Deletes the required Work Item in your Azure DevOps instance.
	Delete Link between Work Items	Deletes the link between Work Items.
	Update Work Item	Updates a Work Item in your instance of the Azure DevOps cloud.
	Update Work Item Project Details	Moves between projects in the same organization.
	Add Attachment	Adds an attachment associated with a ServiceNow record to the required work item on the Azure DevOps instance.

Spoke triggers

ServiceNow supports specific events on the Azure DevOps instance that create triggers. You must first configure a flow with a supported trigger definition. When an event, for example, a work item is commented on, occurs in Azure DevOps, it sends the payload via a webhook to the ServiceNow instance. After that, the flow that you configured is triggered at the ServiceNow instance to automate a workflow. The supported events are:

Category	Trigger	Definition
Work Item Management	Work item commented on	Trigger initiates when a work item is commented on.
	Work item created	Trigger initiates when a new work item is created.
	Work item deleted	Trigger initiates when a work item is deleted.
	Work item restored	Trigger initiates when a work item is newly restored.
	Work item updated	Trigger initiates when a work item is changed.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Microsoft Azure DevOps Boards core process management AI agent	Manages core process management tasks (that is, look up a projects stream, look up area paths, look up an area path of a team, look up work item types by process, look up team settings, look up an iteration by path, look up work item data by ID, look up creatable fields, look up work item types, look up iteration paths of a team, look up processes, look up editable fields, look up an area by path, delete a team iteration, look up work item relations by ID, look up queries by Wiql, create an iteration, look up work item type fields by process, look up teams, post an iteration to a team, look up iteration paths, update an iteration, delete an iteration) in Microsoft Azure DevOps Boards.
Microsoft Azure DevOps Boards work item management AI agent	Manages work item management tasks (that is, add an attachment, delete a work item, create a link between work items, create a service hook, delete a link between work items, update work item project details) inMicrosoft Azure DevOps Boards.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

If you want to use different connections in your flow, subflows, and actions, create the child alias and select the default alias record as its parent. To configure the child alias, perform the same steps that are needed to configure the parent alias. Depending on your requirement and set up, you can choose either the parent alias or child alias in your flow, subflows, and actions.

You can also use multiple Azure DevOps accounts. In this case, you should provide the respective **Password** while configuring the credential record and specify the relevant **Connection URL** while configuring the connection record.

- If you want to set up the Microsoft Azure DevOps Boards spoke using OAuth, see Set up the Microsoft Azure DevOps Boards spoke using OAuth.
- If you want to set up the Microsoft Azure DevOps Boards spoke using personal access token, see Set up the Microsoft Azure DevOps Boards spoke using personal access token.

Set up the Microsoft Azure DevOps Boards spoke using OAuth

Integrate the ServiceNow instance and Azure DevOps Boards using OAuth 2.0 authentication to authenticate ServiceNow requests.

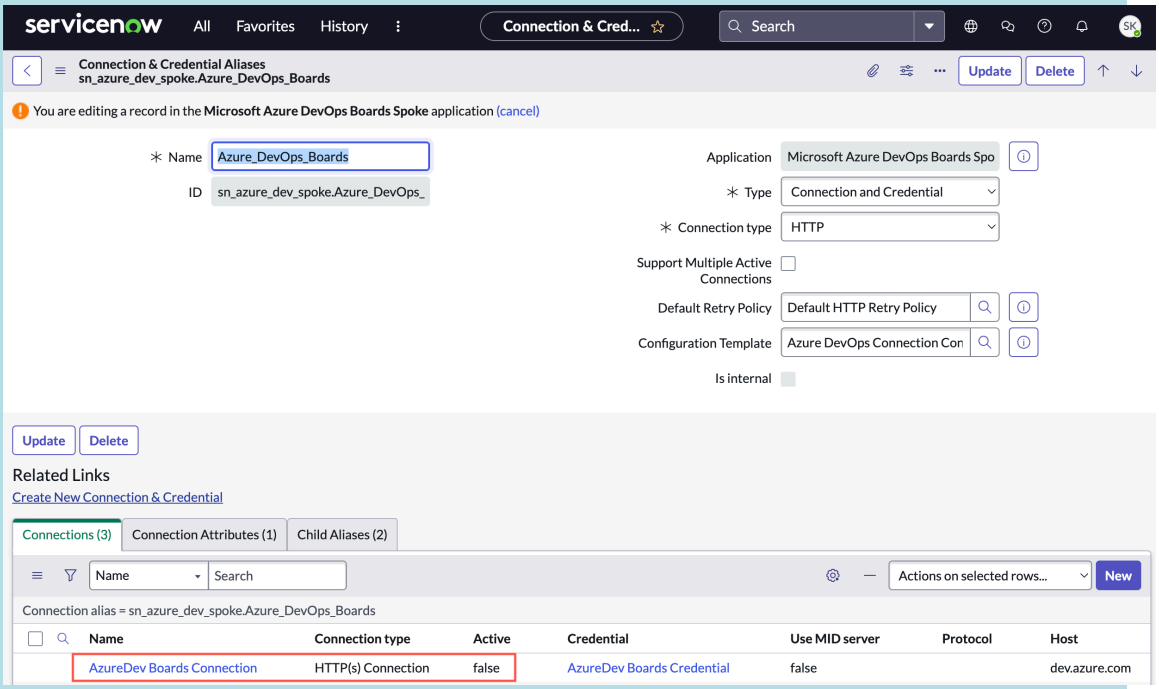
Before you begin

- Request an Integration Hub subscription.
- Activate Azure DevOps Boards spoke
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- If you are setting up the Azure DevOps Boards spoke using OAuth, you need not set up the spoke using personal access token.
- If the Azure DevOps Boards spoke is already configured and set up, ensure that you set the value of **Active** to **false** for the existing connection before you proceed to set up the spoke using OAuth.



Register an application using the Microsoft Azure portal

Provide authorization to the ServiceNow instance by registering an application in the Microsoft Azure portal.

Before you begin

Role required: admin.

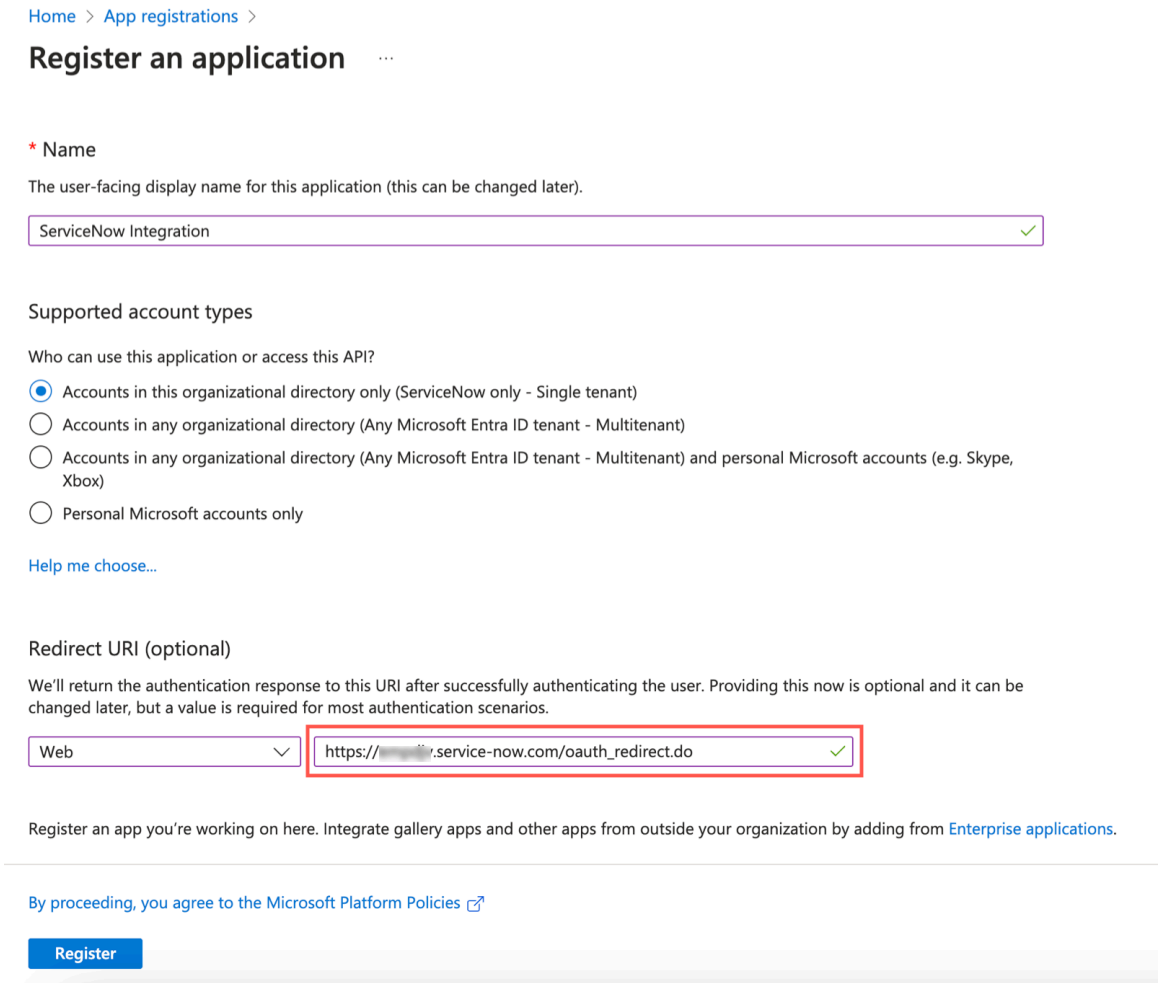
About this task

Complete these steps from the Microsoft Azure portal.

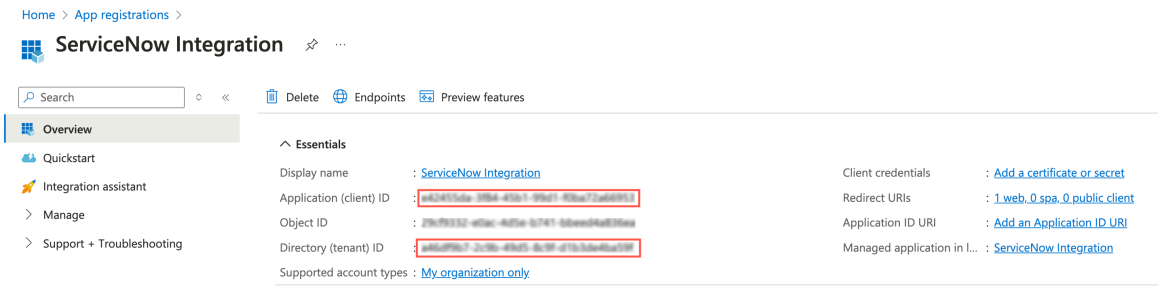
Procedure

1. Log in to the Microsoft Azure portal as an admin.
2. Click **App Registrations**.
3. Click **New registration**.
4. On the form, fill in fields as per your requirement.
   For Redirect URI, specify the ServiceNow instance URL in this format: `https://<ServiceNow-Instance-Name>.service-now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Register**.
   The application is created and the values of **Application (client) ID** and **Directory (tenant) ID** are displayed.



6. Copy and record the values of **Application (client) ID** and **Directory (tenant) ID**.
7. Generate a client secret for the application.

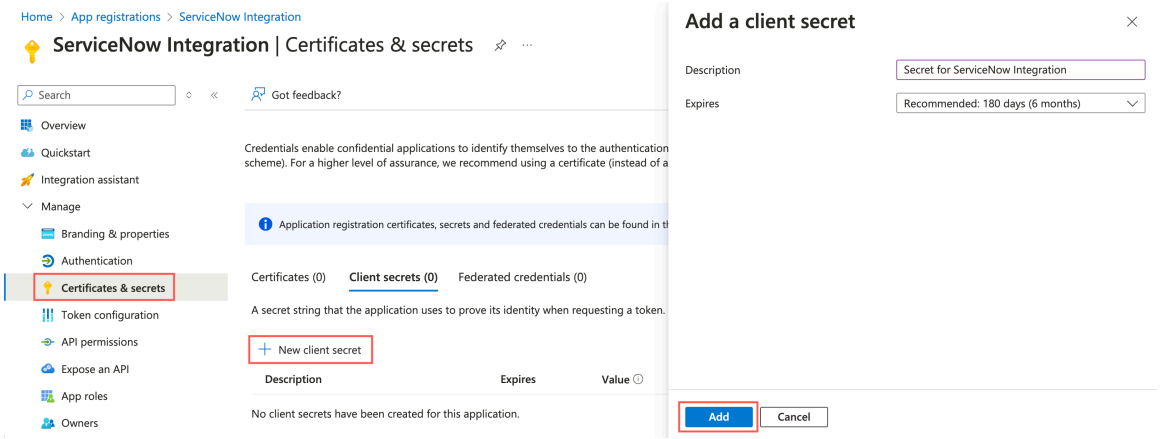
   a. Under **Manage**, click **Certificates & secrets**.

   b. Click **New client secret**.

   c. On the form, enter provide a description and specify the duration after which the secret expires.

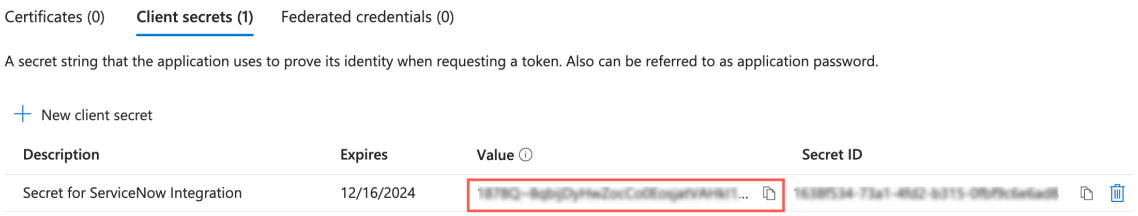
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Click **Add**.



The client secret is created and its value is displayed.

e. Copy the value of client secret for later use.

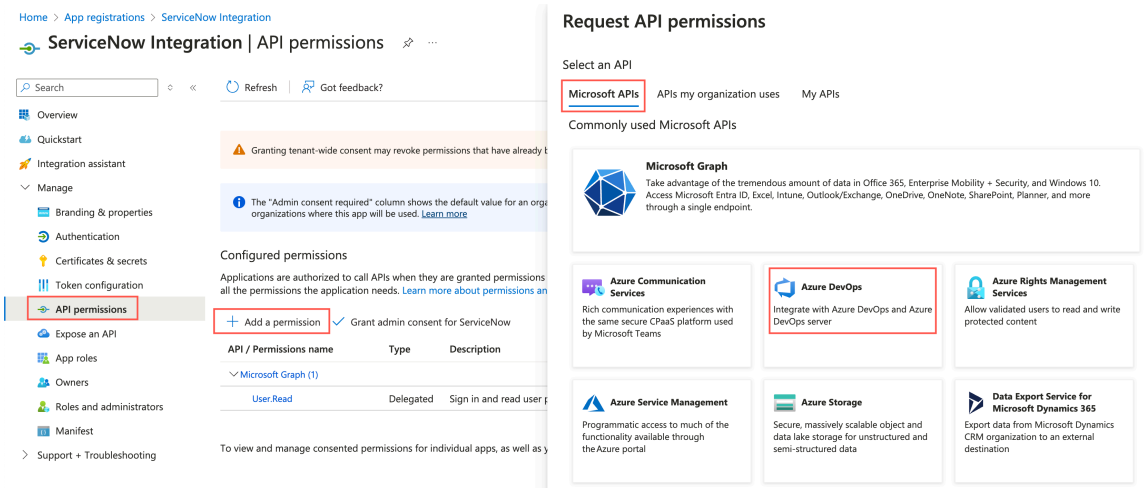


8. Provide the required API permissions to the application.

a. Under **Manage**, click **API permissions**.

b. Click **Add a permission**.

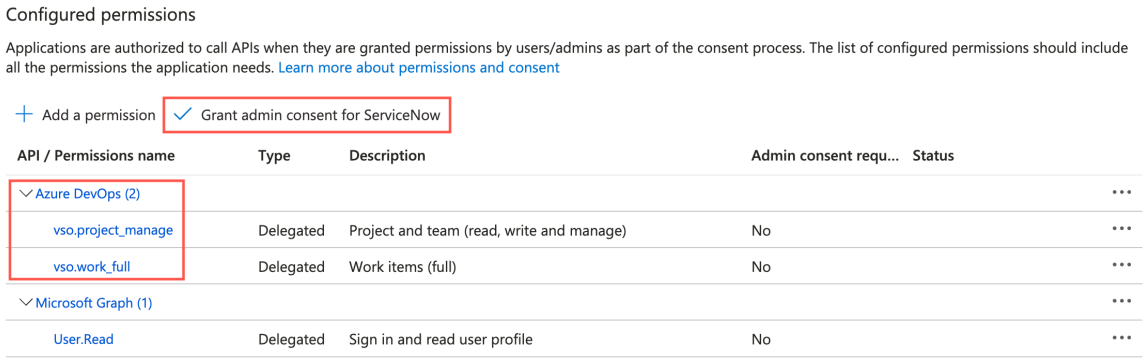
c. Under **Microsoft APIs**, click **Azure DevOps**.



d. Expand **vso** and select these permissions **vso.project_manage** and **vso.work_full**.
The **User.Read** permission under **Microsoft Graph** is selected by default. Configure other permissions as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Click **Grant admin consent for ServiceNow**.



f. When prompted, confirm your choice to grant admin consent for ServiceNow.

Result

An application has been registered in Microsoft Azure portal. You can use this application to connect to your Azure DevOps project from ServiceNow instance.

Create a connection record for the Microsoft Azure DevOps Boards Spoke

Create a connection record that enables the ServiceNow instance to send connection requests to the Microsoft Azure DevOps Boards.

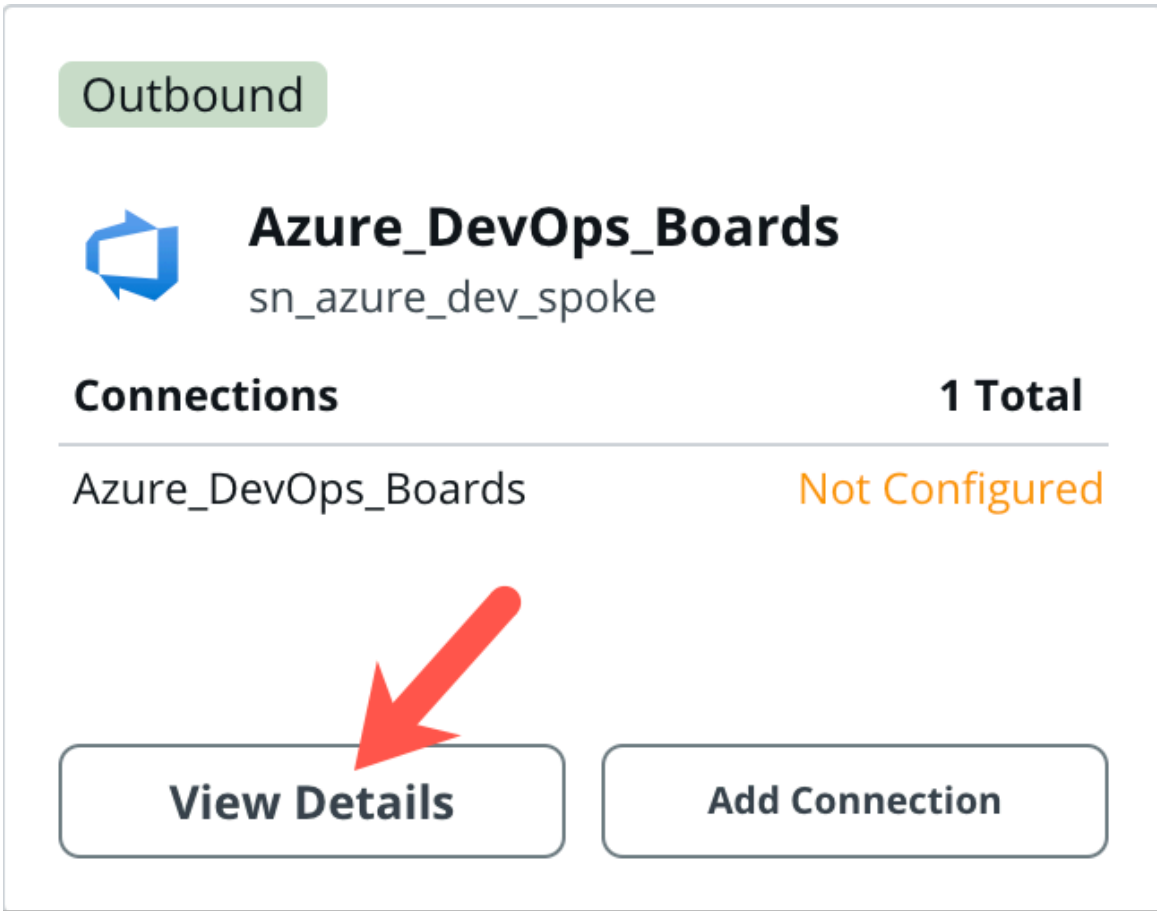
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select **Integrations**.
3. In the Search all connections field, enter `Azure DevOps Boards`.
   Confirm that the **Outbound** tab is selected.
4. In the Azure_DevOps_Boards tile, select **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



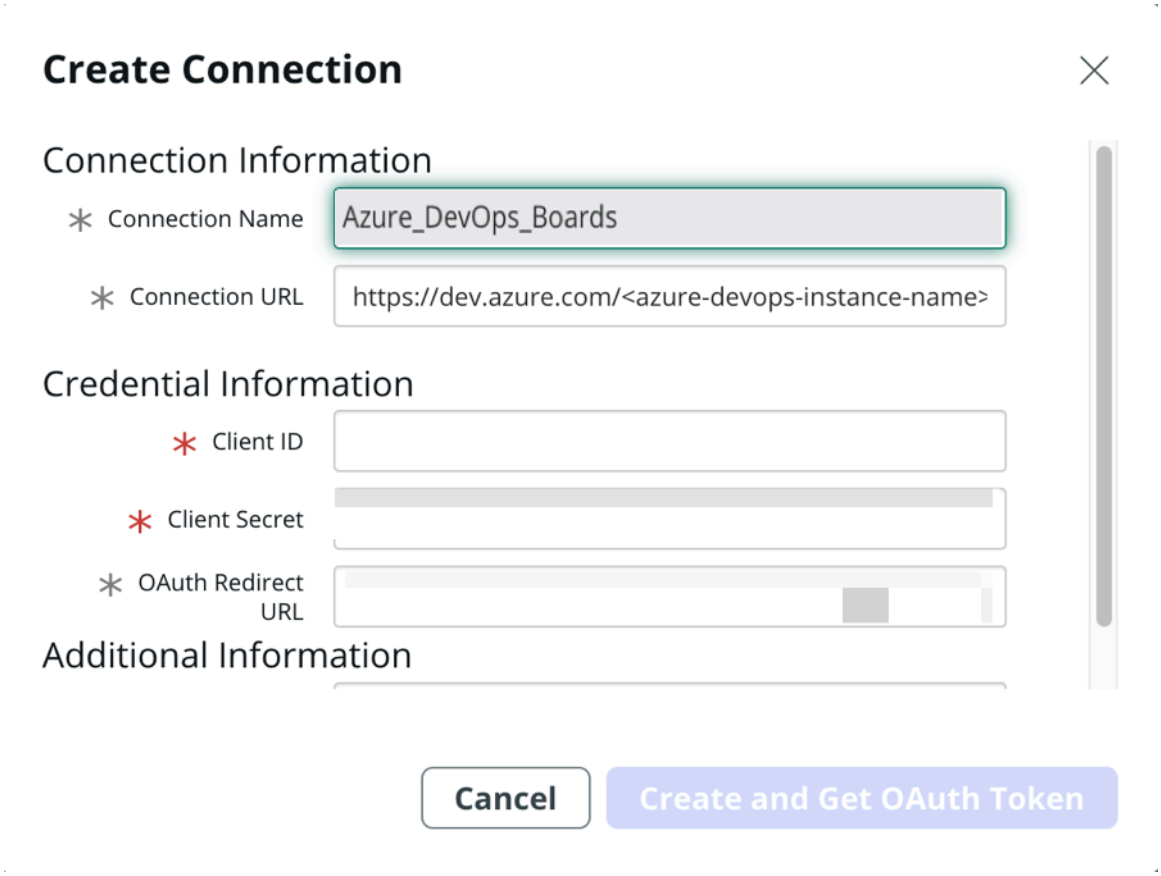
5. Select **Configure**.
6. Fill the form.

Azure DevOps Boards connection form

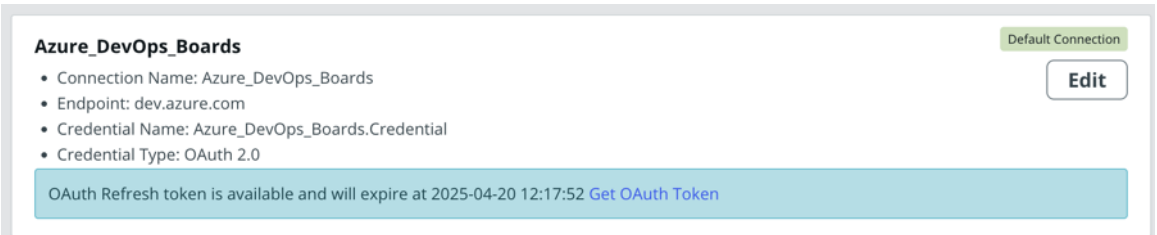
Field	Description
Connection Name	Option to provide the name of the connection record. The default and read-only name of the first connection record that you create is Azure_DevOps_Boards.
Connection URL	Option to provide the endpoint that the alias uses to interact with your Azure DevOps environment.
Client ID	Option to provide the client ID that you generated while registering an application on Microsoft Azure portal.
Client Secret	Option to provide the client secret that you generated while registering an application on Microsoft Azure portal.
OAuth Redirect URL	Option to provide the redirect URL. You must provide the redirect URL in the format `https://<your-instance-name>.service.now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Tenant ID	Option to provide the tenant ID that you generated while registering an application on Microsoft Azure portal.



7. Select **Create and Get OAuth Token**.
   You log in to the Microsoft Azure portal and upon successful authentication, OAuth token is issued.



Set up the Microsoft Azure DevOps Boards spoke using personal access token

Integrate the ServiceNow instance and Azure DevOps Boards using basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Azure DevOps Boards spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If you want to use different connections in your flow, subflows, and actions, create the child alias and select the default alias record as its parent. To configure the child alias, perform the same steps that are needed to configure the parent alias. Depending on your requirement and set up, you can choose either the parent alias or child alias in your flow, subflows, and actions.
You can also use multiple Azure DevOps accounts. In this case, you should provide the respective **Password** while configuring the credential record and specify the relevant **Connection URL** while configuring the connection record.

Obtain the personal access token

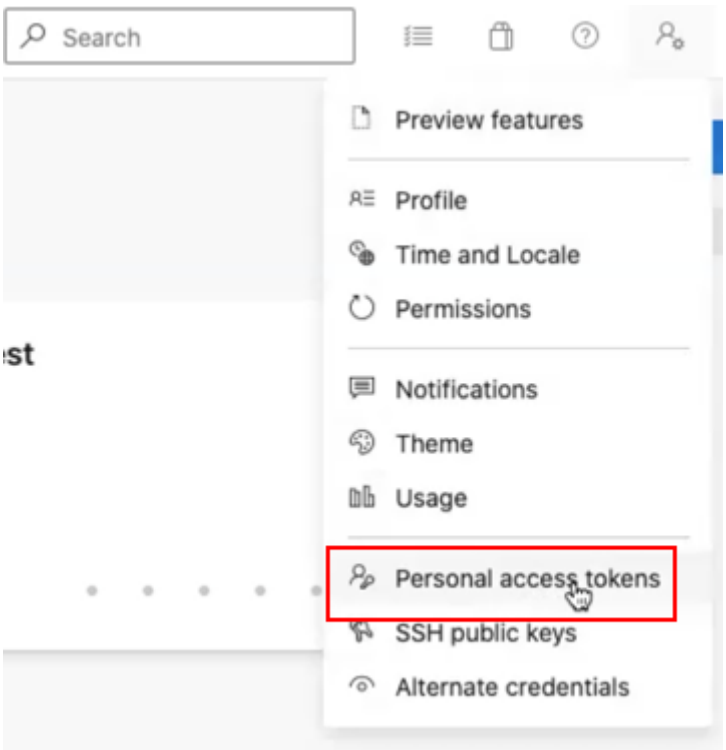
Authenticate Azure DevOps Boards by using the personal access tokens.

Before you begin

Role required: admin

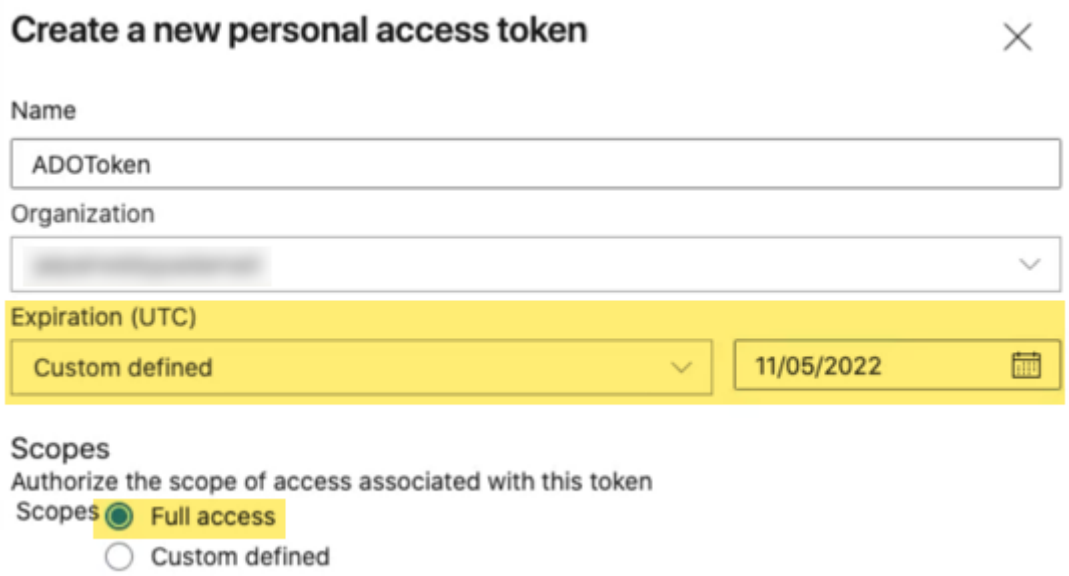
Procedure

1. Log in to your Azure DevOps portal as an admin.
2. Navigate to **User Settings** > **Personal access tokens**.

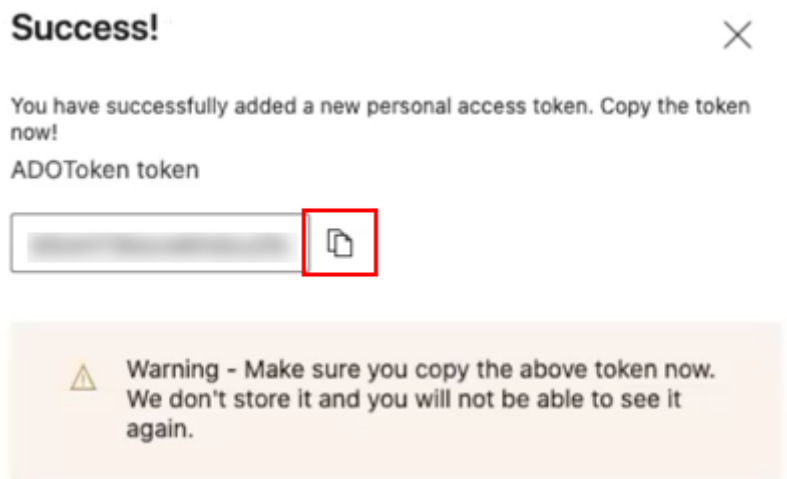


3. Click **New Token**.
4. On the form, fill the required fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Create**.



The token is displayed.

6. Copy and record the value of token for later use.

Configure a connection record for Microsoft Azure DevOps Boards Spoke

Add and configure a Azure DevOps Boards connection to authenticate ServiceNow requests.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
3. Under What type of Credentials would you like to create?, select Basic Auth Credentials.
4. Fill the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credentials table

Field	Details
Name	Option to provide the name that identifies the record.
Order	Option to provide the order in which the credentials are used. For example, enter `100`.
User name	Option to provide the user name that you enter as credential.
Password	Option to provide the password that you enter as credential.
Active	Option to actively use the credential record. Select the option.

5. Select **Submit**.
   The credentials are created.
6. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**.
7. Search for the alias Azure_DevOps_Boards.
8. Select the alias Azure_DevOps_Boards.
9. Under the **Connections** tab, select **New**.
10. Fill the form.

HTTP(s) Connection

Field	Description
Name	Option to provide a unique name of the connection.
Active	Option to indicate that this connection is active. **Note:** You can keep either the connection record for the OAuth 2.0 or that for the Basic Auth active. If you want to keep both connection records active, create one of the connection records under a child alias under the Azure_DevOps_Boards connection and credential alias.
Credential	Option to select the credential that you have created earlier.
Domain	Option to provide the domain to which the connection belongs.

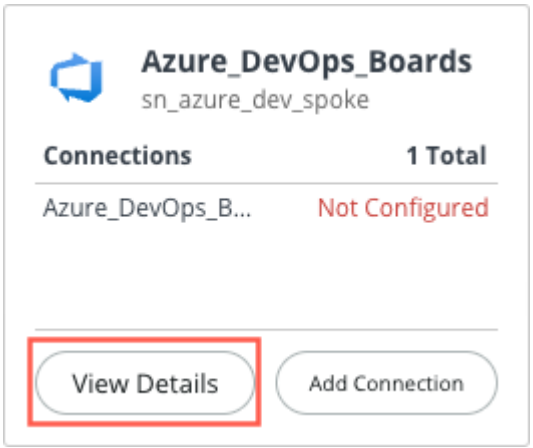
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection alias	Option to provide the parent connection alias. This field is automatically set to `sn_azure_dev_spoke.Azure_DevOps_Boards`.
URL builder	Either manually enter the connection URL or use system to build the URL based on the inputs. Default is unchecked. If checked, the connection URL is calculated from the following fields: ○ Mutual authentication — Check box if mutual authentication is used. ○ Protocol — If mutual authentication is not used, enter protocol. The default is HTTPs. ○ Protocol profile — If mutual authentication is used, enter protocol profile from sys_protocol_profile. ○ Host ○ Port ○ Base path — Path of the connection string. **Note:** If mutual authentication is checked, connection URL is built: Protocol + :// + host:port +URL. If mutual authentication is unchecked, connection URL is built: Protocol profile + :// + host:port +URL
Connection URL	If URL builder is unchecked, enter the connection URL into this field. **Note:** If mutual authentication is checked, connection URL is built: Protocol + :// + host:port +URL. If mutual authentication is unchecked, connection URL is built: Protocol profile + :// + host:port +URL
Use MID server	Option to specify MID server.
Connection timeout	Number of milliseconds the system waits for a successful host connection. If a successful connection does not occur during this time, the connection request times out. Leave this field empty to use the system default connection timeout value.

11. Select **Submit**.
12. Navigate to **All** > **Process Automation** > **Workflow Studio**.
13. Click the **Integrations** tab.
14. Under **Connections**, toggle and enable the **Outbound** connections.
15. Locate the alias for **Azure_DevOps_Boards** and click **View Details**.

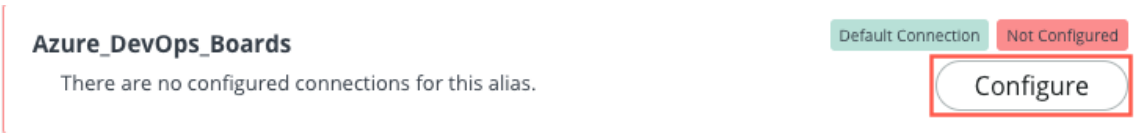
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Azure DevOps Boards spoke, click **View Details**.



- To manage more than one Azure DevOps Boards spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

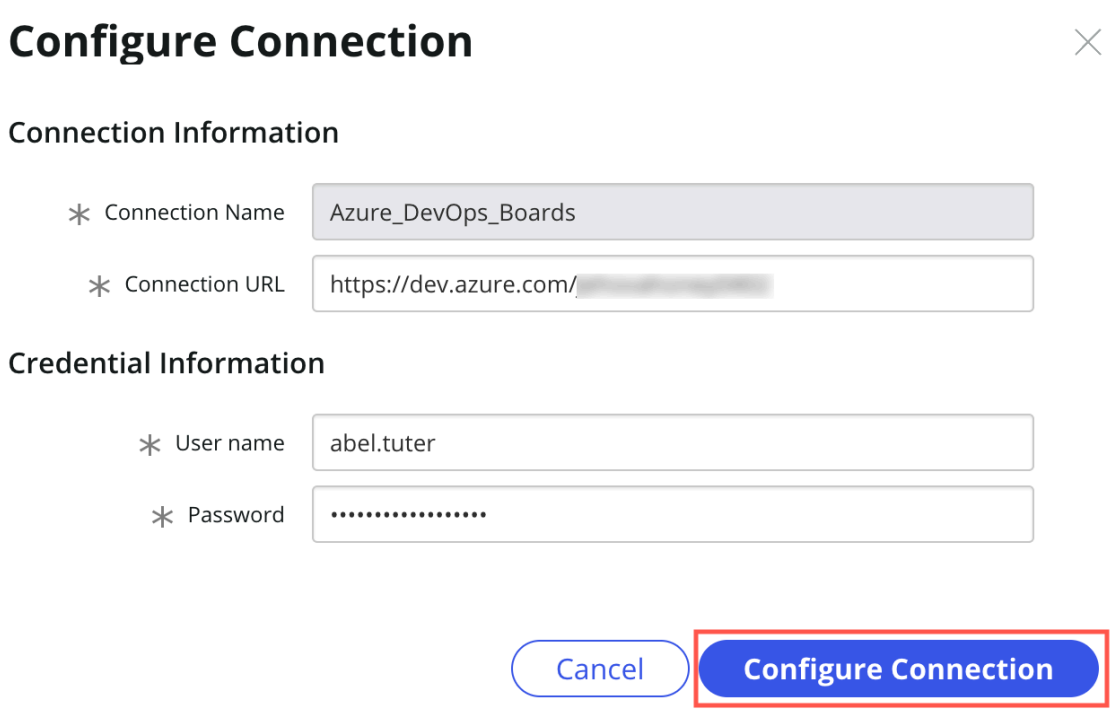
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



16. On the **Configure Connection** form, fill in the fields:

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, enter `Azure DevOps Boards Connection`.
Connection URL	URL of the Azure DevOps instance. For example, enter the URL in this format: `https://dev.azure.com/<instance-name>`.
User name	User name to log in to your Azure DevOps instance.
Password	Personal access token to authenticate Azure DevOps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



17. Click **Configure Connection**.

Result
The spoke connection is configured and ready to be used.

Set up triggers for the Microsoft Azure DevOps Boards spoke

Set up triggers for the Microsoft Azure DevOps spoke for the required events. The endpoint enables webhooks to connect with your ServiceNow instance.

Before you begin
Role required: admin

Configure triggers in ServiceNow instance

Configure endpoint for webhooks in Microsoft Azure DevOps that support the token authentication.

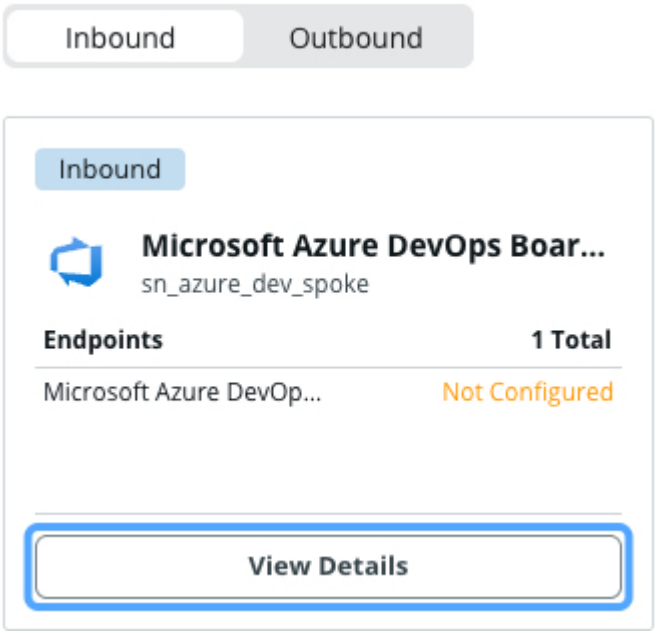
Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Toggle and enable the **Inbound** connections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Locate the **Microsoft Azure DevOps Boards Spoke** endpoint and click **View Details**.



5. For the **Microsoft Azure DevOps Boards External Trigger** end point, click **Configure**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a service hook subscription for Microsoft Azure DevOps Boards spoke

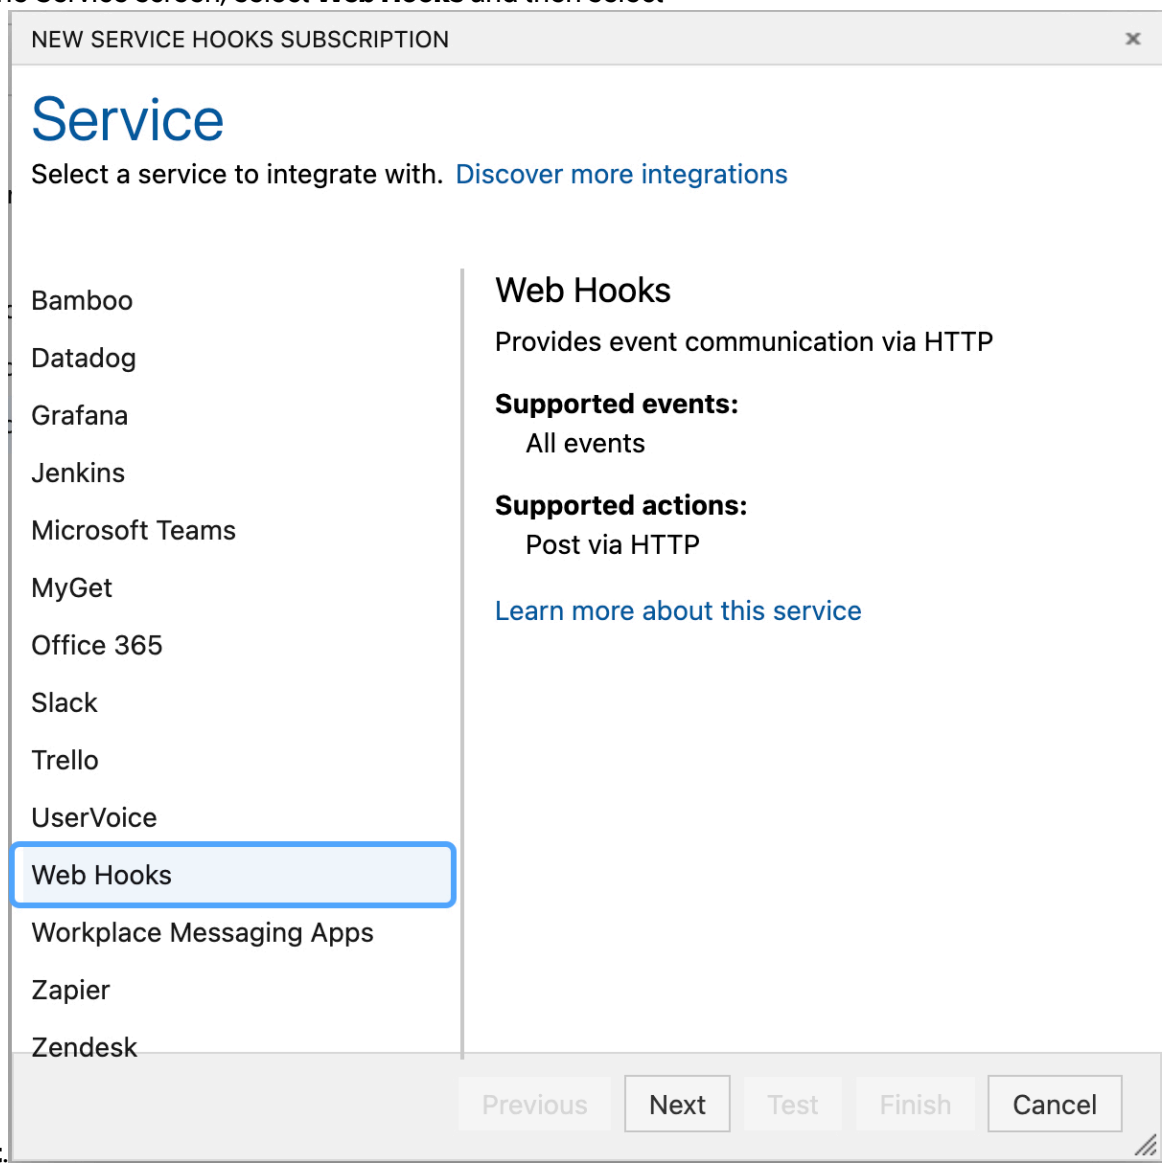
Create and configure a service webhook in Microsoft Azure Devops for Microsoft Azure DevOps Boards spoke.

Before you begin

- Role required: admin
- Configure triggers in ServiceNow instance

Procedure

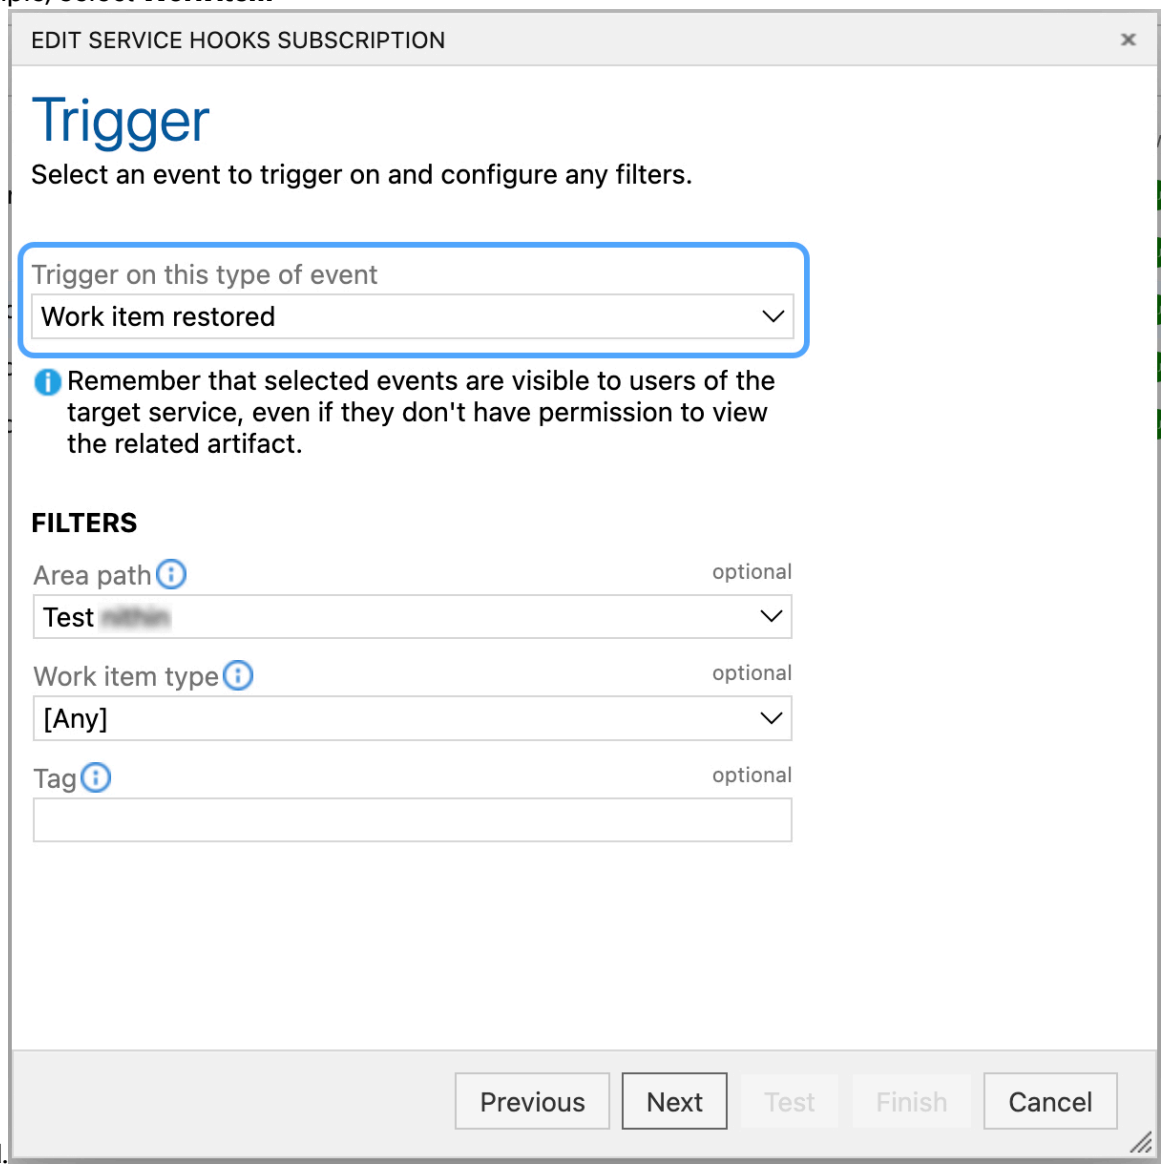
1. In your Azure DevOps project, navigate to **Project settings** > **Service hooks** at https://<organization-name>/<project-name>/_settings/serviceHooks.
2. On the Service Hooks page, select the **+** icon or **Create subscription**.
3. On the Service screen, select **Web Hooks** and then select **Next**.



4. From the **Trigger on this type of event** list, select a supported Azure Devops event and click **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

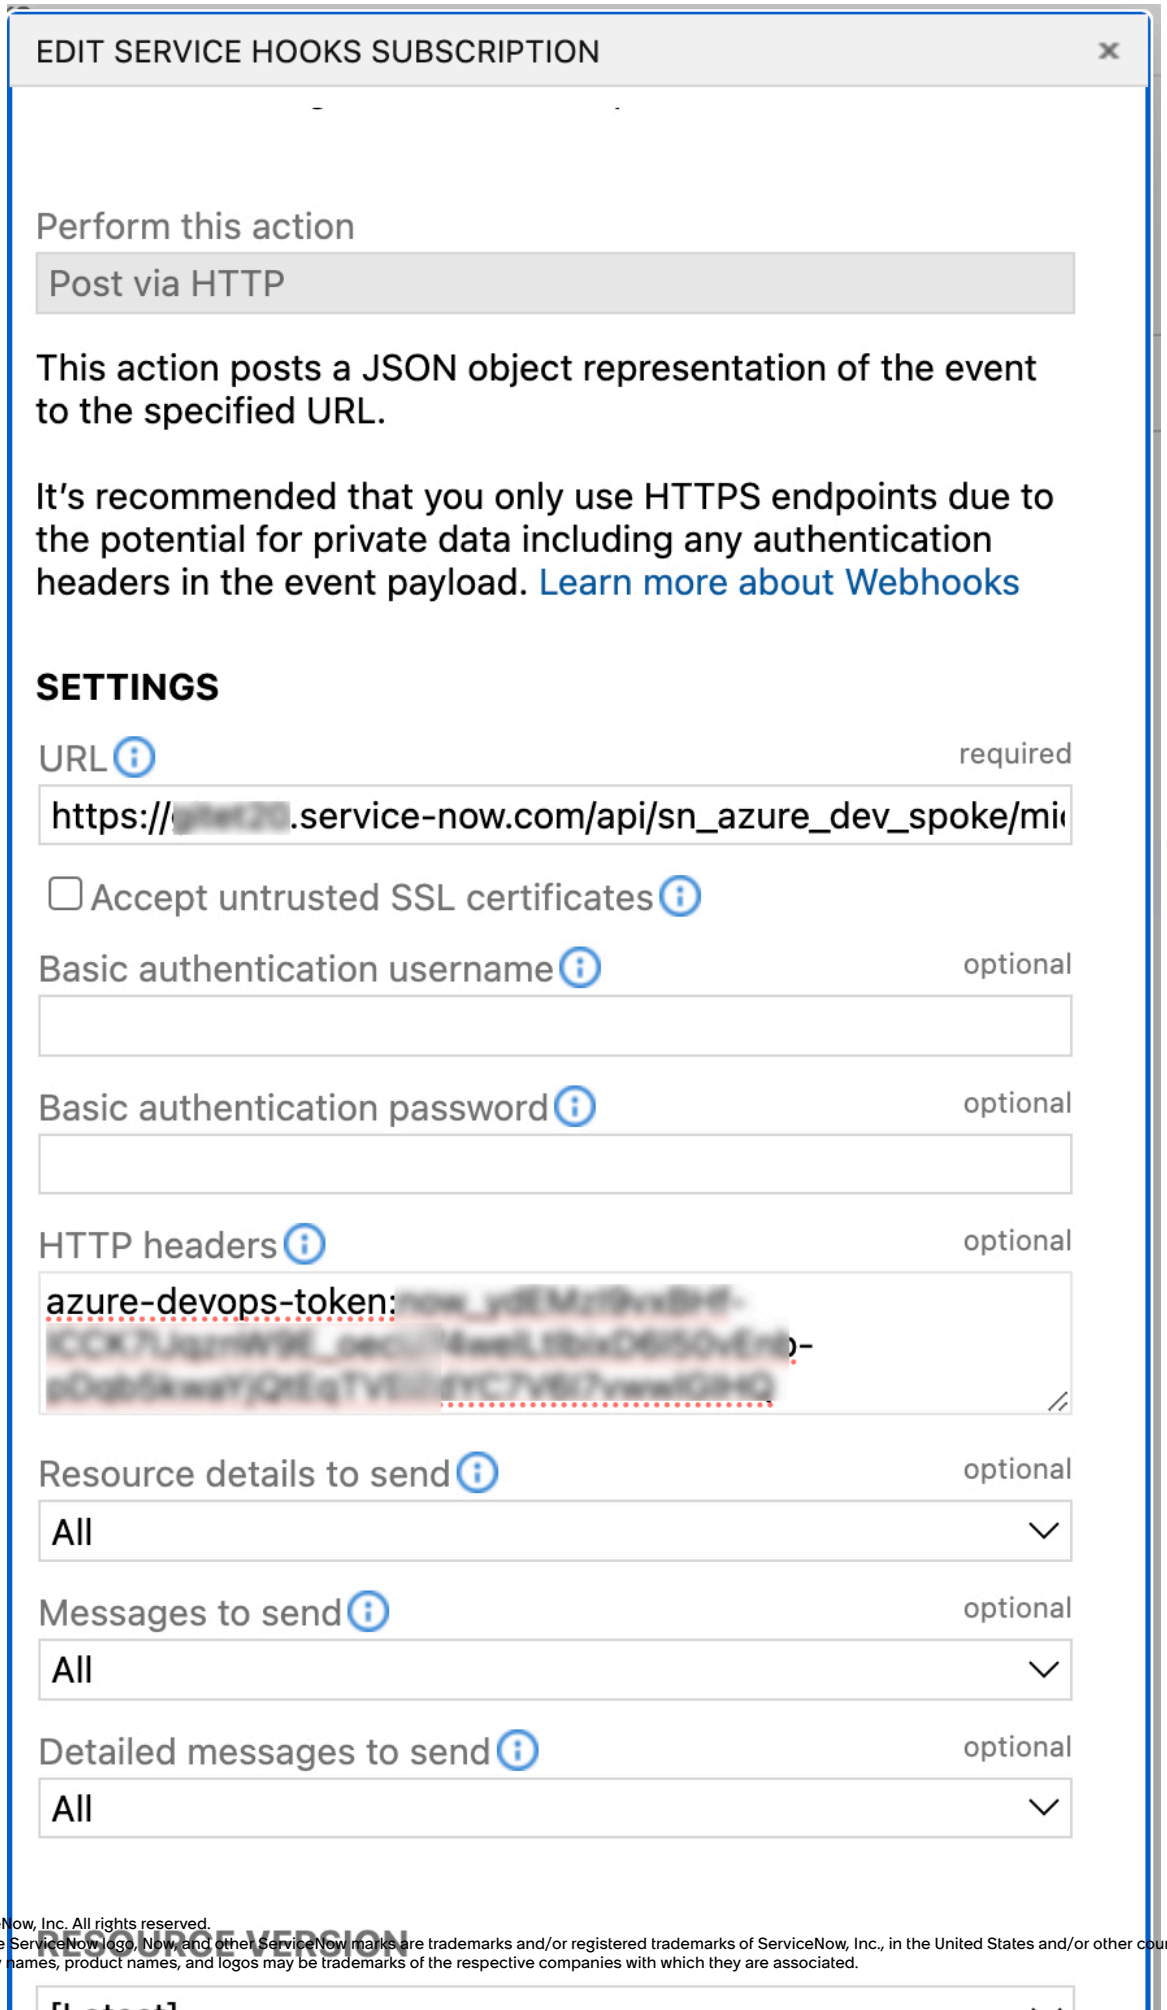
For example, select **Work item restored**.



5. On the NEW SERVICE HOOKS SUBSCRIPTION form, fill in the fields for an action.

Field	Description
URL	URL generated while configuring triggers in ServiceNow instance in the URL field.
HTTP headers	Key-value pair of header parameter and token generated in this format: `azure-devops-board-token: <token-value>`
RESOURCE VERSION	Select [Latest].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **Finish**.
7. Repeat the steps 2 through step 6 for the following supported event triggers:
   - Work item commented on
   - Work item created
   - Work item deleted
   - Work item restored
   - Work item updated

Result
Now you can create a flow and start using the supported trigger events in the flow.

Microsoft Azure DevOps Pipelines Spoke

The Microsoft Azure DevOps Pipelines spoke enables you to automate your work on pipelines on Azure DevOps. Create a flow with the actions that automate your work on Azure DevOps. For example, create a flow that automates the retrieval of the details of logs for a pipeline.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Azure DevOps Pipelines REST API version 7.0 and Azure DevOps Server 2022 but may be compatible with the later versions.

Spoke version

Microsoft Azure DevOps Pipelines spoke v1.0.0 is the latest version.

Spoke requirements

- Spoke dependencies are installed
- Personal access token is generated on Azure DevOps
- Microsoft Azure DevOps Pipelines alias is set up on your ServiceNow instance
- Microsoft Azure DevOps Pipelines spoke plugin is installed on your ServiceNow instance

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- com.glide.hub.action_type.datastream
- com.glide.hub.integration.runtime

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- com.glide.cobject
- com.glide.hub.action_step.rest

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke actions

The Microsoft Azure DevOps spoke provides actions to automate Azure DevOps Pipelines' tasks when events occur in your ServiceNow instance. Available actions include:

Note:
To execute the actions, you must first set up an outbound integration by configuring the Microsoft Azure DevOps Pipelines spoke connection and credential record.

Category	Action	Description
Pipeline Management	Look up Pipelines Stream	Retrieves the details of all pipelines such as ID and name for an Azure DevOps project.
	Look up Pipeline	Retrieves the details of a pipeline such as the ID and name of the pipeline.
Run Management	Run Pipeline	Runs a pipeline based on the details you specify.
	Look up Run	Retrieves details of a run such as name and ID for a pipeline.
	Look up Runs	Retrieves the list of the top 10000 runs such as name and ID for a pipeline.
Log Management	Look up Logs	Retrieves the details of all logs such as URL and signed content for a corresponding pipeline run.
	Look up Log	Retrieves the details of a log object such as ID and URL for a corresponding pipeline run.
Artifact Management	Look up Artifact	Retrieves an artifact object from a pipeline run.
Utility Actions	Attach File to ServiceNow Record	Attaches the log or artifact file to a ServiceNow record.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For more information, see Connections and Credentials.

Set up Microsoft Azure DevOps Pipelines spoke

Integrate your ServiceNow instance and Azure DevOps Pipelines application by setting up a connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Azure DevOps Pipelines spoke.
- Role required: admin.

Configure the default connection record

Configure the default connection record for your Azure DevOps Pipelines application that enables integration of your ServiceNow instance with the Azure DevOps Pipelines application.

Before you begin

Role required: admin

Procedure

1. Create a personal access token in Azure DevOps portal.
   Azure DevOps application authenticates the ServiceNow instance access request based on the personal access token presented.

   a. Log in to Azure DevOps portal.

   b. On the landing page, select the User Settings icon ( ).

   c. In the menu, select **Personal access tokens**.

   d. On the Personal Access Tokens page, select **+ New Token**.

   e. Fill the Create a new personal access token form.

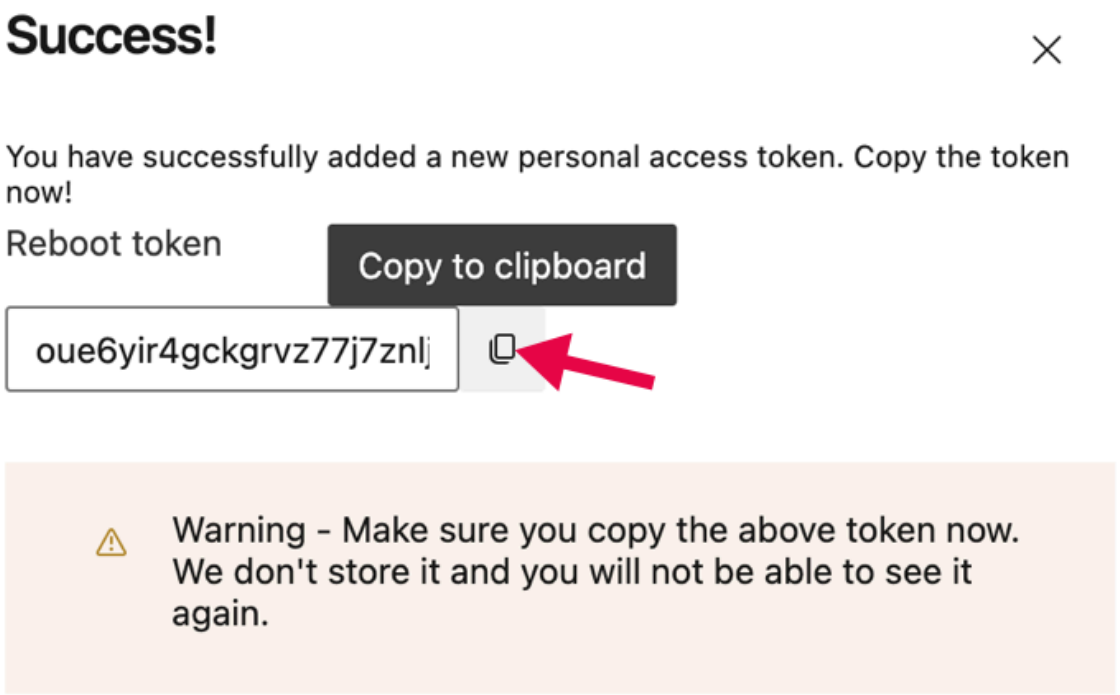
Create a new personal access token

Field	Description
Name	Custom name of the personal access token.
Organization	It contains all the resources and settings related to the DevOps pipeline and project management. **Tip:** To locate the name of the organization, navigate to the home page of the DevOps Pipeline application. The name of the organization is provided above the Projects tab.
Expiration (UTC)	Expiration date of the personal access token.
Scopes	Resources or settings in Azure DevOps Pipelines application that you can access with the personal access token. Select Custom defined and under the Build section, select Read & execute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Select **Create**.

g. To copy the personal access token, click the Copy to clipboard button.



h. Select **Close**.

2. Configure the default connection record in your ServiceNow instance.

a. Log in to your ServiceNow instance.

b. Navigate to **All** > **Process Automation** > **Workflow Studio**.

c. Click the **Integrations** tab.

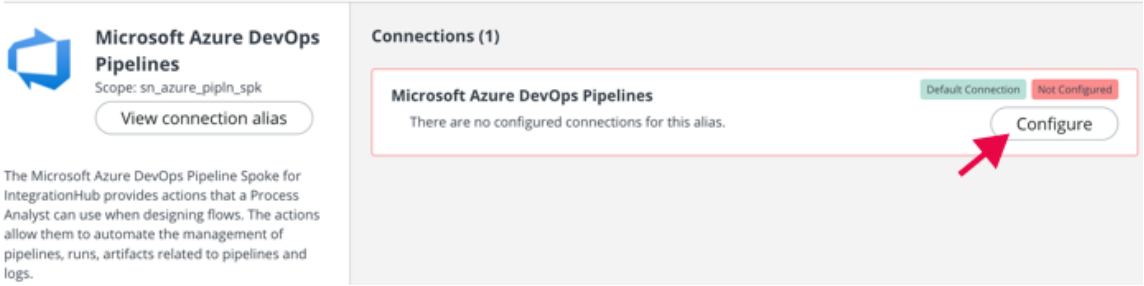
d. Select **Connections**.

e. In the Search all connections field, enter `Microsoft Azure DevOps Pipelines`.

f. In the Microsoft Azure DevOps Pipelines card, click **View Details**.

g. Click **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

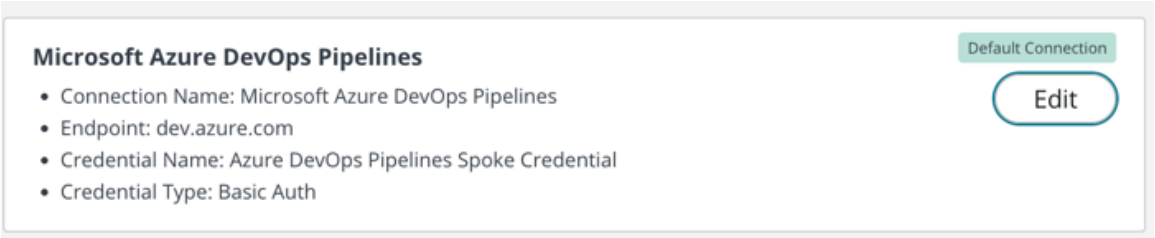


h. Fill the form.

Configure Connection

Field	Description
Connection Name	Name of the connection record. The default and read-only name of the first connection is Microsoft Azure DevOps Pipelines. **Note:** To provide a custom name of a connection, you must create a connection record. To create, select **Add Connection**.
Connection URL	URL to the Azure DevOps Pipelines application. The URL format is `https://dev.azure.com/<organization>`. Replace the placeholder <organization> with the organization name in the Azure DevOps Pipelines application. **Tip:** You can find the organization name under the Organization column of the Personal Access Tokens page.
Personal Access Token	Enter the personal access token you had created.

i. Select **Configure Connection**.
The connection record is created.



Microsoft Azure Managed Storage Spoke

Manage the Microsoft Azure managed disks from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

The Microsoft Azure Managed Storage spoke v2.0.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke) is installed and configured on your ServiceNow instance.
- ServiceNow Integration Hub Action Template - Data Stream
- ServiceNow Integration Hub Action Step - get Connection Info
- Microsoft Azure Virtual Network spoke is installed and configured on your ServiceNow instance.

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for the API version 2023-10-02, but may be compatible with the later versions.

Spoke requirements

- User account with full access to the Microsoft Azure managed disks.
- Microsoft Azure Resource Management spoke

Spoke flows and subflows

This spoke has no flows or subflows.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Microsoft Azure Managed Storage spoke provides actions to automate the Microsoft Azure disks and disk snapshots when events occur in the ServiceNow instance. Available actions include:

Spoke actions

Category	Action	Description
Disk Management	Revoke Access from Disk	Revokes access from the specified disk.
	Create Managed Upload Disk	Creates a disk with the specified upload size. **Tip:** Find the current status of an operation by using the 'Look up Operational Status of Resource' action from Azure Resource Management spoke.
	Update Disk Size	Updates the size of the specified disk.
	Set Disk Tags	Updates the tags of the specified disk. The provided tags will replace any existing tags on the disk.
	Grant Access to Disk	Grants access to the specified disk. **Tip:** Find the current status of an operation by using the 'Look up Operational Status of Resource' action from Azure Resource Management spoke.
	Update Disk Storage Account	Updates the details of the storage account associated with the specified disk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description
		Tip: Find the current status of an operation by using the 'Look up Operational Status of Resource' action from Azure Resource Management spoke.
	Delete Disk	Deletes the specified disk. **Tip:** Find the current status of an operation by using the 'Look up Operational Status of Resource' action from Azure Resource Management spoke.
	Create Managed Disk	Creates a disk with the specified disk size in GB. **Tip:** Find the current status of an operation by using the 'Look up Operational Status of Resource' action from Azure Resource Management spoke.
	Look up Disk	Retrieves information about the specified disk in the specified resource group.
	Look up Disks Stream by Resource Group	Retrieves the list of disks in the specified Resource Group.
	Create Managed Disk from Snapshot	Creates a disk using a snapshot. **Tip:** Find the current status of an operation by using the 'Look up Operational Status of Resource' action from Azure Resource Management spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Microsoft Azure Notification Hub Spoke

Integrate ServiceNow instance with Microsoft Azure Notification Hub. Manage Azure notification hubs from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Azure Notification Hub spoke v2.0.0 is the latest version.

Supported versions

This spoke was built for Azure Notification Hub version 2023-09-01, but may be compatible with later versions.

Spoke requirements

- Storage account in your Microsoft Azure portal for integration with your ServiceNow instance.
- Register the application in the Microsoft Azure portal and record the access keys and directory IDs.

Spoke dependencies

If you're having trouble installing the app, verify that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Flow Designer Action Step - Payload Builder (com.glide.hub.action_step.payload)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- Get Connection Info (com.glide.hub.action_step.get_connection_info)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- IHUB Spoke Util Pack (com.snc.ihub_spoke_util_pack)
- Microsoft Azure Resource Management Spoke is installed and the connection record configured on your ServiceNow instance.
- Microsoft Azure Notification Hub SAS connection and credential alias record is configured on your ServiceNow instance.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Microsoft Azure Notification Hub Spoke provides actions to automate Azure Notification Hub tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Installation Management	Create or Update Installation	Creates or updates an installation.
	Delete Installation	Deletes an installation.
	Look up Installation	Retrieves installation based on the Installation ID.
	Update Installation	Partially updates an installation using the JSON-Patch.
	Look up Namespaces Stream by Resource Group	Returns the list of available namespaces within a resource group.
	Look up Namespaces Stream by Subscription ID	Returns the list of available namespaces within the subscription.
Namespace Management	Look up Namespace	Returns the details of the specified namespace.
	Create or Update Namespace	Creates or updates a Notification Hub namespace. **Note:** This operation is idempotent.
	Delete Namespace	Deletes an existing namespace. This operation also removes all associated Notification Hubs under the namespace.
	Update Namespace	Patches the existing namespace.
Notification Hub Management	Create or Update Notification Hub	Creates or updates a Notification Hub in a namespace.
	Delete Notification Hub	Deletes a notification hub associated with a namespace.
	Look up Notification Hub	Returns the details of the specified notification hub.
	Look up Notification Hubs Stream by Namespace	Returns the list of available notification hubs associated with a namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Registration Management	Create APNS Registration	Creates a registration for an Apple Push Notification service (APNS) device. This method generates a registration ID that you can use to retrieve, update, and delete this registration.
	Create GCM Registration	Creates a registration for Google Cloud Messaging (GCM) device. This method generates a registration ID that you can use to retrieve, update, and delete this registration.
	Create Registration ID	Returns a registration ID (without creating a registration).
	Delete Registration	Deletes a registration.
	Look up Registration	Retrieves information about a registration.
	Update APNS Registration	Updates an existing APNS registration.
	Update GCM Registration	Updates an existing GCM registration.
	Look up Registrations Stream	Retrieves all registrations.
Notification Management	Send APNS Native Notification	Sends an APNS native notification through a Notification Hub.
	Send GCM Native Notification	Sends a GCM native notification through a Notification Hub.
	Send Notification to Device Handle	Sends a notification directly to a device handle (a valid token as expressed by the Notification type). **Note:** Users of this API don't need to use Registrations or Installations.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Microsoft Azure Notification Hub spoke.

Set up the Microsoft Azure Notification Hub spoke

Set up your ServiceNow instance to integrate with the Microsoft Azure Notification Hub. Setting enables the Microsoft Azure Notification Hub to authenticate requests from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Azure Notification Hub spoke.
- Role required: admin.

Set up Microsoft Azure Resource Management connection alias

Set up the Microsoft Azure Resource Management connection alias to do the actions under the Notification Hub Management and Namespace Management categories of the Microsoft Azure Notification Hub spoke.

Before you begin

Role required: admin

- To view the procedure to set up the Microsoft Azure Resource Management connection alias, see Set up the Microsoft Azure Resource Management spoke.

Set up Microsoft Azure Notification Hub SAS connection alias

Establish a connection between the Microsoft Azure Notification Hub SAS connection alias and the Microsoft Azure portal.

Before you begin

Role required: admin

About this task

The Microsoft Azure Notification Hub SAS connection alias enables you to do the actions in the Installation Management, Notification Management, and Registration Management categories of the Microsoft Azure Notification Hub

spoke.

Procedure

1. Log in to your ServiceNow instance.
2. Navigate to **All** > **Process Automation** > **Workflow Studio**.
3. Select the **Integrations** tab.
4. Select **Connections**.
5. In the Search all connections field, search the Microsoft Azure Notification Hub SAS connection alias record.

   Note:
   The **Outbound** tab is enabled by default. Or else, toggle to enable it.

6. On the Microsoft Azure Notification Hub SAS connection alias tile, select **View Details**.
7. Select **Configure**.
8. Fill the form.

Microsoft Azure Notification Hub SAS alias setup information

Field	Description
Connection name	Name of the connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential name	Name of the credential that is used to access the Microsoft Azure Notification Hub SAS.
Shared Access Key Name	Name of the shared access key to the Microsoft Azure Notification Hub SAS.
Shared Access Key	Shared access key to the Microsoft Azure Notification Hub SAS. Generate the key from the Microsoft Azure portal. To view the procedure, see Generate shared access key for Microsoft Azure Notification Hub SAS.

9. Select **Create**.

Generate shared access key for Microsoft Azure Notification Hub SAS

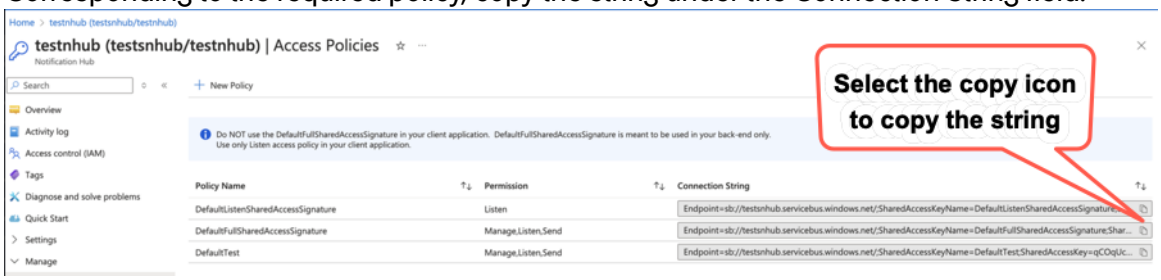
Generate a shared access key that you must provide to create a connection between the Microsoft Azure Notification Hub SAS connection alias and the Microsoft Azure portal.

Before you begin

Role required: admin.

Procedure

1. Log in to https://portal.azure.com.
2. Select **Notification Hubs**.
3. Select the required notification hub and then select **Apply**.
4. Select a notification hub to open it.
   The spoke performs the actions on the notification hub that you open.
5. Under Manage, select **Access Policies**.
6. Corresponding to the required policy, copy the string under the Connection String field.



7. From the string that you copied, copy the shared access key.
   Copy the value of the SharedAccessKey in the string.

			Delegated (personal Microsoft account)	Not supported
			Application	RoleManagement.Read.Directory, RoleManagement.Read.All, Directory.Read.All, RoleManagement.ReadWrite.Directory, Directory.ReadWrite.All
	Remove Role from a User or Group	Remove the required role for a user or group.	Delegated (work or school account)	RoleManagement.ReadWrite.Directory
			Delegated (personal Microsoft account)	Not supported
			Application	RoleManagement.ReadWrite.Directory
User Management	Look up Users by Role Stream	Lists details all the users that have the required role.	Delegated (work or school account)	RoleManagement.Read.Directory, RoleManagement.Read.All, Directory.Read.All, RoleManagement.ReadWrite.Directory, Directory.ReadWrite.All
			Delegated (personal Microsoft account)	Not supported
			Application	RoleManagement.Read.Directory, RoleManagement.Read.All, Directory.Read.All, RoleManagement.ReadWrite.Directory, Directory.ReadWrite.All

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Microsoft Azure RBAC spoke

Integrate the ServiceNow instance and Microsoft Azure RBAC using OAuth 2.0 authentication to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate Microsoft Azure RBAC spoke.
- Role required: admin.

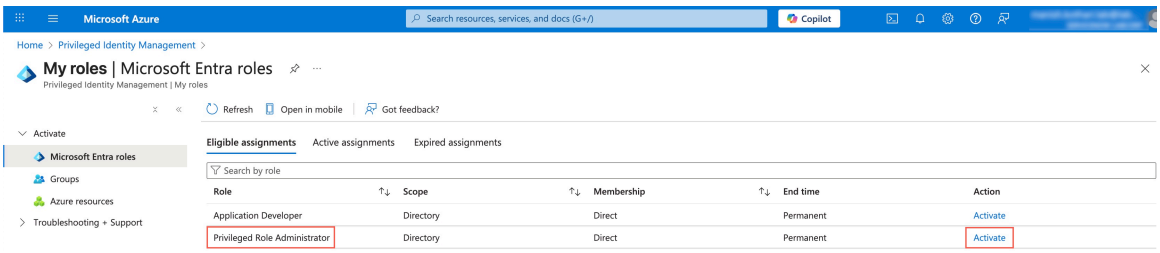
Register an application using the Microsoft Azure portal

Provide authorization to the ServiceNow instance by registering an application in the Microsoft Azure portal.

Before you begin

Role required: Privileged Role Administrator

1. Log in to the Microsoft Azure portal as an admin.
2. Under **Azure services**, click **Microsoft Entra Privileged Identity**.
3. Under **Tasks**, click **My roles**.
4. Ensure that **Privileged Role Administrator** role is available and is activated.



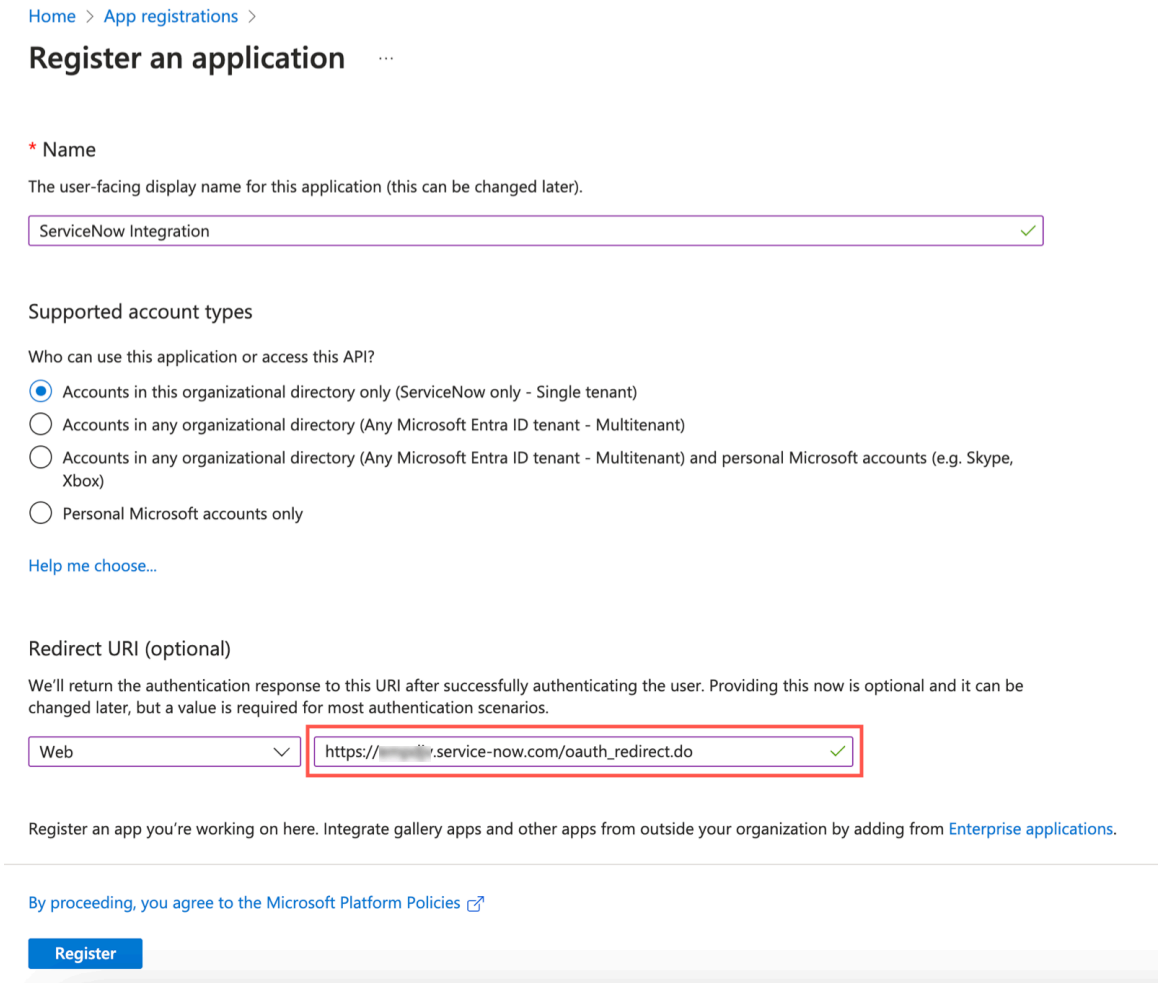
About this task

Complete these steps from the Microsoft Azure portal.

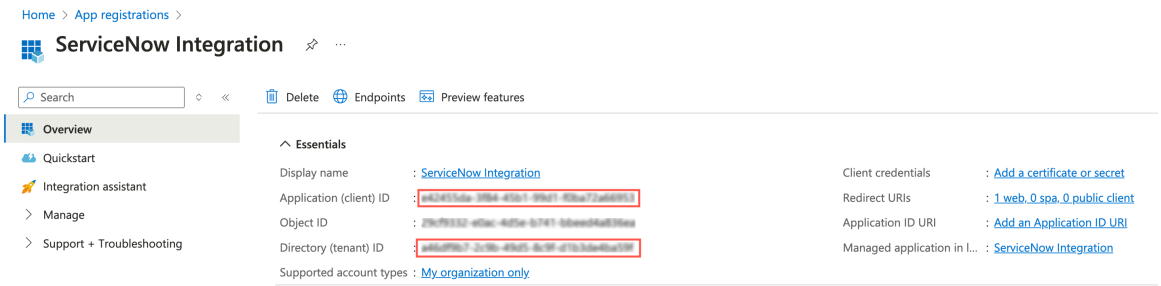
Procedure

1. Log in to the Microsoft Azure portal as an admin.
2. Click **App Registrations**.
3. Click **New registration**.
4. On the form, fill in fields as per your requirement.
   For Redirect URI, specify the ServiceNow instance URL in this format: `https://<ServiceNow-Instance-Name>.service-now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



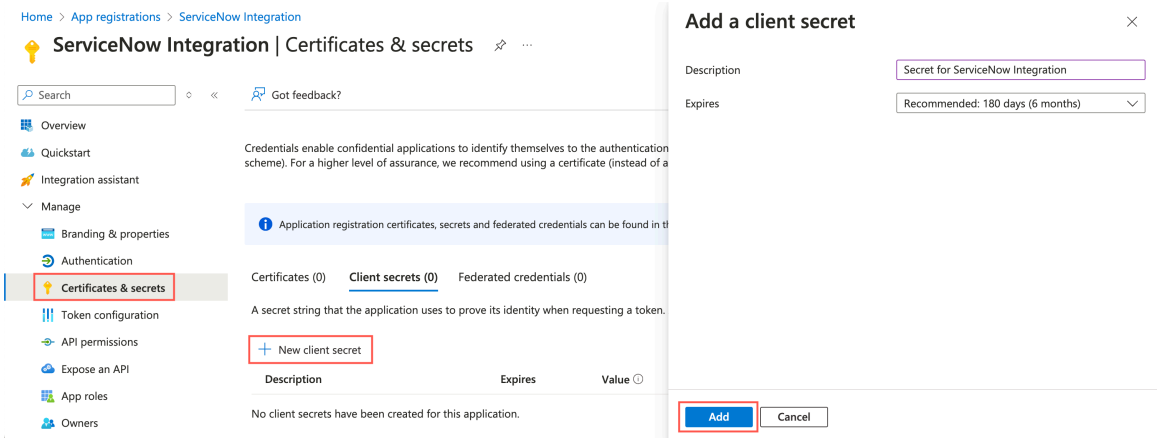
5. Click **Register**.
   The application is created and the values of **Application (client) ID** and **Directory (tenant) ID** are displayed.



6. Copy and record the values of **Application (client) ID** and **Directory (tenant) ID**.
7. Generate a client secret for the application.
   a. Under **Manage**, click **Certificates & secrets**.
   b. Click **New client secret**.
   c. On the form, enter provide a description and specify the duration after which the secret expires.

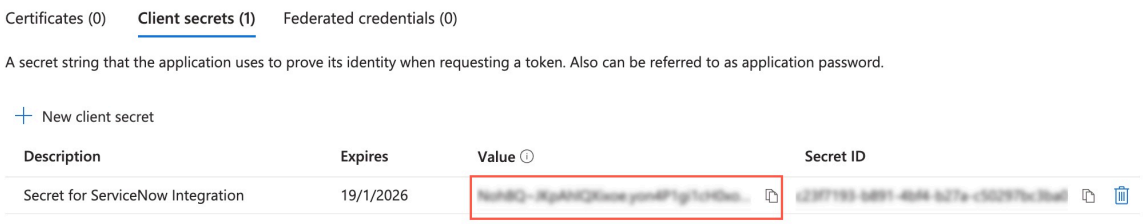
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Click **Add**.



The client secret is created and its value is displayed.

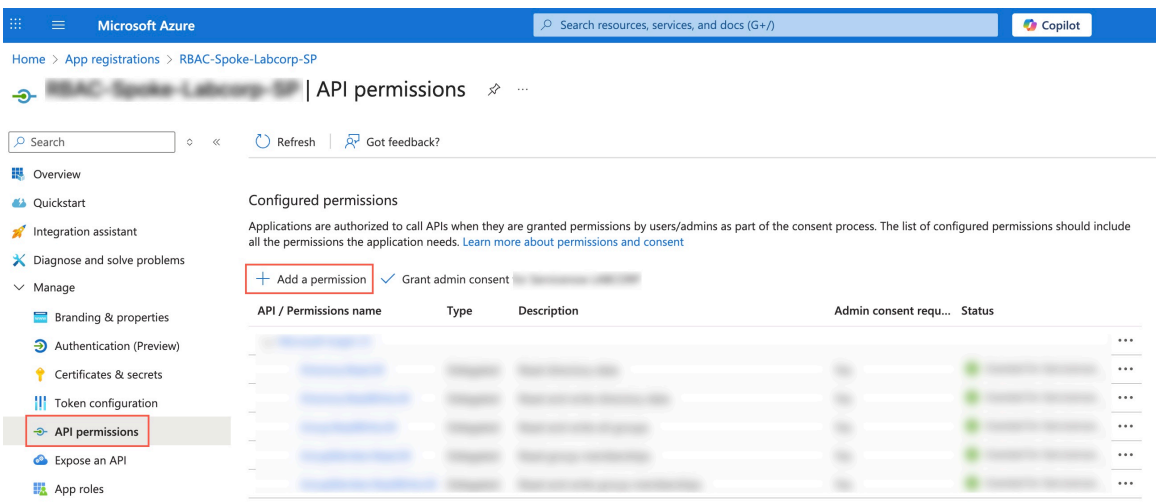
e. Copy the value of client secret for later use.



8. Provide the required API permissions.

a. Under **Manage**, click **API permissions**.

b. Click **Add a permission** to add the required permissions to access the APIs.
For information about permissions needed to perform the required actions, see the Spoke actions section here: Microsoft Azure RBAC Spoke.



c. Click **Grant admin consent for ServiceNow**.
See Quickstart: Configure a client application to access a web API for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a connection record for the Microsoft Azure RBAC spoke

Add and configure a Microsoft Azure RBAC spoke connection to authenticate ServiceNow requests.

Before you begin

Role required: admin

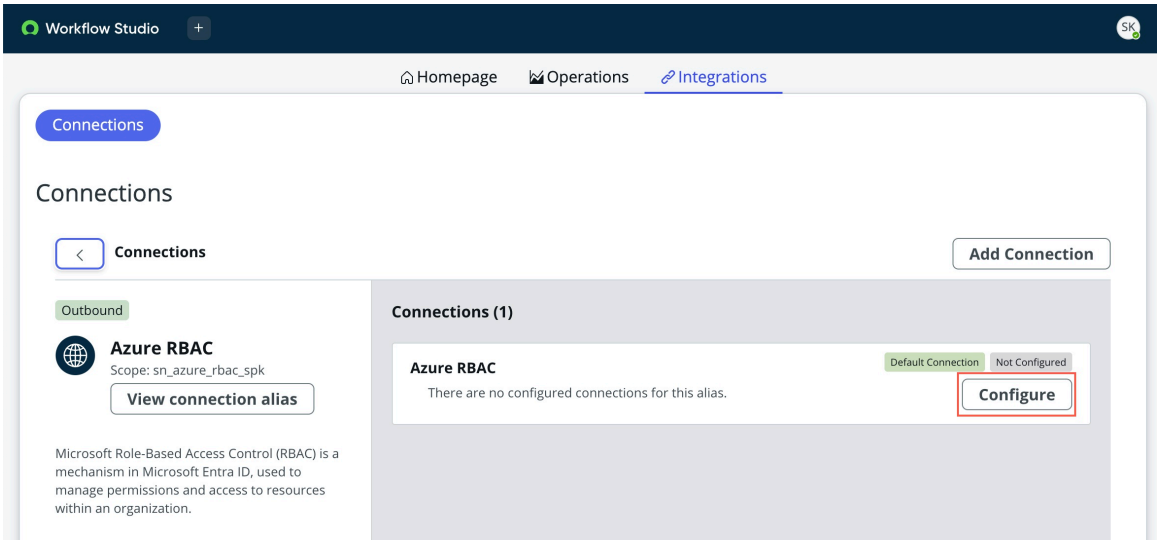
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Azure RBAC** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Microsoft Azure RBAC spoke, click **View Details**.

   - To manage more than one Microsoft Azure RBAC spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

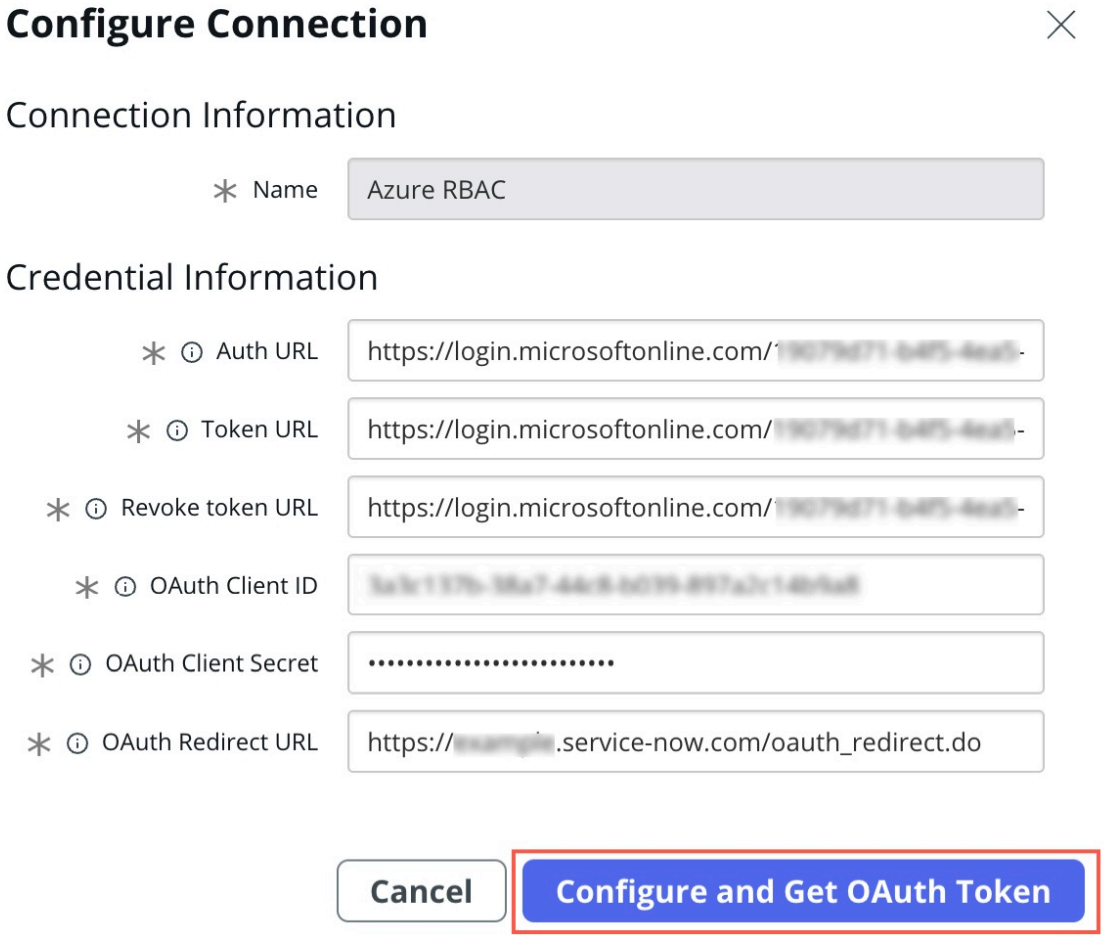


5. On the form, fill in the fields.

Connection form

Field	Description
Connection Information	
Name	Name to identify the connection record. By default, the name is **Azure RBAC**.
Credential Information	
Auth URL	OAuth authorization code endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/authorize`.
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`.
Revoke token URL	OAuth server token revocation endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/revoke`.
OAuth Client ID	Application ID created during application registration.
OAuth Client Secret	Client secret created during application registration.
OAuth Redirect URL	OAuth callback endpoint. Enter `https://<instance-name>.service-now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Configure Connection**.

Result
The spoke connection is configured and is ready to be used.

Microsoft Azure Resource Management Spoke

Azure Resource Management enables you to create, update, and delete the resources in your Microsoft Azure subscription from within ServiceNow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

These spokes depend on the installation of the Microsoft Azure Resource Management spoke plugin and its setup for the execution of their actions.

- Microsoft Azure SQL Database spoke
- Microsoft Azure Virtual Network spoke

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Microsoft Azure Managed Storage spoke
- Microsoft Azure Cosmos DB spoke
- Microsoft Azure Notification Hub spoke
- Microsoft Azure Traffic Manager spoke
- Microsoft Azure Automation spoke
- Microsoft Azure Virtual Machine spoke

Spoke version

Microsoft Azure Resource Management spoke v2.0.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for the API version 2021-04-01, but may be compatible with the later versions.

Spoke actions

The Microsoft Azure Resource Management spoke provides actions to automate the resource management tasks when events occur in the ServiceNow instance. Available actions include:

Category	Action	Description
Metadata Retrieval	Look up Databases	Retrieves a list of databases in a server.
	Look up Elastic Pools	Retrieves a list of elastic pools in Microsoft Azure.
	Look up Locations	Retrieves a list of locations.
	Look up Operational Status of Resource	Returns the operational status of the resource (virtual machine, network, disk, and so on) that is created or updated.
	Look up Resource Groups	Retrieves a list of resource groups.
	Look up SQL Servers	Retrieves a list of servers in a resource group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Microsoft Azure Resource Management spoke.

Set up the Microsoft Azure Resource Management spoke

Integrate the ServiceNow instance and the Microsoft Azure Resource Management by configuring the Microsoft Azure Resource Management connection record on your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Create a custom OAuth application on the Microsoft Azure portal.
- Activate the Microsoft Azure Resource Management spoke.
- Role required: admin.

Register Microsoft Azure Resource Management as OAuth provider

Create an OAuth application on Microsoft Azure that authenticates requests for OAuth tokens from your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Log in to https://portal.azure.com/.
2. Select **App registrations**.
3. Select **New registration**.
4. Fill the form.

OAuth application details

Field	Description
Name	Name of the OAuth application.
Supported account types	Option to specify who can use the OAuth application that you're creating to access Microsoft Azure Resource Management.
Redirect URI (optional)	Option to provide the redirect URI. The redirect URI format is https://<instance-name>.service-now.com/oauth_redirect.do. From the Select a platform list, select **Web**.

5. Select **Register**.
   The OAuth application is registered.
6. Copy the values from the following fields under the Essentials heading:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application (client) ID
- Directory (tenant) ID

7. In the Client credentials field, select **Add a certificate or secret**.
8. Under the Client secrets heading, select **New client secret**.
9. In the Add a client secret window, do the following actions.

   a. In the Description field, enter a description of the client secret.

   b. In the Expires field, enter the expiry period of the client secret.

   c. Select **Add**.
   The client secret is generated.

10. Under the Value heading, copy and store the client secret at a secure place.
    Microsoft Azure Resource Management is registered as an OAuth provider and the information required to set up the connection record is available.

Create connection record

Integrate the ServiceNow instance and the Microsoft Azure Resource Management by configuring the Microsoft Azure Resource Management connection record on your ServiceNow instance.

Before you begin

Role required: admin.

Procedure

1. Log in to your ServiceNow instance.
2. Navigate to **All** > **Process Automation** > **Workflow Studio**.
3. Select the **Integrations** tab.
4. Select **Connections**.
5. In the Search all connections field, search the Microsoft Azure Resource Management connection alias record.

   Note:
   The **Outbound** tab is enabled by default. Or else, toggle to enable it.

6. On the Microsoft Azure Resource Management connection alias tile, select **View Details**.
7. Select **Configure**.
8. Fill the form.

Microsoft Azure Resource Management connection alias

Field	Description
Connection Name	Name of the connection alias record.
Authorization URL	URL that your ServiceNow instance uses to request OAuth tokens from the Microsoft Azure portal. The URL must in the following format: `https://`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`login.microsoftonline.com/{tenant ID}/oauth2/v2.0/authorize`.
Token URL	URL that your ServiceNow instance uses to get the OAuth token. The URL must in the following format: `https://login.microsoftonline.com/{tenant}/oauth2/v2.0/token`.
Token Revocation URL	URL that your ServiceNow instance uses to cancel the OAuth token. The URL must in the following format: `https://login.microsoftonline.com/{tenant ID}/oauth2/v2.0/revoke`. **Note:** This field is optional.
Client ID	Unique ID of the OAuth application that you created on the Microsoft Azure portal. The Microsoft Azure portal uses this ID to authenticate your ServiceNow instance requests.
Client Secret	The secret that Microsoft Azure portal uses to authenticate your ServiceNow instance requests. You generate the client secret when you create the OAuth application on Microsoft Azure portal.
Redirect URL	Specific address where the third-party application sends your ServiceNow instance back after the request is authenticated. You must set the redirect URL when you create the OAuth application on Microsoft Azure portal.

9. Select **Configure and Get OAuth Token**.
   You're required to log in to https://portal.azure.com/ before the OAuth token is provided.

   On successful authentication, the request is authenticated and the OAuth token is available.

Microsoft Azure SQL Database Spoke

Configure and manage the Microsoft Azure SQL databases from within the ServiceNow instance. When you install the Microsoft Azure SQL database spoke, you also get the Microsoft Azure SQL Resource Management spoke. The Microsoft Azure Resource Manager provides a management layer that enables you to create, update, and delete the resources in your Microsoft Azure subscription.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Azure SQL Database spoke v2.0.0 is the latest version.

Supported versions

This spoke was built for the API version 2021-11-01, but may be compatible with the later versions.

Spoke requirements

User with full access to Microsoft Azure Azure Cloud Computing.

Spoke dependencies

If you're having trouble installing the app, confirm that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Azure Resource Management spoke (sn_azure_rm_spoke) v 2.0.0 is installed and a connection alias is created on your instance.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation. For more information on the licenses, contact your account manager.

Spoke actions

The provides actions to automate Microsoft Azure Microsoft Azure SQL tasks when events occur in the ServiceNow instance. Available actions include:

Category	Action	Description
Database Management	Create Generic Database	Creates a generic database in Microsoft Azure.
	Create Hyperscale Database	Creates a Hyperscale database in Microsoft Azure.
	Create VCore Database	Creates a VCore database in Microsoft Azure.
	Delete Database	Deletes the required database in a server.
	Look up Database	Retrieves details of a database.
	Look up Databases Stream by Elastic Pool	Retrieves a list of databases in an elastic pool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Databases Stream by Server	Retrieves a list of databases in a server.
	Look up Operational Status	Generates the operational status of a database that is created or updated.
	Rename Database	Renames a database.
	Update Database	Updates the SKU or the properties of a database.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Microsoft Azure SQL Database Spoke

To execute the actions of the Microsoft Azure SQL Database Spoke, you must first install and configure the Microsoft Azure Resource Management Spoke. No separate configuration of the Microsoft Azure SQL Database Spoke is necessary. To view the procedure to set up the Microsoft Azure Resource Management Spoke, see Set up the Microsoft Azure Resource Management spoke.

Microsoft Azure Traffic Manager Spoke

Integrate ServiceNow instance with Azure Traffic Manager. Manage DNS-based traffic distribution and load balancing from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Azure Traffic Manager spoke v2.0.0 is the latest version.

Supported versions

This spoke was built for Azure Traffic Manager 2022-04-01, but may be compatible with later versions.

Spoke requirements

Client ID and Client Secret of the Azure Traffic Manager registered in the Azure portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, confirm that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Azure Resource Management spoke (sn_azure_rm_spoke) v 2.0.0 is installed and a connection alias is created on your instance.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation. For more information on the licenses, contact your account manager.

Spoke actions

The Azure Traffic Manager Spoke provides actions to automate DNS-based traffic load-balancing tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Endpoint Management	Create Endpoint	Creates a Traffic Manager Endpoint.
	Delete Endpoint	Deletes a Traffic Manager Endpoint.
	Look up Endpoint	Retrieves the details of a Traffic Manager Endpoint.
	Update Endpoint	Updates a Traffic Manager Endpoint.
Profile Management	Create Profile	Creates a Traffic Manager Profile.
	Delete Profile	Deletes a Traffic Manager Profile.
	Look up DNS Name Availability	Checks the availability of a Traffic Manager Relative DNS name.
	Look up Profile	Look up a Traffic Manager Profile.
	Look up Profiles by Resource Group	Look up Traffic Manager Profiles by Resource Group.
	Look up Profiles by Subscription ID	Look up Traffic Manager Profiles by Subscription ID.
	Update Profile	Updates a Traffic Manger Profile.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Microsoft Azure Traffic Manager Spoke

To execute the actions of the Microsoft Azure Traffic Manager Spoke, you must first install and configure the Microsoft Azure Resource Management Spoke. No separate configuration of the Microsoft Azure Traffic Manager Spoke is necessary. To view the procedure to set up the Microsoft Azure Resource Management Spoke, see Set up the Microsoft Azure Resource Management spoke.

Microsoft Azure Virtual Machine Spoke

Manage the Microsoft Azure Virtual Machine (VM) from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

The Microsoft Azure Virtual Machine spoke v2.0.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Step - Get Connection Info (com.glide.hub.action_step.get_connection_info)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Microsoft Azure Resource Management Spoke v2.0. After installing, you must configure the connection for the Microsoft Azure Resource Management Spoke v2.0 connection record to request OAuth tokens from the Microsoft Azure portal.

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for the Application Programming Interface (API) version 2024-03-01, but may be compatible with the later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke)
- Microsoft Azure Virtual Network spoke (com.sn.ms.azure.virtual.network.spoke)
- Microsoft Azure Managed Storage spoke (com.sn.ms.azure.managed.storage.spoke)

Spoke flows and subflows

This spoke has no flows or subflows.

Spoke actions

The Microsoft Azure Virtual Machine spoke provides actions to automate the Microsoft Azure Virtual Machine tasks when events occur in the ServiceNow instance. Available actions include:

Spoke actions

Category	Action	Description
Image Management	Create Image from Virtual Machine	Creates an image from an existing virtual machine.
	Delete Image	Deletes an image. **Note:** Use the Look up Operational Status of Resource' action from Azure Resource Management spoke to find the status of the operation.
	Look up Image	Retrieves image information from a specified resource group.
	Look up Images Stream by Resource Group	Retrieves the list of images under a Resource Group.
	Look up Images Stream by Subscription ID	Retrieves the list of images in the subscription.
	Set Tags on Image	Sets the tags on image. **Note:** Use the Look up Operational Status of Resource' action from Azure Resource Management spoke to find the status of the operation.
Virtual Machine Management	Attach Disk	Attaches data disk to the virtual machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description
	Create virtual machine.	Creates a virtual machine.
	Create Virtual Machine from Image	Creates virtual machines from an image.
	Deallocate Virtual Machine	Shuts down the virtual machine and releases the compute resources.
	Delete Virtual Machine	Deletes a virtual machine.
	Detach Disk	Detaches data disk from the virtual machine. **Note:** Use the Look up Operational Status of Resource' action from Azure Resource Management spoke to find the status of the operation.
	Generalize Virtual Machine	Sets the OS state of the virtual machine to generalized.
	Look up Virtual Machine	Retrieves information about a virtual machine.
	Look up Virtual Machine Runtime Details	Retrieves the information about the run-time state of a virtual machine.
	Look up Virtual Machines Stream by Resource Group	Retrieves the list of virtual machines under a Resource Group.
	Look up Virtual Machines Stream by Subscription ID	Retrieves all virtual machines in the specified subscription.
	Power Off Virtual Machine	Powers off a virtual machine or stops it.
	Redeploy Virtual Machine	Shuts down the virtual machine, moves it to a new node, and powers it back on.
	Resize Virtual Machine	Resizes the specified virtual machine. **Note:** This operation can take a while to complete.
	Restart Virtual Machine	Restarts a virtual machine.
	Start Virtual Machine	Starts a virtual machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description
Virtual Machine Image Resource Management	Look up Virtual Machine Image	Gets a virtual machine image.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Microsoft Azure Virtual Machine Spoke

To execute the actions of the Microsoft Azure Virtual Machine Spoke, you must first install and configure the Microsoft Azure Resource Management Spoke. No separate configuration of the Microsoft Azure Virtual Machine Spoke is necessary. To view the procedure to set up the Microsoft Azure Resource Management Spoke, see Set up the Microsoft Azure Resource Management spoke.

Microsoft Azure Virtual Network Spoke

Manage Microsoft Azure Virtual Network (VNet) from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Azure Virtual Network spoke v2.0.0 is the latest version.

Spoke dependencies

If you’re having trouble installing the app, confirm that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - Get Connection Info
- Azure Resource Management spoke (sn_azure_rm_spoke) v 2.0.0 is installed and a connection alias is created on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation. For more information on the licenses, contact your account manager.

Supported Versions

This spoke was built for API version 2023-09-01 for List Network Interface Names by ResourceGroup and Look Up Network Interfaces By Resource Group, 2019-11-01 for other actions but may be compatible with later versions.

Spoke requirements

- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke)
- Microsoft Azure subscription with access to Azure Virtual Network service

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Microsoft Azure Virtual Network spoke provides actions to automate Microsoft Azure Virtual Network tasks when events occur in ServiceNow instance. Available actions include:

Spoke actions

Category	Action	Description
Network Interface Management	Create Network Interface	Creates a network interface.
	Delete Network Interface	Deletes the specified network interface.
	Look up Network Interface	Retrieves specified network interface information in a specified resource group.
	Look up Network Interfaces Stream by Resource Group	Lists all the network interfaces in the specified resource group. Page size is fixed to 100 as per Microsoft.
	Look up Network Interfaces Stream by Subscription ID	Lists all the network interfaces in the specified Subscription ID. Page size is fixed to 100 as per Microsoft.
	Update Network Interface Tags	Updates tags on network interface.
Public IP Address Management	Create Public IP Address	Creates a public IP address as per the provided Resource Group.
	Delete Public IP Address	Deletes the specified public IP address in a specified resource group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description
	Look up Public IP Address	Retrieves specified the public IP address information in a specified resource group.
	Look up Public IP Addresses Stream by Resource Group	Lists all the public IP addresses in the specified resource group. Page size is fixed to 100 as per Microsoft.
	Look up Public IP Addresses Stream by Subscription ID	Lists all the public IP addresses in the specified subscription. Page size is fixed to 100 as per Microsoft.
	Update Public IP Address Tags	Updates tags on Public IP Address.
Subnet Management	Create Subnet	Creates a subnet in the specified virtual network.
	Delete Subnet	Delete the specified subnet in a specified virtual network and resource group.
	Look up Subnet	Retrieves specified subnet information in a specified virtual network and resource group.
	Look up Subnets Stream	Lists all the subnets in the specified virtual network. Page size is fixed to 100 as per Microsoft.
Virtual Network Management	Create Virtual Network	Creates a virtual network in the specified resource group.
	Create Virtual Network with Subnet	Creates a virtual network with provided Subnet in the specified resource group.
	Delete Virtual Network	Deletes the specified virtual network in a specified resource group.
	Look up Virtual Network	Retrieves specified virtual network information in a specified resource group.
	Look up Virtual Network Usage Status Stream	Lists the virtual network usage status in a specified resource group. Page size is fixed to 100 as per Microsoft.
	Look up Virtual Networks Stream by Resource Group	Lists all the virtual networks in the specified resource group. Page size is fixed to 100 as per Microsoft.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description
	Look up Virtual Networks Stream by Subscription ID	Lists all the virtual networks in the specified Subscription. Page size is fixed to 100 as per Microsoft.
	Update Virtual Network Tags	Updates tags on virtual network.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Microsoft Azure Virtual Network Spoke

To execute the actions of the Microsoft Azure Virtual Network Spoke, you must first install and configure the Microsoft Azure Resource Management Spoke. No separate configuration of the Microsoft Azure Virtual Network Spoke is necessary. To view the procedure to set up the Microsoft Azure Resource Management Spoke, see Set up the Microsoft Azure Resource Management spoke.

Microsoft Dynamics 365 for Finance and Operations Spoke

Provides baseline actions to integrate your ServiceNow instance with Microsoft Dynamics 365 Finance and Operations. You can retrieve and process business events that are triggered in Microsoft Dynamics 365 Finance and Operations application.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Dynamics 365 for Finance and Operations spoke v2.4.3 is the latest version.

Supported versions

This spoke was built for Microsoft Dynamics version: 10.0.16 PU40, but may be compatible with later versions.

Spoke requirements

Microsoft Dynamics 365 Finance and Operations account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- IHUB Spoke Util Pack (com.snc.ihub_spoke_util_pack)
- ServiceNow IntegrationHub Starter Pack Installer (com.glide.hub.integrations)
- Explicit Roles (com.glide.explicit_roles)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Streaming (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Microsoft Dynamics 365 for Finance and Operations spoke provides sample flows to demonstrate automating the syncing data tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Microsoft D365 FinOps Record Sync	Synchronises data from Microsoft Dynamics 365 Finance and Operations with your ServiceNow instance.

Spoke subflows

The Microsoft Dynamics 365 for Finance and Operations spoke provides sample subflows to demonstrate automating Microsoft Dynamics 365 for Finance and Operations tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Create Fixed Asset Records	Creates multiple fixed asset records in Microsoft Dynamics 365 Finance and Operations.
Create Purchase Order and Purchase Order Lines	Creates purchase order and multiple purchase order lines in Microsoft Dynamics 365 Finance and Operations.
Download/Refresh Metadata	Downloads and refreshes the metadata from Microsoft Dynamics 365 Finance and Operations.
Update Purchase Order and Purchase Order Lines	Updates the purchase order and purchase order lines in Microsoft Dynamics 365 Finance and Operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Microsoft Dynamics 365 for Finance and Operations spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Account Codes Management	Look up Account Codes Stream	Retrieves account codes from Microsoft Dynamics 365 Finance and Operations.
Delivery Location Management	Look up Delivery Location Stream	Retrieves delivery locations from Microsoft Dynamics 365 Finance and Operations.
Fixed Asset Management	Create Fixed Assets	Creates fixed asset records in Microsoft Dynamics 365 Finance and Operations.
Item Master Management	Look up Item Master Stream	Retrieves item masters from Microsoft Dynamics 365 Finance and Operations.
Legal Entity Management	Legal Entity Management	Retrieves legal entities from Microsoft Dynamics 365 Finance and Operations.
Metadata Retrieval	Look up Choices Metadata	Retrieves the choices values from Microsoft Dynamics 365 Finance and Operations.
	Look up Creatable Fields Metadata	Retrieves creatable fields for an entity from Microsoft Dynamics 365 Finance and Operations.
	Look up Editable Entities Metadata	Retrieves editable entities from Microsoft Dynamics 365 Finance and Operations.
	Look up Entity Filter Metadata	Retrieves filter fields of an entity from Microsoft Dynamics 365 Finance and Operations.
	Look up Navigation Properties Metadata	Retrieves navigation prosperities of an entity Microsoft Dynamics 365 Finance and Operations.
	Look up OData Metadata	Retrieves metadata document from Microsoft Dynamics 365 Finance and Operations.
	Look up Readable Entities Metadata	Retrieves all readable entities from Microsoft Dynamics 365 Finance and Operations.
	Look up Record Schema Metadata	Retrieves the schema table of a record from Microsoft Dynamics 365 Finance and Operations.
	Look up Related Record Schema Metadata	Retrieves schema of a related entity from Microsoft Dynamics 365 Finance and Operations.
	Look up Updatable Fields Metadata	Retrieves updatable fields of an entity from Microsoft Dynamics 365 Finance and Operations.
Purchase Order Management	Create Purchase Order	Creates a purchase order record from Microsoft Dynamics 365 Finance and Operations.
	Create Purchase Order Line	Creates a purchase order line record from Microsoft Dynamics 365 Finance and Operations.
Record Management	Create Record	Creates a record in Microsoft Dynamics 365 Finance and Operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Record	Deletes a record in Microsoft Dynamics 365 Finance and Operations.
	Look up Record by Business Keys	Retrieves details of a record for the specified business key from Microsoft Dynamics 365 Finance and Operations.
	Look up Records by Search Query	Retrieves records for the specified search query from Microsoft Dynamics 365 Finance and Operations.
	Look Up Records Stream	Retrieves records of a table through data streaming from Microsoft Dynamics 365 Finance and Operations.
	Look up Related Records	Retrieves the related records of an entity from Microsoft Dynamics 365 Finance and Operations.
	Update Record	Updates the specified record in Microsoft Dynamics 365 Finance and Operations.
Supplier Management	Look up Suppliers Stream	Retrieves suppliers information from Microsoft Dynamics 365 Finance and Operations.

Spoke module

The Microsoft Dynamics 365 for Finance and Operations spoke adds the application to your instance and includes these modules:

Module	Description
Microsoft D365 FinOps Metadata	Displays the details of all the Microsoft Dynamic 365 Finance and Operations entities. **Note:** The **Look up Updatable Fields Metadata** and **Look up Creatable Fields Metadata** actions use the entity records from this module to create dynamic input fields.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Microsoft Dynamics 365 for Finance and Operations spoke.

Set up the Microsoft Dynamics 365 for Finance and Operations spoke

Integrate the ServiceNow instance and Microsoft Dynamics 365 for Finance and Operations by creating a custom OAuth application in Microsoft Azure to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Dynamics 365 for Finance and Operations spoke.
- Role required: admin.

Note:
After configuring the connection and credential alias, make sure to retrieve the latest metadata from Microsoft Dynamics 365 Finance and Operations application.

Register Microsoft Dynamics 365 for Finance and Operations as an OAuth provider

Register Microsoft Dynamics 365 for Finance and Operations as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record for Microsoft D365 Fin and Ops Spoke OAuth.
3. On the form, fill these values.

Application Registries form

Field	Description
Name	Name to uniquely identify the record. For example, enter: `Microsoft Dynamics 365 for Finance and Operations OAuth`
Client ID	Client ID created during the Microsoft Dynamics 365 for Finance and Operations application configuration.
Client Secret	Client Secret created during the Microsoft Dynamics 365 for Finance and Operations application configuration.
Authorization URL	OAuth authorization code endpoint. Enter: `https://login.microsoftonline.com/<AzureTenantID>/oauth2/v2.0/authorize`
Token URL	OAuth server token endpoint. Enter: `https://login.microsoftonline.com/<AzureTenantID>/oauth2/v2.0/token`
Token Revocation URL	OAuth server token revocation endpoint.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`
OAuth API Script	Script to customize the request and response. Select .
Logo URL	URL that contains an image to use as the application logo.
Default Grant Type	Grant type used to establish the token. Select **Client Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.

4. Right-click the form header, and click **Save**.

Create a connection record for the Microsoft Dynamics 365 for Finance and Operations

Create a connection record for your Microsoft Dynamics 365 for Finance and Operations. The Microsoft Dynamics 365 for Finance and Operations spoke connection and credential aliases use these connections to perform actions in Microsoft Dynamics 365 for Finance and Operations.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for **MicrosoftD365FinAndOps**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Microsoft Dynamics 365 for Finance and Operations Connection`.
Credential	Credential record created for Microsoft Dynamics 365 for Finance and Operations . Search and select `MicrosoftD365FinAndOps.Credential`.
Connection alias	Alias record associated with this connection. Enter `sn_ms_fin_ops_spk.MicrosoftD365FinAndOps`
Connection URL	Base URL to connect to **Microsoft Dynamics 365 for Finance and Operations**. Enter: `https://<instance_ID>.cloudax.dynamics.com/`
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

5. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Retrieve metadata from Microsoft Dynamics 365 Finance and Operations

Retrieve the metadata from Microsoft Dynamics 365 Finance and Operations and store it in your ServiceNow instance. Dynamic actions require the latest metadata from Microsoft Dynamics 365 Finance and Operations.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Microsoft D365 FinOps Metadata** > **Microsoft D365 FinOps Metadata Content**.
2. Click **Get/Refresh Metadata**.
3. Select the alias to retrieve updated metadata from Microsoft Dynamics 365 Finance and Operation application and click **Ok**.

Note:
Make sure to retrieve the latest metadata whenever there any changes in the Microsoft Dynamics 365 Finance and Operations application.

Set up bi-directional webhook for the Microsoft Dynamics 365 for Finance and Operations Spoke

Configure webhook to subscribe to Microsoft Dynamics 365 for Finance and Operations Spoke with a ServiceNow callback URL.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Microsoft D365 FnO spoke** > **FnO Webhook Registries**.
2. Click **New**.
3. On the form fill in the fields.

Field	Description
Name	Unique name for the webhook registry. For example, `Microsoft Dynamics 365 for Finance and Operations webhook`.
Description	Optional description for the webhook.
Generate Callback URL	Option to generate a callback URL which is used to register the webhook in the Microsoft Dynamics 365 Finance and Operations portal.
Generate New Secret	Option to generate a secret key for Microsoft Dynamics 365 Finance and Operations webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: When you generate a new secret, ensure that you generate the callback URL also after generating the secret. Record the callback URL for registering the app in Azure portal.

Customize bi-directional webhook in the Microsoft Dynamics 365 Finance and Operations spoke

Create webhook routing policy and subflow as per your requirement in the Microsoft Dynamics 365 Finance and Operations spoke.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Click **Subflows**.
3. Create a copy of the required subflow.
4. Customize the required subflow as per your requirement and publish it.
5. Navigate to **Microsoft D365 FnO Spoke** > **FnO WebHook Routing Policies**.
6. Click **New**.
7. On the form, fill in the fields.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. Default answer is applicable when the conditions are not met. **a.** Click the Lookup icon. **b.** Select the required subflow from the **Document:** list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.
Condition	Conditions to be met when the required events occur in Microsoft Dynamics 365 Finance and Operations. See Microsoft Dynamics 365 for Finance and Operations Spoke for information about the supported fields.
Answer	Subflow that has to be triggered when the specified conditions are met.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **Submit**.

> **Note:**
> These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Result
Routing policy and subflow are created.

Register an app in Microsoft Azure portal for Microsoft Dynamics 365 Finance and Operations spoke

Register your ServiceNow instance in Microsoft Azure portal in order to use Microsoft Dynamics 365 Finance and Operations spoke.

Before you begin
Role required: admin

Procedure

1. Log in to Azure portal.
2. Navigate to App registrations and register an app for the webhook.
3. Create a key vault using the Azure portal.
   For more information, see Create a key vault using the Azure portal.
4. Navigate to **Access policies**.
5. Create an access policy.
6. Select **Get** under Secret permissions and click **Next**.
7. In the **Principal** tab, search for the name of the app registered earlier and click **Next**.
8. In the **Application (optional)** tab, click Next.
9. In the **Review + create** tab, click **Create**.
10. Navigate to **Secrets** section.
11. Click on **+ Generate/Import**.
12. On the Create a secret page, enter a name and provide the callback URL generated from your ServiceNow instance.
13. Click **Create**.
14. Log in to your Microsoft Dynamics 365 Finance and Operations portal.
15. Navigate to **System administration** > **Business events** > **Business events catalog**.
16. Navigate to the Endpoints tab and click **New**.
17. Select the endpoint type as HTTPS from the Standard view and click **Next**.
18. On the form, fill in the details.

Endpoint name	Name of the endpoint.
Endpoint type	Type of the endpoint.
Key Vault	Key vault created for the application.
Azure Active Directory Application ID	Object ID of the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure application secret	Secret created for the application
Key vault DNS name	Vault URI of the application.
Key vault secret name	Name of the key vault secret.

19. Click **Ok**.

> **Note:**
> Ensure that key vault access policy is created for the application. The access policy should allow the application registry to access secrets from the key vault.

20. Navigate to the Business Events tab and search for a category.
For example, Purchase orders.
21. Select the required category from the list and click **Activate**.
22. In the Configure new business event section, select the legal entity and endpoint name.
23. Click Ok.

> **Note:**
> Ensure that these API permissions are enabled for the application.
> - Access Dynamics AX Custom Service
> - Access Dynamics AX data
> - Access Dynamics AX online as organization users

Result
The webhook is registered and ready for testing.

Microsoft Dynamics CRM Spoke

Provide the baseline actions to interact with Microsoft Dynamic Entities through introspection.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Dynamics CRM spoke v1.9.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Infoblox spoke provides sample flows to create an opportunity in Dynamics CRM.

Flow	Description
Create Opportunity in Dynamics CRM	Creates an opportunity in Dynamics CRM and updates the opportunity record in your ServiceNow instance.

Spoke subflows

This spoke ships with the following subflows.

Subflow	Description
Process Dynamics CRM Webhook	Receives the Dynamic CRM webhook notification and converts it into an array of objects and logs the details.
Process Dynamics CRM Webhook for Opportunity	Receives the Dynamic CRM webhook notification and updates the opportunity table record.

Available sample conversational subflows

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

Conversational subflow	Usage
Look up Opportunities - Sample	Retrieves opportunity details from Microsoft Dynamics CRM based on the specified filter criteria.
Look up Contacts - Sample	Retrieves contact details from Microsoft Dynamics CRM based on the specified filter criteria.
Look up Accounts - Sample	Retrieves account details from Microsoft Dynamics CRM based on the specified filter criteria.
Look up Leads - Sample	Retrieves leads details from Microsoft Dynamics CRM based on the specified filter criteria.
Create Lead - Sample	Creates lead in Microsoft Dynamics CRM.

In this example, a lead is created for John Smith who is interested in CRM Software and is focused on improving sales processes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Microsoft Dynamics CRM spoke provides the baseline actions to interact with Microsoft Dynamic Entities through introspection. Available actions include:

Category	Action	Description
Account Management	Create Account	Create an account in Microsoft Dynamics CRM.
	Look up Account Details by Account ID	Retrieve the details of the required account in Microsoft Dynamics CRM.
	Look up Accounts Stream	Retrieve details of all the accounts in Microsoft Dynamics CRM.
Case Management	Create Case	Create case in Microsoft Dynamics CRM.
	Look up Case Details by Case ID	Retrieve details of the specified case in Microsoft Dynamics CRM.
Contact Management	Create Contact	Create contact in Microsoft Dynamics CRM.
	Look up Contact Details by Contact ID	Retrieve details of the required contact in Microsoft Dynamics CRM.
	Look up Contacts Stream	Retrieve details of all the opportunities in Microsoft Dynamics CRM.
Lead Management	Create Lead	Create lead in Microsoft Dynamics CRM.
	Look up Lead Details by Lead ID	Retrieve details of the required lead in Microsoft Dynamics CRM.
Metadata Retrieval	Look up Entities	Retrieve all the entities and their logical names in Microsoft Dynamics CRM.
	Look up Entity Metadata	Retrieve all the metadata available for the required entity type in Microsoft Dynamics CRM.
	Look up Entity URL	Retrieve all the entities and its entity set name (public URL name) available in Microsoft Dynamics CRM.
	Look up Field Choice List	Retrieve all the choice lists for the fields that are in the name and label pair format.
Opportunity Management	Create Opportunity	Create an opportunity in Microsoft Dynamics CRM.
	Look up Opportunities Stream	Retrieves details of all the opportunities in Microsoft Dynamics CRM.
	Look up Opportunity Details by Opportunity ID	Retrieve the details of the required opportunity in Microsoft Dynamics CRM.
Record Management	Create Record	Create a record in Microsoft Dynamics CRM.
	Delete Record	Deletes a record in Microsoft Dynamics CRM.
	Look up Primary Attributes and Logical Name	Retrieve primary attributes and logical name for the specified entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Record by Record ID	Retrieve information of the specified record in an Entity.
	Look up Record by Search Query	Retrieve record based on the search query and entity selected from the choice list.
	Look Up Records (Before Paris Version)	Retrieve records based on the search query and specific entity.
	Look up Records Stream	Retrieve records based on the search query and specific entity.
	Subflow Helper Action	Parses the JSON input and converts it into an array object. This can action can be used for creating subflows.
	Update Record	Update a record in Microsoft Dynamics CRM.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Microsoft Dynamics CRM record management AI agent	Manages CRM records including deleting, and retrieving the required records.
Microsoft Dynamics CRM case management AI agent	Creates case in Microsoft Dynamics CRM and retrieves details of the specified case.
Microsoft Dynamics CRM contact management AI agent	Retrieves contact streams and contact details by ID, and creates new contacts.
Microsoft Dynamics CRM lead management AI agent	Creates lead in Microsoft Dynamics CRM and retrieves details of the required lead.
Microsoft Dynamics CRM account management AI agent	Creates an account in Microsoft Dynamics CRM and retrieves details of the required accounts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
Microsoft Dynamics CRM opportunity management AI agent	Creates opportunities, retrieves opportunity details, parses CRM entity data, and manages opportunity streams.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke module

The Microsoft Dynamics CRM spoke adds a Microsoft Dynamics CRM module to your ServiceNow instance. The Opportunities module displays the details of the opportunities.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Microsoft_Dynamics_CRM alias record to authorize actions.

Connection alias	Description	Connection URL
Microsoft_Dynamics_CRM	Connection to Microsoft Dynamics CRM	URL configured when you create your application in Azure. This URL ends with `dynamics.com`.

For information about setting up the spoke, see Set up Microsoft Dynamics CRM spoke.

Set up Microsoft Dynamics CRM spoke

Integrate the ServiceNow instance and Microsoft Dynamics CRM by using the Windows credentials to authenticate ServiceNow requests.

Before you begin

- Request Integration Hub subscription.
- Install Microsoft AD.
- Activate the Microsoft Dynamics CRM spoke.
- Role required: admin.

About this task

Perform these steps to use all Microsoft Dynamics CRM spoke actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Microsoft Dynamics CRM application

Create a custom OAuth application from your Microsoft Dynamics CRM account to enable OAuth 2.0 authentication with the Microsoft Dynamics CRM.

Before you begin

Microsoft Dynamics CRM requirements:

- Microsoft Dynamics CRM account
- Microsoft Azure account
- Role required: Microsoft Dynamics CRM admin

About this task

Complete these steps from your Azure Developer account. See the Azure product documentation for instructions on creating and configuring custom applications.

Procedure

1. Log in to the Microsoft Azure App registration portal with your organization credentials.
2. Register a new custom application by filling in the application name, the supported account type, and the redirect URI, and then click **Register**.
   An overview of the application's basic information is shown.
3. Copy the application ID to a text file.
   You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.
4. Add a client secret.
   a. In Microsoft Azure, navigate to **Manage** > **Certificates & secrets**.
   b. Provide a description and an expiration date and click **Add**.

   Note:
   The client secret is only displayed in plain text for a short time. You use the client secret when you connect the application to ServiceNow.
5. Enable the permissions you want the application to support.
   For more information, see the Microsoft Graph permissions reference.
   a. In Microsoft Azure, navigate to **Manage** > **API permissions**.
   b. Click the Microsoft Graph tile.
   c. Select the Delegated or Application permissions that the application supports.
   Delegated permissions enable the application to access the API as a signed-in user.
   Application permissions enable the application to run as a background service or daemon without a signed-in user.
   d. Click **Add permissions**.

What to do next

Register Microsoft Dynamics CRM as OAuth provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register Microsoft Dynamics CRM as OAuth provider

Use the information generated during Microsoft Dynamics CRM account configuration to register Microsoft Dynamics CRM as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

- Request Integration Hub subscription.
- Activate Microsoft Dynamics CRM.
- Create a Microsoft Dynamics CRM application.
- Role required: admin.

Procedure

1. In ServiceNow, navigate to **System OAuth** > **Application Registry**.
2. Click **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. On the form, fill in the fields.

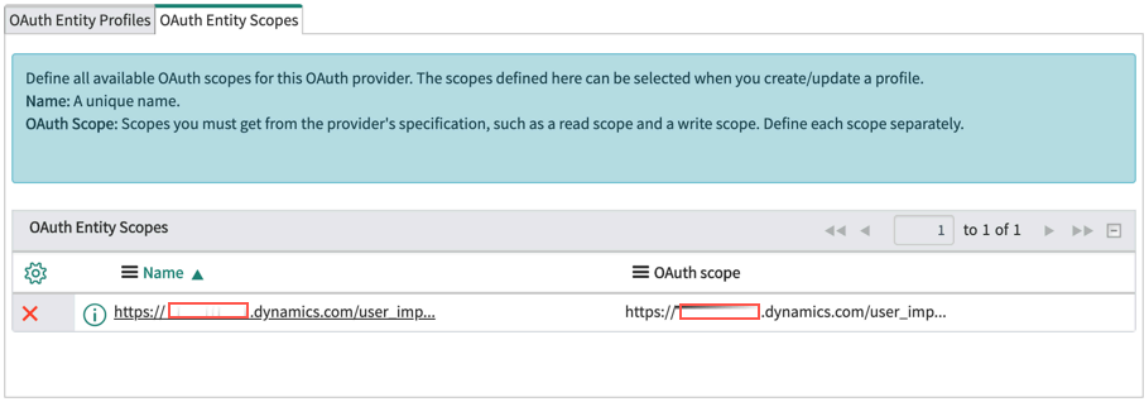
Application Registries form

Field	Value required
Name	Enter any name to uniquely identify the record, for example `Dynamics CRM OAuth profile`.
Client ID	Enter the Application ID of the Microsoft Dynamics CRM application you created in Azure.
Client Secret	Enter the Client Secret you generated when you created the application in Azure.
Default Grant type	Select **Authorization Code**.
Authorization URL	Click the lock icon (🔒), enter `https://login.microsoftonline.com/common/oauth2/v2.0/authorize` followed by a question mark and the resource attribute of your instance, and then click the lock icon again. The resource attribute of the URL. For example, `?resource=https://mycompany.crm.dynamics.com`. This attribute is the URL of your Microsoft application.
Token URL	Click the lock icon (🔒), enter `https://login.microsoftonline.com/common/oauth2/v2.0/token`, and then click the lock icon again.
Redirect URL	Click the lock icon (🔒), enter `https://<instance>.service-now.com/oauth_redirect.do`, and then click the lock icon again.

5. In the **OAuth Entity Scopes** related list, edit the provided entity scope to include the URL of your Microsoft Dynamics CRM application.

   The name and the OAuth scope are often the same string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

What to do next

Create credential record for Microsoft Dynamics CRM.

Create Credential records for the Microsoft Dynamics CRM spoke

Create Credential records for the Microsoft Dynamics CRM custom OAuth application you created during Microsoft Dynamics CRM account configuration. The Microsoft Dynamics CRM spoke connection and credential aliases use these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `Dynamics Credentials`.
Active	Enable
OAuth Entity Profile	Select the OAuth profile you created when you registered the custom Microsoft Dynamics CRM application as an OAuth provider. For example, select **Dynamics OAuth profile**.
Order	Select the order to apply this credential. For example, enter 100.

5. Save the record.
6. From Related Links, click **Get OAuth Token**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

Note:
Ensure that you allow pop-up windows in your browser.

Create Connection records for the Microsoft Dynamics CRM spoke

Create Connection records to your Microsoft Azure account. The Microsoft Dynamics CRM spoke connection and credential alias uses these connections to perform actions on Microsoft Dynamics CRM.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the connection and credential alias for the Microsoft Dynamics CRM application.
3. On the **Connections** tab, click **New**.
   The system displays a blank **HTTP(s) Connection** form.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `MS Dynamics CRM Connection`.
Credential	Select the Credential record you created for Microsoft Dynamics CRM. For example, select **MS Dynamics Credentials**.
Connection alias	Select the Connection alias record you created for Microsoft Dynamics CRM.
Active	Enable
Connection URL	Enter the root Dynamics URL. For example, `https://<SiteName>.dynamics.com`.

5. Click **Submit**.

Configure Microsoft Dynamics CRM webhook details

Register Microsoft Dynamics CRM webhook in ServiceNow to notify the ServiceNow application when certain events occur in Microsoft Dynamics CRM.

Before you begin
Role required: admin

- Microsoft Dynamics CRM requires registration through the Windows Plugin Registration Tool. To install the Windows Plugin Registration Tool, see the Microsoft document Download tools from NuGet.
- The Endpoint URL is the ServiceNow instance URL to which event information is posted. For example, `https://<instance-name>.service-now.com/api/sn_ms_crm_spoke/dynamics_webhook_callbacks`.
- The key-value pair you use to register the webhook in the Plugin Registration Tool is the same as the Name and Authorization Key in Dynamics CRM Webhook Details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Dynamics CRM Webhook Details** > **Client Details**.
2. Click **New**.
3. In the **Name** field, enter the webhook's plugin key.
4. In the **Authorization Key** field, enter the value from the webhook's key-value pair.

Configure Microsoft Dynamics CRM webhook decision policy

Create webhook routing policy and subflow according to your requirements.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Flow Designer** > **Designer**
2. Click **Subflows**.
3. Create a copy of the default sample subflow, Process Dynamics CRM Webhook.
4. Customize the subflow according to your requirement and publish it.
   See Create a subflow in Workflow Studio for more information about creating and using subflows.
5. Navigate to **Dynamics CRM Webhook Details** > **Decision Policy**.
6. On the **Decisions** tab, click **New**.
7. On the form, fill in the fields.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Answer	Option to specify if this answer is the default answer. Default answer is applicable when the conditions are not met. **a.** Click the Lookup icon. **b.** Select the required subflow from the **Document:** list. **Note:** Ensure that the **Table name** is `Dynamics CRM Webhook Answer Subflow [sn_ms_crm_spoke_dynamic_crm_webhook_answer_subflow]`.
Condition	Conditions to be met when the required events occur in Microsoft Dynamics CRM.

8. Click **Submit**.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Result

Decision policy and subflow are created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Endpoint Configuration Manager Spoke

The Microsoft Endpoint Configuration Manager (MECM) spoke automates actions to manage user collections, device collections, devices, and application deployments.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Endpoint Configuration Manager spoke v1.9 is the latest version.

Supported versions

This spoke was built for Configuration Manager 2006, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step – PowerShell (com.glide.hub.action_step.powershell)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step – JDBC (com.glide.hub.action_step.jdbc)
- ServiceNow IntegrationHub Action Step – REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and need appropriate licenses, if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke subflows

The Microsoft Endpoint Configuration Manager spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope. Available sample subflows include:

Microsoft Endpoint Configuration Manager spoke subflow descriptions

Subflow	Description
Create Collection	Creates a collection in Microsoft Endpoint Configuration Manager and creates corresponding records for the new collection in the MECM Collections table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Endpoint Configuration Manager spoke subflow descriptions (continued)

Subflow	Description
	Note: This subflow is executed by AI agents.
Delete Collection	Deletes the specified collection from Microsoft Endpoint Configuration Manager server and removes the corresponding records from the MECM Collections table. **Note:** This subflow is executed by AI agents.
Add Target Collection to Application	Adds a target collection to the specified application in Microsoft Endpoint Configuration Manager and creates a corresponding record in the MECM Deployments table accordingly. **Note:** This subflow is executed by AI agents.
Remove Target Collection from Application	Removes a target group from the specified application on Microsoft Endpoint Configuration Manager server and removes the corresponding records from the MECM Deployments table accordingly. **Note:** This subflow is executed by AI agents.
Configure Collection	Creates a collection and configure it with specified Application ID in the Microsoft Endpoint Configuration Manager Portal.
Create Software Configuration	Creates the software configuration record of the specified Microsoft Endpoint Configuration Manager application.
Look Up Collections	Returns the list of all instal or uninstall Collections associated with the given Microsoft Endpoint Configuration Manager Application ID.
Revoke Application	Adds a user or device to an uninstalled collection and then removes it from the installed collection in the MECM server.
Look up Configuration Data	Retrieves the configuration data for the requested item.
Deploy Application	Adds a user or a device to an installed collection and then removes it from the uninstalled collection in the MECM server.
Discover and Store Data	Finds the data from the server and then updates the records in the Application, Collection, and Deployment tables.

Note:
These subflows are available only when the Client Software Distribution 2.0 application is installed.

Spoke actions

The Microsoft Endpoint Configuration Manager spoke provides actions to automate tasks when events happen on your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Endpoint Configuration Manager spoke action descriptions

Category	Action	Description
Advanced Actions	Look up Device Collections Stream (Database)	Retrieves the device collection data from the MECM server using the Java Database Connectivity (JDBC) connection.
	Look up User Collections Stream (Database)	Retrieves the user collection data from the MECM server using the JDBC connection.
Applications	Look up Applications	Retrieves the application data from the MECM server.
Device Management	Look up CMPivot Response by Operation ID	Retrieves CMPivot response from the MECM server.
	Look up Device by ID	Retrieves the device data from the MECM server.
	Run CMPivot Query	Runs the CMPivot query and retrieves the operation IDs from the MECM server.
	Run MECM Script	Runs the MECM script and returns the operation ID from the MECM server.
	Look up MECM Script by Name	Retrieves the Globally Unique Identifier (GUID) of the MECM script from the MECM server.
	Look up MECM Script Response by Operation ID	Retrieves the MECM script response from the MECM server.
	Look up MECM Script Execution Response	Retrieves the MECM Script Execution Response from the MECM server.
Data Management **Note:** These actions are available only when the Client Software Distribution 2.0 application is installed.	Look up Configuration Data	Retrieves the configuration data from the requested item or software configuration.
	Prepare Deployment Data	Prepares the deployment data for the requested item.
	Prepare Revocation Data	Prepares the revocation data for the requested item.
	Store Discovered Data	Stores the applications and deployment data in the corresponding tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Endpoint Configuration Manager spoke action descriptions (continued)

Category	Action	Description
Deployments	Add device collection to application	Adds a Device Collection to a targeted application in Microsoft Endpoint Configuration Manager. **Note:** The application must have at least one deployment type and content distributed to a distribution point before deployment.
	Look up Deployments	Retrieves the deployment data from the MECM server.
	Remove User Collection from Application	Removes a user collection from an application in the MECM.
	Add User Collection to Application	Adds a user collection to a targeted application in MECM. **Note:** The application must have at least one deployment type and content distributed to a distribution point before deployment.
	Remove Device Collection from Application	Removes a device collection from an application in MECM.
Device Collections	Add to Device Collection	Adds the named device to the collection specified.
	Is Device in Collection	Checks if a device exists in the device collection in the MECM server.
	Look up Device Collections	Retrieves the device collection data from the MECM server.
	Remove from Device Collection	Removes the specified device from the collection in the MECM server.
	Create Device Collection	Creates a new device collection in MECM with a unique collection name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Endpoint Configuration Manager spoke action descriptions (continued)

Category	Action	Description
		Note: Provide values for the following input fields: • **Collection Name**: Mandatory input. Name of the collection that is a group of devices or users that you manage together. • **Limiting Collection Name**: Optional input. An existing collection that will define which device can be the member of this new collection. Only the devices which are the member of Limiting collection can be added in this new collection. For device collections, default limiting collection is "All Systems".
	Delete Device Collection	Deletes a device collection from Microsoft Endpoint Configuration Manager (MECM) by Collection ID, avoiding ambiguity from duplicate collection names.
User Collections	Add to User Collection	Adds a user to a collection.
	Is User in Collection	Checks if a user exists in a user collection in the MECM server.
	Look up User Collections	Retrieves the user collection data from the MECM server.
	Remove from User Collection	Removes a user from a collection in the MECM server.
	Create User Collection	Creates a new user collection in MECM with a unique collection name. **Note:** Provide values for the following input fields: • **Collection Name**: Mandatory input. Name of the collection that is a group of devices or users that you manage together. • **Limiting Collection Name**: Optional input. An existing collection that will define which device can be the member of this new collection. Only the devices which are the member of Limiting collection can be added in this new collection. For device collections, default limiting collection is "All Systems".
	Delete User Collection	Deletes a user collection from MECM by Collection ID, avoiding ambiguity from duplicate collection names.
Software Management	Create Catalog Item	Creates a catalog item of the specified MECM Application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke module

The MECM spoke adds the MECM application to your instance. The application includes the following modules and data accessed through the spoke modules stored in the respective tables:

Microsoft Endpoint Configuration Manager spoke module descriptions

Module	Description	Table
Applications	Displays the list of applications from the Microsoft Endpoint Configuration Manager server.	Application [sn_ms_epcfgmgr_spk_app
Configurations	Stores the software configuration details for the applications.	Configuration [sn_ms_epcfgmgr_spk_sf_c
Server Instances	Stores the details of the servers provided.	Server Instance [sn_ms_epcfgmgr_spk_ser
Deployments	Displays the list of deployments from the Microsoft Endpoint Configuration Manager server.	Deployment [sn_ms_epcfgmgr_spk_dep
Collections	Displays the list of collections from the Microsoft Endpoint Configuration Manager server.	Collection [sn_ms_epcfgmgr_spk_coll

Note:
These modules are available only when the Client Software Distribution 2.0 application is installed.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Configure Microsoft Endpoint Configuration Manager and set up the spoke.

MID Server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For information, see MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Configure Microsoft Endpoint Configuration Manager and set up the spoke

Follow the Microsoft Endpoint Configuration Manager configuration procedures in the order shown.

Note:
Ensure that user must be able to establish remote PowerShell sessions with the MECM server. The spoke scripts use *Microsoft.PowerShell32* configuration for creating sessions. For user permissions, see User permissions in Microsoft Learn.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the Application Administrator role on the Microsoft Endpoint Configuration Manager server

Ensure that the Microsoft Endpoint Configuration Manager administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

Before you begin

Role required: Microsoft Endpoint Configuration Manager Application Administrator

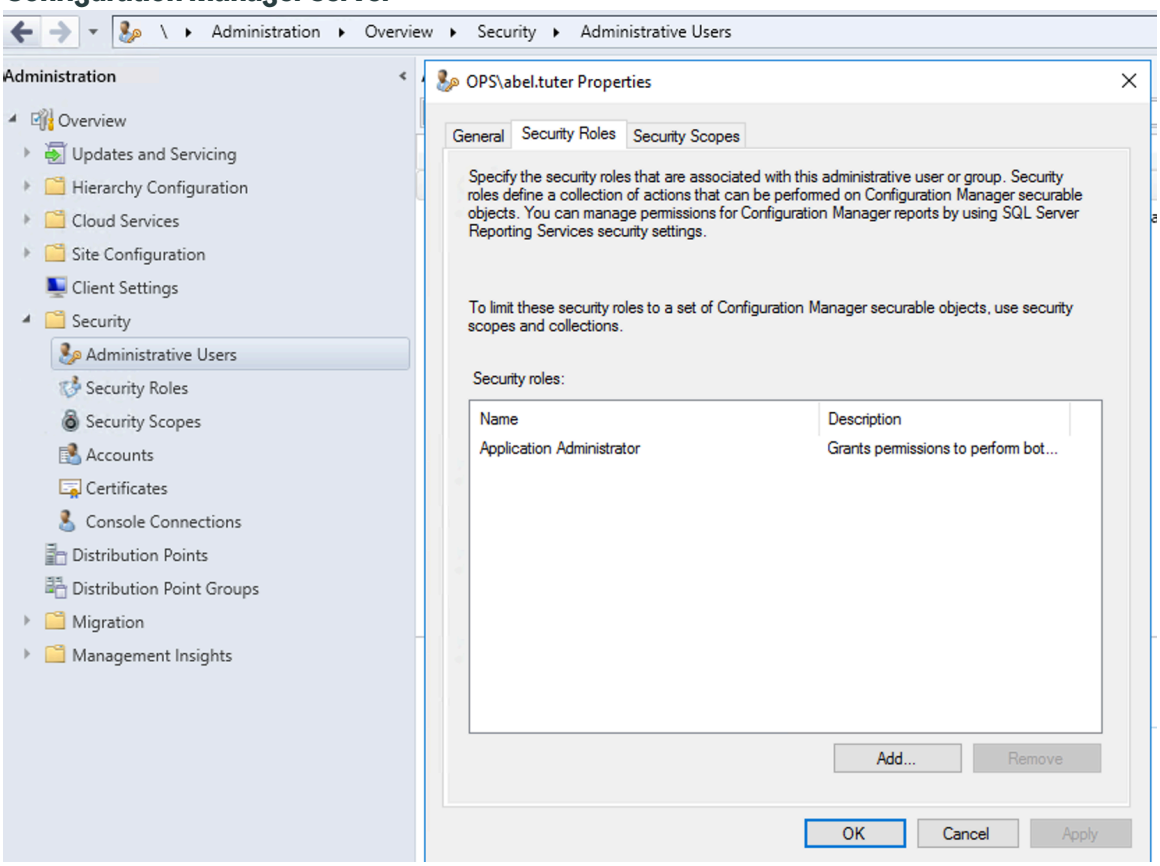
About this task

These instructions are for Microsoft Windows Server 2016 Standard.

Procedure

1. In the Microsoft Endpoint Configuration Manager console, navigate to **Administration** > **Security** > **Administrative Users**.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select **Properties** from the drop-down menu.
4. In the Properties dialog box, select the **Security Roles** tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click **Add**, select this role from the list, and click **OK**.

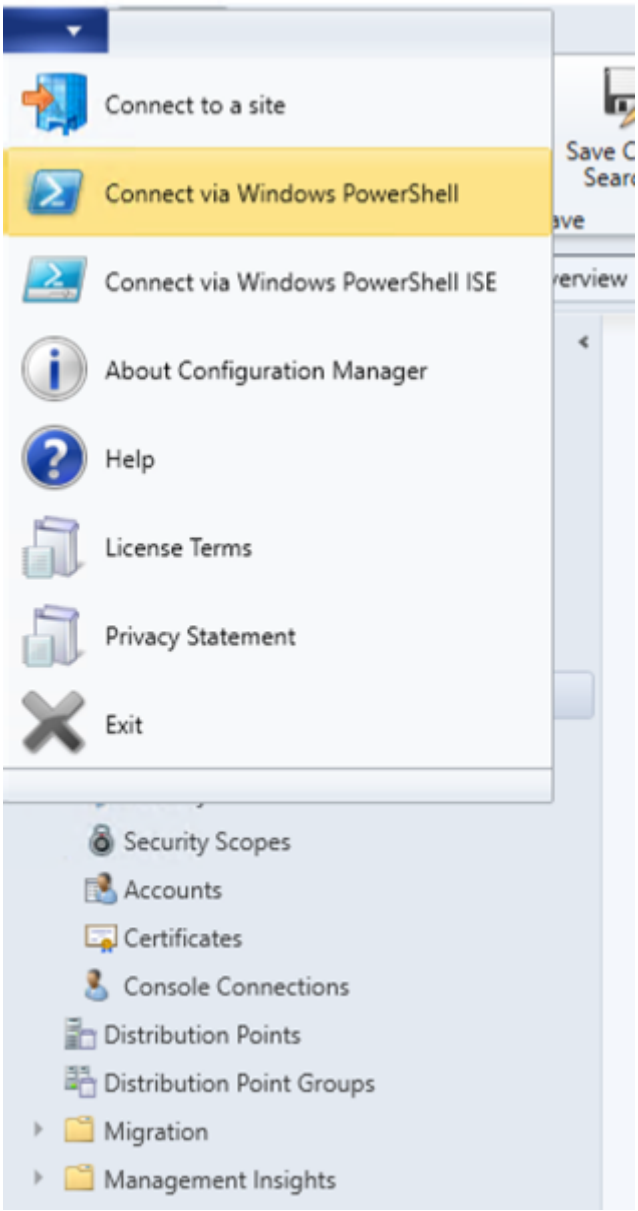
Granting the Application Administrator role on the Microsoft Endpoint Configuration Manager server



7. Log into Microsoft Endpoint Configuration Manager as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect to PowerShell



9. Ensure that the user can access the CM console.
   This action establishes the environment path to PowerShell for the logged in Application Administrator user.

Update the Microsoft Endpoint Configuration Manager cmdlet libraries

Ensure that the Microsoft Endpoint Configuration Manager Cmdlet Library is up-to-date.

Before you begin

Role required: Either Microsoft Endpoint Configuration Manager current user or system administrator, depending on settings.

About this task

The Microsoft Endpoint Configuration Manager Cmdlet Library installs and updates the Windows PowerShell module. Microsoft Endpoint Configuration Manager checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the Microsoft Endpoint Configuration Manager server to fail, because the system cannot parse the Microsoft Endpoint Configuration Manager activity output. This is an example warning message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
WARNING: An update to the
    Microsoft Endpoint Configuration Manager  Cmdlet
Library is available. Please go to
'http://go.microsoft.com/fwlink/?LinkId=528947' to download the
 latest version.
Running cmdlet version: 5.0.8231.1004 Latest cmdlet version:
 5.0.8328.1155
```

Download the latest version of the cmdlet library from http://go.microsoft.com/fwlink/?LinkId=528947. For installation instructions, see https://technet.microsoft.com/en-us/library/dn958404(v=sc.20).aspx.

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

Procedure

1. Log in to the Microsoft Endpoint Configuration Manager console as an administrator.
2. Open the menu from the upper left corner of the console.
3. Select **Connect via Windows PowerShell**.
4. Run one of these commands to disable the update check:
   - **Per-user**: *`Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`*
   - **Per-system**: *`Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`*

   Important:
   The per-system cmdlet must run in an elevated Windows PowerShell session.
5. Run the *`Get-CMCmdletUpdateCheck`* command to refresh the console and check the settings.
6. Ensure that the value of the *`IsEnabled`* configuration variable has changed to **False**. This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the *`-IsUpdateCheckEnabled 1`* command for either the current user or for the system.

Set up the Microsoft Endpoint Configuration Manager spoke

Integrate the ServiceNow instance and Microsoft Endpoint Configuration Manager account using the PowerShell and JDBC credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Endpoint Configuration Manager spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configure the default connection and credential alias to authenticate requests.

   a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

   b. Open the record **Microsoft Endpoint Configuration Spoke**.

   c. Click the **Create New Connection & Credential** related link.

   d. On the form, fill these values.

Field	Description
Server Instance Name	Name of the Microsoft Endpoint Configuration Manager server.
Host	Provider domain name.
Credential Name	Name to identify the credential record.
User Name	User name to log in to the Microsoft Endpoint Configuration Manager server.
Password	Password to log in to the Microsoft Endpoint Configuration Manager server.

   e. Click **Create**.

2. To use the two advanced actions, Look up Device Collections Stream (Database) and Look up User Collections Stream (Database), configure the JDBC credential.

   Note:
   If you are using the Microsoft Endpoint Configuration Manager spoke with Client Software Distribution 2.0 application, you must configure the JDBC credential.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Open the record **Microsoft Endpoint Configuration JDBC**.

   c. Click the **Create New Connection & Credential** related link.

   d. On the form, fill these values.

Field	Description
Connection Name	Name to identify the JDBC connection record. For example, `JDBC Connection`.
Host	Host name or IP address of the database server.
Database name	Name of the database.
Credential Name	Name to identify the connection record. For example, `JDBC Credentials`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
User name	User name to log in to the JDBC database. Ensure that the user role is at least public with db_datareader.
Password	Password to log in to the JDBC database.

e. Click **Create**.
If the MecmConnector jar is not present on the MID Server, restart the MID server so that the jar file gets synchronised from the instance to the MID server.

What to do next

To use the Microsoft Endpoint Configuration Manager spoke with Client Software Distribution 2.0 application, see CSD 2.0 for Microsoft Endpoint Configuration Manager.

Create a connection and credential record for the Microsoft Endpoint Configuration Manager spoke REST actions

Create a connection record for your Microsoft Endpoint Configuration Manager. The Microsoft Endpoint Configuration Manager connection and credential aliases use these connections to perform actions in Microsoft Endpoint Configuration Manager.

Before you begin

- To get the **Realm** value from the Microsoft Endpoint Configuration Manager server, do the following:
  1. Open **Programs** > **Administrative Tools** > **Active Directory Management**.
  2. Select **Active Directory Domains and Trusts**.

     The Active Directory domain names are listed. The Active Directory domain name is also the related Kerberos realm name and DNS domain name. Select the domain that you want to use for integration.
- After getting Realm details, run the following command from the Command Line to get the Key Distribution Center value.

  `nslookup -type=srv _kerberos._tcp.<REALM_NAME_IN_UPPER_CASE>`

  Copy the `svr hostname` value from the list and use it as the **Key Distribution Center** value.
- Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for **Microsoft Endpoint Configuration REST**.
3. From the **Related Links** tab, click **Create New Connection & Credential**.
4. On the form, fill these fields.

Connection form

Field	Description
Connection Name	Name to uniquely identify the connection. For example, `MS Endpoint Configuration Manager REST Connection`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	Base URL to connect to **Microsoft Endpoint Configuration Manager**. Enter: `https://<computer_name>.com`
Credential Name	Credential record created for Microsoft Endpoint Configuration Manager. For example, `MS Endpoint Configuration Manager Cred`.
User Name	User name to connect to your Microsoft Endpoint Configuration Manager account. **Note:** You must provide the user name without prefixing with the domain name.
Password	Password to connect to your Microsoft Endpoint Configuration Manager account.
Key Distribution Center	Key distribution center of the Microsoft Endpoint Configuration Manager server.
Realm	Active Directory domain name in uppercase from the Microsoft Endpoint Configuration Manager server. For example, OPS . LAB3 . EXAMPLE . COM

Note:
If either Key Distribution Center or Realm values is changed in the credential record, make sure to restart the MID server to sync the update. Because Key Distribution Center and Realm values are set as JRE properties on MID server.

5. Click **Submit**.

What to do next

Before using any REST based actions, make sure the MID JAR file, MecmConnector, is present at `<MID Folder>\agent\extlib` on MID server.

Microsoft Entra Entitlement Management Spoke

Retrieves details of access packages and access package assignments in Microsoft Entra Entitlement Management from your ServiceNow instance.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Microsoft Entra Entitlement Management v1.0, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Microsoft Entitlement Management account requirements

The Microsoft Entitlement Management spoke requires creating a custom app on your Microsoft Entra account to generate OAuth 2.0 tokens. See: Create a custom application in Azure portal.

Spoke actions

The Microsoft Entra Entitlement Management spoke provides actions to automate entitlement management tasks when events occurs in your ServiceNow instance. Available actions include:

Note:
To use the actions, ensure that you provide at least one of the required permissions.

Category	Action	Description	Permissions Required (from least to most privileged)	
Access Package Assignment Management	Look up Access Package Assignment	Retrieves the details of the specified access package assignment.	Delegated (work or school account)	EntitlementManagement.Read.All, EntitlementManagement.ReadWrite.All
			Delegated (personal Microsoft account)	Not supported
			Application	EntitlementManagement.Read.All, EntitlementManagement.ReadWrite.All

		requests. Signed-in user is the user whose Entra credentials were used while generating the token.		

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Microsoft Entra Entitlement Management spoke

Integrate your ServiceNow instance and the Microsoft Entra account by creating a custom OAuth application in Microsoft Entra Entitlement Management to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Entra Entitlement Management spoke.
- Role required: admin.

Create a custom application in Azure portal

Create a custom app using your Azure portal to enable OAuth 2.0 authentication with the Microsoft Entra Entitlement Management spoke.

Before you begin

- Request Integration Hub subscription.
- Activate the Microsoft Entra Entitlement Management spoke.
- Microsoft Entra Entitlement Management spoke requirements:
  - Microsoft Entra Entitlement Management account
  - Microsoft Entra Entitlement Management administrator credentials
- Role required: admin

About this task

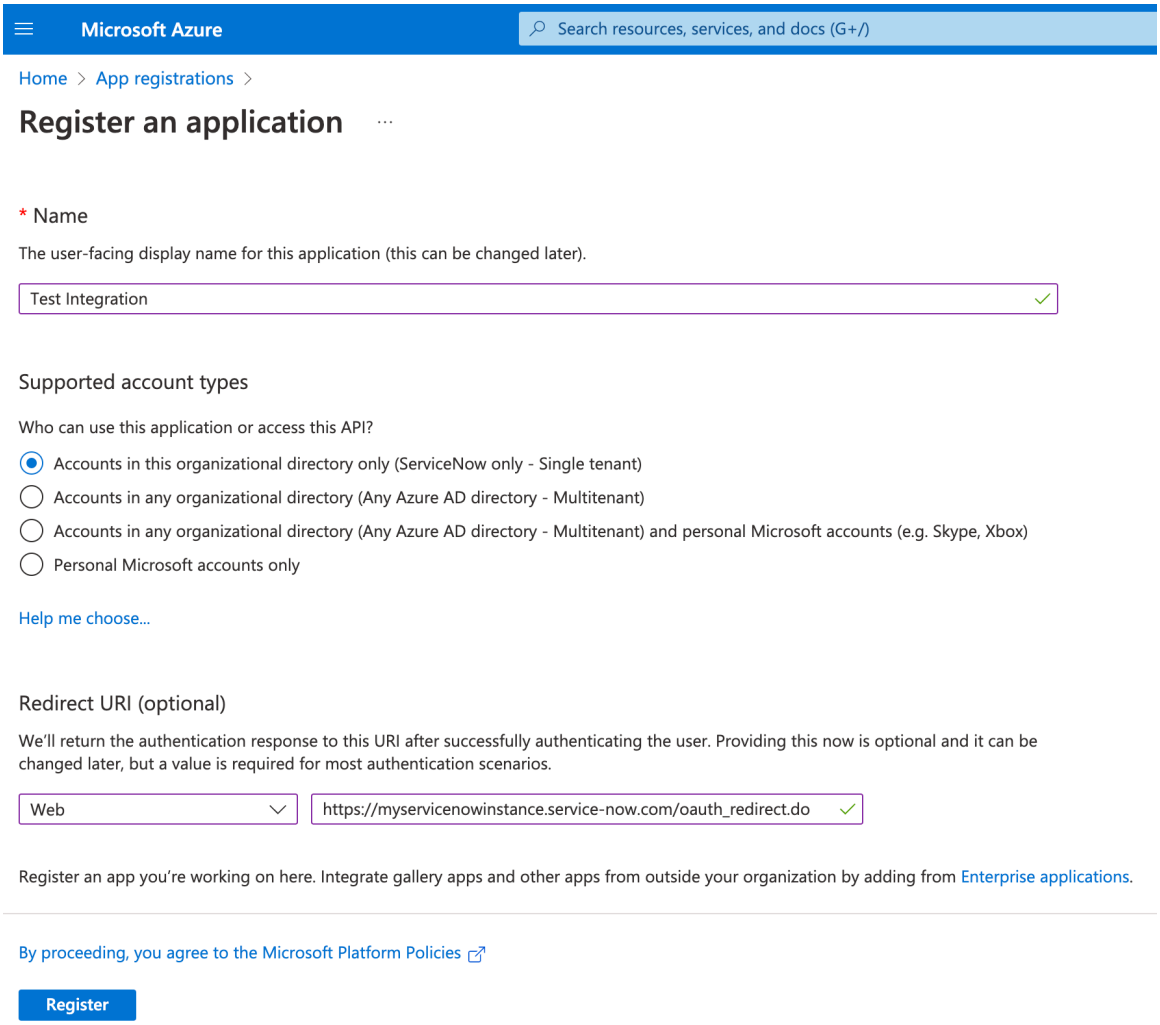
Complete these steps from your Azure portal. See the Microsoft identity platform documentation documentation for instructions on creating and configuring custom applications.

Procedure

1. From your Azure portal, navigate to **App registrations** and click **New registration**.
2. On the form, fill the values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In **Redirect URI**, enter your ServiceNow instance URL in this format: `https://<Instance-Name>.service-now.com/oauth_redirect.do`.
   See Create a Microsoft Entra application and service principal that can access resources for instructions on registering and configuring an application.

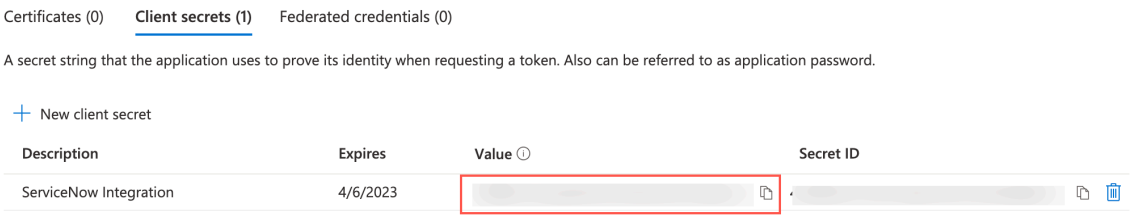


4. Click **Register**.
   The application is created and the required details are displayed.
5. Copy and record the value of Directory ID.
   This value is required to register the app as a third-party OAuth provider on your ServiceNow instance.

6. Click **Certificates & secrets**.
7. Click **New client secret**.
   Secret is generated and displayed.
8. Copy and record the value.

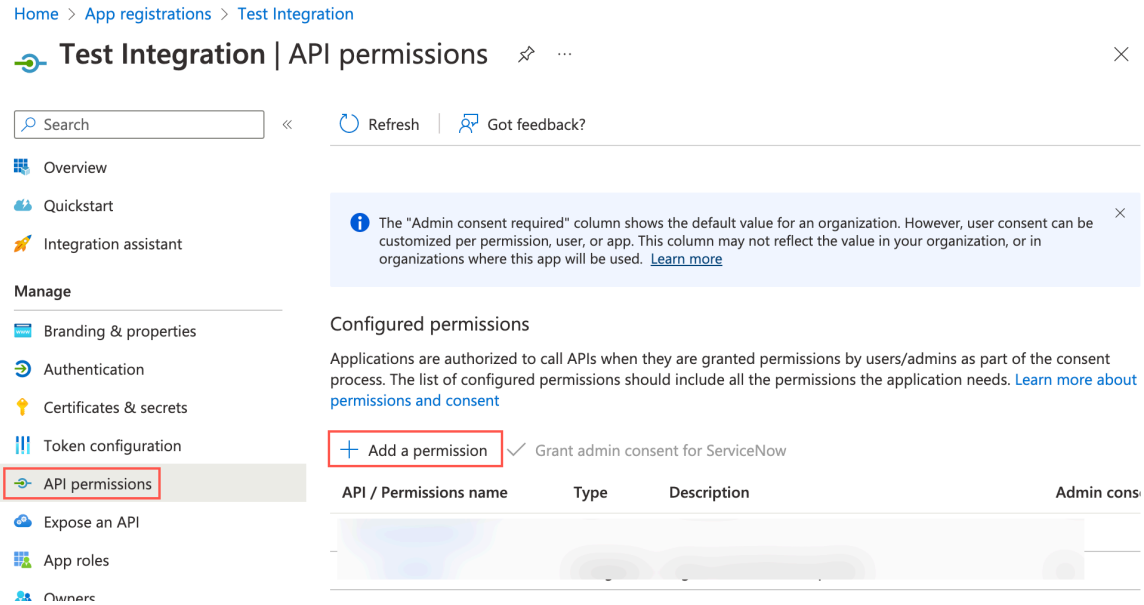
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This value is required to register the app as a third-party OAuth provider on your ServiceNow instance.



9. Click **API permissions**.
10. Click **Add a permission** to add the required permissions to access the APIs.

    For information about permissions needed to perform the required actions, see the Spoke actions section here: Spoke actions.



11. Grant admin consent to your application.
    See Quickstart: Configure a client application to access a web API for more information.

Configure a connection for the Microsoft Entra Entitlement Management spoke

Configure a connection to your Microsoft Entra Entitlement Management account. The Microsoft Entra Entitlement Management spoke connection and credential aliases use these connections to perform actions in the Microsoft Entra Entitlement Management.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **EntraEntitlementManagement** and click **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Entra Entitlement Management spoke, click **View Details**.

- To manage more than one Entra Entitlement Management spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

5. On the form, fill in these fields:

Field	Value required
Connection Information	
Name	Auto-generated name to identify the connection record.
Credential Information	
Auth URL	Authorization URL in this format: `https://login.microsoftonline.com/<Directory ID>/oauth2/v2.0/authorize`. Replace `<Directory ID>` with the directory ID in your Entra Entitlement Management configuration.
Token URL	Token URL in this format: `https://login.microsoftonline.com/<Directory ID>/oauth2/v2.0/token`. Replace `<Directory ID>` with the directory ID in your Microsoft Entra Entitlement Management configuration properties.
Revoke token URL	Revoke token URL in this format: `https://login.microsoftonline.com/<Directory ID>/oauth2/v2.0/revoke`. Replace `<Directory ID>` with the directory ID in your Entra Entitlement Management configuration properties.
OAuth Client ID	Client ID you created during the Entra Entitlement Management application registration.
OAuth Client Secret	Key value you created during the Entra Entitlement Management application registration.
OAuth Redirect URL	Redirect URL of your ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`.

6. Click **Configure and Get OAuth Token**.

Result

The Microsoft Entra Entitlement Management spoke is set up and integrated with the ServiceNow instance.

Microsoft Entra ID Spoke (formerly Microsoft Azure Active Directory spoke)

Manage users, applications, groups, devices, tenants, service principals, and passwords. Apply licenses and provision users in Office 365.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Entra ID spoke (formerly known as Microsoft Azure Active Directory spoke) v4.7.4 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- IHUB Spoke Util Pack (com.snc.ihub_spoke_util_pack)
- ServiceNow IntegrationHub Action Step - PowerShell (com.glide.hub.action_step.powershell)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Remote Directory Sync

Spoke flows

The Microsoft Entra ID spoke provides sample flows in the draft state to demonstrate automating Microsoft Entra tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
User Offboarding	Disables an Entra ID user account and removes the user from the Entra ID groups when a ServiceNow user record is deactivated.
User Onboarding	Creates and enables an Entra ID user account when a ServiceNow user record is activated.

Spoke subflows

The Microsoft Entra ID spoke provides sample subflows in the draft state to demonstrate automating Entra tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Add User to Group	Looks up the groups that a ServiceNow User record belongs to, and adds the associated Entra ID user account to the same Entra ID groups.

Available sample conversational subflows

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample conversational subflows

Conversational subflow	Description
Look up Groups - Sample	Retrieves information about the specified groups in the Entra ID.
Look up Group Members - Sample	Retrieves information about the specified group members in the Entra ID.
Look up Users - Sample	Retrieves information about users in the Entra ID.
Look up Direct Reports - Sample	Retrieves information about the direct reports in the Entra ID.
Add User to Group using Email Address - Sample	Adds the specified Entra ID user to the specified Entra ID group using the user's email address.
Add User to a group - Sample	Adds the specified Entra ID user to the specified Entra ID group.

Spoke actions

The Microsoft Entra ID spoke provides actions to automate Entra tasks when events occur in ServiceNow. Available actions include:

Note:

- One of the mentioned permissions is required to call the API.
- Ensure that you are aware of these considerations:
  - Select the Delegated permission if you intend to use the **Authorization Code** grant type while registering Entra ID as an OAuth provider.
  - Select the Application permission if you intend to use the **Client Credentials** grant type while registering Entra ID as an OAuth provider.

Category	Action	Description	Permissions Required (from least to most privileged)	
		Note: Entra ID does not allow updating values to null. Null or empty values are discarded in Entra ID when null is passed as an input.	Delegated (personal Microsoft account)	User.ReadWrite
			Application	User.ReadWrite.All, User.ManageIdentitie Directory.ReadWrite.All
	Does User owns Group	Checks if an existing user is a owner of a group in Entra ID.	Delegated (work or school account)	GroupMember.Read.All, Group.Read.All, GroupMember.ReadWrite.All, Group.ReadWrite.All, Directory.Read.All
			Delegated (personal Microsoft account)	Not supported.
			Application	GroupMember.Read.All, Group.Read.All, GroupMember.ReadWrite.All, Group.ReadWrite.All, Directory.Read.All
	Look up Incremental Changes for Users Stream	Retrieves the list of users in Entra ID. By using Delta Token, enables you discover changes to users without having to fetch the entire set of users.	Delegated (work or school account)	User.Read, User.ReadWrite, User.ReadBa User.Read.All, User.ReadWrite.All, Directory.Read.All, Directory.ReadWrite.A
			Delegated (personal Microsoft account)	Not supported.
			Application	User.Read.All, User.ReadWrite.All, Directory.Read.All, Directory.ReadWrite.A

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available AI agents include:

AI agent	Description
Microsoft Entra ID user management AI agent	Automates user and group management tasks in Microsoft Entra ID. The AI agent creates, enables and disables users, manages security and office groups, and performs advanced queries such as, retrieving incremental changes or direct reports.
Microsoft Entra ID group management AI agent	Automates user and group management tasks in Microsoft Entra ID. The AI agent retrieves group details, manages group memberships, creates security groups, and automates user provisioning into Office 365.
Microsoft Entra ID license management AI agent	Automates the management of users, security groups, and office groups in Microsoft Entra ID. The AI agent retrieves details about the subscribed SKUs, assigns user licenses, and remove user licenses.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Microsoft Entra ID account requirements

The Microsoft Entra ID spoke requires creating a custom app on your Microsoft Entra account to generate OAuth 2.0 tokens. See: Create an Microsoft Entra ID application.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the AzureAD alias record to authorize actions on Microsoft Entra ID.

Connection alias	Description	Connection URL
AzureAD	Connection to Microsoft Entra ID.	https://graph.microsoft.com

For information about setting up the spoke, see Set up Microsoft Entra ID spoke.

© 2026 ServiceNow, Inc. All rights reserved.

Set up Microsoft Entra ID spoke

Integrate the ServiceNow instance and your Microsoft Entra account by creating a custom OAuth application in Microsoft Entra ID to authenticate ServiceNow requests.

Demonstrates how to set up the Microsoft Entra ID spoke (formerly known as Microsoft Azure Active Directory spoke).

Note:
This video is made using ServiceNow instance of the Utah version and Flow Designer UI is shown. If you are using ServiceNow instance of the Washington DC version or later, perform the same steps and navigate to Workflow Studio instead of Flow Designer.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Entra ID spoke.
- Role required: admin.

Create an Microsoft Entra ID application

Create a custom app using your Azure portal to enable OAuth 2.0 authentication with the Microsoft Entra ID spoke.

Before you begin

- Request Integration Hub subscription.
- Activate the Microsoft Entra ID spoke.
- Microsoft Entra ID spoke requirements:
  - Microsoft Entra ID account
  - Microsoft Entra ID administrator credentials
- Role required: admin

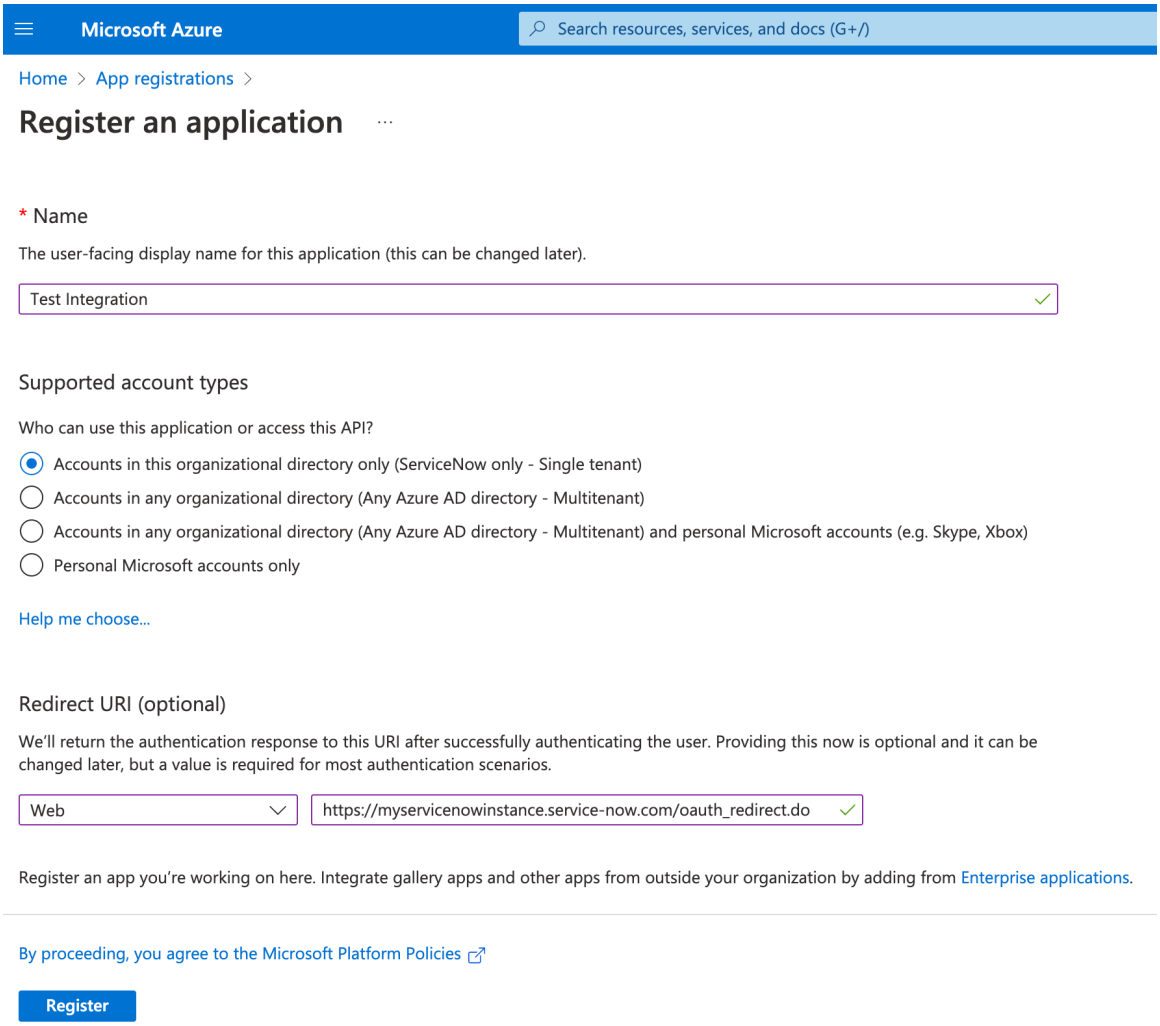
About this task

Complete these steps from your Azure portal. See the Microsoft identity platform documentation documentation for instructions on creating and configuring custom applications.

Procedure

1. From your Azure portal, access Microsoft Entra ID.
2. Create an Microsoft Entra ID application.
   Alternatively, you can use an existing application. Ensure that you configure the existing application as outlined here.
3. Navigate to **App registrations** and click **New registration**.
4. On the form, fill the values.
5. In **Redirect URI**, enter your ServiceNow instance URL in this format: `https://<Instance-Name>.service-now.com/oauth_redirect.do`.
   See Create a Microsoft Entra application and service principal that can access resources for instructions on registering and configuring an application.

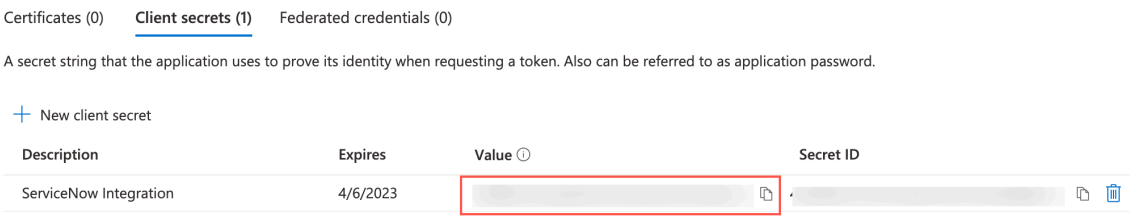
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Register**.
   The application is created and the required details are displayed.
7. Copy and record the value of Directory ID.
   This value is required to register the app as a third-party OAuth provider on your ServiceNow instance.

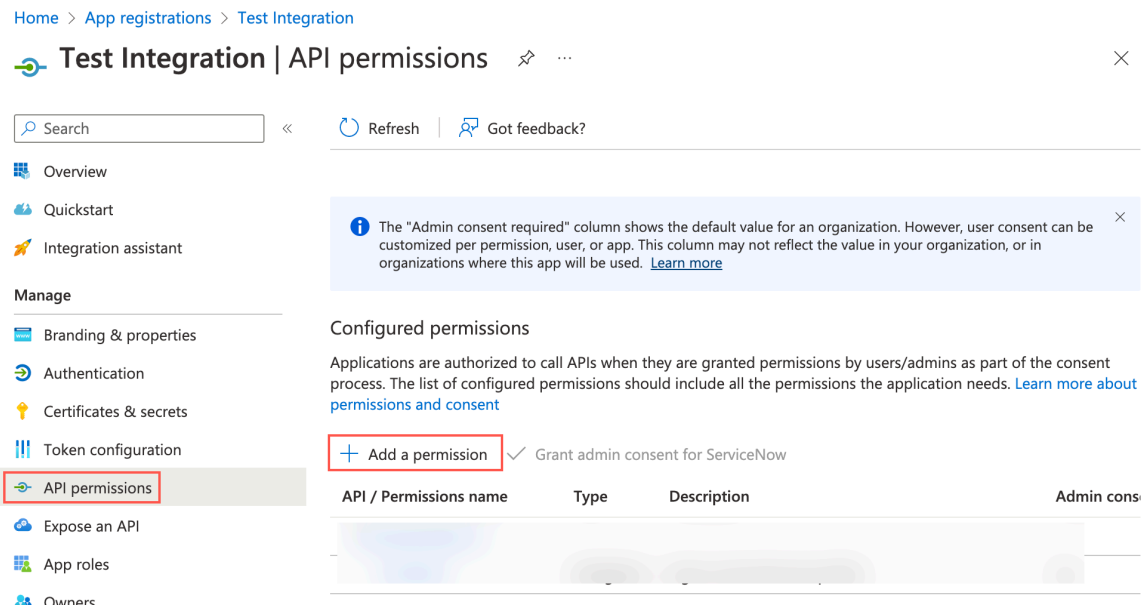
8. Click **Certificates & secrets**.
9. Click **New client secret**.
   Secret is generated and displayed.
10. Copy and record the value.
    This value is required to register the app as a third-party OAuth provider on your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. Click **API permissions**.
12. Click **Add a permission** to add the required permissions to access the APIs.

    For information about permissions needed to perform the required actions, see the Spoke actions section here: Microsoft Entra ID Spoke (formerly Microsoft Azure Active Directory spoke).



13. Grant admin consent to your application.
    See Quickstart: Configure a client application to access a web API for more information.

Configure a connection for the Microsoft Entra ID spoke

Configure a connection to your Microsoft Entra ID account. The Microsoft Entra ID spoke connection and credential aliases use these connections to perform actions in the Microsoft Entra ID.

Before you begin

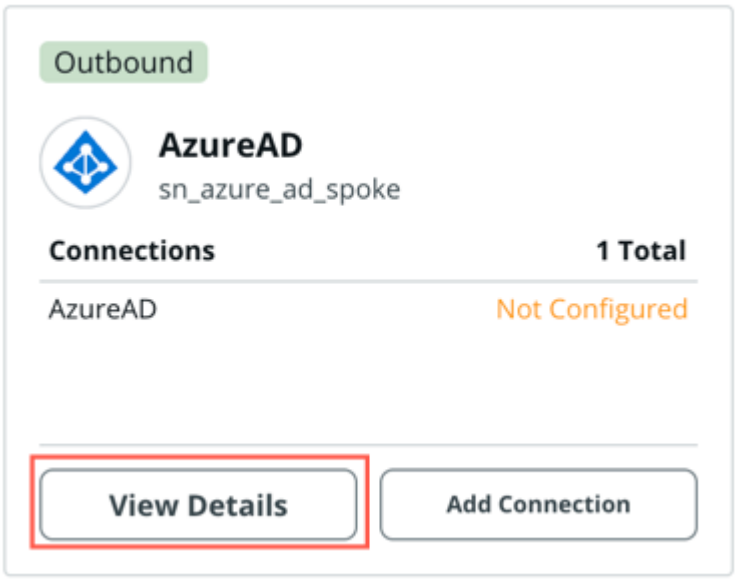
Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **AzureAD** and click **View Details**.

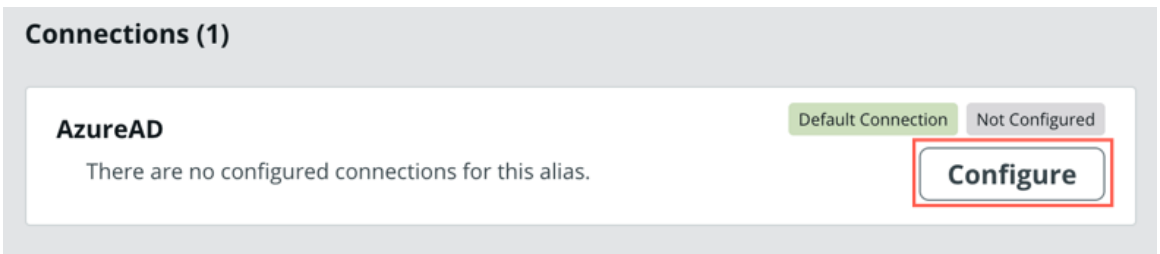
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Entra ID spoke, click **View Details**.



- To manage more than one Entra ID spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

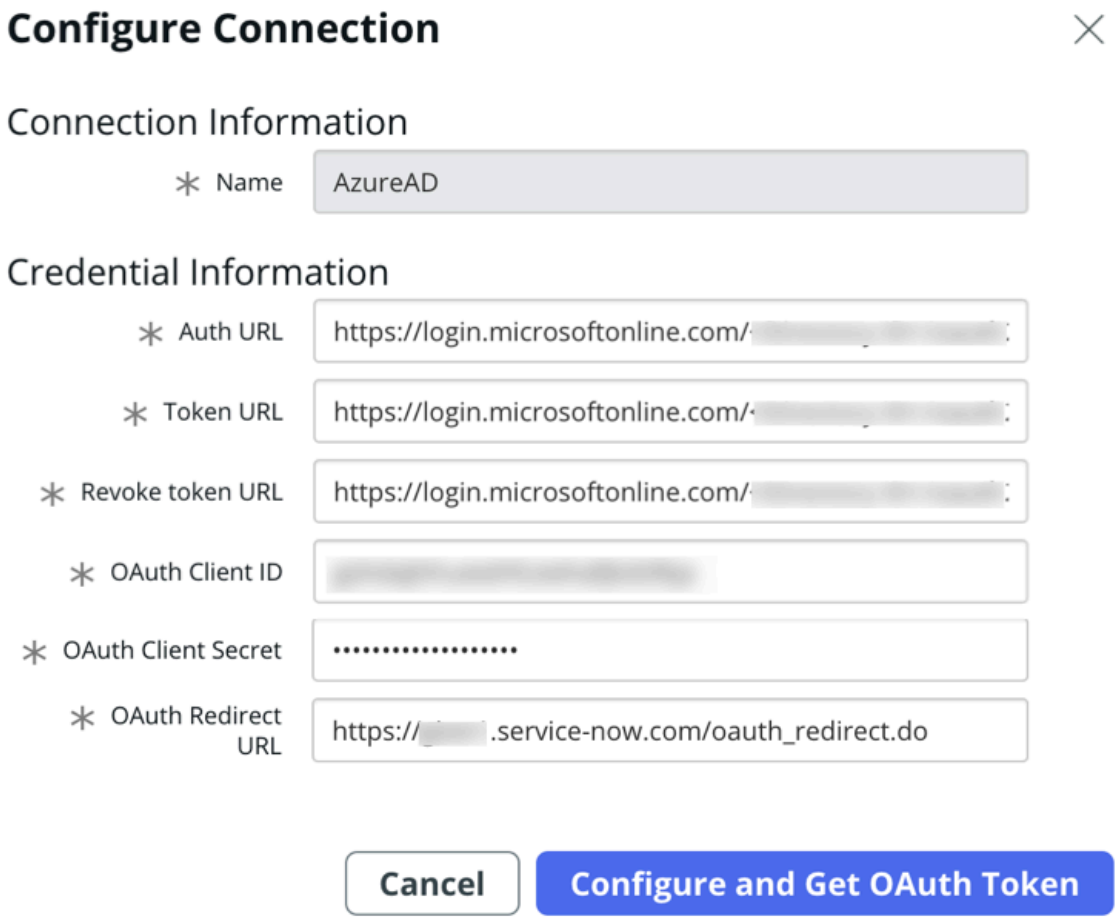


5. On the form, fill in these fields:

Field	Value required
Connection Information	
Name	Auto-generated name to identify the connection record.
Credential Information	
Auth URL	Authorization URL in this format: `https://login.microsoftonline.com/<Directory ID>/oauth2/v2.0/authorize`. Replace `<Directory ID>` with the directory ID in your Entra ID configuration.
Token URL	Token URL in this format: `https://login.microsoftonline.com/<Directory ID>/oauth2/v2.0/token`. Replace `<Directory ID>` with the directory ID in your Microsoft Entra ID configuration properties.
Revoke token URL	Revoke token URL in this format: `https://login.microsoftonline.com/<Directory ID>/oauth2/v2.0/revoke`. Replace `<Directory ID>` with the directory ID in your Entra ID configuration properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
OAuth Client ID	Client ID you created during the Entra ID application registration.
OAuth Client Secret	Key value you created during the Entra ID application registration.
OAuth Redirect URL	Redirect URL of your ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`.



6. Click **Configure and Get OAuth Token**.

Result
The Microsoft Entra ID spoke is set up and integrated with the ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
By default, the grant type of the application registry record is set to **Authorization Code**.

- If you want to use credentials of an Azure user to obtain the OAuth token and run all flows with that user delegation, use **Authorization Code**. Currently, delegation of permission to each logged in ServiceNow user isn't supported.
- If you want to grant permission to an app instead of an individual user, change the grant type to **Client Credentials**. This ensures that all flows, either interactive or background, will use the app permissions to execute the flows. For more information on how to use Client Credentials, see KB0993701.
- In situations where you can't use one grant type but require both the **Authorization Code** and **Client Credentials** grant types to perform the actions, create a child alias.

Regenerate Entra ID OAuth token

Regenerate the Entra ID OAuth token when it expires.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select the Entra ID spoke OAuth Credential record.

   Example
   For example, select **Azure AD Credentials**.
3. From Related Links, click **Get OAuth Token**.

Microsoft Exchange Online Spoke

The Microsoft Exchange Online spoke creates and manages calendar and mail in Microsoft Exchange Online. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.

Note:
User and group management can be done using Microsoft Azure AD only and not Microsoft Exchange Online spoke.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Exchange Online spoke v3.12.0 is the latest version.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Remote Tables (com.glide.script.vtable)
- System Import Data Source (com.glide.system_import_data_source)
- iHub Spoke Util Pack (com.snc.ihub_spoke_util_pack)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported version

Microsoft Graph REST API v1.0

Spoke module

The Microsoft Exchange Online spoke adds the Microsoft Exchange Online application to your instance and includes these modules:

Module	Description
Events	Displays the list of events in Microsoft Exchange Online.
Subscriptions	Displays the list of subscriptions in Microsoft Exchange Online.
Webhook Registry	Displays the list of webhook registries of Microsoft Exchange Online.
Calendars	Displays a list of calendars in Microsoft Exchange Online.
Calendar Events Transform Data	Displays the list of records from the data source.

Spoke flows

The Microsoft Exchange Online spoke provides sample flows in the published state to demonstrate automating renewing subscriptions. Available sample flows include:

Flow	Description
Renew Subscriptions	Retrieves all the subscription records and renews the subscriptions if a renewal is required, based on the expiration time. If any subscription has its status marked as 'Being

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
	deleted', then its record is deleted and isn't considered for renewal.

Spoke subflows

The spoke provides subflows in the Published state to integrate with the Microsoft Exchange Online service. These subflows can be used as part of other subflows and flows.

Category	Subflows	Description
Webhook management	Check Event Subscription	Checks if a webhook subscription with specified event resource, or notification URL and change type exists.
	Create or Update Subscription Record	Checks if the specified subscription record exists in Microsoft Exchange Online and updates the subscription record if it exists. If the subscription record doesn't exist, a new subscription record is created.
	Create or Update Subscriptions for Resources	Checks for the subscriptions for the specified resources. If the subscription for the specified resources don't exist, then new subscriptions are created. **Note:** This subflow is available only when the Workplace Calendar Synchronization plugin is already installed.
	Delete Subscription	Deletes the specified subscription when the specified subscription is related only with the specified application.
	Recreate Removed Subscription	Recreates a removed webhook subscription using the details from the related subscription record.
	Subscription Lifecycle Management	Manages the lifecycle of a webhook subscription.
Calendar Management	Calendar Synchronization	Synchronizes the calendar by retrieving events from the Exchange Online Calendar Events Transformed Data

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Subflows	Description
		table and adding the retrieved events to the Microsoft Exchange Online Events table. It creates a subscription if a valid subscription doesn't exist for the user's specified calendar.
	Create or Update Event Record	Checks for the specific existing event record and updates with the specified properties. If the specified event record does not exist, a new event record is created.
	Delete Calendar Scheduling Event	Deletes the specified event in Microsoft Exchange Online and the related records from events tables, related attachments, related records from event attendees and event to subscription m2m tables.
	Delete Event Record	Deletes the specified event record from events tables and the related attachments, related records from event attendees and event to subscription m2m tables.
	Event Lifecycle Management	Retrieves the event details and updates the records in event, attendees, event to subscription m2m tables accordingly.
	Look up and Update Attachments to Event Record	Retrieves the attachments of a specific event record from Microsoft Exchange Online and updates them.
	Look up and Update Calendar Scheduling Change	Retrieves the event details of a specified event record and updates them.
	Sync up Events	Synchronizes the calendar view based on the data from the Exchange Online Calendar Events Transformed Data table.
	Update Calendar Scheduling Event	Updates the properties of an event object in Microsoft Exchange Online and the related record in the events table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Use the Microsoft Exchange Online Webhook Registry table to generate a callback URL and store the secret value (Client state) for webhook subscriptions.
- Make sure that webhook subscription is stored in the Microsoft Exchange Online Subscriptions table with the Status field set to Active.

Spoke actions

The Microsoft Exchange Online spoke provides actions to automate calendar and mail tasks when an incident is created in the ServiceNow instance.

Microsoft Exchange Online spoke actions

Category	Action	Description
Calendar Management	Copy Attachment to Calendar Event	Copies a ServiceNow attachment to an Exchange calendar event.
	Create Calendar Event	Creates an event in the user's default calendar and specifies the time zone for the start and end times of the event.
	Create Recurring Calendar Events	Creates a recurring event in the user's default calendar and specifies the time zone for the start and end times of the event.
	Delete Attachment	Deletes the specified attachment in the specified event.
	Delete Calendar Event	Deletes a calendar event.
	Find Meeting Times	Retrieves meeting times and locations based on the availability of the meeting organizer and attendees for the specified time and locations.
	Look up Attachments by Event ID	Retrieves all the attachments in the specified event.
	Look up Calendar by ID	Retrieves the calendar details for the specified ID.
	Look up Calendar Events by User ID	Retrieves the list of event objects in the user's mailbox.
	Look up Calendar View Stream	Retrieves the list of meeting entries for the specified User ID for the specified time period.
	Look up Calendars Stream	Retrieves details of the calendars of all the users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Exchange Online spoke actions (continued)

Category	Action	Description
	Look up Event by ID	Retrieves the calendar event details for the specified ID.
	Look up Schedules	Retrieves the list of schedules.
	Look up Out of Office Settings	Retrieves the details of the out-of-office settings for the specified recipients.
	Look up Time Zones	Retrieves details of all the available time zones.
	Update Calendar Event	Updates the properties of an event object.
Mail Management	Delete Message	Deletes the message in a user's inbox or from a custom folder.
	Look Up Mail Folders by User ID	Retrieves all the mail folders for a specified User ID.
	Look Up Messages by Mail Folder ID	Retrieves all the messages in a mail folder.
	Look Up Messages by User ID	Retrieves all the messages in the inbox folder of the user.
	Send Mail	Sends an email with the message subject and message body to the specified list of recipients.
	Set Mailbox Auto Reply	Sets the user’s auto-reply message for the given time period.
Webhook Management	Look up Subscription by ID	Retrieves details of the webhook subscription for the specified ID.
	Look up Subscriptions Stream	Retrieves details of all webhook subscriptions.
	Renew Webhook Subscription	Renews the subscription of the specified webhook.
	Subscribe Webhook	Creates a webhook subscription for the specified resource.
	Unsubscribe Webhook	Deletes the specified webhook subscription.
Mailbox Management	Create MailBox	Creates mailboxes and user accounts simultaneously.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Exchange Online spoke actions (continued)

Category	Action	Description
	Delete MailBox	Deletes or disables mailboxes and user accounts simultaneously.
	Enable MailBox	Enables a mailbox in Microsoft Exchange Online. The mailbox can be in an archived state.
	Look up MailBox	Retrieves the list of mailboxes.
User Management	Look up Relevant Users Stream	Retrieves a stream of users who are most relevant to the specified user, based on collaboration and organizational context. Relevance is determined by the user's communication and collaboration patterns, and business relationships.

Permissions required to run these actions are:

Mailbox Management	Create MailBox	These actions uses powershell cmdlets and hence doesn't requires API permissions.	
	Delete MailBox		
	Enable MailBox		
	Look up MailBox		

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Microsoft Exchange Online calendar management AI agent	Automates workflows related to the calendar within Microsoft Exchange Online such as calendar event management, attachment handling, and time zone look ups.
Microsoft Exchange Online room management AI agent	Automates workflows related to the room management within Microsoft Exchange Online such as 'Look up Rooms Stream'.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
Microsoft Exchange Online metadata retrieval management AI agent	Automates workflows related to the room metadata management within Microsoft Exchange Online such as looking up room metadata and time zone metadata.
Microsoft Exchange Online meeting scheduler AI agent	Automates calendar management tasks within Microsoft Exchange Online. It enables users to find the available meeting time slots and create the meetings accordingly.
Microsoft Exchange Online mail manager	Automates mail management tasks within Microsoft Exchange Online such as look up mail folders and messages, delete messages, and set mailbox auto-replies.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Microsoft account requirements

The Microsoft Exchange Online spoke needs registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Microsoft Exchange Online spoke.

MID Server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. Make sure that Power Shell with EXO V2 module is installed. This module is required for executing the Mailbox management actions. Use the connection record associated with the Mailbox alias to configure where actions run as well as set MID Server selection attributes. For more information about the MID Server, see MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up Microsoft Exchange Online spoke

Integrate the ServiceNow instance and Microsoft Exchange Online account by creating a custom OAuth application in Microsoft Exchange Online to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Exchange Online spoke.
- Role required: admin.

Register an application using the Microsoft Azure portal

Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Before you begin

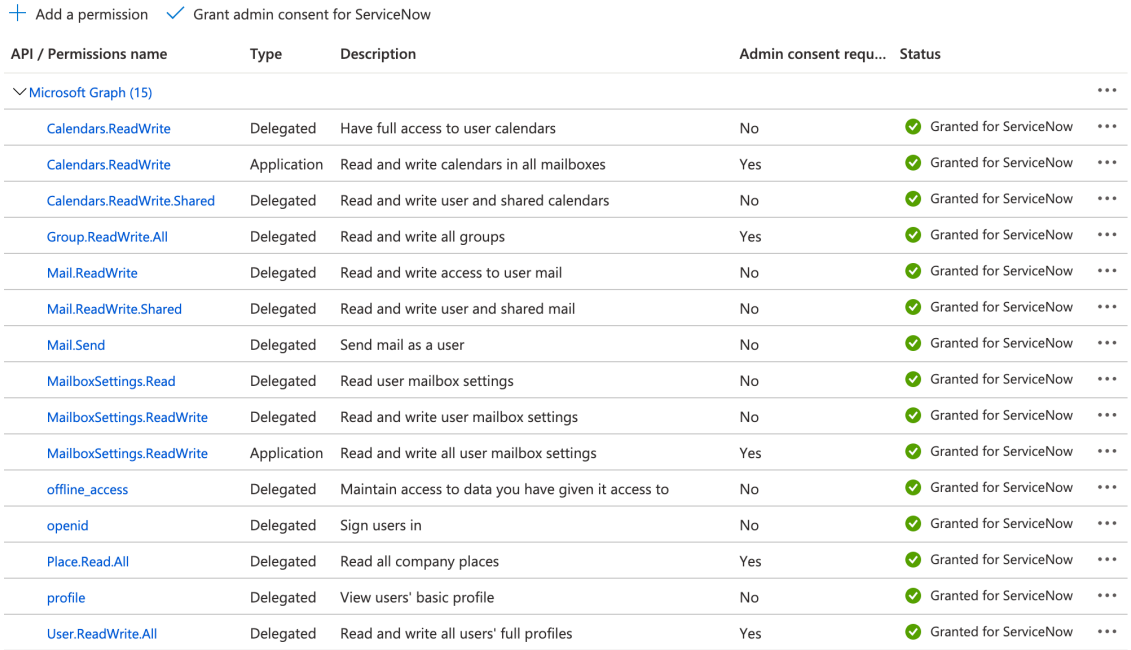
Role required: Azure Active Directory admin

About this task

Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the Microsoft Azure documentation.

Procedure

1. In the Microsoft Azure portal, add the **Redirect URIs** in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`
2. For the **Required Permissions**, select **Microsoft Graph**.



+ Add a permission ✓ Grant admin consent for ServiceNow

API / Permissions name	Type	Description	Admin consent requ...	Status
Microsoft Graph (15)				
Calendars.ReadWrite	Delegated	Have full access to user calendars	No	Granted for ServiceNow
Calendars.ReadWrite	Application	Read and write calendars in all mailboxes	Yes	Granted for ServiceNow
Calendars.ReadWrite.Shared	Delegated	Read and write user and shared calendars	No	Granted for ServiceNow
Group.ReadWrite.All	Delegated	Read and write all groups	Yes	Granted for ServiceNow
Mail.ReadWrite	Delegated	Read and write access to user mail	No	Granted for ServiceNow
Mail.ReadWrite.Shared	Delegated	Read and write user and shared mail	No	Granted for ServiceNow
Mail.Send	Delegated	Send mail as a user	No	Granted for ServiceNow
MailboxSettings.Read	Delegated	Read user mailbox settings	No	Granted for ServiceNow
MailboxSettings.ReadWrite	Delegated	Read and write user mailbox settings	No	Granted for ServiceNow
MailboxSettings.ReadWrite	Application	Read and write all user mailbox settings	Yes	Granted for ServiceNow
offline_access	Delegated	Maintain access to data you have given it access to	No	Granted for ServiceNow
openid	Delegated	Sign users in	No	Granted for ServiceNow
Place.Read.All	Delegated	Read all company places	Yes	Granted for ServiceNow
profile	Delegated	View users' basic profile	No	Granted for ServiceNow
User.ReadWrite.All	Delegated	Read and write all users' full profiles	Yes	Granted for ServiceNow

3. Record the **Client Secret** for use in later configurations.

Result

The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Exchange Online as the OAuth provider

Register Microsoft Exchange Online as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Use the information generated during the registration of the application in the Microsoft Azure portal.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open the record, **Microsoft Exchange Online**.
3. On the form, fill in the fields.

Application Registries form

Field	Description
Name	Name to uniquely identify the record. For example, `Microsoft Exchange Online`.
Client ID	Application ID created during application registration.
Client Secret	Client secret created during application registration.
OAuth API Script	Optional script to customize the request and response.
Logo URL	URL that contains an image to use as the application logo.
Default Grant Type	Grant type used to establish the token. Select **Authorization Code**.
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Authorization URL	OAuth authorization code endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/authorize`
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`
Token Revocation URL	OAuth server token revocation endpoint.
Redirect URL	OAuth callback endpoint. Enter `https://<instance-name>.service-now.com/oauth_redirect.do`
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Send Credentials	Client credentials in the request.

4. Right-click the form header, and click **Save**.
   A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, `Microsoft Exchange Online default_profile`.
5. Navigate to **System OAuth** > **Application Registry**.
6. Open the record, **Microsoft Exchange Online_clientCredentials**.
7. On the form, fill in the fields.

Application Registries form

Field	Description
Client ID	Application ID created during application registration.
Client Secret	Client secret created during application registration.
Default Grant Type	Grant type used to establish the token. Select **Client Credentials**.
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`
Redirect URL	OAuth callback endpoint. Enter `https://<instance-name>.service-now.com/oauth_redirect.do`

8. Right-click the form header, and click **Save**.
   A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, `Microsoft Exchange Online_clientCredentials default_profile`.

Create credential records for the Microsoft Exchange Online spoke

Authorize the Microsoft Exchange Online spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Exchange Online connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message, `What type of Credentials would you like to create?`
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth 2.0 Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `Exchange_Online_Credentials`.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of Microsoft Exchange Online spoke as an OAuth provider with **Default Grant Type** as **Authorization Code**. For example, `Microsoft Exchange Online`.
Applies to	MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Order that the credentials are used. For example, enter `100`.

5. Right-click the form header and click **Save**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.
7. Navigate to **Connections & Credentials** > **Credentials**.
8. Click **New**.
   The system displays the message, `What type of Credentials would you like to create?`
9. Select **OAuth 2.0 Credentials**.
10. On the form, fill in the fields.

OAuth 2.0 Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `Exchange_Online_Credentials_clientCred`.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of Microsoft Exchange Online spoke as an OAuth provider with **Default Grant Type** as **Client Credentials**. For example, `Microsoft Exchange Online_clientCredentials default_profile`.
Applies to	MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Order that the credentials are used. For example, enter `100`.

11. Right-click the form header and click **Save**.
12. To generate the OAuth token, click the **Get OAuth Token** related link.

Result

The credential records for the Microsoft Exchange Online spoke are created.

Create a credential record for the Microsoft Exchange Online spoke Mailbox actions

Create a credential record for the Microsoft Exchange Online spoke Mailbox actions. The Microsoft Exchange Online spoke connection and credential alias uses these credentials to authorize Mailbox actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Make sure that MID Server is setup and configured
- Make sure that Power Shell with EXO V2 module is installed. This module is required for executing Mailbox management actions.
- Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **Windows Credentials**.
4. On the form, fill in the fields.

Windows Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, MS Exchange Online Mailbox Cred.
Active	Option to actively use the credential record.
User name	User name with access to the target Windows host.
Password	Password for the account.
Applies to	Option to specify if the credential applies to all MID Servers in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use this credential in the **MID servers** field.
Order	Order to apply this credential. For example, `100`.
Credential alias	Credential alias associated with the spoke.

5. Right-click the form header and click **Submit**.

Result

A Windows Credential record is created for the Microsoft Exchange Online spoke Mailbox actions.

Create connection records for the Microsoft Exchange Online spoke

Perform actions in Microsoft Exchange Online by creating connection records for your Microsoft Exchange Online account. The Microsoft Exchange Online spoke connection and credential alias uses these connections to perform actions.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record, **Microsoft_Exchange_Online**.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.

HTTP(s) Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Exchange_Online_Connection`.
Credential	Credential record created for Microsoft Exchange Online. For example, `Exchange_Online_Credentials`.
Connection alias	Alias record associated with this connection.
URL builder	**Note:** Do not select the check box.
Connection URL	Connection URL. Enter `https://graph.microsoft.com`.
Use MID server	Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

5. Click **Update**.
6. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
7. Open the record, **Microsoft_Exchange_Online_clientCred**.
8. In the Connections related list, click **New**.
9. On the form, fill in the fields.

HTTP(s) Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Exchange_Online_Connection_clientCred`.
Credential	Credential record created for Microsoft Exchange Online. For example, `Exchange_Online_Credentials_clientCred`.
Connection alias	Alias record associated with this connection.
URL builder	**Note:** Do not select the check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	Connection URL. Enter `https://graph.microsoft.com`.
Use MID server	Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

10. Click **Update**.

Result

The Microsoft Exchange Online spoke is set up and integrated with the ServiceNow instance.

Create a connection record for the Microsoft Exchange Online spoke Mailbox actions

Create a connection record for your Microsoft Exchange Online spoke Mailbox actions. The Microsoft Exchange Online spoke connection and credential aliases use these connections to perform only Mailbox actions.

Before you begin

- Make sure that MID Server is setup and configured
- Make sure that Power Shell with EXO V2 module is installed. This module is required for executing Mailbox management actions.
- Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the **Microsoft Exchange Online MID** record.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `MS Exchange Online Mailbox Connection`.
Credential	Credential record created for Microsoft Exchange Online spoke Mailbox actions. For example, `MS Exchange Online spoke Mailbox Cred`.
Connection alias	Alias record associated with this connection.
Connection URL	Base URL to connect to **Microsoft Exchange Online**. Enter: `127.0.0.1`
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use MID server	Option to use MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.

5. Click **Submit**.

Result
A connection record is created for Microsoft Exchange Online spoke Mailbox actions.

Regenerate the Microsoft Exchange Online OAuth token

Authorize the Microsoft Exchange Online spoke by regenerating the Microsoft Exchange Online OAuth token after it expires.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select the Microsoft Exchange Online spoke OAuth Credential record.
3. To regenerate the OAuth token, click the **Get OAuth Token** related link.

Result
The Microsoft Exchange Online spoke receives a new OAuth access token.

Microsoft Exchange Server Spoke

The Microsoft Exchange Server spoke creates and manages address list, mailbox, and calendar events in Microsoft Exchange mail system.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Exchange Server spoke v2.5.1 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - PowerShell (com.glide.hub.action_step.powershell)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

- Exchange Server 2016 installed on Windows Server 2016

  Note:
  The Create Calendar Event For User and Lookup Room Availability actions are supported only on Exchange Server 2013.

- Exchange Server 2013 installed on Windows Server 2012 R2

This spoke may be compatible with the earlier versions of Microsoft Exchange Server.

Spoke requirements

Powershell remoting must be enabled on the target Exchange Server. For more information about the Microsoft Exchange Server, see Exchange Server documentation.

Spoke flows

The Exchange Server spoke provides sample flows to demonstrate automating the Exchange Server tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

Flow	Description
Pull From Subscriptions	Uses the Look up Items From Subscription ID subflow to periodically retrieve the modified items in an active subscription and saves the details in the ServiceNow instance.
Look up Calendar Item from Item ID Flow	Uses the Look up Items From Subscription ID subflow to display the details of the modified items in a subscription in the Subscription to Events Mapping module.
Renew Subscription	Uses the Renew Subscription subflow to renew subscription.

Note:
Subscriptions are valid for 24 hours and flows renew the subscriptions periodically. If there are failures with the third-party applications, subscriptions will not be renewed. That is, **Active** is set to **False**. In the event of failure, you should use the create subscription flow to create a subscription.

Spoke subflows

The Exchange Server spoke provides sample subflows to demonstrate automating the Exchange Server tasks. To customize a sample subflow, copy it to the required application scope. Available sample subflows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Look up Items From Subscription ID	Saves the details of the modified items in a subscription to the Event to Subscription Mapping table.
Create Subscription	Creates a subscription for the specified mailbox and adds it to the Subscription table. If the subscription already exists, the subflow adds the application details to the subscription record.
Renew Subscription	Renews a subscription for the given mailbox.

Spoke actions

The Microsoft Exchange Server spoke provides actions to automate address list, mailbox, and calendar event tasks.

Microsoft Exchange Server spoke actions

Category	Action	Description
Address List Management	Create Address List Using Included Recipients	Creates a new address list in Exchange Server using the **Included Recipients** field.
	Create Address List Using Recipient Filter	Creates a new address list in Exchange Server using the **Recipient** field.
	Delete Address List	Deletes the required address list on a required Exchange Server.
	Get Address List Details	Retrieves the details of a required address list on a required Exchange Server.
	Look Up Address List	Retrieves the address list details on a required Exchange Server using a search query.
	Look up Address List Details	Retrieves details of the specified address list by identity.
	Move Address List	Moves an address list to another location in the address hierarchy.
	Synchronize Address List	Refreshes email clients with the latest details, for a required address list in Exchange Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Exchange Server spoke actions (continued)

Category	Action	Description
	Update Address List Using Included Recipients	Updates details and recipients of a required address list using a the **Included Recipients** field.
	Update Address List Using Recipient Filter	Updates details and recipients of a required address list details using the **Recipient Filter** field.
Mailbox Management	Create Calendar Event For User	Creates a calendar event in Exchange Server. Calendar event can be either a meeting or appointment. **Note:** • This action is supported only on Exchange Server 2013. • This action uses the Exchange_https connection and credential alias.
	Create Mailbox	Creates mailboxes and user accounts simultaneously.
	Delete Mailbox	Deletes a mailbox in Exchange Server.
	Disable Mailbox	Disables a mailbox in Exchange Server.
	Enable Mailbox	Enables a mailbox in Exchange Server.
	Look up Calendar by Event ID	Retrieves the list of calendar events.
	Look up Mailbox	Retrieves mailbox properties for a given mailbox in Exchange Server.
	Look up Room Availability	Retrieves the availability response for a given array of room objects.
	Update Mailbox	Updates the properties of a mailbox in Exchange Server.
	Set Mailbox Auto Reply	Schedules the auto-reply for a given mailbox in Exchange Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Exchange Server spoke actions (continued)

Category	Action	Description
	Lookup Room Mailboxes	Retrieves all the room mailboxes in Exchange Server.
Meeting Management	Look up Meeting Suggestions	Retrieves the meeting suggestions for the specified mailboxes.
	Update a Calendar Meeting	Updates an existing calendar event that has already been created. While updating the meeting, in addition to saving the modified appointment item to the calendar folder, the updated meeting request is sent to all attendees.
	Look up Meetings Stream	Retrieves details of the user's meetings within the specified start and end times.
	Look up Folder ID	Retrieves Folder ID of the required folder.
	Delete Calendar Event for User	Deletes the specified existing calendar event. The update is sent to all attendees.
	Look up User Availabilities	Retrieves the availability response for a given mailbox.
Subscription Management **Note:** The Exchange Server spoke supports the calendar events only.	Create Subscription	Creates a new subscription for given mailbox.
	Look up Calendar Item from Item ID	Retrieves the calendar information for the given calendar ID.
	Look up Events by Subscription ID	Retrieves the latest changes in the calendar folder for the subscription since the last watermark.
Attachment Management	Copy Attachment to Event Record	Copies an calendar event's attachment to the specified record in the ServiceNow instance.
	Create Attachment	Adds attachment to an event.
	Delete Attachment	Deletes an attachment associated with the provided Attachment ID.
	Delete Attachments	Deletes one or more attachments associated with the specified event record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Exchange Server spoke actions (continued)

Category	Action	Description
	from Event Record	
	Look up Attachment by Attachment ID	Retrieves the specified attachment.

Spoke modules

The Exchange Server spoke adds a Microsoft Exchange Server Spoke module to your ServiceNow instance. Data is these modules is populated when the associated flows are executed:

Module	Description
Subscriptions	Displays details of the subscriptions in Exchange Server. Data is populated in this module when the Create Subscriptions and Renew Subscriptions subflows are executed.
Events	Displays details of the events in Exchange Server. Data is populated in this module when the Look up Calendar Item from Item ID flow is executed.
Event Attendees	Displays details of the event attendees in the events. Data is populated in this module when the Look up Calendar Item from Item ID flow is executed.
Subscription to Events Mapping	Displays details of the subscriptions and events. Data is populated in this module when the Look up Items From Subscription ID subflow is executed.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Two connection and credential aliases are created when the Microsoft Exchange Server spoke is activated, Exchange and Exchange_https.

Note:

- The Exchange_https alias is supported only on Exchange Server 2013.
- The Exchange_https alias is required to use the Create Calendar Event For User and Lookup Room Availability actions.

For information about setting up the spoke, see Set up the Microsoft Exchange Server spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server requirements

Your instance must have a MID Server set up and configured to run PowerShell 2.0. Use the connection record associated with the Microsoft Exchange alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Microsoft Exchange Server spoke

Connect your ServiceNow instance with the Microsoft Exchange Server by setting up the connection and credential records for both the Microsoft Exchange Server that are provided when you install Integration Hub on your instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the latest Microsoft Exchange Server spoke plugin on your ServiceNow instance.
- Role required: admin.

About this task

The Microsoft Exchange Server spoke provides two aliases: Exchange and Exchange_https and their respective configuration templates as out of the box components when you install the Microsoft Exchange Server . These out of the box components enable you to easily set up the connection and credential records for both the aliases by just providing the connection and credential information. The out of the box components are already configured for you. To learn how to create the connections and credential records, see:

- Configure a connection for the Exchange alias
- Configure a connection for the Exchange_https alias

You can perform all spoke actions except the Create Calendar Event For User and Lookup Room Availability actions. The Create Calendar Event For User and Lookup Room Availability actions are supported only on Exchange Server 2013.

Note:
The user details that are provided in the credential record must have the application impersonation role.

To use the Create Calendar Event For User and Lookup Room Availability actions, perform the same steps again for the Exchange_https connection and credential alias. MID Server isn't necessary to perform this action.

Configure a connection for the Exchange alias

Configure a connection for the Exchange alias to establish a connection between the ServiceNow® instance and the Microsoft Exchange Server host.

Before you begin

Role required: admin.

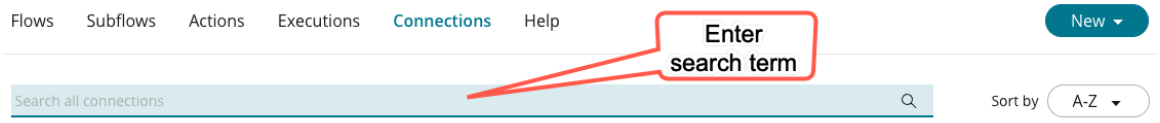
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the **Exchange** alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
To find the alias, in the Search all connections field, enter `Exchange`.

Search the Exchange alias on the Connections tab



The Exchange alias tile appears under the **Connections** tab.

5. Click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Microsoft Exchange Server spoke, click **View Details**

Default connection record

   - To manage more than one Microsoft Exchange Server spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

Configure button for Exchange alias

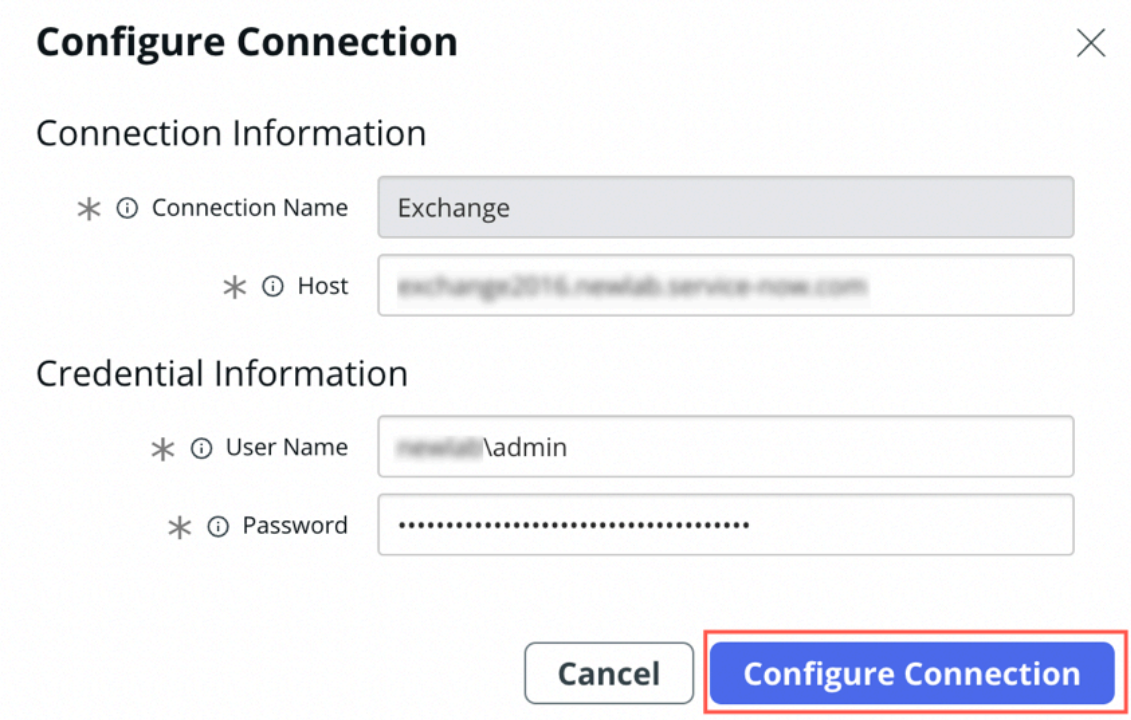
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the form, fill in the fields.

Exchange alias connection and credential form

Field	Description
Connection Name	Name that uniquely identifies the connection and credential record. For example, Microsoft Exchange. **Note:** The connection name of the first record is read-only. You can provide custom names for the subsequent records.
Host	Fully qualified domain name of the target host where the Microsoft Exchange Server is installed. For example, `<host>.<domain>.com`.
User Name	User name with access to the target Windows host.
Password	Password for the account.

Configure Connection form



7. Select **Configure Connection**.
   The connection and credential record for the Exchange alias is created.

Configure a connection for the Exchange_https alias

Configure a connection for the Exchange_https alias to establish a connection between the ServiceNow® instance and the Microsoft Exchange Server host.

Before you begin

Role required: admin.

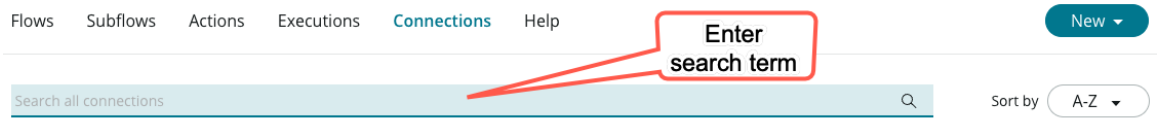
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the **Exchange_https** alias.

Tip:
To find the alias, in the Search all connections field, enter `Exchange_https`.

Search the Exchange_https alias on the Connections tab



The Exchange_https alias tile appears under the **Connections** tab.

5. Click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Microsoft Exchange Server spoke, click **View Details**

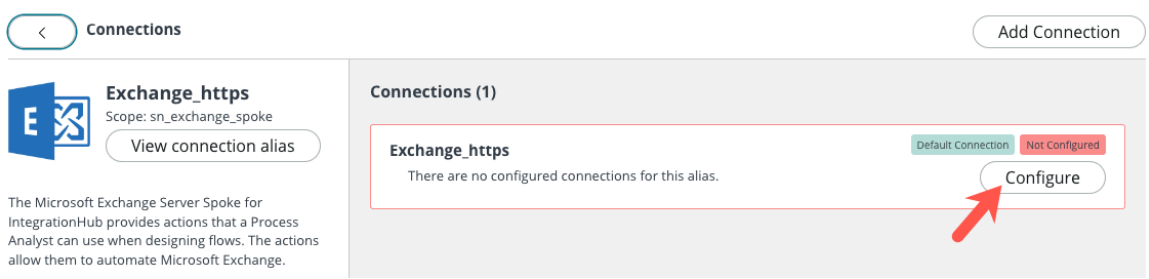
Default connection record

   - To manage more than one Microsoft Exchange Server spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure button for Exchange_https connection record alias



6. On the form, fill in the fields.

Exchange_https connection form

Field	Description
Connection Name	Name that uniquely identifies the connection and credential record. For example, Exchange_https. **Note:** The connection name of the first record is read-only. You can provide custom names for the subsequent records.
Host	Fully qualified domain name of the target host where the Microsoft Exchange Server is installed. For example, `https://mail.example.com/EWS/Exchange.asmx` can be the format of the host URL where ○ `mail.example.com` is the placeholder for your Exchange server's domain ○ `/EWS/Exchange.asmx` is the path to the Exchange Web Services (EWS) endpoint
User Name	User name with access to the target Windows host.
Password	Password for the account.

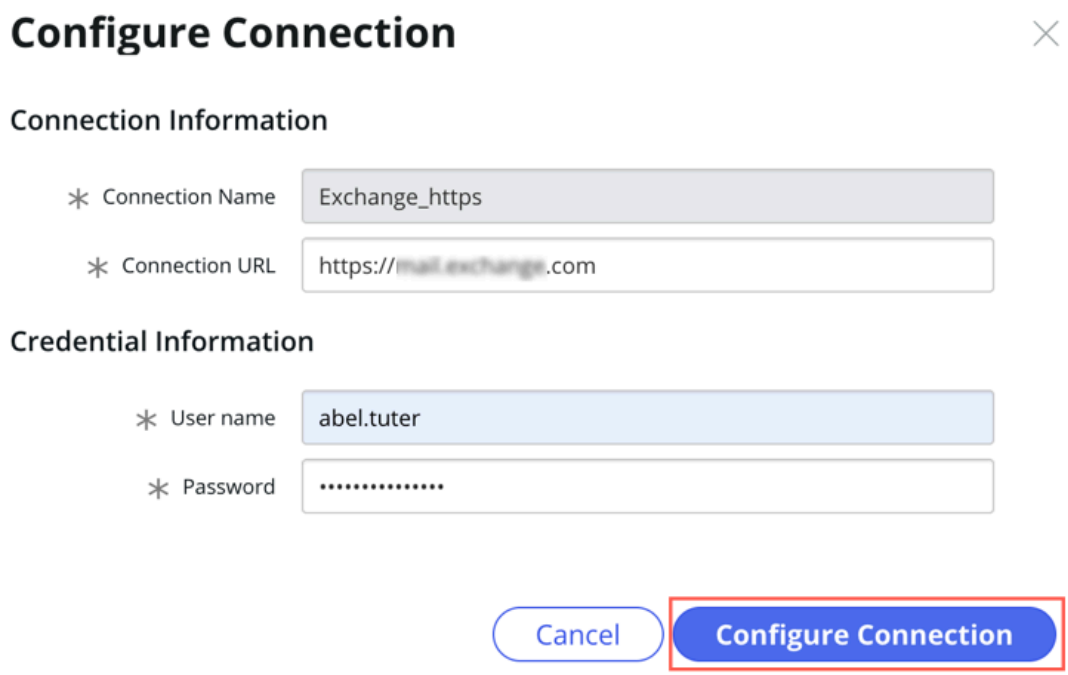
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Connection form



7. Select **Configure Connection**.
The connection and credential record for the Exchange_https alias is created.

Microsoft Intune Spoke

Manage devices and applications in the Microsoft Intune account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

The Microsoft Intune spoke v1.4.1 is the latest version.

Note:
Deployment of applications on Android devices isn't supported.

Supported versions

This spoke was built for the Microsoft Intune Application programming Interface (API) version v1, but may be compatible with the later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Microsoft Entra ID Spoke (formerly Microsoft Azure Active Directory spoke)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation. For more information on licenses, contact your account manager.

Spoke subflows

The Microsoft Intune spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to required application scope. Available sample subflows include:

Subflow	Description
Create Software Configuration	Enables a CSD agent to create the software configuration record of the specified Microsoft Intune application.
Configure Group	Enables a CSD agent to create and configure the Microsoft Intune group in Intune Admin Portal.
Deploy Application	Adds the provided user or device to a group in the Microsoft Intune server.
Discover and Store Data	Discovers the data from the Microsoft Intune server and updates the records in the Application [sn_ms_intune_spoke_application], Group [sn_ms_intune_spoke_group], and Deployment [sn_ms_intune_spoke_deployment] tables.
Look up Application Details	Retrieves the additional deployment details for applications and updates the respective records in the deployment table.
Look up Configuration Data	Retrieves configuration data for the specified requested item or software configuration record.
Look up Groups	Returns the list of install groups or uninstall groups associated with given application id.
Revoke Application	Removes the provided user or device from the given group in the Microsoft Intune server.

Important:
To use these subflows, install the Client Software Distribution 2.0 application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Microsoft Intune spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Application Management	Get Managed Application	Retrieves the details of an application.
	Look up Application Assignments	Retrieves the application assignment data from the Microsoft Intune server.
	Look up Managed Applications	Retrieves a list of all the applications.
Device Management	Delete Managed Device	Deletes a managed device.
	Get Managed Device	Retrieves the details of a managed device.
	Look up Managed Devices	Retrieves the details of a managed device.
	Look up Managed Devices By Application	Retrieves the details of a managed device within an application.
	Sync Managed Device	Forces a managed device to check in with Microsoft Intune to retrieve and apply any pending actions, policies, and configuration updates.
	Look up Managed Devices By User	Retrieves the details of a managed device for a user.
	Update Managed Device	Updates the details of a managed device.
Metadata Retrieval	Look up Application ID	Returns the Application ID for the dynamic input of the Lookup Managed Devices By Application action.
Data Management **Important:** To use these actions, install the Client Software Distribution 2.0 application.	Look up Configuration Data	Retrieves the configuration data from a requested item or software configuration.
	Prepare Software Data	Prepares the software data for the specified requested item that can be used for deployment or revocation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke module

The Microsoft Intune spoke adds the Microsoft Intune application to your instance and includes these modules:

Module	Description	Table
Applications	Displays the list of applications from the Microsoft Intune server.	Application [sn_ms_intune_spoke_application]
Groups	Displays the list of groups from the Microsoft Intune server.	Group [sn_ms_intune_spoke_group]
Configurations	Stores software configuration details for the applications.	Configuration [sn_ms_intune_spoke_sf_config]
Deployments	Displays the list of deployments on the Microsoft Intune server.	Deployment [sn_ms_intune_spoke_deployment]
Server Instances	Stores details of the provider servers.	Server Instance [sn_ms_intune_spoke_server]

Important:
To use these modules and tables, install the Client Software Distribution 2.0 application.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Microsoft Intune spoke.

Set up the Microsoft Intune spoke

Integrate your ServiceNow instance with the Microsoft Intune account by creating a custom OAuth application in Microsoft Intune.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Intune plugin.
- Role required: admin.

Register OAuth application using the Microsoft Azure portal

Provide authorization to the ServiceNow instance by registering an application on Microsoft Entra ID.

Before you begin

Role required: Azure Active Directory admin

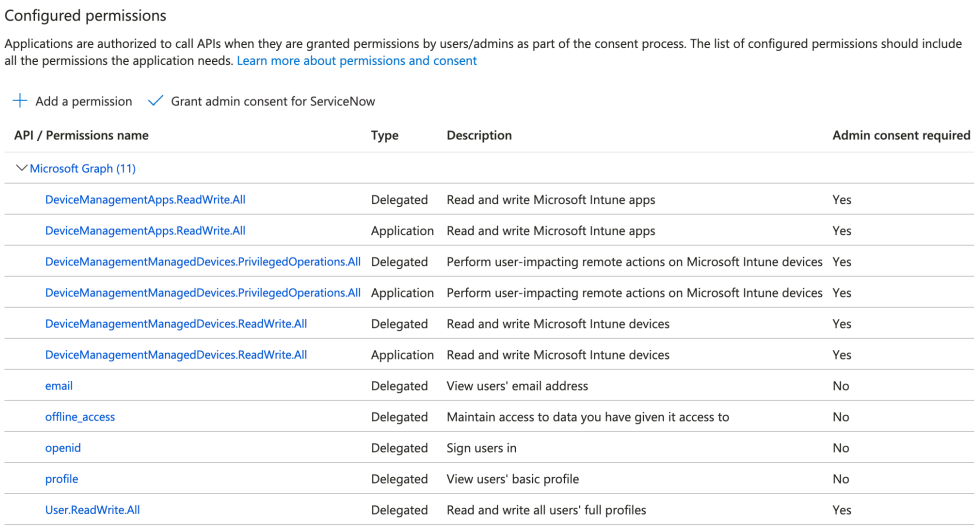
About this task

Complete these steps from the Microsoft Azure portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to the Microsoft Azure portal.
   For instructions on registering an application, see Tutorial: Register an app with Azure Active Directory in the Microsoft Azure documentation.
2. In the Azure portal, add the **Redirect URIs**.
   The Redirect URI should be in the format `https://<instance-name>.service-now.com/oauth_redirect.do`. For more information, see Authentication and authorization for Azure Time Series Insights API.
3. For the **Required Permissions**, ensure that you provide these permissions:



Configured permissions

Applications are authorized to call APIs when they are granted permissions by users/admins as part of the consent process. The list of configured permissions should include all the permissions the application needs. Learn more about permissions and consent

+ Add a permission ✓ Grant admin consent for ServiceNow

API / Permissions name	Type	Description	Admin consent required
Microsoft Graph (11)			
DeviceManagementApps.ReadWrite.All	Delegated	Read and write Microsoft Intune apps	Yes
DeviceManagementApps.ReadWrite.All	Application	Read and write Microsoft Intune apps	Yes
DeviceManagementManagedDevices.PrivilegedOperations.All	Delegated	Perform user-impacting remote actions on Microsoft Intune devices	Yes
DeviceManagementManagedDevices.PrivilegedOperations.All	Application	Perform user-impacting remote actions on Microsoft Intune devices	Yes
DeviceManagementManagedDevices.ReadWrite.All	Delegated	Read and write Microsoft Intune devices	Yes
DeviceManagementManagedDevices.ReadWrite.All	Application	Read and write Microsoft Intune devices	Yes
email	Delegated	View users' email address	No
offline_access	Delegated	Maintain access to data you have given it access to	No
openid	Delegated	Sign users in	No
profile	Delegated	View users' basic profile	No
User.ReadWrite.All	Delegated	Read and write all users' full profiles	Yes

   Depending on your requirement, the permissions can be of the type, **Application**, or **Delegated**. For more information, see Quickstart: Configure a client application to access a web API in Microsoft Docs.
4. In the Azure portal, create a client secret.
   For more information, see Option 2: Create a new application secret.
5. Copy the client secret for later reference.

Result
The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Intune as an OAuth provider

Use the information generated during the application configuration in Microsoft Azure portal to register Microsoft Intune as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record, **Microsoft Intune**.
3. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Registries form

Field	Description
Client ID	Application ID created during application registration.
Client Secret	Client secret created during application registration.
Active	Option to actively use the application registry.
Authorization URL	OAuth authorization code endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/authorize`.
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`.
Token Revocation URL	OAuth server token revocation endpoint.
Redirect URL	OAuth callback endpoint. Enter `https://<instance-name>.service-now.com/oauth_redirect.do`.

4. Right-click the form header, and click **Save**.

Create a credential record for the Microsoft Intune spoke

Authorize the Microsoft Intune spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Intune connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

OAuth 2.0 Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `MS Intune Cred`.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of Microsoft Intune as an OAuth provider. For example, `Microsoft Intune default_profile`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Right-click the form header and click **Submit**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

Create a connection record for the Microsoft Intune spoke

Perform actions in Microsoft Intune by creating connection records for your Microsoft Intune account. The Microsoft Intune connection and credential alias uses these connections to perform actions.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, **Microsoft_Intune**.
3. From the **Connections** tab, click **New**.
4. On the form, fill in the fields.

HTTP(s) Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `MS Intune Connection`.
Credential	Credential record created for Microsoft Intune spoke. For example, `MS Intune Cred`.
Connection alias	Alias record associated with this connection.
URL builder	**Note:** Do not select the check box.
Connection URL	Connection URL. Enter `https://graph.microsoft.com`.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

5. In the **Attributes** tab, specify `v1.0` for **u_version**.
6. Click **Submit**.

Result
The Microsoft Intune spoke is set up and Microsoft Intune is integrated with the ServiceNow instance.

Microsoft OneDrive Spoke

Automate file and folder management and collaboration in Microsoft OneDrive. Adds Microsoft OneDrive data to your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft OneDrive spoke v2.8.2 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

API version v1.

Spoke flows

The Microsoft OneDrive spoke gives sample flows in the draft state to demonstrate automating Microsoft OneDrive tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Renew Subscriptions	Renews the expired subscriptions by updating the expiration date of the subscription.

Spoke subflows

The Microsoft OneDrive spoke provides sample subflows in the draft state to demonstrate automating Microsoft OneDrive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Download New OneDrive File to Servicenow	Downloads the new files uploaded in a resource to a ServiceNow record

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Subscribe to Webhook	Subscribes a listener application to receive notifications when data changes.
Sync Changes	Tracks changes to a drive and its children over time.
Get Document Latest URL	Gets the latest path of a file in OneDrive using the Sys ID of the document as an input. To use this subflow, a corresponding OneDrive connection and credential must be created, and a OneDrive authorization token should be available.
Reconnect Document from Microsoft OneDrive	Gets the latest web URL and webdav URL of a document from the Microsoft OneDrive by using the Document Sys ID, Provider Detail Sys ID, Target Table Name, Target Table Sys ID, and the Document Name. To use this subflow, a corresponding OneDrive connection and credential must be created, and a OneDrive authorization token must be available.

Spoke actions

The Microsoft OneDrive spoke provides actions to automate Microsoft OneDrive tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
