Drive Management	Look up Drive Info	Gets the metadata of a specific Microsoft OneDrive drive.
Folder Management	Move File Or Folder Item	Moves a file or folder in Microsoft OneDrive to the target location.
	Create Folder	Creates a folder in Microsoft OneDrive.
	Update File Or Folder Name	Updates the name for a file or folder item by ID.
	Delete File Or Folder Item	Deletes a file or folder from Microsoft OneDrive.
File Management	Check In File	Checks in a drive item and sends a sharing invitation. When you check in a file, other users can access the checked-in file.
	Check Out File	Checks out a drive item from OneDrive. When you check out a drive item, other users cannot edit the document. Other users also cannot see the changes that you made in the document until you check in the document.
	Copy OneDrive File to Attachment	Copies a file in Microsoft OneDrive to an attachment in a record in a ServiceNow record.
	Copy Attachment to OneDrive	Copies an attachment record in ServiceNow to Microsoft OneDrive
	Copy File Or Folder Item	Asynchronously creates a copy of a Microsoft OneDrive item (including children), under a new parent item or with a new name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Items	Retrieves a list of drive items from a path or the source and source ID of a drive item.
	Look up File Or Folder Item Info By ID	Gets file metadata information from the file or folder ID in Microsoft OneDrive.
	Look up File Or Folder Item Info By Path	Gets file metadata information from the file path in Microsoft OneDrive.
	Copy Attachment To OneDrive Using Path	Copies an attachment record in ServiceNow to OneDrive.
	Copy OneDrive File To Attachment Using File Path	Copies a file using its path in OneDrive to an attachment in a record in ServiceNow.
	Copy OneDrive File Version To Attachment	Copies a file in OneDrive to an attachment in a record in ServiceNow.
	Delete Version of a File	Deletes the specified version of a file from OneDrive.
	Look up All Versions of a File	Retrieves all the versions a file in OneDrive.
	Restore File Version	Restores the specified file version and make this version the latest.
	Upload and Replace File	Uploads the updated version of an existing file or replaces the existing file with a new file. **Note:** The maximum size of the file cannot exceed 4 MB.
Search Documents	Search Files or Folder Items	Searches the drive items (files or folders) based on metadata attributes such as the item name.
Document Sharing	Add Collaborator	Adds a collaborator and their permissions to a file or a folder. You can identify the collaborator by their Azure AD Alias or an Object ID.
	Look up Collaborators	Lists all the collaborator details associated with a file or folder in Microsoft OneDrive.
	Remove Collaborator	Removes a collaborator from a file or folder in Microsoft OneDrive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Permission Management	Add Permission	Sends a sharing invitation for a drive item. A sharing invitation allows the recipients to access the drive item and optionally sends them an email with a sharing link.
	Create Sharing Link	Creates a sharing link which allows you to share a drive item with other users.
	Delete Permission	Removes access to a drive item.
	Look up Permissions	Retrieves the sharing permissions of a drive item.
	Update Permission	Updates the expiration date of the subscription.
Webhook Management	Subscribe Webhook	Creates a subscription that sends notifications when data changes.
	Unsubscribe Webhook	Deletes the specified subscription ID.
	Get SyncToken for Subscription	Retrieves the latest sync token for the specified subscription ID.
	Look up Subscriptions	Retrieves the list of active subscriptions.
	Renew Subscription	Updates the expiration date of the subscription.
	Sync Changes	Tracks changes to a drive and drive's children over time.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
Microsoft OneDrive sharing management AI agent	Adds or removes a collaborator and manages their permissions for a file or folder in Microsoft OneDrive. Also, lists all the collaborator details associated with a file or folder.
Microsoft OneDrive drive management AI agent	Retrieves the metadata of a specific drive in Microsoft OneDrive.
Microsoft OneDrive file management AI agent	Manages files, file versions, and attachments in Microsoft OneDrive. Also, retrieves details of the required file.
Microsoft OneDrive folder management AI agent	Manages folders in Microsoft OneDrive.
Microsoft OneDrive permission management AI agent	Creates sharing link for a drive item and manages permissions.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke module

Bi-directional webhooks can be set up to get notifications about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in OneDrive that you want to be notified about. When the conditions are met, a routing policy triggers the associated subflow, which in turn automates the OneDrive tasks.

The bi-directional webhooks require separate setup and can be used independently without using the spoke actions. By default, the OneDrive Webhooks application is available in the OneDrive spoke and has the following modules:

Module	Description
OneDrive SyncToken	Enables you to view SyncTokens of OneDrive.
OneDrive Webhook Registries	Enables you to create and view the OneDrive webhooks in ServiceNow.
OneDrive Webhook Routing Policy	Enables you to create and view the routing policies for the OneDrive webhooks in ServiceNow. You can also customize the conditions in the routing policies as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OneDrive Online account requirements

The Microsoft OneDrive spoke requires a custom app that you create in Microsoft Azure.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Single tenant

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Select this alias in the Tenant record to authorize changes in Microsoft OneDrive for a single tenant.

For information about setting up the spoke, see Set up Microsoft OneDrive spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Microsoft OneDrive alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up Microsoft OneDrive spoke

Integrate the ServiceNow instance and Microsoft OneDrive spoke by using OAuth 2.0 credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft OneDrive spoke.
- Role required: admin.

Configure Microsoft OneDrive application

Create a custom OAuth application from your Microsoft OneDrive account to enable OAuth 2.0 authentication with the Microsoft OneDrive spoke.

Before you begin

Microsoft OneDrive requirements:

- Microsoft OneDrive account
- Microsoft Azure account
- Role required: Microsoft OneDrive tenant administrator credentials

About this task

Complete these steps from your Azure Developer account. See the Azure product documentation for instructions on creating and configuring custom applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to the Microsoft Azure App registration portal with your organization credentials.
2. Register a new custom application.
   Fill in the application name, the supported account type, and the redirect URI, and then click **Register**.
   An overview of the application's basic information is shown.

   Note:
   Ensure that you enter the redirect URI in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

3. Copy the application ID to a text file.
   You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.
4. Add a client secret.

   a. In Microsoft Azure, navigate to **Manage** > **Certificates & secrets**.

   b. Provide a description and an expiration date and click **Add**.

   Note:
   The client secret is only displayed in plain text for a short time. You use the client secret when you connect the application to ServiceNow.

5. Enable the permissions you want the application to support.
   For more information, see the Microsoft Graph permissions reference.

   a. In Microsoft Azure, navigate to **Manage** > **API permissions**.

   b. Click the Microsoft Graph tile.

   c. Select the Delegated or Application permissions that the application supports.
   Delegated permissions enable the application to access the API as a signed-in user.
   Application permissions enable the application to run as a background service or daemon without a signed-in user. You must mention these API permissions in the **OAuth Entity scopes** tab while configuring the application registry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You must ensure that these API permissions are provided for your custom app.

Name	OAuth scope
Calendars.ReadWrite	Calendars.ReadWrite
Calendars.ReadWrite.Shared	Calendars.ReadWrite.Shared
email	email
Files.Read	Files.Read
Files.Read.All	Files.Read.All
offline_access	offline_access

d. Click **Add permissions**.

Register Microsoft OneDrive as OAuth provider

Use the information generated during Microsoft OneDrive account configuration to register Microsoft OneDrive as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

- Request Integration Hub subscription.
- Activate Microsoft OneDrive spoke.
- Create Microsoft OneDrive application.
- If you are using a single tenant app registration, obtain the value of **Directory (tenant) ID** from the Azure portal.

Role required: admin

Procedure

1. In ServiceNow, navigate to **System OAuth** > **Application Registry**.
2. Click **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. Enter these values in the Application Registries form:

Field	Value required
Name	Enter any name to uniquely identify the record, for example `OneDrive OAuth profile`.
Client ID	Enter the Application ID of the OneDrive application you created in Azure.
Client Secret	Enter the Client Secret you generated when you created the application in Azure.
Default Grant type	Select **Authorization Code**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Authorization URL	○ If you are using a multi-tenant app registration, click the lock icon , enter `https://login.microsoftonline.com/common/oauth2/v2.0/authorize`, and then click the lock icon again. ○ If you are using a single tenant app registration, click the lock icon , enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/authorize`, and then click the lock icon again. In the URL, replace `<Directory-ID>` with the value of **Directory (tenant) ID** obtained from the Azure portal.
Token URL	Click the lock icon , enter `https://login.microsoftonline.com/common/oauth2/v2.0/token`, and then click the lock icon again.
Redirect URL	Click the lock icon , enter `https://<instance>.service-now.com/oauth_redirect.do`, and then click the lock icon again.

5. In the **OAuth Entity Scopes** related list, add scopes to match the permissions you defined when you configured the Microsoft OneDrive application.
   Click **Insert a new row** and enter the name and the OAuth scope of the permission. The name and the OAuth scope are often the same string. Ensure that these scopes are provided.

Name	OAuth scope
Calendars.ReadWrite	Calendars.ReadWrite
Calendars.ReadWrite.Shared	Calendars.ReadWrite.Shared
email	email
Files.Read	Files.Read
Files.Read.All	Files.Read.All
offline_access	offline_access

Note:
The scopes mentioned here must be same as the API permissions provided during the custom app configuration.

6. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

Create Connection and Credential Alias for Microsoft OneDrive spoke

Create Connection records to your Microsoft OneDrive account. The Microsoft OneDrive spoke connection and credential aliases use these connections to perform actions in the Microsoft OneDrive.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **OneDrive**.
2. From **Related Links**, click **Create New Connection & Credential**.
3. On the form, fill in these fields:

Field	Value required
Connection Name	Name to identify the connection. This field is automatically set to Microsoft Onedrive Spoke Connection
Connection URL	The URL to make connection to the spoke. This field is automatically set to https://graph.microsoft.com
OAuth Entity Name	Name of the OAuth entity profile. This field is automatically set to Microsoft Onedrive Spoke Auth.
OAuth Client ID	Client ID of the OneDrive application you registered in Microsoft Azure App registration portal.
OAuth Client Secret	Client Secret generated when you registered the application in Microsoft Azure portal.
OAuth Redirect URL	The redirect URL. The format of the URL is https://<your-instance>.service-now.com/oauth_redirect.do

4. Click Create and Get OAuth Token.

Result
The Microsoft OneDrive spoke is set up and integrated with the ServiceNow instance.

Set up a bi-directional webhook for the Microsoft OneDrive spoke

Configure a webhook to subscribe to OneDrive with a ServiceNow callback URL.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft OneDrive spoke.
- Role required: admin.

Register a OneDrive webhook in ServiceNow

Register a OneDrive webhook in ServiceNow to notify the ServiceNow app when certain events occur in OneDrive.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Microsoft OneDrive Spoke** > **OneDrive Webhook Registries**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft OneDrive Webhook Registries

Field	Description
Name	Unique name to identify the record. For example, `OneDrive webhook`.
Description	Description of the record.
Path	OneDrive path. By default, this path is set to `api/sn_onedrive_spoke/onedrive/subscription`
Secret Key	Secret key for accessing OneDrive webhook. **Note:** The **Secret Key** field value is auto-populated when the webhook registry record is saved.

4. Right-click the form header and click **Save**.
5. Click **CallBack URL**.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

Customize OneDrive bi-directional webhook

Create a webhook routing policy and subflow according to your requirement.

Before you begin

Role required: admin

About this task

Routing policies in the OneDrive Webhook Routing Policy module triggers the subflows and notifies the ServiceNow instance when certain events occur in your OneDrive account. See OneDrive spoke for information about the fields that the routing policy and subflows support.

Procedure

1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Click **Subflows**.
3. Create a copy of any of the default subflows, for example, Sync Changes.
4. Customize the subflow according to your requirement and publish it.
   See Building subflows for more information about creating and using subflows, and OneDrive spoke v1.6 for information about the supported subflows.
5. Navigate to **Microsoft OneDrive Spoke** > **OneDrive Webhook Routing Policy**.
6. Click **New**.
7. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met. **a.** Click the lookup icon ( ). **b.** Select the required subflow from the Document list. **Note:** Ensure that the Table name is `Flow [sys_hub_flow]`.
Condition	Conditions to be met when the required events occur in OneDrive.
Answer	Subflow which is triggered when the specified conditions are met.

8. Click **Submit**.

Result
The routing policy and subflow are created.

Microsoft SCCM Spoke

Automate management of user collections, device collections, and application deployments on a Microsoft System Center Configuration Management (SCCM) server.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft SCCM spoke v1.1.2 is the latest version.

Spoke flows & subflows

This spoke has no sample flows or subflows.

Spoke actions

The Microsoft System Center Configuration Management (SCCM) spoke spoke provides actions to automate SCCM tasks when events occur in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Application Management	Get Applications	Retrieves the application data from the SCCM server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Deployment Management	Get Deployments	Retrieves deployment data from the SCCM server.
Device Management	Add to Device Collection	Adds a device to a collection in SCCM.
	Get Device Collections	Retrieves device collection data from the SCCM server.
	Is Device In Collection	Checks if a specified device exists in a device collection.
	Remove From Device Collection	Removes a device from an existing device collection.
User Management	Add to User Collection	Adds a user to a collection in SCCM.
	Get User Collections	Retrieves user collection data from the SCCM Server.
	Is User In Collection	Checks if a specified user exists in a user collection.
	Remove From User Collection	Removes a user from a user collection.

To see inputs and outputs for these activities, see SCCM activity pack.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the SCCM alias record to authorize actions on a Microsoft System Center Configuration Management (SCCM) server.

Connection alias	Description	Connection URL
SCCM	Connection to the SCCM server.	The URL of the host machine where the SCCM server is installed.

For information about setting up the spoke, see Set up the Microsoft SCCM spoke.

MID server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For information, see MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Microsoft SCCM spoke

Integrate the ServiceNow instance and SCCM using Windows credentials to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft SCCM spoke.
- Role required: admin.
- Configure the MID Server for SCCM activities.

Note:
Ensure that user must be able to establish remote PowerShell sessions with the Microsoft SCCM server. The spoke scripts use *`Microsoft.PowerShell32`* configuration for creating sessions. For user permissions, see User permissions in Microsoft Learn.

Create Credential record for the SCCM spoke

Create a Credential record to the SCCM server. The SCCM spoke connection and credential alias uses this credential to authorize actions.

Before you begin

- Request Integration Hub subscription
- Role required: admin
- Configure the MID Server for SCCM activities

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Windows Credentials**.
   A blank Windows Credentials form displays.
4. Enter these values, then click **Submit**.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `SCCM Credential`.
Active	Enable
User name	Enter a user name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.
Password	Enter the password for the account.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID servers**.
Order	Select the order to apply this credential. For example, enter `100`.

Create Connection record for the SCCM spoke

Create a Connection record to your SCCM host machine. The SCCM spoke connection and credential alias uses this connection to perform actions in SCCM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request Integration Hub subscription
- Create Credential record for the SCCM spoke
- Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **SCCM**.
3. From the **Connections** tab, click **New**.
   The system displays a blank Basic Connection form.
4. Enter these values, then click **Submit**.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `SCCM Connection`.
Credential	Select the Credential record you created for Windows. For example, select **SCCM Credential**.
Host	Enter the fully qualified domain name of the target host where the SCCM server is installed. For example, `<host>.<domain>.com`.
Use MID server	Enable
Override default port	Enter the target port used by the connection. If blank, the system uses the default port.

What to do next

Configure MID Server as WinRM trusted host

Microsoft Security Response Center Spoke

Integrate the Microsoft Security Response Center API with your ServiceNow instance to investigate all reports of security vulnerabilities affecting the Microsoft products and services, and gather information to manage security risks and keep the system protected.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes .

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview .

Spoke version

Microsoft Security Response Center spoke v1.3.0 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

This spoke was built for Microsoft Security Response Center API version 2020, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Security Response Center spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Abuse Management	Submit Abuse Report	Submits report to the Microsoft Computer Emergency Response Team using the Common Abuse Reporting system (CARS).
Security Management	Get Security Update Details	Retrieves information about the specific CVRF ID.
	Look up Security Updates	Retrieves the list of all Microsoft security updates.
	Look up Security Updates By Key	Retrieves the list of security updates based on the provided ID, CVE, or year.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agent is Microsoft Security Response Center security manager. This AI agent retrieves details of the security updates based on the provided ID, CVE, or year.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Microsoft Security Response Center spoke.

Set up the Microsoft Security Response Center spoke

Set up an outbound integration between your ServiceNow instance and the Microsoft Security Response Center instance by setting up a connection and credential record.

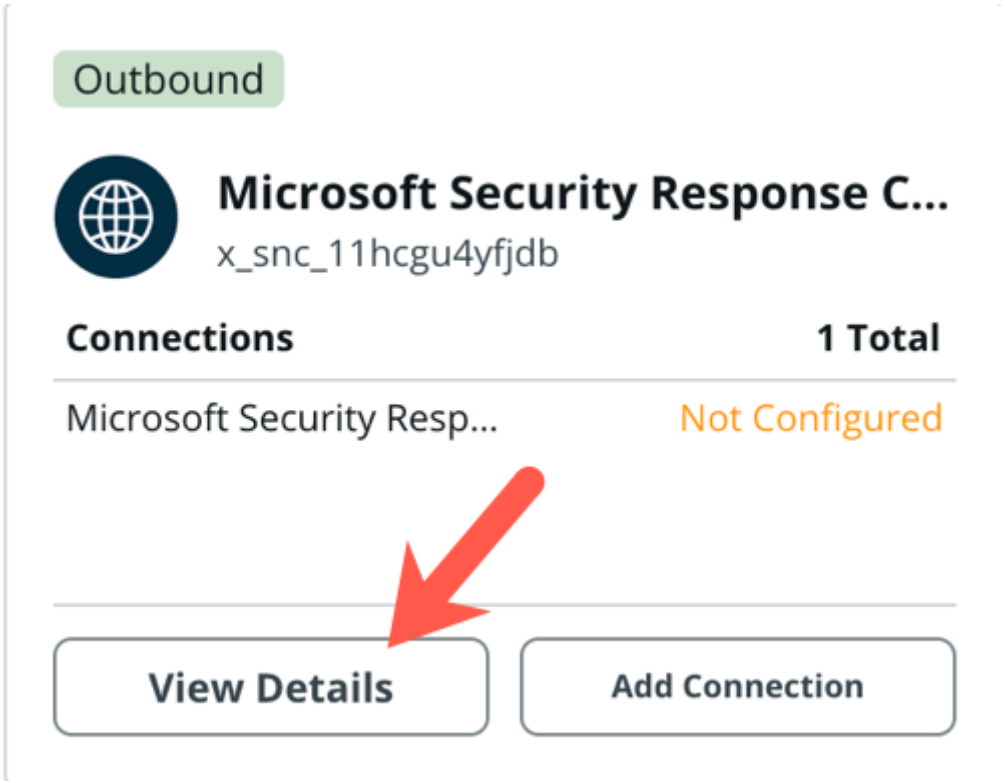
Before you begin

- Admin access to the Microsoft Security Response Center portal.
- Request an Integration Hub subscription.
- Activate the Microsoft Security Response Center spoke.
- Role required: admin

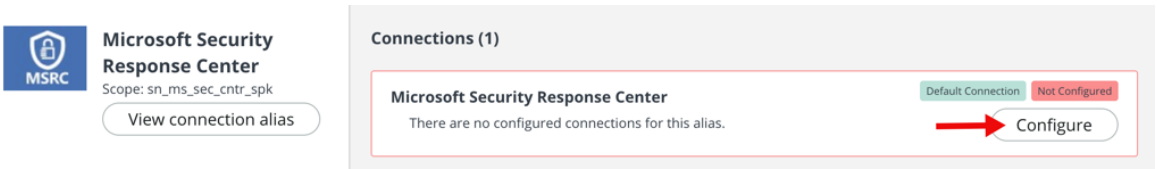
Procedure

1. Obtain the API key from the Microsoft Security Response Center portal that you must provide in the connection and credential record.
2. Navigate to **All** > **Process Automation** > **Workflow Studio**.
3. Click the **Integrations** tab.
4. Click the **Connections** tab.
5. In the Search all connections field, enter `Microsoft Security Response Center`.
6. In the Microsoft Security Response Center tile, select **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select **Configure**.

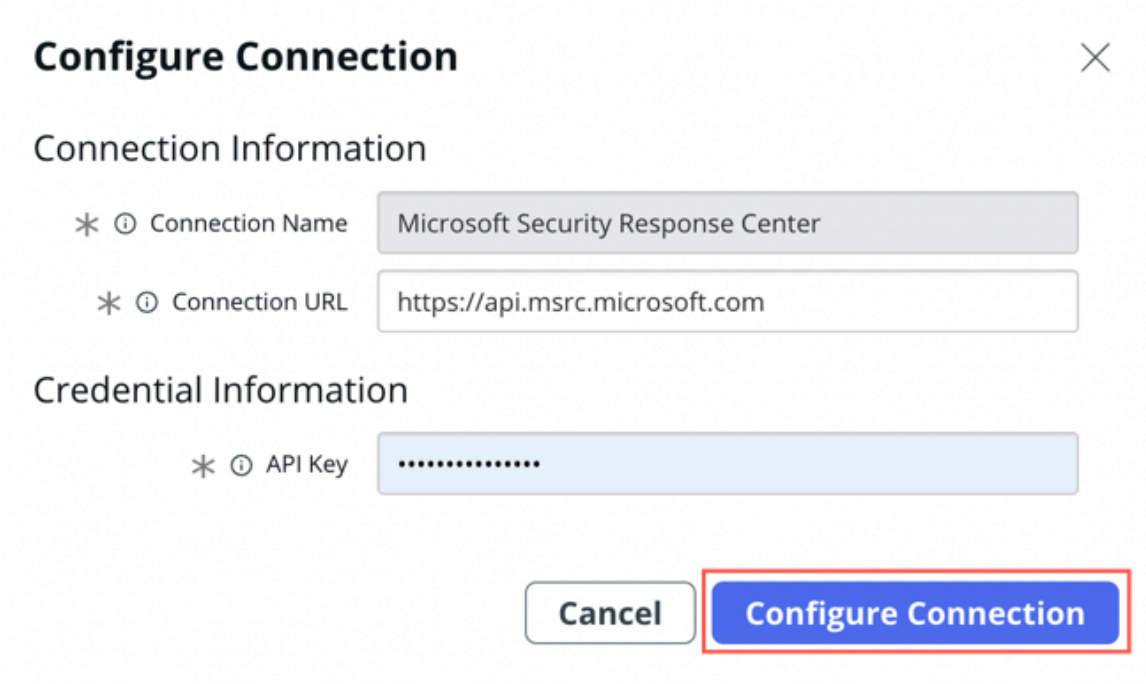


8. Fill the Configure Connection form.

Configure connection

Field	Description
Connection Name	Unique name of the connection record. **Note:** The default and read-only name of the first connection record is Microsoft Security Response Center. To provide a custom connection name, select **Add Connection**to create a connection record.
Connection URL	The URL to the Microsoft Security Response Center server. The URL is https://api.msrc.microsoft.com.
API Key	API key that you copied from the Microsoft Security Update API page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Select **Configure Connection**.

   The spoke connection is configured and ready to be used.

Microsoft SharePoint Online Spoke

The Microsoft SharePoint Online spoke integrates your ServiceNow® instance with Microsoft SharePoint Online so that you can automate various predefined actions as part of a Workflow. For example, you can rename a folder on Microsoft SharePoint Online when a record in the database is updated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft SharePoint Online spoke v2.10.0 is the latest version.

Note:
The Microsoft SharePoint online spokes does not support the On-premise SharePoint.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Complex Object (com.glide.cobject)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

Microsoft SharePoint Application Programming Interface (API) version v1.

Spoke flows

The Microsoft SharePoint Online spoke provides sample flows in the draft state to demonstrate automating the Microsoft SharePoint Online tasks. To customize a sample flow, copy it to a new application scope. The following table shows the available sample flows.

Flow	Description
New Attachment on Record creates folder, and copies attachment	When an attachment is created in a database table, a folder is created for a knowledge record on the Microsoft SharePoint Online spoke. Then, the attachment is copied to the folder.
Create Site For Knowledge Base	When a knowledge base is created in the database table, the flow creates a site for it on the Microsoft SharePoint Online

Note:

- If the single sign-on (SSO) is set up, you can use the action Look Up User Information By Login Name and verify that you're approved to perform the spoke actions.
- Flow designers and action designers must ensure that the user authorization checks are performed before the flow or action is executed.

Spoke subflows

The Microsoft SharePoint Online spoke provides a sample subflow in the draft state to demonstrate automating Microsoft SharePoint Online tasks. To customize the subflow, copy it to a new application scope.

Subflow	Description
Remove Then Add A User To A Group	Removes a user from a Microsoft SharePoint Online group and adds a new user.
Delete Modern Site (without O365 Group)	Deletes the modern site associated with Non O365 Group (communication site).
Submit Modern Site (with O365 Group) for Deletion	Submits a modern Site (with O365 Group) for Deletion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
	Note: It may take up to 30 minutes for site to move under deleted sites section of SharePoint Admin portal.

Note: Flow designers and action designers must ensure that user authorization checks are performed before the flow or action is executed.

Spoke actions

The Microsoft SharePoint Online spokeprovides actions to automate various Microsoft SharePoint Online tasks that are based on the triggers in the ServiceNow instance.

You can perform some actions by using the SharePoint Online connection and the remaining actions by using the SharePoint Graph connection.

The actions in the following table use the SharePoint Online connection and the credential alias record.

Actions using the Sharepoint Online connection and credential alias record		
Category	**Action**	**Description**
Site Management	Create Modern Site	Creates a modern site of types Communication sites and Non-group associated Team Sites.
	Create Subsite	Creates a subsite on Sharepoint Online. The Tenant determines the root location.
	Delete Modern Site	Deletes the modern site associated with non-O365 Group (communication site).
	Delete Subsite	Removes a subsite from Sharepoint Online. The Connection URL used determines what is the Root location.
	Look up Modern Site Information	Retrieves details of a modern site.
	Look up Changes For Site	Retrieves the changes for a site that is based on the query conditions.
	Look up Role Assignments	Retrieves all the role assignments that are defined on the site.
	Look Up Site Collection ID	Looks up a specific site ID.
	Look Up Subsite Details	Looks up information about a subsite.
	Update Site Information	Updates a Microsoft SharePoint Online site.
Folder Management	Create Folder	Creates a folder in a document library on a Microsoft SharePoint Online site.
	Delete Folder	Deletes a folder in Microsoft SharePoint Online.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions using the Sharepoint Online connection and credential alias record		
Category	**Action**	**Description**
		Note: You receive no warning or notification before the folder is removed.
	List Files In A Folder	Gets a list of files in a folder.
	List Folders In A Folder	Gets a list of the folders in a folder.
	Look Up Folder	Looks up a folder in Microsoft SharePoint Online and returns its properties. For example, the output can contain the property "Relative URL".
	Rename A Folder	Renames a folder in Microsoft SharePoint Online.
	Share Folder With Group	Shares a folder with a group in Microsoft SharePoint Online. The group must belong to the Microsoft SharePoint Online tenant account.
	Share Folder With User	Shares a folder with a user inMicrosoft SharePoint Online. The user must belong to the Microsoft SharePoint Online tenant account.
	Unshare Folder With Group	Removes the access to a folder from a group. The group must belong to the Microsoft SharePoint Online tenant account.
	Unshare Folder With User	Removes the access to a folder from a user. The user must belong to the Microsoft SharePoint Online tenant account.
File Management	Attach Sharepoint File To A Record	Attaches a Microsoft SharePoint Online file to a ServiceNow record.
	Check-in File	Sets a file in the Microsoft SharePoint Online in the checked in state. To find the version number of the file after its state is set to checked in, use the Look Up File Details action, **Note:** The file is already uploaded and the action just updates the status of the file to be checked in.
	Check-out File	Sets a file in the Microsoft SharePoint Online in the checked out state. To find the version number of the file after its state is set to checked out, use the Look Up File Details action, **Note:** The file is already downloaded and the action just updates the status of the file to checked out.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions using the Sharepoint Online connection and credential alias record		
Category	**Action**	**Description**
	Copy Attachment To Folder	Copies a ServiceNow attachment to a Microsoft SharePoint Online folder.
	Copy File	Copies a file with a new name.
	Create A Text File	Creates a text file with the information that you provide.
	Delete File	Deletes a file in Microsoft SharePoint Online.
	Look Up File Details	Looks up the file details in Microsoft SharePoint Online.
	Move File	Moves a file to another location in Microsoft SharePoint Online.
	Share File With Group	Shares a file with a group inMicrosoft SharePoint Online. The group must belong to the Microsoft SharePoint Online tenant account.
	Share File With User	Shares a file with a Microsoft SharePoint Online user. The user must belong to the Microsoft SharePoint Online tenant account.
	Unshare File With Group	Removes the access to a file from a Microsoft SharePoint Online group. The group must belong to the Microsoft SharePoint Online tenant account.
	Unshare File With User	Removes the access to a file from a Microsoft SharePoint Online user. The user must belong to the Microsoft SharePoint Online tenant account.
User Management	Look Up User Information By Login Name	Searches a Microsoft SharePoint Online site for information on a user and returns the information.
	Look Up User Information By Email	Searches the specified Microsoft SharePoint Online site for a given user and return SharePoint information about that account.
	Look Up User's Sharepoint Groups	Searches the Microsoft SharePoint Online site for information on all groups that a user is a member of and returns the information.
Search Management	Look up Search Query Results Stream	Searches the SharePoint Root site and retrieves the result based on the provided search query.
Group Management	Add Role To Site	Adds a role to a Microsoft SharePoint Online user or group.
	Add User To Group	Adds a user to a Microsoft SharePoint Online site group.
	Create Group	Creates a group in a Microsoft SharePoint Online site.
	Delete Group	Deletes a group on a Microsoft SharePoint Online site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions using the Sharepoint Online connection and credential alias record		
Category	**Action**	**Description**
	Look Up Group By Name	Looks up a group by its name in a site location in the Microsoft SharePoint Online. If no site location is specified, the action searches the root site of the tenant.
	Remove Role From Site	Removes permissions from a group or a user.
	Remove User From Group	Removes a user from a Microsoft SharePoint Online site group.
	Update Group Owner (User)	Updates a user as the group owner.
	Look up M365 Members by Site Group	Retrieves a list of the users and M365 groups associated with a Microsoft SharePoint Online Site Group.
List Management	Create List	Creates a list in a Microsoft SharePoint Online site with its title and description.
	Create List Subscription	Creates a webhook subscription for a list.
	Delete List By ID	Deletes a list in a Microsoft SharePoint Online site by its ID.
	Look Up List Details By ID	Looks up a list in a Microsoft SharePoint Online site by its ID.
	Look Up List ID By Title	Looks up a list in a Microsoft SharePoint Online by its title.
	Update list in a site by ID	Updates a list in a Microsoft SharePoint Online site by its ID.
List Item Management	Create List Item	Creates a list item inside a list.
	Delete List Item By ID	Deletes a list item by both the list ID and the list item ID.
	Look Up List Item By ID	Looks up a list item by both the list ID and the list item ID.
	Look Up List Items In A List	Gets a list of items from a list in different formats.
	Update List Item By ID	Updates a list item title by its ID.

Note:
Flow designers and action designers must ensure that user authorization checks are performed before the flow or action is executed.

These actions use the SharePoint Graph connection and credential alias record:

© 2026 ServiceNow, Inc. All rights reserved.

Actions using the SharePoint Graph connection and credential alias record		
Category	**Action**	**Description**
Change Management	Get Change Query Properties	Retrieves the change query properties that are used to define a query that is performed against the change log.
	Get Delta Link Token For Drive	Retrieves the latest delta link token for a drive.
	Get Next Token	Retrieves the next link token from the SharePoint Resource Next Link Token table.
File Management	Get File Download Link	Retrieves the download URL of the file.
	Look up File Permissions	Gets the permissions for a file.
	Look up Files	Retrieves all the files in a drive.
List Management	Create List Subscription	Creates a webhook subscription for a list.
	Renew List Subscription	Renews a webhook subscription for a list.
	Delete List Subscription	Deletes the webhook subscription for a list.
	Get List	Retrieves the details of a list from the SharePoint tenant.
	Look up Drives	Retrieves all the drives for a site.
Site Management	Delete Modern Site with O365 Group	Submit the modern site associated with the O365 Group (team site) for deletion. It deletes the associated 0365 group that deletes the site. **Note:** After execution, it can take up to 30 minutes for a site to be deleted.
	Look up Modern Site Group Information	Retrieves the associated O365 group details of a modern site (team site).
	Look up Site Collections	Retrieves all the site collections.
	Look up Subsites	Retrieves details of all the subsites in a site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions using the SharePoint Graph connection and credential alias record		
Category	**Action**	**Description**
	Create Root Site Subscription	Creates a webhook subscription for a root site.
	Look up Site Permissions	Retrieves all permissions for a site.
	Get Site	Gets the site details.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Microsoft SharePoint Online file management AI agent	Automates file-related tasks such as, sharing files with users or groups, copying files, moving files, creating text files, retrieving file details, and managing file permissions.
Microsoft SharePoint Online list management AI agent	Automates SharePoint operations such as, managing lists, creating and renewing subscriptions, retrieving list details, and automating workflows.
Microsoft SharePoint Online site management AI agent	Automates SharePoint operations such as, creating and deleting sites, managing site collections, retrieving site information, and automating SharePoint workflows.
Microsoft SharePoint Online group management AI agent	Automates group management processes such as, adding or removing users from groups, creating or deleting groups, updating group ownership, and managing roles within SharePoint sites.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
Microsoft SharePoint Online list item management AI agent	Automates SharePoint operations such as, creating, updating, deleting, and retrieving list items.
Microsoft SharePoint Online user management AI agent	Automates user management tasks such as, a retrieving user's SharePoint groups, user information by login name, and user details by email.
Microsoft SharePoint Online folder management AI agent	Automates folder management tasks such as, renaming folders, creating folders, sharing and unsharing folders with users or groups, listing files and folders, and deleting folders.
Microsoft SharePoint Online change management AI agent	Perform the Get Next Token and Get Delta Link Token For Drive actions.
Microsoft SharePoint Online search management AI agent	Retrieves the required search query results and enables users to streamline processes.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

SharePoint Online account requirements

The Microsoft SharePoint Online spoke requires that you create a custom app on your SharePoint Online account to generate OAuth 2.0 tokens. See Configure OAuth application in Microsoft Azure.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Single tenant

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft SharePoint Online. Select this alias in the Tenant record to authorize changes in Microsoft SharePoint Online for a single tenant.

Multiple tenants

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft SharePoint Online. Create a connection and credential alias record for each additional tenant site that you want to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. Create a connection and credential alias record for each additional tenant site that you want

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. See Create aliases for multiple tenants.

Note:

Three alias records are available by default with the spoke; Sharepoint Online, SharePoint Graph, and SharePoint Graph Root Site Subscription. Each alias record requires a tenant to be associated with it. If you intend to use all SharePoint Online, Graph, and Root Subscription actions in the spoke, you must ensure that you have created three tenant records in the Tenants tables of the Microsoft SharePoint Online spoke so that each tenant record is associated with its respective alias record.

- If configuring an integration for a single tenant, use the existing **MicrosoftSharepointOnline** alias record.
- You can use multiple tenants with the **Microsoft SharePoint Graph** connection alias only.

Configure OAuth application in Microsoft Azure

Create an OAuth application in Microsoft Azure to verify and authorize connection requests from your ServiceNow instance.

Before you begin

Role required: admin

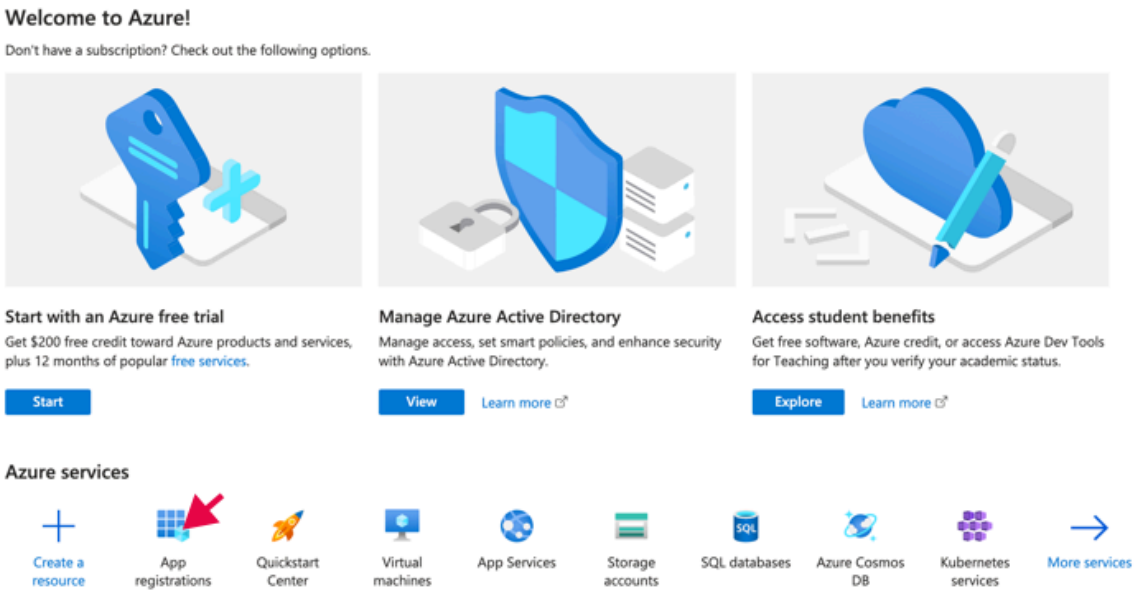
Access to Microsoft Azure portal to create an OAuth application.

Procedure

1. Register an application on Microsoft Azure.

a. Log in to https://portal.azure.com/.

b. Select **App registrations**.



c. On the App registrations page, select **+ New registration**.

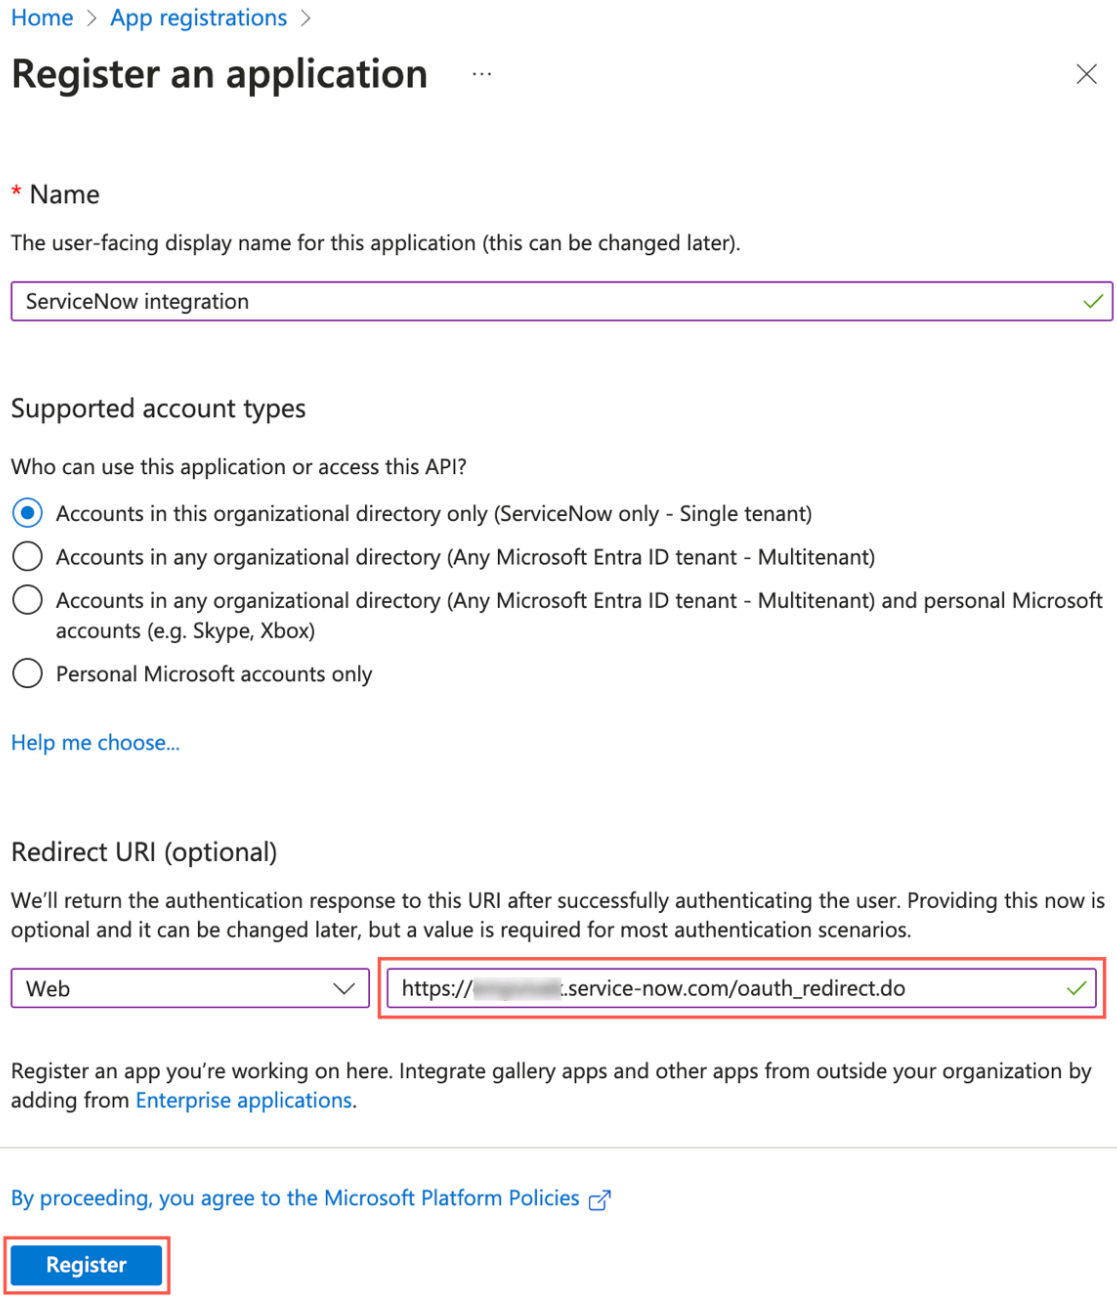
d. Fill the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register an application

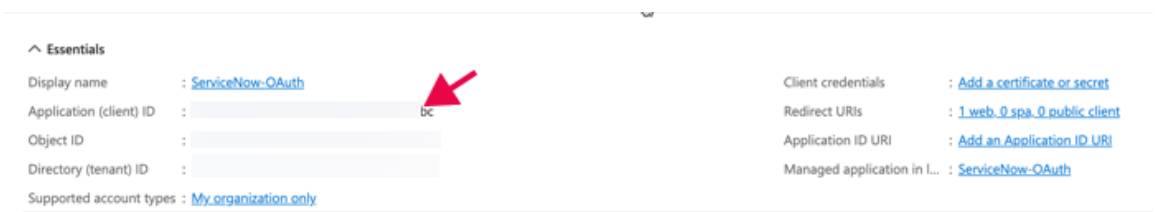
Field	Description
Name	Custom name of the OAuth application that you are creating.
Supported account types	Accounts the tenant in Microsoft Azure AD directory supports.
Redirect URI	The redirect URL to your ServiceNow instance that requests connection to Microsoft SharePoint online. From the Select a platform list, select Web and enter your ServiceNow instance URL in the format `https://<instance-name>.service-now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Select **Register**.
The OAuth app is registered.

2. To get the application ID, from the OAuth application page, copy the Application (client) ID.

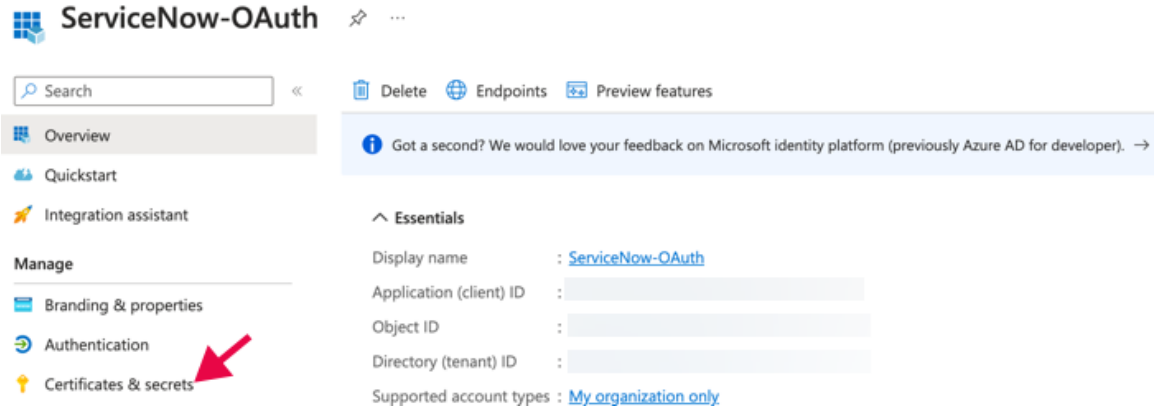


You need the Application (client) ID when you set up the connection record for Microsoft SharePoint Graph.

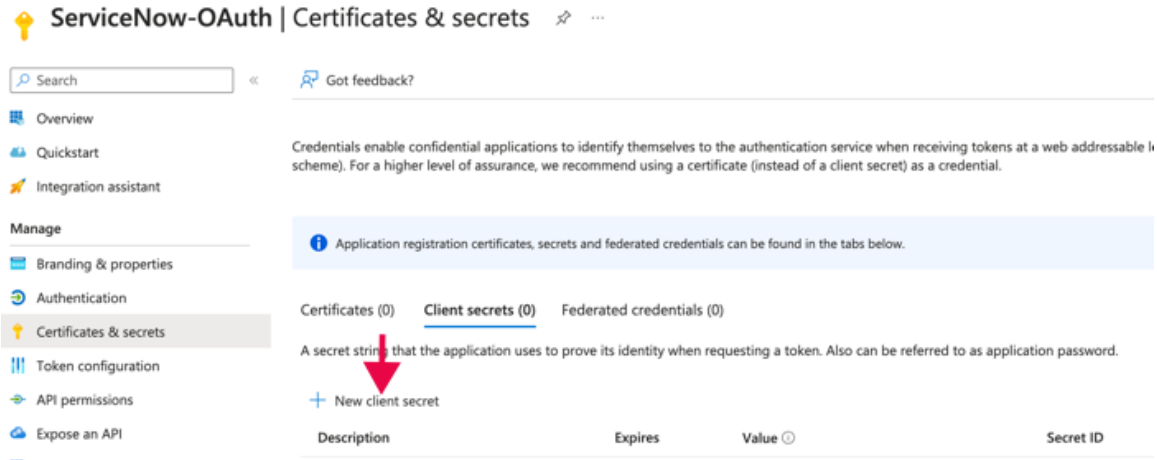
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Get the client secret.

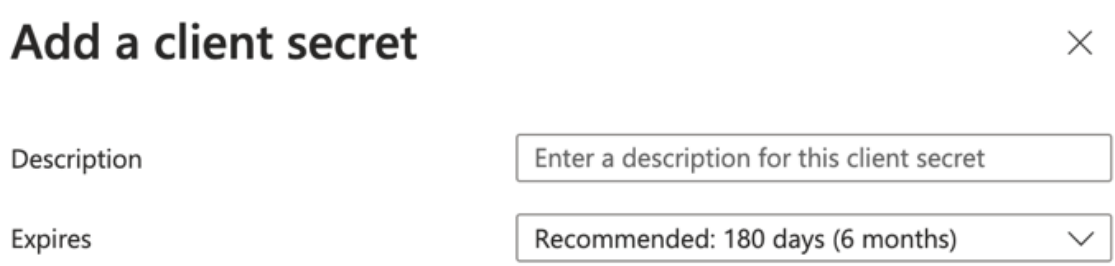
a. On the OAuth application page, select Certificates & secrets.



b. Select **+ New client secret**.



c. Set up the client secret.



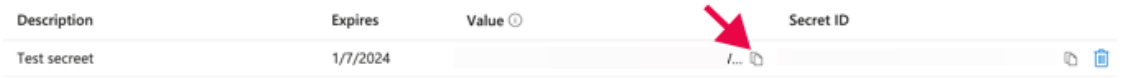
- Description: A contextual description of the client secret.
- Expires: Time limit after which the client secret is invalid.

Note:
You need the client secret when you set up the connection record for Microsoft SharePoint Graph.

d. Select **Add**.
The Client secret is generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Copy the secret and store at a secure place.



Configure Microsoft SharePoint Graph connection

Configure a Microsoft SharePoint Graph connection and a connection record that enable your ServiceNow instance to integrate with the Microsoft SharePoint using the Microsoft Graph.

Before you begin

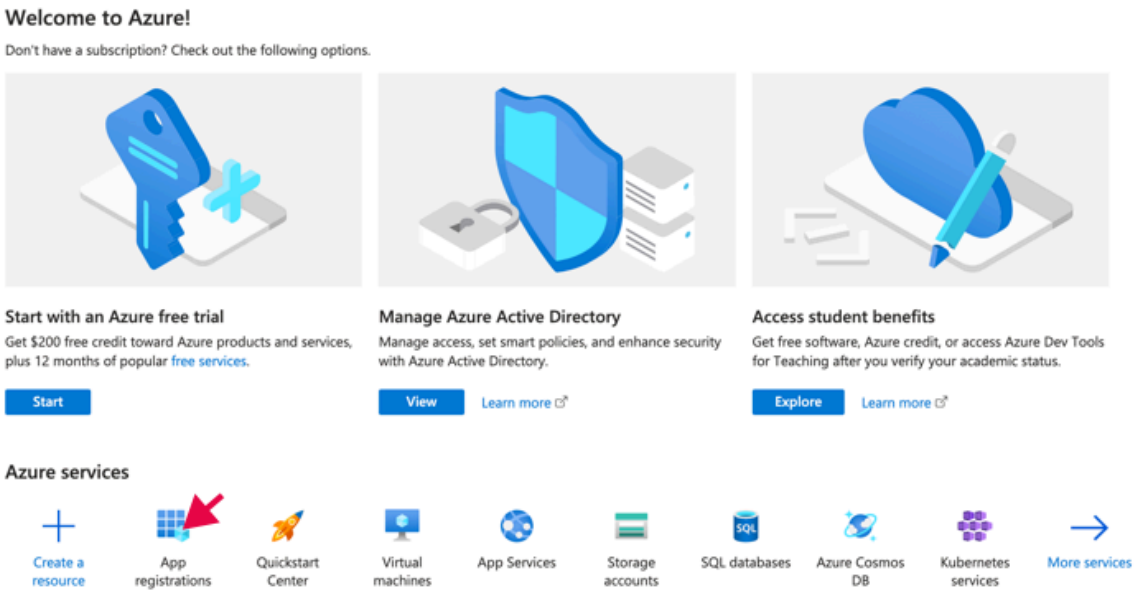
- Request an Integration Hub subscription.
- Activate the Microsoft SharePoint Online spoke.
- Access to Microsoft Azure portal.
- Create an OAuth application on Microsoft Azure portal.
- Role required: admin.

Procedure

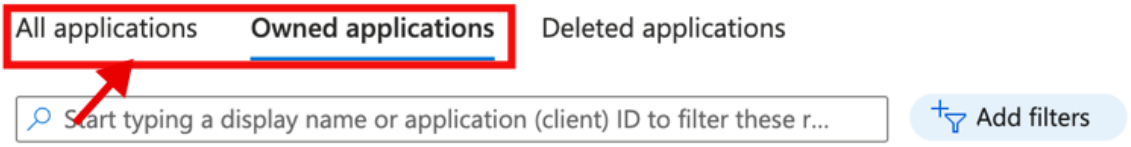
1. Configure a SharePoint Graph connection by adding permissions.

a. Log in to https://portal.azure.com/.

b. Select **App registrations**.



c. Select **All applications** or **Owned applications**.



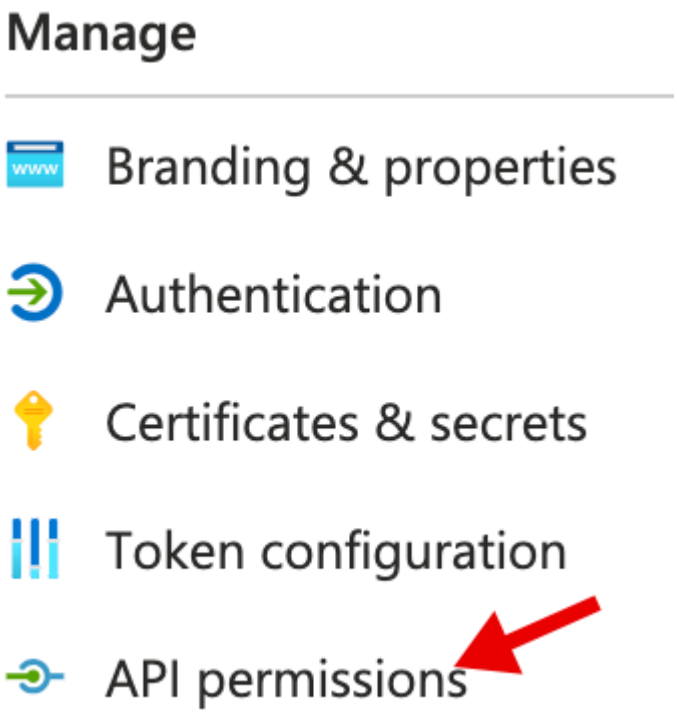
d. In the search field, enter the name of the OAuth application you had created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To learn how to configure an OAuth application, see Configure OAuth application in Microsoft Azure.

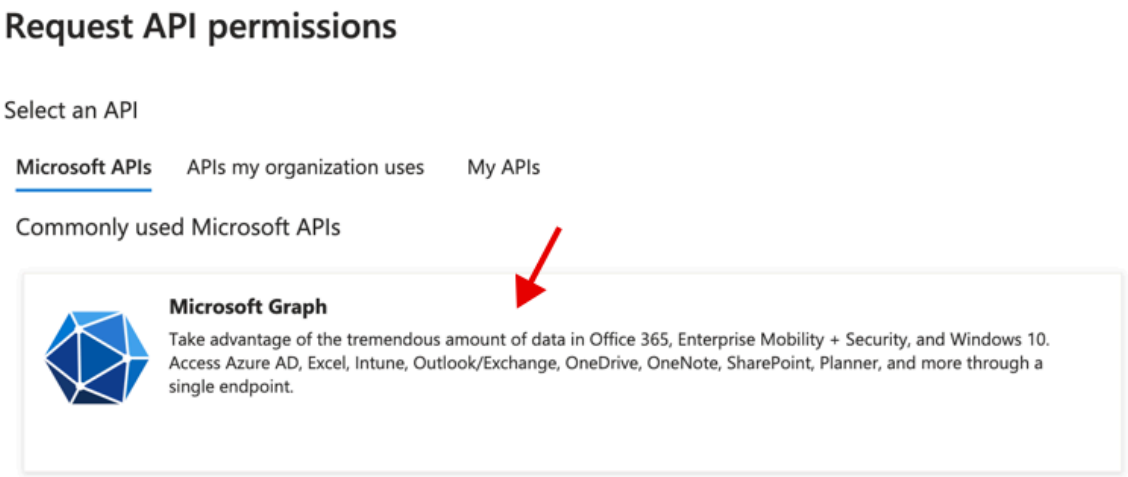
e. In the search results, select the name of the OAuth application you had configured.

f. On the left panel, under the Manage heading, select API permissions.



g. Under the Configured permissions heading, select **+ Add a permission**.

h. In the Request API permissions window, select **Microsoft Graph**.

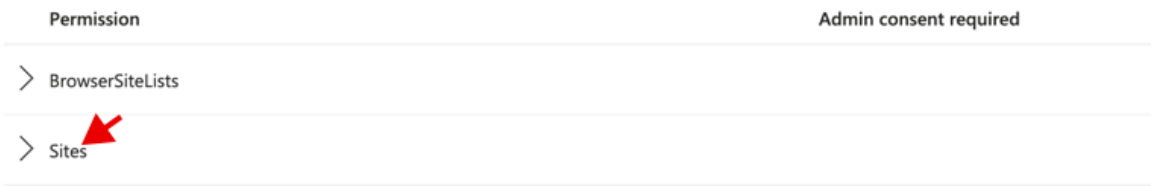


i. Select **Delegated permissions**.

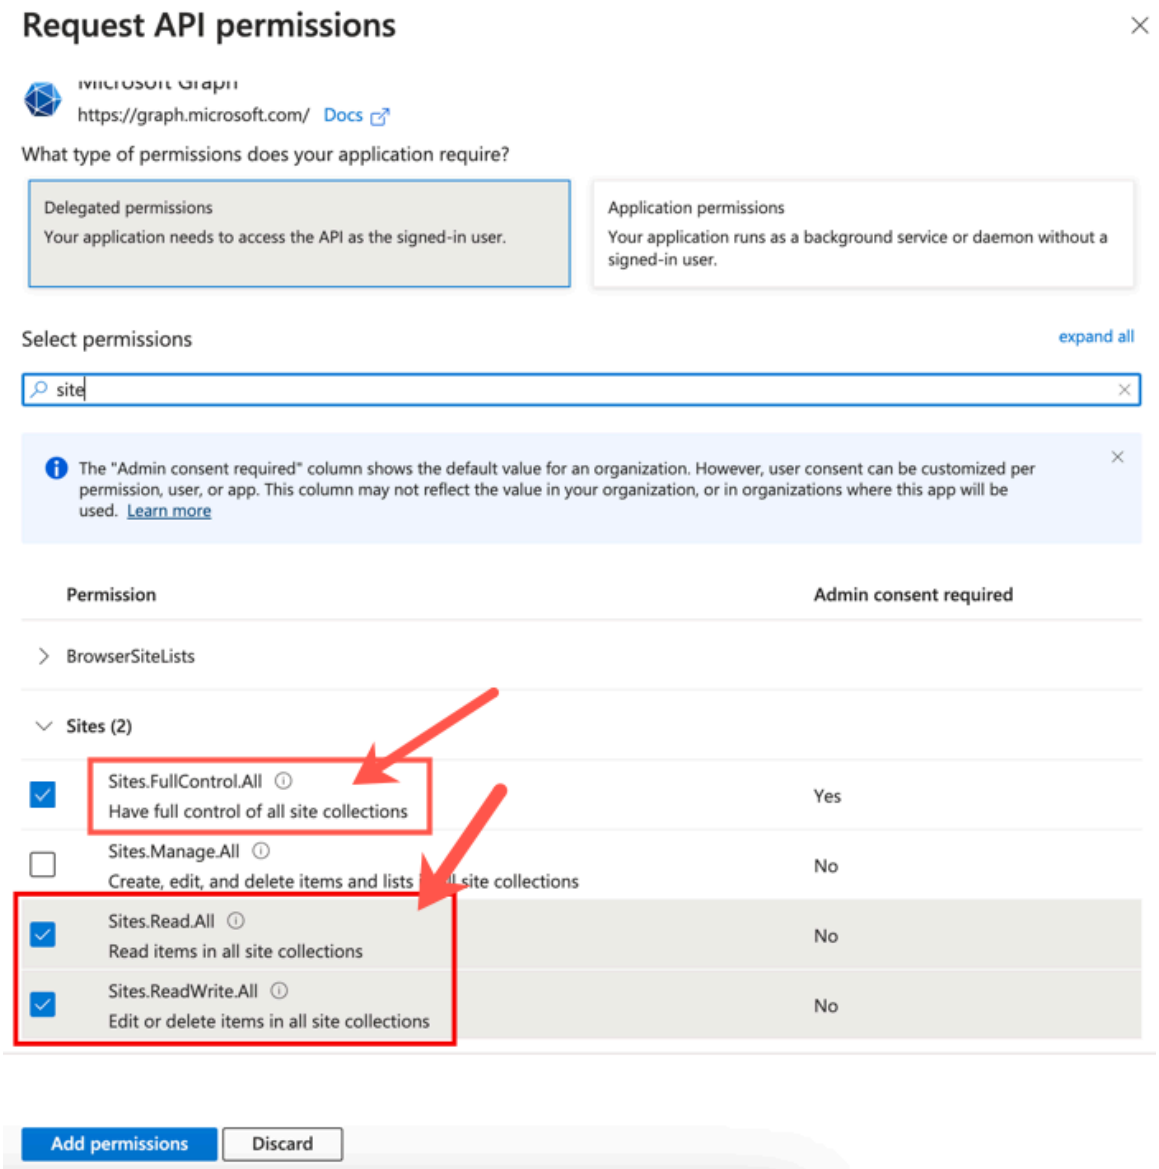
j. Under the Select permissions heading, enter `site` in the search field.

k. Expand the Sites list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

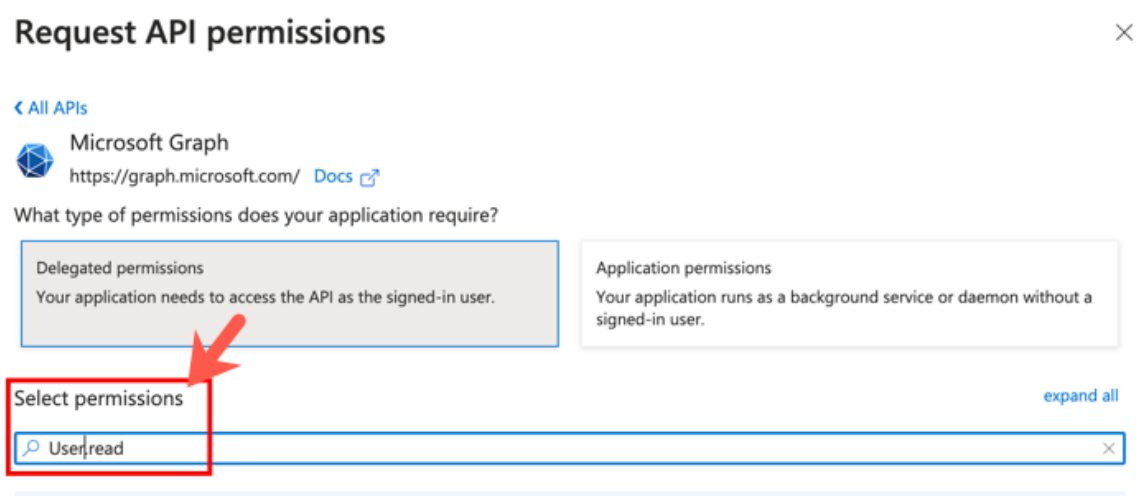


l. Select `Sites.FullControl.all`, `Sites.Read.All` and `Sites.ReadWrite.All`.



m. Under the Select permissions heading, enter `User.read` in the search field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



n. Select **Add permissions**.
The permission is added.

o. Optional: To grant admin consent, under the Configured permissions heading, select **Grant admin consent**.

p. Optional: Select **Yes**.
Admin consent is mandatory if the value under the Admin consent required column for the Sites.Read.All permission is Yes.

2. Configure the Microsoft SharePoint Graph connection record.

a. Log in to your ServiceNow instance.

> **Note:**
> The URL of the instance and that of the instance you had provided as the redirect URL must be the same.

b. Navigate to **All** > **Process Automation** > **Workflow Studio**.

c. Select the **Integrations** tab.

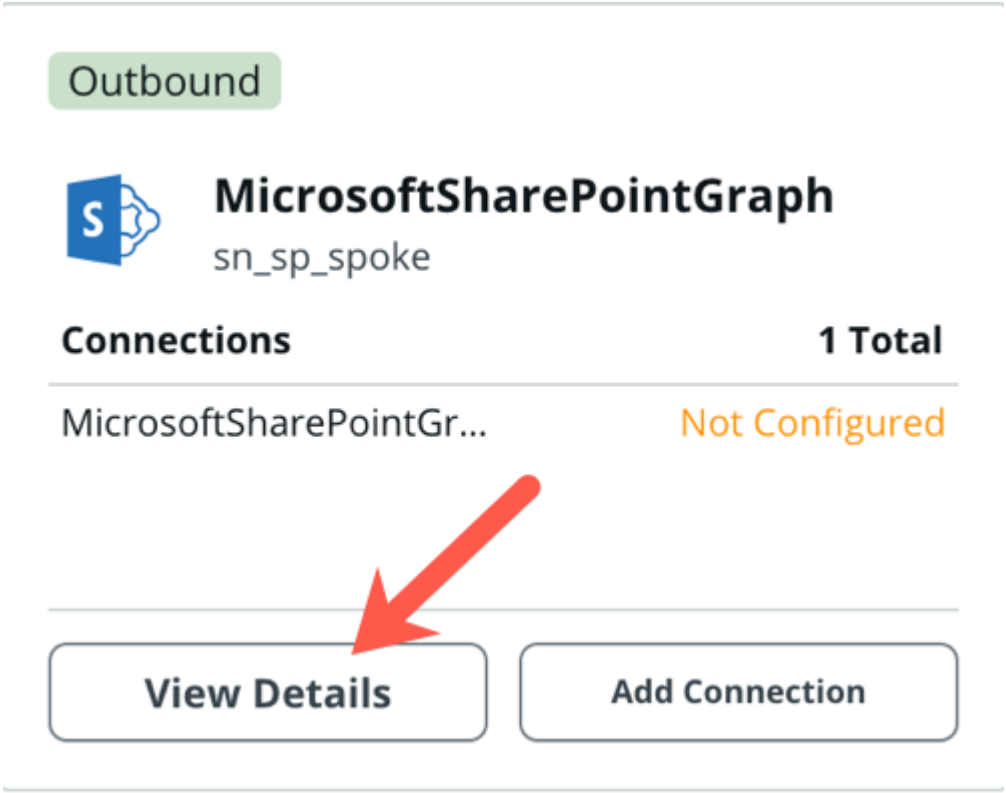
d. In the Search all connections field, enter `Microsoft SharePoint`.

> **Note:**
> The **Outbound** tab is selected by default. Confirm that the **Outbound** tab is already selected.

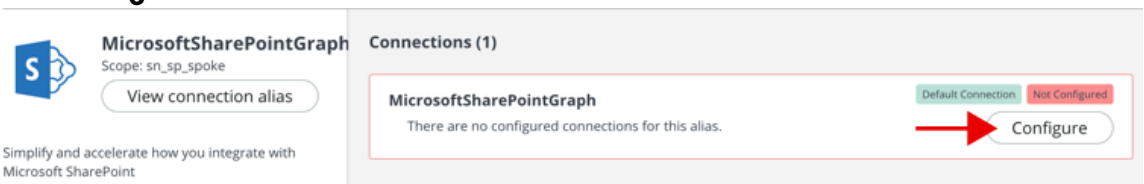
e. In the Search all connections field, enter `Microsoft SharePoint`.

f. In the MicrosoftSharePointGraph tile, click **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



g. Click **Configure**.



h. On the form, fill these details.

Field	Description
Connection Name	The name of the connection record. The default and read-only name of the first connection record is MicrosoftSharePointGraph. To provide a custom name, you must create a connection record by clicking **Add connection**.
Connection URL	The URL to connect to the Microsoft Graph APIs. The URL is https://graph.microsoft.com/v1.0.
OAuth Entity Name	Name of the OAuth application that you created. To learn how to create an OAuth app, see Configure OAuth application in Microsoft Azure.
OAuth Client ID	Client ID that was generated when you created the OAuth app. To learn where to find the client ID, see Configure OAuth application in Microsoft Azure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Client Secret	Client secret that was generated when you created the OAuth app. To learn where to find the client ID, see Configure OAuth application in Microsoft Azure.
OAuth Authorization URL	The URL must be in the format: `https://login.microsoftonline.com/<tenant-id>/oauth2/v2.0/authorize?response_mode=query`. **Tip:** To find the tenant ID, do the steps. i. Log in to https://portal.azure.com/. ii. Under the Manage Azure Active Directory heading, select **View**. The tenant ID is available under the Basic information heading. OAuth Token URL	The URL must be in the format: `https://login.microsoftonline.com/<tenant-id>/oauth2/v2.0/token`. **Tip:** To find the tenant ID, do the steps. i. Log in to https://portal.azure.com/. ii. Under the Manage Azure Active Directory heading, select **View**. The tenant ID is available under the Basic information heading. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token Revocation URL	The URL must be in the format: `https://login.microsoftonline.com/<tenant-id>/oauth2/v2.0/token`. **Tip:** To find the tenant ID, do the steps. i. Log in to https://portal.azure.com/. ii. Under the Manage Azure Active Directory heading, select **View**. The tenant ID is available under the Basic information heading. OAuth Redirect URL	The URL must be in the format: `https://<instance-name>.service-now.com/oauth_redirect.do`.

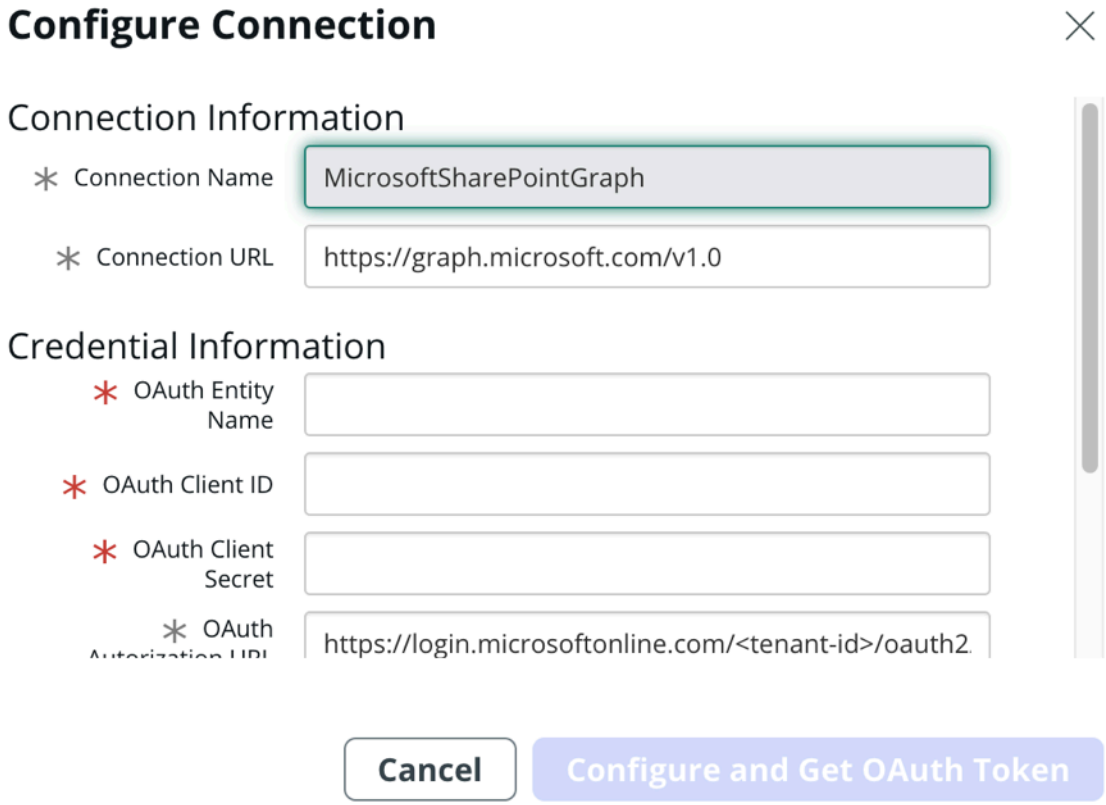
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



i. Select **Configure and Get OAuth Token**.

3. Click **Configure and Get OAuth Token**.
   The connection record is created.

4. To use the Microsoft Graph action, create a record in the Tenant table (sn_sp_spoke_tenant) on your ServiceNow instance.

Note:
After you configure and get OAuth token, an application registry record is created with the details you have provided. In this application record, do not select any **OAuth API Script**.

Configure Microsoft SharePoint Online connection record

Integrate your ServiceNow instance with the Microsoft SharePoint Online by setting up the Microsoft SharePoint Online and a connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request Integration Hub subscription
- Activate Microsoft SharePoint Online Spoke
- Create an OAuth application on Microsoft Azure portal.
- Access to Microsoft Azure portal
- Role required: admin

Generate certificate for Windows

Generate a digital certificate file in the .cer format to upload it to Microsoft Azure.

Before you begin

Role required: admin

Procedure

1. Navigate to https://learn.microsoft.com/en-us/sharepoint/dev/solution-guidance/security-apponly-azuread#setting-up-an-azure-ad-app-for-app-only-access.
2. Execute the PowerShell script.
   The script generates two files with .PFX and .CER extensions.

   Note:
   Store or remember the password that is used to encrypt private key to generate the .PFX file and .CER files.

3. Use the .PFX file to create a Java Key Store (JKS) file.

   Note:
   Store or remember the password that is used to generate the .JKS file from the .PFX file.

Generate self-signed certificate for Mac

Generate a digital certificate file in the .cer format to upload it to Microsoft Azure.

Before you begin

Role required: admin

Procedure

1. Open the terminal on your Mac machine.
2. Replace the placeholder `<filename>` with a file name of your choice and execute this script `keytool -genkey -keyalg RSA -alias selfsigned -keystore <filename>.jks -storepass <enter password for keystore> -validity 720 -keysize 2048`.

   Note:
   The password to the keystore must contain at least six characters.

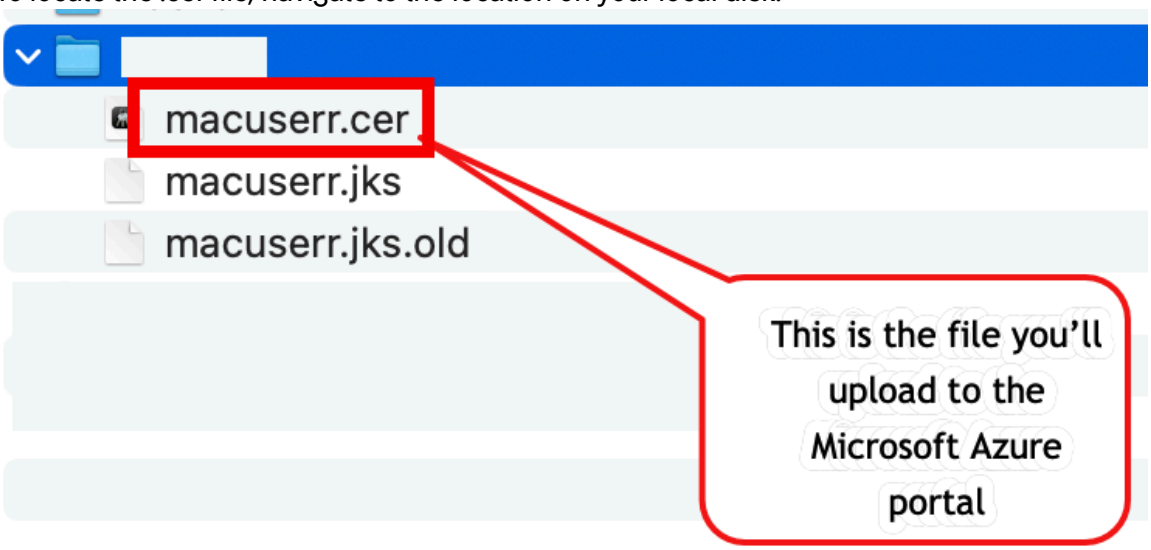
   The keystore asks you to enter certain information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enter your custom information, as given in the image for illustration.

```
What is your first and last name?
  [Unknown]:  John Smith
What is the name of your organizational unit?
  [Unknown]:  UIN
What is the name of your organization?
  [Unknown]:  UTR
What is the name of your City or Locality?
  [Unknown]:  Texas
What is the name of your State or Province?
  [Unknown]:  Texas
What is the two-letter country code for this unit?
  [Unknown]:  1
Is CN=John Smith, OU=UIN, O=UTR, L=Texas, ST=Texas, C=1 correct?
  [no]:  Yes
```

4. Press **Return**.
   You are advised to migrate to PKCS12 format.
5. Replace the placeholder `<filename>` with a file name of your choice and execute this script `keytool -importkeystore -srckeystore <filename>.jks -destkeystore <filename>.jks -deststoretype pkcs12`.
6. Enter the source keystore password.
   The migration to PKCS12 is successful.
7. Replace the placeholder `<filename>` with a file name of your choice and execute this script `keytool -exportcert -keyalg RSA -alias selfsigned -keystore <filename>.jks -storepass <password to the keystore> -rfc -file <filename>.cer`.
   The script generates the .cer file.
8. To locate the .cer file, navigate to the location on your local disk.



Configure an application in Microsoft Azure

Create a custom app using your Azure portal to authenticate requests.

Before you begin

- Access to Microsoft Azure portal
- Role required: admin

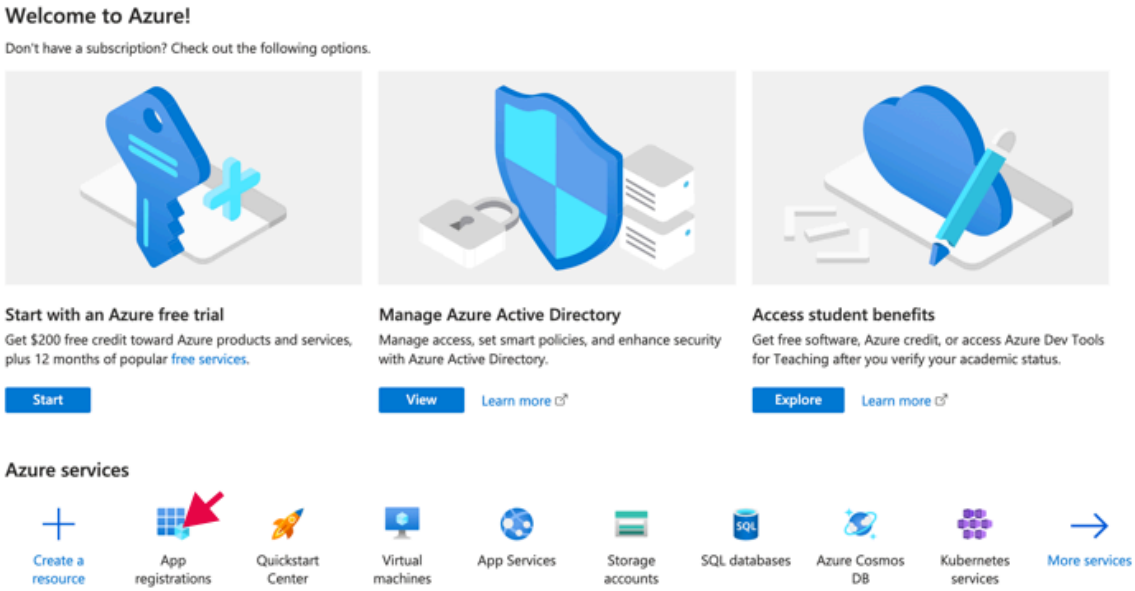
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

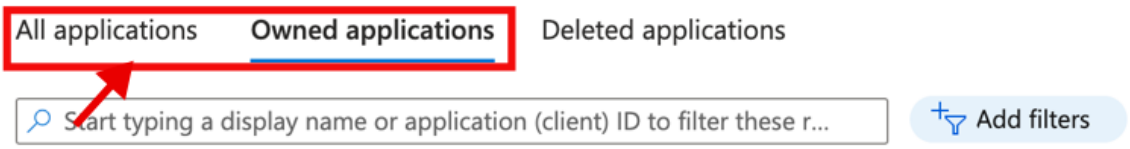
1. Upload the certificate to Microsoft Azure portal.

a. Log in to https://portal.azure.com/.

b. Select **App registrations**.



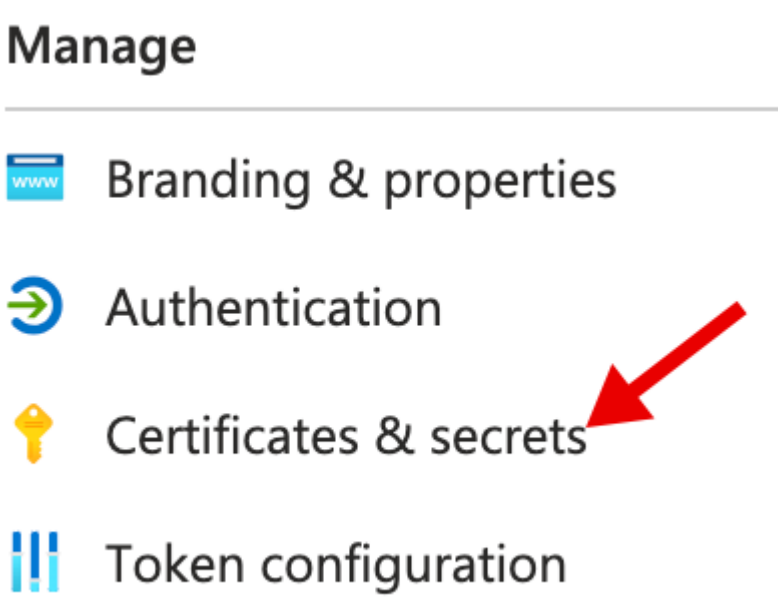
c. Select **All applications** or **Owned applications.**



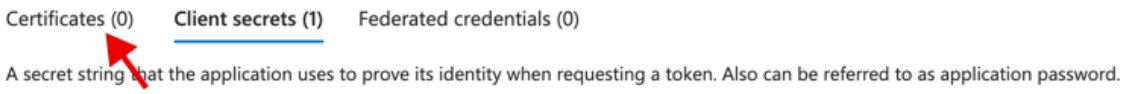
d. In the search field, enter the name of the OAuth application you had created.
To learn how to configure an OAuth application, see Configure OAuth application in Microsoft Azure.

e. On the left panel, under Manage heading, select Certificates & secrets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Under Certificates & secrets, select Certificates.



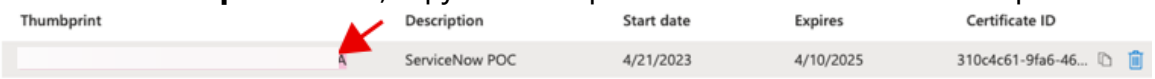
g. Select **Upload certificate**.

h. In the Upload certificate window, select the folder icon ( ) to navigate to the .cer file you had generated.

i. In the Description field, enter a description of the certificate.

j. Select **Add**.
The certificate is uploaded.

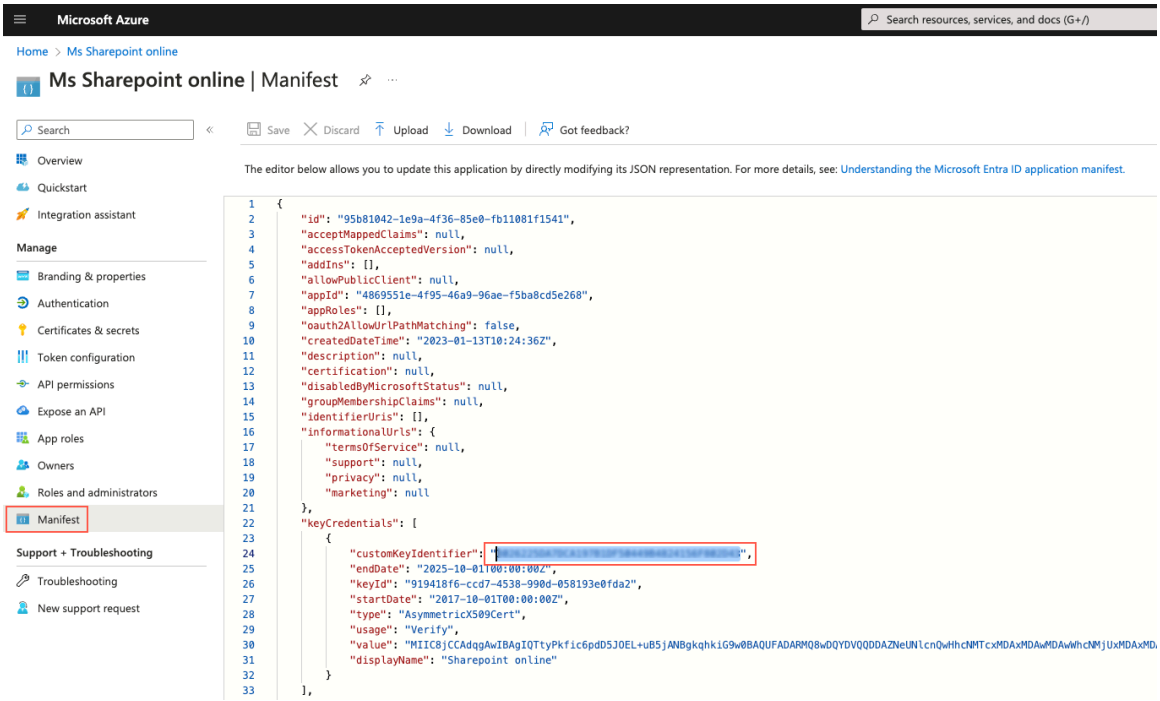
k. Under the **Thumbprint** column, copy the thumbprint value and store it at a secure place.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure that you copy the entire value of **Thumbprint**.

Alternatively, you can copy the **Thumbprint** by clicking **Manifest**.



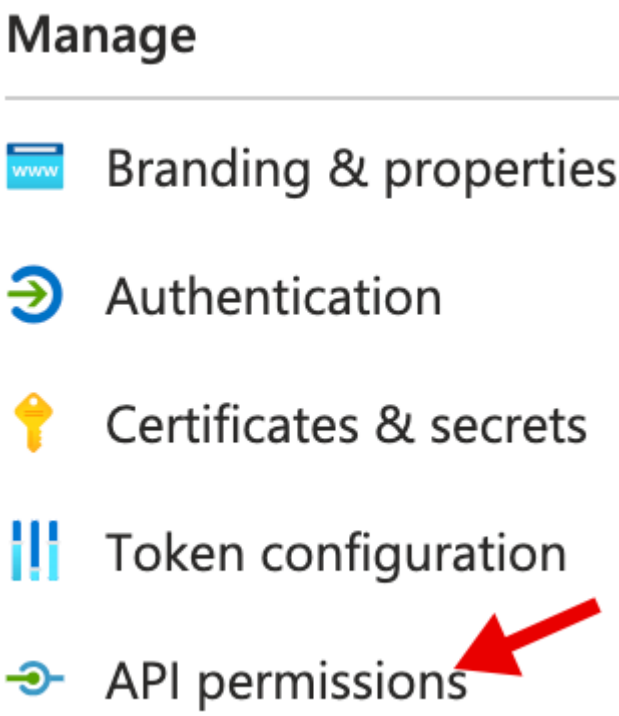
I. Encode the Thumbprint value to a Base64 value and record the value for later use.

Note:
You can use a Hexadecimal to Base64 (Hex to Base64) converter tool to encode the **Thumbprint** value to a Base64 value.

2. Obtain permissions to access the REST APIs that the spoke needs to automate actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

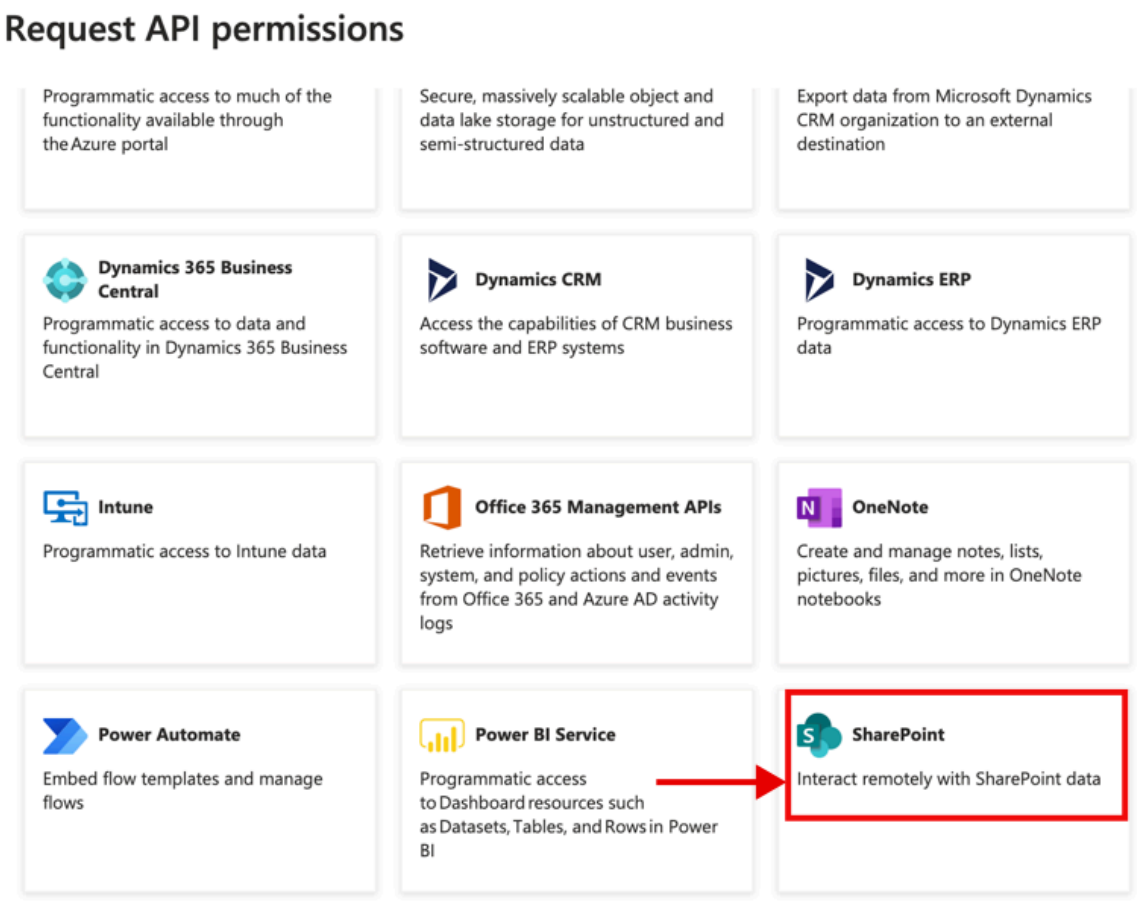
a. On the left panel, under the Manage heading, select API permissions.



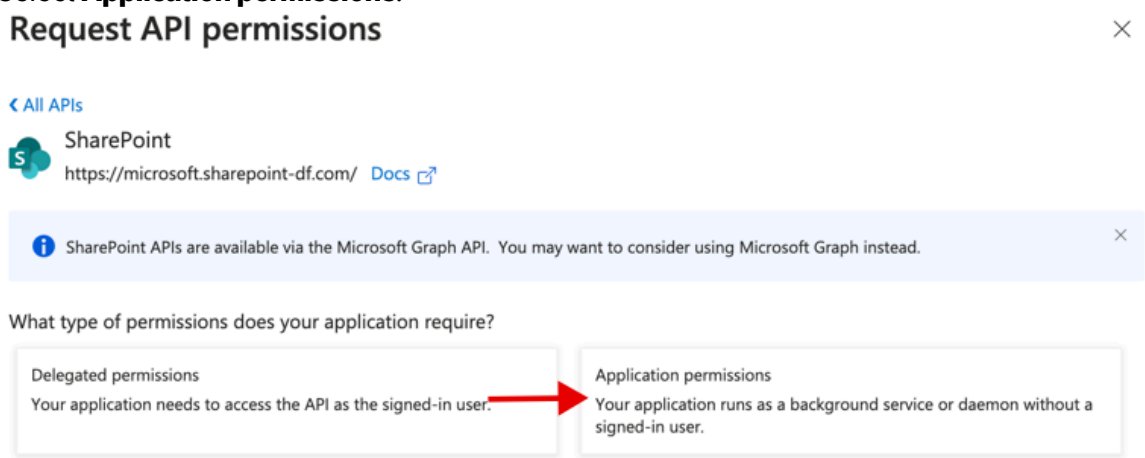
b. Under the Configured permissions heading, select **+ Add a permission**.

c. In the Request API permissions window, select **SharePoint**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Select **Application permissions**.

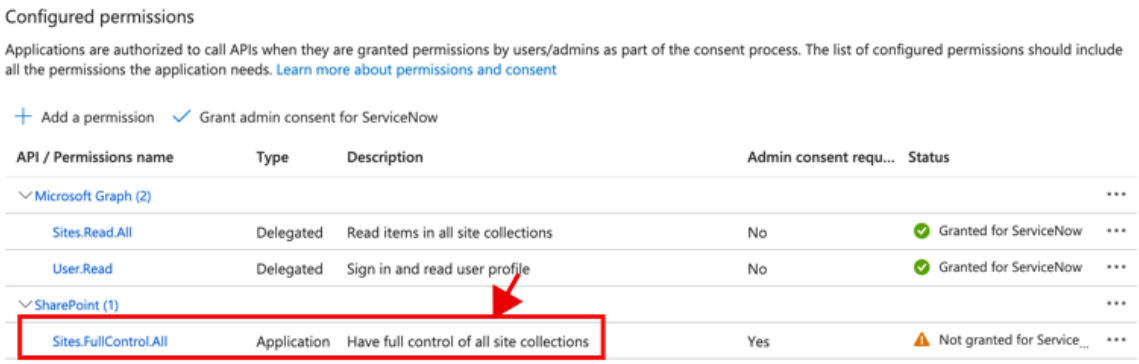


e. Expand the Sites list.

f. Select Sites.FullControl.All.
Your ServiceNow instance now has full control of all sites in Microsoft SharePoint Online.

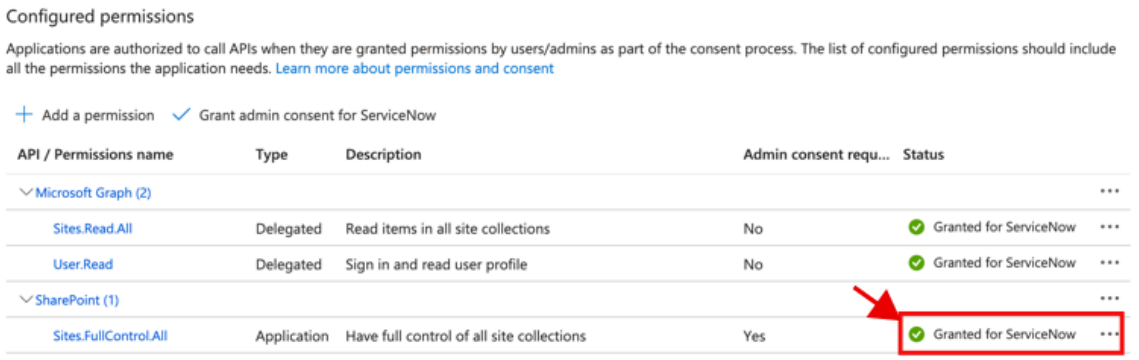
g. Select **Add permissions**.
The permissions are added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



h. To grant admin consent, select **Grant admin consent for ServiceNow**.

i. In the Grant admin consent confirmation window, select **Yes**.
The admin consent is granted.



Tip:
If you want to use other permissions apart from `Sites.FullControl.All`, contact your SharePoint and Azure administrators to determine the exact permissions that are needed for your organisational policies.

Attach a Java Key Store certificate

Enable the JWT Bearer Grant token authentication by attaching a valid Java Key Store (JKS) certificate.

Before you begin

- Valid Java Key Store certificate
- Role required: admin

Procedure

1. Navigate to **System Definition** > **Certificates**.
2. Open the record **Microsoft SharePoint Online Certificate**.

Note:
Ensure that you use the default record **Microsoft SharePoint Online Certificate** only.

3. Enter the password associated with the JKS file in **Key store password**.
4. Select **Java Key Store** as the **Type**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click the attachments icon ( ) and attach the JKS certificate you had generated.
   For more information, see Configure OAuth application in Microsoft Azure.
6. Click **Validate Stores/Certificates**.
7. Click **Update**.

Configure the JWT signing key

Create a JSON Web Token (JWT) signing key to assign to your Java Key Store certificate.

Before you begin

Role required: admin

Procedure

1. Navigate to **System OAuth** > **JWT Keys**.
2. Open the record **Microsoft SharePoint Online JWT Keys**.
3. Enter the password that is used to encrypt private key to generate the .PFX file and .CER file in **Signing Key Password**.
4. Click **Update**.

Configure the JWT provider

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

Before you begin

- Copy and record the value of **Application (client) ID** and **Directory (tenant) ID** of the application you had registered in the Azure portal.

- Role required: admin

Procedure

1. Navigate to **System OAuth** > **JWT Providers**.
2. Open the record **Microsoft SharePoint Online JWT Provider**.
3. Enter values for **iss**, **sub**, and **aud** in the Standard Claims related list.

Field	Value
aud	Microsoft Online URL in this format: `https://login.microsoftonline.com/<tenant-id>/oauth2/token`. Replace `<tenant-id>` with **Directory (tenant) ID** value of your application had registered in the Azure portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
iss	**Application (client) ID** of the application you had registered in Azure portal.
sub	**Application (client) ID** of the application you had registered in Azure portal.

4. Click **Update**.

Register Microsoft SharePoint Online as OAuth provider

Use the information generated during Microsoft SharePoint Online account configuration to register Microsoft SharePoint Online as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin.

Procedure

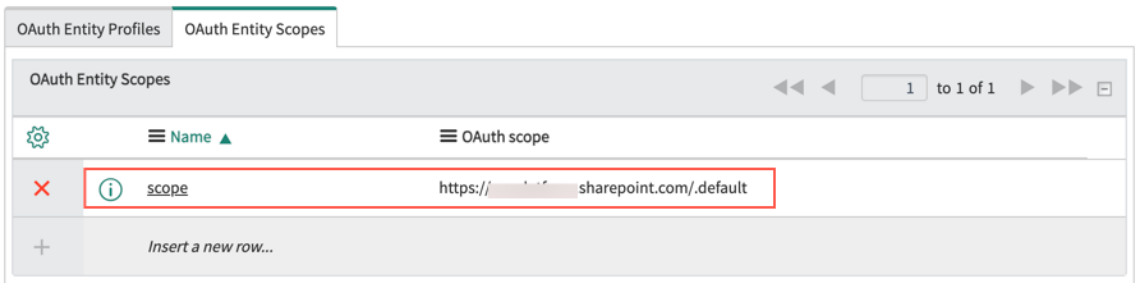
1. Navigate to **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. Enter these values.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `SharePoint OAuth profile`.
Client ID	Client ID in this format: `<ClientID>`.
Client Secret	Client Secret you created during the Microsoft SharePoint Online account configuration.
OAuth API Script	Select **OAuthUtilSPJWTOnline**.
Default Grant type	Select **Client Credentials**.
Token URL	Token URL in this format: `https://login.microsoftonline.com/<tenant-id>/oauth2/token`. Replace `<tenant-id>` with **Directory (tenant) ID** value of your application had registered in the Azure portal.

5. In the OAuth Entity Scopes related list, insert a record with these values.

Name	OAuth scope
scope	`https://<MS-SharePoint-tenant-name>.sharepoint.com/.default`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials and creates the OAuth Entity Profiles related list.

Result

The instance can request OAuth 2.0 tokens for the spoke.

Create credential records for the Microsoft SharePoint Online spoke

Create Credential records to the Microsoft SharePoint Online custom OAuth application you created during Microsoft SharePoint Online account configuration. The Microsoft SharePoint Online spoke connection and credential aliases use these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `SharePoint Credentials`.
Active	Enable
OAuth Entity Profile	Select the OAuth profile you created when you registered the custom Microsoft SharePoint Online application as an OAuth provider. For example, select **SharePoint OAuth profile**.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Select the order to apply this credential. For example, enter `100`.

5. Save the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create connection records for the Microsoft SharePoint Online spoke

Create Connection records to your Microsoft SharePoint Online account. The Microsoft SharePoint Online spoke connection and credential alias uses these connections to perform actions on Microsoft SharePoint Online.

Before you begin

Role required: admin.

Procedure

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the connection and credential alias record for MicrosoftSharePointOnline.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill in the fields.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `SharePoint Connection`.
Credential	Select the Credential record you created for Microsoft SharePoint Online. For example, select **SharePoint Credentials**.
Connection alias	Select the Connection alias record you created for Microsoft SharePoint Online.
Active	Enable
Connection URL	Enter the root SharePoint URL. For example, `https://<SiteName>.sharepoint.com`.

5. In the **Attributes** tab, enter the Base64 encoded value of **Thumbprint**.

> **Note:**
> The **Thumbprint** value is a hexadecimal value. You can use a Hexadecimal to Base64 (Hex to Base64) converter tool to encode the **Thumbprint** value to a Base64 value.

6. Click **Submit**.
   The Microsoft SharePoint Online account is integrated with your ServiceNow instance and the spoke is ready to be used.

> **Note:**
> If the single sign-on is setup, configure your flows to retrieve the user details from Microsoft SharePoint Online using the spoke action, Look Up User Information By Login Name, to verify if the user is authorised to perform the required actions.

What to do next

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Open the credential record you had created. For example, **SharePoint Credentials**.
3. From Related Links, click **Get OAuth Token**.

   The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

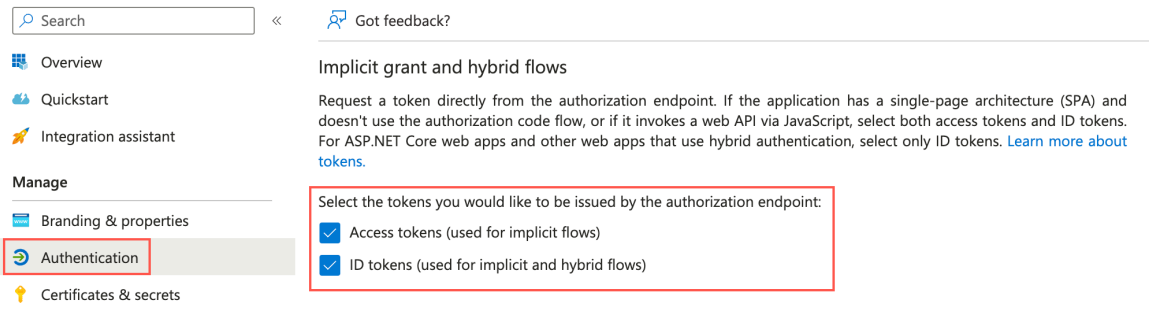
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Confirm that the thumbprint has been defined in the connection record
- Confirm that you allow pop-up windows in your browser.

The spoke setup is completed and you can use the flows as per your requirement.

Note:
If the generated token doesn't work after the spoke setup, open your OAuth application in the Azure portal and select the two checkboxes under **Implicit grant and hybrid flows**.



Create aliases for multiple tenants

Create a connection and credential alias record for each additional tenant site that you want to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online.

Before you begin
Role required: admin.

About this task
If configuring an integration for a single tenant, use the existing **MicrosoftSharepointOnline** alias record.

Note:

- You can use multiple tenants with the **Microsoft SharePoint Graph** connection alias only.
- Three alias records are available by default with the spoke; Sharepoint Online, SharePoint Graph, and SharePoint Graph Root Site Subscription. Each alias record requires a tenant to be associated with it. If you intend to use all SharePoint Online, Graph, and Root Subscription actions in the spoke, you must ensure that you have created three tenant records in the Tenants tables of the Microsoft SharePoint Online spoke so that each tenant record is associated with its respective alias record.

Procedure

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Click **New**.
   A blank Connection & Credential Alias record opens
3. On the **Connection & Credential Aliases** form, fill the following values.

Connection & Credential Aliases form fields

Field	Value
Name	Unique name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Type	Connection and Credential
Connection type	HTTP

4. Click **Submit**.

What to do next
Associate a credential record and a connection record with the alias to authorize actions on the SharePoint tenant site. Create an alias record and associated connection and credential records for each tenant you want to support.

Define Microsoft SharePoint Online tenants

Define a profile for your Microsoft SharePoint Online tenant site. The Microsoft SharePoint Online spoke uses the tenant record and associated Connection and Credential alias to perform actions on Microsoft SharePoint Online.

Before you begin
Role required: admin.

Procedure
1. Navigate to **Microsoft Sharepoint Online** > **Tenants**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	Enter a name for the tenant.
Alias	Select a connection and credential alias. If configuring the integration for a single tenant, select the **MicrosoftSharepointOnline** alias. If configuring the integration for multiple tenants, select the desired alias.
Sharepoint Root URL	Enter the root SharePoint URL without the https:// prefix. For example, `<SiteName>.sharepoint.com`
Tenant Id	Enter the Tenant ID. This is the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint Online tenant you want to connect to. See Configure OAuth application in Microsoft Azure.
Resource Id	Auto-populated with **00000003-0000-0ff1-ce00-000000000000**.

4. Click **Submit**.

What to do next
If configuring an integration with multiple Microsoft SharePoint Online tenants, create additional tenant profiles as needed.

Configure the SharePoint Graph Root Site Subscription connection and credential alias record

Integrate the ServiceNow instance and Microsoft SharePoint Online by creating a custom OAuth application in Microsoft SharePoint Online to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request Integration Hub subscription
- Activate Microsoft SharePoint Online spoke
- Role required: admin

About this task

If you intend to use the Create Root Site Subscription action and configure **SharePointGraphRootSiteSubscription** connection and credential alias record, you must create another tenant.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credential Aliases**.
2. Open the record, **SharePointGraphRootSiteSubscription**.
3. Click the **Create New Connection & Credential** related link.
4. On the form, fill these details.

Field	Description
OAuth Entity Name	Name to identify the OAuth application registry record.
OAuth Client ID	Client ID in this format: `<ClientID>@<TenantID>`.
OAuth Client Secret	Client Secret you created during the Microsoft SharePoint Online account configuration.
OAuth Token URL	Token URL in this format: `https://login.microsoftonline.com/<tenant-id>/oauth2/v2.0/token`

Note:
You may change default values as per your requirement.

5. Click **Create and Get OAuth Token**.

Microsoft Teams Communications Spoke

Manage groups calls and meetings in the Microsoft Teams Communications account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Microsoft Teams Communications spoke v1.5.1 is the latest version.

Supported versions

This spoke was built for Microsoft Teams Communications API version v1 and beta version, but may be compatible with later versions.

Note:
The Create Online Meeting and Mute Participants spoke actions use the beta API version. All the remaining actions use the API version v1.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Teams Communications spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Call Management	Delete Group Call	Deletes the specified active group call.
	Get Group Call Details	Retrieves details of the specified active group call.
	Get Group Call Participant Details	Retrieves the properties and relationships of a participant object or list of participant objects from Microsoft Graph API.
	Invite Participants to Group Call	Invites participants to the specified active group call.
	Keep Group Call Alive	Keeps a group call alive if the keep alive request is made within 45 minutes of the previous request. If the request is not made within 45 minutes, the group call is considered as an inactive call.
	Mute Participants in Group Call	Mutes one or more participants in an active group call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Start Group Call	Initiates a group call.
Meeting Management	Create Meeting Event	Creates a Microsoft Teams-enabled calendar event with comprehensive meeting configuration options. This action allows you to schedule online meetings, manage attendee lists, configure meeting settings, and support both one-time and recurring meeting patterns.
	Create Notification Subscription	Creates a subscription to receive real-time notifications for Microsoft Teams resources. This action allows you to monitor changes to resources such as chats and online meeting artifacts such as transcripts and recordings, by subscribing to specified event types.
	Create User Online Meeting	Creates a user online meeting using the /users/{userId}/onlineMeetings Microsoft Graph API endpoint.
	Create Online Meeting	Creates a user online meeting using the /communications/onlineMeeting Microsoft Graph API endpoint.
	Look up meeting data	Retrieves meeting details associated with the specified event ID.
	Look up Meeting Recording Content	Retrieves the recording content of a specified online meeting.
	Look up transcript data	Retrieves the meeting transcript using the specified user ID and meeting ID.
	Look up transcripts	Retrieves Microsoft Teams transcripts using the specified user ID, meeting ID, and transcript ID.
User Management	Look up User IDs Stream	Retrieves the user ID and display name for the specified users.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Microsoft Teams Communications spoke.

Set up the Microsoft Teams Communications spoke

Integrate the ServiceNow instance and Microsoft Teams Communications account by creating a custom OAuth application in Microsoft Teams Communications to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Teams Communications spoke.
- Role required: admin.

Create an app in Microsoft Teams to enable making calls

Create an app to make outbound calls from Microsoft Teams.

Before you begin

Role required: admin, Microsoft Teams admin, Microsoft Azure admin

Procedure

1. Log in to Microsoft Teams developer portal.

Note:

The Developer Portal for the Government Community Cloud (GCC) is accessible only through an application within Microsoft Teams. It is not available as a separate, standalone website. For more information, see Developer Portal for Teams. To create an app for GCC, you must create the app from Microsoft Teams.

2. Create an app.

   a. Navigate to **Apps** > **New app**.

   b. Enter a valid name for the app in the Add app pop-up page and select **Add**.

   c. On the App details page, fill in the fields.

App details page

Field	Description
Short name	Name of your application. For example, ServiceNow for Notify Microsoft Teams.
Full name	Full name of your application.
App ID	Unique identification number for the app. **Note:** This App ID is different from the Bot ID/App ID that will be generated in further steps.
Short description	Brief description of the app.
Long description	Detailed description of the app.
Version	Version for the app. For example, 1.0.
Developer or company Name	Name of your company.
Website	Link to your company website.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Privacy policy	Link to the privacy statement for your app.
Terms of use	Link to the terms and conditions for your app.

d. Select **Save**.
An app is created in Microsoft Teams.

3. Create a bot for the new app.

a. Navigate to **Configure** > **App features**.

b. Select **Bot**.

c. Select **Create a new bot**.

d. Select **New Bot**.

e. Enter a valid name for bot in the Add bot pop-up page and select **Add**.

f. Copy to a notepad the Bot ID value of the new bot using one of the following options and this will be your app Client ID.

- Copy the ID from the browser URL.
- Navigate back to **Bots** > **Tools**, and copy the Bot ID.

g. Go to **Channels**, enable **Microsoft Teams**, and select **Save**.

h. Select **Client secrets** and enter a client secret for your bot.
A Client secret is generated.

> **Note:**
> Ensure you copy the generated Client secret to a notepad because it will not appear again.

4. Copy the Client ID or Bot ID of the new bot to the Application (client ID).

a. Go to **Apps** and select the app you created.

b. Navigate to **Configure** > **Basic information**.

c. Paste the Client ID/Bot ID that you copied during step 3f in the **Application (client) ID** field and select **Save**.

5. Configure additional app features for new bot.

a. Go to **Apps** and select the app you created.

b. Navigate to **Configure** > **App features** > **Bot** > **Select an existing bot** and select the bot you created.

c. Select **Support audio calls** and **Support video calls** from 'What can your bot do?'.

d. Select **Personal**, **Team**, and **Group chat** from 'Select the scopes in which people can use this command'.

6. Copy the new app attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Log in to Microsoft Azure portal as Microsoft Azure admin.

b. Navigate to **Azure services** > **Azure Active Directory** > **Manage** > **App registrations**.

c. Search and open the new bot created for the spoke by name or by Application (client) ID.

d. Make a note of client ID/Application (client) ID, Object ID, and tenant ID to update these values in your ServiceNow instance in later procedures.

Note:
Bot ID created in the Microsoft Teams Developer portal and Application (client) ID in the Microsoft Azure portal are the same.

Manage permissions and authenticate the app and bot in Microsoft Azure portal

Assign permissions to users to be able to authenticate successfully and participate in conference calls in Microsoft Teams.

Before you begin
Role required: Microsoft Azure admin

About this task
You can manage the permissions required by the app and bot to perform required actions for conference calls.

Procedure

1. Log in to Microsoft Azure portal.
2. Navigate to **Azure Services** > **Azure Active Directory** > **Manage** > **App registrations**.
3. Search and open the bot created in step 3 in the section Create an app in Microsoft Teams to enable making calls by name or by Application (client) ID.
4. Navigate to **Manage** > **API Permissions** > **Add a permission** > **Microsoft Graph** and select **Application Permissions**.
5. Search and select the following values using **Select permissions**, and then select **Add permissions** to grant the permission.
   - **User.Read.All** from User list.
   - **OnlineMeetings.ReadWrite.All** from OnlineMeetings list.
   - **Calls.InitiateGroupCall.All**, **Calls.JoinGroupCall.All**, **Calls.JoinGroupCallAsGuest.All** from Calls list.
6. Grant admins access to the Microsoft Azure applications that require admin approval.
   a. Select **Grant admin consent for <tenant>** in the API permissions page.
   b. Select **Yes** in the Grant admin consent confirmation pop-up page.

Create a Service user to make calls from Microsoft Teams

Create a service user role to be able to start online meetings on behalf of users in Microsoft Teams.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to Microsoft Azure portal.
2. Create a Service user.
   a. Navigate to **Azure services** > **User**.
   b. Select **New user**.
   c. On the form, fill the fields.

New user

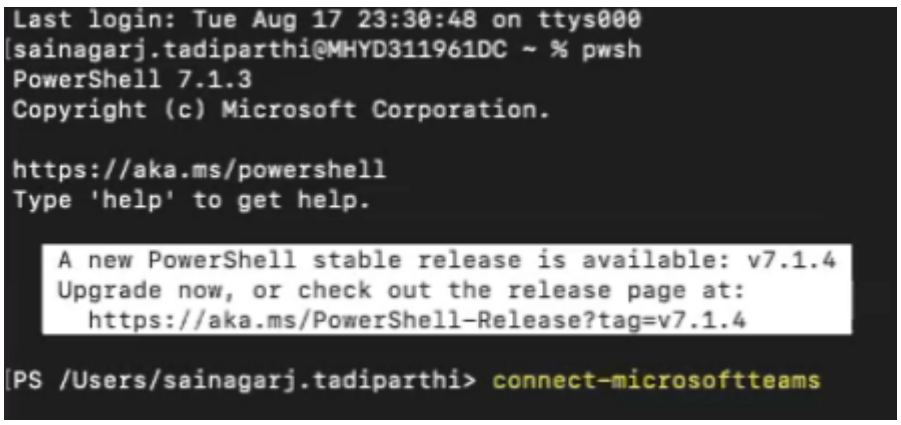
Field	Description
User name	Option to provide the user name for the user.
Name	Option to provide the name of the user.

   d. Select **Create**.
   e. Select the created user to view the details.

> **Note:**
> Ensure that the Service User has the required license/subscription and a valid usage location set to make conference calls from Microsoft Teams.

3. Run the PowerShell command from Terminal on macOS or from the Command prompt on Windows OS.
   a. Type the command `pwsh` and press **Enter**.
   b. Connect your Microsoft tenant with PowerShell.
   c. Run the following command in PowerShell.

```
connect-microsoftteams
```



Upon successful connection, a confirmation message is displayed in the browser.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell will also display the tenant details.

4. Run the command below to create a new Application Access Policy in PowerShell.

   Use the bot ID created in step 3 in the section Create an app in Microsoft Teams to enable making calls as the AppId for the command.

   For more information on the application access policy, see Configure application access to online meetings.

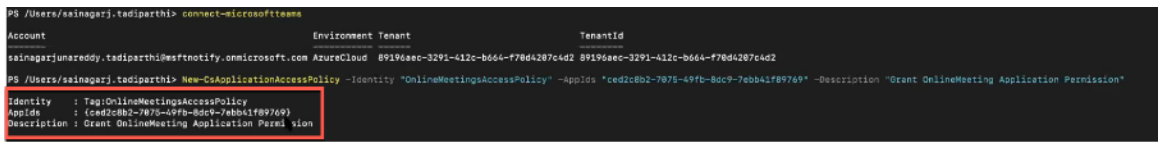
```
Syntax:

New-CsApplicationAccessPolicy -Identity "<PolicyName (can
 be anything)>" -AppIds "<AppIds>" -Description "<Policy
 Description>"

Example:
If you have a Self-configured (single tenant) setup, use the
 application ID from Azure portal.

For Example: New-CsApplicationAccessPolicy
 -Identity "OnlineMeetingsAccessPolicy" -AppIds
 "aaaaaaaa-1234-er4r-8dc9-123456789012" -Description "Grant
 OnlineMeeting Application Permission"
```

   Upon successfully creating the policy, the details are displayed in PowerShell.



5. Run the user permission policy in PowerShell.

   a. Go to the Microsoft Azure portal.

   b. Navigate to **Home** > **Users**.

   c. Select the user created.

   d. Copy the **Object ID** of the user to notepad.

   e. Use the policy name created in the previous step as the **PolicyName** of the command and the **Object ID** as the **UserAzureID** respectively in the command to execute in PowerShell.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Syntax:

Grant-CsApplicationAccessPolicy -Identity "<UserAzureID>"
 -PolicyName "<PolicyName>"

Example:

Grant-CsApplicationAccessPolicy -Identity
 "fdcd9c17-ceae-468f-906f-2er76b4dd0f4" -PolicyName
 "OnlineMeetingsAccessPolicy"
```

Register Microsoft Teams Communications as an OAuth provider

Use the information generated during the application configuration in Microsoft Azure portal to register Microsoft Teams Communications as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays this message: `What kind of OAuth application?`.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Application ID created during application registration.
Client Secret	Client secret created during application registration.
Active	Option to actively use the application registry.
Authorization URL	OAuth authorization code endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/authorize`.
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`.
Token Revocation URL	OAuth server token revocation endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Redirect URL	OAuth callback endpoint. Enter `https://<instance-name>.service-now.com/oauth_redirect.do`.
Default Grant type	Grant type used to establish the token. Select **Client Credentials**.

5. Right-click the form header, and click **Save**.
6. In the **OAuth Entity Scopes** tab, insert a row and fill these values:

Field	Description
Name	Name to identify the entity scope record. For example, `MS Teams Comm OAuth Scope`.
OAuth scope	OAuth entity scope. Enter `.default`.

7. Right-click the form header, and click **Save**.
8. In the **OAuth Entity Profiles** tab, open the default profile record.
9. In the **OAuth Entity Scopes** tab, insert a record.
10. Search and select the OAuth entity scope you had created.
11. Click **Update**.

Create a credential record for the Microsoft Teams Communications

Authorize the Microsoft Teams Communications spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Teams Communications connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, **MSTeamsCommunicationsSpoke**.
3. From the **Credentials** tab, click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill in the fields.

OAuth 2.0 Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `MS Teams Comm Cred`.
Active	Option to actively use the credential record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Entity Profile	OAuth profile created during the registration of Microsoft Teams Communications as an OAuth provider. For example, `MS Teams Comm OAuth Prof`.

6. Right-click the form header and click **Submit**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Microsoft Teams Graph Spoke

The Microsoft Teams Graph spoke manages applications, calendar, teams, channels, chats, notifications, and webhooks in Microsoft Teams. To create, manage, or delete users and groups, use the Microsoft Entra ID spoke (formerly Microsoft Azure Active Directory spoke).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note:

- Teams in the Microsoft Teams Graph spoke are created from the groups in Microsoft Entra ID (formerly Microsoft Azure Active Directory). To create a team using the Microsoft Teams Graph spoke, the associated group must be present in Microsoft Entra ID.
- User and group management can be done using Microsoft Entra ID only and not Microsoft Teams Graph spoke.
- Teams can be created from the Microsoft Office 365 group only.
- The team ID in Microsoft Teams is the same as the group ID of the associated group in Microsoft Entra ID.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft Teams Graph spoke v4.4.1 is the latest version.

Supported version

Microsoft Graph REST API v1.0.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- Flow Designer Designer Model (com.glide.hub.designer_backend.model)
- Complex Object (com.glide.cobject)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Remote Tables (com.glide.script.vtable)
- ServiceNow IntegrationHub Action Step - Get Connection Info (com.glide.hub.action_step.get_connection_info)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Microsoft Teams Graph spoke provides a sample flow, Post ServiceNow Incident Worknotes Updates to Microsoft Teams Chat, to demonstrate automating the task of posting a Microsoft Teams chat message to the assigned user with details about the latest work notes added to the incident.

Spoke subflows

The Microsoft Teams Graph spoke provides samples subflows to demonstrate automating the tasks. To customize a sample flow, copy it to the required application scope. Available sample subflows include:

Microsoft Teams Graph spoke subflows

Subflow	Description
Post Incident Details	Posts details of the required incident to a Microsoft Teams channel.
Process Inbound Notifications	Retrieves the details of the specified message based on the input data received from webhook subscription.
Renew Webhook Subscription Helper Subflow	Renews a subscription if renewal is required, which is decided based upon inputs.
Renew Webhook Subscriptions	Retrieves all the webhook subscriptions and renews them if renewal is required.
Subscribe Webhook	Creates a webhook subscription for the specified team's channel.

Spoke actions

The Microsoft Teams Graph spoke provides actions to automate team and channel tasks when an incident is created in the ServiceNow instance.

You can perform some actions by using the Microsoft Teams Spoke connection and the remaining actions by using the Microsoft Teams Graph Client Credentials connection.

The actions in the following table use the Microsoft Teams Spoke connection and credential alias record. These actions require the delegated permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Teams Graph spoke actions that use the Microsoft Teams Spoke connection and credential alias

Category	Action	Description	Permissions required (from least to most privileged)	
Application Management	Install Application to User	Installs the specified application in the personal scope of the user.	Delegated (work or school account)	TeamsAppInstallation.ReadWriteS TeamsAppInstallation.ReadWriteF
	Look up User App Installation	Retrieves the details of the specified application's installation for the user.	Delegated (work or school account)	TeamsAppInstallation.ReadForUse TeamsAppInstallation.ReadWriteS TeamsAppInstallation.ReadWriteF
Calendar Management	Look up Schedules	Retrieves the availability information (free or busy) for a collection of users, distributions lists, or resources (rooms or equipment) for the specified time period.	Delegated (work or school account)	Calendars.Read, Calendars.ReadWrite
Channel Management	Add Member to Channel	Adds the specified member to the specified channel.	Delegated (work or school account)	ChannelMember.ReadWrite.All
	Create Channel	Create a new channel in a team.	Delegated (work or school account)	Channel.Create, Group.ReadWrite.All, Directory.ReadWrite.All
	Delete Channel	Removes the specified channel from the required team and deletes all conversations.	Delegated (work or school account)	Channel.Delete.All, Group.ReadWrite.All, Directory.ReadWrite.All
	Look up Channel	Retrieves the properties and relationships of a channel.	Delegated (work or school account)	Channel.ReadBasic.All, ChannelSettings.Read.All, ChannelSettings.ReadWrite.All, Group.Read.All, Group.ReadWrite.All, Directory.Read.All, Directory.ReadWrite.All
	Look up Channel by Name	Retrieves the Channel ID and properties given	Delegated (work or school account)	Channel.ReadBasic.All, ChannelSettings.Read.All, ChannelSettings.ReadWrite.All,

Microsoft Teams Graph spoke actions that use the Microsoft Teams Spoke connection and credential alias (continued)

Category	Action	Description	Permissions required (from least to most privileged)	
		or make Team setting updates.		
	Create Team	Create a team from an existing Office 365 group. **Note:** The team ID is the same as the group ID.	Delegated (work or school account)	Group.ReadWrite.All, Directory.ReadWrite.All
	Delete Team	Deletes the specified team.	Delegated (work or school account)	Group.ReadWrite.All
	Look up Team	Retrieves the properties and relationships of a team.	Delegated (work or school account)	Team.ReadBasic.All, TeamSettings.Read.All, TeamSettings.ReadWrite.All, Group.Read.All, Group.ReadWrite.All, Directory.Read.All, Directory.ReadWrite.All
	Look up Team Members Stream	Retrieves list of team members.	Delegated (work or school account)	TeamMember.Read.All, TeamMember.ReadWrite.All
	Look up Teams by User	Lists teams of the user containing IDs and their display names.	Delegated (work or school account)	Team.ReadBasic.All, TeamSettings.Read.All, TeamSettings.ReadWrite.All, User.Read.All, User.ReadWrite.All, Directory.Read.All, Directory.ReadWrite.All
	Remove Member from Team	Removes the specified member from the specified team.	Delegated (work or school account)	TeamMember.ReadWrite.All
	Unarchive Team	Restores an archived team. Enables members to post to channels in the team, make comments, and like posts again.	Delegated (work or school account)	TeamSettings.ReadWrite.All, Group.ReadWrite.All, Directory.ReadWrite.All

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Teams Graph spoke actions that use the Microsoft Teams Spoke connection and credential alias (continued)

Category	Action	Description	Permissions required (from least to most privileged)	
	Update Team	Updates the properties of a specific team.	Delegated (work or school account)	TeamSettings.ReadWrite.All, Group.ReadWrite.All, Directory.ReadWrite.All

The actions in the following table use the Microsoft Teams Graph Client connection and credential alias record. These actions require the application permissions.

Microsoft Teams Graph spoke actions that use the Microsoft Teams Graph Client Credentials connection and credential alias

Category	Action	Description	Permissions required (from least to most privileged)	
Calendar Management	Create Meeting	Creates an online meeting event in the MS Teams calendar.	Application	Calendars.ReadWrite
	Delete Meeting	Deletes meeting event from the MS Teams calendar.	Application	Calendars.ReadWrite
	Look up Meeting	Retrieves meeting event details from the MS Teams calendar.	Application	Calendars.Read
	Look up Meeting Occurrences	Retrieves recurrence child meeting ID from the MS Teams calendar.	Application	Calendars.Read
	Look up Meetings Stream	Retrieves meeting events details from the MS Teams calendar.	Application	Calendars.Read, Calendars.ReadWrite
	Update Meeting	Creates an online meeting event in the MS Teams calendar.	Application	Calendars.ReadWrite
Webhook Management	Look up Webhook Subscription	Retrieves details of the required webhook subscription.	Application	ChannelMessage.Read.All, Chat.Read.All

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Teams Graph spoke actions that use the Microsoft Teams Graph Client Credentials connection and credential alias (continued)

Category	Action	Description	Permissions required (from least to most privileged)	
	Look up Webhook Subscriptions Stream	Retrieves details of all webhook subscriptions.	Application	ChannelMessage.Read.All, Chat.Read.All
	Renew Webhook Subscription	Renews the specified webhook subscription.	Application	ChannelMessage.Read.All, Chat.Read.All
	Subscribe Webhook	Creates a webhook subscription for the specified resource.	Application	ChannelMessage.Read.All, Chat.Read.All
	Unsubscribe Webhook	Deletes the specified webhook subscription.	Application	ChannelMessage.Read.All, Chat.Read.All

Important:
Ensure that you are aware about these default spoke configurations.

- By default, the grant type is set to **Authorization Code**.
- All actions in the Application Management, Channel Management, Chat Management, Notification Management, and Team Management categories, and Look up Schedules action in the Calendar Management category use the **Microsoft Teams Spoke** connection and credential alias and these actions require delegated permissions.
- The Calendar and Webhook Management spoke actions (except Look up schedules action in Calendar Management) use the **Microsoft Teams Graph Client Credentials** connection and credential alias and these actions require application permissions.

If you want to use the Microsoft Teams Graph Spoke without user interaction, you should change the grant type to **Client Credentials** so that the ServiceNow application can access the Microsoft Teams Graph API without user involvement. For instructions on how to change grant type and the required configurations, see the Knowledge Base article - KB1635160 on ServiceNow - NOW Support.

For more information about the required permissions, see Microsoft Teams documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of the spoke actions require the channel ID, group ID, or team ID as one of the inputs. To learn these details, log in to Microsoft Teams, navigate to **Teams**, and click **Get link to channel** for the required channel. The channel link contains the required details. For example, if the channel link is `https://teams.microsoft.com/l/channel/19%3a1aa3730712e245a0af31e4095d66d613%40thread.skype /New%2520channel%2520in%2520team? groupId=7fb91938-5e8c-4968-bf7d-3987df7716f3 &tenantId=a46df9b7-2c9b-49d5-8c9f-d1b3de4ba59f`, the group ID and team ID are `7fb91938-5e8c-4968-bf7d-3987df7716f3`, and the channel ID is`19:1aa3730712e245a0af31e4095d66d613@thread.skype` or `1aa3730712e245a0af31e4095d66d613`.

For more information about accessing the channel ID and group ID through Microsoft Teams, see Microsoft Teams documentation.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Microsoft Teams application management AI agent	Automates tasks related to Microsoft Teams and Integration Hub. Performs actions such as looking up app installations and installing applications for the users.
Microsoft Teams channel management AI agent	Manages Microsoft Teams channels through IntegrationHub. It provides capabilities such as creating channels, managing members, and retrieving channel information.
Microsoft Teams chat management AI agent	Automates workflows between ServiceNow and Microsoft Teams by providing capabilities such as looking up chats and messages.
Microsoft Teams notification management AI agent	Automates communication between ServiceNow and Microsoft Teams by sending messages, updates, and replies to Microsoft Teams channels. The agent supports actions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
	like 'Post Change Details', 'Post Message', and 'Post Reply to Message' to ensure effective notification management for change requests.
Microsoft Teams team management AI agent	Automates tasks such as creating and managing Teams, adding or removing members, and retrieving team-related information. Enhances team management and communication workflows within an organization.
Microsoft Teams calendar management AI agent	Automates workflows between ServiceNow and Microsoft Teams. Performs actions such as deleting, and retrieving meeting details.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke modules

The Microsoft Teams Graph spoke adds the Microsoft Teams Graph Spoke to your ServiceNow instance and includes these modules.

Microsoft Teams Graph spoke modules

Module	Description
Delta Token	Displays the list of available Delta Tokens.
Webhook Registry	Displays the list of available webhook registries.
Webhook Decision Policy	Displays the list of decision policies.
Webhook Subscriptions	Displays the details of webhook subscriptions.

Microsoft account requirements

The Microsoft Teams Graph spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Set up the Microsoft Teams Graph spoke.

MID Server requirements

The Microsoft Teams Graph spoke actions use REST calls, which can run on an instance or a MID Server. Use the connection record associated with the Microsoft alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Microsoft Teams Graph spoke

Integrate the ServiceNow instance and Microsoft Teams account by creating a custom OAuth application in Microsoft Azure portal to authenticate ServiceNow requests.

Demonstrates how to set up the Microsoft Teams Graph spoke.

Before you begin

- Request an Integration Hub subscription.
- Activate the Microsoft Teams Graph spoke.
- Role required: admin.

Register an application using the Microsoft Azure portal

Provide authorization to the ServiceNow instance by registering an application in Microsoft Entra ID (formerly Microsoft Azure Active Directory).

Before you begin

Role required: Microsoft Entra ID admin

About this task

Complete these steps from the Microsoft Azure portal.

Procedure

1. In the Microsoft Azure portal, copy and record the **Directory ID** for later use.
   For more information, see Get tenant and app ID values for signing in in Microsoft Entra ID documentation.
2. Register your application in Azure portal. For instructions on registering an application, see Tutorial: Register an app with Microsoft Entra ID in the Microsoft Docs.
3. Copy and record the **Application ID** for later use.
4. Add the **Redirect URL** in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`.
   For more information, see Authentication and authorization for Azure Time Series Insights API in Microsoft Docs.
5. For the **Required Permissions**, select **Microsoft Graph**.

   For more information, see Permissions and consent in the Microsoft identity platform in Microsoft Docs.

   For information about the permissions required to use the spoke actions, see the Spoke actions section in Microsoft Teams Graph Spoke. Provide permissions as per your requirement. For more information about the permissions, see Microsoft Graph REST API v1.0 reference in Microsoft Docs.
6. Record the **Client Secret** for use in later configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The ServiceNow application is created with Microsoft Entra ID.

Configure connections for the Microsoft Teams Graph spoke

Add and configure the Microsoft Teams connections to authenticate ServiceNow requests in the Microsoft Teams Graph spoke.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Click the **Connections** tab.
3. Configure the **Microsoft Teams Spoke** connection.
   a. Locate the **Microsoft Teams Spoke** connection alias and click **View Details**.

      Note:
      Don't click **Add Connection**.

   b. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.

   c. On the **Configure Connection** form, fill in the fields.

Field	Description
Name	Name to identify the alias record associated with this connection.
Connection URL	Connection URL. Enter `https://graph.microsoft.com`.
API Version	The value is set to **v1.0** by default. If you are using any other API version, update the version number here.
Authorization URL	OAuth authorization code endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/authorize`.
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`.
Token Revocation URL	OAuth server token revocation endpoint.
OAuth Client ID	Application ID created during application registration.
OAuth Client Secret	Client secret created during application registration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Redirect URL	OAuth callback endpoint. Enter `https://<instance-name>.service-now.com/oauth_redirect.do`.

d. Click **Configure and Get OAuth Token**.

4. Configure the **Microsoft Teams Graph Client Credentials** connection.
Except the Look up Schedules action, all the other calendar and webhook management spoke actions use this connection record.

a. Locate the **Microsoft Teams Graph Client Credentials** connection alias and click **View Details**.

Note:
Don't click **Add Connection**.

b. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.

c. On the form, fill in the fields.

Configure Connection form

Field	Description
Name	Name to identify the alias record associated with this connection.
Connection URL	Connection URL. Enter `https://graph.microsoft.com`.
API Version	The value is set to **v1.0** by default. If you are using any other API version, update the version number here.
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`.
OAuth Client ID	Application ID created during application registration.
OAuth Client Secret	Client secret created during application registration.

d. Click **Configure and Get OAuth Token**.

Result
The spoke connections are configured and the spoke ready to be used.

Set up a bi-directional webhook for the Microsoft Teams Graph spoke

Configure a webhook to subscribe to Microsoft Teams with a ServiceNow callback URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

https://player.vimeo.com/video/1017605866?h=b990f0cb15&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

- Request the required IntegrationHub subscription
- Activate the Microsoft Teams Graph spoke
- Role required: admin

Register a Microsoft Teams Graph webhook in ServiceNow instance

Register Microsoft Teams in your ServiceNow instance to notify the ServiceNow app when certain events occur in Microsoft Teams.

Before you begin

Role required: admin

Procedure

1. Navigate to **Microsoft Teams Graph Spoke** > **Webhook Registry**.
2. Click **New**.
3. On the form, fill in these fields:

Name	Name to identify the webhook registry. For example, `MS Teams Graph webhook registry`.
Client State	Client State
Path	Microsoft Teams Graph webhook path. This field is auto-populated to `api/sn_msteams_ahv2/ms_teams_webhook`.
Description	Description of the webhook registry.

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.
   The system auto-populates the webhook callback URL.

Create webhook subscription for a channel

Create a webhook subscription for the required channel in a team by testing the Subscribe Webhook subflow.

Before you begin

Role required: admin

Procedure

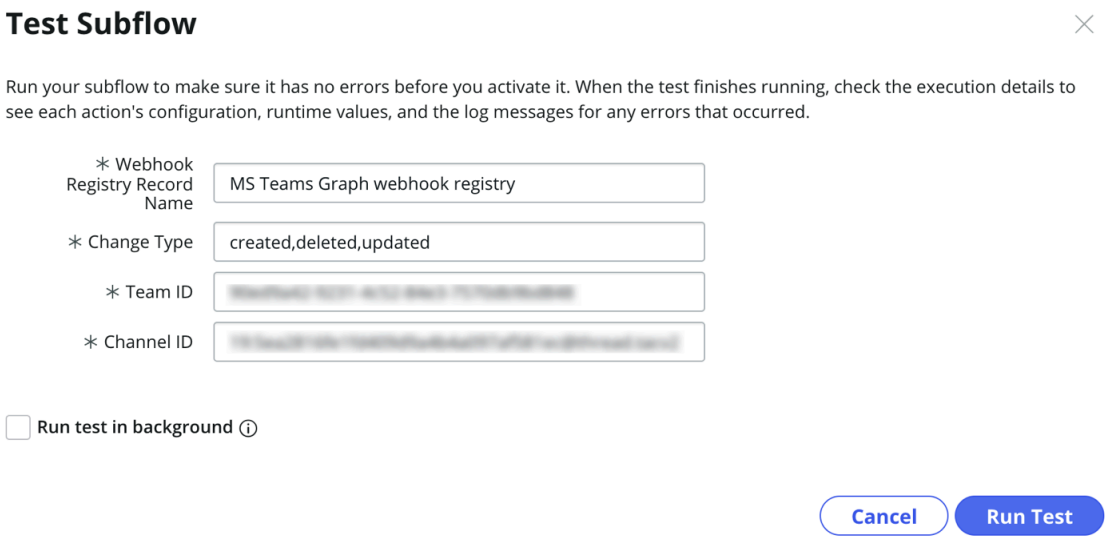
1. Navigate to **Process Automation** > **Workflow Studio**.
2. Click **Subflows**.
3. Open the **Subscribe Webhook** subflow.
4. Click **Test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the form, fill in these values.

Field	Description
Webhook Registry Record Name	Name of the webhook record you had provided when you registered the webhook in ServiceNow instance. For example, `MS Teams Graph webhook registry`.
Change Type	Type of change in the subscribed resource that should send a change notification. The supported values are: `created`, `updated`, and `deleted`. You can provide multiple comma-separated values.
Team ID	Unique identifier of the team.
Channel ID	Unique identifier of the channel.

Test the Subscribe Webhook subflow



6. Click **Run Test**.
   Subscription for the required channel is created.

   See Building subflows for more information about testing subflows.

Customize a spoke subflow

Customize the required subflow that is shipped along with the spoke by creating a copy of it.

Before you begin
Role required: admin

Procedure

1. Navigate to **Process Automation** > **Workflow Studio**.
2. Click **Subflows**.
3. Open the required subflow that is shipped along with the Microsoft Teams Graph spoke.
   For example, **Process Inbound Notifications** subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click the more actions icon ( ) and select **Copy subflow**.
5. In **New flow name**, enter a unique name you want the copied subflow to have.
   For example, **Copy of Process Inbound Notifications** subflow.
6. Click **Copy**.
   A copy of the subflow is created.
7. Customize the subflow according to your requirement and publish it.
   See Building subflows for more information about creating and using subflows.

Configure Microsoft Teams Graph webhook decision policy

Create webhook routing policy and subflow according to your requirements.

Before you begin

Role required: admin

Procedure

1. Navigate to **Microsoft Teams Graph Spoke** > **Webhook Decision Policy**
2. Click **New**.
3. On the form, fill in the fields.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Answer	Subflow that should be triggered when the conditions are met. **a.** Click the Lookup icon. **b.** Select the required subflow from the **Document**: list. For example, **Copy of Process Inbound Notifications**.
Default Answer	Option to specify if this answer is the default answer. Default answer is applicable when the conditions are not met.
Condition	Conditions to be met when the incoming webhook delivers data from Microsoft Teams.

4. Click **Submit**.

Note:
These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Microsoft Teams Spoke

The Microsoft Teams spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Microsoft Teams channels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Important:
Starting with the Yokohama release, Microsoft Teams Spoke is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. Microsoft Teams Graph Spokeprovides the latest experience for this functionality.

For more information, search for the term `Microsoft Teams Spoke for ServiceNow IntegrationHub` in Plugins planned for deprecation.

Spoke version

Microsoft Teams spoke v1.1.3 is the latest version .

Microsoft Teams actions

The Microsoft Teams spoke is an available integration through Integration Hub. You can specify the following Microsoft Teams actions within a flow:

Action	Description
Post a Message	Send a message to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL, Title, and Message to send.
Post Change Details	Send details about a ServiceNow change record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Change record to send.
Post Incident Details	Send details about a ServiceNow incident record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.
Post Problem Details	Send details about a ServiceNow problem record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.

Microsoft Teams Inputs

The following inputs are common to the Microsoft Teams actions:

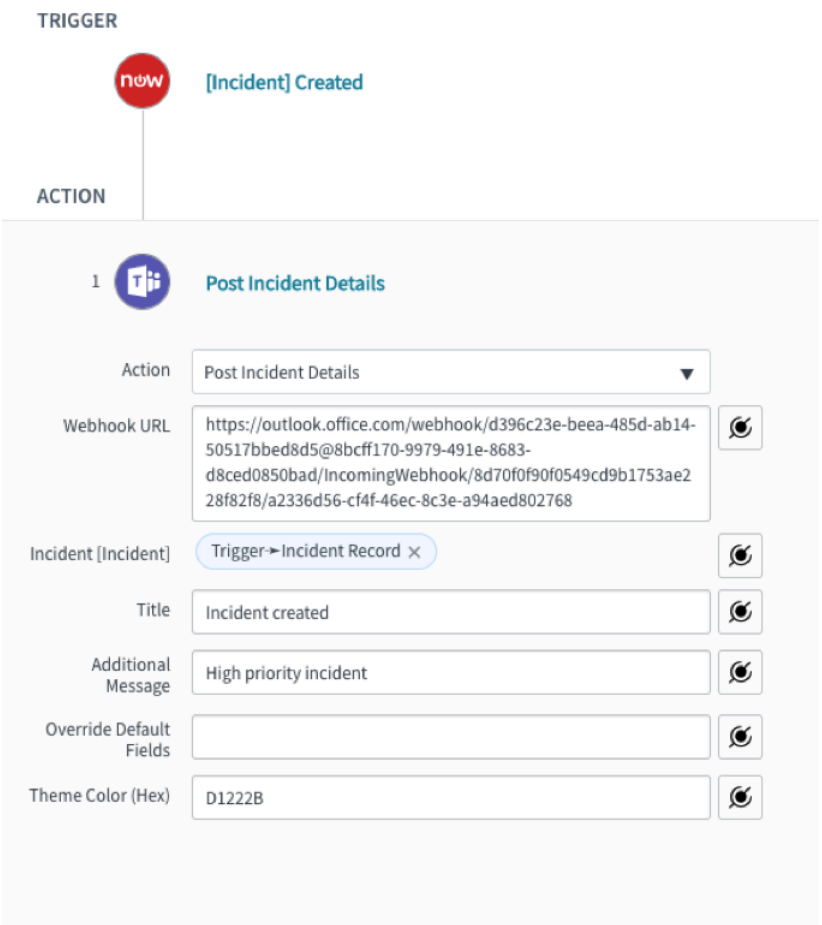
Input	Description
[Required] Webhook URL	The Microsoft Teams webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Microsoft Teams documentation.
[Optional] Title	Title of the message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input	Description
[Optional] Additional Message	Add a message before the record details.
[Optional] Override Default Fields	You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.
[Optional] Theme Color (Hex)	Hex code value of color to highlight the message.
[Optional] Action URL	URL to the page that opens when you click the button. For more information, see https://learn.microsoft.com/en-us/microsoftteams/platform/webhooks-and-connectors/how-to/connectors-using?tabs=cURL.
[Optional] Action Name	Name of the action that you can automate with the flow.

Example

You can add a Microsoft Teams Post Incident Details action to a flow which identifies newly created high priority incidents and a specified theme color.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Miro Spoke

The Miro spoke provides actions to view and analyze meaningful usage data for Miro software subscriptions. Analyze usage for your Miro Enterprise account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Miro spoke v3.3.1 is the latest version.

Supported version

This spoke was built for Miro Enterprise version v2 and Miro SCIM version v1, but may be compatible with later versions.

Spoke requirements

- Miro Company Admin account
- SSO/SAML enabled on your Miro account

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Miro spoke provides actions to automate Miro tasks when events occurs in your ServiceNow instance. Available actions include:

Note:
To prevent unauthorised access, make sure that the required scope in Miro has the least privileges for the spoke actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Miro required scopes
Board Item Management	Add Card Item to Board	Adds a card item to a board in Miro.	boards:write
	Add Shape Item to Board	Adds a shape item to a board in Miro.	boards:write
	Add Sticky Note Item to Board	Adds a sticky note item to a board in Miro.	boards:write
	Add Text Item to Board	Adds a text item to a board in Miro.	boards:write
Board Management	Create Board	Creates a board in Miro.	boards:write
	Delete Board	Deletes the specified board in Miro.	boards:write
	Look up Board	Retrieves information about the specified board from Miro.	boards:read
	Look up Boards Stream	Retrieves information about all the boards in Miro.	boards:read
	Update Board	Updates the specified board in Miro.	boards:write
Team Management	Add User to Team	Adds a Miro user to the team.	organizations:teams:write
	Create Team	Creates a new team in Miro.	organizations:teams:write
	Delete Team	Deletes a team from the organization.	organizations:teams:write
	Look up Team	Retrieves information about the specified team from Miro.	organizations:teams:read
	Look up Teams Stream	Retrieves the list of teams in the organization.	organizations:teams:read
	Remove User from Team	Removes a Miro user from the team.	organizations:teams:write
	Update Team	Updates the specified team in Miro.	organizations:teams:write
User Management	Activate User	Activates the specified user in Miro account.	Not applicable. This is a Miro SCIM action.
	Create User	Creates a user in Miro account.	Not applicable. This is a Miro SCIM action.
	Deactivate User	Deactivates a Miro user account.	Not applicable. This is a Miro SCIM action.
	Delete User	Deletes a user from a Miro account.	Not applicable. This is a Miro SCIM action.
	Look up Authenticated User	Retrieves information about the authenticated user account.	None.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Miro required scopes
	Look up Organization Members Stream	Retrieves the details of all the members in an organization.	organizations:read
	Look up User	Retrieves information of the specified user.	Not applicable. This is a Miro SCIM action.
	Look up Users Stream	Retrieves the list of users in an organization.	Not applicable. This is a Miro SCIM action.
	Update User	Updates the specified user in Miro.	Not applicable. This is a Miro SCIM action.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Miro board item management AI agent	Manages board items tasks (that is, add a sticky note item to a board, add a shape item to a board, add a card item to a board, add a text item to a board) in Miro.
Miro team management AI agent	Manages team management tasks (that is, update a team, remove a user from a team, delete a team, add a user to a team, look up a team, create a team) in Miro.
Miro user management AI agent	Manages user management tasks (that is, look up an authenticated user, delete a user, create a user, activate a user, deactivate a user, update a user, look up a user) in Miro.
Miro board management AI agent	Manages board management tasks (that is, create a board, update a board, look up a board, delete a board) in Miro.

Looking for an AI agent?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke flows

The Miro spoke provides sample flows to demonstrate automating the Miro tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Add User to Miro Team	Looks up a user and the related team in Miro based on the group member and group in your ServiceNow instance and then add the user to the Miro team.
Remove Deactivated User from Miro Teams	Looks up a user in Miro teams, group members in your ServiceNow instance and then removes the user from each team in Miro.

Spoke module

The Miro spoke adds a Miro Spoke module to your ServiceNow instance. The Miro Spoke module syncronizes and stores information about Miro Teams and Miro Users. The Miro spoke contains the following tables:

- Miro Teams (sn_miro_spoke_teams)
- Miro Users (sn_miro_spoke_users)

Module	Description
Miro Teams	Lists all the teams in Miro.
Miro Users	Lists all the users in Miro.

Integration Hub imports

The Miro spoke adds the following Integration Hub imports to your ServiceNow instance. The Integration Hub imports help you import data from Miro account to your ServiceNow instance in an automated way. For more information about Integration Hub imports, seeIntegration Hub - Import.

Import	Description
Create or Update Miro Teams Records	Imports teams details from Miro account into the Miro Teams table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import	Description
Create or Update Miro Users Records	Import users details from Miro account into Miro Users table.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Miro spoke.

Set up the Miro spoke

Integrate the ServiceNow instance and Miro by creating a custom OAuth application in Miro to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Miro spoke.
- Role required:
  - ServiceNow admin
  - Miro Company Admin

Create a Miro Enterprise OAuth 2.0 application

Create a Miro Enterprise OAuth 2.0 application to enable access to the Miro API.

Before you begin

Role required: Miro company admin.

Procedure

1. From a web browser, open the Miro Platform.
2. If you have not created any teams within your organization or you want to build and test the OAuth 2.0 application using fake data, get a developer team.
3. On the page header of the Miro Platform, click **Your Apps**.
   The sign up page opens.
4. Sign in using your Company Admin credentials.
   Your default organization profile opens.
5. At the top of the left navigation pane, click the organization profile icon to select the organization that you want to build the OAuth 2.0 application for.
   The profile for the selected organization opens.
6. On the left navigation pane, click **Profile settings**.
7. Select the **API, SDK & Embed** tab of your profile settings.
8. In the Your apps section, select the **I agree to the Terms and Conditions** check box and then click **Create new app**.
   The Create new app dialog box opens.
9. On the dialog box, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new app dialog box

Field	Description
App name	Name of the OAuth 2.0 application.
Description	Brief description of the OAuth 2.0 application.

10. Select the team that you want to build the OAuth 2.0 application for.
11. Click **Create app**.
    The settings for your newly created app open.
12. In the Your app <*app-name*> section, copy the values in the **Client id** and **Client secret** fields.
    Save them in a secure location for later use.
13. In the Redirect URLs section, enter the URL of the OAuth provider that users are redirected to after authentication and then click **Add**.
    Enter `https://`*`instance`*`.service-now.com/oauth_redirect.do`, where <*instance*> is the name of your ServiceNow instance.
14. In the OAuth scopes section, enable the **organizations:read** OAuth scope.
    OAuth scopes specify the level of access that the application has to your protected resources. The organizations:read OAuth scope enables your application to read information about your organizations and organization members.

What to do next

Keep your organization profile open so that you can enable SCIM (System for Cross-domain Identity Management) on your Miro Enterprise account.

Enable SCIM on your Miro Enterprise account

Enable SCIM (System for Cross-domain Identity Management) on your Miro Enterprise account so that you can generate an API access token for authenticating your Miro API requests.

Before you begin

Role required: Miro Company Admin

Procedure

1. On the left navigation pane of your Miro organization profile, click **Security**.
2. On the Security page, select the option to **Enable SSO/SAML**.
3. After SSO/SAML is enabled, select the option to enable **SCIM Provisioning**.
   Miro automatically generates and displays your API access token in the **Api Token** field.
4. **Optional:** Select the **Send email notifications to users provisioned by SCIM** check box to allow Miro to send email notifications to all users that have been provisioned using SCIM.
5. Copy the API access token in the **Api Token** field.
   Save it in a secure location for later use.

Create a Miro Enterprise connection

Create a connection between your Miro Enterprise applications and your ServiceNow instance.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From your ServiceNow instance, navigate to **All** > **Process Automation** > **Workflow Studio**.
   The Workflow Studio launches in a new tab.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.
4. Click **View Details** for your Miro Enterprise connection.
5. From your Miro Enterprise connection details, click **Add Connection**.
   The Create Connection dialog box opens.
6. On the dialog box, fill in the fields.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the Miro Enterprise connection. This field populates automatically.
Credential Information	
OAuth Client ID	Client ID that is assigned to your Miro Enterprise OAuth 2.0 application.
OAuth Client Secret	Client secret that is assigned to your Miro Enterprise OAuth 2.0 application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the redirect URL that you specified in Create a Miro Enterprise OAuth 2.0 application.

7. Click **Create and Get OAuth Token**.
   The Miro OAuth authorization dialog box opens.
8. On the dialog box, locate the team that you built the Miro Enterprise OAuth 2.0 application for and then click **Install**.
   The OAuth access token becomes available for authorizing your Miro Enterprise connection.

Create a Miro Enterprise SCIM connection

Create a connection between the Miro Enterprise SCIM and your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. From your ServiceNow instance, navigate to **Process Automation** > **Flow Designer**.
   The Flow Designer launches in a new tab.
2. Select the **Connections** tab.
3. Click **View Details** for your Miro Enterprise SCIM connection.
4. From your Miro Enterprise SCIM connection details, click **Add Connection**.
   The Create Connection dialog box opens.
5. On the dialog box, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the Miro Enterprise SCIM connection. This field populates automatically.
Credential Information	
API Token	API access token for authenticating Miro API requests. Enter the same API access token that you generated and copied in Enable SCIM on your Miro Enterprise account.

6. Click **Create Connection**.

monday.com Spoke

The monday.com spoke provides actions to view and analyze meaningful usage data for monday.com software subscriptions. Analyze usage for a monday.com account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke requirements

monday.com admin account.

Spoke version

monday.com v1.1.5 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The monday.com spoke provides actions to automate monday.com tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Board Management	Add Subscribers to Board	Adds the specified subscribers to a board.
	Archive Board	Archives the specified board.
	Create Board	Creates a board.
	Delete Board	Deletes the specified board.
	Delete Subscribers from Board	Deletes the specified subscribers from a board.
	Duplicate Board	Creates duplicates of the specified board.
	Look up Board Activities Stream	Retrieves the activities of the specified board.
	Look up Board by ID	Retrieves the details of the specified board.
	Look up Boards Stream	Retrieves a list of the boards.
	Update Board Description	Updates the description of the specified board.
Column Management	Create Column	Creates a column in the specified board.
	Look up Columns by Board ID	Retrieves details of all columns in the specified board.
	Update Column Title	Updates the title of the specified column.
Column Values Management	Look up Column Values	Retrieves details of the column values in the specified board and item.
File Management	Add File to File Column	Adds a file to the file column of a specific item.
	Add File to Update	Adds a file to the specified update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up File by ID	Retrieves details of the specified file.
	Look up Files by Board ID	Retrieves details of files in the specified board.
Group Management	Archive Group	Archives the specified group.
	Create Group	Creates an empty group in the specified board.
	Delete Group	Deletes the specified group.
	Duplicate Group	Creates a duplicate of the specified group.
	Look up Group by ID	Retrieves the group details for the specified board ID and group ID.
	Look up Groups by Board ID	Retrieves the details of all the groups in a board.
Item Management	Archive Item	Archives the specified item.
	Clear Item's Updates	Clears all updates on a specific item, including replies and likes.
	Create Item	Creates an item in a group.
	Create Subitem	Creates a new subitem for the specified parent item. **Note:** For creating subitems via the API, the board should already have a subitems column, or at least one subitem created.
	Delete Item	Deletes the specified item from a group.
	Duplicate Item	Creates a duplicate of the specified item in a group.
	Look up Items	Retrieves details of the items in the specified board and group.
	Look up Items by IDs	Retrieves details of the specified items.
	Look up Items Stream by Board ID	Retrieves the items for the specified board.
	Move Item to Group	Moves an item between groups in the same board.
Notification Management	Create Notification	Creates a notification with the specified details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Tag Management	Create or Look up Tag	Creates a tag when the specified type of tag does not exist. If the tag already exists, the details of the tag are retrieved.
	Look up Shareable or Private Tags	Retrieves details of the board-specific private or and shareable tags.
	Look up Tag by ID	Retrieves details of the specified public tag that is displayed on the main boards. By default, the main boards are accessible to all member-level and viewer-level users.
	Look up Tags	Retrieves details of all the public tags that are displayed on the main boards. By default, the main boards are accessible to all member-level and viewer-level users.
Team Management	Look up Team by ID	Retrieves details of the specified team.
	Look up Teams	Retrieves details of the teams.
Update Management	Create an Update	Adds an update to the specified item.
	Delete an Update	Deletes the specified update of an item.
	Look up Updates Stream	Retrieves the list of updates.
User Management	Look up Users	Retrieves details of the specified type of users.
	Look up Users by IDs	Retrieves details of the specified users.
	Look up Users Stream	Retrieves the list of the users.
Webhook Management	Create Webhook	Creates a webhook subscription based on the specified event.
	Delete Webhook	Deletes the specified webhook.
Workspace Management	Add Teams to Workspace	Adds the specified teams to the required workspace.
	Add Users to Workspace	Adds the specified users to the required workspace and defines if the users will be added as regular subscribers or as owners of the workspace.
	Create Workspace	Creates a workspace.
	Delete Teams from Workspace	Deletes the specified teams from the required a workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Users from Workspace	Deletes the specified users from a workspace.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Spoke module

The monday.com spoke adds Monday Spoke application to your instance and includes the following modules:

Module	Description
Users	Displays the list of users in monday.com.
Boards	Displays the list of all boards from monday.com.
Routing Policies	Displays the list of routing policies for monday.com spoke.
Webhook Registry	Displays the list of webhook registries for monday.com spoke.

Spoke subflows

The monday.com spoke provides subflows in the Published state to integrate with monday.com application.

Category	Subflow	Description
Webhook Management	Process Monday Webhooks	Runs when an associated subscribed event triggers in monday.com

Spoke table

The monday.com spoke adds the following table:

Table	Description
Monday Boards	Stores all the boards present in your monday.com account.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the monday.com spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the monday.com spoke

Integrate the ServiceNow instance and monday.com by creating a custom OAuth application in monday.com to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the monday.com spoke.
- monday.com role required: admin.
- Role required: admin.

Create a monday OAuth2 application

Create a monday OAuth2 application to authorize access to the monday.com API.

Before you begin

Role required: monday.com admin.

About this task

A monday application enables you to build workflows, user experiences, and products on top of the existing monday.com work operating system (Work OS). When you configure a monday application to use OAuth2, it is granted access to the monday.com API so that it can read and modify user data.

Procedure

1. From a web browser, go to monday.com.
2. Log in using your admin credentials.
3. At the bottom of the left navigation menu, click your profile icon and then select **Developers**.
   The My Apps page opens.
4. Click **Create App**.
   The Basic Information page for the new application opens.
5. In the Display Information section, fill in the fields.

Display Information

Field	Description
Name	Name of the monday application.
Short Description	Description of the application.

6. **Optional:** In the same section, add your own application icon by clicking the auto-generated icon and then selecting an icon image.
   You can also change the icon color by clicking **App Color** and then selecting either a preset or custom color. If you do not add your own application icon or select an icon color, the application uses the auto-generated icon and default icon color.
7. In the App Credentials section, copy the values in the **Client ID** and **Client Secret** fields. Save them in a secure location for later use.
8. Click **Save App**.
9. From the left navigation menu of the new application, navigate to **General** > **OAuth**.
   The **Scopes** tab of the OAuth & Permissions page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. In the Scopes section, specify how the application can access or use different types of user data by selecting the checkboxes for the following OAuth scopes according to your requirement:
    - **me:read**
    - **boards:read**
    - **boards:write**
    - **workspaces:read**
    - **workspaces:write**
    - **users:read**

    For more information about permission scopes, see Set Up Permission Scopes.
11. Click **Save Feature**.
12. Select the **Redirect URLs** tab of the OAuth & Permissions page.
13. In the Redirect URLs section, enter the URL of the OAuth provider that users are redirected to after authentication.
    Enter `https://instance.service-now.com/oauth_redirect.do`, where <*instance*> is the name of your ServiceNow instance.
14. Click **Save Feature**.
15. Navigate to **Manage** > **App Versions**.
16. Click the three dot menu under **Actions** and select **Promote to live**.
    For more information, see Promoting a draft version to live.
17. From the **Promote selected version** pop-up, click **Promote**.

Create a monday connection

Create a connection between your monday applications and your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. From your ServiceNow instance, navigate to **Process Automation** > **Flow Designer**.
   The Flow Designer launches in a new tab.
2. Select the **Connections** tab.
3. Locate your monday connection and then click **Add Connection**.
   The Create Connection and Credential dialog box opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Name	Name of the connection.
Connection URL	Base URL for the monday.com API. This field is automatically set to `https://api.monday.com/v2`.
OAuth Client ID	Client ID that is assigned to your monday application.
OAuth Client Secret	Client secret that is assigned to your monday application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the redirect URL that you specified in Create a monday OAuth2 application.

5. Click **Create and Get OAuth Token**.
   The Authorize App dialog box opens.
6. In the dialog box, sign in using the same monday.com credentials that you used to create your monday application.
7. Click **Allow**.
   The OAuth access token becomes available for authorizing your monday connection.

Set up bi-directional webhook for the monday.com spoke

Configure a webhook to subscribe to monday.com with a ServiceNow callback URL.

Before you begin

- Request an Integration Hub subscription.
- Activate the monday.com spoke.
- Set up the monday.com spoke.
- Role required: admin.

Register the monday webhook in ServiceNow

Register a monday webhook in ServiceNow to notify the ServiceNow app when certain events occur in monday.com

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Monday Spoke** > **Webhook** > **Routing Policies** > **Webhook Registry**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name to uniquely identify the webhook registry. For example, `monday spoke webhook registry`.
Path	monday webhook path.
Token	Authentication token from your ServiceNow instance which is used for validating monday.com spoke requests.

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

Result
The monday webhook is registered in your ServiceNow instance and callback URL is generated.

Add a callback URL in monday.com

Specify a webhook callback URL in your monday account to create a webhook.

Before you begin

- Register monday webhook and generate callback URL in your ServiceNow instance.
- Role required: admin

Procedure

1. Login to monday.com.
2. Navigate to **Workspace** > **Integrate** > **Integrations Center** > **Webhooks** > **Add to board**.
3. Open a workspace and right-click on **Integrate**.
4. In the **Integrations Center** tab, click **Webhooks**.
5. Select an event type and click **Add to board**.
6. Specify the generated callback URL from ServiceNow instance and click **Connect**.

Customize the bi-directional webhook in the monday.com spoke

Create a webhook routing policy and customize a subflow according to your requirements.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Click **Subflows**.
3. Create a copy of one of the available sublflows.
4. Customize the subflow according to your requirement and publish it.
5. Navigate to **Monday Spoke** > **Routing Policies**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **New**.
7. On the form, fill in the fields.

Field	Description
Label	Unique label to identify the routing policy.
Answer	Option to specify if this answer is the default answer. Default answer is applicable when the conditions are not met. **a.** Click the Lookup icon. **b.** Select the required subflow from the **Document**: list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.
Condition	Conditions to be met when the incoming webhook delivers data from monday.com.

8. Click **Submit**.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Metrikus spoke

Metrikus spoke provides actions to retrieve data from various sensors (such as occupancy sensor, air quality sensor, temperature sensor etc.) that are found at a workplace.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Metrikus spoke - IntegrationHub overview.

Supported versions

This spoke was built for Metrikus Beta v1.0.

Key features

Metrikus Spoke integrates with Flow Designer Integration Hub. It fetches the occupancy sensor data from Metrikus and provides the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Get event data. For example, when an employee enters a meeting room,when an employee occupies a desk).Get occupancy data for Workplace Connectors space records from Metrikus.
- Get occupancy data.
- The occupancy data is used for configuring automatic reservation check in.
- Workplace Service Delivery Location Directory shows Occupancy state for a selected location or space.

Spoke requirements

- Ensure that you have Metrikus login credentials.
- Metrikus provided Client ID and Client Secret key.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime [com.glide.hub.integration.runtime]
- ServiceNow IntegrationHub Action Step - OpenAPI [com.glide.hub.action_step.openapi]
- Metrikus Spoke [com.sn.wsd.metrikus.spoke]

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Metrikus Spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Actions

Actions	Description
Look up Space Tree	Get all the spaces along with the location hierarchy from Metrikus.
Look up Space Occupancy Batches	Gets batches of spaces (for example, 2000) and get occupancy data from Metrikus for all batches to combine and map it.
Look up Latest Desk Occupancy	Gets occupancy data for desks in a batch (for example, 2000.)
Look up Latest Space Occupancy	Gets occupancy data for spaces in a batch (for example, 2000)
Look up Desks Occupancy Batches	Gets batches of desks (for example, 2000) and get occupancy data to combine and map it with Metrikus Spoke.

Spoke subflows

The Metrikus Spoke provides sample subflows to demonstrate automating Workplace Connectors tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Get All occupancy by Ids	Retrieves occupancy data of both Workplace Connectors spaces and desks.
Get Occupancy by desks by Ids	Retrieves occupancy data of all desks. Invoked by **Get All Occupancy by Ids**sub flow.
Get Occupancy by spaces	Retrieves occupancy of all spaces. Invoked by the **Get All Occupancy by Ids** sub flow.

Spoke user roles

The Metrikus spoke provides the System Administrator user role to control access to data:

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up Metrikus spoke

Integrate the ServiceNow instance and Metrikus Spoke. Create a connection and credential alias in the Metrikus spoke to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Ensure that you have activated the Metrikus Spoke plugin dependencies.
- Activate the Metrikus Spoke plugin (sn_wsd_metrikus_spoke).
- Metrikus Client ID and Client secret key.
- Role required: admin.

Integrate Metrikus with your ServiceNow instance

Create the connection records to your Metrikus account. The Metrikus Spoke connection and credential aliases use these connections to perform actions in Metrikus.

Procedure

1. Navigate to **All** > *Integration Hub* > **Connections & Credentials** > *Metrikus*.
2. Select the **Create New Connections & Credential** related link.
3. On the form, fill in the fields:

Enter the Connection Information

Field	Description and value required
Connection Name	Name to identify the connection. This field is automatically set to Metrikus Spoke connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description and value required
Connection URL	The URL to make connection to the spoke. This field is automatically set to https://nextgen-api.metrikus.io.

Enter the Credential Information

Field	Description and value required
Credential Name	Name of the Metrikus Spokec credential. For example, **Metrikus Credential**
Token URL	Token URL address https://nextgen-api.metrikus.io/oauth/token.
OAuth Client ID	Client ID of the Metrikus application to register in the registration portal.
OAuth Client Secret	Client Secret key that is generated while registering the Metrikus application in the Metrikus portal.

4. Select **Create and Get OAuth Token**.

   The Metrikus Spoke is set up and integrated with your ServiceNow® Store instance.

What to do next

Navigate to **All** > *Workplace Connectors* > **Provider Connector Configuration** table. The Workplace Core locations provided in this table are mapped with the external Ids provided by Metrikus. The external IDs provided by Metrikus are transformed to retrieve workplace occupancy data in Workplace Connectors Space Occupancy Data table.

Navex EthicsPoint Spoke

The Navex EthicsPoint spoke enables you to pull employee relation cases from a Navex EthicsPoint instance into a ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Navex EthicsPoint spoke v1.0.3 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - JSON Parser [com.glide.hub.action_step.jsonparser]
- IntegrationHub Standard Spokes [com.glide.hub.action_step.xmlparser]

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke actions

The Navex EthicsPoint spoke provides actions to automate tasks when events occur in the ServiceNow instance.

Category	Action	Description
Attachment Management	Look up Case File - Attachment File	Retrieves the case file attachment.
	Look up Case Text File	Retrieves the case text file.
Case Management	Add Child Note	Adds a child note to the specified case.
	Add Participant	Adds a participant to the specified case.
	Look up Full Case	Retrieves the full case for the specified case ID.
	Look up Participant	Retrieves the participant for the specified ID.
	Look up Query Case Stream	Retrieves the query case stream for the case.
	Update Case	Updates the case for the specified case ID.
	Update Participant	Updates the participant for the specified case.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up Navex EthicsPoint spoke spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up Navex EthicsPoint spoke spoke

Integrate the ServiceNow instance and Navex EthicsPoint spoke instance using the Basic Auth credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Navex EthicsPoint spoke.
- Role required: admin.

Create basic auth credentials

Integrate the ServiceNow instance and the Navex EthicsPoint instance by using the Basic Auth credentials to authenticate ServiceNow requests.

Before you begin

Role required: admin

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credentials**.
4. On the form, fill in the fields.

Field	Description
Name	Name to identify the record.
User name	User name to be entered as credential.
Password	Password to be entered as credential.
Active	Option to actively use the credential record. Select the option.
Order	Order that the credentials are used. For example, enter 100.

5. Right-click the form header and click **Save**.

Create connection records

Create connection records to your Navex EthicsPoint instance. The Navex EthicsPoint spoke connection and credential alias uses these connections to perform actions in Navex EthicsPoint instance.

Before you begin

Role required: admin

Procedure

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the following records and create connections for each of the record.
   For each connection, you must also Create basic auth credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- NavexConnection for Attachment
- NavexConnection for Case Management
- NavexConnection for Lookup List

3. From the **Connections** tab, click **New**.
4. On the form, fill in the fields.

HTTP(s) Connection form

Field	Value required
Name	Name to uniquely identify the connection record.
Credential	Basic Auth credential record that you created for Navex EthicsPoint.
Connection alias	Alias record associated with this connection.
Connection URL	URL of the Navex EthicsPoint instance.
Active	Option to actively use the connection. Select the option.
Domain	Domain that the action or activity runs in.

5. In the **Attributes** tab, fill in the value in the **Password** and **Username** fields.
6. Click **Submit**.

Okta Spoke

Use Okta to manage users, passwords, and groups.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Okta spoke v4.7.1 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- com.glide.cobject:sys,com.glide.script.vtable
- com.snc.remote_directory_sync
- XML Parser for ServiceNow IntegrationHub (com.glide.hub.action_step.xmlparser)
- Flow Designer Designer Model (com.glide.hub.designer_backend.model)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

API version v1.

Spoke flows

The Okta spoke provides sample flows in the draft state to demonstrate automating user and group management tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Add User to Okta Group	When a user is created, adds the user to the specified group.
Onboard User in Okta	When a user is created in ServiceNow, creates and activates the user in Okta.
Remove Okta Group Membership on Deactivation	When a user is deactivated, removes the user from all Okta groups.

Note:
Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.

Spoke subflows

The Okta spoke provides sample subflows to demonstrate automating Okta tasks. Available subflows are:

Subflow category	Subflow	Description
Webhook management	Check Activate Application Event Hook	Verifies if an event hook for the application-lifecycle-activate exists in Okta.
	Inbound Integration from Okta to ServiceNow	Allows inbound integration from Okta to a ServiceNow instance. Verifies if an event hook already exists for an application. If the event hook

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow category	Subflow	Description
		does not exist, a new event hook is created. **Note:** Make sure that **Configuration URI** field value is in this format: `https://<instance-name>.service-now.com/api/sn_okta_spoke/oktawebhook`
Group Management	Get Groups	Updates an existing group or creates a group in Okta.
Application Management	Create or Update Okta Applications Record	Creates a Okta application record or updates an existing Okta application record.

Available sample conversational subflows

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

Sample conversational subflows

Conversational subflow	Description
Expire User Password - Sample	Expires the user's password in Okta.
Reset to Temporary Password - Sample	Resets the user's password in Okta to a temporary password.
Look up Group Details - Sample	Retrieves details of the required group in Okta.
Look up User Profile - Sample	Retrieves details of the required user profile in Okta.
Add User to Group - Sample	Adds user to the required group.
Look up Group Members - Sample	Retrieves details of users in the required group in Okta.
Is User in Group - Sample	Specifies if the user is a member of the provided group.
Look up Users by Application - Sample	Retrieves details of users that have access to the specific application.

Spoke module

The Okta spoke adds the Okta application to your ServiceNow instance and includes these modules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
Okta Applications	Shows the list of applications.
Okta groups	Shows the list of user groups in Okta.
Okta Users	Shows the list of users in Okta.
Okta Webhook Registry	Shows the list of webhook registries.

Spoke actions

The Okta spoke provides actions to authenticate and manage users and groups. Available actions include:

Category	Action	Description
User Management	Activate User	Starts the process of activating a user in Okta by enabling new or returning users to configure their Okta account from an activation URL. This action can either have Okta send the activation URL to the user as an email, or it can return the activation URL as a data pill for use in a later action to send an email or notification.
	Clear User Session	Clears all active sessions the specified user has with Okta, which forces the user to log back in the next time they use Okta.
	Create User	Creates the specified user in Okta with the specified standard, optional, and mandatory field values. **Note:** Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.
	Deactivate User	Deactivates the specified user in Okta, which removes the user's groups and application assignments, and changes the user status to DEACTIVATED. This action is commonly used when a user departs the company indefinitely. **Note:** Do not perform this action on users with a DEPROVISIONED status.
	Delete User	Deletes the specified user within Okta, which completely removes the user. This action is commonly used to clean up your user base after compliance regulations have been met.
	Is User Account Locked	Determines if a user account is locked.
	Lookup Okta User ID	Retrieves the Okta user ID for the specified Okta login ID or login short name.
	Lookup User Account	Retrieves user details for the specified Okta user ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Details by User ID	
	Lookup User Profile by User ID	Retrieves user profile details for the specified Okta user ID.
	Restart User Activation	Restarts the specified user's activation within Okta. Use this action if the user did not complete their activation with the activation code or link provided by the **Activate User** Action.
	Suspend User	Suspends the specified user within Okta by changing the user status from ACTIVE to SUSPENDED. For example, use this action to suspend access for users who are on temporary leave. To reactivate a suspended user, use the **Unsuspend** action.
	Unsuspend User	Unsuspends the specified user in Okta.
	Update User Profile	Updates the user profile details for the specified user in Okta.
	Look up Users Stream	Retrieves users from Okta based on the filter value.
Password Management	Change User's Password	Changes the specified user's password after validating the user's current password.
	Expire User Password	Expires the specified user's password within Okta. This action is commonly used as a reaction to stop breaching attempts.
	Reset to Temporary Password	Resets the specified user's password within Okta to a temporary password. This action is commonly used to get a user logged in who has forgotten their password.
	Reset User Factors	Resets all of the multi-factor access devices for the specified user within Okta. This action is commonly used when a user loses their multi-factor authentication device or method.
	Set User Password	Sets the specified user's password in Okta.
	Unlock User	Unlocks the specified user in Okta.
Group Management	Add User To Group	Adds the specified user to the specified group in Okta.
	Create Group	Creates the specified group in Okta.
	Get Groups	Retrieves all new and updated groups in Okta.
	Is User In Group	Determines if the specified user is a member of the specified group in Okta.
	Lookup Group Details by Group ID	Retrieves group details for the specified Okta group ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Lookup Group ID By Name	Retrieves group details and group ID for the specified Okta group name.
	Remove User From Group	Removes the specified user from the specified Okta group ID.
	Update Group	Updates the group details for the specified Okta group ID.
	Look up Groups Stream	Retrieves groups from Okta, based on the filter criteria.
Group Membership Management	Look up Group Members Stream	Retrieves users from the specified Okta group.
	Look up User Groups Stream	Retrieves the group information from Okta to which the user belongs to.
Application Access Management	Look up Users by Application ID Stream	Retrieves users who have access to the specified application.
	Look up Groups by Application ID Stream	Retrieves groups who have access to the specified application.
	Revoke User Application Access	Revokes access to an application for the required user.
Application Management	Look up Applications Stream	Retrieves applications from Okta, based on the filter criteria. For more information about the criteria you can specify in the **Filter** input, see List applications in Okta Developer Documentation.
	Look up Application by Application ID	Retrieves details of the specified application ID in Okta.
	Look up App Launcher Applications Stream	Retrieves applications that are either active or are assigned to users.
Logs Management	Look up Okta Logs Stream	Retrieves the logs in Okta that are filtered by the given filter value and within the specified time duration. For more information about the event types and system logs, see Event Types in Okta Developer Documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Metadata Retrieval	Look up Additional Fields for User	Retrieves the metadata of the additional fields for a user in Okta.
	Look up Applications Metadata	Retrieves the metadata of applications in Okta.
	Look up Event Hooks Metadata	Retrieves the metadata of the event hooks in Okta. **Note:** Make sure that you use this action along with the actions that use Event Hook ID as a dynamic input.
	Look up Groups Metadata	Retrieves the metadata details of the groups in Okta.
Webhook Management	Activate Event Hook	Changes the status of the specified event hook to active in Okta.
	Create Event Hook	Creates an active event hook in Okta. **Note:** Make sure that **Configuration URI** field value is in this format: `https://<instance-name>.service-now.com/api/sn_okta_spoke/oktawebhook`
	Deactivate Event Hook	Sets the status of the specified Okta event hook to inactive.
	Look up Event Hook by ID	Retrieves details of the Okta event hook for the specified ID.
	Look up Event Hooks	Retrieves details of all the event hooks in Okta.
	Update Event Hook	Updates the specified event hook in Okta. **Note:** Make sure that **Configuration URI** field value is in this format: `https://<instance-name>.service-now.com/api/sn_okta_spoke/oktawebhook`
	Verify Event Hook	Verifies and retrieves an external service endpoint configured for an event hook in Okta.

Available conversational actions

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

Available conversation action is Create Group that creates a group in Okta with the provided details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Okta group management AI agent	Automates group-related tasks in Okta using Integration Hub such as those related to managing of groups, handling user memberships, and retrieving group details.
Okta password management AI agent	Automates password-related workflows in Okta from Integration Hub. Automate actions such as reset password to temporary values, set new password, expire passwords, unlock user accounts, reset user authentication factors, and change user passwords.
Okta group membership management AI agent	Automates group-related workflows in Okta from Integration Hub. Automate actions such as Look up User Groups Stream', and 'Look up Group Members Stream'.
Okta user management AI agent	Automates user management workflows in Okta from Integration Hub. Automate actions such as manage user accounts, sessions, and statuses.
Okta application access management AI agent	Automates access management workflows in Okta from Integration Hub. Automate actions such as look up users and groups by application ID stream, and revoking user application access.
Okta application management AI agent	Automates application management-related workflows in Okta from Integration Hub. Automate actions such as look up applications, retrieve application details by ID, and create or update Okta application records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
Okta logs management AI agent	Automates log management-related workflows in Okta from Integration Hub. Automate actions such as 'Look up Okta Logs Stream'.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Okta account requirements

The Okta spoke requires generating and configuring your Okta account to use a web API key.

Credential and connection alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Okta Connection & Credential Alias record to authorize actions. For information about setting up the spoke, see Set up Okta spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Okta alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up Okta spoke

Integrate the Okta spoke with Okta to automate various actions on Okta. For example, you can automate the activation of a user on Okta. To integrate, connect your ServiceNow instance and Okta using an API key or OAuth authentication.

Set up the Okta spoke.

Before you begin

- Request Integration Hub subscription.
- Activate the Okta spoke on your ServiceNow instance.
- Account with the Okta developers portal.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Depending on your requirement, you can set up the spoke using an API key or OAuth credentials. However, you can use only one alias at a time for a ServiceNow domain.

Set up Okta spoke using API key

Integrate the ServiceNow instance and your Okta account using an API key to authenticate ServiceNow requests.

Generate an API key to request authentication

Generate an API key on your Okta organization or developer account to have the connection record authenticated by the Okta developer's or organizational account.

Before you begin

Okta requirements:

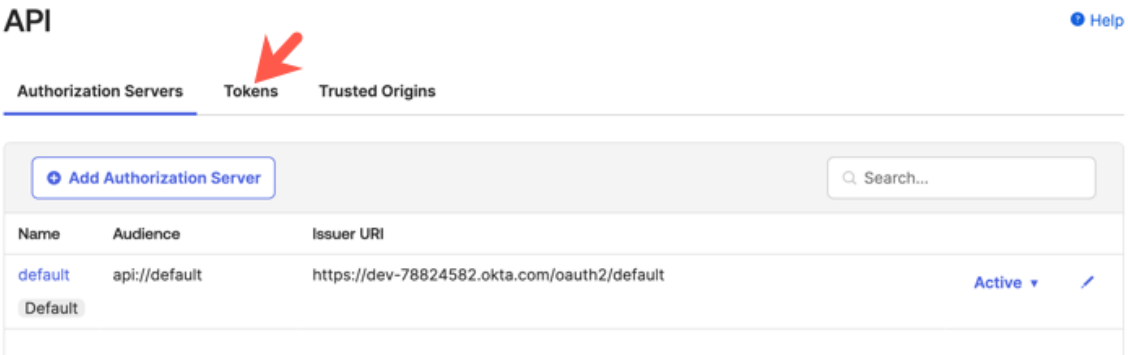
- Okta organization or developer account
- Role required: Okta administrator

About this task

The API key enables the Okta organization or developer account to authenticate an access request from your ServiceNow instance.

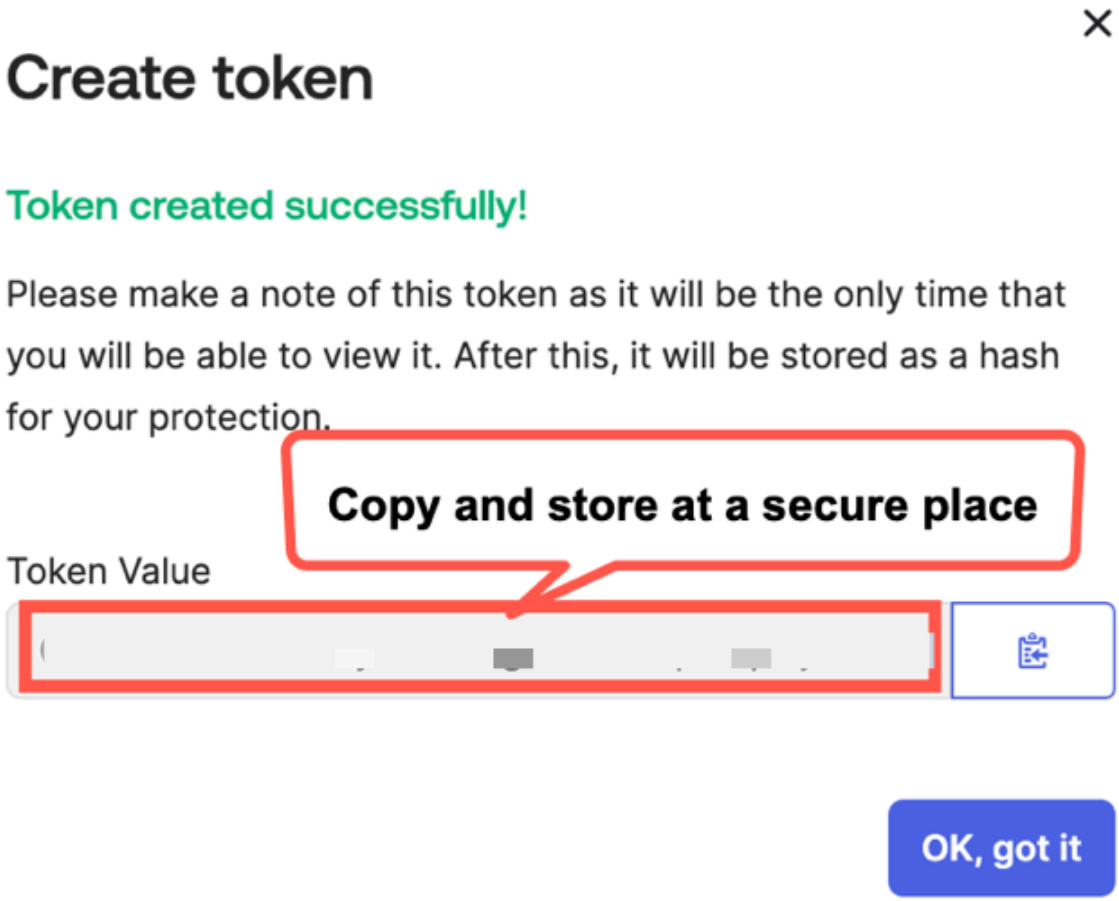
Procedure

1. Log in to https://developer.okta.com/login/.
2. On the left panel, navigate to **Security** > **API**.
3. On the API page, select Tokens.

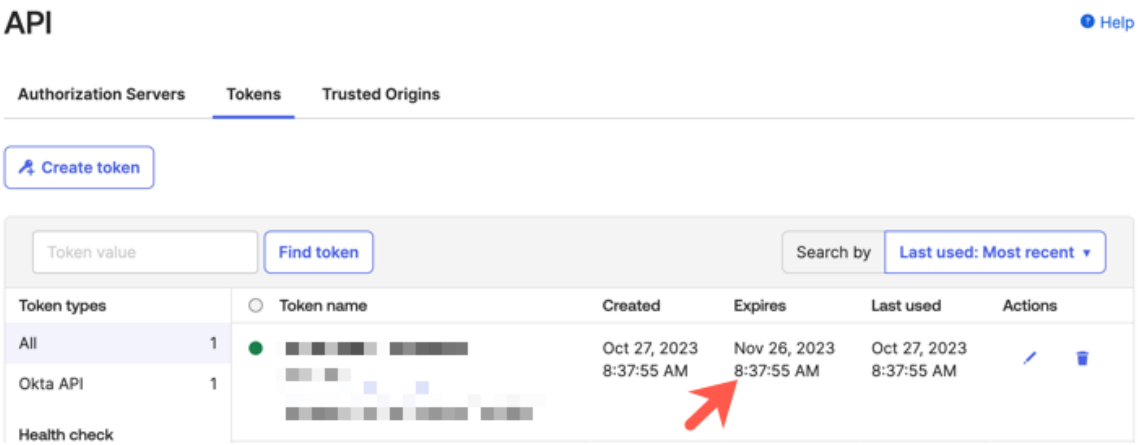


4. Select **Create token**.
5. In the Create token window, enter a name for the token.
6. Select **Create token**.
   The token is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Copy the API token and store at a secured place.
   Note the expiry date of the token.



Create an API Key credential record for the Okta spoke

Create Credential records to the Okta application that you created. The Okta spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
3. Select **API Key Credentials**.
4. Fill the form.

Field	Value required
Name	A custom name that uniquely identifies the record. For example, `Okta Credentials`.
Active	Activates the credential record so that it's used to connect to the Okta account.
API Key	API token that you had generated in your Okta account in the format `SSWS <API token>`. Replace `<API token>` with the API token. To learn how to generate an API token, see Generate an API key to request authentication.
Applies to	MID Server that can use this credential. For example, select **All MID Servers**.
Order	Order (sequence) in which this credential is used as it attempts to access the Okta API. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. For example, enter `100`.
Credential alias	The credential alias for Okta spoke that resolves in runtime when connecting to the Okta API.

5. Select **Submit**.

Create a connection record for the Okta spoke

Create a Connection record to the Okta API. The Okta spoke connection and credential alias uses these connections to perform actions in Okta.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Okta**.
3. From the **Connections** tab, select **New**.
4. Fill the form.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Okta Connection`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Credential	Select the Credential record that you created for Okta. For example, select **Okta Credentials**.
Connection URL	Enter your Okta organization URL. For example, `https://dev-418994.oktapreview.com`.

5. Select **Submit**.

Set up Okta using OAuth credentials

Integrate the ServiceNow instance and your Okta account by creating a custom OAuth application in Okta to authenticate the ServiceNow requests.

Before you begin

- Access to the Okta Developer Console
- Role required: admin

Create an OAuth application in Okta

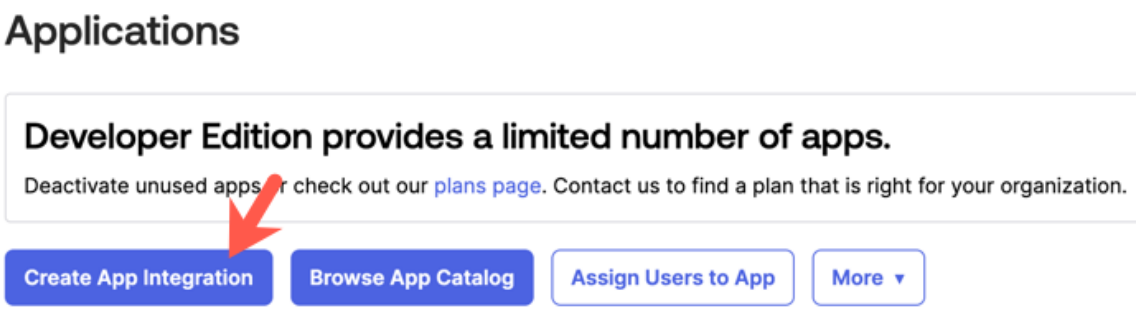
Create a custom OAuth application in your Okta developer's account to enable OAuth 2.0 authentication of the requests from your ServiceNow instance.

Before you begin

Role required: admin
Administrator access to Okta Developer's or Organization account

Procedure

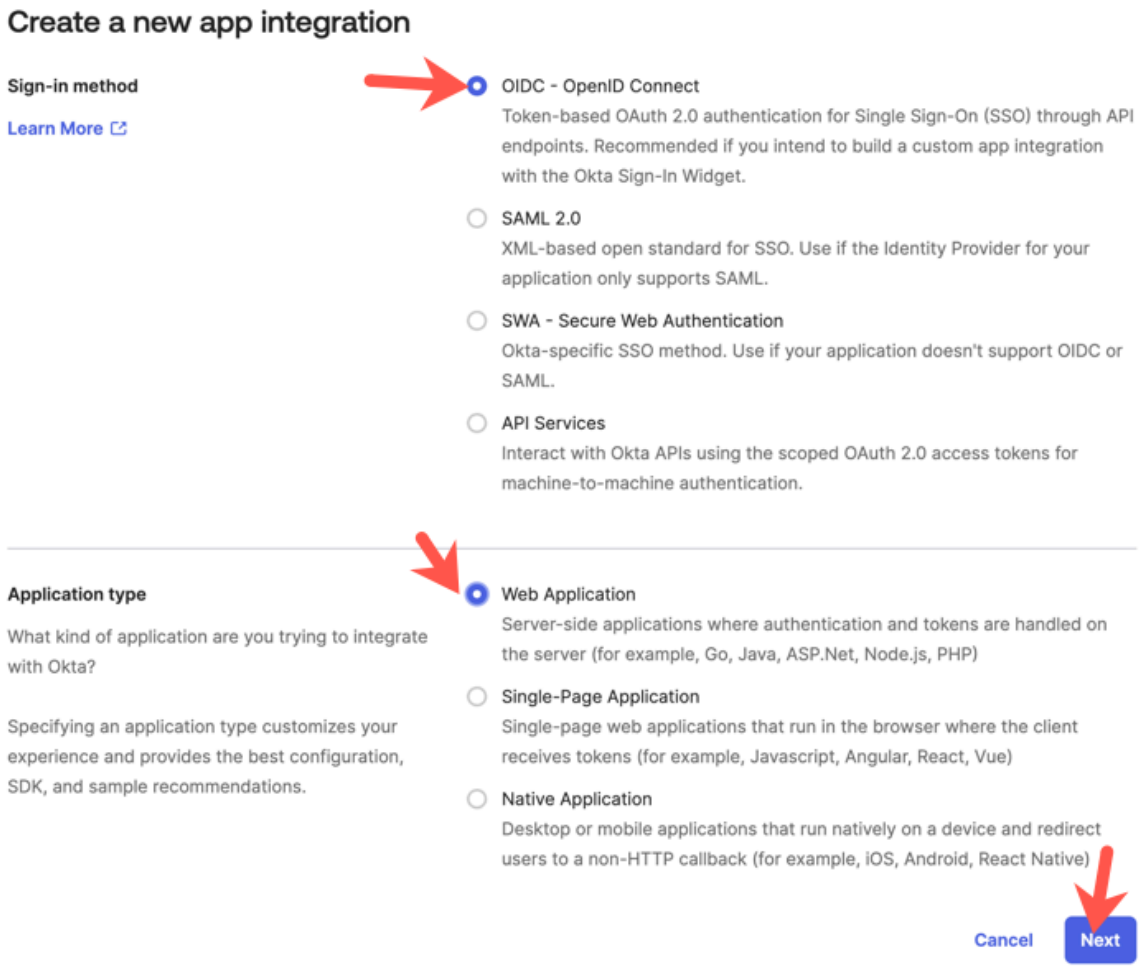
1. Log in to https://developer.okta.com/login/ .
2. On the left panel, select **Applications** > **Applications** > .
3. On the Applications page, select **Create App Integration**.



4. On the Create a new app integration window, select OIDC - OpenID Connect.
5. Select
   - OIDC - OpenID Connect
   - Web Application

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select



Next.

7. Fill the form.

New Web App Integration

Field	Description
App integration name	Custom name of the OAuth application.
Logo	Logo of the OAuth application. Uploading a logo is optional.
Grant type	The type of OAuth 2.0 flow to use depending on the type of application you're building. To learn how to select the appropriate option, see https://developer.okta.com/docs/concepts/oauth-openid/#openid-connect. Select the options: ○ Authorization Code ○ Refresh Token ○ Implicit (Hybrid) ▪ Allow ID Token with implicit grant type ▪ Allow access token with implicit grant type

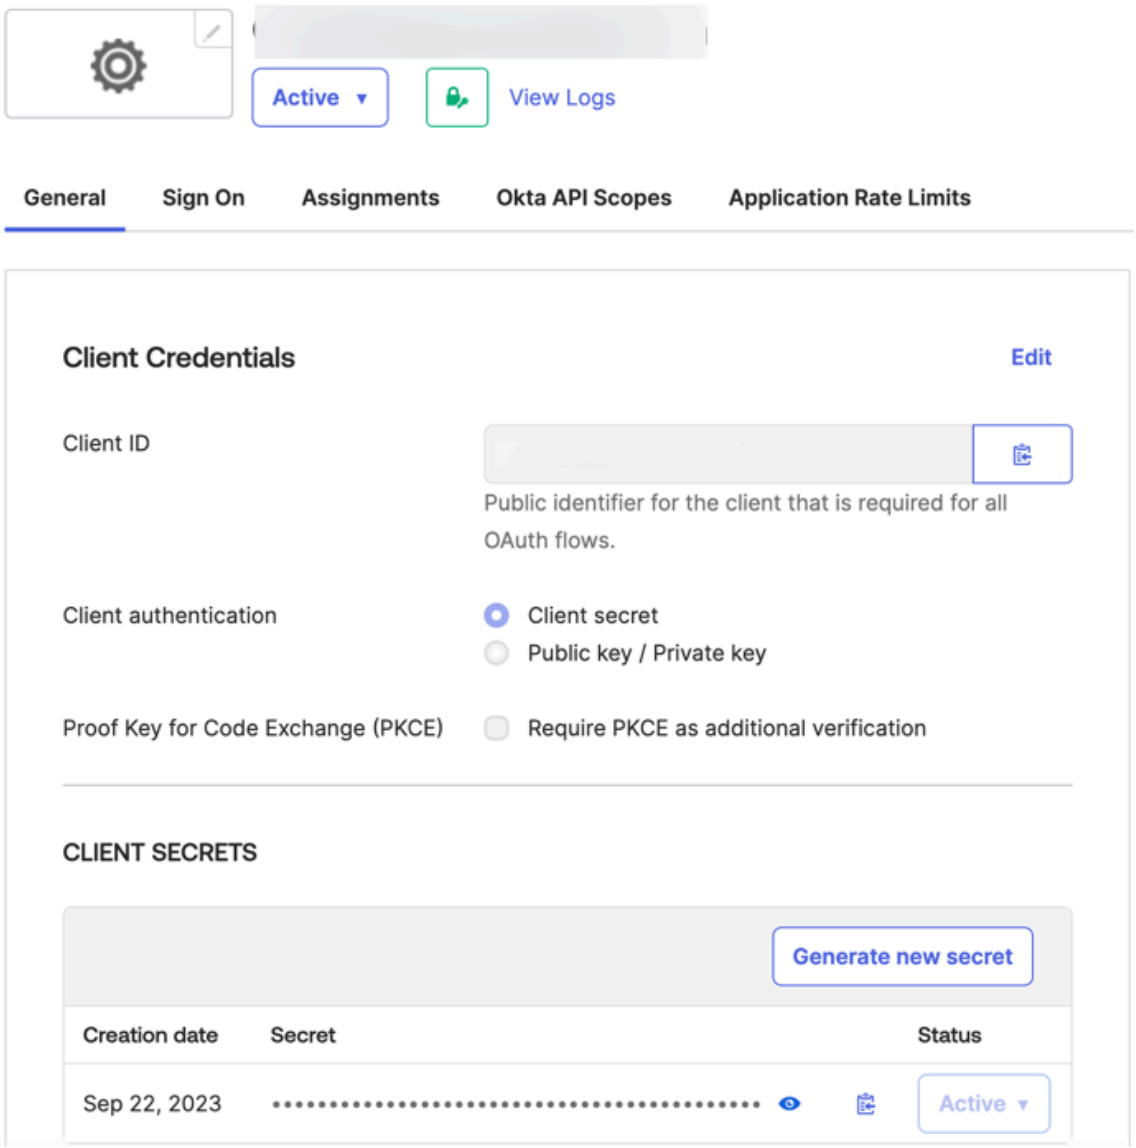
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Sign-in redirect URIs	The URI that receives the authentication response and ID token from Okta. Enter your ServiceNow instance URL in the format `https://<instance-name>.service-now.com/oauth_redirect.do`.
Sign-out redirect URIs	The URI that contacts Okta to close a user session. Enter your ServiceNow instance URL in the format `https://<instance-name>.service-now.com/oauth_redirect.do`
Base URIs	URI of the self-hosted Okta widget. Providing the base URI is optional.
Controlled access	Option to assign access to Okta integration in your organization. To assign access: ○ To assign access to everyone in the organization, select **Allow everyone in your organization to access**. ○ To assign access to selected groups, select **Limit access to selected groups** and enter the group names in the Selected group(s) field. ○ To assign access after integration, select **Skip group assignment for now**.

8. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The OAuth application is

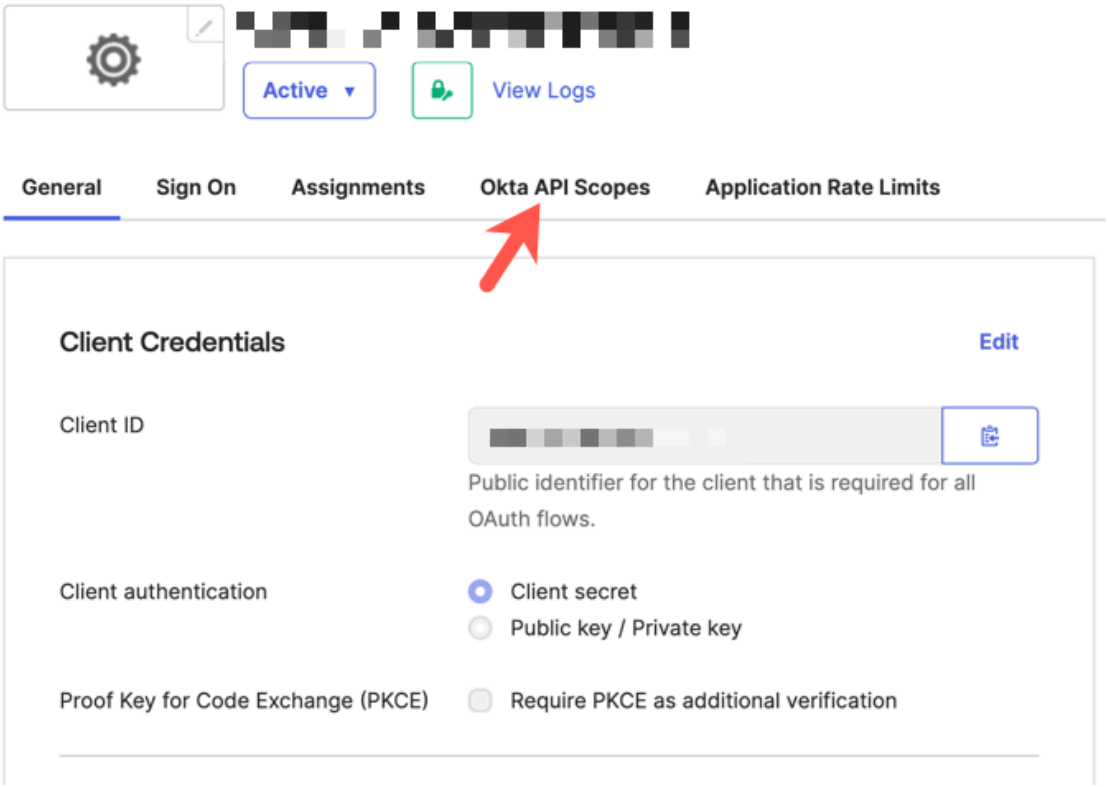


created.

9. Grant permissions to access Okta APIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Okta API Scopes**.



b. Under **Actions**, select **Grant for the APIs**.

> **Note:**
> These are all the OAuth scopes required for all the spoke actions to work. If you are only using a subset of the available spoke actions, you can select only the scopes required, based on your own security requirements.

- okta.users.manage
- okta.apps.manage
- okta.logs.read
- okta.groups.read
- okta.groups.manage
- okta.users.read
- okta.apps.read
- okta.eventHooks.read
- okta.eventHooks.manage

For more information about the API scopes, see Define allowed scopes in Okta Developer Documentation.

Create a connection record for Okta Spoke

Create a connection record that contains the information to connect to the Okta server. Your ServiceNow instance uses this form to send authentication requests to the OAuth application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

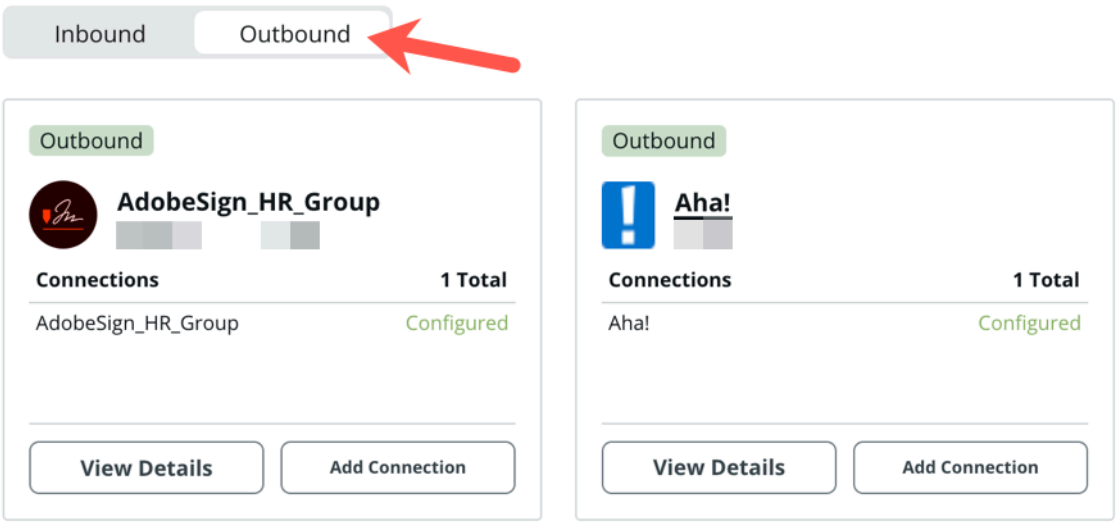
Important:
If you have configured different OAuth scopes as mentioned in step 9 of Create an OAuth application in Okta, do not perform this procedure. Instead, perform the steps outlined in Connect to a third-party OAuth provider and add the corresponding OAuth scopes that align with your Okta Web Application that are granted in step 9 of Create an OAuth application in Okta.

Role required: admin.

Procedure

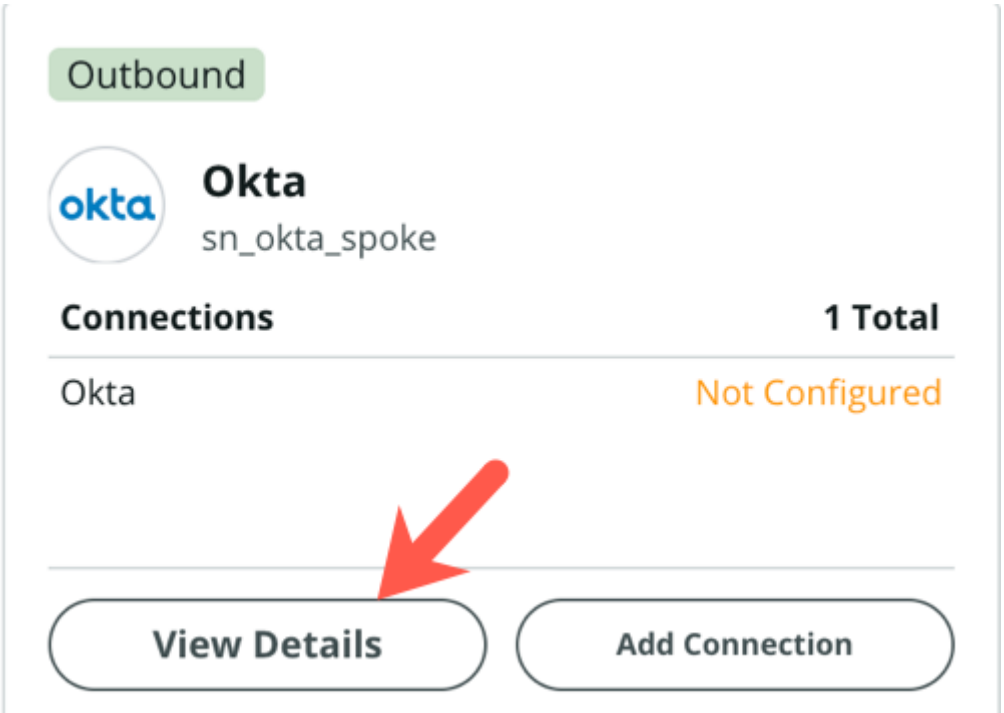
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. In the Search all connections field, enter `Okta`.

Note:
The Outbound tab is enabled by default. Confirm that it's enabled.



4. On the Okta spoke tile, select **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

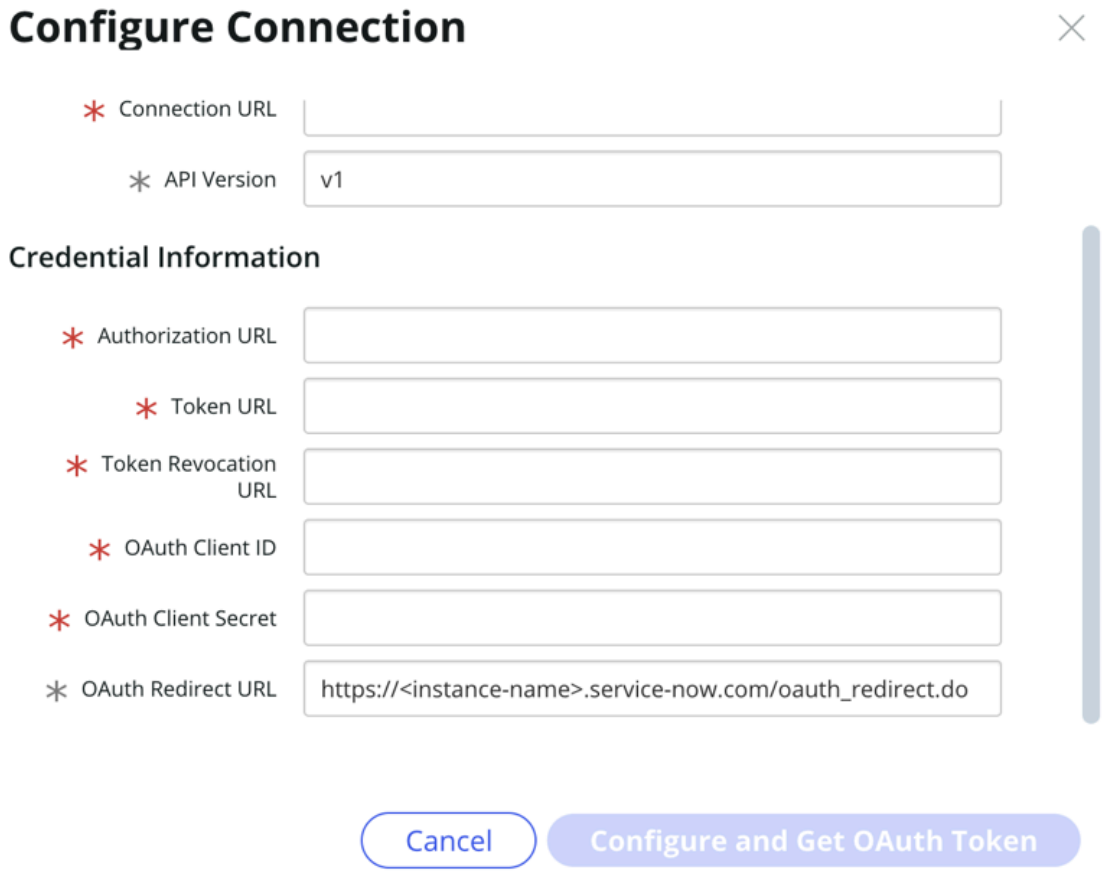


5. Select **Configure**.
6. On the form, fill these values.

Configure Connection

Field	Description
Name	Name of the connection established with the Okta instance. The first connection's default name is automatically assigned to match the name specified in the Connections and Credentials form on the Connection & Credential Aliases page. To provide your custom name, create a connection record by selecting **Add Connection**.
Connection URL	The URL to connect to the Okta server. The URL format is https://[yourOktaDomain].com.
API Version	The version of the Okta APIs.
Authorization URL	The URL that the OAuth application at Okta provides to seek authorization to access the Okta resource server. The format is `https://{youroktadomain}.com/oauth2/{API version}/authorize`.
Token URL	The URL to obtain the access token. The format is `https://{youroktadomain}.com/oauth2/{API version}/token`.
Token Revocation URL	The URL provided by the OAuth authorization server that enables a client application to request the revocation or cancellation of access tokens and refresh tokens that were previously issued. The format is `https://{youroktadomain}.com/oauth2/{API version}/revoke`.
OAuth Client ID	The client ID generated in the Okta developer's account.
OAuth Client Secret	The client secret generated in the Okta developer's account.
OAuth Redirect URL	Redirect the URL to your ServiceNow instance. The format is `https://{instance-name}.service-now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select **Configure and Get OAuth Token**.
   The OAuth Access token is generated for the Okta spoke.

> **Note:**
> You must log in to Okta before the OAuth access token is granted.

Fetch Okta groups

Fetch Okta groups into your instance so that you can assign them to different users. You can fetch the groups on an as-needed or scheduled basis.

Before you begin
Role required: okta.admin

Procedure

1. To fetch Okta groups on an as-needed basis.

   a. Navigate to **Okta spoke** > **Okta groups**.

   b. Select **Fetch Okta groups**.
      The Get Groups subflow is triggered.

   c. From the Okta groups list, you can review the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Name	Name of the Okta group.
Description	Description of the Okta group.
Group ID	Group ID of the Okta group.
Type	Type of the Okta group.
Group creation date	Date when Okta group was created.
Group last updated date	Date when Okta group was last updated.
Created	Date when Okta group was first synchronized with your ServiceNow instance.
Updated	Date when Okta group was last synchronized with your ServiceNow instance.

2. Fetch Okta groups on a scheduled basis.

   a. Navigate to **System Defintion** > **Scheduled Jobs**.

   b. Open the **Fetch Okta Groups** record.

   c. Update the fields, as needed.

   Note:

   - Make sure that the **Active** option is selected so that the scheduled job is activated for use.
   - The Updated column on your ServiceNow instance displays the time when the Okta group details was updated.

   d. Click **Update**.

Set up a bi-directional webhook for Okta spoke

Configure a webhook to subscribe to Okta with a ServiceNow callback URL.

Before you begin

- Request an Integration Hub subscription
- Install or activate the Okta spoke plugin
- Role required: admin

Register Okta webhook

Register an Okta webhook in your ServiceNow instance to notify the ServiceNow app when certain events occur in Okta.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Okta Spoke** > **Okta Webhook Registry**.
2. Select **New**.
3. On the form, fill in these fields.

Field	Description
Name	A unique name to identify the webhook registry. **Note:** The name must be only `Okta Webhook Authentication`.
Description	Short description of the webhook registry.
Authentication Key	Authentication key used for connecting to Okta webhook.
Authentication Value	Authentication value used for connecting to Okta webhook.

4. Select **Submit**.

OneLogin Spoke

Manage users, passwords, roles, and groups in the OneLogin account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

OneLogin v1.0.2 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The OneLogin spoke provides actions to to manage users, passwords, roles, and groups. Available actions include:

Category	Action	Description
Group Management	Look up Groups	Retrieves the list of groups available in the OneLogin account.
Password Management	Get Lock Status	Retrieves the lock status of the user in OneLogin.
	Lock User	Locks the specified user account in OneLogin.
	Unlock User	Unlocks user in OneLogin.
	Update Password	Updates the user's password in OneLogin.
User Management	Create User	Creates a user in OneLogin.
	Get User Details	Retrieves details of the required user in OneLogin.
	Look up Users	Retrieves details of the required users.
	Update User	Updates the attributes of a user in OneLogin.
User Role Management	Assign Role	Assigns role to user in the OneLogin account.
	Get Roles by User	Retrieves the role IDs assigned to the user in the OneLogin account.
	Look up Roles	Retrieves details of the roles.
	Remove Role	Removes the specified role assigned to a user in OneLogin account.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the OneLogin spoke.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the OneLogin spoke

Integrate the ServiceNow instance and OneLogin account using the OAuth credentials to authenticate ServiceNow requests.

Create an API credential in the OneLogin portal

Create an API credential in the OneLogin portal to enable OAuth 2.0 authentication and obtain the values of client ID and client secret.

Before you begin

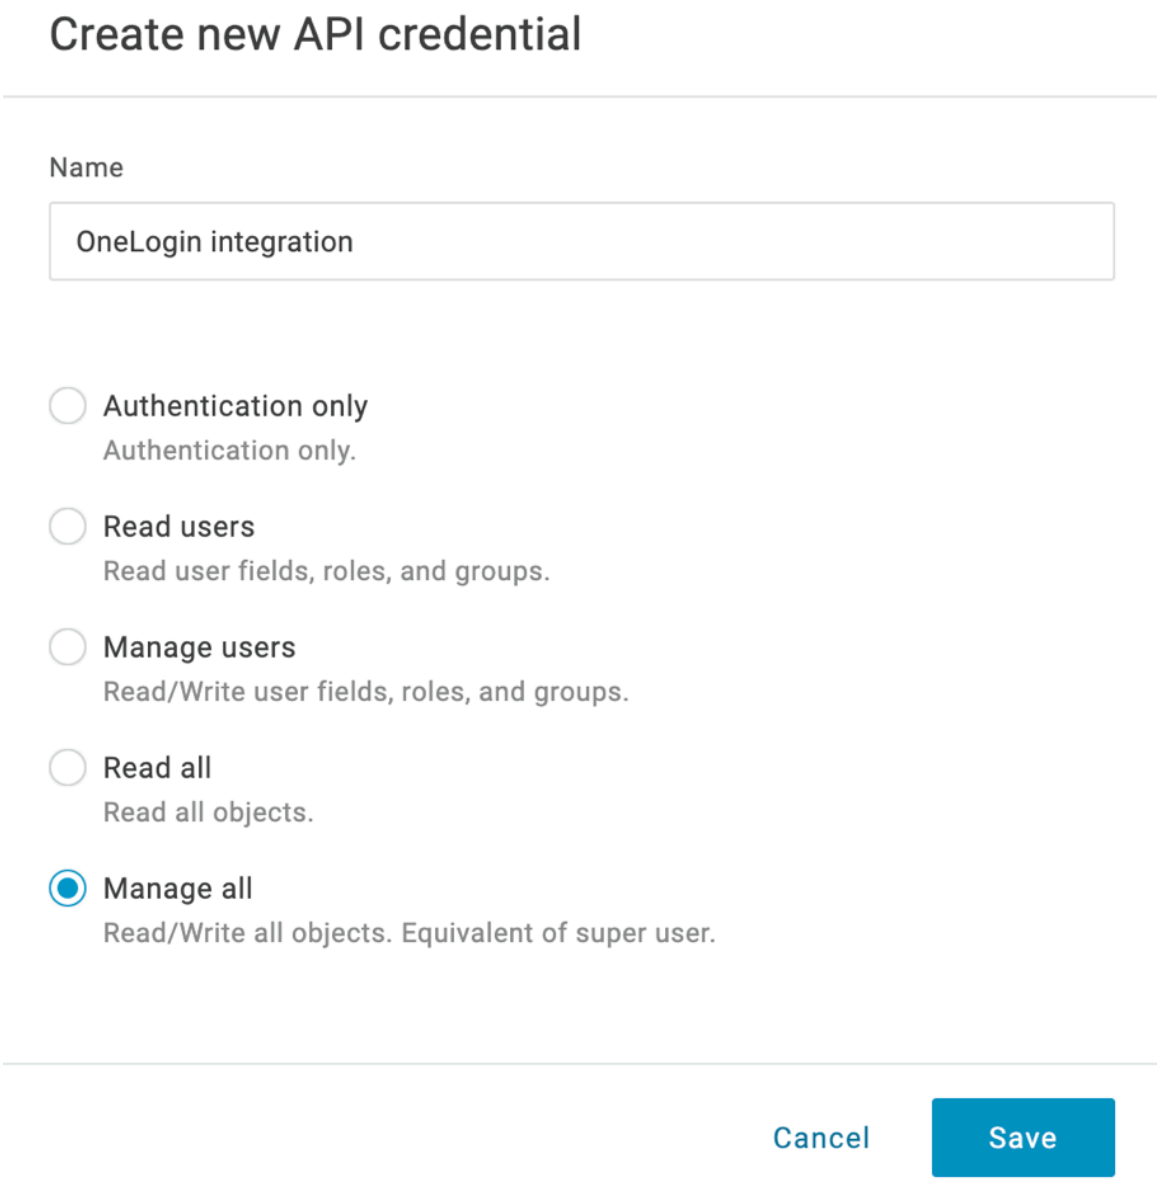
Role required: admin or account owner.

Procedure

1. Log in to your OneLogin account as an account owner or administrator.
2. Navigate to **Developers** > **API Credentials**.
3. In the API Access page, click **New Credential**.
4. On the form, enter the credential name and select scope for the credential.
   For more information, see Working with API Credentials.

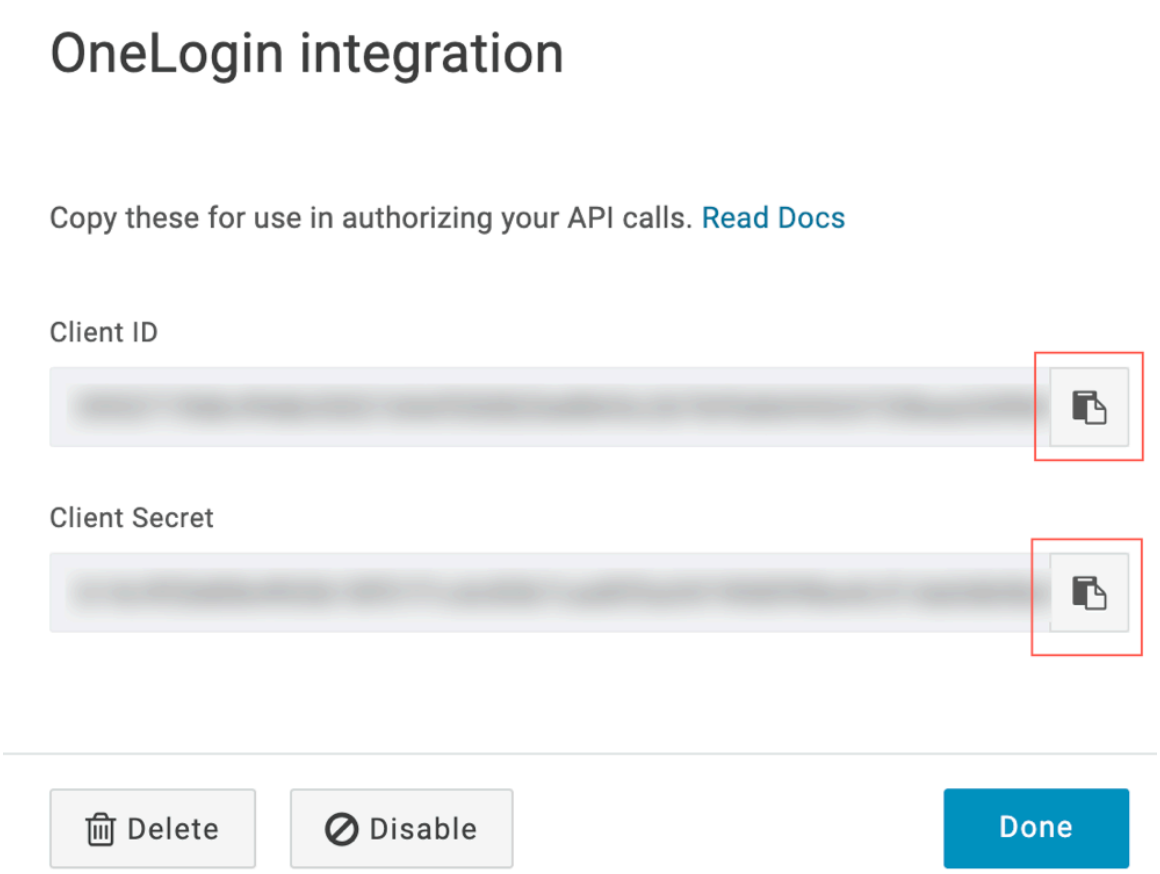
> **Note:**
> Ensure that you select either **Manage users** or **Manage all** permission.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Save**.
   The values of client ID and client secret are displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Copy and record the values of client ID and client secret for later use.

Configure the OneLogin connection and credential alias record

Configure the default connection and credential alias to integrate the ServiceNow instance and OneLogin account to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the OneLogin spoke.
- Role required: admin.

Procedure

1. Navigate to **Connection & Credentials** > **Connection & Credential Aliases**.
2. Open the record, **OneLogin**.
3. Click the **Create New Connection & Credential** related link.
4. On the form, fill these values.

Field	Description
Connection Name	Name to identify the connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	Connection URL in this format: `https://api.<region>.onelogin.com`. Replace `<region>` with the region of your OneLogin account.
Credential Name	Name to identify the credential record.
OAuth Entity Name	Name to identify the OAuth record.
OAuth Client ID	Client ID of the credential created in the OneLogin portal.
OAuth Client Secret	Client secret of the credential created in the OneLogin portal.
OAuth Token URL	Token URL in this format: `https://api.<region>.onelogin.com/auth/oauth2/v2/token`. Replace `<region>` with the region of your OneLogin account.

5. Click **Create and Get OAuth Token**.
   ServiceNow instance is integrated with the OneLogin account.

Oracle Autonomous DB Spoke

Manage the Oracle Autonomous Database operations from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle Autonomous DB spoke v1.0.6 is the latest version.

Supported versions

This spoke was built for Oracle Autonomous DB 20160918, but may be compatible with later versions.

Spoke requirements

Oracle Autonomous DB account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Oracle Cloud IAM spoke(com.sn.oci.iam.spoke)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Oracle Autonomous DB spoke provides actions to automate Oracle Autonomous DB tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Database Backup Management	Create Database Backup	Creates an Autonomous Database backup for the specified database based on the specified request parameters.
	Get Database Backup	Retrieves the details of the specified Autonomous Database backup.
	Look up Database Backups	Retrieves a list of Autonomous Database backups based on the specified database ID or compartment ID.
Database Management	Create Database	Creates an Autonomous Database.
	Create Database by Cloning	Creates a clone of the existing Autonomous Database.
	Delete Database	Deletes the specified Autonomous Database.
	Deregister Database Data Safe	Deregisters the specified Autonomous Database asynchronously with data safe.
	Failover Database	Initiates a failover database of the specified Autonomous Database to a standby.
	Get Database	Retrieves details of the specified Autonomous Database.
	Look up Databases	Retrieves a list of Autonomous Databases.
	Register Database Data Safe	Registers the specified Autonomous Database asynchronously with data safe.
	Restart Database	Restarts the specified Autonomous Database.
	Start Database	Starts the specified Autonomous Database.
	Stop Database	Stops the specified Autonomous Database.
	Update Database	Updates the specified Autonomous Database.
Database Version	Look up Database Versions	Retrieves the list of supported Autonomous Database versions.

© 2026 ServiceNow, Inc. All rights reserved.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Oracle Autonomous DB spoke.

Set up the Oracle Autonomous DB spoke

Integrate the ServiceNow instance and Oracle Autonomous DB by using the credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the Oracle Cloud IAM Spoke.
- Activate the Oracle Autonomous DB spoke.
- Role required: admin.

Create a credential record for the Oracle Cloud IAM spoke

Create a credential record for the Oracle Cloud IAM account. The Oracle Cloud IAM spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Use the public key from the Java Keystore (JKS) file and generate a fingerprint from your Oracle Cloud account. For more information about fingerprint, see Required Keys and OCIDs.

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **OCI SHA256WithRSA Signature**.
4. On the form, fill these values.

OCI SHA256WithRSA Signature Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Oracle IAM Cloud Cred.
Certificate Sys ID	Sys ID of the OCI Signing Certificate.
Alias	Alias of the KeyStore.
Alias Password	Alias password of the KeyStore.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Key ID	Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: `ocid1.tenancy.oc1..<unique_ID>/ocid1.user.oc1..<unique_ID>/<key_fingerprint>`.
Applies to	Option to specify if the credential applies to all MID Servers in the network.
Active	Option to actively use the credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select `OCI SHA256RSA Signing Algorithm`

5. Right-click the form header and click **Submit**.

Create a connection record for the Oracle Cloud IAM spoke

Create a connection record for your Oracle Cloud IAM account. The Oracle Cloud IAM spoke connection and credential aliases use these connections to perform actions in Oracle Cloud IAM.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for **OracleIAM_credentialANDconnecton**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle IAM conn`.
Credential	Credential record created for Oracle Autonomous DB spoke. For example, `Oracle IAM Cred`.
Connection alias	Alias record associated with this connection. Search and select `sn_oci_iam_spoke.OracleIAM_credentialAN`
Host	Fully qualified domain name of the target host where the **Oracle Cloud IAM** server is hosted. For example, `database.ap-mumbai-1.oraclecloud.com`.
Connection URL	Base URL to connect to **Oracle Cloud IAM**. For example, `https://database.ap-mumbai-1.oraclecloud.com`.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use MID server	Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.

5. Click **Submit**.

Create a credential record for the Oracle Autonomous DB spoke

Create a credential record for the Oracle Autonomous DB account. The Oracle Autonomous DB spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **OCI SHA256WithRSA Signature**.
4. On the form, fill these values.

OCI SHA256WithRSA Signature Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Oracle IAM Cloud Cred.
Certificate Sys ID	Sys ID of the OCI Signing Certificate.
Alias	Alias of the KeyStore.
Alias Password	Alias password of the KeyStore.
Key ID	Key ID (kid) helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: ocid1.tenancy.oc1..<unique_ID>/ ocid1.user.oc1..<unique_ID>/<key_fingerprint>.
Applies to	Option to specify if the credential applies to all MID Servers in the network.
Active	Option to actively use the credential record.
Credential alias	Associated credential record. If you have already created a credential alias, search and select the record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select `OCI SHA256RSA Signing Algorithm`

5. Right-click the form header and click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a connection record for the Oracle Autonomous DB spoke

Create a connection record for your Oracle Autonomous DB account. The Oracle Autonomous DB spoke connection and credential aliases use these connections to perform actions in Oracle Autonomous DB.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for **Oracle Autonomous Database**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle Auto DB Connection`.
Credential	Credential record created for Oracle Autonomous DB spoke. For example, `Oracle ADB Creds`.
Connection alias	Alias record associated with this connection. Search and select `sn_oci_adb_spoke.Oracle_Autonomous_Database`
Host	Fully qualified domain name of the target host where the **Oracle Autonomous DB** server is hosted. For example, `database.ap-mumbai-1.oraclecloud.com`.
Connection URL	Base URL to connect to **Oracle Autonomous DB**. For example, `https://database.ap-mumbai-1.oraclecloud.com`.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.
Use MID server	Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.

5. Click **Submit**.

Oracle Block Storage Spoke

Manage block storage and volumes in the Oracle Block Storage account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle Block Storage spoke v1.0.4 is the latest version.

Supported versions

This spoke was built for Oracle Block Storage API version 20160918, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Oracle Cloud IAM Spoke
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Oracle Block Storage spoke provides actions to automate Oracle Block Storage tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Volume Backup Management	Change Volume Backup Compartment	Moves a volume backup into a different compartment within the same tenancy.
	Create Volume Backup	Creates a new backup of the specified volume.
	Delete Volume Backup	Deletes a volume backup.
	Get Volume Backup	Retrieves information about the specified volume backup.
	Look up Volume Backups	Retrieves list of the volume backups in the specified compartment.
	Update Volume Backup	Updates the specified volume backup.
Volume Backup Policy Management	Create Volume Backup Policy	Creates a user defined backup policy.
	Delete Volume Backup Policy	Deletes a user defined backup policy.
	Get Volume Backup Policy	Retrieves details of the specified volume backup policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Volume Backup Policies	Retrieves list of the volume backup policies in the specified compartment.
	Update Volume Backup Policy	Updates a user defined backup policy.
Volume Group Backup Management	Change Volume Group Backup Compartment	Moves a volume group backup into a different compartment within the same tenancy.
	Create Volume Group Backup	Creates a new backup volume group of the specified volume group.
	Delete Volume Group Backup	Deletes the specified volume group backup.
	Get Volume Group Backup	Retrieves details of the specified volume group backup.
	Look up Volume Group Backups	Retrieves list of the volume group backups in the specified compartment.
	Update Volume Group Backup	Updates the specified volume group backup.
Volume Group Management	Change Volume Group Compartment	Moves a volume group into a different compartment within the same tenancy.
	Create Volume Group	Creates a new volume group in the specified compartment.
	Delete Volume Group	Deletes the specified volume group.
	Get Volume Group	Retrieves details of the specified volume group.
	Look up Volume Groups	Retrieves list of the volume groups in the specified compartment.
	Update Volume Group	Updates the specified volume group.
Volume Management	Attach Volume	Attaches the specified storage volume to the specified instance.
	Change Volume Compartment	Moves a volume into a different compartment within the same tenancy.
	Create Volume	Creates a new volume in the specified compartment.
	Delete Volume	Deletes the specified volume.
	Detach Volume	Detaches a storage volume from an instance.
	Get Volume	Retrieves details of the specified volume.
	Get Volume Attachment	Retrieves information about the specified volume attachment.
	Look up Volume Attachments	Retrieves list of the volume attachments in the specified compartment.
	Look up Volumes	Retrieves list of the volume in the specified compartment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Volume	Updates the specified volume in the specified compartment.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Oracle Block Storage spoke.

Set up the Oracle Block Storage spoke

Integrate the ServiceNow instance and Oracle Block Storage account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the Oracle Cloud IAM Spoke.
- Activate the Oracle Block Storage spoke.
- Role required: admin.

Procedure

1. **Optional:** Create a JKS certificate.
   You can create a JKS certificate for the Oracle Block Storage spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.
2. **Optional:** Create X.509 certificate.
   You can create a X.509 certificate for the Oracle Block Storage spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.
3. Create a child alias in the Oracle Cloud IAM spoke connection and credential alias.
   a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.
   b. Click **New**.
   c. On the form, fill these values:

Connection & Credential Aliases form

Field	Description
Name	Name to identify the alias record. For example, `Oracle Block Storage Alias`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Parent Alias	Connection and credential alias record of the Oracle Cloud IAM spoke. For example, **sn_oci_iam_spoke.OracleIAM_credentialANDconnecton**.

d. Right-click the form header and click **Save**.

4. Create credential record for the Oracle Block Storage spoke.

a. Navigate to **Connections & Credentials** > **Credentials**.

b. Click **New**.
The system displays this message: `What type of Credentials would you like to create?`

c. Select **OCI SHA256WithRSA Signature**.

d. On the form, fill in the fields.

Note:
You can specify details of the certificates you created specifically for the Oracle Block Storage spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

OCI SHA256WithRSA Signature Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle Block Storage Cred`.
Certificate Sys ID	Sys ID of the Signing Certificate.
Alias	Alias of the KeyStore.
Alias Password	Alias password of the KeyStore.
Key ID	Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: `ocid1.tenancy.oc1..<unique_ID>/ ocid1.user.oc1..<unique_ID>/<key_fingerprint>`.
Applies to	Option to specify if the credential applies to all MID Servers in the network.
Active	Option to actively use the credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select `OCI SHA256RSA Signing Algorithm`

e. Right-click the form header and click **Submit**.

5. Create connection record for the Oracle Block Storage spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the child alias record you had created, for example, **Oracle Obj Storage Alias**.

c. From the **Connections** tab, click **New**.

d. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle Block Storage conn`.
Credential	Credential record created for Oracle Block Storage spoke. For example, `Oracle Block Storage Cred`.
Connection alias	Alias record associated with this connection.
Connection URL	Base URL to connect to Oracle Block Storage. For example, `https://iaas.ap-mumbai-1.oraclecloud.com`.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

e. Click **Submit**.

The ServiceNow instance and Oracle Block Storage account are integrated. You can use the spoke actions to build flows and automate tasks as required.

Oracle Boot Volume Spoke

Manage boot volumes, backups, and KMS keys in Oracle Boot Volume account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle Boot Volume v1.0.6 is the latest version.

Supported versions

This spoke was built for Oracle Boot Volume API version 20160918, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Oracle Cloud IAM Spoke
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Oracle Boot Volume spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Boot Volume Backup Management	Change Boot Volume Backup Compartment	Moves a boot volume backup to a different compartment within the same tenancy.
	Copy Boot Volume Backup	Creates a boot volume backup copy in specified region.
	Create Boot Volume Backup	Creates a boot volume backup of the specified boot volume.
	Delete Boot Volume Backup	Deletes a boot volume backup.
	Get Boot Volume Backup	Gets information for the specified boot volume backup.
	Look up Boot Volume Backups	Lists the boot volumes backup in the specified compartment.
	Update Boot Volume Backup	Updates specified boot volume backup.
Boot Volume KMS Key Management	Delete Boot Volume KMS Key	Removes the specified boot volume's assigned Key Management encryption key.
	Get Boot Volume KMS Key	Gets the Key Management encryption key assigned to the specified boot volume.
	Update Boot Volume KMS Key	Updates the specified volume with a new Key Management encryption key.
Boot Volume Management	Attach Boot Volume	Attaches the specified boot volume to the specified instance.
	Change Boot Volume Compartment	Moves a boot volume to a different compartment within the same tenancy.
	Create Boot Volume	Creates a boot volume in the specified compartment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Boot Volume	Deletes the specified boot volume.
	Detach Boot Volume	Detaches a boot volume from an instance.
	Get Boot Volume	Gets information for the specified boot volume.
	Get Boot Volume Attachment	Gets information about the specified boot volume attachment.
	Look up Boot Volume Attachments	Lists the boot volume attachments in the specified compartment.
	Look up Boot Volumes	Lists the boot volumes in the specified compartment.
	Update Boot Volume	Updates the specified boot volume.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Oracle Boot Volume spoke.

Set up the Oracle Boot Volume spoke

Integrate the ServiceNow instance and Oracle Boot Volume account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the Oracle Cloud IAM Spoke.
- Activate the Oracle Boot Volume spoke.
- Role required: admin.

Procedure

1. **Optional:** Create a JKS certificate.
   You can create a JKS certificate for the Oracle Boot Volume spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.
2. **Optional:** Create X.509 certificate.
   You can create a X.509 certificate for the Oracle Boot Volume spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.
3. Create credential record for the Oracle Boot Volume spoke.
   a. Navigate to **Connections & Credentials** > **Credentials**.
   b. Click **New**.
      The system displays this message: `What type of Credentials would you like to create?`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **OCI SHA256WithRSA Signature**.

d. On the form, fill in the fields.

> **Note:**
> You can specify details of the certificates you created specifically for the Oracle Boot Volume spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

OCI SHA256WithRSA Signature Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle Boot Vol Cred`.
Certificate Sys ID	Sys ID of the Signing Certificate.
Alias	Alias of the KeyStore.
Alias Password	Alias password of the KeyStore.
Key ID	Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: `ocid1.tenancy.oc1..<unique_ID>/ ocid1.user.oc1..<unique_ID>/<key_fingerprint>`.
Applies to	Option to specify if the credential applies to all MID Servers in the network.
Active	Option to actively use the credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select `OCI SHA256RSA Signing Algorithm`

e. Right-click the form header and click **Submit**.

4. Create connection record for the Oracle Boot Volume spoke.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the alias record of the Oracle Boot Volume spoke, for example, **Oracle_Boot_Volume_Connection**.

c. From the **Connections** tab, click **New**.

d. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle Boot Volume Conn`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential	Credential record created for Oracle Boot Volume spoke. For example, `Oracle Boot Vol Cred`.
Connection alias	Alias record associated with this connection.
Connection URL	Base URL to connect to Oracle Boot Volume. For example, `https://iaas.ap-mumbai-1.oraclecloud.com`.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

e. Click **Submit**.

The ServiceNow instance and Oracle Boot Volume account are integrated. You can use the spoke actions to build flows and automate tasks as required.

Oracle Cloud IAM Spoke

Manage user identities and user access in Oracle Infrastructure Identity and Access Management (IAM) from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle Cloud IAM spoke v1.1.3 is the latest version.

Supported versions

This spoke was built for Oracle Cloud IAM 20160918, but may be compatible with later versions.

Spoke requirements

Oracle Cloud account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Oracle Cloud IAM spoke provides actions to automate Oracle Cloud IAM tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Compartment Management	Bulk Delete Resources	Deletes multiple resources from the specified compartment in a batch.
	Bulk Move Resources	Moves multiple resources from one compartment to another compartment in a batch.
	Create Compartment	Creates a child compartment in the specified parent compartment.
	Get Compartment	Retrieves details of the specified compartment.
	Look up Compartments	Retrieves a list of compartments in the specified tenancy.
	Move Compartment	Moves the specified child compartment to a different parent compartment in the same tenancy.
	Recover Compartment	Recovers a deleted compartment and changes its state to active.
	Update Compartment	Updates the specified compartment.
Group Management	Create Group	Creates a group in the specified tenancy.
	Delete Group	Deletes the specified group.
	Get Group	Retrieves information about the specified group.
	Look up Groups	Retrieves a list of groups in the specified tenancy.
	Update Group	Updates the specified group.
OCI Metadata	Get Tenancy	Retrieves information about the specified tenancy.
	Look up Available Domains	Retrieves a list of availability domains in the specified tenancy.
	Look up Regions	Retrieves a list of all the regions offered by Oracle Cloud Infrastructure.
Policy Management	Create Policy	Create a policy in the specified compartment.
	Delete Policy	Deletes the specified policy.
	Get Policy	Retrieves information of the specified policy.
	Look up Policies	Retrieves a list of policies in the specified compartment.
	Update Policy	Updates the specified policy.
User Management	Add User to Group	Adds the specified user to the specified group.
	Create User	Creates a user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete User	Deletes the specified user.
	Get User	Retrieves the details of the specified user.
	Look up User Group Membership	Retrieves a list of the user group memberships in the specified tenancy.
	Look up Users	Retrieves a list of the users in the specified tenancy.
	Remove User from Group	Removes a user from a group by deleting the corresponding user group membership.
	Update User	Updates details of the specified user.
	Update User Capabilities	Updates capabilities of the specified user.
	Update User State	Unblocks the specified user.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Oracle Cloud IAM spoke.

Set up the Oracle Cloud IAM spoke

Integrate the ServiceNow instance and Oracle Cloud IAM by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Oracle Cloud IAM spoke.
- Role required: admin

Create a Java KeyStore (JKS) certificate

Use the keytool utility to generate, import, and export certificates.

Before you begin

- Make sure that the keytool utility is installed on your computer.
- Role required: admin

Procedure

1. Change to the directory where the certificate is to be saved.
   By default, keytool creates a keystore file in the directory where the keystore commands are run.
2. Enter the following keytool command to generate the certificate in the keystore file, keystore.jks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
keytool -genkeypair -alias <mycertificate> -keyalg RSA
-keysize 2048 -validity 365 -keystore keystore.jks -storepass
your_keystore_password -keypass your_key_password
```

Note:
Replace the placeholders <mycertificate>, <your_keystore_password>, and <your_key_password> with your certificate name, keystore password, and key password in all the sample commands.

3. Enter your first name and last name, organization, and other details in the keytool prompt. These details are required for generating the certificate.
4. Enter the following commands in the following sequence.

```
keytool -export -alias sample -storepass <storepassword> -file
 server.cer -keystore keystore.jks
keytool -import -v -trustcacerts -alias sample -file server.cer
 -keystore cacerts.jks -keypass <keypassword> -storepass
 <storepassword>
keytool -export -alias sample -keystore keystore.jks -rfc -file
 public.cert
keytool -export -alias sample -keystore keystore.jks -rfc -file
 certificate.pem
keytool -list -rfc -keystore keystore.jks -alias sample
 -storepass <storepassword>
keytool -importkeystore -srckeystore keystore.jks -destkeystore
 keystore.p12 -deststoretype PKCS12 -srcalias <alias>
 -deststorepass <storepassword> -destkeypass <keypassword>
openssl pkcs12 -in keystore.p12 -nokeys -out cert.pem
openssl pkcs12 -in keystore.p12 -nodes -nocerts -out
 PrivateKey.pem
openssl rsa -in key.pem -pubout -out PublicKey.pem
keytool -list -v -keystore keystore.p12 -storetype PKCS12
 -storepass <storepassword>
```

   Verify the generated keystore.jks file in the target directory.
5. Enter the following command to extract public key from the Java Keystore file.
   `openssl x509 -pubkey -noout -in cert.pem > publickey.pem`

Create X.509 certificate for the Oracle Cloud IAM spoke

You must create a X.509 certificate and attach the Java Keystore file to it. This certificate is used for connecting to Oracle Cloud IAM.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. In the form, fill in these fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

X.509 Certificate form

Field	Description
Name	Unique name to identify the certificate. For example, `OCI IAM certificate`
Type	Type of the certificate. Select **Java Key Store**.
Notify on expiration	List of persons who are to be notified when a ceritificate is about to expire.
Keystore password	Password of the keystore.
Warn in days to expire	Number of days when a warning is sent to the user before the certificate expires.
Active	Option to make the certificate active.
Short description	Short description for the keystore.

4. Click the attachments icon and upload the keystore.jks file.
5. Click **Validate Stores/Certificates**.

Create a credential record for the Oracle Cloud IAM spoke

Create a credential record for the Oracle Cloud IAM account. The Oracle Cloud IAM spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Use the public key from the Java Keystore (JKS) file and generate a fingerprint from your Oracle Cloud account. For more information about fingerprint, see Required Keys and OCIDs.

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **OCI SHA256WithRSA Signature**.
4. On the form, fill these values.

OCI SHA256WithRSA Signature Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Oracle IAM Cloud Cred.
Certificate Sys ID	Sys ID of the OCI Signing Certificate.
Alias	Alias of the KeyStore.
Alias Password	Alias password of the KeyStore.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Key ID	Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: `ocid1.tenancy.oc1..<unique_ID>/ocid1.user.oc1..<unique_ID>/<key_fingerprint>`.
Applies to	Option to specify if the credential applies to all MID Servers in the network.
Active	Option to actively use the credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select `OCI SHA256RSA Signing Algorithm`

5. Right-click the form header and click **Submit**.

Create a connection record for the Oracle Cloud IAM spoke

Create a connection record for your Oracle Cloud IAM account. The Oracle Cloud IAM spoke connection and credential aliases use these connections to perform actions in Oracle Cloud IAM.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for **OracleIAM_credentialANDconnecton**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle IAM conn`.
Credential	Credential record created for Oracle Autonomous DB spoke. For example, `Oracle IAM Cred`.
Connection alias	Alias record associated with this connection. Search and select `sn_oci_iam_spoke.OracleIAM_credentialAN`
Connection URL	Base URL to connect to **Oracle Cloud IAM**. For example, `https://database.ap-mumbai-1.oraclecloud.com`.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

5. Click **Submit**.

Oracle Compute Engine Spoke

Manage images and instance in the Oracle Compute Engine account from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle Compute Engine v1.0.4 is the latest version.

Supported versions

This spoke was built for Oracle Compute Engine API version 20160918, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Oracle Cloud IAM Spoke
- Oracle Object Storage Management Spoke
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Oracle Compute Engine spoke provides actions to automate Oracle Compute Engine tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Custom Image Management	Change Image Compartment	Moves an Image into a different compartment within the same tenancy.
	Create Image	Creates a custom image in the specified compartment.
	Delete Image	Deletes the specified custom image.
	Export Image	Exports the specified image to the Oracle Cloud Infrastructure Object Storage service.
	Get Image	Retrieves a specified custom image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Images	Retrieves a list of available images in the specified compartment.
	Update Image	Updates details of the specified custom image.
Image Shape Compatibility Management	Add Image Shape Compatibility	Adds a shape to the compatible shapes list for the image.
	Delete Image Shape Compatibility	Deletes an image shape compatibility entry.
	Get Image Shape Compatibility	Retrieves a specified image shape compatibility entry.
	Look up Image Shape Compatibilities	Retrieves a list of all the compatible shapes for the specified image.
Instance Configuration Management	Change Instance Configuration Compartment	Moves an Instance Configuration into a different compartment within the same tenancy.
	Create Instance Configuration	Creates an instance configuration.
	Delete Instance Configuration	Deletes the specified instance configuration.
	Get Instance Configuration	Gets the specified instance configuration.
	Look up Instance Configurations	Retrieves a list of instance configurations in the specified compartment.
	Update Instance Configuration	Updates details of the specified instance configuration.
Instance Management	Change Instance Compartment	Moves an Instance into a different compartment within the same tenancy.
	Create Instance	Creates an instance.
	Delete Instance	Deletes a specified instance.
	Get Instance	Retrieves information about the specified instance.
	Instance Action	Performs a specified power action on an instance.
	Look up Instances	Retrieves a list of instances in the specified compartment.
	Update Instance	Updates details of the specified instance.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Set up the Oracle Compute Engine spoke.

Set up the Oracle Compute Engine spoke

Integrate the ServiceNow instance and Oracle Compute Engine account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the Oracle Cloud IAM Spoke.
- Activate and set up the Oracle Object Storage Management Spoke.
- Activate the Oracle Compute Engine spoke.
- Role required: admin.

Procedure

1. **Optional:** Create a JKS certificate.
   You can create a JKS certificate for the Oracle Compute Engine spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.
2. **Optional:** Create X.509 certificate.
   You can create a X.509 certificate for the Oracle Compute Engine spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.
3. Create credential record for the Oracle Compute Engine spoke.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Click **New**.
   The system displays this message: `What type of Credentials would you like to create?`

   c. Select **OCI SHA256WithRSA Signature**.

   d. On the form, fill these values.

   Note:
   You can specify details of the certificates you created specifically for the Oracle Compute Engine spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

OCI SHA256WithRSA Signature Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle CE Cred`.
Certificate Sys ID	Sys ID of the Signing Certificate.
Alias	Alias of the KeyStore.
Alias Password	Alias password of the KeyStore.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Key ID	Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: `ocid1.tenancy.oc1..<unique_ID>/ocid1.user.oc1..<unique_ID>/<key_fingerprint>`.
Applies to	Option to specify if the credential applies to all MID Servers in the network.
Active	Option to actively use the credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select `OCI SHA256RSA Signing Algorithm`

e. Right-click the form header and click **Submit**.

4. Create connection record for the Oracle Compute Engine spoke.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the alias record of the Oracle Boot Volume spoke, for example, **Oracle_Compute_Engine**.

c. From the **Connections** tab, click **New**.

d. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle CE Conn`.
Credential	Credential record created for Oracle Boot Volume spoke. For example, `Oracle CE Cred`.
Connection alias	Alias record associated with this connection.
Connection URL	Base URL to connect to Oracle Compute Engine. For example, `https://iaas.ap-mumbai-1.oraclecloud.com`.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

e. Click **Submit**.

The ServiceNow instance and Oracle Compute Engine account are integrated. You can use the spoke actions to build flows and automate tasks as required.

Oracle EBS Spoke

Manage sales orders, procurement, finance, customers, ledgers, and so on, in the Oracle EBS instance from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note:
The packages should be redeployed when you are upgrading to the Oracle EBS spoke v1.1 from Oracle EBS spoke v1. For more information, see Set up the Oracle EBS spoke.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle EBS spoke v1.13.4 is the latest version.

Supported versions

This spoke was built for these versions, but may be compatible with later versions.

- Operating system version: Red Hat Enterprise Linux release 8.9 (Ootpa)
- Oracle database version: 12.1.0.2.0
- Oracle E-Business Suite application tier version: 12.2.12
- Oracle WebLogic Server version: 10.3.6.0.171017 PSU
- Oracle WebTier version: 11.1.1.9
- Oracle Forms and Reports: 10.1.2.3

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Oracle EBS spoke provides a sample flow, Look up Daily Rates to demonstrate automating tasks. The flow runs daily and retrieves the Daily Currency Exchange Rates from Oracle EBS for the current date and saves the details in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Oracle EBS spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope. Available sample subflows include:

Subflow	Description
AP Invoices - Create Interface Entries	Creates interface entries of AP Invoices in Oracle EBS.
AP Invoices - Get Processing Details	Retrieves the concurrent program status and other details from Oracle EBS.
Fetch AP invoice details	Retrieves the AP invoice details from Oracle EBS.
Fixed Assets - Create Interface Entries	Creates interface entries of fixed assets in Oracle EBS.
Fixed Assets - Get Processing Details	Retrieves the concurrent program status and other details from Oracle EBS.
Get Journal Posted Status	Retrieves the current status of a GL journal header.
Goods Receipts - Create Interface Entries	Creates interface entries of Goods Receipts in Oracle EBS.
Goods Receipts - Get Processing Details	Retrieves the concurrent program status and other details from Oracle EBS.
Purchase Orders - Create Interface Entries	Creates interface entries of purchase orders in Oracle EBS.
Purchase Orders - Get Processing Details	Retrieves the concurrent program status and other details from Oracle EBS.

Spoke actions

The Oracle EBS spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Approval Management	Approve or Reject Approval Request	Approves or rejects the specified approval request in Oracle EBS.
	Cancel Approval	Cancels the specified approval request in Oracle EBS.
Finance	Create AP Invoice - Run Concurrent Program	Runs the concurrent program that imports invoice data from the interface table to the base table of Oracle EBS.
	Get AP Invoice	Retrieves details of the required AP invoice.
	Get Fixed Asset	Retrieves details of the required fixed asset.
	Get Vendor	Retrieves details of the required vendor.
	Get Vendor Site	Retrieves details of the required vendor site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Import Fixed Asset - Run Concurrent Program	Runs the concurrent program that imports the fixed asset data from the interface table to base table of Oracle EBS.
	Look up AR Invoices	Retrieves details of the AR invoices.
	Look up Daily Rate	Retrieves details of the specified daily rate based on the input criteria.
	Look up Legal Entity	Retrieves details of a the required legal entity.
	Look up Ship To Locations	Retrieves details of the required shipped locations based on the input criteria.
Inventory Management	Submit Inventory - Run Concurrent Program	Submits an inventory item CC program.
	Update Inventory Items	Updates details of the inventory items.
Invoice Management	Authorize Payment - Apply Hold	Applies hold on the specified authorized payment invoices in Oracle EBS.
	Authorize Payment - Release Hold	Releases hold on the specified authorized payment invoices in Oracle EBS.
	Cancel Invoice	Cancels an invoice in Oracle EBS.
	Create AP Invoice	Creates an Accounts Payable (AP) invoice in Oracle EBS. **Note:** The internal name of the latest version of the action is create_ap_invoice_v3. To use it, you must install the latest version of the spoke from the ServiceNow store.
	Look up AP Invoices	Retrieves an Accounts Payable (AP) invoice details from Oracle EBS.
	Look up Invoice Payment Status	Retrieves the invoice payment status from Oracle EBS.
	Submit Invoice - Run Concurrent Program	Submits an invoice - run concurrent program in Oracle EBS.
Journal Ledger	Create Journals	Creates a journal.
	Get GL Journal Batch	Retrieves details of the required GL journal batch.
	Get GL Journal Header	Retrieves details of the required GL journal header.
	Get GL Ledger	Retrieves details of the required GL ledger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get GL Subledger Account	Retrieves details of the required GL subledger account.
	Import Journals - Run Concurrent Program	Runs the concurrent program that imports journals data from the interface table to the base table of Oracle EBS.
	Look up GL Balance	Retrieves details of the required GL balance based on the input criteria.
	Look up GL Balances	Retrieves details of the required GL balance based on the input query.
	Look up GL Code Combinations	Retrieves details of the required GL code combinations based on the input query.
	Look up GL Journals	Retrieves details of the required GL journals based on the input criteria.
	Look up GL Ledgers	Retrieves details of the required GL ledgers based on the input criteria.
	Look up GL Subledger Accounts	Retrieves details of the required GL subledger accounts based on the input criteria.
	Post Journals - Run Concurrent Program	Runs the concurrent program that posts the unposted journals.
	Reverse Journals - Run Concurrent Program	Runs the concurrent program that reverses the posted journals.
Master	Create Item	Creates an item.
	Look up Cost Center	Retrieves details about the required cost center.
	Look up Item	Retrieves details about the required item.
	Look up Item Category	Retrieves details about the required item category.
Utility Actions	Generate Input Payload With Crossreference	Generates array type input payload for Create Actions from subflow input payload while assigning configured cross-reference field with the ServiceNow ID(s).
	Get Additional EBS Fields	Retrieves list of fields which can be further used as a dynamic template or dynamic object, based on an input string, Action Internal Name.
	Get Records	Retrieves data from any Oracle EBS module using an SQL query.
	Look up Common Object Details	Retrieves the common details of the object specified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Concurrent Program Status	Retrieves the status of a concurrent request.
	Parse OEBS Record Details	Converts the JSON output of 'Get Records' Action into structured Object format.
	Wait for Request Completion	Waits until the status of the request completes.
Transfer Order Management	Create Transfer Order	Creates a transfer order with the specified details.
	Look up Transfer Orders	Retrieves details of the required transfer orders.
Procurement	Create Goods Receipts	Creates a goods receipt.
	Get Advance Shipment Notice	Retrieves details of the required advance shipment notice.
	Look up Advance Shipment Notices	Retrieves details of multiple advance shipment notices based on the input query.
Asset Management	Create Asset	Creates an asset with the specified details.
	Look up Asset Categories Stream	Retrieves the details of the look up asset categories.
	Submit Asset - Run Concurrent Program	Returns the concurrent status of the specified asset in Oracle EBS.
Bills and Payments	Look up Bill Details	Retrieves details of the required bills.
	Look up Outstanding Balances	Retrieves details of the required outstanding balances.
	Look up Payment Details	Retrieves details of the required payments.
	Look up Payment Status	Retrieves status of the required payments.
Customer	Create Customer Account	Creates a customer account.
	Create Customer Account Role	Creates a customer account role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Customer Contact	Creates a customer account contact.
	Create Customer Relation	Creates a customer relation record.
	Create Person	Creates a person record.
	Look up Customer Accounts	Retrieves details of the required customer accounts.
	Look up Customer Contacts	Retrieves the required customer contacts.
	Update Customer Account	Updates details of the required customer account.
	Update Customer Contact	Updates details of the required customer contact.
Sales Order	Look up Sales Order Status Stream	Retrieves status details of the required sales orders.
	Look up Sales Order Stream	Retrieves details of the required sales orders.
Contract Management	Create Contract	Creates a contract in Oracle EBS.
	Create Contract - Run Concurrent Program	Retrieves the concurrent status of contract in Oracle EBS.
Purchase Order Management	Cancel Purchase Order	Cancels the purchase order.
	Create Blanket Release	Creates blanket release in Oracle EBS. **Note:** The internal name of the latest version of the action is create_blanket_release_v2. To use it, you must install the latest version of the spoke from the ServiceNow store.
	Create Blanket Release - Run Concurrent Program	Retrieves the concurrent status of blanket release in Oracle EBS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Blanket Purchase Agreement	Creates a blanket purchase agreement. **Note:** The internal name of the latest version of the action is create_blanket_purchase_agreement_v2. To use it, you must install the latest version of the spoke from the ServiceNow store.
	Create Purchase Order	Creates purchase orders in Oracle EBS. **Note:** The internal name of the latest version of the action is create_purchase_order_v3. To use it, you must install the latest version of the spoke from the ServiceNow store.
	Create Purchase Order - Run Concurrent Program	Runs the concurrent program that imports the purchase order data from the interface table to the base table of Oracle EBS.
	Update Blanket Purchase Agreement	Updates the details of the specified blanket purchase agreement. **Note:** The internal name of the latest version of the action is update_blanket_purchase_agreement_v2. To use it, you must install the latest version of the spoke from the ServiceNow store.
	Update Purchase Order	Updates the purchase order in Oracle EBS. **Note:** The internal name of the latest version of the action is update_purchase_order_v3. To use it, you must install the latest version of the spoke from the ServiceNow store.
Receipt Management	Cancel PO Goods Receipt	Cancels the purchase order (PO) goods receipt. **Note:** The internal name of the latest version of the action is create_po_goods_receipt_v2. To use it, you must install the latest version of the spoke from the ServiceNow store.
	Create Goods Receipt - Run Concurrent Program	Creates a good receipt in concurrent program mode.
	Create PO Goods Receipt	Creates a Purchase Order (PO) goods receipt in Oracle EBS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up PO Receipts	Retrieves purchase order (PO) receipts from Oracle EBS.
	Update PO Goods Receipt	Updates a Purchase Order (PO) goods receipt in Oracle EBS.
Supplier Management	Create Bank Account	Creates a bank account.
	Create Supplier	Creates a supplier in Oracle EBS.
	Create Supplier Site	Creates a supplier site in Oracle EBS.
	Deactivate Supplier	Deactivates the specified supplier in Oracle EBS.
	Deactivate Supplier Site	Deactivates the specified supplier site in Oracle EBS.
	Look up Bank Accounts Stream	Retrieves the supplier bank account details.
	Look up Supplier Sites Stream	Retrieves the supplier site details from Oracle EBS.
	Look up Suppliers Stream	Retrieves the supplier details from Oracle EBS.
	Update Bank Account	Updates the specified bank account in Oracle EBS.
	Update Supplier	Updates the specified supplier details in Oracle EBS.
	Update Supplier Site	Updates the specified supplier site details in Oracle EBS.
	Void Supplier Bank Account	Makes the supplier bank account as void.
Primary Data Management	Look up Attachments	Retrieves the file attachments related to purchase order, supplier, and other specified details from Oracle EBS.
	Look up Currencies	Retrieves currency details from Oracle EBS.
	Look up GL Accounts Stream	Retrieves GL account details from Oracle EBS.
	Look up GL Cost Centers Stream	Retrieves the cost center details from Oracle EBS.
	Look up GL Daily Rates	Retrieves GL Daily Rate details from Oracle EBS.
	Look up GL Ledgers	Retrieves Ledger details from Oracle EBS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up GL Legal Entities	Retrieves GL Legal Entity details from Oracle EBS.
	Look up HR Locations Stream	Retrieves the details of HR locations from Oracle EBS.
	Look up Inventory Items Stream	Retrieves the inventory item details from Oracle EBS.
	Look up Item Categories Stream	Retrieves the item category details from Oracle EBS.
	Look up Operating Units	Retrieves Operating Unit details from Oracle EBS.
	Look up Payment Terms	Retrieves payment term details.
	Look up Purchase Groups	Retrieves Purchasing Group details from Oracle EBS.
	Look up Purchasing Organizations	Retrieves Purchasing Organization details from Oracle EBS.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Oracle EBS spoke.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Oracle EBS alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps.

Note:
If your Oracle EBS instance is only accessible on a private network, you must use MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Oracle EBS spoke

Integrate the ServiceNow instance and your Oracle EBS instance using a basic authentication to authenticate the ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Oracle EBS spoke.
- Admin access to the Oracle EBS account.
- Role required: admin.

Set up for Oracle Database 12C and later versions

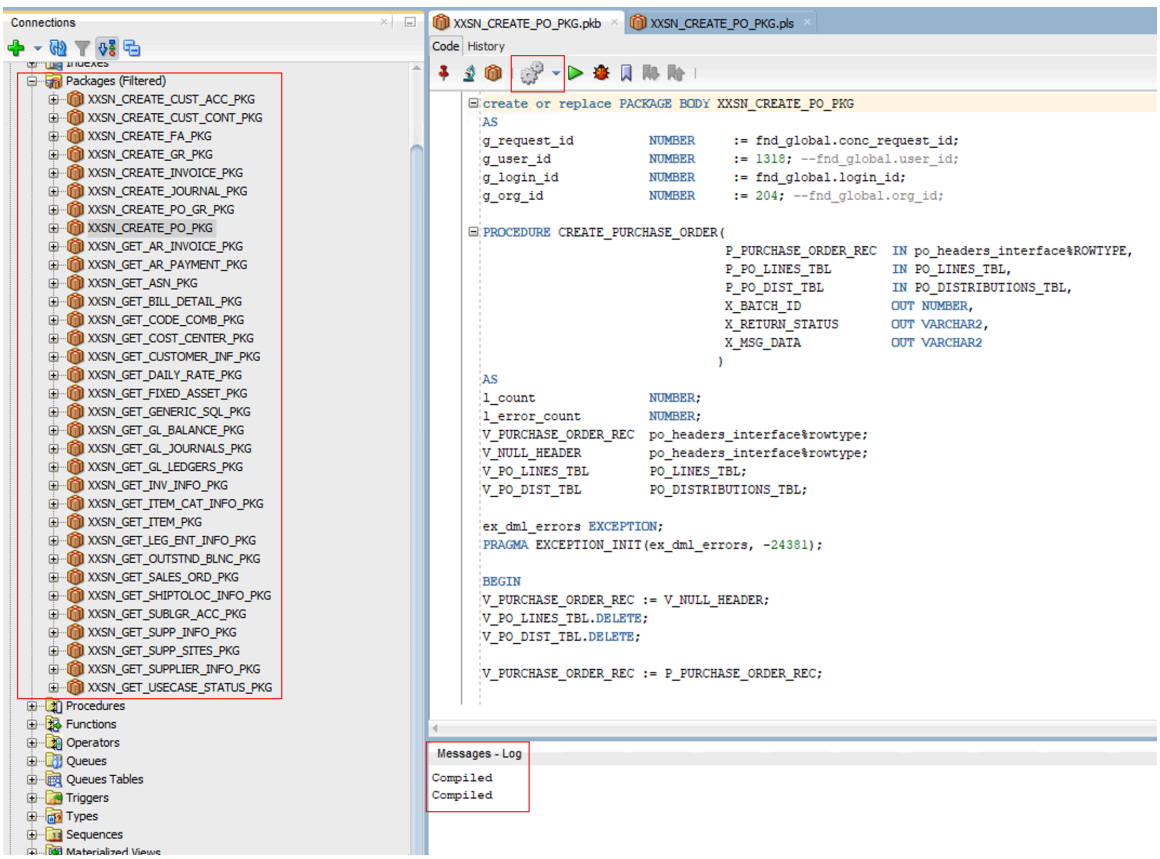
Configure Oracle Database 12C and later versions to work with the Oracle E-Business Suite spoke by deploying REST APIs and setting up ServiceNow connections.

Before you begin

Role required: admin

Procedure

1. From the ServiceNow® Store Oracle E-Business Suite Spoke Dependencies for Oracle Database 12c and 18c download the project file, Oracle_e-business_suite spoke_dependencies.zip and save it in the required local folder.
2. Unzip the contents of the Oracle_e-business_suite spoke_dependencies.zip file.
3. In SQL Developer or an SQL client, compile all the PKB and PLS files in the APPS schema.



4. In Oracle EBS server, deploy the Oracle EBS REST API.

   For the steps to enable the REST API per extension, see Deploying REST Web Services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must perform these steps for every PLS file. While deploying each PLS file, you must provide the relevant values. Here, the procedure is outlined using *XXSN_CREATE_PO_PKG.pls* as an example.

a. Copy and upload the compiled package .pls files to these respective directories:

- `$PO_TOP/patch/115/sql/tmp/`
- `$PO_TOP/patch/115/sql/`

Note:
Ensure that you replace the $PO_TOP with the module the package belongs to such as, $AP_TOP, $PO_TOP, and so on.

b. Log in to PuTTY of your Oracle EBS server and execute the Integration Repository Parser.

i. To generate an iLDT (*.ildt) file, execute the Integration Repository Parser using this syntax:

```
$IAS_ORACLE_HOME/perl/bin/perl $FND_TOP/bin/irep_parser.pl
 -g -v -username=sysadmin
 po:patch/115/sql:XXSN_CREATE_PO_PKG.pls:12.0=$PO_TOP/patch/
115/sql/tmp/XXSN_CREATE_PO_PKG.pls
```

ii. If you aren't generating .ildt file for the XXSN_CREATE_PO_PKG.pls file, replace `po` and `$PO_TOP` with required `Top`.

iii. If you aren't generating .ildt file for the XXSN_CREATE_PO_PKG.pls file, replace `XXSN_CREATE_PO_PKG.pls` with the required package name.

```
# Interface Repository Annotation Processor, 12.0.0

#
# Generating annotation output.
# Processing file 'XXSN_CREATE_PO_PKG.pls'.
# Using YAPP-based parser.
#  Found a package-level annotation for 'XXSN_CREATE_PO_PKG'.
#  Found a detail-level annotation...
# Found a procedure named 'CREATE_PURCHASE_ORDER'.
#  Found a detail-level annotation...
# Found a procedure named 'SUBMIT_PURCHASE_ORDER_CC'.
#  Found a detail-level annotation...
# Found a procedure named 'CANCEL_PO'.
# Done all files.
```

c. Upload the generated iLDT file to Integration repository by executing this command:

```
$FND_TOP/bin/FNDLOAD apps/apps 0 Y UPLOAD
 $FND_TOP/patch/115/import/wfirep.lct
 XXSN_CREATE_PO_PKG_pls.ildt
```

Note:
Replace `XXSN_CREATE_PO_PKG_` with the required package name.

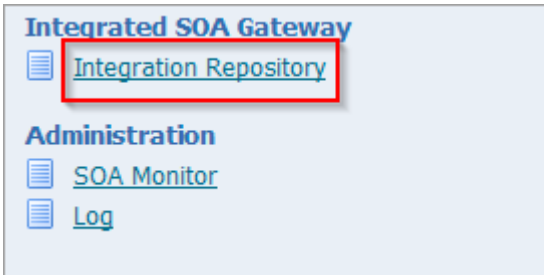
```
bash-4.2$ $FND_TOP/bin/FNDLOAD apps/apps 0 Y UPLOAD $FND_TOP/patch/115/import/wfirep.lct XXSN_CREATE_PO_PKG_pls.ildt
Log filename : L7734829.log

Report filename : O7734829.out
```

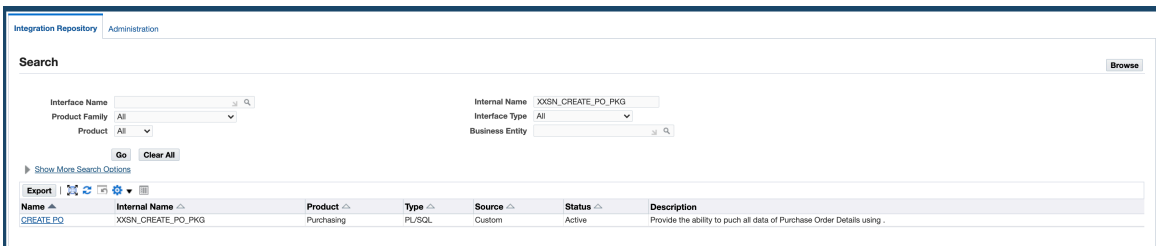
d. Log in to your Oracle E-Business Suite instance as system administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

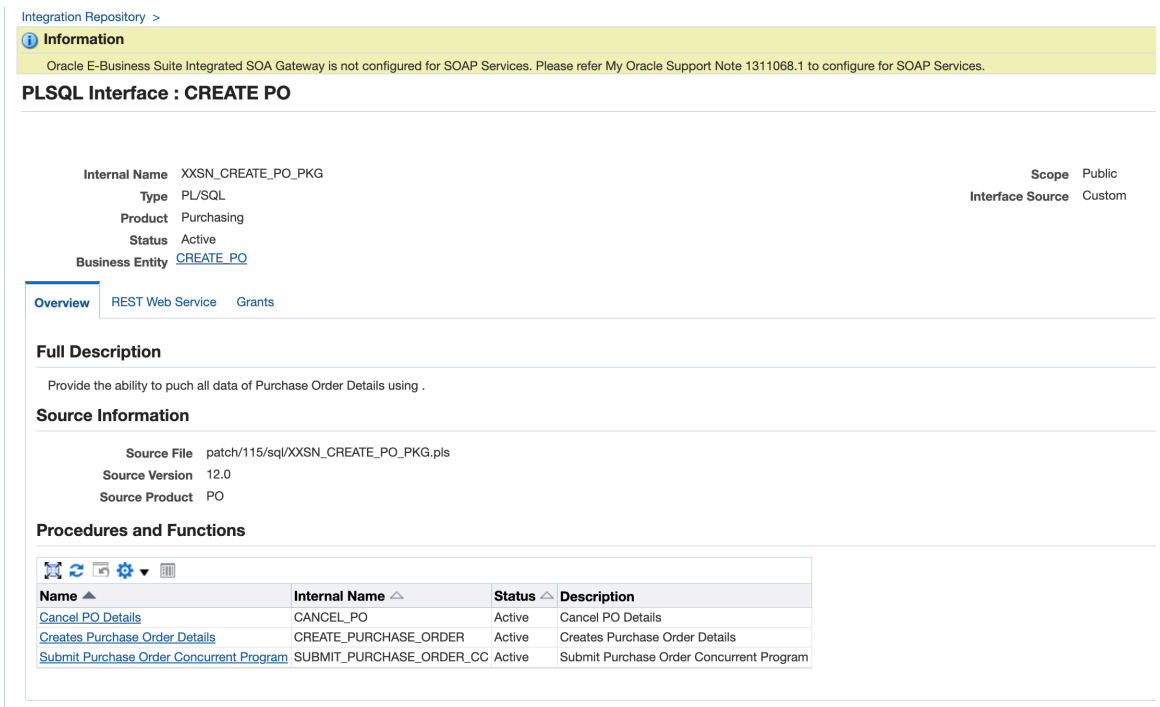
e. Switch to the **Integrated SOA Gateway** responsibility and select **Integration Repository**.



f. Search for the web service with the internal name, `XXSN_CREATE_PO_PKG`.



g. Click the link in the search result to access the list of available metods in the interface package.



Note:
In the PL/SQL interface type, both SOAP and REST web services are available. However, this procedure focuses on the REST web service.

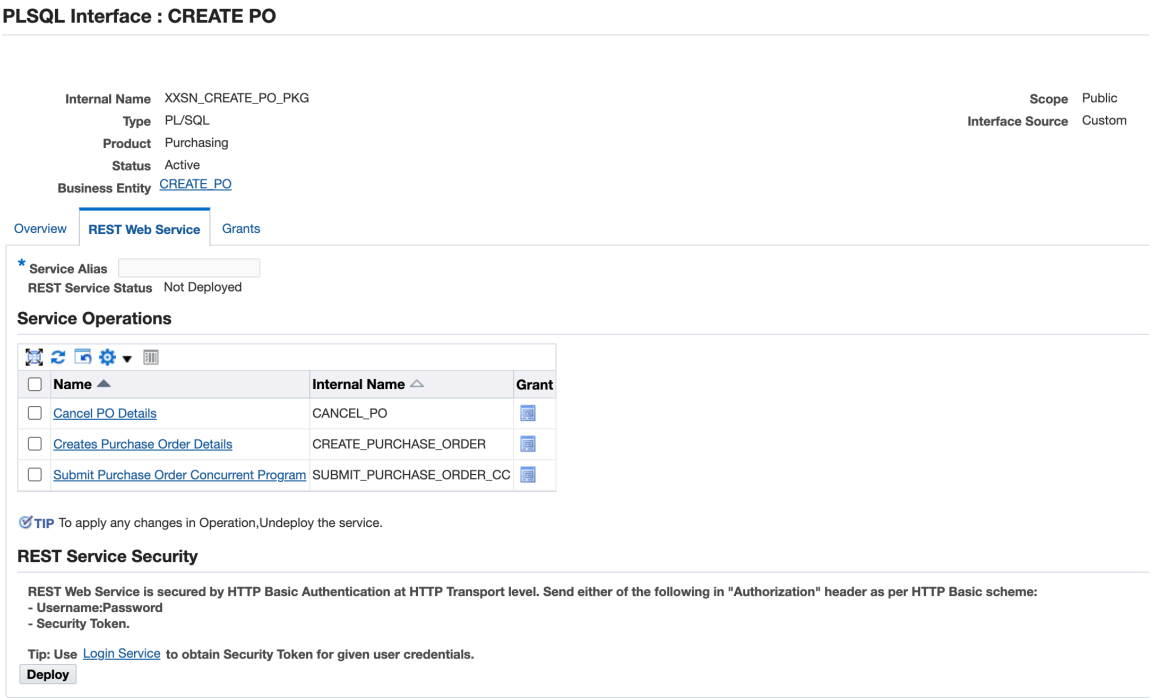
h. Click the **REST Web Service** tab.

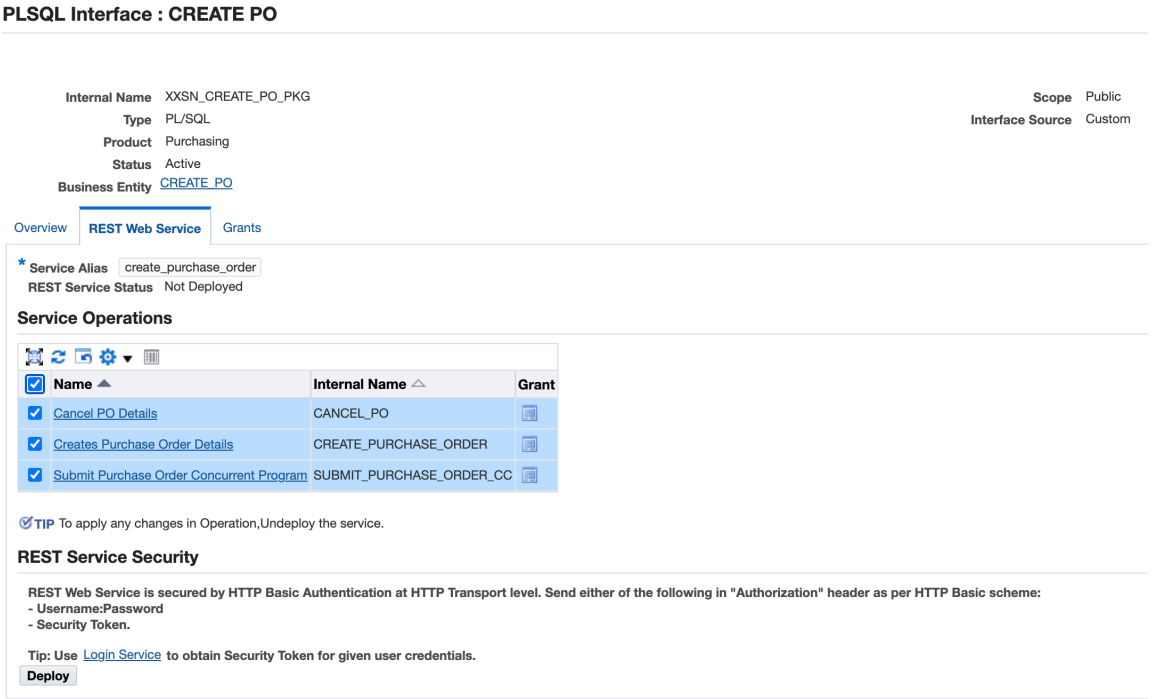
i. Set an alias for this service. For exmaple, `hr`.

ii. Click **Deploy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

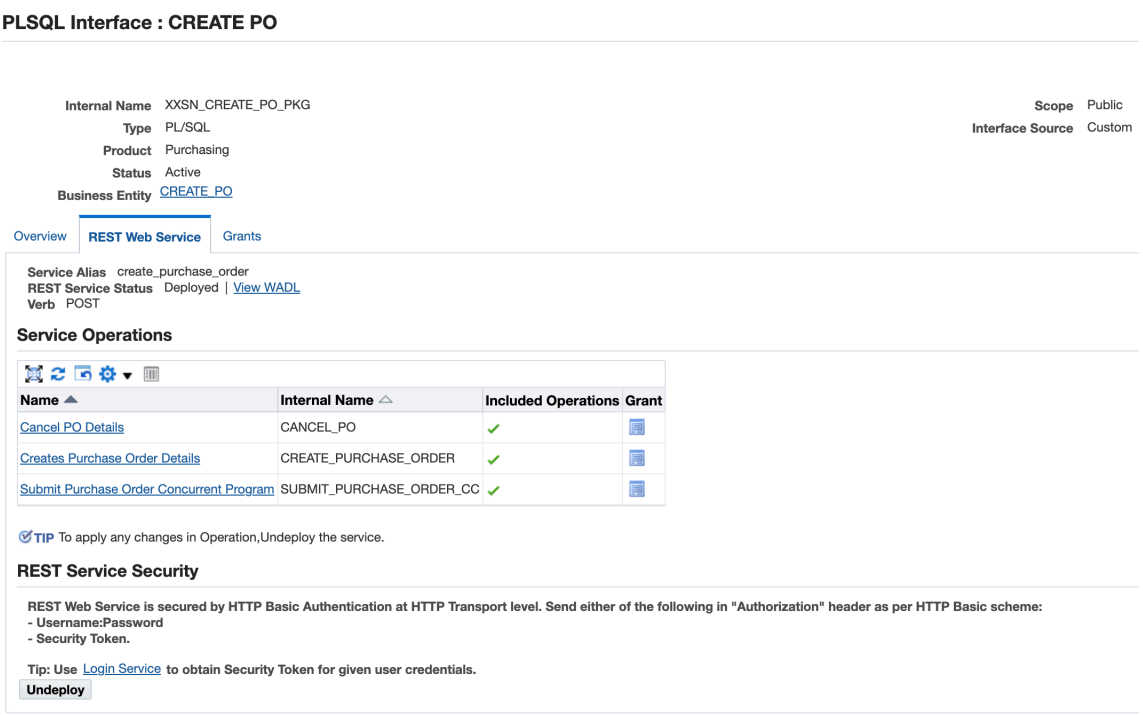
i. View the Create PO method by clicking the **REST Web Service** tab.





j. Enter the unique service alias name, select the **Create PO** method, and click **Deploy**.

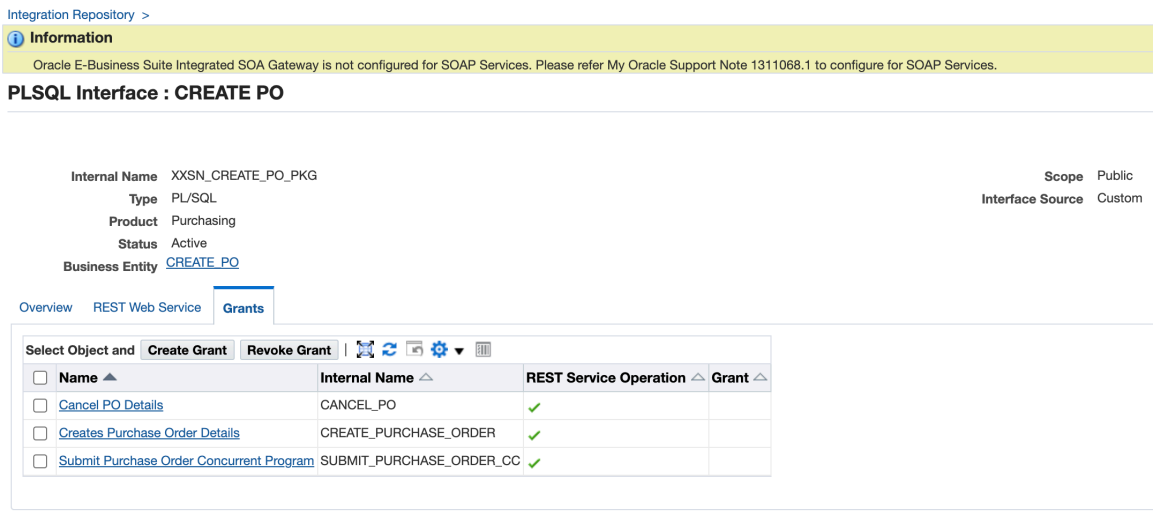
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



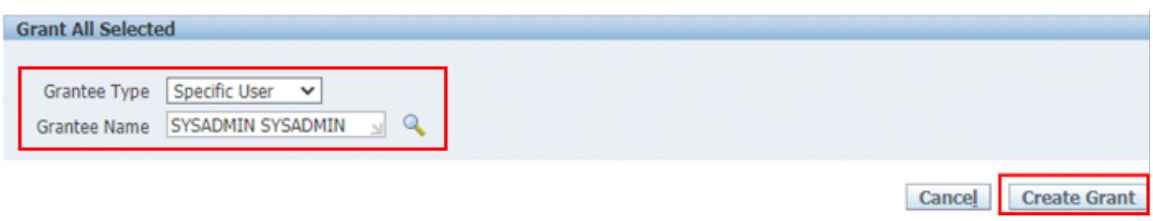
A confirmation message is displayed that the service is successfully deployed.

k. Click **View WADL** to access the physical location of the service endpoint where the service is hosted.

l. Open the **Grants** tab, select **Create PO**, and click **Create Grant**.

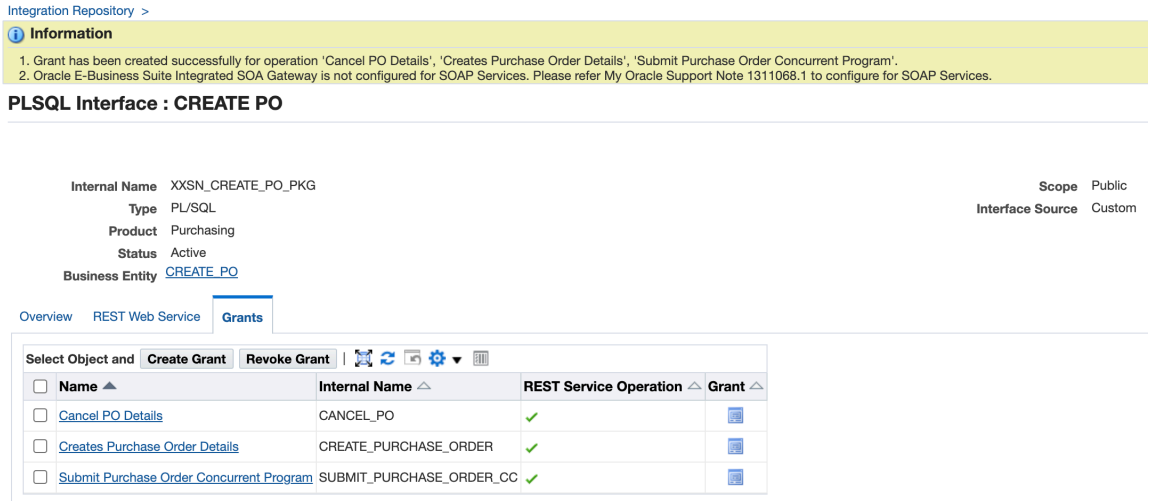


m. Select a grantee type, enter the user name to whom you want to give the grant access to use the web service, and click **Create Grant**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A confirmation message is displayed mentioning that the grant has been successfully created.



Note:
To revoke grant, click **Revoke Grants** in the **Grants** tab and select the required users.

n. Perform the above steps for all the required actions and ensure that you use the same names (associated with the respective action) as mentioned in the Resource Path column of the following table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

o. Restart the server and using PuTTY, perform these steps up on logging in to the Oracle EBS server.

i. Execute the commands: *cd $ADMIN_SCRIPTS_HOME* and *./adadminsrvctl.sh stop*.

ii. Enter the WebLogic password and EBS password.

iii. Execute the command, *./adadminsrvctl.sh start*.

iv. Enter the WebLogic password and EBS password.

v. To check the status, execute the command, *./adadminsrvctl.sh status*.

5. Create a credential record for the Oracle EBS spoke.

a. Navigate to **Connections & Credentials** > **Credentials**.

b. Click **New**.
The system displays the message `What type of Credentials would you like to create?`.

c. Select **Basic Auth Credentials**.

d. On the form, fill these values.

Field	Description
Name	Name to uniquely identify the credential record. For example, `OEBS Cred`.
User name	User name to log in to the Oracle EBS instance.
Password	Password to log in to the Oracle EBS instance.
Active	Option to actively use the credential record.

e. Click **Submit**.

6. Create a connection record for the Oracle EBS spoke.

a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

b. Open the record for the Oracle EBS spoke.

c. From the **Connections** tab, click **New**.

d. On the form, fill these values.

Field	Description
Name	Name to uniquely identify the connection record. For example, `OEBS Conn`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential	Credential record you created for the Oracle EBS spoke.
Connection URL	Connection URL to connect to your Oracle EBS instance.

e. Click **Submit**.

Set up for Oracle Database 19C and later versions

Configure Oracle Database 19C and later versions to work with the Oracle E-Business Suite spoke by deploying REST APIs and setting up ServiceNow connections.

Before you begin

Role required: admin

Procedure

1. From the ServiceNow® Store Oracle EBS Spoke Dependencies for Oracle Database 19c or later download the project file, Oracle_e-business_suite spoke_dependencies.zip and save it in the required local folder.
2. Unzip the contents of the Oracle_e-business_suite spoke_dependencies.zip file.
3. In SQL Developer or an SQL client, compile all the PKB and PLS files in the APPS schema.
4. Review the module package reference to identify the correct values for your deployment.

   The following table lists the .pls filename, $TOP variable, product short-code, and service alias required for each Oracle EBS module. Use the values in this table wherever the steps below reference a module-specific path, product code, or alias.

Module	Package (.pls filename)	$TOP variable	Product code	Service alias
General Ledger	xxsn_gl_integration_pkg.pls	$GL_TOP	gl	xxsn_gl_integration_pkg
AP — Supplier	xxsn_supplier_integration_pkg.pls	$AP_TOP	ap	xxsn_supplier_integration_pk
Purchasing	xxsn_po_integration_pkg.pls	$PO_TOP	po	xxsn_po_integration_pkg
Accounts Payable	xxsn_ap_integration_pkg.pls	$AP_TOP	ap	xxsn_ap_integration_pkg
Fixed Assets	xxsn_fa_integration_pkg.pls	$FA_TOP	fa	xxsn_fa_integration_pkg
Sourcing	xxsn_pon_integration_pkg.pls	$PON_TOP	pon	xxsn_pon_integration_pkg
Inventory	xxsn_inv_integration_pkg.pls	$INV_TOP	inv	xxsn_inv_integration_pkg
Common	xxsn_common_integration_pkg	$FND_TOP	fnds	xxsn_common_integration_pkg
Receivables	xxsn_ar_integration_pkg.pls	$AR_TOP	ap	xxsn_ar_integrations_pkg
Order Management	xxsn_om_integration_pkg.pls	$ONT_TOP	ont	xxsn_om_integration_pkg

5. In Oracle EBS server, deploy the Oracle EBS REST API.

   For the steps to enable the REST API per extension, see Deploying REST Web Services.

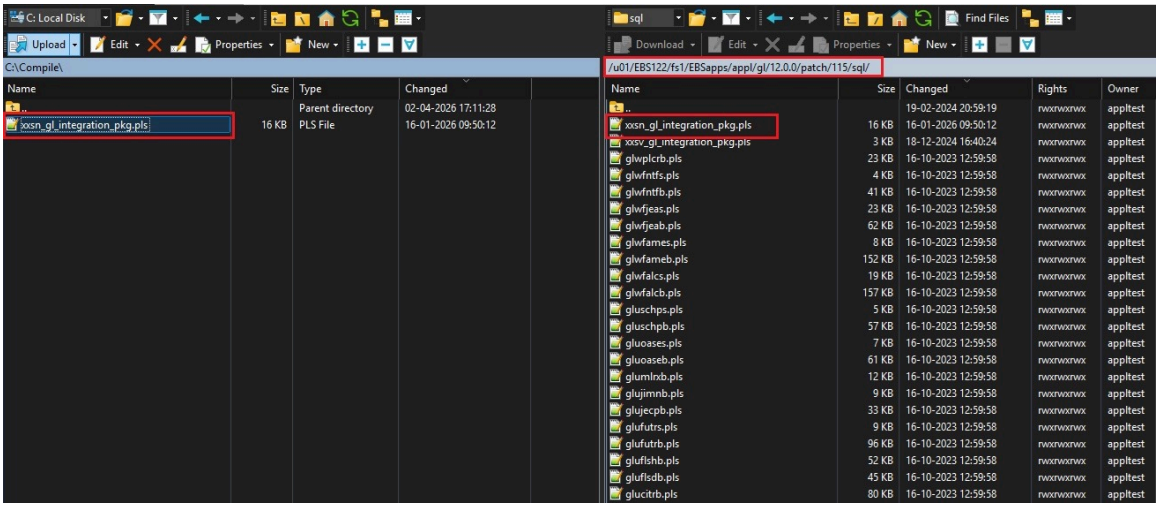
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must perform these steps for every PLS file. While deploying each PLS file, you must provide the relevant values. Here, the procedure is outlined using *`xxsn_gl_integration_pkg.pls`* as an example.

a. Copy and upload the compiled package .pls files to these respective directories:

- `$GL_TOP/patch/115/sql/tmp/`
- `$GL_TOP/patch/115/sql/`

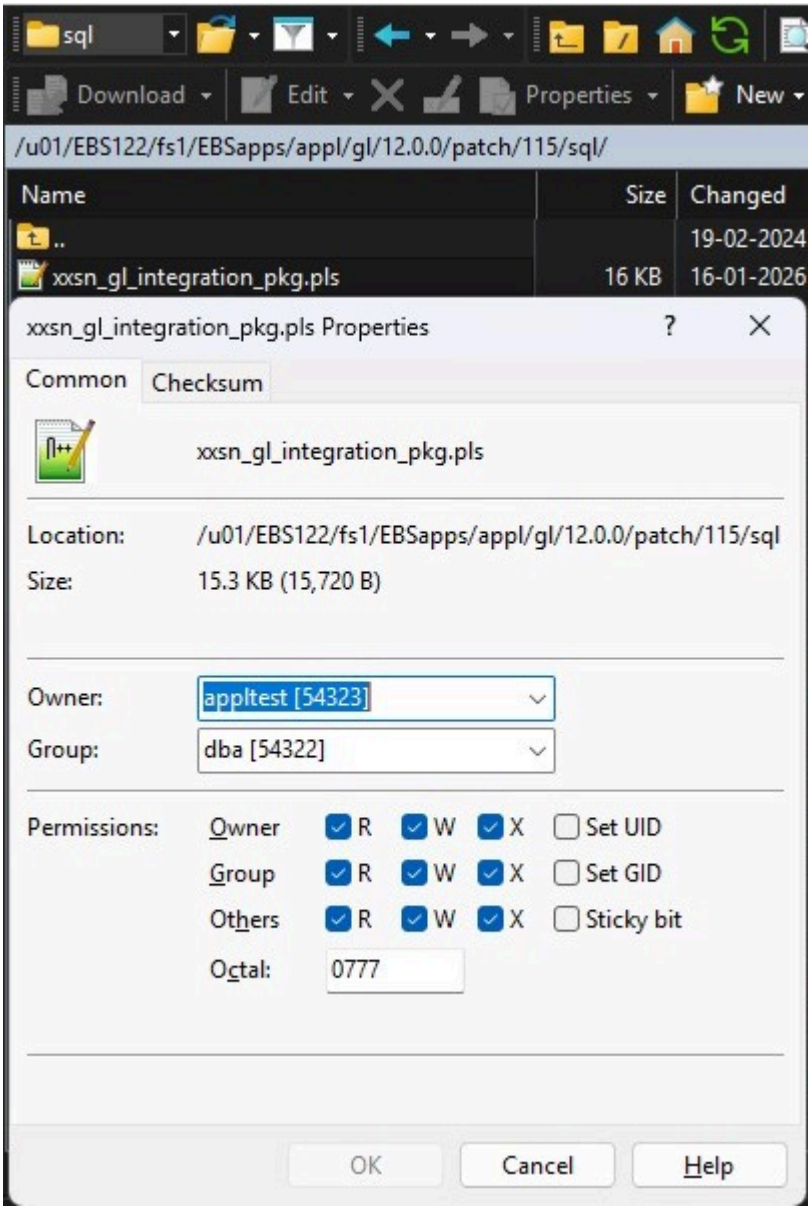
Note:
Ensure that you replace the $GL_TOP with the $TOP variable for the module the package belongs to. For the correct $TOP variable per module, see the module package reference table in the previous step.



b. Grant `777` permissions to the uploaded `.pls` file.

In your SFTP client, right-click the `.pls` file, click **Properties**, and set the **Octal** permission value to `0777`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
777 permissions are required for the Integration Repository parser to process the file. Without this step, the command in the next substep fails.

c. Log in to PuTTY of your Oracle EBS server and execute the Integration Repository Parser.

i. To generate an iLDT (*.ildt) file, execute the Integration Repository Parser using this syntax:

```
$IAS_ORACLE_HOME/perl/bin/perl $FND_TOP/bin/irep_parser.pl
 -g -v -username=sysadmin
 gl:patch/115/sql:xxsn_gl_integration_pkg.pls:12.0=$GL_TOP/p
atch/115/sql/xxsn_gl_integration_pkg.pls
```

ii. If you aren't generating the .ildt file for the `xxsn_gl_integration_pkg.pls` file, replace `gl` and `$GL_TOP` with the product code and `$TOP` variable for the required module. For the correct values per module, see the module package reference table in the previous step.

iii. If you aren't generating the .ildt file for the `xxsn_gl_integration_pkg.pls` file, replace `xxsn_gl_integration_pkg.pls` with the required package name.

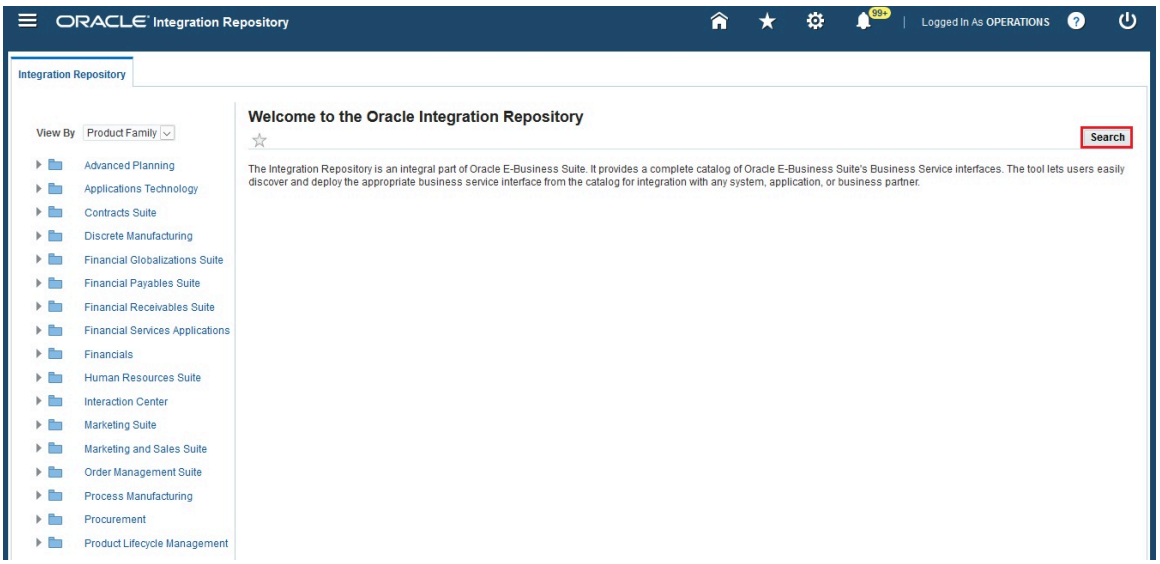
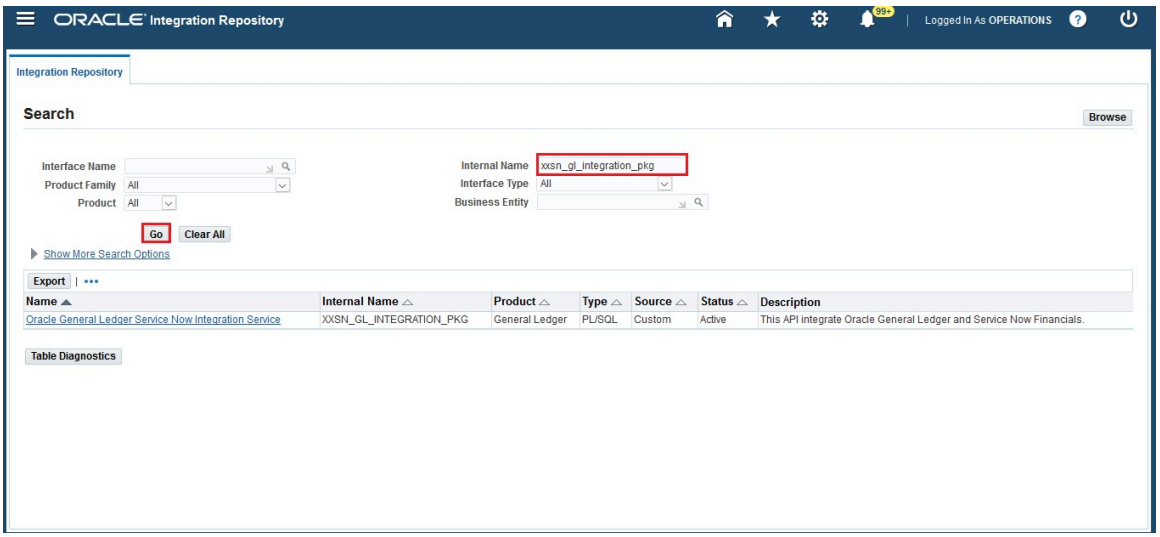
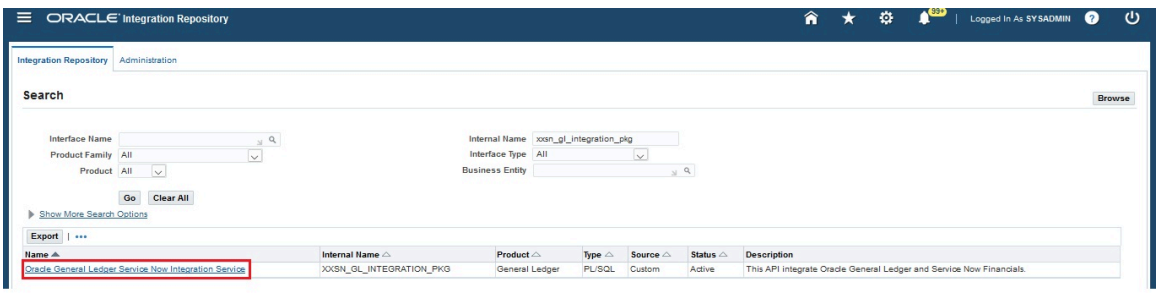
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



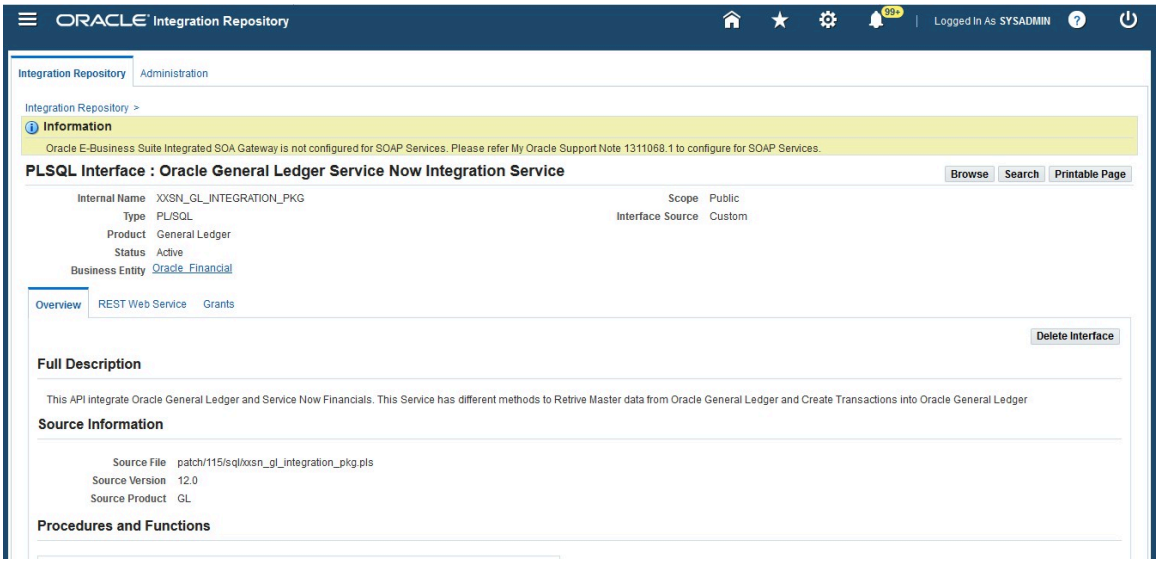
g. Search for the web service with the internal name, `xxsn_gl_integration_pkg`.





h. Click the link in the search result to access the list of available methods in the interface package.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
In the PL/SQL interface type, both SOAP and REST web services are available. However, this procedure focuses on the REST web service.

i. Click the **REST Web Service** tab.

   i. In the **Service Alias** field, enter the service alias for your module. For the correct alias value per module, see the module package reference table in the previous step.

      Note:
      The service alias must exactly match the value in the **Service Alias** column of the module package reference table. Aliases are case-sensitive.

   ii. Click **Deploy**.

j. View the General Ledger Integration service method by clicking the **REST Web Service** tab.

6. Create a credential record for the Oracle EBS spoke.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`.

   c. Select **Basic Auth Credentials**.

   d. On the form, fill these values.

Field	Description
Name	Name to uniquely identify the credential record. For example, `OEBS Cred`.
User name	User name to log in to the Oracle EBS instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Password to log in to the Oracle EBS instance.
Active	Option to actively use the credential record.

e. Click **Submit**.

7. Create a connection record for the Oracle EBS spoke.

a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

b. Open the record for the Oracle EBS spoke.

c. From the **Connections** tab, click **New**.

d. On the form, fill these values.

Field	Description
Name	Name to uniquely identify the connection record. For example, 0EBS Conn.
Credential	Credential record you created for the Oracle EBS spoke.
Connection URL	Connection URL to connect to your Oracle EBS instance.

e. Click **Submit**.

Oracle Financial Cloud Spoke

Manage invoices, ledger, and records in an Oracle Financial Cloud instance from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle Financial Cloud spoke v1.5 is the latest version.

Supported versions

This spoke was built for Oracle Financial Cloud API version 11.13.18.05.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Utility Actions Spoke
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Oracle Financial Cloud spoke provides sample flows to demonstrate automating the Oracle Financial Cloud tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Get Accounted AP Invoices	Retrieves information about the accounted AP invoices. This flow triggers the Get Accounted AP Invoice subflow and includes the Look up Record Details action.
Import Journals	Imports the journal records from your ServiceNow instance to Oracle Financial Cloud system. To import the journal records, you must create the required records in the GL Interface module.
Import AP Invoices	Imports accounts payable invoice line and accounts payable invoice records from your ServiceNow instance to Oracle Financial Cloud system. To import the accounts payable invoice line and accounts payable invoice records, you must create the required records in the AP Invoices Interface and AP Invoices Lines Interface modules respectively.

Note:
The success message displayed after flow executions during the data imports from ServiceNow instance to Oracle Financial Cloud system, only indicates that data has been successfully pushed to Oracle Financial Cloud system. You must verify that the data import is successfully completed by accessing the Oracle Financial Cloud system.

Spoke subflows

The Oracle Financial Cloud spoke provides sample subflow, Get Accounted AP Invoice, to demonstrate automating Oracle Financial Cloud tasks. The subflow retrieves the accounted AP

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

invoice records and is used in the Get Accounted AP Invoices flow. To customize the sample subflow, copy it to a new application scope.

Spoke actions

The Oracle Financial Cloud spoke provides actions to automate Oracle Financial Cloud tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
All Record Management	Create Record	Creates a record related to the specified object in Oracle Financial Cloud.
	Delete Record	Deletes a record related to the specified object in Oracle Financial Cloud.
	Look up Record Details	Retrieves record details in an object.
	Look up Record Details By ID	Retrieves details of the specified record in an object.
	Look up Records Stream	Retrieves a list of records related to the specified record or object from Oracle Financial Cloud.
	Update Record	Updates the record related to the specified object in Oracle Financial Cloud.
AP Invoice Management	Import AP Invoices	Imports the actionable payment invoices.
	Look up AP Invoice Lines	Retrieves information about the accounts payable invoice lines.
	Look up AP Invoices	Retrieves information about the actionable payment invoices.
Currency Conversion	Look up Currency Rates	Retrieves information about the currency rates.
General Ledger	Get Code Combinations Details	Retrieves information about the code combinations.
	Get Subledger Balances	Retrieves information about the subledger balances.
	Import Journals	Imports details about the journals.
	Look up Ledger Balance	Retrieves information about the ledger balances.
Invoice Management	Look up Invoice Payments Status	Retrieves the status of invoice payment for the specified invoice ID from Oracle Financial Cloud.
	Update Invoice Payment Status	Updates the status of an existing invoice payment in Oracle Financial Cloud.
Metadata Retrieval	Get Object Data for Oracle Cloud Financials	Retrieves the object metadata for the specified object from Oracle Financials Cloud.
	Get Objects (Metadata)	Retrieves the list of all records or objects from Oracle Financial Cloud.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Object Schema (Metadata)	Retrieves all schema or fields related data from Oracle Financial Cloud for the specified object.
	Get Dynamic Response Schema (Metadata)	Retrieves all output schema or fields related data from Oracle Financial Cloud for the specified object.
Primary Data Management	Look up HR Locations Stream	Retrieve the list of all locations with the object name "locations".
	Look up Cost Centers Stream	Retrieves the details of the Cost Centers from the Oracle Financial Cloud.
Purchase Order Management	Create Purchase Order and PO Lines	Creates a purchase order and adds associated purchase order lines in Oracle Financial Cloud.
	Update Purchase Order and PO Lines	Updates an existing purchase order and its associated purchase order lines in Oracle Financial Cloud.
Supplier Record Management	Look up Suppliers	Retrieves information about the suppliers.

Spoke modules

The Oracle Financial Cloud spoke adds the Oracle Financial Cloud application to your instance and includes these modules:

Module	Description
Accounted AP Invoices	Displays information about the accounted AP invoices. This information is retrieved when the Get Accounted AP Invoices flow is triggered.
AP Invoices Interface	Displays the accounts payable invoice records. Admin must create these records in the ServiceNow instance in this module. The Import AP Invoices flow imports these invoices from your ServiceNow instance to Oracle Financial Cloud system.
AP Invoices Lines Interface	Displays the accounts payable invoice line records. Admin must create these records in the ServiceNow instance in this module. The Import AP Invoices flow imports these invoices from your ServiceNow instance to Oracle Financial Cloud system.
BI Report Paths	Displays information about the folder path where the required report is saved. The Get Subledger Balances and Get Code Combinations Details actions retrieve the subledger balances from these folder paths. Admin must create two records for the two actions and specify the folder path in this module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
	Get Currency Rates	Displays information about the currency rates. The currency rates are retrieved from the remote table, Get Currency Rates [sn_ofc_spoke_st_get_currency_rates]. You can use the remote table as reference and create another remote table for currency rates as per your requirement.
GL Interface	Displays the journal records. The Import Journals flow imports these records from your ServiceNow instance to Oracle Financial Cloud system. Admin must create the required journal records in this module.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential records are available along with the spoke. You must configure these alias record to use the spoke. See Set up the Oracle Financial Cloud spoke for more information.

Note:
Depending on the Oracle Financial Cloud policies and account settings, you may have to change or refresh the credentials in your credential record periodically.

For information about setting up the spoke, see Set up the Oracle Financial Cloud spoke.

Set up the Oracle Financial Cloud spoke

Integrate the ServiceNow instance and Oracle Financial Cloud instance by using the basic auth credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Oracle Financial Cloud spoke.
- Role required: admin.

Configure a connection for the Oracle Financial Cloud spoke

Configure a connection to authenticate ServiceNow requests in an Oracle Financial Cloud spoke.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the **Connections** tab.
3. Configure an **OracleCloudFinancials** connection.

   a. Search for the **OracleCloudFinancials** connection alias.
   There are two options.

Option	Description
View Details	To configure the default connection and credential alias record shipped with the spoke.
Add Connection	To manage more than one spoke connection records. For more information, see Supporting multiple connections

   b. Select **View Details**.

   c. Configure, edit, or add a connection.

   - Select **Configure** or **Edit** to set up an existing connection.
   - Select **Add Connection** to create and configure a new connection.

   d. On the configuration form, fill in the fields.

Field	Value
Connection Name	`OracleCloudFinancials`.
Connection URL	The instance URL in this format:`<provider-domain-name>.fa.ocs.oraclecloud.com/`.
User name	The Oracle account user name.
Password	The Oracle admin account password.

   e. Confirm your configuration.

   For an existing connection, select **Edit Connection**. For a new connection, select **Create Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Repeat step 3 to configure **OrancleCloudFinancialsReport** with the following information:

Field	Value
Connection Name	`OracleCloudFinancialsReport`.
Connection URL	The instance URL in this format: `<provider-domain-name>.fa.ocs.oraclecloud.com/xmlpserver/services/v2/ReportService`.
User name	The Oracle account user name.
Password	The Oracle admin account password.

What to do next

Create the necessary records in the following relevant spoke modules, or use the available spoke actions directly:

- AP Invoices Interface
- AP Invoices Lines Interface
- BI Report Paths
- GL Interface

Oracle HCM Cloud Spoke

Manage work structures and human capital in Oracle HCM Cloud instance from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle HCM Cloud spoke v4.4.0 is the latest version.

Supported versions

This spoke was built for Oracle HCM Cloud API version 11.13.18.05, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

Oracle HCM Cloud subscription.

Spoke dependencies

If you're having trouble installing the app, verify that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- Large JSON and XML Payload Builder API (com.glide.streaming_builder)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Oracle HCM Cloud spoke provides sample subflows to demonstrate automating Oracle HCM Cloud tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Get Active Department	Retrieves the active department information by calling the **Look up Departments** action.

Spoke actions

The Oracle HCM Cloud spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
All Record Management	Look up Record Details	Retrieves all record details.
	Look up Time Record Details	Retrieves the employee's time sheet for the specified time.
Absence Management	Look up Time Off Balance	Retrieves the time-off details of an employee.
	Look up Absence Type	Retrieves the absence type for the specified employee.
	Look up Absence Type Reason	Retrieves absence type reasons for all the available absence types.
	Request Time Off	Request time off for the specified employee.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Employee Information Management	Update Personal Details	Updates the employee details, such as the email address, phone number, date of birth, or blood type.
Employee Document Management	Get Employee Documents by Employee ID	Retrieves the documents of an employee by the employee ID.
	Get Employee Documents Attachments	Retrieves the attachments of an employee's document.
Benefits Management	Look up Benefit Enrollments	Retrieves the benefit enrollment details of an employee.
Compensation Management	Get Total Rewards	Retrieves the total rewards details of an employee.
	Look up Individual Compensation	Retrieves the individual compensation details of an employee.
Employee Atom Feeds	Look up Atom Feeds Employees Assignments Stream	Retrieves the changes made in employee assignments.
	Look up Atom Feeds Employees New hire Stream	Retrieves information about the employees who were recently hired.
	Look up Atom Feeds Employees Termination Stream	Retrieves information about the terminated employees.
	Look up Atom Feeds Employees Update Stream	Retrieves information about the employee updates.
Feedback Management	Look up Feedback	Retrieves the feedback received for the employees.
Goals Management	Look up Goals	Retrieves the goals of an employee.
Human Capital Management	Look up Departments Stream	Retrieves information about the departments.
	Look up Employee Assignments	Retrieves information about the employees assignments.
	Look up Employees Stream	Retrieves information about the employees.
	Get User Holiday Calendar	Retrieves information about the holidays for the specified year in the specified country.
	Look up Jobs Stream	Retrieves information about the jobs.
	Look up Locations Stream	Retrieves information about the locations.
	Look up Organizations Stream	Retrieves a list of organizations from Oracle HCM.
	Look up Positions Stream	Retrieves information about the positions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Workers Stream	Retrieves information about the workers.
	Look up Active and Inactive Workers Stream	Retrieves information about the active and inactive workers.
Job Management	Look up Job Application Attachment	Retrieves the job application attachments.
	Look up Job Applications Stream	Retrieves a list of job applications fromOracle HCM.
	Look up Recruiting Candidates	Retrieves the details of a recruiting candidate.
	Look up Recruiting Job Requisitions Stream	Retrieves a list of recruiting job requisitions.
Metadata Retrieval	Get Oracle Cloud HCM Array.Object Schema	Retrieves information about the Oracle Cloud HCM array object schema.
	Get Oracle Cloud HCM Object Metadata	Retrieves information about the Oracle Cloud HCM object metadata.
	Get Oracle Cloud HCM Objects	Retrieves information from Oracle Cloud HCM Objects.
Payroll Management	Look up External Bank Accounts	Retrieves external bank account information for employees.
	Look up Payroll	Retrieves payroll information of an employee.
	Look up Legislative Data Group	Retrieves legislative data group details for an employee.
	Look up Payslip	Retrieves payslip details for an employee.
	Look up Payroll Elements	Retrieves payroll element information of employees.
Workstructures Atom Feeds	Look up Atom Feeds Jobs Stream	Retrieves the changes made in jobs.
	Look up Atom Feeds Locations Stream	Retrieves the changes made in locations.
	Look up Atom Feeds Organizations Stream	Retrieves the changes made in organizations.
	Look up Atom Feeds Positions Stream	Retrieves the changes made in positions.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Oracle HCM Cloud feedback management AI agent	Retrieves and manages feedback that the employees received.
Oracle HCM Cloud goals management AI agent	Retrieves goals and provide relevant actionable information to enable users manage and track their objectives.
Oracle HCM Cloud human capital management AI agent	Retrieves employee data, organizational structures, and other HR-related tasks by leveraging predefined actions.
Oracle HCM Cloud jobs management AI agent	Retrieves and manages data related to recruiting, job applications, and candidate information.
Oracle HCM Cloud payroll management AI agent	Retrieves, processes, and manages payroll-related data.
Oracle HCM Cloud compensation management AI agent	Retrieves and manages compensation-related data. Also, provides access to critical information and insights.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Available sample agentic workflows

Install Now Assist for Integration Hub and start using the available sample agentic workflows and AI agents. For more information, see Now Assist for Integration Hub.

In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. Use the available sample agentic workflow in AI Agent Studio so that AI agents can coordinate to solve complex problems. To modify the available sample agentic workflow as per your requirement, see Modify an agentic workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample agentic workflow	Description	AI agents used	Always ON by default?
Fetch Individual Compensation and Payslip and Total Rewards	Retrieves and consolidates an employee's compensation data from Oracle HCM, including payslips, salary details, and total rewards information. It orchestrates multiple Oracle HCM actions and presents the results as a clear, HR#friendly summary that supports payroll review, employee inquiries, and compensation analysis.	• Oracle HCM Cloud payroll management AI agent • Oracle HCM Cloud compensation management AI agent	Yes
Fetch Goals and Performance Feedback	Retrieves employee goals and performance feedback from Oracle HCM and presents the information as a consolidated goals and performance summary. It helps HR teams and managers quickly review progress, feedback, and performance context in a clear format.	• Oracle HCM Cloud goals management AI agent • Oracle HCM Cloud feedback management AI agent	Yes

Spoke module

The Oracle HCM Cloud spoke adds the Oracle HCM Cloud application to your instance and includes the modules in the following table.

Module	Description
BI Report Paths	Lists the BI report paths for the actions.
Look up Holiday Calendars	Lists the holiday calendars.
New Positions	Lists the available new positions.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Configure the Oracle HCM Cloud spoke connection record.

Set up the Oracle HCM Cloud spoke

Set up the Oracle HCM spoke to integrate your ServiceNow instance with the Oracle REST APIs.

Before you begin

- Request an Integration Hub subscription.
- Activate the Oracle HCM Cloud spoke.
- Access to the Oracle HCM tenant site.
- Ensure that OpenSSL is installed on your machine.
- Role required: admin.

About this task

Oracle REST APIs mandate a JWT authentication of requests that your ServiceNow instance makes. To set up your Oracle HCM Cloud spoke, you must enable your ServiceNow instance to handle JWT authentication, configure the connection record, and add the roles necessary to execute the Oracle HCM Cloud spoke actions.

Generate the X.509 key pair and fingerprints on your Mac machine

Generate the X.509 key pair and its fingerprint on your Mac machine that you upload to the Oracle HCM tenant.

Before you begin

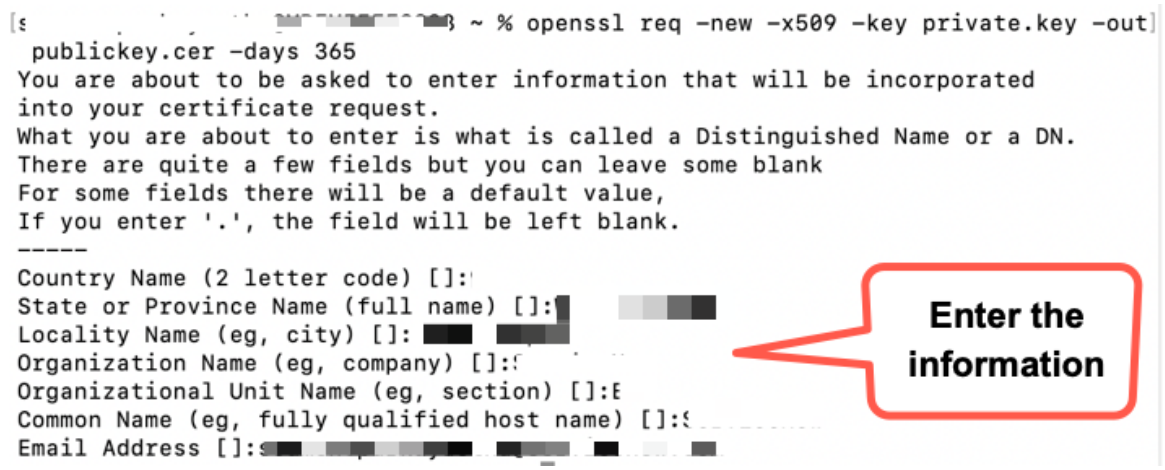
Role required: admin

Ensure that OpenSSL is installed. To verify that OpenSSL is installed, execute the command `openssl version` on the terminal.

Procedure

1. Open the terminal.
2. To generate the private key, run the command `openssl genrsa -out private.key 2048`.
   The private key is generated.
   ```
   Generating RSA private key, 2048 bit long modulus
   .....+++++
   ..........+++++
   e is 65537 (0x10001)
   ```
3. To generate the public key, run the command `openssl req -new -x509 -key private.key -out publickey.cer -days 365`.
4. Enter the information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The public key is generated.

5. To generate the fingerprint, execute the command `openssl x509 -sha1 -in publickey.cer -noout -fingerprint`.
   The fingerprint is generated in the form of a hexadecimal value.
6. Convert the hexadecimal value to a Base64 value.
7. Copy the Base64 value and store in a secure place.
   You need the Base64 value when you configure the connections and credential record on your ServiceNow instance.

Generate X.509 key pair and fingerprints on your Windows machine

Generate the X.509 key pair and its fingerprint on your Windows machine that you upload to the Oracle HCM tenant.

Before you begin

Role required: admin

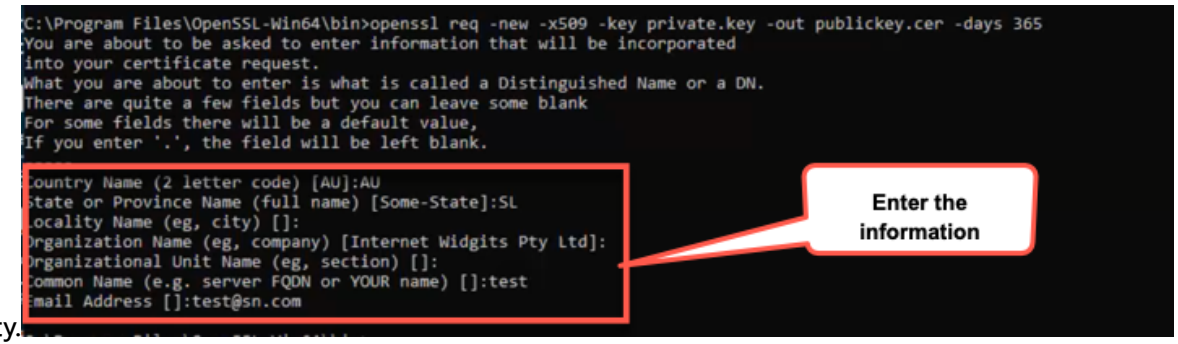
Ensure that OpenSSL is installed.

Procedure

1. On your Windows machine, copy the path to the `bin` folder under the `OpenSSL-Win<bit>` folder.
2. Run the Command Prompt as an administrator.
3. On the prompt, use the `cd` command to change the current directory to the `bin` folder.
4. To generate the private key, run the command `openssl genrsa -out private.key 2048`.
   The private is generated under the bin folder.
5. To generate the public key, run the command `openssl req -new -x509 -key private.key -out publickey.cer -days 365`.
6. Enter the information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can choose to leave one or more fields empty.



The public key is generated in the bin folder.

7. To generate the fingerprint, run the command `openssl x509 -sha1 -in publickey.cer -noout -fingerprint`.
   The fingerprint is generated in the form of a hexadecimal value.
8. Convert the hexadecimal value to a Base64 value.
9. Copy the Base64 value and store in a secure place.
   You need the Base64 value when you configure the connections and credential records on your ServiceNow instance.

Create a trusted issuer

Create a trusted issuer on the Oracle HCM tenant site that certifies the authenticity of the public certificate that you had generated on your Mac or Windows machine.

Before you begin

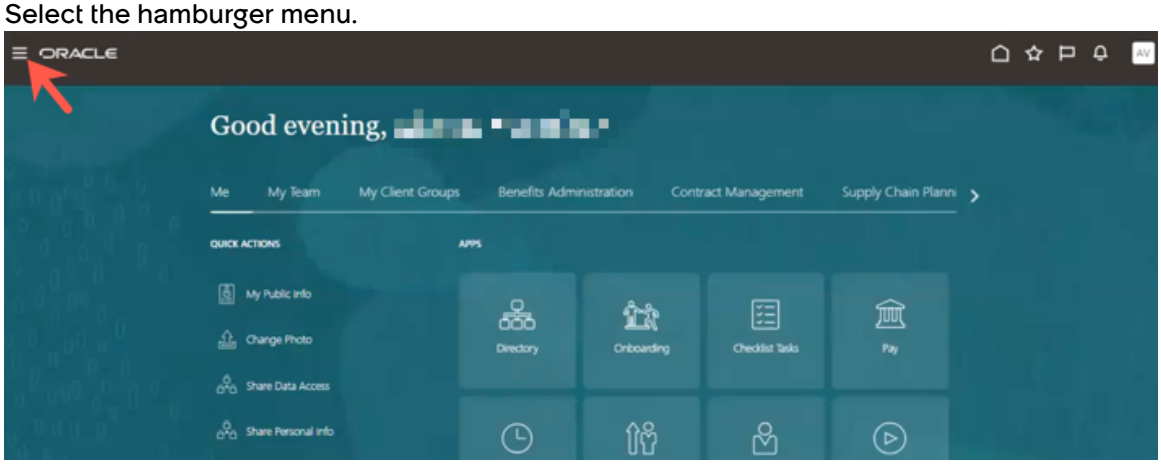
Role required: admin

You've generated the private and public certificates.

Access to the Oracle HCM tenant site.

Procedure

1. Log in to the Oracle HCM tenant site.
2. Select the hamburger menu.



3. Navigate to **Tools** > **Security Console**.
4. On the left panel, select API Authentication.
5. Select **Create Oracle API Authentication Provider**.
6. Select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. In the Trusted Issuer field, enter a custom name for the trusted issuer.

   Tip:
   Copy and save the name of the trusted issuer at a secured place.

8. In the Token Type field, select **JWT**.
9. Select **Save and Close**.
10. On the left panel, select **Inbound API Authentication Public Certificates**.
11. Select **Add New Certificate**.
12. In the Certificate Alias field, enter the name of the trusted issuer that you had created.
13. In the Import Public Certificate field, select **Choose File** to select and upload the public certificate you had generated.
14. Select **Save**.

Generate a Java KeyStore file

Convert the public certificate that you had generated to a Java KeyStore file on your machine because your ServiceNow instance supports a Java KeyStore file. After generating, you must upload the file to your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Open the command prompt on your machine.
2. Use the `cd` command to change the directory to the location where you had generated the public certificate.
3. On the command prompt, execute the command `openssl pkcs12 -export -in publickey.cer -inkey private.key -out <your-file-name>.p12 -name "<your-custom-name>”`.
4. In the Enter Export Password prompt, create an export password.
5. In the Verifying - Enter Export Password prompt, reenter the export password you had created. The P12 file is created.
6. Copy the P12 file to the respective JDK/bin folder of your machine.

   Note:
   Depending on the OS of your machine, the location of the JDK/bin folder might vary.

7. Copy the path to the JDK/bin folder.
8. In the command prompt, use the `cd` command to change the current directory to the JDK/bin folder.
9. To convert the P12 file to a Java KeyStore file, execute the command `keytool -importkeystore -srckeystore <P12-file-name>.p12 -srcstoretype pkcs12 -destkeystore <Java-KeyStore-filename>.jks`.
10. In the Enter destination keystore password prompt, create a password.
11. In the Re-enter new password prompt, reenter the destination keystore password you had created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. In the Enter source keystore password prompt, enter the same password that you had created to generate the P12 file.
The Java KeyStore file is created in the JDK/bin location.

Upload Java KeyStore certificate to ServiceNow instance

Upload the Java KeyStore certificate to your ServiceNow instance to enable the creation of connections and credentials.

Before you begin
Role required: admin

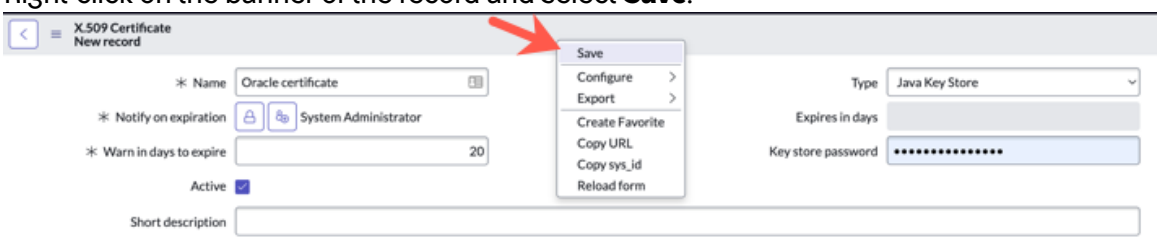
Procedure

1. On your ServiceNow instance, navigate to the X.509 certificate list by entering `sys_certificate.LIST` in the navigation filter.
2. Select **New**.
3. Fill the form.

New record

Field	Description
Name	Custom name of the certificate.
Type	Type of certificate. Select Java Key Store.
Notify on expiration	The role that should be notified when the certificate expires.
Expires in days	The validity of the certificate.
Warn in days to expire	The number of days before which the role receives a warning of expiry.
Key store password	Key store password that you had created.
Active	Indicates that the Java Key Store certificate is active.
Short description	Short description of the record.

4. Right-click on the banner of the record and select **Save**.

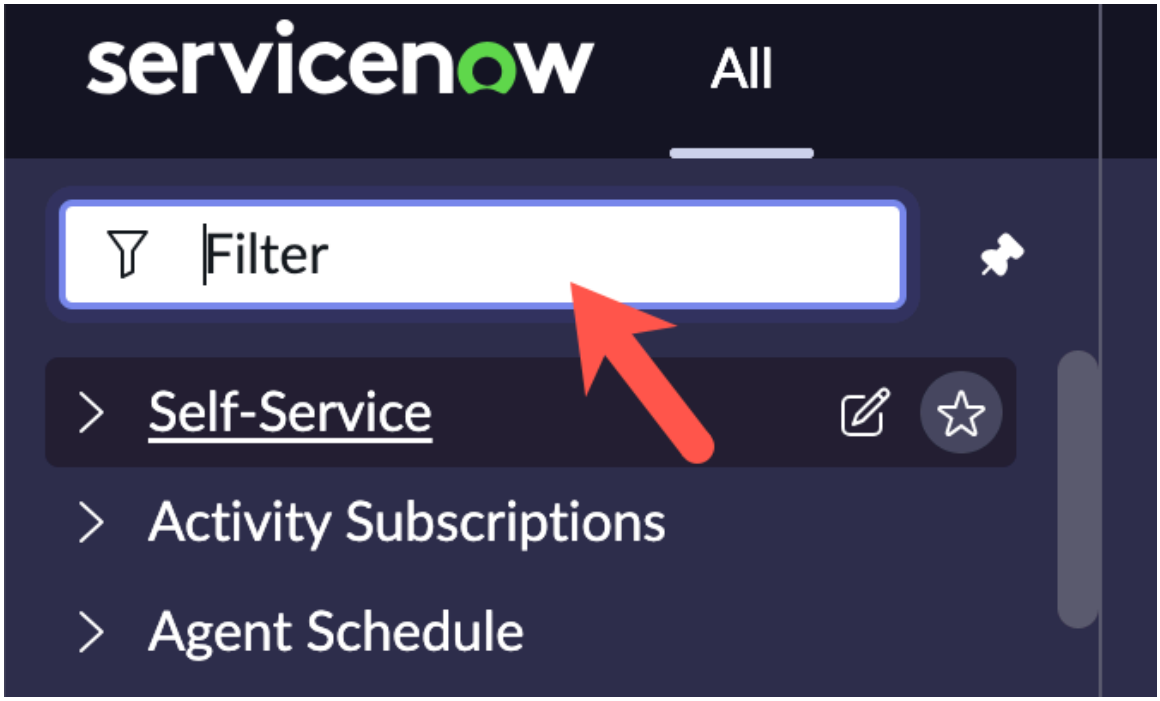


5. Select the **Manage Attachments** icon ( ) to attach the Java KeyStore file.

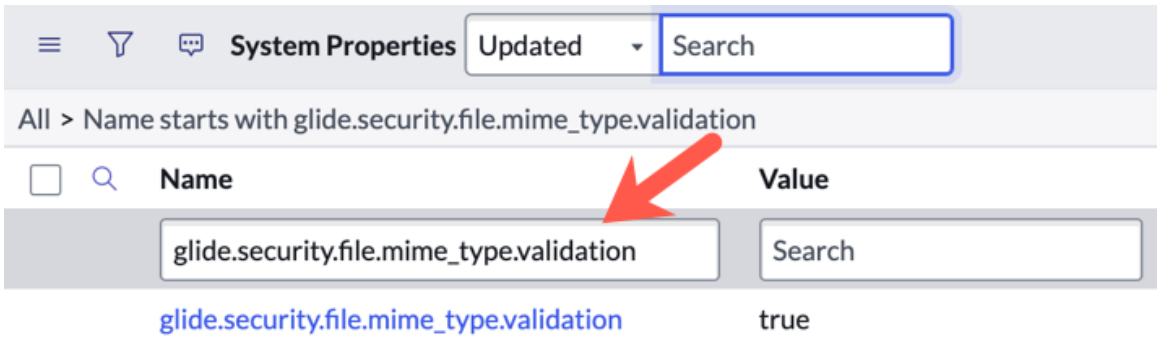
Trouble?
If your instance displays an error of the type "<file-name>.jks File type not permitted or mime type does not match the file content", complete the steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the filter field of your instance, enter `sys_properties.LIST` and press **Enter**.



b. In the Name field of the System Properties page, enter `glide.security.file.mime_type.validation` and press **Enter**.



c. Select the system property glide.security.file.mime_type.validation.

d. In the Value field, update the value to `False`.

e. Right-click on the banner of the form and select **Save**.

6. Select **Save**.

7. To validate the certificate, select the Validate Stores/Certificates link.
You've uploaded the Java Key Store certificate to your ServiceNow instance.

Configure the Oracle HCM Cloud spoke connection record

Set up an outbound integration between the ServiceNow instance and the Oracle HCM instances by creating connection and credential records.

Before you begin

- Request an Integration Hub subscription.
- Activate the Oracle HCM Cloud spoke spoke plugin on the ServiceNow instance.
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Set the connection and credential for the Oracle Cloud HCM instance.
   a. Select Connections.
   b. Turn on the Outbound tab.
   c. In the Search all connections field, enter `Oracle HCM`.
   d. On the OracleCloudHCM tile, select **View Details**.
   e. Select **Configure**.
   f. Fill the form.

Oracle HCM Cloud connection and credential configuration form

Field	Description
Name	Name of the connection. **Note:** For the first connection, the default name is OracleCloudHCM that is read-only. However, for all the connection records you set up after the first record, you can provide a custom name.
Connection URL	URL to connect to the Oracle HCM tenant.
Version	Version of the Oracle API.
JWT Provider Name	Name of the JWT provider.
JWT Keys Name	Name of the JWT key.
Signing Keystore	Name of the key store that you had created. To learn how to create a key store, see Upload Java KeyStore certificate to ServiceNow instance.
Signing Key Password	Password that you had created while creating the Java KeyStore file.
Issuer (iss) Claim value	The value that you had configured while creating a trusted issuer. For more information, see Create a trusted issuer.
Subject (sub) Claim value	User name that has access to the REST API endpoint.
Fingerprint/x5t value	Base 64 value that you had obtained while generating the fingerprint.

   g. Select **Configure Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To update the default expiry time of a token, do the steps.

a. In the filter field of your instance, enter `sys_properties.LIST` and press **Enter**.

b. In the Name field of the System Properties page, enter `jwt.provider.expiry.interval.limit` and press **Enter**.

c. On the jwt.provider.expiry.interval.limit page, update the value in the Value field.

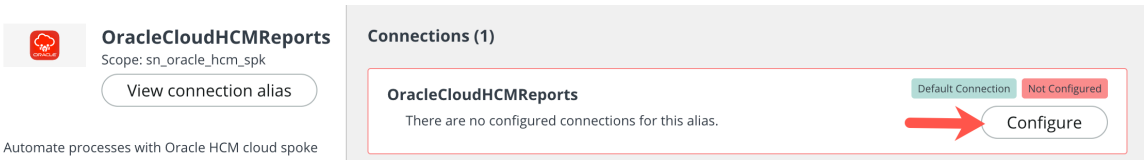
d. Navigate to **All** > **JWT Providers**.

e. Set the same expiry value in seconds in the field Expiry Interval (sec).

3. Set the connection and credential for the Oracle Cloud HCM Reports instance.

a. On the OracleCloudHCMReports tile, select **View Details**.

b. Select **Configure**.



c. In the form, fill the details.

Oracle Cloud HCM Reports Connection record form

Field	Description
Connection Name	Name of the connection. **Note:** For the first connection, the default name is OracleCloudHCMReports that is read-only. However, for all the connection records you set up after the first record, you can provide a custom name.
Connection URL	URL to connect to the Oracle HCM Cloud Reports instance. The format is `https://<provider-domain-name>.com`
User name	User name to log in to your target host on which Oracle Cloud HCM Reports is installed.
Password	Password to authenticate and log in to your target host on which Oracle Cloud HCM Reports is installed.

d. Select **Configure Connection**.

Create roles in the Oracle HCM Cloud

Create roles to execute all actions in the Oracle HCM spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Access to the Oracle HCM Cloud tenant with the IT Security Manager role.

About this task

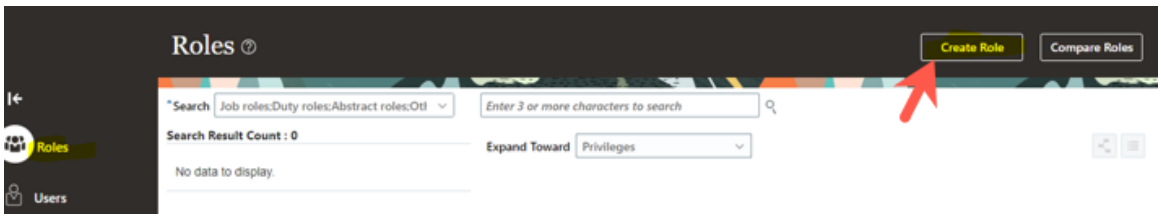
You need both seeded and custom roles in the Oracle HCM Cloud. The table provides the roles that you need.

Oracle HCM Cloud roles

Role Name	Role Code
Application Administrator	ORA_FND_APPLICATION_ADMINISTRATOR_JOB
Application Implementation Administrator	ORA_ASM_APPLICATION_IMPLEMENTATION_ADMIN_ABSTRA
Application Implementation Consultant	ORA_ASM_APPLICATION_IMPLEMENTATION_CONSULTANT_J
Application Implementation Manager	ORA_ASM_APPLICATION_IMPLEMENTATION_MANAGER_JOE
Employee_SN	PER_EMPLOYEE_ABSTRACT_SN
Human Capital Management Integration Specialist_SN	HUMAN_CAPITAL_MANAGEMENT_INTEGRATION_SPECIALIST
Human Resource Analyst_ViewAll	PER_HUMAN_RESOURCE_ANALYST_JOB_VIEWALL
Human Resource Manager_ViewAll	PER_HUMAN_RESOURCE_MANAGER_JOB_VIEWALL
Human Resource Specialist_ViewAll	PER_HUMAN_RESOURCE_SPECIALIST_JOB_VIEWALL
Line Manager_SN	PER_LINE_MANAGER_ABSTRACT_CUSTOM
Product Management VP	ORA_ACE_PRODUCT_MANAGEMENT_VP_JOB
Product Manager	ORA_EGP_PRODUCT_MANAGER_JOB
Recruiter	ORA_IRC_RECRUITER_JOB
Recruiting Administrator	ORA_PER_RECRUITING_ADMINISTRATOR_JOB
Recruiting Agent	ORA_IRC_RECRUITING_AGENT_JOB
Recruiting Manager	ORA_IRC_RECRUITING_MANAGER_JOB
SN_Access Opportunity Marketplace	SN_Access_Opportunity_Marketplace

Procedure

1. Log in to the Oracle HCM Cloud.
2. On the left panel, navigate to **Tools** > **Security Console**.
3. Select Roles.
4. Select **Create Role**.

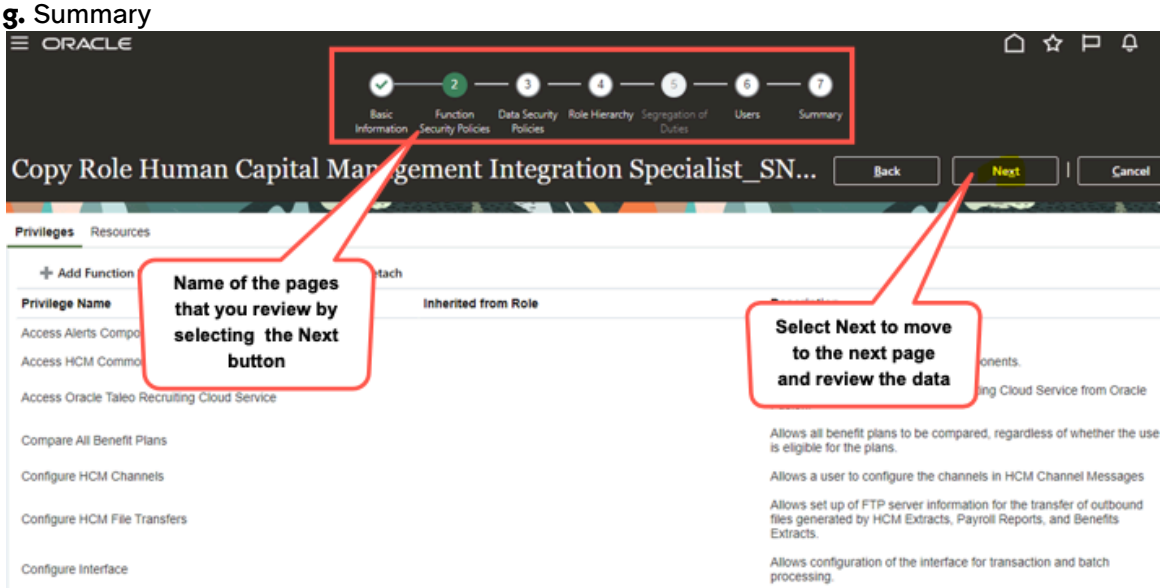


5. In the Search field, enter the role name and press **Enter**.
   The search results display the role name as one of the results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the Actions button and select **Copy Role**.

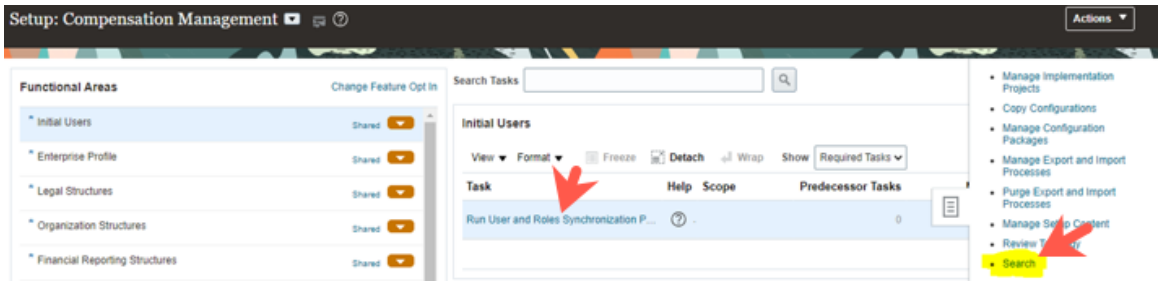
7. In the Copy Options window, select **Copy Role**.
8. In the Role Name field, enter the role name and select **Next**.
9. To move to the next pages and review the information shown, select **Next** on the subsequent pages.
   Page information
   a. Basic information
   b. Function Security Policies
   c. Data Security Policies
   d. Role Hierarchy
   e. Segregation of Duties
   f. Users
   g. Summary



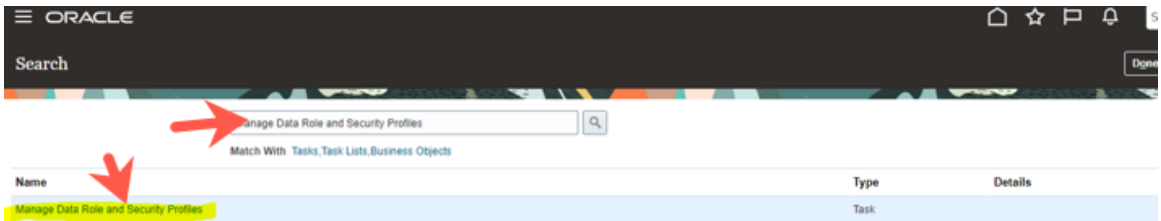
10. Select **Submit and Close**.
11. Select your profile icon and then select Settings and Actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

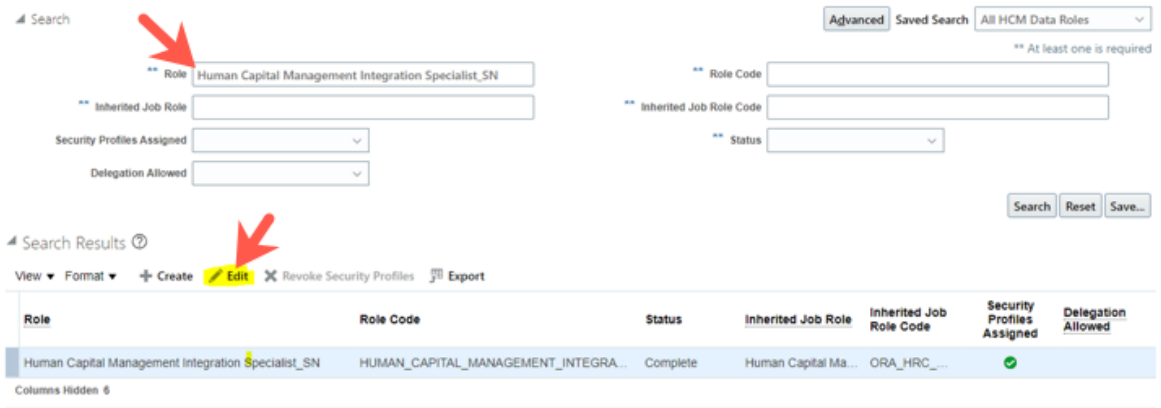
12. Select **Setup and Maintenance**.
13. Select the task and then select Search.



14. In the Search field, enter `Manage Data Role and Security Profiles` and press **Enter**.

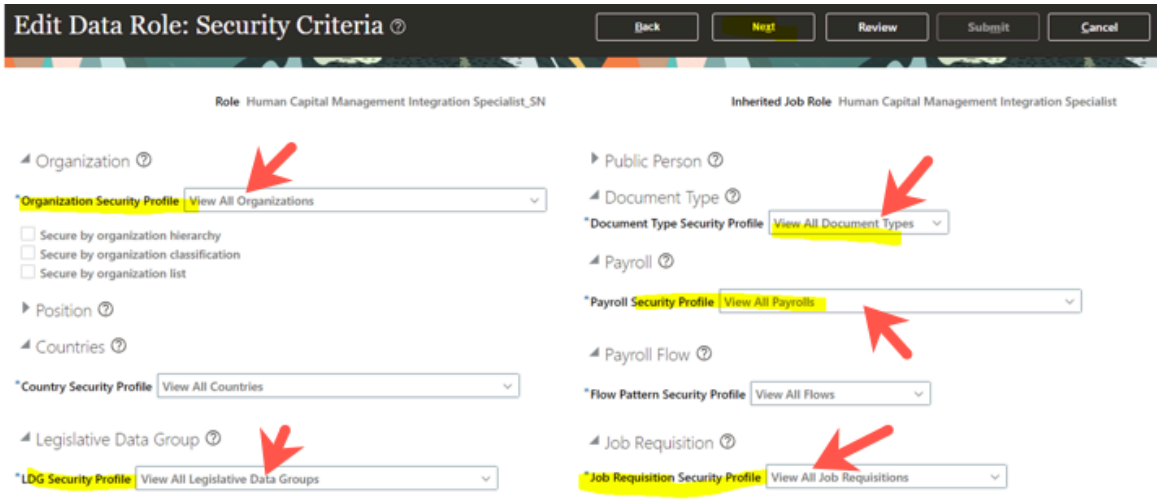


15. In the Role field, enter the role name and select **Edit**.



16. Select **Next**.
17. Provide inputs for the required fields and select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



18. To navigate through the next few pages, select **Next** on the subsequent pages.
19. Select **Submit**.
20. Assign the role to the user.

    a. On the left panel, navigate to **Tools** > **Security Console**.

    b. On the left panel, select Users.

    c. In the User Name field, enter a user name and select the search icon.
    The user name and its details are displayed.

    d. Select the user name link.

    e. On the Edit User Account page, select **Edit**.

    f. On the Edit User Account page, select **Add Role**.

    g. In the Search field, ensure that the Roles option is selected and then enter the role name.

    h. Select **Add Role Membership**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Select **Done**.

j. Select **Save and Close**.

Create BI report paths for Oracle HCM Cloud spoke

Create BI reports paths to specify the folder paths where the reports are saved.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Oracle HCM Cloud** > **BI Report Paths**.
2. Click **New**.
3. On the form, fill in the fields:

Field	Description
Report Name	Name of the BI report.
Action Name	Name of the action.
Folder Path	Folder path of Oracle HCM Cloud.

Sample BI Report Paths

Report Name	Action Name	Folder Path
Holiday Calendar Report.xdo	Look up Holiday Calendar	/Custom/Human Capital Management/
Legislativedatagroup Report.xdo	Get Legislative Group ID	/Custom/Human Capital Management/
USOnlinePayslip.xdo	Look up Payroll	/Human Capital Management/Payroll/ Payment Distribution/US/
Element Screen Entry Values.xdo	Look up Payroll Elements	/Custom/Human Capital Management/
Individual Compensation Report.xdo	Look up Individual Compensation	/Custom/Human Capital Management/

Note:
Report Name and Folder Path may vary based on the Oracle HCM Cloud instance.

Oracle NetSuite Spoke

Automate create, read, update, and delete (CRUD) record management operations in Oracle NetSuite from your ServiceNow instance by using the Oracle NetSuite spoke. It provides preconfigured actions, subflows, connection and credential aliases, and scripted REST APIs to do these operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle NetSuite spoke v1.0.3 is the latest version.

Supported versions

This spoke was built for Oracle NetSuite API version 1.0, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.object)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Oracle NetSuite spoke provides sample subflows to demonstrate automating Oracle NetSuite tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Get Record Details (Inbound)	Triggers the 'Look up Record Details' action. The output of the action is logged for reference. You can replace the logging step with custom logic, such as creating records in a desired table, depending on the requirement to store record details.
Create Purchase Order (Outbound)	Triggers the 'Create Record' action of the Oracle NetSuite Spoke. Required data is provided through subflow inputs, and all fields are structured exactly as per the API requirements. All subflow inputs are passed directly to the action, except for one: the input of type Array of Objects is converted to a string using

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
	the OracleNetsuiteUtils.stringifyArray(array) method before being passed. This method should be used for all Array of Object type inputs.

Spoke actions

The Oracle NetSuite spoke provides actions to automate Oracle NetSuite tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Record Management	Create Record	Creates a record corresponding to an object in Oracle NetSuite. For example, create a new record for the object: “purchaseOrder”.
	Delete Record	Delete a record corresponding to an object in Oracle NetSuite. For example, delete a record for the object: “account”.
	Look up Record Details	Retrieves any type of record details from Oracle NetSuite.
	Update Record	Updates a record corresponding to an object in Oracle NetSuite. For example, update a record for the object: "purchaseOrder".
	Look up Record List Stream	Retrieves the list for a given record or object from Oracle NetSuite. For example, retrieve the list of all purchaseOrder(s).
Metadata Retrieval	Get Objects (Metadata)	Retrieves the list of all records or objects from Oracle NetSuite.
	Get Object Schema (Metadata)	Retrieves all schema or fields related data from Oracle NetSuite for a given object.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Oracle NetSuite Spoke.

Set up Oracle NetSuite Spoke

Set up your ServiceNow instance and Oracle NetSuite application so that they are integrated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate Oracle NetSuite Spoke.
- Role required: admin

Configure OAuth 2.0 in Oracle NetSuite

Configure an OAuth 2.0 profile on Oracle NetSuite that enables integration between it and the ServiceNow instance through the OAuth 2.0 framework.

Before you begin

Role required: admin

Procedure

1. Log in to Oracle NetSuite.
2. Navigate to **Setup** > **Integration** > **Manage Integrations**.
3. Select **New**.
4. Fill the form.

OAuth 2.0 form

Field	Description
Name	Option to enter a unique name for the OAuth integration profile.
Description	Option to enter a description of the OAuth integration profile.
Authorization Code Grant	Option to indicate the flow that the ServiceNow instance will use to access Oracle NetSuite.
Redirect URI	Option to enter the redirect URI of ServiceNow instance in the format: `https://<instancename>.service-now.com/oauth_rediect.do`.
REST Web Services	Option to indicate the scope.

5. Select **Save**.
   The client ID and client secret are generated.
6. Copy and store the client ID and client secret at a secure place.
   You will need the client ID and client secret when you configure the connection and credential alias on your ServiceNow instance.

Upload Update Set

Upload and commit the Update Set to your ServiceNow instance to deploy a script include called OAuthCustomOracleNetsuitGlobal to the ServiceNow instance.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The OAuthCustomOracleNetsuitGlobal script in the Update Set contains methods for Oracle OAuth connections, designed specifically for Oracle NetSuite integration. You can upload and commit the Update Set across ServiceNow instances and enable them to handle Oracle NetSuite integration.

Procedure

1. From the Oracle NetSuite spoke page on ServiceNow Store, download the `OAuthCustomOracleNetsuitGlobal` Update Set from to your local disk.
2. Navigate to **System Update Sets** > **Retrieved Update Sets**.
3. Under Related Links, select Import Update Set from XML.
4. Select **Choose File** and then navigate to the location of the `OAuthCustomOracleNetsuitGlobal` Update Set.
5. Select **Upload**.
6. Select **Commit Update Set**.
   The OAuthCustomOracleNetsuitGlobal script is deployed into the ServiceNow instance.

Configure a connection record for Oracle NetSuite

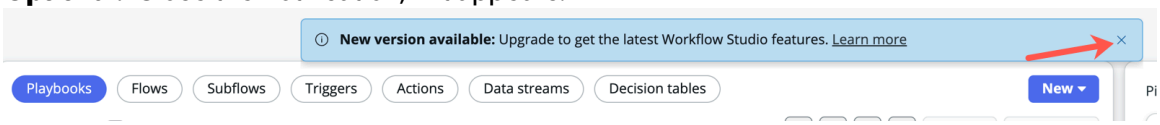
Configure a connection record between your ServiceNow instance and Oracle NetSuite. The record centrally stores credentials, OAuth tokens, client ID, and client secret, and is a reusable connection across flows.

Before you begin

Role required: admin

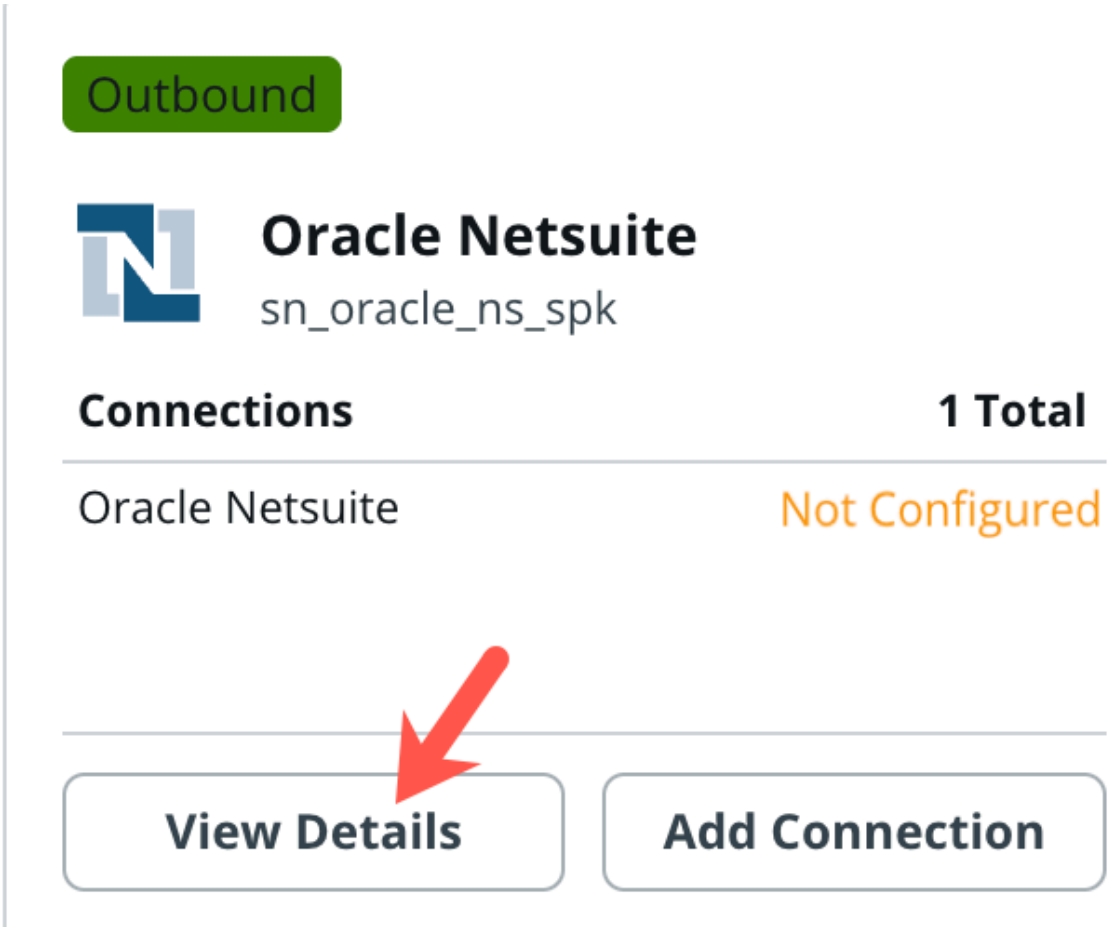
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. **Optional:** Close the notification, if it appears.

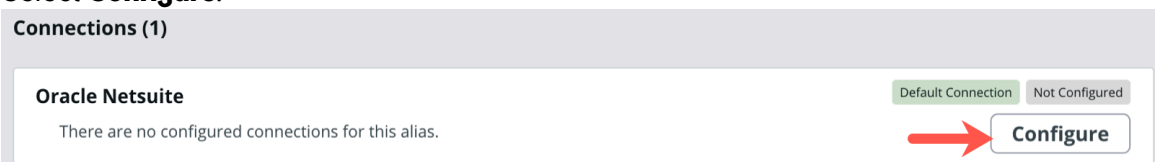


3. Select **Integrations**.
4. Select the **Connections** tab.
5. In the Search all connections field, enter `Oracle NetSuite`.
   If the **Outbound** tab is selected by default, you can do this step. If it isn't selected, confirm that you have selected it.
6. On the Oracle NetSuite card, select **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select **Configure**.



8. Fill the form.

Configure Connection form

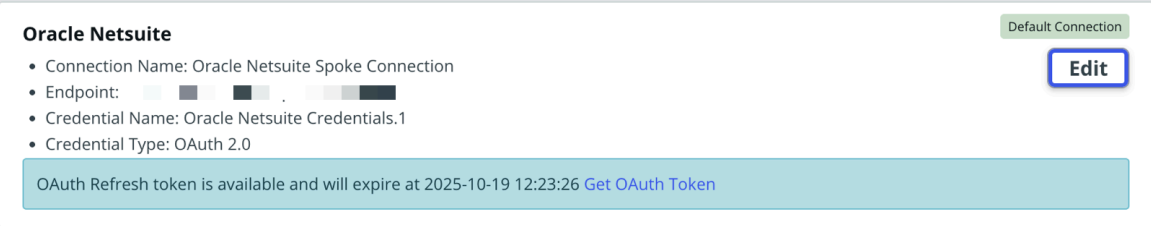
Field	Description
Connection Name	Option to provide a unique name to the connection record.
Connection URL	Option to provide the base API URL of the third-party application your ServiceNow instance connects to.
OAuth Entity Name	Option to provide the name of the OAuth Entity Configuration record in ServiceNow.
OAuth Client ID	Option to provide the OAuth client ID that you had generated earlier.
OAuth Client Secret	Option to provide the OAuth client secret that you had generated earlier.
OAuth API Script	Option to provide an optional Script Include in ServiceNow that can customize the OAuth flow. You must select

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`OAuthCustomOracleNetsuitGlobal` script that you had downloaded.
OAuth Redirect URL	Option to enter the redirect URI of ServiceNow instance in the format: `https://<instancename>.service-now.com/oauth_rediect.do`.
OAuth Authorization URL	Option to provide the URL of Oracle NetSuite's authorization server.
OAuth Token URL	Option to provide the endpoint that issues access tokens after authorization.

9. Select **Configure and Get OAuth Token**.
   The OAuth Access token is generated for the Oracle NetSuite spoke.

Note:
You must log in to Oracle NetSuite before the OAuth access token is granted.



Generate webhook authentication token

Generate an authentication token that enables the Oracle NetSuite requests to your ServiceNow instance to get authenticated. The requests contain events occurring in the Oracle NetSuite real-time. For example, Oracle NetSuite sends a notification when a customer record is created.

Before you begin
Role required: admin

About this task

Important:
Skip this procedure if you don't need to initiate an inbound call from Oracle NetSuite to ServiceNow.

Oracle NetSuite Webhook, a preconfigured sample scripted REST API, is available on your ServiceNow instance. It listens to events occurring on the Oracle NetSuite real-time, and logs the status of the events as success or failure in your ServiceNow instance. To enable the authentication of the events that Oracle NetSuite sends to the scripted REST API, you must generate an authentication token in the Oracle NetSuite webhook registry. The token is included in the webhook that Oracle NetSuite sends.

To access the webhook, navigate to **All**>**System Web Services> Scripted Web Services> Scripted REST APIs**, in the Name field, enter `Oracle NetSuite Webhook`, and press **Enter**.

Procedure

1. Navigate to **All** > **Oracle Netsuite Spoke** > **Webhook Registry**.
2. Select **New**.

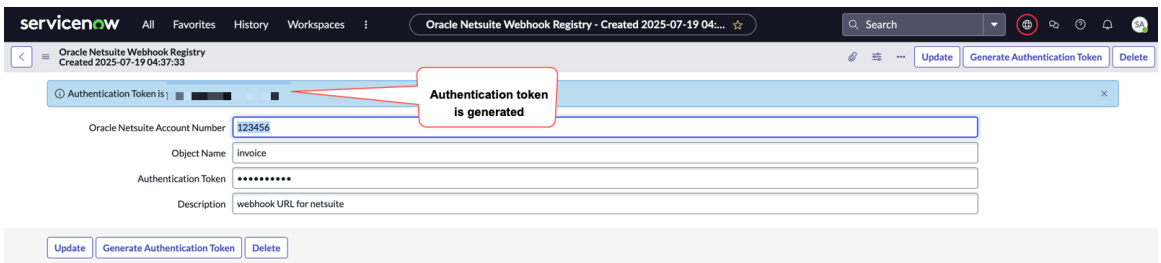
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Fill the form.

Oracle Netsuite Webhook Registry

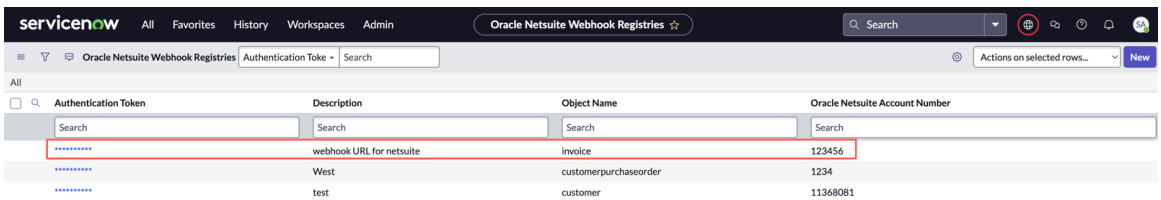
Field	Description
Oracle Netsuite Account Number	Option to enter the account number that the Oracle NetSuite provides.
Object Name	Option to provide the type of the object in Oracle NetSuite that it includes in the webhook. For example, customer.
Authentication Token	Option to generate the authentication token that Oracle NetSuite uses to have its requests authenticated on your ServiceNow instance. The token is generated after you select **Generate Authentication Token**.
Description	Option to enter a description of the webhook.

4. Select **Generate Authentication Token**.
The authentication token is generated.



5. Copy and store the authentication token at a secure place.

6. Select **Update**.
The webhook is recorded in the webhook registry.



Deploy SuiteScript in Oracle NetSuite

Deploy a SuiteScript that enables the Oracle NetSuite to send real-time event details to the scripted API in your ServiceNow instance using the webhook.

Before you begin

Role required: admin

About this task

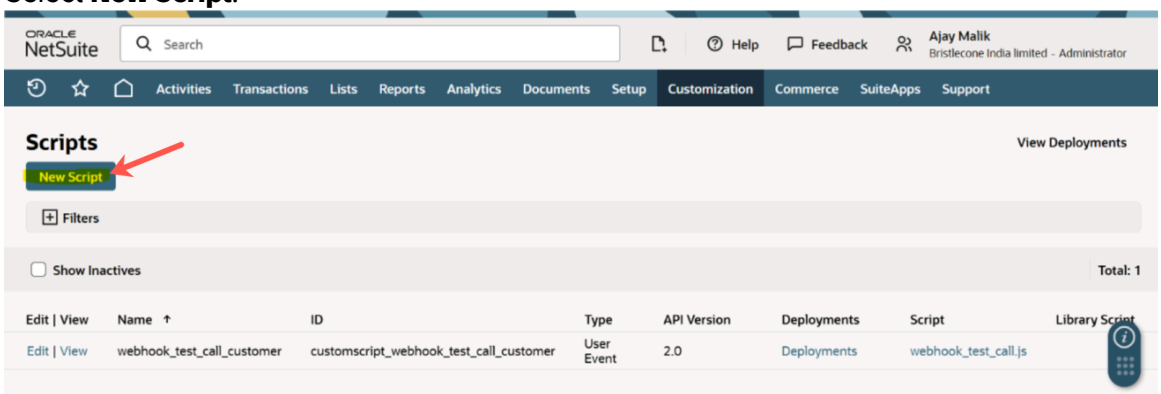
Important:
Skip this procedure if you don't need to initiate an inbound call from Oracle NetSuite to ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

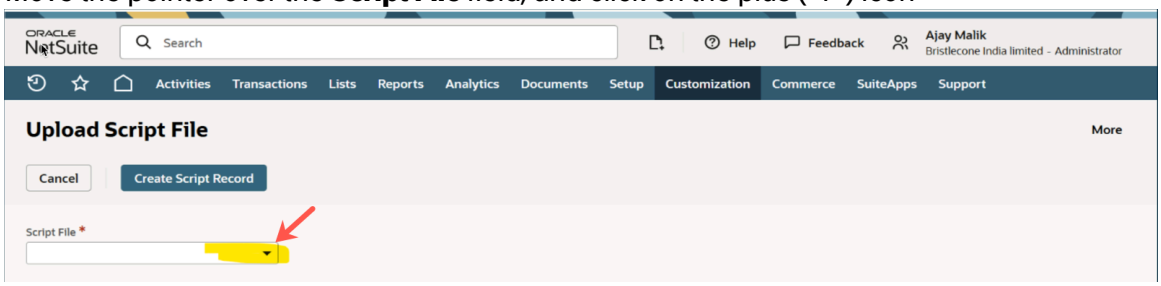
ServiceNow provides a preconfigured sample SuiteScript that you can update and enable the Oracle NetSuite to send real-time events to the scripted API in your ServiceNow instance. You update the SuiteScript by providing the authentication token you had generated, ServiceNow Webhook URL, object, and the Oracle NetSuite account number at appropriate places in the NetSuite script. After configuring the sample NetSuite script, you must deploy it on the Oracle NetSuite application so it can send events to the scripted API in your ServiceNow instance.

Procedure

1. From the Oracle NetSuite spoke page on ServiceNow Store, download the `servicenow_webhook_call.js` file to your local disk.
2. Log in to Oracle NetSuite.
3. Navigate to **Customization** > **Scripting** > **Scripts** > **New**.
4. Select **New Script**.



5. Move the pointer over the **Script File** field, and click on the plus (“+”) icon

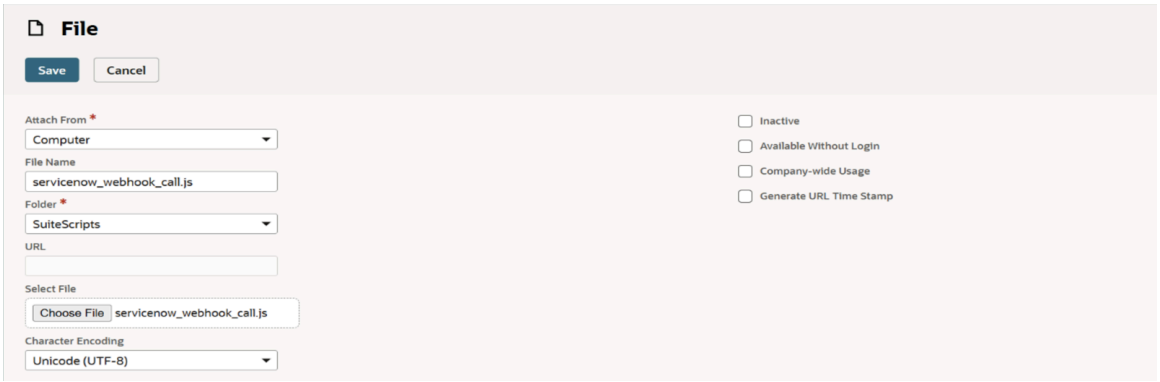


6. Fill the form.

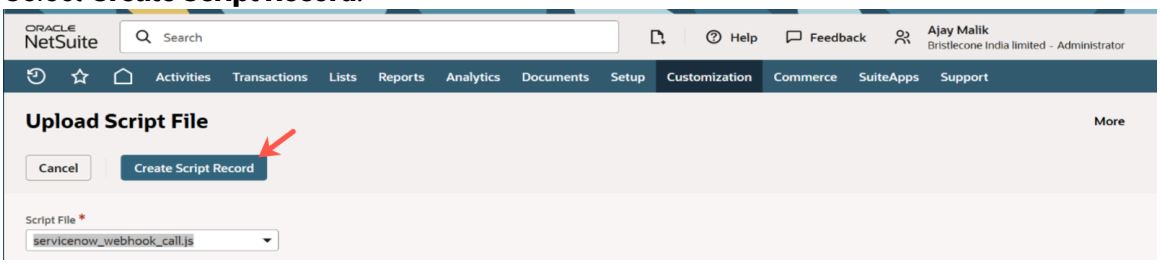
File table

Field	Description
Attach From	Option to indicate the location from which you will attach the SuiteScript.
File Name	Option to provide the name of the SuiteScript file. **Important:** You must provide the extension (.js) of the SuiteScript file with its name.
Folder	Option to provide the name of the folder that contains the SuiteScript file.
Select File	Option to select the SuiteScript file.

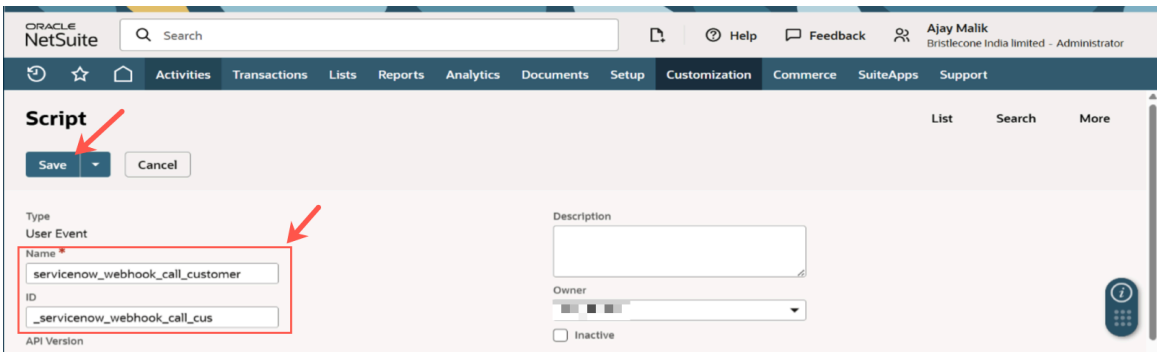
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select **Save**.
8. Select **Create Script Record**.

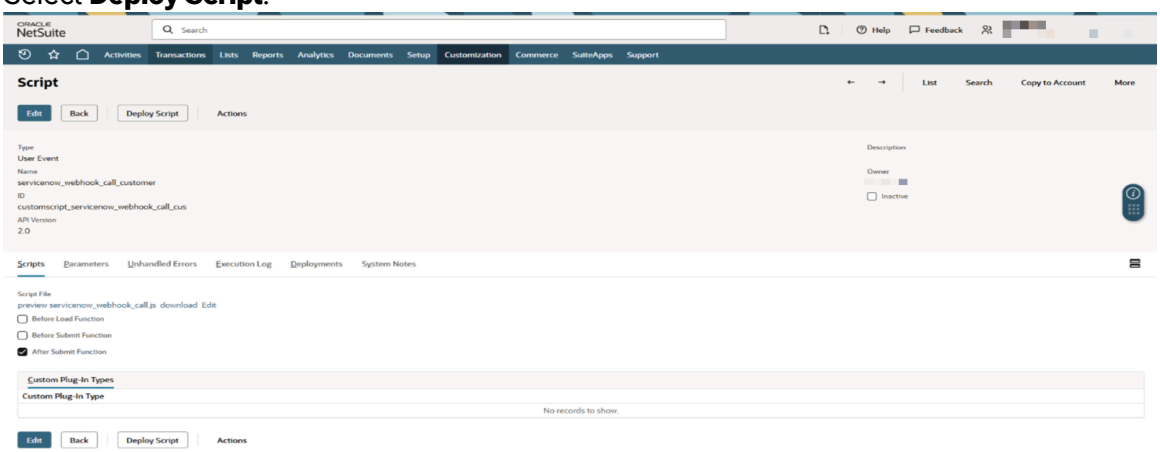


9. In the Name field, enter a unique name.
   For example, `servicenow_webhook_call_customer`.
10. Provide an ID format with underscores.
    For example, `_servicenow_webhook_call_cus`
11. Select **Save**.



The script record screen appears.

12. Select **Deploy Script**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

13. In the Script Deployment page, enter the name of the object in the Applies to field.
    Example of an object: Customer.
14. Enter the ID that you have already created earlier in the procedure.
15. Enter information in the other fields, as required.
16. Select **Save**.
    The NetSuite script is deployed.

Oracle Object Storage Management Spoke

Manage objects, buckets, and namespace in the Oracle Object Storage Management account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle Object Storage Management spoke v1.0.3 is the latest version.

Supported versions

This spoke was built for Oracle Object Storage Management API version 20160918, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Oracle Cloud IAM Spoke
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Oracle Object Storage Management spoke provides actions to automate Oracle Object Storage Management tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Bucket Management	Create Bucket	Creates a bucket in the specified Oracle Cloud Namespace.
	Delete Bucket	Deletes the specified bucket.
	Get Bucket	Retrieves details of the specified bucket.
	Look up Buckets	Retrieves a list of buckets in the specified compartment.
	Re-encrypt Bucket	Re-encrypts the specified bucket.
	Update Bucket	Updates details of the specified bucket.
Namespace Metadata	Get Namespace	Retrieves the name of the Object Storage namespace for the user.
Object Management	Copy Object	Creates a request to copy an object within a region or to another region.
	Create or Update Object	Creates a new object or overwrites an existing object with the same name
	Delete Object	Deletes the specified object.
	Get Object	Retrieves the specified object.
	Look up Objects	Retrieves a list of objects in the specified bucket.
	Re-encrypt Object	Re-encrypts the specified object.
	Rename Object	Renames the specified object.
	Restore Object	Restores the specified object.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Oracle Object Storage Management spoke.

Set up the Oracle Object Storage Management spoke

Integrate the ServiceNow instance and Oracle Object Storage Management account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the Oracle Cloud IAM Spoke.
- Activate the Oracle Object Storage Management spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. **Optional:** Create a JKS certificate.
   You can create a JKS certificate for the Oracle Object Storage Management spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.
2. **Optional:** Create X.509 certificate.
   You can create a X.509 certificate for the Oracle Object Storage Management spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.
3. Create a child alias in the Oracle Cloud IAM spoke connection and credential alias.
   a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.
   b. Click **New**.
   c. On the form, fill these values:

Connection & Credential Aliases form

Field	Description
Name	Name to identify the alias record. For example, `Oracle Obj Storage Alias`.
Parent Alias	Connection and credential alias record of the Oracle Cloud IAM spoke. For example, **sn_oci_iam_spoke.OracleIAM_credentialANDconnecton**.

   d. Right-click the form header and click **Save**.
4. Create credential record for the Oracle Object Storage Management spoke.
   a. Navigate to **Connections & Credentials** > **Credentials**.
   b. Click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
   c. Select **OCI SHA256WithRSA Signature**.
   d. On the form, fill these values.

> **Note:**
> You can specify details of the certificates you created specifically for the Oracle Object Storage Management spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

OCI SHA256WithRSA Signature Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `OCI Obj Cred`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Certificate Sys ID	Sys ID of the Signing Certificate.
Alias	Alias of the KeyStore.
Alias Password	Alias password of the KeyStore.
Key ID	Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: `ocid1.tenancy.oc1..<unique_ID>/ocid1.user.oc1..<unique_ID>/<key_fingerprint>`.
Applies to	Option to specify if the credential applies to all MID Servers in the network.
Active	Option to actively use the credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select `OCI SHA256RSA Signing Algorithm`

e. Right-click the form header and click **Submit**.

5. Create connection record for the Oracle Object Storage Management spoke.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the child alias record you had created. For example, **Oracle Obj Storage Alias**.

c. From the **Connections** tab, click **New**.

d. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle Obj Storage conn`.
Credential	Credential record created for Oracle Object Storage Management spoke. For example, `OCI Obj Cred`.
Connection alias	Alias record associated with this connection.
Connection URL	Base URL to connect to Oracle Object Storage Management. For example, `https://objectstorage.ap-mumbai-1.oraclecloud.com`.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

e. Click **Submit**.

The ServiceNow instance and Oracle Object Storage Management account are integrated. You can use the spoke actions to build flows and automate tasks as required.

Oracle Peoplesoft Financial Spoke

Manage finances and procurement in the Oracle Peoplesoft Financial instance from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle Peoplesoft Financial spoke v1.0.7 is the latest version.

Supported versions

- PeopleSoft FSCM 9.2 Update Image 37
- PeopleTools 8.58.05
- Oracle Database 19.3.0.0
- Elasticsearch 7.0.0
- Kibana 7.0.0
- Oracle Linux 7.8x
- Oracle Database version above 12.2.0.0
- PeopleTools above 8.56

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Remote Tables (com.glide.script.vtable)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke flows

The Oracle Peoplesoft Financial spoke provides a sample flow, Create PO, to demonstrate automating the PO creation. To customize the sample flow, copy it to the required application scope.

Spoke subflows

The Oracle Peoplesoft Financial spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope. Available sample subflows include:

Subflow	Description
BU and Vendor Validation	Validates if a vendor or business unit exists in Oracle Peoplesoft Financial.
Create PO After BU Validation	Validates a business unit before creating a purchase order using that business unit.
Polling Suppliers	Retrieves details of the daily suppliers based on the mentioned polling frequency and creates or updates records in PSFT data table based on Vendor ID.

Spoke actions

The Oracle Peoplesoft Financial spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Finance	Create Bulk Journals	Creates bulk journals.
	Create Invoice	Creates an invoice in Oracle Peoplesoft Financial.
	Get Business Unit By Business Unit ID	Retrieves details of the specified business unit.
	Get Department By Department ID	Retrieves the department cost center details of the specified department.
	Get GI Account Details	Retrieves details of the specified GI account.
	Get Item Details	Retrieves details of the items, based on the input criteria.
	Lookup AP Invoice Line	Retrieves the AP invoice line details of the specified voucher.
	Lookup AP Invoice Header	Retrieves details of the AP invoice headers, based on the input criteria.
	Lookup Business Units	Retrieves details of the business units, based on the input criteria.
	Lookup Currency Rate	Retrieves details of the currency market rate, based on the input criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Lookup Departments	Retrieves details of the departments, based on the input criteria.
	Lookup GI Balance	Retrieves details of the GI balance, based on the input criteria.
	Lookup Invoice Payment Status	Retrieves the list of invoice statuses, based on the input criteria.
Procurement	Cancel PO	Cancels the specified PO.
	Create Bid Event	Creates a bid event in the specified business unit.
	Create Bulk Assets	Creates assets with the provided details.
	Create Bulk Goods Receipts	Creates good receipts with the provided details.
	Create PO	Creates a PO with the provided details.
	Create Vendor	Creates a vendor with the provided details.
	Get Ship To Location By Ship To ID	Retrieves all the ship to locations details, based on the input Ship to ID.
	Get Supplier By Vendor ID	Retrieves the supplier details based on the input Vendor ID.
	Lookup Fixed Assets	Retrieves details of all the fixed assets, based on the input criteria.
	Lookup Advance Shipment Receipts	Retrieves details of the advance shipment receipts, based on the input criteria.
	Lookup Bid Event	Retrieves details of all the bid events, based on the input criteria.
	Lookup PO Header	Retrieves details of the PO header, based on the input criteria.
	Lookup PO Line	Retrieves details of the PO line, based on the input criteria.
	Lookup Ship To Locations	Retrieves list of all the ship to locations, based on the input criteria.
	Lookup Suppliers	Retrieves details of all the suppliers, based on the input criteria.
	Update PO	Updates details of the PO.
Utility		
	Process Trigger	Triggers the specified process.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Oracle Peoplesoft Financial spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server requirements

To use these actions, your instance must have a MID Server set up and configured to use SOAP. For more information about running actions on the MID Server, see Integration steps. For more information about the MID Server, see MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Oracle Peoplesoft Financial spoke

Integrate the Oracle Peoplesoft Financial and ServiceNow instances, and authenticate the requests using the basic authentication.

Before you begin

- Request an Integration Hub subscription.
- Activate the Oracle Peoplesoft Financial spoke.
- Ensure that you have access to Oracle Peoplesoft Application Designer.
- Roles required: ServiceNow admin and Oracle Peoplesoft Financial System Admin.

Procedure

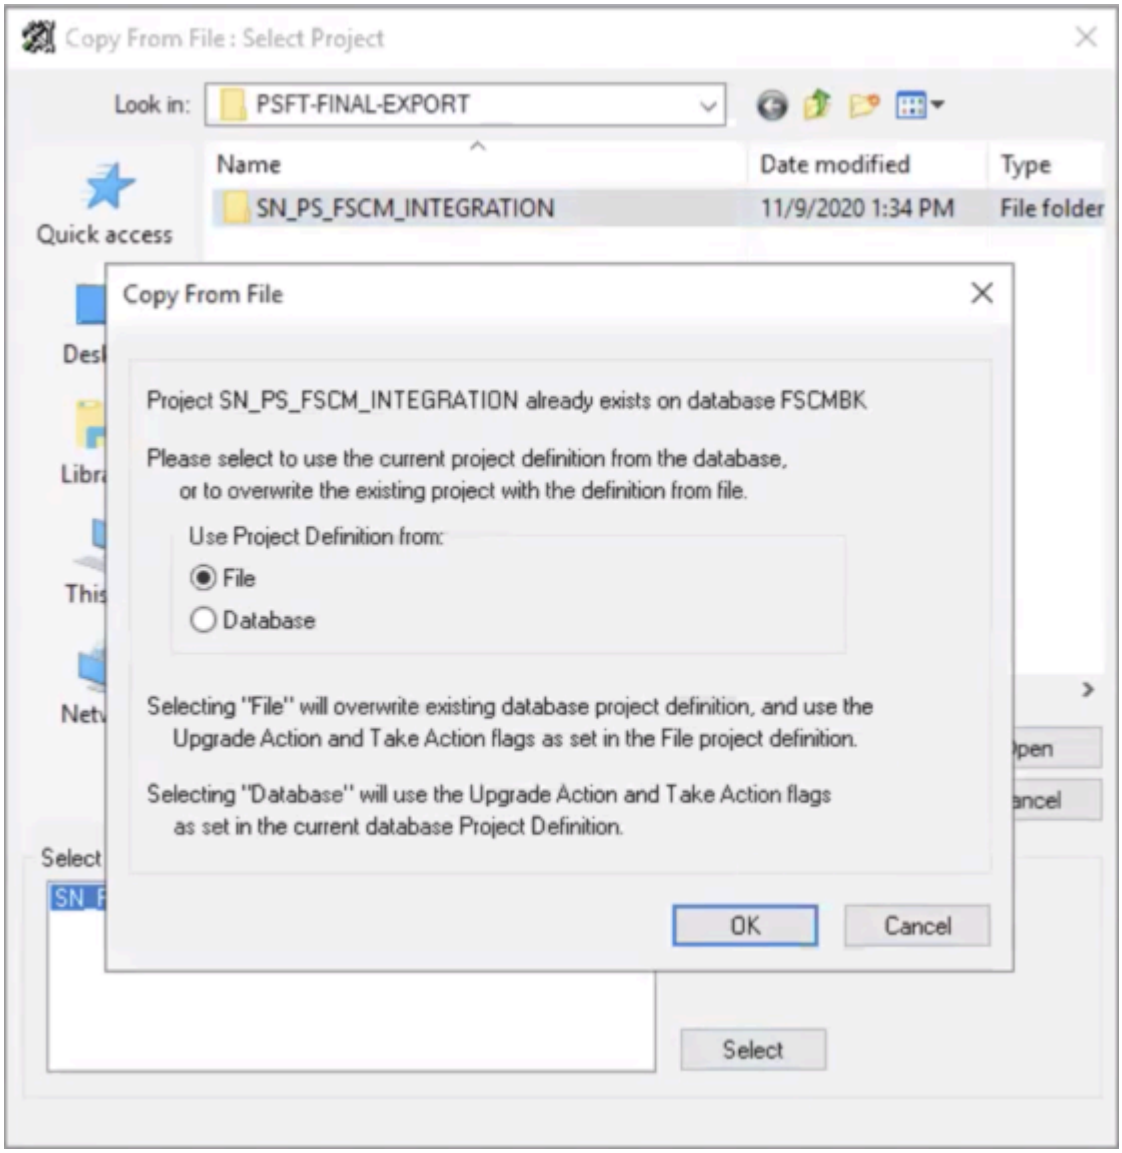
1. In the Application Designer, import the Oracle Peoplesoft Financial project.

   a. From the ServiceNow® Store download the project file, SN_PS_FSCM_INTEGRATION.zip and save it in the required local folder.

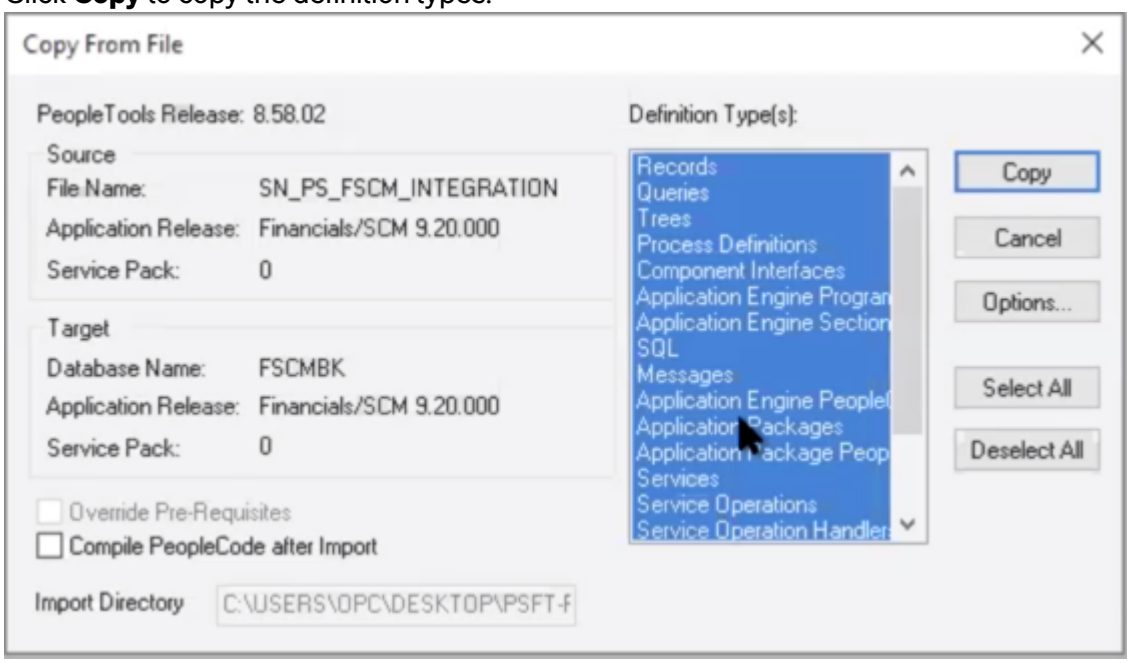
   b. Import the Oracle Peoplesoft Financial project to the target environment that is, Oracle Peoplesoft Application Designer.

   c. Navigate to **Copy Project** > **From File** and select the project file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Click **Copy** to copy the definition types.

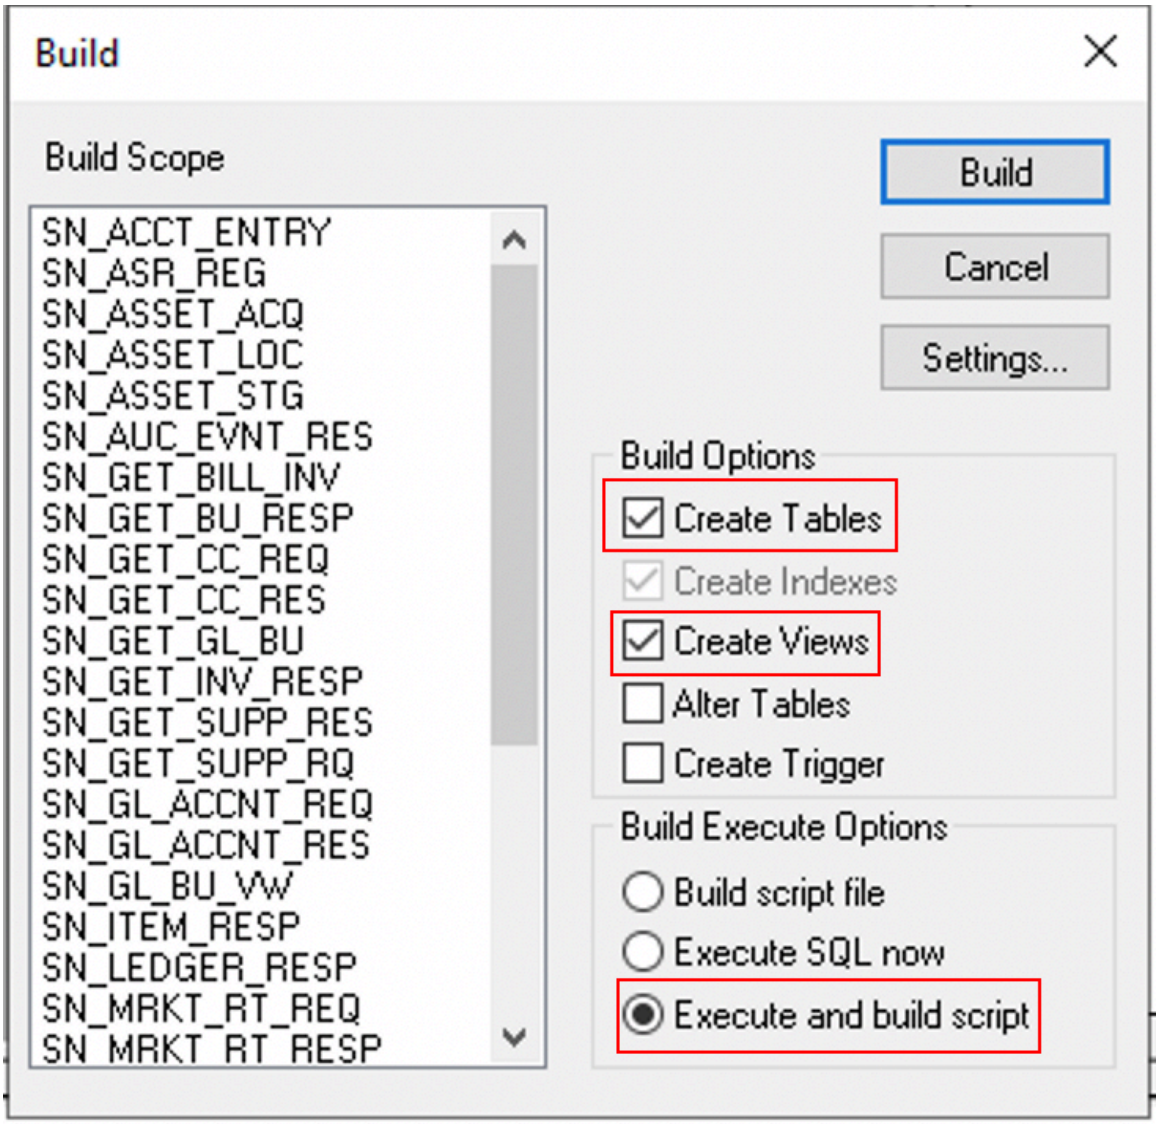


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Verify that the project has all the objects; Application packages, Records, Services, and Service Operations.

f. Build the project by navigating to **Build** > **Project**.

g. Select **Create Tables**, **Create Views**, and **Execute and build script** options.



The required tables are created in the target Oracle Peoplesoft Financial database.

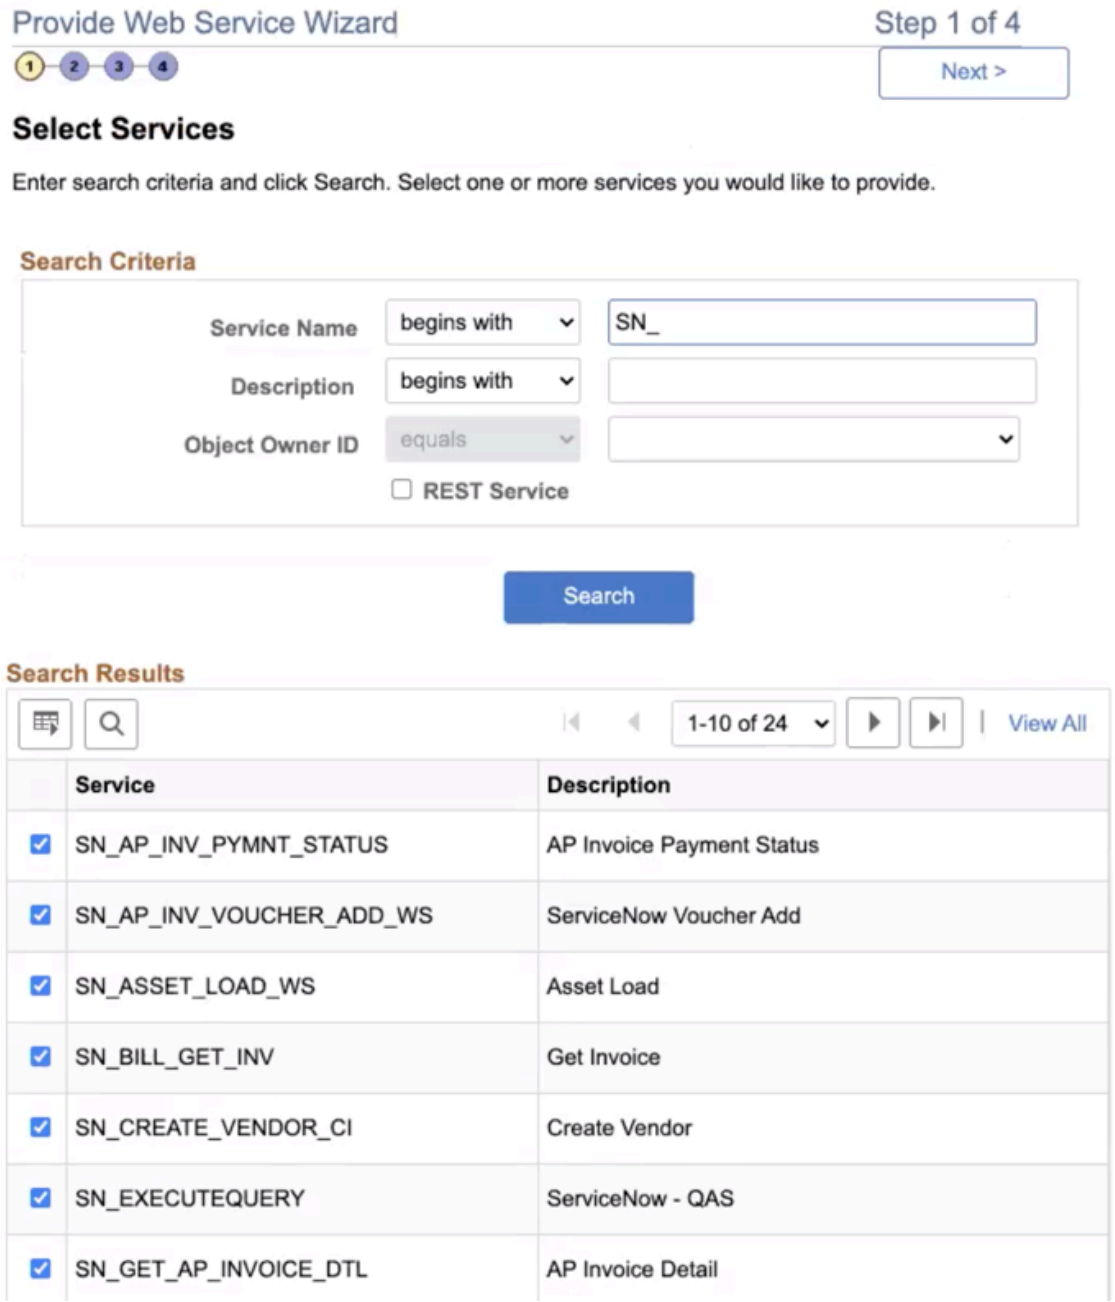
2. Enable the required web services on your Oracle Peoplesoft Financial instance.

a. Log in to your Oracle Peoplesoft Financial instance as an System Admin.

b. Navigate to **Navigator** > **People Tools** > **Integration Broker** > **Web Services** > **Provide Web Service**.

c. In the Search Criteria, specify `sn_` for **Service Name** and click **Search**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Select the check box against the required web services and click **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure that you select 24 ServiceNow web services.

Service	Description
SN_AP_INV_PYMNT_STATUS	AP Invoice Payment Status
SN_AP_INV_VOUCHER_ADD_WS	ServiceNow Voucher Add
SN_ASSET_LOAD_WS	Asset Load
SN_BILL_GET_INV	Get Invoice
SN_CREATE_VENDOR_CI	Create Vendor
SN_EXECUTEQUERY	ServiceNow - QAS
SN_GET_AP_INVOICE_DTL	AP Invoice Detail
SN_GET_ASR	Advance Shipment Receipt
SN_GET_ASSET	SN_GET_ASSET
SN_GET_BID_EVENT	ServiceNow Bid Event
SN_GET_CC	Get Const centres
SN_GET_CURRENCY_RATES	Get Currency Rates
SN_GET_GL_ACCOUNT	Get GI Accounts
SN_GET_GL_BALANCE	Ledger Data
SN_GET_GL_BU	Get GL BU
SN_GET_ITEM_MASTER	Item Master
SN_GET_POHDR	PO Header
SN_GET_POLN	Get PO Line
SN_GET_SHIPTO_LOCATIONS	Get Ship to Locations
SN_GET_SUPPLIERS	Get Suppliers/Vendors
SN_JOURNAL_LOAD	ServiceNow Journal Load
SN_MANAGE_PROCESSES	ServiceNow Process webservice
SN_PO_CANCEL	SN PO CANCEL
SN_RECPT_LOAD	Receipt frm SN

e. Under **Operations**, select the check box against the required web service and click **Next**.

f. Click **View WSDL** to view the WSDL file and click **Next**.

g. In **Specify Publishing Options**, click **Finish**.
Generated WSDL URL is displayed in this format: `<Base-URL>/<webservice-endpoint>.wsdl`

h. Navigate to **Navigator** > **People Tools** > **Integration Broker** > **Web Services** > **CI-Based Services**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Perform the same steps that you had earlier performed for the webservices.

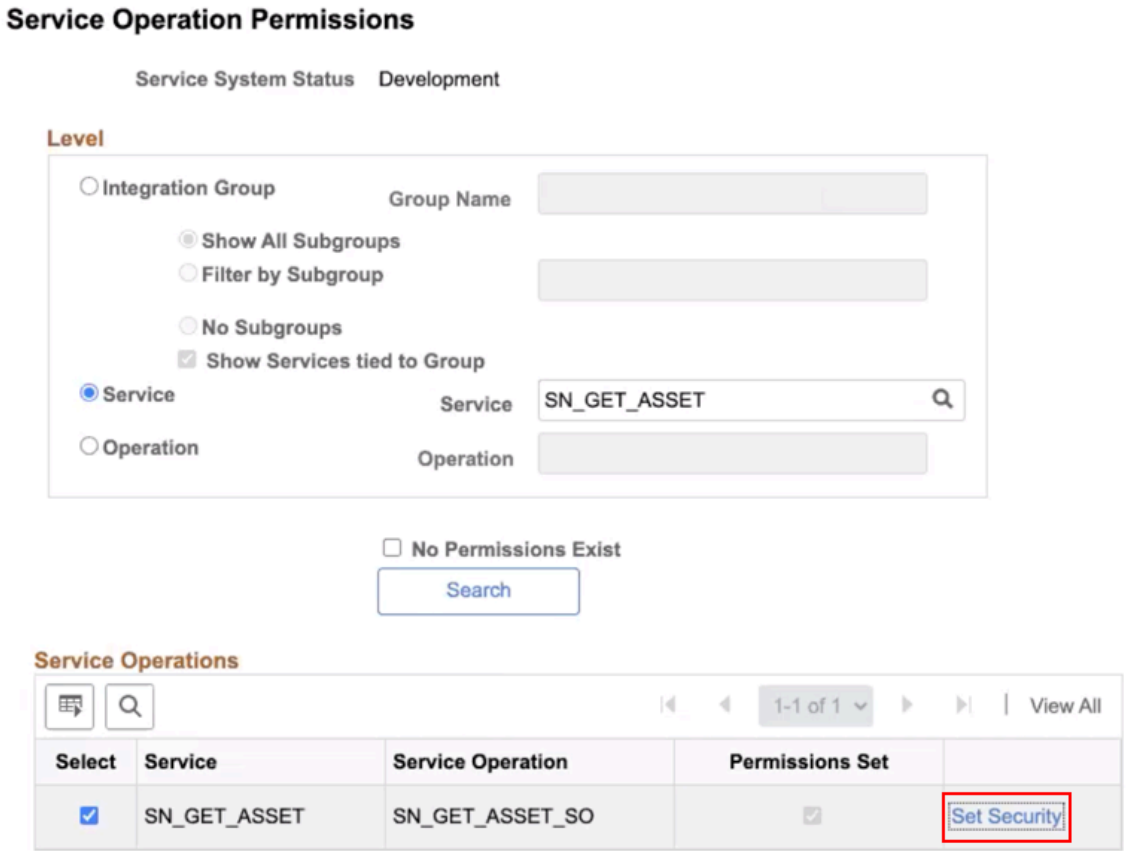
Note:
Configure the webservices as per your requirement.

3. Provide the required permissions to the web services.

a. Log in to your Oracle Peoplesoft Financial instance as a System Admin.

b. Navigate to **Navigator** > **People Tools** > **Integration Broker** > **Web Services** > **Service Utilities** > **Service Operation Permissions**.

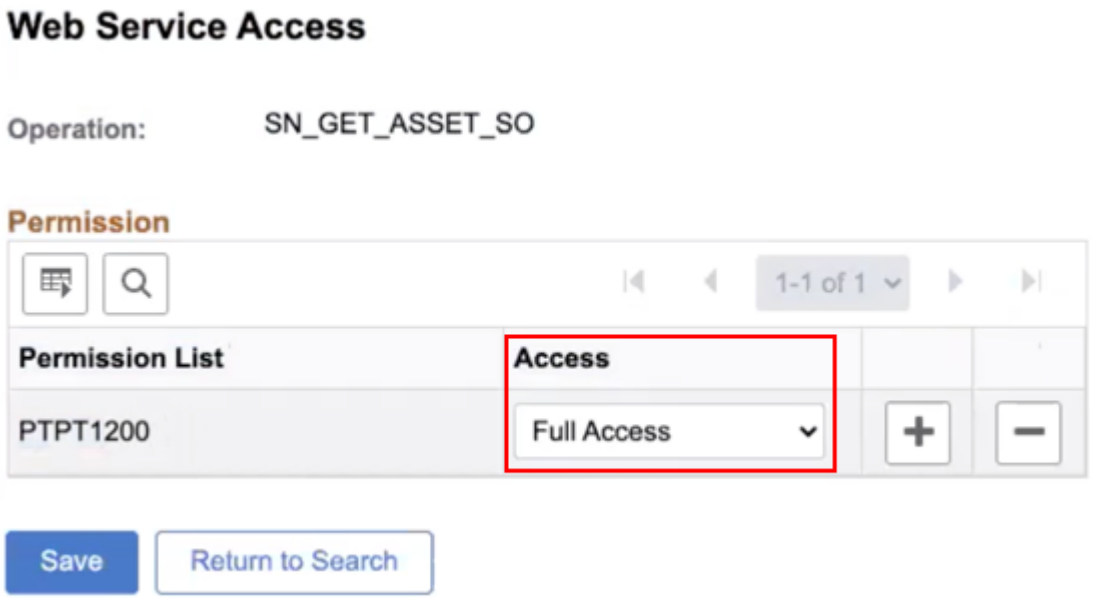
c. Select **Service** option, specify the service name in **Service**, and click **Search**.



d. Select the check box against the required web service and click **Set Security**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. In **Web Service Access**, provide access as per your requirement and click **Save**.



4. Using SQL Developer or Data Mover in Oracle Peoplesoft Application Designer, connect to the database and run these scripts to ensure that the journal entry, SN_ACCT_ENTRY is built.

5. Configure a connection record for the Oracle Peoplesoft Financial spoke.

   a. Log in to the ServiceNow instance as an admin.

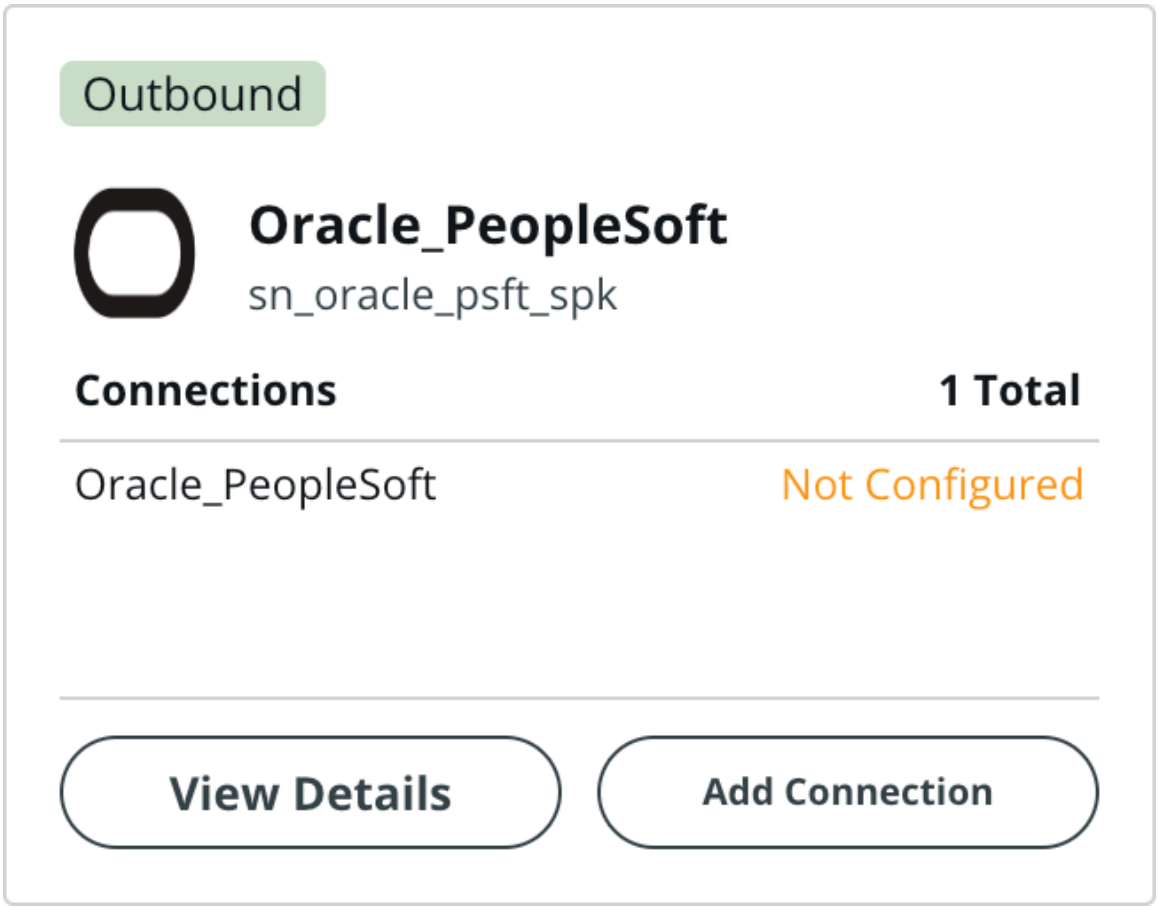
   b. Navigate to **All** > **Process Automation** > **Flow Designer**

   c. Select the **Connections** tab.

   d. Locate the **Oracle_PeopleSoft** alias and click **View Details**.

      Note:
      Don't click **Add Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Click **Configure**.

f. On the **Configure Connection**, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection.
Connection URL	Base URL obtained from the generated WSDL URL. **Note:** Remove the `<webservice-endpoint>.wsdl` part of the WSDL URL while specifying the Connection URL.
User name	User name of your Oracle Peoplesoft Financial account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Password of your Oracle Peoplesoft Financial account.

g. Click **Configure Connection**.

6. Provide Oracle Peoplesoft Financial credentials to use the Process Trigger action.
   a. Log in to the ServiceNow instance as an admin.
   b. Navigate to **Oracle Peoplesoft Credentials** > **Oracle Peoplesoft Credentials**.
   c. Click **New**.
   d. On the form, enter the username and password of user with the required permissions.
   e. Click **Submit**.
7. Retrieve details of the daily suppliers up to the required date.
   a. Log in to the ServiceNow instance as an admin.
   b. Navigate to **PSFT Flow Execution** > **PSFT Flow Executions**.
   c. Click **New**.
   d. Select the date up to which you want to retrieve the daily suppliers data in **Last Successfull Execution**.
   e. Click **Submit**.
   Based on the trigger you have configured in the Polling Suppliers subflow, data is retrieved periodically. To view the data, navigate to **PSFT** > **PSFT Data**.

Oracle Virtual Cloud Network Spoke

Manage networks, route tables, security lists, and subnets in Oracle Virtual Cloud Network account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Oracle Virtual Cloud Network spoke v1.0.4 is the latest version.

Supported versions

This spoke was built for Oracle Virtual Cloud Network API version 20160918, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Oracle Cloud IAM Spoke
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Oracle Virtual Cloud Network spoke provides actions to automate Oracle Virtual Cloud Network tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Network Management	Change Network Compartment	Moves the specified VCN to a different compartment within the same tenancy.
	Create Network	Creates a virtual cloud network.
	Delete Network	Delete the specified VCN.
	Get Network	Retrieves details of the required VCN.
	Look up Networks	Lists the VCNs in the specified compartment.
	Update Network	Updates details of the specified VCN.
Route Table Management	Change Route Table Compartment	Moves a route table to different compartment within the same tenancy.
	Create Route Table	Creates a route table for the specified VCN.
	Delete Route Table	Delete the specified route table.
	Get Route Table	Retrieves the specified route table details.
	Look up Route Tables	Lists the route table in the specified compartment.
	Update Route Table	Updates details of the specified route table.
Security List Management	Change Security List Compartment	Moves the specified security list to different compartment within the same tenancy.
	Create Security List	Creates a security list for the specified VCN.
	Delete Security List	Deletes the specified security list.
	Get Security List	Retrieves specified security list's information.
	Look up Security Lists	Lists the security lists in the specified compartment.
	Update Security List	Updates display name or rules of the specified security list.
Subnet Management	Change Subnet Compartment	Moves the specified subnet to a different compartment within the same tenancy.
	Create Subnet	Creates a subnet in the specified VCN.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Subnet	Deletes the specified subnet.
	Get Subnet	Retrieves details of the specified subnet.
	Look up Subnets	Lists the subnets in the specified compartment.
	Update Subnet	Updates subnet in the specified VCN.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Oracle Virtual Cloud Network spoke.

Set up the Oracle Virtual Cloud Network spoke

Integrate the ServiceNow instance and Oracle Virtual Cloud Network account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the Oracle Cloud IAM Spoke.
- Activate the Oracle Virtual Cloud Network spoke.
- Role required: admin.

Procedure

1. **Optional:** Create a JKS certificate.
   You can create a JKS certificate for the Oracle Virtual Cloud Network spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.
2. **Optional:** Create X.509 certificate.
   You can create a X.509 certificate for the Oracle Virtual Cloud Network spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.
3. Create credential record for the Oracle Virtual Cloud Network spoke.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Click **New**.
   The system displays this message: `What type of Credentials would you like to create?`

   c. Select **OCI SHA256WithRSA Signature**.

   d. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can specify details of the certificates you created specifically for the Oracle Virtual Cloud Network spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

OCI SHA256WithRSA Signature Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle Virtual Cloud Network Cred`.
Certificate Sys ID	Sys ID of the Signing Certificate.
Alias	Alias of the KeyStore.
Alias Password	Alias password of the KeyStore.
Key ID	Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: `ocid1.tenancy.oc1..<unique_ID>/ ocid1.user.oc1..<unique_ID>/<key_fingerprint>`.
Applies to	Option to specify if the credential applies to all MID Servers in the network.
Active	Option to actively use the credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select `OCI SHA256RSA Signing Algorithm`

e. Right-click the form header and click **Submit**.

4. Create connection record for the Oracle Virtual Cloud Network spoke.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the alias record of the Oracle Virtual Cloud Network spoke, for example, **Oracle_VCN_Connection**.

c. From the **Connections** tab, click **New**.

d. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Oracle_VCN_Conn`.
Credential	Credential record created for Oracle Virtual Cloud Network spoke. For example, `Oracle Virtual Cloud Network Cred`.
Connection alias	Alias record associated with this connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	Base URL to connect to Oracle Virtual Cloud Network. For example, `https://iaas.ap-mumbai-1.oraclecloud.com`.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

e. Click **Submit**.

The ServiceNow instance and Oracle Virtual Cloud Network account are integrated. You can use the spoke actions to build flows and automate tasks as required.

PagerDuty Spoke

The PagerDuty spoke provides actions to view and analyze meaningful usage data for PagerDuty software subscriptions. Analyze on-call users to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for PagerDuty v1.5.1, but may be compatible with later versions.

Spoke requirements

PagerDuty global admin account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The PagerDuty spoke provides sample subflows to demonstrate automating PagerDuty tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
PagerDuty Download Subscriptions	Downloads user subscriptions from the PagerDuty portal. To use this subflow, perform the steps outlined in Integrating with PagerDuty.
PagerDuty Reclaim Subscription	Deactivates user accounts in PagerDuty. To use this subflow, perform the steps outlined in Integrating with PagerDuty.
PagerDuty Update User Activity	Retrieves the activity of users who are on an on-call schedule. To use this subflow, perform the steps outlined in Integrating with PagerDuty.

Spoke actions

The PagerDuty spoke provides actions to automate PagerDuty tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Audit Management	Look up Audit Record Stream	Retrieves information about the list of audits.
Business Service Management	Create Business Service	Creates business service by passing the Number field.
	Create Business Service Subscribers	Creates a business service subscriber.
	Delete Business Service	Deletes a business service.
	Look up Business Service by ID	Retrieves information about the specified business service.
	Look up Business Service Dependencies by Business Service ID	Retrieves the Business Service Dependencies by Business Service ID.
	Look up Business Service Subscribers by Business Service ID	Retrieves Business Service Subscribers by Business Service ID.
	Look up Business Services Stream	Retrieves a Business Services Stream.
	Remove Business Service Subscribers	Removes the specified business service subscriber.
	Update Business Service	Updates a business service.
Escalation Policy Management	Delete Escalation Policy	Deletes the specified escalation policy.
	Look up Escalation Policies Stream	Retrieves information about the list of escalation policies.
	Look up Escalation Policy by ID	Retrieves Escalation Policy by ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Escalation Policy	Updates an escalation policy.
	Create Escalation Policy	Creates an escalation policy
Extension Management	Create Extension	Creates an extension.
	Look up Extension by ID	Retrieves information about the specified extension.
	Look up Extensions Stream	Retrieves information about the list of extensions.
	Update Extension	Updates an extension.
Incident Management	Create Incident	Creates an incident with the specified details.
	Look up Incident by ID	Retrieves information about an incident by its ID.
	Look up Incidents Stream	Retrieves information about the list of incidents.
	Update Incident	Updates an incident with the specified details.
Notifications Management	Look Up Notification Stream	Retrieves the list of notifications.
Schedule Management	Create Schedule	Creates a schedule.
	Look up Schedule by ID	Retrieves information about a schedule ID.
	Look up Schedules Stream	Retrieves information about the list of schedules.
	Update Schedule	Updates a schedule with the specified information.
Service Management	Create Service	Creates a service
	Look up Service by ID	Retrieves the details of a service by its ID.
	Look up Services Stream	Retrieves information about the list of services.
	Update Service	Updates a service with the specified information.
Tag Management	Create Tag	Creates a tag.
	Delete Tag	Deletes the specified tag.
	Look up Tag by ID	Retrieves information about the specific tag.
	Look up Tags Stream	Retrieves information about the required tags.
	Assign Tags	Assigns tags to the required entity.
Team Management	Add Escalation Policy to Team	Adds the escalation policy to a team with the specified details.
	Add User to Team	Adds users to the specified team.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Team	Creates a team.
	Create Team Subscriptions	Creates a team subscription.
	Delete Team	Deletes the specified team.
	Look up Subscriptions in Team	Retrieves information about the specified subscription in a team.
	Look up Team by ID	Retrieves the specific team by ID.
	Look up Teams Stream	Retrieves the information about the list of teams.
	Look up Users in Team	Retrieves information about the specified users from a team.
	Remove Escalation Policy from Team	Removes the specified escalation policy from the specified team.
	Remove Team Subscriptions	Removes the specified team subscription.
	Remove User from Team	Removes the specified user from the specified team.
	Update Team	Updates the details of a team.
Webhook Management	Create Webhook Subscription	Creates a webhook subscription.
	Delete Webhook	Deletes a webhook.
	Look up Webhook Subscription by ID	Retrieves information about the specified webhook subscription ID.
	Look up Webhook Subscription Stream	Retrieves information about the list of webhook subscriptions.
	Update Webhook Subscription	Updates the specified webhook subscription.
User Management	Look Up Users	Retrieves all PagerDuty user subscriptions.
	Look Up On Call Users	Retrieves information about the last time that a user was on an on-call schedule.
	Remove User	Deactivates a user account in PagerDuty.
	Look up Users Stream	Retrieves information about the list of users.
	Create User	Creates a user.
	Update User	Updates the details of the specified user.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
PagerDuty team management AI agent	Creates teams, updates team details, manages users and escalation policies, and retrieves information about teams and their subscriptions.
PagerDuty business service management AI agent	Creates, updates, and deletes business services, manages subscribers, and retrieves dependencies.
PagerDuty schedule management AI agent	Retrieves schedule streams and details of the required schedule.
PagerDuty extension management AI agent	Retrieevs details of the required extensions, creates new extensions, retrieves a stream of extensions, and updates existing extensions.
PagerDuty user management AI agent	Retrieves details of the on-call users, updates user details, creates new users, removes the required users and retrieves the user streams.
PagerDuty incident management AI agent	Creates new incidents, updates existing ones, and retrieves details of the required incident.
PagerDuty notification management AI agent	Retrieves details of notifications.
PagerDuty service management AI agent	Creates new services, updates details of existing services, and retrieves details of the required service.
PagerDuty audit management AI agent	Retrieves the audit records and integrates the PagerDuty functionalities into broader operational flow.
PagerDuty escalation policy management AI agent	Creates, updates, deletes, and retrieves escalation policies, as well as stream policy data for integration into workflows
PagerDuty tag management AI agent	Creates tags, retrieves details of the required tag, retrieves tag streams, deletes tags, and assigns tags.

Looking for an AI agent?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up PagerDuty spoke

Set up an outbound integration between your ServiceNow instance and the PagerDuty server with a connection and credential record.

Before you begin

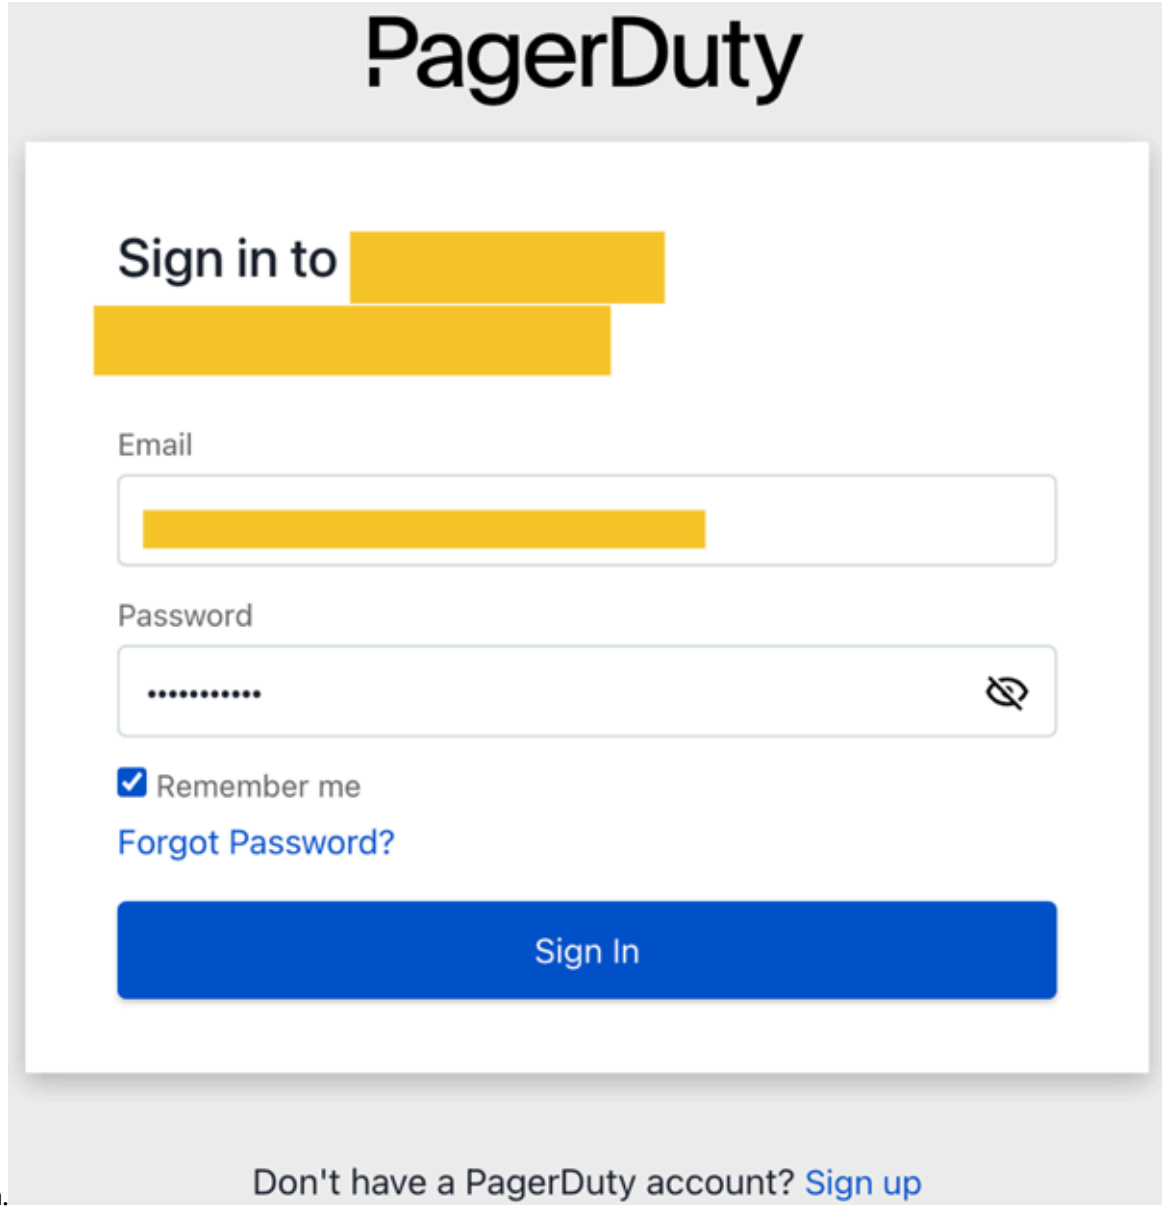
- Request an Integration Hub subscription.
- Activate the PagerDuty spoke.
- Access to the PagerDuty application so you can set up the OAuth 2.0 app.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

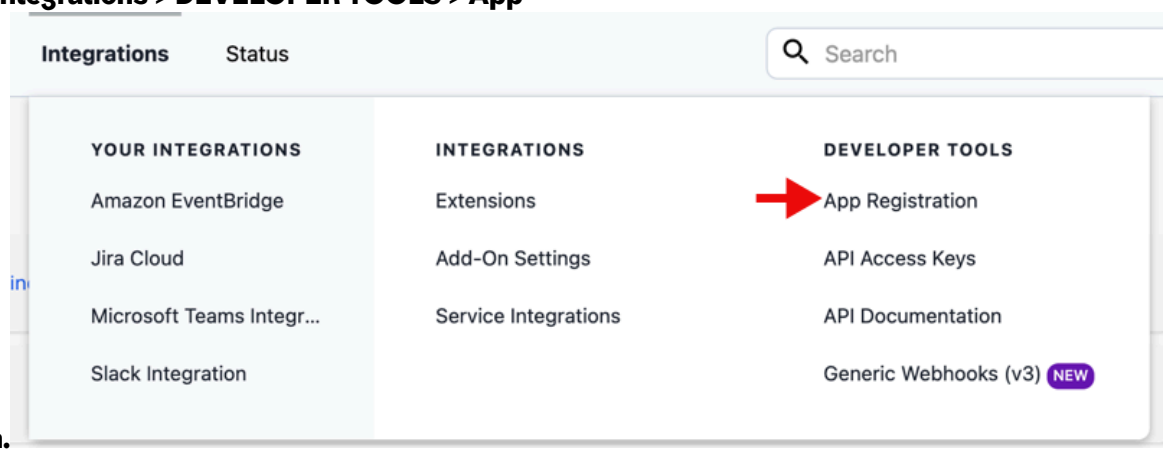
Procedure

1. Set up PagerDuty as the OAuth provider.

a. Log in to the PagerDuty application.



b. Navigate to **Integrations** > **DEVELOPER TOOLS** > **App Registration**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

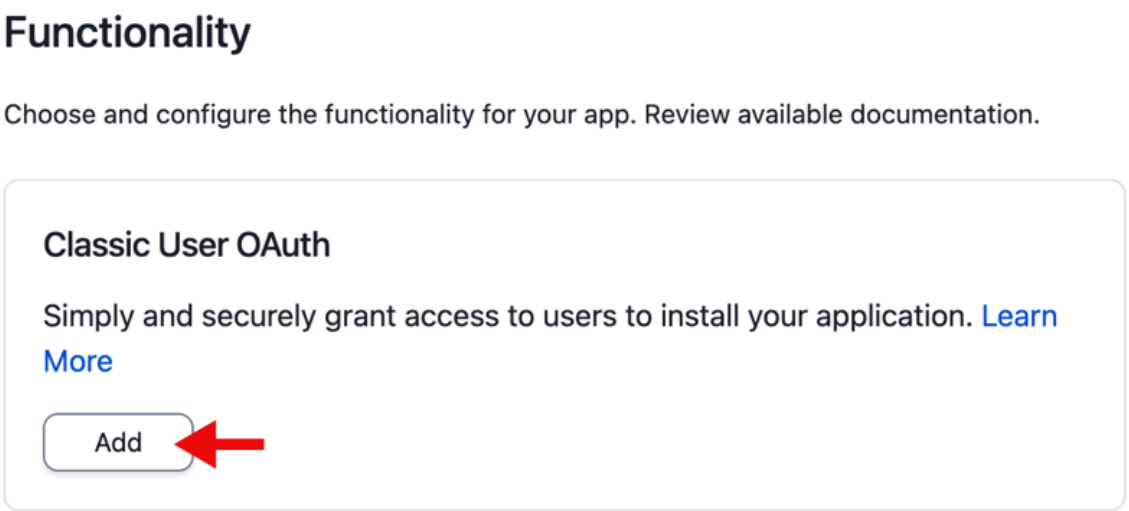
c. Select **Create New App**.

d. In the App Name field, enter a unique name for the OAuth app.

e. In the Brief Description field, enter a brief description of the OAuth app.

f. Select **Save**.

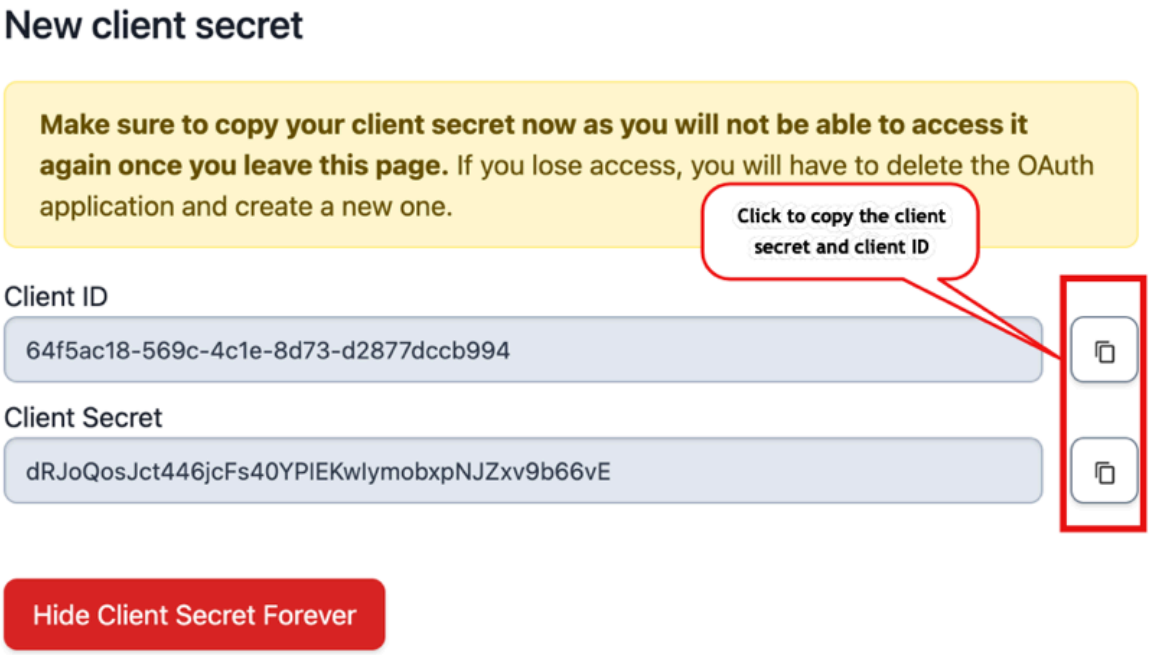
g. Under the Classic User OAuth heading, select



Add.

h. In the Redirect URL field, enter your ServiceNow instance URL.

i. Select **Save**.
PagerDuty generates the client ID and client



secret.

j. Copy and store the client ID and secret.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You need the client ID and secret when you set up the connection and credential record.
You have set the PagerDuty OAuth app.

2. Set up the connection and credential record.

   a. Log in to your ServiceNow instance.

   b. Navigate to **All** > **Process Automation** > **Flow Designer.**

   c. Select Connections.

   d. In the Search all connections field, enter `PagerDuty`.

   e. On the PagerDuty tile, select **View Details**.

   f. Select **Configure**.

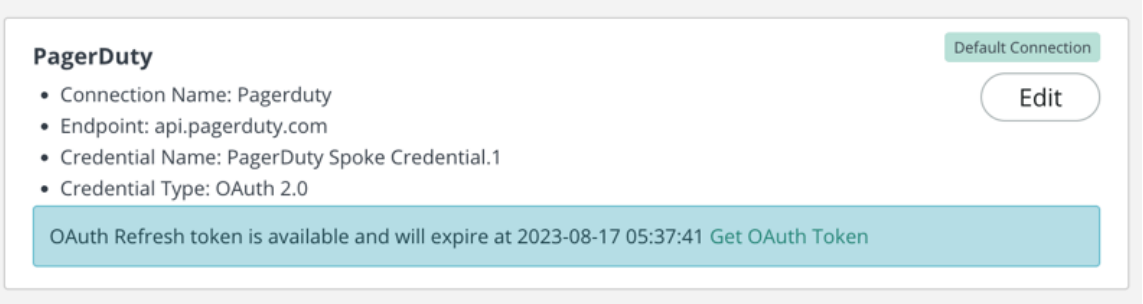
   g. Fill the Create Connection form.

Create Connection

Field	Description
Connection Name	Name of the connection. **Note:** The default and read-only name of the first connection is PagerDuty. To provide a custom name for the connection, select **Add Connection**.
Name	Name of the credential. **Note:** The default and read-only name of the first credential is PagerDuty. To provide a custom name for the credential, select **Add Connection**.
OAuth Client ID	OAuth client ID that you generated when you set up the OAuth app.
OAuth Client Secret	OAuth client secret that you generated when you set up the OAuth app.
OAuth Redirect URL	The redirect URL that you had provided when you set up the OAuth app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

h. Select **Create and Get OAuth Token**.
The OAuth token becomes available.



Plivo Spoke

Enable communications with your customers using the Plivo platform from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Plivo spoke v1.2.0 is the latest version.

Supported versions

This spoke was built for Plivo API version v1, but may be compatible with later versions.

Spoke requirements

- Admin access to the Plivo console.
- **AUTH ID** and **AUTH TOKEN**. You can find these vales in the dashboard of your Plivo account. For more information, see Authentication in the Plivo documentation.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Plivo spoke provides sample subflows to demonstrate automating the Plivo tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Plivo Call Handler	Manages calls associated with the Plivo account.
Plivo SMS Handler	Manages SMS associated with the Plivo account.

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

Note:

- You must configure webhooks to use the spoke subflow. See Set up a bi-directional webhook for the Plivo spoke for information regarding setting up and configuring the webhook.
- The sample subflow runs as a user by default. The subflow can be configured to run as system.

Spoke actions

The Plivo spoke provides actions to automate the Plivo tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Application Management	Create Application	Creates an application.
	Delete Application	Deletes an application.
	Get Application	Retrieves details of an application.
	Look up Applications	Retrieves list of all application IDs.
	Update Application	Updates details of an application.
Call Management	Get Call	Retrieves Call Detail Record(CDR) of the call.
	Hang Up Call	Ends an ongoing call or cancel a queued outbound call.
	Look up Call	Retrieves details of the specified call.
	Make Call	Initiates an outbound call.
	Start Recording Call	Starts recording an ongoing outbound call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Stop Recording Call	Stops all the ongoing recordings for the specified call UUID.
Conference Management	Get Conference	Gets details of a conference.
	Hang Up Conference	Hangs up all ongoing conferences in your account.
	Hang Up Member	Hangs up a member in a conference.
	Kick Member	Disconnects a member in a conference.
	Look up Conferences	Retrieves a list of all conferences that are ongoing on your account.
	Mute Member	Mutes members in a conference.
	Unmute Member	Unmutes members in a conference.
SMS Management	Get Message	Retrieves the details of the specified message.
	Look up Message	Retrieves the details of the messages.
	Send Bulk SMS	Sends SMS to the multiple numbers.
	Send SMS	Sends the SMS to the specified number.

Spoke module

Webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow instance. These conditions are based on the events in Plivo that you want to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Plivo tasks.

Webhooks require separate setup and can be used independently without using the spoke actions. The Plivo spoke adds the Plivo Spoke application to your instance and includes these modules:

Module	Description
Plivo Webhook Registries	Create and view the Plivo webhooks in ServiceNow.
Plivo Webhook Routing Policy	Create and view the routing policies for the Plivo webhooks in ServiceNow. You can also customise the conditions in the routing policies as per your requirement.

Use the Plivo Webhook Registries module to register a Plivo webhook. You must generate a Callback URL and provide this URL in your Plivo account.

Routing policies and subflows support these Plivo fields:

- Keywords
- Call Event
- Caller Name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event Type
- SMS Text
- To Number
- Show Related Fields

Create routing policy in the Plivo WebHook Routing Policies module and specify conditions as per your requirement. See Set up a bi-directional webhook for the Plivo spoke for information regarding setting up and configuring the webhooks.

Spoke user roles

The Plivo spoke provides a Plivo Admin (sn_plivo_spoke.Plivo_Admin) role.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Plivo spoke.

Set up the Plivo spoke

Integrate the ServiceNow instance and Plivo account by using the basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Plivo spoke.
- Role required: admin.

Configure a connection for the Plivo spoke

Add and configure a Plivo connection to authenticate ServiceNow requests in Plivo spoke.

Before you begin

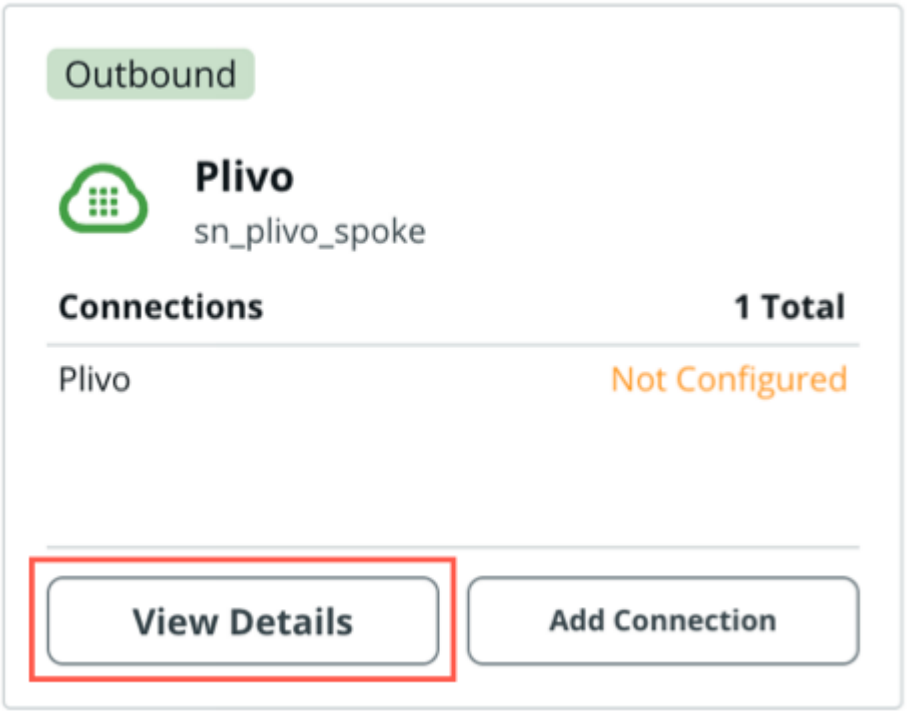
- Values of **AUTH ID** and **AUTH TOKEN**. You can find these vales in the dashboard of your Plivo account. For more information, see Authentication in the Plivo documentation.
- Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Plivo** and click **View Details**.

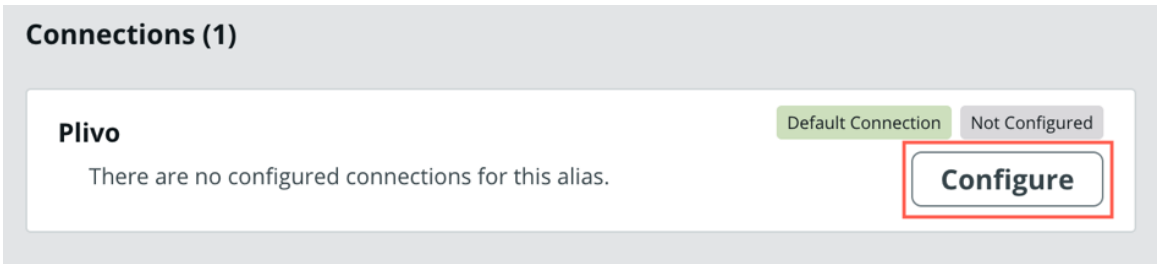
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Plivo spoke, click **View Details**.



- To manage more than one Plivo spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



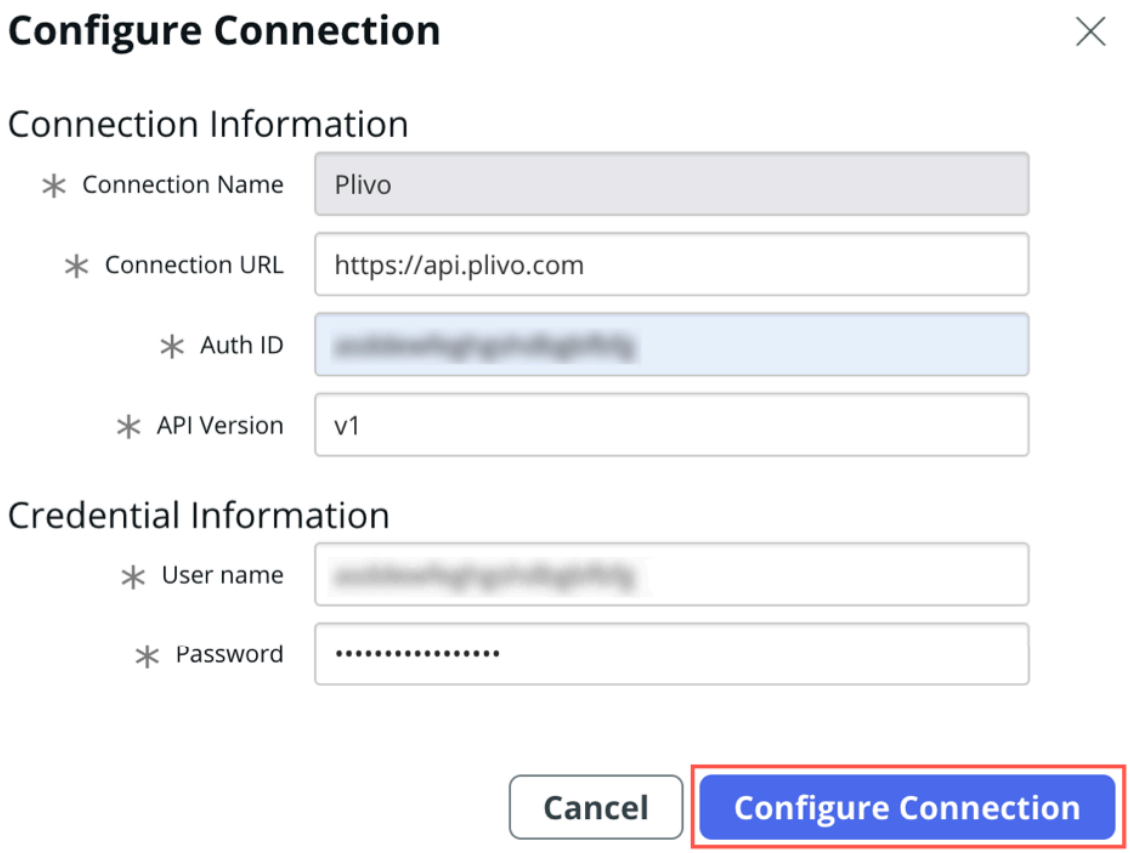
5. On the **Configure Connection** form, fill in the fields:

Configuration form

Field	Description
Connection Name	Name to uniquely identify the connection record.
Connection URL	Base URL to connect to Plivo. Enter `https://api.plivo.com`.
Auth ID	Auth ID of your Plivo account.
API Version	API version of your Plivo account. Enter `v1`.
User name	Auth ID of your Plivo account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Auth token of your Plivo account.



6. Click **Configure Connection**.

Result
The spoke connection is configured and ready to be used.

Set up a bi-directional webhook for the Plivo spoke

Configure a webhook to subscribe to your Plivo account with a ServiceNow callback URL.

Before you begin

- Request Integration Hub subscription.
- Activate the Plivo spoke.
- Set up the Plivo spoke
- Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin.

Register a Plivo webhook in ServiceNow

Register a Plivo webhook in your ServiceNow instance to notify the ServiceNow app when certain events occur in Plivo.

Before you begin
Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Plivo Spoke** > **Plivo Webhook Registries**.
2. Click **New**.
3. On the form, fill in the fields.

Plivo Webhook Registry form

Field	Description
Name	Unique name to identify the record. For example, `Plivo webhook`.
Description	Description of the record.
Path	Plivo webhook path. By default, this path is set to `api/sn_plivo_spoke/plivo_webhook_handler/wh_entry`.

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

Result
The Plivo webhook is registered in your ServiceNow instance.

Add a callback URL in Plivo

Provide a webhook callback URL in your Plivo account to create a webhook.

Before you begin
Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

Procedure

1. Log in to your Plivo console.
2. Create an application in the Plivo console as per your requirement.
   For more information about creating an application in the Plivo console, see the Create an Application section in the Make your first Outbound Call page of the Plivo documentation. You can also refer to the Plivo Application documentation for more information about creating and updating an application using Plivo APIs.
3. Enter the webhook callback URL in **MESSAGE URL** and **ANSWER URL**, and configure the application as per your requirement.

Result
The callback URL is added in your Plivo account. You can create routing policies and subflows as per your requirement. See Create routing policy and customize webhook for information regarding the creation of new routing policies and subflows.

Create routing policy and customize webhook

Create a webhook routing policy and subflow as per your requirement.

Before you begin
Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Routing policy in the Plivo WebHook Routing Policy module triggers the subflows and notifies the ServiceNow instance when certain events occur in your Plivo account. See Plivo Spoke for information about the fields that the routing policy and subflows support.

Procedure

1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Click **Subflows**.
3. Create a copy of the default subflow.
   Two subflows are available along with Plivo spoke; Plivo Call Handler and Plivo SMS Handler. You can create a copy of either of these subflows as per your requirement.
4. Customize the subflow as per your requirement and publish it.
   See Building subflows for more information about creating and using subflows, and Plivo Spoke for information about the supported fields.
5. Navigate to **Plivo Spoke** > **Plivo WebHook Routing Policy**.
6. Click **New**.
7. On the form, fill in the fields.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met. **a.** Click the lookup icon ( ). **b.** Select the required subflow from the Document list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.
Condition	Conditions to be met when the required events occur in Plivo.
Answer	Subflow that must be triggered when the specified conditions are met.

Routing policies and subflows support these Plivo fields:

- Keywords
- Call Event
- Caller Name
- Event Type
- SMS Text
- To Number
- Show Related Fields

8. Click **Submit**.

Note:
These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The routing policy and subflow are created.

Pluralsight Spoke

Manage users, learning, courses, and so on in the Pluralsight Skills account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Pluralsight spoke v1.2.0 is the latest version.

Supported versions

This spoke was built for Pluralsight GraphQL API version v1, but may be compatible with other future API versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Pluralsight spoke provides actions to automate Pluralsight tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Course Management	Look up Courses	Retrieves details of the specified Pluralsight courses.
Learning Management	Look up Learning Status for Course	Retrieves the learning status of the specified Pluralsight course.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Learning Status for User	Retrieves the learning status for the specified Pluralsight user.
	Look up Learning Status Data Stream	Retrieves the learning status of the specified course in Pluralsight.
Skill Management	Look up Skill Assessment Results	Retrieves the skill assessment results in Pluralsight. **Note:** • Pluralsight Enterprise Plan is required to use this action. • The action output, **Attempt Number** starts with **0** and this value is synchronised with value from Pluralsight.
	Look up Skill Assessments	Retrieves the list of all available skill assessments in Pluralsight that can be taken by a user.
	Look up Skill IQ Summary	Retrieves the skill IQ summary in Pluralsight.
User Management	Create User	Creates a user in Pluralsight. **Note:** API key must have the write permission to perform this action.
	Deactivate User	Removes a user's license from plan in Pluralsight. **Note:** API key must have the write permission to perform this action.
	Invite User	Invites the specified user to a plan in Pluralsight. **Note:** API key must have the write permission to perform this action.
	Look up Users	Retrieves details of the users in Pluralsight.

See Set up the Pluralsight spoke for information about setting up the Pluralsight spoke.

Set up the Pluralsight spoke

Integrate the ServiceNow instance and your Pluralsight Skills account using an API key to have the ServiceNow instance requests authenticated by the Pluralsight host.

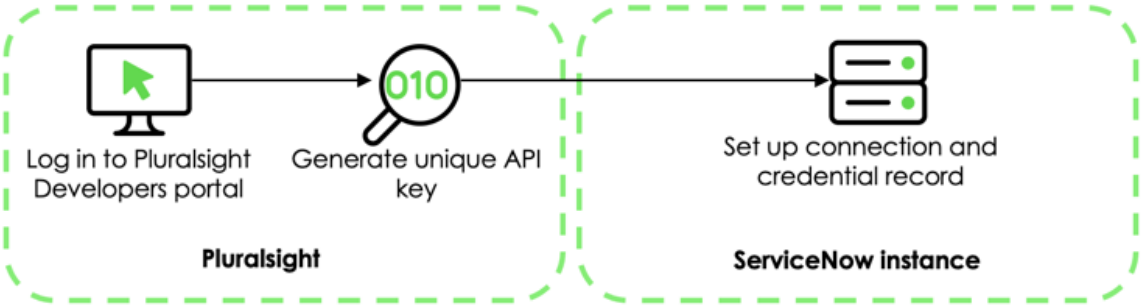
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Pluralsight spoke.
- Admin access to the Pluralsight Skills account.
- Role required: admin.

About this task

This task enables you to integrate your ServiceNow instance with the Pluralsight host. See the flow, as given in the image below.



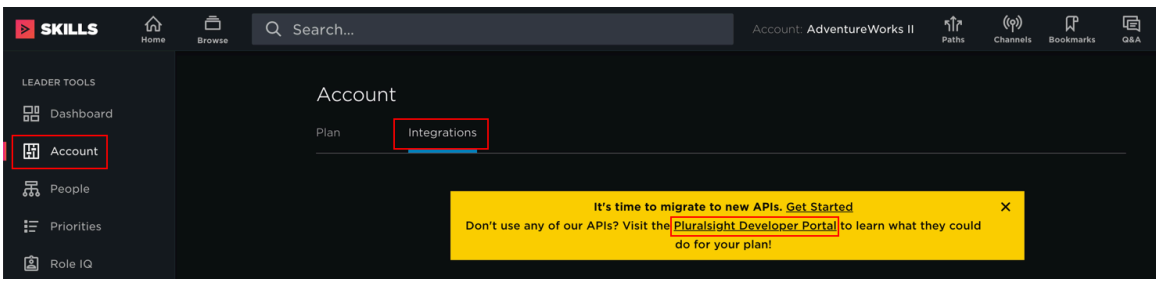
Procedure

1. Create an API key in your Pluralsight Skills account.

a. Log in to your Pluralsight Skill account as an admin.

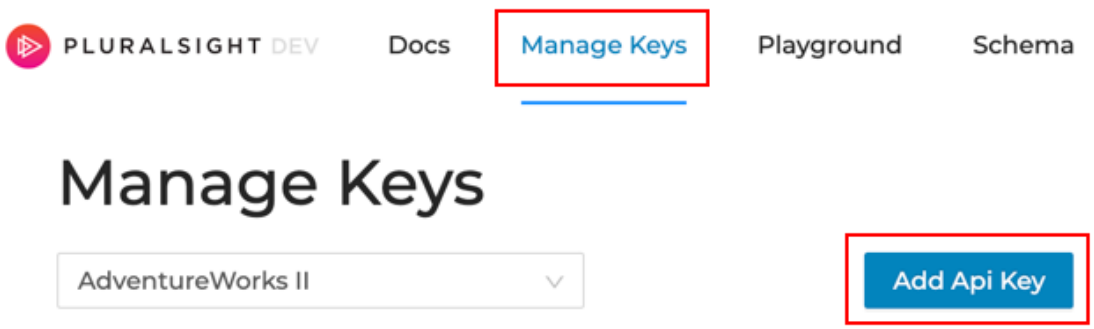
b. Navigate to **Account** and click the **Integrations** tab.

c. Click the Pluralsight Developer Portal link.



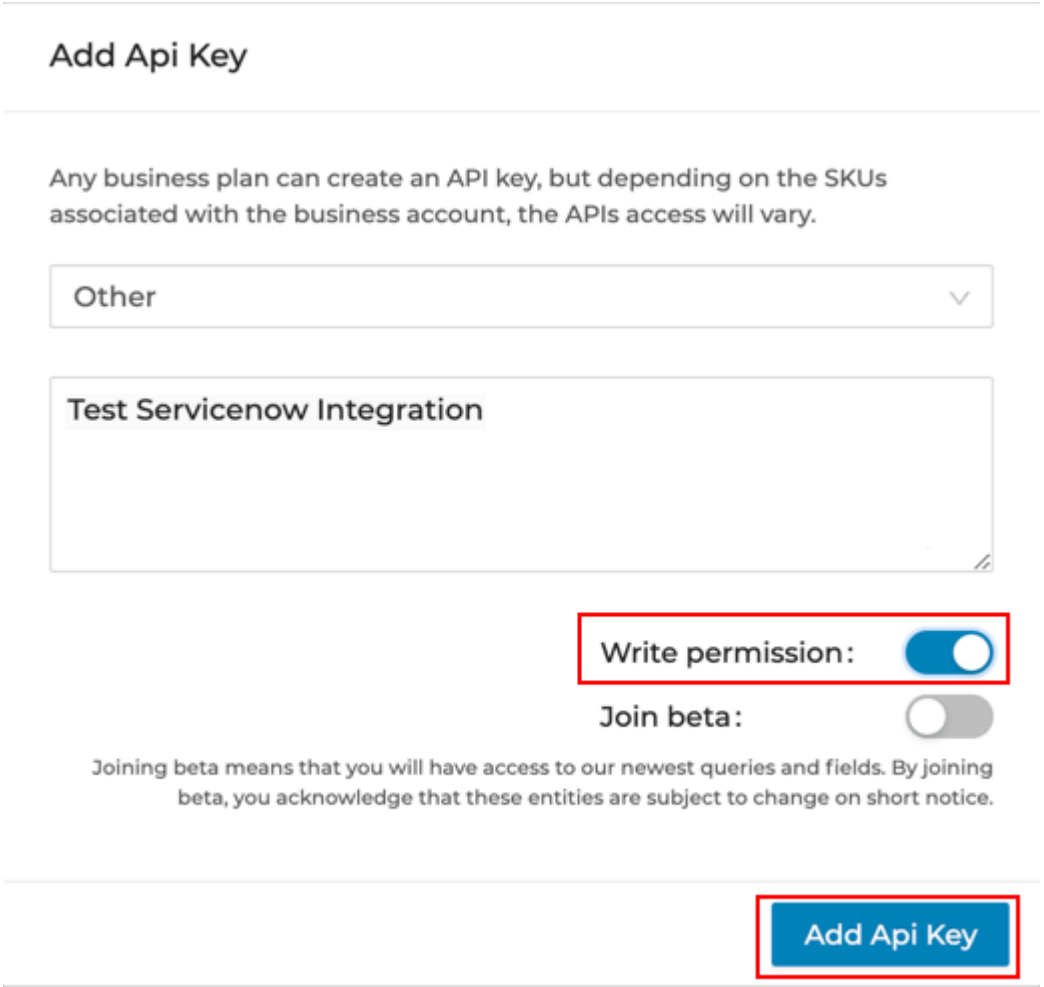
d. In the Pluralsight Developer Portal, click the **Manage Keys** tab.

e. Click **Add Api Key**.

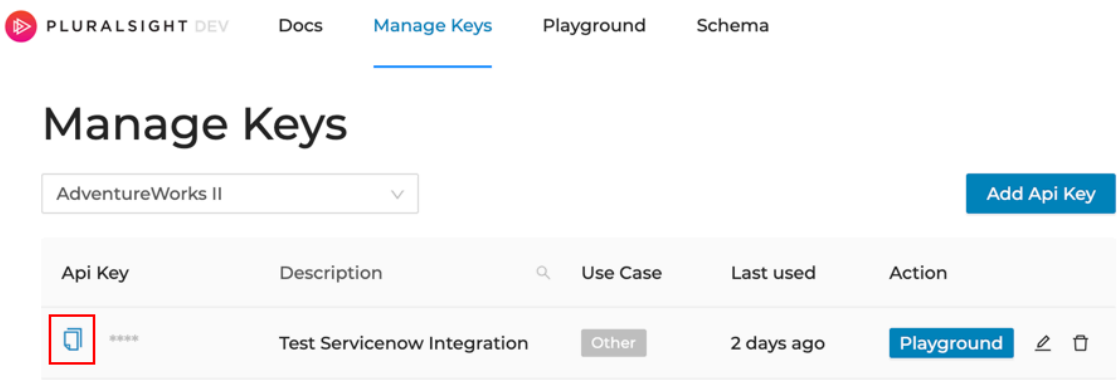


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. On the form, fill the fields and provide write permissions to the API Key.



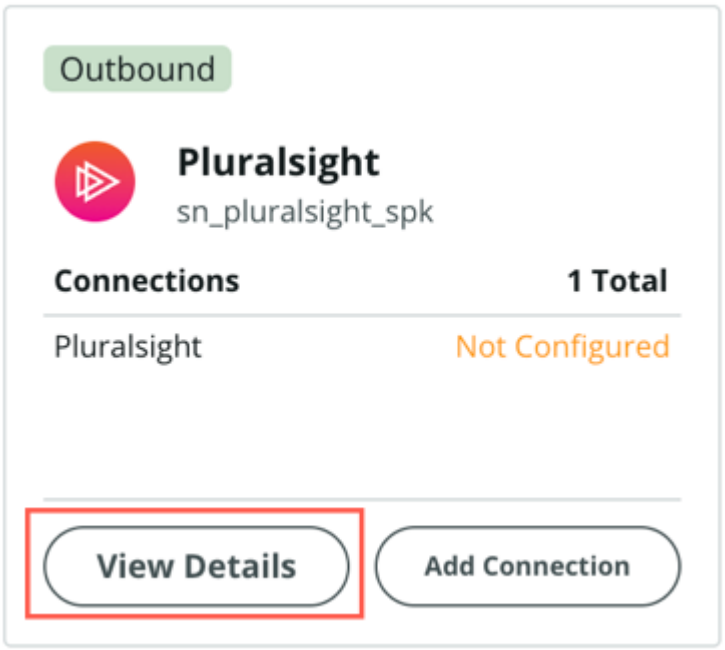
g. Copy the API Key for later use.



2. Log in to your ServiceNow instance.
3. Navigate to **All** > **Process Automation** > **Workflow Studio**.
4. Click the **Integrations** tab.
5. Under **Connections**, toggle and enable the **Outbound** connections.
6. Locate the alias for **Pluralsight** and click **View Details**.

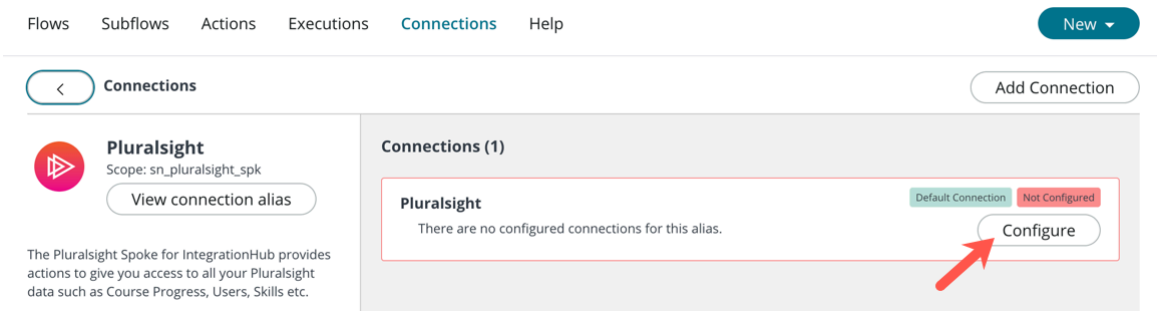
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Pluralsight spoke, click **View Details**.



- To manage more than one Pluralsight spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

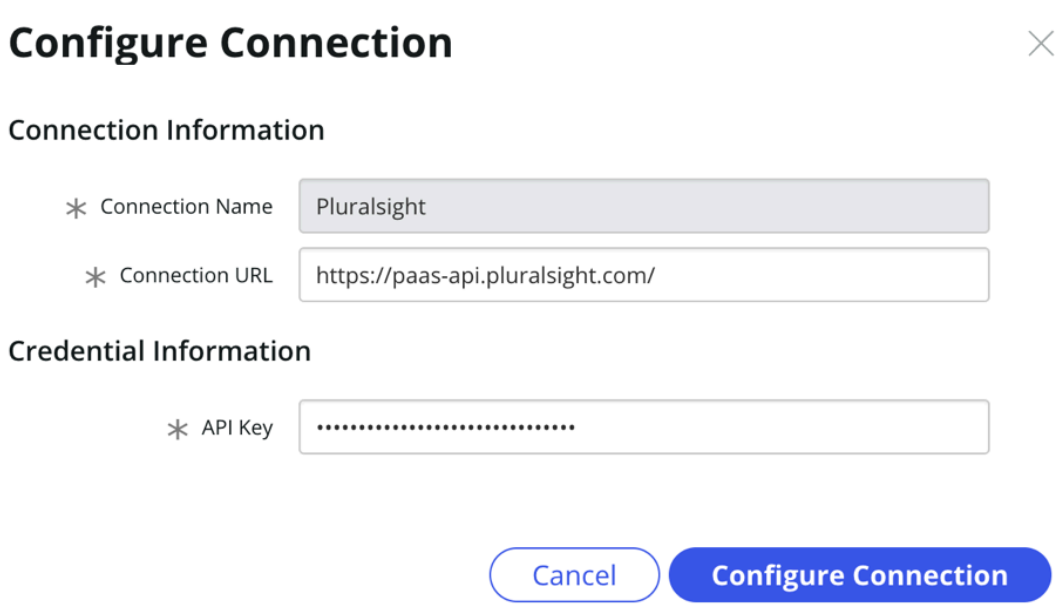


7. On the Configure Connection form, fill the values,

Configure Connection form

Connection Name	Name of the connection between the ServiceNow instance and the Pluralsight host. The connection name is read-only.
Connection URL	The URL to the Pluralsight skills account. Enter `https://paas-api.pluralsight.com/`
API Key	API key generated earlier from the Pluralsight developers portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Click **Configure Connection**.
   The connection and credentials connection record is created.

Qualtrics Spoke

Integrate ServiceNow instance with Qualtrics. Manage web-based survey distribution in Qualtrics from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Qualtrics spoke v1.3.0 is the latest version.

Supported versions

This spoke was built for Qualtrics v3, but may be compatible with later versions.

Spoke requirements

Qualtrics account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Qualtrics spoke provides sample flows to demonstrate automating the Qualtrics tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Create distribution when incident is closed	Creates a distribution for a survey and sends the survey to the incident caller, when an incident is closed.
Look up Contact by Email	Retrieves details of the customer and the customer score. That is, customer value and customer satisfaction, which can be high or low based on the configured decision policy.
Upsert Contact or Consumer to Qualtrics	Updates details of the existing consumer records or creates consumer record in Qualtrics. This flow is triggered when a record in created or updated in the Contacts and Consumers module of your ServiceNow instance. When a record is created the Contacts and Consumers module of your ServiceNow instance, the Upsert Contact or Consumer to Qualtrics flow is triggered and creates the record in Qualtrics. Also, Reference ID that is generated in Qualtrics, is updated in the Contacts and Consumers module of your ServiceNow instance.

Spoke subflows

The Qualtrics spoke provides sample subflows to demonstrate automating Qualtrics tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Look up Contact in Mailing List	Retrieves the look up ID of the specified contact.
Look up Mailing List by Name	Retrieves ID of the mailing list for the specified name.
Look up Message by Name	Retrieves ID of the message for the specified name.
Look up Survey by Name	Retrieves ID of the survey with the specified name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Qualtrics spoke provides actions to automate Qualtrics tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Contact Management	Create Contact	Creates a contact in the specified directory.
	Look up Contact by Email	Retrieves contacts in a directory of the required email address.
	Look up Contact Distribution Email History Stream	Retrieves the distribution email history for the specified contact in a directory.
	Look up Contact Distribution Response Histories Stream	Retrieves a list of distribution response history for a specified contact in a directory.
	Look up Contacts Stream	Retrieves a list of contacts from a directory.
	Update Contact	Updates the specified contact details in the specified directory.
Distribution Management	Create Distribution	Creates a distribution for a survey.
	Look up Distribution Links Stream	Retrieves a list of distribution links for an existing distribution of the specified survey.
	Look up Distributions Stream	Retrieves a list of distributions for a survey.
Library Management	Look up Library Messages Stream	Retrieves a list of messages in a library.
Mailing List Management	Create Contact in Mailing List	Creates a directory contact in a specified mailing list.
	Look up Contact in Mailing Lists Stream	Retrieves a contact from a mailing list in the specified directory.
	Look up Mailing Lists	Retrieves a list of mailing lists in a directory.
	Remove Contact from Mailing List	Removes a contact from the specified mailing list.
Metadata Retrieval	Look up Directories Metadata	Retrieves the metadata of a list of directories within a brand. **Note:** Ensure that this action is always used along with relevant actions that use dynamic inputs.
	Look up Libraries Metadata	Retrieves a list of libraries. **Note:** Ensure that this action is always used along with relevant actions that use dynamic inputs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Survey Management	Look up Surveys	Retrieves a list of surveys available to the user.
Event Subscription Management	Create Subscription	Creates an event subscription.
	Look up Subscription by Subscription ID	Retrieves all event subscriptions.
	Look up Subscriptions Stream	Retrieves all event subscriptions.

Spoke modules

The Qualtrics spoke provides these modules.

Module	Description
Contacts and Consumers	Create, view, and modify the contact and consumer records. When a record is created or updated here, the Upsert Contact or Consumer to Qualtrics flow is triggered.
Qualtrics Score Mapping Answers	View the score mapping answers.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Qualtrics spoke.

Set up the Qualtrics spoke

Integrate the ServiceNow instance and Qualtrics by registering Qualtrics as an OAuth provider to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Qualtrics spoke.
- Role required: admin.

Obtain required details from Qualtrics account

Copy and record the values of token, Organization ID, Client ID, and Client secret from your Qualtrics account for authentication.

Before you begin

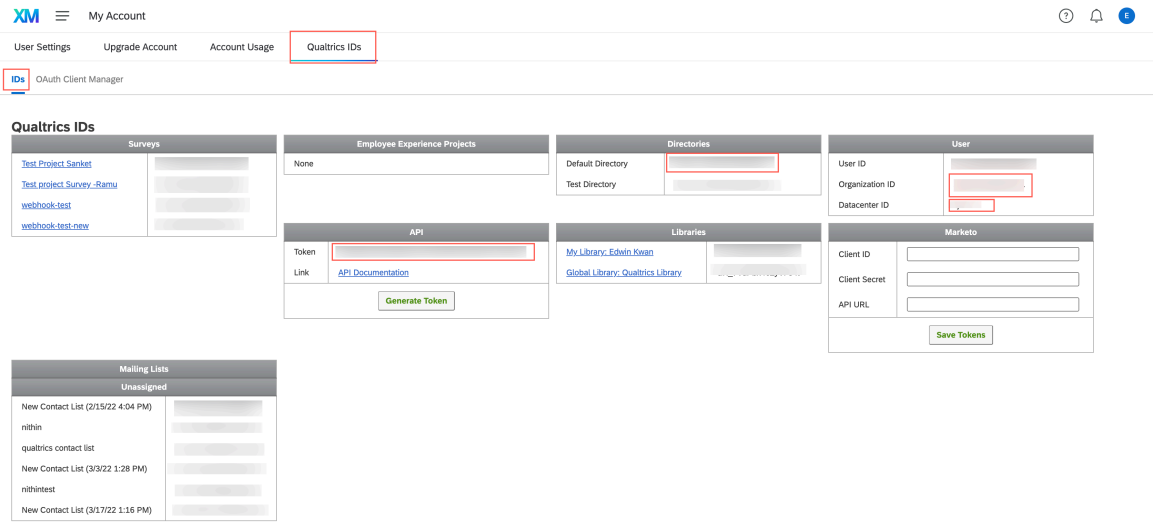
Role required: admin

Procedure

1. Log in to your Qualtrics account as an admin.
2. Navigate to **Account Settings** > **Qualtrics IDs**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

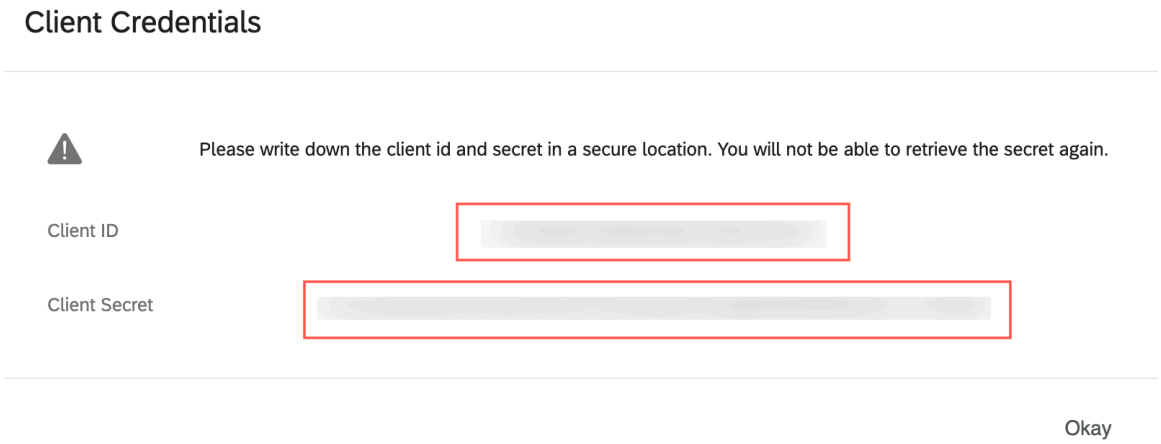
3. Under **User**, copy and record the values of **Organization ID** and **Datacenter ID**.
4. Under **Directories**, copy and record the value of **Default Directory**.
5. Under **API**, copy and record the value of **Token**.



6. Click the **OAuth Client Manager** tab.
7. Click **Create Client**.
8. On the form, fill the values.

Field	Description
Name	Name to identify the client record.
Scopes	Select `manage:all`.
Grant Type	Select `Client Credentials`.

9. Click **Create Client**.



The values of Client ID and Client Secret are displayed. Copy and record these values for later use.

Configure a connection

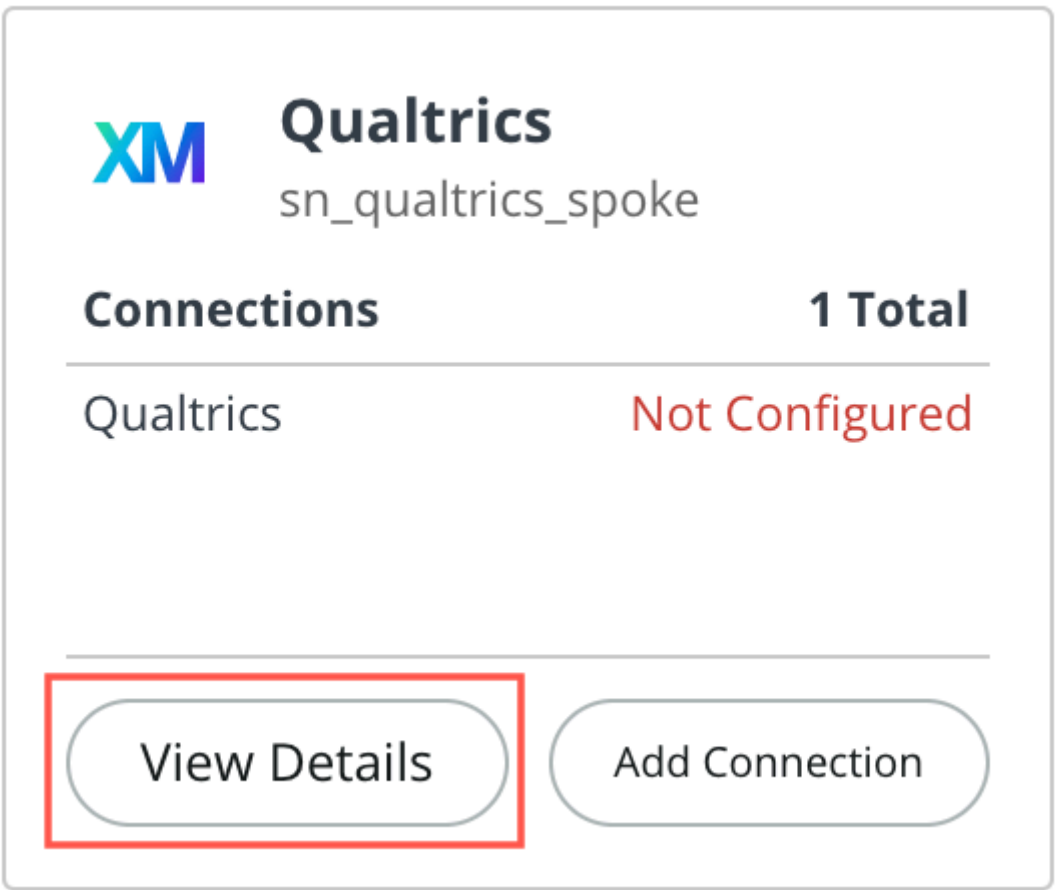
Add and configure a Qualtrics connection to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

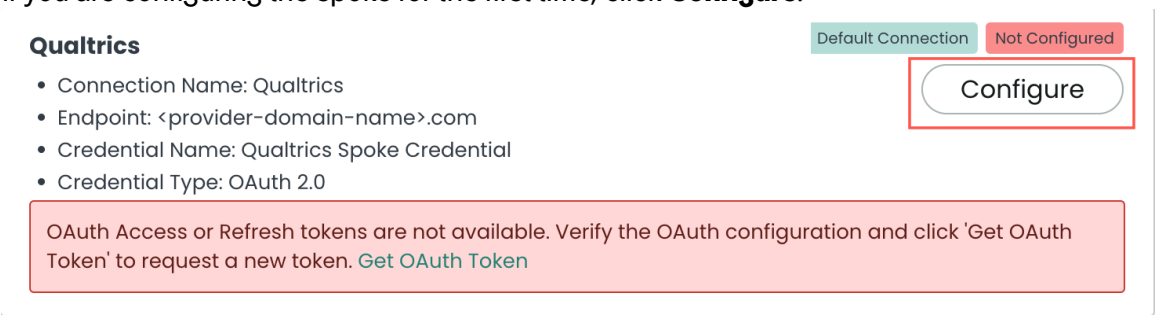
Before you begin
Role required: admin

Procedure
1. Navigate to **Process Automation** > **Flow Designer**.
2. Click the **Connections** tab.
3. Locate the alias for **Qualtrics** and click **View Details**.

> **Note:**
> Don't click **Add Connection**.



4. If you are configuring the spoke for the first time, click **Configure**.



5. On the Configure Connection form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to **Qualtrics**. Enter: `https:<Organization-ID>.qualtrics.com/API/v3`
X-API-TOKEN	Unique token you had copied from the Qualtrics account settings.
OAuth Name	Name to identify the application registry record.
OAuth Client ID	Client ID you had copied when you created a client in your Qualtrics account.
OAuth Client Secret	Client Secret you had copied when you created a client in your Qualtrics account.
Token URL	OAuth server token endpoint. Enter: `https://<Data-Center-ID>.qualtrics.com/oauth2/token`. **Note:** Select the Qualtrics data center based on your geographic location.

6. Click **Configure and Get OAuth Token**.

Result
The spoke is configured and ready to be used.

Configure system parameter

Configure the system parameter *sn_qualtrics_spoke.qualtrics_directory* and specify the Qualtrics Directory ID that can be used in the flows.

Before you begin
Role required: admin.

Procedure

1. In the filter navigator, enter `sys_properties.list`.
2. Search and open the record with **Name** as **sn_qualtrics_spoke.qualtrics_directory**.
3. In **Value**, specify the Qualtrics Directory ID.
4. Click **Update**.

Rally Spoke

Manage subscriptions for Rally by analyzing usage based on last login and activity time to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Rally spoke v1.0.3 is the latest version.

Spoke requirements

Rally account with an admin role.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream Inputs (com.glide.hub.action_type.datastream)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses when used outside the spoke implementation.

Spoke actions

The Rally spoke provides actions to automate Rally tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Subscription Management	Look up Subscriptions Stream	Retrieves all subscriptions.
User Management	Look up Users Stream	Retrieves all users in an account.
	Update User	Modifies the specified user's details.
	Delete User	Deletes the specified user and associated records from the account.
	User Inputs - Dynamic	Retrieves the list of fields to be used as dynamic input.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Rally spoke.

Set up the Rally spoke

Integrate the ServiceNow instance and Rally by using Rally credentials to authenticate ServiceNow requests.

Register a Rally OAuth application

Register the Rally OAuth application to access the Rally API 2.0 and to receive a Client ID and Client secret.

Before you begin

- Request an Integration Hub subscription.
- Activate the Rally spoke.
- Role required: admin.

Procedure

1. Log in to CA Agile Central by using your admin credentials.
2. Select **OAUTH CLIENTS** > **Create New Client**.
3. In the Create Oauth Client dialog box, fill in the fields.

Field	Value
Application Name	Provide a name for the application.
Callback URL	Callback URL of the ServiceNow instance to which the application is to be integrated. For example, `https://<instance_url>/oauth_redirect.do`.

4. Select **Next**.
5. Copy the Client ID and Client secret for later use.

Redox Electronic Health Record Spoke

Enable communications with your customers using the Redox platform from your ServiceNow instance.

Important:

Starting with the Yokohama release, Redox Electronic Health Record Spoke is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported.

For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Redox Electronic Health Record Spoke v1.0.3 is the current version.

Key features

The Redox Electronic Health Record Spoke enables a hospital, payer (insurance), or life sciences company to:

- Enable interoperability with an electronic medical record (EMR) or another healthcare system by leveraging the ServiceNow Healthcare and Life Sciences data model that is based on the Health Insurance Portability and Accountability Act (HIPAA) and the Health Level Seven International (HL7) industry standards. For more information, see Healthcare and Life Sciences data model.
- Improve patient care and reduce cost by reducing data duplicity and entry.
- Connect to the healthcare ecosystem by enabling patient-centric workflows.

Spoke requirements

- Administrator access to the Redox Dashboard.
- **API Key** and **Source Secret**. You can find these values in the dashboard of your Redox account. For more information, see Authenticate an API key in the Redox documentation.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Redox Electronic Health Record Spoke provides actions to automate Redox tasks when events occur in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Scheduling	Create Appointment	Creates a new appointment.
	Reschedule Appointment	Reschedules an existing appointment.
	Modify Appointment	Modifies an existing appointment.
	Cancel Appointment	Cancels an existing appointment.
	Look up Booked Appointments	Queries and returns booked appointments within a given time range.
	Look up Available Slots	Queries and returns times available for booking an appointment within a given time range.
Clinical Summary	Look up Latest Clinical Summary	Queries and returns the most recent clinical summary for a given patient at the specified health system.
	Look Up Visit Summary	Queries and returns visit summaries for a given patient at the specified health system within the specified time frame.
	Send Visit Information	Sends a visit summary to another application or to an EHR.
Media	Create Media Document	Adds a new media document to the patient's chart.
	Replace Media Document	Replaces a media document that was previously added to the patient's chart.
	Delete Media Document	Deletes a media document that was previously added to the patient's chart.
	Look Up Media Documents	Queries and returns media documents based on the specified filter criteria.
Notes	Create Note Document	Adds a new note document to the patient's chart.
	Replace Note Document	Replaces a note document that was previously added to the patient's chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Note Document	Deletes a note document that was previously added to the patient's chart.
	Look Up Note Documents	Queries and returns note documents based on the specified filter criteria.
Patient Education	Send Patient Education	Adds education assignments to a patient's chart.
	Send Patient Update	Updates education assignments in a patient's chart.
	Send Patient Education Delete	Removes education assignments from a patient's chart.
Patient Admin	Look up Patient Demographics and Visit Information	Queries and returns patient demographics and visit information.
	Look up Admitted Patients	Queries and returns all currently admitted patients from a facility.
Referral	Update Referral	Modifies a referral.
Result	Look up Results	Queries and returns results of diagnostic tests including labs, radiology, and imaging.
	Pull Diagnostic Info	Displays a diagnostic result message.
Vaccination	Look up Patient Vaccinations	Queries and returns patient's vaccinations based on demographic data.
	Look Up Vaccine Administration	Queries and returns vaccine administration information.
Patient Search	Look Up Patient	Queries and returns an existing patent record.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Set up the Redox Electronic Health Record Spoke.

Set up the Redox Electronic Health Record Spoke

Integrate your ServiceNow instance and the Redox engine with both inbound and outbound configuration.

Before you begin

Important:

Starting with the Yokohama release, Redox Electronic Health Record Spoke is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported.

For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

- Request an Integration Hub subscription.
- Ensure you have the admin access to the Redox engine dashboard https://dashboard.redoxengine.com/#/login.
- Activate the Redox Electronic Health Record Spoke.
- Role required: admin.

About this task

This task gives the procedure to set up both the inbound and outbound transactions between your ServiceNow instance and the Redox engine. After you configure the inbound transactions, the Redox engine can make calls to the ServiceNow REST Application Programming Interface (API). The outbound setup enables the ServiceNow instance to get authenticated and connect with the Redox engine.

Procedure

1. Create a Redox Electronic Health Record Spoke connection and credential record.
   This procedure enables the outbound transactions.
2. Configure the external Redox healthcare system as a source system for the Redox Electronic Health Record Spoke.
   This procedure enables the inbound transactions.

Create a Redox Electronic Health Record Spoke connection and credential record

Enable your ServiceNow instance to connect with the Redox engine by setting up a connection and credential record.

Before you begin

Important:

Starting with the Yokohama release, Redox Electronic Health Record Spoke is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported.

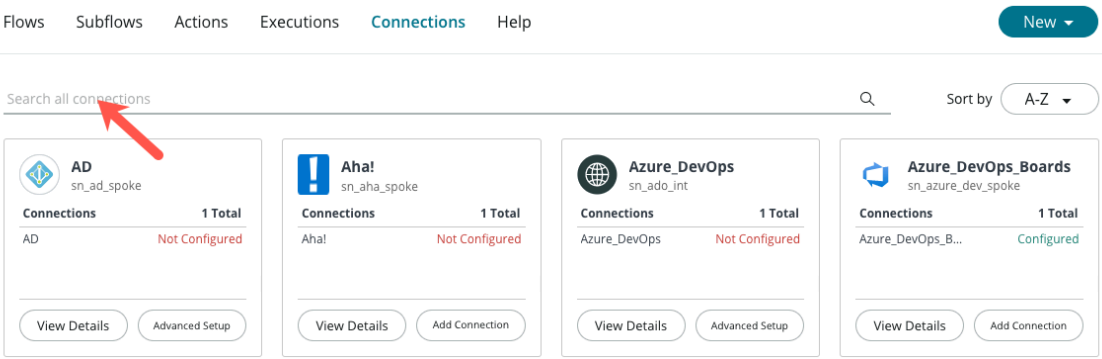
For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Role required: admin

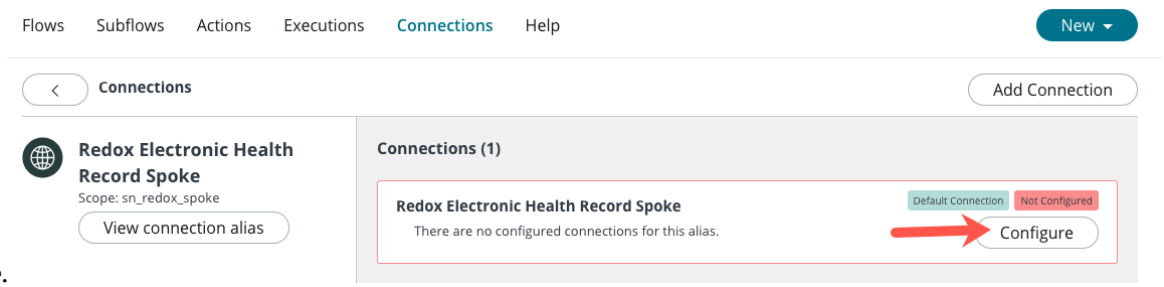
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to your ServiceNow instance.
2. Navigate to **All** > **Process Automation** > **Flow Designer**.
3. On the Flow Designer page, select Connections.
4. In the Search all connections field, enter *Redox*.



5. On the Redox Electronic Health Record Spoke card, click **View Details**.
6. Click **Configure**.



7. In the Configure Connection form, fill details.

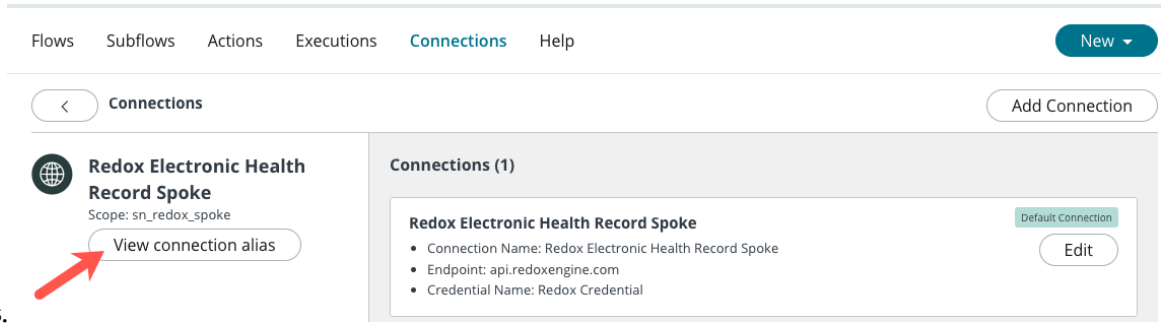
Configure Connection form

Field	Description
Connection Name	Name of the connection. **Note:** If you're creating the first record, then Redox Electronic Health Record Spoke is the default name and it's read-only. If you create any record after that, you can provide custom connection name.
Connection URL	The URL to connect to the Redox engine. Enter https://api.redoxengine.com/.
Name	Name of the Redox Electronic Health Record Spoke credential. The default name is Redox credential but you can update it.
API Key	The API key to access the Redox engine dashboard. You must generate the key on the Redox engine dashboard https://dashboard.redoxengine.com/#/login. **Tip:** To learn how to generate the API key, see the Redox developer documentation.

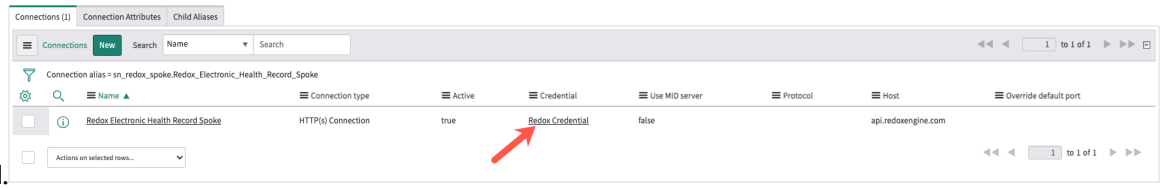
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Secret	The source secret to access the Redox engine dashboard. You must generate the secret on the Redox engine dashboard https://dashboard.redoxengine.com/#/login. **Tip:** To learn how to generate the secret, see the Redox developer documentation.

8. Click **Configure Connection**.
   The connection and credential record is created.
9. Click **View connection alias**.



10. In the **Credential** column, select **Redox Credential**.



11. On the Redox credential page, click **Get Token** to generate a token for raising authenticated requests from the spoke actions.

Configure the external Redox healthcare system as a source system for the Redox Electronic Health Record Spoke

Enable the Redox Electronic Health Record Spoke to send data to the external Redox healthcare system by configuring the source and destination IDs of the system in your ServiceNow instance.

Before you begin

Important:

Starting with the Yokohama release, Redox Electronic Health Record Spoke is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported.

For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

- Configure the Source system [sn_hcls_source_system] table to send data to an external Redox healthcare system by using the Redox Inbound Integration application.
  For more information, see Configure an external Redox healthcare system as a source system for a custom integration.
- Specify the destination ID used in the Source system [sn_hcls_source_system] table for each spoke action in your flow.

Roadmunk Spoke

The Roadmunk spoke provides actions to view and analyze meaningful usage data for Roadmunk software subscriptions. Analyze usage for your Roadmunk account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Roadmunk spoke v1.6.6 is the latest version.

Supported versions

This spoke was built for the Roadmunk June 2021 release version, but may be compatible with later versions.

Spoke requirements

Roadmunk account with an Account Admin user role.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Roadmunk spoke provides actions to automate Roadmunk tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Account Management	Look up Account	Retrieves information about a Roadmunk account.
Feedback Management	Look up Feedback Stream	Retrieves a list of all feedback.
Idea Management	Look up Ideas Stream	Retrieves a list of all ideas.
Roadmap Management	Look up Roadmaps Stream	Retrieves a list of all roadmaps.
User Management	Look up Users Stream	Retrieves a list of all users within an account.
	Look up Users Using File	Retrieves a list of users from a file that is attached to a record.
	Deactivate User	Deactivates a Roadmunk user.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Roadmunk spoke.

Set up the Roadmunk spoke

Integrate the ServiceNow instance and Roadmunk by using an API access token to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Roadmunk spoke.
- Roadmunk role required: Account Admin.
- Role required: admin.

Generate a Roadmunk API access token

Generate an API access token that authorizes access to the Roadmunk GraphQL API.

Before you begin

Role required: Roadmunk Account Admin

Procedure

1. From a web browser, open Roadmunk.
2. Log in using your account admin credentials.
   The Roadmunk dashboard opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the left navigation menu of the Roadmunk dashboard, click your profile icon and then select **Account Settings**.
   Your account settings open.
4. On the page header of your account settings, select the **Integrations** tab.
5. Under Existing Integrations, click **Add an integration**.
6. When prompted to select an integration to configure, select **API Tokens**.
   The Roadmunk API Tokens form opens.
7. Enter a name for your API access token in the **Application Name** field.
8. Click **Create API Token**.
   The API access token generates and then the API Token Created dialog box opens.
9. On the dialog box, copy your API access token by clicking **Copy To Clipboard**.
   Save it in a secure location for later use.

Create a Roadmunk connection

Create a connection between your Roadmunk applications and your ServiceNow instance so that your instance can retrieve user data from your applications.

Before you begin

Role required: admin

Procedure

1. From your ServiceNow instance, navigate to **Process Automation** > **Flow Designer**.
   The Flow Designer launches in a new tab.
2. Select the **Connections** tab.
3. Locate your Roadmunk connection and then click **Add Connection**.
   The Create Connection dialog box opens.
4. On the dialog box, fill in the fields.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the Roadmunk connection. This field populates automatically.
Connection URL	URL for the connection. This field is automatically set to **https://app-gateway.roadmunk.com**, where **app** is the default geographic region (North America) in which the connection is being created. If you are creating the connection outside of the default **app** (North America) region, you can change the value of the region to either **eu** (Europe) or **apac** (Asia-Pacific Region).
Credential Information	
API Token	API access token that authorizes access to the Roadmunk GraphQL API. Enter the same API access token that you generated in Generate a Roadmunk API access token.

5. Click **Create Connection**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Saba Spoke

The Saba spoke enables you to pull learning courses, course activity and users from a Saba instance into a ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Saba spoke v1.1.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - JSON Parser [com.glide.hub.action_step.jsonparser]
- IntegrationHub Standard Spokes [com.glide.hub.action_step.xmlparser]

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke flows

The Saba spoke provides a flow to pull tokens on a scheduled basis. Enable the flow to ensure that the spoke actions work properly.

Flow	Description
Get Saba Token	Retrieves access token for Saba and generates a new refresh token after every six days.

Spoke actions

The Saba spoke provides actions to automate Saba tasks when events occur in the ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Get Authorization Code	Retrieves the authorization code that is required to get the access token in the Saba system.
Get Access Token	Retrieves the access token for Saba based on username, password, authorization code, connection alias, and application registry.
Get Refresh Token	Retrieves the refresh token for Saba.
Get Saba System Timezone Difference	Compares the time zones of the Saba system and ServiceNow platform and retrieves the difference.
Look up Courses Stream	Retrieves the main view to get course data. This is based on filters such as count per page, and start page.
Look up User Course Activity Stream	Retrieves user progress on course items.
Look up Users Stream	Retrieves data of employees from the the Saba system.
Save Assignment	Creates or updates a standard assignment.

Spoke module

The Saba spoke adds a Saba application to your ServiceNow instance. The Saba application has the following module:

Module	Description
Credentials	Details required to pull tokens from the Saba system.

Saba spoke account requirements

The Saba spoke requires registering an OAuth 2.0 application in your Saba account to generate OAuth 2.0 tokens for the Saba spoke. Record the generated Client ID, Client Secret, Application key, Integration user name, and password for later use.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up Saba spoke.

Set up Saba spoke

Integrate your Saba application with your ServiceNow instance. Register an OAuth application in Saba and authenticate requests from a ServiceNow instance.

Before you begin

- Request Integration Hub subscription.
- Activate the Saba spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Saba integration user or admin credentials.
- Role required: admin.

Note:
Make sure that the application registry, connections, and credentials are within the application scope.

Register Saba as an OAuth provider

Use the information generated during the Saba application creation and configuration to register Saba as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin.

Procedure

1. Navigate to **System OAuth** > **Application Registry**.
2. Open the record for the Saba spoke.
3. On the form, fill in the fields.

Application Registries

Field	Value required
Name	Name to uniquely identify the record.
Client ID	Client ID created during the application configuration in Saba.
Client Secret	Client Secret created during the application configuration in Saba.
Default Grant type	Grant type used to establish the token: **Authorization Code**
Application	Application scope that contains this record: **Saba Spoke**
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry. Select the option.
Token URL	OAuth server token endpoint.

4. Right-click the form header, and click **Save**.

Create connection record for the Saba spoke

Create connection records to your Saba application. The Saba spoke connection and credential alias uses these connections to perform actions in Saba.

Before you begin
Role required: admin

Procedure

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record for the Saba spoke.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP(s) Connection form

Field	Value required
Name	Name to uniquely identify the connection record.
Credential	OAuth credential record you created for Saba.
Connection alias	Alias record associated with this connection. For example, enter `sn_saba_spoke.Saba`
URL builder	**Note:** Do not select the check box.
Connection URL	URL of the Saba instance.
Use MID server	This field isn't applicable.
Active	Option to actively use the connection. Select the option.
Domain	Domain that the action or activity runs in.

5. Click **Submit**.

Create credential record for the Saba spoke

Authorize the Saba spoke actions by creating credential records for the application registered in Saba. The Saba spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

Field	Description
Name	Name to uniquely identify the record. For example, Saba.
Active	Option to actively use the credential record. Select the option.
OAuth Entity Profile	Default OAuth entity profile of the Saba spoke.
Order	Order that the credentials are used. For example, enter `100`.

5. Right-click the form header and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create basic Auth credentials for the Saba spoke

Integrate the ServiceNow instance and Saba instance by using the basic Auth credentials to authenticate ServiceNow requests.

Before you begin

Role required: admin.

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select Basic Auth Credentials.
4. On the form, fill in the fields.

Field	Description
Name	Name to uniquely identify the record. For example, Saba.
User name	User name to be entered as credential.
Password	Password to be entered as credential.
Active	Option to actively use the credential record. Select the option.
Order	Order that the credentials are used. For example, enter `100`.

5. Right-click the form header and click **Save**.

Provide Saba user credentials

Create a record to provide details and credentials of the required Saba user. The Saba spoke uses these user credentials to perform actions in Saba.

Before you begin

Role required: admin.

Procedure

1. Navigate to **Saba** > **Credentials**.
2. Click **New**.
3. On the form, fill these values.

Saba Credentials form

Field	Descriptions
Credential	Reference to the Saba integration user credential record.
Connection & Credential Alias	Default alias record associated with the Saba spoke.
Refresh Token Expires	Date and time by when the Saba refresh token expires. Once the Get Saba Token flow is activated, the Saba spoke generates a new token periodically, before the current refresh token expires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Submit**.
5. To generate the Saba token, click the **Get Saba Token** related link.

Salesforce Marketing Cloud Spoke

The Salesforce Marketing Cloud spoke is built by Bristlecone, Inc. This spoke provides actions to retrieve records from your Salesforce Marketing Cloud data extensions and retrieve and update user information.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Salesforce Marketing Cloud spoke v1.5.2 is the latest version.

Supported versions

This spoke was built for Salesforce Marketing Cloud Corporate Edition.

Spoke requirements

Admin user with privileges to create new users and roles in Salesforce Marketing Cloud.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Salesforce Marketing Cloud spoke provides actions to automate Salesforce Marketing Cloud tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Data Extension Management	Look up Data Extension Attributes	Retrieves records from data extensions with less than 2500 records.
	Look up Data Extension Attributes for Bulk Records Stream	Retrieves bulk records from data extensions.
User Management	Look up Users Stream	Retrieves user properties for your Salesforce Marketing Cloud users based on the specified user properties and associated filters.
	Update User by User ID	Updates user properties based on the user ID.

Spoke tables

The Salesforce Marketing Cloud spoke adds the following table:

Table	Description	Fields
Configurations	Displays the list of Salesforce Marketing Cloud configurations, such as data extensions.	• Configuration Type • Configuration Value

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

The Salesforce Marketing Cloud spoke uses a Connection & Credential alias for the connection setup and the user profile that is attached to the SOAP security policies for the credential setup. If you are connecting to multiple Salesforce Marketing Cloud environments, you must use the same credential information in each environment.

For information about setting up the spoke, see Set up the Salesforce Marketing Cloud spoke.

Set up the Salesforce Marketing Cloud spoke

Integrate the ServiceNow instance and Salesforce Marketing Cloud by using Salesforce Marketing Cloud credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Salesforce Marketing Cloud spoke.
- Salesforce Marketing Cloud role required: admin user with privileges to create new users and roles.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. **Optional:** Using basic authentication for Salesforce Marketing Cloud spoke
2. **Optional:** Using OAuth 2.0 for Salesforce Marketing Cloud spoke

Using basic authentication for Salesforce Marketing Cloud spoke

You can use basic authentication to validate ServiceNow requests instance with Salesforce Marketing Cloud spoke.

Create a user for accessing the Salesforce Marketing Cloud SOAP API

Create a user with which you can access the Salesforce Marketing Cloud SOAP API. The SOAP API enables you to retrieve records from your Salesforce Marketing Cloud data extensions and get information about your Salesforce Marketing Cloud users.

Before you begin

Role required: Salesforce admin user with privileges to create new users and roles.

Procedure

1. From a web browser, go to your Salesforce Marketing Cloud instance.
2. Log in using your admin credentials.
3. On the page header of your instance, click your profile icon and then select **Setup**.
   The Setup page opens.
4. Create a Salesforce Marketing Cloud user.

   a. Navigate to **Administration** > **Users** > **Users** and then click **Create**.
   The New User form opens.

   b. In the General Settings form section, fill in the fields.

General Settings

Field	Description
Name	Name of the user.
Reply Email Address	Email address that you want to send and reply to email messages from. Salesforce Marketing Cloud also sends forgotten password requests to this email address. After you enter an email address, click **Verify** to verify the email address.
Add to From Name Dropdown	Option to send the reply email address through a domain verification process before the email address populates in an email.
Notification Email Address	Email address that you want to send Salesforce Marketing Cloud notifications to.
Username	Username for the user.
External Key	Key that uniquely identifies the user during API calls.
Time Zone	Time zone in which the user is located.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Culture Code	Language that is used on the Salesforce Marketing Cloud user interface for this user.
API User	Option indicating whether the user can access the Salesforce Marketing Cloud APIs. Select the check box to enable this option.
Temporary Password	Temporary password with which the user can log in for the first time. The user is prompted to change this password on the first login.
Verify Password	Field to verify the temporary password.

c. Click **Save**.

5. Create a user role that enables assigned users to access the Salesforce Marketing Cloud SOAP API and also manage users and data extensions.

a. Navigate to **Administration** > **Users** > **Roles** and then click **Create**.
The New Role form opens.

b. In the Properties form section, fill in the fields.

Properties

Field	Description
Name	Name of the user role.
External Key	Key that uniquely identifies the user role.
Description	Description of the user role.

c. In the Permissions form section, expand the **Email** > **Subscribers** > **Data Extension** permission category and then select the **Allow** check box for the View and Manage Data access permissions.

d. Expand the **Email** > **Admin** > **API Access** permission category and then select the **Allow** check box for the WebService API access permission.

e. Expand the **Administration** > **Users** permission category and then select the **Allow** check box for the following access permissions:

- View
- Update
- Disable
- Manage Business Units

f. Click **Save**.

6. Assign the user role to your Salesforce Marketing Cloud user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Administration** > **Users** > **Users**.

b. From the list of available users, select the check box for the user that you created in step 4.

c. Click **Manage Roles**.
The Roles form for the selected user opens.

d. In the Roles form section, click **Edit Roles**.

e. When the list of available roles appears, select the check box for the user role that you created in step 5.

f. Click **Save**.

Create a connection and credential for Salesforce Marketing Cloud

Create a connection and credential for Salesforce Marketing Cloud so that you can connect your ServiceNow instance with the Salesforce Marketing Cloud SOAP API.

Before you begin

Role required: admin

Procedure

1. From your ServiceNow instance, navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. From the list of available connection and credential aliases, select **SalesforceMarketingCloud**.
3. On the Connection & Credential Aliases form, click the **Create New Connection & Credential** related link.
The Create Connection and Credential dialog box opens.
4. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Please Enter the Connection Information	
Connection Name	Name of the connection.
SOAP Connection URL	URL of your SOAPConnection endpoint. Enter `https://<subdomain>.soap.marketingcloudapis.com/Service.asmx`, where <*subdomain*> is your Salesforce Marketing Cloud subdomain.
Please Enter the Credential Information	
Username Profile Name	Name of your credentials.
Username	Username of the user that you can access the Salesforce Marketing Cloud SOAP API with. Enter the username of the user that you created in Create a user for accessing the Salesforce Marketing Cloud SOAP API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Password of the user that you can access the Salesforce Marketing Cloud SOAP API with. Enter the password of the user that you created in Create a user for accessing the Salesforce Marketing Cloud SOAP API.

5. Click **Create**.

Using OAuth 2.0 for Salesforce Marketing Cloud spoke

You can use OAuth 2.0 to validate ServiceNow requests instance with Salesforce Marketing Cloud spoke.

Create OAuth 2.0 credentials for Salesforce Marketing Cloud spoke

Create Salesforce Marketing Cloud OAuth 2.0 credentials to use Salesforce Marketing Cloud spoke.

Before you begin

Role required: Salesforce Marketing Cloud admin

Procedure

1. Log in to the Salesforce Marketing Cloud tenant.
2. Navigate to **Setup Home** > **Platform Tools** > **Apps** > **Installed Packages**.
3. Select **New** to create a package.
4. Select **Add Component**.
5. Select **API Integration** to integrate Salesforce Marketing Cloud APIs to your application.
6. Select **Next**.
7. Select **Server-to-Server** as the integration type.
8. Select **Next**.
9. Select the required scopes for your integration.
10. Select **Save**.
    Your Client Id and Client Secret gets displayed in your configuration summary. Navigate to the Components section under **SETUP** > **INSTALLED PACKAGES** > **DETAILS** to view the Client Id and Client Secret. Copy the values to use them later.

Create a connection and credential for Salesforce Marketing Cloud spoke

Create a connection and credential for OAuth 2.0 authorization of Salesforce Marketing Cloud spoke.

Before you begin

Role required: admin

- Create OAuth 2.0 credentials for Salesforce Marketing Cloud spoke

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the **SalesforceMarketingCloudSOAPConnection** record.
3. From the **Related Links** tab, click **Create New Connection & Credential** link.
4. On the Connection & Credential Aliases form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Name	Name to uniquely identify the connection. For example, `SFMC SOAP Connection`.
SOAP Connection URL	URL of your SOAP Connection endpoint. Enter `https://<subdomain>.soap.marketingcloudapis.com/Service.asmx`, where *<subdomain>* is your Salesforce Marketing Cloud subdomain.
OAuth Client ID	Client ID created for the Salesforce Marketing Cloud spoke.
OAuth Client Secret	Client secret created for the Salesforce Marketing Cloud spoke.
OAuth Redirect URL	OAuth redirect URL. It must be in the format `https://<instance-name.service-now.com>/oauth_redirect.do`.
Contacts Counts Data Extension	Name of the data extension that you want to retrieve Contacts Counts report data from.

5. Select **Create and Get OAuth Token**.

Salesforce Spoke

The Salesforce spoke is built by Bristlecone, Inc. Access and manage data in the Account, Contact, Case, Lead, Opportunity, Order, and User objects of your Salesforce instance from the ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Salesforce spoke v2.4.3 is the latest version.

Supported version

This spoke was built for the Salesforce API version v64.0, but may be compatible with later versions.

Spoke requirements

- Salesforce account
- Salesforce admin credentials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Salesforce connected app configured to integrate with ServiceNow
- Salesforce connected app details such as, consumer key and consumer secret.
- Integration Hub subscription

Note:
For users who have installed Salesforce spoke v1, you can't upgrade from Salesforce spoke v1 to Salesforce spoke v1.2 directly. To upgrade, you must uninstall the Salesforce spoke v1 and then, install the Salesforce spoke v1.2.

You must also note that, Salesforce spoke v1 is certified on New York and Salesforce spoke v1.2 is certified on Orlando and Paris.

Spoke subflows

The Salesforce spoke provides subflows to access and manage data in the Salesforce Account, Case, Contract, and Opportunity objects.

Subflow	Description
Account Subflow	Processes data in the account object when the Salesforce webhook is triggered.
Case Subflow	Processes data in the case object when the Salesforce webhook is triggered.
Contract Subflow	Processes data in the contract object when the Salesforce webhook is triggered.
Opportunity Subflow	Processes data in the opportunity object when the Salesforce webhook is triggered.
Salesforce Subflow	Processes data in any Salesforce object when the Salesforce webhook is triggered.

Spoke actions

The Salesforce spoke provides actions to access and manage data in the Salesforce , Account, Contact, Case, Lead, Opportunity, Order, and User objects.

Category	Action	Description
Account Management	Create Account	Creates an account in Salesforce.
	Look up Accounts	Retrieves all the account details based on the specified SOQL query.
	Look up Records for Account	Retrieves all the records for an account based on the given relationship name.
Record Management	Create Record	Creates a record in Salesforce. **Note:** Ensure that you use relevant actions to create records for Account, Contact, Case, Lead, Opportunity, Order, and User.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Record	Deletes a record in Salesforce.
	Get Record Details	Retrieves the specific record in Salesforce by Record ID.
	Look up Attachment from Records	Retrieves an attachment from a record if it was uploaded using the Salesforce Classic view.
	Look up Contracts	Retrieves all the contract details based on the specified SOQL query.
	Look up Related Records	Retrieves all the records for the specified object name associated with their given relationship name.
	Subflow Helper Action	Parses the subflow's JSON input and generates an array of object.
	Update Record	Updates a record in Salesforce.
	Look up Document from Record	Retrieves a document from a record if it was uploaded using the Salesforce Lightning view.
Case Management	Create Case	Creates a case in Salesforce.
Lead Management	Create Lead	Creates a lead in Salesforce.
Metadata Retrieval	Metadata - Check Service Cloud Feature	Checks whether Salesforce Service Cloud is enabled on the target Salesforce instance. To use this action, perform the steps outlined in the Create a Salesforce CRM integration profile section in Integrating with Salesforce CRM.
	Metadata - Get Account Types	Retrieves all the available account types in Salesforce.
	Metadata - Get Creatable Fields	Retrieves a list of creatable fields in a required standard or custom Salesforce table.
	Metadata - Get Creatable Objects	Retrieves a list of creatable objects in Salesforce.
	Metadata - Get Deletable Objects	Retrieves a list of deletable objects in Salesforce.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Metadata - Get Updatable Fields	Retrieves a list of updatable fields in a required standard or custom Salesforce table.
	Metadata - Get Updatable Objects	Retrieves a list of updatable objects in Salesforce.
	Metadata - Get Account Fields	Retrieves a list of fields in the Salesforce Account object.
	Metadata - Get Case Origin Values	Retrieves a list of case origins in Salesforce. The value field of the case origin from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get Case Priorities	Retrieves a list of case priorities in Salesforce. The value field of the case priority from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get Case Reasons	Retrieves a list of case reasons in Salesforce. The value field of the case reason from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get Case Status Values	Retrieves a list of case status values in Salesforce. The value field of the case status from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get Industries for Accounts	Retrieves all the industries available for accounts in Salesforce.
	Metadata - Get Industries for Lead	Retrieves a list of industries in the Salesforce Lead object. The value field of the industry from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get Lead Status	Retrieves a list of lead status values in Salesforce. The value field of the lead status from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get Objects	Retrieves all the available object names in Salesforce.
	Metadata - Get Opportunity Stages	Retrieves a list of opportunity stages in Salesforce. The value field of the opportunity stage from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get Opportunity Types	Retrieves a list of opportunity types in Salesforce. The value field of the opportunity type from the Salesforce response body is mapped to the name field in JSON output.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Metadata - Get Order Status Values	Retrieves a list of order status values in Salesforce. The value field of the order status from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get Organization Type	Retrieves the organization type of the Salesforce instance. To use this action, perform the steps outlined in the Create a Salesforce integration profile section in Integrating with Salesforce.
	Metadata - Get Record Fields	Retrieves all the record fields for the specified table name.
	Metadata - Get Relationship Fields	Retrieves all the relationship fields for the specified object name.
	Metadata - Get Relationship Names	Retrieves all the relationship names for the specified object name.
	Metadata - Get User Email Encodings	Retrieves a list of email encodings in the Salesforce User object. The value field of the email encoding from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get User Languages	Retrieves a list of languages in the Salesforce User object. The value field of the user language from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get User Locales	Retrieves a list of locales in the Salesforce User object. The value field of the user locale from the Salesforce response body is mapped to the name field in JSON output.
	Metadata - Get User Time Zones	Retrieves list of time zones in the Salesforce User object. The value field of the time zone from the Salesforce response body is mapped to the name field in JSON output.
Opportunity Management	Create Opportunity	Creates an opportunity in Salesforce.
Order Management	Create Order	Creates an order in Salesforce.
License Management	Look up User Licenses Stream	Retrieves user subscription information that is available in Salesforce. To use this action, perform the steps outlined in the Create a Salesforce CRM integration profile section in Integrating with Salesforce CRM.
	Look up Usage Based Entitlements Stream	Retrieves the consumption usage details for the resources. To use this action, perform the steps outlined in the Create a Salesforce CRM integration profile section in Integrating with Salesforce CRM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
User Management	Create User	Creates a user in Salesforce.
	Look up User Profiles	Retrieves a list of user profiles in Salesforce. The name and ID fields of the user profiles from the Salesforce response body are mapped to the label and name fields respectively in the JSON output.
	Look up User Roles	Retrieves a list of user roles in Salesforce. The name and ID fields of the user profiles from the Salesforce response body are mapped to the label and name fields respectively in the JSON output.
	Look up Users	Retrieves user attributes for Salesforce users. To use this action, perform the steps outlined in the Create a Salesforce CRM integration profile section in Integrating with Salesforce CRM.
	Remove User	Reclaims a user account in Salesforce. To use this action, perform the steps outlined in the Create a Salesforce CRM integration profile section in Integrating with Salesforce CRM.

Salesforce account requirements

The Salesforce spoke requires configuring your Salesforce account to generate an OAuth 2.0 JWT Bearer Grant token.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Salesforce spoke.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Salesforce alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Salesforce spoke

Integrate your Salesforce account with your ServiceNow instance. Create a custom OAuth application in Salesforce and authenticate requests from ServiceNow.

Before you begin

- Request an Integration Hub subscription
- Activate the Salesforce spoke
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Two spoke setup procedures are outlined here. Perform one of the procedures as per your requirement.

- To setup the spoke using OAuth authorization template, see Option 1: Set up the Salesforce spoke using OAuth authorization template.
- To setup the spoke using JWT signing key, see Option 2: Set up the Salesforce spoke using JWT signing key.

Note:
Don't delete the default connection alias record. This can result in an unexpected behavior. Configure your connection using the default connection alias.

Configure a connection for Salesforce spoke

Add and configure a Salesforce connection to authenticate ServiceNow requests in Salesforce spoke.

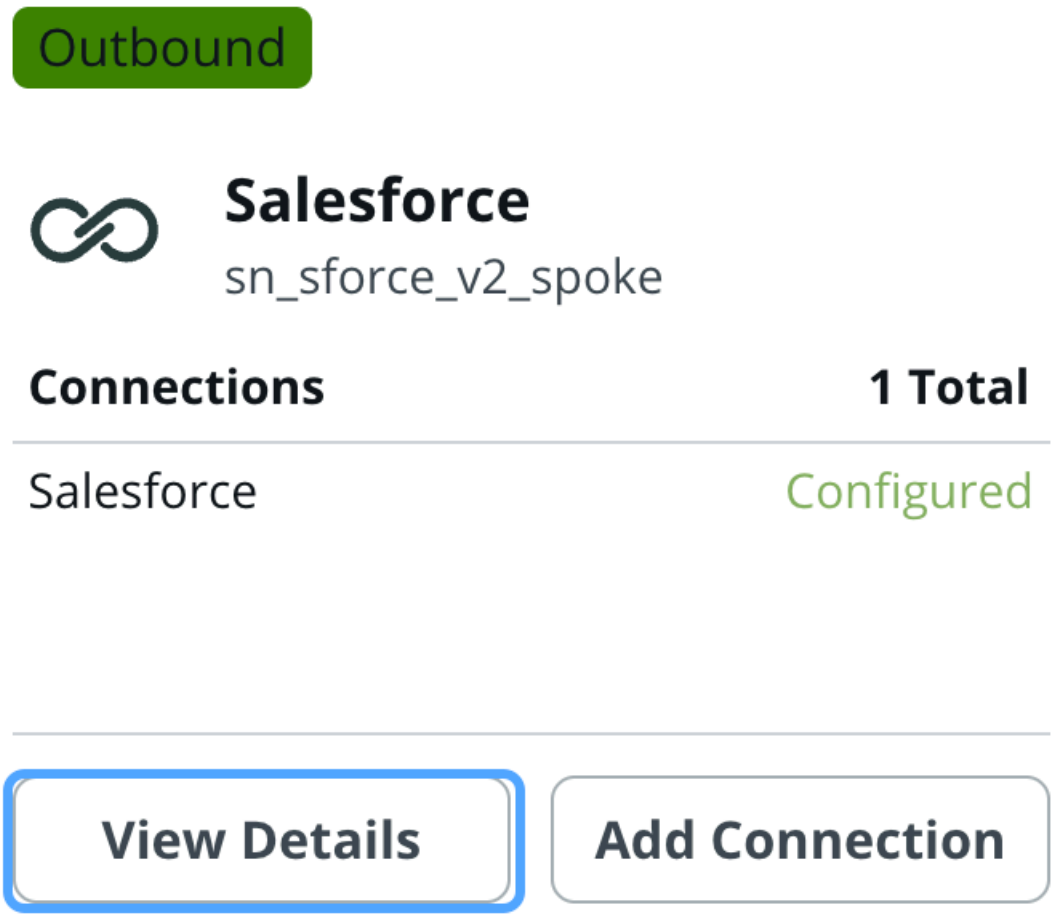
Before you begin
Role required: admin

Procedure

1. Navigate to **Process Automation** > **Workflow Studio**.
2. Select **Integrations**.
3. Select the **Connections** tab.
4. Use the search box to find the **Salesforce** connection alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **View Details**.



6. Configure the Salesforce connection.

   a. Add or edit a connection.

      - To set up an existing connection, select **Configure** or **Edit**.
      - To create and configure a new connection, select **Add Connection**.

      Note:
      To support multiple connections through a spoke, see Supporting multiple connections.

   b. On the configuration form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection. For example, `Salesforce`.
Connection URL (Instance URL)	URL to make a connection to Salesforce. Use this format: `https://<organization_name>.my.salesforce.com`.
Grant Type	OAuth grant type for authentication. Select one of the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ **Authorization Code** ▪ **Client Credentials**
OAuth Client ID	Client ID generated in Salesforce for OAuth authentication.
OAuth Client Secret	Client Secret generated in Salesforce for OAuth authentication.
OAuth Redirect URL	URL where Salesforce redirects after successful authentication. Use this format: `https://<instance_name>.service-now.com/oauth_redirect.do`.

c. Select **Save and Get OAuth Token**.

Result
The Salesforce spoke connection is configured and ready to be used.

Create a connected app in Salesforce

Create a connected app in your Salesforce account to enable OAuth 2.0 authentication with the Salesforce spoke.

Before you begin
- Salesforce account
- Role required: Salesforce admin

About this task
Complete these steps from your Salesforce account. See Create a Connected App in Salesforce Trailblazer forum documentation for instructions on creating and configuring connected apps.

Procedure
1. From your Salesforce account, create a connected app.
2. Configure the connected app to enable your Salesforce application to share data with your ServiceNow instance.

   a. Select **Enable OAuth Settings** and configure the authentication settings.

   b. If you want to set up the spoke using JWT signing key, select **Use Digital Signatures** and upload a Java KeyStore (JKS) certificate.

   c. Select the OAuth scopes:

Grant Type	OAuth scopes
Authorization Code	▪ **Access and manage your data (api)** ▪ **Perform requests on your behalf at any time (refresh_token, offline_access)**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Grant Type	OAuth scopes
Client Credentials	**Access and manage your data (api)**

d. Specify ServiceNow instance URL in Callback URL in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`

e. After creating the connected app, under **OAuth Policies** on the Edit Policies page, set these values:

Field	Value
Permitted Users	Admin approved users are pre-authorized
IP Restrictions	Relax IP Restrictions

f. Configure user provisioning for the connected app as per your requirement.

3. Record the values of **Consumer Key** and **Consumer Secret**.

Note:

- Assign profile and permission set as per your requirement.
- In OAuth app IP restrictions, specify OAuth policies to ensure that the connected app works like a default app.

Result

The connected app is created in Salesforce.

Option 1: Set up the Salesforce spoke using OAuth authorization template

Integrate your Salesforce account with your ServiceNow instance. Create a custom OAuth application in Salesforce and authenticate requests from ServiceNow using OAuth authorization template.

Before you begin

- Create a connected app in Salesforce
- Role required: admin

Procedure

1. Navigate to **Connection & Credentials** > **Connection & Credential Aliases**.
2. Open the record, **Salesforce**.
3. Click the **Create New Connection & Credential** related link.
4. On the form, fill these values.

Create Connection and Credential form

Field	Description
Connection name	Name to identify the connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL (Instance URL)	Base URL to connect to your Salesforce instance in this format: `https://<instance-name>.salesforce.com`
OAuth Client ID	Consumer key that you generated during the Salesforce connected app configuration.
OAuth Client Secret	Consumer secret that you generated during the Salesforce connected app configuration.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically.

5. Click **Create and Get OAuth Token**.
   The OAuth2 authentication dialog box is displayed.
6. Log in to the Salesforce admin account that you used to create your Salesforce application. Your ServiceNow instance creates an OAuth token for Salesforce and then automatically returns you to the Integration Profile form.
7. Click **Publish**.

Option 2: Set up the Salesforce spoke using JWT signing key

Integrate your Salesforce account with your ServiceNow instance. Create a custom OAuth application in Salesforce and authenticate requests from ServiceNow using JWT signing key.

Before you begin

- Create a connected app in Salesforce
- Role required: admin

Attach a Java Key Store certificate to the Salesforce spoke

Enable the JSON Web Token (JWT) Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Salesforce spoke.

Before you begin

- Valid Java KeyStore certificate
- Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. On the form, fill in the fields.

X.509 Certificate form

Field	Description
Name	Name to uniquely identify the record. For example, `Salesforce Certificate`.
Expiration notification	Option to send a notification when the certificate is about to expire.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Notify on expiration	Users that are notified when the certificate expires.
Warn in days to expire	Number of days to send a notification before the certificate expires.
Active	Option to actively use the certificate.
Format	Certificate format. The instance supports the PEM and DER formats.
Type	Type of certificate. Select **Java Key Store**.
Valid from	Date from which the certificate is valid.
Expires	Date on which the certificate expires.
Expires in days	Number of days until the certificate expires.
Key store password	Password associated with the certificate.
Short description	Summary about the certificate.
PEM Certificate	Contents of the X509 certificate.

4. Click the attachments icon ( ) and attach a JKS certificate.
5. Click **Validate Stores/Certificates**.

Result
The JKS certificate is created and attached to the Salesforce spoke.

Create a JWT signing key for the Salesforce spoke

Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Keys form

Field	Description
Name	Name to uniquely identify the JWT signing key. For example, `Salesforce JWT Keys`.
Signing Keystore	Valid JKS certificate attached in the previous task. For example, `Salesforce Certificate`.
Key Id	Key ID to identify which key is used when multiple keys are used to sign tokens.
Application	Application scope that contains this record. Select Salesforce spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Signing Algorithm	Algorithm to sign with the JWT key.
Signing Key Password	Password associated with the signing key.
Active	Option to actively use the certificate.

4. Click **Submit**.

Result
The JWT key is created and assigned to the JKS certificate.

Create a JWT provider for the Salesforce spoke

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Provider form

Field	Description
Name	Name to uniquely identify the JWT provider. For example, `Salesforce JWT Provider`.
Expiry Interval (sec)	Number, in seconds, to set the lifespan of JWT provider tokens.
Signing Configuration	JWT signing key from the previous step. For example, `Salesforce JWT Keys`.

4. Right-click the form header, and click **Save**.
   The Standard Claims and Custom Claims related lists are displayed.
5. In the **Standard Claims** related list, enter values for **iss**, **sub**, and **aud**.
   See OAuth 2.0 JWT Bearer Flow for Server-to-Server Integration in Salesforce Trailblazer forum documentation for instructions.
6. Click **Update**.

Result
The JWT provider is added to your ServiceNow instance.

Register Salesforce as an OAuth Provider

Use the information generated during Salesforce connected app configuration to register Salesforce as an OAuth provider and enable the instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message `What kind of OAuth application?`
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `Salesforce OAuth`.
Client ID	Consumer key that you generated during the Salesforce connected app configuration.
Client Secret	Consumer secret that you generated during the Salesforce connected app configuration.
OAuth API Script	Optional script to customize the request and response.
Default Grant type	Grant type used to establish the token. Select **JWT Bearer**.
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record. Select Salesforce.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Authorization URL	This field should be left blank.
Token URL	OAuth server token endpoint. ○ For production instance, enter `https://login.salesforce.com/services/oauth2/token`. ○ For sandbox instance, enter `https://test.salesforce.com/services/oauth2/token`
Token Revocation URL	This field should be left blank.
Redirect URL	This field should be left blank.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL** field.
   - The system populates **OAuth Entity Profile** with **Grant Type** as **JWT Bearer**. For example, **OAuth Entity Profile** is created with default **Name**, **Salesforce JWT provider default_profile** .
6. Copy the value from the **Redirect URL** field.
7. Click **Update**.
8. Log in to your Salesforce account to edit the configuration of your connected app. See the Salesforce Trailblazer forum documentation for instructions.
9. Paste the Redirect URL value into the Callback URL of your Salesforce connected app. For example, paste `https://<instance-name>.service-now.com/oauth_redirect.do`.

Result
The instance can request OAuth 2.0 tokens for the Salesforce spoke.

Note:
When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, a user with the admin role can regenerate the spoke OAuth token.

Create credential records for the Salesforce spoke

Create Credential records for the Salesforce connected app that you created. The Salesforce spoke connection and credential alias use these credentials to authorize actions.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `Salesforce Credentials`.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile that you created when you registered the Salesforce connected app as an OAuth provider. For example, select **Salesforce OAuth default_profile**.
Applies to	MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Order to apply this credential. For example, enter `100`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

Result
The credential record for the Salesforce spoke is created.

Create connection records for the Salesforce spoke

Create connection records for your Salesforce account. The Salesforce spoke connection and credential alias use these connections to perform actions in Salesforce.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Salesforce**.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Salesforce Connection`.
Credential	Credential record you that created for Salesforce. For example, select **Salesforce Credentials**.
Connection alias	Alias record associated with this connection.
URL builder	**Note:** Do not select the check box.
Connection URL	Base URL to connect to your Salesforce instance. For example, `https://<instance-name>.salesforce.com`.
Use MID server	Option to use a MID Server. If you select this check box, define the fields in the Advanced MID Server Configuration related list.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

5. Right-click the form header and click **Save**.
6. Ensure that **api_version** is set `v48.0` in the Attributes related list.

Result
The Salesforce spoke is set up and integrated with the ServiceNow instance.

Set up a bidirectional webhook

Configure a webhook to subscribe to Salesforce events with a ServiceNow callback URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Role required: admin

Procedure

1. Log in as an administrator to your Salesforce instance.
2. Obtain the Salesforce instance details.
   For more information, see the View instance information for your Salesforce Organization knowledge article in Salesforce Trailblazer forum.

   a. If you don't have Salesforce custom domains, obtain the Salesforce instance name from the Company Information page.

   b. If you have custom domains, navigate to **Domain Management** > **My Domain** and copy the domain name.
   For example, if the complete domain name on the page is **newdomain-customdomain.my.salesforce.com**, copy and record the value `newdomain-customdomain`.

3. Obtain the 18-digit Organization ID of your Salesforce instance.

   a. Navigate to the Developer Console in your Salesforce instance and run this query:

   ```
   Select Id from Organization
   ```

   b. Copy and record the value of the 18-digit Organization ID.

4. Log in to your ServiceNow instance.
5. Create a webhook registry.

   a. Navigate to **Salesforce Webhook Registry** > **Salesforce Webhook Registries**.

   b. Click **New**.

   c. On the form, fill these values:

Field	Description
Organization ID	18-digit Organization ID of your Salesforce instance.
Instance Name	Name of the Salesforce instance obtained from the Company Information page or custom domain of the Salesforce instance obtained from **Domain Management** > **My Domain**.

   d. Right-click the form header and click **Save**.

6. Obtain the resource path from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.

b. Open the record, **Salesforce Webhook Callbacks**.

c. In the **Resources** tab, click the **Default Callback** record.

d. Copy and record the value of **Resource path**.
The required ServiceNow endpoint URL is: `https://<intance-name>.service-now.com/<resource-path>`

7. Configure the default subflows or create customsubflows.
These subflows are triggered when the required events occur in Salesforce instance. For more information, see Building subflows.

8. Configure the webhook routing policy.

a. Navigate to **System Definition** > **Decision Tables**.

b. Open the record, **Salesforce Decision Webhook Policy**.

c. In the **Decisions** tab, click **New**.

d. On the form, fill these values:

Field	Description
Label	Unique label to identify the routing policy.
Answer	Subflow that must be triggered when the specified conditions are met.
Default Answer	Option to specify if this is the default answer.
Condition	Conditions to be met when the required events occur in Salesforce.

Note:
By default, these Salesforce objects are supported in the webhook routing policies:

- Account
- Case
- Contract
- Opportunity

You can configure the default decision table to support other Salesforce objects as per your requirement.

e. Click **Save**.

9. From your Salesforce instance, create outbound message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about creating the outbound message, see Outbound Message Actions in Salesforce Trailblazer forum.

10. In the Endpoint URL, enter the endpoint URL in this format: https://<intance-name>.service-now.com/<resource-path>.

SAP Ariba Spoke

The SAP Ariba spoke is built by Bristlecone, Inc. Manage the primary and transactional data of buying and sourcing suites in the SAP Ariba instance from your ServiceNow instance. The SAP Ariba system offers a single SaaS offering edition and the SAP Ariba spoke works as-is irrespective of the datacenter chosen.

Important:
The SAP Ariba spoke uses the ITK-style service (file upload or file download) REST APIs via MIME multi-part format, and not ITK jar. So, although SAP Ariba announced end of life of ITK jar by Dec 31st, 2023, which resulted in the removal of ITK from the SAP download site and SAP Portal, there is no functionality impact to the existing SAP Ariba spoke.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Starting on March 1st 2022, all SAP spokes will be available only on the Store.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SAP Ariba spoke v1.14.0 is the latest version.

Supported versions

This spoke was built for SAP Ariba v2.0, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- Enable file upload or file download REST services by creating a shared secret. Copy and record the integration password for later use.

  Note:
  If you want to create two shared secrets, one for sourcing suite and another for buying a suite, you must provide the same shared secret.

  - To create a shared secret for sourcing suite, navigate to **Administration** in your SAP Ariba solution.
  - To create a shared secret for buying a suite, navigate to **Core Administration** in your SAP Ariba solution.

  To create a new shared secret:

  1. Log in to your SAP Ariba solution.
  2. Select **Manage** in the navigation menu.
  3. Select **Core Administration** or **Administration**.
  4. Select the expansion arrow for **Integration Manager**.
  5. Select **Integration Toolkit Security**.
  6. In **Shared Secret Authentication**, enter integration password in **Integration password**.
  7. Select **Save**.

  For more information, see Security Configuration for Master Data Integration in SAP Help Portal.

- Copy and record the realm of your SAP Ariba instance.
- In **Administration**, create an inbound endpoint in **End Point Configuration** under **Integration Manager**. Copy and record the login password that you have provided under **HTTP Authentication**. For information about creating an endpoint, see Configure the SAP Ariba Solution in SAP Help Portal.

  To create an integration end point in your SAP Ariba solution:

  1. Log in to your SAP Ariba solution.
  2. Select **Manage** in the navigation menu.
  3. Select **Administration**.
  4. Select the expansion arrow for **Integration Manager**.
  5. Select **End Point Configuration**.
  6. Select **Create New**.
  7. On the End Point Configuration - Create End Point page, enter a name for the end point in **Name** and select **Inbound** for **Type**.
  8. In the **HTTP Authentication** section, enter a user ID in the **Login** field and a password in the **Password** field.

     You need the user ID and password to authenticate your HTTP calls later.
  9. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable SOAP service of the Import Sourcing Project task for your inbound endpoint in **Integration Configuration** under **Integration Manager**.

- Copy and record the URL in the Integration Task **URL** field.
- Open the WSDL file. Copy and record the value of the *targetNamespace* parameter.

For information about Integration Task **URL** and *targetNamespace*, see Configure the SAP Ariba Solution in SAP Help Portal.

To enable an integration task and link it to an existing end point:

1. Log in to your SAP Ariba solution.
2. Select **Manage** in the navigation menu.
3. Select **Administration**.
4. Select the expansion arrow for **Integration Manager**.
5. Select **Integration Configuration**.
6. Locate the task that you want to enable.

   Select **List All** or enter search criteria.
7. Select **Search**.
8. Select **Actions** and select **Edit** for the required task.
9. In the Edit data import/export task page, select **Enabled** for **Status**.
10. For **End point**, select the required end point.
11. Select **Save**.

- In **Core Administration**, create an inbound endpoint in **End Point Configuration** under **Integration Manager**. Copy and record the login password that you have provided under **HTTP Authentication**. For information about creating an endpoint, see Configure the SAP Ariba Solution in SAP Help Portal.

  To create an integration end point in your SAP Ariba solution:

  1. Log in into your SAP Ariba solution.
  2. Select **Manage** in the navigation menu.
  3. Select **Core Administration**.
  4. Select the expansion arrow for **Integration Manager**.
  5. Select **End Point Configuration**.
  6. Select **Create New**.
  7. On the End Point Configuration - Create End Point page, enter a name for the end point for **Name**.
  8. Select **Inbound** for **Type**.
  9. In the **HTTP Authentication** section, enter a user ID in the **Login** field and a password in the **Password** field.

     You need the user ID and password to authenticate your HTTP calls later.
  10. Select **Save**.

  Enable SOAP service of the Import Suppliers task for your inbound endpoint in **Integration Configuration** under **Integration Manager**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Copy and record the URL in the Integration Task **URL** field.
- Open the WSDL file. Copy and record the value of the *targetNamespace* parameter.

To enable an integration task and link it to an existing end point:

1. Log in into your SAP Ariba solution.
2. Select **Manage** in the navigation menu.
3. Select **Core Administration**.
4. Select the expansion arrow for **Integration Manager**.
5. Select **Integration Configuration**.
6. Locate the task that you want to enable.

   Select **List All** or enter search criteria.

7. Select **Search**.
8. Select **Actions** and select **Edit** for the required task.
9. In the Edit data import/export task page, select **Enabled** for **Status**.
10. For **End point**, select the required end point.
11. Select **Save**.

For information about Integration Task **URL** and *targetNamespace*, see Configure the SAP ARiba Solution in SAP Help Portal.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Flow Designer Action Step - Script on MID (com.glide.hub.action_step.script_mid)
- Utility Actions Spoke

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The SAP Ariba spoke provides sample flows to demonstrate automating the SAP Ariba tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

Flow	Description
Import Supplier Organizations Buyer	Imports supplier organizations from ServiceNow to the buying suite of your SAP Ariba instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
Import Supplier Organizations Sourcing	Imports supplier organizations from ServiceNow to the sourcing suite of your SAP Ariba instance.

Spoke subflows

The SAP Ariba spoke provides sample subflows to demonstrate the sequence of reusable actions in a flow. To customize the sample subflows, copy them to the required application scope.

Spoke subflows

Subflow	Description
Look up Export Task - Subflow v2 (Xanadu and Beyond)	Searches for the export task event ZIP file, copies the ZIP file to an SFTP location. Then the file is unzipped and the unzipped XLS or CSV files are copied to the specified ServiceNow table record.
Update Requisition sample subflow	Updates the requestions specified in the payload.
Create Requisition sample subflow	Creates a requisition record after verifying that a requestion with the specified requisition details does not exist.

Note:
The sample subflow requires a server host, port, and working directory.

Spoke actions

The SAP Ariba spoke provides actions to automate SAP Ariba tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Export Management	Copy Ariba File To Data Source	Takes sys ID of the source record and transfers the attachment to the target data source.
Import Management	Execute Ariba Import Task	Triggers the SAP Ariba import task for the specified operation.
	Look up Export Task	Executes an Ariba export task event where a ZIP file is received as response and stored to the selected data source.
Invoice Management	Look up Invoices CXML	Retrieves invoices from SAP business network in cXML format.
	Look up Pending Messages ID CXML	Retrieves the pending messages ID in CXML format.
	Reject Invoice CXML	Rejects the specified invoice submitted by suppliers in SAP business network.
Approvals Procurement Management	Look up Approvals Status	Retrieves tasks that are pending for approval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Downstream Approvals Stream	Retrieves details related to the approvable invoices or requisitions.
	Update Downstream Approval Status	Retrieves the details of approval entities.
Approval Sourcing Management	Create Approval Status	Performs the specified action on an entity. Possible values for the entity task are Approve, Deny, and DenyWithResubmit.
	Look up Approval Entities	Retrieves the details of approval entities.
Buyer Management	Look up Purchase Order Lines Stream	Retrieves information from line items in purchase orders for a specified buyer.
	Look up Purchase Orders Stream	Retrieves header information in purchase orders for a specified buyer.
	Look up Shipment Notice Items Stream	Retrieves details of all the items in the shipment notice.
	Look up Shipment Notices Stream	Retrieves shipment related data including delivery, transport, and supplier details.
Procurement Export Management	Look up Downstream Supplier Locations	Initiates an Ariba export process, prompting the system to generate and deliver a ZIP file which contains essential data stored as a response within the user's selected data source.
	Look up Receipts	Initiates an Ariba export process, prompting the system to generate and deliver a ZIP file which contains essential data stored as a response within the user's selected data source.
Procurement Import Management	Import Downstream Supplier	Creates or updates supplier details in Ariba system along with supplier location and supplier remittance location.
Receipt Management	Create Receipt	Creates receipt or import receipt from external applications.
Requisition Management (SOAP-based)	Create Requisition	Creates a requisition record with the provided details.
	Update Requisition	Updates a requisition record with the specified information.
	Cancel requisition	Cancels a requisition record with the details provided.
Procurement Management (REST-based)	Look up Conversion Rates Stream	Retrieves details related to conversion rates.
	Look up Cost Centers Stream	Retrieves cost centers details from SAP ARIBA REST.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Currency Rates Stream	Retrieves details related to the currency rates.
	Look up Fixed Assets Stream	Retrieves fixed assets details from SAP ARIBA REST.
	Look up GL Accounts Stream	Retrieves details of the available primary data entities.
	Look up Legal Entities Stream	Retrieves metadata for legal entity.
	Look up Material Groups Stream	Retrieves the primary data of material group from SAP Ariba.
	Look up Materials Stream	Retrieves the general data of materials in SAP Ariba REST.
	Look up Payment Terms Stream	Retrieves details of the available primary data entities.
	Look up Purchase Groups Stream	Retrieves purchase group details from SAP system.
	Look up Purchasing Organizations Stream	Retrieves purchasing organization details from SAP ARIBA REST.
	Look up Upstream Supplier Locations Stream	Retrieves the primary data of supplier locations.
Sourcing Event Management	Create Award Scenario	Creates an award scenario with the provided details.
	Create Event Line Items	Adds line items to the specified event and sets term values as specified.
	Create Event Questions	Adds questions to the specified event and sets term values as specified.
	Create Item Attachments	Uploads a file as an attachment for the specified item and term in the specified event. The item and term must exist. The event state must be **Draft**.
	Create Sourcing Event	Initiates the process of creating a sourcing event, such as a request for proposal (RFP), within the SAP Ariba Event Management.
	Create Supplier Award	Awards the supplier by recognizing their successful proposal.
	Create Supplier Invitations	Invites multiple suppliers to the specified event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Supplier Invitations	Deletes multiple suppliers for the specified event.
	Download Attachment from Supplier Bid Responses	Retrieves details of the supplier response.
	Look up Awarded Bids	Retrieves details of the awarded bids for an event.
	Look up Event Templates	Retrieves sourcing template IDs and other template details, including item definitions.
	Look up Supplier Bids	Retrieves supplier bids for an event.
	Update Event State	Modifies an event's state using its unique identifier that is, Event ID.
Supplier Management	Create Sourcing Project	Creates a sourcing project with the provided details.
	Update Sourcing Project	Updates the project header fields of an existing sourcing project.
Sourcing Management (REST-based)	Look up Departments Stream	Retrieves the department primary data available in the system.
Supplier Management (REST-based)	Look up Downstream Remittance Location Stream	Retrieves details of the available master data entities.
	Look up Downstream Suppliers Stream	Retrieves#details related to the#suppliers.
Supplier Management (SOAP-based)	Create Suppliers	Creates a supplier with the provided details.
	Look up Upstream Suppliers Stream	Retrieves the general data of the primary supplier.
Contract Management	Create Contract	Creates contracts with the provided details, in contract workspaces.
	Look up Contracts Stream	Retrieves#details related to contract workspaces.
Async Reporting	Create Job	Creates the job to retrieve the record for PO and PR.
	Look up Job Status	Retrieves details of the required job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Job Management	Look up transactions	Retrieves the requisition and purchase order details based on **Job ID** and **File Name**.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
SAP Ariba approvals procurement management AI agent	Manages procurement approvals and workflows within SAP Ariba. This AI agent enables users to track approval statuses, streamline procurement processes, and maintain operational control through seamless integration with SAP Ariba.
SAP Ariba sourcing event management AI agent	Manages sourcing events and supplier-related processes within SAP Ariba. This AI agent supports tasks such as handling supplier bids, managing award scenarios, and updating event states, helping procurement teams and sourcing managers optimize workflows and improve operational efficiency.
SAP Ariba invoice management AI agent	Manages invoice-related tasks within SAP Ariba. This AI agent enables users to look up pending message IDs and retrieve invoice details, helping streamline invoice management and improve operational efficiency in SAP Ariba environments.
SAP Ariba procurement export management AI agent	Manages procurement export tasks and SAP Ariba integration within IntegrationHub. This AI agent provides capabilities such as looking up receipts to streamline procurement processes and enhance operational efficiency. It is ideal for procurement managers, integration specialists, and business users who need

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
	seamless access to SAP Ariba data and actions.
SAP Ariba approvals sourcing management AI agent	Manages approval workflows and sourcing management processes within SAP Ariba. This AI agent can perform actions such as creating approval statuses to streamline approvals and sourcing activities, helping users enhance efficiency in SAP Ariba integrations and approvals management.

Available sample agentic workflows

Install Now Assist for Integration Hub and start using the available sample agentic workflows and AI agents. For more information, see Now Assist for Integration Hub.

In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. Use the available sample agentic workflow in AI Agent Studio so that AI agents can coordinate to solve complex problems. To modify the available sample agentic workflow as per your requirement, see Modify an agentic workflow.

Available sample agentic workflow includes:

Sample agentic workflow	Description	AI agents used	Always ON by default?
Approval Status Lookup and Creation	Identifies the user's approval-related intent, validates employee identity, executes the required SAP Ariba approval actions, and returns a single consolidated, HR-focused summary of the results.		No **Note:** To activate the workflow, see Activate an agentic workflow template.

Spoke module

The SAP Ariba spoke adds the SAP Ariba Spoke application to your instance and includes these modules:

Module	Description
Ariba Export Configuration Definition	Displays the list of available export configurations. By default, 33 export configurations are available along with the spoke. You can modify the default export configuration or create export configurations, according to requirements. For example, if you have used the Execute Ariba Export Task action in your flow to export receipts, data is retrieved from your SAP Ariba instance to ServiceNow instance. You must copy these records

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
	to data source. Otherwise, the records are deleted after the time period mentioned in the *Ariba Export Task Scheduler* scheduled script has lapsed. You can use the Copy Ariba File To Data Source action in your flow to copy the record to your data source.
Ariba Export Task Execution	Displays the CSV files generated when data is exported from your SAP Ariba instance to ServiceNow instance. You must copy these records to data source. Otherwise, the records are deleted after the time period mentioned in the *Ariba Export Task Scheduler* scheduled script has lapsed.
Ariba Import Configuration Definition	Displays the list of available import configurations. By default, two import configurations are available along with the spoke. You must use Execute Ariba Import Task action in your flow to create the required records. • If you have selected the **MasterDataBatchPull** task in the Execute Ariba Import Task action, the primary data records for the sourcing suite are created or updated in your SAP Ariba instance. • If you have selected the **CombinedDataPull** task in the Execute Ariba Import Task action, the primary data records for the buying suite are created or updated in your SAP Ariba instance.
Supplier IDs Buyer	Displays information about the suppliers in the buying suite. Admin must create the supplier records here. The Look Up Supplier IDs Buyer Records action in the Import Supplier Organizations Buyer sample flow uses these records to run the flow.
Supplier IDs Sourcing	Displays information about the suppliers in the sourcing suite. An admin must create the supplier records here. The Look Up Supplier IDs Sourcing Records action in the Import Supplier Organizations Sourcing sample flow uses these records to run the flow.
Supplier Organizations Buyer	Displays information about the supplier organizations in the buying suite. Admin must create records here. The Look Up Supplier Organizations Buyer Records action in the Import Supplier Organizations Buyer sample flow uses these records to run the flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
Supplier Organizations Sourcing	Displays information about the supplier organizations in the sourcing suite. An admin must create records here. The Look Up Supplier Organizations Sourcing Records action in the Import Supplier Organizations Sourcing sample flow uses these records to run the flow.

Data accessed through these spoke modules is stored in these tables:

Table	Description
Ariba Export Configuration Definition [sn_sap_ariba_spoke_ariba_file_definition]	Stores information about the export configurations.
Ariba Import Configuration Definition [sn_sap_ariba_spoke_ariba_import_configuration_definition]	Stores information about the import configurations.
Ariba Export Task Execution [sn_sap_ariba_spoke_ariba_task_execution]	Stores information about the CSV files generated when data is exported from your SAP Ariba instance to ServiceNow instance.
Supplier Organizations Sourcing [sn_sap_ariba_spoke_import_supplier_organizations_csv]	Stores information about the supplier organizations in the sourcing suite. Admin must create these records in the Supplier Organizations Sourcing module.
Supplier IDs Sourcing [sn_sap_ariba_spoke_supplier_ids]	Stores information about the suppliers in the sourcing suite. Admin must create these records in the Supplier IDs Sourcing module.
Supplier IDs Buyer [sn_sap_ariba_spoke_supplier_ids_buyer]	Stores information about the suppliers in the buying suite. Admin must create these records in the Supplier IDs Buyer module.
Supplier Organizations Buyer [sn_sap_ariba_spoke_supplier_organizations]	Stores information about the supplier organizations in the buying suite. Admin must create these records in the Supplier Organizations Buyer module.

Spoke scheduled script and system property

A scheduled script, *`Ariba Export Task Scheduler`*, and system property, *`sn_sap_ariba_spoke.ariba.export.task.scheduler`*, are available along with the spoke. The system property defines the number of days by which all the records older than this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

will be purged. The script uses this value to purge the records that have not been copied to the data source.

- To view the scheduled script, enter `sysauto_script_list.do` in the filter navigator and search for the script, *`Ariba Export Task Scheduler`*.
- To view the system property, navigate to **System Properties** > **All Properties** and search for the system property, *`sn_sap_ariba_spoke.ariba.export.task.scheduler`*.

You can configure the scheduled script and system property according to your requirement.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

These connection and credential alias records are available along with the spoke:

Connection & Credential Alias	Associated spoke action category
SAP_Ariba_Import	Import Management
SAP_Ariba_Export	Export Management
SAP_Ariba_Sourcing	Sourcing Management
SAP_Ariba_Suppliers	Supplier Management (SOAP-based)
SAP Ariba SSH	SSH Management
SAP Ariba Rest Procurement	Procurement Management (REST-based)
SAP Ariba Rest Buyer	Buyer Management
SAP Ariba Rest Sourcing	Sourcing Management (REST-based)
SAP Ariba Procurement Export	Procurement Export Management
SAP Ariba Soap Receipts	Receipt Management
SAP Ariba Procurement Import	Procurement Import Management
SAP Ariba Rest Suppliers	Supplier Management (REST-based)
SAP Ariba Approvals Procurement	Approvals Procurement Management
SAP Ariba Approvals Sourcing	• Approvals Sourcing Management • Approvals Procurement Management
SAP Ariba Rest Event	Sourcing Event Management
SAP Ariba Rest Ship Notices	Buyer Management
SAP Ariba Soap Requisition	Requisition Management(SOAP-based)

For information about setting up the spoke, see Set up the SAP Ariba spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the SAP Ariba alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps

Note:
The Linux server that is needed to create the SSH credential record, must be installed in the same network's machine or virtual machine where your MID Server is installed.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the SAP Ariba spoke

Integrate the ServiceNow instance and SAP Ariba by using the SSH, Basic Auth, and API Key credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SAP Ariba spoke.
- Role required: admin.

About this task

For information about the connection and credential alias record that must be configured to use actions in an action category, see Connection and credential alias requirements.

Procedure

1. Configure the **SAP_Ariba_Import** connection and credential alias record.

   a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

   b. Open the record, **SAP_Ariba_Import**.

   c. Click the Create New Connection & Credential related link.

   d. On the form, fill these values.

Create Connection and Credential form

Field	Description
Please Enter the Connection Information	
Connection Name	Name to identify the connection record. For example, `SAP Ariba Import Connection`.
Connection URL	Base URL to connect to SAP Ariba instance. For example, `https://s1.ariba.com`
Realm value	Realm of your SAP Ariba instance.
Shared secret	Integration password provided for shared secret-based authentication. For more

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	information, see Shared secret-based authentication in SAP Help Portal.
Please Enter the Credential Information	
Credential Name	Name to identify the credential record. For example, `SAP Ariba Import Credential`.
API Key	Integration password provided for shared secret-based authentication. For more information, see Shared secret-based authentication in SAP Help Portal.

e. Click **Create**.

2. Configure the **SAP_Ariba_Export** connection and credential alias record.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the record, **SAP_Ariba_Export**.

c. Click the Create New Connection & Credential related link.

d. On the form, fill these values.

Create Connection and Credential form

Field	Description
Please Enter the Connection Information	
Connection Name	Name to identify the connection record. For example, `SAP Ariba Export Connection`.
Connection URL	Base URL to connect to SAP Ariba instance. For example, `https://s1.ariba.com`
Realm value	Realm of your SAP Ariba instance.
Please Enter the Credential Information	
Credential Name	Name to identify the credential record. For example, `SAP Ariba Export Credential`.
API Key	Integration password provided for shared secret-based authentication. For more information, see Security Configuration for Master Data Integration in SAP Help Portal.

e. Click **Create**.

3. Configure the **SAP_Ariba_Sourcing** connection and credential alias record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the record, **SAP_Ariba_Sourcing**.

c. Click the Create New Connection & Credential related link.

d. On the form, fill these values.

Create Connection and Credential form

Field	Description
Please Enter the Connection Information	
Connection Name	Name to identify the connection record. For example, `SAP Ariba Sourcing Connection`.
Connection URL	Integration Task **URL** created when you enabled SOAP service of the Import Sourcing Project task for the inbound endpoint in **Administration**. For information about Integration Task **URL** and *`targetNamespace`*, see Enable an Integration Task in SAP Help Portal.
Target Namespace	Value of the *`targetNamespace`* parameter in WSDL file created in **Administration**. For information about Integration Task **URL** and *`targetNamespace`*, see Enable an Integration Task in SAP Help Portal.
Please Enter the Credential Information	
Credential Name	Name to identify the credential record. For example, `SAP Ariba Sourcing Credential`.
User Name	User name to log in to your SAP Ariba instance.
Password	Login password provided under HTTP Authentication when you created an inbound endpoint in **Administration**. For information about creating an endpoint, see Create New Integration End-Point in SAP Help Portal.

e. Click **Create**.

4. Configure the **SAP_Ariba_Suppliers** connection and credential alias record.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the record, **SAP_Ariba_Suppliers**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Click the Create New Connection & Credential related link.

d. On the form, fill these values.

Create Connection and Credential form

Field	Description
Please Enter the Connection Information	
Connection Name	Name to identify the connection record. For example, `SAP Ariba Suppliers Connection`.
Connection URL	Integration Task **URL** created when you enabled SOAP service of the Import Sourcing Project task for the inbound endpoint in **Administration**. For information about Integration Task **URL** and *`targetNamespace`*, see Enable an Integration Task in SAP Help Portal.
Target Namespace	Value of the *`targetNamespace`* parameter in WSDL file created in **Administration**. For information about Integration Task **URL** and *`targetNamespace`*, see Enable an Integration Task in SAP Help Portal.
Please Enter the Credential Information	
Credential Name	Name to identify the credential record. For example, `SAP Ariba Sourcing Credential`.
User Name	User name to log in to your SAP Ariba instance.
Password	Login password provided under HTTP Authentication when you created an inbound endpoint in **Administration**. For information about creating an endpoint, see Create New Integration End-Point in SAP Help Portal.

e. Click **Create**.

5. Create an SSH credential record.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the record, **SAP Ariba SSH**.

c. In the **Credentials** tab, click **New**.
The system displays the message `What type of Credentials would you like to create?`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **SSH Credentials**.

e. On the form, fill in the fields.

Field	Description
Name	Name to identify the credential record. For example, `SAP Ariba SSH Credential`.
User name	User name to log in to the Linux server on which the SFTP and SSH are set up.
Password	Password to log in to the Linux server on which the SFTP and SSH are set up.

Note:
The Linux server must be installed in the same network's machine or virtual machine where your MID Server is installed.

f. Click **Submit**.

6. Configure the **SAP Ariba Rest Procurement** connection.

a. Navigate to **All** > **Process Automation** > **Workflow Studio**.

b. Click the **Integrations** tab.

c. Under **Connections**, toggle and enable the **Outbound** connections.

d. Search for **SAP Ariba Rest Procurement** connection.

e. Click **View Details**.

f. Click **Add Connection**.

g. On the form, fill in these values.

Field	Description
Connection Information	
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to SAP Ariba instance. For example, `https://s1.ariba.com`.
API Version	API version of the SAP Ariba instance.
Realm Value	Realm of your SAP Ariba instance.
API Key	Integration password provided for shared secret-based authentication. For more information, see Security Configuration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	for Master Data Integration in SAP Help Portal.
Credential Information	
OAuth Client ID	Client ID of your SAP Ariba instance. For more information, see Finding Your Application's Application Key and OAuth Client ID in SAP Help Portal.
OAuth Client Secret	Client Secret of your SAP Ariba instance. For more information, see Finding Your Application's Application Key and OAuth Client ID in SAP Help Portal.

h. Click **Create and Get OAuth Token**.

7. Configure the **SAP Ariba Rest Buyer** connection.

a. Navigate to **All** > **Process Automation** > **Flow Designer**.

b. Click the **Connections** tab.

c. Toggle and enable the **Outbound** connections.

d. Search for **SAP Ariba Rest Buyer** connection.

e. Click **View Details**.

f. Click **Add Connection**.

g. On the form, fill in these values.

Field	Description
Connection Information	
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to SAP Ariba instance. For example, `https://s1.ariba.com`.
API Version	API version of the SAP Ariba instance.
Realm Value	Realm of your SAP Ariba instance.
API Key	Integration password provided for shared secret-based authentication. For more information, see Security Configuration for Master Data Integration in SAP Help Portal.
Ariba Network ID	Unique identifier of the SAP Ariba network account.
Credential Information

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Client ID	Client ID of your SAP Ariba instance. For more information, see Finding Your Application's Application Key and OAuth Client ID in SAP Help Portal.
OAuth Client Secret	Client Secret of your SAP Ariba instance. For more information, see Finding Your Application's Application Key and OAuth Client ID in SAP Help Portal.

h. Click **Create and Get OAuth Token**.

8. Configure the **SAP Ariba Rest Sourcing** connection.

a. Navigate to **All** > **Process Automation** > **Flow Designer**.

b. Click the **Connections** tab.

c. Toggle and enable the **Outbound** connections.

d. Search for **SAP Ariba Rest Sourcing** connection.

e. Click **View Details**.

f. Click **Add Connection**.

g. On the form, fill in these values.

Field	Description
Connection Information	
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to SAP Ariba instance. For example, `https://s1.ariba.com`.
API Version	API version of the SAP Ariba instance.
Realm Value	Realm of your SAP Ariba instance.
API Key	Integration password provided for shared secret-based authentication. For more information, see Security Configuration for Master Data Integration in SAP Help Portal.
Credential Information	
OAuth Client ID	Client ID of your SAP Ariba instance. For more information, see Finding Your Application's Application Key and OAuth Client ID in SAP Help Portal.

Field	Description
OAuth Client Secret	Client Secret of your SAP Ariba instance. For more information, see Finding Your Application's Application Key and OAuth Client ID in SAP Help Portal.

h. Click **Create and Get OAuth Token**.

9. Configure the **SAP Ariba Procurement Export** connection.

a. Navigate to **All** > **Process Automation** > **Flow Designer**.

b. Click the **Connections** tab.

c. Toggle and enable the **Outbound** connections.

d. Search for **SAP Ariba Procurement Export** connection.

e. Click **View Details**.

f. Click **Add Connection**.

g. On the form, fill in these values.

Field	Description
Connection Information	
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to SAP Ariba instance. For example, `https://s1.ariba.com`.
Realm Value	Realm of your SAP Ariba instance.
Shared Secret	Integration password provided for shared secret-based authentication. For more information, see Shared secret-based authentication in SAP Help Portal.

h. Click **Create Connection**.

10. Configure the **SAP Ariba SOAP Receipts** connection.

a. Navigate to **All** > **Process Automation** > **Flow Designer**.

b. Click the **Connections** tab.

c. Toggle and enable the **Outbound** connections.

d. Search for **SAP Ariba SOAP Receipts** connection.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Click **View Details**.

f. Click **Add Connection**.

g. On the form, fill in these values.

Field	Description
Connection Information	
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to SAP Ariba instance. For example, `https://s1.ariba.com`.
Credential Information	
User name	User name to log in to your SAP Ariba instance.
Password	Login password provided under HTTP Authentication when you created an inbound endpoint in Administration. For information about creating an endpoint, see Create New Integration End-Point in SAP Help Portal.

h. Click **Create Connection**.

11. Configure the **SAP Ariba Procurement Import** connection.

a. Navigate to **All** > **Process Automation** > **Flow Designer**.

b. Click the **Connections** tab.

c. Toggle and enable the **Outbound** connections.

d. Search for **SAP Ariba Procurement Import** connection.

e. Click **View Details**.

f. Click **Add Connection**.

g. On the form, fill in these values.

Field	Description
Connection Information	
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to SAP Ariba instance. For example, `https://s1.ariba.com`.

h. Click **Create and Get OAuth Token**.

What to do next

Create buyer and supplier records in these spoke modules:

- Supplier IDs Buyer
- Supplier IDs Sourcing
- Supplier Organizations Buyer
- Supplier Organizations Sourcing

Actions in the sample flows require these records.

SAP Commerce Cloud Spoke

The SAP Commerce Cloud spoke is built by Bristlecone, Inc. Retrieve shopping cart content, order details, and order history for a selected customer.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes. Starting on March 1st 2022, all SAP spokes will be available only on the Store.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for SAP Commerce Cloud Version: 2211-jdk21.1 but may be compatible with later versions.

Spoke requirements

SAP Commerce Cloud subscription.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub action Step - REST (com.glide.hub.action_step.rest)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke version

SAP Commerce Cloud Spoke v1.1.0 is the latest version.

Spoke actions

The SAP Commerce Cloud provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Order Management	Look Up Order Details	Retrieves order details of the specified order.
	Look Up Orders	Retrieves the order history for the specified user ID.
Shopping Cart	Look Up Shopping Cart	Retrieves the shopping cart content for the specified user ID.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the SAP Commerce Cloud spoke.

Set up the SAP Commerce Cloud spoke

Integrate your ServiceNow instance with the SAP Commerce Cloud to automate various actions on the SAP Commerce Cloud. For example, you can set up a flow that looks up a shopping cart at a specified time every day.

Before you begin

- Request an Integration Hub subscription.
- Install the SAP Commerce Cloud plugin.
- Role required: admin.
- Access to the SAP Backoffice account.

Create the SAP Commerce Cloud credentials

Generate the credentials that you use to create the connection record for the SAP Commerce Cloud spoke. Your ServiceNow instance uses the connection record connect with the SAP Commerce Cloud.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

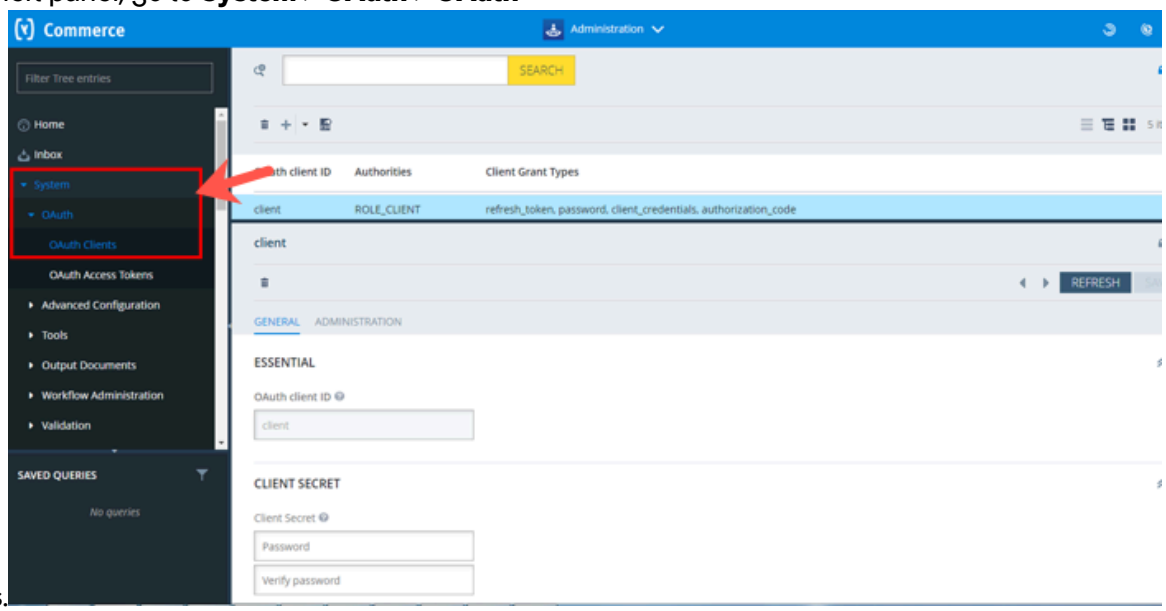
Before you begin

Role required: admin

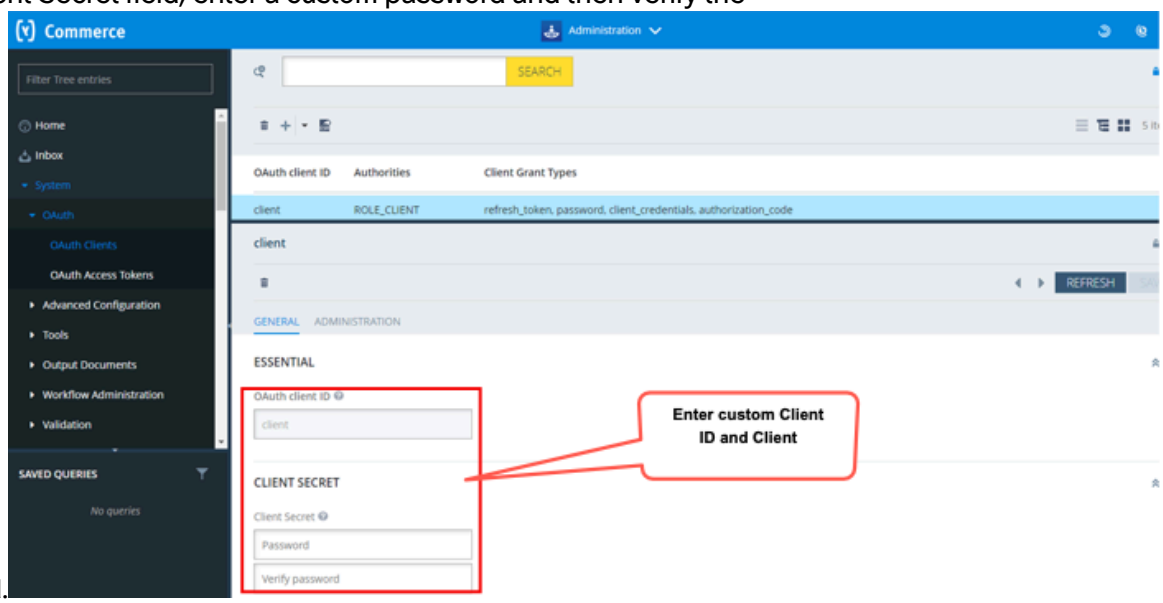
Access to the SAP Backoffice account.

Procedure

1. Log in to the SAP Backoffice account.
2. On the left panel, go to **System** > **OAuth** > **OAuth Clients**.



3. To create a client ID, select the Add Client ID icon ( ).
4. In the OAuth client ID, enter a custom client ID.
5. In the Client Secret field, enter a custom password and then verify the password.



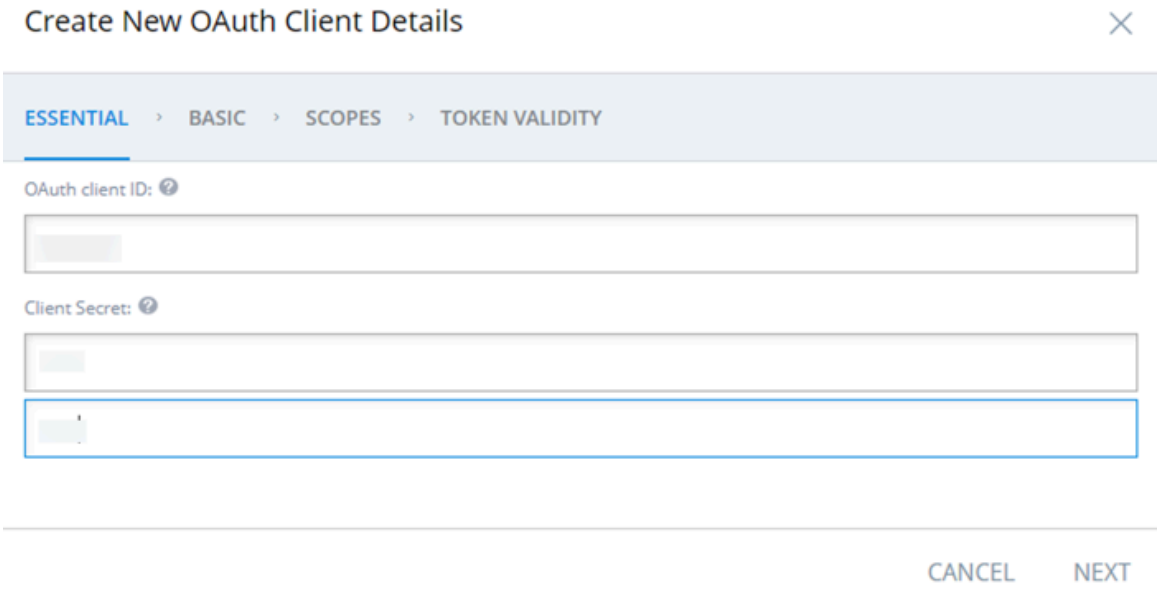
6. Under BASIC, add the details.
   a. Under Authorities, add ROLE_CLIENT.
   b. Under Client Grant Types, add the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- client_credentials
- refresh_token
- password
- authorization_code

c. Under Scopes, add basic.

7. On the Create New OAuth Client Details window, do the



steps.

a. Under ESSENTIAL, enter the custom OAuth client ID and client secret.

b. Under BASIC, add ROLE_CLIENT and under Client Grant Types, add the values.

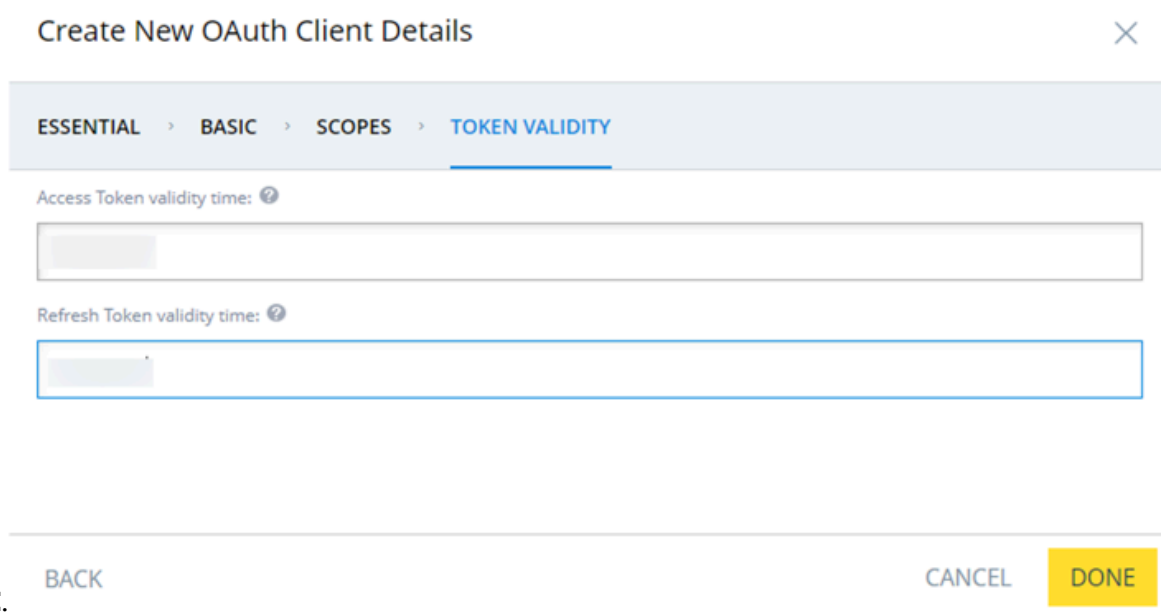
- client_credentials
- refresh_token
- password
- authorization_code

c. Under SCOPES, add enter basic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Under TOKEN VALIDITY, enter the time for which the token to access the SAP Commerce Cloud is valid.

e. Select



DONE.

The credentials to create a SAP Commerce Cloud connection record are created.

Create connection record for SAP Commerce Cloud spoke

Create a connection record that enables your ServiceNow instance to connect with the SAP Commerce Cloud record. The connection record has the underlying connection information required to integrate with SAP Commerce Cloud.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select **Connections**.
3. Turn on the Outbound tab.
4. In the Search all connections field, enter `SAP Commerce Cloud`.
5. On the SAPCommerceCloud card, select **View Details**.
6. Select **Configure**.
7. Fill the form.

Configure Connection

Field	Description
Connection Name	Name of the connection record. The default and read-only name of the first connection record is SAPCommerceCloud. To provide a custom name to a connection record, you

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	must create a connection record by selecting **Add Connection**.
Connection URL	URL that your ServiceNow instance uses to connect to the SAP Commerce Cloud.
OAuth Client ID	Client ID that you generated on your SAP Backoffice account.
OAuth Client Secret	Client secret that you had generated on your SAP Backoffice account.
OAuth Redirect URL	URL of your ServiceNow instance in the format `https://<instance-name>.service-now.com/oauth_redirect.do`.
OAuth Token URL	URL in the format `https://<instance-name>/authorizationserver/oauth/token`.

8. Select **Create and Get OAuth Token.**
   The OAuth token is generated and your ServiceNow is connected to the SAP Commerce Cloud.

Create a credential record for the SAP Commerce Cloud

Integrate the ServiceNow instance and SAP Commerce Cloud spoke by creating a custom OAuth application in SAP Commerce Cloud to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate SAP Commerce Cloud.
- Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, SAP Commerce Cloud cred Cred.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of SAP Commerce Cloud as an OAuth provider. For example, SAP Commerce Cloud default_profile OAuth Profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applies to	Option to specify if the credential applies to all MID Servers in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use this credential in the **MID servers** field.
Order	Order to apply this credential. For example, `100`.
Credential alias	Credential alias associated with the spoke.

Create a connection record for the SAP Commerce Cloud

Create a connection record for your SAP Commerce Cloud account. The SAP Commerce Cloud connection and credential aliases use these connections to perform actions in SAP Commerce Cloud.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for SAP Commerce Cloud.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `SAP Commerce Cloud Connection`.
Credential	Credential record created for SAP Commerce Cloud spoke. For example, `SAP Commerce Cloud Cred`.
Connection alias	Alias record associated with this connection.
Host	IP address of the target host where the SAP Commerce Cloud server is installed.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.

5. Click **Submit**.

SAP Concur Spoke

The SAP Concur spoke is built by Bristlecone, Inc. Manage expenses, payments, purchases, users, travel, and so on in the SAP Concur account from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes. Starting on March 1st 2022, all SAP spokes will be available only on the Store.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

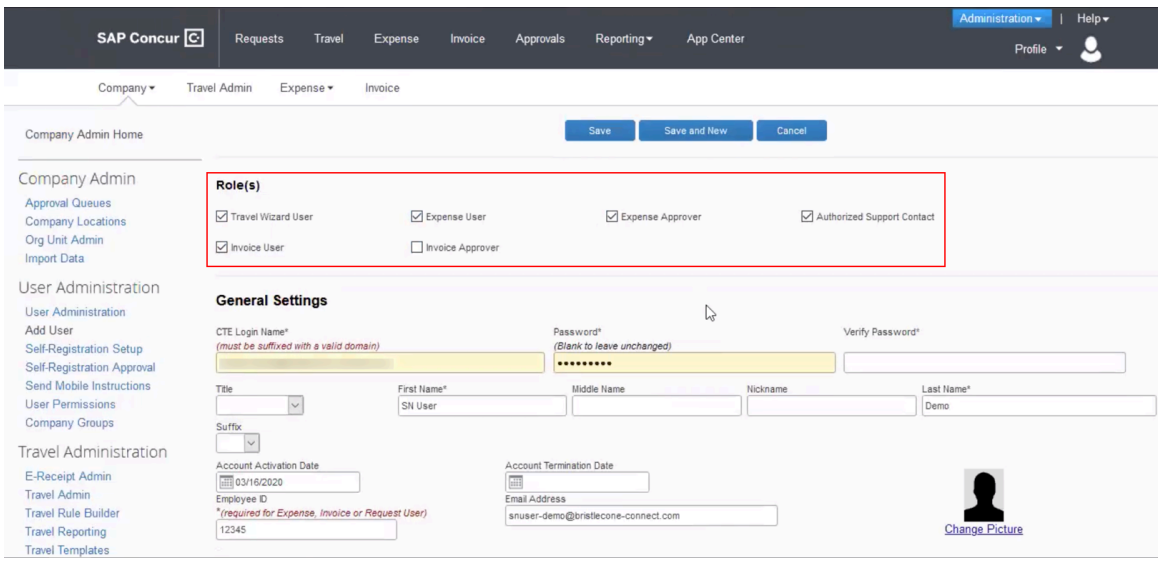
This spoke was built for SAP Concur API versions v3.0 and v4.0, but may be compatible with later versions.

Spoke version

SAP Concur spoke v2.3.2 is the latest version.

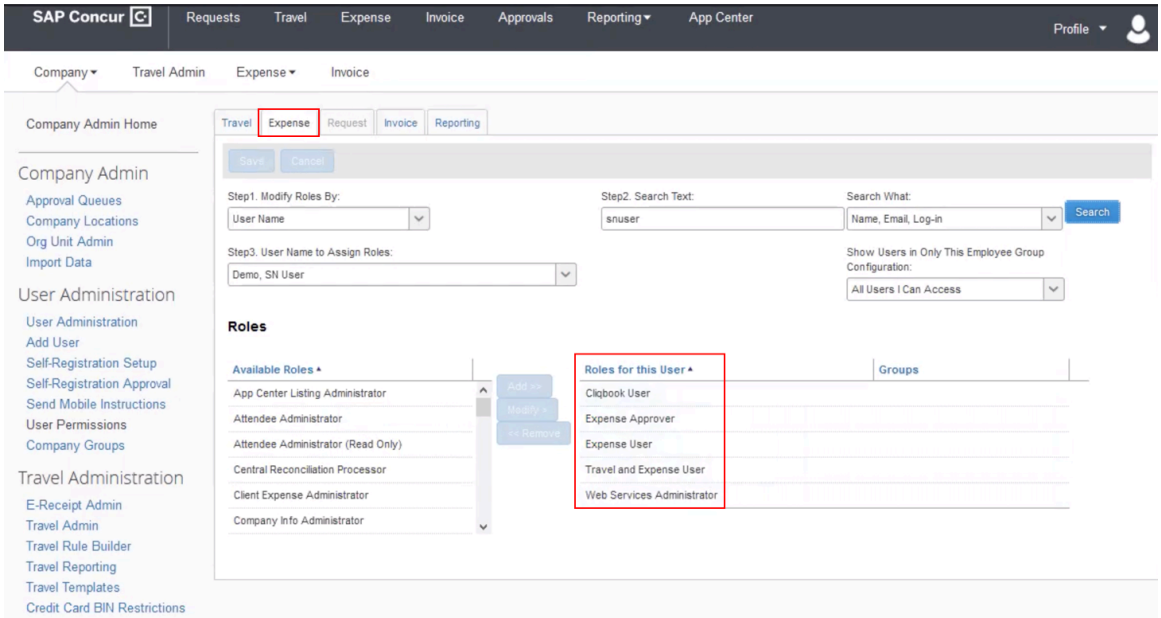
Spoke requirements

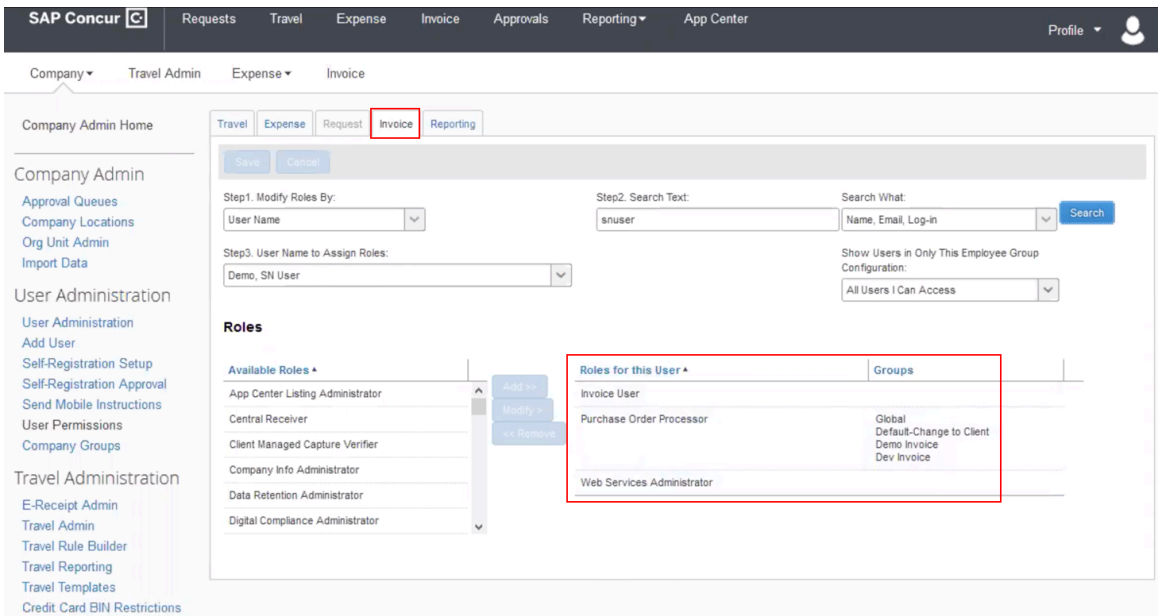
- SAP Concur API user with these roles:
  - Travel Wizard User
  - Expense User
  - Expense Approver
  - Authorised Support Contact
  - Invoice User



- SAP Concur API user with these Expense API and Invoice User permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.





- Contact SAP Concur Implementation team to obtain values of Client ID, Client Secret, Company ID, and Company Request Token, and define the scope of the client application.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Remote Tables (com.glide.script.vtable)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The SAP Concur spoke provides a sample flow, Get All Modified Expense Reports to demonstrate retrieving the expense reports modified within 24 hours of the provided Expense Report Last Modified Date. To customize the sample flow, copy it to the required application scope.

Spoke subflows

The SAP Concur spoke provides a sample subflow, Get Expense Report Workflow Step ID to demonstrate retrieving the Workflow Step ID of an expense report on the basis of whether the given expense report is submitted or not. The output Workflow Step ID is required to run the Execute Workflow Action for Expense Report action. To customize the sample subflow, copy it to the required application scope.

Spoke actions

The SAP Concur spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Expense Configuration Management	Get Expense Group Configurations	Retrieves all the expense group configuration for the specified user.
Expense Entry Management	Create Expense Entry	Creates a new expense entry for the specified user.
	Delete Expense Entry	Deletes the specified expense entry.
	Get Expense Entry Details	Retrieves details of the specified expense entry.
	Look up Expense Entries	Retrieves all expense entries owned by the user.
	Look up Expense Itemizations Stream	Retrieves all expense itemizations owned by the user.
	Update Expense Entry	Updates details of the specified expense entry.
Expense Report Management	Create Expense Report	Creates an expense report with the supplied data.
	Execute Workflow Action for Expense Report	Executes a workflow action for an expense report using it's workflow step ID. **Note:** One of the action inputs is Workflow Step ID. Use the default subflow, Get Expense Report Workflow Step ID, to obtain the required Workflow Step ID value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Expense Report Details	Retrieves details of the specified expense report.
	Look up Comments	Retrieves the comments from the specified report header and from the specific expense within an expense report.
	Look up Expense Reports	Retrieves all expense reports owned by the user, based on the search criteria.
	Look up Expense Reports After Last Modified Date	Retrieves the reports modified within 24 hours after the specified Report Last Modified Date.
	Submit Expense Report	Submits an expense report for the specified report.
	Update Expense Report	Updates details of the expense report for the specified report.
Itinerary Management	Look up Itinerary by Trip ID	Retrieves information about the required trip.
Payment Request Management	Create Payment Request	Creates a payment request with all relevant details, including line items and associated allocations.
	Get Payment Request Details	Retrieves details such as Payment Request Header, Payment Request Line Item and Payment Request Allocation, for the specified payment request.
	Update Payment Request	Updates details of the specified payment request such as line items and associated allocations.
Purchase Order Management	Create Purchase Order	Creates a purchase order in SAP Concur.
	Get Purchase Order Details	Retrieves information about the specified purchase order.
	Update Purchase Order	Updates details of the specified purchase order.
Receipt Management	Get Expense Entry Receipt Image URL	Retrieves expense entry receipt image URL of the specified expense entry.
	Get Expense Report Receipt Image URL	Retrieves expense report receipt image URL of the specified expense report.
	Post Expense Report Receipt Image	Creates a receipt image for the specified expense report.
User Management	Get User Details	Retrieves details of the specified user. **Note:** Details of only the expense users are retrieved using this action.
	Look up Users	Retrieves details of the required user, based on the provided search criteria.

© 2026 ServiceNow, Inc. All rights reserved.

Category	Action	Description
	Look up Users Stream	Retrieves details of all users in a given company. The filter operation can also be used to retrieve the required user's identity information.
Webhook Management	Create Webhook Subscription	Creates subscriptions in SAP Concur for the selected topic with provided endpoint.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

AI agent	Description
SAP Concur payment request management AI agent	Manages and retrieves payment request details.
SAP Concur expense report management AI agent	Manages and submits expense reports, retrieves detailed information, and manages comments
SAP Concur purchase order management AI agent	Manages purchase order operations and retrieves the required purchase order details.
SAP Concur expense entry management AI agent	Manages and retrieves expense entry details.
SAP Concur receipt management AI agent	Manages receipts by enabling users to perform tasks such as uploading receipt images to expense reports, retrieving URLs for expense entry receipt images, and obtaining URLs for expense report receipt images.
SAP Concur itinerary management AI agent	Manages itineraries and expenses, and retrieves the required itinerary information.

Looking for an AI agent?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Available sample agentic workflows

Install Now Assist for Integration Hub and start using the available sample agentic workflows and AI agents. For more information, see Now Assist for Integration Hub.

In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. Use the available sample agentic workflow in AI Agent Studio so that AI agents can coordinate to solve complex problems. To modify the available sample agentic workflow as per your requirement, see Modify an agentic workflow.

Available sample agentic workflow includes:

Sample agentic workflow	Description	AI agents used	Always ON by default?
Get Purchase Order and Payment Request Details	Retrieves purchase order information and the corresponding payment request details for review and processing.	• SAP Concur payment request management AI agent • SAP Concur purchase order management AI agent	No **Note:** To activate the workflow, see Activate an agentic workflow template.
Upload Expense Receipt Image and Submit Expense Report	Retrieves recently updated expense reports, uploads a receipt image to an expense report, and submits the expense report for approval.	• SAP Concur receipt management AI agent • SAP Concur expense report management AI agent	No **Note:** To activate the workflow, see Activate an agentic workflow template.

Spoke module

The SAP Concur spoke adds the SAP Concur Spoke application to your instance and includes these modules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
SAP Concur Expense Entries	View details of the expense entries. After you Set up the SAP Concur spoke and map the users in the SAP Concur User Mappings module, the system retrieves details of the expense entries and populates in this module.
SAP Concur Expense Report Details	View the expense report details. Configure the default flow Get All Modified Expense Reports as per your requirement to retrieve and populate data.
SAP Concur Expense Report Last Modified Date	View the latest timestamp or last modified date on which the flow was executed or reports were filtered. Configure the default flow Get All Modified Expense Reports as per your requirement to retrieve and populate data.
SAP Concur Expense Reports	View the expense reports. After you set up the Set up the SAP Concur spoke and map the users, the system retrieves details of the expense reports and populates in this module.
SAP Concur User Mappings	Map ServiceNow users to their corresponding User IDs in SAP Concur.

Spoke user roles

The SAP Concur spoke provides these user roles to control access to data:

User role	Description
sn_sap_concur_spok.SAP Concur Spoke Admin	Users with this role can perform all operations.
sn_sap_concur_spok.SAP Concur Expense Entries User	Users with this role can only view the data available in the SAP Concur Expense Entries module.
sn_sap_concur_spok.SAP Concur Expense Reports User	Users with this role can only view the data available in the SAP Concur Expense Reports module.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the SAP Concur spoke.

Configure the SAP Concur spoke

Configure the SAP Concur spoke to integrate your ServiceNow instance with SAP Concur. After integration, you can create flows and automate actions on SAP Concur. For example, you can create a flow so that when a trigger occurs, it gets itinerary details based on the trip ID.

Before you begin

- Request an Integration Hub subscription.
- Activate the SAP Concur spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configure the SAP Concur Event Subscription Service alias.

   a. Navigate to **All** > **Process Automation** > **Flow Designer**.

   b. Select Connections.

   c. Turn on the Outbound tab.

   d. In the Search all connections field, enter `SAP Concur`.

   e. On the SAP Concur Event Subscription Service card, select **View Details**.

   f. Select **Configure**.

   g. Fill the form.

Configure Connection

Field	Description
Name	Name of the connection record. The default and read-only name of the first connection record is the SAP Concur Event Subscription Service. To create a record with your custom name, select **Add Connection**.
Connection URL	URL to connect to SAP Concur APIs in the format `https://www-{region}.api.concursolutions.com`.
Version	API version.
Token URL	Token URL to get the OAuth token in the format `https://{region}.api.concursolutions.com/oauth2/v0/token`.
Client ID	Client ID generated on SAP Concur. **Note:** If you don't have the client ID, contact your SAP Concur SME.
Client Secret	Client secret generated on SAP Concur. **Note:** If you don't have the client secret, contact your SAP Concur SME.

   h. Select **Configure and get OAuth Token**.
   The OAuth token is generated and the connection record for the SAP Concur Event Subscription Service alias is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Configure the SAP Concur v4 APIs alias.

   a. Navigate to **All** > **Process Automation** > **Flow Designer**.

   b. Select Connections.

   c. Turn on the Outbound tab.

   d. In the Search all connections field, enter `SAP Concur`.

   e. On the SAP Concur v4 APIs card, select **View Details**.

   f. Select **Configure**.

   g. Fill the form.

Configure Connection

Field	Description
Name	Name of the connection record. The default and read-only name of the first connection record is the SAP Concur v4 APIs. To create a record with your custom name, select **Add Connection**.
Connection URL	URL to connect to SAP Concur APIs in the format `https://{region}.api.concursolutions.com`.
Version	API version.
Token URL	Token URL to get the OAuth token in the format `https://{region}.api.concursolutions.com/oauth2/v0/token`.
Client ID	Client ID generated on SAP Concur. **Note:** If you don't have the client ID, contact your SAP Concur SME.
Client Secret	Client secret generated on SAP Concur. **Note:** If you don't have the client secret, contact your SAP Concur SME.

   h. Select **Configure and get OAuth Token**.
   The OAuth token is generated and the connection record for the SAP Concur v4 APIs alias is created.

3. Configure the SAP Concur alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **Process Automation** > **Flow Designer**.

b. Select Connections.

c. Turn on the Outbound tab.

d. In the Search all connections field, enter `SAP Concur`.

e. On the SAPConcur card, select **View Details**.

f. Select **Configure**.

g. Fill the form.

Configure Connection

Field	Description
Name	Name of the connection record. The default and read-only name of the first connection record is the SAPConcur. To create a record with your custom name, select **Add Connection**.
Connection URL	URL to connect to SAP Concur APIs in the format `https://{region}.api.concursolutions.com`.
Token URL	Token URL to get the OAuth token in the format `https://{region}.api.concursolutions.com/oauth2/v0/token`.
Client ID	Client ID generated on SAP Concur. **Note:** If you don't have the client ID, contact your SAP Concur SME.
Client Secret	Client secret generated on SAP Concur. **Note:** If you don't have the client secret, contact your SAP Concur SME.
OAuth Redirect URL	OAuth redirect URL in the format `https://<instancename>.service-now.com/oauth_redirect.do`.

h. Select **Configure and get OAuth Token**.
The OAuth token is generated and the connection record for the SAPConcur alias is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the SAP Concur spoke

Integrate the ServiceNow instance and SAP Concur by creating a custom OAuth application in SAP Concur to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SAP Concur spoke.
- Role required: admin

Procedure

1. Register SAP Concur as an OAuth provider.

   a. Navigate to **System OAuth** > **Application Registry**.

   b. Click **New**.
   The system displays the message **What kind of OAuth application?**

   c. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.

   d. On the form, fill these values.

Field	Description
Name	Name to uniquely identify the application registry. For example, `SAP Concur OAuth`.
Client ID	Client ID of your SAP Concur client application. Contact SAP Concur Implementation team to obtain this value.
Client Secret	Client secret of your SAP Concur client application. Contact SAP Concur Implementation team to obtain this value.
Default Grant type	Grant type used to establish the token. Select **Resource Owner Password Credentials**.
Token URL	URL from which the ServiceNow instance obtains the access token. Format of the token URL is, `https://<host-name>/oauth2/v0/token`. Here, host name is the fully qualified domain name of the target host where SAP Concur is installed.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

   e. Right-click the form header, and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The system validates the OAuth credentials and populates the **Redirect URL**.
- The system populates **OAuth Entity Profile** with **Grant Type** as **Resource Owner Password Credentials**. For example, **OAuth Entity Profile** is created with default **Name**, **SAPConcur**

2. Create a credential record for the SAP Concur spoke.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.

   c. Select **OAuth 2.0 Credentials**.

   d. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `SAP Concur Cred`.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile you created when you registered the custom SAP Concur application as an OAuth provider. For example, select **SAPConcur**.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Select the order to apply this credential. For example, enter `100`.

   e. Save the record.

3. Create a connection record for the SAP Concur spoke.

   a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

   b. Open for the record, **SAPConcur**.

   c. From the **Connections** tab, click **New**.

   d. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `SAP Concur Connection`.
Credential	Credential record you created for SAP Concur. For example, select **SAP Concur Cred**.
Connection URL	Connection URL to connect to SAP Concur in this format: `<Host>/api`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Host	Fully qualified domain name of the target host where SAP Concur is installed. For example, `us.api.concursolutions.com` or `eu.api.concursolutions.com`.
Protocol	`https`
Base path	`/api`

e. Click **Submit**.

4. Generate OAuth token by providing the SAP Concur API user credentials.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Open the credential record you had created.
   Example: **SAP Concur Cred**

   c. Click the **Get OAuth Token** related link and provide the SAP Concur API user credentials to generate the OAuth token.

5. Configure the connection, **SAP Concur Event Subscription Service**.

   a. Navigate to **Process Automation** > **Flow Designer**.

   b. Click the **Connections** tab.

   c. Locate the **SAP Concur Event Subscription Service** connection alias and click **View Details**.

   d. To configure the spoke for the first time, select **Configure** or click **Edit**.

   e. On the **Connection** form, fill in the fields.

Field	Description
Name	Name of the connection alias record.
Connection URL	Connection URL in this format: `https://www-<Region>.api.concursolutions.com`. Replace `<Region>` with the appropriate SAP Concur region.
Version	Enter `v4`.
Token URL	Token URL in this format: `https://<Region>.api.concursolutions.com/oauth2/v0/token`. Replace `<Region>` with the appropriate SAP Concur region.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client ID	Client ID of your SAP Concur client application. Contact SAP Concur Implementation team to obtain this value.
Client Secret	Client secret of your SAP Concur client application. Contact SAP Concur Implementation team to obtain this value.

f. Click **Create and Get OAuth Token**.

A confirmation message is displayed that the OAuth token is generated successfully.

6. Configure the connection, **SAP Concur v4 APIs**.

a. Navigate to **Process Automation** > **Flow Designer**.

b. Click the **Connections** tab.

c. Locate the **SAP Concur v4 APIs** connection alias and click **View Details**.

d. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.

e. On the **Connection** form, fill in the fields.

Field	Description
Name	Name of the connection alias record.
Connection URL	Connection URL in this format: `https://<Region>.api.concursolutions.com`. Replace `<Region>` with the appropriate SAP Concur region.
Version	Enter `v4`.
Token URL	Token URL in this format: `https://<Region>.api.concursolutions.com/oauth2/v0/token`. Replace `<Region>` with the appropriate SAP Concur region.
Client ID	Client ID of your SAP Concur client application. Contact SAP Concur Implementation team to obtain this value.
Client Secret	Client secret of your SAP Concur client application. Contact SAP Concur Implementation team to obtain this value.

f. Click **Create and Get OAuth Token**.
In a new window, you will be prompted to enter **Username** and **Password**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. For **Username**, provide the Company ID of the SAP Concur instance and for **Password**, provide the value of Company Request Token.

> **Note:**
> Contact SAP Concur Implementation team to obtain the values of Company ID and Company Request Token.

h. Click **Get OAuth Token**.

7. Map SAP Concur users to the ServiceNow user in the SAP Concur User Mappings module.

a. Navigate to **SAP Concur Spoke** > **SAP Concur User Mappings**.

b. Click **New**.

c. On the form, fill these values.

Field	Description
ServiceNow User	Reference to the user record in the User [sys_user] table.
SAP Concur User ID	User ID of the required user in SAP Concur.

d. Click **Submit**.

> **Note:**
> If a user attempts to access data in the SAP Concur Expense Entries module without being mapped to the corresponding SAP Concur User ID in the SAP Concur User Mappings module, this error message is displayed.`A user with username adminn does not exist.`
>
> Map the ServiceNow user to the correspnding User ID in SAP Concur too access data in the SAP Concur Expense Entries module.

- SAP Concur spoke is set up.
- Data is retrieved and displayed in the SAP Concur Expense Entries and SAP Concur Expense Reports modules.

SAP ECC IDoc Spoke

The SAP ECC IDoc spoke is built by Bristlecone, Inc. Manage finance, items, and procurement in SAP ECC IDoc account from your ServiceNow instance.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes. Starting on March 1st 2022, all SAP spokes will be available only on the Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SAP ECC IDoc spoke v1.5.1 is the latest version.

Supported versions

This spoke was built for these SAP ECC IDoc versions, but may be compatible with later versions:

- SAP application version: SAP ECC6 (Spoke is developed on EHp8.)
- NetWeaver Version: SAP NW 7.5
- SAP JCo:3.0.20

Spoke requirements

- Contact the admin of your SAP ECC IDoc account and obtain these SAP proprietary JAR files and other required files:
  - `sapidoc3.jar` and `sapjco3.jar`.
  - `libsapjco3.so`: If your MID Server is installed on a Linux machine, obtain this file.
  - `sapjco3.dll`: If your MID Server is installed on a Windows machine, obtain this file.

  A JAR file, `sapConnector-1.0.1.jar` is available along with the spoke to provide a custom interface between SAP ECC IDoc account and ServiceNow instance. The JAR file is installed as part of the spoke in your ServiceNow instance.
- Copy and record the client value of the target host where the SAP ECC IDoc server is installed.
- If you are using this spoke along with the SAP ECC RFC spoke, during spoke upgrades, ensure that you upgrade both the spokes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- Flow Designer Action Step - Script on MID (com.glide.hub.action_step.script_mid)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The SAP ECC IDoc spoke provides actions to automate SAP ECC IDoc tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Finance	Create Fixed Assets	Creates fixed asset in your SAP ECC IDoc account.
	Create GL Account	Creates a GL account in your SAP ECC IDoc account.
	Create Invoice	Creates an invoice document in your SAP ECC IDoc account.
	Post Journal Entry	Posts a journal entry in your SAP ECC IDoc account.
	Update Fixed Assets	Updates details of the fixed assets in your SAP ECC IDoc account.
	Update GL Account	Updates details of the specified GL account in your SAP ECC IDoc account.
Items	Create Material	Creates a material (item) in your SAP ECC IDoc account.
	Update Material	Updates details of the specified material (item) in your SAP ECC IDoc account.
Procurement	Create Goods Receipt	Creates a goods receipt in your SAP ECC IDoc account.
	Create Purchase Order	Creates a purchase order in your SAP ECC IDoc account.
	Create Vendor	Creates a vendor in your SAP ECC IDoc account.
	Update Purchase Order	Updates details of the specified purchase order in your SAP ECC IDoc account.
Customer	Create Customer	Creates a customer account in SAP ECC IDoc.
	Update Customer	Update details of the required customer account in SAP ECC IDoc.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use Remote Function Call (RFC) protocol (SAP Proprietary protocol – SAP Standard Interface) leveraging Application Link Enabling (ALE) framework, which can run on an instance or MID Server. Use the connection record associated with the SAP ECC IDoc alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the SAP ECC IDoc spoke

Integrate the ServiceNow instance and SAP ECC IDoc spoke by using the Basic Auth credentials to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the SAP ECC IDoc spoke.
- Role required: admin.

Configure MID Server for the SAP ECC IDoc spoke

Configure MID Server using the SAP proprietary JAR files to integrate SAP ECC IDoc account with your ServiceNow® instance.

Before you begin

Role required: admin.

Procedure

1. **Optional:** Navigate to **All** > **System Properties** > **Security**.

   Note:
   This is applicable only if your MID Server is installed on a Linux machine

2. **Optional:** Disable the MIME type validation for file attachments.

   
   Note:
   This is applicable only if your MID Server is installed on a Linux machine.

3. Navigate to **MID Server** > **JAR Files**.
4. Upload the required SAP proprietary files (JAR, SO, or DLL) obtained after contacting your SAP ECC IDoc admin.
   For more information, see Synchronize a JAR file to MID Servers.

What to do next

Ensure that the files are synchronised in the `<MID-Server-root-directory>/agent/extlib` directory. If the files aren't synchronised, restart the MID Server.

Create a credential record for the SAP ECC IDoc spoke

Create a credential record for the SAP ECC IDoc account. The SAP ECC IDoc spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`

3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic Auth Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `SAP ECC IDoc Cred`.
User name	User name to log in to your SAP ECC IDoc account.
Password	Password to authenticate and log in to your SAP ECC IDoc account.
Active	Option to actively use the credential record.
Order	Order to apply this credential. For example, `100`.
Credential alias	Credential alias associated with the spoke.

5. Click **Submit**.

Create a connection record for the SAP ECC IDoc spoke

Create a connection record for your SAP ECC IDoc account. The SAP ECC IDoc spoke connection and credential aliases use these connections to perform actions in SAP ECC IDoc.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for SAP ECC IDoc.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `SAP ECC IDoc Connection`.
Credential	Credential record created for SAP ECC IDoc spoke. For example, `SAP ECC IDoc Cred`.
Connection alias	Alias record associated with this connection.
Host	Fully qualified domain name of the target host where the SAP ECC IDoc server is installed.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.
Use MID server	Option to use a MID Server for this connection. Select the check box and define the fields in the **Advanced MID Server Configuration** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Advanced MID Server Configuration** tab, provide these details.

Field	Description
Capabilities	Capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection.
MID Application	Application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. To learn more about how a MID Server is selected during runtime, see MID Server selection.

6. In the **Attributes** tab, provide these details.

Field	Description
Client	Client value of the target host where the SAP ECC IDoc server is installed.
u_system_number	System number of the target host where the SAP ECC IDoc server is installed.
u_lang	Language selected in the target host where the SAP ECC IDoc server is installed.

7. Click **Submit**.

SAP ECC RFC Spoke

The SAP ECC RFC spoke is built by Bristlecone, Inc. Manage items, journals, procurements, and others, in SAP ECC RFC account from your ServiceNow® instance.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes. Starting on March 1st 2022, all SAP spokes will be available only on the Store.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SAP ECC RFC spoke v2.9.4 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

This spoke was built for these SAP ECC RFC versions and the spoke is compatible with versions listed below:

- SAP application version where spoke is developed: SAP EHP8 for ERP6.0
- Compatible SAP application versions: SAP ECC6.0 Base pack until latest SAP EHP8 for ERP6.0
- SAP JCo: 3.0.20 or later

Spoke requirements

- Contact the admin of your SAP ECC RFC account and obtain these SAP proprietary JAR files and other required files:
  - `sapjco3.jar`.
  - `libsapjco3.so`: If your MID Server is installed on a Linux machine, obtain this file.
  - `sapjco3.dll`: If your MID Server is installed on a Windows machine, obtain this file.

  A JAR file, `sapConnector-1.0.1.jar`, is available along with the spoke to provide custom interface to interact and execute RFCs and IDocs in the SAP ECC RFC account. The JAR file is installed as part of the spoke in your ServiceNow instance.
- Copy and record the client value of the target host where the SAP ECC RFC server is installed.
- Configure the values of these system properties:
  - *`com.snc.process_flow.reporting.serialized.val_size_limit`*: This property serializes JSON objects and ensures that the data is in the required format. Specify the number of bytes as per your requirement. For more information, see Workflow Studio system\n properties .
  - *`glide.rest.max_content_length`*: This property specifies the payload size. Specify the maximum payload size you want to use in your flows. The maximum value you can specify for this property is, 25 MB.
- If you are using this spoke along with the SAP ECC IDoc, SAP S4 HANA IDoc, SAP S4 HANA RFC spokes, during spoke upgrades, ensure that you upgrade all the spokes to their latest versions.

Note:
If you are upgrading the spoke from an earlier version, make sure to restart the MID server.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke flows

The SAP ECC RFC spoke provides sample flows to demonstrate automating the SAP ECC RFC tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

Flow	Description
Retrieve Users By Role	Retrieves details of the SAP ECC RFC users with the specified role. The user details can be accessed by navigating to **SAP ECC RFC Spoke** > **SAP ECC Users**.
Retrieve Incoming Invoice	Retrieves details of the incoming SAP ECC RFC invoices. The invoice details can be accessed by navigating to **SAP ECC RFC Spoke** > **SAP ECC Invoices Data**.
Create Sales Order and Look up Status	Creates a sales order and retrieves the status information.
Create Cost Center	Demonstrates how to use the Execute RFC and Create Table Field Object actions.

Spoke actions

The SAP ECC RFC spoke provides actions to automate SAP ECC RFC tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Items	Look up Material Groups	Retrieves the list of material groups from your SAP ECC RFC account.
	Look up Materials By Plant	Retrieves the list of materials (items) based on plant selection criteria.
	Look up Materials by Storage Location	Retrieves the list of materials (items) based on the storage location selection criteria.
Journals	Post Journal Entry	Posts a journal entry to a GL account in your SAP ECC RFC account.
	Reverse Journal Entry	Reverses a journal entry in a GL account in your SAP ECC RFC account.
Lookups	Look up Cost Centers by Controlling Area	Retrieves cost centers based on the controlling area from your SAP ECC RFC account.
Metadata Retrieval	Look up RFC Input Schema	Retrieves the input schema for the RFC, from SAP ECC RFC dynamically.
	Look up RFC Output Schema	Retrieves the output schema from SAP ECC RFC dynamically, for the selected RFC.
	Look up RFC Table Field Input Metadata	Dynamically retrieves the input schema from SAP ECC RFC, for the selected field in the RFC tables.
	Look up RFC Table Field Output Metadata	Dynamically retrieves the output schema from SAP ECC RFC, for the selected field in the RFC tables.
	Look up RFC Tables Input Metadata	Dynamically retrieves the tables input schema for the RFC, from SAP ECC RFC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up RFC Input Metadata	Dynamically retrieves the input schema for the RFC, from SAP ECC – RFC.
	Look up RFC Output Metadata	Dynamically retrieves the output schema from SAP ECC - RFC, for the selected RFC.
Procurement	Authorize Payment	Creates an authorize payment document in SAP ECC RFC.
	Create Fixed Asset	Create a fixed asset in SAP ECC RFC.
	Create Service Goods Receipt	Creates a Service goods receipt document in SAP ECC - RFC.
	Create Goods Receipt	Creates a goods receipt document in SAP ECC RFC.
	Create Invoice	Creates an invoice in SAP ECC RFC.
	Cancel Invoice	Cancels an invoice document in SAP ECC - RFC.
	Cancel Goods Receipt	Cancels a goods receipt document in SAP ECC - RFC.
	Create Non Purchase Order Invoice	Creates a non purchase order invoice document in SAP ECC – RFC.
	Create Purchase Order	Creates a purchase order in SAP ECC RFC.
	Create Vendor	Creates a vendor in SAP ECC RFC.
	Update Vendor	Updates details of a vendor in SAP ECC RFC.
	Look up Asset Category	Retrieves details of the specified asset from SAP ECC - RFC.
	Look up Invoices	Retrieves details of the specified invoice from SAP ECC - RFC.
	Look up Invoices By Date	Retrieves invoices from SAP ECC RFC based on the provided date.
	Look up Purchase Orders and Purchase Order Lines	Retrieves details of the purchase order and purchase order lines from SAP ECC - RFC.
	Look up Purchase Order Attachments	Retrieves the details of the purchase order from SAP ECC - RFC.
	Look up Receipts	Retrieves the details of the receipts from SAP ECC - RFC.
	Look up Vendors	Retrieves vendors details from SAP ECC - RFC.
	Look up Advance Shipment Notices	Retrieves details of the advance shipment notices in SAP ECC - RFC.
	Look up Payment Status for Invoice	Retrieves the payment status for invoice from SAP ECC - RFC.
	Update Purchase Order	Updates an existing purchase order in SAP ECC RFC

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Records Management	Execute RFC	Executes an RFC from the available list for the create, update, or read operations.
	Execute RFC for Look up Operations	Executes an RFC from the available list of read operations.
Bills and Payment	Look Up Bill Details By ID	Retrieves bills based on sales order from SAP ECC RFC.
	Look Up Outstanding Balance	Retrieves outstanding balance of a customer from SAP ECC RFC.
	Look Up Payments	Retrieves pending payments of the customer from SAP ECC RFC.
Customer	Look Up Customer Info	Retrieves customer information based on company code and customer from SAP ECC RFC.
Transfer Order	Create Transfer Order and Line Items	Creates a transfer order in SAP ECC - RFC.
	Look up Transfer Order and Line Items	Retrieves transfer orders from SAP ECC - RFC.
Utility	Create Table Field Object	Envelops user inputs for the selected table field of given BAPI in an object.
Inventory (or) Sales	Look Up Inventory of Parts	Retrieves inventory for the plant and material from SAP ECC RFC.
Finance Management	Create Asset	Creates an asset in SAP ECC - RFC with the provided details.
Sales Order	Create Sales Order	Creates a sales order in SAP ECC RFC.
	Look Up Sales Order	Retrieves sales order details from SAP ECC RFC.
	Look Up Sales Orders	Retrieves sales orders based on customer from SAP ECC RFC.
	Update Sales Order	Updates details of the required sales order in SAP ECC RFC.

Spoke modules

The SAP ECC RFC spoke adds the SAP ECC RFC Spoke application to your instance and includes these modules:

Module	Description
SAP ECC Flow Executions	Displays the last successful execution date of the Retrieve Incoming Invoice flow. Before the first flow execution, you must create a record in this module to specify the date from which the incoming invoice details should be fetched.
SAP ECC Invoices Data	Displays the records retrieved by the Retrieve Incoming Invoice flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
SAP ECC RFCs	Displays the list of BAPIs. The Execute RFC action and Execute RFC for Look up Operations actions uses this as input. **Note:** Value of Operation Type is used to specify the kind of operation BAPI is expected to do. If the operation is read, the operation will be available in both Execute RFC for Look up Operations and Execute RFC actions. If the operation is write, the operation is only available for Execute RFC action as input.
SAP ECC Users	Displays details of the SAP ECC RFC users. The Retrieve Users By Role flow retrieves details of the users with the specified role.

Spoke user roles

The SAP ECC RFC spoke provides user roles to control access to data.

- Users with the sn_sap_ecc_rfc_spo.SAP_ECC_RFC_Spoke_Admin role have access to the spoke tables.
- Users with the sn_sap_ecc_rfc_spo.SAP_ECC_RFC_Spoke_Read role can view data in the SAP ECC RFCs table and module.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the SAP ECC RFC spoke.

MID Server requirements

These actions use Remote Function Call (RFC) protocol (SAP Proprietary protocol – SAP Standard Interface), which can run on an instance or MID Server. Use the connection record associated with the SAP ECC RFC spoke alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps

Note:

- If the MID Server is installed on a Linux machine, perform the configurations as outlined in Configure MID Server for the SAP ECC RFC spoke.
- If the MID Server is installed on a Windows machine, no configurations are needed.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the SAP ECC RFC spoke

Integrate the ServiceNow instance and SAP ECC RFC account by using the Basic Auth credentials to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the SAP ECC IDoc spoke.
- Role required: admin.

Configure MID Server for the SAP ECC RFC spoke

Configure MID Server using the SAP proprietary JAR files to integrate SAP ECC RFC account with your ServiceNow® instance.

Before you begin

Role required: admin.

Procedure

1. **Optional:** Navigate to **All** > **System Properties** > **Security**.

   Note:
   This is applicable only if your MID Server is installed on a Linux machine

2. **Optional:** Disable the MIME type validation for file attachments.

   
   Note:
   This is applicable only if your MID Server is installed on a Linux machine

3. Navigate to **MID Server** > **JAR Files**.
4. Upload the required SAP proprietary files (JAR, SO, or DLL) obtained after contacting your SAP ECC RFC admin.
   For more information, see Synchronize a JAR file to MID Servers.

What to do next

Ensure that the files are synchronised in the `<MID-Server-root-directory>/agent/extlib` directory. If the files aren't synchronised, restart the MID Server.

Create a credential record for the SAP ECC RFC spoke

Create a credential record for the SAP ECC RFC account. The SAP ECC RFC spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`

3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic Auth Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `SAP ECC RFC Cred`.
User name	User name to log in to your SAP ECC RFC account.
Password	Password to authenticate and log in to your SAP ECC RFC account.
Active	Option to actively use the credential record.
Order	Order to apply this credential. For example, `100`.
Credential alias	Credential alias associated with the spoke.

5. Click **Submit**.

Create a connection record for the SAP ECC RFC spoke

Create a connection record for your SAP ECC RFC account. The SAP ECC RFC spoke connection and credential aliases use these connections to perform actions in SAP ECC RFC.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for SAP ECC RFC.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `SAP ECC RFC Connection`.
Credential	Credential record created for SAP ECC RFC spoke. For example, `SAP ECC RFC Cred`.
Connection alias	Alias record associated with this connection.
Host	IP address of the target host where the SAP ECC RFC server is installed.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.
Use MID server	Option to use a MID Server for this connection. Select the check box and define the fields in the **Advanced MID Server Configuration** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Advanced MID Server Configuration** tab, provide these details.

Field	Description
Capabilities	Capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection.
MID Application	Application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. To learn more about how a MID Server is selected during runtime, see MID Server selection.

6. In the **Connection Attributes** tab, provide these details.

Field	Description
Client	Client value of the target host where the SAP ECC RFC server is installed.
System Number	System number of the target host where the SAP ECC RFC server is installed.
Language	Language selected in the target host where the SAP ECC RFC server is installed.

7. **Optional:** If you intend to connect to an SAP load-balanced environment, provide values for these additional fields in the **Connection Attributes** tab:
   - **Message Server**
   - **Group**
   - **Host**
8. Click **Submit**.

SAP Fieldglass Spoke

The SAP Fieldglass spoke is built by Bristlecone, Inc. Manage job postings, workers, timesheets and expenses, and approvals in SAP Fieldglass account from your ServiceNow instance.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes. Starting on March 1st 2022, all SAP spokes will be available only on the Store.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

SAP Fieldglass spoke v1.2.1 is the latest version.

Supported versions

This spoke was built for SAP Fieldglass v2.0, but may be compatible with later versions.

Note:
SAP Fieldglass APIs doesn’t support JSON by default. You must reach out to the SAP Fieldglass support to enable JSON support for the APIs.

Spoke requirements

- Copy and record the API Key. Contact the SAP Fieldglass support team if you don't have the value.
- By default, all APIs are not enabled. Contact the SAP Fieldglass support team to enable these APIs and enable JSON support for these APIs:

API Type	API
Job Posting	Job Posting Upload
	Job Posting Update Upload
	Job Posting Redistribution Upload
	Job Posting Cost Center Allocation Upload
	Standard Job Posting Qualification Upload
	Job Posting Close Upload
	Job Seeker Reject Upload
Supplier Job Posting	Get Job Posting
	Submit Job Seeker
Work Order Management	Work Order Upload
	Work Order Revision Upload
	Work Order Close Upload
Supplier - Work Order	Get Work Order Offer
	Accept Work Order Offer
	Accept Work Order Multiple Rate
	Decline Work Order Offer
	Accept Work Order Revision
	Decline Work Order Revision
Workers	Active Worker Delta Single Line Download (LastRundate)
	Active Worker Download
Time Sheet and Expense	Time Sheet Upload

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Type	API
	Expense sheet Upload
	Approved Expense sheet download (LastRundate)
	Approved Timesheet Fixed Format Download (LastRundate)
	Time Sheet Rejection Upload
Approvals and Rejection	approvals
Master Data	Supplier Download
	Reason Code Download
	Business unit Download
	Cost center Download
	Legal Entity Download
	Shift Download
	Rate Schedule Download
	Site Details Download

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Encryption Support (com.glide.encryption)
- Key Management Framework plugin (com.glide.kmf.global)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The SAP Fieldglass spoke provides sample flows to demonstrate automating the tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

Flow	Description
Sample Look up Approval and Metadata Flow	Approves the pending approvals in SAP Fieldglass.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
Sample Look up Flow	Retrieves or downloads data related to currently active workers and data related to workers who had revisions since the last successful run date of the connector.

Spoke actions

The SAP Fieldglass spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Buyer - Approvals and Rejection	Approve	Approves the pending approvals in SAP Fieldglass.
	Look up Pending Approvals	Retrieves the list of pending approvals.
	Look up Reject Reasons	Retrieves the list of available reject reasons.
	Reject	Rejects the pending approvals in SAP Fieldglass.
Buyer - Job Posting	Close Job Posting	Closes the specified job posting in SAP Fieldglass.
	Close Job Posting Bulk	Closes multiple job postings in SAP Fieldglass.
	Create Job Posting	Creates a job posting in SAP Fieldglass.
	Reject Job Seeker	Rejects the specified job seeker in SAP Fieldglass.
	Reject Job Seeker Bulk	Rejects multiple job seekers in SAP Fieldglass.
	Update Job Posting	Updates details of the required job posting.
	Update Job Posting Cost Center Allocation	Updates the cost center code for the existing job posting.
	Update Job Posting Cost Center Allocation Bulk	Updates the cost center code for multiple existing job postings.
	Update Job Posting Distribution	Distributes single or bulk job posting to the suppliers.
	Update Job Posting Qualification	Updates or uploads one or more job posting templates or qualifications data for the required job posting.
Buyer - Time Sheet and Expense	Look up Approved Expense Sheets	Retrieves details of the approved expense sheets.
	Look up Approved Time Sheets	Retrieves details of the approved time sheet.
	Reject Time Sheet Bulk	Rejects single or bulk time sheet.
	Upload Expense Sheet	Uploads expense sheet in SAP Fieldglass.
	Upload Time Sheets	Uploads time sheets in SAP Fieldglass.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Buyer - Work Order Management	Close Work Order	Closes a work order if workers have not been on-boarded.
	Revise Work Order	Revises the specified work order in SAP Fieldglass.
	Upload Work Order	Uploads work order to SAP Fieldglass.
Buyer - Workers	Look up Active Workers	Retrieves or downloads data related to currently active workers.
	Look up Active Workers Delta	Retrieves or downloads data related to workers who had revisions since the last successful run date of the connector.
	Upload SOW Worker	Uploads or creates an SOW Worker for the existing Statement Of Work.
Metadata Retrieval	Get Buyer Token	Generates access token for SAP Fieldglass buyer.
	Get Supplier Token	Generates access token for the SAP Fieldglass supplier.
	Last Run Date	Retrieves the required data after the last run date.
	Look up Business Units	Retrieves list of the available business units.
	Look up Cost Centers	Retrieves list of the available Cost Centers.
	Look up Legal Entities	Retrieves list of the available legal entities.
	Look up Rate Schedules	Retrieves list of the available rate schedules.
	Look up Reason Codes	Retrieves list of the available reason codes.
	Look up Shift Details	Retrieves list of the available shifts.
	Look up Site Details	Retrieves list of the available sites.
	Look up Suppliers	Retrieves list of the available suppliers.
	Sample JSON Parser Action	Parses the JSON object and converts it to an array of objects.
Supplier - Job Posting	Get Job Posting	Retrieves details of the required job posting.
	Submit Job Seeker	Submits a job seeker in SAP Fieldglass.
Supplier - Work Order	Accept Work Order Multiple Rates	Accepts work order multiple rates in SAP Fieldglass.
	Accept Work Order Offer	Accepts work order in SAP Fieldglass.
	Accept Work Order Revision	Accepts the revised work order in SAP Fieldglass.
	Accept Work Order Revision Multiple Rates	Accepts the revised Work order with multiple Rates.
	Decline Work Order Offer	Declines the specified work order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Decline Work Order Revision	Declines the revised work order.
	Get Work Order Offer	Retrieves details of the required work order.

Spoke modules

The SAP Fieldglass spoke adds the SAP Fieldglass Spoke application to your instance and includes these modules:

Module	Description
Active Worker Downloads	Displays details of the active workers. Data is retrieved when you run the Look up Active Workers spoke action.
Create Job Postings	Displays details about the job postings. Data is retrieved from the SAP Fieldglass instance after you set up the webhook. For more information, see Set up webhook for the SAP Fieldglass spoke.
SAP Fieldglass Buyer Credentials	Displays the buyer credential records.
SAP Fieldglass Modules	Displays details about the modules. The spoke actions internally use these modules during flow execution. You can manage the modules as per your requirement.
SAP Fieldglass Supplier Credentials	Displays the supplier credential records.
SAP Fieldglass Webhook Registries	Displays the webhook registries. You can create webhook registry for an event as per your requirement. For more information, see Set up webhook for the SAP Fieldglass spoke.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are available along with spoke; one record for supplier and another record for buyer. For information about setting up the spoke, see Set up the SAP Fieldglass spoke.

Generate API key

Generate an API key on the SAP Fieldglass tenant to enable your ServiceNow instance to connect to the SAP Fieldglass tenant. You provide the API key on the SAP Fieldglass spoke connection record and the SAP Fieldglass tenant authenticates your ServiceNow instance based on the API key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

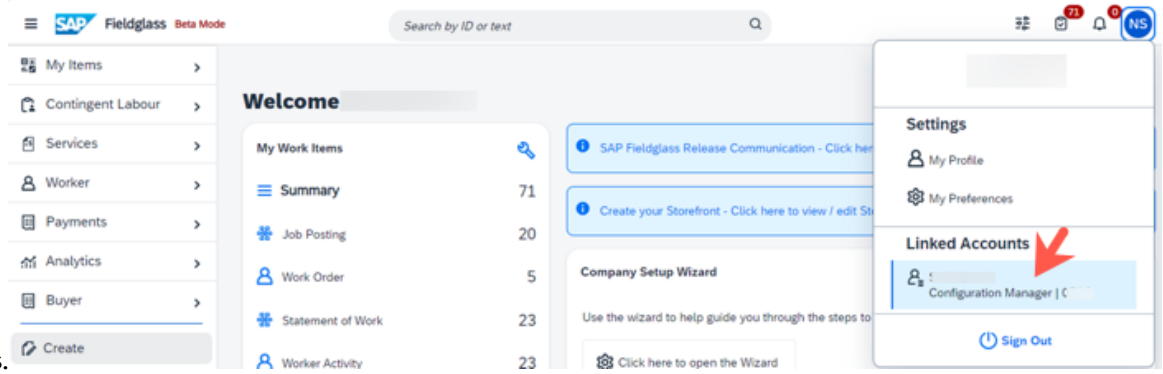
Before you begin

Role required: admin

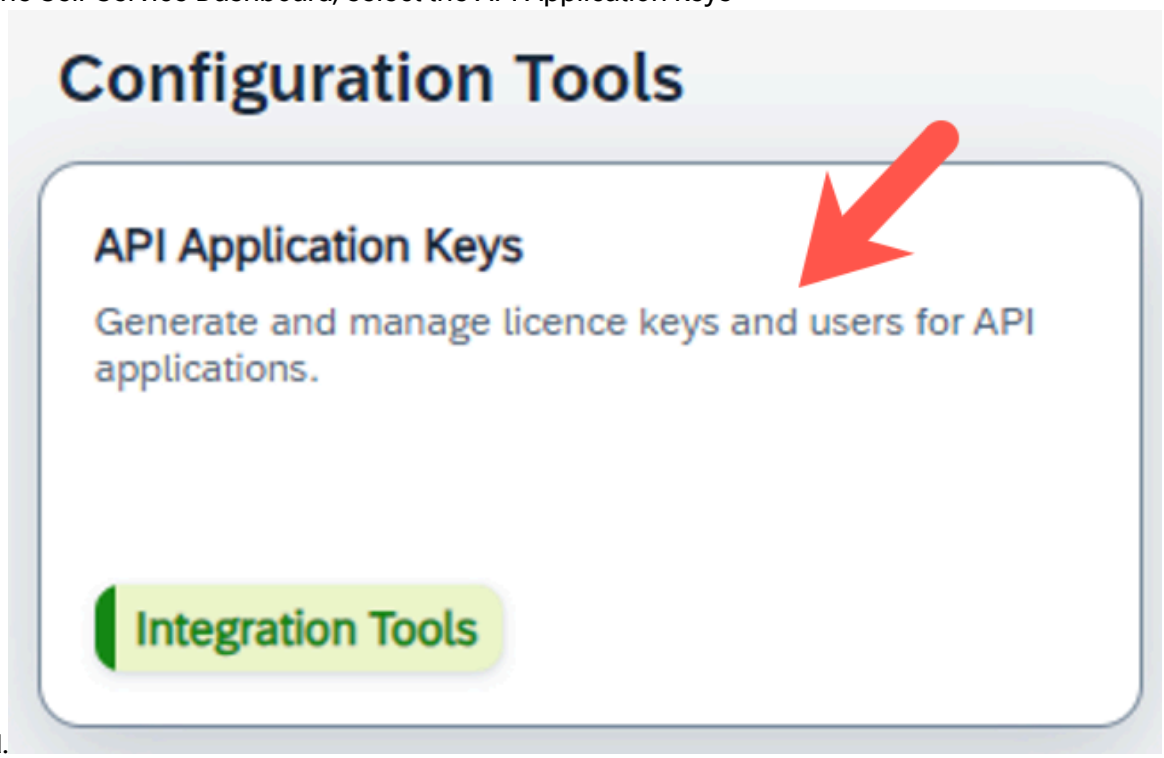
Access to SAP Fieldglass tenant account.

Procedure

1. Log in to your SAP Fieldglass tenant account.
2. Select Linked Accounts.

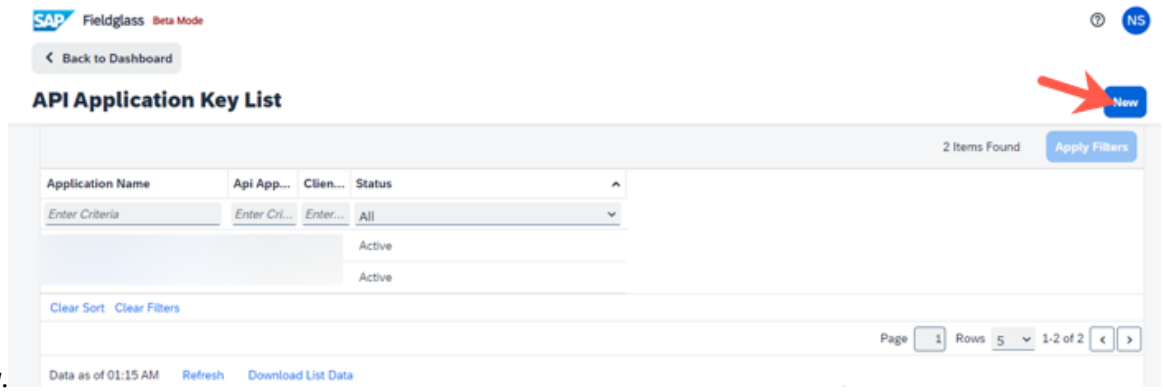


3. On the Self-Service Dashboard, select the API Application Keys card.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

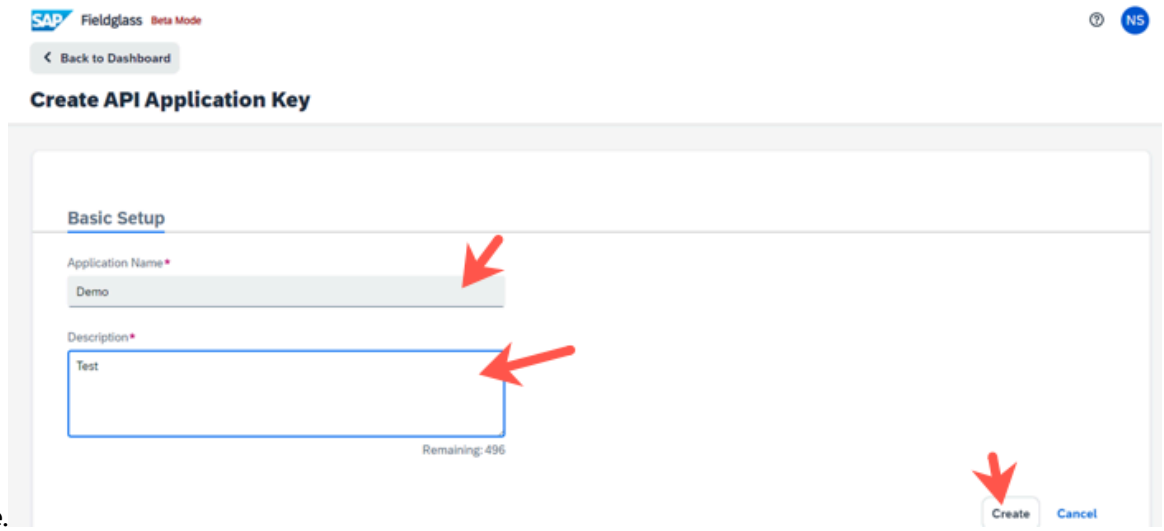
4. Select **New**.



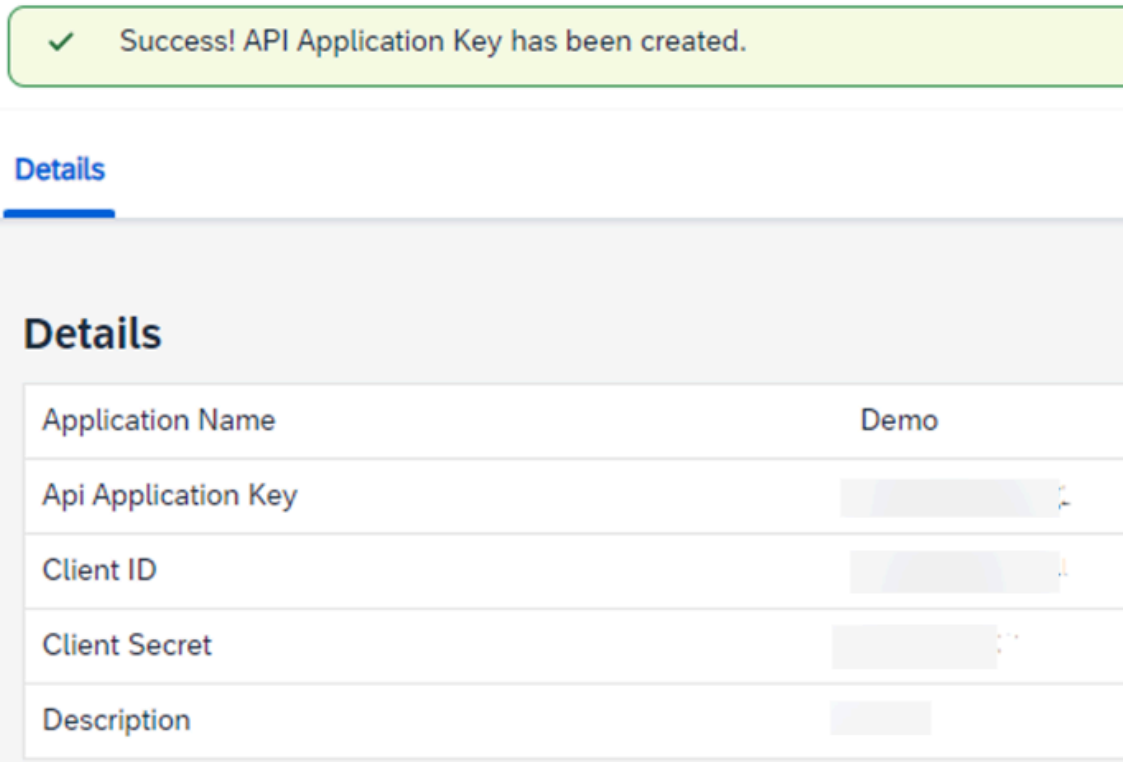
5. On the Create Application Key page, enter values.
   - Application Name: Name of the application.
   - Description: Custom description of the API key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select



Create.
The API key and other details are



generated.

Configure SAP Fieldglass connection record

Configure the connection record to enable your ServiceNow instance to connect with the SAP Fieldglass tenant.

Before you begin

- Request an Integration Hub subscription.
- Ensure you've generated the API key from the SAP Fieldglass tenant.
- Activate the SAP Fieldglass spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configure the connection record for the SAPFieldGlassBuyer alias.
   a. Navigate to **All** > **Process Automation** > **Flow Designer**.
   b. Select Connections.
   c. Turn on the Outbound tab.
   d. In the Search all connections field, enter `SAP Fieldglass`.
   e. On the SAP SAPFieldGlassBuyer card, select **View Details**.
   f. Select **Configure**.
   g. Fill the form.

Configure Connection

Field	Description
Name	Name of the connection record. The default and read-only name of the first connection record is the SAPFieldglassBuyer Connection. To create a record with your custom name, select **Add Connection**.
Connection URL	URL to connect to SAP Fieldglass APIs in the format `https://<SAP Fieldglass environment URL>.com/api`.
Name	Custom name of the credentials to access the SAP Fieldglass tenant.
User name	User name to log in to the SAP Fieldglass tenant.
Password	Password to log in to the SAP Fieldglass tenant.
APIKey	API key of the buyer.

   h. Select **Configure Connection**.

2. Configure the connection record for the SAPFieldGlassSupplier alias.
   a. Navigate to **All** > **Process Automation** > **Flow Designer**.
   b. Select Connections.
   c. Turn on the Outbound tab.
   d. In the Search all connections field, enter `SAP Fieldglass`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. On the SAP SAPFieldGlassSupplier card, select **View Details**.

f. Select **Configure**.

g. Fill the form.

Configure Connection

Field	Description
Name	Name of the connection record. The default and read-only name of the first connection record is the SAPFieldGlassSupplier Connection. To create a record with your custom name, select **Add Connection**.
Connection URL	URL to connect to SAP Fieldglass APIs in the format `https://<SAP Fieldglass environment URL>.com/api`.
Name	Custom name of the credentials to access the SAP Fieldglass tenant.
User name	User name SAP Fieldglass buyer tenant.
Password	Password of SAP Fieldglass buyer tenant.
APIKey	API key of the supplier.

h. Select **Configure Connection**.

Set up the SAP Fieldglass spoke

Integrate the ServiceNow instance and SAP Fieldglass account using API keys to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate SAP Fieldglass spoke.
- Role required: admin

Procedure

1. Configure the connection and credential alias record for the SAP Fieldglass buyer instance.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the record, **SAPFieldGlassBuyer**.

c. Click the Create New Connection & Credential related link.

d. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection and Credential form

Field	Description
Please Enter the Connection Information	
Name	Name to identify the connection record. For example, SAP `Fieldglass Buyer Connection`.
Connection URL	URL of the SAP Fieldglass buyer instance.
Please Enter the Credential Information	
Name	Name to identify the credential record. For example, SAP `Fieldglass Buyer Credential`.
User name	User name to log in to your SAP Fieldglass buyer instance.
Password	Password to log in to your SAP Fieldglass buyer instance.
APIKey	API key of your SAP Fieldglass buyer instance.

e. Click **Create**.

2. Configure the connection and credential alias record for the SAP Fieldglass supplier instance.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the record, **SAPFieldGlassSupplier**.

c. Click the Create New Connection & Credential related link.

d. On the form, fill these values.

Create Connection and Credential form

Field	Description
Please Enter the Connection Information	
Name	Name to identify the connection record. For example, SAP `Fieldglass Supplier Connection`.
Connection URL	URL of the SAP Fieldglass supplier instance.
Please Enter the Credential Information	
Name	Name to identify the credential record. For example, SAP `Fieldglass Supplier Credential`.
User name	User name to log in to your SAP Fieldglass supplier instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Password to log in to your SAP Fieldglass supplier instance.
APIKey	API key of your SAP Fieldglass supplier instance.

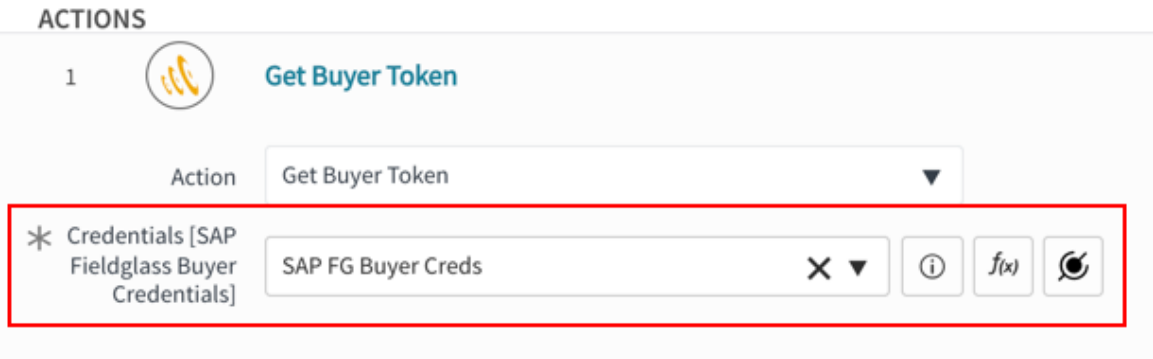
e. Click **Create**.

3. Create flow to generate buyer token.

a. Navigate to **Flow Designer** > **Designer**.

b. Create a flow and include the Get Buyer Token spoke action.
For more information about creating flows, see Building flows.

c. Select the buyer credential record for **Credentials [SAP Fieldglass Buyer Credentials]**.



d. Test the flow.
After successful execution, these fields are auto-populated in the SAP Fieldglass Buyer credential record:

- **Access Token**: Access token is generated.
- **Token Status**: Status is set to **Active**.
- **Expiry**: Expiry date and time of the access token is displayed.

4. Create flow to generate supplier token.

a. Navigate to **Flow Designer** > **Designer**.

b. Create a flow and include the Get Supplier Token spoke action.
For more information about creating flows, see Building flows.

c. Select the supplier credential record for **Credentials [SAP Fieldglass Supplier Credentials]**.

d. Test the flow.
After successful execution, these fields are auto-populated in the SAP Fieldglass Supplier credential record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Access Token**: Access token is generated.
- **Token Status**: Status is set to **Active**.
- **Expiry**: Expiry date and time of the access token is displayed.

Set up webhook for the SAP Fieldglass spoke

Retrieve the required information from SAP Fieldglass instance to your ServiceNow instance by setting up webhook to authenticate the requests.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **SAP Fieldglass Spoke** > **SAP Fieldglass Webhook Registries**.
2. Click **New**.
3. On the form, fill in the fields.

SAP Fieldglass Webhook Registry form

Field	Description
SAP Fieldglass Event	Event for which you want to set up the webhook. For example, `Create job posting`.
User name	Leave this field empty.
Password	Leave this field empty.
SAP Fieldglass Instance	URL of your SAP Fieldglass instance.

4. Click **Generate UserName and Password**.
   User name and **Password** are displayed.
5. Copy and record the values.
6. Share information with the appropriate teams.
   - Contact the SAP Fieldglass team to configure the webhook endpoint.
   - Share the user name and password combination with the SAP Fieldglass team.

SAP S4 HANA IDoc Spoke

The SAP S4 HANA IDoc spoke is built by Bristlecone, Inc. Manage finance, items, and procurement in SAP S4 HANA IDoc account from your ServiceNow instance.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes. Starting on March 1st 2022, all SAP spokes will be available only on the Store.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

SAP S4 HANA IDoc spoke v1.2.0 is the latest version.

Supported versions

This spoke was built for SAP S4 HANA IDoc 2023.

Spoke requirements

- Contact the admin of your SAP S4 HANA IDoc account and obtain these SAP proprietary JAR files and other required files:
  - `sapidoc3.jar` and `sapjco3.jar`.
  - `libsapjco3.so`: If your MID Server is installed on a Linux machine, obtain this file.
  - `sapjco3.dll`: If your MID Server is installed on a Windows machine, obtain this file.

  A JAR file, `sapConnector-1.0.1.jar` is available along with the spoke to provide a custom interface between SAP S4 HANA IDoc account and ServiceNow instance. The JAR file is installed as part of the spoke in your ServiceNow instance.
- Copy and record the client value of the target host where the SAP S4 HANA IDoc server is installed.
- To retrieve information for authorization purposes, use the Execute RFC spoke action in the SAP S4 HANA RFC Spoke.
- If you are using this spoke along with the SAP ECC IDoc, SAP ECC RFC, SAP S4 HANA RFC spokes, during spoke upgrades, ensure that you upgrade all the spokes to their latest versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- Flow Designer Action Step - Script on MID (com.glide.hub.action_step.script_mid)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The SAP S/4 HANA IDoc spoke provides actions to automate SAP S4 HANA IDoc tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Customer Account	Create Customer Account	Creates a customer account in SAP S/4HANA.
	Update Customer Account	Updates details of the specified customer account in SAP S/4HANA.
Finance	Create Fixed Assets	Creates a fixed asset in SAP S4 HANA IDoc.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create GL Account	Creates a GL account in SAP S4 HANA IDoc.
	Create Invoice	Creates an invoice document in SAP S4 HANA IDoc.
	Post Journal Entry	Posts a journal entry to a GL account in SAP S4 HANA IDoc.
	Update Fixed Assets	Updates details of a fixed asset in SAP S4 HANA IDoc.
	Update GL Account	Updates details of the specified GL account in SAP S4 HANA IDoc.
Items	Create Material	Creates a material (item) in SAP S4 HANA IDoc.
	Update Material	Updates details of the specified material (item) in SAP S4 HANA IDoc.
Procurement	Create Goods Receipt	Creates a goods receipt in SAP S4 HANA IDoc.
	Create Purchase Order	Creates a purchase order in SAP S4 HANA IDoc.
	Create Vendor	Creates a vendor in SAP S4 HANA IDoc.
	Update Purchase Order	Updates details of the specified purchase order in SAP S4 HANA IDoc.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the SAP S4 HANA IDoc spoke.

MID Server requirements

These actions use Remote Function Call (RFC) protocol (SAP Proprietary protocol – SAP Standard Interface) leveraging Application Link Enabling (ALE) framework, which can run on an instance or MID Server. Use the connection record associated with the SAP S4 HANA IDoc alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the SAP S4 HANA IDoc spoke

Integrate the ServiceNow instance and SAP S4 HANA IDoc spoke by using the Basic Auth credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SAP S4 HANA IDoc spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To retrieve information, use the Execute RFC spoke action in the SAP S4 HANA RFC Spoke.

Procedure

1. Configure MID Server using the SAP proprietary JAR files.

   a. **Optional:** Navigate to **System Properties** > **Security**.

   Note:
   This is applicable only if your MID Server is installed on a Linux machine

   b. **Optional:** Disable the MIME type validation for file attachments.

   
   Note:
   This is applicable only if your MID Server is installed on a Linux machine.

   c. Navigate to **MID Server** > **JAR Files**.

   d. Upload the required SAP proprietary files (JAR, SO, or DLL) obtained after contacting your SAP S4 HANA IDoc admin.
   For more information, see Synchronize a JAR file to MID Servers.

   Note:
   Ensure that the files are synchronised in the `<MID-Server-root-directory>/agent/extlib` directory. If the files aren't synchronised, restart the MID Server.

2. Create a credential record for the SAP S4 HANA IDoc account.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`

   c. Select **Basic Auth Credentials**.

   d. On the form, fill these values.

Basic Auth Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `SAP S4 HANA IDoc Cred`.
User name	User name to log in to your SAP S4 HANA IDoc account.
Password	Password to authenticate and log in to your SAP S4 HANA IDoc account.
Active	Option to actively use the credential record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Order to apply this credential. For example, `100`.
Credential alias	Credential alias associated with the spoke.

e. Click **Submit**.

3. Create a connection record for your SAP S4 HANA IDoc account.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the alias record for SAP S4 HANA IDoc.

c. From the **Connections** tab, click **New**.

d. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `SAP S4 HANA IDoc Connection`.
Credential	Credential record created for SAP S/4 HANA IDoc spoke. For example, `SAP S4 HANA IDoc Cred`.
Connection alias	Alias record associated with this connection.
Host	Fully qualified domain name of the target host where the SAP S4 HANA IDoc server is installed.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.
Use MID server	Option to use a MID Server for this connection. Select the check box and define the fields in the **Advanced MID Server Configuration** tab.

e. In the **Advanced MID Server Configuration** tab, provide these details.

Field	Description
Capabilities	Capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID Application	Application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. To learn more about how a MID Server is selected during runtime, see MID Server selection.

f. In the **Attributes** tab, provide these details.

Field	Description
Client	Client value of the target host where the SAP S4 HANA IDoc server is installed.
u_system_number	System number of the target host where the SAP S4 HANA IDoc server is installed.
u_lang	Language selected in the target host where the SAP S4 HANA IDoc server is installed.

g. Click **Submit**.

SAP S4 HANA OData spoke

The SAP S4 HANA OData spoke is built by Bristlecone, Inc. Manage items, journals, procurements, and transactions in the SAP S4 HANA OData account from your ServiceNow® instance.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes. Starting on March 1st 2022, all SAP spokes will be available only on the Store.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SAP S4 HANA OData spoke v1.11.2 is the latest version.

Supported versions

This spoke was tested with SAP S/4HANA version 2023.

Spoke requirements

- SAP S4 HANA OData account
- Configure the value of this system property:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

com.snc.process_flow.reporting.serialized.val_size_limit: This property serializes JSON objects and ensures that the data is in the required format. Specify the number of bytes as per your requirement. For more information, see Workflow Studio system properties.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Scheduled jobs

The SAP S4 HANA OData spoke is shipped with the *Generate Token and Cookie* scheduled job.

Generate Token and Cookie: This scheduled job is run every 26 minutes, which creates a token and cookie.

Note:
The Fetch Token action depends on this scheduled job.

Spoke actions

The SAP S4 HANA OData spoke provides actions to automate SAP S4 HANA OData tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Contract Management	Create Contract	Creates a new purchase contract in SAP S4 HANA with one or more items. Validates the payload before submission.
	Look up Contracts Stream	Retrieves details of all items across purchase contracts from SAP S4 HANA.
Sourcing Management	Create Sourcing Request	Creates a request for quotation in SAP S4 HANA by setting header details.
	Look up Sourcing Requests Stream	Retrieves the header details of all the requests for quotations from SAP S4 HANA.
Catalog Management	Create Material	Creates a material record in SAP S4 HANA by setting the required header details.
	Delete Material	Deletes the material record for the specified product number from SAP S4 HANA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Primary Data Management	Look up Company Codes Stream	Retrieves details of all the available company codes.
	Look up Currencies Stream	Retrieves details of all the available currencies.
	Look up Business Partners Stream	Retrieves business partner's data fields of all the available records in the system.
	Look up FX Rates Stream	Retrieves details of all the currency foreign exchange rates.
	Look up Cost Centers Stream	Retrieve details of all the cost centers.
	Look up GL Accounts in Chart of Accounts Stream	Retrieves the details of all general ledger accounts available in your system.
	Look up Chart of Accounts Stream	Retrieves details of the available charts of accounts.
	Look Up Plant Addresses Stream	Retrieves details of the specified plant address master.
	Look up Purchasing Organizations Stream	Retrieves details of all the purchasing organizations.
	Look up Payment Terms Stream	Retrieves all the details of the payment terms.
	Look up Purchase Group Stream	Retrieves details of the specified purchasing group master.
	Look up Material Groups Stream	Retrieves the materials groups stream synchronously.
	Look up Base Unit of Measure Stream	Retrieves the list of entries from unit of measure text.
	Look up Business Partner Addresses Stream	Retrieves business partner address data fields of all the available records in your SAP S4 HANA OData account.
	Look up Materials Stream	Retrieves details of all general data of product master.
Utility Management	Look up Last Run Date	Retrieves the last run date and time of the flow.
	Fetch Token	Retrieves the CSRF (Cross-Site Request Forgery) token and cookie for other spoke actions. **Note:** This action is run every 6 hours through the Generate Token and Cookie scheduled job and update the system properties.
Purchase Order Management	Update Purchase Order Line	Updates the item details of an item in a purchase order using the Purchase Order Number and Purchase Order Item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Purchase Order for ASN	Updates the item details in a purchase order.
	Update Purchase Order	Updates the header details for the specified purchase order number.
	Look up Purchase Orders Stream	Retrieves general details of the specified product master.
	Create Non Purchase Order Invoice	Creates a supplier invoice using, for example, the company code, the invoice gross amount, and the invoicing party.
	Cancel Purchase Order Line	Deletes an item in a purchase order for the specified purchase order number and item number.
	Create Purchase Order	Creates a purchase order with the specified details.
	Create Line Item on Existing Purchase Order	Creates a line item in the existing purchase order with the header and item details passed in the request body.
	Look up Purchase orders Stream	Retrieves details of all purchase orders and the related items.
	Look up Purchase order Line Items Stream	Retrieves details of all purchase order line items.
Payment Management	Authorize Payment	Removes payment blocks that are set at the time of document creation.
	Look up Payment Term	Retrieves details of the payment terms.
	Look up Payments and Payment Status Stream	Retrieves payment information such as transaction currency, customer, payment status, accounting document and posting date.
Receipt Management	Create Service Goods Receipt	Creates service goods receipt in SAP S4 HANA OData.
	Cancel Goods Receipt	Cancels the material document for the specified material document number and material document year.
	Create Goods Receipt	Creates a material document compost by header and item for a specific business process.
	Create Receipt for Advance Shipment Notification	Creates a material document with a header and item for a business process.
	Look up Receipt	Retrieves the receipt details for the specified material document and other material document details.
Invoice Management	Create Invoice	Creates a supplier invoice based on the specified details, such as, company code, invoice gross amount, and invoicing party
	Cancel Invoice	Delete a supplier invoice that hasn't been posted using the supplier invoice and the fiscal year.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Invoices Stream	Retrieves general data of supplier master.
Shipment Management	Create Advance Shipment Notification	Creates an inbound delivery based on the specified purchase order.
	Look up Advance Shipment Notification	Retrieves the advance shipment notification details for the specified delivery document number.
	Look up Ship-to-Plant Addresses Stream	Retrieves the plant address details.
Supplier Management	Create Supplier	Creates a supplier.
	Delete Supplier Bank Account	Deletes the bank data for the specified business partner number and bank identification number.
	Look up Suppliers Stream	Retrieves details of the specified supplier master.
	Update Business Partner Address	Updates business partner address data of the record identified by address ID and business partner number.
	Update Supplier Company	Updates the supplier company data by using the Supplier and Company Code fields.
	Update Business Partner Bank	Updates bank data of the business partner record identified by business partner number and bank identification.
	Update Supplier	Updates the details of the specified supplier.
	Update Supplier Fax Number	Updates the fax number by using Address ID.
	Update Supplier Email Address	Updates email address by using Address ID.
	Update Supplier Phone Number	Updates business partner mobile or telephone address data of the record identified by Address ID.
	Create Company Code for Existing Supplier	Creates a company code for an existing supplier.
	Create Bank Details for Existing Supplier	Creates new business partner bank data linked to business partner.

Spoke module

The SAP S4 HANA OData spoke adds a SAP S4 HANA OData module to your ServiceNow instance.

Module	Description
Remote Table > **Purchase Orders**	Retrieves all the existing purchase orders in SAP S4 HANA OData.
Inbound flow > **Purchase Orders**	Lists the most recent changes in purchase order status between the most recent successful runtime and the present runtime.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
Inbound flow > **Last Successful Execution**	Lists the last successful execution details of the flows.

Spoke flow

The SAP S4 HANA OData spoke adds the following flow.

Flow	Description
Sample Look up Purchase Orders Flow	Retrieves the list of most recent changes in purchase order status between the most recent successful runtime and the present runtime.

Spoke subflow

The SAP S4 HANA OData spoke adds the following subflow.

Subflow	Description
Sample Create Purchase Order Subflow	Searches if a purchase order exists and creates a purchase order when no results are found.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up SAP S4 HANA OData spoke

Integrate the ServiceNow instance and SAP S4 HANA OData spoke by using the Basic Auth credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SAP S4 HANA OData spoke.
- Role required: admin.

Create a connection record for the SAP S4 HANA OData spoke

Create a credential record for the SAP S4 HANA OData spoke. The SAP S4 HANA OData spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials Aliases**.
2. Open the **SAP S4 HANA OData** record.
3. From the Related Links tab, select **Create New Connection & Credential**.
4. On the Create Connection and Credential form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, `SAP S4 HANA OData Connection`.
Connection URL	Fully qualified domain name of the target host where the SAP S4 HANA OData server is installed.
Use MID server	Option to select MID server. This field selected by default.
User Name	User name of your SAP S4 HANA OData account.
Password	Password of your SAP S4 HANA OData account.

5. Click **Create**.

SAP S4 HANA Public Cloud Spoke

The SAP S4 HANA Public Cloud spoke is built by Bristlecone, Inc. Manage primary data, purchase orders, receipts, and suppliers in SAP S4 HANA public cloud instance from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SAP S4 HANA Public Cloud spoke v1.3 is the latest version.

Supported versions

This spoke was built for SAP S4 HANA 2023.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- SAP S4 HANA Public Cloud account
- Configure the value of this system property:

  com.snc.process_flow.reporting.serialized.val_size_limit: This property serializes JSON objects and ensures that the data is in the required format. Specify the number of bytes as per your requirement. For more information, see Workflow Studio system properties.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The SAP S4HANA Public Cloud spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Primary Data Management	Look up Business Partner Addresses Stream	Retrieves business partner address data fields of all the available records in the system.
	Look up Business Partners Stream	Retrieves business partner's data fields of all the available records in the system.
	Look up Base Unit of Measure Stream	Reads a set of entries from the Unit of Measure text.
	Look up Chart of Accounts Stream	Retrieves details of the available charts of accounts.
	Look up Company	Retrieves the details related to Company Codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Codes Stream	
	Look up Cost Centers Stream	Retrieve details of all cost centers.
	Look up GL Accounts in Chart of Accounts Stream	Retrieves the details of the available General Ledger (GL) accounts for the chart of accounts.
	Look up Material Groups Stream	Retrieves the materials groups stream synchronously.
	Look up Materials Stream	Retrieves details of all general data of product master.
Purchase Order Management	Look up Purchase Orders Stream	Retrieves general data of the required product master.
	Create Purchase Order and PO Lines	Creates a new purchase order with the header and item details passed in the request body.
Receipt Management	Create Receipt	Creates a material document by header and item for the specific business process.
	Create Service Goods Receipt	Creates a service goods receipt in SAP S4 Hana Cloud.
	Look up Receipts Stream	Retrieves details related to material documents.
Supplier Management	Create Supplier	Creates a new supplier with the provided details.
	Look up Suppliers Stream	Retrieves general data of the supplier master.
Invoice Management	Create Invoice	Creates a supplier invoice using the company code, invoice gross amount, and invoicing party.
	Look up Invoices Stream	Reads the supplier invoice data using, for example, the supplier invoice, the fiscal year, the company code, the document currency, the document date, the invoice gross amount, the invoicing party and the posting date.
Shipment Management	Look up Advance	Retrieves general data of the required advanced shipment notices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Shipment Notification Stream	
Utility Management	Fetch Token and Cookie	Retrieves the CSRF (Cross-Site Request Forgery) token and cookie for other spoke actions. **Note:** This action runs every 6 hours through the Generate Token and Cookie scheduled job and updates the system properties.
User Management	Look up Users Stream	Retrieves the general data of the users present in the system. The data fetched are user ID, user name, description, email address, and so on.

Spoke scheduled job

The SAP S4HANA Public Cloud spoke provides a scheduled job, Generate Token and Cookie - Cloud Spoke. This scheduled job is run every 26 minutes, which creates a token and cookie. The Fetch Token and Cookie spoke action depends on this scheduled job.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Setup the SAP S4 HANA Public Cloud spoke.

Setup the SAP S4 HANA Public Cloud spoke

Integrate the ServiceNow instance and SAP S4 HANA public cloud instance by using basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SAP S4 HANA Public Cloud spoke.
- Role required: admin.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connection & Credential Aliases**.
2. Open the record, **SAP S4 HANA Cloud**.
3. Click the **Create New Connection & Credential** related link.
4. On the form, fill in these values.

Field	Description
Connection Name	Name to identify the connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	URL to connect to SAP S4 HANA public cloud instance.
User Name	User name to log in to the SAP S4 HANA public cloud instance.
Password	Password to log in to the SAP S4 HANA public cloud instance.

5. Click **Create**.

SAP S4 HANA RFC Spoke

The SAP S4 HANA RFC spoke is built by Bristlecone, Inc. Manage procurement, records, journals, and others, in SAP S4 HANA RFC account from your ServiceNow® instance.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes. Starting on March 1st 2022, all SAP spokes will be available only on the Store.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SAP S4 HANA RFC spoke v2.6.1 is the latest version.

Supported versions

This spoke was built for SAP S4 HANA RFC 2023.

Spoke requirements

- Contact the admin of your SAP S4 HANA RFC account and obtain these SAP proprietary JAR files and other required files:
  - `sapjco3.jar`.
  - `libsapjco3.so`: If your MID Server is installed on a Linux machine, obtain this file.
  - `sapjco3.dll`: If your MID Server is installed on a Windows machine, obtain this file.

  A JAR file, `sapConnector-1.0.jar`, is available along with the spoke to provide custom interface to interact and execute RFCs and IDocs in the SAP S4 HANA RFC account. The JAR file is installed as part of the spoke in your ServiceNow instance.
- Copy and record the client value of the target host where the SAP S4 HANA RFC server is installed.
- Configure the values of these system properties:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *com.snc.process_flow.reporting.serialized.val_size_limit*: This property serializes JSON objects and ensures that the data is in the required format. Specify the number of bytes as per your requirement. For more information, see Workflow Studio system\n properties.
- *glide.rest.max_content_length*: This property specifies the payload size. Specify the maximum payload size you want to use in your flows. The maximum value you can specify for this property is, 25 MB.

- If you are using this spoke along with the SAP ECC IDoc, SAP S4 HANA IDoc, SAP ECC RFC spokes, during spoke upgrades, ensure that you upgrade all the spokes to their latest versions.

Note:
To retrieve information for authorization purposes, use the Execute RFC spoke action.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The SAP S/4 HANA RFC spoke provides sample flows to demonstrate automating the SAP S4 HANA RFC tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

Flow	Description
Retrieve Incoming Invoice	Retrieves the invoice data periodically. This data is displayed in the SAP S/4HANA Invoice Data module.
Retrieve Users by Role	Retrieves details of the users, based on the provided user role. This data is displayed in the SAP S/4HANA Users Records module.

Spoke actions

The SAP S/4 HANA RFC spoke provides actions to automate SAP S4 HANA RFC tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Items	Look up Material Groups	Retrieves details of the material groups.
	Look up Materials by Plant	Retrieves details of the materials (items) based on plant selection criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Materials by Storage Locations	Retrieves details of the materials (items) based on storage location selection criteria.
Journals	Post Journal Entry	Posts a journal entry to a GL Account in SAP S4 HANA RFC.
	Reverse Journal Entry	Reverses a journal entry in a GL Account in SAP S4 HANA RFC.
Lookups	Look up Cost Centers by Controlling Area	Retrieves details of the cost centers based on the controlling area.
Metadata Retrieval	Get RFC Input Schema	Dynamically retrieves the input schema for the RFC.
	Get RFC Output Schema	Dynamically retrieves the output schema for the RFC.
	Look up RFC Table Field Input Metadata	Dynamically retrieves the input schema from SAP S4 HANA RFC for the selected field in the RFC tables.
	Look up RFC Table Field Output Metadata	Dynamically retrieves the output schema from SAP S4 HANA RFC for the selected field in the RFC tables.
	Look up RFC Tables Input Metadata	Dynamically retrieves the tables input schema for the RFC from SAP S4 HANA RFC.
Procurement	Authorize Payment	Creates an authorize payment document in SAP S/4 HANA - RFC.
	Create Fixed Asset	Creates a fixed asset in SAP S4 HANA RFC.
	Create Goods Receipt	Creates a goods receipt document in SAP S4 HANA RFC.
	Create Invoice	Creates an invoice document in SAP S4 HANA RFC.
	Cancel Invoice	Cancels an invoice document in SAP S/4HANA RFC.
	Cancel Goods Receipt	Cancels a goods receipt document in SAP S/4HANA - RFC.
	Create Non Purchase Order Invoice	Creates a non purchase order invoice document in SAP S4 HANA – RFC.
	Create Purchase Order	Creates a purchase order in SAP S4 HANA RFC.
	Create Service Goods Receipt	Creates a service goods receipt document in SAP S/4HANA - RFC.
	Create Vendor	Creates a vendor in SAP S/4HANA - RFC.
	Look up Asset Category	Retrieves details about the specified asset from SAP S/4HANA - RFC.
	Look up Invoices	Retrieves details of the invoices from SAP S/4 HANA - RFC.
	Look up Purchase Order Attachments	Retrieves details of the Purchase Order attachment from SAP S/4HANA RFC.
	Look up Invoices by Date	Retrieves details of the invoices based on entry date.
	Look up Purchase Orders and Purchase Order Lines	Retrieves details of the Purchase Orders and Purchase Order Lines from SAP S/4 HANA - RFC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Receipts	Retrieves details of the receipts from SAP S/4HANA RFC.
	Look up Vendors	Retrieves vendors details from SAP S/4HANA - RFC.
	Look up Advance Shipment Notices	Retrieves Advance Shipment Notices in SAP S/4HANA - RFC.
	Look up Payment Status for Invoice	Retrieves the payment status for invoice from SAP S/4HANA - RFC.
	Update Purchase Order	Updates details of the specified purchase order.
	Update Vendor	Updates details of a vendor in SAP S/4HANA - RFC.
Records Management	Execute RFC	Executes an RFC from the available list for create, update, or read operation.
	Execute RFC For Look up Operations	Executes an RFC from the available list.
Transfer Order	Create Transfer Order and Line Items	Creates a transfer order in SAP S/4HANA - RFC.
	Look up Transfer Order and Line Items	Retrieves transfer orders from SAP S/4HANA - RFC.
Utility	Create Table Field Metadata	Envelops user inputs for the selected table field of the given BAPI in an object.
Finance Management	Create Asset	Create an asset in SAP S4 HANA - RFC with the provided details.
Sales Order	Create Sales Order	Creates a sales order in SAP S/4HANA - RFC.
	Look up Sales Order	Retrieves sales order details from SAP S/4HANA - RFC.
	Look up Sales Orders	Retrieves sales orders based on given customer number from SAP S/4HANA - RFC.
	Update Sales Order	Updates details of the given sales order in SAP S/4HANA - RFC.
Bills and Payments	Look up Bill Details By ID	Retrieves bill details for the given document ID from SAP S/4HANA - RFC.
	Look up Outstanding Balance	Retrieves outstanding balance of a customer from SAP S/4HANA - RFC.
	Look up Payments	Retrieves pending payments of the customer from SAP S/4HANA - RFC.
Customer Management	Look up Customer Information	Retrieves customer information for the given company code and customer number from SAP S/4HANA - RFC.
Inventory (or) Sales	Look up Inventory of Parts	Retrieves inventory for the given plant and material from SAP S/4HANA-RFC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke module

The SAP S/4 HANA RFC spoke adds the SAP S4 HANA RFC Spoke application to your instance and includes these modules:

Module	Description
SAP S/4 HANA - RFCs	Displays the list RFCs. Some RFCs are provided along with spoke. You can create additional RFCs as per your requirement. The Execute RFC action uses these records as an input.
SAP S/4 HANA Flow Executions	Displays the dates on which the Retrieve Incoming Invoice flow is executed. After you set up the SAP S4 HANA RFC spoke, create a record to specify the date up to which you want to retrieve the invoice data. For more information, see Set up the SAP S4 HANA RFC spoke.
SAP S/4 HANA Invoice Data	Displays details of the invoice data. Customize and execute the default flow, Retrieve Incoming Invoice to retrieve the invoice data.
SAP S/4 HANA Users Records	Displays details of the users, based on their user role. Customize and execute the default flow, Retrieve Users by Role to retrieve the user information.

Spoke user roles

The SAP S4 HANA RFC provides the sn_sap_s4_hana_rfc.SAP_S4_HANA_RFC_Spoke_Admin user role to control access to data. Users with the sn_sap_s4_hana_rfc.SAP_S4_HANA_RFC_Spoke_Admin role have access to the spoke tables.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use Remote Function Call (RFC) protocol (SAP Proprietary protocol – SAP Standard Interface), which can run on an instance or MID Server. Use the connection record associated with SAP S4 HANA RFC spoke alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps

Note:

- If the MID Server is installed on a Linux machine, perform the configurations as outlined in Set up the SAP S4 HANA RFC spoke.
- If the MID Server is installed on a Windows machine, no configurations are needed.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the SAP S4 HANA RFC spoke

Integrate the ServiceNow instance and SAP S4 HANA RFC spoke by using the Basic Auth credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SAP S4 HANA RFC spoke.
- Role required: admin.

Note:
To retrieve information for authorization purposes, use the Execute RFC spoke action.

Procedure

1. Configure MID Server using the SAP proprietary JAR files.

   a. **Optional:** Navigate to **System Properties** > **Security**.

   Note:
   This is applicable only if your MID Server is installed on a Linux machine

   b. **Optional:** Disable the MIME type validation for file attachments.

   
   Note:
   This is applicable only if your MID Server is installed on a Linux machine.

   c. Navigate to **MID Server** > **JAR Files**.

   d. Upload the required SAP proprietary files (JAR, SO, or DLL) obtained after contacting your SAP S4 HANA RFC admin.
   For more information, see Synchronize a JAR file to MID Servers.

   Note:
   Ensure that the files are synchronized in the `<MID-Server-root-directory>/agent/extlib` directory. If the files aren't synchronized, restart the MID Server.

2. Create a credential record for the SAP S4 HANA RFC account.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`

   c. Select **Basic Auth Credentials**.

   d. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic Auth Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `SAP S4 HANA RFC Cred`.
User name	User name to log in to your SAP S4 HANA RFC account.
Password	Password to authenticate and log in to your SAP S4 HANA RFC account.
Active	Option to actively use the credential record.
Order	Order to apply this credential. For example, `100`.
Credential alias	Credential alias associated with the spoke.

e. Click **Submit**.

3. Create a connection record for your SAP S4 HANA RFC account.

a. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.

b. Open the alias record for SAP S4 HANA RFC.

c. From the **Connections** tab, click **New**.

d. On the form, fill in the fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `SAP S4 HANA RFC Connection`.
Credential	Credential record created for SAP S/4 HANA IDoc spoke. For example, `SAP S4 HANA RFC Cred`.
Connection alias	Alias record associated with this connection.
Host	Fully qualified domain name of the target host where the SAP S4 HANA RFC server is installed.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.
Use MID server	Option to use a MID Server for this connection. Select the check box and define the fields in the **Advanced MID Server Configuration** tab.

e. In the **Advanced MID Server Configuration** tab, provide these details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID Selection	Option to select MID Server as required. This field is available when **Define Connection Inline** is selected from the Source Connection list.
MID Application	Option to use a MID Server to run the SFTP step. This field is available when **Define Connection Inline** is selected from the Source Connection list and **Auto-Select MID Server** is selected from the MID Selection list. To learn more about how a MID Server is selected during runtime, see MID Server selection.
Capabilities	Capability of the MID Server. Select **SSH**. This field is available when **Define Connection Inline** is selected from the Source Connection list and **Auto-Select MID Server** is selected from the MID Selection list. Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection.
MID Server	Data pill of the required MID Server. This field is available when **Define Connection Inline** is selected from the Source Connection list and **Specific MID Server** is selected from the MID Selection list.

f. In the **Attributes** tab, provide these details.

Field	Description
u_client	Client value of the target host where the SAP S4 HANA RFC server is installed.
u_system_number	System number of the target host where the SAP S4 HANA RFC server is installed.
u_lang	Language selected in the target host where the SAP S4 HANA RFC server is installed.

g. Click **Submit**.

4. Create a record in the SAP S/4HANA Flow Executions module to specify date up to which you want to retrieve the invoice data.

a. Navigate to **SAP S/4HANA - RFC Spoke** > **SAP S/4HANA Flow Executions**.

b. Click **New**.

c. In **Last Successful Execution**, specify the date up to which you want to retrieve the invoice data.

d. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Retrieve Incoming Invoice flow takes this date as an input and retrieves the invoice data. Depending on the configured flow trigger, the Retrieve Incoming Invoice flow periodically retrieves the invoice data. To view the invoice data, navigate to **SAP S/4HANA - RFC Spoke** > **SAP S/4HANA Invoice Data**.

Result
The spoke is configured and the actions can be used.

Note:
If you want to use multiple connections, ensure that you create them as child alias records under the default connection alias record. Also, you must ensure that all the connection records are active.

SCCM Usage Metering Spoke

Manage the process of fetching software usage data from a Microsoft System Center Configuration Management (SCCM) Usage Metering server. Get data about software usage metering and when the software was last used using this spoke.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SCCM Usage Metering spoke v1.0.2 is the latest version.

Supported versions

This spoke was built for Microsoft SCCM version 1602, but may be compatible with later versions.

Spoke Requirements

- Microsoft System Center Configuration Management Usage Metering Server version 2012 R2 with software metering enabled. For more information about software metering, see Software metering in Configuration Manager

  Note:
  Ensure that metering rules are configured in SCCM for the required software.

- Microsoft SQL Server 2014

Spoke flows and subflows

This spoke has no flows and subflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The SCCM Usage Metering spoke provides actions to retrieve software usage data from a Microsoft System Center Configuration Management Usage Metering server. Available actions include:

Spoke actions

Action	Description
Get Software Last Used Data	Retrieves the last usage data of the required software from the Microsoft SCCM server.
Get Software Usage Data	Retrieves usage metering of the required software from the Microsoft SCCM server.

Note:

The spoke actions support a maximum payload of 10 MB from the SCCM server for the JDBC step.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the SCCM Usage Metering spoke.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record that is associated with the Microsoft SCCM Usage Metering alias to configure where actions run as well as to set MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the SCCM Usage Metering spoke

Integrate the ServiceNow instance and SCCM using Java Database Connectivity (JDBC) credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SCCM Usage Metering spoke.
- Role required: admin.

Create Connection records for the SCCM Usage Metering spoke

Create Connection records to the SCCM server. The SCCM Usage Metering spoke connection and credential aliases use these connections to perform actions in SCCM.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Credentials & Connections** > **Connections**.
2. Click **New** and select **JDBC Connection**.
3. On the form, fill in the fields.
   The database selection in the **Format** field determines which fields are available.

Field	Description
Name	Unique name of the JDBC connection. For example, `JDBC MySQLProd`.
Credential	Credential for the JDBC provider. Enter the user name and password of the database.
Connection alias	Alias record associated with the connection.
Query timeout	Maximum elapsed time the JDBC query allowed to run without a response.
Connection timeout	Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.
Active	Option to make the connection active.
Domain	Domain for the table. By default, the JDBC Connection [jdbc_connection] table runs in the global domain.
Format	Database type for the connection. The choices are: ○ **MySQL** ○ **Oracle** ○ **SQLServer** ○ **None**
Host	Host name or IP address of the database server.
Oracle port	Port that the Oracle database is using. The default value is **1521**. **Note:** This field is available when **Oracle** is selected from the Format list.
Oracle sid	Oracle database site identifier. The default value is **orcl**. **Note:** This field is available when **Oracle** is selected from the Format list.
Database name	Name of the database. **Note:** This field is available when **MySQL** or **SQLServer** is selected from the Format list.
Override default port	Port that the selected database is using.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is available when **MySQL** or **SQLServer** is selected from the Format list.
Instance name	Instance name for the selected SQLServer. **Note:** This field is available when **SQLServer** is selected from the Format list.
Connection URL	URL that MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. For example, jdbc:<database>://<hostname>;selectMethods=cursor;databaseName=<database_name>. **Note:** If the format selected is not one of the default databases, you must create the connection URL manually. So that the MID Server can create the connection.
Use MID server	Option to use a MID Server for the action. If selected, define fields in the **Advanced MID Server Configuration** section.
Capabilities	Capabilities that the MID Server must support to be eligible for selection. Only displays if **Use MID server** is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.
MID Application	Application that the MID Server must support to be eligible for selection. Only displays if **Use MID server** is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.

Create Credential records for the SCCM Usage Metering spoke

Create Credential records to the SCCM server. The SCCM Usage Metering spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **JDBC Credentials**.
4. On the form, fill these values.

Field	Description
Name	Name to uniquely identify the credential.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option to use the credentials.
Applies to	Option to verify if the credentials apply to **All MID servers** in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use these credentials in the **MID servers** field.
Order	Order to apply this credential. For example, enter `100`.
User name	User name to access the database.
Password	Password to access the database.
Credential alias	Credential alias associated with the spoke.

5. Click **Submit**.

Secureworks CTP Spoke

Integrate ServiceNow instance with Secureworks Counter Threat Platform (CTP). Manage events and tickets in Secureworks Counter Threat Platform from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Secureworks CTP spoke v1.0.3 is the latest version.

Supported versions

This spoke was built for Secureworks CTP V4, but may be compatible with later versions.

Spoke requirements

Secureworks portal account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Secureworks CTP spoke provides actions to automate Secureworks CTP tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Event Management	Get Event Details	Retrieves the details of a specific event.
	Get Recent Events	Retrieves details of a list of recent events.
Ticket Management	Assign Ticket To Secureworks SOC	Assigns a ticket to the Secureworks Security Operations Centers (SOC) Team.
	Close Secureworks Ticket	Closes the specified Secureworks ticket.
	Get Ticket Details	Retrieves the details of the specified Secureworks ticket.
	Look up Tickets	Retrieves a list of tickets from Secureworks.
	Post Worklog to Secureworks Ticket	Adds a worklog to the Secureworks ticket.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Secureworks CTP spoke.

Set up the Secureworks CTP spoke

Integrate the ServiceNow instance and Secureworks CTP by registering a custom application in Secureworks Portal to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Secureworks CTP spoke.
- Create an API password from the Account Management section of your Secureworks CTP account.
- Role required: admin.

Create a credential record for the Secureworks CTP spoke

Create a credential record for the Secureworks CTP account. The Secureworks CTP spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **API Key Credentials**.
4. On the form, fill these fields.

API Key Credentials

Field	Description
Name	Name to uniquely identify the record. For example, enter `Secureworks Cred`
Active	Option to actively use the credential record.
API Key	API key generated in your Secureworks account. Enter the API key in this format: `APIKEY username:password`
Applies to	MID Servers that can use this credential.
Order	Sequence in which the credential is applied.
Credential alias	Alias to use the credential. Click the padlock icon and enter `sn_sw_ctp_spoke.Secureworks`

5. Right-click the form header and click **Submit**.

Create a connection record for the Secureworks CTP spoke

Create a connection record for your Secureworks account. The Secureworks CTP spoke connection and credential aliases use these connections to perform API actions in Secureworks portal.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for **Secureworks**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Secureworks Connection`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential	Credential record created for Secureworks CTP spoke. Enter the credential you created. For example`Secureworks Cred`.
Connection alias	Alias record associated with this connection. The default alias is `sn_sw_ctp_spoke.Secureworks`.
Connection URL	Base URL to connect to **Secureworks**. Enter: `https://api.secureworks.com`
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

5. Click **Submit**.

ServiceNow Remote Instance Spoke

Integrate your local and remote ServiceNow instances to export, import, and manage records from your local instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription on the local instance where it will be installed. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

ServiceNow Remote Instance spoke v2.2.8 is the latest version.

Supported versions

This spoke was built for the Orlando version and later.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

Ensure that the spoke users have only the required minimum permissions to access data in ServiceNow tables. Do not assign elevated privilege roles to users of this spoke unless very much required. This practice ensures controlled access to data.

Note:
The terms remote instance and local instance are used in these contexts:

- Local instance: This is the ServiceNow instance from which the communication is initiated and established.
- Remote instance: This is the ServiceNow instance with which the local instance communicates.

Spoke actions

The ServiceNow Remote Instance spoke provides actions to export, import, and manage records when events occurs in your local ServiceNow instance. Available actions include:

Category	Action	Description
Change request Management	Export Change Request Record	Exports a change request record to a remote instance from the local instance.
	Import Change Request Record	Imports a record from the Change Request table of the remote instance to the local instance.
Incident Management	Export Incident Record	Exports an Incident record to a remote instance from the local instance.
	Import Incident Record	Imports a record from Incident table of the remote instance to the local instance.
Problem Management	Export Problem Record	Exports a Problem record to a remote instance from the local instance.
	Import Problem Record	Imports a record from Problem table of the remote instance to the local instance.
Table Management	Look Up Fields By Remote Table	Retrieves all the fields from the given remote table.
	Look Up Local Import Set Tables	Retrieves information about the given local import set table.
	Look Up Remote Import Set Tables	Retrieves information about the given remote import table.
	Look Up Remote Tables	Retrieves information about the given remote table.
Attachment Management	Copy Attachment From Remote Instance	Copies the required attachment from the remote instance. **Note:** You must select the required attachment using data pills only.
	Copy Attachment To Remote Instance	Copies the required attachment to the remote instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: You must select the required attachment using data pills only.
	Look Up Local Attachments Names	Retrieves name of the required attachment.
Case Management	Export Case as Incident	Exports a case record as an incident record to a remote instance from the local instance.
	Export Case Record	Exports a case record to the remote instance from the local instance.
	Export Case Task Record	Exports a Case Task record to the remote instance from the local instance.
	Export Incident as Case	Exports an incident record as a case record to the remote instance from the local instance.
	Import Case as Incident	Imports a record from the case table of the remote instance as an incident record to the local instance.
	Import Case Record	Imports a record from the Case table of the remote instance to the local instance.
	Import Case Task Record	Imports a record from the Task table of the remote instance to the local instance.
	Import Incident as Case	Imports a record from the Incident table of the remote instance as a case record to the local instance.
Record Management	Create or Update Remote Record	Creates a record or updates an existing record in the remote instance.
	Create or Update Remote Record Using Import Set	Creates a record in the remote import set.
	Create Remote Record	Creates record in remote instance.
	Delete Remote Record	Deletes record in remote instance.
	Export Record Using Import Set	Exports a record from the selected local table to a remote instance.
	Get Remote Record	Retrieves the required record information from the remote instance.
	Import Record Using Import Set	Imports a record from table in the remote instance to the local instance.
	Look Up Remote Record	Retrieves the required record from the remote Instance.
	Look Up Remote Records	Retrieves multiple records from the remote instance table.
	Update Remote Record	Updates the required record in the remote instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **Company** field is required to import or export records using the default transform maps. However, users can modify the transform maps as per their requirement. Also, use the import sets when working with integration involving data transfer.

Spoke transform maps

The ServiceNow Remote Instance spoke provides sample transform maps in active state and associated sample target tables to demonstrate using transform maps to save the remote ServiceNow instance data in your local ServiceNow tables. You can use these sample transform maps and target tables as reference to create transform maps as per your requirement.

For more information, see Transform maps.

Note:

- By default, the sample transform maps uses **sys_id** as the coalesce field. You can customise the transform map script as per your requirement to change the coalesce field.
- By default, the export and import actions use the spoke tables. You can change this to use different import sets.
- The time zones may be different in your ServiceNow instances. Ensure that you customise flows accordingly.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are required for this spoke; one for the local instance and other for the remote instance. For information about setting up the spoke, see Set up the ServiceNow Remote Instance spoke.

Set up the ServiceNow Remote Instance spoke

Integrate the local and remote ServiceNow instances by creating an OAuth API endpoint in the remote ServiceNow instance to authenticate requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the ServiceNow Remote Instance spoke in remote and local ServiceNow instances.

Note:
The terms remote instance and local instance are used in these contexts:

- Local instance: This is the ServiceNow instance from which the communication is initiated and established.
- Remote instance: This is the ServiceNow instance with which the local instance communicates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Role required: admin.

Note:
Admin role is required to only set up the spoke.

To use the spoke, ensure that the spoke users have only the required minimum permissions to access data in ServiceNow tables. Do not assign elevated privilege roles to users of this spoke unless very much required. This practice ensures controlled access to data.

The integration users must have the flow_operator and other required roles to access the table they want to interact with. Also, they need roles to access the Table [sys_db_object] and Dictionary Entry [sys_dictionary] tables to show dynamic options such as, table names and fields in a table.

Register remote ServiceNow instance as an OAuth provider

Register remote ServiceNow instance as an OAuth provider so that the local ServiceNow instance can request OAuth 2.0 tokens.

Before you begin

- In the remote ServiceNow instance:
  - Create an OAuth API endpoint for external clients. In **Redirect URL**, specify the URL of the local ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`. For more information, see Create an endpoint for clients to access the instance.
  - Copy and record the values of Client ID and Client Secret.
- Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record, **RemoteSpoke**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID created in the remote ServiceNow instance.
Client Secret	Client Secret created in the remote ServiceNow instance.
Authorization URL	URL of the remote ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_auth.do`.
Token URL	URL of the remote ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_token.do`.
Redirect URL	URL of the local ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`.
Default Grant Type	Grant type used to establish the token. Select **Authorization Code**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.

4. Right-click the form header, and click **Save**.

Create Credential record for the remote ServiceNow instance

Create credential record for the remote ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Note:
You must perform this task in a local ServiceNow instance.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, `Remote Credentials`.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of the remote ServiceNow instance as an OAuth provider. For example, select **RemoteSpoke default_profile**.
Order	Order that the credentials are used. For example, enter `100`.

5. Right-click the form header and click **Submit**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

Create Connection record for the remote ServiceNow instance

Create Connection record for your remote ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential aliases use these connections to perform actions.

Before you begin
Role required: admin.

> **Note:**
> You must perform this task in a local ServiceNow instance.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, **ServiceNowRemoteInstance**.
3. From the **Connections** tab, click **New**.
4. On the form, fill in the fields.

HTTP(s) Connection form

Field	Value required
Name	Name to uniquely identify the record. For example, `Remote Connection`.
Credential	Credential record created for remote ServiceNow instance. For example, **Remote Credentials**.
Connection alias	Alias record associated with this connection.
URL builder	**Note:** Do not select the check box.
Connection URL	URL of the remote ServiceNow instance. For example, `https://<remote-instance-name>.service-now.com/`.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

5. Click **Submit**.

Create Credential record for the local ServiceNow instance

Create credential record for the local ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin.

> **Note:**
> You must perform this task in a local ServiceNow instance.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays the message `What type of Credentials would you like to create?`.

3. Select **Basic Auth Credentials**.
4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, `Local Credentials`.
Username	Username to log in to the local ServiceNow instance.
Password	Password to log in to the local ServiceNow instance.
Active	Option to actively use the credential record.

5. Right-click the form header and click **Submit**.

Create Connection record for the local ServiceNow instance

Create Connection record for your local ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential aliases use these connections to perform actions.

Before you begin

Role required: admin.

Note:
You must perform this task in a local ServiceNow instance.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, **ServiceNowRemoteInstanceLocalAlias**.
3. From the **Connections** tab, click **New**.
4. On the form, fill in the fields.

HTTP(s) Connection form

Field	Value required
Name	Name to uniquely identify the record. For example, `Local Connection`.
Credential	Credential record created for local ServiceNow instance. For example, **Local Credentials**.
Connection alias	Alias record associated with this connection.
Connection URL	URL of the local ServiceNow instance. For example, `https://<local-instance-name>.service-now.com/`.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

5. Click **Submit**.

ServiceNow University Spoke

Manage the courses on the ServiceNow University platform from your ServiceNow instance. For example, get the details of all the courses on ServiceNow University by executing a spoke action from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

ServiceNow University spoke subscription

The ServiceNow University spoke is available with the ITSM Enterprise license. You can integrate Coaching with Learning with ServiceNow University. For more information, see External Content Integration Sources.

Spoke actions

The ServiceNow University spoke provides actions to automate ServiceNow University tasks when events occurs in your ServiceNow instance. Available actions include:

Action	Description
Look up Courses Stream	Provides course details.
Look up User Courses Activity Stream	Provides course activity for all users for a specific time period.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Setting up the ServiceNow University spoke

Connect ServiceNow University with Coaching with Learning to pull courses from ServiceNow University into your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the ServiceNow University spoke.
- Role required: admin.

- Integrate Coaching with Learning with ServiceNow University. For more information, see External Content Integration Sources.
- Contact nowlearningapi@servicenow.com to get your spoke credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You must have an ITSM Enterprise license subscription to get your spoke credentials.

- For more information on OAuth Credentials, see OAuth 2.0 credentials.

Procedure

1. Navigate to **All** > **Connections&Credentials** > **Connections&Credentials Aliases**.
2. Select *ServiceNow University*.
3. Select the **Create New Connection&Credential** related link.
   The **Create Connection and Credential** form appears.
4. Create the ServiceNow University connection.

   a. On the form, fill in the fields.

Field	Description
Connection Information	
Connection Name	A unique name for the connection; for example, ServiceNow University Connection.
Connection URL	The ServiceNow server to retrieve the API information. **Default value**: https://api.servicenow.com.
API Version	Version of the connection URL to connect to the connection server. **Default value**: v1
Ocp-Apim-Subscription-Key	Encryption key for the ServiceNow University subscription. Contact nowlearningapi@servicenow.com to get your encryption key.
OAuth Credential Information	
Credential Name	A unique name for the credential; for example, ServiceNow University Credential.
Token URL	On your web browser, enter: https://ssosignon.servicenow.com/oauth2/ausxfcnusg830r7kp0x7/v1/token This is the link to the OAuth server token endpoint.
Client Id	The Client ID of the application registered in the third-party OAuth server. Contact nowlearningapi@servicenow.com to get your Client ID.
Client Secret	The Client Secret of the application registered in the third-party OAuth server. Contact nowlearningapi@servicenow.com to get your client secret.
Username	User name to access the credential. Contactnowlearningapi@servicenow.com to get your user name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Password to access the credential. Contact nowlearningapi@servicenow.com to get your password.
Scope	Validates the ServiceNow University application programming interface (API) based on the parameters set in the application scope. **Default value:** openid email offline_access

b. Select **Create and Get OAuth Token**.

Result
The connection alias you've created appears in the Connection and Credentials related list.

Important:

- You can only have one Connection in the Connections related list. If you are creating another connection, you must make the first one inactive.
- The OAuth token also displays in the **ServiceNow University Spoke** > **Credentials**. You can have only one active ServiceNow University credential. If you are creating another credential, you must make the first one inactive.

Configure the ServiceNow University action flow in Workflow Studio

Integrate the ServiceNow instance and ServiceNow University by using the Oauth credentials to authenticate ServiceNow requests.

Before you begin

- Have ITSM Enterprise license subscription.
- Integrate Coaching with Learning with ServiceNow University. For more information, see External Content Integration Sources.
- Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the **Actions** tab.
3. Get the course details from ServiceNow ServiceNow University.

   a. Select **Look up Courses Stream**.

   b. In the **Inputs** action outline, select **Test** and specify the input value for the following fields:

Field	Description
Type	Type of course; for example, a path.
Updated	Fetches courses updates from the specified date.
Created	Fetches courses created from the specified date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	The order in which the course must be displayed.
Page Size	The number of courses per page.
Offset	Fetches the item from the specified offset. For example, if the offset is 10, the application fetches it from the 10th item.

c. Select **Run Test**.

The **Outputs** action outline displays the following course details:

Field	Description
Number	Course identification number.
Name	Name of the content.
Short description	Short description for the content.
Description	Content description.
Type	Course type; for example, whether the course is a path or collection.
State	The status of each course; for example, whether it is in draft or published state.
Portal link	URL to access the course.

4. Configure the course activity for all users for a specific time period.

Note:
The default time period for course activities is 30 days.

a. Select **Look up User Course Activity Stream**.

b. In the **Inputs** tab, specify the data type for the following fields:

Field	Description
States	The status of each course; for example, whether it is in draft or published state.
User Emails	Email of the users associated with the course activity.
Enrolled	Date the user enrolled in the course.
Completed	Fetches courses that were completed after the specified date.
Updated	Fetches courses updates from the specified date.
Order	The order in which the course must be displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Page Size	The number of pages to fetch.
Offset	Fetches the item from the specified offset. For example, if the offset is 10, the application fetches it from the 10th item.

c. Select **Run Test**.

In the **Outputs** tab, specify the output value for the following fields:

Field	Description
User Email	User emails associated with the course activity.
Content Name	Name of the content.
Content Number	The content identification number.
Percent Complete	Course percentage completion.
State	Course status.
Completion Date	The date when the course was completed.
Enrollment Date	The date when the user enrolled in the course.

Building actions

Shodan Spoke

Manage exploits, alerts, hosts, and others, in Shodan account from your ServiceNow® instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Shodan spoke v1.1.0 is the latest version.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Shodan spoke provides actions to automate Shodan tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Exploit Management	Exploit Search	Searches for exploits from vulnerability data sources.
	Get Exploit Count	Retrieves the number of exploits for a specific query.
Network Alert Management	Get Alert Details	Retrieves details of the specific network alert.
	Look up Alerts	Retrieves the list of network alerts.
Search Management	Get Host Details	Retrieves details of all services that are associated with specified host IP.
	Get Host Count	Retrieves the total number of hosts that match the provided query and requested facet information.
	Search Shodan	Retrieves details from a Shodan search.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential alias records are available along with the Shodan spoke.

For information about setting up the spoke, see Set up the Shodan spoke.

Set up the Shodan spoke

Integrate the Shodan account and your ServiceNow® instance using the API keys.

Before you begin

- Request an Integration Hub subscription.
- Activate the Shodan spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- API key of your Shodan account.
- Role required: admin.

Configure a connection for Shodan spoke

Add and configure Shodan connections to authenticate ServiceNow® requests to the Shodan server.

About this task

You must configure two connections: Shodan and Shodan Exploit.

Before you begin

- Role required: admin
- Log in to your Shodan account and get the API Key.

Procedure

1. Configure the Shodan connection.

   a. Navigate to **All** > **Process Automation** > **Workflow Studio**.

   b. Select the **Integrations** tab.

   c. In the Search all connections field, enter `Shodan`.
   The **Outbound** tab is active by default. If it's not active, toggle it to activate.

   d. On the Shodan alias tile, select **View Details**.

   e. Select **Configure**.

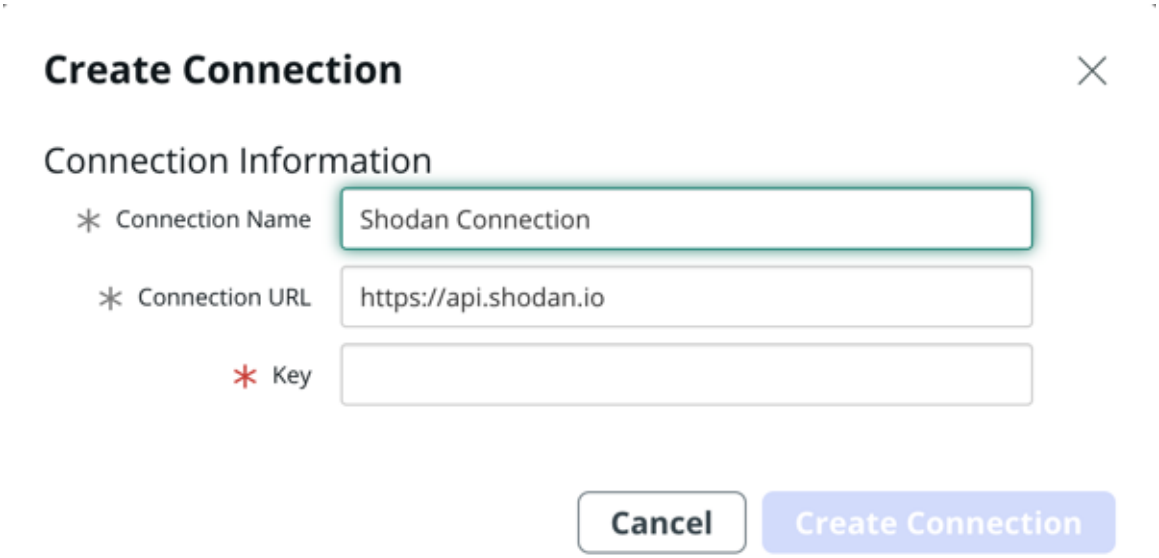
   f. Fill the form.

Shodan alias connection form

Field	Description
Connection Name	Name to identify the connection. The default value is Shodan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	URL to connect to Shodan. The default value is `https://api.shodan.io`
Key	API key from your Shodan account.



g. Select **Create Connection**.

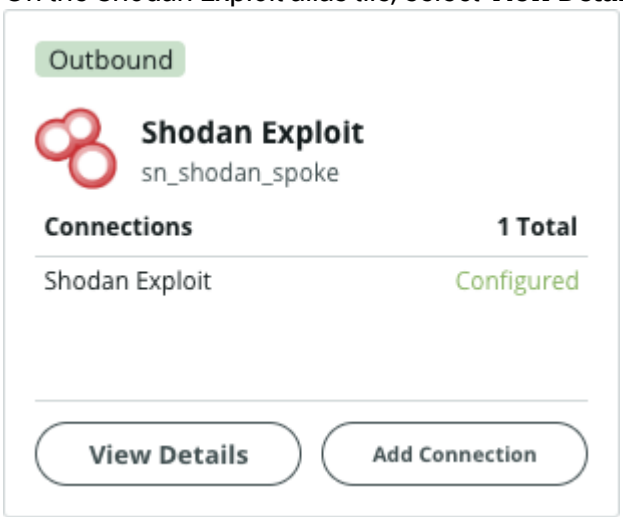
2. Configure the Shodan Exploit connection.

a. Navigate to **All** > **Process Automation** > **Workflow Studio**.

b. Select the **Integrations** tab.

c. In the Search all connections field, enter `Shodan Exploit`.
The **Outbound** tab is active by default. If it's not active, toggle it to activate.

d. On the Shodan Exploit alias tile, select **View Details**.



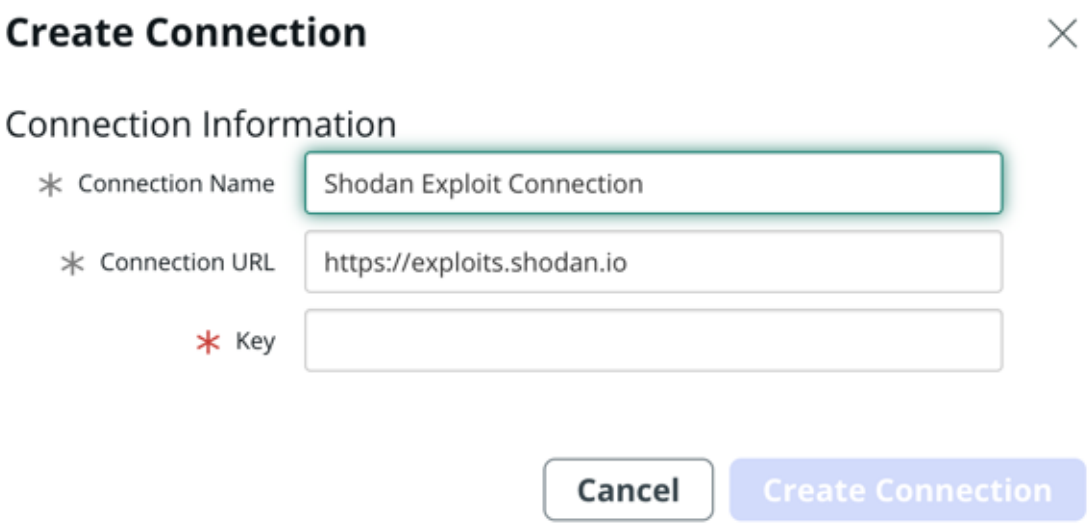
e. Select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Fill the form.

Shodan Exploit alias connection form

Field	Description
Connection Name	Name to identify the connection. The default value is Shodan.
Connection URL	URL to connect to Shodan. The default value is `https://api.shodan.io`
Key	API key from your Shodan account.



g. Select **Create Connection**.

Slack Spoke

Use the Slack spoke to post messages and manage access to channels.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview. To learn more about the subscription, contact your account manager.

Spoke version

The Slack spoke v1.8.0 is the latest version.

Slack account requirements

The Slack spoke requires creating a workspace and custom app on your Slack account to generate the OAuth 2.0 tokens for the Slack spoke. See Configure Slack app.

Note:
The spoke set up procedure outlined here requires bot user tokens only. You can't use the Create User and Deactivate User actions while using the bot token scopes. To use these actions, you must obtain user token from your Slack account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Slack spoke provides some sample subflows to demonstrate automating the Slack workspace tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Insert Slack User Details by Member ID	Inserts details of the required user in the Slack User Cache module, based on the Member ID.
Insert Slack User Details by User ID	Inserts details of the required user in the Slack User Cache module, based on the User ID.
Post Actionable Message	Posts an actionable message to a Slack channel. **Note:** This subflow requires an outbound configuration as an input. Customize the default outbound configurations or create an outbound configuration as per your requirement. For more information, see Configure outbound configurations in ServiceNow instance.
Post Approval Message	Posts an approval message to a Slack channel. **Note:** This subflow requires an outbound configuration as an input. Customize the default outbound configurations or create an outbound configuration as per your requirement. For more information, see Configure outbound configurations in ServiceNow instance.
Respond to Slack Approval Message	Posts an acknowledgment message on a Slack channel.
Respond to Slack Command	Posts a response to a command on a Slack channel.
Respond to Slack Message Action	Posts a notification on a Slack channel.

While customizing the subflows, make sure that the subflows are configured to avoid infinite loops.

Spoke actions

The Slack spoke provides actions to automate the Slack workspace tasks when events occur in the ServiceNow instance. Available actions include:

Category	Action	Description
Conversation Management	Add User to Channel	Adds an existing user to the specified channel in the Slack workspace.
	Archive Channel	Archives a channel in a Slack workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Rename Conversation	Renames a conversation.
	Look up Conversation Info	Retrieves information about a conversation.
	Create Channel	Creates a channel in a Slack workspace.
	Look Up Attachments Stream By Conversation or Member ID	Retrieves attachments related with the relevant channel, member, or bot user.
	Look up Channel History Stream	Retrieves the history of a channel. You must provide the channel ID, and the start and end date as inputs.
	Look up Conversation	Retrieves the conversation messages for a thread from the specified channel.
	Open Conversation	Opens or resumes a direct message or a multi-person direct message.
	Look up Conversation IDs Stream by Member ID	Retrieves details of the Conversation IDs related with the specified member on Slack.
	Set Topic for Channel	Sets the topic for a Slack channel.
	Remove User from Channel	Removes a user from a channel in the Slack workspace.
Notification Management	Post Actionable Message	Posts an actionable message to a Slack channel. **Note:** This action requires an outbound configuration as an input. Customize the default outbound configurations or create an outbound configuration as per your requirement. For more information, see Configure outbound configurations in ServiceNow instance.
	Post Approval Message	Posts an approval message to a Slack channel. **Note:** This action requires an outbound configuration as an input. Customize the default outbound configurations or create an outbound configuration as per your requirement. For more information, see Configure outbound configurations in ServiceNow instance.
	Post Change Details	Posts Change record details to a channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Post Incident Details	Posts Incident record details to a channel.
	Post Message	Posts a message to a Slack Channel.
	Post Response to Slack	Posts a response to Slack.
	Update Approval Record	Updates an approval record.
	Post Problem Details	Posts a Problem record detail to a channel.
User Management	Create User	Creates a user in the Slack workspace. **Note:** This action requires a user token from the Slack account. If you have bot user tokens, you can't use this action.
	Deactivate User	Deactivates the specified user from the Slack workspace. **Note:** This action requires a user token from the Slack account. If you have bot user tokens, you can't use this action.
	Look up User	Returns information about the specified user or bot. The information can be name, time zone, workspace admin rights, and team ownership of a user or bot.
	Deactivate Subscription	Deactivates a user subscription in Slack. To use this action, perform the steps outlined in the Create a Slack Enterprise Grid application and Create a Slack Enterprise connection section in Integrating with Slack.
	Look up Access Logs Stream	Retrieves the access logs for all users since the provided oldest date. To use this action, perform the steps outlined in the Create a Slack workspace application and Create a Slack workspace connection section in Integrating with Slack.
	Look up Users Stream	Retrieves all users in the Slack Enterprise grid. To use this action, perform the steps outlined in the Create a Slack Enterprise Grid application and Create a Slack Enterprise connection section in Integrating with Slack.

Note:

- Create User and Deactivate User actions require the admin scope. The spoke set up procedure outlined here requires bot user tokens only. You can't use the Create User and Deactivate User actions while using the bot token scopes. To use these actions, you must obtain user token from your Slack account.
- The admin scope is available to Slack workspace owners only.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Slack user manager	Manages Slack users and integrates Slack actions with the ServiceNow workflows. It looks up users and streamlines user management and communication within the Slack Channels.
Slack notification manager	Automates workflows by executing the Slack Spoke actions. It enables the users to send notifications and updates such as details of incidents, problems, changes, and requests to the Slack channels. It streamlines communication and manages notifications better.
Slack conversation manager	Performs actions such as setting channel topics, renaming conversations, adding or removing users from channels, creating and archiving channels.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke modules

The Slack spoke adds the Slack application to your ServiceNow instance. The Slack application includes these modules:

Module	Description
Slack Modal Configuration	Create modals and specify fields that should be displayed in your Slack modal.
Slack User Cache	Access information about users who have performed actions on the Slack channel that needed updates in the ServiceNow instance or a response from the ServiceNow instance.
Slack Channel Cache	Access information about the channels on which actions are performed that needed updates in the ServiceNow instance or response from ServiceNow instance.
Inbound Decisions	Specify events in Slack application for which actions must be performed in ServiceNow instance. For example, you can specify inbound decisions to update the task details in your ServiceNow instance when an approver approves the task on the relevant Slack channel. Five sample inbound decisions are available for your reference. Customize these decisions or create inbound decisions as per your requirement. When the conditions mentioned in the inbound decisions are met, the associated subflow is triggered and a record is created in the Slack User Cache module for the Slack user, who initiated the inbound action.
Inbound Decisions for Modals	Specify subflows that must be triggered when the required inbound decisions are met. When the conditions mentioned in the inbound decisions are met, the associated subflow is triggered and a record is created in the Slack User Cache module for the Slack user, who initiated the inbound action.
Slack Outbound Choices	Choices that should be displayed as a list on the Slack channels.
Inbound Slack Message	Access information about the inbound messages to your ServiceNow instance from the Slack application.
Outbound Configurations	Specify events in ServiceNow instance for which actions must be performed on Slack application. For example, you can specify outbound configurations to send a message on Slack channel asking for approval when a task is created in your ServiceNow instance. Three sample outbound configurations are available for your reference. Customize these configurations or create outbound configurations as per your requirement. The outbound configurations also provide a template to the Post Actionable Message and Post Approval Message actions. For example, you can configure the outbound configurations to display

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
	the **Approve** and **Reject** buttons in the approval message that is sent on the relevant Slack channel. When the configurations mentioned in the outbound configurations are met, the relevant subflow is triggered to perform actions in the Slack application.
Slack Configurations	Provide information about the Slack app and Signing Key.

Data in these modules is populated from these spoke tables:

Table	Fields
Slack Channel Cache [sn_slack_ah_v2_slack_channel_cache]	• Channel ID • Channel Link • Channel Name • Creator • Document ID • Is Archived • Is Private • Source table
Slack Configurations [sn_slack_ah_v2_slack_configurations]	• Client Secret • Connection Alias • Property Name • Slack App
Slack Credential [sn_slack_ah_v2_slack_credential]	• Authentication Key • Active • Context Name • Domain Name • Privacy Key
Slack Outbound Choices [sn_slack_ah_v2_slack_outbound_choices]	• Name • Active • Language • Sequence • Domain • Value

Table	Fields
Slack User Cache [sn_slack_ah_v2_slack_user_details]	• Display Name • Slack Member ID • Team ID • User
Slack Workspace Tokens [sn_slack_ah_v2_slack_workspace_tokens]	• Connection Alias • Slack App • Workspace Name
Slack Modal Configuration [sn_slack_ah_v2_slack_modal_configuration]	• Modal Title • Name • Script Validation • Custom Modal

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Slack spoke.

Set up Slack spoke

Integrate the ServiceNow instance and your Slack account by creating a custom OAuth application in Slack to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Slack spoke.
- Slack account.
- Add Slack users to the User [sys_user] table of your ServiceNow instance, with **Email** being the unique identifier.
- Role required: admin.

About this task

The spoke set up procedure outlined here requires bot user tokens only. You can't use the Create User and Deactivate User actions while using the bot token scopes. To use these actions, you must obtain user token from your Slack account.

Perform these steps to set up the Slack spoke.

1. Configure Slack app.
2. Add Slack connection in ServiceNow instance.
3. Provide Signing Key in ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Configure outbound configurations in ServiceNow instance.
5. Configure inbound decisions in ServiceNow instance.

Configure Slack app

Create a custom OAuth application on your Slack workspace to enable OAuth 2.0 authentication with the Slack spoke.

Before you begin

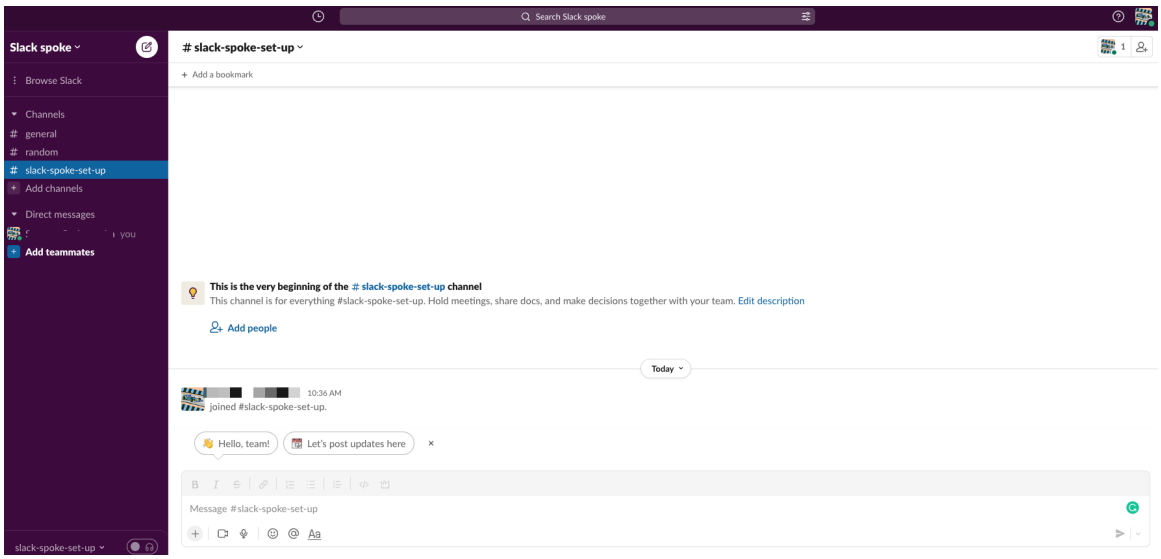
Role required: admin

About this task

Complete these steps from your Slack account. You can create an app or configure an existing app as per the configurations outlines here.

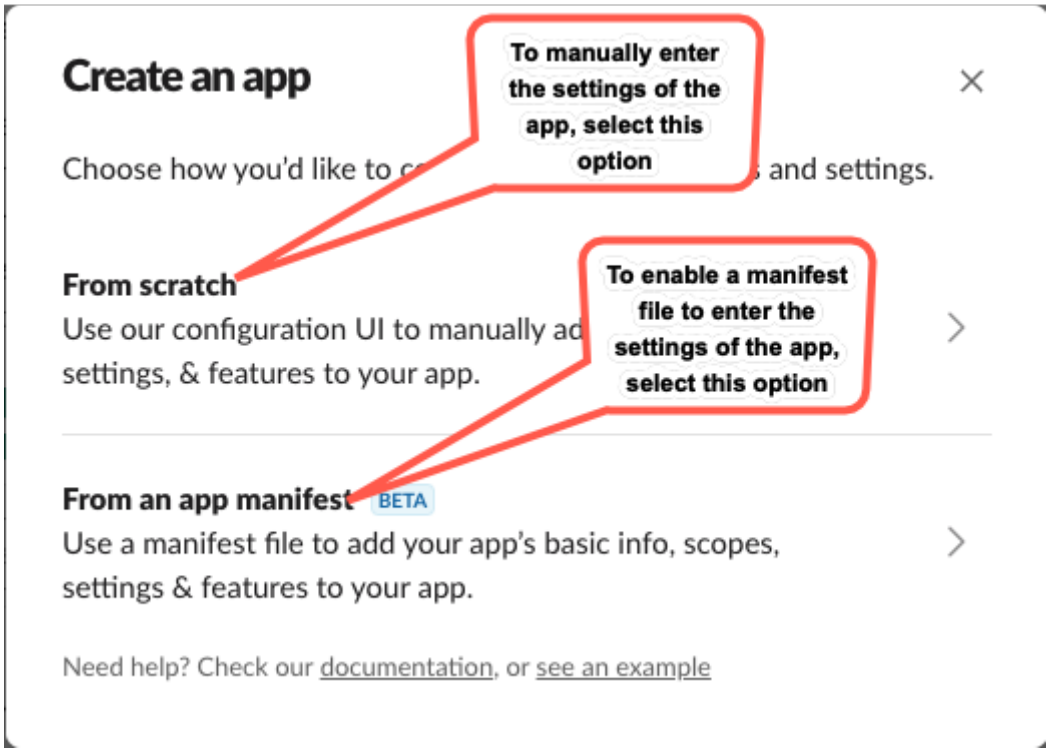
Procedure

1. Create a Slack workspace.
   To learn how to create a workspace, see Create a Slack workspace .The following image shows a typical Slack workspace.



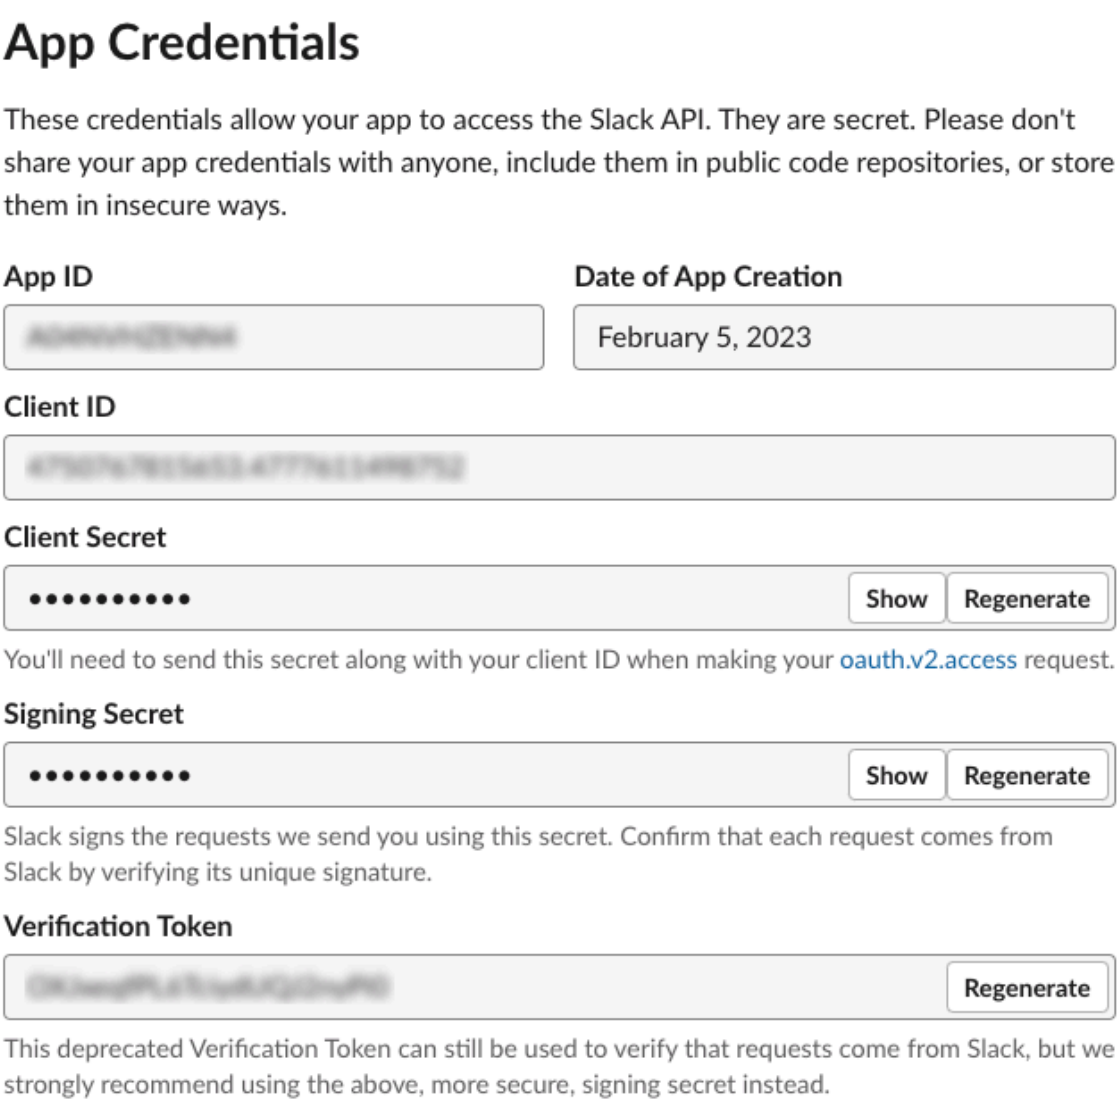
2. Navigate to the Slack API console.
3. Click **Create an app**.
4. On the Create an app window, select the most appropriate method to create the app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. From the App Credentials page on the Basic Information page, copy and record the values of Client ID, Client Secret, and Signing Secret of your Slack app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information, see the Obtain Client ID and Client Secret for later step.

6. On the OAuth & Permissions page:

   a. Specify the ServiceNow instance URL in **Redirect URLs** in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`.

   b. Add these bot token scopes:

   - channels:history
   - channels:manage
   - channels:read
   - chat:write
   - chat:write.customize
   - groups:read
   - im:read
   - mpim:read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- groups:history
- groups:write
- im:history
- im:write
- mpim:history
- mpim:write
- users:read
- users:read.email
- files:read

For more information, see Scopes and permissions.

Note:
The spoke set up procedure outlined here requires bot user tokens only. You can't use the Create User and Deactivate User actions while using the bot token scopes. To use these actions, you must obtain user token from your Slack account.

7. On the Slash Commands page, create a command and specify these values:

Field	Value
Command	/now
Request URL	https://<instance-name>.service-now.com/api/sn_slack_ah_v2/command_service/<slack-app-name>
Short Description	Description about the command.
Usage Hint	List of parameters than can be passed. For example, `[operation] [table]`.

For more information, see the Creating a Slash command step.

8. On the Interactivity & Shortcuts page:

   a. Enable **Interactivity** and specify the ServiceNow instance URL in **Request URL** in this format: `https://<instance-name>.service-now.com/api/sn_slack_ah_v2/slack/<slack-app-name>/interactivepayload`.
   For more information, see the Preparing your app for user interactions section.

   b. Create a shortcut that appears on messages and enter the value, `post_message_now` for **Callback ID**.
   For more information, see the Creating a shortcut section.

9. Create a Slack bot and add the bot to your Slack app and required channels.
   For more information, see Create a bot for your workspace.

Add Slack connection in ServiceNow instance

Add the Slack connection in Workflow Studio to configure the Slack spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.

> **Note:**
> You can add multiple connections for your Slack spoke; one for each Slack workspace.

4. On the Slack spoke tile, click **View Details**.
5. In the Connections page, click **Configure**.
   The pop-up window displays a blank Configure Connection form.
6. On the form, fill these values.

Configure Connection form

Field	Description
Connection URL	URL to connect to Slack. Enter `https://slack.com`.
Credential Name	Name to identify the credential record. For example, `Slack Cred`.
OAuth Name	Name to identify the OAuth record. For example, `Slack OAuth`.
OAuth Client ID	Client ID of your Slack app.
OAuth Client Secret	Client Secret of your Slack app.
OAuth Redirect URL	Redirect URL provided in your Slack app. This value is auto-populated.

7. Click **Configure and Get OAuth Token**.
8. In the pop-up window, click **Allow**.
   The OAuth Access token is generated for the Slack spoke.

Provide Signing Key in ServiceNow instance

Provide Slack app details and Signing Key in your ServiceNow instance for authenticating requests from ServiceNow.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Slack** > **Slack Configurations**.
2. Open the default record.
   You can also create new record to provide other signing keys.
3. On the form, fill these values.

Slack Configuration form

Field	Description
Slack App	Name of your Slack app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This name should same as the app name provided while creating the Slack app.
Connection Alias	Connection alias associated with the selected app in the **Connections** tab.
Property Name	Name of the Slack configuration. Enter `Signing Secret`.
Signing Secret	Signing Secret of your Slack app.

4. Click **Update**.

Configure outbound configurations in ServiceNow instance

Specify events in ServiceNow instance for which actions must be performed on your Slack spoke application.

Before you begin

Role required: admin

About this task

The outbound configurations provide a template to the Post Actionable Message and Post Approval Message actions and subflows. You can customise the default outbound configurations or create outbound configuration as per your requirement.

Procedure

1. Navigate to **All** > **Slack** > **Outbound Configurations**.
2. Click **New** to create a outbound configuration template or click the default outbound configuration to configure it.
3. On the Outbound Configuration form, fill these values.

Outbound Configuration form

Field	Description
Name	Name to identify the outbound configuration record.
Message Title	Title of message that is posted in the Slack spoke channel. For example, `Pending approvals for {0}`.
Target Table	ServiceNow table from which the record details are retrieved.
Fields	Fields from the ServiceNow table whose values must be displayed in the message that is posted in the Slack spoke channel.
Buttons	Buttons for the relevant users to take action in the Slack spoke channel. For example, **Approve** or **Reject** a request. For more information about buttons and their styling, see Button element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Users must have the required permissions to perform the necessary actions. For example, user must have the required permissions to approve or reject a request. These permissions are based on user roles assigned to users in your ServiceNow instance.
Choice List	Slack outbound choices such as, Reject. These options are displayed as a list in the Slack channel.
Action ID	Unique identifier of the outbound configuration. **Note:** **Action ID** of the outbound configuration must be used in the relevant inbound decision to complete the flow. For example, **Action ID** of the Approval Message outbound configuration is provided in the Approval Decision inbound decision. This ensures that upon the request approval or rejection, update is made to the relevant record in your ServiceNow instance.

4. Click **Submit**.

Configure inbound decisions in ServiceNow instance

Specify events in your Slack spoke application for which actions must be performed in ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Slack** > **Inbound Decisions**.
2. Click **New**.
3. On the Decision form, fill these values.

Decision form

Field	Description
Label	Name to identify the inbound decision.
Answer	Subflow that must be triggered when the specified conditions are met.
Default Answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met. **a.** Click the lookup icon ( ). **b.** Select the required subflow from the Document list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.
Condition	Conditions to be met in your Slack application for which actions must be performed in ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For updating relevant record in your ServiceNow instance, specify the **Action ID** value you had provided while configuring outbound configurations in the condition. **Note:** **Action ID** of the outbound configuration must be used in the relevant inbound decision to complete the flow. For example, **Action ID** of the Approval Message outbound configuration is provided in the Approval Decision inbound decision. This ensures that upon the request approval or rejection, update is made to the relevant record in your ServiceNow instance.

4. Click **Submit**.
   When events meet conditions specified in the policy, the associated subflow is triggered.

   Note:
   These inbound decisions are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

   If you want to display modals in Slack, see Configure Slack modals in ServiceNow instance.

Configure Slack modals in ServiceNow instance

Create modal and specify fields that should be displayed in your Slack modal. Modal UI can be generated in two ways; automatically using a ServiceNow table and manually using a custom **View Payload**.

Before you begin
Role required: admin.

About this task
For example, if you want to create incident using modal in Slack, the Create Incident modal requires **Priority**, **Category**, and **Short Description** fields.

Note:
Modals can be triggered from these interactive Slack components:

- Command,
- Block action,
- Global shortcut, and
- Message shortcut.

Procedure
1. To create a modal with UI that is automatically generated using a ServiceNow table:

   a. Navigate to **Slack** > **Slack Modal Configuration**.

   b. Click **New**.

   c. On the Slack Modal Configuration form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Slack Modal Configuration form

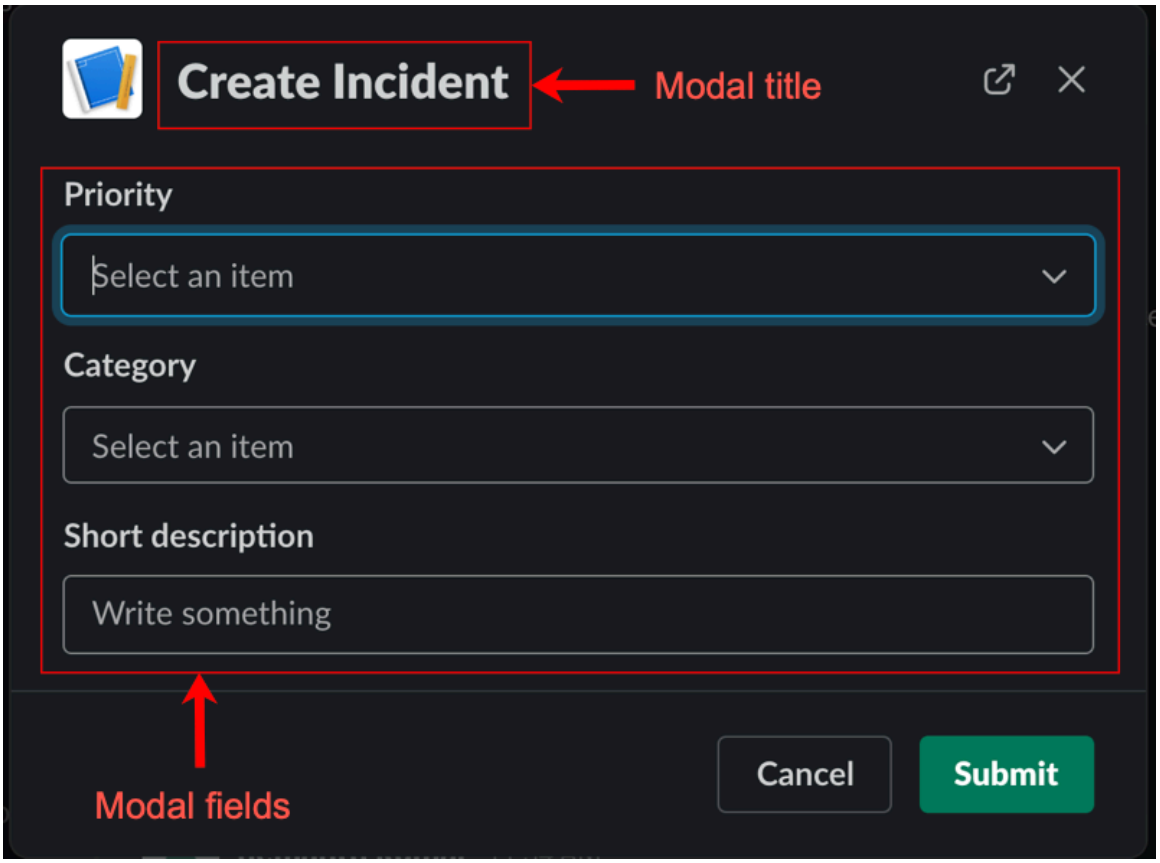
Field	Description
Name	Name to identify the record. For example, `Modal to create incident`.
Modal Title	Modal title that is displayed on Slack. For example, `Create Incident`.
Table	ServiceNow table corresponding to the modal fields. For example, **Incident [incident]**.
Custom Modal	Option to configure a custom modal.
Input Fields	Inputs fields that should be displayed on Slack. For example, select **Priority**, **Category**, and **Short Description**. Ensure that these modal fields correspond to the selected ServiceNow table. For example, you can't display task related fields on a modal that creates an incident. **Note:** Only the string, date, and choice field types are supported.
Active	Option to actively use the record.
Script Validation	Script to validate inputs provided by the user in the modal. To validate the user-provided inputs, ensure that you are aware of the format in which values are retrieved from the modal and parse the response from Slack. The sample payload when user provides values for the **Priority**, **Category**, and **Short Description** fields in the Create Incident modal is: `{"priority":{"4gk":{"type":"static_select","selected_option":{"text":{"type":"plain_text","text":"1 - Critical","emoji":true},"value":"1"}}},"category":{"iV7":{"type":"static_select","selected_option":{"text":{"type":"plain_text","text":"Software","emoji":true},"value":"software"}}},"short_description":{"XS/Q=":{"type":"plain_text_input","value":"hemanth"}}}` To display validation errors in the modal, configure the script to return an object keys, status, and errorObject. errorObject should have a value of object that will be displayed on Slack. The object should have response_action and error. Also, configure the script to return an object with keys of status and statusMessage when there are no validation errors. statusMessage is optional and you can configure it as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	(function() {
	var data = JSON.parse(payload);
	var key = Object.keys(data.short_description);
	var shortdesc = data.short_description[key[0]].value;
	var result = new Object;
	if (shortdesc.length > 10) {
	var obj = {
	'response_action': "errors",
	"errors": {
	"short_description": "You have reached your maximum limit of characters allowed"
	}
	};
	result = {
	"status": "error",
	"errorObject": obj
	};
	return result;
	} else {
	result = {
	"status": "success",
	"statusMessage": "`Request submitted successfully.`"
	};
	return result;
	}
	})();

d. Right-click the form header and click **Save**.
The Create Incident modal is created in Slack.



2. To create a modal with UI that is manually generated using a custom **View Payload**:

a. Navigate to **Slack** > **Slack Modal Configuration**.

b. Click **New**.

c. On the Slack Modal Configuration form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Slack Modal Configuration form

Field	Description
Name	Name to identify the record. For example, `Modal to create incident`.
Custom Modal	Option to configure a custom modal. Select this check box.
View Payload	Payload generated by Slack Block Kit Builder that defines the modal UI. For more information, see Block Kit and Building with Block Kit.
Active	Option to actively use the record.

Script Validation	Script to validate inputs provided by the user in the modal. To validate the user-provided inputs, ensure that you are aware of the format in which values are retrieved from the modal and parse the response from Slack.
	
	The sample payload when user provides values for the **Priority**, **Category**, and **Short Description** fields in the Create Incident modal is:
	
	`{"priority":{"4gk":{"type":"static_select","selected_option":{"text":{"type":"plain_text","text":"1 - Critical","emoji":true},"value":"1"}}},"category":{"iV7":{"type":"static_select","selected_option":{"text":{"type":"plain_text","text":"Software","emoji":true},"value":"software"}}},"short_description":{"XS/Q=":{"type":"plain_text_input","value":"hemanth"}}}`
	
	To display validation errors in the modal, configure the script to return an object keys, status, and errorObject. errorObject should have a value of object that will be displayed on Slack. The object should have response_action and error.
	
	Also, configure the script to return an object with keys of status and statusMessage when there are no validation errors. statusMessage is optional and you can configure it as per your requirement.
	
	`var data = JSON.parse(payload);`
	`var key = Object.keys(data.short_description);`
	`var shortdesc = data.short_description[key[0]].value;`
	`var result = new Object;`
	`if (shortdesc.length > 10) {`
	`var obj = {`
	`'response_action': "errors",`
	`"errors": {`
	`"short_description": "You have reached your maximum limit of characters allowed"`
	`}`
	`};`
	`result = {`
	`"status": "error",`
	`"errorObject": obj`
	`};`
	`return result;`
	`} else {`
	`result = {`
	`"status": "success",`
	`"statusMessage": "`Request submitted successfully.`"`
	`};`
	`return result;`
	`}`
	`})();`

d. Right-click the form header and click **Save**.
The Create Incident modal is created in Slack.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Specify conditions to define when the modals should be displayed:

   a. Navigate to **Slack** > **Inbound Decisions For Modals** .

   b. On the Decision form, fill these values.

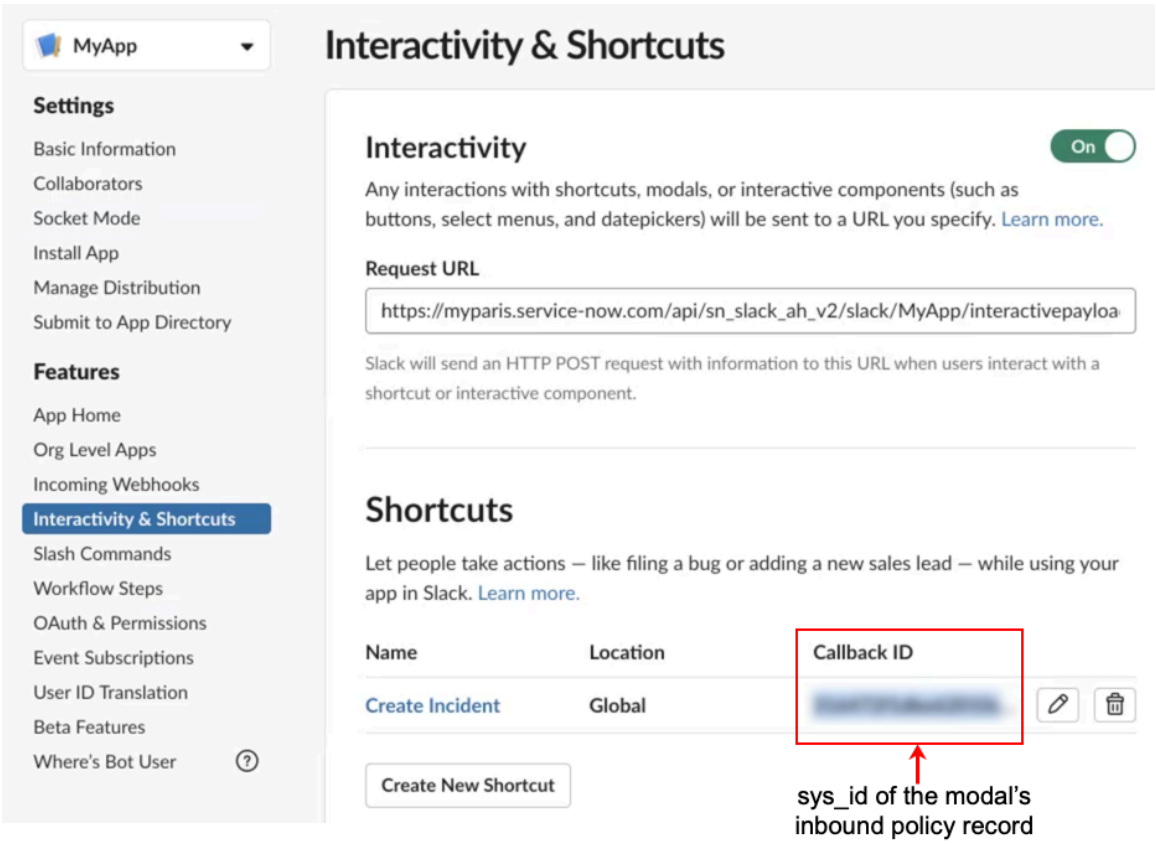
Decision form

Field	Description
Label	Name to identify the inbound modal decision.
Answer	Modal that must be displayed when the specified conditions are met. Ensure that you select the required record from the Slack Modal Configuration [sn_slack_ah_v2_slack_modal_configuration] table.
Default Answer	Option to specify if this is the default modal. The default modal is applicable when the conditions are not met.
Condition	Conditions to be met in your Slack application to display the modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Copy and record the value of sys_id. You can use this sys_id as the unique value in **Callback ID** while configuring the shortcut or message shortcut in your Slack app.



Note:
Two system properties are added to handle the inbound communications:

System properties

Category	Property name	Description	Example
Slash commands	sn_slack_ah_v2.common.special_characters	The characters encoded using the encodeURIComponent method are handled internally. To replace any additional special characters used in Slash commands in the Slack application with their encoded URI characters, add the characters in a JSON format.	{ "~" : "%7E", "\(" : "%28", }

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Click **Submit**.
When events in Slack meet conditions specified in the policy, the associated modal is displayed.

Note:
These inbound decisions are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

4. Specify tasks to be performed when user provides values in the modals by creating an inbound policy:

a. Navigate to **Slack** > **Inbound Decisions**.

b. Click **New**.

c. On the Decision form, fill these values.

Decision form

Field	Description
Label	Name to identify the inbound decision.
Answer	Subflow that must be triggered when the specified conditions are met.
Default Answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met. i. Click the lookup icon ( ). ii. Select the required subflow from the Document list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`. Ensure that you have configured the subflow to process the response payload from Slack to automate tasks.
Condition	Conditions to be met to perform tasks in ServiceNow instance. Specify the modal record in the condition.  **Note:** **Condition** must have condition specific to the modal record only.

d. Click **Submit**.
When Slack user provides inputs in the modal, the associated subflow is triggered after validating the inputs. Depending on the automations configured in your subflow, tasks are performed.

Automate and customize Slack tasks

Automate Slack tasks as per your requirement, using the sample these scenarios as a reference.

You can use the default outbound configurations, inbound decisions, and subflows as reference to customize tasks as per your requirement.

Example: Automate Slack commands

Perform these steps to automate events such as, create incident records, based on the Slack commands:

1. Configure the Slack commands on the Slash Commands page of your custom application. For more information, see Configure Slack app.
2. In Workflow Studio, create a subflow configure to create the incident records as per your requirement or create a copy of the default subflow, Respond to Slack Command, and configure it.

   Note:
   Create an action and use the payload in the subflow input as per your requirement.

3. Configure inbound decisions in ServiceNow instance.
   a. In the **Condition**, ensure that you specify the value of **command** as `/now` and specify the required parameters.

      Note:
      You can specify up to 2 parameters in your condition to trigger the required subflow.

   b. In **Answer**, select the subflow you had configured.

When a Slack user enters the command, `/now create incident <text>`, the condition specified in inbound decision is met and the associated subflow is triggered. Similarly, you can customize subflows and inbound decisions to configure more Slack commands such as:

- `/now list incidents` to list all active incidents assigned to the logged in user.
- `/now help` to display all available commands and their describe usage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `/now note [note]` to add notes to the required incident.
- `/now create incident [short description] > [optional: urgency] > [optional: impact]` to create an incident with specified short description, urgency, and impact. For example, `/now create incident Email is not working > 3 > 2`.

Example: Automate message actions

1. In your Slack custom application, create a shortcut that appears on messages and enter the value, `post_message_now` for **Callback ID**. For more information, see Configure Slack app.
2. In Workflow Studio, create a subflow configure to create the incident records as per your requirement or create a copy of the default subflow, Respond to Slack Message Action, and configure it.

   Note:
   Create an action and use the payload in the subflow input as per your requirement.

3. Configure inbound decisions in ServiceNow instance.
   a. In the **Condition**, ensure that you specify the value of **callback_id** as `post_message_now` and specify the required parameters.

   b. In **Answer**, select the subflow you had configured.

Example: Post an approval message

Perform these steps to automate posting an approval message on a Slack channel.

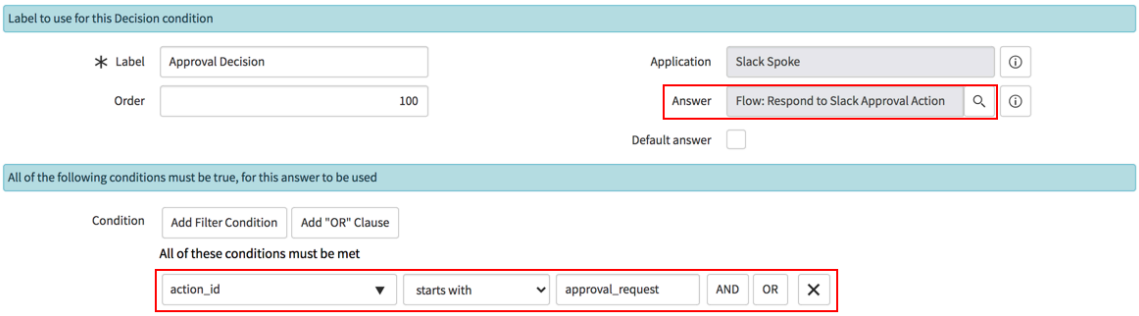
1. In Workflow Studio, create a copy of the default subflow, Respond to Slack Approval Action, and configure it as per your requirement.

   Note:
   Create an action and use the payload in the subflow input as per your requirement.

2. Configure outbound configurations in ServiceNow instance
   a. Open the default outbound configuration, **Approval Message**.
   b. In **Action ID** , specify the unique identifier for automating the task of posting an acknowledgement message. For example, value of **Action ID** can be `approval_request`.
3. Configure inbound decisions in ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Condition**, ensure that you specify the value of **Action ID** as `approval_request`. You can specify other conditions as per your requirement.



b. In **Answer**, select the subflow you had configured.

When the Slack events match the relevant the action ID, the associated subflow, that is, the Respond to Slack Approval Action subflow is triggered. This subflow contains the logic to update the required record and send the relevant acknowledgement message on Slack channel.

Example: Assign request based on acknowledgement

Perform these steps to automate assigning request:

1. In Workflow Studio, create a copy of the default subflow, On-Call Assign by Acknowledgement, and configure it as per your requirement.

   Note:
   Create an action and use the payload in the subflow input as per your requirement.

2. Configure outbound configurations in ServiceNow instance.
   a. Open the default outbound configuration, **On Call: Assign by Acknowledgement**.
   b. In **Action ID** , specify the unique identifier for automating the task of posting an acknowledgement message. For example, value of **Action ID** can be `on_call_assign_by_acknowledgement`.
3. Configure inbound decisions in ServiceNow instance.
   a. In the **Condition**, ensure that you specify the value of **Action ID** as `on_call_assign_by_acknowledgement`. You can specify other conditions as per your requirement.
   b. In **Answer**, select the subflow you had configured.

Example: Post an actionable message

Perform these steps to automate posting an actionable message:

1. Configure outbound configurations in ServiceNow instance.
   a. Open the default outbound configuration, **On Call: Assign by Acknowledgement**.
   b. Select **Target Table** and **Fields** as per your requirement. For example, **short_description** and **priority** from the **Task [task]** table.
   c. Select **Buttons** as per your requirement. For example, `Accept` and `Reject`.
   d. In **Action ID** , specify the unique identifier for automating the task of posting an acknowledgement message. For example, value of **Action ID** can be `on_call_assign_by_acknowledgement`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. In Workflow Studio, create a copy of the default subflow, Post Actionable Message, and configure it as per your requirement.

   Note:
   Create an action and use the payload in the subflow input as per your requirement.

   a. In the **Record Sys_ID** input, provide the sys ID of the required record. For example, specify the sys ID of the task record.

   b. In the **Template** input, select template you had created in the outbound configurations.

3. Configure inbound decisions in ServiceNow instance.

   a. In the **Condition**, ensure that you specify the value of **Action ID** as `on_call_assign_by_acknowledgement`. You can specify other conditions as per your requirement.

   b. In **Answer**, select the subflow you had configured.

SmartRecruiters Spoke

The SmartRecruiters spoke provides actions to view and analyze meaningful usage data for SmartRecruiters software subscriptions. Analyze usage for your SmartRecruiters account based on more than 60 activities, including job application creation and job ad creation. Use this data to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for the SmartRecruiters January 2021 release version, but may be compatible with later versions.

Spoke requirements

SmartRecruiters admin account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The SmartRecruiters spoke provides actions to automate SmartRecruiters tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Audit Management	Look up Audit Events Stream	Retrieves the list of audit events for all users.
User Management	Activate User	Activates the specified user's account.
	Deactivate User	Deactivates the specified user's account.
	Look up Users Stream	Retrieves the list of all users within an account.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the SmartRecruiters spoke.

Set up the SmartRecruiters spoke

Integrate the ServiceNow instance and SmartRecruiters by using API credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SmartRecruiters spoke.
- SmartRecruiters role required: admin.
- Role required: admin.

Generate a SmartRecruiters API key

Generate an API key for authenticating SmartRecruiters API requests.

Before you begin

Role required: SmartRecruiters admin

Procedure

1. From a web browser, open SmartRecruiters.
2. Sign in using your admin credentials.
   The Administrator's view of the SmartRecruiters portal opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the page header of the SmartRecruiters portal, click your profile icon and then select **Settings/Admin**.
   Your SmartRecruiter settings open.
4. Under Company Settings, locate the Administration section and then select **Apps & Integrations**.
   The Apps & Integrations page opens.
5. Select the **CREDENTIALS** tab and then click **NEW CREDENTIAL**.
6. When prompted to select the type of credential that you want to generate for your applications, select **API key**.
7. Click **Next**.
8. Enter a name for your API key in the **Credentials name** field.
9. Enter a description for your API key in the **Description** field.
10. Click **Generate**.
    SmartRecruiters automatically generates and displays your API key.
11. Copy your API key and save it in a secure location for later use.

Create a SmartRecruiters connection

Create a connection between your SmartRecruiters applications and your ServiceNow instance so that your instance can retrieve user data from your applications.

Before you begin

Role required: admin

Procedure

1. From your ServiceNow instance, navigate to **Process Automation** > **Flow Designer**.
   The Flow Designer launches in a new tab.
2. Select the **Connections** tab.
3. Locate your SmartRecruiters connection and then click **Add Connection**.
   The Create Connection dialog box opens.
4. On the dialog box, fill in the fields.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the SmartRecruiters connection. This field populates automatically.
Connection URL	URL for the connection. This field is automatically set to **https://api.smartrecruiters.com**.
Credential Information	
API Key	API key for your SmartRecruiters applications. Enter the same API key that you generated in Generate a SmartRecruiters API key.

5. Click **Create Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Smartsheet Spoke

The Smartsheet spoke integrates the ServiceNow® platform with Smartsheet so that you can automate various actions, such as creating cells in a particular sheet when a database table is updated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Smartsheet spoke v2.6.1 is the latest version.

Supported versions

This spoke was built for Smartsheet v1.0.1, but may be compatible with later versions.

Spoke requirements

You must have a Smartsheet admin account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- The latest Smartsheet spoke plugin

Note:
Some of these plugins are licensable features and need appropriate licenses, if used outside the spoke implementation. For information about licenses, contact your account manager.

Spoke subflows

The Smartsheet spoke provides sample subflows to demonstrate automating Smartsheet tasks. To customize a sample subflow, copy it to a new application scope. The available sample subflows are described in the following table:

Smartsheet spoke subflow descriptions

Subflow	Description
Smartsheet Download Subscriptions	Downloads user subscriptions from the Smartsheet portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Smartsheet spoke subflow descriptions (continued)

Subflow	Description
	To use this subflow, perform the steps outlined in Integrating with Smartsheet.
Smartsheet Update User Activity	Retrieves Smartsheet user activity. To use this subflow, perform the steps outlined in Integrating with Smartsheet.
Smartsheet Reclaim Subscription	Deactivates user accounts in Smartsheet. To use this subflow, perform the steps outlined in Integrating with Smartsheet.

Spoke actions

The Smartsheet spoke provides actions to automate Smartsheet tasks when events occur in your ServiceNow instance. The available actions are described in the following table:

Smartsheet spoke descriptions

Category	Action	Description
Attachment Management	Attach File to Sheet	Attaches a file to a sheet.
	Attach URL to Sheet	Attaches a URL to a sheet.
	Look up Attachment by ID	Retrieves the information about the attachments on a sheet.
	Look up Attachments Stream	Retrieves the information of all the attachments on a sheet.
Cell History	Look up Cell History Stream	Retrieves the information on the cell modification history.
Column Management	Create Column	Creates the columns in a sheet.
	Look up Column by ID	Retrieves the information about a column in a sheet.
	Look up Columns Stream	Retrieves the information of all the columns from the sheet.
	Update Column	Updates a column in a sheet.
Comment Management	Create Comment	Creates a comment in a sheet.
	Create Comment with Attachment	Creates a comment on a discussion with the attachment to a sheet. The comment provides context and useful information.
	Look up Comment by ID	Retrieves the information on a comment.
	Update Comment	Updates a comment on a sheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Smartsheet spoke descriptions (continued)

Category	Action	Description
Cross Sheet Reference Management	Create Cross Sheet Reference	Creates the cross sheet reference between two sheets.
	Look up Cross Sheet Reference by ID	Retrieves the information about a cross sheet reference on a particular sheet.
	Look up Cross Sheet References Stream	Retrieves the information about all cross sheet references on a particular sheet.
Event Management	Check Event Reporting	Checks if the customer has the event reporting add-on enabled. If enabled, a value of 0 is returned. If not, a value of 1 is returned.
Folder Management	Create Folder	Creates a folder on the Home pane of the Smartsheet project.
	Look up Folders Stream	Retrieves the information on all top-level child folders on the Home pane of the Smartsheet project.
	Update Folder	Updates the name and the permalink of a folder.
Group Management	Create Group	Creates a group.
	Look up Org Groups Stream	Retrieves information on all the groups in the organization.
	Update Group	Updates the details of a group.
Row Management	Create Row	Creates a row in a sheet.
	Look up Row by ID	Retrieves information on a row in a specific sheet.
	Update Row	Updates a row in a sheet.
Send via Email Management	Email Report	Sends a report as an attachment to an email.
	Email Sheet	Sends a sheet as an attachment to an email.
	Send Rows via Email	Sends rows via email.
Sharing Management	Create Share Sheet	Shares a sheet with users and groups.
	Look up Sheet Shares Stream	Retrieves a list of all users and groups that share a sheet.
	Update Share Sheet	Updates the access level of a user or a group for a sheet.
Sheet Management	Create Sheet	Creates a sheet in the folder if the folder ID is provided. Else, it creates a sheet in the user's sheet folder.
	Look up Sheet by ID	Retrieves information on a sheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Smartsheet spoke descriptions (continued)

Category	Action	Description
	Look up Sheets Stream	Retrieves a list of all the sheets that the user can access.
	Update Sheet	Updates a sheet.
User Management	Create User	Creates a user.
	Deactivate User	Deactivates the specified user account in Smartsheet.
	Look up Admin User	Retrieves the details of the admin user that generated the access token.
	Look up User Activity Stream	Gets the details of user activities.
	Look up User by ID	Retrieves the details of a user.
	Look up Users Stream	Retrieves the information of all the users.
	Remove User	Deactivates a user account.
	Update User	Updates the details of a user.
Webhooks Management	Create Webhook	Creates a webhook.
	Delete Webhook	Deletes a webhook.
	Look up Webhook by ID	Retrieves the details of a webhook.
	Look up Webhooks Stream	Retrieves the details of all the webhooks.
	Reset Webhook Shared Secret	Resets the shared secret for a webhook.
	Update Webhook	Updates the details of a webhook.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Smartsheet user management AI agent	Enables Process Analysts to automate user management workflows within Smartsheet using Integration Hub. It can automate tasks such as create, update, remove users, and retrieve user information.
Smartsheet sheet management AI agent	Enables Process Analysts to automate sheet management workflows within Smartsheet using Integration Hub. It can automate looking up sheets by their ID.
Smartsheet column management AI agent	Assists the Process Analyst in managing and automating column-related tasks in Smartsheet which enables better design and execution of flows in Integration Hub. The agent performs tasks such as fetch list of available columns in a sheet, and a specific column in a sheet.
Smartsheet attachment management AI agent	Enables the Process Analyst to improve Smartsheet workflows by automating attachment-related tasks such as attaching files or URLs, looking up attachment streams, and looking up attachments by ID.
Smartsheet group management AI agent	Enables the Process Analyst to improve group management workflows by automating certain tasks. The Process Analyst can automate tasks such as getting the list of available groups, and update group name.
Smartsheet sharing management AI agent	Enables the Process Analyst to improve workflows related to sharing in Smartsheet by automating certain actions such as looking up sheet share streams, and creating share sheets.
Smartsheet cross sheet reference management AI agent	Improves workflows related to cross-referencing of sheets by automating certain tasks such as looking up cross-sheet references stream and by ID, and creating a cross-sheet.
Smartsheet row management AI agent	Automates row management by performing certain tasks such as creating new rows, helping users manage data effectively and optimize their processes.
Smartsheet comment management AI agent	Automates various tasks related to comments such as adding a comment, adding a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
	comment with attachment, updating a comment, and look up for a comment.
Smartsheet cell history AI agent	Automates various tasks related to the history of the data in the cells such as looking up cell history stream to retrieve and analyze historical data from Smartsheet cells,
Smartsheet folder management AI agent	Automates folder-related tasks such as fetch list of available folders, create a new folder, and update a folder.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Smartsheet spoke

Set up the Smartsheet spoke to enable integration between the ServiceNow® instance and Smartsheet.

Before you begin

- Request an Integration Hub subscription.
- Activate the Smartsheet plugin.
- Create an alias for Smartsheet Application Programming Interface (API) key.
- Role required: admin.

About this task

Setting up involves generating an API key on the Smartsheet and creating a connection and credential record on the ServiceNow instance.

Generate the Smartsheet Application Programming Interface (API) key

Generate the Smartsheet API key to be a part of every API call in an HTTP authorization header. Authenticating the API key is a part of the integration process between the ServiceNow® instance and Smartsheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

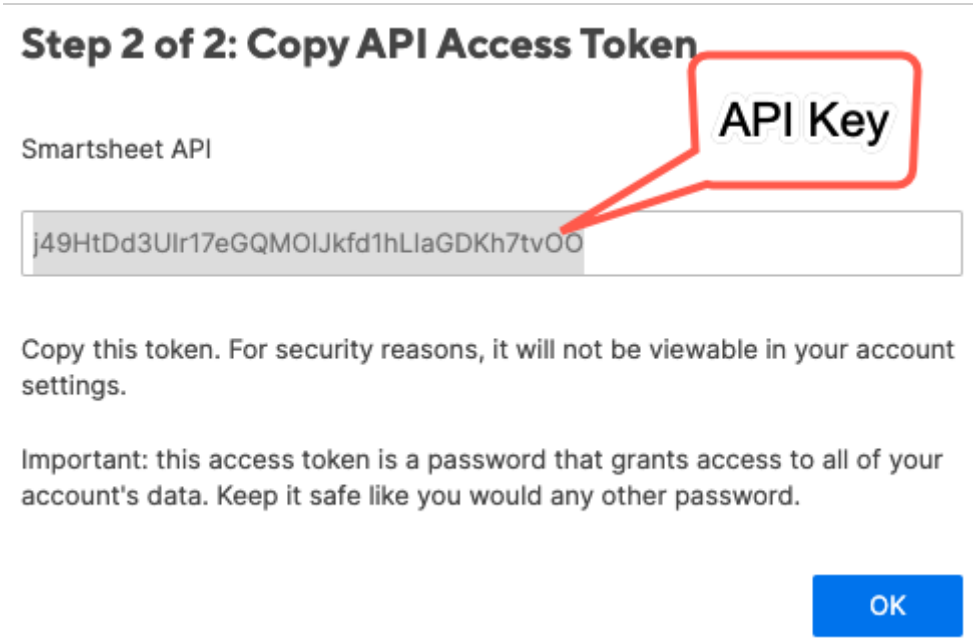
Before you begin

- Create an account with Smartsheet that is allowed to generate API keys.
- Role required: admin

Procedure

1. Log in to https://app.smartsheet.com/.
2. In the left pane, select the Smartsheet account icon.
3. Select **Personal Settings**.
4. Select the **API Access** tab.
5. Select **Generate new access token**.
6. In the API Access Token Name box, enter the name of the API token.
7. Select **OK**.
   An API key is generated, as shown in the following example.

Smartsheet API key generated

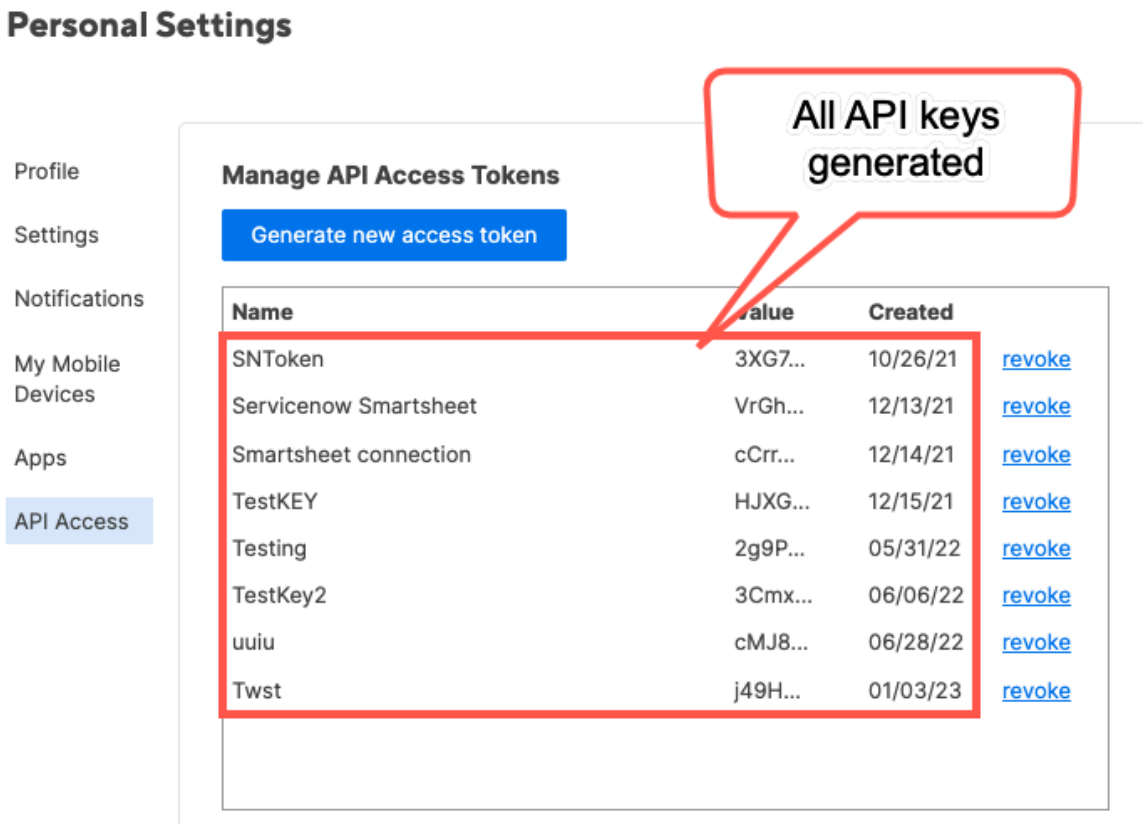


8. Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The generated API key is available in the Manage API Access Tokens section as shown in the following example.

All available Smartsheet API keys



Set up Smartsheet spoke connection and credentials

Set up the connection and credential record to enable the ServiceNow® instance to get authenticated and connected to Smartsheet.

Before you begin

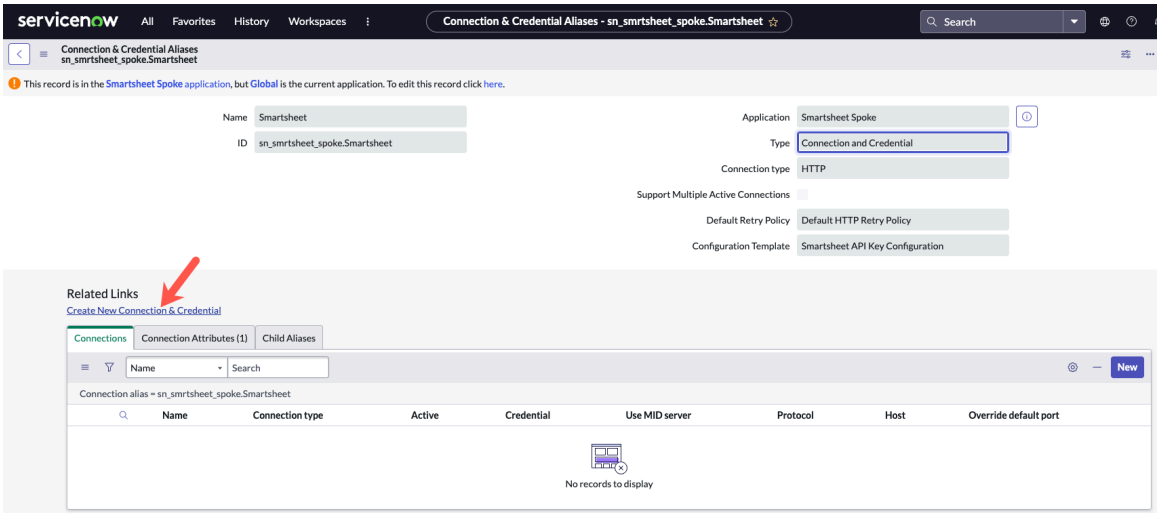
Role required: admin

Procedure

1. Navigate to **All** > **Connection & Credential Aliases**.
2. Open the record for the Smartsheet alias.
3. From the Related Links section, select **Create New Connection & Credential**.
   The following example shows the Create New Connection & Credential link that you select to set up a connection and credential record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Smartsheet connection and credential record creation link



4. On the form, fill in these fields.

Smartsheet connection and credential record form

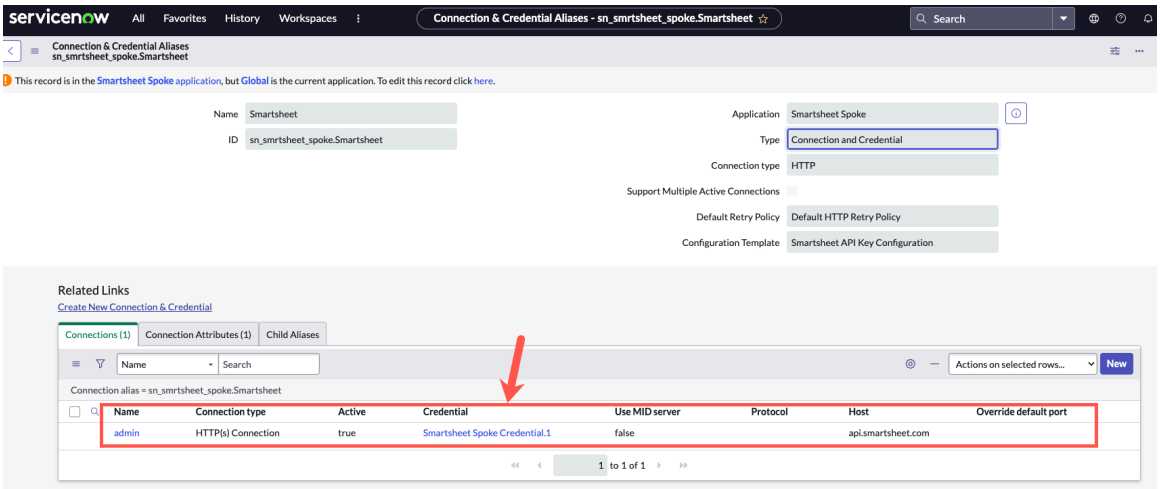
Field	Description
Name	User name that is used to connect to Smartsheet.
Connection URL	This field is automatically set to `https://api.smartsheet.com`. **Note:** Based on regions, replace the Connection URL with these respective URLs: ○ Smartsheet Gov: `https://api.smartsheetgov.com/` ○ Smartsheet Regions Europe: `https://api.smartsheet.eu/` ○ Smartsheet Regions Australia: `https://api.smartsheet.au/`
API Key	Application Programming Interface (API) key that is generated on Smartsheet. **Note:** To learn how to generate the API key, see Generate the Smartsheet Application Programming Interface (API) key.

5. Select **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A new connection and credential record is created in the **Connections** tab. This record is the default record unless you create another record and set that one as the default.

The following example shows that a connection and credential record is created and available under the **Connections** tab.



Snowflake Spoke

Manage data warehousing capabilities of Snowflake directly from your ServiceNow instance. You can create, delete, search, records, execute queries, and perform other data manipulation tasks in Snowflake from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Snowflake spoke v1.0.3 is the latest version.

Supported versions

This spoke was built for Snowflake v2, but may be compatible with later versions.

Spoke requirements

Snowflake account

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Workflow Studio - Dynamic Outputs (com.glide.hub.dynamic_outputs)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Flow Designer - Flow Engine (com.glide.hub.flow_engine)
- Flow Designer Action Step - Payload Builder (com.glide.hub.action_step.payload)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Snowflake spoke provides actions to automate Snowflake data manipulation tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Record Management	Create Record	Creates a record in the Snowflake tables with the specified details using the INSERT statement.
	Delete Records	Deletes the specified records in the Snowflake tables using the DELETE statement.
	Execute Custom Query	Runs the custom query in the Snowflake database using a custom statement and retrieves the result.
	Look up Columns	Retrieves a list of columns from the Snowflake table. **Note:** Make sure that your Snowflake Service Account has access privilege to the columns that you want to fetch.
	Look up Records	Runs the SELECT statement and retrieves the matching records from Snowflake tables.
	Look up Tables	Retrieves a list of tables from the specified database and specified warehouse in Snowflake. **Note:** Make sure that your Snowflake Service Account has access privileges to the tables that you want to fetch.
	Update Records	Updates the specified records in the Snowflake tables using the UPDATE statement.

Set up the Snowflake spoke

Integrate the ServiceNow instance and Snowflake spoke by using the OAuth credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Snowflake spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a connection for Snowflake spoke

Add and configure a Snowflake connection to authenticate ServiceNow requests.

Before you begin

- Get the OAuth client ID and client secret for your Snowflake account. For more information, see Snowflake OAuth.
- Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Snowflake** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Snowflake spoke, click **View Details**.

   - To manage more than one Snowflake connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, seeSupporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

5. On the **Configure Connection** form, fill in the fields:

Field	Description
Connection Name	Name to uniquely identify the connection.
Connection URL	URL to connect to Snowflake. Enter the URL in this format: `https://<your_domain>.snowflakecomputing.com`.
Application Registry Name	Name of the application registry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credentials Name	Name to uniquely identify the credentials. For example, `Snowflake credential`.
OAuth Client ID	OAuth client ID of your Snowflake account.
OAuth Client Secret	OAuth client secret of your Snowflake account.
Authorization URL	Snowflake authorization URL. Enter the URL in this format: `https://<your_domain>.snowflakecomputing.com/oauth/authorize`
Token URL	URL from which the ServiceNow instance obtains the access token. Enter the URL in this format: `https://<your_domain>.snowflakecomputing.com/oauth/token-request`
Oauth Entity Profile Name	OAuth Entity Profile Name for your Snowflake account.
OAuth Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do` is auto-populated.

6. Click **Configure Configure and Get OAuth Token**.

Result
The spoke connection is configured and ready to be used.

Socure Spoke

Integrate ServiceNow instance with your Socure account to access information about scores, watchlists, and so on.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Subscription information

This spoke requires a subscription. Contact your ServiceNow account manager or sales representative for subscription details. For more information, see Legal schedules - IntegrationHub overview

Spoke version

Socure spoke v1.1.0 is the latest version.

Supported versions

This spoke was built for Socure V3.0, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Socure Spoke provides actions (under the ID Modules category) to automate tasks when events occur in your ServiceNow instance. Available actions include:

Action	Description
Look up Address Risk Score	Retrieves the address risk scores and reason codes.
Look up Fraud Score	Retrieves the fraud scores and reason codes.
Look up Email Risk Score	Retrieves the email risk scores and reason codes.
Look up KYC Score	Retrieves the KYC(Know your Customer) scores and reason codes.
Look up Reason Codes and Descriptions	Retrieves the reason codes and descriptions.
Look up Phone Risk Score	Retrieves the phone risk scores and reason codes.
Look up Watchlist	Retrieves the global watchlist matches.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Socure spoke.

Set up the Socure spoke

Integrate the ServiceNow instance and Socure account using an API key to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Socure spoke.
- Contact the Socure support team and obtain the connection URL to connect to Socure account.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Obtain the IP addresses of your ServiceNow instance.

   a. Log in to ServiceNow - NOW Support.

   b. Search for the **My IP Information** service catalog item.

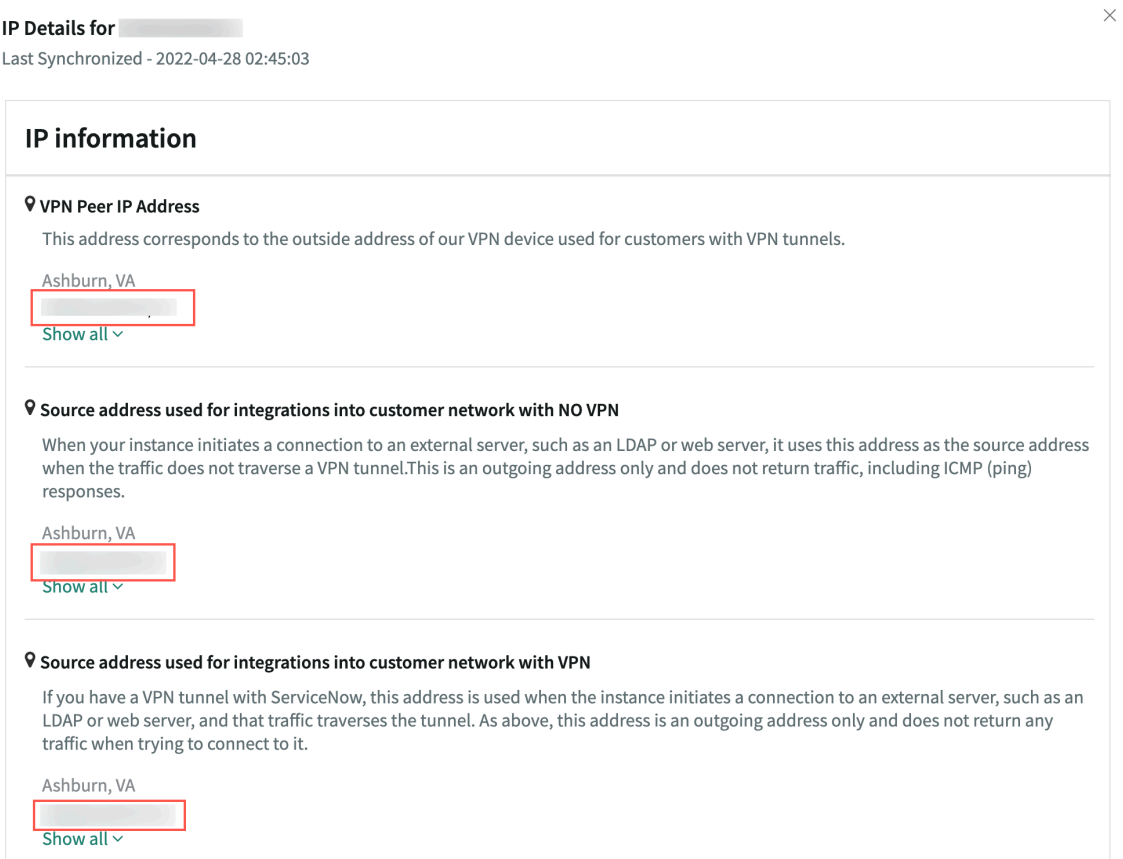
   c. Click the service catalog item.

   d. Provide your instance name in **Select the instance**.

   e. Click **Submit**.
   The IP addresses are displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Copy and record the IP addresses for later use.



2. Obtain the value of token from your Socure admin account.

a. Log in to your Socure admin account with your admin credentials.

b. Click the **Settings** tab.

c. In the **Account Settings** tab, provide these values.

- Select **Production** from the **Environment** list.
- In **Allowed Domains**, specify the IP addresses of your ServiceNow instance. Separate multiple IP addresses using comma (,).
- Copy and record the value of **ID+key** for later use.

3. Create credential record for the Socure spoke in your ServiceNow instance.

a. Navigate to **Connections & Credentials** > **Credentials**.

b. Click **New**.
The system displays the message **What type of Credentials would you like to create?**.

c. Select **API Key Credentials**.
A blank API Key Credentials form displays.

d. Enter these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `Socure Credentials`.
Active	Option to actively use the credential record.
API Key	Socure token in this format: `SocureApiKey <Value of ID+key>`.
Applies to	**Note:** This option is not applicable to this spoke.
Order	Order to apply this credential. For example, enter `100`.

e. Click **Submit**.

4. Create connection record for the Socure spoke in your ServiceNow instance.

a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

b. Open for the record for **Socure**.

c. From the **Connections** tab, click **New**.
The system displays a blank HTTP(s) Connection form.

d. Enter these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Socure Connection`.
Credential	Select the Credential record you created for Socure. For example, select **Socure Credentials**.
Connection URL	Connection URL to connect to Socure account.

e. Click **Submit**.

SuccessFactors Learning Spoke

SuccessFactors Learning spoke can be used retrieve all learning-related information such as user data, course data, syncing user activity, retrieving assignments/enrollments, etc.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

This spoke was built for version 1.5, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key features

SuccessFactors Learning enables a flow designer to:

- Retrieve learning information
- User data
- Course data
- Syncing user activity

Spoke requirements

SAP Successfactor LMS module subscription

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The SuccessFactors Learning does not provide any sample flows.

Spoke subflows

The SuccessFactors Learning provides sample subflows to demonstrate automating Learning tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Look up users	Retrieve user related information.
Look up courses	Retrieve course related information.

Spoke actions

The SuccessFactors Learning provides actions to automate Learning tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Meta data retrieval	Get access token	Retrieves access token from SuccessFactors Learning.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
User management	Look up users	Retrieves user details from SuccessFactors Learning.
Course management	Look up courses	Retrieves courses details from SuccessFactors Learning.
	Look up user activities	Retrieves user activities from SuccessFactors Learning.
	Track approvals	Retrieves approvals from SuccessFactors Learning.
	Look up enrollment	: Retrieves enrollment details from SuccessFactors Learning.
	Create assignment enrollment	Create assignment enrollment into SuccessFactors Learning.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the SuccessFactors Learning spoke

Integrate the ServiceNow instance and SuccessFactors Learning by using the SuccessFactors Learning REST credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SuccessFactors Learning spoke.
- Role required: admin.

Create a connection record for the SuccessFactors Learning spoke

Create a connection record for your spoke. The SuccessFactors Learning connection and credential aliases use these connections to perform actions in SuccessFactors *Learning*.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for *SuccessFactors* **Learning**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `<Application-Name> Connection`.
Credential	Credential record created for *SuccessFactors* Learning. For example, `<Application-Name> Cred`.
Connection alias	Alias record associated with this connection.
Host	Fully qualified domain name of the target host where the *Learning* server is installed. For example, `<host>.<domain>.com`.
Connection URL	Base URL to connect to *Learning*. Enter: `https://scfpart001153.scdemo.successfactors.eu/learning`
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.
Use MID server	Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.

5. Click **Submit**.

Create a credential record for the SuccessFactors Learning spoke

Create a credential record for the spoke. The SuccessFactors Learning connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
3. Select **SuccessFactors Learning REST Credentials**.
4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, `Local Credentials`.
Active	Option to actively use the credential record.
Username	Username to log in to the local ServiceNow instance.
Company ID	Company ID information provided by the client.
User type	Password to log in to the local ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Resource type	Resource type information provided by the client.
Client ID	A unique string representing the registration information provided by the client.
Client Secret	A secret code known only to the application and the authorization server.

5. Right-click the form header and click **Submit**.

SuccessFactors Spoke

The SuccessFactors spoke is built by Bristlecone, Inc. Manage data and entities in SuccessFactors from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes. Starting on March 1st 2022, all SAP spokes will be available only on the Store.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SuccessFactors spoke v4.10.1 is the latest version.

Supported versions

This spoke was built for SuccessFactors v2.0, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Remote Tables (com.glide.script.vtable)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke flows

The SuccessFactors spoke provides sample flows in the draft state to demonstrate automating the SuccessFactors tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Create Todo	Creates a to-do record in SuccessFactors.
Update Todo	Updates details of the specified to-do record in SuccessFactors.
Run SuccessFactors Integration Flow	Retrieves entire data or only updates made after the last refresh, for the selected entities, from SuccessFactors to your ServiceNow instance. By default, you can retrieves data from these entities in SuccessFactors: • Department • Location • Job Profile • Workers Profile • Effective Workers Profile • Job History Including Secondary Assignments • Todo

Note:
The Create Todo and Update Todo flows demonstrate the to-do record management when events occur in ServiceNow. You can customize these flows according to your requirement to manage records of other entities from your ServiceNow instance.

Spoke subflows

The SuccessFactors spoke provides sample subflows in the draft state to demonstrate automating the SuccessFactors tasks. To customize a sample subflow, copy the sample subflow to a new application scope. Available sample subflows include:

Subflow	Description
Look up Departments	Retrieves the department data from SuccessFactors and stores it in SuccessFactors Departments Staging Table.
Retrieve Effective Worker Profiles	Retrieves the Effective Worker Profiles data from SuccessFactors and stores it in SuccessFactors Worker Profiles Staging Table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Retrieve Full Job History Including Secondary Assignments	Retrieves all primary and secondary job history data from SuccessFactors.
Retrieve Job Profiles	Retrieves the job profile data from SuccessFactors and stores it in SuccessFactors Job Profile Staging Table.
Retrieve Locations	Retrieves the location data from SuccessFactors and stores it in SuccessFactors Locations Staging Table.
Retrieve Todos	Retrieves the to-do data from SuccessFactors and stores it in SuccessFactors Inbound Todos Staging Table.
Retrieve Worker Profiles	Retrieves the Worker Profiles data from SuccessFactors and stores it in SuccessFactors Worker Profiles Staging Table.
Run SuccessFactors Service	Retrieves entire data or only updates made from the last successful runtime, for the selected entities.
Process SuccessFactors Webhooks	Processes the SAP SuccessFactors webhook event. For more information about setting up the webhooks, see Set up webhook for the SuccessFactors spoke.
Retrieve Worker Profile by Company Territory Code	Retrieves the data of worker profile from SAP SuccessFactors based on company territory code, and stores it in the 'SuccessFactors Worker Profiles Staging Table' **Note:** Worker profiles without employment or job information will not be retrieved, as the subflow fetches data based on the company territory code, which is assigned only after employment is assigned to the worker.

Spoke actions

The SuccessFactors spoke provides sample actions in the draft state to demonstrate automating the SuccessFactors tasks when events occur in ServiceNow. To customize a sample action, copy it to a new application scope. Available sample actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- To help prevent unauthorized users from accessing the sensitive data, the hasRole functionality has been implemented for the sensitive actions of the SuccessFactors spoke. As a result, users without the System Administrator role won't be able to run successfully the actions if they don't have the SuccessFactors Spoke Admin role. This rule is applicable from SuccessFactors spoke v3.1.5 and v4.0.3 of the spoke respectively. For more information, see the SuccessFactors Spoke hasRole fix details knowledge base article on NOW Support.
- To help prevent unauthorized users from generating reports for SuccessFactors spoke tables, report_view ACLs are incorporated with the spoke admin role. Thus, you must have the SuccessFactors Spoke's Admin role to generate a report.

Category	Action	Description
Employee Management	Employee Address Information	Retrieves the address information of the specified employee.
	Employee Annual Compensation	Retrieves the annual compensation details of the specified employee.
	Employee Compensation Details	Retrieves compensation details of the specified employee.
	Employee Documents	Retrieves all the viewable documents of the specified employee.
	Employee Payment Method Details	Retrieves the details about payment method of the specified employee.
	Employee Time Off	Retrieves the time offs taken by the specified employee.
	Employee Time Off Balances	Retrieves the time off-balance details of the specified employee.
	My TimeCard Details	Retrieves the time sheet details of the specified employee.
	Change User Roles	Adds user to the given permission group.
	Employee All Payment Methods Details	Retrieves details of all the payment methods of the specified employee.
	Employee Recurring Compensations	Manages the recurring component of a specified employee's compensation.
	Get Employee Benefit Enrollments	Retrieves details of the benefit enrollments of the specified

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		employee during a specific time period.
	Offboard an Employee	Triggers the termination process of the specified employee.
	Org Change	Changes the organization related information of the specified employee.
	Report No Shows	Reports no show for the specified employee.
	Reporting Structure	Retrieves the reporting structure of the specified employee.
	Request Time Off	Applies a time off request for the specified employee.
	Update Employee Address	Updates the address of the specified employee.
	Update Employee DOB	Updates the date of birth of the specified employee.
	Update Employee Email	Updates the details of the email of the specified employee.
	Update Employee Phone	Updates the phone details of the specified employee.
	Update Employee Personal Information	Updates the personal information of the specified employee.
	Update Employee Personal Information - Global	Updates the global information of the specified employee.
	Update Employee Start Dates	Updates the start date of employment of the specified employee.
HR Foundational Data	Login into SuccessFactors	Logs in to SuccessFactors and retrieves the Session ID.
	Retrieve Current Employment Information	Retrieves the current employment information from SuccessFactors.
	Look up Departments	Retrieves the department data from SuccessFactors.
	Look up Addresses Stream	Retrieves address information from SuccessFactors.
	Look up Emails Stream	Retrieves emails information.
	Look up Person Biographical Stream	Retrieves person biographical information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Personal Detailed Information Stream	Retrieves personal detailed information.
	Look up Employment Information Stream	Retrieves the employment information from SuccessFactors.
	Look up Phone Stream	Retrieves phone information from SuccessFactors.
	Look up Employee Global Assignments Stream	Retrieves all global assignment details from SAP SuccessFactors.
	Look up Secondary Assignments Stream	Retrieves all secondary assignments from SAP SuccessFactors.
	Retrieve Full Job History Including Secondary Assignments	Retrieves the complete job history data including secondary assignments from SuccessFactors.
	Retrieve Effective Worker IDs	Retrieves the effective Worker Profiles ID from SuccessFactors.
	Retrieve Profiles by Person ID	Retrieves the Worker Profiles data by Person ID from SuccessFactors.
	Retrieve Effective Worker Profiles	Retrieves the Effective Worker Profiles data from SuccessFactors.
	Retrieve Job History Including Secondary Assignments (Deprecated)	Retrieves the job history data including secondary assignments from SuccessFactors.
	Retrieve Job Profiles	Retrieves the job profile data from SuccessFactors.
	Retrieve Locations	Retrieves the location data from SuccessFactors.
	Retrieve Worker Profiles	Retrieves the Worker Profiles data from SuccessFactors.
	Get Holiday Calendar	Retrieves holiday calendar for a country.
Metadata Retrieval	Get Dynamic Output Fields	Creates a dynamic output structure for mapping of fields

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Note: To execute the creatable, deletable, updatable, and list metadata actions, create a system property with **Name** as *com.glide.attachment.max_get_size* in the Global scope and set its **Value** to 20000000.		in response for the given entity.
	Get Entities - Creatable	Retrieves the entities for which the create operation is supported.
	Get Entities - Deletable	Retrieves the entities for which the delete operation is supported.
	Get Entities - Updatable	Retrieves entities for which the update operation is supported.
	Get Entities List	Retrieves the list of all entities.
	Get Fields - Creatable	Retrieves all the creatable non-navigation properties in an entity.
	Get Fields - Updatable	Retrieves all the updatable non-navigation fields in an entity.
	Get Key Fields	Retrieves all the key fields in the specified entity.
	Get Required Fields - Creatable	Retrieves all the required insertable fields in the specified entity.
	Get Updatable Todo Fields	Retrieves the list of updatable fields in the Outbound Todos Staging Table.
	Get Available Positions	Retrieves all the available positions for given company and location code.
	Get Business Units	Retrieves all the available business units in SuccessFactors.
	Get Companies	Retrieves all the available active companies in SuccessFactors.
	Get Countries	Retrieves all the available countries in SuccessFactors.
	Get Country Code	Retrieves country code of a country.
	Get Dynamic Permission Groups	Retrieves all the available dynamic permission groups.
	Get Event Reasons By Event ID	Retrieves all the event reasons for the specified Event ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Global Information By Entity	Retrieves metadata of the entity specified to fetch the global information.
	Get Global Personal Information Supported Countries	Retrieves details of the countries that support the creation and modification of the personal global information.
	Get Locations By Company Code	Retrieves all the active locations from SuccessFactors for the specified company code.
	Get People Pools By Group ID	Retrieves all people pools with only user name category for the specified group.
	Get Pick List Options	Retrieves all the available pick list options for the specified pick list ID.
	Get Pick List Options By Country	Retrieves the pick list options of the specified country.
	Get Recurring Pay Components Defined for Employee	Retrieves recurring pay components and relevant information for the specified employee.
	Get Required Fields - Creatable	Retrieves all the required insertable fields in the specified entity.
	Get Time Types By User ID	Retrieves all the available time types of the specified employee in SAP SuccessFactors.
	Get Updatable Todo Fields	Retrieves the list of updatable fields in the SuccessFactors Outbound Todos Staging table.
	Look up Company Territory Code	Retrieves all available company territory codes from SAP SuccessFactors.
Record Management	Create Record	Creates a record in SuccessFactors. **Note:** The Create Record action displays non-navigable fields only in the creatable fields list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Record	Deletes the specified record in SuccessFactors.
	Execute Entity By URL	Takes navigation URL as input and provides the response for that navigation URL.
	Get Record	Retrieves the record for the selected entity and for the given key fields.
	Update Record	Updates details of the specified record.
Todos	Create Todo	Create a to-do record in SuccessFactors.
	Get Todo By ID	Get details of a to-do from SuccessFactors.
	Retrieve Todos	Retrieves the to-do data from SuccessFactors, except those with Category ID as 57.
	Update Todo	Updates details of the specified to-do record.
User Management	Look up User Activity	Retrieves the last activity time of your SAP SuccessFactors users.
	Look up User Activity SFTP	Retrieves the last activity time of your SAP SuccessFactors users by fetching the report published on an SSH File Transfer Protocol (SFTP) location.
	Look up Users	Retrieves the list of SAP SuccessFactors users.
	Look up User by User ID	Retrieves the worker details of the SuccessFactors user.
	Look up User Personal Details	Retrieves user personal details of the specified employee.
	Suspend User	Suspends a user account.
Utility Category	Call A SuccessFactors Subflow	Executes the specified SuccessFactors spoke subflow synchronously.
	Call Run SuccessFactors Service Subflow	Executes the Run SuccessFactors Service subflow asynchronously.
	Check Flow Status	Checks if the context of flow is running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Last Run Date	Retrieves the last run date and time of the flow.
	Update Record In Outbound Todos Staging Table	Updates details of the specified to-do record in SuccessFactors Outbound Todos Staging Table. **Note:** Only an admin user can run this action.
Goal Management	Look up Goals by User ID	Retrieves goals information from SuccessFactors for the specified user ID. **Note:** Only an admin user can run this action.
Payroll Management	Look up Employee Payrolls	Retrieves payroll details of the specified employee.
Skill Management	Create or Update Skill Profile	Creates or updates skill profile and profile skill mappings for a particular employee.
	Look up Employee Skills Stream	Retrieves the skill information of required employee.
	Look up Skills Stream	Retrieves the skill information.
Job Management	Look up Attachment by ID	Retrieves attachment content and stores it in the SuccessFactors Attachments data source for the specified attachment ID. To access the attachments, navigate to **All** > **System Import Sets** > **Administration** > **Data Sources** and open the record **SuccessFactors Attachments**. The required files are attached to this data source record. **Note:** Only an admin user can run this action.
	Look up Candidate by ID	Retrieves candidate information from SuccessFactors for the specified candidate ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: Only an admin user can run this action.
	Look up Job Applications Stream	Retrieves job application information from SuccessFactors. **Note:** Only an admin user can run this action.
	Look up Job Codes Stream	Retrieves job level, employment type, and job type information from SuccessFactors. **Note:** Only an admin user can run this action.
	Look up Job Requisition by ID	Retrieves job requisition details for the specified requisition ID. **Note:** • Create a copy of the Lookup Job Requisition by ID action, if the API attribute of Job Level ID and Employment Type ID is configured with other custom attributes except customString3 and customString4, and modify the post-processing script with the expected API attribute path. • Only an admin user can run this action.
	Look up Job Requisition Postings Stream	Retrieves job posting information from SuccessFactors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: Only an admin user can run this action.
	Look up Employee Jobs Stream	Retrieves All Employee Jobs information from SuccessFactors.
	Look up Job Profiles Stream	Retrieves job profiles information from SuccessFactors.

Note:
If a spoke action requires date or time as an input, ensure that you provide the value in GMT time zone only.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

AI agent	Description
SuccessFactors payroll management AI agent	Retrieves and manages payroll related information.
SuccessFactors user management AI agent	Retrieve detailed personal information of users.
SuccessFactors todos AI agent	Synchronizes, retrieves, manages, and creates todos.
SuccessFactors hr foundational data AI agent	Retrieves the holiday calendar.
SuccessFactors jobs management AI agent	Retrieves candidate information based on the ID.
SuccessFactors employee management AI agent	Retrieves and manages employee-related information such as, benefit information and time off details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Available sample agentic workflows

Install Now Assist for Integration Hub and start using the available sample agentic workflows and AI agents. For more information, see Now Assist for Integration Hub.

In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. Use the available sample agentic workflow in AI Agent Studio so that AI agents can coordinate to solve complex problems. To modify the available sample agentic workflow as per your requirement, see Modify an agentic workflow.

Sample agentic workflow	Description	AI agents used	Always ON by default?
Fetch User Details and Time#Off Balance and Time#Off Details	Retrieves a worker's profile information along with their time#off balance and time#off details for a specified date. It is designed to help downstream processes access accurate HR and time#management data from SuccessFactors.	• SuccessFactors Employee Managem AI Agent • SuccessFa User Managem AI Agent	No **Note:** To activate the workflow, see Activate an agentic workflow template.
Fetch Employee Payrolls and Benefit Enrollments	Retrieves an employee's payroll information and benefit enrollment details from SuccessFactors. It is intended for use cases requiring payroll validation, compensation planning, and benefits#related decision support.	• SuccessFactors Payroll Managem AI Agent • SuccessFa Employee Managem AI Agent	No **Note:** To activate the workflow, see Activate an agentic workflow template.

Spoke modules

The SuccessFactors spoke provides sample modules in the draft state to demonstrate automating the SuccessFactors tasks when events occur in ServiceNow. To customize a module, copy it to a new application scope. Available sample modules include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
Department Staging Table	Displays the department data retrieved from SuccessFactors.
Locations Staging Table	Displays the location data retrieved from SuccessFactors.
Job Profile Staging Table	Displays the job profile data retrieved from SuccessFactors.
Worker Profiles Staging Table	Displays the worker profile data retrieved from SuccessFactors.
Inbound Todos Staging Table	Displays the to-do records retrieved from SuccessFactors.
Outbound Todos Staging Table	Displays the todo records created in ServiceNow. When a todo record is created or updated in ServiceNow, the Create Todo or Update Todo flow is triggered and the same record is created or updated in SuccessFactors. All the associated record details, are retrieved from SuccessFactors and saved in this staging table. If the flow fails to create or update record in SuccessFactors, the associated record or updates in ServiceNow is also deleted.
Employee Job Information And History	Displays the job information and job history of all users.
View My Time Off Balance	Displays the time off balance of the logged-in user.
View My Time Off Details	Displays details of the time off requests of the logged-in user.
Webhook Registry	Displays the list of webhook registries. Admin must create webhook registry here. For more information, see Set up webhook for the SuccessFactors spoke.
View My Time Card Details For Past 1 Month	Displays time card details of the previous one month for the logged-in user.
View My Worker Profile	Displays the worker profile details of the logged-in user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
View My Holiday Calendar	Displays the holiday calendar applicable to the logged-in user.
View My Reporting Structure	Displays the reporting structure details of the logged-in user.
View My Direct Deposit Information	Displays the direct deposit details of the logged-in user.
View My Total Rewards	Displays the total rewards of the logged-in user.

To retrieve the data, run Run SuccessFactors Integration Flow. The data in the staging tables is available for seven days. During this time period, you must use transform maps to save this data in the required target ServiceNow tables according to your requirement.

Spoke transform maps

The SuccessFactors spoke provides sample transform maps in inactive state and associated sample target tables to demonstrate using transform maps to save SuccessFactors data in your ServiceNow tables. You can use these sample transform maps and target tables as reference to create transform maps according to your requirement.

For more information, see Transform maps.

Spoke user roles

These user roles are available along with the spoke:

- SuccessFactors Admin (sn_successfactors.SuccessFactors Admin): If you have this role, you can access all spoke modules and tables.
- SuccessFactors Private Data (sn_successfactors.SuccessFactors Private Data): If you have this role, you can access to data in these spoke modules:
  - View My Direct Deposit Information
  - View My Total Rewards
- SuccessFactors Public Data (sn_successfactors.SuccessFactors Public Data): If you have this role, you can access to data in these spoke modules:
  - View My Time Off Balance
  - View My Time Off Details
  - View My Time Card Details For Past 1 Month
  - View My Worker Profile
  - View My Holiday Calendar
  - View My Reporting Structure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are available with the SuccessFactors spoke. One for the SOAP API and the other for the OData API.

For information about setting up the spoke, see Set up the SuccessFactors spoke v4.x.x.

Set up the SuccessFactors spoke v4.x.x

Integrate the ServiceNow instance with your SuccessFactors instance using OAuth client application and API key.

Before you begin

- Request an Integration Hub subscription.
- Activate the SuccessFactors spoke.
- Enable these system properties:
  - *glide.pf.rest.response_payload_max_size*: The maximum value is, 10240.
  - *com.snc.process_flow.reporting.serialized.val_size_limit*: The maximum value is, 16384.
  - *com.glide.transform.json.max-partial-length*: The maximum value is, 65536.
- Role required: admin.

Note:
This procedure is applicable if you are setting up the SuccessFactors spoke v4.10.1 for the first time. If you are using an earlier version of the SuccessFactors spoke, see Migrate to SuccessFactors spoke v4.10.1 for the migration procedure.

For more information about setting up the spoke, see SAP SuccessFactors Spoke - OAuth Setup & Migration - Pre-Tokyo, Tokyo and beyond in ServiceNow Community.

Register OAuth client application in SuccessFactors

Enable client certificate authentication for the outbound communication by generating the keystore.jks and keystore.cer files.

Before you begin

- Generate a valid JKS certificate. For information about creating a JKS certificate, see Creating Java Keystore(JKS) with Private Key and Certificate Chain in SAP Help Portal, or, do the steps.
  1. Use the command `openssl genrsa -out private.key 2048` to generate the private.key file.
  2. Use the private.key to create x.509 certificate (.cer file) that contains your public key.

     Use the command `openssl req -new -x509 -key private.key -out publickey.cer -days 365`
- Convert the public and private key to a .p12 file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the command to do the above step `openssl pkcs12 -export -in publickey.cer -inkey private.key -out successfactors.p12 -name "<provide custom name>".`

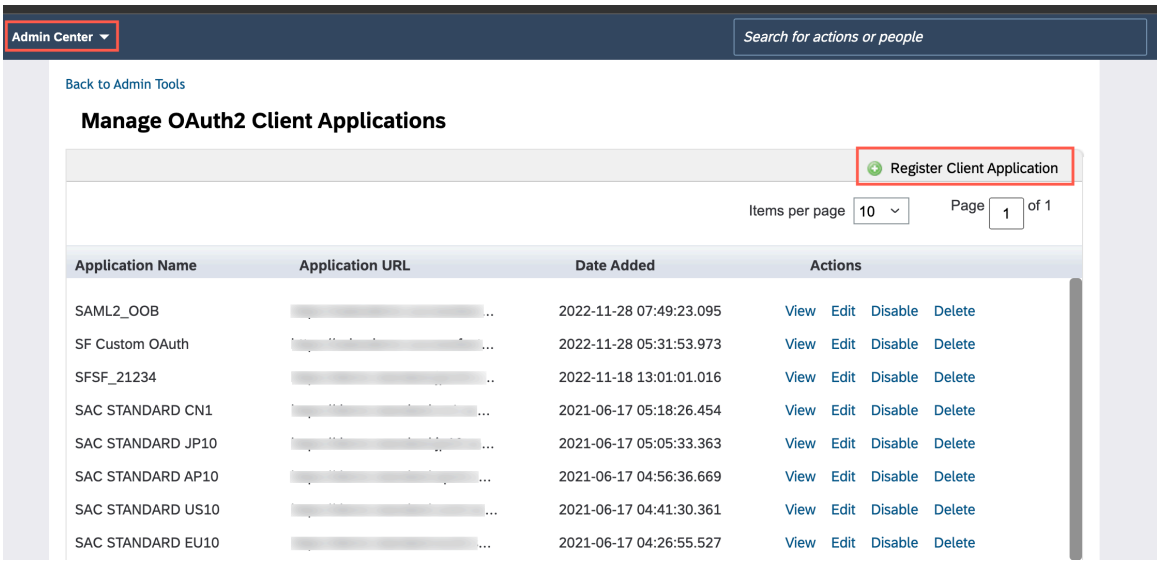
- Convert the .p12 file to .jks

  Use the command to do the above step `keytool -importkeystore -srckeystore successfactors.p12 -srcstoretype pkcs12 -destkeystore successfactors.jks`.

- Role required: admin.

Procedure

1. Log in to the SuccessFactors account as an admin.
2. Navigate to **Admin Centre** and click **Company Settings**.
3. Click **Manage OAuth2 Client Applications**.
4. Click **Register Client Application**.



5. Provide the required details on the form.
   In the **X.509 Certificate** field, provide contents of the cert.pem file (public key) without the headers.
6. Click **Submit**.
   API Key is generated and displayed. Copy and record the value for later use.

Upload the JKS certificate in your ServiceNow instance

Enable client certificate authentication for the outbound communication by uploading the JKS certificate in your ServiceNow instance.

Before you begin

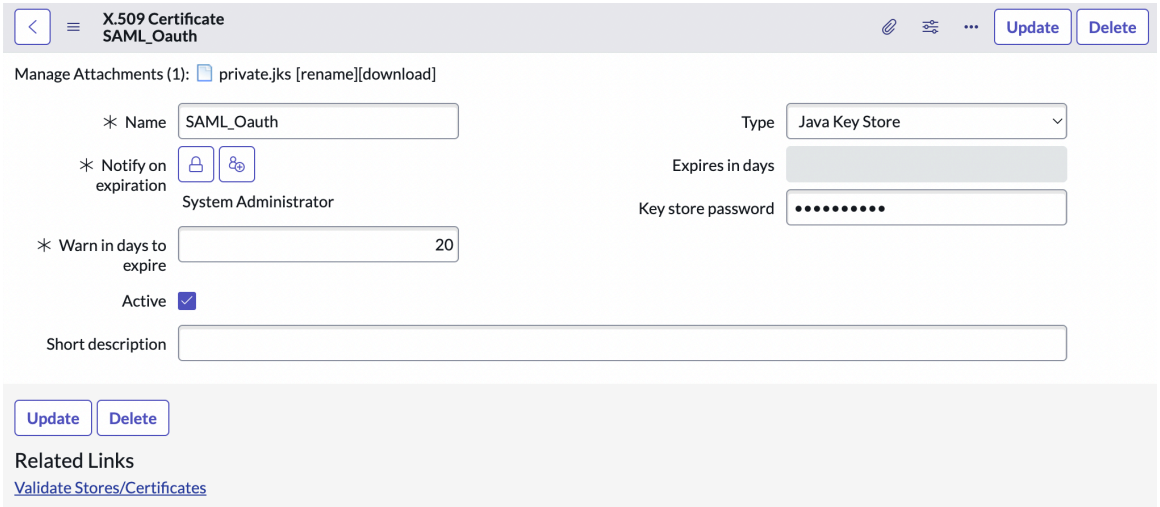
Role required: admin

Procedure

1. Log in to your ServiceNow instance as an admin.
2. Upload the JKS certificate to your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For instructions to upload the JKS certificate, see Upload a certificate to an instance .



Register SuccessFactors as an OAuth provider

Use the API key generated during the client application configuration to register the application as an OAuth provider.

Before you begin

Role required: admin

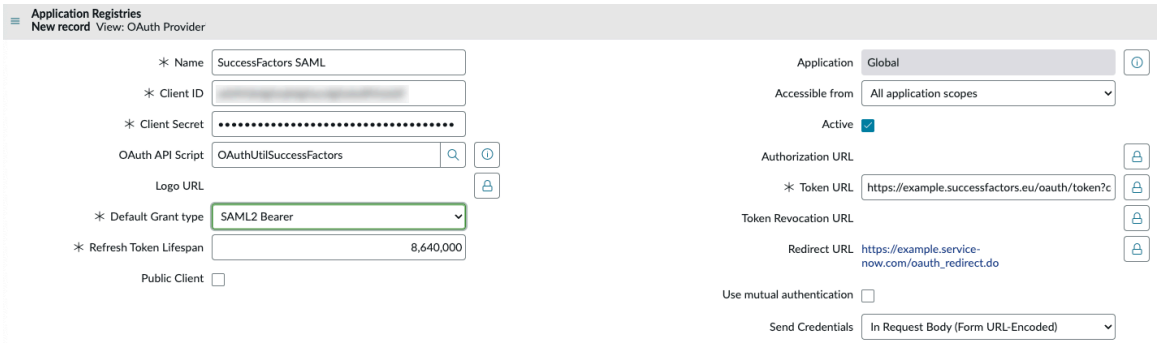
Procedure

1. In your ServiceNow instance, navigate to **System OAuth** > **Application Registry**.
2. Click **New**.
3. In the form, fill in these fields.

Field	Description
Name	Unique name to identify the certificate. For example, `SuccessFactors SAML`.
Client ID	Value of the API key you had copied after registering the OAuth client application in SuccessFactors.
Client Secret	**Note:** Client secret is not needed to register the application as an OAuth provider. You can provide any value for this field.
OAuth API Script	Name of the OAuth API script. Search for `OAuthUtilSuccessFactors` and select it from the list.
Default Grant Type	Default grant type used to establish the token. Select **SAML2 Bearer**.
Token URL	SuccessFactors OAuth server endpoint URL that includes the Company ID in this format: `https://`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`<SuccessFactors_Instance_Name>/oauth/token?company_id=<Company_ID>`. For example, `https://example.successfactors.eu/oauth/token?company_id=SFCPART123456`.



4. Click **Submit**.

Create the SAML2 assertion producer record

Create a SAML2 assertion record to generate the SAML2 assertion and exchange the assertion for the access tokens with the provider.

Before you begin

Role required: admin

Procedure

1. Create a SAML2 assertion producer record in your ServiceNow instance.

   a. Navigate to **All** > **System OAuth** > **SAML2 Assertion Producers**.

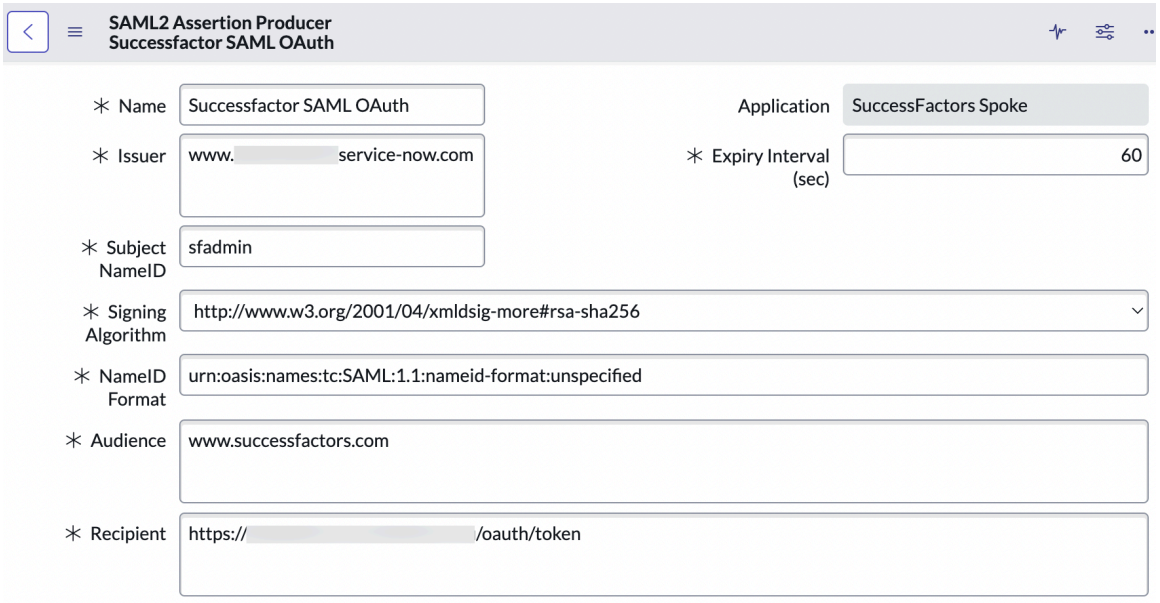
   b. Click **New**.

   c. On the form, fill these values.

Field	Description
Name	Unique name to identify the SAML2 assertion producer record. For example, `Successfactor SAML OAuth`.
Issuer	Unique identifier for the assertion issuing entity. Provide the ServiceNow instance URL.
Subject NameID	User name to log in to the SuccessFactors instance. For example, `sfadmin`.
Audience	Intended audience for the assertion. Enter the value, `www.successfactors.com`.
Recipient	Intended recipient for the assertion. Enter URL in this format, `https://`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`<SuccessFactors-Instance-Name>/oauth/token`.



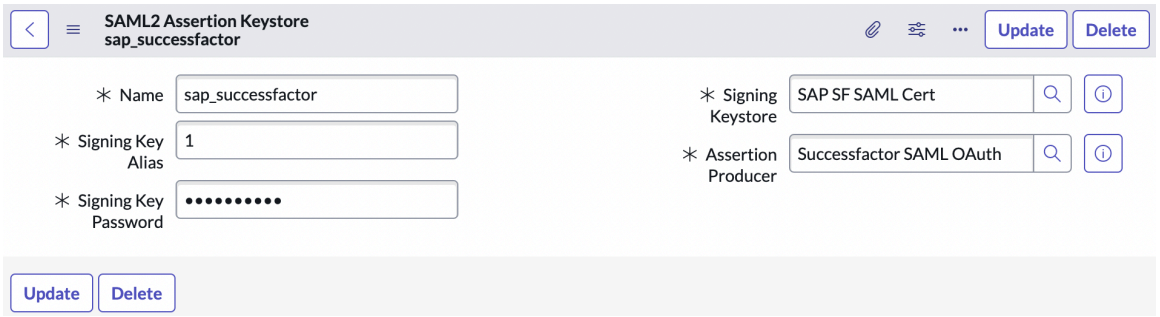
d. Right-click the form header and click **Save**.

e. Under the **SAML2 Assertion Keystores** tab, click **New**.

f. On the form, fill these values.

Field	Description
Name	Unique name to identify the SAML2 assertion keystore record. For example, `sap_successfactor`.
Signing Key Alias	Alias of key entry stored in the Keystore used to sign the assertion. For example, `1`.
Signing Key Password	Password of the key entry stored in the keystore used to sign the assertion.
Signing Keystore	Required X.509 certificate record. Select the X.509 certificate record that you had earlier created. For more information, see Upload the JKS certificate in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



g. Click **Submit**.

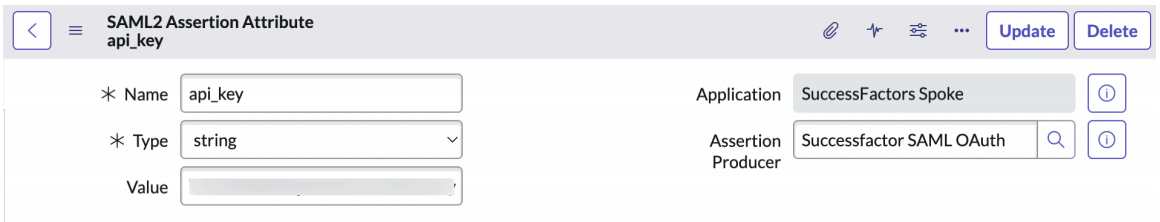
h. Navigate to **All** > **System OAuth** > **SAML2 Assertion Producers**.

i. Open the SAML2 assertion producer record that you had created.
For example, **Successfactor SAML OAuth**.

j. Under the **SAML2 Assertion Attributes** tab, click **New**.

k. On the form, fill these values.

Field	Description
Name	Name to identify the SAML2 assertion attribute record. Enter `api_key`.
Type	Type of the **Value** field. Select **String**.
Value	API key generated after the OAuth client application is created in SuccessFactors.



l. Click **Submit**.

2. Associate the SAML2 assertion producer with the application registry record.

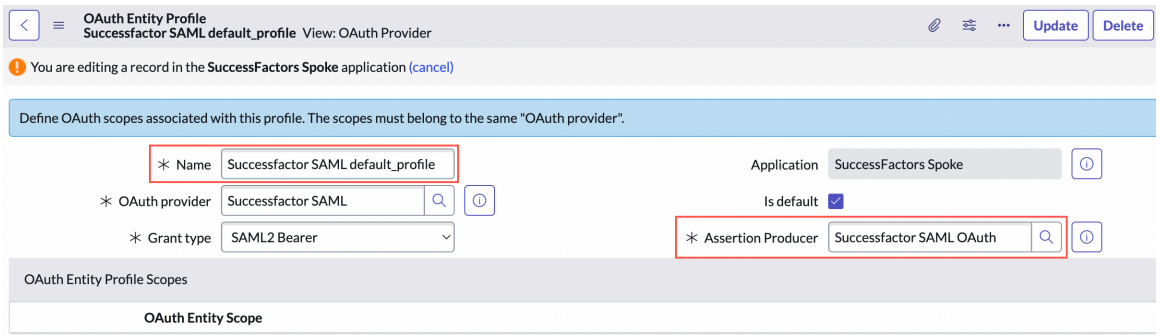
a. Navigate to **System OAuth** > **Application Registry**.

b. Open the application registry record that you had created.
For example, **SuccessFactors OAuth Reg**. For more information about creating the application registry, see Register SuccessFactors as an OAuth provider.

c. Under the **OAuth Entity Profiles** tab, open the default OAuth entity profile record.
For example, **Successfactor SAML default_profile**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. For the **Assertion Producer** field, select the SAML2 assertion producer record you had created.
For example, **Successfactor SAML OAuth**.



e. Click **Update**.

Create Credential record for the OData API

Create Credential record for the OData APIs in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these credentials to authorize actions using the OData API.

Before you begin

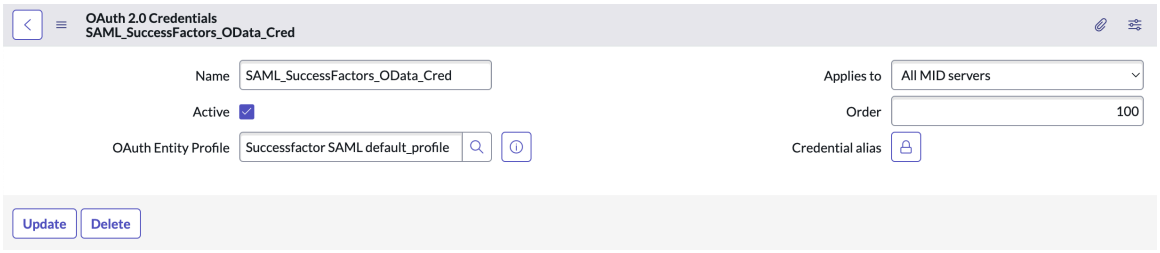
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   An empty OAuth 2.0 Credentials form is displayed.
4. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `SAML_SuccessFactors_OData_Cred`.
OAuth Entity Profile	OAuth entity profile record that is associated with the OAuth application registry you had created. For example, `Successfactor SAML default_profile`. For more information about creating the application registry, see Register SuccessFactors as an OAuth provider.
Active	Option to actively use the credential record.
Order	Order to apply this credential. For example, enter `100`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Submit**.

Result

The credential record to authorize actions using the OData API is created.

Create Credential record for the SOAP API

Create Credential record for the SOAP APIs in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these credentials to authorize actions using the SOAP APIs.

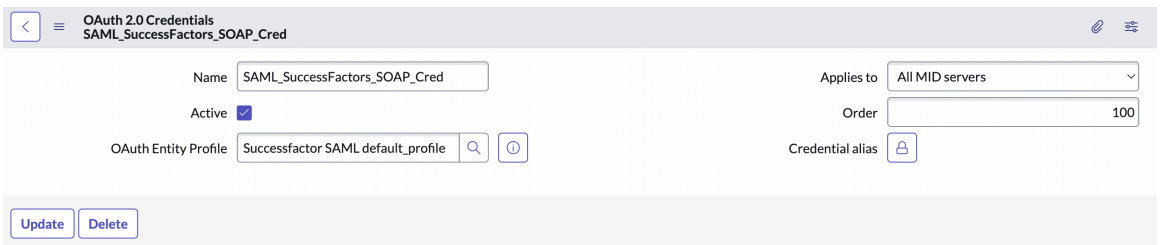
Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   An empty OAuth 2.0 Credentials form is displayed.
4. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `SAML_SuccessFactors_SOAP_Cred`.
OAuth Entity Profile	OAuth entity profile record associated with the OAuth application registry you had created. For example, `Successfactor SAML default_profile`. For more information about creating the application registry, see Register SuccessFactors as an OAuth provider.
Active	Option to actively use the credential record.
Order	Order to apply this credential. For example, enter `100`.



5. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The credential record to authorize actions using the SOAP API is created.

Create Connection record for the OData API

Create a Connection record for the OData API in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these connections to perform actions in SuccessFactors.

Before you begin
Role required: admin.

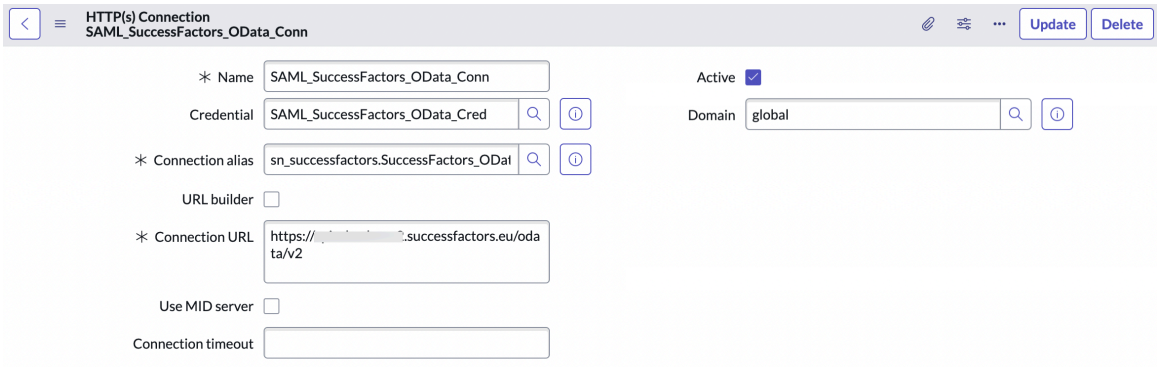
Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **SuccessFactors OData**.
   For example, **SuccessFactors_OData**.
3. From the **Connections** tab, click **New**.
   The system displays an empty HTTP(s) Connection form.
4. On the form, fill these values.

HTTP(s) Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `SAML_SuccessFactors_OData_Conn`.
Credential	Credential record you created for the REST API. For example, `SAML_SuccessFactors_OData_Cred`.
Connection URL	SuccessFactors service root URL in this format: `https://<SuccessFactors_Instance_Name>/odata/v2`. For example, `https://example.successfactors.eu/odata/v2`. **Note:** If you are using an SAP Cloud account, see List of SAP SuccessFactors API Servers in SAP Help Portal to select the correct endpoint that is needed to target the API server.
Active	Option to actively use the connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Submit**.

Result
The connection record for the REST API in SuccessFactors is created.

Create Connection record for the SOAP API

Create a Connection record for the SOAP API in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these connections to perform actions in SuccessFactors.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **SuccessFactors SOAP API**.
   For example, **SuccessFactors_Comp_Emp**.
3. From the **Connections** tab, click **New**.
   The system displays an empty HTTP(s) Connection form.
4. On the form, fill these values.

HTTP(s) Connection form

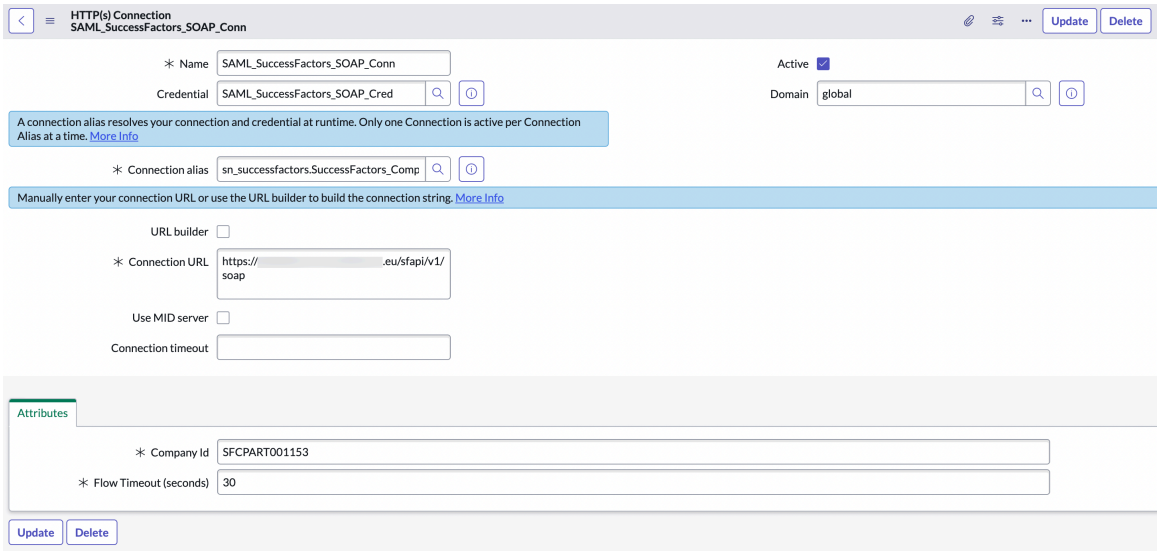
Field	Description
Name	Name to uniquely identify the record. For example, `SAML_SuccessFactors_SOAP_Conn`.
Credential	Credential record you created for the SOAP API. For example, `SAML_SuccessFactors_SOAP_Cred`.
Connection URL	SuccessFactors connection URL. For example, `https://<SuccessFactors_Instance_Name>/sfapi/v1/soap`. For example, `https://example.successfactors.eu/sfapi/v1/soap`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If you are using an SAP Cloud account, see List of SAP SuccessFactors API Servers in SAP Help Portal to select the correct endpoint that is needed to target the API server.
Active	Option to actively use the connection record.

5. In the **Attributes** tab, provide these fields.

Field	Description
Company Id	Immutable Company ID of your SuccessFactors instance.
Flow Timeout (seconds)	Maximum time in seconds up to which data can be received from SuccessFactors during the flow execution. If the time taken to retrieve data from SuccessFactors exceeds the timeout duration, the flow or subflow is cancelled. Default value is, 30.



6. Click **Submit**.

Result

The connection record for the SOAP API in SuccessFactors is created.

Synchronize data between SuccessFactors and ServiceNow

Customise the sample flows as per your requirement to synchronize data between your SuccessFactors and ServiceNow instances.

Todo entity

The SuccessFactors spoke provides sample flows to synchronize data bi-directionally for the todo entity. The sample flow, Run SuccessFactors Integration Flow can customised to retrieve data from SuccessFactors, while the Create Todo and Update Todo flows creates or updates

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the todo records in SuccessFactors when events occur in ServiceNow. While customising the sample flows, ensure that you provide appropriate triggers to retrieve and save future updates using transform maps.

Other default entities

For these entities, the sample flow, Run SuccessFactors Integration Flow, can be customised to retrieve data from SuccessFactors:

- Department
- Location
- Job Profile
- Workers Profile
- Effective Workers Profile
- Job History Including Secondary Assignments

To create or update records in SuccessFactors for these entities when events occur in ServiceNow:

- Create flows or subflows as per your choice or customise the sample flows and subflows.
- Use Metadata Retrieval and Record Management actions in your flows.
- Ensure that you provide appropriate triggers to retrieve and save future updates using transform maps.

Other SuccessFactors entities

Depending on the SuccessFactors permissions and configurations, you can also synchronize data of other entities as per your requirement.

Set up the SuccessFactors spoke v3.x.x

Integrate the ServiceNow instance with your SuccessFactors spoke instance using basic credentials.

Before you begin

- Request an Integration Hub subscription.
- Activate the SuccessFactors spoke.
- Enable these system properties:
  - *glide.pf.rest.response_payload_max_size*: The maximum value is, 10240.
  - *com.snc.process_flow.reporting.serialized.val_size_limit*: The maximum value is, 16384.
  - *com.glide.transform.json.max-partial-length*: The maximum value is, 65536.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
SuccessFactors will be deprecating basic authentication by Nov 2026 and hence, everyone must use OAuth SAML, which SuccessFactors spoke v4.10.1 supports.

- If you are installing the SuccessFactors spoke for the first time, install SuccessFactors spoke v4.10.1. For more information about setting up SuccessFactors spoke v4.10.1, Set up the SuccessFactors spoke v4.x.x.
- If you are using an earlier version of the SuccessFactors spoke, migrate to SuccessFactors spoke v4.10.1. For more information, see Migrate to SuccessFactors spoke v4.10.1.

Create Credential record for the OData API

Create Credential record for the OData APIs in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these credentials to authorize actions using the OData API.

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.
4. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `SAPSF OData Credentials`.
User name	User name with the OData API permission in this format: `<username>@<SAP-SuccessFactors-CompanyID>`.
Password	Associated password.
Active	Option to actively use the credential record.
Order	Order to apply this credential. For example, enter `100`.

5. Click **Submit**.

Result
The credential record to authorize actions using the OData API is created.

Create Credential record for the SOAP API

Create Credential record for the SOAP APIs in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these credentials to authorize actions using the SOAP APIs.

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **SuccessFactors SOAP Credentials**.
   A blank SuccessFactors SOAP Credentials form displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `SAPSF Comp Emp Credentials`.
User name	User name with the SOAP API permission.
Password	Associated password.
Active	Option to actively use the credential record.
Order	Order to apply this credential. For example, enter `100`.

5. Click **Submit**.

Result
The credential record to authorize actions using the SOAP API is created.

Create Connection record for the OData API

Create a Connection record for the OData API in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these connections to perform actions in SuccessFactors.

Procedure

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **SuccessFactors OData API**, for example, **SuccessFactors_Odata**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill these values.

HTTP(s) Connection form

Field	Description
Name	Name to uniquely identify the record. For example, SF_REST.
Credential	Credential record you created for the OData API. For example, `SAPSF OData Credentials`.
Connection URL	SuccessFactors service root URL. For example, `https://apisalesdemo4.successfactors.com/odata/v2`. **Note:** If you are using an SAP Cloud account, see List of SAP SuccessFactors API Servers in SAP Help Portal to select the correct endpoint that is needed to target the API server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option to actively use the connection record.

5. Click **Submit**.

Result
The connection record for the OData API in SuccessFactors is created.

Create Connection record for the SOAP API

Create a Connection record for the SOAP API in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these connections to perform actions in SuccessFactors.

Procedure

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **SuccessFactors SOAP API**, for example, **SuccessFactors_Comp_Emp**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill these values.

HTTP(s) Connection form

Field	Description
Name	Name to uniquely identify the record. For example, SF_REST.
Credential	Credential record you created for the SOAP API. For example, SAPSF Comp Emp Credentials.
Connection URL	SuccessFactors connection URL. For example, `https://salesdemo4.successfactors.com/sfapi/v1/soap`. **Note:** If you are using an SAP Cloud account, see List of SAP SuccessFactors API Servers in SAP Help Portal to select the correct endpoint that is needed to target the API server.
Active	Option to actively use the connection record.

5. In the **Attributes** tab, provide these fields.

Field	Description
Company Id	Immutable Company ID of your SuccessFactors instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Flow Timeout (seconds)	Maximum time in seconds up to which data can be received from SuccessFactors during the flow execution. If the time taken to retrieve data from SuccessFactors exceeds the timeout duration, the flow or subflow is cancelled. Default value is, 30.

6. Click **Submit**.

Result
The connection record for the SOAP API in SuccessFactors is created.

Synchronize data between SuccessFactors and ServiceNow

Customise the sample flows as per your requirement to synchronize data between your SuccessFactors and ServiceNow instances.

Todo entity

The SuccessFactors spoke provides sample flows to synchronize data bi-directionally for the todo entity. The sample flow, Run SuccessFactors Integration Flow can customised to retrieve data from SuccessFactors, while the Create Todo and Update Todo flows creates or updates the todo records in SuccessFactors when events occur in ServiceNow. While customising the sample flows, ensure that you provide appropriate triggers to retrieve and save future updates using transform maps.

Other default entities

For these entities, the sample flow, Run SuccessFactors Integration Flow, can be customised to retrieve data from SuccessFactors:

- Department
- Location
- Job Profile
- Workers Profile
- Effective Workers Profile
- Job History Including Secondary Assignments

To create or update records in SuccessFactors for these entities when events occur in ServiceNow:

- Create flows or subflows as per your choice or customise the sample flows and subflows.
- Use Metadata Retrieval and Record Management actions in your flows.
- Ensure that you provide appropriate triggers to retrieve and save future updates using transform maps.

Other SuccessFactors entities

Depending on the SuccessFactors permissions and configurations, you can also synchronize data of other entities as per your requirement.

Set up webhook for the SuccessFactors spoke

Configure a webhook to subscribe to your SuccessFactors account with a ServiceNow callback URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Set up the SuccessFactors spoke v4.x.x
- Role required: admin

Procedure

1. Configure the default decision table.
   a. Navigate to **System Definition** > **Decision Tables**.
   b. Search for the record, `Successfactors Webhook` and open it.
   c. In the **Decision Inputs** tab, open the **Webhook Event** record.
   d. In the **Choices** tab, create record for the event for which you want to subscribe. For example, enter `Employee Time Off` in **Label** and **Name** to subscribe to the Employee Time Off events.
   e. Navigate back to the `Successfactors Webhook` record.
   f. In the **Decisions** tab, open the **Default Decision** record.
   g. Select the required webhook event in **Condition** and select the subflow in **Answer**.
   When the specified webhook event occurs, the associated subflow is triggered.

   Note:
   You can customise the default subflow or create a subflow as per your requirement.

2. Create a webhook registry.
   a. Navigate to **SuccessFactors Spoke** > **Webhook Registry**.
   b. Click **New**.
   c. On the form, enter `SuccessFactors Webhook Authentication` for **Name** and provide **Description**.

   Note:
   The **Name** of the webhook registry must be `SuccessFactors Webhook Authentication`.

   d. Click **Generate Username and Password**.
   Username and Password are generated and the values are displayed.
   e. Copy and record the values of the generated values for later use.

3. Copy and record the value of **Resource path**.
   a. Navigate to **System Web Services** > **Scripted REST APIs**.
   b. Search for the record, `SuccessfactorsWebhook` and open it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Resources** tab, click the **processWebhook** record.

d. Copy and record the value provided in **Resource path**.

4. Configure events in your SuccessFactors instance.

a. Log in to your SuccessFactors instance and navigate to **Admin Center** > **Event Notification Subscription**.

b. In the **External Event** tab, provide these values:

Field	Description
Endpoint URL	ServiceNow instance endpoint URL in this format: `https://<servicenow-instance>.com/<resource-path>`
Authentication	Select **Basic**.
User	User name generated when the webhook registry is created.
Password	Password when the webhook registry is created.

c. Configure the subscriber in the **Subscriber** tab as per your requirement.

d. Select the required **Service Event Bus Topic** in the **SEB External Event** tab as per your requirement and select the events for which you want to receive notifications. For example, `Employee Time Off`.

Migrate to SuccessFactors spoke v4.10.1

Migrate from an earlier version of the SuccessFactors spoke to SuccessFactors spoke v4.10.1 by selecting the credential records that are associated with the SuccessFactors spoke v4.10.1.

Before you begin

- Perform these procedures to migrate to SuccessFactors spoke v4.10.1.
  - Register OAuth client application in SuccessFactors
  - Upload the JKS certificate in your ServiceNow instance
  - Register SuccessFactors as an OAuth provider
  - Create the SAML2 assertion producer record
  - Create Credential record for the OData API
  - Create Credential record for the SOAP API
- Role required: admin.

Note:
This procedure is applicable if you are currently using an earlier version of the SuccessFactors spoke and intend to upgrade to SuccessFactors spoke v4.10.1.

If you are setting up the SuccessFactors spoke 4.10.1 for the first time, see Set up the SuccessFactors spoke v4.x.x.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record, **SuccessFactors_OData**.
3. In the **Connections** tab, open the existing the connection record.
4. For **Credential**, select the credential record you had created for SuccessFactors spoke v4.10.1. For example, `SAML_SuccessFactors_OData_Cred`.
5. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
6. Open for the record, **SuccessFactors_Comp_Emp**.
7. In the **Connections** tab, open the existing the connection record.
8. For **Credential**, select the credential record you had created for SuccessFactors spoke v4.10.1. For example, `SAML_SuccessFactors_SOAP_Cred`.

SumTotal Spoke

Pull learning courses from SumTotal instance to ServiceNow instance to build an integrated learning content repository.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SumTotal spoke v1.0.2 is the latest version.

Supported versions

This spoke was built for SumTotal version v1, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke actions

Action	Description
Look up Activities Stream	Retrieves the main view to get activity or course data.
Look up Learning Status Stream	Retrieves the main view to get all user transcript-related data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Look up Users Stream	Retrieves core data of the required employees in SumTotal.
Save Assignment	Creates or updates a standard assignment.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the SumTotal spoke.

Set up the SumTotal spoke

Integrate your ServiceNow instance with the SumTotal application host so the SumTotal spoke can perform actions on the SumTotal server.

Before you begin

- Request an Integration Hub subscription.
- Activate the SumTotal spoke.
- Ensure that the SumTotal configuration template is selected in the SumTotal alias page.
- Role required: admin.

About this task

This task enables you to set up a connection and credential record so that your ServiceNow instance can integrate with the SumTotal host. The connection and credential alias record is a form that contains the SumTotal spoke configuration template and the connection and credential details to connect to the SumTotal host.

Set up SumTotal spoke connection and credential record

Integrate your ServiceNow instance with the SumTotal host by setting up the connection and credential record.

Before you begin

- Role required: admin

About this task

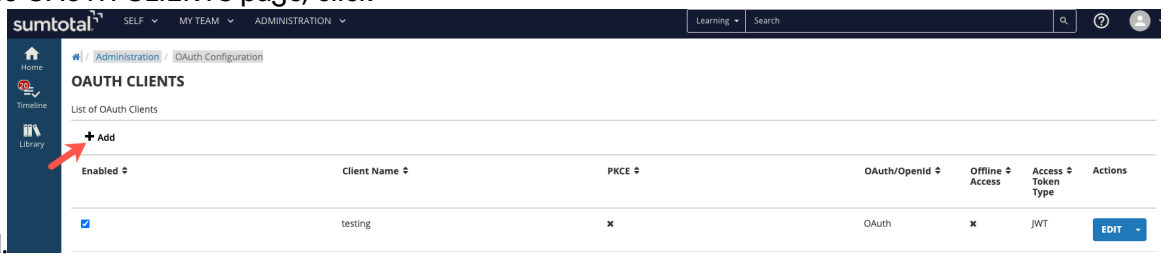
The image provides the flow of creating a connection and credential record.

Procedure

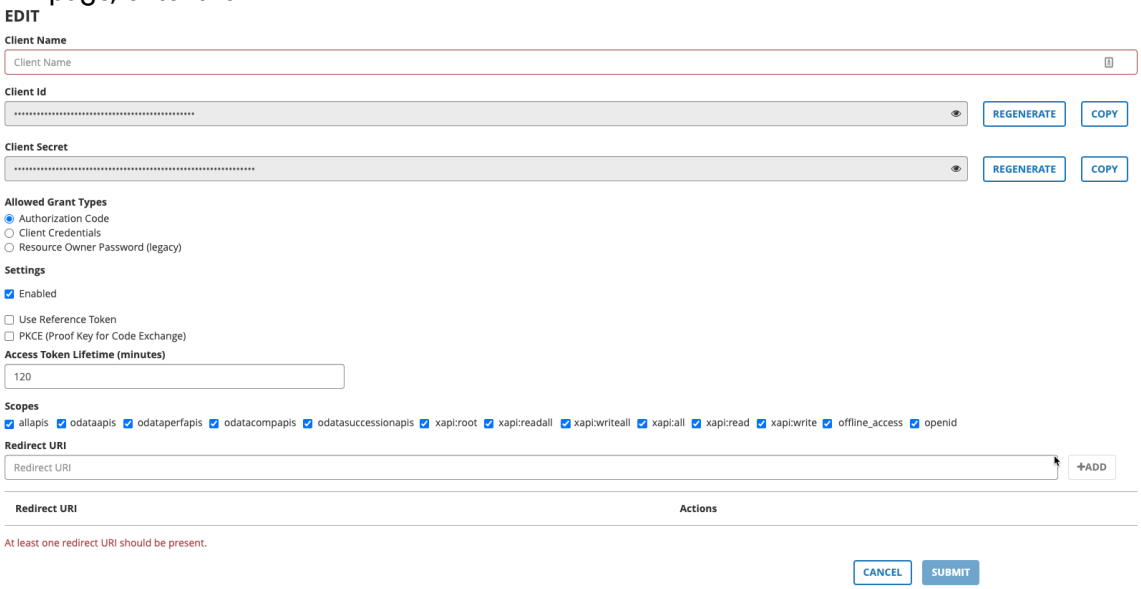
1. Log in to the SumTotal host.
2. Navigate to **ADMINISTRATION** > **System** > **Configuration** > **Technical Configuration** > **OAuth Configuration** > **.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the OAUTH CLIENTS page, click **+Add**.



4. In the EDIT page, enter the details.



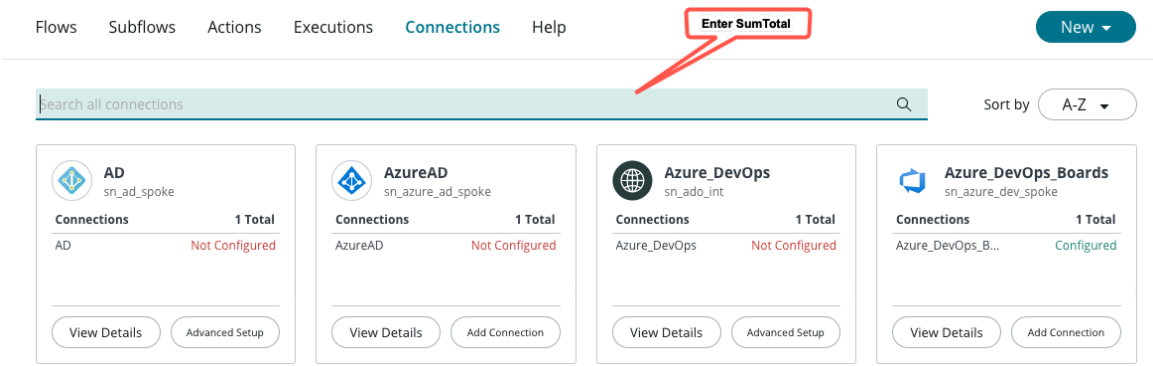
SumTotal OAuth client setup form

Field	Description
Client Name	Custom name of the OAuth client.
Client Id	Unique ID of the OAuth client. You need it when setting up the connection and credential record in the ServiceNow instance. **Tip:** To copy the ID, click **COPY**.
Client Secret	Client secret to set up the connection and credential record in the ServiceNow instance. **Tip:** To copy the ID, click **COPY**.
Allowed Grant Types	Select **Client Credentials**.
Settings	Select **Enabled**.
Access Token Lifetime (minutes)	The duration of the access token.
Scopes	Select **allapis**.

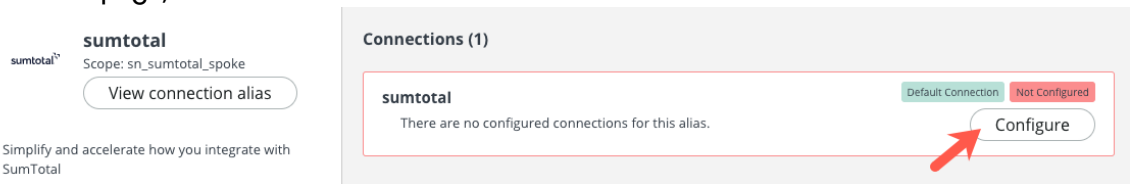
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Redirect URI	URL of the location after the app is successfully authorized and granted an access token.

5. Click **Submit**.
   The SumTotal OAuth client is created.
6. Log in to your ServiceNow instance.
7. Navigate to **All** > **Process Automation** > **Flow Designer.**
8. Click Connections.
9. To search for the SumTotal connections record, enter `SumTotal`.



10. In the SumTotal connection card, click **View Details**.
11. On the Connections page, click **Configure**.

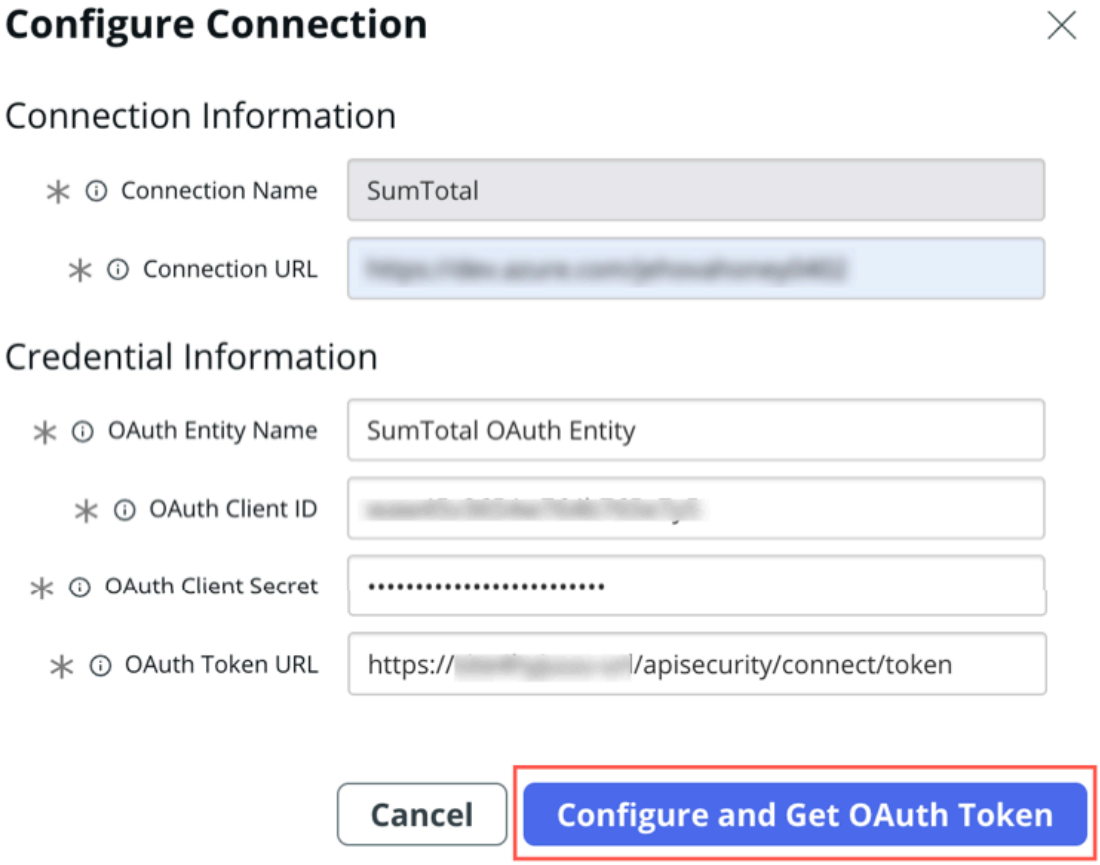


12. In the Configure Connection form, fill the details.

Configure connection form

Field	Description
Connection Name	Name of the connection. **Note:** The name is read-only.
Connection URL	URL to connect to the SumTotal host.
OAuth Entity Name	Custom name of the OAuth entity.
OAuth Client ID	Client ID generated and copied from the SumTotal host.
OAuth Client Secret	Client secret generated and copied from the SumTotal host.
OAuth Token URL	URL to the token to access the SumTotal host. URL should be entered in the format https://{site-url}/apisecurity/connect/token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



13. Click **Configure and Get OAuth Token**.

    The spoke is configured and ready to be used.

SurveyMonkey Spoke

Manage surveys, responses, collectors, and so on in the SurveyMonkey account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

SurveyMonkey spoke v2.0.6 is the latest version.

Supported versions

This spoke was built for SurveyMonkey API version v3, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

Admin access to SurveyMonkey API Developer Portal.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The SurveyMonkey spoke provides actions to automate SurveyMonkey tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Collector Management	Create Collector	Creates a collector for the given survey. Public app users need access to the Create/Modify Collectors scope.
	Delete Collector	Deletes the specified collector. Public app users need access to the Create/Modify Collectors scope.
	Get Collector Details	Retrieves details of the specified collector. Public app users need access to the View Collectors scope.
	Look up Collectors Stream	Retrieves details of collectors in the specified survey.
Contact Management	Add Contacts to Contact List	Creates multiple contacts in a contact list. Public app users need access to the Create/Modify Contacts scope.
	Create Contact List	Creates a contact list. Public app users need access to the Create/Modify Contacts scope.
	Delete Contact List	Deletes the specified contact list. Public app users need access to the Create/Modify Contacts scope.
	Look up Contact Lists	Retrieves all contact lists. Public app users need access to the View Contacts scope.
	Look up Contacts in Contact List	Retrieves all contacts in a contact list. Public app users need access to the View Contacts scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Contact List	Modifies a contact list. Public app users need access to the Create/Modify Contacts scope.
Folder Management	Create Folder	Creates a folder.
	Look up Folders	Retrieves the available folders.
Response Management	Look up Survey Responses	Retrieves a list of responses. Public app users need access to the View Responses scope.
	Look up Survey Trends	Retrieves the answer counts within the specified time period. Public app users need access to the View Response Details scope.
Survey and Question Management	Create Question	Creates a question on the survey page. Public app users need access to the Create/Modify Surveys scope.
	Create Survey	Creates an empty survey. Public app users need access to the Create/Modify Surveys scope.
	Delete Question	Deletes the specified question. Public app users need access to the Create/Modify Surveys scope.
	Delete Survey	Deletes the specified survey. Public app users need access to the Create/Modify Surveys scope.
	Get Survey Details	Retrieves a list of full responses, including answers to all questions. Public app users need access to the View Response Details scope.
	Look up Questions	Retrieves all questions in the specified survey.
	Look up Survey Pages	Retrieves details of the page. Public app users need access to the View Surveys scope.
	Look up Surveys	Retrieves a list of surveys owned by or shared with the authenticated user. Public app users need access to the View Surveys scope.
	Update Question	Updates details of the specified question. Public app users need access to the Create/Modify Surveys scope
	Update Survey	Modifies title, nickname, or language of the specified survey. Public app users need access to the Create/Modify Surveys scope.
Team Management	Look up Team Activity Stream	Retrieves activity data for the specified team.
	Look up Team Member Details	Retrieves details of the specified team member.
	Look up Team Members Stream	Retrieves details of all members in the specified team.
	Look up Teams Stream	Retrieves details of all teams that the authenticated user account belongs to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
User Management	Get User Details	Retrieves the current user's account details including their plan. Public app users need access to the View Users scope.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the SurveyMonkey spoke.

Set up the SurveyMonkey spoke

Integrate the ServiceNow instance and SurveyMonkey account by creating a custom OAuth application in SurveyMonkey API Developer Portal to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the SurveyMonkey spoke.
- Role required: admin.

Procedure

1. Log in to SurveyMonkey API Developer Portal as an admin and add an app.

   a. In **OAuth Redirect URL**, enter the ServiceNow instance URL in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`.

   b. Copy and record the values of **Client ID** and **Secret**.

   c. Provide these scopes for the app:
   - Create/Modify Surveys
   - Create/Modify Collectors
   - Create/Modify Responses
   - View Response Details
   - View Contacts
   - Create/Modify Webhooks
   - View Library Assets
   - View Surveys
   - View Collectors
   - View Responses
   - Create/Modify Contacts

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View Users
- View Webhook

Note:
If you provide any additional scopes, ensure that you add these scopes in the **OAuth Entity Scopes** tab of the default application registry available in your ServiceNow instance.

2. Configure the default application registry.

   a. Navigate to **System OAuth** > **Application Registry**.

   b. Open the record, **Survey Monkey**.

   c. On the form, fill these values:

Field	Description
Client ID	Client ID of the app created in SurveyMonkey API Developer Portal.
Client Secret	Secret of the app created in SurveyMonkey API Developer Portal.
Redirect URL	ServiceNow instance URL in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`. Replace `<instance-name>` with your instance name.

Note:
If you have provided additional scopes, create records for those scopes in the **OAuth Entity Scopes** tab.

3. Create a credential record.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.

   c. Select **OAuth 2.0 Credentials**.

   d. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. Enter `SurveyMonkey Credentials`.
Active	Option to actively use the credential record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
OAuth Entity Profile	OAuth profile you created when you registered the SurveyMonkey app as an OAuth provider. Select **Survey Monkey default_profile**.
Applies to	MID Servers that can use this credential. Select **All MID Servers**.
Order	Order to apply this credential. Enter `100`.

e. Right-click the form header and click **Save**.

4. Create a connection record.

a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

b. Open for the record for **SurveyMonkey**.

c. From the **Connections** tab, click **New**.
The system displays a blank HTTP(s) Connection form.

d. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. Enter`SurveyMonkey Connection`.
Credential	Credential record you created for Zoom. Select **SurveyMonkey Credentials**.
Connection alias	Alias record associated with this connection.
Connection URL	Base URL to connect to your SurveyMonkey account. Enter `https://api.surveymonkey.net`.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

e. **Optional:** In the **Attributes** tab, provide your SurveyMonkey API version if it is different than the default value of v3.

f. Click **Submit**.

The ServiceNow instance and SurveyMonkey account are integrated.

Tableau spoke

The Tableau spoke provides actions to view and analyze meaningful usage data for software subscriptions so that you can reclaim stale licenses.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Tableau API version v3.21, but might be compatible with later versions.

Spoke requirements

- Tableau Cloud account
- Tableau Cloud Role required: Site administrator
- JSON Web Token (JWT) Connected App or Personal access token (PAT) to authenticate the ServiceNow instance.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Tableau spoke provides actions to automate Tableau tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
User Management	Look up Users Stream	Retrieves users from the Tableau Cloud application.
	Remove User	Revokes a user license in the Tableau Cloud application.
Organization Management	Get Access Token	Gets the access token to authenticate the API calls.

Spoke user roles

The Tableau spoke provides the following user role to control access to data:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User role	Description
Tableau Admin (sn_tableau_spoke.tableau_admin)	Creates connections for the Tableau Cloud application.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For more information about setting up the spoke, see Set up the Tableau spoke.

Set up the Tableau spoke

Integrate your ServiceNow instance and Tableau Cloud to automate flows and perform actions on the Tableau Cloud application.

Before you begin

- Request an Integration Hub subscription.
- Activate the Tableau spoke.
- Tableau Cloud Role required: Site administrator.

Procedure

Use one of the following authentication types to validate ServiceNow instance requests with the Tableau spoke.

- Personal Access Token (PAT)
- JSON Web Token (JWT)

a. Validate ServiceNow instance requests with the Tableau spoke using the PAT authentication type.

i. Log in to the Tableau Cloud account using admin credentials.

ii. Select your profile icon.

iii. Select **My Account Settings**.

iv. Scroll down to the **Personal Access Tokens** section on your profile page.

v. In the text field, provide a token name.

For example, `Test 1`.

vi. Select **Create Token**.

The Personal Access Token is generated with a Token name and Secret.

vii. To copy the Personal Access Token Secret, select **Copy Secret**.

> **Important:**
>
> Keep the Personal Access Token Secret at a secure place. You would need it when you create a connection record for Tableau.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Validate ServiceNow instance requests with the Tableau spoke using the JWT authentication type.

i. Log in to the Tableau Cloud account using admin credentials.

ii. Select your profile icon.

iii. From the left-pane, select **Settings**.

iv. Select the **Connected Apps** tab.

v. On the Connected Apps page, select the **Direct Trust** option from the **New Connected Apps** drop-down list.

vi. In the **Create Connected App** dialog box, fill in the Connected app name, Access level, and Domain allow list details.

vii. Select **Create**.

The Connected App that you created gets displayed on the Connected Apps page. By default, the Connected App is inactive.

viii. To enable the Connected App, select the ellipsis icon (•••) in the Actions column and select **Enable**.

The status of the Connected App shows as enabled.

ix. Select the Connected App name.

Keep the Secret ID and Secret value at a secure place. You would need it when you create a connection record for Tableau.

x. To copy the Client ID, select **Copy Client ID**.

Keep the Client ID at a secure place. You would need it when you create a connection record for Tableau.

What to do next

Create a connection and credential for the Tableau spoke

Create a connection and credential for the Tableau spoke

Create a connection and credential record for the Tableau Cloud application. The Tableau connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: ServiceNow admin or Tableau Cloud Site administrator

Register your Tableau Cloud application.

- If you're using the Personal Access Token (PAT) authentication type, record the Personal Access Token Secret.
- If you're using the JSON Web Token (JWT) authentication type, record the Client ID and Client Secret.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Select the **TableauCloud** record.
   The Connection & Credential Aliases page opens.
3. Under the Related Links section, select **Create New Connection & Credential**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the dialog box, fill in the fields.

Create Connection and Credential

Field	Description
Please Enter the Connection Information	
Connection Name	Name of the connection. This field is automatically set to *Tableau Cloud* Connection.
Connection URL	The URL used for connecting to the server on which Tableau Cloud is installed.
Content URL	The permanent name of the site to sign in to. The content URL appears in the URL path of Tableau content in your browser address bar after the Tableau Server URL. mySite is the content URL in the following example: `http://<server or cloud URL>/#/site/mySite/explore`.
Please Enter the Credential Information Select the PAT or JWT authentication type. The fields change based on the authentication type that you select.	
Fields for the PAT authentication type	
Token Name	The Token name that you provided while setting up the Tableau spoke by using the PAT authentication type. For more information, see Set up the Tableau spoke
Token Secret	The Token secret that you copied while setting up the Tableau spoke by using the PAT authentication type. For more information, see Set up the Tableau spoke. .
Expiry Interval (sec)	Life span of the generated Personal Access Token (PAT). Default value: 14400 sec **Important:** You mustn't modify the value of this field.
Fields for the JWT authentication type	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Secret ID	The Secret ID that you copied while setting up the Tableau spoke by using the JWT authentication type. For more information, see Set up the Tableau spoke.
Secret Value	The Secret Value that you copied while setting up the Tableau spoke by using the JWT authentication type. For more information, see Set up the Tableau spoke.
Username	User name, that is, the email address of the authenticated Tableau Cloud user.
Client ID	The Client ID that you copied while setting up the Tableau spoke by using the JWT authentication type. For more information, see Set up the Tableau spoke.
Expiry Interval (sec)	Life span of the generated JSON Web Token (JWT). Default value: 3600 sec **Important:** You mustn't modify the value of this field.

5. Select **Create and Get OAuth Token**.

Result

A connection and credential record is created in the ServiceNow instance.

Trello Spoke

Manage Trello Enterprise subscriptions using your ServiceNow instance. Analyze data usage for Trello enterprise and reclaim idle subscriptions.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Trello spoke v1.4.0 is the latest version.

Spoke requirements

- Trello Enterprise admin access
- Ensure that your Trello subscription is linked to Atlassian account.
- Ensure that your authorized account has both Trello Enterprise admin and Atlassian account admin access.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Trello spoke provides the Upsert Trello Board flow to check if a new board has been created in the Trello Boards table, or if an existing board has been updated and accordingly synchronizes it in Trello. To customize the sample flow, copy it to the required application scope.

Spoke subflows

The Trello spoke provides the Process Trello Webhook subflow to retrieve data based on the changes happening in Trello. The subflow is executed when the webhook is triggered. To customize the sample flow, copy it to the required application scope.

Spoke actions

The Trello spoke provides actions to automate Trello tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Retrieve Actions	Look up Action by ID	Retrieves details of the required action.
	Look up Actions by Board ID	Retrieves details of actions from the specified board.
	Look up Actions by Card ID	Retrieves details of the actions from the specified card.
	Look up Actions by List ID	Retrieves details of the actions from the specified card.
	Look up Actions by Organization ID	Retrieves details of actions from the specified organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Action	Updates content of a comment for an action.
Attachment Management	Create Attachment on Card	Attaches a file to the required card.
	Delete Attachment by ID	Deletes the specified attachment.
	Look up Attachment by ID	Retrieves details of the required attachment.
	Look up Attachments by Card ID	Retrieve attachments on card.
Board Management	Create Board	Creates a board with the provided details.
	Delete Board by ID	Deletes the specified board.
	Look up Board by ID	Retrieves details of the required board.
	Look up Boards by Organization ID	Retrieves details of boards from the specified organization.
	Update Board	Updates details of the specified board.
Card Management	Create Card	Creates a card with the provided details.
	Delete Card by ID	Deletes the specified card.
	Look up Card by ID	Retrieves details of the required card.
	Update Card	Updates details of the card.
Checklist Management	Create Checklist	Creates a checklist with the provided details.
	Look up Checklist by ID	Retrieves details of the required checklist.
Custom Field Management	Create Custom Field	Creates a custom field with the provided details.
	Look up Custom Field by ID	Retrieves details about the required custom field.
Label Management	Look up Label by ID	Retrieves details of the required label.
List Management	Create List	Creates a list with the provided details.
	Look up List by ID	Retrieves details of the specified list.
Organization Management	Look up Organization by ID	Retrieves details of the required organization.
Sticker Management	Add Sticker to Card	Adds a sticker to the required card.
	Delete Sticker by ID	Deletes the specified sticker.
	Look up Sticker by ID	Retrieves details of the required sticker.
	Look up Stickers by Card ID	Retrieves details of stickers on a card.
	Update Sticker	Updates details of the specific sticker.
User Management	Look up Enterprise ID	Retrieves the organization ID of the authenticated user account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Enterprise Members Stream	Retrieves details of all members in an enterprise organization.
	Update Active Status of Enterprise Member	Updates the active status of the specified member in an enterprise.
	Update License Status of Enterprise Member	Updates whether the provided member should use one of the enterprise's available licenses or not.
Webhook Management	Create Webhook	Creates a webhook with the provided details.
	Delete Webhook by ID	Deletes the specified webhook.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Spoke modules

The Trello spoke adds the Trello Spoke application to ServiceNow instance. The Trello Spoke application includes these modules:

Module	Description
Boards	Enables you to create boards in Trello. When you create a record here, the Upsert Trello Board flow is triggered and creates or updates the board details in Trello.
Remote Table	
Users	Enables you to access the Trello user details.
Webhook	
Routing Policies	Stores the routing policies of the Trello webhook. A default record is available along with the spoke. You can customize the default routing policy as per your requirement.
Webhook Registries	Stores the webhook registries. The webhook registry registers a Trello webhook in ServiceNow to notify ServiceNow when certain events occur in Trello. You can create a webhook for the required board. When any changes occur in the board, the webhook is triggered, the Process Trello Webhook subflow is executed, and the board changes can be viewed in the subflow logs.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Generate Trello API key and token and Create a Trello connection.

Set up the Trello spoke

Integrate the ServiceNow instance and Trello by creating an API key in Trello to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Trello spoke.
- Role required: admin.

Generate Trello API key and token

Generate a Trello API key and token to get access to the Trello portal.

Before you begin

Trello Role required: admin

Verify that you have a managed user account and Atlassian admin access.

Procedure

1. Go to Trello.
2. Log in as an enterprise admin.
3. Go to Developer API Keys.
4. Copy the API key from Personal Key on the Developer API keys page.
5. In the following link, replace {YourAPIKey} with the API key that you copied in the last step and open the link.
   `https://trello.com/1/authorize?expiration=never&scope=read,write,account&response_type=token&name=ServerTo`

   For example, if your API key is 123xyz, then open the following link- `https://trello.com/1/authorize?expiration=never&scope=read,write,account&response_type=token&name=ServerTo`

   The MyPersonalToken page appears and asks if you want to give access to your account.
6. Select **Allow**.
   An API token is generated. Copy this API token and store it securely.

Create a Trello connection

Set up your ServiceNow instance to add the Trello API key and API token.

Before you begin

ServiceNow Role required: admin

Procedure

1. Log in to your ServiceNow instance.
2. Navigate to **Process Automation** > **Flow Designer**.
3. Select the **Connections** tab.
4. Locate the Trello Alias connection alias and select **View Details**.
5. Configure the Trello spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you're configuring the spoke for the first time, select **Configure**.
- If you aren't configuring the spoke for the first time, select **Edit**.

6. On the form, fill in the fields.

Edit Connection form

Field	Description
Connection Name	Name to identify the connection record.
Connection URL	Enter the URL as `https://api.trello.com/`.
API Key	The API key that you copied from the Trello portal.
API Token	The API token that you copied from the Trello portal.

7. Select **Configure Connection**.

Set up a webhook

Configure a webhook to subscribe to Trello with a ServiceNow callback URL.

Before you begin

Role required: admin

Procedure

1. Log in to your ServiceNow instance as an admin.
2. Copy the value of base API path.
   a. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
   b. Locate the record, **Trello Webhooks**.
   c. Copy the value populated in **Base API path** and record it for later use.
3. Create a webhook registry for the Trello spoke.
   a. Navigate to **All** > **Trello Spoke** > **Webhook** > **Webhook Registries**.
   b. Click **New**.
   c. On the form, fill the values.

Field	Description
Name	Name to identify the webhook registry record.
Path	Base API path URL you had copied.
Token	Token record as per your requirement.

   d. Right-click the form header and click **Save**.
   e. Click **Callback URL**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The webhook callback URL is generated and displayed.

f. Copy the webhook callback URL and record it for later use.

What to do next

Provide the webhook callback URL when you run the Create Webhook spoke action. For the required board the webhook is created.

Twilio Spoke

Use the Twilio spoke to send SMS, make voice calls, create conference calls, manage calls, manage short codes, notify services, and messaging services.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes .

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview .

Spoke version

Twilio spoke v1.2.0 is the latest version.

Supported versions

This spoke was built for Twilio Base version 2010-04-01, Twilio Messaging version v1, and Twilio Notify version v1, but may be compatible with later versions.

Spoke requirements

- Twilio account.
- **AccountSid** and **AuthToken** of the account to create a Basic Auth credential.
- The following plugins are installed when you install the Twilio spoke.
  - ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
  - ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
  - ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

See Twilio documentation for instructions on creating an account.

Spoke actions

The Twilio spoke provides actions to automate sending SMS, making voice calls, and creating conference calls when events occur in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Account Management	Create Application	Creates an application resource in a Twilio account.
	Delete Application	Deletes an application resource from a Twilio account.
	Get Application	Retrieves the required application resource.
	Look Up Accounts	Retrieves the account resources in a Twilio account. The list includes the account and its sub-account resources.
	Look Up Applications	Retrieves the application resources in a Twilio account.
	Update Application	Updates properties of an application resource in a Twilio account.
Call Management	Dequeue Call	Removes a call from a queue.
	Get Call	Retrieves the required call resource.
	Get Incoming Phone Number	Retrieves the incoming phone number resource.
	Hang Up Call	Ends a call in progress.
	Look Up Incoming Phone Numbers	Retrieves the incoming phone number resources in a Twilio account.
	Make a Call With Recording	Places a call to a phone number and records the call.
	Make a Call Without Recording	Places a call to a phone number and doesn't record the call.
	Modify Call	Modifies a call in progress.
	Mute Or Unmute Participant	Mutes or unmutes a participant resource in a conference call.
	Remove Participant From Conference Call	Removes a participant resource from a conference call.
	Update Incoming Phone Number	Updates properties of an incoming phone number resource in a Twilio account.
Messaging Service Management	Add Phone Number To Messaging Service	Adds a phone number resource to the messaging service.
	Add Short Code To Messaging Service	Adds a short code resource to the messaging service.
	Create Messaging Service	Creates a new messaging service resource in a Twilio account.
	Delete Messaging Service	Deletes a messaging service resource from a Twilio account.
	Look Up Messaging Service Phone Numbers	Retrieves the phone number resources in a messaging service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look Up Messaging Service Short Codes	Retrieves the short code resources associated with a messaging service.
	Look Up Messaging Services	Retrieves the messaging service resources in a Twilio account.
	Remove Phone Number From Messaging Service	Removes a phone number resource from a messaging service.
	Remove Short Code From Messaging Service	Removes a short code resource from a messaging service.
Notification Service Management	Create Notify Service	Creates a new notify service resource in a Twilio account.
	Delete Notify Service	Deletes a notify service resource from Twilio account.
	Look Up Notify Services	Retrieves the notify service resources in a Twilio account.
Short Code Management	Get Short Code	Retrieves a short code resource.
	Look Up Short Codes	Retrieves the short code resources of a Twilio account.
	Reset Short Code	Resets the short code resource.
	Update Short Code	Updates properties of a short code resource in a Twilio account.
Text Messaging	Send Bulk SMS	Sends an SMS to multiple phone numbers.
	Send SMS	Sends an SMS to a phone number.

Note:
To receive information about Status Callbacks, you must configure webhooks in Twilio. See Twilio documentation for instructions on creating and configuring webhooks.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Note:
Three connection and credential alias records are needed for the Twilio spoke. One each for Twilio Base, Twilio Notify, and Twilio Messaging. Each alias should be associated with the respective Twilio API.

For information about setting up the spoke, see Set up Twilio spoke.

Set up Twilio spoke

Integrate the ServiceNow instance and Twilio using basic authentication to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Twilio spoke.
- Role required: admin.

Configure connection for Twilio spoke

Add and configure Twilio Base, Twilio Messaging, and Twilio Notify connections to authenticate ServiceNow requests in Twilio spoke.

Before you begin

Role required: admin

Procedure

1. Configure the **Twilio_Base** connection alias.

   a. Navigate to **All** > **Process Automation** > **Workflow Studio**.

   b. Click the **Integrations** tab.

   c. Under **Connections**, toggle and enable the **Outbound** connections.

   d. Locate the alias for **Twilio_Base** and click **View Details**.

   - To configure the default connection and credential alias record that is shipped along with the Twilio spoke, click **View Details**.

   - To manage more than one Twilio Base spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

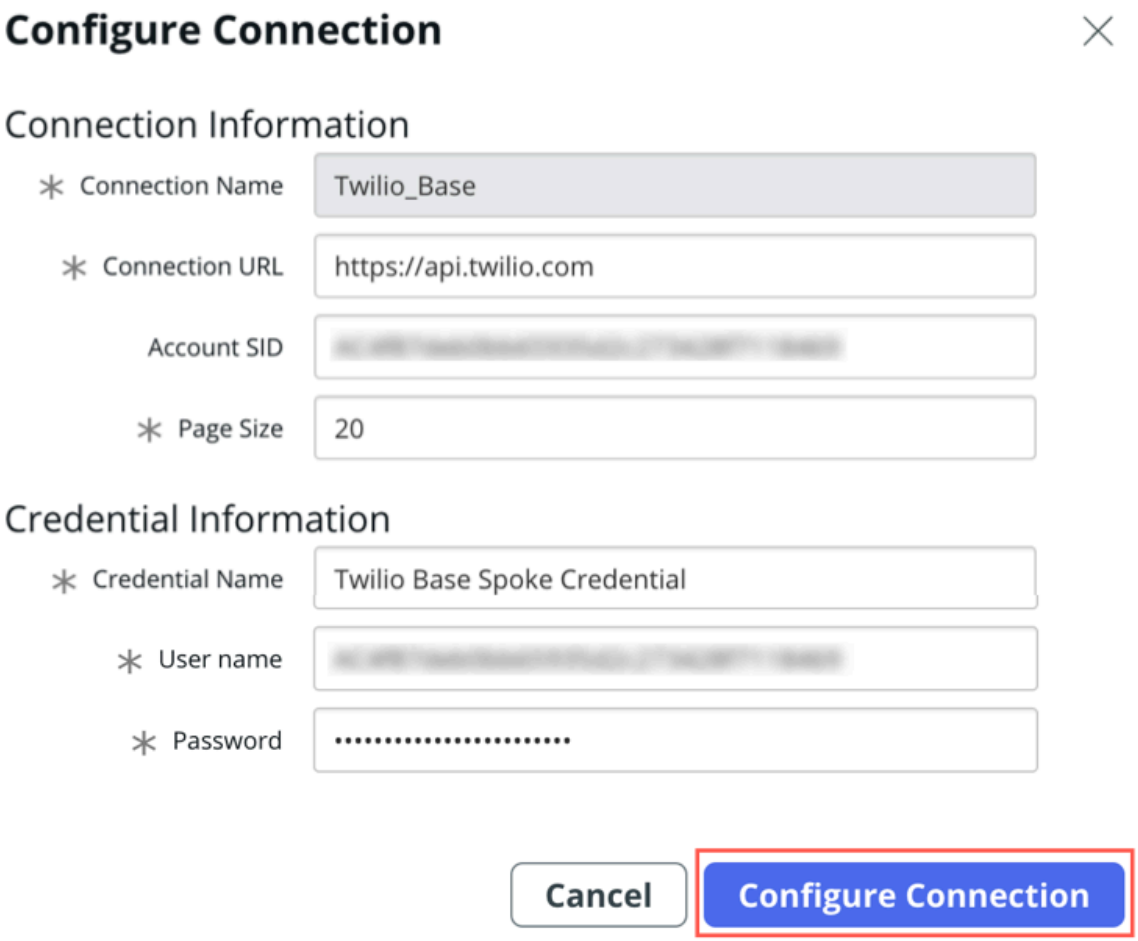
   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

   e. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection form

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, enter `Twilio_Base`.
Connection URL	Connection URL for Twilio Base. This field is automatically set to `https://api.twilio.com`.
Account SID	Account String Identifier (SID) of Twilio Base.
Page Size	Page size for data stream of Twilio Base.
Credential Name	Name to uniquely identify the Twilio Base credential record. For example, `Twilio Base Spoke Credential`.
User name	Account String Identifier (SID) of Twilio Base.
Password	Auth Token of the Twilio account.



f. Click **Configure Connection**.

2. Configure the **Twilio_Messaging** connection alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **Process Automation** > **Workflow Studio**.

b. Click the **Integrations** tab.

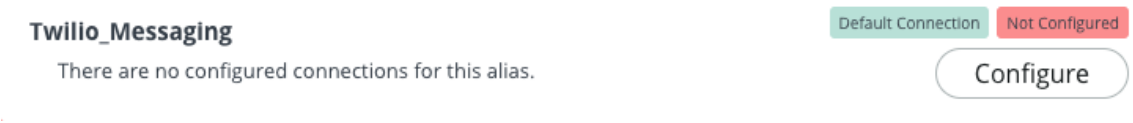
c. Under **Connections**, toggle and enable the **Outbound** connections.

d. Locate the alias for **Twilio_Messaging** and click **View Details**.

- To configure the default connection and credential alias record that is shipped along with the Twilio spoke, click **View Details**.

- To manage more than one Twilio Messaging spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



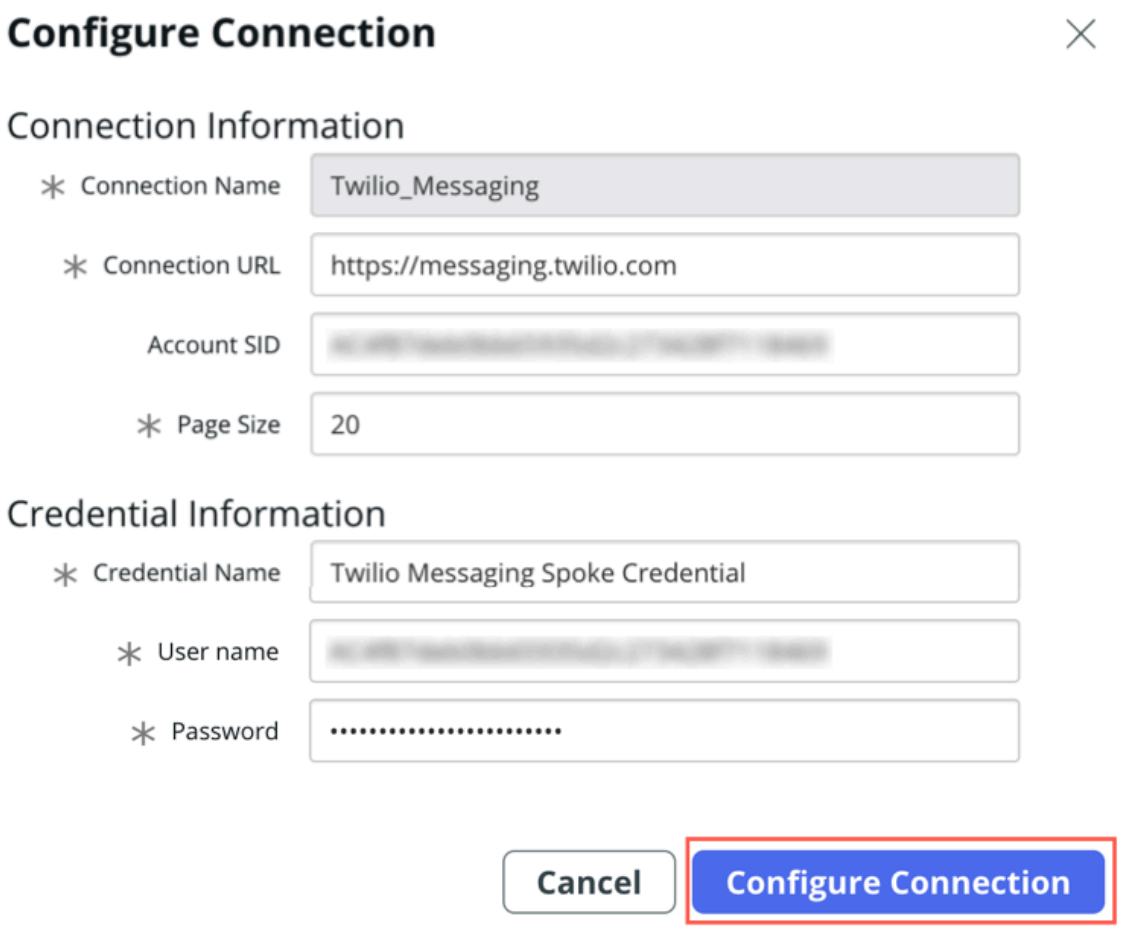
e. On the form, fill in the fields.

Connection form

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, enter `Twilio_Messaging`.
Connection URL	Connection URL for Twilio Messaging. This field is automatically set to `https://messaging.twilio.com`.
Account SID	Account String Identifier (SID) of Twilio Messaging.
Page Size	Page size for data stream of Twilio Messaging.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential Name	Name to uniquely identify the Twilio Messaging credential record. For example, `Twilio Messaging Spoke Credential`.
User name	Account String Identifier (SID) of the Twilio Messaging account.
Password	Auth token of the Twilio account.



f. Click **Configure Connection**.

3. Configure the **Twilio_Notify** connection alias.

   a. Navigate to **All** > **Process Automation** > **Workflow Studio**.

   b. Click the **Integrations** tab.

   c. Under **Connections**, toggle and enable the **Outbound** connections.

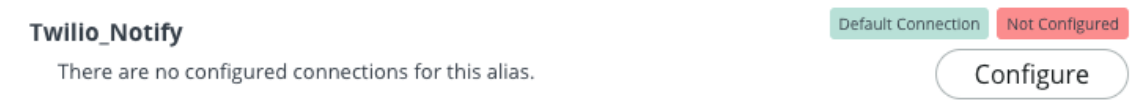
   d. Locate the alias for **Twilio_Notify** and click **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Twilio spoke, click **View Details**.

- To manage more than one Twilio Notify spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

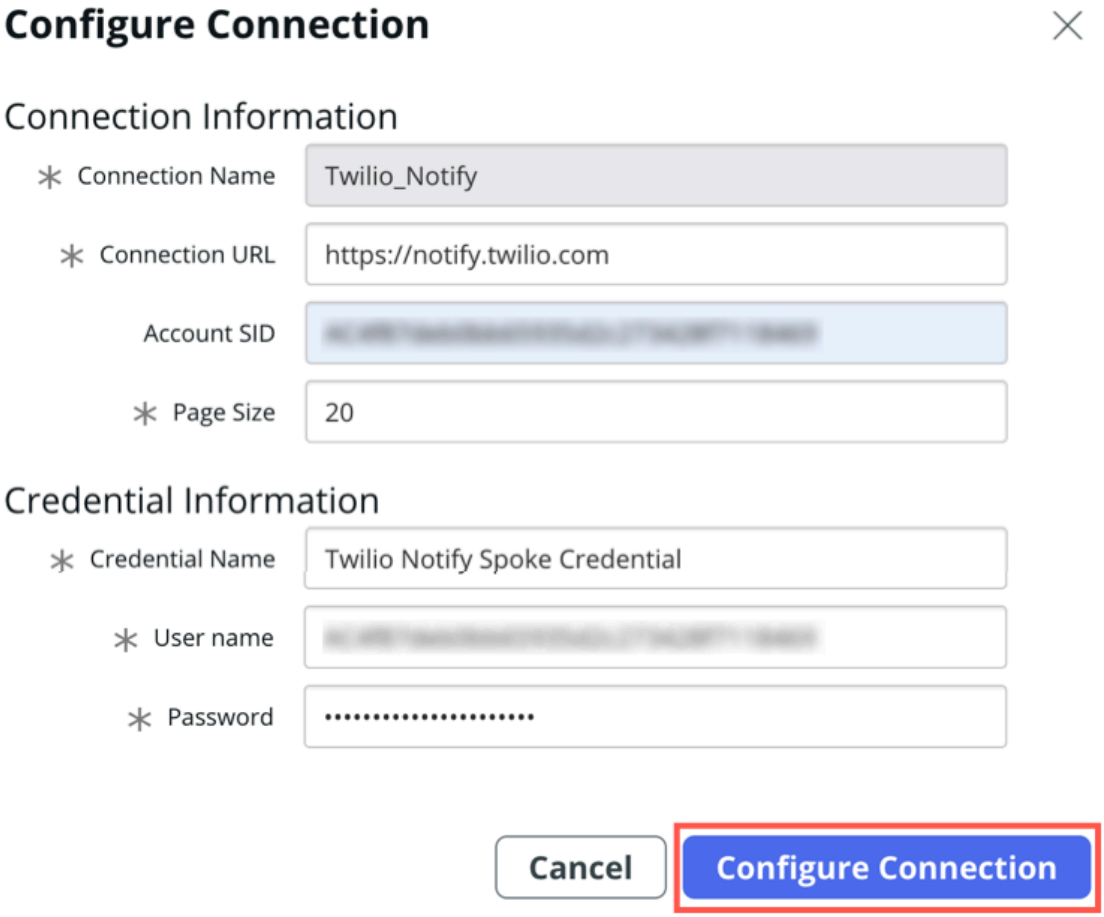
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



e. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, enter `Twilio_Notify`.
Connection URL	Connection URL for Twilio Notify. This field is automatically set to `https://notify.twilio.com`.
Account SID	Account String Identifier (SID) of Twilio Notify.
Page Size	Page size for data stream of Twilio Notify.
Credential Name	Name to uniquely identify the Twilio Notify credential record. For example, `Twilio Notify Spoke Credential`.
User name	Account String Identifier (SID) of the Twilio Notify account.
Password	Auth token of the Twilio account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Click **Configure Connection**.

Result
The spoke connection is configured and ready to be used.

UCF Spoke

Manage processes to collect and coordinate the compliance requirements applicable to your organization from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

UCF spoke v1.1.0 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported version

This spoke was built for UCF v2.0, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke requirements

- Common Control Hub (CCH) account
- CCH administrator credentials

Spoke actions

The UCF spoke provides actions to automate UCF tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Content Record Management	Get Authority Documents	Retrieves authority documents that are downloaded from the UCF Common Controls Hub.
	Get Citation Control Objective Mapping	Retrieves the Citation and Control objective mapping information.
	Get Citation Documents	Retrieves the citations that are downloaded from the UCF Common Controls Hub.
	Get Control Objective Documents	Retrieves the citation to controls that are downloaded from the UCF Common Controls Hub.
Metadata Retrieval	Get Authority Document List	Retrieves the current user's authority document lists.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Set up the UCF spoke.

Set up the UCF spoke

Integrate the ServiceNow instance and UCF by creating a custom OAuth application in UCF to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the UCF spoke.
- Role required: admin.

Create an application in UCF

Create an application in Common Controls Hub (CCH) to enable OAuth 2.0 authentication with the UCF spoke.

Before you begin

Role required: CCH administrator

Procedure

1. Create an application in UCF.
   For a step-by-step procedure to create an application using your CCH account, see the CCH Support documentation.
2. While creating the application, ensure that you provide this information:
   - **Redirect URL**: ServiceNow instance URL in the format, `https://<Instance-Name>.service-now.com/oauth_redirect.do`
   - **Authorization URL**: Location on your website to which CCH redirects the interested users.
3. Copy and record the **Client ID** and **Client Secret** for later use.

Result

The application is created in CCH to enable OAuth 2.0 authentication with the UCF spoke.

Configure a connection for the UCF spoke

Add and configure a UCF connection to authenticate ServiceNow requests in the UCF spoke.

Before you begin

Role required: admin

Procedure

1. Navigate to **Process Automation** > **Flow Designer**.
2. Click the **Connections** tab.
3. Locate the **UCF** connection alias and click **View Details**.
4. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.
5. On the form, fill in the values.

Field	Description
Connection Name	Name to identify the connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	Enter `https://api.unifiedcompliance.com/`.
OAuth Entity Name	Name to identify the OAuth entity record.
OAuth Client ID	Client ID created during the application configuration in CCH.
OAuth Client Secret	Client Secret created during the application configuration in CCH.
OAuth Redirect URL	OAuth callback endpoint. System generates the URL upon saving the application registry. This is the URL of the ServiceNow instance in this format: `https://<Instance-Name>/service-now.com/oauth_redirect.do`.

6. Click **Create and Get OAuth Token**.

Udemy Spoke

Manage the courses on the Udemy platform from your ServiceNow instance. For example, get the details of all the courses on Udemy by executing a spoke action from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Udemy spoke v1.0.2 is the latest version.

Supported versions

This spoke was built for Udemy API version v2, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation. To get help on the licenses, contact your account manager.

Spoke actions

The Udemy spoke actions automate how you manage the courses on the Udemy platform. Available actions include:

Category	Action	Description
Default	Look up Courses Stream	Gets the details of the courses on Udemy. For example, course length, description, video duration, and the course title.
Learning Management	Look up Course Synchronization Stream	Retrieves details of the courses. For example, course title, description, and duration. If the action is successfully executed, the status is "Success", or else, the status is "Failure" and an appropriate error code is shown.
	Look up Course Synchronization Token	Retrieves the synchronization token to fetch the next set of updated or created course.
	Look up User Course Activity Stream	Retrieves the data on the progress made by the course subscriber.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Udemy spoke.

For information about setting up the spoke, see Set up the Udemy spoke

Set up the Udemy spoke

Enable your ServiceNow instance to connect to the Udemy instance by setting up a connection and credential record for the Udemy spoke. The Udemy instance uses the record to authenticate the requests from the ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Udemy spoke plugin.
- Ensure that you have the admin access to the Udemy instance.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Generate an Application Programming Interface (API) key from your Udemy instance.

   a. Log in to your Udemy instance.

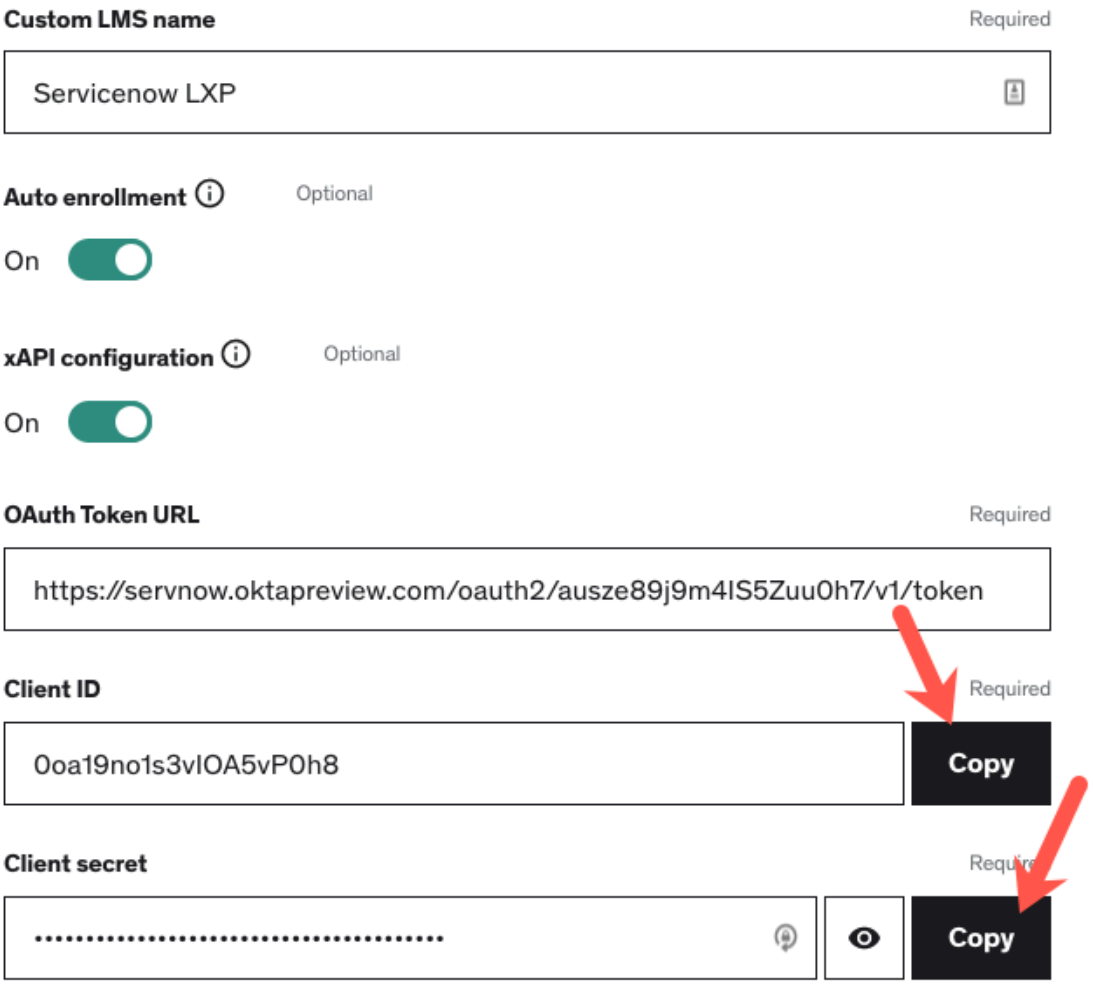
   b. Navigate to **Manage** > **Settings**.

   c. Under Settings, select LMX/LXP integrations.

   d. Click **Copy** to copy the client ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Click **Copy** to copy the client



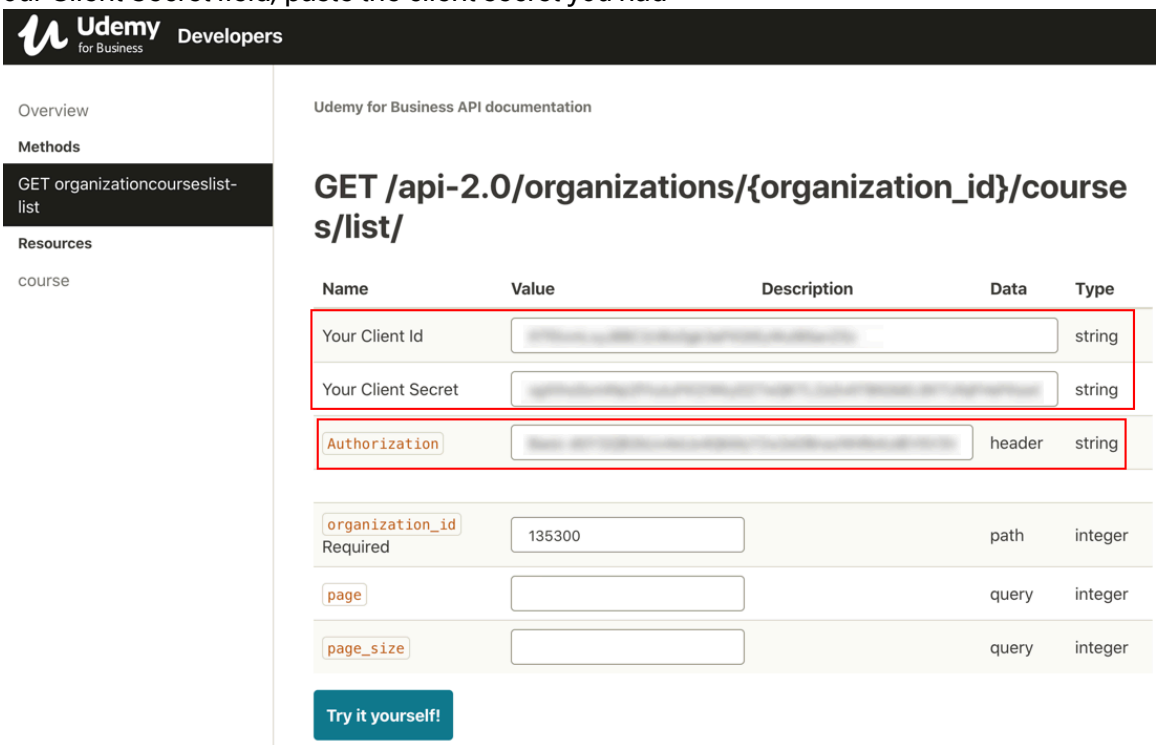
secret.

f. Go to GET /api-2.0/organizations/{organization_id}/courses/list/ .

g. In the Your Client Id field, paste the client ID you had copied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

h. In the Your Client Secret field, paste the client secret you had



copied.
The API key is generated and displayed in the **Authorization** field. Copy and record the value for later use.

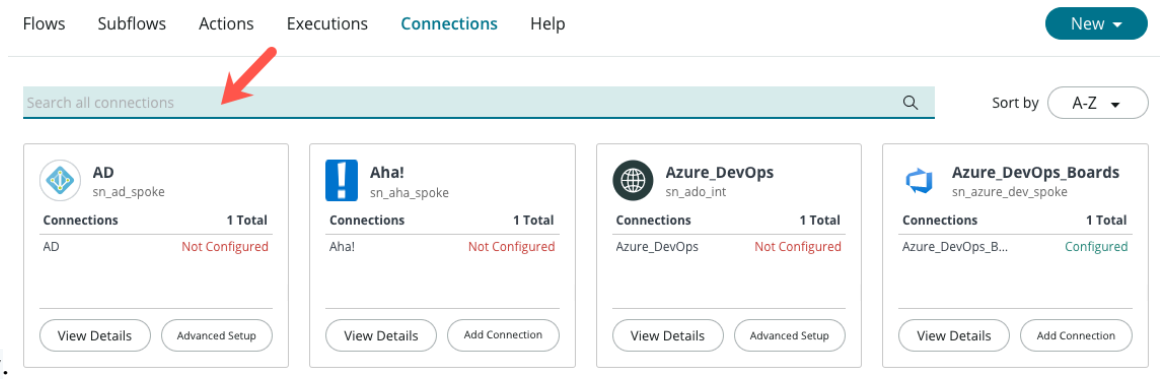
2. Create a connection and credential record to connect to the Udemy instance.

a. Log in to your ServiceNow instance.

b. Navigate to **All** > **Process Automation** > **Flow Designer**.

c. Select Connections.

d. In the Search all connections field, enter

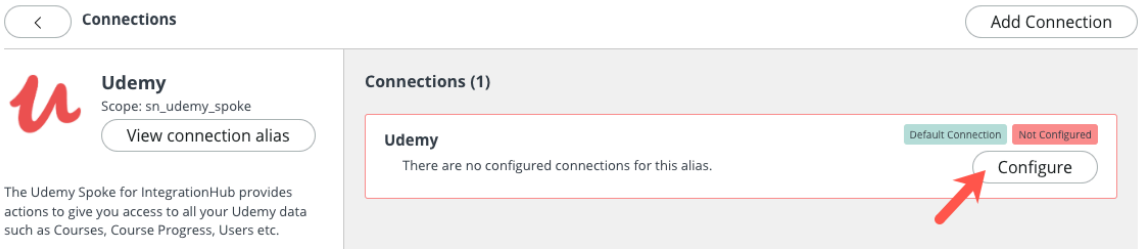


Udemy.

e. In the Udemy connection card, select **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Click **Configure**.



g. Fill the form with the details.

Configure connection form

Field	Description
Connection Name	Name of the connection record. **Note:** The default and the read-only name of the connection is Udemy for the first record that you create. However, you can provide custom connection names for all connection records you create after the first record.
Connection URL	The URL used to connect to the Udemy server or instance. The format is `https://<provider-domain-name>.com`.
Domain Name	The domain name of your Udemy instance.
Domain ID	The domain ID of your Udemy instance. **Note:** To get the domain ID, do the following steps: i. Log in to the Udemy instance. ii. Go to **Manage>Settings**. iii. On the left panel, under Settings, select API. iv. Under the API heading, select the API documentation link for the Courses API section. The API Client and Account Id are available under the Your API Client and Your Account Id section.
API Version	The version of the API that you use to connect to the Udemy instance or server. The default version is api-2.0.
API Key	The API key that you had generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential Name	Custom name of the connection and credential record.

h. Click **Configure Connection**.
The connection and credential record is created.

UiPath Spoke

Automate business processes in UiPath from your ServiceNow® instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

UiPath spoke v2.5.0 is the latest version.

Supported version

This spoke was built for these UiPath versions, but may be compatible with later versions.

- Platform version 2020.4.1
- Cloud Platform version 2022.7.14

Spoke requirements

Ensure that you have UiPath account information before you Set up the UiPath spoke.

- If you are using the UiPath Cloud Platform:
  - Token URL
  - Client Id
  - Account Logical Name
  - Tenant Logical Name
  - User Key
- If you are using the UiPath Platform installed on private or public cloud:
  - Tenant Name
  - Credentials to authenticate the UiPath Orchestrator API

See the UiPath documentation for more information about obtaining the required details.

Spoke subflows

The UiPath spoke provides subflows to retrieve information about jobs, processes, robots, and so on. Available subflows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Process UiPath Job Webhook	Retrieves information about the jobs in UiPath. This subflow is the answer for the default Flow: Process UiPath Job Webhook routing policy.
Process UiPath Process Webhook	Retrieves information about the processes in UiPath. This subflow is the answer for the default Flow: Process UiPath Process Webhook routing policy.
Process UiPath Robot Webhook	Retrieves information about the robots in UiPath. This subflow is the answer for the default Flow: Process UiPath Robot Webhook routing policy.
Process UiPath Any Webhook	Retrieves information about any other required entity. To process information about the required entity, create a copy of this subflow and customize it as per your requirement.

Note:
While customizing a new subflow, create a copy of one of the default subflows to ensure that all the default input payload items are present.

Spoke actions

The UiPath spoke provides actions to manage environments, jobs, machines, processes, robots, queue, and release, when events occur in ServiceNow. Available actions include:

Category	Action	Description
Environment Management **Note:** These actions work within classic folders only.	Look up Environment by ID	Retrieves the details of the required environment.
	Look up Environments	Retrieves the details of the required environments. The environments are retrieved based on the filter query.
	Look up Folders	Looks up folders under a tenant in UiPath and gets the folder name and ID.
Job Management	Look up Job By ID	Retrieves the details of the required job.
	Look up Jobs	Retrieves the details of the required jobs. The jobs are retrieved based on the filter query.
	Start Jobs	Starts the jobs to execute the required process. **Note:** When working with the modern folders, select either **Allocate Dynamically** from the **Execution Target** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Machine Management	Look up Machine By ID	Retrieves the details of the required machine.
	Look up Machines	Retrieves the details of the required machines. The machines are retrieved based on the filter query.
Process Management	Look up Processes	Retrieves the details of the required processes. The processes are retrieved based on the filter query.
Queue Management	Add Item to Queue	Adds a new item to the specified queue.
	Create Queue	Creates a queue with the specified configuration.
	Delete Queue	Deletes the specified queue.
	Delete Queue Item	Deletes the specified queue item.
	Look up Queue Items	Retrieves a list of queue item definition records.
	Look up Queues	Retrieves the details of the required queue definition records. The queues are retrieved based on the filter query.
Release Management	Look up Release By ID	Retrieves the details of the required release.
	Look up Releases	Retrieves the details of the required releases. The releases are retrieved based on the filter query.
Robot Management **Note:** These actions work within classic folders only.	Create Robot	Creates a robot in UiPath.
	Delete Robot	Deletes a robot in UiPath.
	Look up Robot By ID	Retrieves the details of the required robot.
	Look up Robots	Retrieves the details of the required robots. The robots are retrieved based on the filter query.
Session Management **Note:** These actions work within classic folders only.	Look up Sessions	Retrieves the details of the required sessions. The sessions are retrieved based on the filter query.

Spoke modules

The UiPath spoke adds the UiPath application to your ServiceNow instance. The UiPath application includes these modules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
UiPath Webhook Registries	Contains details about the webhook registry records.
UiPath Webhook Routing Policies	Contains details about the webhook routing policy records. Three routing policies are available with the spoke that retrieve information about jobs, robots, and processes.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the UiPath spoke.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the UiPath alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Note:
The MID Server users must have the sn_uipath_spoke.uipath_admin role.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the UiPath spoke

Integrate the ServiceNow instance with your UiPath account to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the UiPath spoke.
- Role required: admin.

About this task

You can set up the UiPath spoke using OAuth authentication or API key as per your requirement.

- See Option 1: Using OAuth authentication to set up the UiPath spoke using OAuth authentication.
  - This authentication is available from UiPath spoke v2.2.1.
  - You can't use MID Server if you set up the spoke using OAuth authentication.
- See Option 2: Using API key to set up the UiPath spoke using API key.

Option 1: Using OAuth authentication

Integrate the ServiceNow instance with your UiPath account using OAuth to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Note:

- This authentication is available from UiPath spoke v2.2.1.
- You can't use MID Server if you set up the spoke using OAuth authentication.

Procedure

1. Register an application in your UiPath account.

   a. Log in to your UiPath account as an admin.

   b. Navigate to **Admin** > **External Applications**.

   c. Click **+ Add Application**.

   d. On the form, fill these values.

Field	Description
Application Name	Name of the OAuth application.
Application Type	Type of OAuth application. Select **Confidential application**.
Resources	Required resource and scopes. i. Click **+ Add Scopes**. ii. Select **Orchestrator API Access** from the **Resource** list. iii. Select these application scopes: ▪ OR.Robots.Read ▪ OR.Robots.Write ▪ OR.Jobs.Read ▪ OR.Jobs.Write ▪ OR.Machines.Read ▪ OR.Execution.Read ▪ OR.Queues.Read ▪ OR.Queues.Write ▪ OR.Folders.Read iv. Click **Save**.
Redirect URL	ServiceNow instance redirect URL in this format: `https://<ServiceNow-instance>.service-now.com/oauth_redirect.do`

   e. Click **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The application is registered and values of App ID and App Secret are displayed.

f. Copy and record the values of app ID and app secret.

2. In your ServiceNow instance, configure the required connection and credential alias.

a. Log in to your ServiceNow instance as an admin.

b. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.

c. Open the record for **UiPath**.

d. For **Configuration Template**, select **UiPath Configuration Template - OAuth Client Credentials**.

e. Click the **Create New Connection & Credential** related link.

f. On the form, fill these fields.

Create Connection and Credential form

Field	Description
Connection information	
Name	Name to identify the OAuth application registry record.
Connection URL	Connection URL in this format: `https://{base_url}/{organization_name}/{tenant-name}/orchestrator_`. This URL depends on the type of UiPath deployment.
Credential information	
Name	Name to identify the credential record.
Token URL	Location of the token endpoint that the instance uses to retrieve and refresh tokens. This URL depends on the type of UiPath deployment.
OAuth Client ID	App ID you had copied after registering application in your UiPath account.
OAuth Client Secret	App secret you had copied after registering application in your UiPath account.
OAuth Redirect URL	ServiceNow instance redirect URL in this format: `https://<ServiceNow-instance>.service-now.com/oauth_redirect.do`.

g. Click **Create**.

h. Click **Submit**.
Connection and credential records are created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Open the UiPath Connection record, from the **Connections** tab.

j. Select a value for the **Orchestrator Feature Enabled** field.

Result
The Connection and Credential alias is configured and the UiPath spoke is set up using OAuth authentication.

Option 2: Using API key

Integrate the ServiceNow instance with your UiPath account using API key to authenticate ServiceNow requests.

Before you begin
Role required: admin

Procedure

1. From your UiPath cloud account, obtain the values of the required API refresh tokens.

   Note:
   These steps are applicable to UiPath cloud account.

   a. Log in to your UiPath account as an admin.

   b. Navigate to **Preferences** > **Privacy & Security**.

   c. For the required tenant, click **View API access**.
   The values of **User Key**, **Organization ID**, **Tenant Name**, and **Client ID** are displayed.

   d. Copy and record these values.

2. In your ServiceNow instance, configure the required connection and credential alias.

   a. Log in to your ServiceNow instance as an admin.

   b. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.

   c. Open the record for **UiPath**.

   d. For **Configuration Template**, select **UiPath Configuration Template - UiPath Cloud** or **UiPath Configuration Template - Private/Public Cloud** as per your requirement.

   e. Click the **Create New Connection & Credential** related link.

   f. On the form, fill these fields.

   - If you have selected **UiPath Configuration Template - UiPath Cloud** for **Configuration Template**, fill these fields.

     Note:
     This option is applicable if you are using UiPath cloud account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection and Credential form

Field	Description
Connection Name	Name to identify the connection record. For example, `UiPath Connection`.
Connection URL	Connection URL in this format: `https://platform.uipath.com/<account-logical-name>/<instance-logical-name>`
Credential Name	Name to identify the credential record. For example, `UiPath Credential`.
Token URL	Location of the token endpoint that the instance uses to retrieve and refresh tokens. For example, `https://account.uipath.com/oauth/token`.
Client Id	Value of client ID you had copied from the UiPath Orchestrator application.
Account Logical Name	Organization ID you had copied from the UiPath Orchestrator application.
Tenant Logical Name	Tenant name you had copied from the UiPath Orchestrator application.
User Key	User key you had copied from the UiPath Orchestrator application.

- If you have selected **UiPath Configuration Template - Private/Public Cloud** for **Configuration Template**, fill these fields.

Create Connection and Credential form

Field	Description
Connection Name	Name to identify the connection record. For example, `UiPath Connection`.
Connection URL	UiPath instance URL.
Credential Name	Name to identify the credential record. For example, `UiPath Credential`.
Token URL	Location of the token endpoint that the instance uses to retrieve and refresh tokens in this format: `http://<instance-URL>/api/account/authenticate`
Tenant Name	Tenant logical name.
Username or email	Username or email address to authenticate the UiPath Orchestrator API.
Password	Associated password.

Note:

- You must enable **Use MID server** option in the connection record and create a SSL certificate from a trusted authority for on-prem support.
- The MID Server users must have the sn_uipath_spoke.uipath_admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. Click **Create**.

h. Click **Submit**.
Connection and credential records are created.

i. Open the UiPath Connection record, from the **Connections** tab.

j. Select a value for the **Orchestrator Feature Enabled** field.

Result
The Connection and Credential alias is configured and the UiPath spoke is set up using API key.

Set up the webhook

Configure a webhook to subscribe to events in the UiPath account with a ServiceNow callback URL.

Before you begin

- Set up the UiPath spoke
- Role required: sn_uipath_spoke.uipath_webhook_registry_user and decision_table_writer, or admin

Procedure

1. Create webhook registry in your ServiceNow instance.

a. Log in to your ServiceNow instance.

b. Navigate to **UiPath** > **UiPath Webhook Registry**.

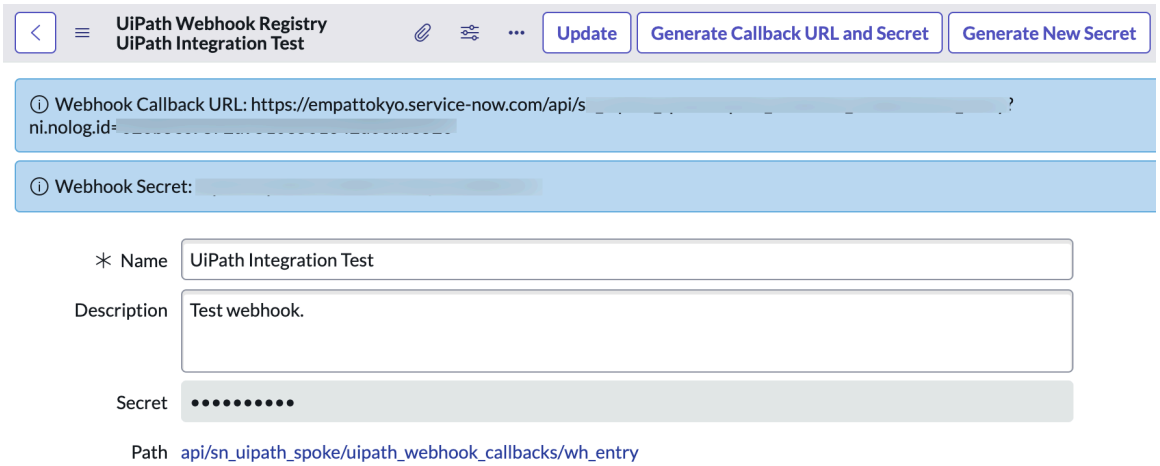
c. Click **New**.

d. On the form, fill these values.

Field	Description
Name	Name to identify the webhook registry record,
Description	Description of the webhook registry.

e. Click **Generate Callback URL and Secret**.
Webhook callback URL and secret are generated and displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Copy and record the values of webhook callback URL and secret.

> **Note:**
> You can change the webhook secret periodically by clicking **Generate New Secret**. After changing the secret, the value must be updated in the UiPath account.

2. Specify the webhook routing policies in your ServiceNow instance.

a. Log in to your ServiceNow instance.

b. Navigate to **UiPath** > **UiPath WebHook Routing Policies**.
Three routing policies are available along with the spoke. You can configure these records and can also create more records as per your requirement.

c. Open the required record.

d. Specify **Condition** that must be met.

e. For **Answer**, select the required subflow that must be triggered when the specified condition is met.

f. Click **Update**.

3. Register the callback URL in the UiPath account.

a. Log in to your UiPath account as an admin.

b. Navigate to **Orchestrator** > **Tenant**.

c. Click the **Webhooks** tab.

d. Click **+ Add webhook**.

e. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
URL	Webhook callback URL you had copied from your ServiceNow instance.
Enabled	Select this check box.
Secret	Webhook secret you had copied from your ServiceNow instance.
Event Type	Events for which you want to subscribe.

f. Click **Save**.

UKG Spoke

Manage time off requests in Kronos from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

UKG spoke v3.3.0 is the latest version.

Supported versions

This spoke was built for Kronos version v1, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke flows

The UKG spoke provides sample flows to demonstrate automating the Kronos tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Kronos - Create Manager Time Off Request	Creates the time of request for a manager or employee.
Kronos - Get New Refresh And Access Token	Retrieves access token for Kronos and generates a new refresh token periodically.
Kronos - Refresh The Access Token	Refreshes the access token for Kronos.
Kronos - Retrieve And Update Manager Time Off Request Status	Retrieves status of the time off request status and updates the details of the associated request item.
Kronos - Time Off Details House Keeping	Deletes the time off requests based on the provided criteria. By default, the flow deletes time off requests that have been approved 7 days ago.

Every flow triggers an associated subflow.

Spoke subflows

The Kronos spoke provides sample subflows to demonstrate automating Kronos tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Kronos - Get Kronos Token	Uses the details provided during spoke setup to retrieve a valid refresh token from Kronos.
Kronos - Create Manager Time Off Request	Creates the time off request and saves the information in your ServiceNow instance.
Kronos - Manager Time Off Request	Creates the time off request for a manager or employee.
Kronos - Retrieve Manager Time Off Request Status Update	Retrieves status of the time off request status and updates the details of the associated request item.
Kronos - Time Off Request Housekeeping	Deletes the time off requests based on the provided criteria. By default, the subflow deletes time off requests that have been approved 7 days ago.
Kronos - Report Missed Punches as Employee	This subflow creates a task which allows the employee's manager to punch the employee's missing entry.

Spoke actions

The UKG spoke provides actions to automate Kronos tasks when events occurs in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Authentication Management	Get Kronos Refresh Token	Retrieves the Refresh Token for Kronos.
	Get Kronos Token	Retrieves the Token for Kronos.
Persons	Create Persons	Creates records for one or more persons.
	Retrieve Person by ID	Retrieves the details of a person for the specified record ID.
	Retrieve Persons	Retries the record details of a list of persons based on the search criteria.
	Update Persons	Updates the records of one or more persons.
Scheduling	Retrieve Manager Schedule	Retrieves the schedule of a list of employees.
Default	Add Timestamp	Adds or records a timestamp for a punch transaction of an employee.
	Approve Timecard Employee	Approves the employee timecard for the specified range of dates.
	Approve Timecard Manager	Adds manager approval for the specified employee's timecard.
	Look up Shift Cover Requests as Manager	Retrieves one or more shift cover requests matching specified search criteria.
	Look up Open Shifts Requests Manager	Retrieves a list of Open Shift Requests based on the Employee ID or Person Number.
	Look up Self Schedule Requests Manager	Retrieves a list of Self Schedule requests based on the Employee ID or Person Number.
	Look up Shift Swap Requests Manager	Retrieves a list of swap requests based on the Employee ID or Person Number.
	Look up Manager Availability Requests	Retrieves all availability requests for the given criteria.
	Retrieve Employee Timecard Request	Retrieves the timecard details of the specified employee.
	Retrieve Employee	Retrieves the details of a list of timecards for the specified employees or for the specified Hyperfind details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Timecards Request	
	Retrieve Manager Timecard	Retrieves the timecard of the specified manager.
	Retrieve Manager Timecards	Retrieves the details of a list of timecards for the specified mangers or the specified Hyperfind details.
	Retrieve Timecard Approvals Employee	Retrieves a list of employee timecard approvals for the specified date range.
	Retrieve Timecard Approvals Manager	Returns a list of manager timecard approvals for the specified date range.
	Update Timecard	Updates the timecard of the specified employee.
Metadata Retrieval	Get Accrual Codes	Retrieves a list of accrual code types according to the user's access rights.
	Look Up Cost Centers	Retrieves a list of available cost centers.
	Look Up Jobs	Retrieves a list of available jobs.
	Look Up Labor Categories	Retrieves a list of available categories.
	Look Up Labor Category Entries	Retrieves a list of available labor category entries.
	Look Up Work Rules	Retrieves a list of available work rules.
	Retrieve Hyperfind Queries	Retrieves a list of Hyperfind queries.
	Retrieve Licenses	Retrieves a list of licenses.
	Retrieve Pay Rules	Retrieves a list of pay rules.
	Retrieve Symbolic Period ID	Retrieves the specified symbolic period.
	Retrieve All Pay Codes	Retrieves all the play code in Kronos.
	Retrieve Employee Request Subtype	Retrieves a list of request subtypes associated with the required Person Number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Retrieve Manager Request Subtype By Employee ID	Retrieves a list of request subtypes associated with the required Employee ID.
	Retrieve Manager Request Subtype By Person Number	Retrieves a list of request subtypes associated with the required Person Number. The action output is necessary for subsequent actions such as, the Retrieve Employee Accrual Balance action from manager's perspective.
	Retrieve Manager Symbolic Amount Qualifiers By Employee ID	Retrieves different types of Retrieve Manager Symbolic Amount Qualifiers By Employee ID, such as half day, full day, and so on, based on Employee ID.
	Retrieve Manager Symbolic Amount Qualifiers By Person Number	Retrieves different types of Retrieve Manager Symbolic Amount Qualifiers By Employee ID, such as half day, full day, and so on, based on Person Number.
	Retrieve Symbolic Periods	Retrieves all the symbolic periods.
Scheduling Management	Create Employee Time Off Request	Creates a time off request based on the provided inputs.
	Create Manager Time Off Requests	Creates a time off request based on the provided inputs.
	Look up Employee Schedule	Retrieves the schedule of the employee.
	Retrieve Employee Accrual Balance	Retrieves details of the different types of employee accrual balance, such as PTO, sick days, and so on.
	Retrieve Employee Time Off Requests	Retrieves details of the time off requests based on the specified search criteria.
	Retrieve Manager Accrual Balance By Employee ID	Retrieves details of the different types of manager accrual balance using Employee ID.
	Retrieve Manager Accrual Balance By Person Number	Retrieves details of the different types of manager accrual balance using Person Number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Retrieve Manager Time Off Requests By Employee ID	Retrieves details of the time off requests based on the specified search criteria and Employee ID.
	Retrieve Manager Time Off Requests By Person Number	Retrieves details of the time off requests based on the specified search criteria and Person Number.
	Update Employee TimeOff Request	Updates the state of an employee time off request.
	Update Manager Time Off Requests	Updates the state of a manager time off request.
Timekeeping	Get Employee Accruals by Person Number	Retrieves different types of employee accrual balances.
	Retrieve Timecard Approvals Manager	Retrieves a list of timecard approvals within the specified date range.

Spoke module

The Kronos spoke adds a Kronos application to your ServiceNow instance. The Kronos application has these modules.

Module	Description
Credentials	Details of the Kronos users with permissions to perform the required actions.
Time Off Request Details	Details of the time off requests, along with the status.
Time Off Request Details Staging Tables	Details of the time off requests from the staging tables.

Kronos spoke account requirements

The Kronos spoke requires registering an OAuth 2.0 application in your Kronos account to generate OAuth 2.0 tokens for the Kronos spoke. Record the generated Client ID, Client Secret, and Application key for later use.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the UKG spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the UKG spoke

Integrate your Kronos application with your ServiceNow instance. Register an OAuth application in Kronos and authenticate requests from ServiceNow.

Before you begin

- Request an Integration Hub subscription.
- Activate the UKG spoke.
- Kronos manager user or superuser credentials.
- Role required: admin.

Note:
Make sure that the application registry, connections, and credentials are within the application scope.

You can choose to set up the UKG spoke using the connection template or using connection and credentials records according to your requirement.

Option 1: Configure a connection for the UKG spoke

Add and configure a connection using the connection template to authenticate ServiceNow requests in UKG spoke.

Before you begin

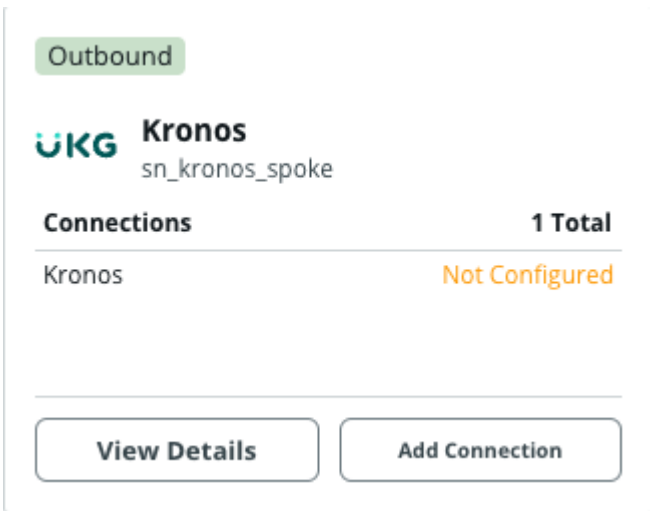
Role required: admin

Note:
If you're updating from a previous version (before version 3.3.0) of the spoke, first you need to remove the current connection record, credentials record, and Kronos user credentials. Then, you can set up the connection using the template.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the **Connections** tab.
3. Locate the **UKG connection** alias and click **View Details**.

Note:
Don't click **Add Connection**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Edit**.
   If you are configuring the spoke for the first time, click **Configure**.

5. On the form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, enter Kronos Conn.
Connection URL	URL of the Kronos instance.
App Key	Application key of the Kronos instance.
OAuth Entity Name	Unique name to identify the OAuth entity profile of the UKG spoke. For example, select `UKG OAuth entity`.
OAuth Client ID	Client ID created during the application configuration in Kronos.
OAuth Client Secret	Client Secret created during the application configuration in Kronos.
Token URL	OAuth server token endpoint. For example, `https://<Kronos-Instance>.com/api/authentication/access_token`.

6. Click **Configure and Get OAuth Token**.
   A modal page displays to enter your Kronos credentials.
7. Enter your Kronos username and password and click **Get OAuth Token**.

Result
Once your OAuth token has been successfully fetched, you can begin using your UKG spoke connection.

Option 2: Using connection and credentials records for UKG spoke setup

Create a connection record and credential record for setting up the UKG spoke.

Before you begin
Role required: admin

Note:
If you have already configured a connection using the connection template, you can ignore this procedure.

Register Kronos as an OAuth provider

Use the information generated during the Kronos application creation and configuration to register Kronos as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open the record for the Kronosspoke.
3. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `Kronos OAuth profile`.
Client ID	Client ID created during the application configuration in Kronos.
Client Secret	Client Secret created during the application configuration in Kronos.
Default Grant type	Grant type used to establish the token. Select **Resource Owner Password Credentials**.
Application	Application scope that contains this record. Select **Kronos Spoke**.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry. Select the option.
Token URL	OAuth server token endpoint. For example, `https://<Kronos-Instance>.com/api/authentication/access_token`.
Redirect URL	OAuth callback endpoint. For example, `https://<ServiceNow-Instance>.com/oauth_redirect.do`.

4. Right-click the form header, and click **Save**.
5. In the **OAuth Entity Scopes** tab, insert a row and provide these values.

Field	Value
Name	Kronos
OAuth scope	givenName mail nonce openid profile sn uid

6. Click **Update**.
7. In the **OAuth Entity Profile** tab, click the default profile, **Kronos oAuth default_profile**.
8. Insert a record in the OAuth Entity Scope related list and select the default entity scope for the Kronos spoke, for example, `Kronos`.
9. Click **Update**.

Create Credential record for the Kronos spoke

Authorize the Kronos spoke actions by creating credential records for the application registered in Kronos. The Kronos spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, `Kronos Cred`.
Active	Option to actively use the credential record. Select the option.
OAuth Entity Profile	Default OAuth entity profile of the Kronos spoke. For example, select **Kronos oAuth default_profile**.
Order	Order that the credentials are used. For example, enter `100`.

5. Right-click the form header and click **Save**.

Provide Kronos user credentials

Create a record to provide details and credentials of the required Kronos user. The Kronos spoke uses these user credentials to perform actions in Kronos.

Before you begin
Role required: admin.

About this task
Ensure that you provide credentials of a manager user or Kronos superuser. With these credentials, time off requests of both employee and manager can be managed.

Procedure

1. Navigate to **All** > **Kronos** > **Credentials**.
2. Click **New**.
3. On the form, fill these values.

Kronos Credentials form

Field	Descriptions
Name	Name to uniquely identify the record.
Application Key	Application Key of the Kronos user.
User name	User name to log in to the user's account in Kronos.
Password	Password of the Kronos user account.
Connection & Credential Alias	Default alias record associated with the Kronos spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Descriptions
Refresh Token Expires	Date and time by when the Kronos refresh token expires. The Kronos spoke generates a new refresh token periodically, before the current refresh token expires.

4. Click **Submit**.
5. To generate the Kronos token, click the **Get Kronos Token** related link.

Result
The Kronos - Get Kronos Token subflow is triggered. The subflow uses the details provided during spoke setup to retrieve a valid refresh token from Kronos. The subflow then, updates the value of **Refresh Token Expires**.

Note:
To access more details about the Kronos refresh token, navigate to **System OAuth** > **Manage Tokens.**. Here, a record is created for each refresh token.

Create Connection record for the Kronos spoke

Create Connection records to your Kronos application. The Kronos spoke connection and credential alias uses these connections to perform actions in Kronos.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record for the Kronos spoke.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

HTTP(s) Connection form

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Kronos Conn`.
Credential	Credential record you created for Kronos. For example, select **Kronos Cred**. See Create Credential record for the Kronos spoke for more information.
Connection alias	Alias record associated with this connection.
URL builder	**Note:** Do not select the check box.
Connection URL	URL of the Kronos instance.
Use MID server	This field isn't applicable.
Active	Option to actively use the connection. Select the option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Domain	Domain that the action or activity runs in.

5. In the **Attributes** tab, fill these values.

Field	Description
u_app_key	Application Key of the Kronos user.
u_version	Kronos version of your instance. Enter `v1`.

6. Click **Submit**.

Create request as manager using the Kronos catalog item

Trigger events in Kronos when an item is requested in the Service Catalog.

Before you begin

- Set up the UKG spoke
- Role required: admin

About this task

The Kronos spoke adds a catalog item for use with the Kronos spoke sample flows.

Procedure

1. Navigate to **All** > **Self-Service** > **Service Catalog**.
2. Click **Kronos**.
3. Click **Kronos - Create Time Off Request As Manager (Super Access)**.
4. Provide details of the time off request.

> **Note:**
> After you have provided a valid **Employee ID** or **Person Number(Qualifier)**, the system may take some time to populate the values in the **Subtype Name using Employee ID** and **Symbolic Amount Qualifier By Employee ID**, or **Subtype Name using Person Number** and **Symbolic Amount Qualifier By Person Number** lists.

5. Click **Order Now**.
   A request item is generated and its generated number is displayed.
6. Click the request number and change the value of **Approval** to **Requested**, **Approved**, or **Rejected**.
7. Click **Update**.

Result

- The Kronos - Create Manager Time Off Request flow is triggered.
- A record is created in the Time Off Request Details module. The status of the time off request is updated when the Kronos - Retrieve And Update Manager Time Off Status flow is triggered.

Utility Actions Spoke

Create file attachments and zip attachments in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Utility Actions spoke v1.3.1 is the latest version.

Supported versions

This spoke is compatible with ServiceNow instance of Yokohama and later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Utility Actions spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Default	Add File to Zip	Adds the file to list of files to be zipped.
	Append to Delimited File	Creates a file line record, corresponding to a row in the delimited file.
	Append to File	Creates a file line record, corresponding to a line in the file to be created.
	Begin File	Creates a file record, to which the actual file would be attached.
	Begin Zip	Creates a file set record, to which the zip file would be attached.
	Build File	Generates the file and attaches it to the file record specified.
	Build Zip	Generates the zip file and attaches it to the file set record specified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: This action requires at least one MID Server with the IntegrationHub Utilities capability.
Spoke Util Actions	Convert Record to Object	Converts the specified record into an object.
	Convert Record to Array of Objects	Converts the given list of records to an array of objects. **Note:** Flow designers must have read access to the sys_dictionary and sys_db_object tables to use this action as the table schema is being populated from these tables.
	Generate Encoded Query	Generates encoded query with the provided name and value pairs. The output encoded query can be used with any field that is of the type, dynamic template. For example, the encoded query output of the Generated Encoded Query action, can be given as an input for Additional Fields in the Create Issue action.
	Look up Latest Comment on Record	Retrieves the latest comment from the required record in ServiceNow instance. The output comment is in the form of a string.

Spoke module and tables

The Utility Actions spoke includes these tables:

Table	Description	Fields
File [sn_utility_spoke_file]	Information about every file that has been created. The associated file is attached to the record. **Note:** You must specify **Schema** if you specify **Delimited File** for **File Type**.	• File Name • File Type • Schema
File Line [sn_utility_spoke_file_line]	Information about each row in delimited file.	• File • Line Content
File Mapping [sn_utility_spoke_file_mapping]	Information about files mapped to a ZIP file. For example, if four files are zipped to a ZIP file, four records are created in this table for each file.	• File • File Set

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description	Fields
File Schema [sn_utility_spoke_file_schema]	Information regarding the delimited files.	• Schema Name • Columns • Delimiter • Has Header • Quoted
File Set [sn_utility_spoke_file_set]	Information about the zip files. The associated ZIP file is attached to the record.	Zip File Name

The Utility Actions spoke adds the IntegrationHub Utilities application to your instance and includes the File Schemas module. The module displays records from the File Schema table.

Auto Flush data retention policies are available for the File and File Set tables. By default, the system retains data in the spoke tables, except the File Schema table, up to 7 days.

Note:

- Auto Flush data retention policies don't apply to records in the File Schema table.
- When the file records in the File table are deleted, the corresponding file line records in the File Line table are also deleted.
- When the file set records in the File Set table are deleted, the corresponding file mapping records in the File Mapping table are also deleted.

To modify the data retention policy, change the value of **Age in seconds** in the Auto Flush form of the required table. For more information, see Autoflush form.

Connection and credential alias requirements

This spoke doesn't require configuration of connection and credential alias. For information about setting up the spoke, see Create schema.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. For more information, see MID server.

Note:

- The Build Zip action in the spoke requires at least one MID Server with the capability IntegrationHub Utilities or ALL. To set up and configure the MID Server, user must have the role sn_utility_spoke.utility_actions_admin role.
- Create a MID Server property with **Value** as `*.service-now.com`.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Create schema

Create schema to create delimited files in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Utility Actions spoke.
- Role required: sn_utility_spoke.utility_actions_admin.

Procedure

1. Navigate to **All** > **IntegrationHub Utilities** > **File Builder** > **File Schemas**.
2. Click **New**.
3. On the form, fill these values.

File Schema form

Field	Description
Schema Name	Name to identify the schema record. For example, `Incident Schema`.
Delimiter	Delimiter in the file. For example, `,` and `\t`. The default value is value is comma.
Has Header	Option to specify if the schema has header.
Quoted	Option to escape the delimiters and surround all values with quotation marks.
Columns	Columns of the schema as a JSON array. For each column, specify column name and data type. For example,

```
[
    {
        "name" : "Number",
        "type" : "string"
    },
    {
        "name" : "Caller First Name",
        "type" : "string"
    },
    {
        "name" : "Caller Last Name",
        "type" : "string"
    },
    {
        "name" : "Short Description",
        "type" : "string"
    },
    {
        "name" : "State",
        "type" : "choice",
        "choices" : [
            {
                "label" : "New",
                "value" : "New"
            },
            {
                "label" : "In Progress",
                "value" : "In Progress"
            },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	<pre>{
	"label" : "On Hold",
	"value" : "On Hold"
	},
	{
	"label" : "Resolved",
	"value" : "resolved"
	},
	{
	"label" : "Closed",
	"value" : "closed"
	}
	]
	},
	{
	"name" : "Active",
	"type" : "boolean"
	}
	]</pre> . For more information, see Create a data gathering action for a dynamic template. **Note:** Ensure that you surround the key and value with quotation marks.

4. Click **Submit**.

Build a flow using the Utility Actions spoke actions

Create a flow in Workflow Studio using the Utility Actions spoke actions to create two files; one for incident records and other for user records, and zip these two files.

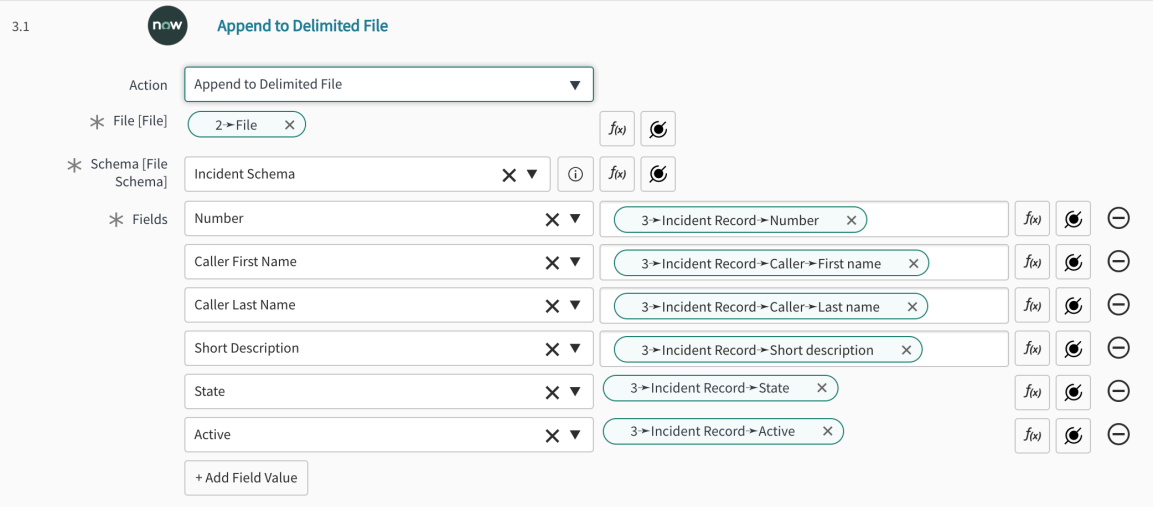
Before you begin
Role required: admin.

About this task
This sample flow demonstrates using the Utility Actions spoke actions to create files. You can configure the flow as per your requirement.

Procedure

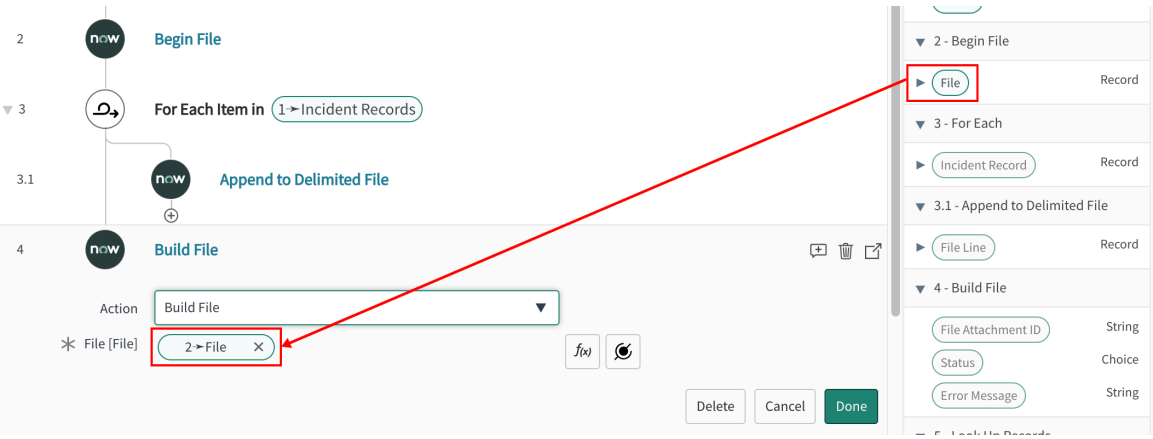
1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Create a flow.
   For more information, see Building flows.
3. In the flow, add these spoke actions or flow logics:
   a. Look Up Incident Records action to retrieve the incident records.
   b. Begin File action to create a file that will contain the incident records.
   c. For Each flow logic to apply the Append to Delimited File action to the list of incident records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

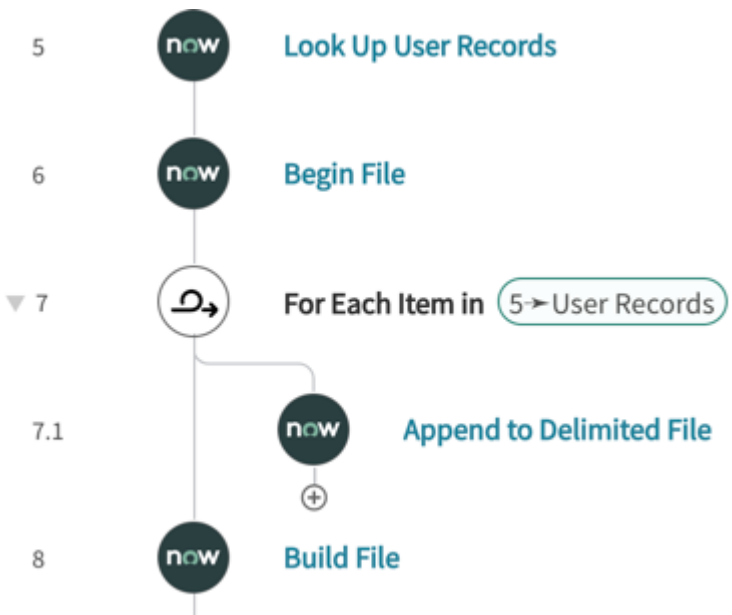


d. Build File action to add rows.

Each incident record is added as a row in the file.



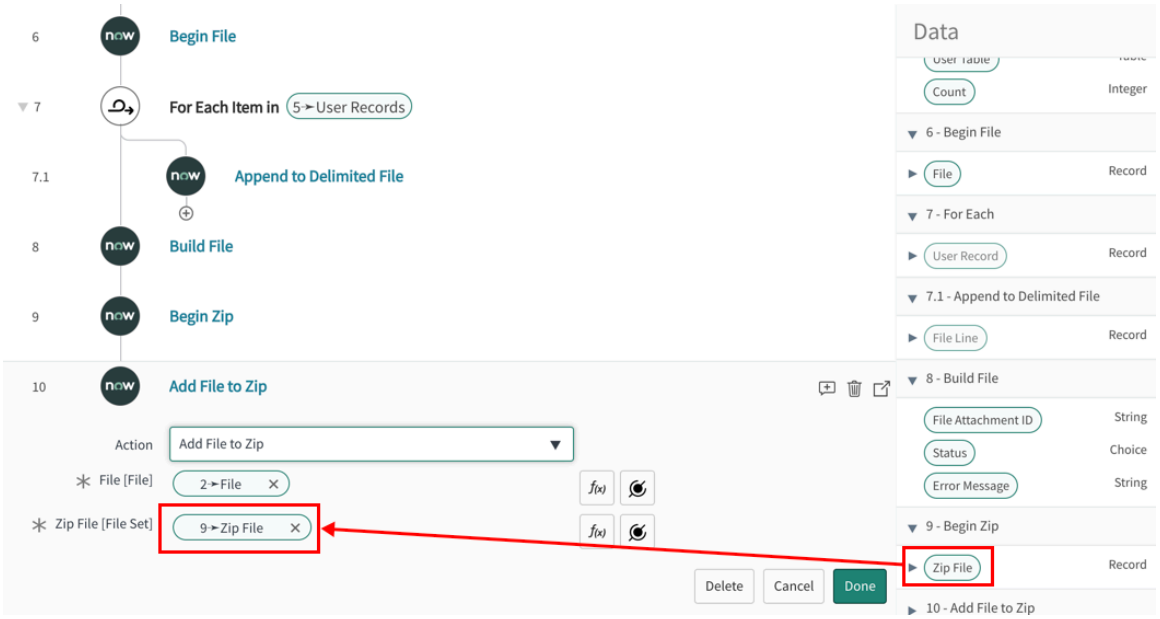
e. Perform similar steps to retrieve records from the User [sys_user] table.



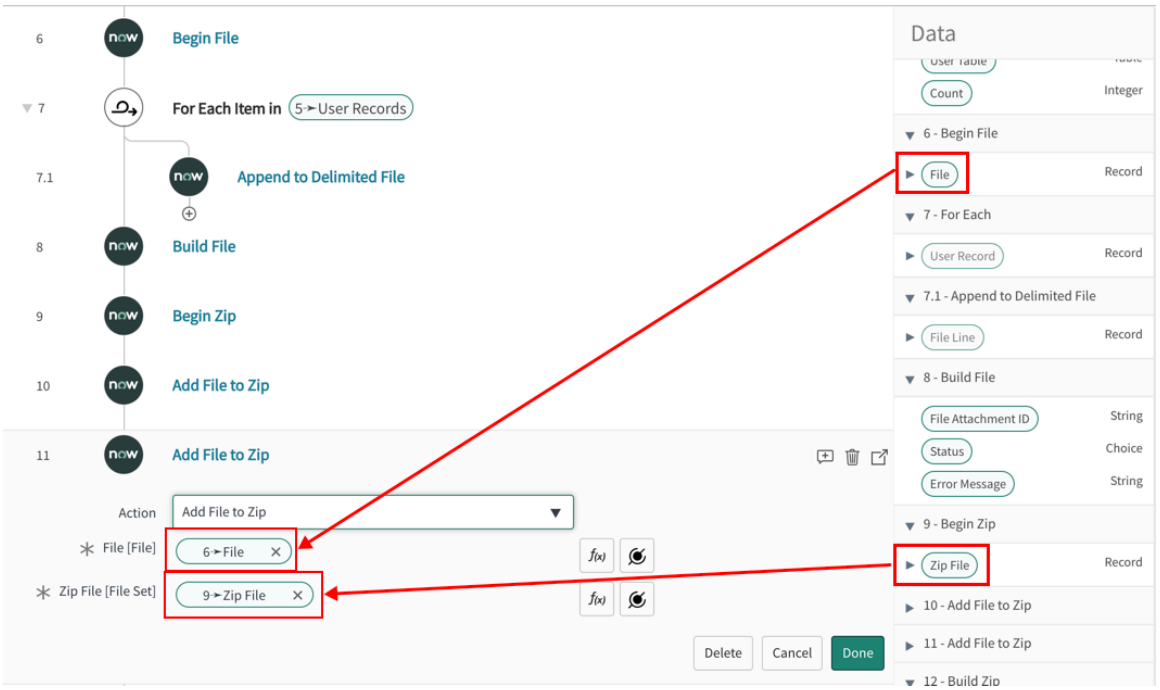
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Begin Zip action to build the ZIP file for the incident and user records.

g. Add File To Zip action to add a file containing the incident records to the ZIP file.



h. Add File To Zip action to add file containing the user records to the ZIP file.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Build a Zip action to create the ZIP file containing the incident and user records.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verifi Spoke

Integrate your ServiceNow instance with the Verifi Spoke to streamline the card dispute resolution process by using the Verifi APIs. This integration facilitates early connections between issuers and merchants in the dispute lifecycle, which simplifies conflict resolutions at the pre-dispute stage and minimizes chargebacks.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Subscription information

This spoke requires a subscription. Contact your ServiceNow account manager or sales representative for subscription details. For more information, see Legal schedules - IntegrationHub overview

Spoke version

Verifi Spoke v1.0 is the latest version.

Supported versions

This spoke was built for Verifi API version 4.0 but may be compatible with later versions.

Key features

Verifi Spoke enables a flow designer to build workflows by using actions that invoke Verifi APIs. This integration enables you to do the following tasks:

- Address disputes with merchants to prevent escalation, which saves time and resources for both issuers and cardholders.
- Create, manage, and close dispute cases by using API actions to ensure smoother operations and enhanced collaboration among stakeholders.
- Resolve disputes early with direct merchant involvement to minimize chargebacks.
- Leverage streamlined processes and pre-dispute resolutions to reduce the effort required in managing disputes.
- Improve cooperation and communication between cardholders, issuers, and merchants.

Spoke requirements

Set up the JSON Web Token (JWT) Key with a shared key (HMAC) and connect a JWT provider to the signing configuration by using a JWT key reference.

Spoke dependencies

Ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Verifi Spoke provides actions to resolve cardholder disputes efficiently.

The actions with sensitive information contain sensitive information in the request and response body. One action involves a request builder to securely create requests and a response parser to handle encrypted API responses. The following table lists the actions that have sensitive information.

Actions with sensitive information

Category	Action	Description
Verifi Case Management	Create Case Request Builder	Use the Request Builder and response parser of the Verifi Create Case API to create a case that represents the cardholder's dispute and submit it for merchant communication.
	Create Case Response Parser	
	Look up Case Request Builder	Use the Request Builder and response parser of the Look up Case API to retrieve the case details from Verifi API.
	Look up Case Response Parser	
	Look up Multiple Cases Request Builder	Use the Request Builder and response parser of the Look up Multiple Cases API to retrieve multiple case details from the Verifi API. The issuer can identify multiple case IDs in a single retrieve attempt.
	Look up Multiple Cases Response Parser	
	CDRN Eligibility Request Builder	Submit a real-time check for merchant eligibility on a case using the CDRN case inquiry-only call, which is facilitated by the request builder and response parser of the Verifi eligibility API.
	CDRN Eligibility Response Parser	
	Update Case Request Builder	Use the request builder and response parser of the Verifi patch API to update the case status to either CLOSED or REVOKED. This functionality enables issuers to efficiently manage case outcomes.
	Update Case	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions with sensitive information (continued)

Category	Action	Description
	Response Parser	

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Verifi Spoke

Set up Verifi Spoke

Integrate the ServiceNow instance and Verifi account by using the JWT authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Verifi spoke.
- Role required: admin.

About this task

JSON Web Tokens (JWTs) enable the capability to configure server-to-server API interactions between ServiceNow and external API providers without requiring any user intervention.

Procedure

1. Generate a JSON Web Token (JWT).
   Create a JWT for your instance by using this link to enable JWT authentication. For Verifi Spoke, generate the authorization by using the *VerifiAuthorizationTokenGenerator* script. For more information, see Generate a JSON Web Token (JWT).
2. Create credential records for the Verifi Spoke.
   Create a connection and credential record for the Verifi Spoke application. The Verifi Spoke connection and credential alias uses these credentials to authorize actions. For more information, see Create a connection and a credential record for the Verifi Spoke.

Create a connection and a credential record for the Verifi Spoke

Create a connection and credential record for the Verifi Spoke application. The Verifi Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

- A shared secret for signing the authentication token.
- Create a JSON Web Token (JWT) key. Associate a JWT provider with the signing configuration by referring to a JWT key.
- An Issuer ID assigned by Verifi. The ID is included in the request headers and authentication token to identify the issuer making API calls.
- Role required: admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Select the **Verifi** record.
   The Connection & Credential Aliases page opens.
3. On the form, fill in the fields.

Connection & credential aliases

Field	Description
Name	Name of the alias. An alias can only contain the alpha, number, and underscore characters.
ID	Unique identifier for the Connections & Credentials alias, based on the format `sn_verifi_spoke.Verifi`.
Application	Application scope against which the Connection & Credentials alias is assigned. The current session scope that you last selected in the application picker appears. For example, **Verifi Spoke** appears if it is the current scope for this session.
Type	Alias type. Select **Connection and Credential**.
Connection type	Name of the connection type, either Basic, HTTP, JDBC, JMS, or Kafka. The default is HTTP.
Support Multiple Active Connections	Designator that indicates whether the alias supports multiple active connections. Add connections by using the Connections table and associate them to the alias by using the Connections related list.
Default Retry Policy	Retry policy for the alias. For more information, see Retry policy.
Configuration Template	Configuration template to use to create a connection and credential record.

4. Select **Save**.
   The Connections and Connection Attributes related list appears.

Related List	Description
Connections	Related connection records associated with this alias. After creating the alias, you can define the connection records and associate them with the alias. If **Support Multiple Active Connections** is selected, you can associate more than one connection with an alias.
Connection Attributes	Attributes for the connection. Define the data that is specific to a connection and use it in an Integration Hub integration step.
Child Aliases	Child aliases that are associated with the parent alias. After creating a connection and credential alias, you can create a child alias to configure multiple connections for the same application integration.

5. **Optional:** If you want to create a new credential and connection associated with your credential alias, under *Related Links*, select **Create New Connection & Credential**.
   In the dialog box, fill in the fields.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection and Credential

Field	Description
Please Enter the Connection Information	
Connection Name	Name of the connection.
Connection URL	URL used for connecting to the server on which Verifi Spoke is installed.
Issuer	An Issuer ID that you copied while setting up the Verifi Spoke by using the JWT authentication type.
API Version	API version that the related spokes are built for. The default value is 4 . 0.
JWT Provider	JWT Provider that you provided while setting up the Verifi Spoke spoke by using the PAT authentication type.

6. **Optional:** If you want to create a child alias for your connection and credential alias, under the Child Aliases related list, select **New**.

   a. Enter a name for the child alias and select **Submit**.
   The child alias inherits the properties from the parent alias. You can then configure a child alias to contain its own set of connection and credential information.

Result
A connection and credential record is created in the ServiceNow instance.

Visa Spoke

Integrate the ServiceNow instance with the Visa spoke to invoke Visa Resolve Online (VROL) APIs for Visa card dispute process and card-on-file payments using Visa Stop Payment Service (VSPS).

Subscription information

This spoke requires a subscription. Contact your account manager or sales representative for subscription details. For more information, see Legal schedules - IntegrationHub overview

Spoke version

Visa spoke v2.0.1 is the latest version.

Key features

The feature includes creating actions to invoke Visa APIs through VROL and VSPS to manage the entire card dispute process and card-on-file payments, including tasks such as:

- Retrieve enriched transaction information
- Perform transaction searches
- Initiate the creation of dispute cases
- Submit Visa questionnaire
- Initiate pre-arbitration and arbitration on existing dispute cases

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

Ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Visa spoke provides actions to invoke Visa APIs under VROL and VSPS to manage the entire card dispute process. Available actions include:

- **Actions with sensitive information** - These actions contain sensitive information in the request and response body. You should use a Tokenization solution when invoking these VROL and VSPS APIs.

Important:
You should disable flow execution logs for Visa APIs that contain Personally Identifiable Information (PII) data. To do this, set the property `com.snc.process_flow.reporting.level` in System Properties to OFF.

VSPS spoke actions

Category	Action	Description
Visa Stop Payment Service	Cancel Multiple Stop Instructions Request Builder	Constructs the request payload for the Cancel API, enabling clients to cancel multiple stop instructions.
	Cancel Multiple Stop Instructions Response Parser	Parses the response of the Cancel API, which can be used to cancel multiple stop instructions.
	Create Stop Payment Instruction by Merchant Identifier Request Builder	Builds the request payload for the API that adds one or more merchant-level stop instructions, accepting a duration, merchant identifiers, PAN, and a start date, along with optional parameters.
	Create Stop Payment Instruction by Merchant Identifier Response Parser	Parses the response of the added merchant API, which issuers or acquirers can use to add one or more merchant-level stop instructions.
	Create Stop Payment Instruction by PAN Request Builder	Adds a PAN-level stop instruction for a specified duration and start date, with optional additional notes and payment frequency.

Category	Action	Description
	Create Stop Payment Instruction by PAN Response Parser	Parses the response of the Add PAN Stop Instruction API, which enables issuers to place a stop instruction on a given PAN for a specified duration and start date.
	Create Stop Payment Instructions by Merchant Category Code Request Builder	Builds the request payload for the API that creates stop payment instructions based on merchant category codes (MCC), accepting PAN, start date, duration, merchant category codes, and optional additional details.
	Create Stop Payment Instructions by Merchant Category Code Response Parser	Parses the response of the create stop payment instruction by merchant category code API. This action can be used to verify the status and details of stop instructions processed based on merchant category codes.
	Look up All Linked Stop Payment Instructions by Stop Instruction ID Request Builder	Builds the request payload for the API that finds all stop instruction details linked to a given stop instruction, accepting a stop instruction ID and search type.
	Look up All Linked Stop Payment Instructions by Stop Instruction ID Response Parser	Parses the response of the linked API. Issuers or acquirers can use this API to find all stop instruction details linked to a given stop instruction.
	Look up Eligible Transactions for Stop Payment by PAN and Date Range Request Builder	Builds the request payload for the API that retrieves eligible transactions. This action accepts a PAN, a date range, a start date, and an optional filter for recurring and installment transactions.
	Look up Eligible Transactions for Stop Payment by PAN and Date Range Response Parser	Parses the response of the eligible transactions API. This action can be used to get a list of transactions that are eligible for placing a stop instruction based on a given PAN and date range.
	Look up Stop Instruction Details by Stop Instruction ID Request Builder	Constructs the request payload for the Retrieve API, which fetches stop

Category	Action	Description
		instruction details using a provided stop instruction ID.
	Look up Stop Instruction Details by Stop Instruction ID Response Parser	Parses the response from the Retrieve API, which can be used to fetch stop instruction details based on the stop instruction ID.
	Look up Stop Payment Instructions by PAN Request Builder	Retrieves stop payment instructions associated with a given PAN, enabling you to search for both active and inactive instructions based on the provided parameters.
	Look up Stop Payment Instructions by PAN Response Parser	Parses the response received from the Lookup Stop Payment Instructions by PAN API.
	Look up Stopped Transactions by PAN Request Builder	Builds the request payload for the Stopped Transactions by PAN API, which enables clients to retrieve stopped transactions by PAN.
	Look up Stopped Transactions by PAN Response Parser	Parses the response of the Stopped Transactions by PAN API, which can be used to retrieve stopped transactions by PAN.
	Look up Stopped Transactions by Stop Instruction ID Request Builder	Builds the request payload for the API that enables you to retrieve a list of stopped transactions using a stop instruction ID.
	Look up Stopped Transactions by Stop Instruction ID Response Parser	Parses the response of the stopped transactions by stop ID API, which enables you to retrieve a list of stopped transactions using a stop instruction ID.s
	Update Stop Instructions Duration by Stop Instruction ID Request Builder	Builds the request payload for the API that extends the end date of multiple stop instructions. It accepts an array of stop instruction IDs and their corresponding durations.
	Update Stop Instructions Duration by Stop Instruction ID Response Parser	Parses the response of the extended API, which enables issuers or acquirers to extend the end date of multiple stop instructions.

Category	Action	Description
	Submit Miscellaneous Fee Request Builder	Produces request payload for the SubmitMiscFee API. It enables clients to request a miscellaneous fee with data.
	Submit Miscellaneous Fee Response Parser	Parses response of the SubmitMiscFee API. It enables clients to request a miscellaneous fee with data.
Fraud Monitoring Program Management	Look up GMFP Details Request Builder	This action builds the request payload for the API GetGMFPDetails
	Look up GMFP Details Response Parser	This action parses the response body returned by VROL system after calling the GMFP Details API.

- **Actions with non-sensitive information** - You can directly invoke these Visa APIs from your ServiceNow instance.

Actions with non-sensitive information

Category	Action	Description
Dispute Financials Management	Initiate Dispute from Transaction or Case	Enables you to initiate dispute from transaction or case.
	Change Dispute Status	Parses response of CardholderPurchaseInquiry. This API provides Real-Time Systems Interface (RTSI) users with the capability to request additional merchant information regarding a transaction. It can also be used to retrieve purchase information for non-VisaNet transactions
Case Management	Look up Image	Retrieves an image added to a newly created case.
	Upload Image	UploadImage is used to add an image to a case.
	Download and Attach Image	Downloads and attaches a Visa case image to a ServiceNow record.
	Update Case Resolution Status	Enables you to update the case resolution status of a case. This may close the case, depending on the status change made.

© 2026 ServiceNow, Inc. All rights reserved.

Category	Action	Description
	Create Case from Transaction	Issuers use this API to create a case from a Transaction Inquiry request.
Questionnaire Management	Submit Dispute Questionnaire	This action enables Real-Time Systems Interface (RTSI) users to submit or save the dispute questionnaire.
	Look up Fraud Bundle Dispute Questionnaire Status	Provides Real-Time Systems Interface (RTSI) users with the capability to retrieve details of a submitted fraud bundle dispute.
	Submit Fraud Bundle Dispute Questionnaire	Provides Real-Time Systems Interface (RTSI) users with the capability to submit or save the fraud bundle dispute questionnaire. This request can include images.
Batch Queues Management	Mark Batch Queue Item as Read	Marks transactions as read to remove them from the Real-Time Systems Interface (RTSI) Batch Queue.
Queues Management	Ignore GMFP	Enables the issuer to change the status of the VFMP transaction to 'Ignored' by sending a request using the GMFPItemID, once they've reviewed each Visa Fraud Monitoring Program (VFMP) transaction in the queue.
	Close Miscellaneous Fee	Provides the functionality to remove miscellaneous fee transactions.
	Close Message	Provides the functionality to remove Request Proof of Posting (RPP) message transactions.
	Accept Dispute	Accepts the dispute liability or accepts the other side's decision, and removes the dispute transaction from the queue.
Transaction Inquiry Management	Close Transaction	This action is used to close certain transactions and remove them from their respective queues.
	Select Associated Transactions	AssociatedTranSelection enables you to confirm or refute the associations of

Category	Action	Description
		some or all of the associated transactions within a group to a selected transaction in a case.
	Look up Associated Transaction List	Enables you to retrieve a list of associated transactions by supplying the associated transaction group ID.
	Look up Associated Transaction Selection	Enables you to confirm or refute the associations of some or all of the associated transactions within a group to a selected transaction in a case.
Dispute Pre-Arbitration Management	Create Dispute Pre Arbitration	Initiates the creation of a Pre-Arbitration using this API.
	Create Dispute Pre Arbitration Response	Provides Real-Time Systems Interface (RTSI) users with the capability to respond to a Pre-Arbitration.
Case Filing Management	Submit Contact Message Response	SubmitContactMessageResponse enables Real-Time Systems Interface (RTSI) users to submit a response to a contact message.
	Submit Dispute Filing	Submit a dispute case filing request, withdrawal, or appeal.
Report Distribution Management	Look up Report Output	Enables you to retrieve the report for a particular run date in CSV format.
	Look up Active Schedule	Enables you to retrieve details of all the scheduled reports for your organization or for a particular report that the user wants to know.
Batch Queue Management	Mark Batch Queue Item as Read	Marks transactions as read to remove them from the Real-Time Systems Interface (RTSI) Batch Queue.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For more information about setting up the spoke, see Set up Visa Spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up Visa Spoke

Integrate the ServiceNow instance and Visa Spoke using basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Visa Spoke.
- Role required: admin.

Upload client certificate to your instance

Upload the client certificate to your ServiceNow instance to enable the creation of connections and credentials.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System LDAP** > **Certificates**.
2. Click **New**.
3. Complete the form.

X.509 Certificate form fields

Field	Description
Name	Enter a name to uniquely identify the record. For example, `Visa Client Certificate`.
Type	Select **PKCS12 Key Store**.
Notify on expiration	Define users to be notified when the certificate expires.
Warn in days to expire	Enter the number of days to send a notification before the certificate expires.
Active	Enable
Expires in days	Enter the number of days until the certificate expires.
Key store password	Enter a password associated with the certificate.
Short description	Enter a summary about the certificate.

4. Click the attachments icon and attach a client certificate(.p12) file.
5. Click **Validate Stores/Certificates** to check if the certificate is correct.
   If the instance encounters any errors with the certificate or keystore, it displays an error message.

Upload a trusted server certificate

Generate a certificate for the Visa Resolve Online (VROL) endpoint and upload it to your ServiceNow instance as a TrustCertificate. By uploading the trusted server certificate, you ensure that your instance is connecting to a valid and secure service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
The instance validates outbound Web Service calls by using the certificate provided by the service provider.

Procedure
1. Create a new Certificate record with the format **PEM** and type **Trust Store Cert**.
2. Do one of the following actions:
   - Attach the service provider's DER formatted certificate.
   - Copy and paste the service provider's PEM format certificate into the **PEM Certificate** field.

Create a protocol profile

You can create a custom HTTPS protocol profile to specify the credentials and certificates used for outbound web services. For example, you can create a custom HTTPS protocol profile to enable mutual authentication.

Before you begin
- Role required: admin
- Upload client certificate to your instance to authenticate the client certificate of the instance.
- Upload a trusted server certificate to authenticate the server certificate of the web service provider.

Procedure
1. Navigate to **All** > **System Security** > **Protocol Profiles**.
2. Click **New**.
3. Fill in the fields on the form, as appropriate.

Name of form

Field	Description
Protocol	Enter a unique name to identify this HTTPS protocol, such as `visahttps`. The protocol name allows you to differentiate between normal HTTPS connections and HTTPS connections that use this protocol profile. The name you enter becomes the protocol name in the URL. For example, `visahttps://endpoint.service.com` **Note:** You cannot create a custom protocol whose name matches as an existing protocol name such as HTTPS.
Keystore	Select the Keystore certificate that you had created when uploading a client certificate. For example `Visa Client Certificate`
Default port	Enter the port number for connections that use this protocol.

Create basic auth server credentials

Create credentials to access a ServiceNow instance for both VROL and VSPS spoke actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential.
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential while it attempts to log in to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Select **Submit**.

Create a Connection & Credential alias for Visa

Create a custom credential record for the Visa Spoke account. The Visa Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Credentials & Connections** > **Connections**, click **New**, and select **HTTP(s) Connection**.
2. Add the following connection information and click **Submit**:

Field	Description
Name	Unique name of this HTTP(s) connection.
Credential	Select the credential record used to authorize the connection.
Connection Alias	Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
URL builder	Either manually enter the connection URL or use system to build the URL based on the inputs. Default is unchecked. If checked, the connection URL is calculated from the following fields: ○ Mutual authentication — Check box if mutual authentication is used. ○ Protocol profile — Select the protocol created. For example, `visahttps`. ○ Host - Enter the Visa Endpoint. For example, `xxx.visa.com` ○ Base path — Path of the connection string. **Note:** If mutual authentication is checked, connection URL is built: Protocol + :// + host:port +URL. If mutual authentication is unchecked, connection URL is built: Protocol profile + :// + host:port +URL
Connection URL	If URL builder is unchecked, enter the connection URL into this field. **Note:** If mutual authentication is checked, connection URL is built: Protocol + :// + host:port +URL. If mutual authentication is unchecked, connection URL is built: Protocol profile + :// + host:port +URL
Active	Check the box to make this connection active.
Domain	Determine the domain the action or activity runs in.

3. Click **Submit**.
   You are ready to create a custom HTTP(s) action or activity.

Vonage Spoke

Manage communications through calls, SMS, and WhatsApp by using the Vonage account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Vonage spoke v2.0.0 is the latest version.

Supported versions

This spoke was built for Vonage for these versions, but may be compatible with later versions:

- Messages API version v1
- Voice API version v1

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- Admin access to Vonage account and Vonage API Dashboard.
- Record the values of **API key** and **API Secret**. You can access these values from the Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.
- Record and save the value of the **Signature Secret**. You can access this value in the Account Settings in Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Vonage spoke provides sample subflows to demonstrate automating Vonage tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Vonage SMS Webhook	Processes the SMS requests from Vonage.
Vonage Voice Webhook	Processes the voice requests from Vonage.
Vonage WhatsApp Webhook	Processes the WhatsApp requests from Vonage.

To customize the default subflow, you must a create a copy of the sample subflow and customize the subflow as per your requirement. While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

Spoke actions

The Vonage spoke provides actions to automate Vonage tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Account Management	Get Account Balance	Retrieves the current balance of the Vonage account.
Call Management	Play DTMF tone into Call	Plays DTMF (Dual-tone multi-frequency) tones into an active call

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Attach Recording To ServiceNow Record	Attaches a call recording to the target ServiceNow record.
	Create Outbound Call	Creates an outbound call to a phone number.
	Generate NCCO	Constructs a Nexmo Call Control Objects (NCCO) that is used in Create an Outbound Call action.
	Generate Connect NCCO	Generates a Nexmo Call Control Object (NCCO) that defines how to connect an outbound call to endpoints such as a phone number or WebSocket.
	Generate Notify NCCO	Generates a Nexmo Call Control Object (NCCO) that defines a notify action for an outbound call.
	Generate Transfer NCCO	Generates a Nexmo Call Control Object (NCCO) that defines how to transfer an active call.
	Look Up Call Details	Retrieves the details of the specified call.
	Look up Calls	Retrieves details of the specified calls.
	Play Audio into Call	Plays an audio file into an active call.
	Play Text to Speech into Call	Plays text-to-speech into an active call.
	Stop Playing Audio into Call	Stops playing an audio file into an active call.
	Stop Text to Speech In Call	Stops text-to-speech into an active call.
	Update Call	Updates the status of an active call.
Number Management	Look up Numbers	Retrieves all the inbound numbers associated with the Vonage account.
RCS Management **Note:** If you are upgrading from an earlier version of the spoke, make sure to generate a new JWT token in your existing credential record before using this category actions.	Send RCS Card Message	Sends an RCS (Rich Communication Services) card message to a specified phone number.
	Send RCS Media Message	Sends an RCS (Rich Communication Services) media message to a specified phone number.
	Send RCS Text Message	Sends an RCS (Rich Communication Services) text message to a specified phone number.
SMS Management	Send SMS	Sends an SMS (Short Message Service) to a phone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
WhatsApp Management **Note:** If you are upgrading from an earlier version of the spoke, make sure to generate a new JWT token in your existing credential record before using this category actions.	Send Contacts	Sends contacts to a WhatsApp number.
	Send Location	Sends geographic coordinates of a location to a WhatsApp number.
	Send Media Message	Sends a media message to a WhatsApp number.
	Send Text Message	Sends a text message to a WhatsApp number.
	Send Text Message Using Template	Sends a text message using the template to a WhatsApp number.

Spoke module

Bi-directional webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow instance. These conditions are based on the events in Vonage that you want to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Vonage tasks. By default, the Vonage Spoke application is available and has the following modules:

- Vonage Webhook Registries
- Vonage WebHook Routing Policies

Use the Vonage Webhook Registries module to assign a token and provide the API path. You must generate a Callback URL here and provide this URL in Vonage. Default routing policies are provided as a reference in the Vonage WebHook Routing Policies module. Customize these routing policies as per your requirement. The routing policy supports these fields:

- Keywords
- Call Direction
- Call Status
- Event Type
- From
- SMS Status
- SMS Text
- To
- WhatsApp Message Status
- WhatsApp Text
- Show Related Fields

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are available along with the Vonage spoke:

Vonage alias	Description
VonagePrimary	Required for the actions that manage SMS, number, and account.
Vonage	Required for the actions that manage calls and WhatsApp.

For information about setting up the spoke, see Set up the Vonage spoke.

Set up the Vonage spoke

Integrate your ServiceNow instance with the Vonage instance to enable communication between them. With this integration, your ServiceNow instance can automate actions on the Vonage instance, while the Vonage instance can send payloads to your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Vonage spoke plugin on your ServiceNow instance.
- Role required: admin.
- Vonage developer instance account.

Configure the Vonage developer instance

Generate essential credentials, such as API keys, secrets, and signature secrets, to set up your Vonage developer instance. Your ServiceNow instance uses these credentials in the connection record to connect to the Vonage developer instance.

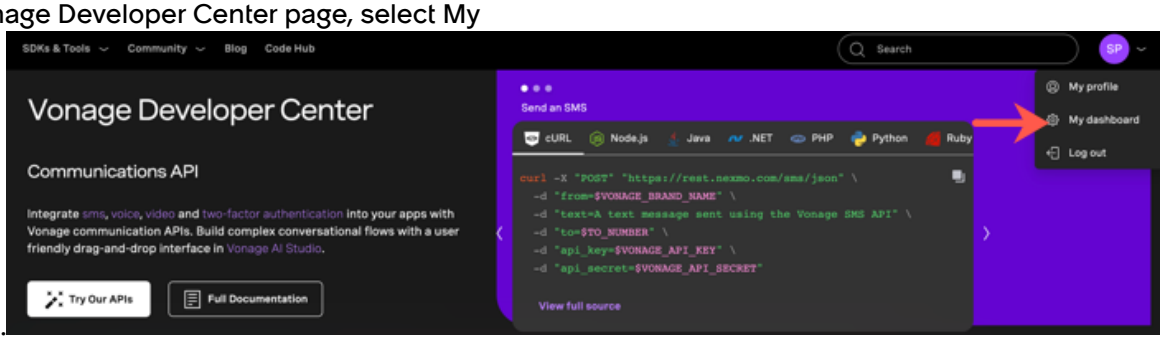
Before you begin

Role required: admin

Access to a Vonage developer account.

Procedure

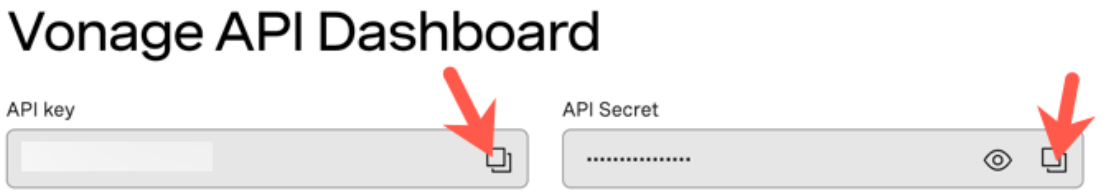
1. Log in to https://developer.vonage.com/en/home.
2. On the Vonage Developer Center page, select My dashboard.



3. On the Vonage API Dashboard page, use the default API key and the API secret or create your custom API key and API secret.

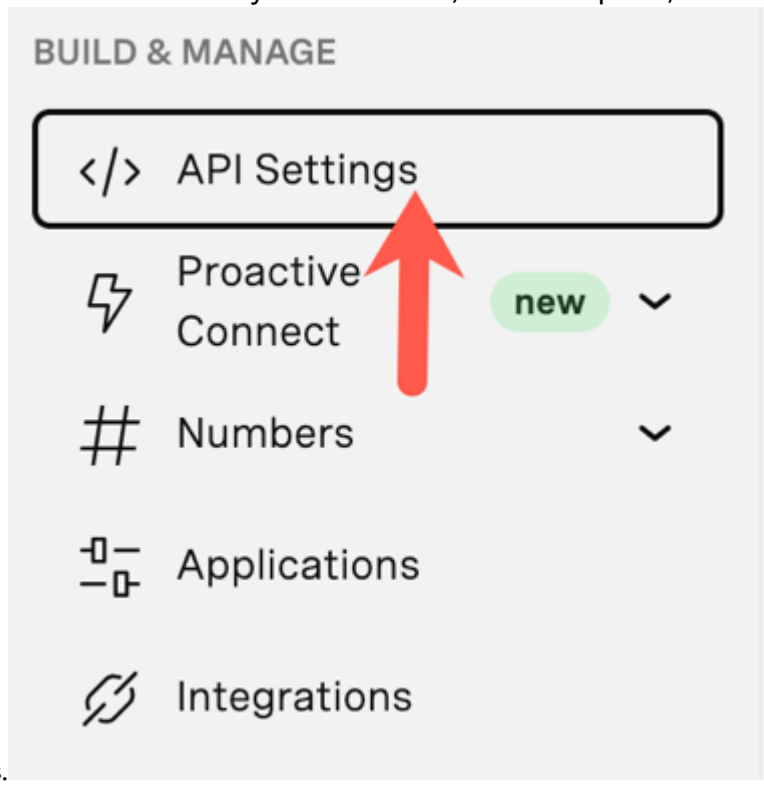
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. To use the default API key and the API secret, copy the default API key and the API secret



values.

b. To generate a custom API key and API secret, on the left panel, select API



Settings.

c. Select **Request more API keys**.

d. Fill and submit the form.

e. Select **Create new secret**.

f. In the Add a new secret window, enter your custom secret.

g. Select **Save**.

4. From the Signature secret field, copy the signature secret.

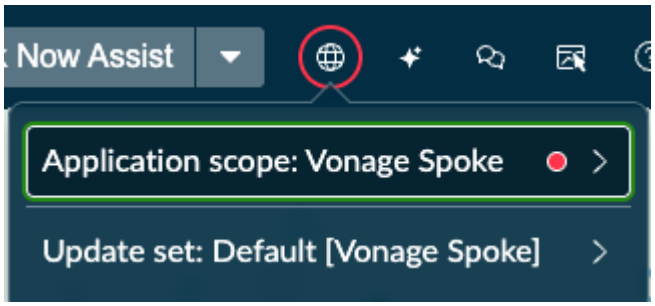
Configure connection record for Vonage connection and credential alias

Configure a connection record that enables your ServiceNow instance to connect with the Vonage instance and automate various actions on the Vonage instance. For example, create a flow on Workflow Studio that gets your Vonage account balance.

Before you begin
Role required: admin

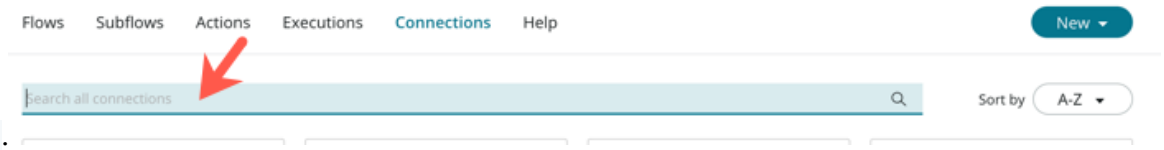
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure that you are in the **Vonage spoke** scope.



Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select Connections.
3. In the Search all connections field, enter



`Vonage`.

4. On the Vonage card, select **View Details**.
5. Select **Configure**.
6. Fill the form.

Create Connection

Field	Description
Connection Name	The default and read-only name of the connection record. To provide a custom name to the connection record, create a connection record by selecting **Add Connection**.
Connection URL	The URL to connect to the Vonage API.
Messages API Version	The version of APIs the connection record requests for using the SMS feature in the Vonage instance.
Voice API Version	The version of APIs the connection record requests for using the Voice feature in the Vonage instance.
Credential Name	Name of the credential record. The default name os Vonage credential which you can update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application Name	Name of the account that you had entered in the Settings page of the Vonage developers account. API Key	API key you had acquired in the Vonage developer instance.
API Secret	API secret you had acquired in the Vonage developer instance.
Signature Secret	Signature secret key you had acquired in the Vonage developer instance.

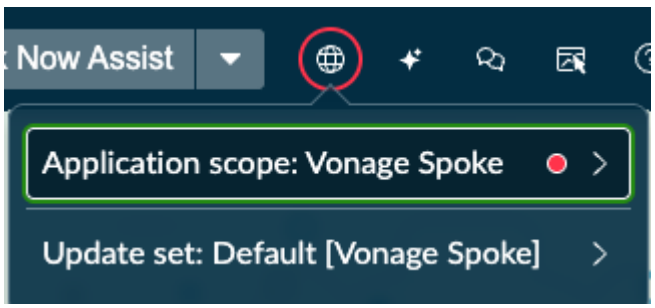
7. Select **Create Connection**.

Configure connection record for Vonage Primary alias

Configure a connection record that enables your ServiceNow instance to connect with the Vonage instance and automate various actions on the Vonage instance. For example, create a flow on Workflow Studio that gets your Vonage account balance.

Before you begin
Role required: admin

Note:
Ensure that you are in the **Vonage spoke** scope.

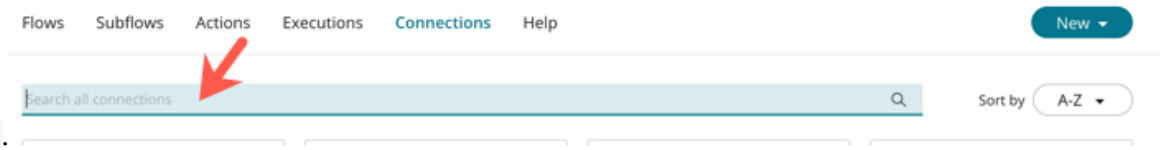


Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select Connections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Search all connections field, enter Vonage.



4. On the VonagePrimary card, select **View Details**.
5. Select **Configure**.
6. Fill the form.

Create Connection

Field	Description
Connection Name	The default and read-only name of the connection record. To provide a custom name to the connection record, create a connection record by selecting **Add Connection**.
Connection URL	The URL to connect to the Vonage API. Enter https://rest.nexmo.com.
API Key	API key you had acquired in the Vonage developer instance.
API Secret	API secret you had acquired in the Vonage developer instance.

7. Select **Create Connection**.

Create a webhook to receive data from Vonage

Set up webhooks for SMS to enable the Vonage API platform to send data to your ServiceNow instance. For instance, if a flow in your ServiceNow instance sends an API request for call details to the Vonage API but the request fails initially, the webhook ensures that the Vonage API sends the data later.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Vonage spoke** > **Vonage webhook Registries**.
2. Select **New**.
3. On the form, fill in these fields.

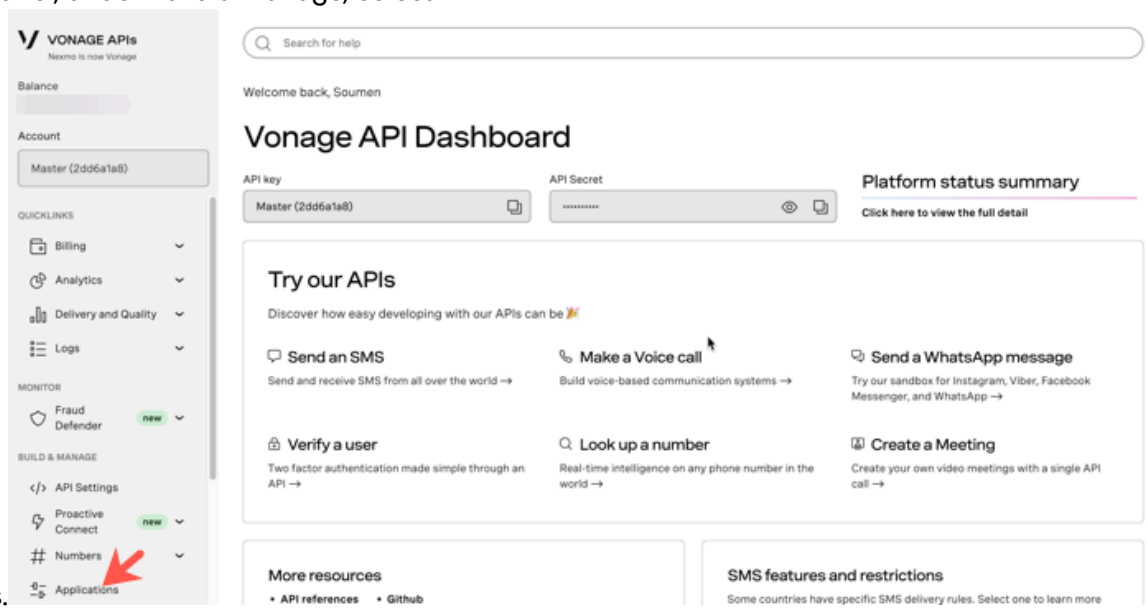
Vonage Webhook Registry form

Field	Description
Name	Name to uniquely identify the webhook record.
Description	Description of the webhook record.
Event Type	Type of event for which the webhook is set up. Select **SMS**.

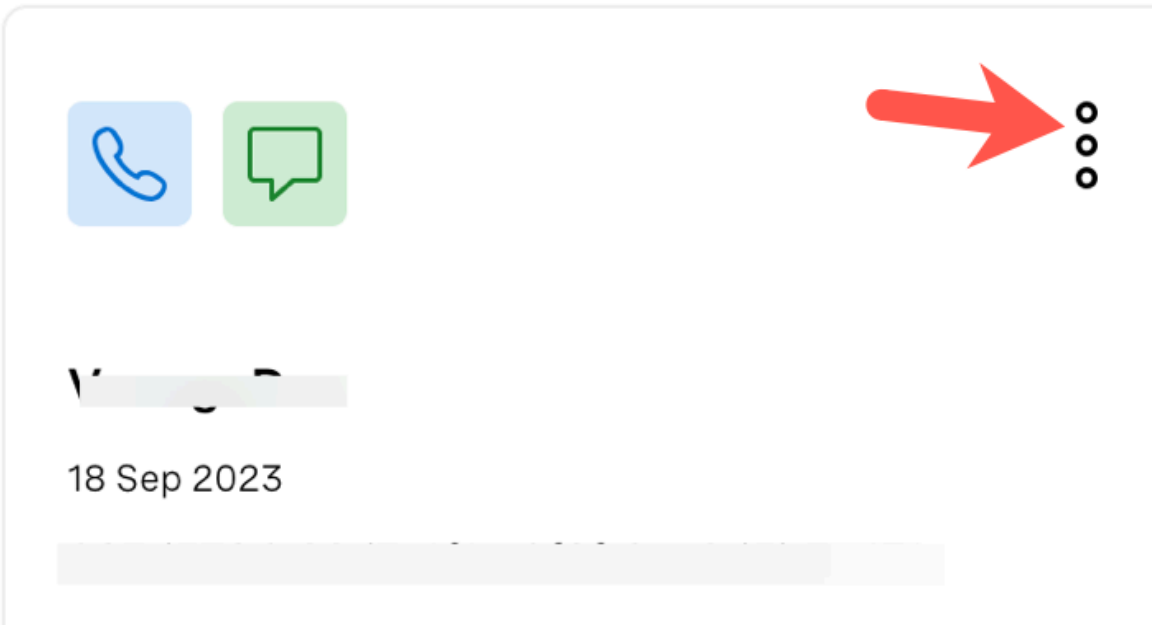
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Secret Key	Secret key to authenticate the webhook requests. Enter your custom secret key.

4. Right-click the form header and select **Save**.
5. Select **Callback URL**.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.
7. Log in to https://developer.vonage.com/en/home.
8. On the left panel, under Build & Manage, select Applications.



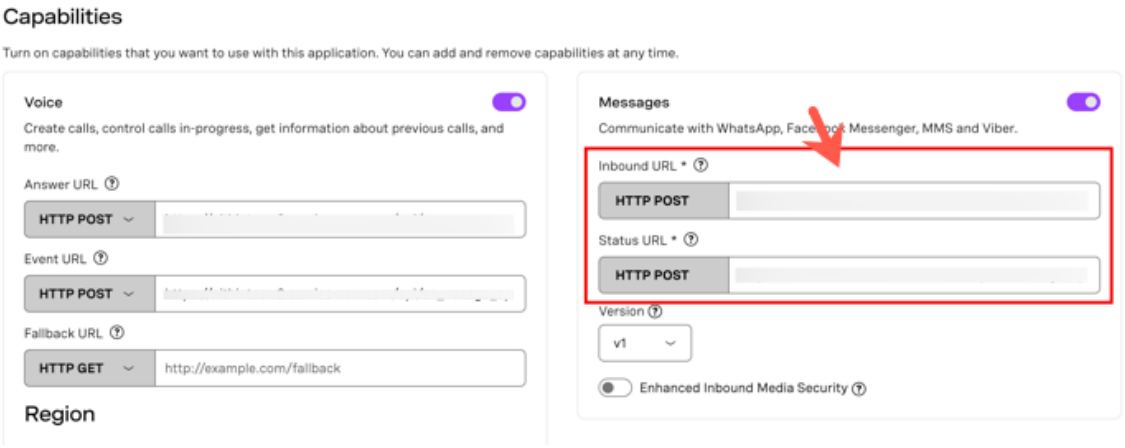
9. On the Your applications page, select the menu icon (⋮) for your application.



10. Select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Under the Messages heading, enter the callback URL in the Inbound URL and the Status URL fields.



12. On the left panel, select API Settings.
13. On the Settings page, under SMS Settings heading, make sure that you've selected **SMS API**.
14. Fill the values.

Field	Value
Delivery receipts (DLR) webhooks	Webhook callback URL
Inbound SMS webhooks	Webhook callback URL

15. Select **Save changes**.
    SMS settings for the application are saved.

Customize webhooks and routing policies

Customise the webhook routing policy and subflow as per your requirement.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Click **Subflows**.
3. Create a copy of the required default subflow.
4. Customize the subflow as per your requirement and publish it.
   See Building subflows for more information about creating and using subflows and Vonage Spoke for information about the fields that the default routing policy and subflows support.
5. Navigate to **Vonage Spoke** > **Vonage WebHook Routing Policy**.
6. Click **New**.
7. On the form, fill in the fields.

Decision form

Field	Description
Label	Unique label to identify the routing policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Default answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met. **a.** Click the lookup icon ( ). **b.** Select the required subflow from the Document list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.
Condition	Conditions to be met when the required events occur in Vonage. The supported Vonage fields are: ○ Keywords ○ Call Direction ○ Call Status ○ Event Type ○ From ○ SMS Status ○ SMS Text ○ To ○ WhatsApp Message Status ○ WhatsApp Text ○ Show Related Fields
Answer	Subflow that must be triggered when the specified conditions are met.

8. Click **Submit**.

Note:
These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Set up triggers for the Vonage spoke

Set up triggers for the Vonage spoke for the required events. The endpoint enables webhooks to connect with your ServiceNow instance.

Configure triggers in ServiceNow instance

Configure endpoint for webhooks in the Vonage that support the token authentication.

Before you begin

Role required: flow_designer and connection_admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab and select **Connections**.
3. Toggle and enable the **Inbound** connections
4. Locate the **Vonage Spoke** endpoint and click **View Details**.

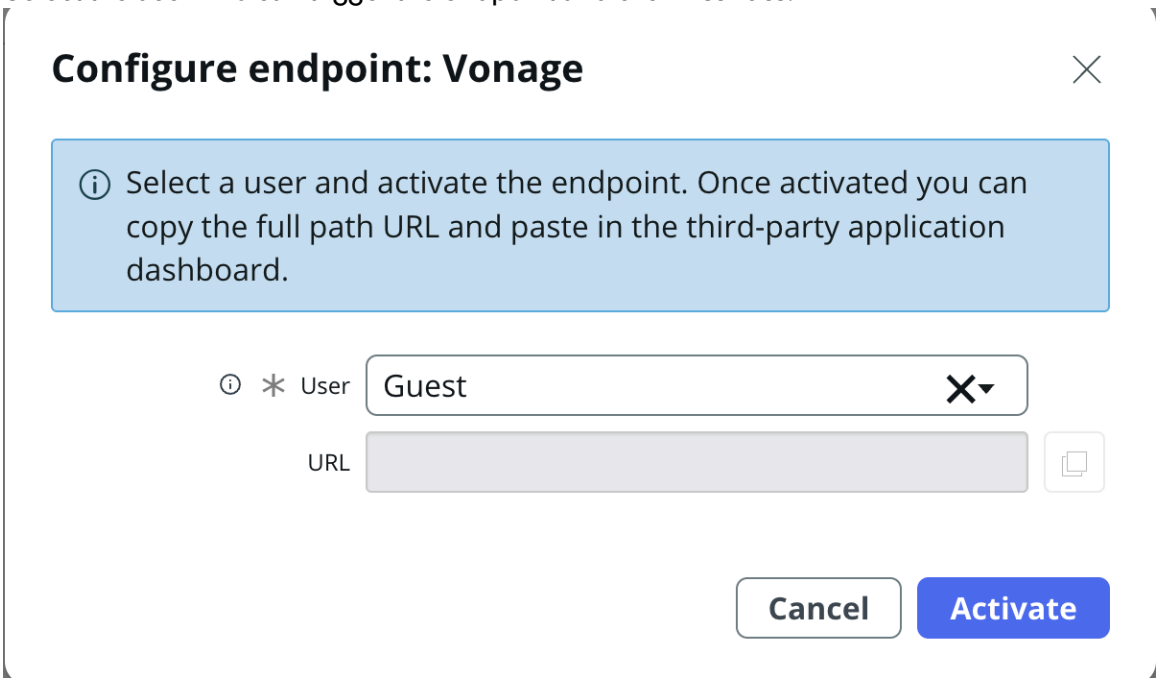
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select either of the endpoints.

Endpoint	Description
Vonage External Trigger	External trigger event sources which use token based authentication. All voice and text based triggers are supported with this endpoint.
Vonage External Trigger (Hash)	External trigger event sources which use hash#based authentication. All RCS message and Whatsapp message triggers are supported with this endpoint.

a. If you select the **Vonage External Trigger** end point, click **Configure**.

b. Select the user who can trigger the endpoint and click **Activate**.



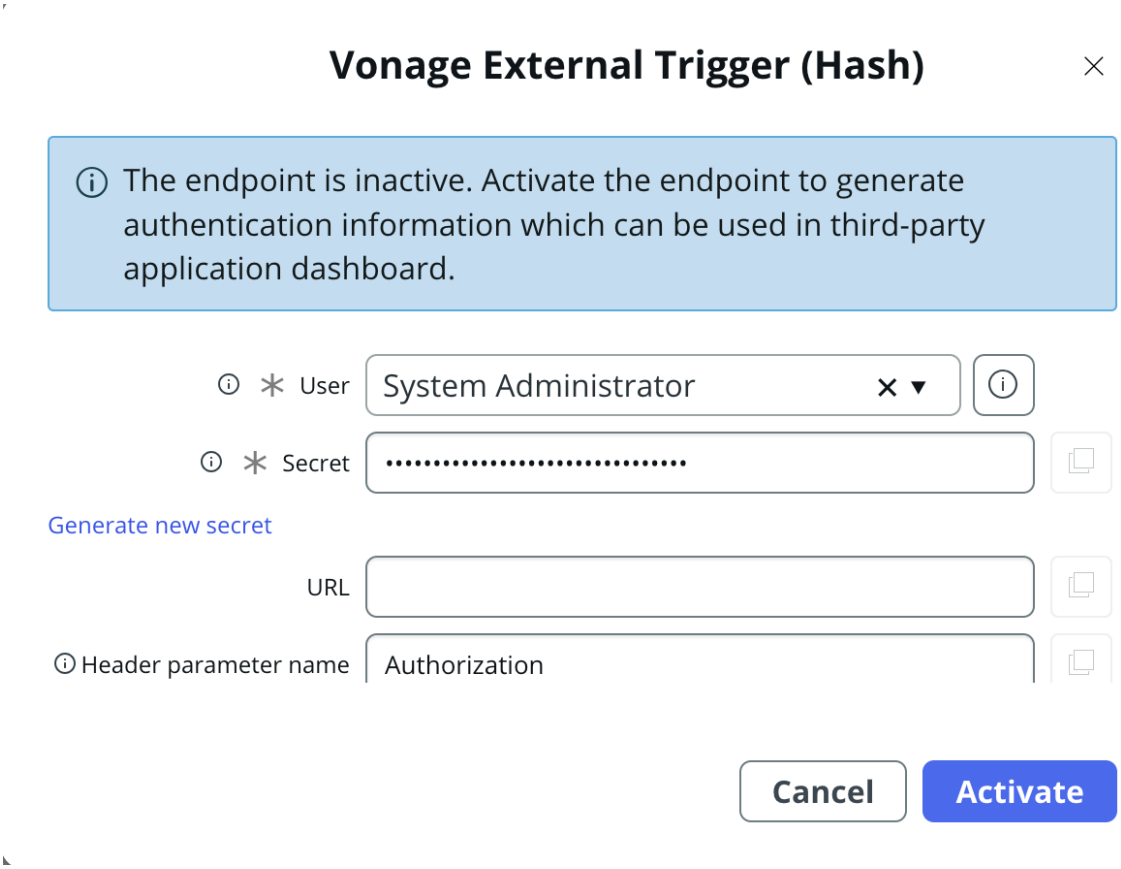
c. Copy the generated endpoint URL.

a. If you select the **Vonage External Trigger (Hash)** end point, click **Configure**.

b. Select the user who can trigger the endpoint and copy paste the Signature Secret in the Secret field.

c. Click **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Copy the generated endpoint URL.

6. Verify that the selected endpoint is working.

Add the endpoint URL in Vonage

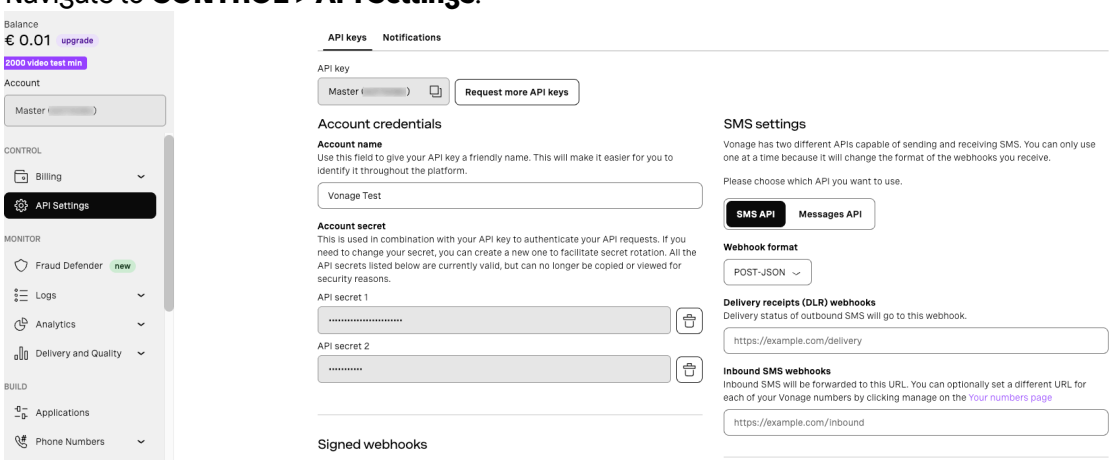
Add the endpoint URL that is generated in your ServiceNow instance in the Vonage API Dashboard to enable webhooks to connect with your ServiceNow instance.

Before you begin
Role required: admin

Procedure

1. Log in to your Vonage API Dashboard.

2. Navigate to **CONTROL** > **API Settings**.

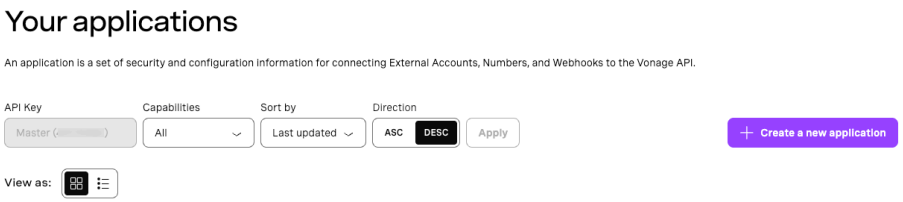


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

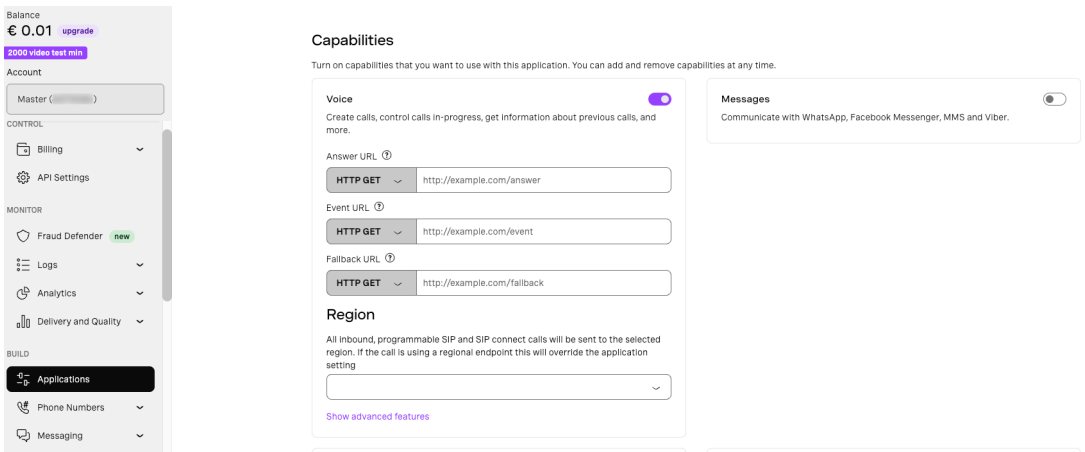
3. Under **Default SMS Setting**, locate the webhook URL fields.
4. In the webhook URL field, paste the generated endpoint URL.

Field	Description
Delivery receipts (DLR) webhooks	Endpoint URL that was generated after you Configure triggers in ServiceNow instance to receive delivery status updates.
Inbound SMS webhooksvo	Endpoint URL that was generated after you Configure triggers in ServiceNow instance to receive inbound messages.

5. Click **Save** to save the changes.
6. To configure webhooks for call management, navigate to **BUILD** > **Applications** > **Create a new application**.



7. While creating an application, toggle the Voice option under Capabilities.
8. Copy the URL generated in your ServiceNow instance and paste it as the Answer URL and Event URL and click **Save**.



Workday Financials Spoke

The Workday Financials spoke is built by Bristlecone, Inc. Manage resources, business units, journals, cost centers, and so on, in Workday Financials application from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Workday Financials spoke v2.1.1 is the latest version.

Supported versions

This spoke was built for Workday Financials SOAP API version v39.0, but may be compatible with later versions.

Spoke requirements

To set up the integration, perform these:

1. Register Integration System User.

> **Note:**
> While filling account information details, ensure that you select the **Do Not Allow UI Sessions** check box.

2. Create a security group and assign it to the integration system user.
   a. In **Action**, navigate to **Security Group** > **Maintain Domain Permissions for Security Group** and provide these permissions:

Domain security policy permissions

Operation	Domain Security Policy	Domain Security Policies Inheriting Permission	Functional Areas
Get Only	Set Up: Worktags - Business Units		Common Financial Management Worktags
Get Only	Set Up: Ledger and Book		Common Financial Management
Get and Put	Process: Journals - Core		Financial Accounting
Get Only	Process: Journals - View		Financial Accounting
Get and Put	Process: Purchase Order - Cancel		Procurement
Get Only	Process: Advance Ship Notice - View		Procurement
Get Only	Process: Supplier Invoice - New		Supplier Accounts
Get Only	Process: Request for Quotes - View		Procurement
Get Only	Set Up: Accounts		Common Financial Management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operation	Domain Security Policy	Domain Security Policies Inheriting Permission	Functional Areas
Get Only	Create: Cost Center		Organizations and Roles
Get Only	Set Up: Currency Rates		Common Financial Management
Get Only	Set Up: Currency (Compensation functional area)		Core Compensation
Get Only	Integration Build		Integration
Get Only	Process: Business Assets		Business Asset Tracking
Get Only	Set Up: Expense Item		Expenses
Get Only	Set Up: Purchase Item		Procurement
Get Only	Reports: Supplier		Supplier
View Only	Process: Purchase Order - Reporting		Procurement
Get and Put	Integration Event		Integration
View Only	Integration Security		Integration

Note:
Ensure that the domain security policies are activated for the security group.

b. Configure the business process policies of your security group and provide these permissions:

Business process security policy permissions

Operation	Business Process Type	Functional Area
Initiate (Register Asset (Web Service))	Asset Registration Event	▪ Business Asset Accounting ▪ Business Asset Tracking
Initiate (Submit Purchase Order Change Order (Web Service))	Change Order	Procurement
Initiate (Submit Purchase Order (Web Service))	Purchase Order Event	Procurement
Initiate (Submit Receipt (Web Service))	Receipt	Procurement
Initiate (Submit Supplier (Web Service))	Supplier Event	Supplier

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operation	Business Process Type	Functional Area
Initiate (Submit Supplier Invoice (Web Service))	Supplier Invoice Event	Supplier Accounts

Note:
Ensure that the business process security policies are activated for the security group.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.cobject)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Authentication

Workday provides an open SOAP API for programmatic access to on-demand business management services. Workday SOAP APIs require basic authentication; that is, user name and password are required.

Note:
This spokes doesn't require you to set up the connection and credential alias.

Spoke subflows

The Workday Financials spoke provides sample subflows to demonstrate automating Workday Financials tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Create PO	Creates a purchase order record in the Purchase Order table. To use the subflow, Set up webhook for your Workday Financials spoke.
Get Supplier Invoice Details	Retrieves details of the specified supplier invoice.

Spoke actions

The Workday Financials spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Approval Management	Approve Business Process	Approves the required business process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Cancel Business Process	Cancels the required business process.
	Deny Business Process	Denies the required business process.
	Look up Approvals	Retrieves the approvals records from Workday and saves the details as an attachment in the Data Source table. **Note:** To use this action, you must create and configure the To Do RaaS report. For instructions, see Configure the To Do report.
Invoice Management	Void or cancel Invoice	Cancels the required supplier invoice.
	Update Supplier Invoice	Updates details of the required supplier invoice.
Receipt Management	Void or Cancel Receipt	Cancels the required receipt.
	Look up Goods Receipts Stream	Retrieves details of the required receipts.
	Update Receipt	Updates details of the required receipt.
Requisition Management	Look up Requisitions Stream	Retrieves the requisition data.
	Update Requisition	Updates details of the required requisition records.
	Create Requisition	Creates requisition record with the provided details.
Purchase Order Management	Look up Purchase Orders and PO Lines Stream	Retrieves details of the required purchase orders and PO lines.
Primary Data Management	Look up Company Contact Information by ID	Retrieves details of the required company contact.
	Look up Organizations Stream	Retrieves the organization data.
	Look up Locations Stream	Retrieves details of the required locations.
Supplier Management	Look up Supplier Contracts Stream	Retrieves details of the supplier contracts.
	Deactivate Supplier	Deactivates the required supplier.
	Create Supplier Location	Creates a supplier location with the provided details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Supplier Location	Updates details of the required supplier location.
	Delete or Void Supplier Bank Account	Deletes the required supplier bank account or makes it void.
	Create Bank Account	Creates a supplier bank account with the provided details.
	Update Bank Account	Updates details of the required supplier bank account.
	Update Supplier	Updates details of the required supplier.
Financial Management	Get Account Set By ID	Retrieves details of the specified account set.
	Get Business Unit By ID	Retrieves details of the specified business unit.
	Get Cost Center By ID	Retrieves details of the specified cost center.
	Get Ledger By ID	Retrieves details of the specified ledger record.
	Look up Account Sets	Retrieves details of the required account sets, based on the provided filter criteria.
	Look up Business Units	Retrieves details of the required business units, based on the provided filter criteria.
	Look up Cost Centers	Retrieves details of the required cost centers, based on the provided filter criteria.
	Look up Fx Rates	Retrieves details of the required Fx rates, based on the provided filter criteria.
	Look up Ledger Accounts	Retrieves the ledger accounts from Workday and saves the details as an attachment in the Data Source table. **Note:** To use this action, you must create and configure the Ledger Account RaaS report. For instructions, see Configure the Ledger Account report.
	Look up Payments and Payment Status	Retrieves the payment and payment status details from Workday and saves the details as an attachment in the Data Source table. **Note:** To use this action, you must create and configure the Payment Status RaaS report. For instructions, see Configure the Payment Status report.
Journal Entry Management	Create Accounting Journal	Creates an accounting journal.
	Look up Journals	Retrieves details of the required journal records, based on the provided filter criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Post Accounting Journal	Posts an accounting journal record.
	Reverse Accounting Journal	Reverses the specified accounting journal.
Metadata Retrieval	Get Additional Fields For Workday Finance	Retrieves additional fields for each action.
	Get Reference ID List	Retrieves values of the Reference ID based on the specified reference type.
	Get Access Token	Retrieves the access tokens for authenticating SOAP based actions using OAuth 2.0.
Resource Management	Cancel Purchase Order	Cancels the specified purchase order.
	Create Fixed Asset Shell	Creates a fixed asset shell.
	Create Supplier	Creates a supplier with the provided details.
	Create Supplier Invoice	Creates a supplier invoice with the provided details.
	Get Advanced Shipment Notice By Number	Retrieves details of the specified advance shipment notice.
	Get Supplier By ID	Retrieves details of the specified supplier.
	Get Supplier Invoice By ID	Retrieves details of the specified supplier invoice.
	Look up Advanced Shipment Notices	Retrieves details of the required advance shipment notices, based on the provided filter criteria.
	Look up Expense Items	Retrieves details of the required expense items, based on the provided filter criteria.
	Look up Fixed Asset Details	Retrieves details of the required fixed assets, based on the provided filter criteria.
	Look up Material Groups Stream	Retrieves the catalog data.
	Look up Purchase Items	Retrieves details of the required purchase items, based on the provided filter criteria.
	Look up Request For Quotes	Retrieves details of the required request for quotes records, based on the provided filter criteria.
	Look up Supplier Invoices	Retrieves details of the required supplier invoices, based on the provided filter criteria.
	Look up Suppliers	Retrieves details of the required suppliers, based on the provided filter criteria.
	Submit Purchase Order	Submits the specified purchase order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Submit Purchase Order Change Order	Submits change order associated with the specified purchase order.
	Submit Receipt	Submits the specified receipt.

Spoke module

The Workday Financials spoke adds the Workday Finance application to your instance and includes these modules:

Module	Description
Connection Details	Contains information about the base URL of the Workday instance or tenant, and API version.
Get Business Units	Displays information about the business units. Admin should configure the sample remote table as per their requirement.
Purchase Orders	Displays information about the purchase orders whenever they are created in the Workday application. To retrieve this information to the ServiceNow instance, you must Set up webhook for your Workday Financials spoke.
Webhook Registries	Contains records of webhooks registries. Admin should create record here Set up webhook for your Workday Financials spoke for the required Workday event.

For information about setting up the spoke, see Set up the Workday Financials spoke and Set up webhook for your Workday Financials spoke.

Set up the Workday Financials spoke

Integrate the ServiceNow instance Workday instance by using the WS-Security Username Profile to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Workday Financials spoke.
- Role required: admin

Provide the Workday Financials base URL

Provide the base URL of your Workday Financials instance in the Connection Details [connection_details] table. Spoke actions based on the SOAP API, use these details for the action execution.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Filter and search for the Connection Details table.
3. Click the **Show List** related list.
4. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the form, fill these values.

Connection Details form

Field	Description
Base URL	Base URL of the Workday instance or tenant name.
Version	Version of the API. For example, enter `v33.2`.

6. Click **Save**.

Create a WS-Security Username Profile for the Workday Financials spoke

Create a WS-Security Username Profile to provide your Workday credentials to authenticate requests from ServiceNow.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **SOAP Integrations** > **WS-Security Username Profiles**.
2. Click **New**.
3. On the form, fill these values.

Field	Description
Name	Name to uniquely identify this credential. For example, enter `WorkdayFinancials User`.
Application	Application in which the record is applicable. Select **Workday Financials Spoke**.
Username	Workday user who has integration rights using Workday Web Services.
Password	Password of the Workday user.

4. Click **Save**.

Configure the SOAP security policy for the Workday Financials spoke

Configure the SOAP security profile by adding the security user name profile you had created to authenticate requests from ServiceNow.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **SOAP Integrations** > **SOAP Security Policies**.
2. Open the record, **WorkdayFinancials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. For **WS-Security Username Profile**, select the security username profile you had created for the Workday Financials spoke.
   See Create a WS-Security Username Profile for the Workday Financials spoke for more information.
4. Do not provide value in **WS-Security X.509 Profile**.
5. Right-click the form header and click **Save**.

Generate client ID and client secret for Workday Financials spoke

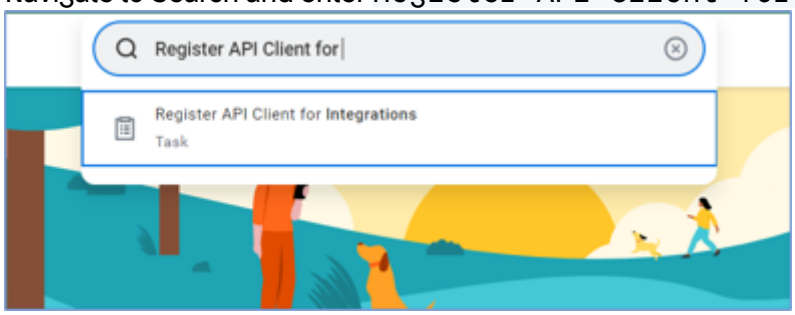
Register Workday Financial spoke as the API client in your Workday account and generate client ID, client secret.

Before you begin

Role required: admin

Procedure

1. Log into your Workday tenant.
2. Navigate to Search and enter `Register API Client for Integrations` task.



3. On the Register API Client for Integrations form, fill in the details.

Field	Description
Client Name	Client name of the app. For example, enter `Workday Financials spoke`.
Non-expiring Refresh Tokens	Option to enable refresh tokens that do not expire.
Scope (Functional Areas)	Select the required functional areas.
Include Workday Owned Scope	Option to select Workday owned scope.

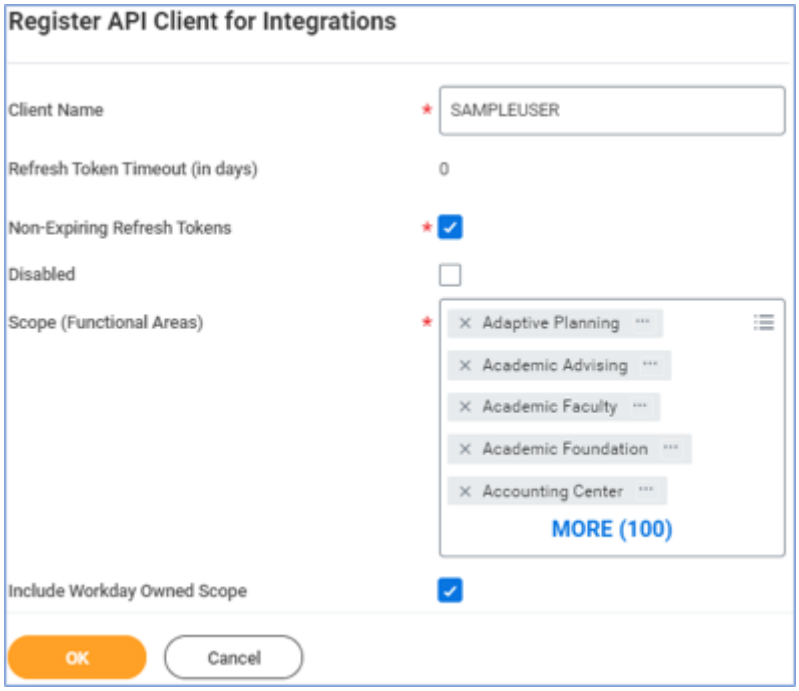
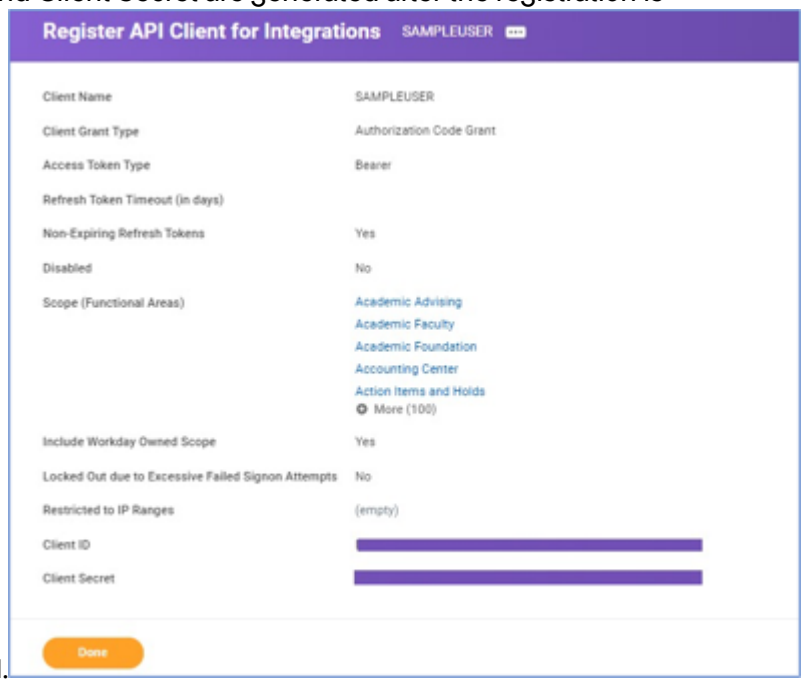
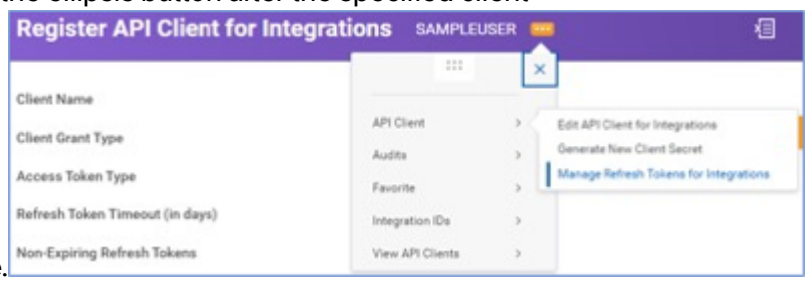
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Click **OK**.
   Client ID and Client Secret are generated after the registration is successful.



5. Click the ellipsis button after the specified client name.

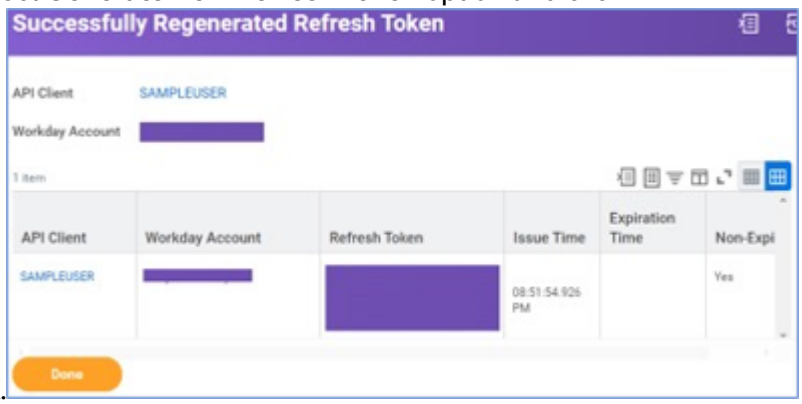


6. Select **API Client** >**Manage Refresh Tokens for Integrations**.
7. Select your Workday Account and click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete or Regenerate Refresh Token screen displays.

8. Select **Generate New Refresh Token** option and click **OK**.



Result
A new refresh token is generated. Copy and store the refresh token for configuring system property.

Generate token URL for Workday Financials spoke

Register API client in your Workday account and generate a token URL for Workday Financials spoke.

Before you begin
Role required: admin

Procedure

1. Log into your Workday tenant.
2. Navigate to Search and enter `Register API Client` task.
3. On the Register API Client, fill in the details.

Field	Description
Client Name	Client name of the app. For example, `Workday Financials spoke`.
Client Grant Type	Select Authorisation Code Grant.
Access Token Type	Access Token Type: Select Bearer
Redirection URI	Enter your ServiceNow URL in this format: `https://<instance>.service-now.com/oauth_redirect.do`.
Non-Expiring Refresh tokens	Option to enable refresh tokens which do not expire.
Scope (Functional Areas)	Select the required functional areas.
Include Workday Owned Scope	Option to select scope that are owned by Workday.

4. Click **OK**.

Result
Copy and store the generated Token Endpoint value for configuring system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure system properties for Workday Financials spoke

Configure the system properties to enable OAuth for SOAP APIs based actions for Workday Financials spoke.

Before you begin

- Generate client ID and client secret for Workday Financials spoke
- Generate token URL for Workday Financials spoke
- Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. In the **Application** column, search for `Workday Financials Spoke`.
3. Open the *`sn_workdayfin_spke.glide.hub.clientid`* system property.
4. Enter the Client ID generated from the Workday account in the **Value** field and click **Update**.
5. Open the *`sn_workdayfin_spke.glide.hub.clientsecret`* system property.
6. Enter the Client secret generated from the Workday account in the **Value** field and click **Update**.
7. Open the *`sn_workdayfin.glide.hub.refreshtoken`* system property.
8. Enter the refresh token generated from the Workday account in the **Value** field and click **Update**.
9. Open the *`sn_workdayfin_spke.glide.hub.tokenurl`* system property.
10. Enter the token URL generated from the Workday account in the **Value** field and click **Update**.

Result

The required system properties are configured for the Workday Financials spoke.

Create a credential record

Create a Basic Auth credential record to use the RaaS-report based actions. The Workday Financials spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.

   The system displays this message: `What type of Credentials would you like to create?`

3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

Name	Name to identify the credential record. For example, `Workday Financials Cred`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User name	User name of the Workday user with access to the RaaS reports.
Password	Password of the Workday user with access to the RaaS reports.

5. Right-click the form header and select **Save**.

Configure a connection record

Create and configure a Workday Financials spoke connection to authenticate ServiceNow requests.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, for example, **WorkdayFinancials**.
3. From the **Connections** tab, select **New**.
4. On the form, fill these values.

Field	Description
Name	Name to identify the connection record. For example, `Workday Financials Conn`.
Credential	Required credential record of the Basic Auth type. Select the credential record you had created for the Workday Financials spoke. For example, `Workday Financials Cred`. For more information, see Create a credential record.
Connection URL	Base URL to connect to your Workday instance.

5. For **tenant_name** in the **Attributes** tab, enter the value of your Workday tenant name.
6. Right-click the form header and select **Save**.

Configure the To Do report

Create and configure the To Do report to retrieve worker's finance related inbox items suc as, to-dos, action items, approval, and so on.

Before you begin

Role required: User with access to create report and the Business process event steps report data source.

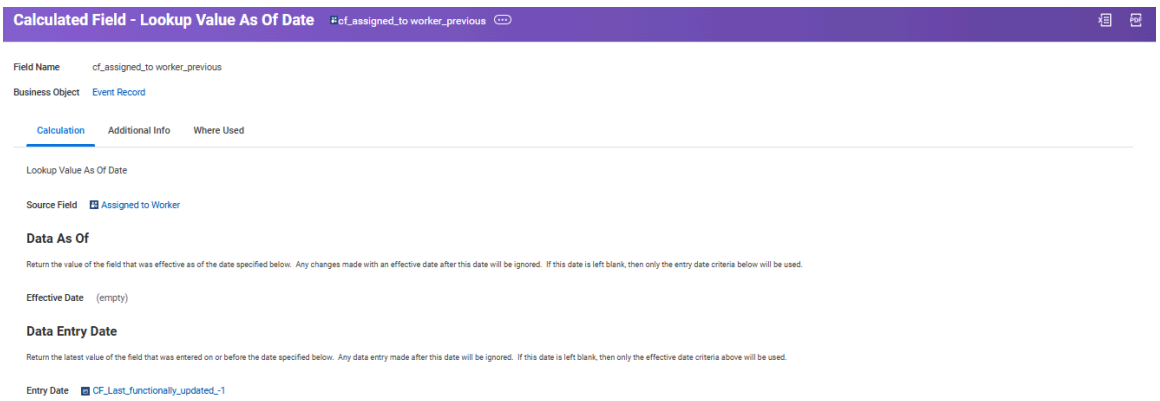
Create all the required calculated fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Calculated field 1:

   a. Create increment and decrement type calculated field named **CF_Last_functionally_updated_-1**.

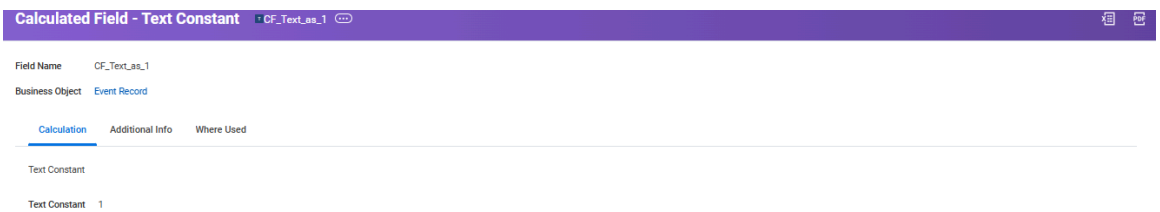
   b. Create Lookup Value As Of Date type calculated field named **cf_assigned_to_worker_previous** and use **CF_Last_functionally_updated_-1** in this field.



2. Calculated field 2:

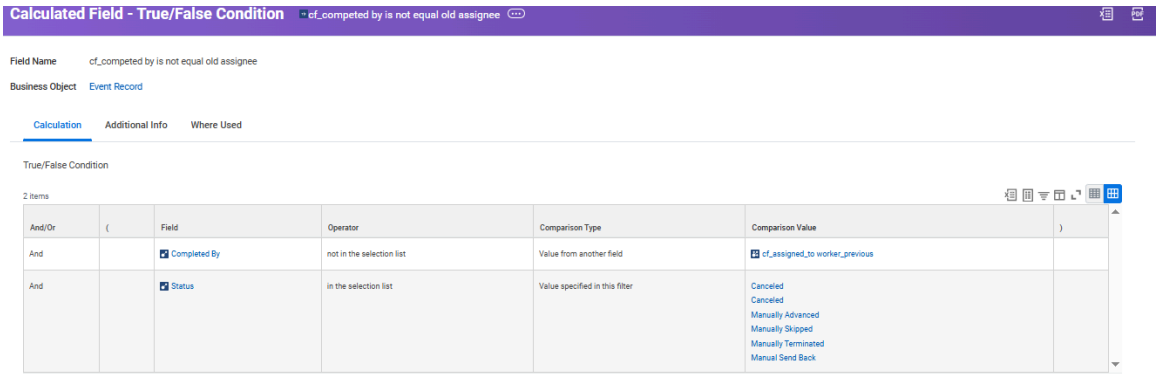
   a. Create text constant type calculated field named **Cf_text_0**.

   b. Create text constant type calculated field named **CF_Text_as_1**.

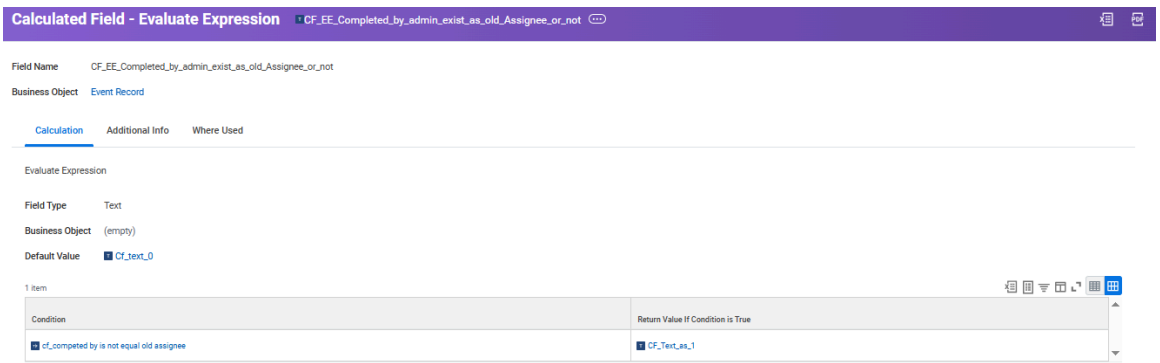


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Create true/false condition type calculated field named **cf_competed_by_is_not_equal_old_assignee**.

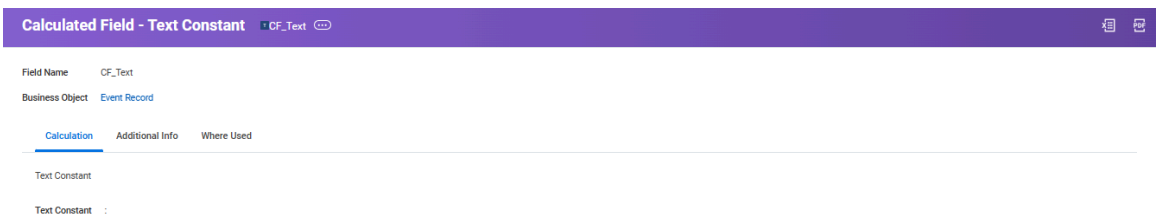


d. Create evaluate expression calculated field named **CF_EE_Completed_by_admin_exist_as_old_Assignee_or_not**.

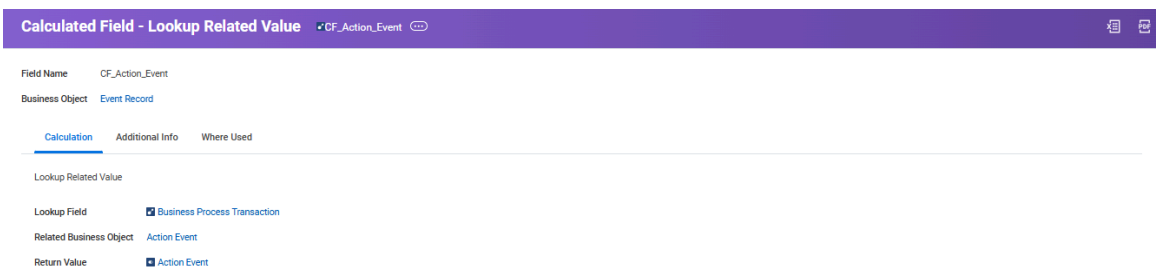


3. Calculated field 3:

a. Create text constant type calculated field named **CF_Text**.

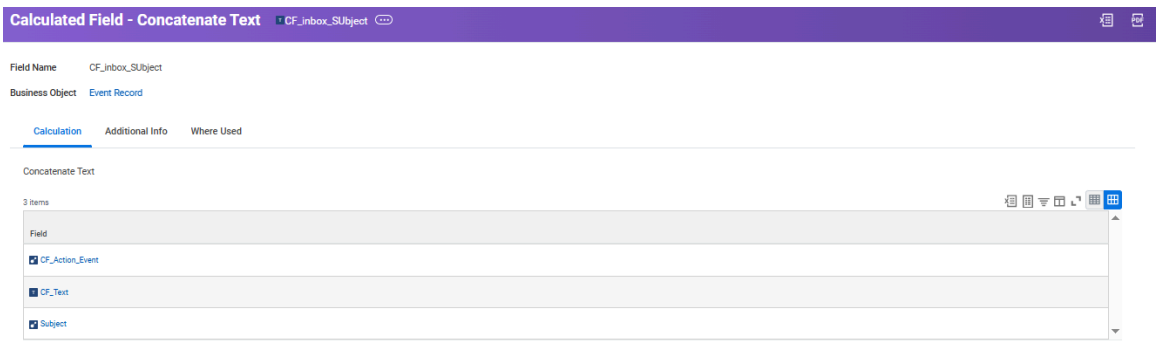


b. Create Lookup related value type calculated field named **CF_Action_Event**.



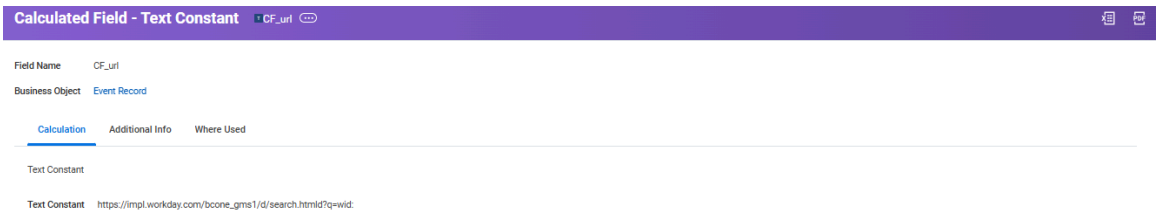
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Create Concatenate text type calculated field named **CF_inbox_SUbject**.

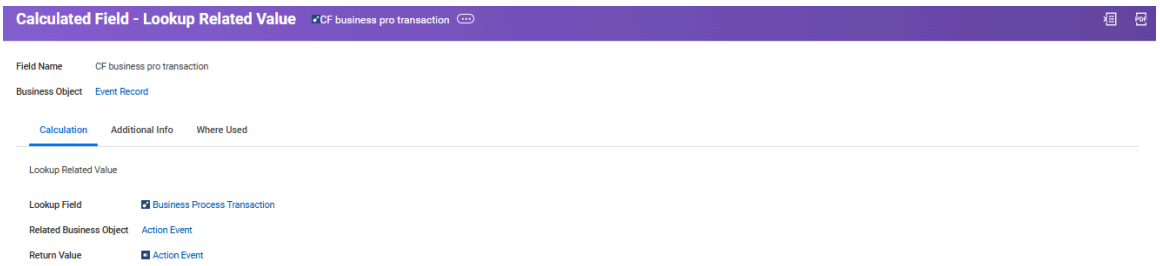


4. Calculated field 4:

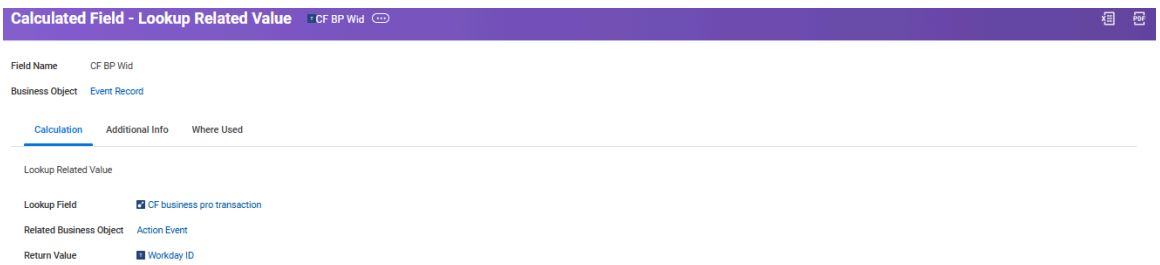
a. Create text constant type calculated field named **CF_url**.



b. Create Lookup related value type calculated field named **CF_business_pro_transaction**.

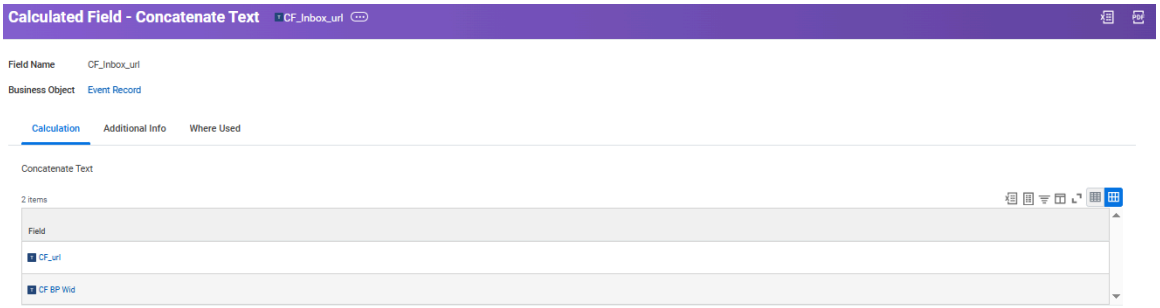


c. Create Lookup related value type calculated field named **CF_BP_Wid**.



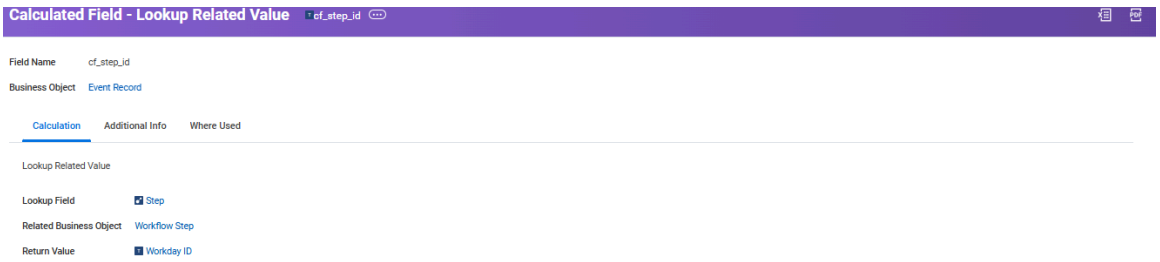
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Create Concatenate text type calculated field named **CF_Inbox_url**.

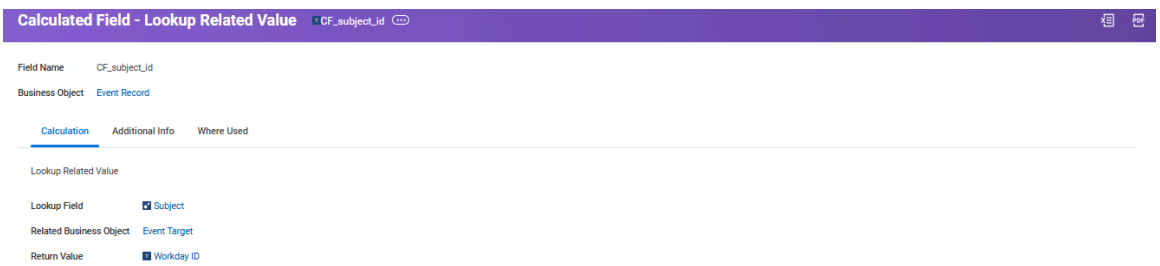


5. Calculated field 5:

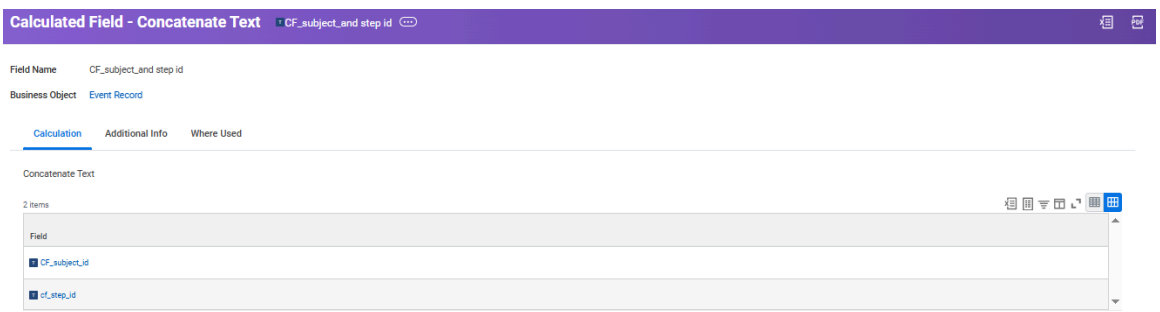
a. Create Lookup related value type calculated field named **cf_step_id**.



b. Create Lookup related value type calculated field named **CF_subject_id**.

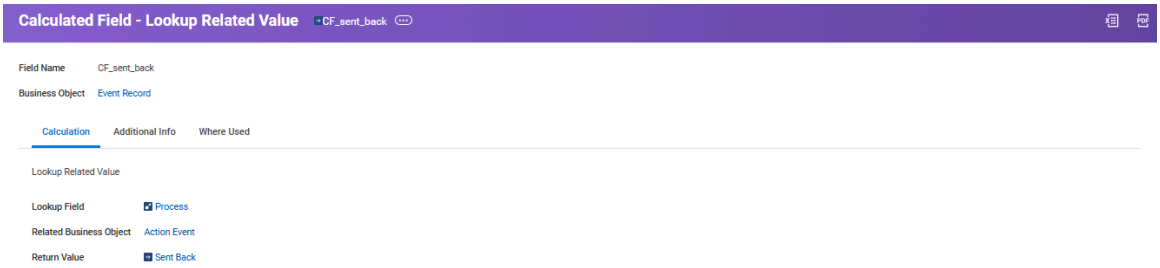


c. Create Lookup related value type calculated field named **CF_subject_and_step_id**.



6. Calculated field 6: Create Lookup related value type calculated field named **CF_sent_back**.

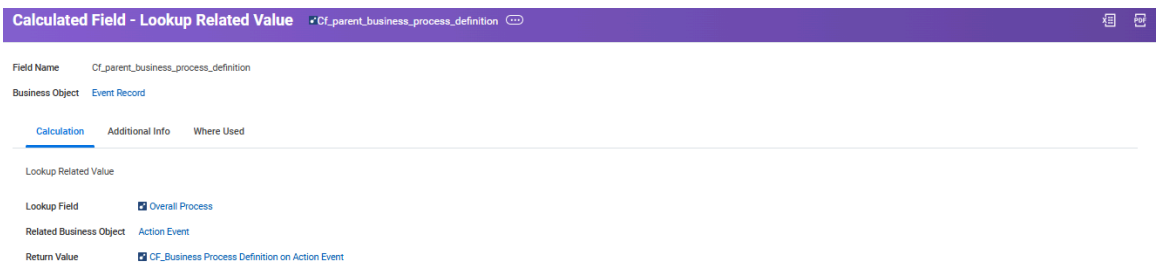
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Calculated field 7:

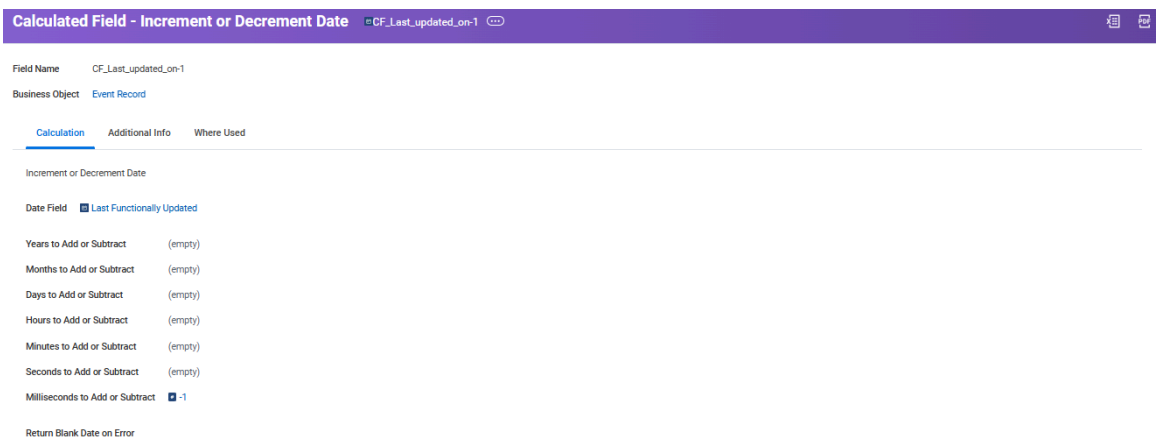
   a. Create Lookup related value type calculated field named **CF_Business Process Definition on Action Event**.

   b. Create Lookup related value type calculated field named **Cf_parent_business_process_definition** and use **CF_Business Process Definition on Action Event** in it.



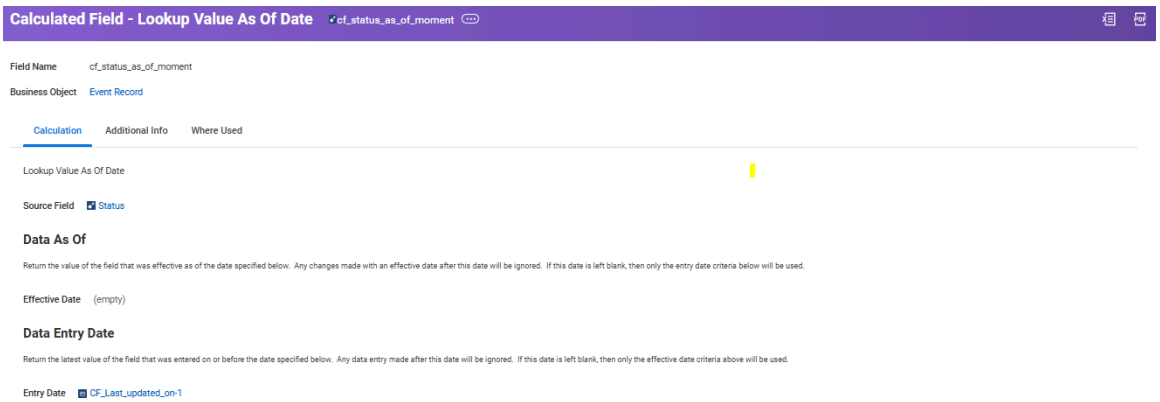
8. Calculated field 8:

   a. Create increment and decrement type calculated field named **CF_Last_updated_on-1**.

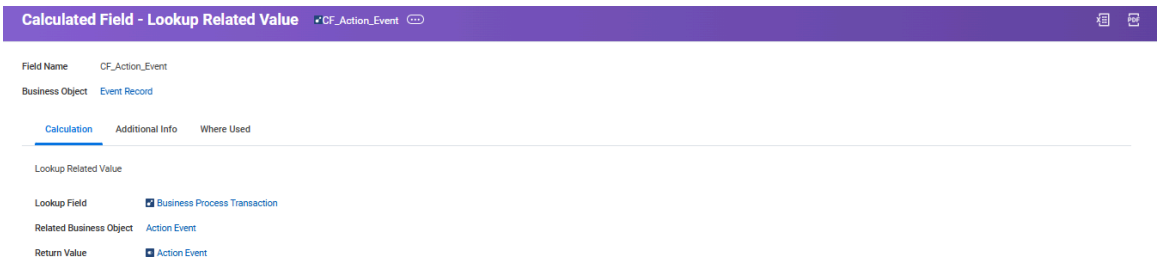


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

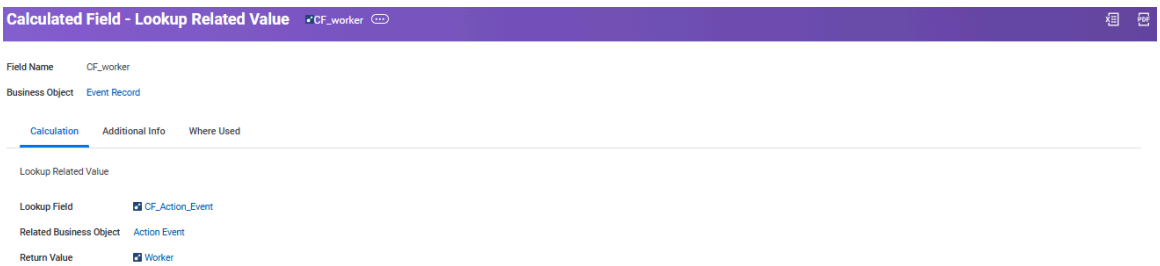
b. Create Lookup Value as of date type calculated field named **cf_status_as_of_moment** and use **CF_Last_updated_on-1** in this field.



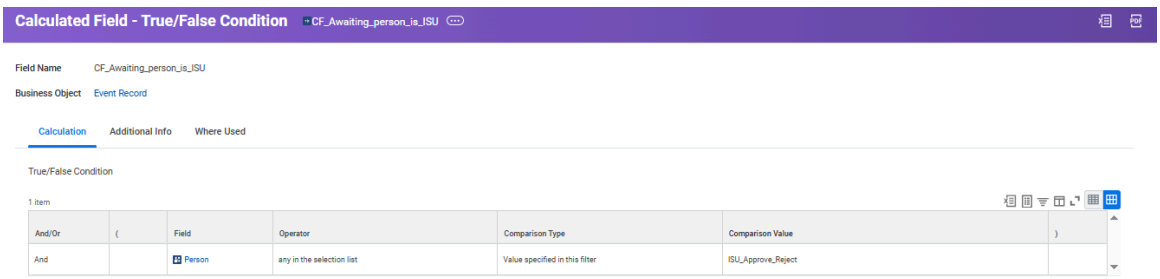
9. Calculated field 9: Create Lookup Value as of date type calculated field named **CF_Action_Event**.



10. Calculated field 10: Create Lookup Value as of date type calculated field named **CF_worker** and use **CF_Action_Event** as lookup field.



11. Calculated field 11: Create True/False condition type calculated field named **CF_Awaiting_person_is_ISU**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

- For identification purpose, all calculated field names starts with CF.
- Create all calculated fields required for this report before developing the report to ensure that they are available while creating the report.
- While creating the report, you can select a different report name. However, ensure that the report field names or column heading override for the respective field (if given in the report document) should be same as it is in report document.

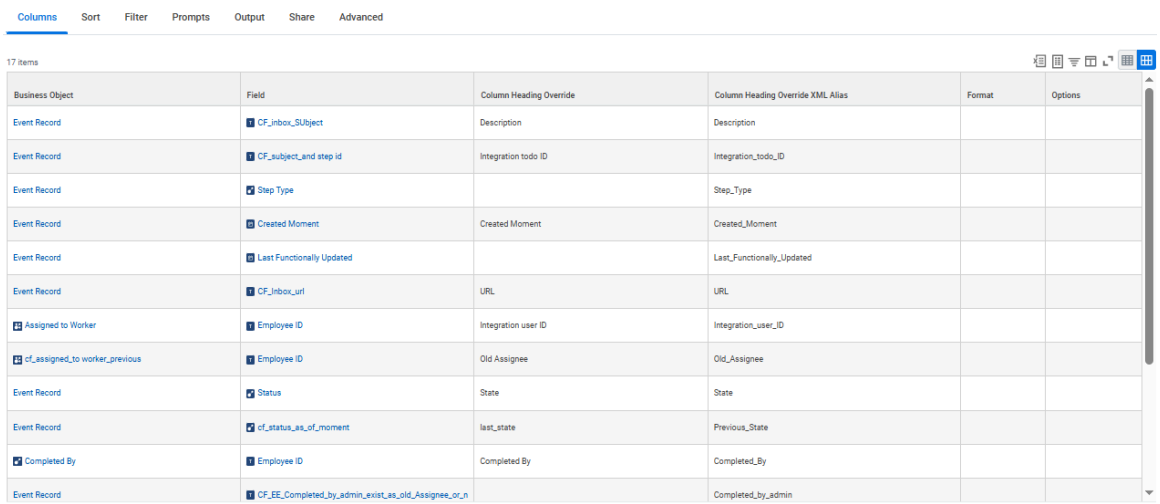
> **Important:**
> Report field label must be same as in report document. Else, the action fails.

- **Group Column Heading** for each business object in the **Group Column Heading** section should be blank.
- While creating filter, ensure that you add parenthesis on filter.
- All reports must be shared or owned by ISU user which will be used for accessing these action on the ServiceNow platform.
- In the **Advanced** section, select the **Enable as webservice** option.

Procedure

1. Access the **Create Custom Report** task.
2. Provide the report name.
   For example, **SNIH_Inbox_Items- finance items**.
3. Select report type as **Advanced**.
4. Clear the **Optimized for performance** option.
5. Select Data Source as **Business Process Event steps**.
6. Ensure that the temporary report option is cleared and click **Ok**.

7. Select the report business object and report fields.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Record	Due Date	Due date	Due_date		
CF_Action_Event	Business Process Type		Business_Process_Name		
CF_Action_Event	Worker		Requested_For		
CF_worker	Employee ID		Requested_For_Employee_ID		
CF_Action_Event	Workday ID		Workday_ID		

8. In Group column heading section, select all business objects.
   Group Column heading for each business object should be blank.

Group Column Headings 5 items

Business Object	Group Column Heading	Group Column Heading XML Alias
Assigned to Worker		assignedToWorkers_group
CF_Action_Event		CF_Action_Event_group
CF_worker		CF_worker_group
Completed By		completedBy_group
cf_assigned_to worker_previous		cf_assigned_to_worker_previous_group

9. In the **Filter** section, select the value as shown and ensure that you add parenthesis.

Columns | Sort | Filter | Prompts | Output | Share | Advanced

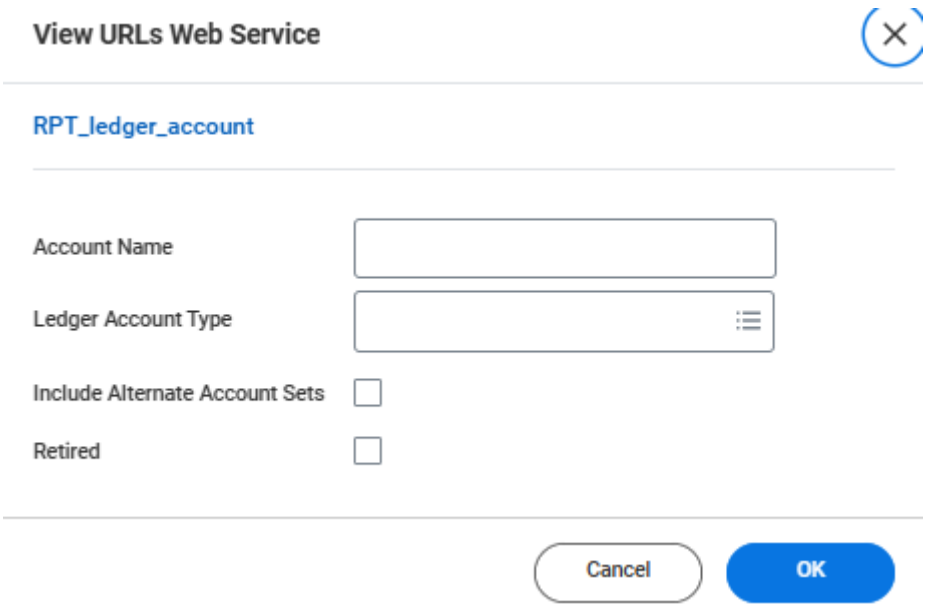
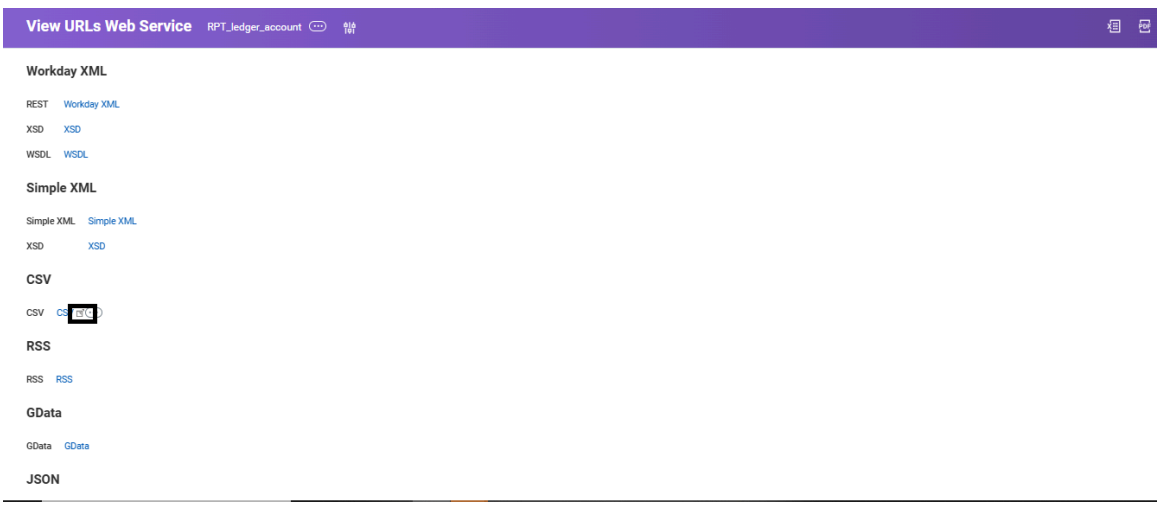
13. Select the required date time range in below parameters and click **OK**.



14. In View URLs Web Service page, click the marked icon under the **CSV** section.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The report is displayed in a new browser tab. You can see the RaaS URL of the report in browser tab and can obtain these details from this link.

- **https://wd2-impl-services1.workday.com** is the base URL of customer's workday tenant.
- **Tenant_Name** is the customer's workday tenant.
- **Report_Owner_user_name** is the user name of the report's owner.
- **RPT_ledger_account** is the report name.

Configure the Payment Status report

Create and configure the Payment Status report to retrieve the supplier payment information within the specified date range.

Before you begin

Role required: User with access to create report and the Supplier Payments report data source.

About this task

- For identification purpose, all calculated field names starts with CF.
- Create all calculated fields required for this report before developing the report to ensure that they are available while creating the report.
- While creating the report, you can select a different report name. However, ensure that the report field names or column heading override for the respective field (if given in the report document) should be same as it is in report document.

> **Important:**
> Report field label must be same as in report document. Else, the action fails.

- **Group Column Heading** for each business object in the **Group Column Heading** section should be blank.
- While creating filter, ensure that you add parenthesis on filter.
- All reports must be shared or owned by ISU user which will be used for accessing these action on the ServiceNow platform.
- In the **Advanced** section, select the **Enable as webservice** option.

Procedure

1. Access the **Create Custom Report** task.
2. Provide the report name.
   For example **CR Payment status report**.
3. Select report type as **Advanced**.
4. Clear the **Optimized for performance** check box.
5. Select **Data Source** as **Supplier Payments**.
6. Clear the **Temporary Report** check box and click **OK**.

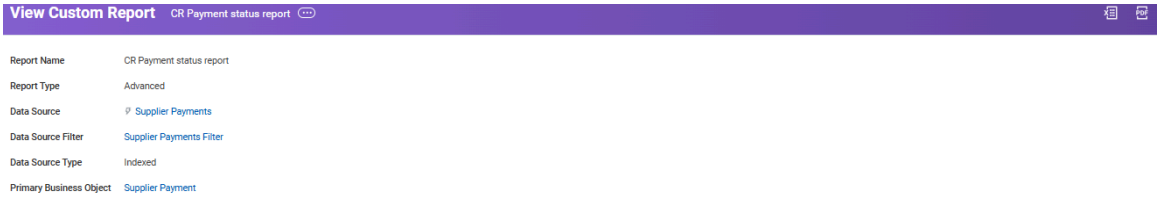
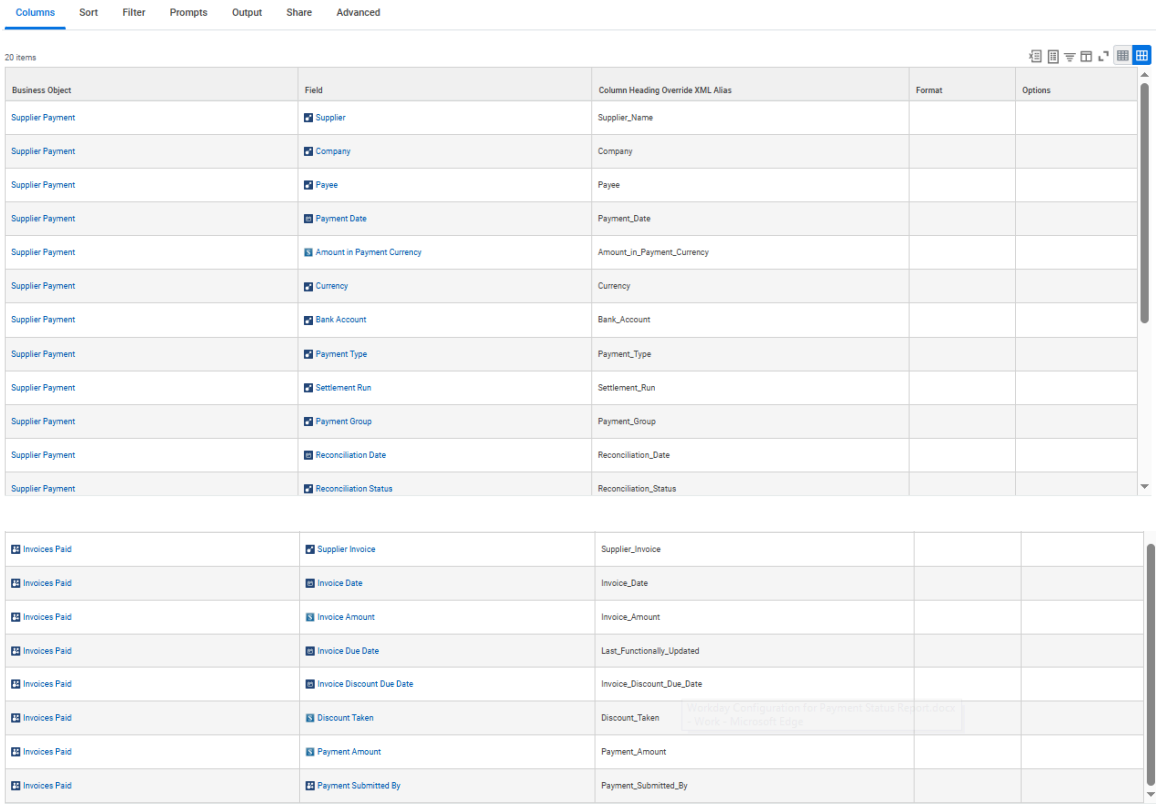
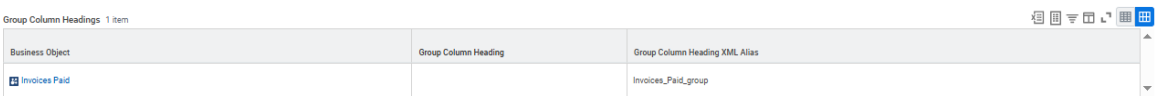
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



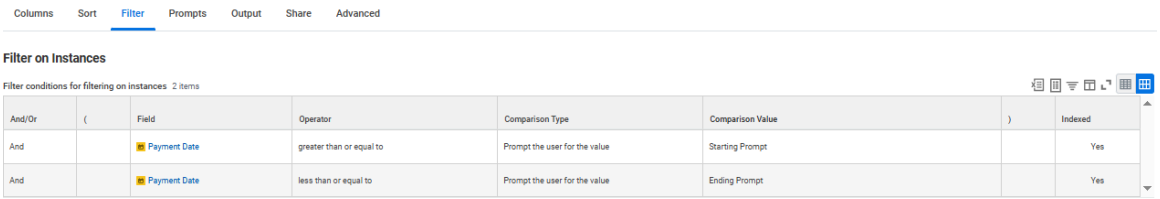
7. Select the report business object and report fields.



8. In Group column heading section, select all business objects.
Group Column heading for each business object should be blank.



9. In **Filter** section, select the value as shown and ensure that you add parenthesis.



10. In prompt section, clear the **Populate Undefined Prompt Defaults** check box.

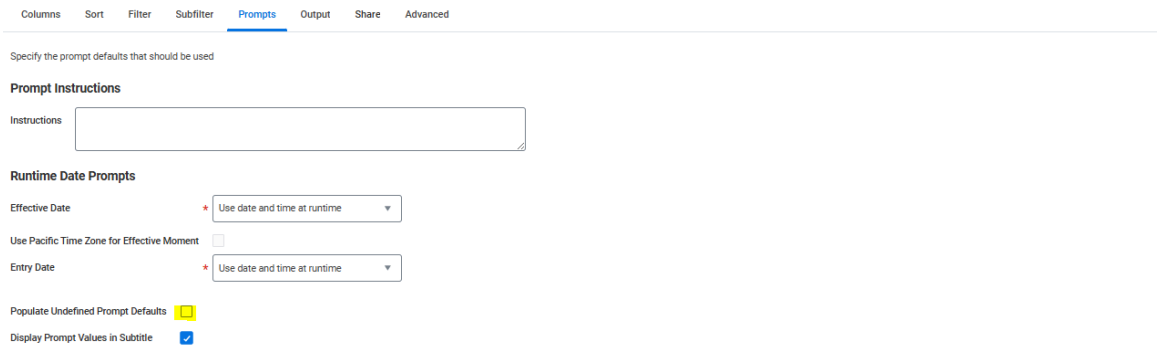
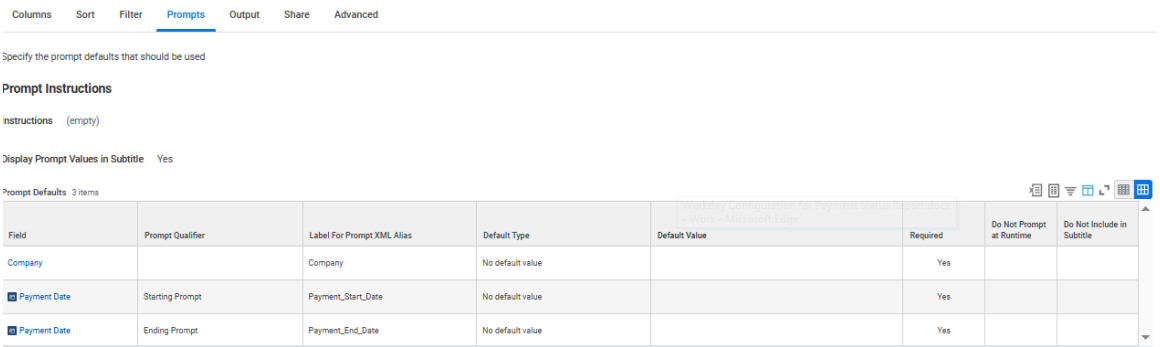
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

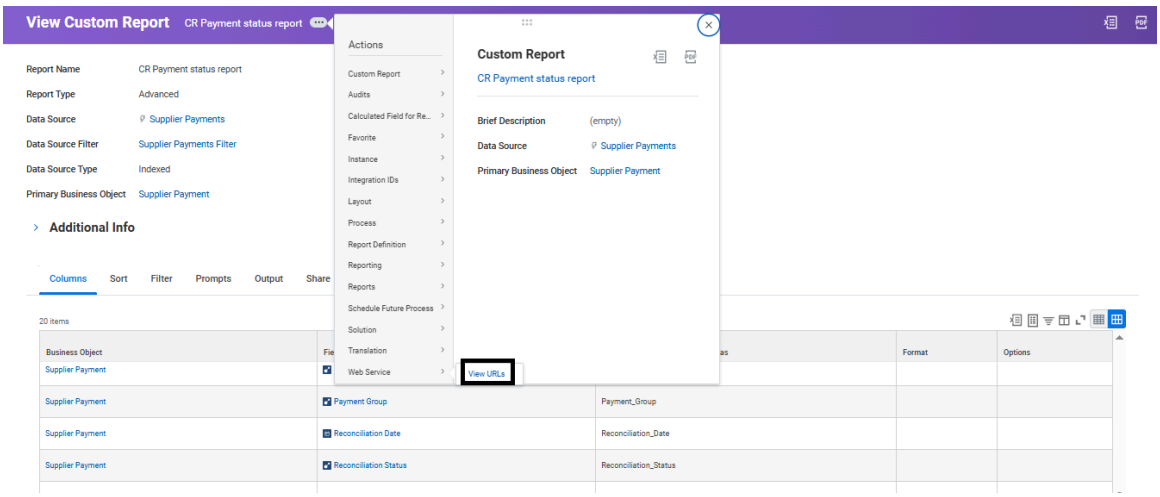


11. Select the value of prompts in the Prompt default section.
Ensure that the **Label For Prompt XML Alias** of all prompt fields must be same as shown.



12. In the Advanced section, select **Enable as webservice** option and click **OK**.

13. After report configuration is done, click the three dots icon and navigate **Web Service** > **View URLs**.



14. Select the required date time range in below parameters and click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

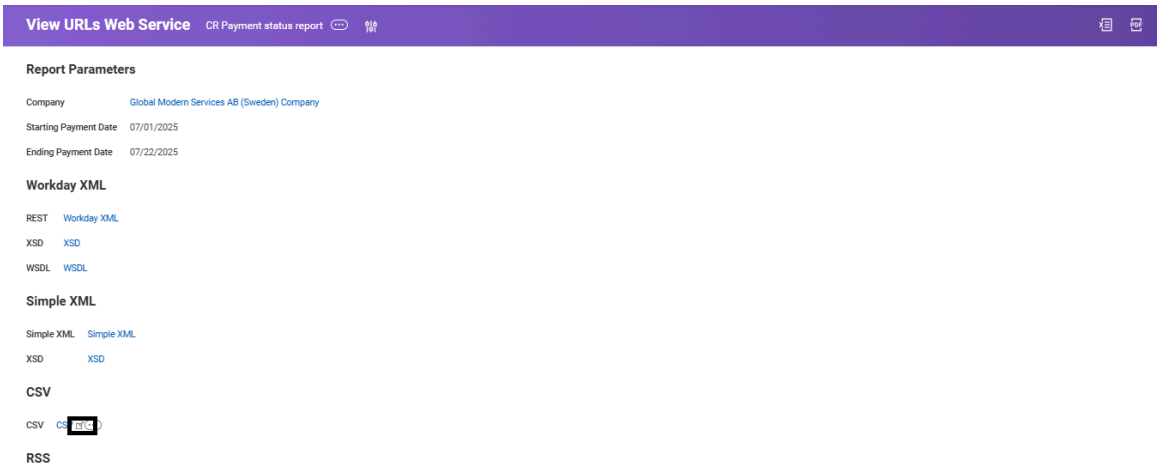
15. In View URLs Web Service page, click the marked icon under **CSV** section.



The report is displayed in a new browser tab. You can see the RaaS URL of the report in browser tab and can obtain these details from this link.

- **https://wd2-impl-services1.workday.com** is the base URL of customer's workday tenant.
- **Tenant_Name** is the customer's workday tenant.
- **Report_Owner_user_name** is the user name of the report's owner.
- **CR_Payment_status_report** is the report name.

Set up webhook for your Workday Financials spoke

Set up a webhook to get the data from the Workday Financials application to your ServiceNow instance when an event occurs.

Before you begin

- Set up the Workday Financials spoke
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate user name and password in your ServiceNow instance

Generate user name and password in your ServiceNow instance to authenticate requests and retrieve the required data from the Workday application.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System Definition** > **Table**.
2. Filter and search for the Workday Financials spoke webhook registry table, for example, **Workday Financials Webhook Registry**.
3. Click the **Show List** related list.
4. Click **New**.
5. On the form, fill these values.

Field	Description
Description	Description of the webhook registry record. Enter `Workday event and authentication for Create PO`.
UserName	Workday user who has integration rights using Workday Web Services.
Password	Password of the Workday user.
Workday Event	Event for which the webhook is set up. Enter `CreatePO`.
Workday Instance	Base URL of the Workday instance or tenant name.

6. Right-click the form header and click **Save**.
7. Click **Generate UserName And Password**.
   Copy and record the values of user name and password. These values must be specified in the Workday instance to authenticate the webhook requests.

Retrieve the resource path from your ServiceNow instance

Retrieve the resource path from your ServiceNow instance for later use to authenticate requests and retrieve the required data from the Workday application

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
2. Open the record for the Workday Financials spoke.
3. In the **Resources** tab, click the **Callback** record.
4. Record and save the value of **Resource path** for later use.

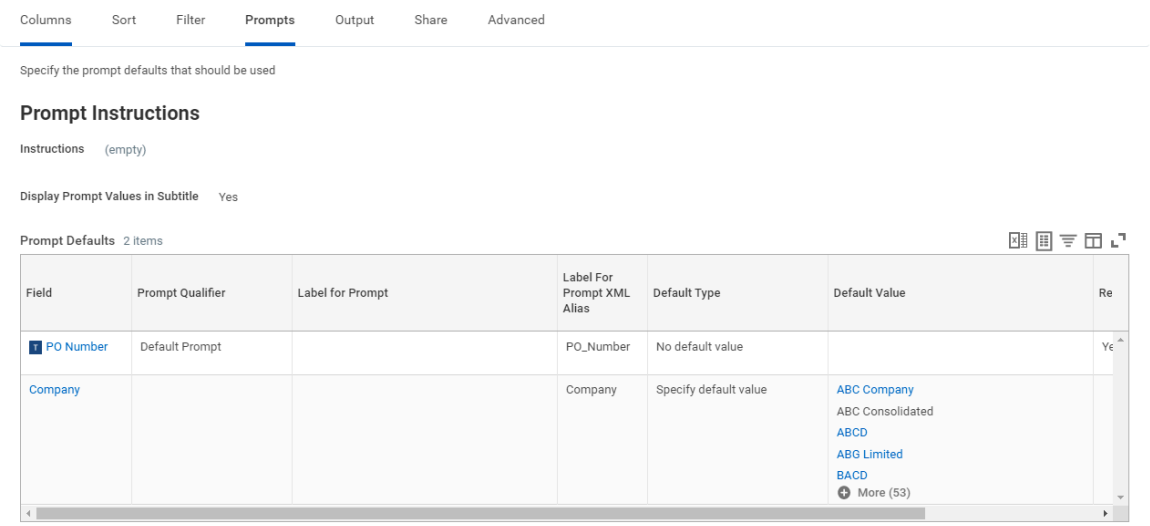
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import CLAR file to your Workday instance

Import CLAR file available at ServiceNow Store to set up webhooks and authenticate requests from ServiceNow instance.

Before you begin

- Workday Studio should be installed.
- Access to custom report creation policy.
  - Create custom report in Workday based on the Purchase_order_report structure and share the report with ISU user.
  - Ensure that you select all companies in company prompt in report.



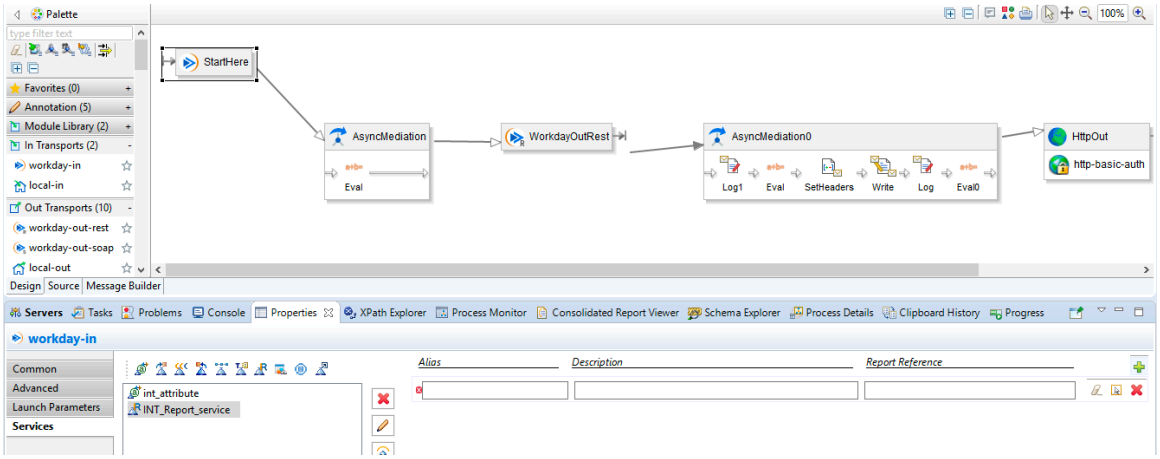
- Access to edit business process definition.
- Access to create and edit integration system.
- Role required: admin

Note:
Except integration name, report field XPath (if required), and Workday instance header, users are cautioned against modifying the values of fields or properties in the CLAR file.

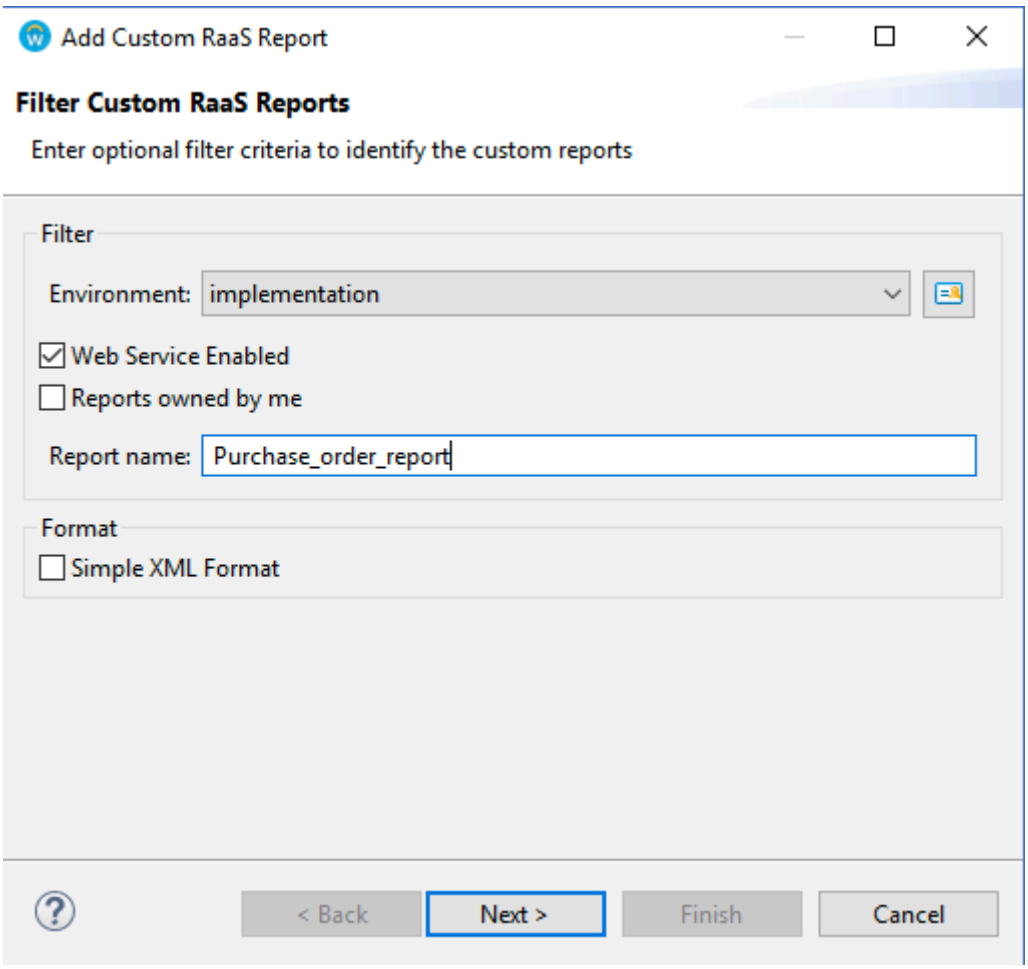
Procedure

1. From the Workday Financials spoke page on ServiceNow Store, download the `Workday-Finance-Webhook-Studio-Sample` file from **Supporting Links and Docs**.
2. Unzip the sample file to obtain the CLAR file.
3. Import the CLAR file to Workday Studio.
4. In the **Properties** tab of the **StartHere** component, navigate to **Services** and select the RAAS report created for this webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

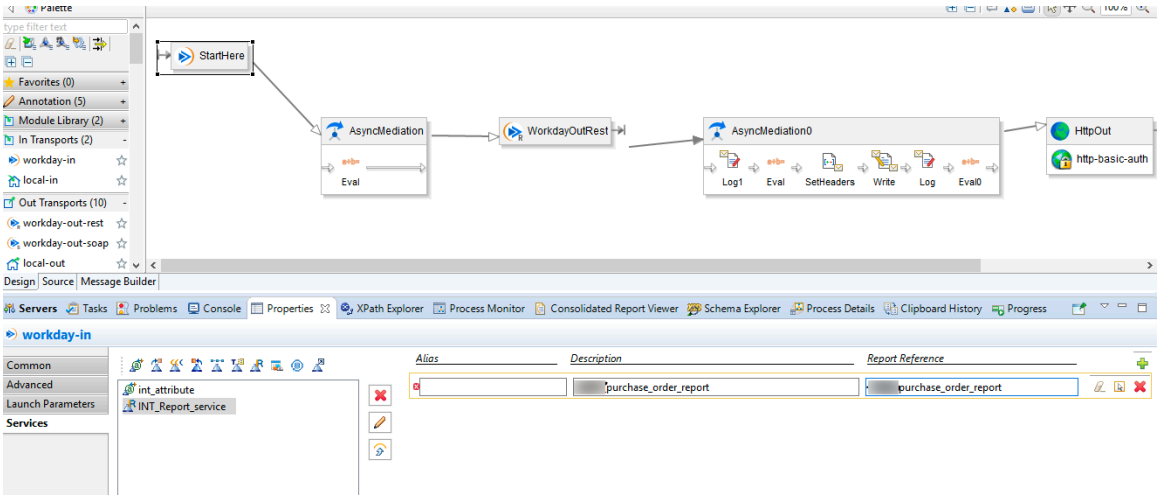


5. Choose the environment where your report exists such as, implementation or sandbox, and configure the report as per your requirement.
6. Provide a report name and select the required report.

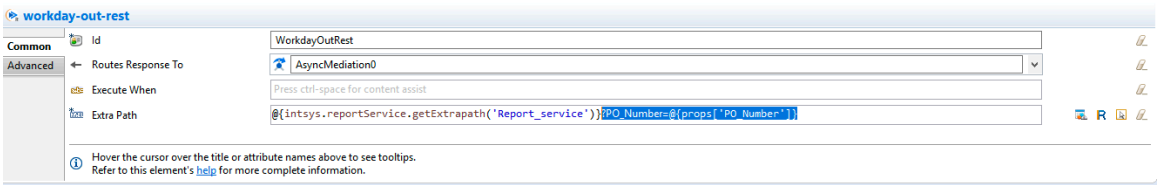


7. Provide the alias name of the report.

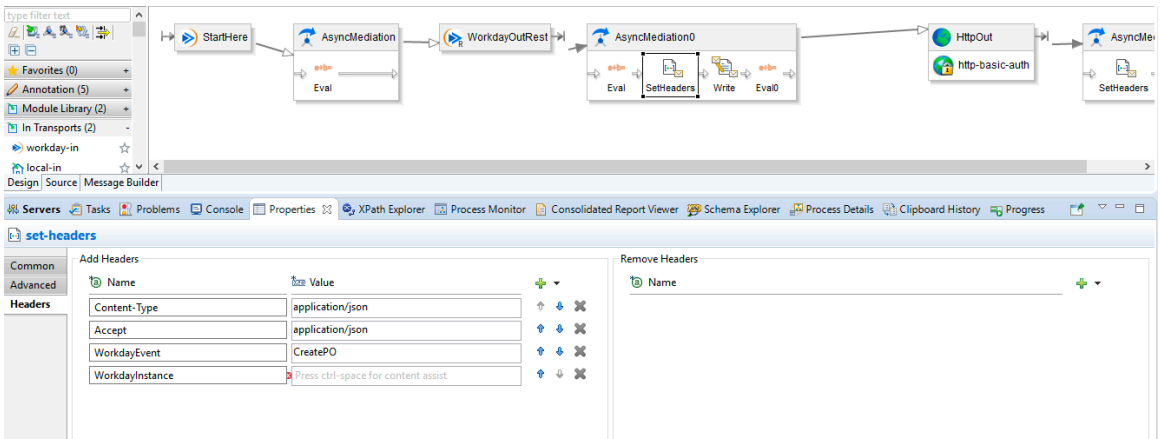
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. After the report alias is added, add the selected path of report in **Extra Path** that is used to run the report based on prompt.



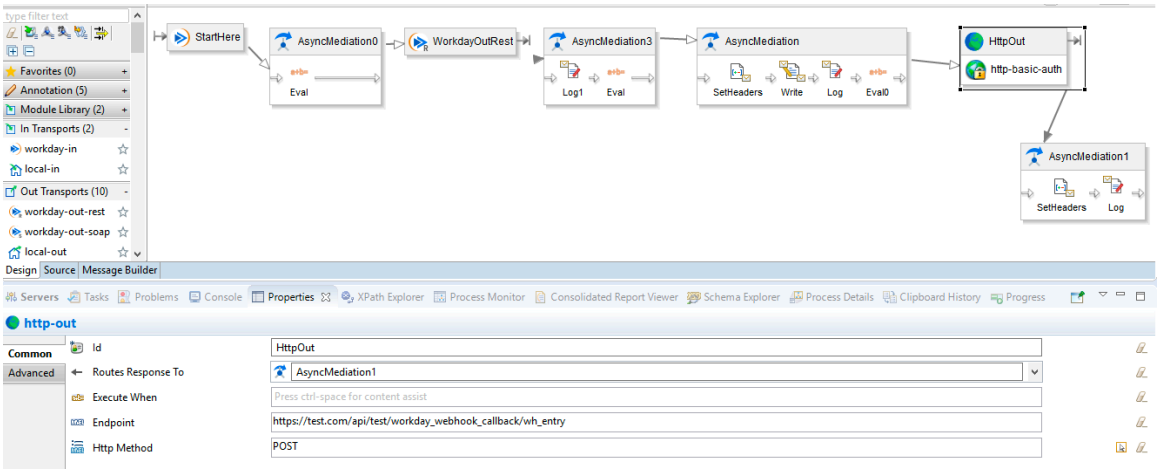
9. In the **Set Headers** component, provide your Workday instance for the **WorkdayInstance** header.



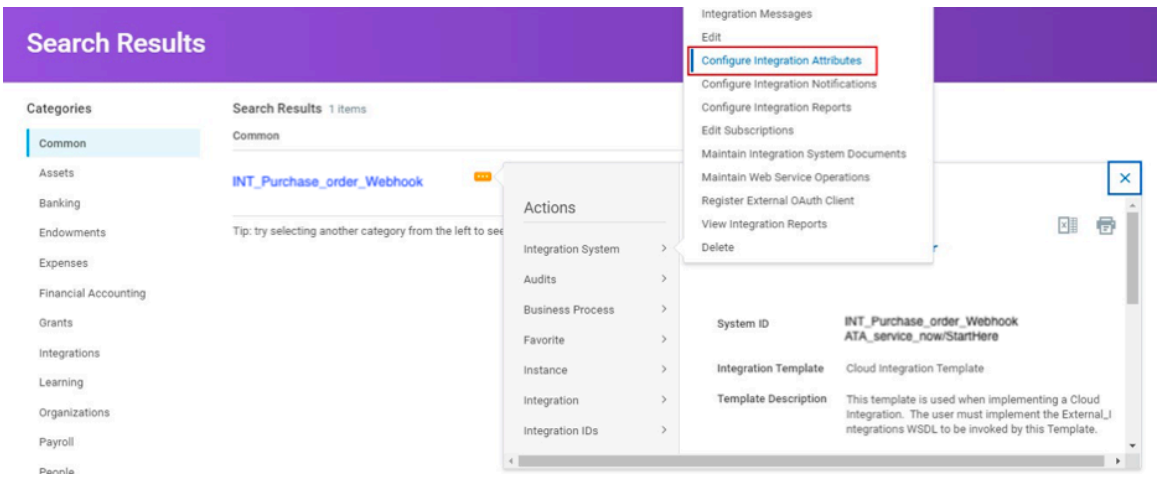
10. In the properties of **HttpOut**, fill in these values.

Field	Value
Endpoint	REST endpoint **Note:** See Retrieve the resource path from your ServiceNow instance for more information.
Http Method	POST

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

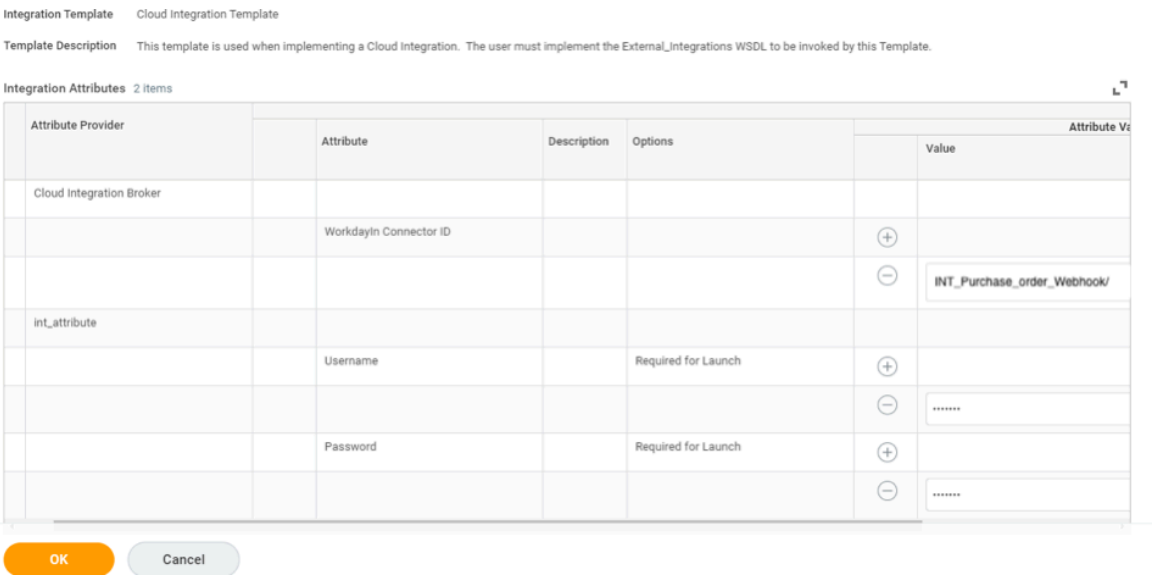


11. Save the changes.
12. In the project explorer, select the integration and deploy it in your Workday system.
13. Log in to your Workday instance and navigate to **Integration** > **Integration System** > **Configure Integration Attributes**.



14. Provide user name and password in **Configure Integration Attributes** that you have generated in Generate user name and password in your ServiceNow instance.

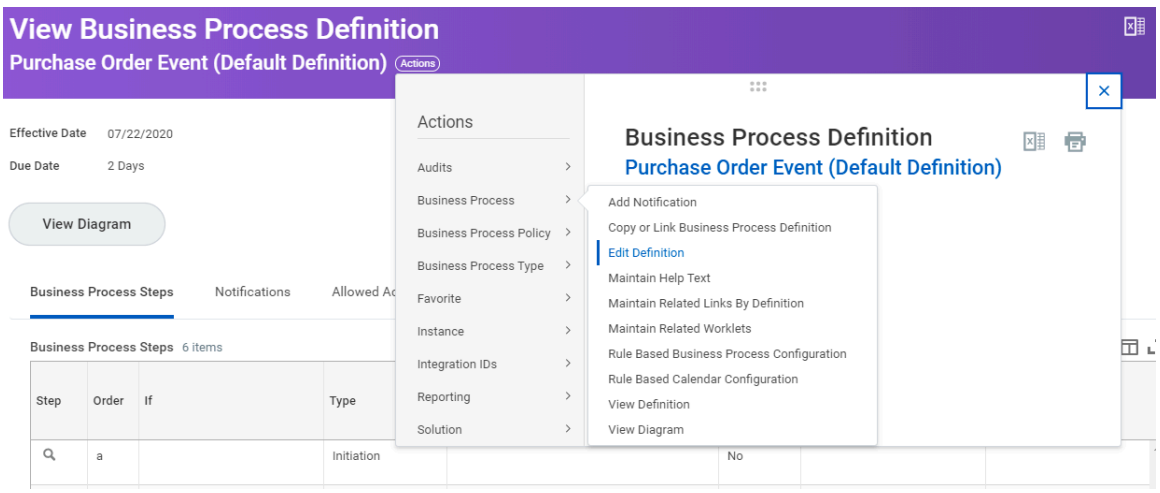
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



15. Modify a business process and add this integration in your business process.

a. Edit definition of the business process.

b. Search for Purchase Order business process in Workday.
If within one customer environment there are more than one purchase order business processes, all the business processes should be configured to enable this webhook for all purchase orders



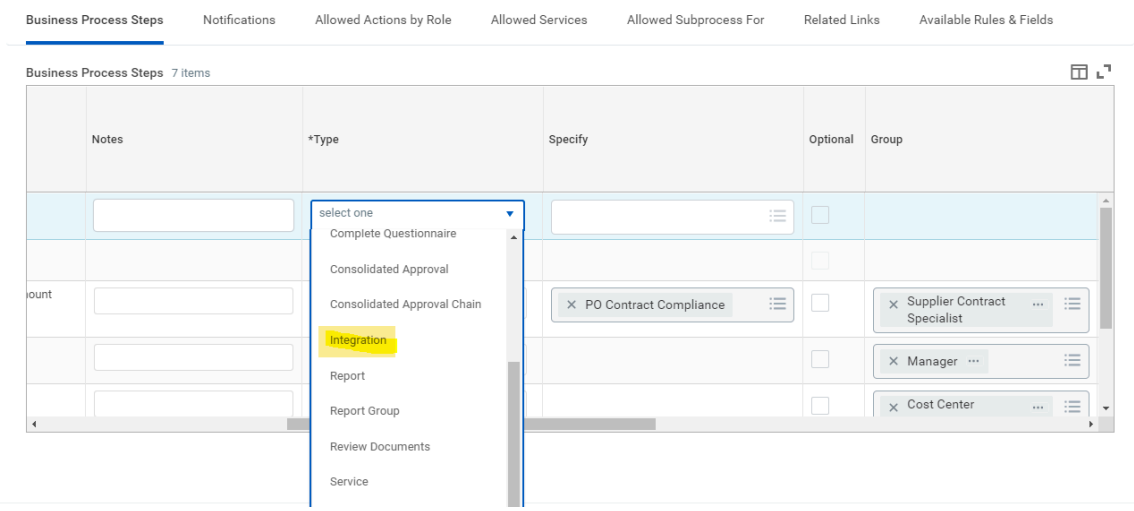
c. Select the effective date and click **Ok**.

d. Click the + sign and add a new business process step in BP.

e. Select an order, which is after the completion step of business process.

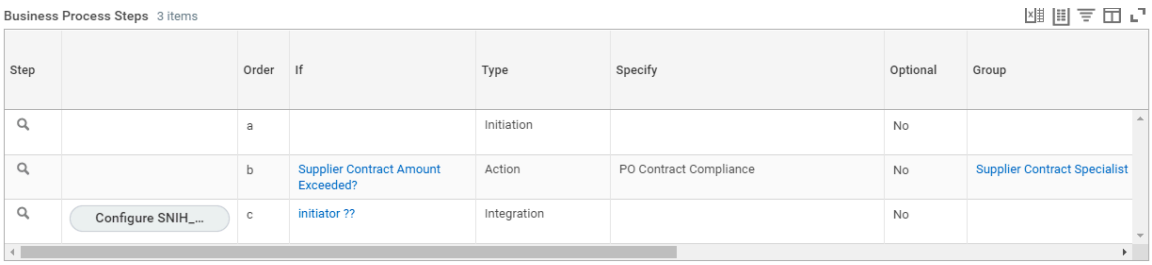
f. Select **Type** as **Integration**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



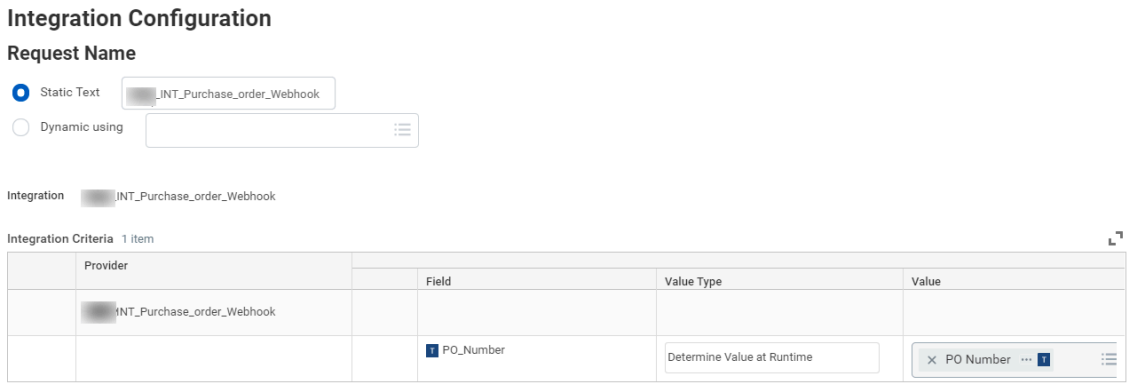
g. Provide ISU username in **Run as User** and click **Ok**.

h. Click **Configure Integration** on the newly added business process step in hire BP.



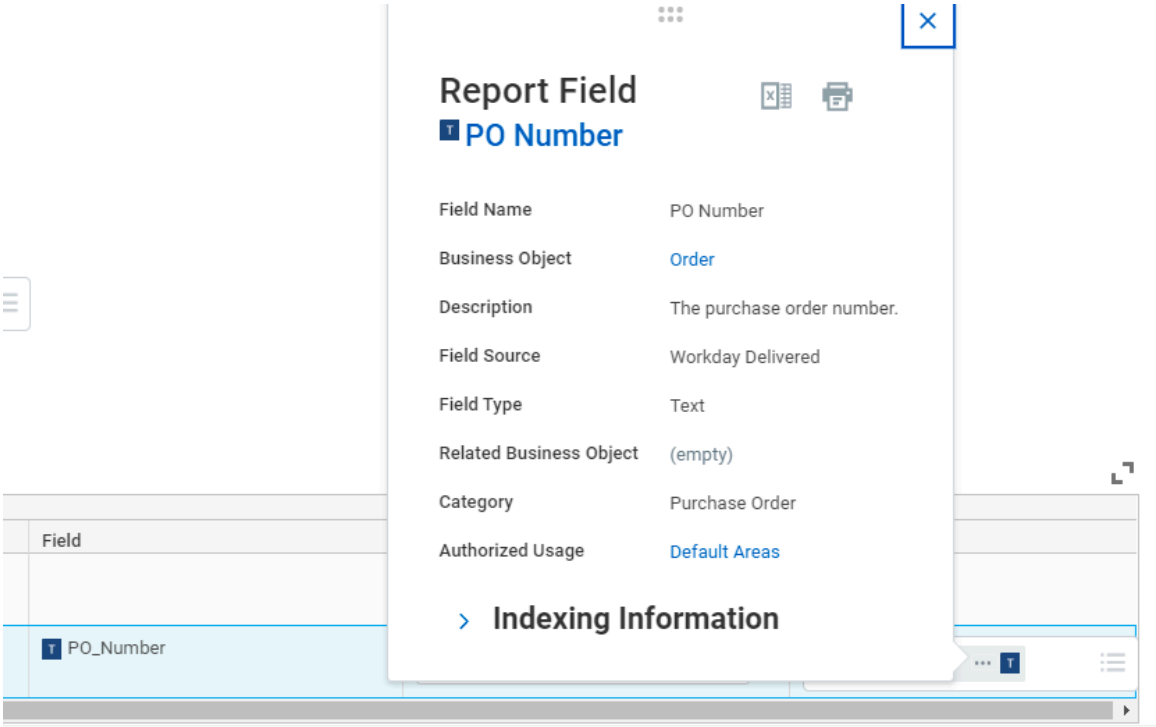
i. On the Configuration Integration Step page, click **Ok**.

j. In integration criteria, select value type as **Determine value at runtime** and select value as **PO Number**.



Selected **PO Number** should be as shown below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



k. Click **Ok**.

l. Create a report for the webhook with these details:

Purchase Order report definition:

Report Definition	SNIH_purchase_order_report
Report Name	SNIH_purchase_order_report
Report Type	Advanced
Data Source	Purchase Orders
Data Source Filter	Purchase Orders Filter
Data Source Type	Indexed
Primary Business Object	Purchase Order

Column labels:

Columns

Business Object	Field	Column Heading Override XML Alias	Format	Options
Purchase Order	PO Number	PO_Number		
Purchase Order	Company	Company		
Purchase Order	Created Moment	Created_Moment		
Purchase Order	Issued Date	Issued_Date		
Purchase Order	Payment Terms	Payment_Terms		

Filter:

Filter

Filter on Instances

Filter conditions for filtering on instances

And/Or	(	Field	Operator	Comparison Type	Comparison Value	)	Indexed
And		PO Number	equal to	Prompt the user for the value and ignore the filter condition if the value is blank	Default Prompt		Yes

Condition as Text	PO Number equal to from user input

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prompt default:

Prompt Defaults

Field	Prompt Qualifier	Label for Prompt	Label For Prompt XML Alias	Default Type	Default Value	Required	Do Not Prompt at Runtime	Do Not Include in Subtitle
PO Number	Default Prompt		PO_Number	No default value		Yes		
Company			Company	Specify default value	ABC Company ABC Consolidated ABCD ABG Limited BACD		Yes	

Workday HR Spoke

The Workday HR spoke is built by Bristlecone, Inc. Manage staffing, resources, payroll, benefits, and so on in the system from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see https://www.servicenow.com/content/dam/servicenow-assets/public/en-us/doc-type/legal/snc-addendum-integrationhub.pdf.

Spoke version

Workday HR spoke v2.11.1 is the latest version.

Supported versions

This spoke was built for Workday HR SOAP Application Programming Interface (API) version v33.2 and REST API version v1, and is compatible until Workday HR SOAP API version v39.0.

Required configurations in Workday

To set up the integration, you must initially perform this procedure in Workday:

1. Register an Integration System User.

   Note:
   While filling account information details, confirm that you select the **Do Not Allow UI Sessions** check box.

2. Create a security group and assign it to the integration system user.

Operation	Domain Security Policy	Domain Security Policies Inheriting Permission	Functional Areas
View Only	Integration Security		Integration
Get and Put	Integration Event		Integration

Note:
Ensure that the domain security policies are activated for the security group.

b. Configure the business process policies of your security group and provide these permissions:

Business process security policy permissions

Operation	Business Process Type	Functional Area
Initiate (Assign Roles (web service))	Assign Roles	Organizations and Roles
Initiate (Change Organization Assignments (web service))	Change Organization Assignments for Worker	Organizations and Roles
Initiate (Maintain Contact Information (Web Service))	Contact Change	Contact Information
Initiate (Add Dependent (web service))	Dependent Event	▪ Benefits ▪ Personal Data
Initiate (Edit Worker Additional Data (Web Service))	Edit Worker Additional Data Event	Staffing
Initiate (Change Legal Name (Web Service))	Legal Name Change	Contact Information
Initiate (No Show (Web Service))	No Show	Staffing
Initiate (Change Personal Information (Web Service))	Personal Information Change	Personal Data
Initiate (Request Leave of Absence (Web Service))	Request Leave of Absence	Time Off and Leave
Initiate (Enter Time off (Web Service))	Request Time Off	Time Off and Leave
Initiate (Terminate Employee (Web Service))	Termination	Staffing

Note:
Confirm that the business process security policies are activated for the security group.

Note:
If you have installed spoke v1, uninstall it and install the spoke v1.1.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, confirm that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.cobject)
- System Import Data Source (glide.system_import_data_source)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Workday HR spoke provides a sample flow, Verify User Sample Flow that demonstrates automating the Workday tasks. This flow calls the subflow with the same name to verify if the user who raised the request is a valid user in the Workday system. To customize a sample flow, copy it to a new application scope.

Spoke subflows

The Workday HR spoke provides sample subflows to demonstrate automating Workday HR tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Verify User Subflow	Verifies if the user who raised request is a valid user in Workday system.
Get WID For Worker	Retrieves WID details of the employee using the Look up Worker Profile action.
Create User	Creates a user in the ServiceNow when the user is onboarded in the Workday system. To use this subflow, you should Set up webhooks for your Workday HR spoke.
Leave of absence	Retrieves the leave of absence details of an employee from Workday using the LeaveofAbsence Webhook.
Deactivate User	Deactivates an user in Workday using the Workday Deactivate User webhook.
Look up job Requisition	Retrieves all the existing job requisition information from Workday application into Job Requisition table.
Update Job Requisition	Retrieves the changes made to the existing job requisition in Workday using the UpdateJobRequisition webhook and stores the changes in the Job Requisition table.
Look up Using WQL Stream	Retrieves Workday HR data using a WQL (Workday Query Language) stream query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Sample Sequences to Make a WQL Call	Constructs a Workday Query Language (WQL) query based on the specified inputs.

Spoke actions that use Workday SOAP APIs

Workday itself organizes its APIs into two major categories: SOAP Public API and REST API. Thus, the Workday HR spoke also reflects the same. You can use the spoke by using one of these two APIs, but not necessarily both, depending on the spoke actions you must use.

The Workday HR spoke provides actions to automate Workday tasks when events occur in your ServiceNow instance. Available actions include:

Note:
The SOAP-based actions use the Workday SOAP web services and require you to perform the configurations mentioned in Configurations to use Workday SOAP Basic Auth with WS-Security.

Actions that use the Workday SOAP APIs		
Category	**Action**	**Description**
Default	Look up Skills	Retrieves the details of the skills from Workday.
Absence Management	Get Time off Balances By Employee ID	Retrieves details of the time off plan balance for the specified employee.
	Look up Time Off Balance	Retrieves details of the time off balance, based on the provided filter criteria.
	Request Leave Of Absence	Creates a long leave absence request or updates an existing request.
	Request Time Off	Creates a short-term leave request.
Approval Management	Approve Business Process	Approves the specified business process in Workday.
	Reject Business Process	Rejects the specified business process in Workday.
Benefits Administration	Add Dependent	Adds a dependent to the specified worker.
	Change Beneficiaries	Updates beneficiary details of the specified worker.
Cash Management	Update Direct Deposit Information	Updates details of the current payment elections.
Metadata Retrieval	Get Additional Workday Fields	Retrieves all additional fields for each action.
	Get Custom Dynamic Input Fields	Retrieves all custom dynamic input fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that use the Workday SOAP APIs		
Category	**Action**	**Description**
	Get Custom Dynamic Output Fields	Retrieves all custom dynamic output fields.
	Get Object For Custom Dynamic Fields	Retrieves object for the specified custom dynamic field.
	Get Parent Object For Custom Dynamic Fields	Retrieves parent object for the specified custom dynamic field.
	Get Reference ID List	Retrieves values of the Reference ID, based on its reference type.
	Get References WID	Retrieves reference IDs for the specified reference type.
	Get Access Token	Retrieves the access tokens for authenticating SOAP-based actions using OAuth 2.0.
	Get Dynamic Response Schema	Retrieves the output schema for the specified query from Workday.
Payroll Management	Get My Tax Withholding Information Canada By Employee ID	Retrieves all types of income withholding orders from Canada for the specified employee.
	Get My Tax Withholding Information US By Employee ID	Retrieves all types of income withholding orders from US for the specified employee.
	Get Payroll Federal W4 Tax Elections By Employee ID	Retrieves federal W-4 tax election data for the specified employee.
	Get Payroll Payee FUTAs By Employee ID	Retrieves FUTA tax election data for the specified employee.
	Get Payroll USA And Local Tax Elections By Employee ID	Retrieves information about the tax elections for state and local tax authorities, for the specified employee.
	Look up Direct Deposit Information Details	Retrieves information about the specified payee, who belongs to an external pay group.
	Look up Payroll Federal W4 Tax Elections	Retrieves the federal W-4 tax election details for the required employees, based on the provided filter criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that use the Workday SOAP APIs		
Category	**Action**	**Description**
	Look up Payroll Payee FUTAs Details	Retrieves the payroll payee FUTA details for the required employees, based on the provided filter criteria.
	Look up Payroll Results	Retrieves payroll results for the required employees, based on the provided filter criteria.
	Look up Payroll USA And Local Tax Elections	Retrieves details of worker tax elections for state and local tax authorities for the required employees, based on the provided filter criteria.
	Look up Tax Elections Ongoing Work Jurisdiction Details	Retrieves details of the ongoing work jurisdiction tax election for the required employees, based on the provided filter criteria.
	Look up Tax Withholding Information Details Canada	Retrieves all types of income withholding orders from Canada for the required employees, based on the provided filter criteria.
	Look up Tax Withholding Information Details US	Retrieves all types of income withholding orders from US for the required employees, based on the provided filter criteria.
Resource Management	Change Legal Name	Changes or sets the legal name for the specified employee.
	Change Personal Information	Changes the personal information of the specified employee.
	Get Employee Documents By Employee ID	Retrieves documents of the specified employee.
	Get My Compensation Details By Employee ID	Retrieves the compensation details of the specified employee.
	Get My Contact Details By Employee ID	Retrieves contact information of the specified employee, such as address, phone number, email address, and beneficiaries.
	Get My Org Structure By Employee ID	Retrieves details of the org structure for the specified employee.
	Get Total Benefit Enrollments By Employee ID	Retrieves details of the benefit enrollments for the specified employee.
	Get Total Rewards By Employee ID	Retrieves details of the total rewards for the specified employee.

Actions that use the Workday SOAP APIs		
Category	**Action**	**Description**
	Look up Compensation Details	Retrieves compensation details for the required employees, based on filter criteria.
	Look up Contact Details	Retrieves contact details for the required employees, such as address, phone number, email address, and beneficiaries, based on filter criteria.
	Look up Employee Documents	Retrieves documents of the required employees, based on the filter criteria.
	Look up Holiday Calendars	Retrieves the details of the holiday calendars.
	Look up Job Profiles	Retrieves details of the job profile, based on the specified criteria.
	Look up Location Details	Retrieves location details, based on the specified criteria.
	Look up Organizations	Retrieves details of the organizations, based on the provided filter criteria.
	Look up Timesheet Details	Retrieves details of the timesheets, based on the provided filter criteria.
	Look up Total Benefit Enrollments	Retrieves details of the benefit enrollments, based on the provided filter criteria.
	Look up Total Rewards	Retrieves details of the employee rewards, based on the provided filter criteria.
	Look up Work Schedule Calendars	Retrieves details of the work schedule calendars.
	Look up Worker Job History Report	Retrieves the job history of a worker.
	Look up Worker Profile	Retrieves details of the employee profiles, based on worker type.
	Look up Workers	Retrieves details such as, first name, last name, address, phone number, email address, instant messenger, worker position, and management chain, based on the provided filter criteria.
	Look up Workers Employment Data	Retrieves details such as, position, position organizations, position management chains, and worker status, based on the provided filter criteria.
	Update My Address	Updates employees details, such as address, phone number, email address, instant messenger, and web address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that use the Workday SOAP APIs		
Category	**Action**	**Description**
	Look up Workers And Employment Info	Retrieves worker profile information from Workday.
	Look up Professional Profiles Stream	Retrieves professional workers profile information from Workday.
Staffing	Change Organization	Assigns values for company, cost center, region, and so on that are configured for staffing usage to a filled position.
	Change Roles	Changes roles of the specified employee.
	No Show	Rescinds the hiring process if a hired employee doesn't show on joining date.
	Offboard Employee	Offboards the specified employee.
	Hire Employee	Hires a user as an employee to the specified job.
	Set Hiring Restrictions	Creates hiring restrictions for a job management supervisory organization.
	Create Position	Creates or opens a position for a supervisory organization using the position management staffing model.
	Look up Positions	Retrieves position-related details based on the position ID from Workday.
	Edit Position	Edits a position that is already filled.
	Edit Hiring Restrictions	Edits the hiring restrictions for a job management supervisory organization.
	Change Job	Changes the job of an employee or a contingent worked. The types of changes include transfer, promotion, demotion, lateral moves, and any other change in the information on the job.
	Close Position	Closes a position.
	Contract Contingent Worker	Hires a user to a contingent position or job.
Talent Management	Create External Skill	Creates a new external skill in Workday and associates it with the specified skill vendor.
	Look up External Skills Mapping Stream	Retrieves the external skill mapping records from Workday for the specified skill vendor or mapping criteria.
	Look up User Skills Stream	Retrieves skill details for a specified employee from Workday, including associated skills and proficiency attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that use the Workday SOAP APIs		
Category	**Action**	**Description**
	Manage External Skill Mapping	Manages external skill mapping records in Workday, including creating, updating, or removing skill associations.
	Update User Skill Proficiency	Updates the proficiency level of a specified user skill in Workday.
Time Tracking	Update Reported Time Blocks	Updates details of reported time blocks.
Skill Management	Manage Employee Skills	Adds or removes skills associated with an employee.
	Look up Employee Skills	Retrieves employees skills from Workday for the specified date range.
Jobs Management	Create Job Requisition	Creates a job requisition in Workday.
	Look up Candidates Stream	Retrieves the candidates information like candidate data, social media account data and others from Workday.
	Look up Compensation Grades Stream	Retrieves compensation details like the default minimum and maximum of the compensation pay range and others from Workday.
	Look up Job Postings Stream	Retrieves job post details like job posting title, job posting description, education data, certification data, and others from Workday.
	Look up Job Requisitions Stream	Retrieves job requisition details like recruiting start date, target hire date and others from Workday.
	Update Job Requisition	Updates the specified job requisition.

Spoke actions that use Workday REST APIs

Workday itself organizes its APIs into two major categories: SOAP Public API and REST API. Thus, the Workday HR spoke also reflects the same. You can use the spoke by using one of these two APIs, but not necessarily both, depending on the spoke actions you must use.

The Workday HR spoke provides actions to automate Workday tasks when events occur in your ServiceNow instance. Available actions include:

Note:
The REST-based actions use the Workday REST API and requires you to perform the configurations mentioned in Configurations to use Workday REST API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that use the Workday REST APIs		
Category	**Action**	**Description**
Absence Management	Look up Worker Time Off and Leave Of Absence Request	Retrieves the time off and leave of absence details of the worker using RaaS report.
Approval Management	Look up In-Progress Approval Requests	Retrieves the approval requests that are in progress from Workday for the specified date range.
Custom Actions **Note:** To use these action, you must create a record in the Workday Custom Objects [x_snc_sn_workday_s_workday_custom_objects] table and provide these details: • Parent Object WS Alias • Extension Object WS Alias • Extension Object Fields • Extension Object Field Data Type • Field Type	Look up Object Custom Fields	Retrieves data relevant to the specified custom object.
	Look up Custom Reports	Retrieves the custom reports.
	Update Object Custom Fields	Updates fields in the specified custom object.
Payroll Management	Look up Payslip	Retrieves payslip details of the specified employee.
Goals Management	Look up Employee Goals	Retrieves the employee goals from Workday.
Feedback Management	Look up Feedback Received	Retrieves the feedback requests from Workday.
Performance Management	Look up Employee Latest Performance Review	Pulls the latest performance review of the employee from Workday. **Important:** Before executing this action, you must set up a report. When you execute the action, it calls the report and the data is sent from Workday HR to your ServiceNow instance. To set up the report, see Configure the Employee Latest Performance Review report.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that use the Workday REST APIs		
Category	**Action**	**Description**
	Look up Employee Performance Review Historical Data	Pulls the historical data on the employee performance review Workday. **Important:** Before executing this action, you must set up a report. When you execute the action, it calls the report and the data is sent from Workday HR to your ServiceNow instance. To set up the report, see Configure the Worker's Historical Performance Review report.
	Look up Succession Planning	Pulls the succession planning from Workday. **Important:** Before executing this action, you must set up a report. When you execute the action, it calls the report and the data is sent from Workday HR to your ServiceNow instance. To set up the report, see Configure Succession Planning Report.
	Look up Succession Pool	Pulls the succession pool from Workday. **Important:** Before executing this action, you must set up a report. When you execute the action, it calls the report and the data is sent from Workday HR to your ServiceNow instance. To set up the report, see Configure Succession Pool report.
Skill Management	Look up Employee Skills	Retrieves employee skills from Workday for specified date range. **Important:** You must create report in Workday instance to use this action. • For more information about extracting workers skill with skill cloud, see Extract workers skill (with the skill cloud). • For more information about extracting workers skill without skill cloud, see Extract workers skill (without the skill cloud).
	Look up Skills	Retrieves skills from Workday.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that use the Workday REST APIs		
Category	**Action**	**Description**
		Important: You must create report in Workday instance to use this action. For more information, see Create report to extract skills.
Resource Management	Get My Reporting Structure	Retrieves details of the reporting structure for the specified employee.
	Look up Holiday Calendars Of An Employee	Retrieves details of the holiday calendar for the specified employee.
	Look up Holiday Calendars Reference WID Of An Employee	Retrieves details of the holiday calendar WID for the specified employee.
	Look up Inbox Items	Retrieves inbox items from Workday for the specified date range.
	Look up Merit And Benefit Plan Details Of An Employee	Retrieves details of merit and benefit plan for the required employees, based on the provided filter criteria.
	Look up Schedule Calendars Reference WID Of An Employee	Retrieves work schedule calendars for the required employees.
	Look up Total Rewards using Report	Retrieves the total rewards for the specified report owner and report.
	Look Up Termination Details Action	Retrieves termination details for a specified employee from Workday.
Metadata Retrieval	Look up Data Source	Retrieves details for the specified Workday data source.
	Look up Data Source Field	Retrieves a specific field for the selected data source and includes the related business object information.
	Look up Data Source Fields Stream	Retrieves all fields for the specified data source, including their related business objects.
	Look up Data Source Filter	Retrieves details for a specific data source filter, including required and optional parameters.
	Look up Data Source Filters Stream	Retrieves all available filters for the specified Workday data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that use the Workday REST APIs		
Category	**Action**	**Description**
	Look up Data Sources Stream	Retrieves all available data sources from Workday.
Attachment Management	Download Workday RAAS CSV	Downloads a specified Workday RAAS report in CSV format and attaches it to the selected data source.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

AI Agent	Description
Workday HR Feedback Management AI Agent	Manages feedback retrieval and review workflows within Workday. This AI agent enables users to access employee feedback, support performance discussions, and streamline HR decision-making through seamless integration with Workday.
Workday HR Approval Management AI Agent	Manages approval workflows and business process decisions within Workday. This AI agent enables users to approve or reject requests, track approval statuses, and optimise HR operations through direct Workday integration.
Workday HR Goals Management AI Agent	Manages employee goal tracking and review processes within Workday. This AI agent enables users to look up goals, monitor progress, and support HR conversations through efficient Workday integration.
Workday HR Performance Management AI Agent	Manages performance review and succession planning workflows within Workday. This AI agent enables users to retrieve reviews, analyse historical data, and access

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
	succession pools for informed HR decision-making.
Workday HR Absence Management AI Agent	Manages absence and leave workflows within Workday. This AI agent enables users to look up time off balances, process leave requests, and manage absence data for streamlined HR operations.
Workday HR Payroll Management AI Agent	Manages payroll and tax information workflows within Workday. This AI agent enables users to retrieve payslips, access tax details, and manage payroll data for efficient HR and payroll operations.
Workday HR Resource Management AI Agent	Manages employee data and organisational resource workflows within Workday. This AI agent enables users to retrieve employee information and manage organisational details for effective HR resource management.

Available sample agentic workflows

Install Now Assist for Integration Hub and start using the available sample agentic workflows and AI agents. For more information, see Now Assist for Integration Hub.

In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. Use the available sample agentic workflow in AI Agent Studio so that AI agents can coordinate to solve complex problems. To modify the available sample agentic workflow as per your requirement, see Modify an agentic workflow.

Sample agentic workflow	Description	AI agents used	Always ON by default?
Fetch Employee Profile, Rewards Details, and Latest Performance Review	Retrieves an employee's profile information, rewards details, and latest performance review data from Workday. This workflow consolidates multiple reports and endpoints to provide a unified view of a worker's employment, rewards history, and performance feedback.	• Workday HR performance management AI agent • Workday HR resource management AI agent	No **Note:** To activate the workflow, see Activate an agentic workflow template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample agentic workflow	Description	AI agents used	Always ON by default?
Fetch Employee Time Off and Holiday Calendar	Retrieves employee#specific time#off information along with the applicable holiday calendar. This workflow returns a summary of approved leave, pending time#off entries, and holidays relevant to the employee's assigned region or work schedule.	• Workday HR absence management AI agent • Workday HR resource management AI agent	No **Note:** To activate the workflow, see Activate an agentic workflow template.

Spoke modules

The Workday HR spoke adds the Workday application to your instance and includes these modules:

Important: The remote tables, View my Total rewards [sn_workday_hr_spke_st_get_payroll_results] and Get Payroll Results [sn_workday_hr_spke_st_view_my_total_rewards], store sensitive data. Hence, discretion is advised before you give users the permission to view data stored in these tables.

Module	Description
Connection Details	Contains information about the base URL of the Workday instance or tenant, and API version.
Custom Objects	To use the custom actions, create a record in the Custom Objects module and provide these details: • Parent Object WS Alias • Extension Object WS Alias • Extension Object Fields • Extension Object Field Data Type • Field Type
Get My Holiday Calendar	Sample remote table that you should customise to retrieve details of the holiday calendar for the logged in employee. From the Get My Holiday Calendar remote table definition, the Get My Holiday Calendar action is called to retrieve the data.
Get Payroll Results	Sample remote table that you should customise to retrieve the payroll information. From the Get Payroll Results remote table definition, the Look up Payroll Results action is called to retrieve the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
	Important: This remote table stores sensitive data. Hence, discretion is advised before you give users the permission to view data stored in these tables.
RAAS Report Access Details	To use actions based on Workday Report as a Service API, create a record in the RAAS Report Access Details module and provide details of the ServiceNow user along with the Workday report owner name and Workday report name. Confirm that the user is entitled to access these reports. Create a record and fill in these values: • **User ID**: User ID of the ServiceNow user, who is entitled to access the required reports. • **Report Name**: Name of the RAAS API while configuring it in Workday system. • **Report Owner Username**: Username of the RAAS owner.
Remote Table Configurations	An entry of column and table name that consists of Workday employee ID of the logged-in user should be made into this table. For example, Employee Number column of the User Table. That is, **Table Name** is `sys_user` and **Field Name** is `employee_number`. **Note:** Confirm that you provide the internal name of the table and field.
View My Direct Deposit Information	Sample remote table that you should customize to retrieve the direct deposit information. From the View My Direct Deposit Information remote table definition, the Look up Direct Deposit Information Details action is called to retrieve the data.
View My Total Rewards	Sample remote table that you should customise to retrieve the total rewards for a logged in employee. From the View My Total Rewards remote table definition, the Look up Total Rewards action is called to retrieve the data. **Important:** This remote table stores sensitive data. Hence, discretion is advised before you give users the permission to view data stored in these tables.
View Time Off Balance	Sample remote table that you should customize to retrieve the time off balance for a logged in employee. From the View Time Off Balance remote table definition, the Look up Time Off Balance action is called to retrieve the data.
Webhook Registry	Contains records of webhooks registries. Admin should create record here to Set up webhooks for your Workday HR spoke for the required Workday HR event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Configurations to use Workday SOAP Basic Auth with WS-Security

Configure your ServiceNow instance to perform actions that use the Workday SOAP Basic Auth with WS-Security.

Before you begin
Role required: admin.

About this task
This is the most traditional Workday SOAP authentication setup.

> **Note:**
> These configurations are needed to use the SOAP-based spoke actions. For information about the SOAP-based spoke actions, see the Spoke actions that use Workday SOAP APIs section in Workday HR Spoke.

Provide the Workday HR base URL

Provide the base URL of your Workday HR instance in the Connection Details [connection_details] table. Spoke actions based on the SOAP API, use these details for the action execution.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Workday HR Spoke** > **Connection Details**.
2. Click the **Show List** related list.
3. Click **New**.
4. On the form, fill these values.

Connection Details form

Field	Description
Base URL	Base URL of the Workday instance or tenant name. Enter the base URL in this format `https://<workday_host_url>/ccx/service/<workday_tenant_name>`
Version	Version of the API. For example, enter `v33.2`.
Webservice Type	Type of web service. Select `SOAP`.

5. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a WS-Security Username Profile for the Workday HR spoke

Create a WS-Security Username Profile to provide your Workday credentials to authenticate requests from ServiceNow.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **SOAP Integrations** > **WS-Security Username Profiles**.
2. Click **New**.
3. On the form, fill these values.

Field	Description
Name	Name to uniquely identify this credential. For example, enter `WorkdayHR User`.
Application	Application in which the record is applicable. Select **Workday HR Spoke**.
Username	Workday user who has integration rights using Workday Web Services.
Password	Password of the Workday user.

4. Click **Save**.

Configure the SOAP security policy for the Workday HR spoke

Configure the SOAP security profile by adding the security user name profile you had created to authenticate requests from ServiceNow.

Before you begin

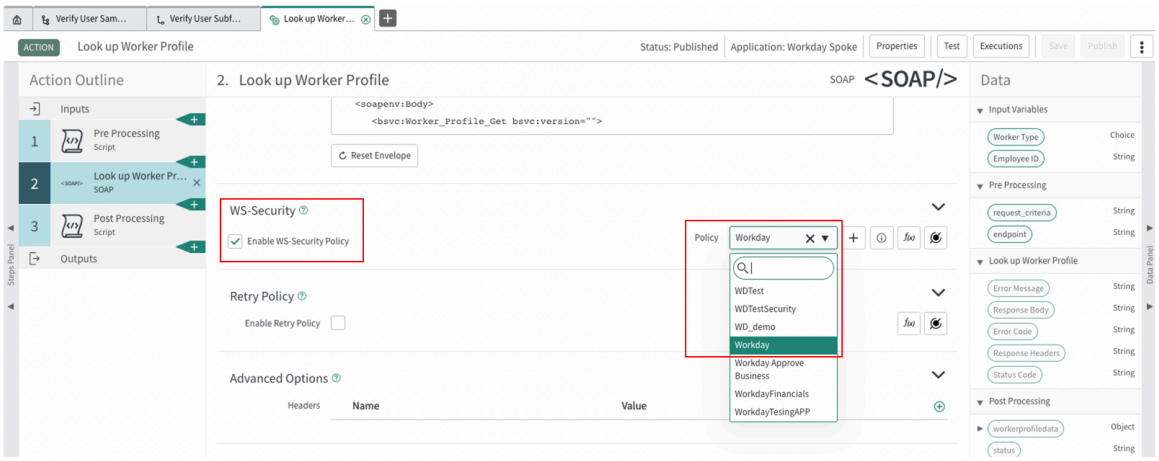
Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **SOAP Integrations** > **SOAP Security Policies**.
2. Open the record for the Workday HR spoke, for example, **WorkdayHR**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you intend to use another SOAP security policy record and not the default record, you must ensure that you select that record in all the actions that use Workday SOAP web services.



Except these listed actions, all other actions use Workday SOAP web services:

3. For **WS-Security Username Profile**, select the security username profile you had created for the Workday HR spoke.
   See Create a WS-Security Username Profile for the Workday HR spoke for more information.
4. Do not provide a value in **WS-Security X.509 Profile**.
5. Right-click the form header and click **Save**.

Configurations to use Workday HR SOAP OAuth

Configure your ServiceNow instance to perform Workday HR SOAP based actions with OAuth 2.0.

Note:
If you are migrating from basic auth to OAuth 2.0 for SOAP based actions, ensure to remove the basic authentication configurations before the migration.

Generate client ID and client secret for Workday HR spoke

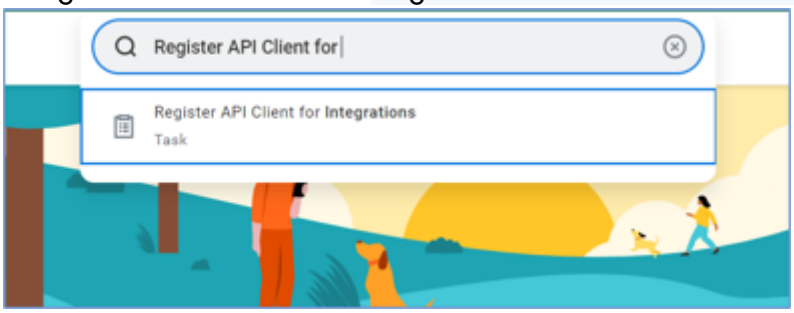
Register Workday HR spoke as the API client in your Workday account and generate client ID, client secret.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

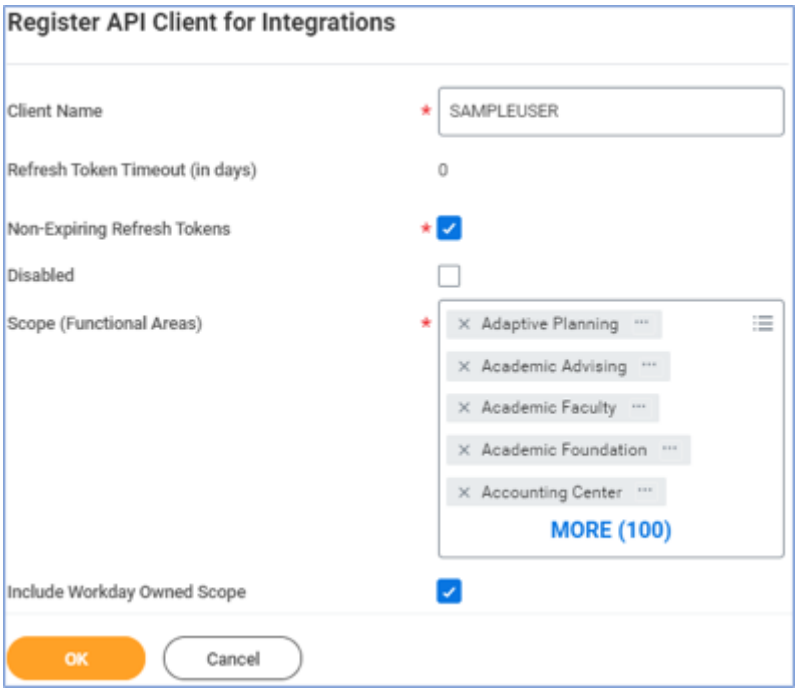
Procedure

1. Log into your Workday tenant.
2. Navigate to Search and enter `Register API Client for Integrations` task.



3. On the Register API Client for Integrations form, fill in the details.

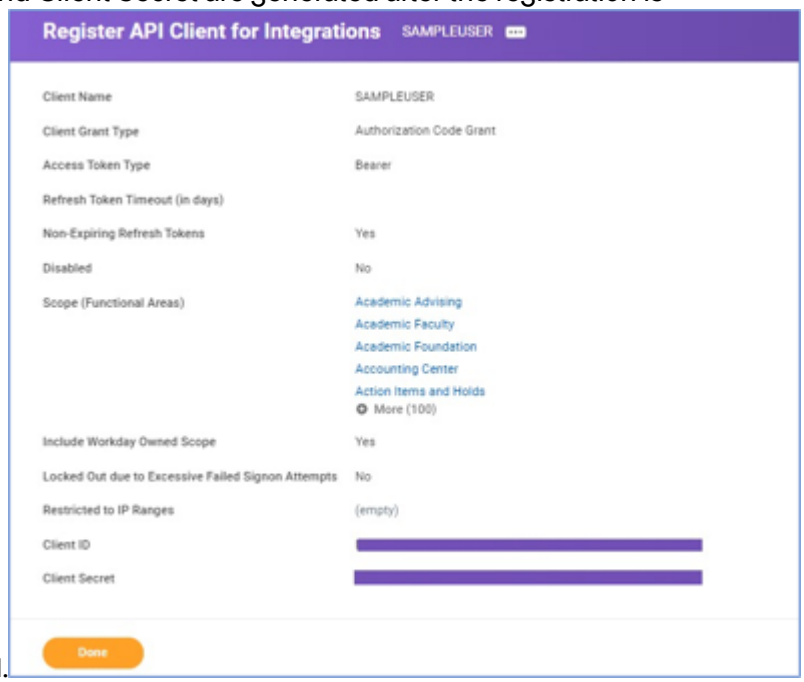
Field	Description
Client Name	Client name of the app. For example, enter `Workday HR spoke`.
Non-expiring Refresh Tokens	Option to enable refresh tokens that do not expire.
Scope (Functional Areas)	Select the required functional areas.
Include Workday Owned Scope	Option to select Workday owned scope.



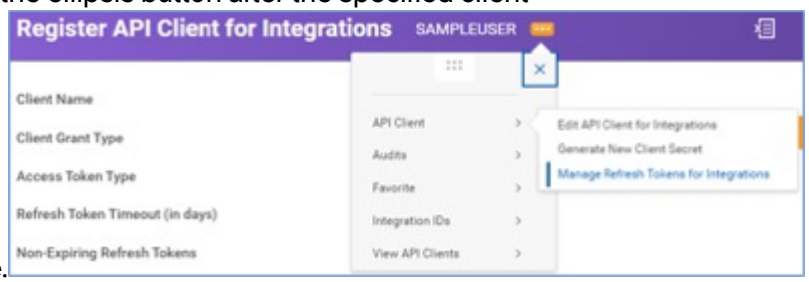
4. Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

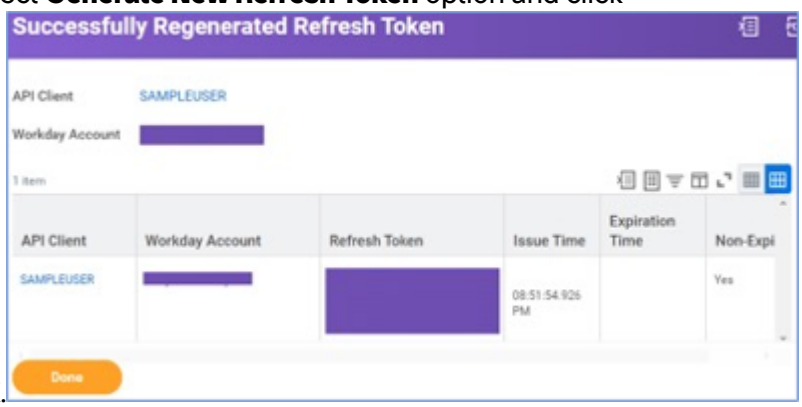
Client ID and Client Secret are generated after the registration is successful.



5. Click the ellipsis button after the specified client name.



6. Select **API Client** >**Manage Refresh Tokens for Integrations**.
7. Select your Workday Account and click **OK**.
   Delete or Regenerate Refresh Token screen displays.
8. Select **Generate New Refresh Token** option and click **OK**.



Result

A new refresh token is generated. Copy and store the refresh token for configuring system property.

Configure system properties for Workday HR spoke

Configure the system properties to enable OAuth 2.0 for SOAP APIs based actions for Workday HR spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Generate client ID and client secret for Workday HR spoke
- Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. In the **Application** column, search for `Workday HR Spoke`.
3. Open the *sn_workday_hr_spke.glide.hub.clientid* system property.
4. Enter the Client ID generated from the Workday account in the **Value** field and click **Update**.
5. Open the *sn_workday_hr_spke.glide.hub.clientsecret* system property.
6. Enter the Client secret generated from the Workday account in the **Value** field and click **Update**.
7. Open the *sn_workday_hr.glide.hub.refreshtoken* system property.
8. Enter the refresh token generated from the Workday account in the **Value** field and click **Update**.
9. Open the *sn_workday_hr_spke.glide.hub.tokenurl* system property.
10. Enter the token URL generated from the Workday account in the **Value** field and click **Update**.

Result

The required system properties are configured for the Workday HR spoke.

Provide the Workday HR base URL

Provide the base URL of your Workday HR instance in the Connection Details [connection_details] table. Spoke actions based on the SOAP API, use these details for the action execution.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Workday HR Spoke** > **Connection Details**.
2. Click the **Show List** related list.
3. Click **New**.
4. On the form, fill these values.

Connection Details form

Field	Description
Base URL	Base URL of the Workday instance or tenant name. Enter the base URL in this format `https://<workday_host_url>/ccx/service/<workday_tenant_name>`
Version	Version of the API. For example, enter `v33.2`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Webservice Type	Type of web service. Select SOAP.

5. Click **Save**.

Configurations to use Workday REST API

Configure your ServiceNow instance to perform actions that use the Workday REST API.

Before you begin

- Request an Integration Hub subscription.
- Activate Workday HR spoke.
- From Workday, obtain these values and record them for later use. These values are need to register your client:
  - Client ID
  - Client Secret
  - Workday REST API Endpoint
  - Token Endpoint
  - Authorization Endpoint
- Role required: admin

About this task

Workday REST and Report-as-a-Service (RAAS) API works with OAuth 2.0 to authorize access to resources in your Workday tenant. To use OAuth 2.0, you must register your client in the tenant, using the Register API Client task.

Configure your ServiceNow instance to use the Workday REST API if you need to use these REST-based spoke actions:

- Get My Reporting Structure
- Look up Object Custom Fields
- Update Object Custom Fields
- Look up Payslip
- Look up Total Rewards Using Report
- Look up Custom Reports
- Look up Inbox Items
- Look up Merit And Benefit Plan Details Of An Employee
- Look up Holiday Calendars Reference WID Of An Employee
- Look up Schedule Calendars Reference WID Of An Employee
- Look up Holiday Calendars Of An Employee
- Look up using WQL Stream

Note:
These configurations are needed to use the REST-based spoke actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register Workday HR as an OAuth provider

Register the Workday HR instance as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays this message: `What kind of OAuth application?`.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

Application Registries form

Field	Description
Name	Name to uniquely identify the record. For example, enter: `Workday HR OAuth`
Application	Application in which the record is applicable. Select **Workday HR Spoke**.
Client ID	Client ID generated while registering your client.
Client Secret	Client secret generated while registering your client.
Authorization URL	Authorization endpoint generated while registering your client.
Token URL	Token endpoint generated while registering your client.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`
Default Grant Type	Grant type used to establish the token. Select **Authorization Code**.
Active	Option to actively use the application registry.

5. Right-click the form header, and click **Save**.
   An OAuth entity profile is created.

Generate token URL for Workday HR spoke

Register API client in your Workday account and generate a token URL for Workday HR spoke.

Before you begin

Role required: admin

Procedure

1. Log into your Workday tenant.
2. Navigate to Search and enter `Register API Client` task.
3. On the Register API Client, fill in the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client Name	Client name of the app. For example, `Workday HR spoke`.
Client Grant Type	Select Authorisation Code Grant.
Access Token Type	Access Token Type: Select Bearer
Redirection URI	Enter your ServiceNow URL in this format: `https://<instance>.service-now.com/oauth_redirect.do`.
Non-Expiring Refresh tokens	Option to enable refresh tokens which do not expire.
Scope (Functional Areas)	Select the required functional areas.
Include Workday Owned Scope	Option to select scope that are owned by Workday.

4. Click **OK**.

Result
Copy and store the generated Token Endpoint value for configuring system property.

Option 1: Configuration to use Workday HR REST API with a template

Configure your ServiceNow instance to perform actions that use the Workday HR REST API using an OAuth authorization template.

Before you begin
Role required: admin

Configure a connection for Workday HR REST API

Add and configure a Workday HR REST API connection to authenticate ServiceNow requests in Workday HR spoke.

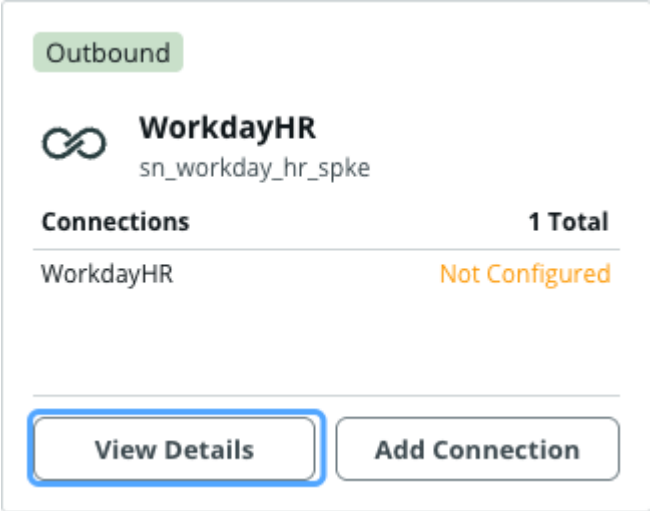
Before you begin

- Role required: admin
- Register Workday HR as an OAuth provider

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select **Integrations**.
3. Select the **Connections** tab.
4. Use the search box to find the **WorkdayHR** connection alias.
5. Click **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Configure a cloud connection.
   a. Add or edit a cloud connection.
      - To set up an existing connection, select **Configure** or **Edit**.

      - To create and configure a new connection, select **Add Connection**.
   b. On the configuration form, fill in the fields.

Configuration form

Field	Description
Name	Name to uniquely identify the connection. For example, `Workday HR spoke connection`.
Connection URL	URL to make a connection to Workday HR. Use this format: `https://<workday_host>/ccx/service/<tenant_name>`
Tenant Name	Name of the Workday tenant. For example, `bcone_gms1`.
API Version	Version of the Workday API to use for requests.
Client ID	Client ID generated in Workday for OAuth authentication.
Client Secret	Client Secret generated in Workday for OAuth authentication.
Authorization URL	URL used to authorize the OAuth connection. Use this format: `https://<workday_host>/authorize`
Token URL	URL used to generate the OAuth token. Use this format: `https://<workday_host>/token`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Redirect URL	URL where Workday redirects after successful authentication. Use this format: `https://<instance_name>.service-now.com/oauth_redirect.do`

7. Click **Save and Get OAuth Token**.

Result
The spoke connection is configured and ready to be used.

Option 2: Configuration to use Workday HR REST API without a Template

Configure your ServiceNow instance to perform actions that use the Workday HR REST API by manually creating connection and credential records.

Before you begin
Role required: admin

Create a credential record for the Workday HR spoke

Create a credential record for the Workday HR instance. The Workday HR spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `Workday HR Cred`.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth entity profile created during the registration of Workday HR as an OAuth provider. For example, OAuth Profile.

5. Right-click the form header and click **Submit**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a connection record for the Workday HR spoke

Create a connection record for your Workday HR instance. The Workday HR spoke connection and credential aliases use these connections to perform actions in Workday HR.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, **WorkdayHR**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

> **Note:**
> Ensure that you create the connection record in the **Workday HR Spoke** application.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Workday HR Connection`.
Credential	Credential record created for Workday HR spoke. For example, `Workday HR Cred`.
Connection alias	Alias record associated with this connection.
Connection URL	URL to connect to your Workday HR instance.
Active	Option to actively use the connection record.

5. In the **Attributes** tab, fill in these values.

Field	Value
Tenant Name	Tenant name of your Workday application.
Version	v1

6. Click **Submit**.

Set up webhooks for your Workday HR spoke

Retrieve details the required employees in the Workday HR application to your ServiceNow instance by setting up the webhooks.

Before you begin

Role required: admin

Configure ServiceNow Webhook API Client for OAuth 2.0 in Workday

Configure API client in Workday to authenticate webhook requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: Workday admin role or the role with granted permission to setup OAuth 2.0 client in Workday.

About this task
You only need to configure this step if you want to use the ServiceNow platform as a listener endpoint, and receive event notifications from Workday. If you don't need to receive any event notifications from Workday, then you can skip the configurations mentioned in this section.

Note:
These configurations must be performed in Workday.

Procedure
1. In Workday, access the Edit Tenant Setup - Security task.
2. Select the **OAuth 2.0 Clients Enabled** option from the **OAuth 2.0 Settings** section.
3. Access the Register API Client task.
4. Enter the **Client Name**.
5. Select the **Client Grant Type** as Authorization Code Grant.
6. Select **Access Token Type** as Bearer.
7. Enter a valid Redirection URI.

   Note:
   Make sure that the OAuth 2.0 Redirection URI is a valid HTTPS URL.

8. **Optional:** Select the Refresh Token Timeout in days.
9. **Optional:** Select the Non-Expiring Refresh Tokens option to prevent the refresh token from timing out.
10. Select the **Grant Administrative Consent** option to grant OAuth permission to a REST API Client tenant-wide.
    When you select this option, you don't have to grant client access explicitly to Workday functional areas.
11. From the Functional Areas prompt, select the functional areas to which your OAuth 2.0 client requires access.
12. **Optional:** If the OAuth 2.0 client requires access to core Workday domains that aren't in any functional areas, select the **Include Workday Owned Scope** option.

Set up CreateUser Webhook for the Workday HR spoke

Use the CreateUser Webhook to get the details of the newly onboarded employee from Workday to your ServiceNow instance.

Generate user name and password in your ServiceNow instance for Create User webhook

Generate user name and password in your ServiceNow instance to authenticate requests for Create User webhook and retrieve the required data from the Workday application.

Before you begin
Role required: ServiceNow admin

Note:
These configurations must be performed in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to your ServiceNow instance as an admin.
2. Navigate to **All** > **System Definition** > **Table**.
3. Filter and search for the Workday HR spoke webhook registry table.
   For example, **Workday Webhook Registry**.
4. Click the **Show List** related list.
5. Click **New**.
6. On the form, fill these values.

Field	Description
Description	Description of the webhook registry record. Enter `Workday event and authentication for Create User`.
UserName	Workday user who has integration rights using Workday Web Services.
Password	Password of the Workday user.
Workday Event	Event for which the webhook is set up. Enter `CreateUser`.
Workday Instance	Workday host URL and tenant name. Enter the URL in this format:`https://<workday_host_url>/<workday_tenant_name>`

7. Right-click the form header and click **Save**.
8. Click **Generate UserName And Password**.
   Copy and record the values of username and password. These values must be specified in the Workday instance to authenticate the webhook requests.

Note:
If you have more than one HIRE BP in your environment, you must configure all the HIRE BPs to enable the Create User webhook for all HIRE employee transactions.

Retrieve the resource path from your ServiceNow instance for Create User webhook

Retrieve the resource path from your ServiceNow instance for later use to authenticate Create User webhook requests and retrieve the required data from the Workday application

Before you begin
Role required: ServiceNow admin.

Note:
These configurations must be performed in your ServiceNow instance.

Procedure

1. Log in to your ServiceNow instance as an admin.
2. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
3. Open the record for the Workday HR spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Resources** tab, click the **Callback** record.
5. Record and save the value of **Resource path** for later use.

Import CLAR file to your Workday instance for Create User webhook

Import CLAR file available at ServiceNow Store to set up Create User webhook and authenticate requests from ServiceNow instance.

Before you begin

- Workday Studio should be installed.
- Access to custom report creation policy.

  Create custom report in workday based on the New_Hire_record report structure and share the report with ISU user.

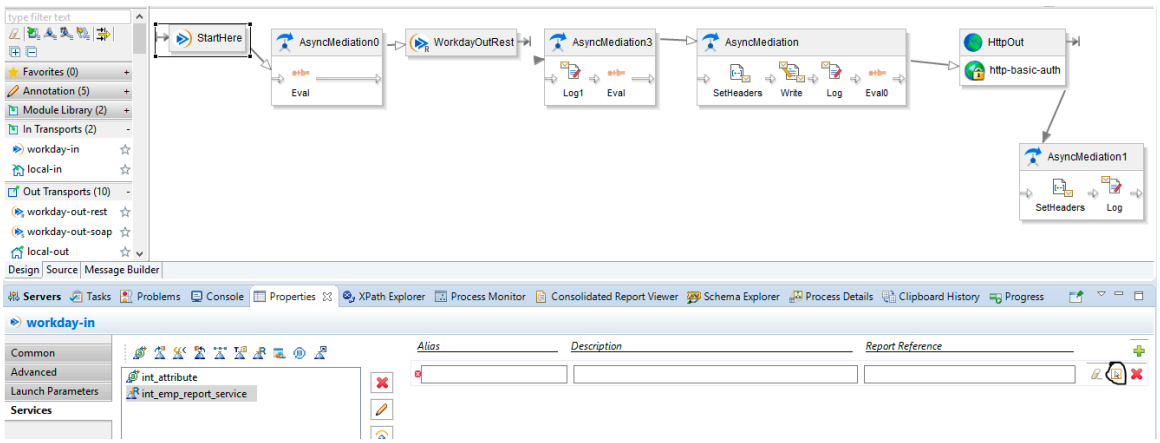
- Access to edit business process definition.
- Access to create and edit integration system.
- Role required: admin

Note:

- Except integration name, report field XPath (if required), and Workday instance header, users are cautioned against modifying the values of fields or properties in the CLAR file.
- These configurations must be performed in Workday Studio.

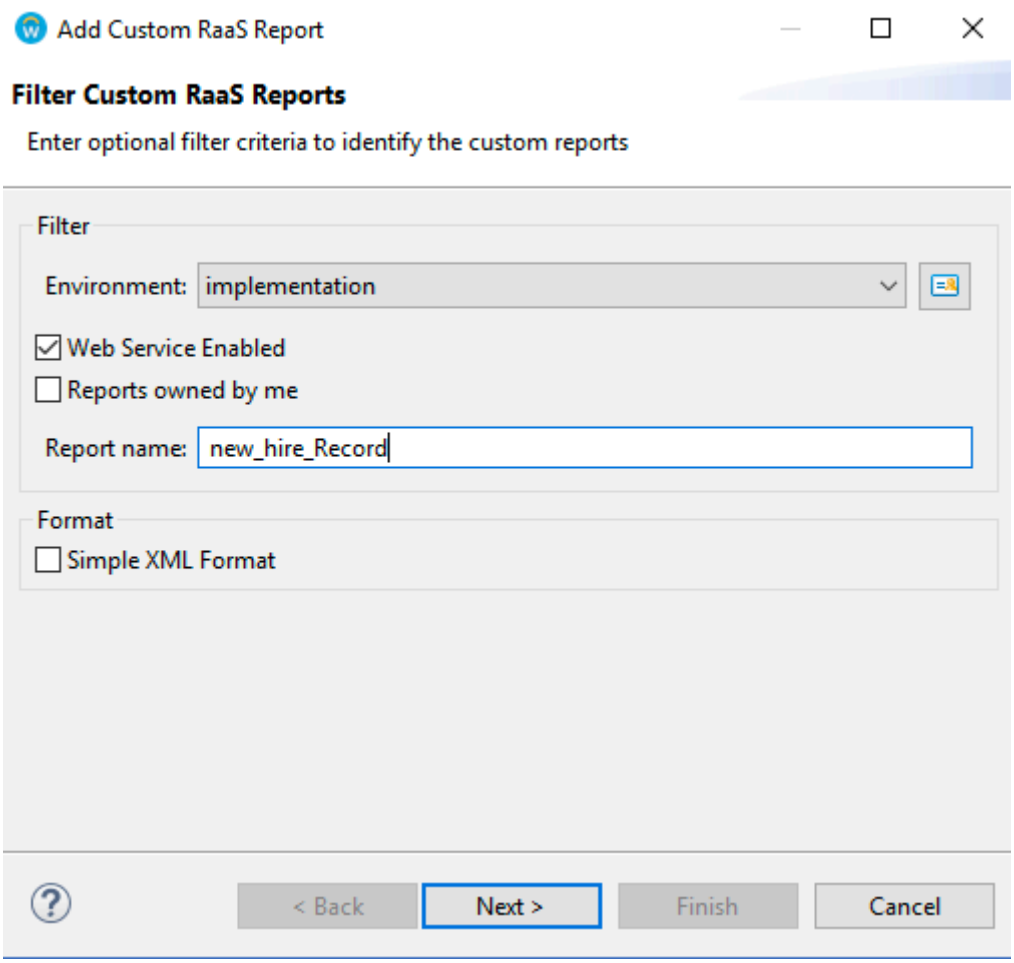
Procedure

1. From the Workday HR spoke page on ServiceNow Store, download the `Workday-HR-Webhook-Studio-Sample` file from **Supporting Links and Docs**.
2. Unzip the sample file to obtain the CLAR file.
3. Import the CLAR file to Workday Studio.
4. In the **Properties** tab of the **StartHere** component, navigate to **Services** and select the RAAS report created for this webhook.

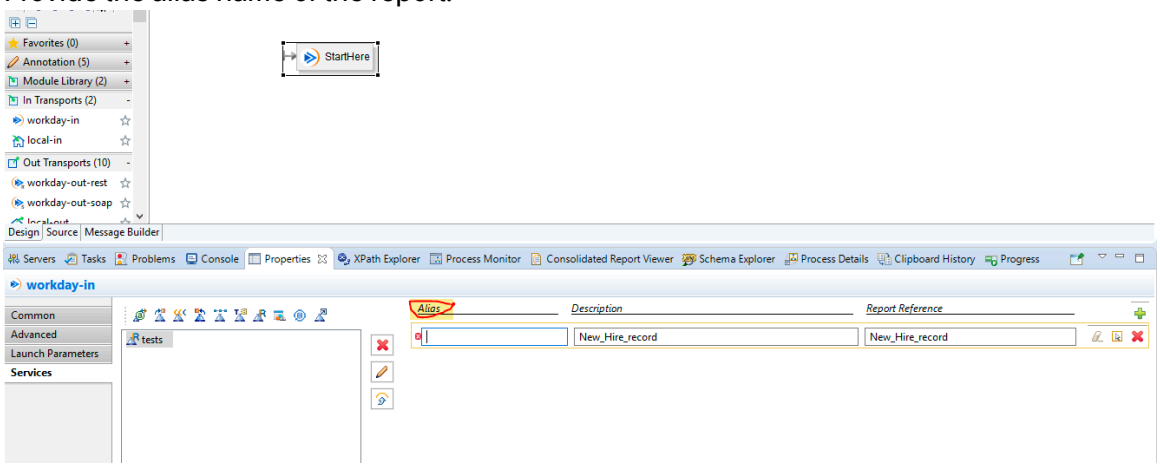


5. Choose the environment where your report exists such as, implementation or sandbox and configure the report as per your requirement.
6. Provide a report name and select the required report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



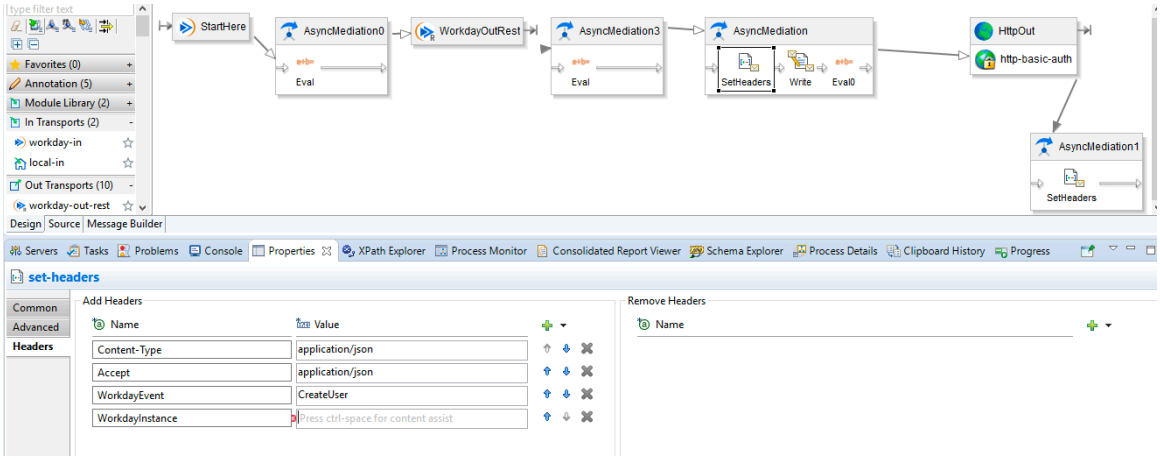
7. Provide the alias name of the report.



8. After the report alias is added, add the selected path of report in **Extra Path** that is used to run the report based on prompt.

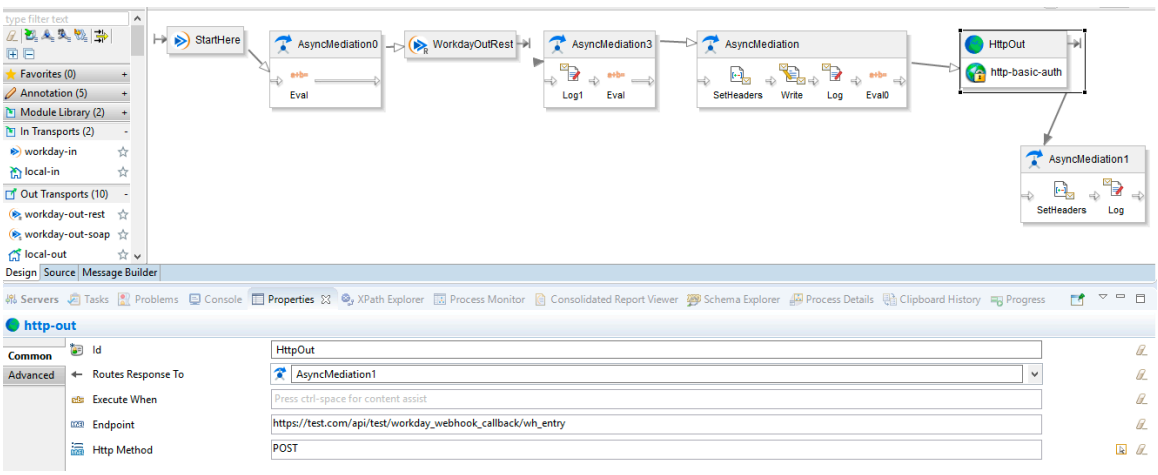
9. In the **Set Headers** component, provide your Workday instance for the **WorkdayInstance** header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. In the properties of **HttpOut**, fill in these values.

Field	Value
Endpoint	REST endpoint **Note:** See Retrieve the resource path from your ServiceNow instance for more information.
Http Method	POST

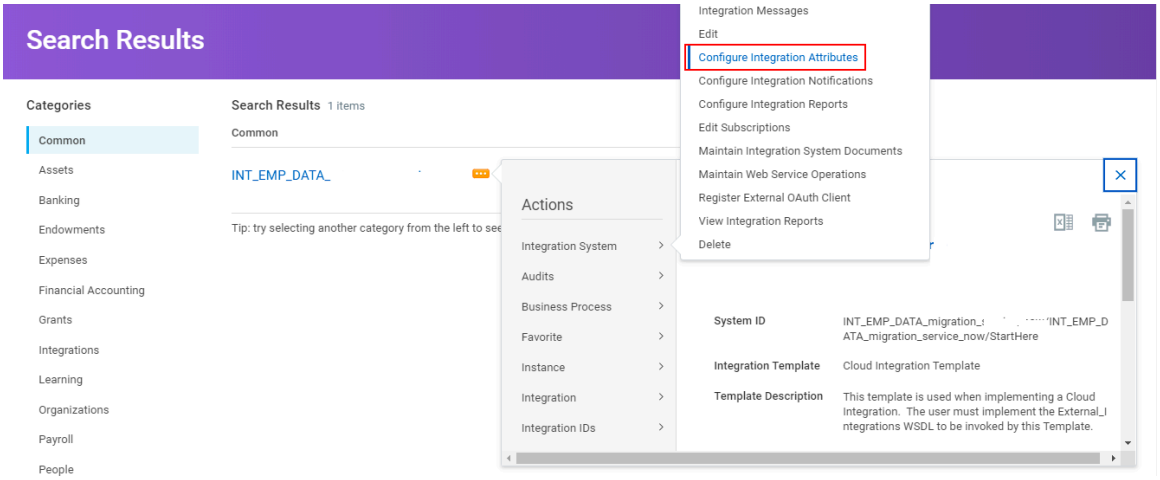


11. Save the changes.

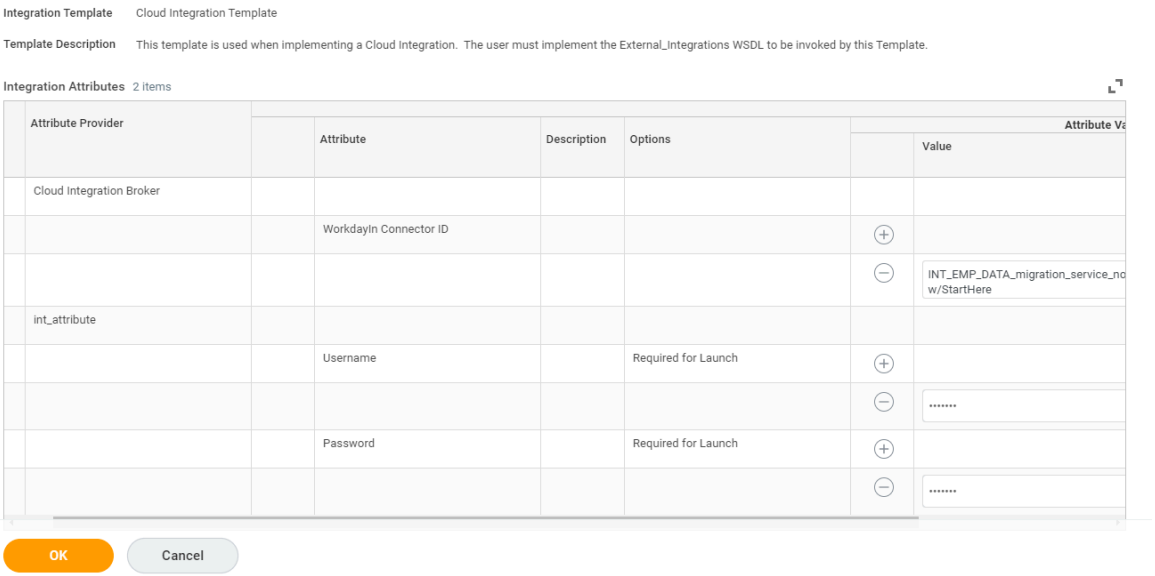
12. In the project explorer, select the integration and deploy it in your Workday system.

13. Log in to your Workday instance and navigate to **Integration** > **Integration System** > **Configure Integration Attributes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



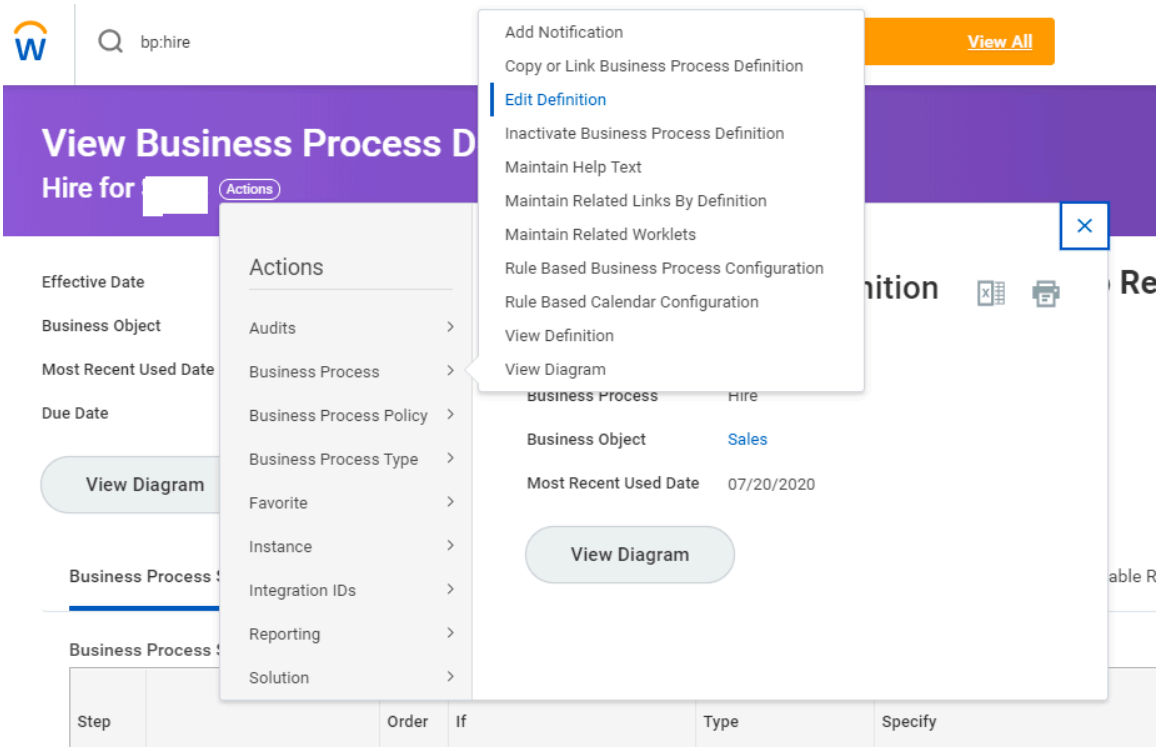
14. Provide user name and password in **Configure Integration Attributes** that you have generated in Generate user name and password in your ServiceNow instance.



15. Modify a business process and add this integration in your business process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Edit definition of the business process.

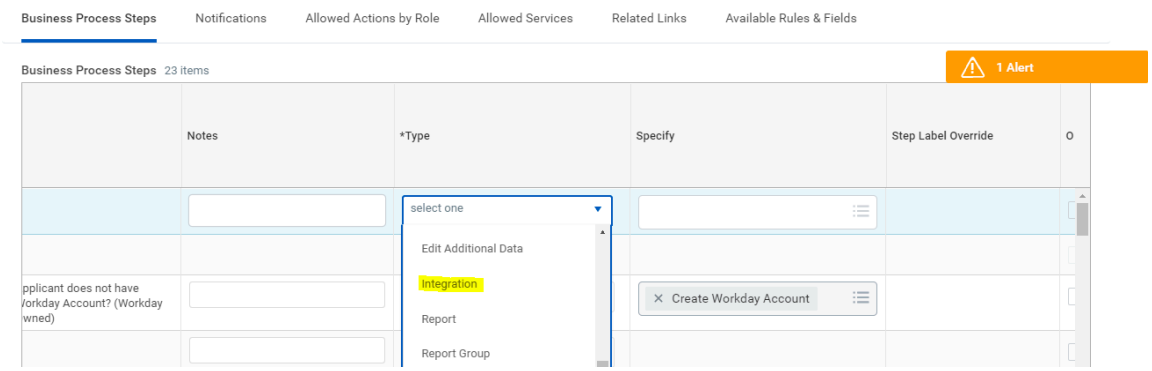


b. Select the effective date and click **Ok**.

c. Click the + sign and add a new business process step in BP.

d. Select an order, which is after the completion step of business process.

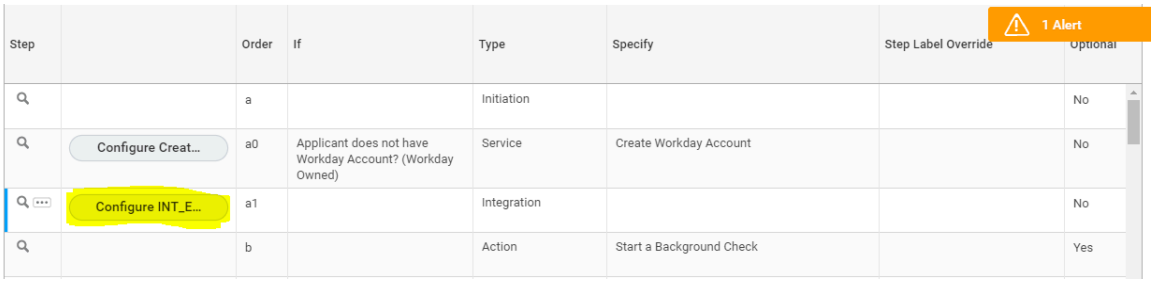
e. Add the business process and select **Type** as **Integration**.



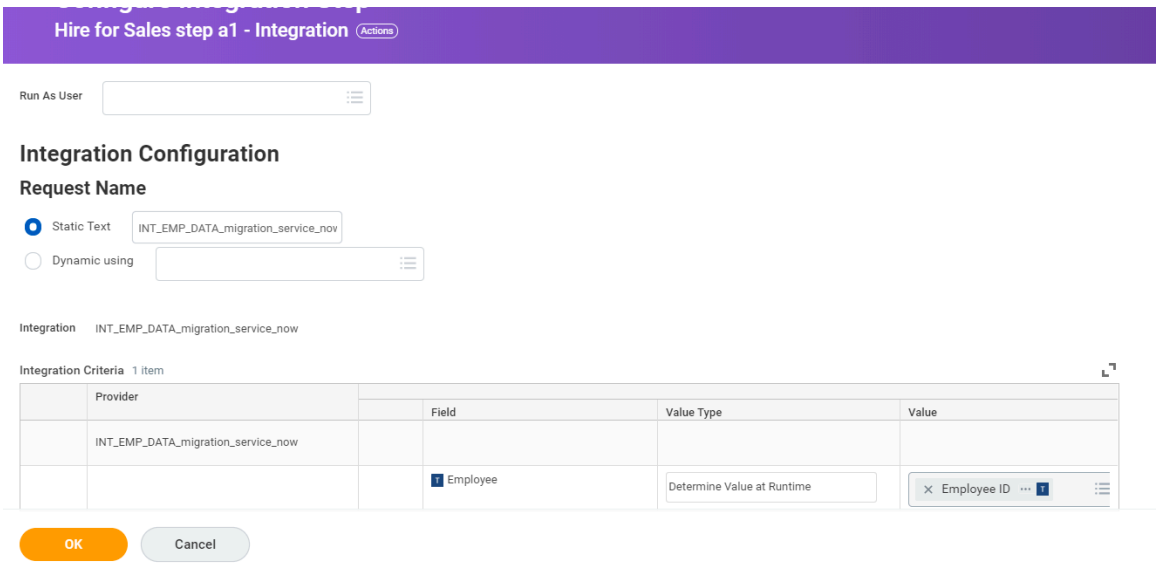
f. Provide ISU username in **Run as User** and click **Ok**.

g. Click **Configure Integration** on the newly added business process step in Hire BP.

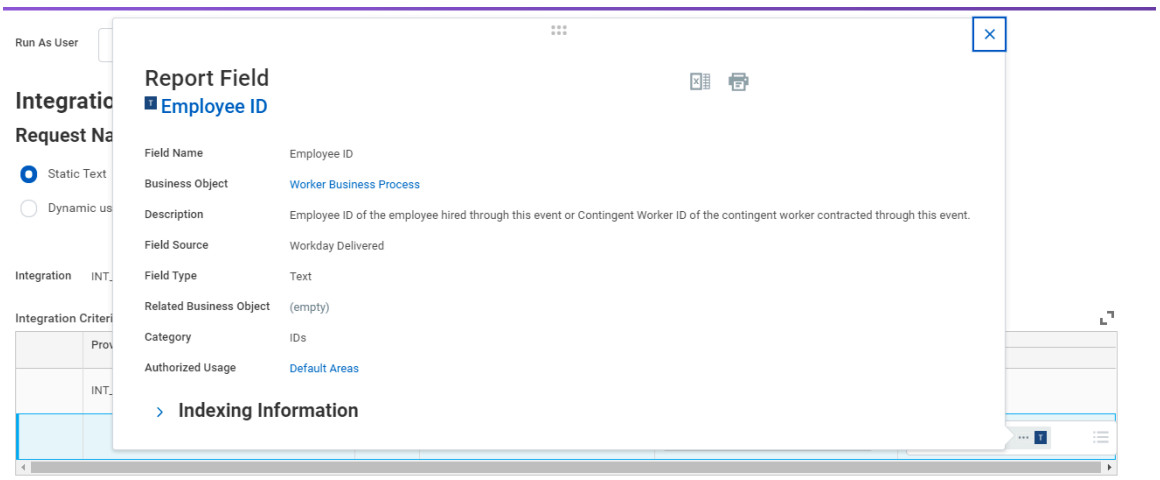
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



h. In integration criteria, select value type as **Determine value at runtime** and select value as **Employee ID**.



Selected **Employee ID** field in value is displayed.



i. Click **Ok**.

j. Create a report for the webhook with these details:

Report definition:

Set up Offboarding Webhook for the Workday HR spoke

Use the Offboarding Webhook to get the details of the offboarded employee from Workday to your ServiceNow instance.

Generate user name and password in your ServiceNow instance for Offboarding webhook

Generate user name and password in your ServiceNow instance to authenticate requests for Offboarding webhook and retrieve the required data from the Workday application.

Before you begin

Role required: admin

Note:
These configurations must be performed in your ServiceNow instance.

Procedure

1. Log in to your ServiceNow instance as an admin.
2. Navigate to **All** > **System Definition** > **Table**.
3. Filter and search for the Workday HR spoke webhook registry table.
   For example, **Workday Webhook Registry**.
4. Click the **Show List** related list.
5. Click **New**.
6. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description of the webhook registry record. Enter `Workday event and authentication for Offboarding`.
UserName	Workday user who has integration rights using Workday Web Services.
Password	Password of the Workday user.
Workday Event	Event for which the webhook is set up.
Workday Instance	Workday host URL and tenant name. Enter the URL in this format:`https://<workday_host_url>/<workday_tenant_name>`

7. Right-click the form header and click **Save**.
8. Click **Generate UserName And Password**.
   Copy and record the values of username and password. These values must be specified in the Workday instance to authenticate the webhook requests.

Note:
If you have more than one HIRE BP in your environment, you must configure all the HIRE BPs to enable the Create User webhook for all HIRE employee transactions.

Retrieve the resource path from your ServiceNow instance for Offboarding webhook

Retrieve the resource path from your ServiceNow instance for later use to authenticate Offboard webhook requests and retrieve the required data from the Workday application

Before you begin

Role required: admin.

Note:
These configurations must be performed in your ServiceNow instance.

Procedure

1. Log in to your ServiceNow instance as an admin.
2. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
3. Open the record for the Workday HR spoke.
4. In the **Resources** tab, click the **Callback** record.
5. Record and save the value of **Resource path** for later use.

Import CLAR file to your Workday instance for Offboarding webhook

Import CLAR file available at ServiceNow Store to set up Offboarding webhook and authenticate requests from ServiceNow instance.

Before you begin

- Workday Studio should be installed.
- Access to custom report creation policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create custom report in workday based on the New_terminated_record report structure and share the report with ISU user.

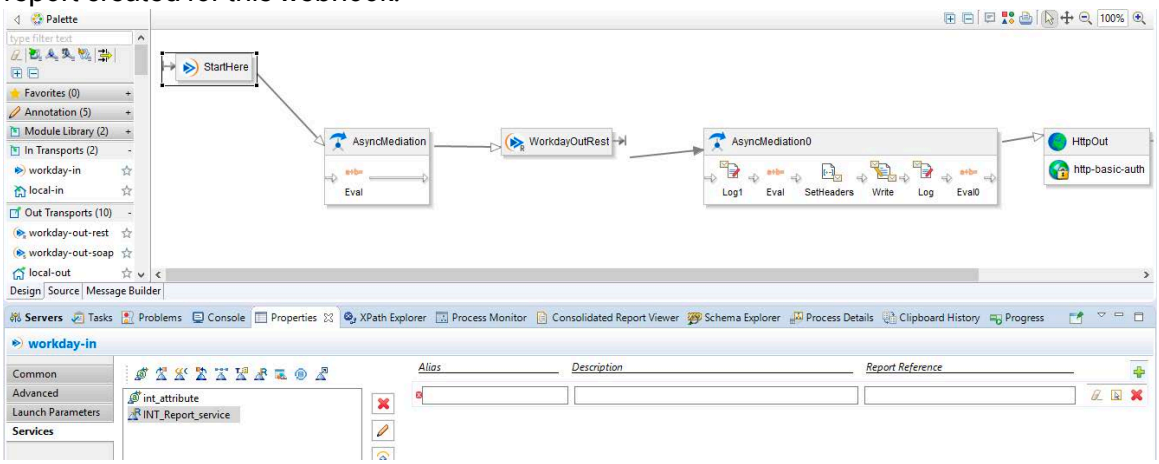
- Access to edit business process definition.
- Access to create and edit integration system.
- Role required: admin

Note:

- Except integration name, report field XPath (if required), and Workday instance header, users are cautioned against modifying the values of fields or properties in the CLAR file.
- These configurations must be performed in Workday Studio.

Procedure

1. From the Workday HR spoke page on ServiceNow Store, download the `Workday-HR-Offboarding-Webhook-Studio-Sample` file from **Supporting Links and Docs**.
2. Unzip the sample file to obtain the CLAR file.
3. Import the CLAR file to Workday Studio.
4. In the **Properties** tab of the **StartHere** component, navigate to **Services** and select the RAAS report created for this webhook.



5. Choose the environment where your report exists such as, implementation or sandbox and configure the report as per your requirement.
6. Provide a report name and select the required report.

q. Select **Populate Undefined Prompt defaults** option from the **Prompts** tab.

r. Select **Enable as web service** option from the **Advanced** tab.

Set up LeaveofAbsence Webhook for the Workday HR spoke

Use the LeaveofAbsence Webhook to get leave of absence details of an employee from Workday to your ServiceNow instance.

Generate user name and password in your ServiceNow instance for LeaveofAbsence webhook

Generate user name and password in your ServiceNow instance to authenticate requests for LeaveofAbsence webhook and retrieve the required data from the Workday application.

Before you begin

Role required: admin

Note:
These configurations must be performed in your ServiceNow instance.

Procedure

1. Log in to your ServiceNow instance as an admin.
2. Navigate to **All** > **System Definition** > **Table**.
3. Filter and search for the Workday HR spoke webhook registry table, for example, **Workday Webhook Registry**.
4. Click the **Show List** related list.
5. Click **New**.
6. On the form, fill these values.

Field	Description
Description	Description of the webhook registry record. Enter `Workday event and authentication for leave of absence`.
UserName	Workday user who has integration rights using Workday Web Services.
Password	Password of the Workday user.
Workday Event	Event for which the webhook is set up. Enter `LeaveofAbsence`.
Workday Instance	Workday host URL and tenant name. Enter the URL in this format:`https://<workday_host_url>/<workday_tenant_name>`

7. Right-click the form header and click **Save**.
8. Click **Generate UserName And Password**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Copy and record the values of username and password. These values must be specified in the Workday instance to authenticate the webhook requests.

Note:
If you have more than one HIRE BP in your environment, you must configure all the HIRE BPs to enable the Create User webhook for all HIRE employee transactions.

Retrieve the resource path from your ServiceNow instance for LeaveofAbsence webhook

Retrieve the resource path from your ServiceNow instance for later use to authenticate Offboard webhook requests and retrieve the required data from the Workday application

Before you begin

Role required: admin.

Note:
These configurations must be performed in your ServiceNow instance.

Procedure

1. Log in to your ServiceNow instance as an admin.
2. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
3. Open the record for the Workday HR spoke.
4. In the **Resources** tab, click the **Callback** record.
5. Record and save the value of **Resource path** for later use.

Import CLAR file to your Workday instance for LeaveofAbsence webhook

Import CLAR file available at ServiceNow Store to set up LeaveofAbsence webhook and authenticate requests from ServiceNow instance.

Before you begin

- Workday Studio should be installed.
- Access to custom report creation policy.

  Create custom report in workday based on the Leave_of_absence_request report structure and share the report with ISU user.

- Access to edit business process definition.
- Access to create and edit integration system.
- Role required: admin

Note:

- Except integration name, report field XPath (if required), and Workday instance header, users are cautioned against modifying the values of fields or properties in the CLAR file.
- These configurations must be performed in Workday Studio.

Procedure

1. From the Workday HR spoke page on ServiceNow Store, download the `Workday-HR-Leave-of-Absence-Webhook-Studio-Sample` file from **Supporting Links and Docs**.
2. Unzip the sample file to obtain the CLAR file.
3. Import the CLAR file to Workday Studio.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

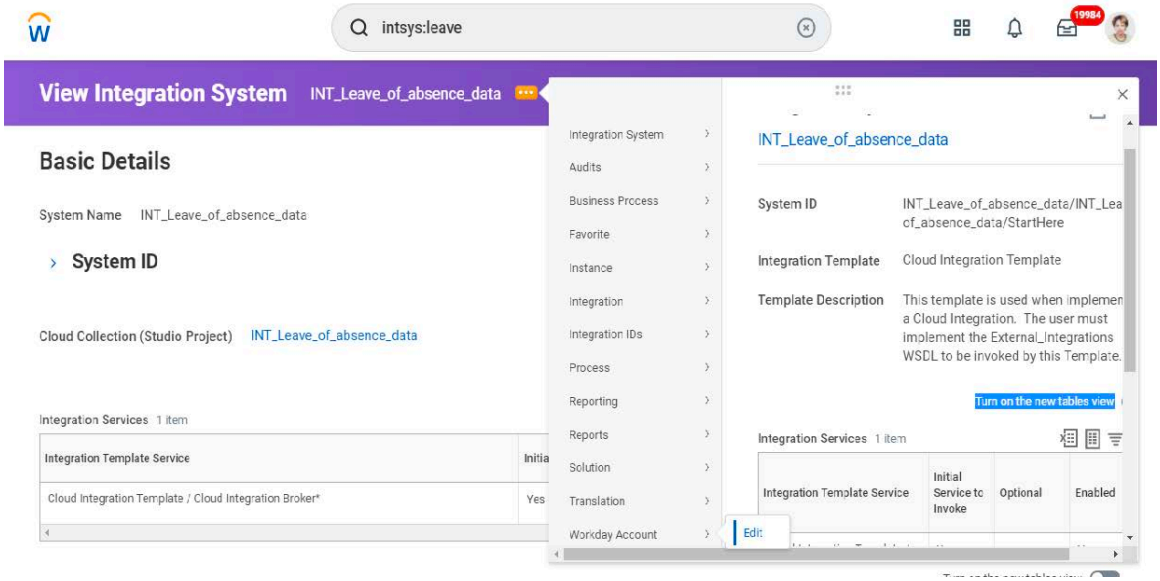
16. Modify a business process and add this integration in your business process.

a. Edit definition of the business process.



b. Select the ISU user in Workday Account box.

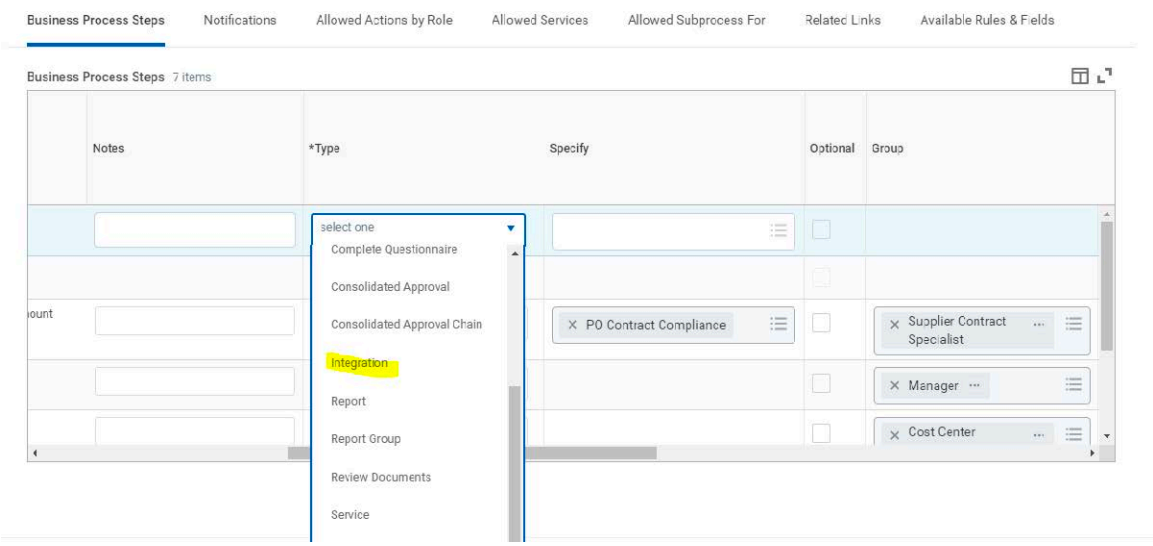
c. Select the effective date and click **Ok**.

d. Click the + sign and add a new business process step in BP.

e. Select an order, which is after the completion step of business process.

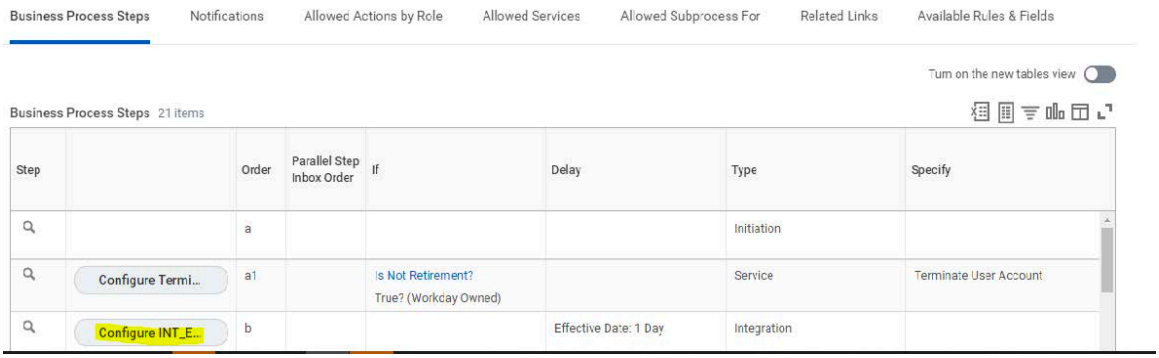
f. Add the business process and select **Type** as **Integration**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



g. Provide ISU username in **Run as User** and click **Ok**.

h. Click **Configure Integration** on the newly added business process step in Hire BP.



i. In integration criteria, select value type as **Determine value at runtime** and select value as **Employee ID**.

Selected **Employee ID** field in value is displayed.

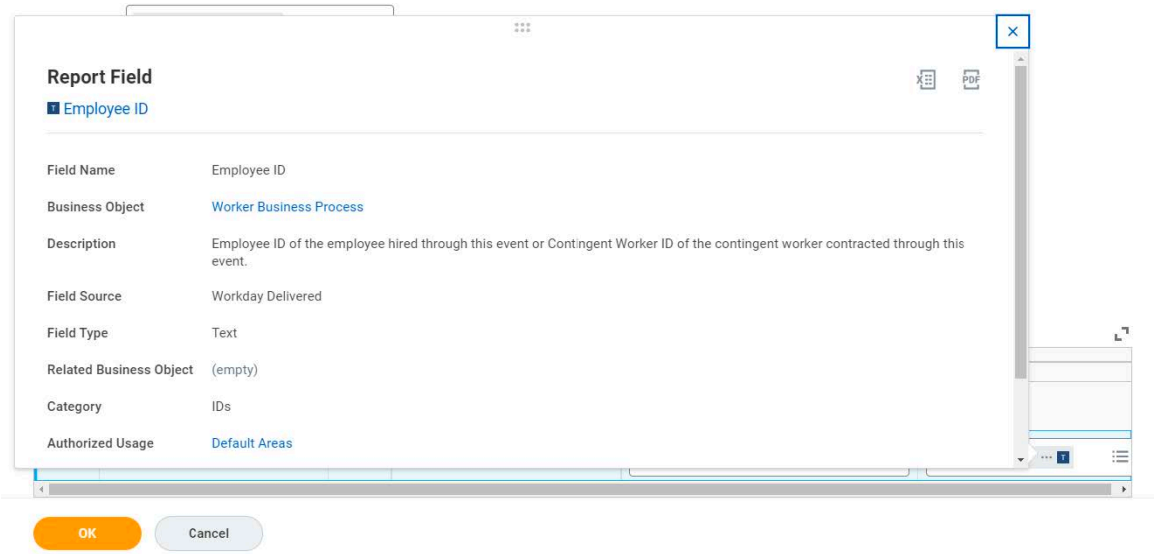
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



j. Click **Ok**.

k. Open **Create Custom Report** task.

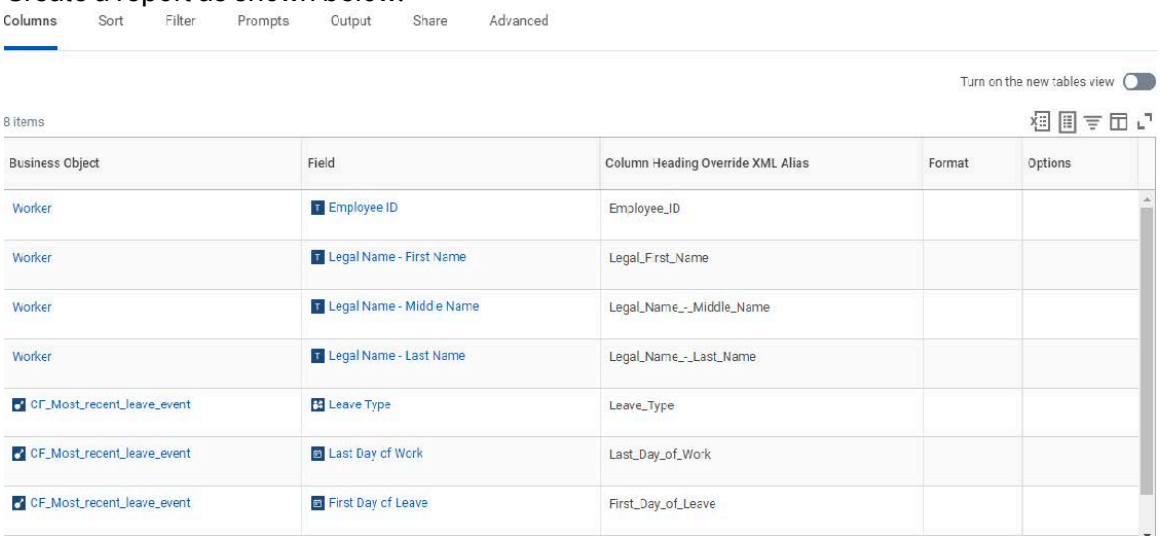
l. Enter the report name, for example, `Leave_of_absence_request`.

m. Select **Report Type** as Advanced.

n. Uncheck the Optimized for performance option.

o. Select **Data Source** as **All Active and Terminated Workers**.

p. Create a report as shown below:



Group Column Heading section in report

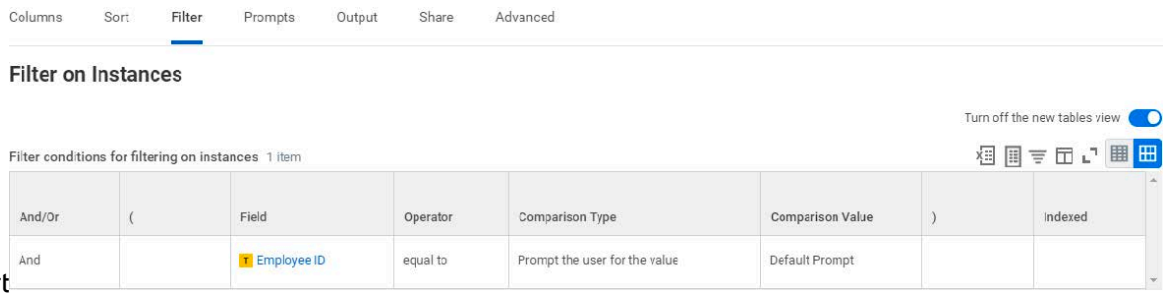
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter section in report



q. Select **Populate Undefined Prompt defaults** option from the **Prompts** tab.

r. Select **Enable as web service** option from the **Advanced** tab.

Extend functionality of the Workday HR spoke

Extend the Workday HR spoke beyond the default functionalities, such as adding new input and output fields.

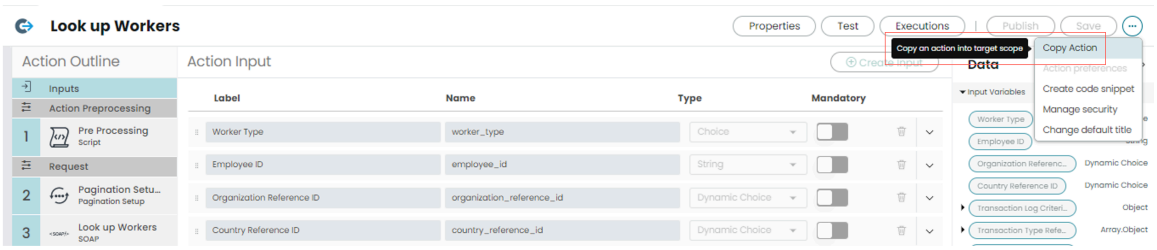
To extend the Workday HR spoke, ensure that the admin is aware of the Workday Public Web Services API and can configure the Workday system.

Example: Extend the Look up Workers action

Look up Workers action available along with the spoke provides most of the required inputs and outputs. Before adding more inputs and outputs to this action, explore ways to use the default spoke action.

This action transforms the input field data pills in the Workday HR spoke to the associated Workday request XML message and synchronously renders back the Workday response XML message as output field data pills in ServiceNow Workflow Studio. Ensure that you check the Sample request message and Sample response message.

Modify or extend the default Look up Workers action by creating a copy of it.



To add Position Reference ID as part of the request criteria for this action:

Note:

- Ensure that you check if the regular input field or the **Additional Field** input field has the desired input. If none of them have the desired input, perform these instructions to manually create the required input field.
- The Look up Workers action supports Position Reference ID request element in the **Additional Fields** input field. For the purpose of demonstration, this field is manually being added in the UI.

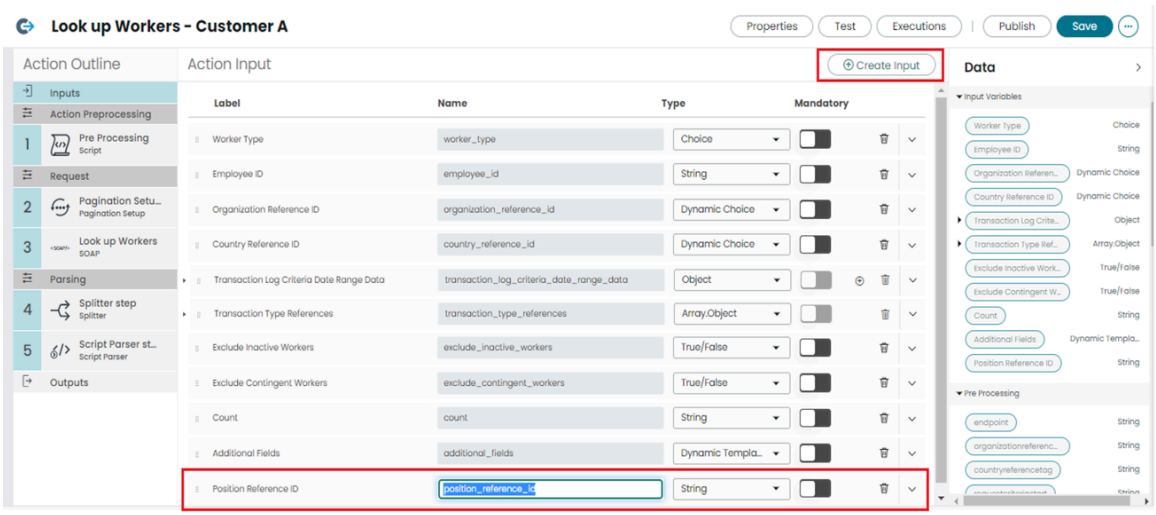
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Evaluate and understand how Position Reference ID is structured in the Workday request message. The XPath to add a Position Reference ID in the request message is two-folded as per the Workday Public Web Services community post.
   a. Position Reference Type attribute: Get_Workers_Request/Request_Criteria/Position_Reference/@type
   b. The attribute value above, per the Public Web Services doc, is a hard-coded "Position ID."

Position_ElementObjectID
part of: Position_ElementObject
Contains a unique identifier for an instance of an object.

Parameter name	Type/Value	Cardinality	Description
#text	string		
@type	WID Position_ID	[1..1]	The unique identifier type. Each "ID" for an instance of an object contains a type and a value. A single instance of an object can have multiple "ID" but only a single "ID" per "type".

   c. Position Reference Value: Get_Workers_Request/Request_Criteria/Position_Reference
   d. The actual value above is a new input field in the spoke action.
2. Create an input variable in the **Action Input** step. Click **Create Input** and add a simple string type input variable.



3. Create an input variable in the Pre Processing script step.
   a. Click **Create Variable**.
   b. Add the input variable name with name as **position_reference_id**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Drag the **Position Reference ID** data pill from **Input Variables** and drop it at the value of the input variable.

4. Leverage the design pattern of var organizationReferenceStr in the script section.

a. Create the XML node to match the Workday Get Worker Request message in this example.

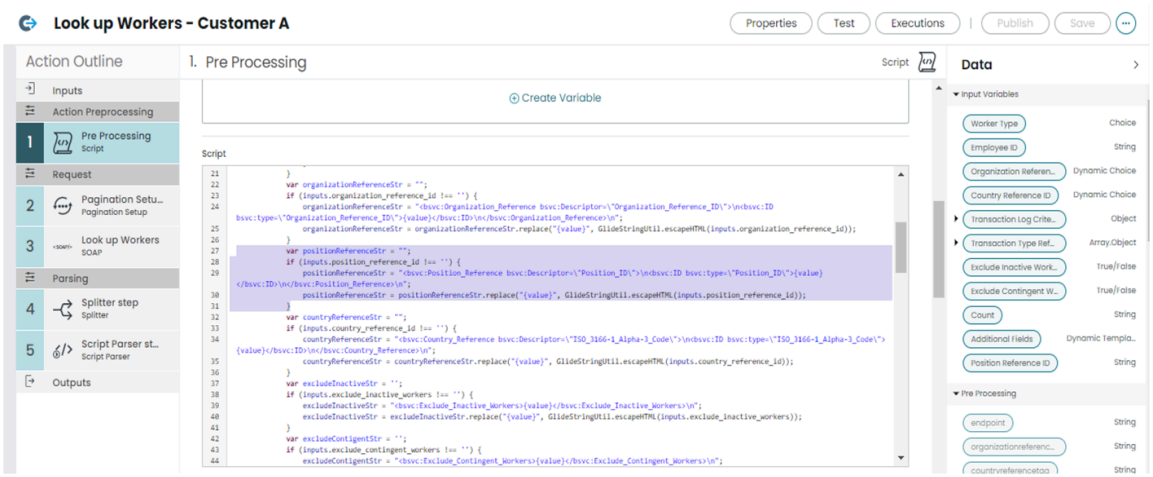
b. Find the appropriate design pattern in the script section accordingly. In this example, this XML node needs to be constructed for Position Reference.

```
<bsvc:Position_Reference bsvc:Descriptor="string">
<bsvc:ID bsvc:type="Position_ID">string</bsvc:ID>
</bsvc:Position_Reference>
```

c. When the above XML is compared with the similar XML node, Organization Reference is a good candidate to leverage the associated design pattern script from. In the **Script** section, the associated script snippet is under “var organizationReferenceStr.

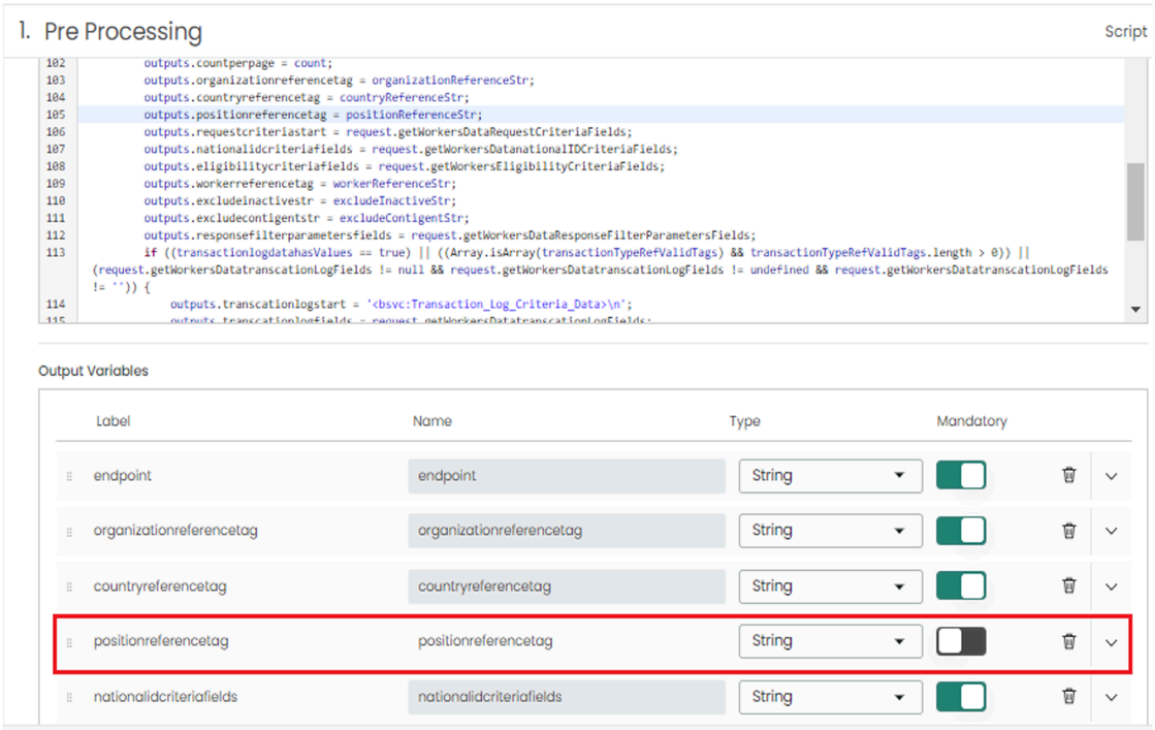
```
<bsvc:Organization_Reference bsvc:Descriptor="string">
<bsvc:ID bsvc:type="Organization_ID">string</bsvc:ID>
</bsvc:Organization_Reference>
```

d. Leverage the var organizationReferenceStr code snippet to construct the Position Reference XML node accordingly.



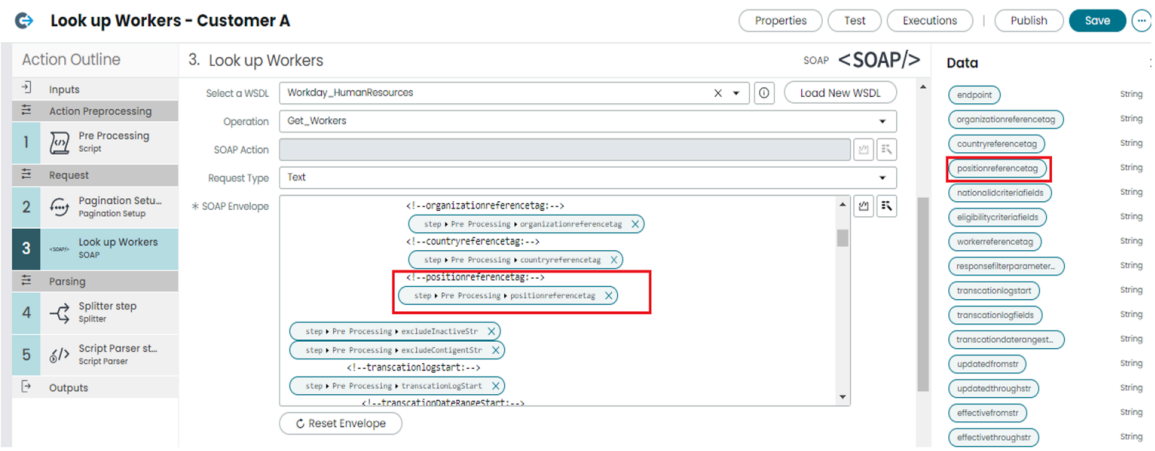
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. On the same script, in the **var request** section, leverage the design pattern, and define an output variable.



5. Create the Position XML node in the SOAP Step.

a. Refer to Workday Get Worker Request message and the position reference node accordingly.

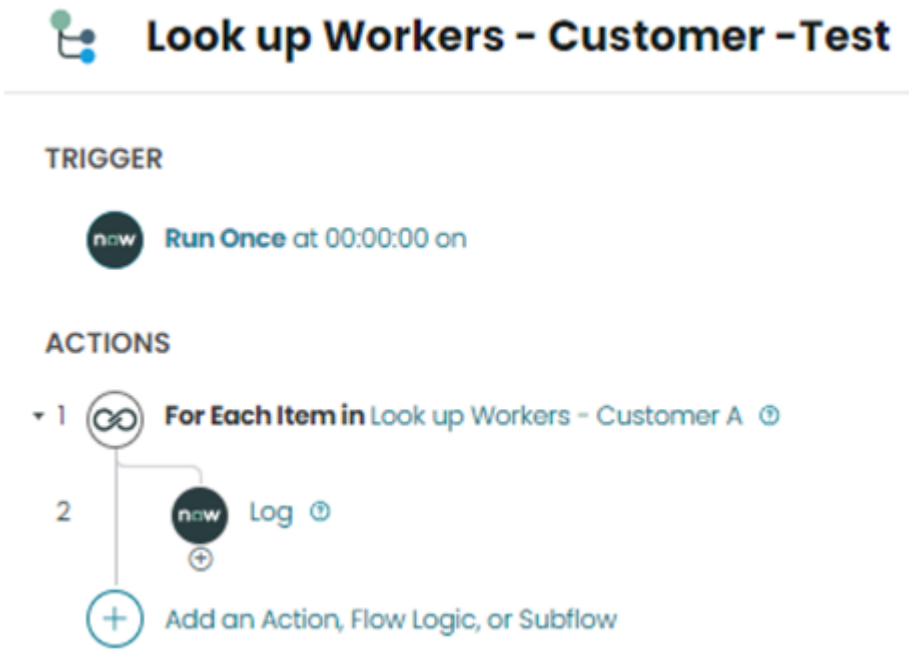


b. Save and publish it.

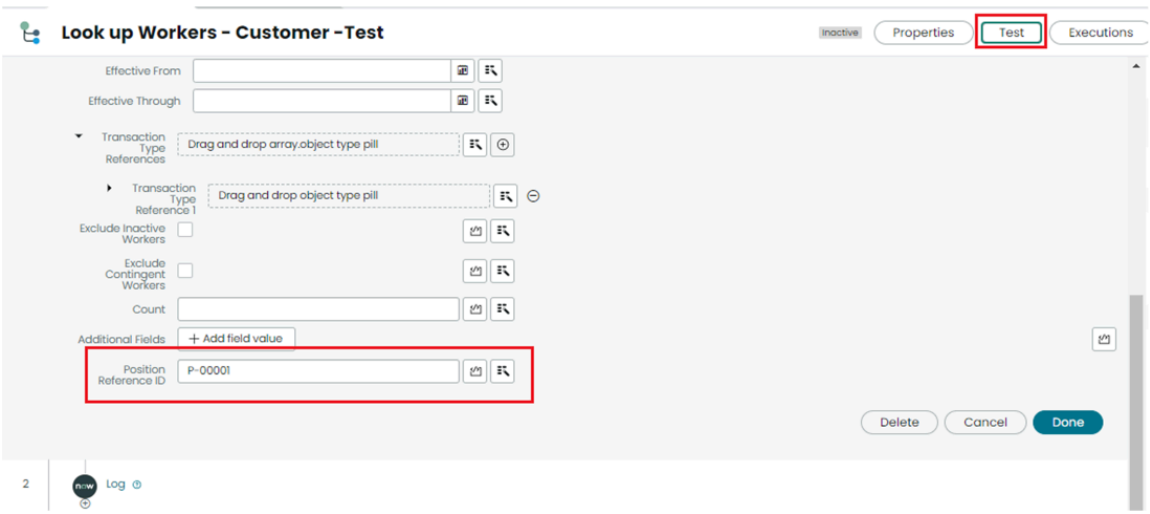
6. Test the action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. As this is a data stream action, it should be tested using a flow. Create a sample flow with the action in it.



b. Provide **Position ID** and test the flow.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Open the execution and navigate to SOAP step to check if the updated XML element node with position reference is created.

Example: Add and modify output fields of Workday spoke action

Extend the Workday spoke to retrieve the local first name and local last name.

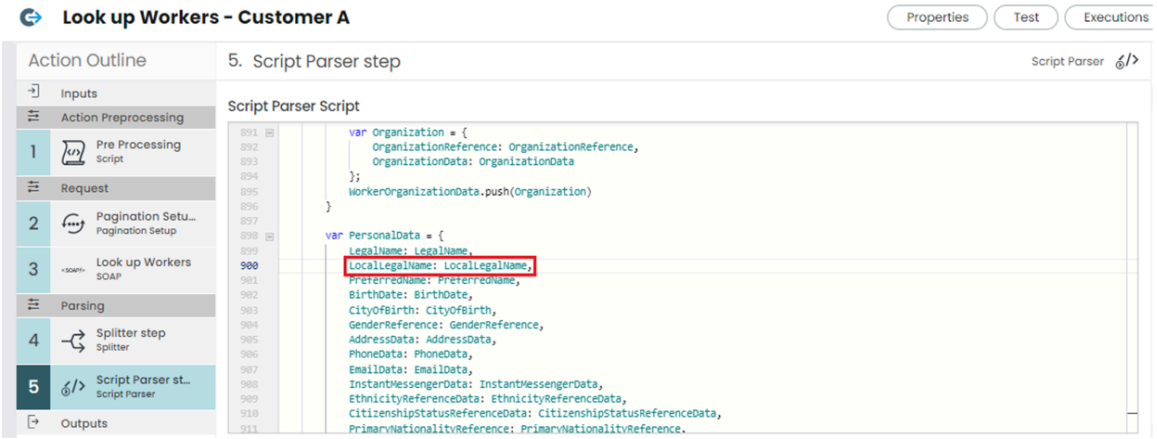
1. Evaluate and understand how the local name is structured in the Workday response message.
   - Local First Name: The XPath for this element is Get_Workers_Response/Response_Data/Worker/Worker_Data/Personal_Data/Name_Data/Legal_Name_Data/Name_Detail_Data/Local_Name_Detail_Data/First_Name
   - Local Last Name: The XPath for this element is Get_Workers_Response/Response_Data/Worker/Worker_Data/Personal_Data/Name_Data/Legal_Name_Data/Name_Detail_Data/Local_Name_Detail_Data/Last_Name
2. Leverage the Legal Name design pattern in the Script Parser step and create the snippet for local legal name.

```
var LocalFirstName =
 xmlDoc.getNodeText(Worker_DataXpath.concat("wd:Personal_Data/w
d:Name_Data/wd:Legal_Name_Data/wd:Name_Detail_Data/wd:Local_Nam
e_Detail_Data/wd:First_Name"));
        var LocalLastName =
 xmlDoc.getNodeText(Worker_DataXpath.concat("wd:Personal_Data/w
d:Name_Data/wd:Legal_Name_Data/wd:Name_Detail_Data/wd:Local_Nam
e_Detail_Data/wd:Last_Name"));

        var LocalLegalName = {
            LocalFirstName: LocalFirstName,
            LocalLastName: LocalLastName,
        };
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Add the LocalLegalName to the PersonalData object.

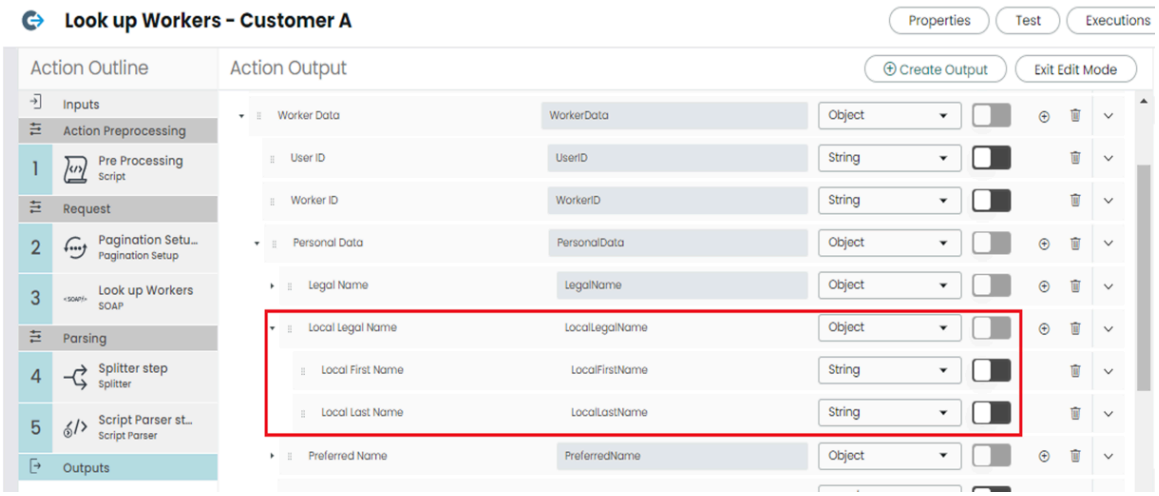


4. Create output variables in the **Outputs** step.

a. Click **Edit Output**.

b. Output fields don't need to follow the exact Workday response message hierarchy. As long as the XPAth from the step 2 follows the right Workday XPath, the spoke action can render the elements accordingly. In this case, adding the **Local Legal Name** under **Personal Data** is sufficient.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



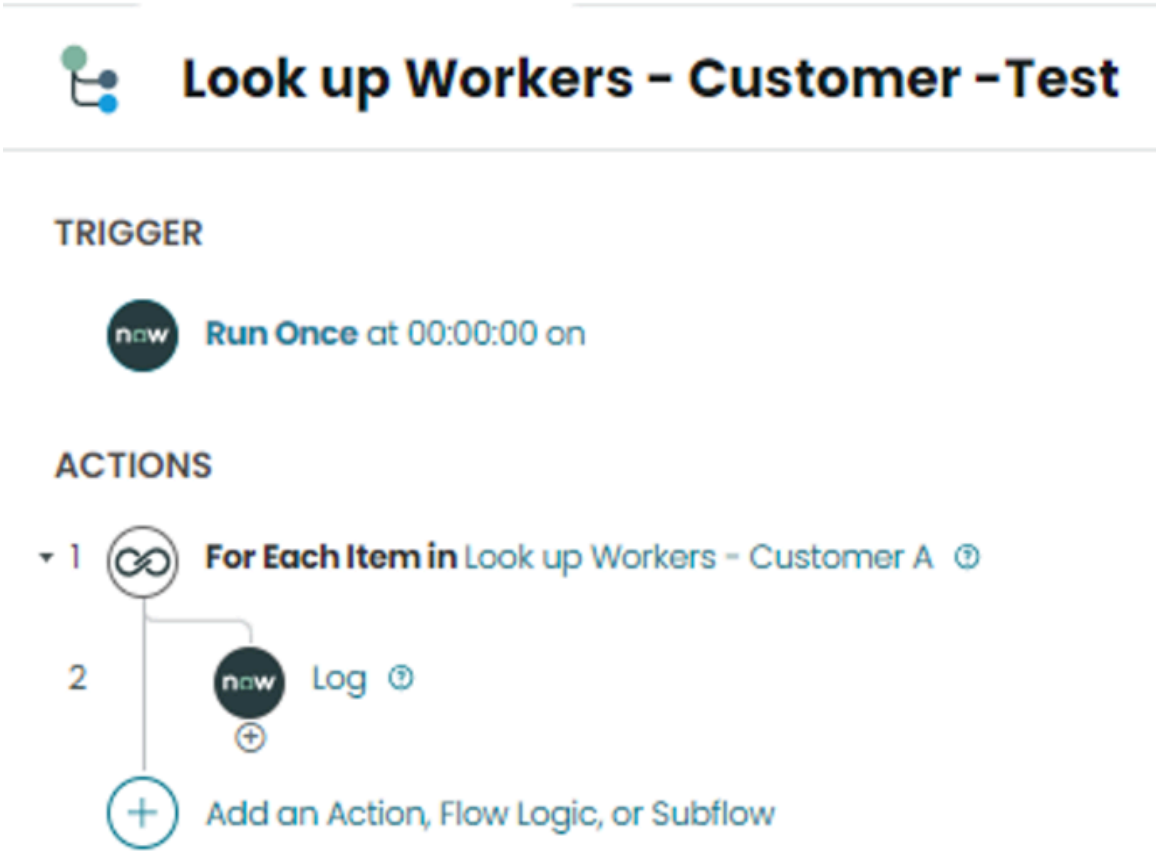
Note:
String variable name under the **Name** section must match with the same var name defined in step 2 above.

5. Save and publish the action.

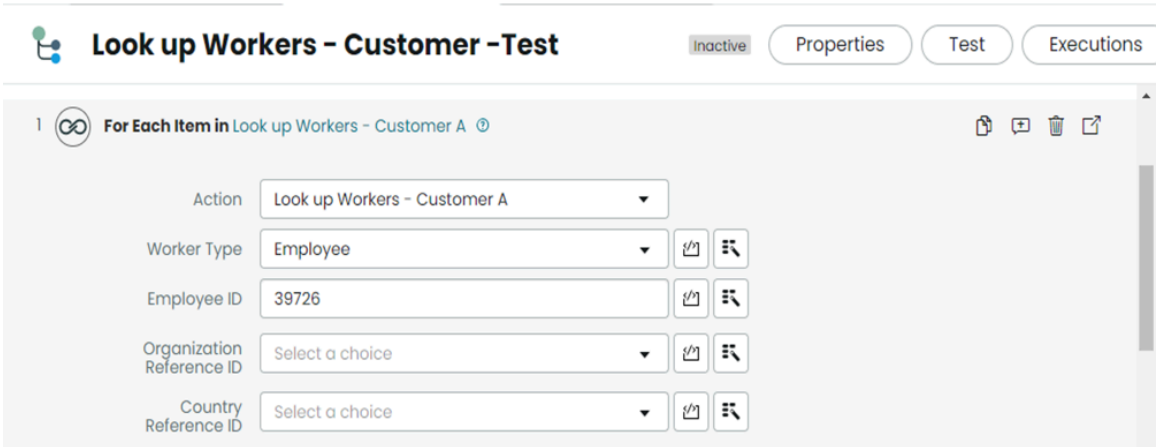
Note:
The Look up Workers action has a maximum number of output elements that a data stream action can have. If any error occurs during the publish of copied action with new output elements, delete a few output elements that are not required and try to publish again.

6. Test the action.
   a. Ensure that the testing worker subject has the local first name and local last name in Workday.
   b. Create a sample flow, add the action to it, and log the response to verify output elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Provide the associated test worker subject's Employee ID to test and run the flow.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Verify the log and executions to verify if the local first name and local last name are retrieved correctly.

Create report to extract skills

Create report to extract skill (maintains skills and skill cloud skills) details from Workday based on the time duration.

Before you begin

- Role required: User with access to report creation and Maintained Skills and Skills Cloud Skills report data source.
- Create all calculated fields for this report before developing the report. This ensure that all fields are available during report creation.

About this task

This procedure must be performed in your Workday instance.

- While creating the report, ensure that the report name, report field names, or column heading override for the respective field (if given in report document) should be same as in the report document.

> **Important:**
> Report field label should be same as in the report document.

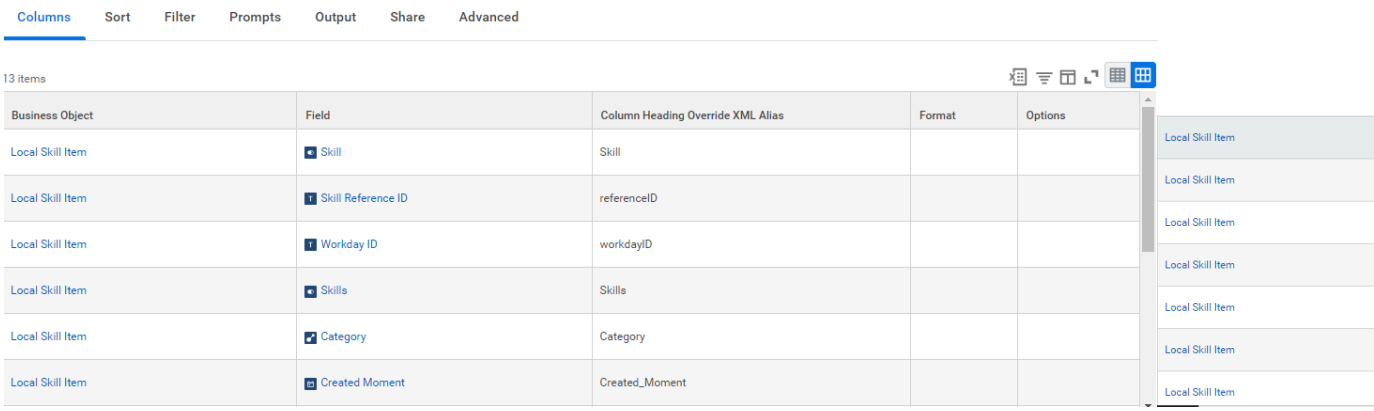
- While creating filter, ensure that you add parenthesis in filter.
- All reports must be owned by ISU user which will be used for accessing these action on the ServiceNow platform.
- In the **Advanced** section, ensure that the **Enable as webservice** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

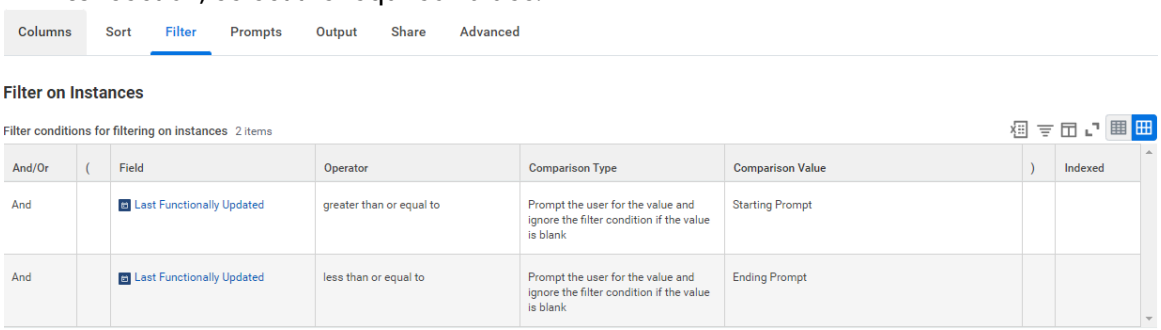
Procedure

1. Access the **Create Custom Report** task.
2. Provide the report name.
   For example, `CR Skills details`.
3. Select report type as **Advanced**.
4. Clear the **Optimized for performance** check box.
5. Select **Maintained Skills and Skills Cloud Skills** for **Data Source**.
6. Do not select the **Temporary report** check box and click *Ok*.

7. Select the report business object and report fields.

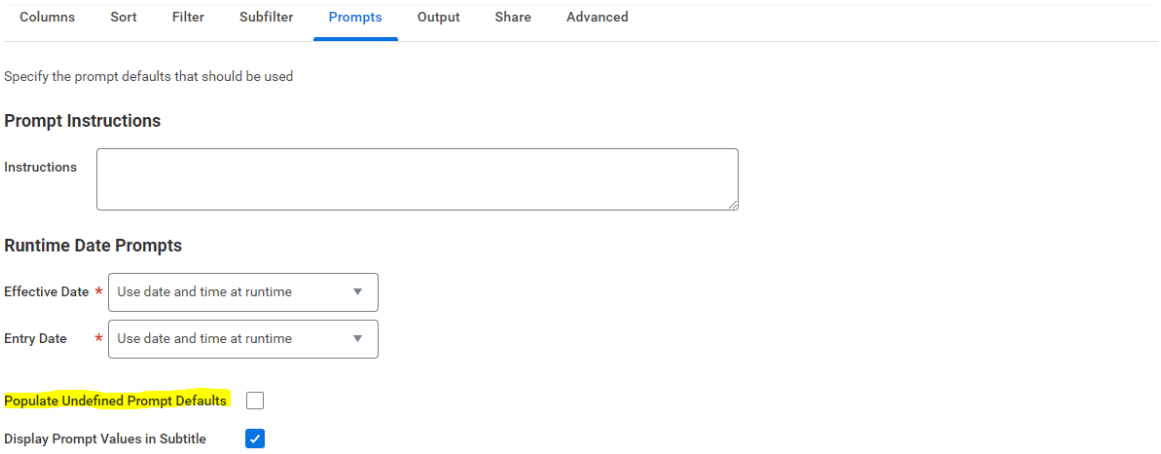


8. In **Filter** section, select the required values.



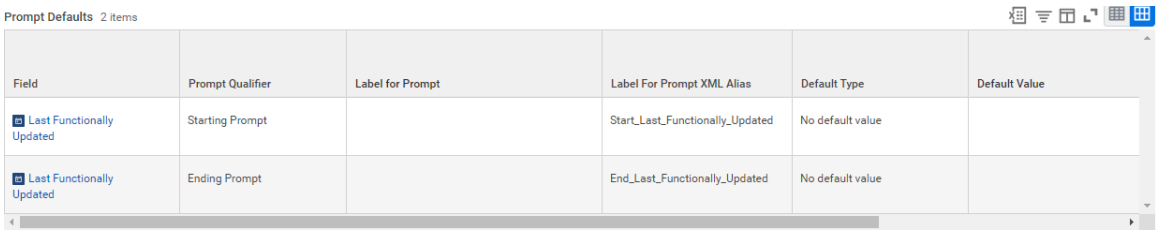
9. In the **Prompts** section, select the **Populate Undefined Prompt Defaults** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

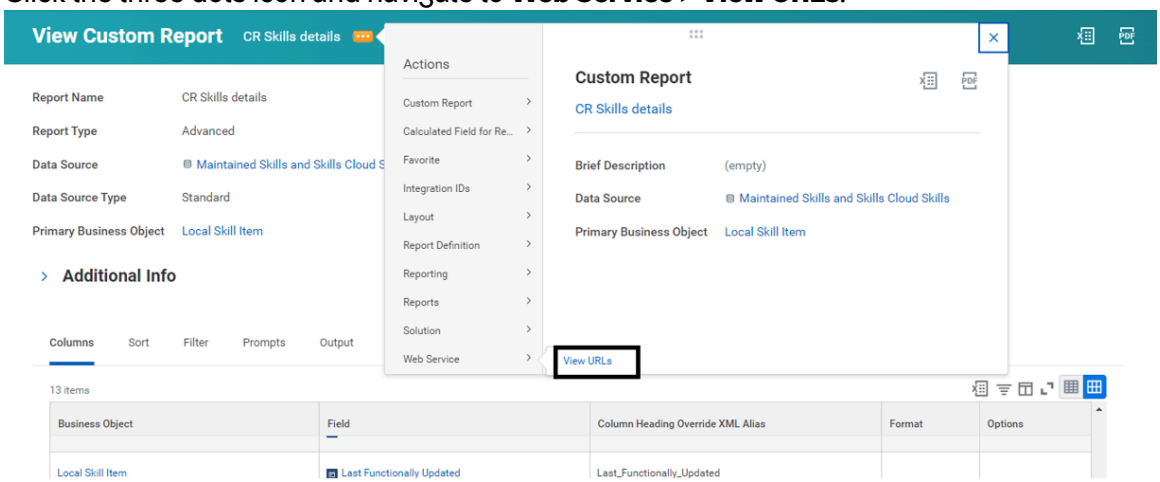


10. Select the value of prompts under the **Prompt Default** section.

    Ensure that the **Label For Prompt XML Alias** values for all prompt fields are as shown here.

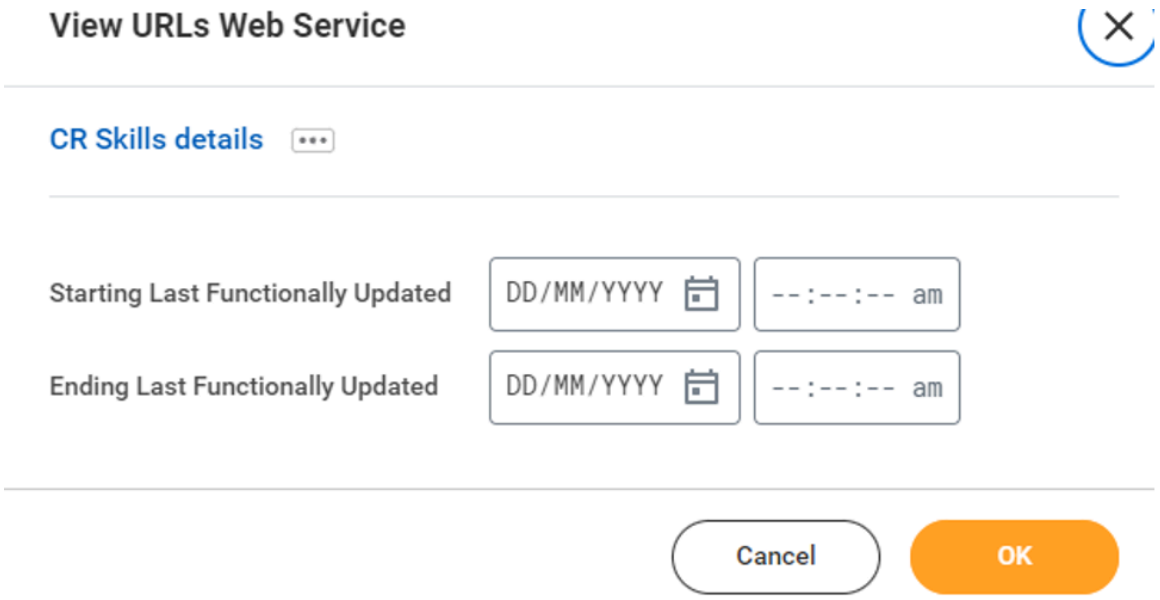


11. In the **Advanced** section, select the **Enable as webservice** check box and click **Ok**.
12. Click the three dots icon and navigate to **Web Service** > **View URLs**.

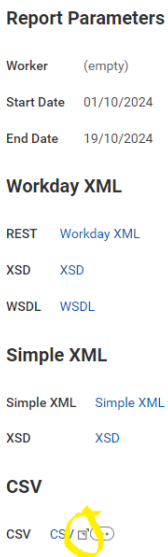


13. Select the time duration for which you want to extract the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

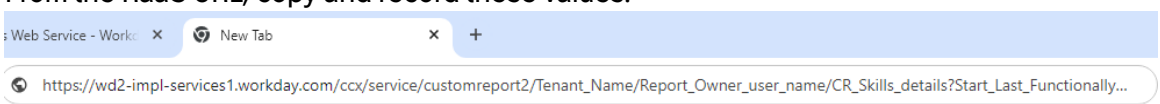


14. In View URLs Web Service page, click the marked icon under **CSV** section.



You will be navigated to a new browser and the RaaS URL of the report is displayed.

15. From the RaaS URL, copy and record these values.



- `https://wd2-impl-services1.workday.com` is the base URL of your Workday tenant.
- **Tenant_Name** is your Workday tenant.
- **Report_Owner_user_name** is user name of the report's owner.
- **CR_Skills_details** is the report name.

Extract workers skill (with the skill cloud)

Extract worker's skill details based on employee ID and time duration.

- **CR_Worker_s_skill_details** is the report name.

Configure the Employee Latest Performance Review report

Set up the report to enable the Look up Employee Latest Performance Review action to fetch the latest performance review report.

Before you begin

Role required: Confirm that you have the access to create the reports.

Confirm that you have the access to the Workers by Organization report data source.

Create all calculated fields for this report before developing the report.

Confirm that the report name, field names, and column headings match exactly as they appear in the report document.

Confirm that you have added parentheses to the filters.

Confirm that reports are owned by the ISU user, which will be used to access these actions on the ServiceNow platform.

Confirm that you have enabled the **Enable as webservice** option.

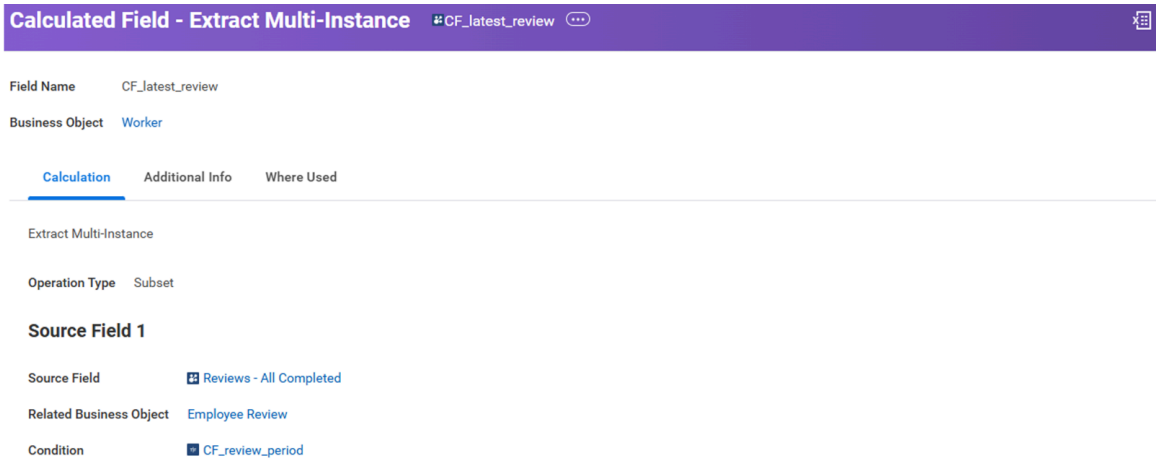
Procedure

1. Create all calculated fields so that these fields can be used while developing report.

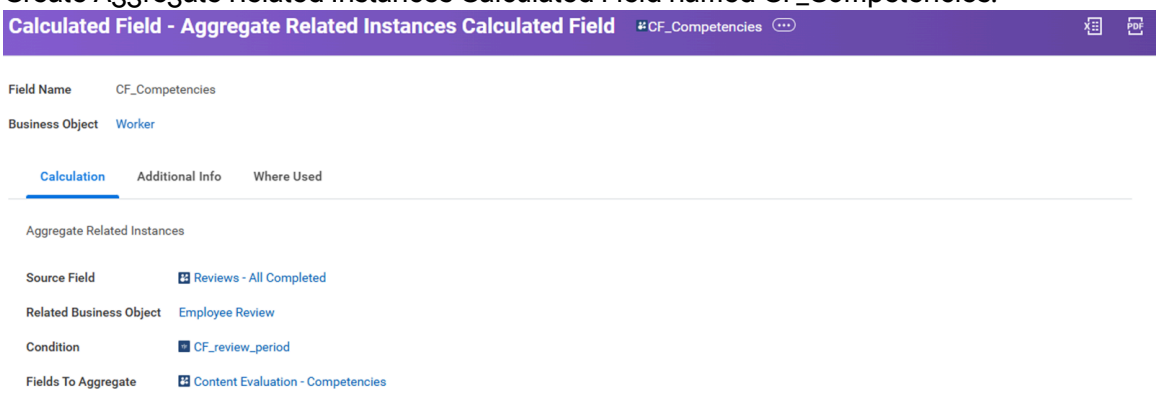
   a. Create True False condition type calculated field named CF_review_period.

   b. Create Extract multi instance calculated field named CF_latest_review.

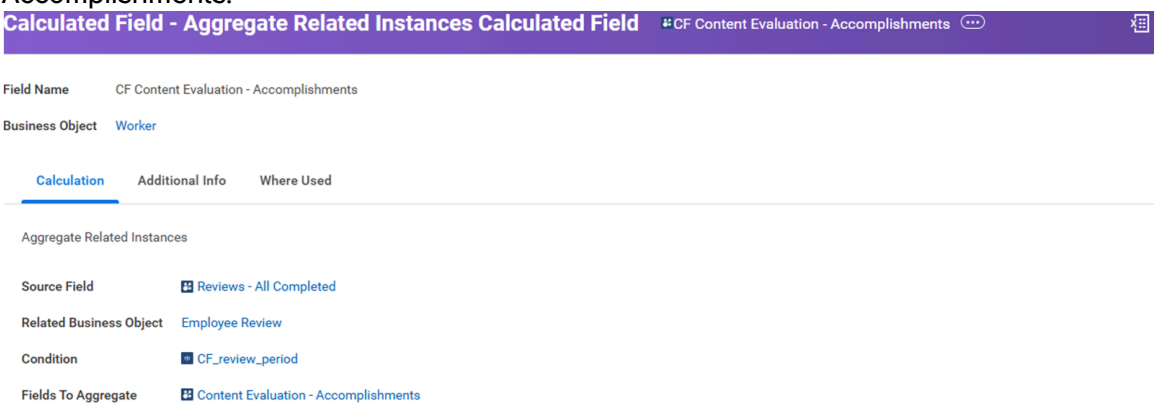
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Create Aggregate Related Instances Calculated Field named CF_Competencies.

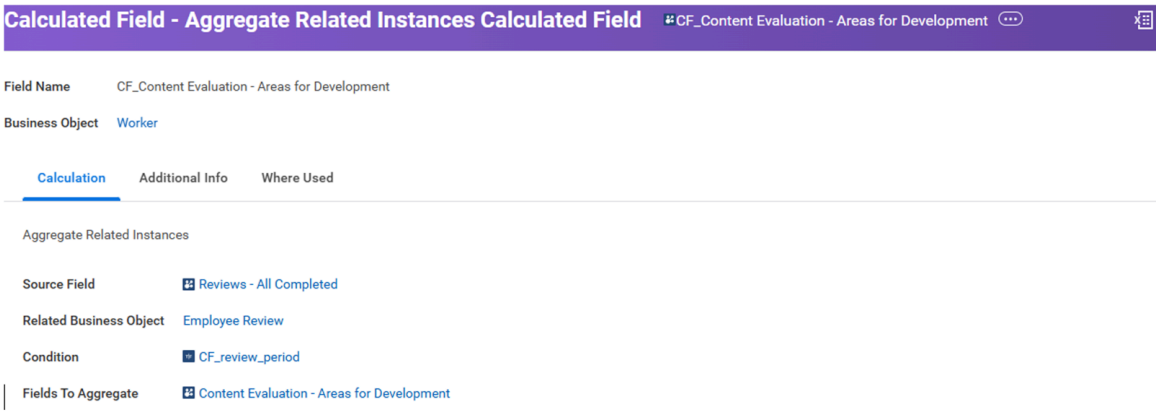


d. Create Aggregate Related Instances Calculated Field named CF Content Evaluation – Accomplishments.

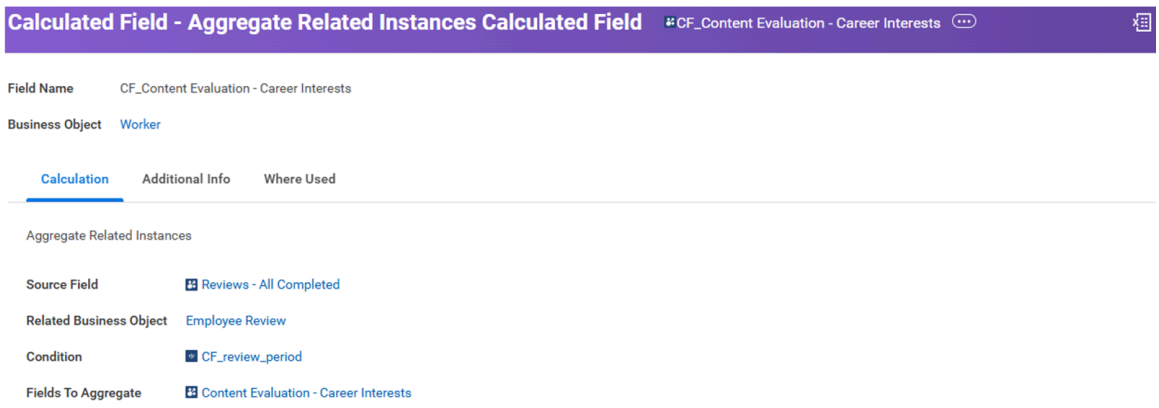


e. Create Aggregate Related Instances Calculated Field named CF_Content Evaluation - Areas for Development.

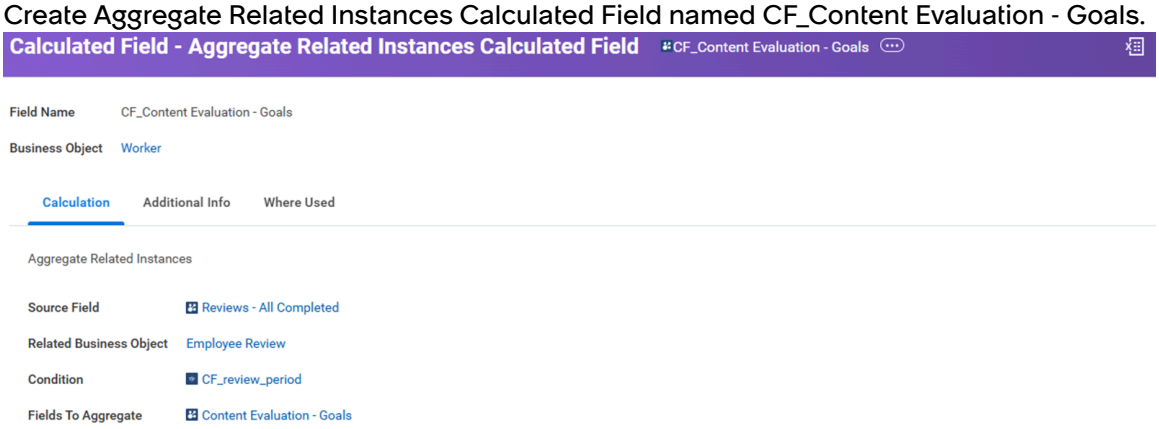
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Create Aggregate Related Instances Calculated Field named CF_Content Evaluation - Career Interests.

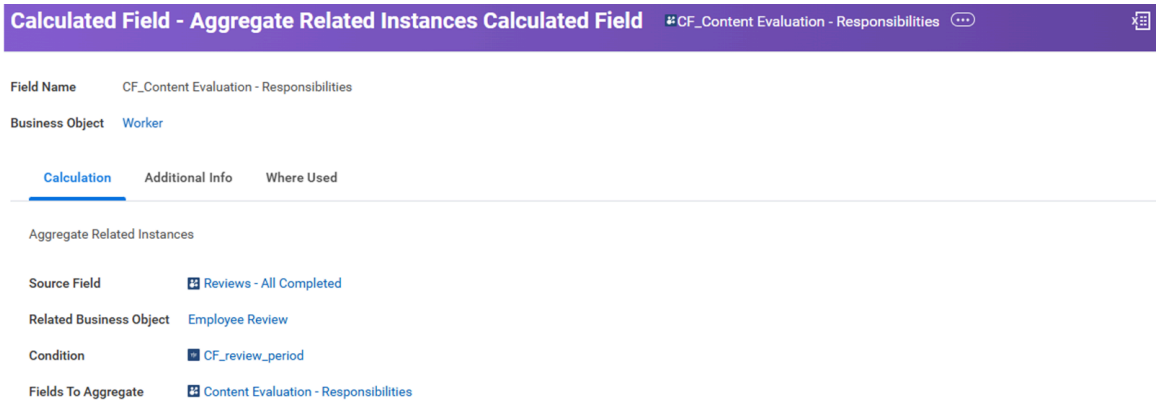


g. Create Aggregate Related Instances Calculated Field named CF_Content Evaluation - Goals.

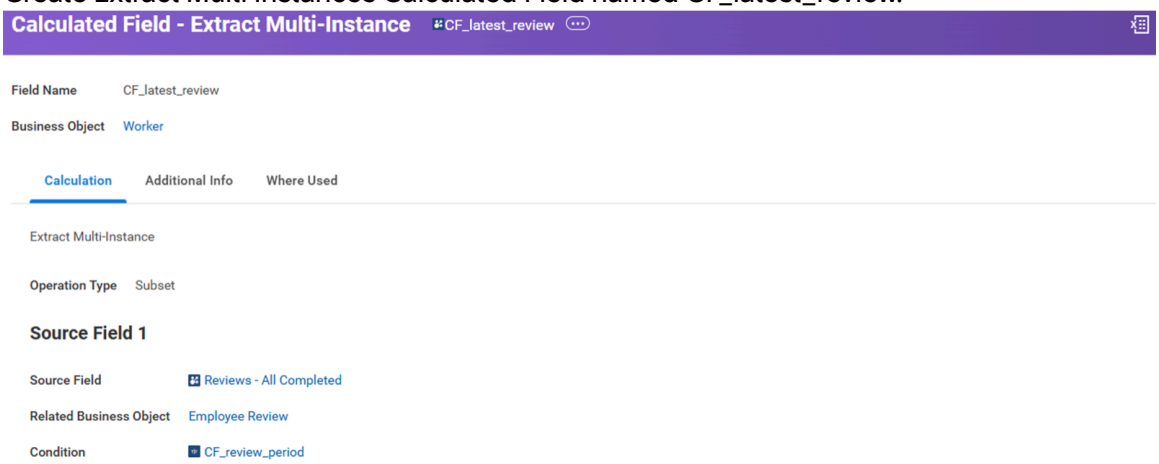


h. Create Aggregate Related Instances Calculated Field named CF_Content Evaluation - Responsibilities.

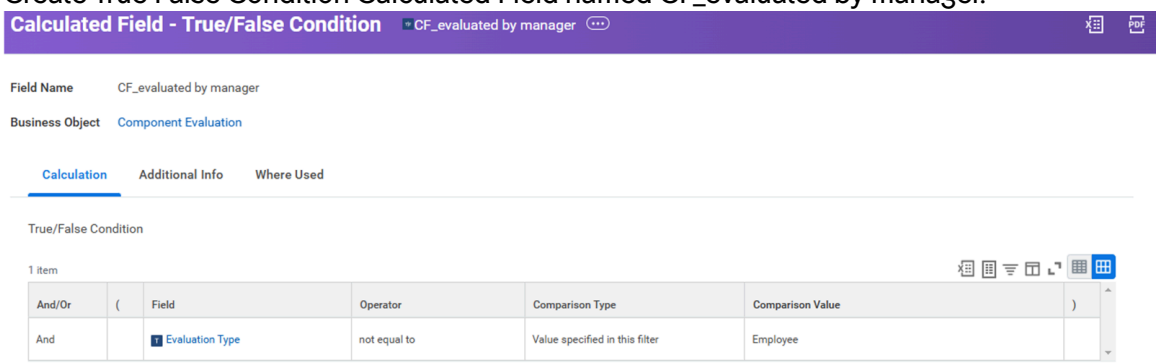
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



i. Create Extract Multi Instances Calculated Field named CF_latest_review.



j. Create True False Condition Calculated Field named CF_evaluated by manager.



2. Create the report.

a. Access the Create Custom Report task.

b. Provide a report name.
An example of report name: CR Employee latest performance review and feedback details.

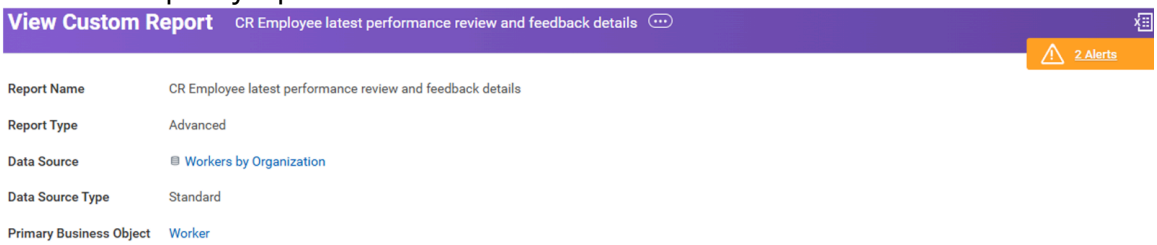
c. Select report type as Advanced.

d. Deselect the Optimized for performance box.

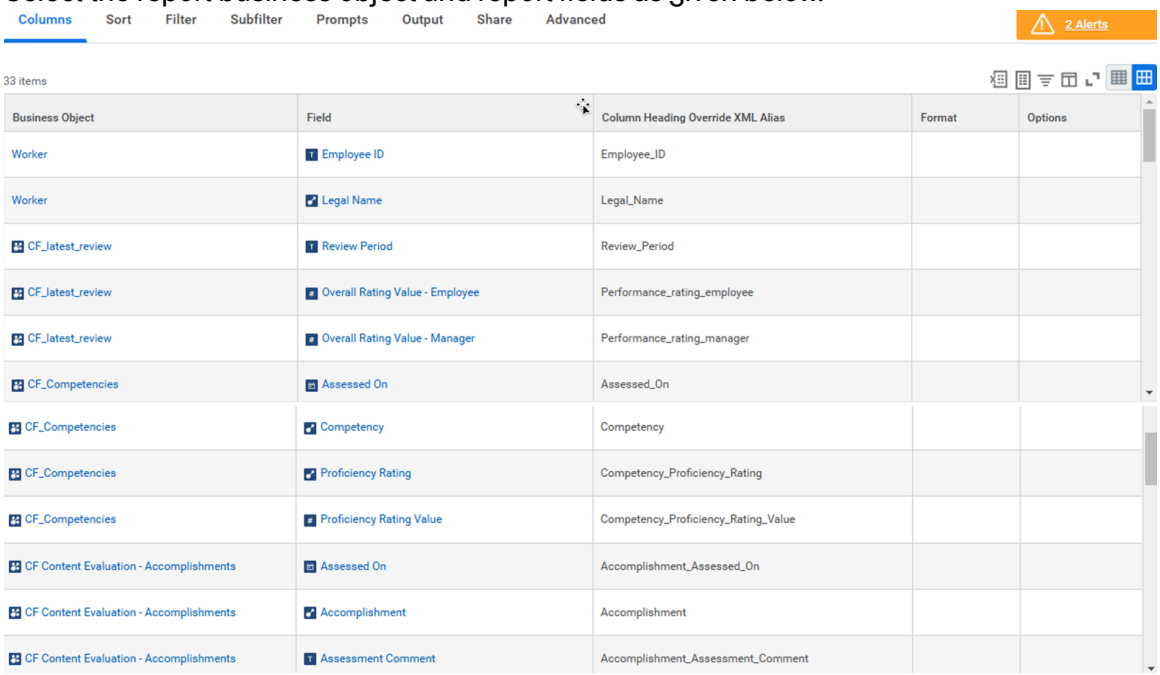
e. Select Data Source as Workers by Organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Deselect temporary report box and then Click **OK**.



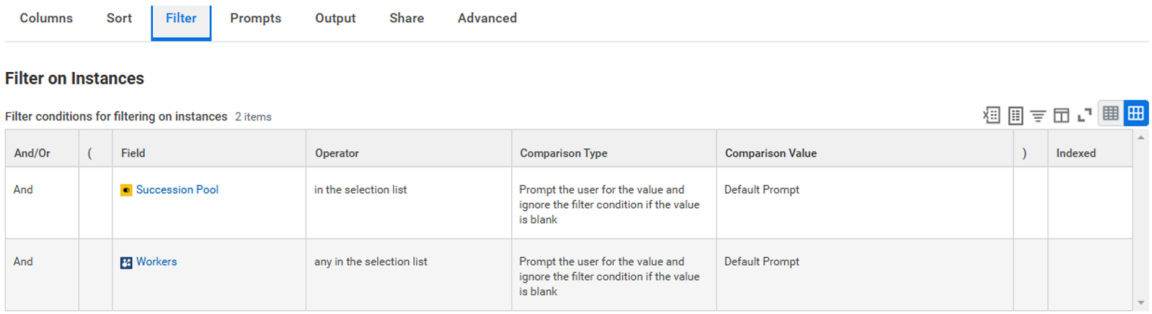
g. Select the report business object and report fields as given below.



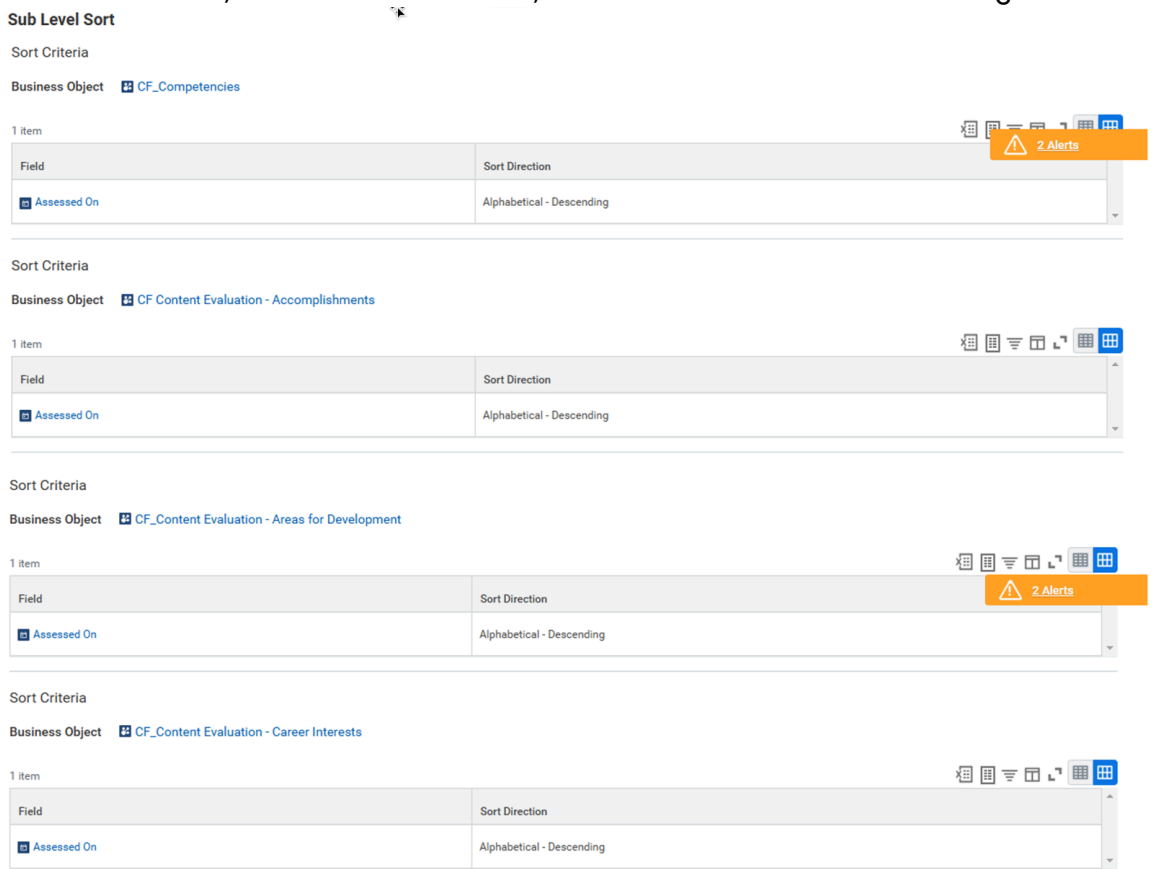
h. In the Group column heading section, select all business object as below.
Group Column heading for each business object will be blank.

i. In the Filter section, select the value as given below.
Confirm that you have added parenthesis as given in below image.

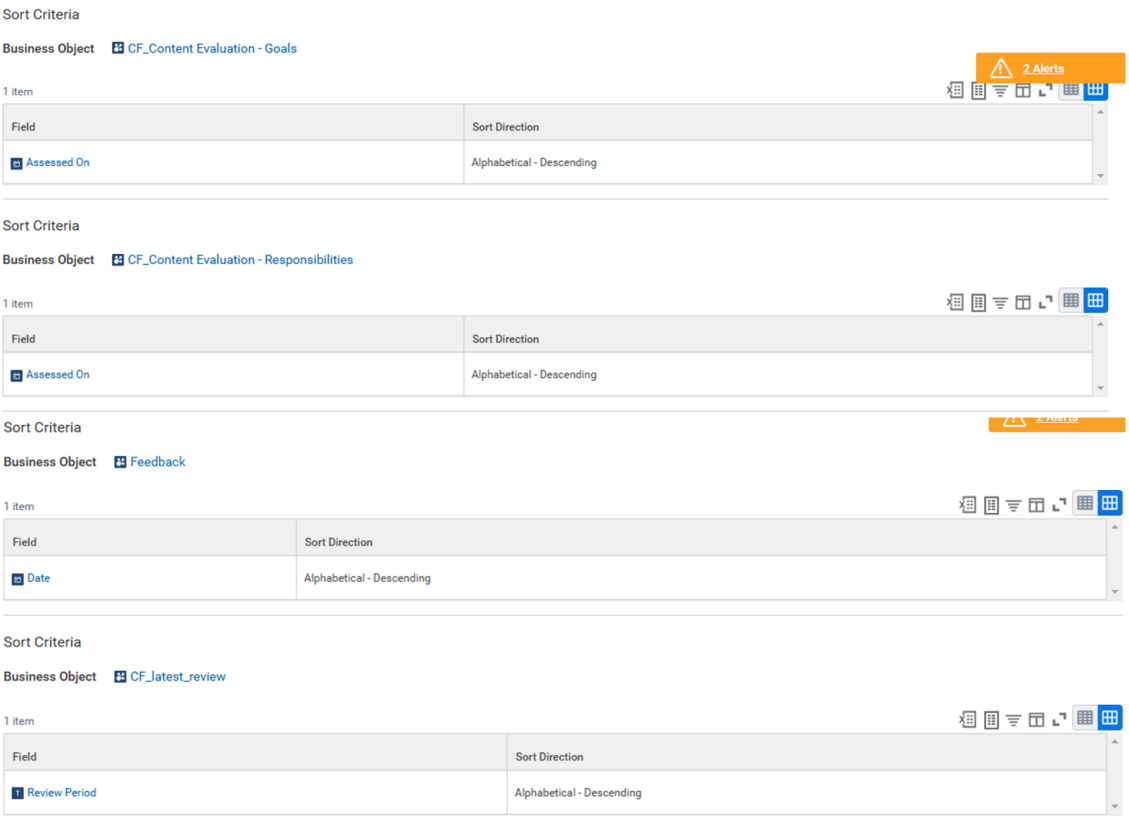
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



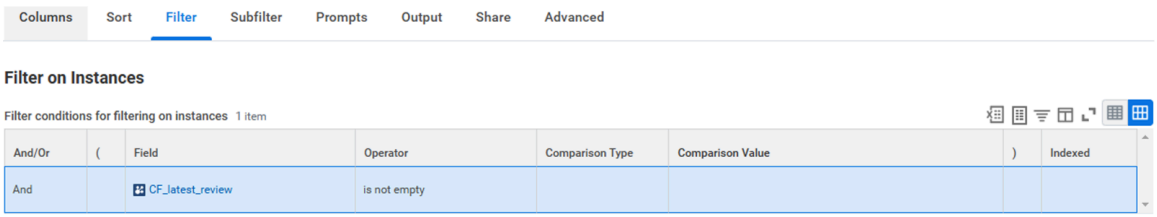
j. In the Sort section, under the Sub level sort, select the value as shown in the image.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



k. In Filter section, select the value as given below.
Confirm that you have added parenthesis as given in below image.



l. In the Sub-Filter section, select the value as given below.
Confirm that you have added parenthesis as given in below image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

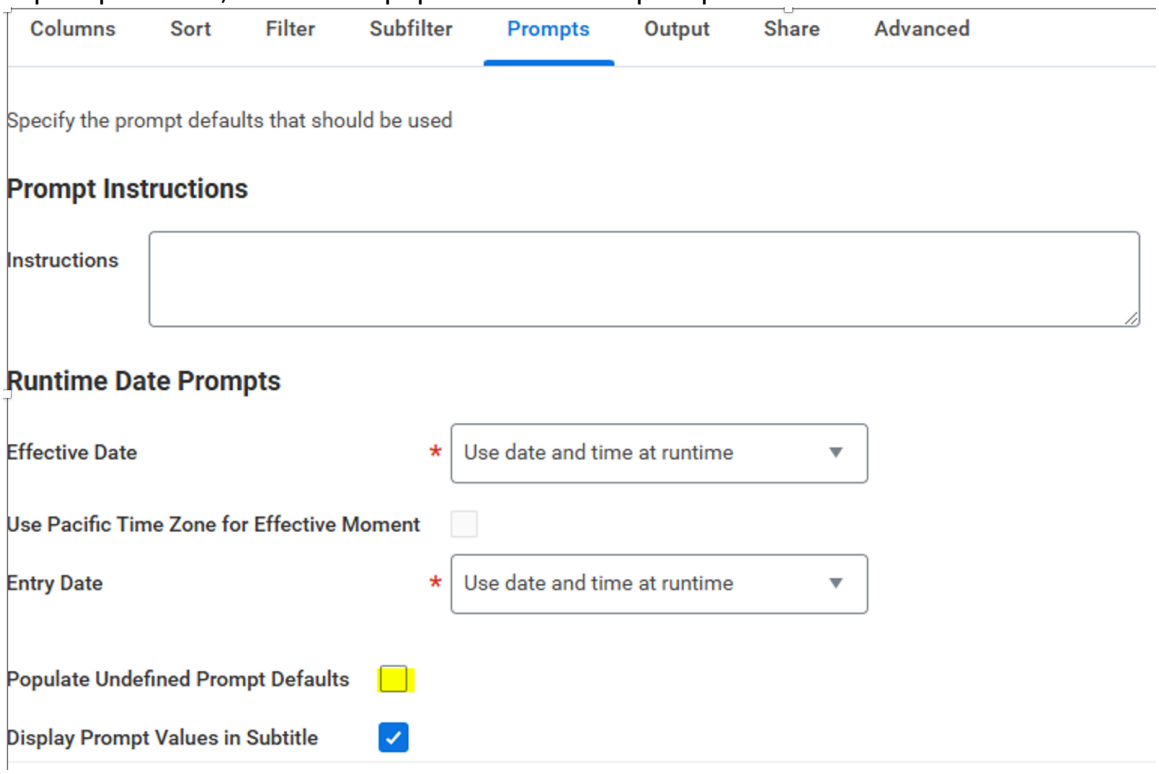
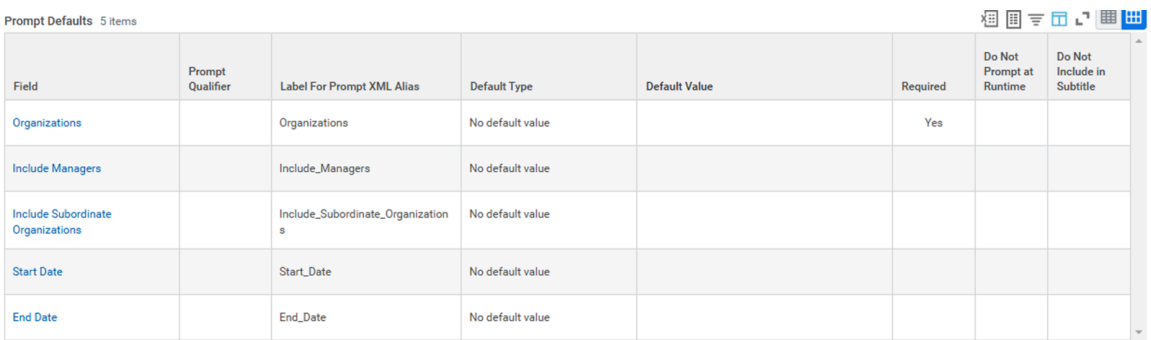
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

m. In prompt section, click on the populate undefined prompt defaults check box.



n. Select the value of prompts as given below under Prompt default section.
Confirm that the Label For Prompt XML Alias of all prompt fields is the same as given in the image below.



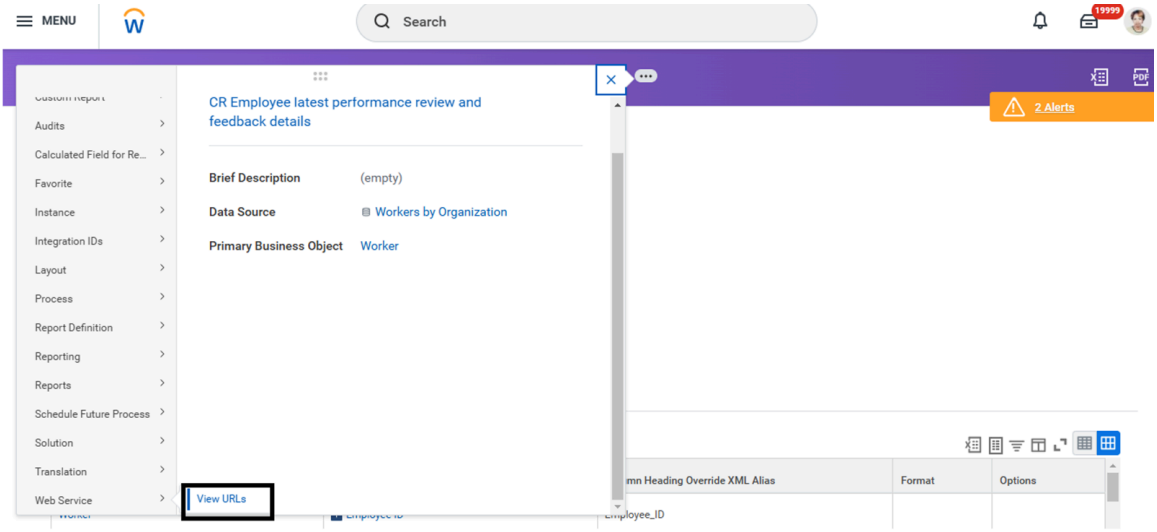
Prompt Defaults 5 items

Field	Prompt Qualifier	Label For Prompt XML Alias	Default Type	Default Value	Required	Do Not Prompt at Runtime	Do Not Include in Subtitle
Organizations		Organizations	No default value		Yes		
Include Managers		Include_Managers	No default value				
Include Subordinate Organizations		Include_Subordinate_Organizations	No default value				
Start Date		Start_Date	No default value				
End Date		End_Date	No default value				

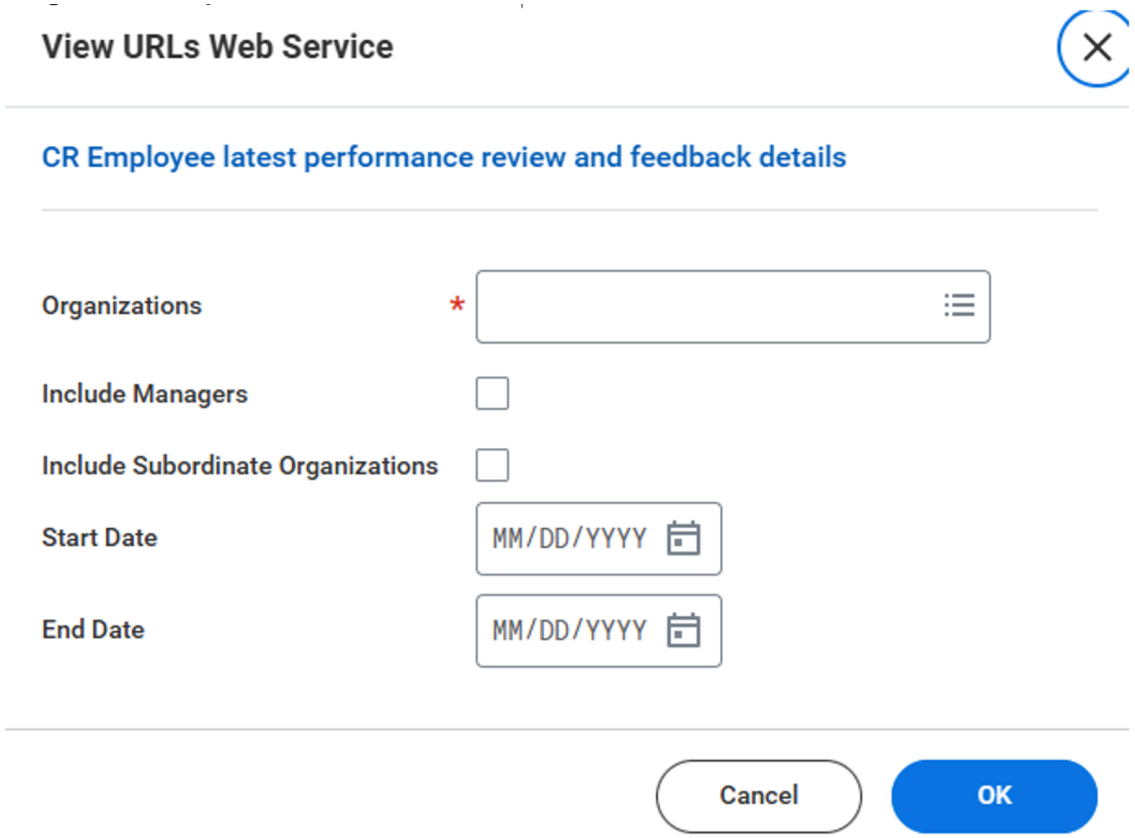
o. In the advanced section, select the **enable as webservice** and then click OK.

p. Click on three dots icon and navigate to **web services> view URLs**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



q. Select the Organization for which you want to run this report and check the box if you want to include subordinate organization and manager and select the date range for which you want to see the data.



r. In the View URLs Web Service page, click on marked icon under CSV section.
A new browser tab opens.

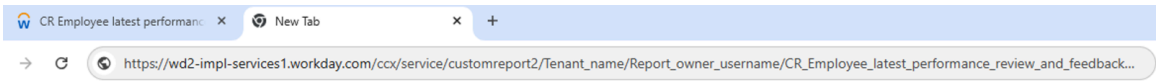
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

s. View the RaaS URL of the report in new browser tab and can get the below details from this link.



https://wd2-impl-services1.workday.com represents the Base URL of customer's workday tenant.
Tenant_Name represents customer's workday tenant.
Report_Owner_user_name represents user name of the report's owner.
Report_Name Represents report name.

Configure Succession Planning Report

Configure the Succession Planning report that the action Look up Succession Planning in the Workday HR spoke uses to view the details of succession planning.

Before you begin

Role required: Confirm that you have the privilege to create the report.

Confirm that you have the access to the data source of the Succession Plans by Organization.

Confirm that all reports are owned by the ISU user.

Confirm that the **Enable as webservice** option in the Advanced section is selected.

Procedure

1. Access the Create Custom Report task.
2. Provide the report name.
3. Select the report type as **Advanced**.
4. Deselect the **Optimized for performance** option.
5. Select the Succession Plans by Organization data source.
6. Confirm that the temporary report option is deselected, and then select **Ok**.

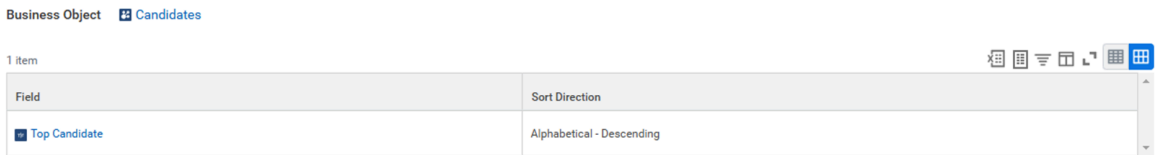
8. In the Group column heading section, select all business object.
The Group Column heading for each business object is empty.

Business Object	Group Column Heading	Group Column Heading XML Alias
Candidates		Candidates_group

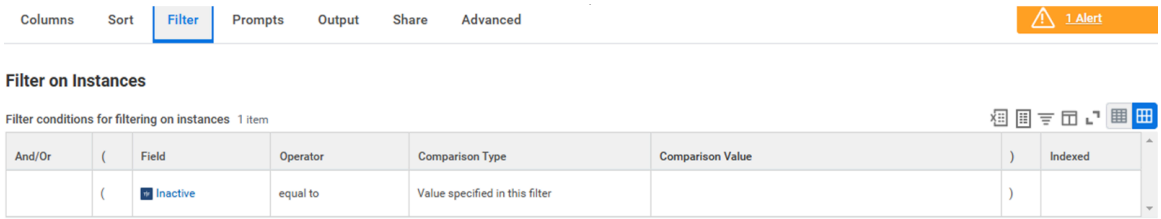
9. In the Sort section, under Sub level sort, select the value as shown.



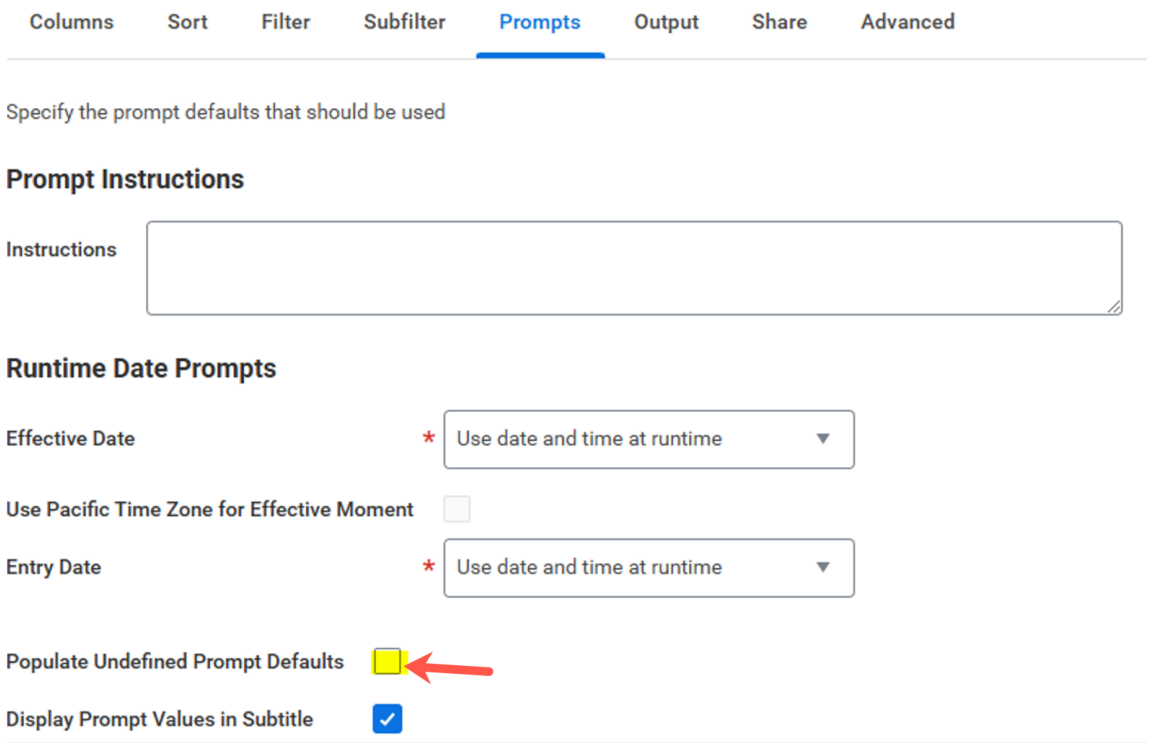
Field	Sort Direction
Top Candidate	Alphabetical - Descending

10. In the Filter section, select the value as given below.
Add parenthesis as given in the image.

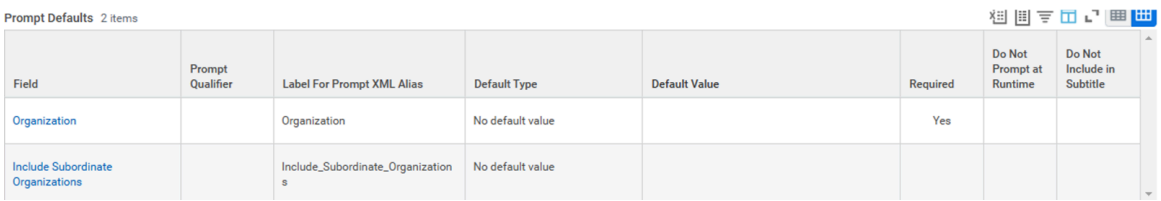
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. In the prompt section, click on **Populate Undefined Prompt Defaults** option.



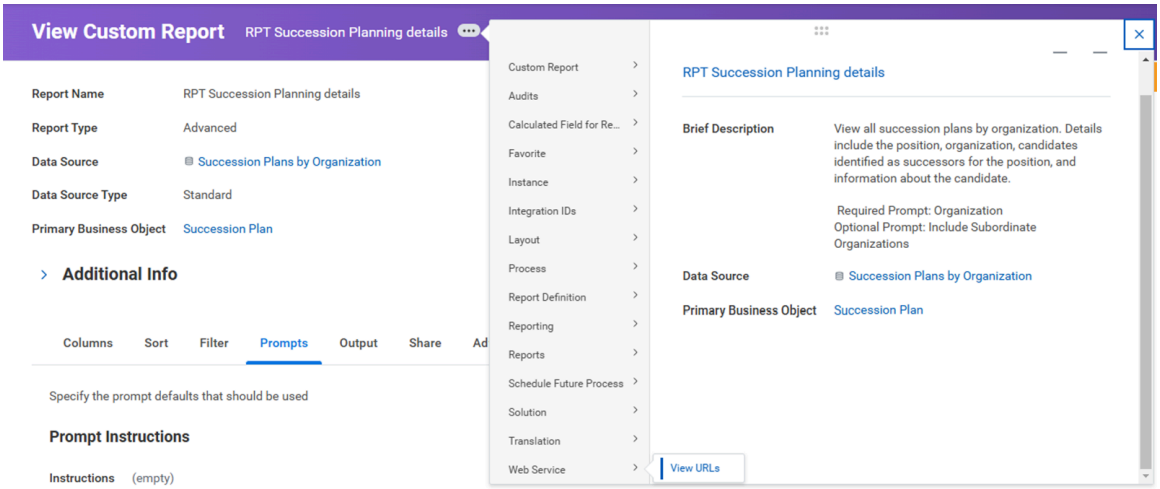
12. Select the value of prompts as given below under the Prompt default section.
Make sure the Label For Prompt XML Alias of all prompt fields must be the same as given below.



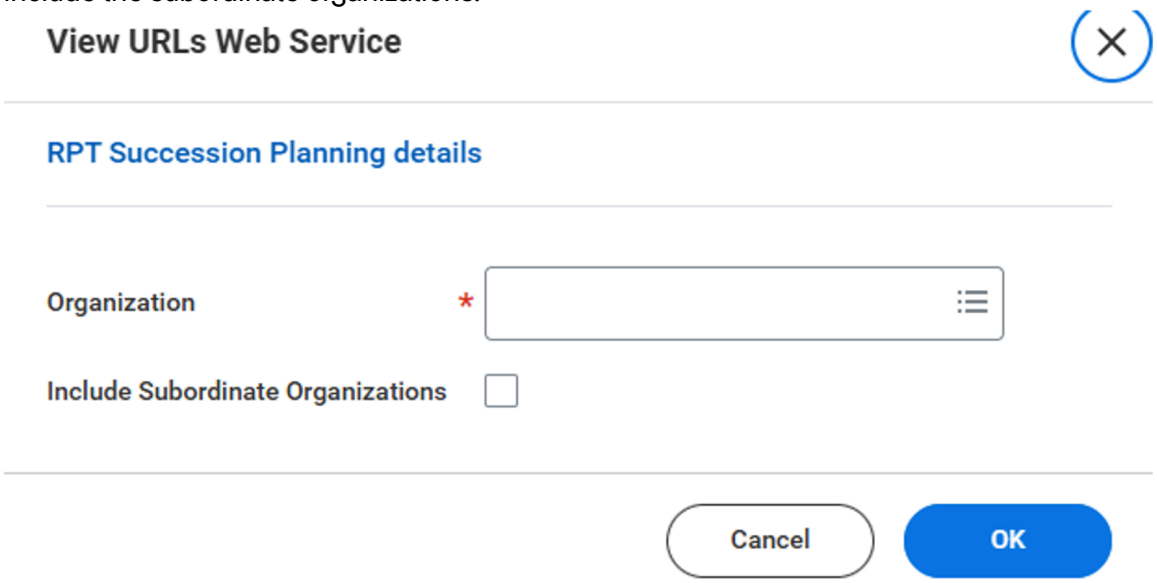
13. In the advanced section, select **enable as webservice**, and then click **OK**.

14. Select the three dots icon and go to **Web services> view URLs**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



15. Select the organization for which you want to run this report and select the box if you want to include the subordinate organizations.



16. In the View URLs Web Service page, click on marked icon under CSV section.

A new browser tab displays the following results.

Details:

- https://wd2-impl-services1.workday.com represents the Base URL of customer's workday tenant.
- Tenant_Name represents customer's workday tenant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Report_Owner_user_name represents user name of the report's owner.
- Report_Name Represents report name.

Configure Succession Pool report

Configure the Succession Pool report to fetch Succession pool data based on Succession pool and employee.

Before you begin

Role required: Confirm that you have the access to create reports.

Confirm that you have report data source "All Succession Pools" access.

Create all calculated fields for this report before developing the report.

Confirm that the report name, report field names or column heading override for the respective field (if given in report doc) are the same as it is in report document.

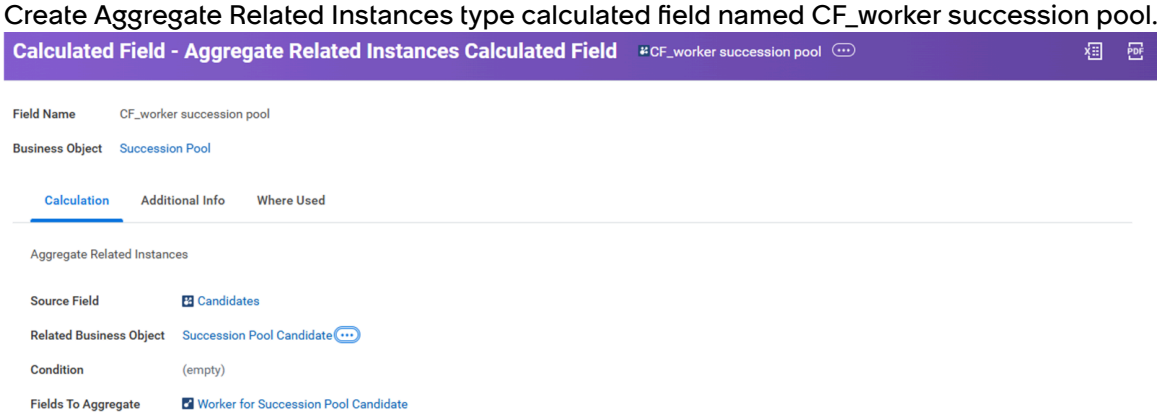
Confirm that the report field label is the same as in report.

Confirm that all reports are owned by the ISU user.

Confirm that in the advanced section, **Enable as webservice** is selected.

Procedure

1. Create Aggregate Related Instances type calculated field named CF_worker succession pool.



2. Create the report.
   a. Access the Create Custom Report task.
   b. Provide the report name.
   c. Select the report type as Advanced.
   d. Deselect the Optimized for performance option.
   e. Select Data Source as All Succession Pools.
   f. Deselect the temporary report box and then click ok.

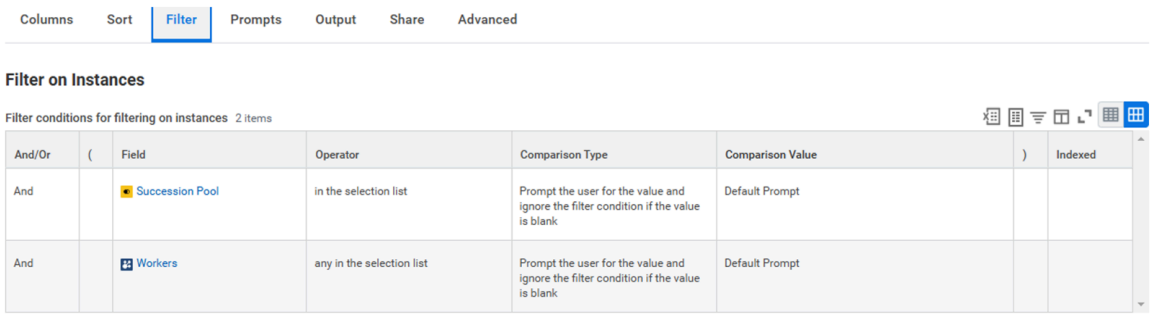
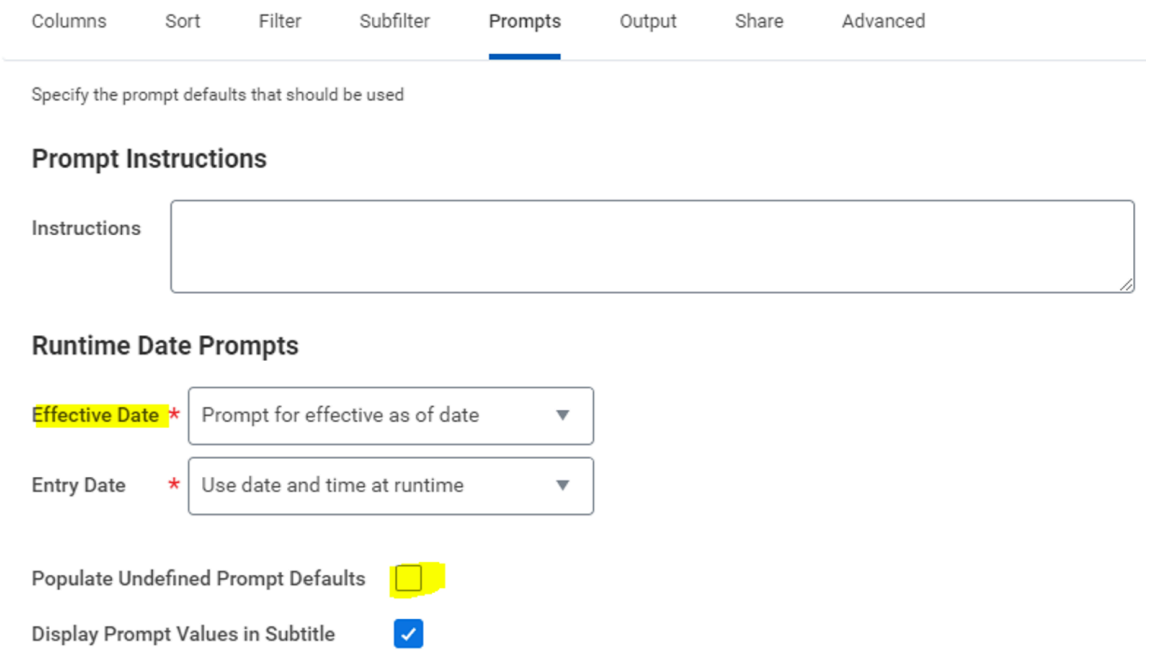
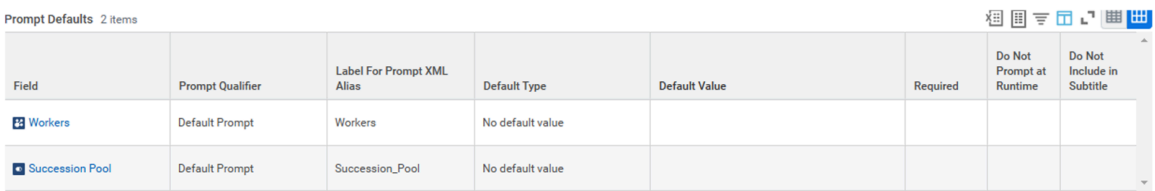
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



j. In prompt section, select the highlighted effective date as prompt for effective as of date and then click on populate undefined prompt defaults check box.



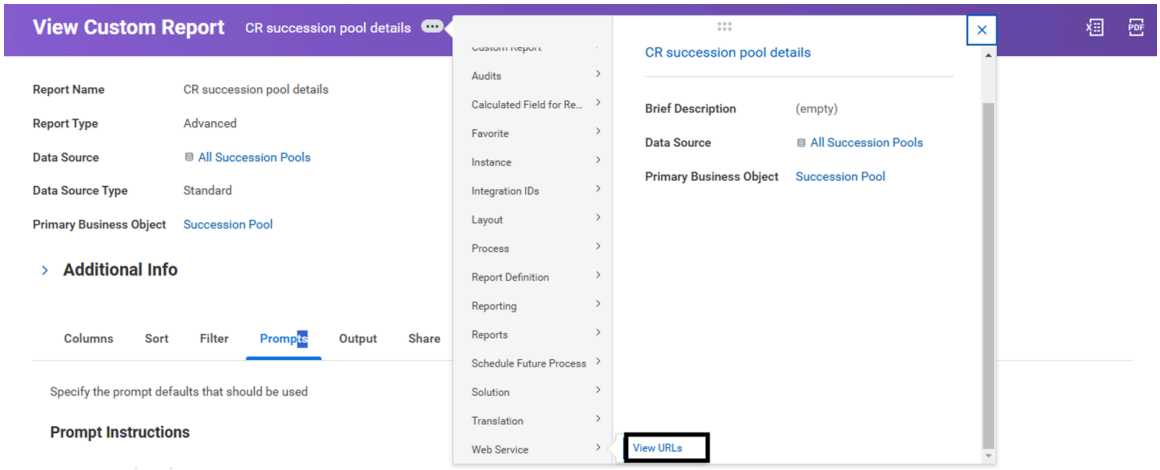
k. Select the value of prompts as given below under Prompt default section.
Make sure the Label For Prompt XML Alias of all prompt fields must be same as the image below.



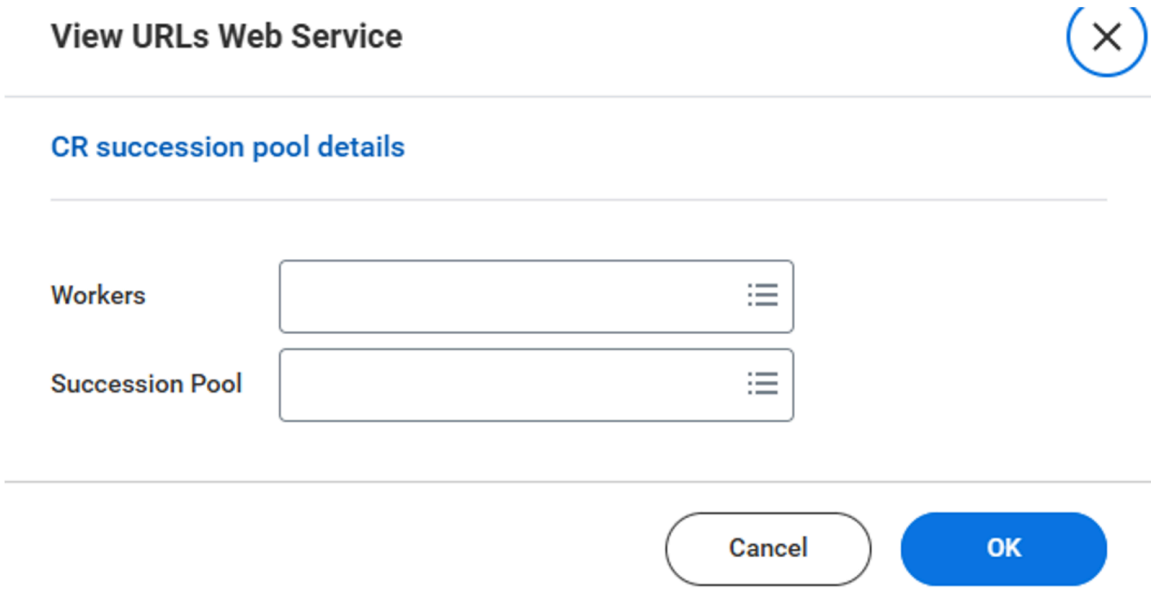
l. In the advanced section, select **enable as webservice** and then click ok.

m. Click on three dots icon and then go to **web services> view URLs** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



n. Select succession pool for which you want to run this report.
If you want any specific worker from the succession pool, select worker otherwise leave it blank.



o. In the View URLs Web Service page, click on marked icon under CSV section.
A new browser tab opens and you can see the RaaS URL of the report in new browser tab.

Configure the Worker's Historical Performance Review report

Configure the report to fetch Workers Historical performance review information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: Confirm that you have the access to create reports.

Confirm that you have report data source “Workers by Organization” access.

Create all calculated fields for this report before developing the report.

Confirm that the report name, report field names or column heading override for the respective field (if given in report doc) are the same as it is in report document.

Confirm that the report field label is the same as in report.

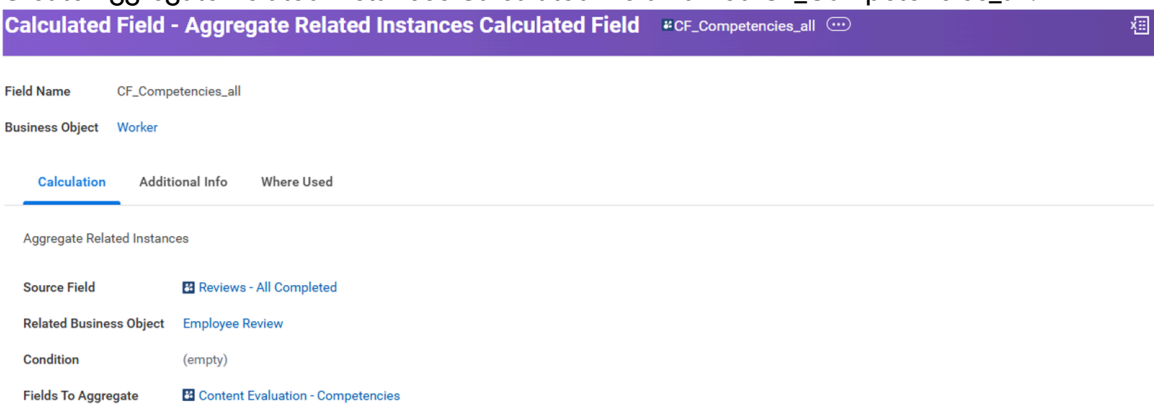
Confirm that all reports are owned by the ISU user.

Confirm that in the advanced section, **Enable as webservice** is selected.

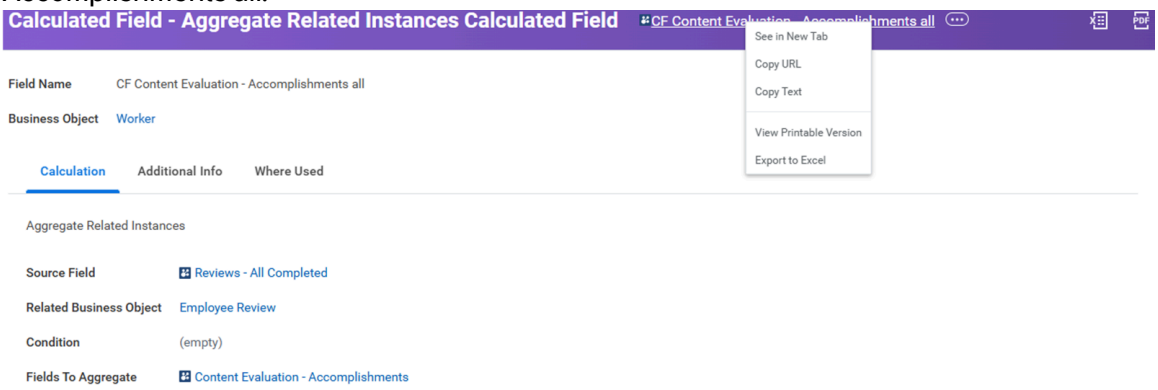
Procedure

1. Create the calculated fields.

a. Create Aggregate Related Instances Calculated Field named CF_Competencies_all.



b. Create Aggregate Related Instances Calculated Field named CF Content Evaluation - Accomplishments all.



c. Create Aggregate Related Instances Calculated Field CF_Content Evaluation - Areas for Development all.

r. In the View URLs Web Service page, click on marked icon under CSV section.
A new browser tab opens.

You can see the RaaS URL of the report in new browser tab.

Workday Learning Spoke

The Workday HR spoke is built by Bristlecone, Inc. Manage approvals, courses, and user in the Workday Learning instance from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Workday Learning spoke v1.1.4 is the latest version.

Supported versions

This spoke was built for Workday Learning v36.0, but may be compatible with later versions.

Spoke requirements

- Register Integration System User.

  Note:
  While filling account information details, ensure that you select the **Do Not Allow UI Sessions** check box.

- Workday REST and Report-as-a-Service (RAAS) API works with OAuth 2.0 to authorize access to resources in your Workday tenant. To use OAuth 2.0, you must register your client in the tenant, using the Register API Client task.

  Record and save these values while registering your client:

  - Client ID
  - Client Secret
  - Workday REST API Endpoint
  - Token Endpoint
  - Authorization Endpoint
- Create a security group and assign it to the integration system user and provide these permissions.

Domain Security Policy Permissions

Operation	Domain Security Policy	Domain Security Policies Inheriting Permission	Functional Areas

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.cobject)
- System Import Data Source (glide.system_import_data_source)
- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Workday Learning spoke provides a sample flow, Trigger Workday Learning Integration. This flow in turn triggers the subflows to automate tasks. To customize the sample flow, copy it to the required application scope.

Spoke subflows

The Workday Learning spoke provides sample subflows to demonstrate automating Workday Learning tasks. To customize a sample subflow, copy it to the required application scope. Available sample subflows include:

Subflow	Description
Assign Course to Workday Learning	Assigns learning courses to the ServiceNow users.
Pull Courses from Workday Learning	Retrieves details of the learning courses and maps courses from Workday Learning to ServiceNow.
Pull User Activity from Workday Learning	Retrieves user course activity data from Workday Learning and saves it in the ServiceNow instance.
Track Approval for Workday Learning	Retrieves details of learning todos from Workday Learning and saves it in the ServiceNow instance.
Workday Learning User Mapping	Maps users between Workday Learning and ServiceNow instance.

Spoke actions

The Workday Learning spoke provides actions to automate Workday tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Approval Management	Look up Approvals	Retrieves approval items from the inbox.
Course Management	Create Assignment	Creates an enrollment in the Learning Content.
	Look up Assignment	Retrieves details of the learning assignments.
	Look up Blended Courses Stream	Retrieves details of the blended courses.
	Look up Course Offerings Stream	Retrieves details of the blended course offerings.
	Look up Digital Courses Stream	Retrieves details of the digital courses.
	Look up Enrollment	Retrieves details of the self learning enrollments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Lessons Stream	Retrieves details of the standalone lessons.
	Look up Programs Stream	Retrieves details of the learning programs.
User Management	Look up Users Stream	Retrieves worker details such as, personal data, employment data, email data, worker reference data, and so on.
Skills management	Look up Skills Stream	Retrieves details of the skills required for the learning program.

Spoke module

The Workday Learning spoke provides Workday Learning application that has these modules:

Module	Description
Report Configuration	Enables you to create a record to specify the RAAS report configurations. Only one record can be created in this module.
Profile Sync Configuration	Enables you to specify the Workday tenant timezone.
Data Sources	
Sync User Activity	Saves the details of the user course activity as an attachment. These details are retrieved by the Look up Assignment action.
Self Enrollment Activity	Saves the details of the user course self enrollment as an attachment. These details are retrieved by the Look up Enrollment action.
Track Approval	Saves the details of the todo approvals as an attachment. These details are retrieved by the Look up Approvals actions.
Scheduled Imports	
Sync User Activity	Enables handling of the transformation errors while synchronizing the user activity.
Self Enrollment Activity	Enables handling of the transformation errors while synchronizing the self enrollment activity.
Track Approval	Enables handling of the transformation errors while synchronizing the approvals.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Workday Learning spoke.

Configure the Track Approval report

Configure the Learning Assignment report in Workday to retrieve worker's inbox items like to-dos, action items, approval, and so on.

Before you begin

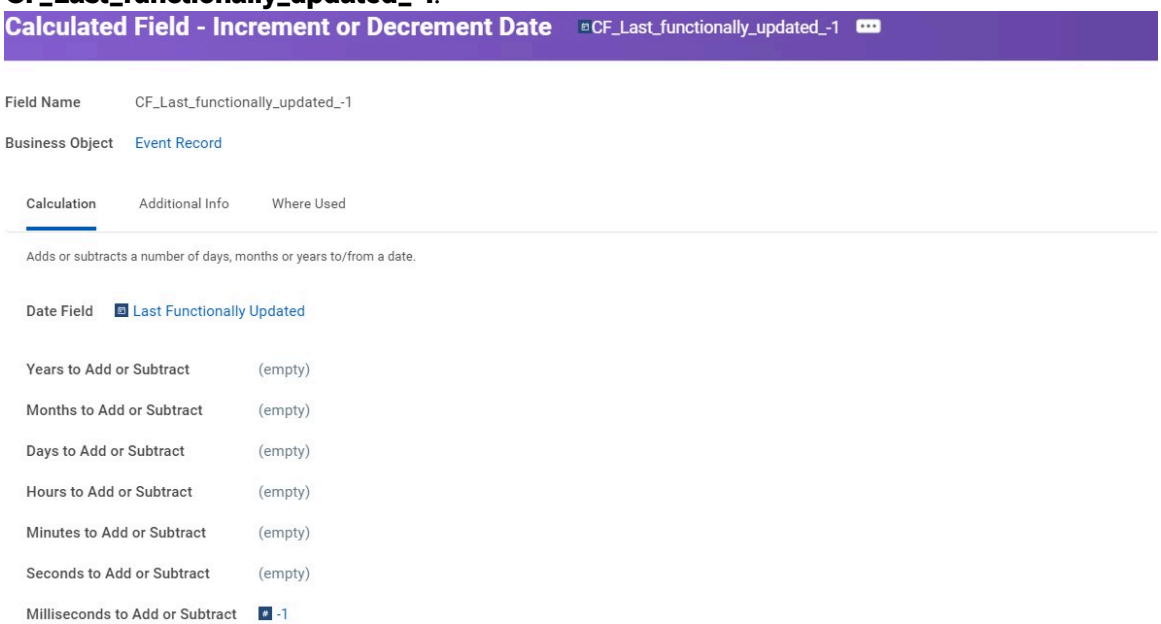
User with access to report creation and the Business process event steps report data source.

About this task

- For identification purposes, all calculated field name starts with **CF**.
- Create all calculated fields for this report before developing the report. Thus, all fields are available while creating the report.
- Report name can be different while creating the report. But ensure that the report field name or column heading override for the respective field (if it's given in the report document) is same as it is in the report document. Report field label should be same as it is in the report document. Else, the developed action fails.
- **Group Column Heading** for each business object in the **Group Column Headings** section should be empty.
- Ensure that you add parenthesis in filter while creating it.
- All reports must be shared or owned by the ISU user that accesses these actions on the ServiceNow platform.
- In the **Advanced** section, select the **Enable as webservice** check box.

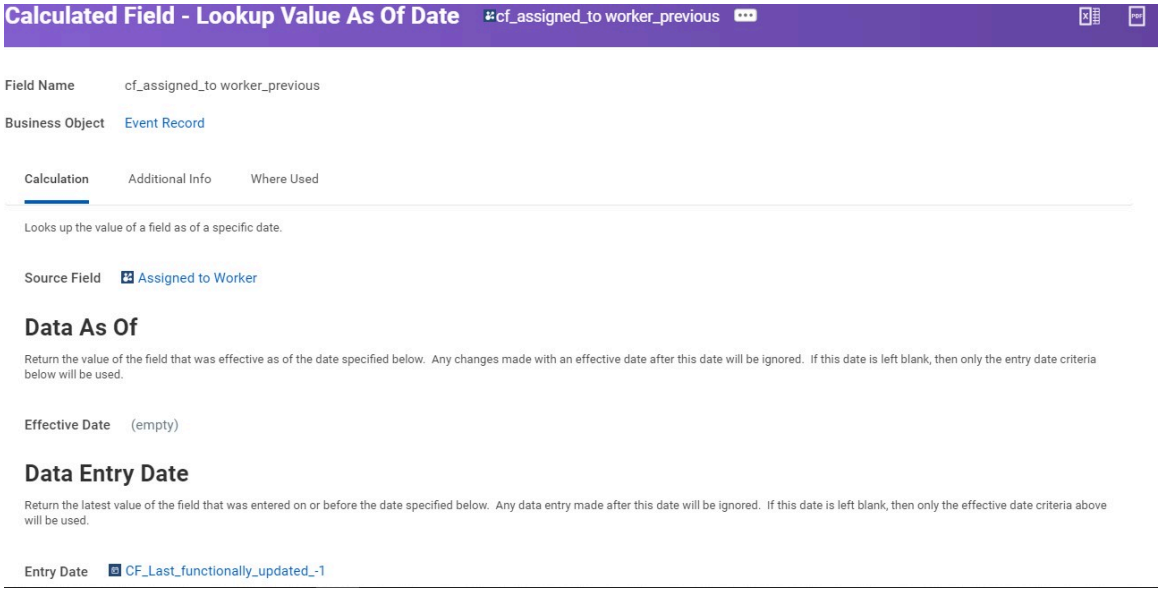
Procedure

1. Create increment and decrement type calculated field with name, **CF_Last_functionally_updated_-1**.

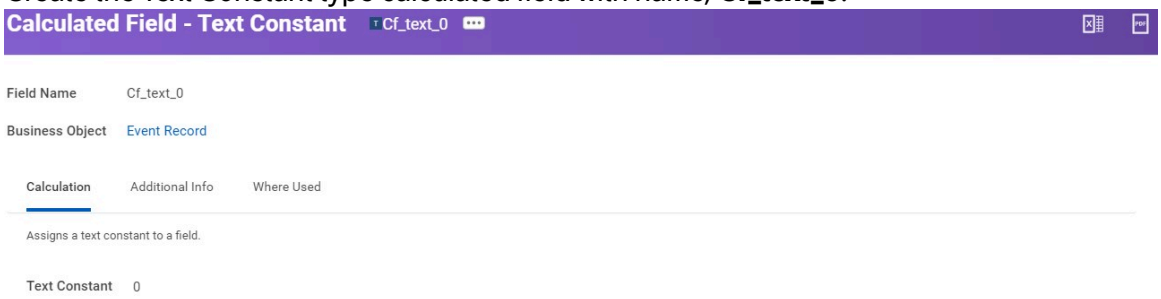


2. Create the Lookup Value As Of Date type calculated field with name, **cf_assigned_to_worker_previous** and use **CF_Last_functionally_updated_-1** in this field.

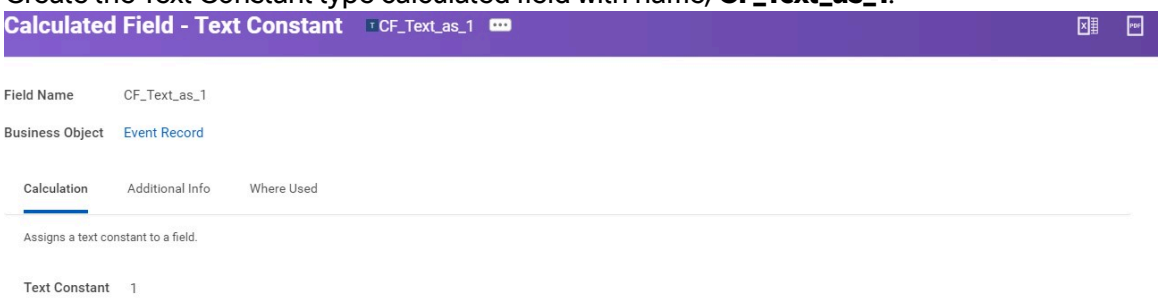
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Create the Text Constant type calculated field with name, **Cf_text_0**.

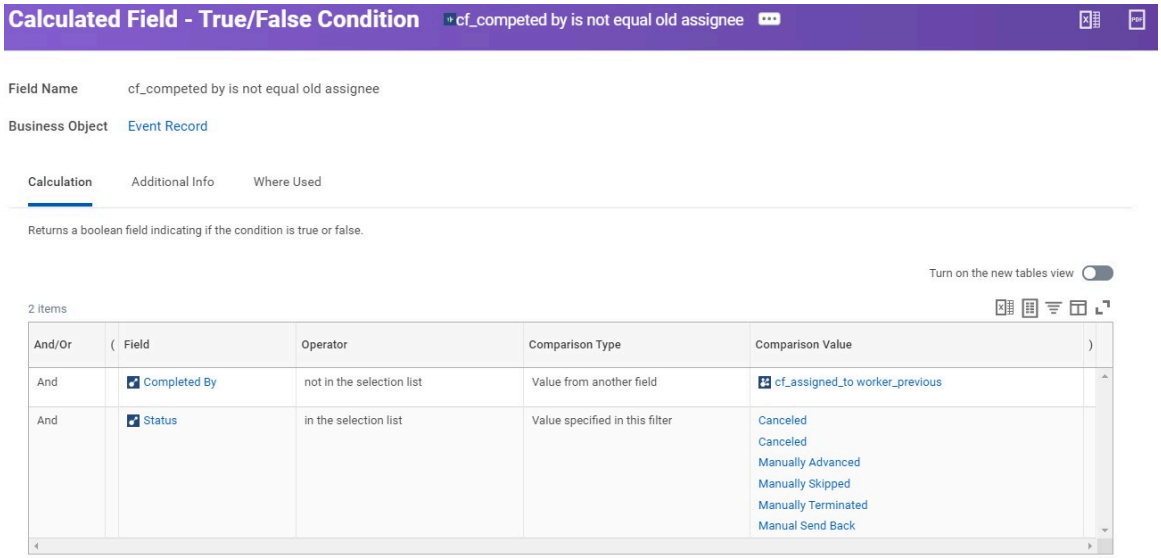


4. Create the Text Constant type calculated field with name, **CF_Text_as_1**.

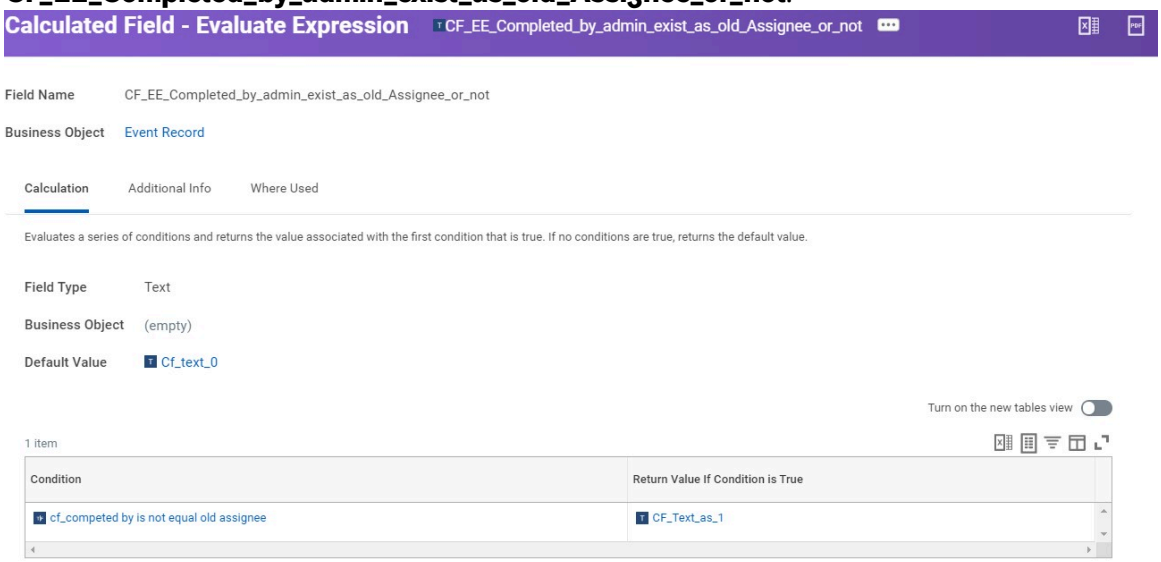


5. Create the True/False condition type calculated field with name, **cf_competed_by_is_not_equal_old_assignee**.

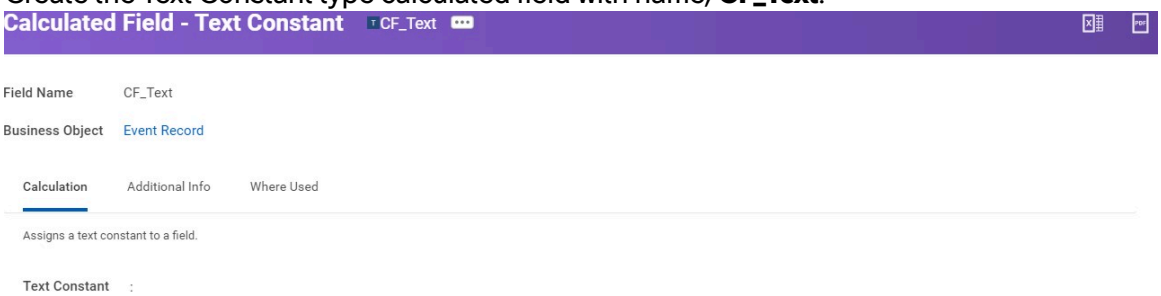
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Create Evaluate Expression calculated field with name, **CF_EE_Completed_by_admin_exist_as_old_Assignee_or_not**.

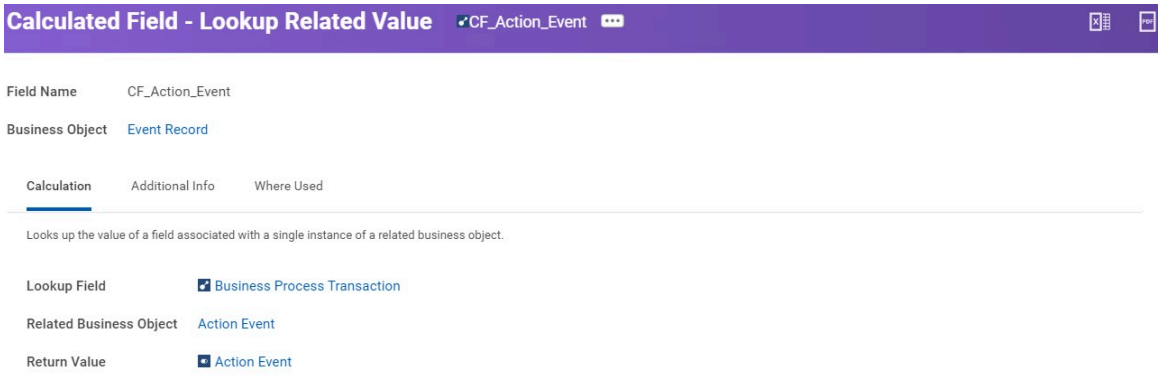


7. Create the Text Constant type calculated field with name, **CF_Text**.

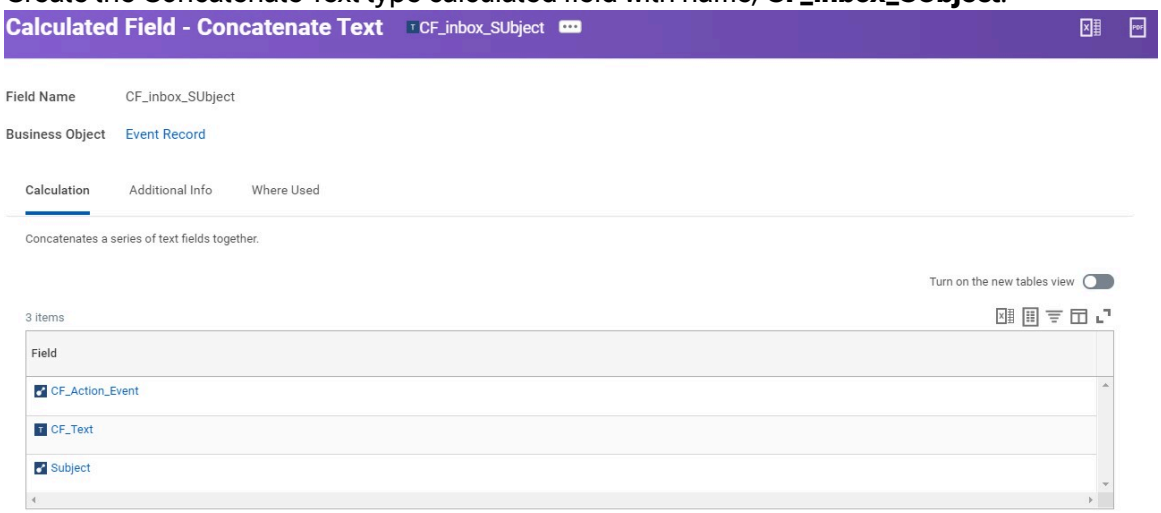


8. Create the Lookup Related Value type calculated field with name, **CF_Action_Event**.

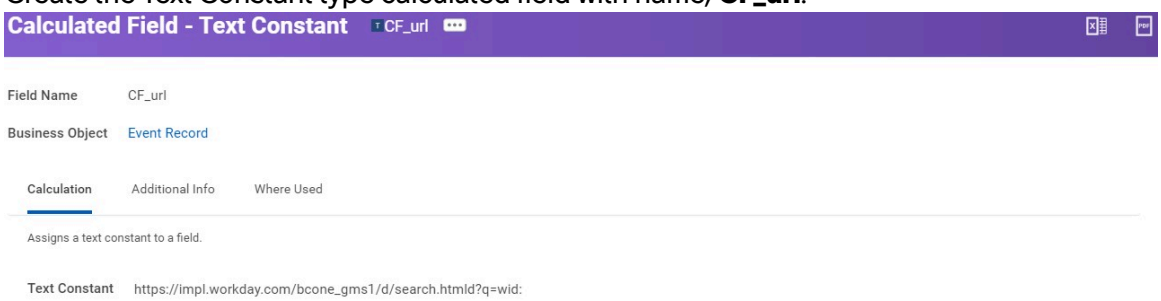
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



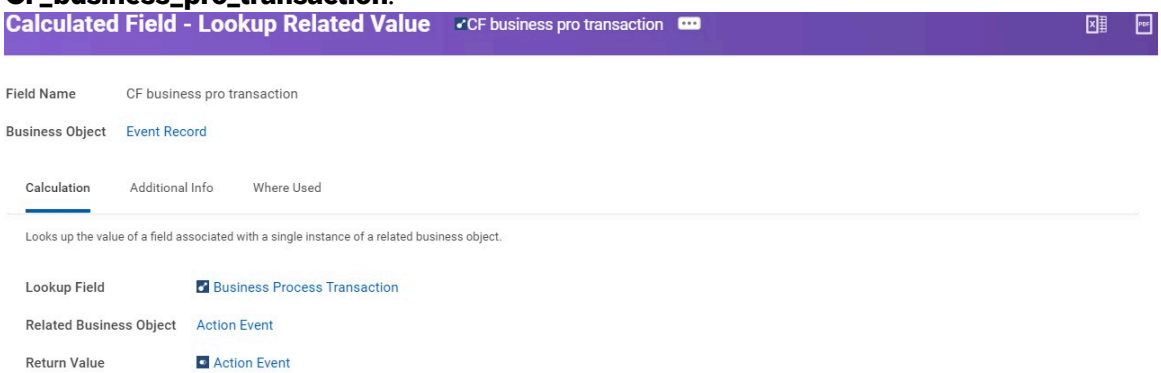
9. Create the Concatenate Text type calculated field with name, **CF_inbox_SUbject**.



10. Create the Text Constant type calculated field with name, **CF_url**.

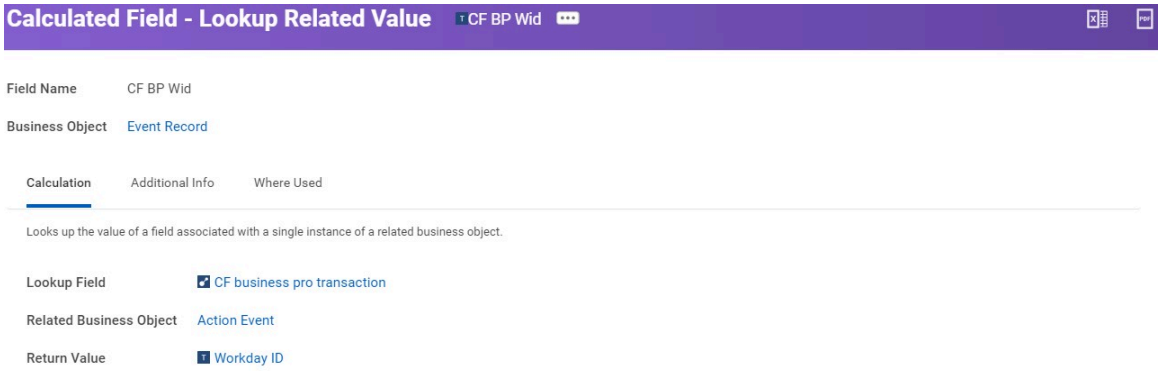


11. Create the Lookup Related Value type calculated field with name, **CF_business_pro_transaction**.

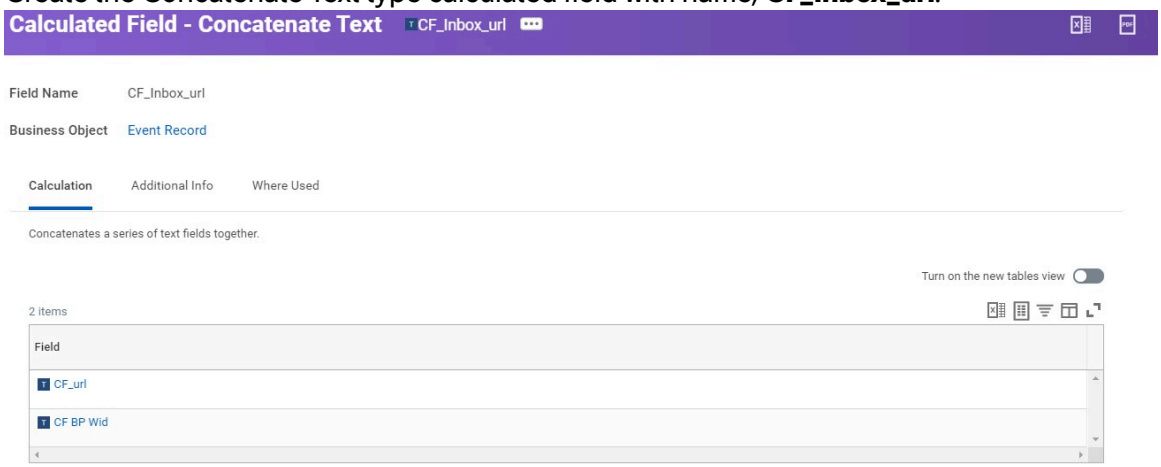


12. Create the Lookup Related Value type calculated field with name, **CF_BP_Wid**.

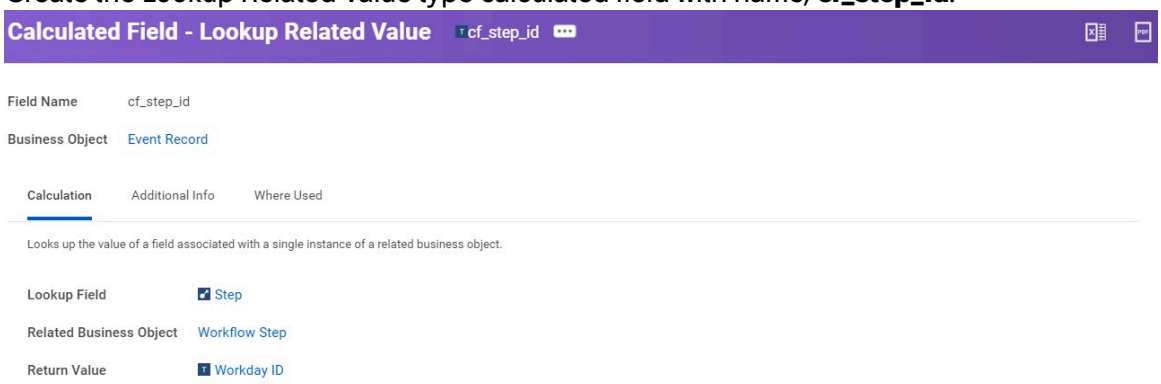
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



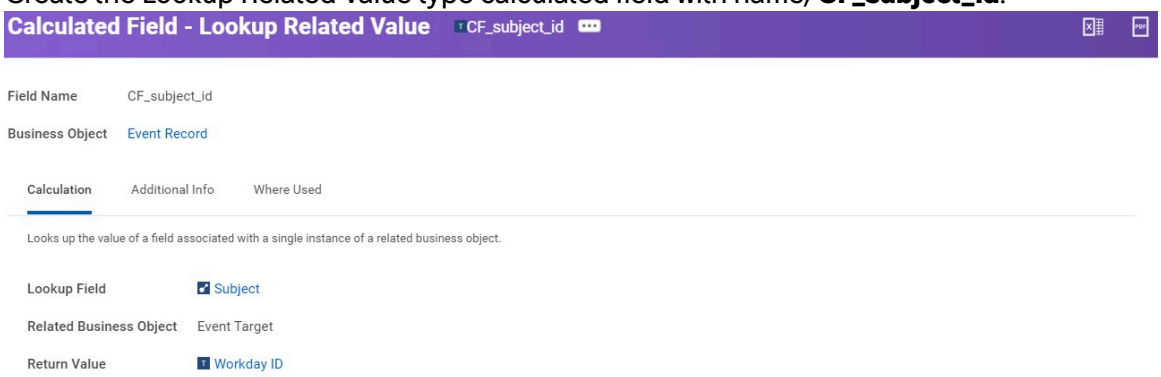
13. Create the Concatenate Text type calculated field with name, **CF_Inbox_url**.



14. Create the Lookup Related Value type calculated field with name, **cf_step_id**.

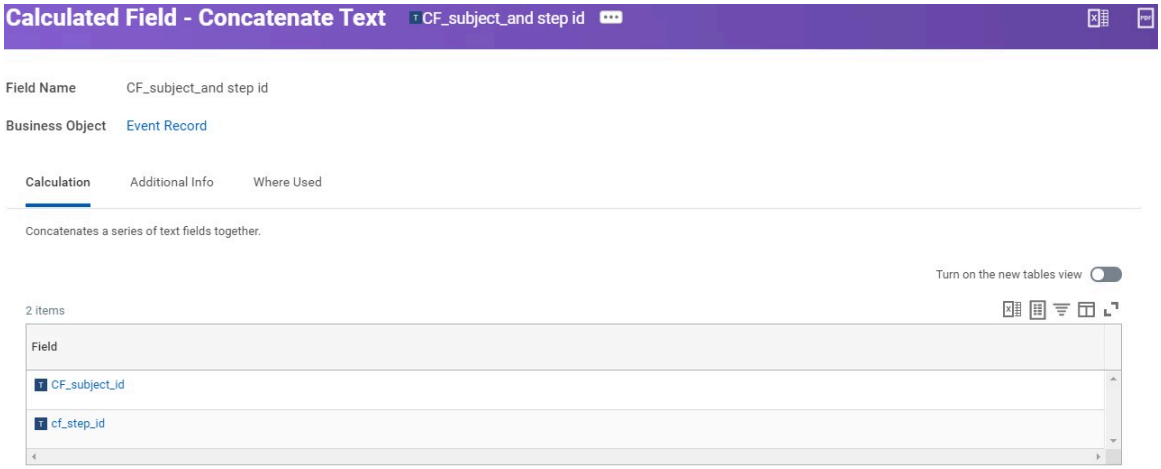


15. Create the Lookup Related Value type calculated field with name, **CF_subject_id**.

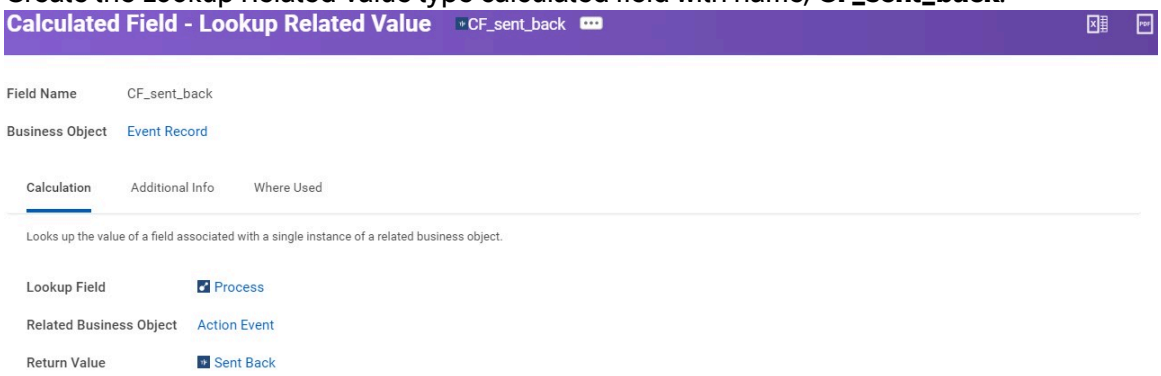


16. Create the Concatenate Text type calculated field with name, **CF_subject_and_step_id**.

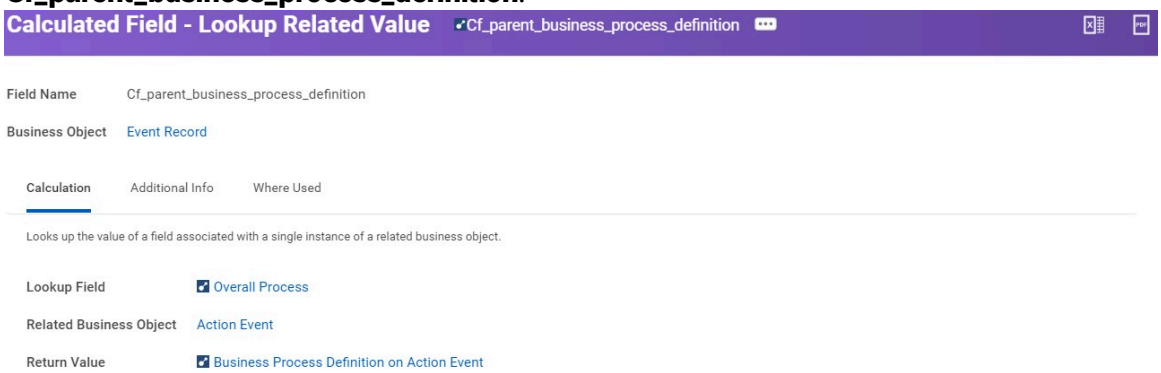
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



17. Create the Lookup Related Value type calculated field with name, **CF_sent_back**.

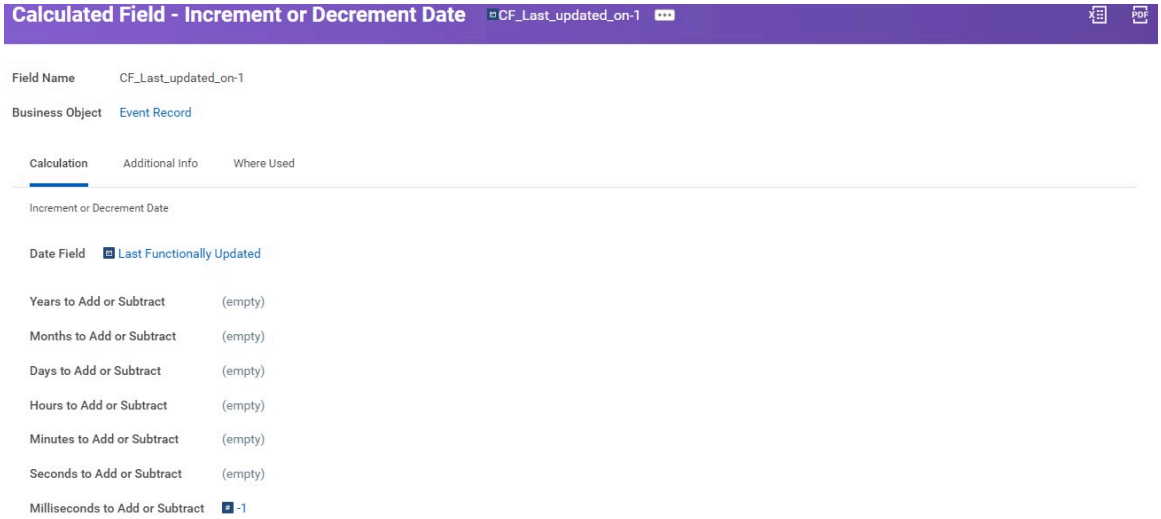


18. Create the Lookup Related Value type calculated field with name, **Cf_parent_business_process_definition**.

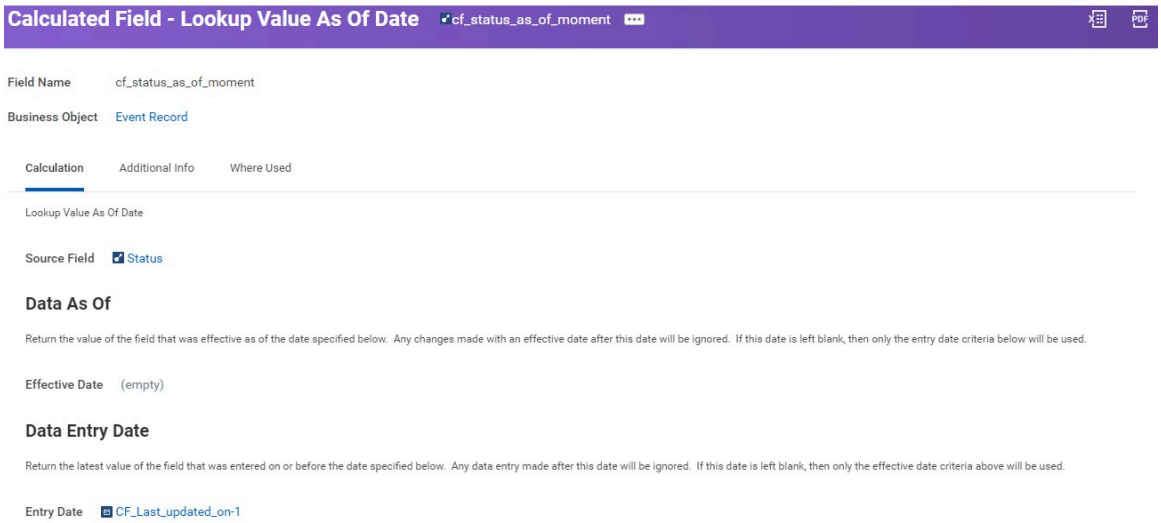


19. Create the Increment or Decrement Date type calculated field with name, **CF_Last_updated_on-1**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



20. Create the Lookup Value As Of Date type calculated field with name, **cf_status_as_of_moment** and use **CF_Last_updated_on-1** in this field.



21. Create the Track Approval report.

a. Access **Create Custom Report** task.

b. Provide the report name such as, **SNIH_Inbox_Items**.

c. Select report type as **Advanced**.

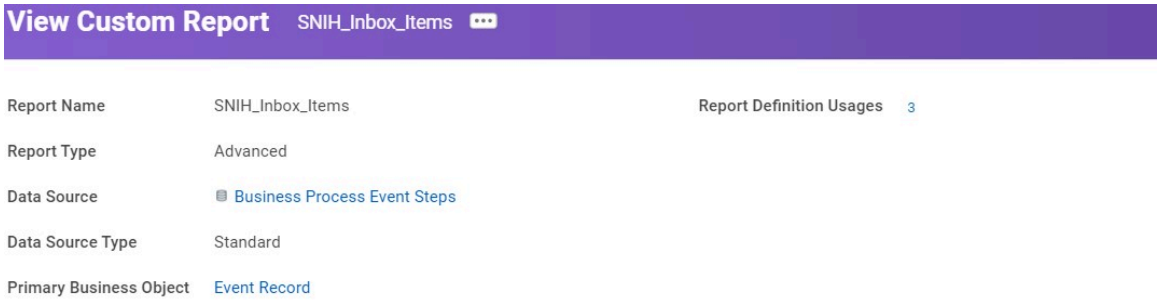
d. Clear the **Optimized for performance** check box.

e. Select **Business Process Event steps** for **Data Source**.

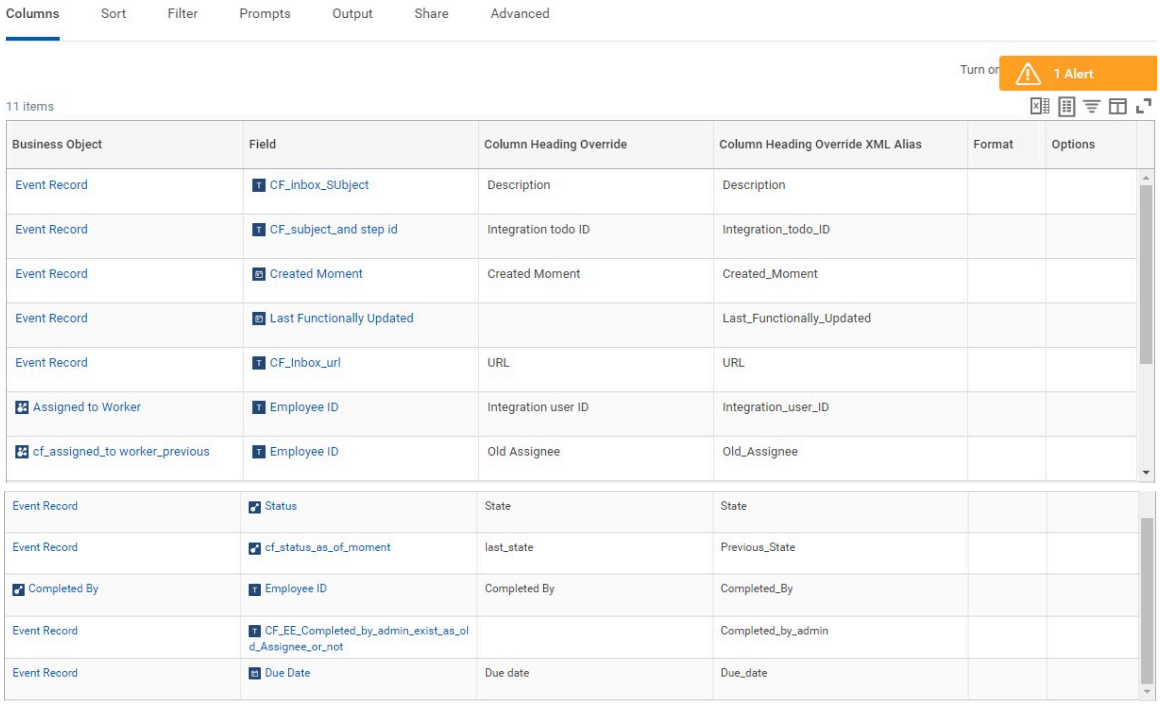
f. Don't select **temporary report** check box.

g. Click **Ok**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



h. Select the report business object and report fields as shown here.



i. In the **Group Column Headings** section, select the business object as shown here.

The **Group Column Heading** for each business object is empty.

j. In the **Filter conditions for filtering on instances** section, select the values as shown.

Be sure to add parentheses.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `https://wd2-impl-services1.workday.com` is the base URL of your Workday tenant.
- `Tenant_Name` is your Workday tenant.
- `Report_Owner_user_name` is the user name of the report's owner.
- `SNIh_Inbox_Items` is the report name.

Configure the Learning Enrollment report

Configure the Learning Enrollment report in Workday to retrieve user's learning enrollments.

Before you begin

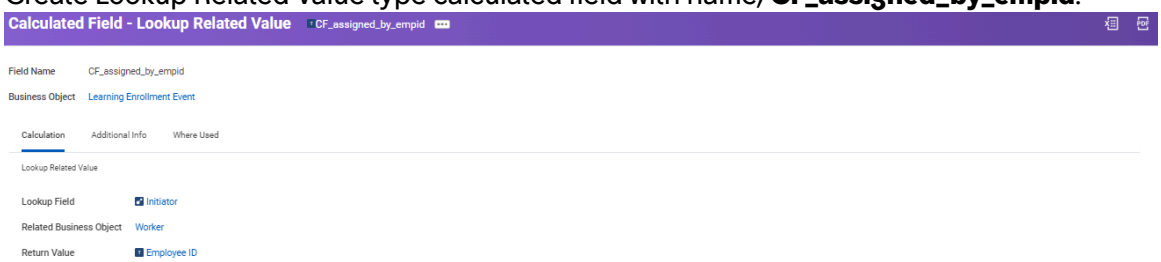
User with access to report creation and the Learning Enrollments data source.

About this task

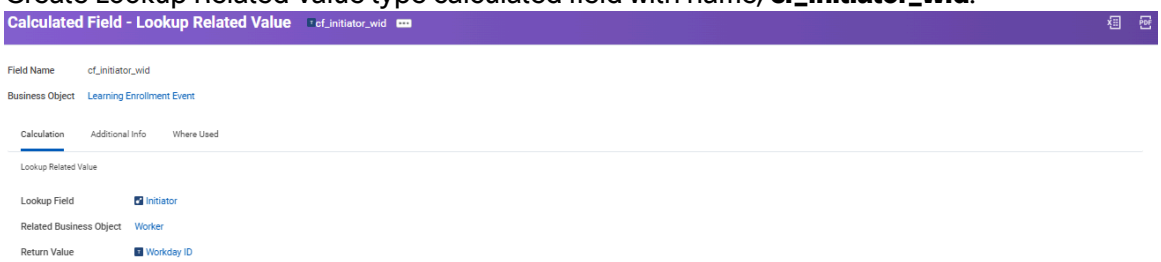
- For identification purposes, all calculated field name starts with **CF**.
- Create all calculated fields for this report before developing the report. Thus, all fields are available while creating the report.
- Report name can be different while creating the report. But ensure that the report field name or column heading override for the respective field (if it's given in the report document) is same as it is in the report document. Report field label should be same as it is in the report document. Else, the developed action fails.
- **Group Column Heading** for each business object in the **Group Column Headings** section should be empty.
- Ensure that you add parenthesis in filter while creating it.
- All reports must be shared or owned by the ISU user that accesses these actions on the ServiceNow platform.
- In the **Advanced** section, select the **Enable as webservice** check box.

Procedure

1. Create Lookup Related Value type calculated field with name, **CF_assigned_by_empid**.

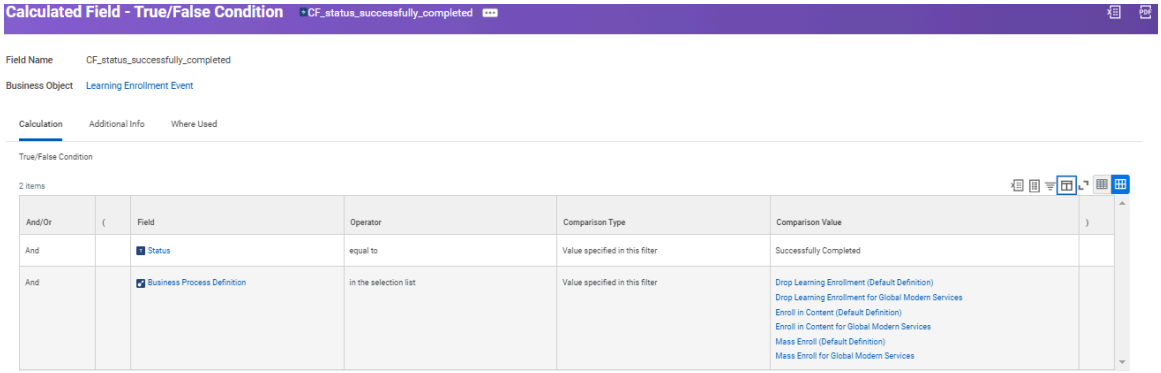


2. Create Lookup Related Value type calculated field with name, **cf_initiator_wid**.

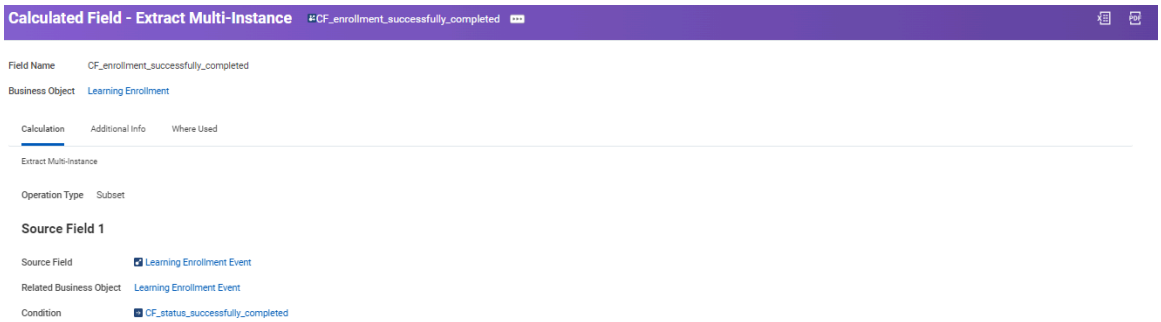


3. Create the True/False condition type calculated field with name, **CF_status_successfully_completed**.

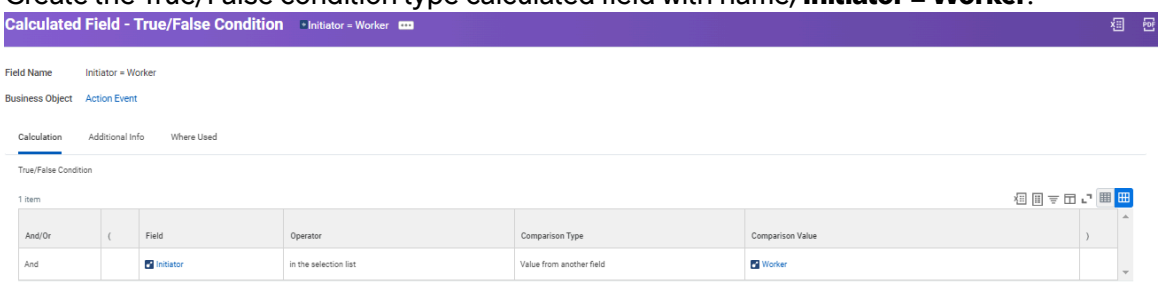
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



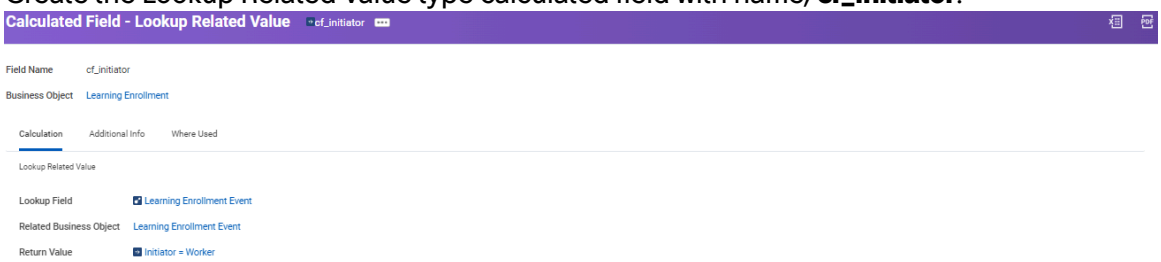
4. Create Extract Multi-instance type calculated field with name, **CF_enrollment_successfully_completed** and select **CF_status_successfully_completed** as the return value.



5. Create the True/False condition type calculated field with name, **Initiator = Worker**.



6. Create the Lookup Related Value type calculated field with name, **cf_initiator**.



7. Create the Learning Enrollment report.

   a. Access the **Create Custom Report** task.

   b. Provide the report name, for example, `Test -Learning Assignment`.

   c. Select report type as **Advanced**.

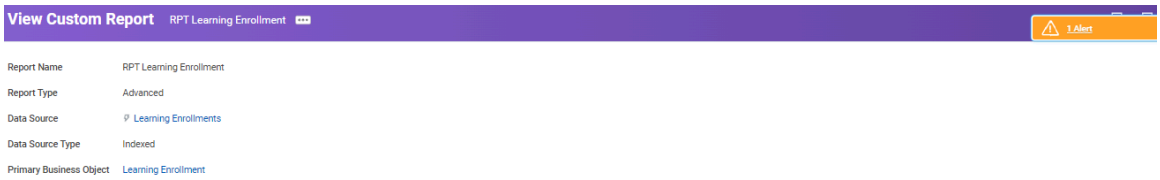
   d. Clear the **Optimized for performance** check box.

   e. Select **Data Source** as **Learning Enrollments**.

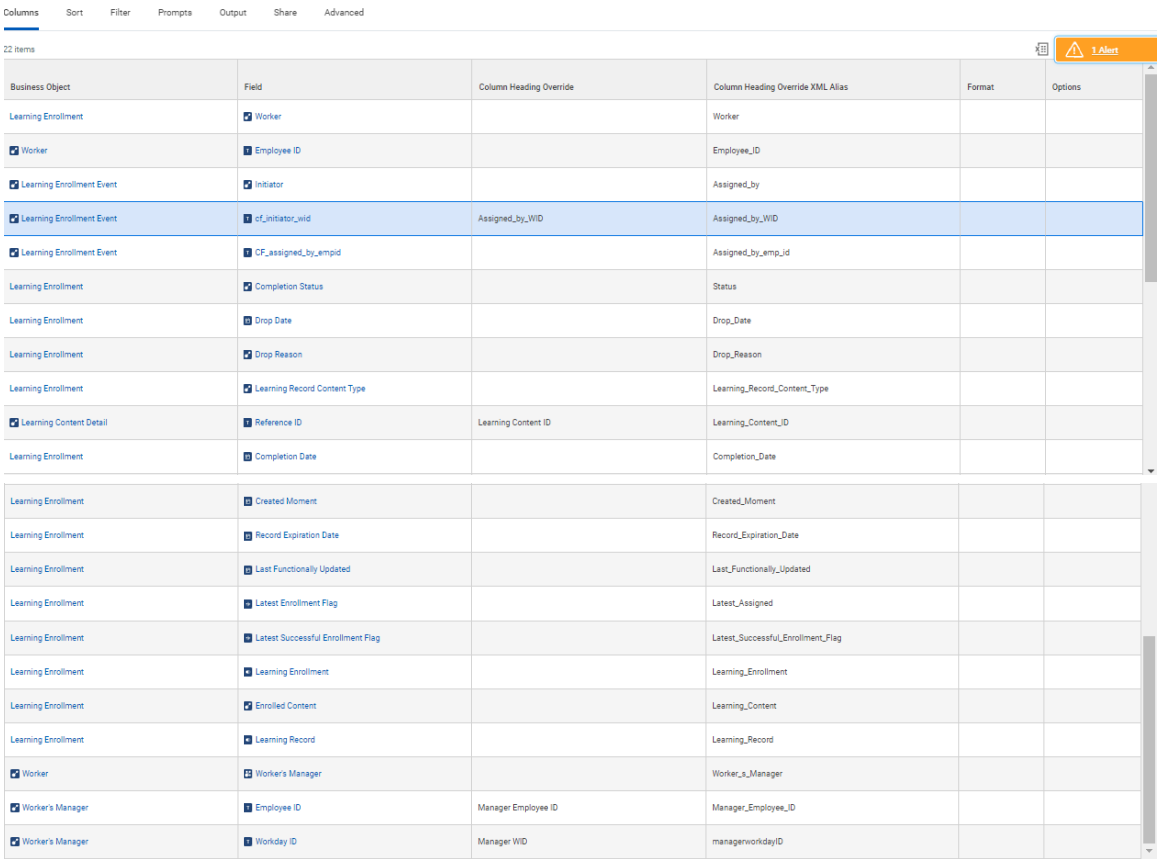
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Don’t select the temporary report check box.

g. Click **Ok**.



h. Select the report business object and report fields.



i. In the **Group Column Headings** section, select all business objects as shown here.

The **Group Column Heading** for each business object is empty.

j. In the **Filter** section, select the values as shown here.

Be sure to add the parentheses.

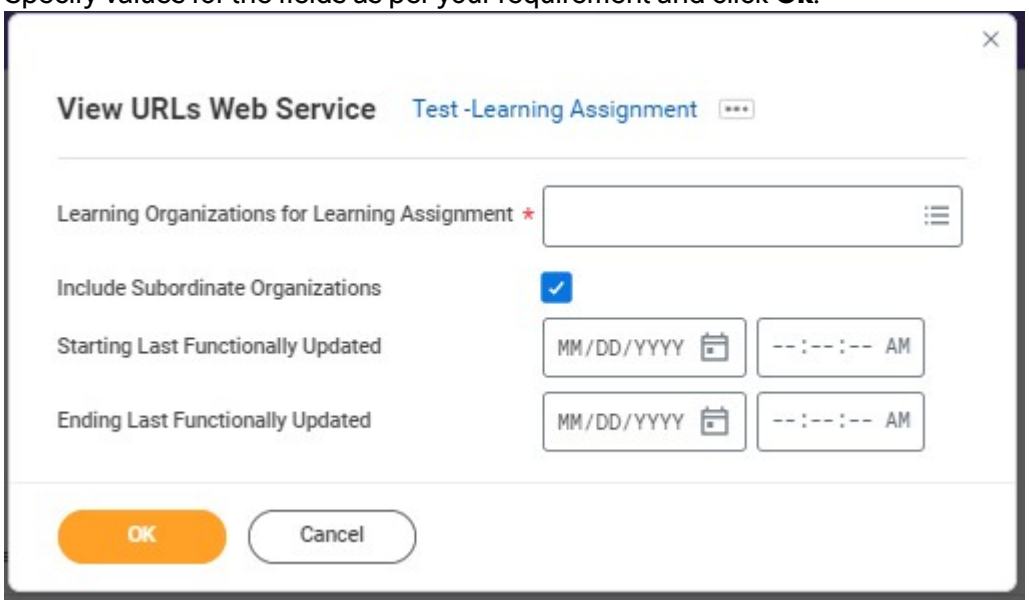
p. Specify values for the fields as per your requirement and click **Ok**.



q. In the View URLs Web Service page, click the active link you want to generate. The RaaS URL is displayed in a new browser tab.

Set up the Workday Learning spoke

Integrate the ServiceNow® instance Workday instance by using the OAuth 2.0 to authenticate ServiceNow® requests.

Before you begin

- Configure these reports in the Workday instance:
  - Learning Assignment
  - Learning Enrollment
  - Track Approval
- Request an Integration Hub subscription.
- Activate the Workday Learning spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configurations to use Workday SOAP web services

Configure your ServiceNow® instance to perform actions that use the Workday SOAP web services.

Before you begin

Role required: admin

Procedure

1. Create a WS-Security Username Profile to provide your Workday credentials to authenticate requests from ServiceNow®.

   a. Navigate to **All** > **Integration Hub** > **SOAP Integrations** > **WS-Security Username Profiles**.

   b. Click **New**.

   c. On the form, fill these values.

   WS-Security Username Profiles (Outbound)

Field	Description
Name	Name to uniquely identify this credential. For example, enter `Workday Learning User`.
Application	Application in which the record is applicable. Select **Workday Learning Spoke**.
Username	Workday user who has integration rights using Workday Web Services.
Password	Password of the Workday user.

   d. Click **Submit**.

2. Configure the SOAP security profile by adding the security user name profile you had created to authenticate requests from ServiceNow.

   a. Navigate to **All** > **IntegrationHub** > **SOAP Integrations** > **SOAP Security Policies**.

   b. Open the record for the Workday Learning spoke, for example, **Workday Learning**.

   Note:
   If you intend to use another SOAP security policy record and not the default record, you must ensure that you select that record you had created in all the actions that use Workday SOAP web services.

   c. For **WS-Security Username Profile**, select the security username profile you had created for the Workday Learning spoke.

   d. Do not provide value in **WS-Security X.509 Profile**.

   e. Right-click the form header and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configurations to use Workday REST API

Configure the default connection and credential record by providing the required details to authenticate requests.

Before you begin

Role required: admin

Procedure

1. Configure the default application registry to register Workday Learning as an OAuth provider.

   a. Navigate to **System OAuth** > **Application Registry**.

   b. Open the record, **Workday Learning**.

   c. On the form, fill these values.

Field	Description
Client ID	Client ID you had copied when you registered an API client in your Workday instance.
Client Secret	Client secret you had copied when you registered an API client in your Workday instance.
Authorization URL	Authorization URL you had copied when you registered an API client in your Workday instance.
Token URL	Token URL you had copied when you registered an API client in your Workday instance.
Redirect URL	Redirect URL of the ServiceNow® instance in this format: `https://<ServiceNow-Instance-Name>.service-now.com/oauth_redirect.do`.
Default Grant type	Default grant type to establish the OAuth token. Select **Authorization Code**.

   d. Click **Update**.

2. Create a credential record.

   a. Navigate to **Integration Hub** > **Credentials**.

   b. Click **New**.
   The system displays the message `What type of Credentials would you like to create?`.

   c. Select **OAuth 2.0 Credentials**.

   d. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name to identify the credential record. For example, `Workday Learning Cred`.
OAuth Entity Profile	Default OAuth entity profile record. For example, `Workday Learning default_profile`.

e. Click **Submit**.

3. Configure the default connection and credential alias record.

a. Navigate to **Integration Hub** > **Connection & Credential Aliases**.

b. Open the **Workday Learning** record.

c. In the **Connections** tab, click **New**.

d. On the form, fill these values.

Field	Description
Name	Name to identify the connection record. For example, **Workday Learning Conn**.
Credential	Associated credential record. Select the credential record you had created earlier. For example, `Workday Learning Cred`.
Connection URL	URL to connect to your Workday instance.

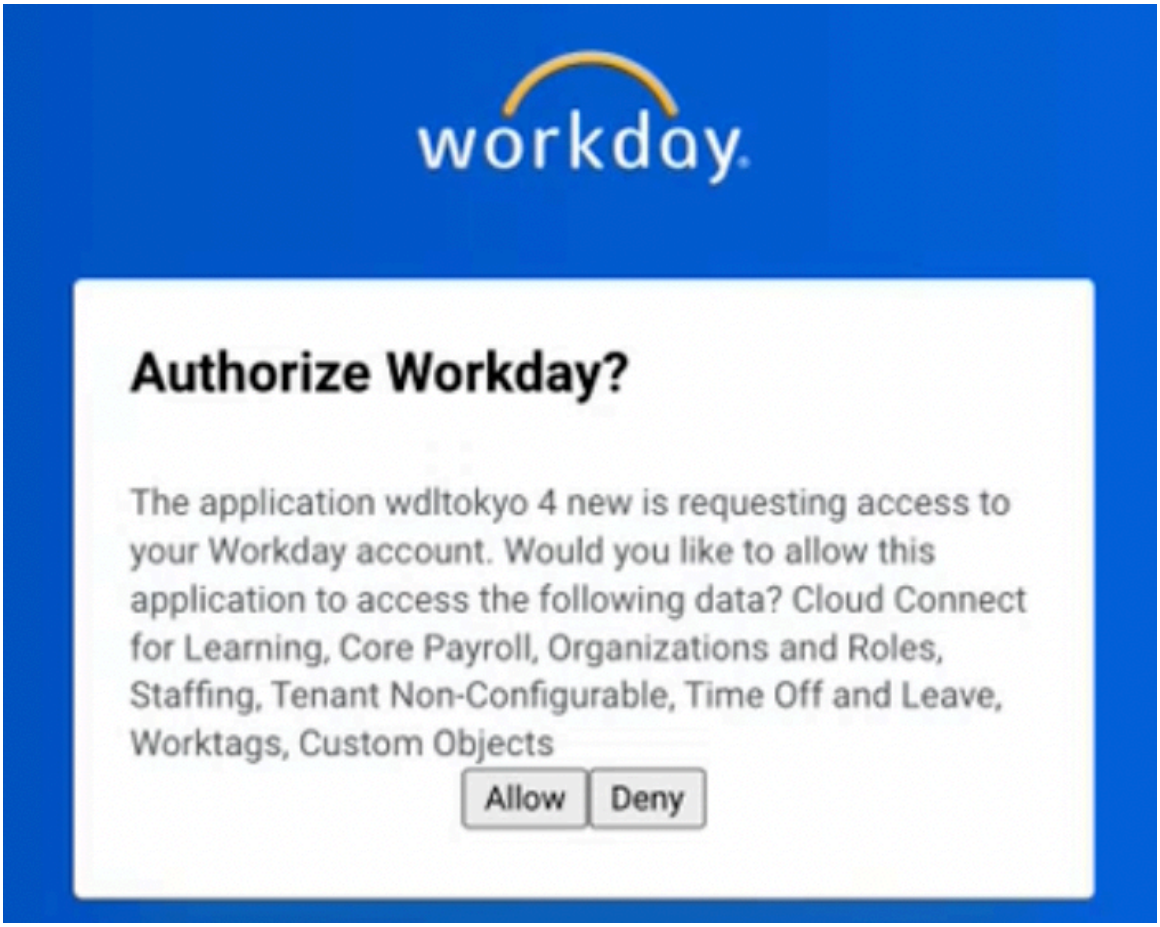
e. In the **Attributes** tab, specify the tenant name of your Workday instance in **Tenant Name**.

f. Click **Submit**.

4. Navigate to **Integration Hub** > **Credentials**.
5. Open the record, **Workday Cred**.
6. Click **Get OAuth Token**.
System prompts to confirm if you want to authorize Workday.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Click **Allow**.



Configure the Workday reports

Set up the required Workday reports in your ServiceNow® instance.

Before you begin

Role required: admin

Procedure

1. Navigate to **Workday Learning** > **Report Configuration**.
2. On the form, fill the fields.

Field	Description
Workday learning assignment RAAS report name	Report name of the learning assignment RAAS report.
Workday learning to dos report owner username	Username of the learning todos RAAS report owner.
Workday learning to dos RAAS report name	Report name of the learning todos RAAS report.
Workday learning enrollment RAAS report name	Report name of the learning enrollment RAAS report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Learning organization type	Organization type to which employee belongs to. You can select either **Organization Reference ID** or **WID**.
Workday learning enrollment report owner username	Username of the learning enrollment RAAS report owner.
Initial load start date time	Initial start date and time that is needed for the Look up Approvals actions.
Workday learning assignment report owner username	Username of the learning assignment RAAS report owner.
Learning organization ID	Unique identifiers of the organizations separated by commas (,). You can provide a maximum of upto 999 identifiers.

3. Click **Submit**.

Note:
You can maintain only one record in this module.

Update timezone

Update the timezone of the Workday tenant in your ServiceNow instance.

Before you begin
Role required: admin

Procedure

1. Navigate to **Workday Learning** > **Profile Sync Configuration**.
2. Click **New**.
3. On the form, select **Workday tenant time zone** and **Domain** as per your requirement.
4. Click **Submit**.

Workfront Spoke

The Workfront spoke provides actions to view and analyze meaningful usage data for Workfront software subscriptions. Analyze usage for your Workfront account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Workfront v1.3.0 is the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

This spoke was built for Workfront v1.1.1, but may be compatible with later versions.

Spoke requirements

Adobe Workfront administrator account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Workfront spoke provides actions to automate Workfront tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Document Management	Check in Documents	Checks in a checked-out document based on its ID.
	Check out Documents	Checks out a checked-in document based on its ID.
	Is Document Linked	Determines if the document is linked by its unique identifier.
	Is Proof Auto Generation Enabled	Determines if proof is auto enabled for the corresponding ID.
	Look up Documents Stream	Retrieves the details of all access levels.
	Upload Attachment	Creates a document in a Workfront Instance.
	Unlink Document	Unlinks a document from the Workfront.
	Upload Attachment to Handle	Creates a new document on the Workfront instance.
	Look up Proof Templates	Gets all proof template information.
	Move Document	Moves a document to a project, task, or an issue.
	Look up Proof Recipients	Returns the details of the recipients for the given template and proof stage ID.
	Look up Proof Stages	Gets the stage information of the Proof ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Total Documents Size	Determines the size of the documents.
	Upload Attachment to Object	Creates or links the document to the Workfront Object after the 'Upload Attachment to Handle' action.
	Look up Documents Stream	Retrieves a list of all documents.
	Look up Templates Stream	Retrieves a list of all templates.
Finance Management	Look up Expenses Stream	Retrieves a list of all expenses.
Issue Management	Move Issue to another Project	Moves an issue to a project.
	Move Issue to Task	Moves one or more issues from the Workfront.
	Bulk Move of Issues	Moves bulk issues to a task.
Portfolio Management	Look up Portfolios Stream	Retrieves a list of all portfolios.
Program Management	Look up Programs Stream	Retrieves a list of all programs.
Project Management	Calculate Project Timeline	Calculates the timeline for a project based on its ID.
	Calculate Project Finance	Calculates the finances for a project with the unique ID specified.
	Set Project Budget	Sets the budget for the specific project with the unique ID specified.
	Look up Issues Stream	Retrieves a list of all issues.
	Look up Projects Stream	Retrieves a list of all projects.
	Look up Tasks Stream	Retrieves a list of all tasks.
Record Management	Accept Object Work	Accepts work in Workfront for the recently created object.
	Approve Approval of Object	Approves the request for the object's approval.
	Assign Assignee to Object	Assigns a team, user, or role to a Workfront object.
	Assign Multiple Assignees to Object	Assigns a Workfront object to multiple users, roles, or a team.
	Calculate Object Data Extension	Calculates the data extension for the specified object.
	Create Object	Creates an object in your Workfront instance.
	Delete Object	Removes an object from the Workfront instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Object by ID	Retrieves the details for the given object ID as an input.
	Look up Object Count	Returns the current item count.
	Recall Object Approval	Recalls the approval request for the Workfront object.
	Reject Approval of Object	Rejects the approval request for the Workfront object.
	Reject Object Work	Rejects the work action on the object.
	Reply to Object Assignment	Responds to the assignment of an object.
	Unassign User from Object	Unassigns a user from a Workfront object.
	Update Object as Done	Updates an object as done in the Workfront.
	Update Object as Not Done	Updates an object as not done in the Workfront.
	Update Object by ID	Updates the object in the Workfront.
Report Management	Look up Filters Stream	Retrieves a list of all filters.
	Look up Reports Stream	Retrieves a list of all reports.
Task Management	Bulk Copy of Tasks	Copies one or more tasks from the Workfront.
	Bulk Move of Tasks	Moves one or more tasks from the Workfront.
	Move Task	Moves a specific task to different project or task.
Template Management	Look up Task Templates	Gets all task template information.
	Look up Project Templates	Gets all project template information.
User Management	API Inputs (Metadata)	Retrieves a list of fields for the specified object code that is used as dynamic input.
	API Outputs (Metadata)	Retrieves a list of fields for the specified object code that is used as dynamic output.
	Look up Access Levels Stream	Retrieves a list of all access levels for Workfront licenses.
	Look up Users Stream	Retrieves a list of all users within an account.
	Update User	Modifies details about the specified user.
Webhook Management	Look up Event Subscriptions Stream	Retrieves the details of all event subscriptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Event Subscription by ID	Retrieves the details of the event subscription for the specified ID.
	Create Event Subscription	Creates a new event subscription in your Workfront instance.
	Delete Event Subscription	Removes a subscription from the Workfront instance.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Workfront spoke.

Set up the Workfront spoke

Set up an outbound integration between the ServiceNow instance and the Workfront instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Workfront spoke.
- Workfront role required: Administrator
- Role required: admin

Generate a Workfront API key

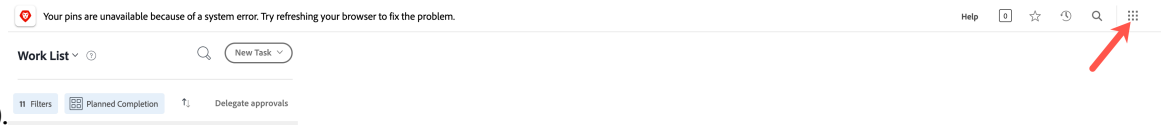
Generate an API key for authenticating Workfront API requests.

Before you begin

Role required: Workfront administrator

Procedure

1. From a web browser, open Adobe Workfront.
2. Log in to the Adobe Workfront instance.
3. On the page header of your Adobe Workfront instance, select the main Menu icon ( ).



4. Select the Setup icon ( ).
5. From the left navigation menu of the Setup page, navigate to **System** > **Customer Info**.

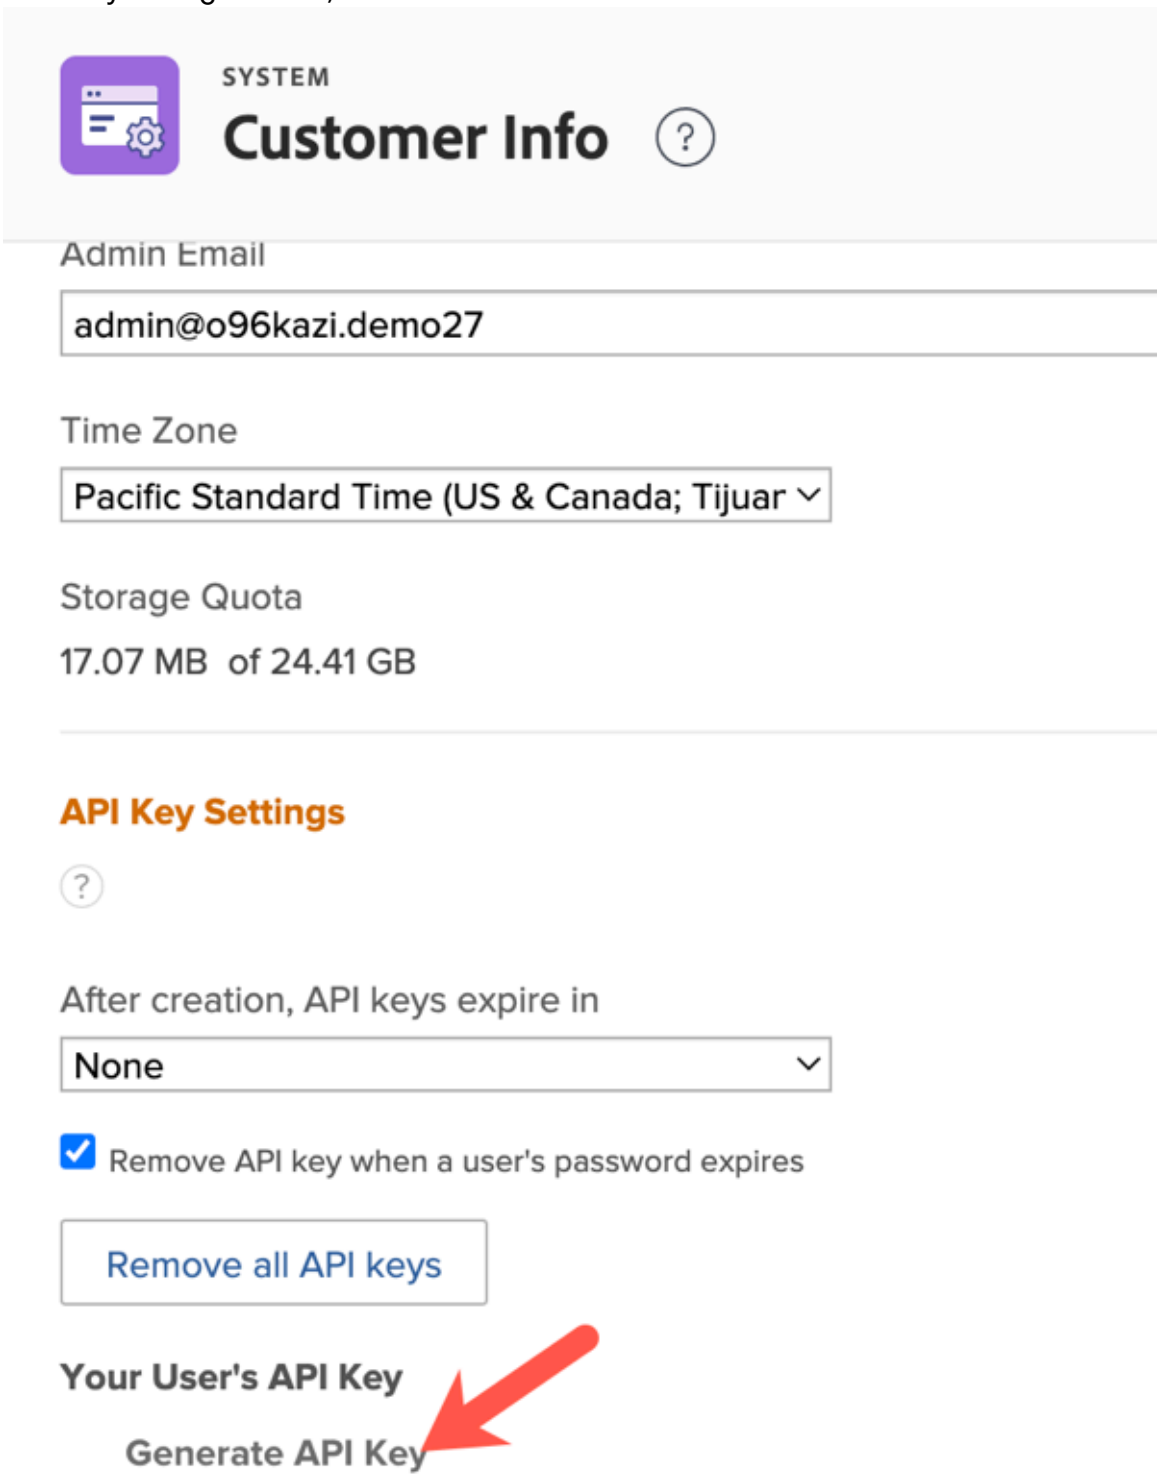
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the API Key Settings section, select **Generate API Key**.



The API key is generated.

7. Copy the API key and save for later use.
8. **Optional:** To set an expiry date to the API key, in the **After creation, API keys expire in** list, select the time period.
9. Click **Save**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a Workfront connection record

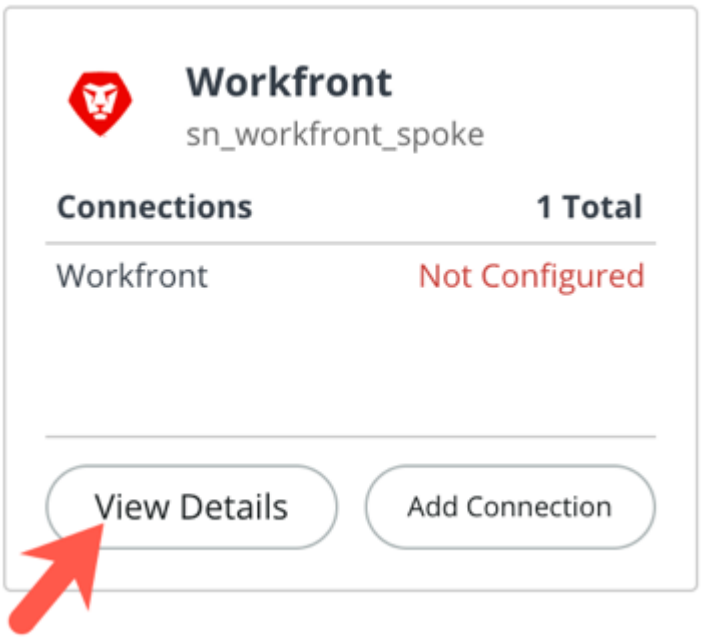
Create a connection record between the ServiceNow instance and the Workfront instance. The connection record consists of the connection details and the API key.

Before you begin

Role required: admin

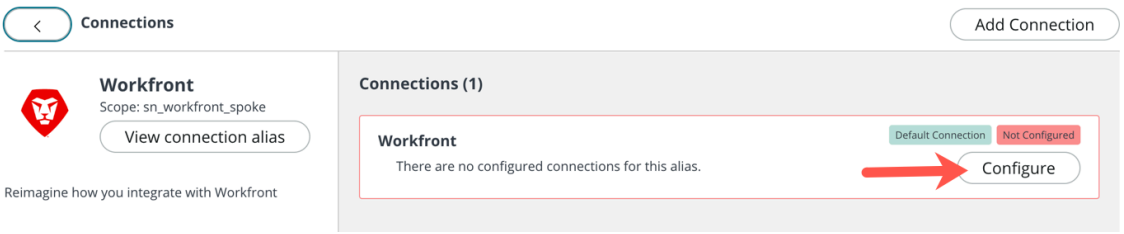
Procedure

1. Log in to the ServiceNow instance.
2. Navigate to **Process Automation** > **Flow Designer**.
3. Select **Connections**.
4. In the Search all connections field, enter `workfront`.
5. On the Workfront tile, click **View**



Details.

6. Click



Configure.

7. Fill the form.

Create Connection dialog box

Field	Description
Connection Name	Name of the Workfront connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The default name of the first connection record is Workfront and it's read-only. To provide a custom name, you must create another connection record.
Connection URL	URL for the connection. Enter `https://<domain-name>.my.workfront.com`, where <*domain-name*> is your company subdomain.
API Key	The API key that you generated from the Workfront instance. To learn how to generate an API key, see Generate a Workfront API key.

8. Click **Configure Connection**.

Workplace from Facebook Spoke

Manage users, groups, and notifications in Workplace from Facebook account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Note:
Workplace from Facebook is compatible with ServiceNow version, Paris with Patch 3 and later.

Spoke version

Workplace from Facebook spoke v4.2.0is the latest version.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Workplace from Facebook spoke provides a sample subflow, Fetch Workplace from Facebook Groups that demonstrates automating group management tasks. To customize the sample flow, copy it to the required application scope.

Spoke actions

The Workplace from Facebook spoke provides actions to manage users, groups, and notifications. Available actions include:

Category	Action	Description
Group Management	Add User To Group	Adds a user to a group in Workplace from Facebook.
	Create Group	Creates a group in Workplace from Facebook.
	Deactivate Groups	Deactivates groups that have not been updated during the last execution of the Fetch Workplace from Facebook Groups subflow.
	Lookup Group ID	Retrieves the group ID for a given group name in Workplace from Facebook.
	Lookup Groups	List all groups in Workplace from Facebook.
	Remove User From Group	Removes a user from a group in Workplace from Facebook.
Group Post Management	Post Message	Posts a message to a Workplace from Facebook group.
	Post Picture	Posts an image and message to a Workplace from Facebook group.
	Post Change Details	Posts change request details in a Workplace from Facebook group.
	Post Incident Details	Posts incident details in a Workplace from Facebook group.
	Post Problem Details	Posts problem details in a Workplace from Facebook group.
User Management	Lookup User ID	Retrieves the user ID from a registered email in Workplace from Facebook.
	Look up Organization Members Stream	Retrieves a list of#users in#Workplace from Facebook.
	Deactivate a User	Deactivates a Workplace from Facebook user.
	Create User	Creates a user in Workplace from Facebook.
	Look up User	Retrieves user details based on the user's registered email in Workplace from Facebook.
Event Management	Look up Events Stream	Retrieves events of the Workplace from Facebook community.
Knowledge Library Category Management	Look up Knowledge Library Categories Stream	Retrieves the knowledge library categories created in Workplace from Facebook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Message Management	Look up Conversations Stream	Retrieves conversations of the specified user.
	Look up Feeds Stream	Retrieves feeds on the specified group.
	Send Change Details	Sends change details to user in a Workplace from Facebook group.
	Send Image	Sends an image or file to users in Workplace from Facebook.
	Send Incident Details	Sends incident details to user in a Workplace from Facebook group.
	Send Message	Sends messages to users in Workplace from Facebook.
	Send Problem Details	Sends problem details to user in a Workplace from Facebook group.

Spoke modules

The Workplace from Facebook spoke adds a Workplace from Facebook application to your ServiceNow instance and includes these modules:

Module	Description
Credentials	Displays the credentials records created for the Workplace from Facebook spoke. You can create credential records as per your requirement. For example, a credential record for each Workplace from Facebook instance.
Install on your Workplace	Displays the default credential record to set up the Workplace from Facebook spoke. For more information, see Set up Workplace from Facebook spoke.
Groups Cache	Displays details of the groups in Workplace from Facebook. When you click **Synchronise Cache**, the Fetch Workplace from Facebook Groups subflow is triggered and the groups details are retrieved.

For information about setting up the spoke, see Set up Workplace from Facebook spoke.

Set up Workplace from Facebook spoke

Integrate the ServiceNow instance and your Workplace from Facebook account using the Workplace from Facebook credentials to authenticate ServiceNow requests.

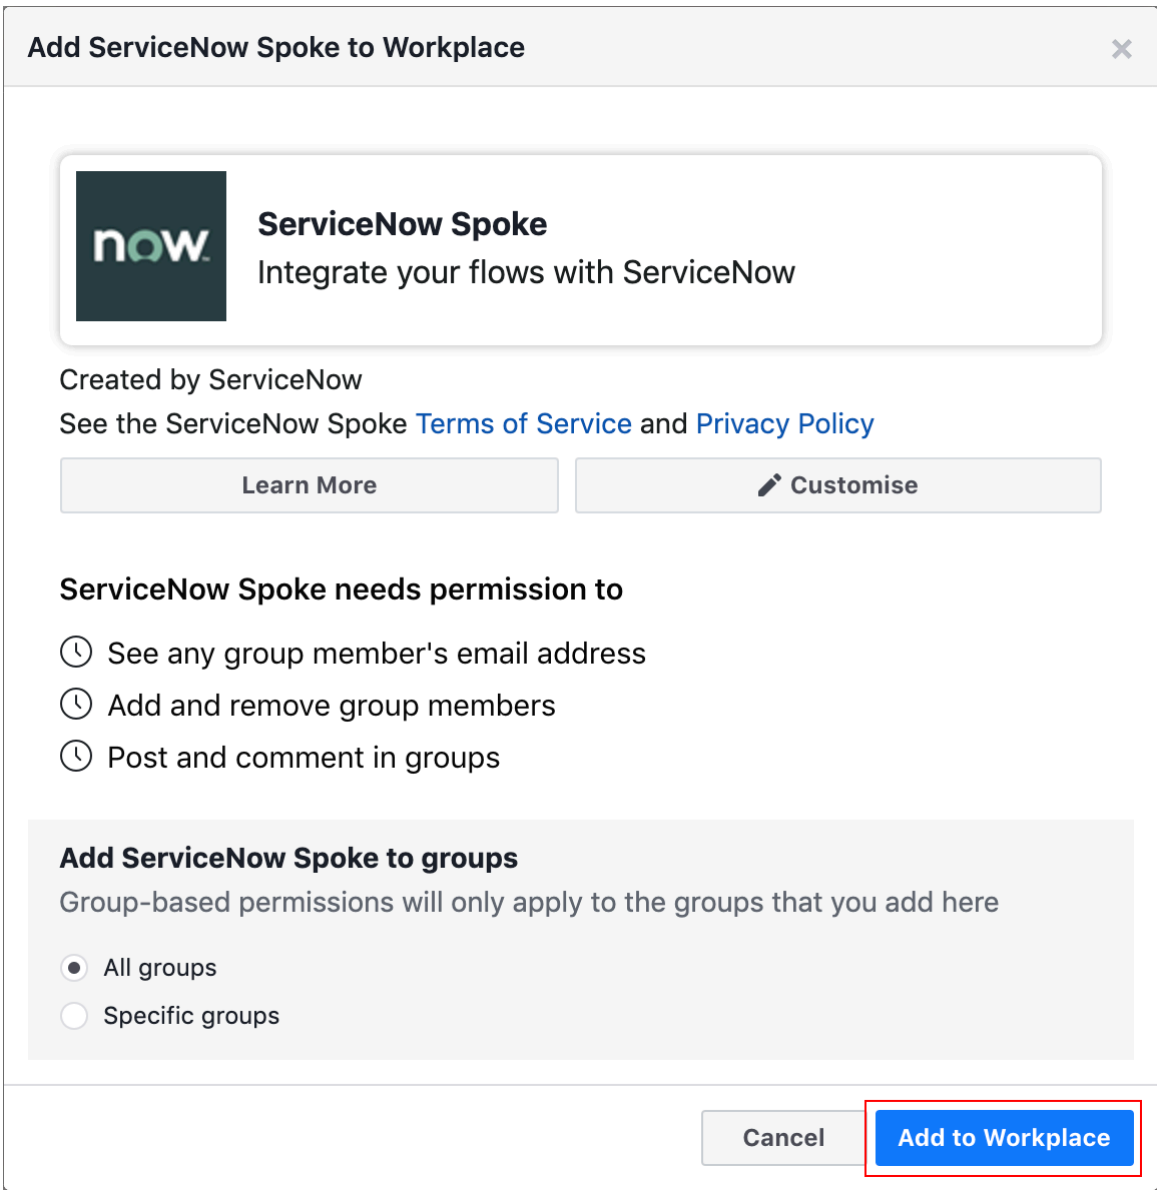
Before you begin

- Request an Integration Hub subscription
- Activate the Workplace from Facebook spoke
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

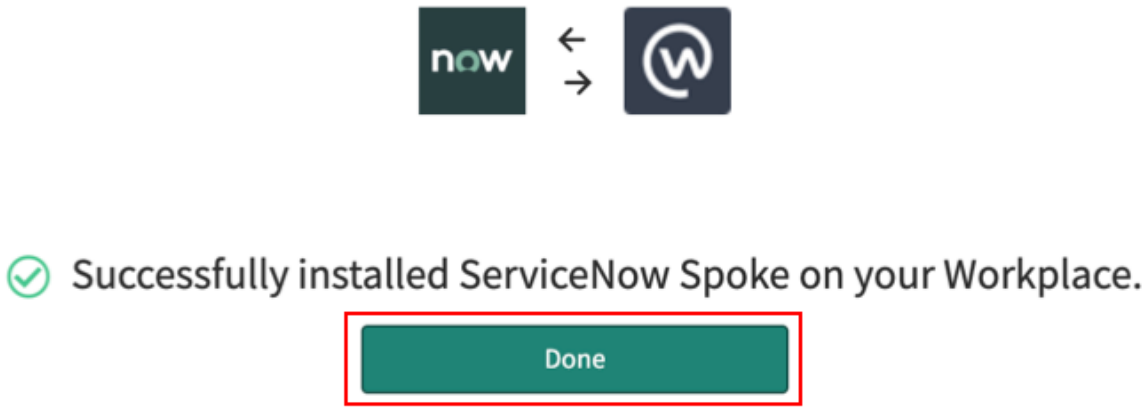
Procedure

1. Navigate to **All** > **Workplace from Facebook** > **Install on your Workplace**.
2. Click **Install on your Workplace**.
   You will redirected to the Workplace sign-up/sign-in page.
3. Log in to your Workplace from Facebook account using your credentials.
   Add ServiceNow Spoke to Workplace pop-up window is displayed.
4. Click **Add to Workplace**.



The ServiceNow spoke is added to Workplace account and a confirmation message is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Done**.
   You will be redirected back to your ServiceNow instance and the relevant fields are updated.
6. **Optional:** If you want to create multiple connection records, perform these steps:
   a. Navigate to **Process Automation** > **Flow Designer**.
   b. Click the **Connections** tab.
   c. Locate the **FB_Workplace_Alias** connection alias and click **View Details**.
   d. Click **Add Connection**.
   e. Provide a name to identify the new connection record for **Connection Name**.
   f. Click **Create Connection**.
   g. Navigate to **All** > **Workplace from Facebook** > **Credentials**.
   h. Open the credential record that is associated with the connection record you had created.
   i. Click **Install on your Workplace**.
   You will redirected to the Workplace sign-up/sign-in page.
   j. Log in to your Workplace from Facebook account using your credentials.
   Add ServiceNow Spoke to Workplace pop-up window is displayed.
   k. Click **Add to Workplace**.
   The ServiceNow spoke is added to Workplace account and a confirmation message is displayed.
   l. Click **Done**.
   You will be redirected back to your ServiceNow instance and the relevant fields are updated.

Result
The Workplace from Facebook account is integrated with your ServiceNow instance.

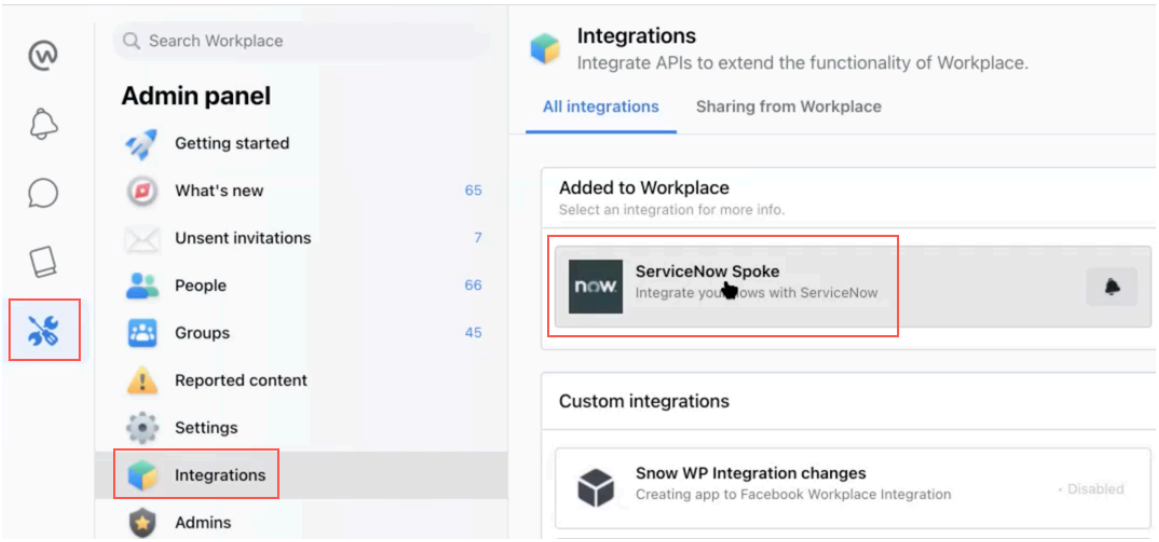
Uninstall Workplace from Facebook spoke

Log in to Workplace from Facebook account to uninstall the Workplace from Facebook spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

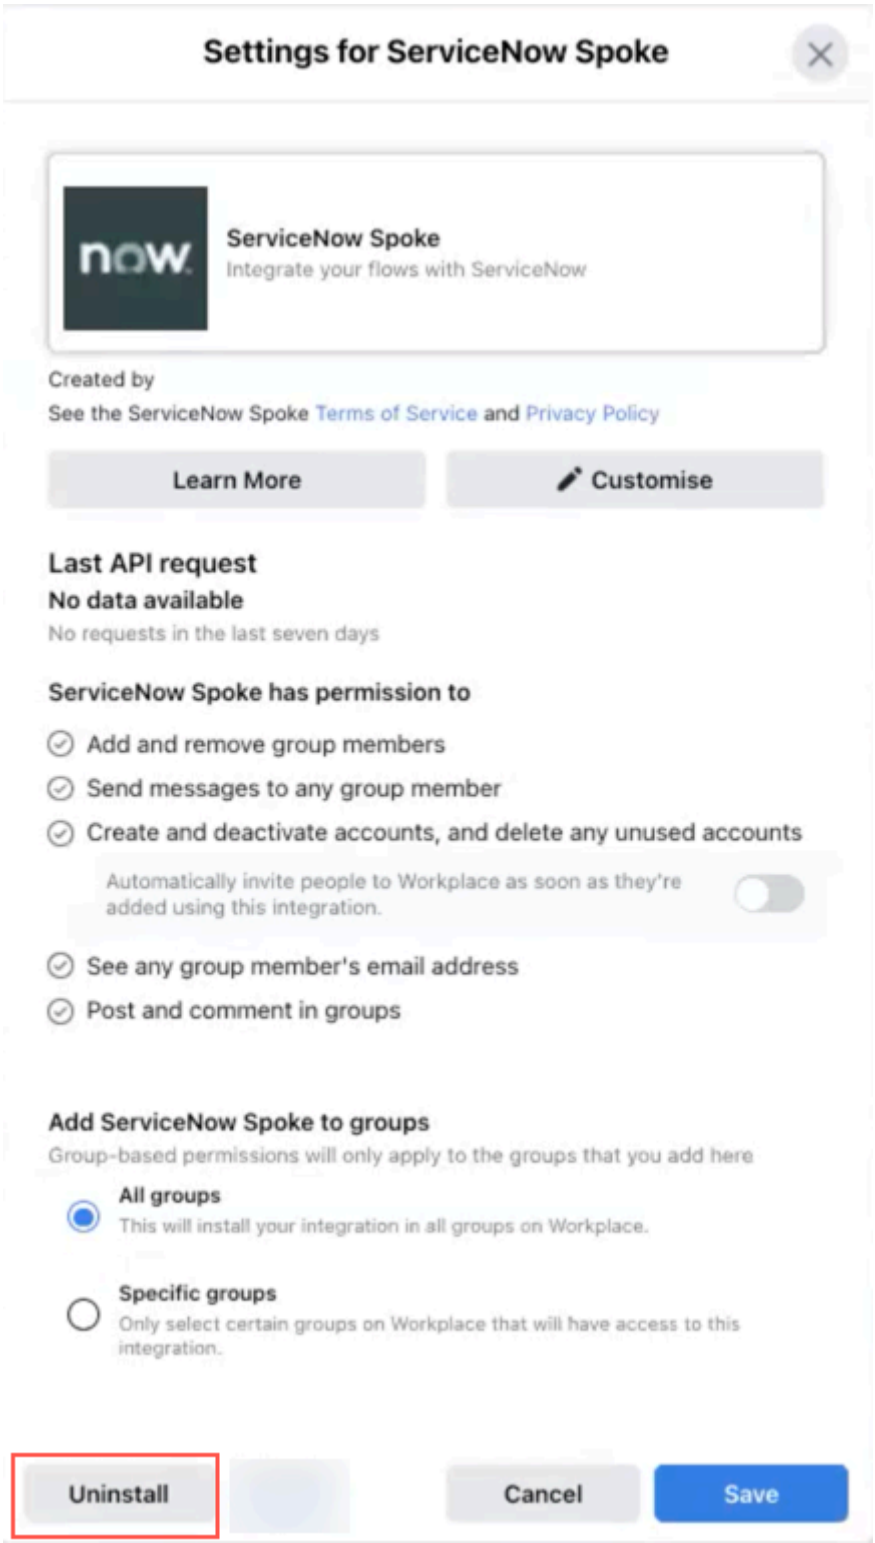
Before you begin
Role required: admin

Procedure
1. Log in to your Workplace from Facebook account as an admin.
2. Navigate to **Admin Panel** > **Integrations**.
3. Enter password.
4. Click **ServiceNow Spoke**.



5. Click **Uninstall**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. In the Uninstall window, confirm your choice by clicking **Uninstall** again.
   The Workplace from Facebook spoke is uninstalled.

Wrike Spoke

Manage approvals, attachments, folders, projects, and so on, in the Wrike account from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Wrike spoke v1.3.0 is the latest version.

Supported versions

This spoke was built for Wrike API version v4, but may be compatible with later versions.

Note:
You must have the Wrike Enterprise account to create an app and obtain values of Client ID and Client Secret from the Wrike account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Wrike spoke provides actions to automate Wrike tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Approvals Management	Create Approval for Folder	Creates an approval for the specified folder or project.
	Create Approval for Task	Creates an approval for the specified folder task.
	Delete Approval	Cancels the specified approval.
	Look up Approvals	Retrieves details of the approvals based on the filter criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Approvals by Folder	Retrieves all approvals on the specified folder or project.
	Look up Approvals by Task	Retrieves all approvals on the specified task.
	Update Approval	Updates details of the specified approval.
Attachment Management	Delete Attachment	Deletes the specified attachment.
	Download Attachment to ServiceNow	Downloads attachment to the specified ServiceNow record.
	Look up Attachments	Retrieves list of attachments.
	Update Attachment	Updates a previously uploaded attachment with the new version.
	Update Attachment to Folder	Uploads an attachment to the specified folder.
	Update Attachment to Task	Adds an attachment to a task record.
Comment Management	Create Comment in Folder	Creates a comment in the folder.
	Create Comment in Task	Creates comment in task.
	Delete Comment	Deletes the specified comment.
	Look up Comments by Folder ID	Retrieves the folder comments.
	Look up Comments by Task ID	Retrieves the task comments.
	Update Comment	Updates the specified comment.
Folder and Project Management	Create Folder	Creates a folder within a folder.
	Create Project	Creates a project within a folder.
	Delete Folder or Project	Moves folder, project and all descendant folders and tasks to Recycle Bin unless they have parents outside of deletion scope.
	Look up Folders	Retrieves the list of entries required to build a folder tree for the current account.
	Update Folder	Updates details of the folder.
	Update Project	Updates details of the project.
Group Management	Create Group	Creates group in account.
	Delete Group	Deletes the specified group.
	Look up Groups	Retrieves all groups in the account.
	Update Group	Updates details of the specified group.
Task Management	Create Task	Creates a task in folder.
	Delete Task	Deletes the specified task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Tasks	Retrieves details of all tasks in current account.
	Update Task	Updates details of the specified task.
User Management	Get User Details	Retrieves information about the specified user.
	Look up Contacts	Retrieves contacts of all users and user groups in the current account.
	Update User Details	Updates details of the specified user.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI Agent	Description
Wrike attachment management AI agent	Enables the Process Analysts to automate attachment-related workflows within Wrike using Integration Hub. It can automate actions such as updating attachments to tasks or folders, downloading attachments to ServiceNow, and deleting attachments.
Wrike approvals management AI agent	Enables the Process Analysts to automate approval workflows in Wrike using Integration Hub. It can automate tasks such as deleting approvals for tasks or folders.
Wrike comment management AI agent	Enables the Process Analyst to automate comment-related tasks in Wrike, such as creating, updating, and deleting comments by folder or task ID.
Wrike group management AI agent	Enables the Process Analysts to automate group-related tasks in Wrike using Integration

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
	Hub. It can automate actions such as deleting groups to enable efficient group management.
Wrike task management AI agent	Enables the Process Analysts to automate tasks in Wrike such as deleting a task.
Wrike user management AI agent	Enables the Process Analysts to automate user and contact management tasks, such as updating user details and retrieving user details.
Wrike folder and project management AI agent	Enables the Process Analyst to automate folder and project management tasks such as deleting folders and projects.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Wrike spoke.

Set up the Wrike spoke

Integrate the ServiceNow instance and Wrike account by creating a custom OAuth application in Wrike API Developer Site to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Wrike spoke.
- Role required: admin.

Procedure

1. Log in to Wrike account as an admin and add an app.
   For more information about creating an app, see OAuth 2.0 Authorization.
2. Copy and record the values of **Client ID** and **Client Secret** for later use.

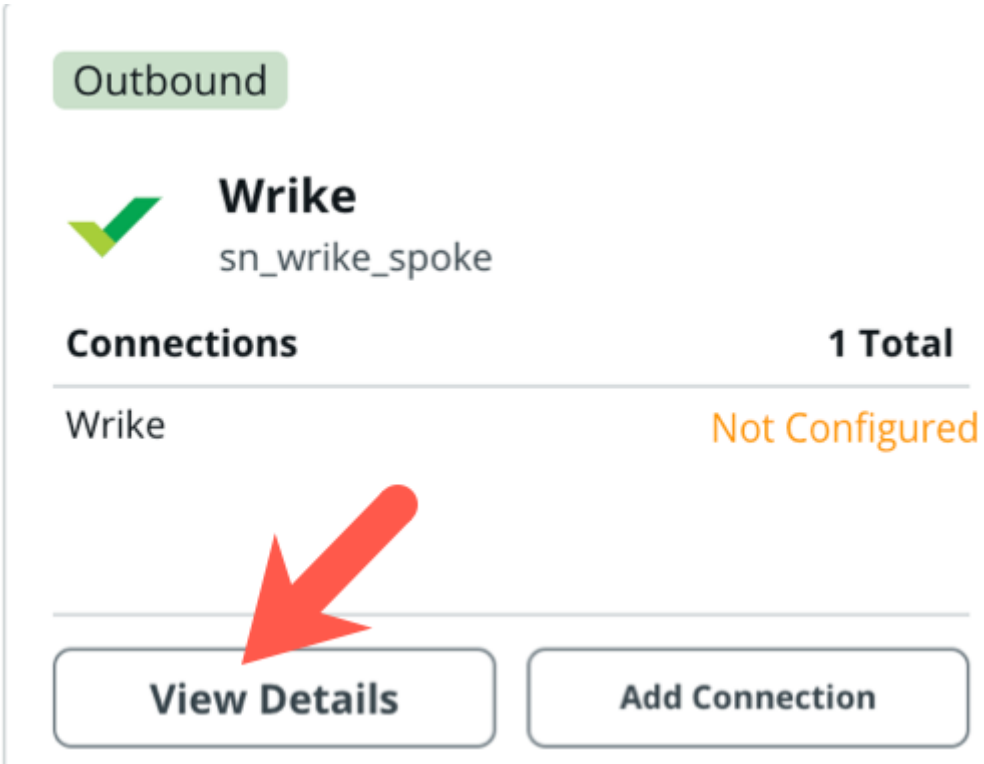
Note:
You must have the Wrike Enterprise account to create an app and obtain values of Client ID and Client Secret from the Wrike account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Log in to your ServiceNow instance.
4. Navigate to **All** > **Process Automation** > **Workflow Studio**.
5. Select **Integrations**.
6. Select the **Connections** tab.
7. In the Search all connections field, enter `Wrike`.

> **Note:**
> The **Outbound** tab is selected by default. Or else, toggle to select it.

8. On the Wrike connection alias tile, select **View Details**.



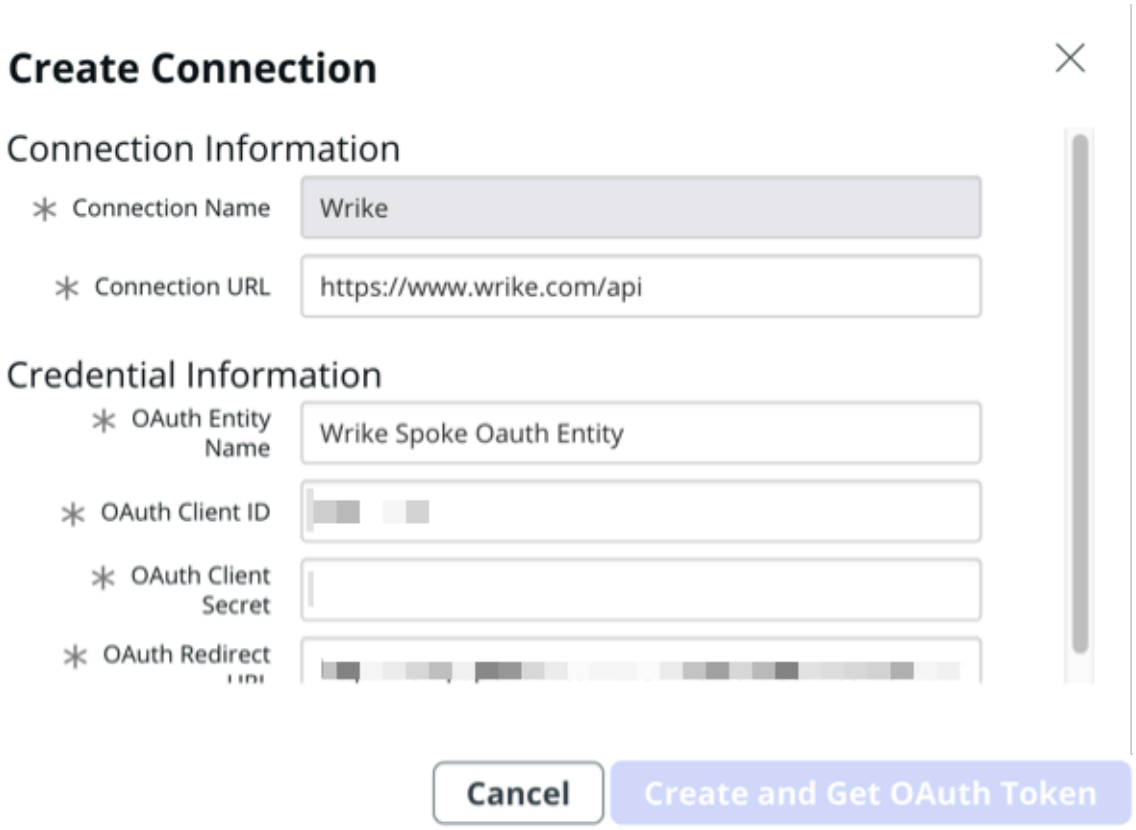
9. Select **Configure**.
10. Fill the form.

Create Connection form

Field	Description
Connection Name	Name of the connection.
Connection URL	Option to provide the web address that specifies the location and access details of Wrike portal.
OAuth Client ID	Option to provide the OAuth client ID that you generated when you set up the OAuth app.
OAuth Client Secret	Option to provide the OAuth client secret that you generated when you set up the OAuth app.
OAuth Redirect URL	Option to provide the redirect URL that you had provided when you set up the OAuth

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	app. The redirect URL must be in the format `https://instance-name.service-now.com/oauth_redirect.do`.



11. Select **Create and Get OAuth Token**.
    You must log in to the Wrike API developer's portal before getting the OAuth token.

X Spoke (formerly Twitter Spoke)

Use the X spoke (formerly Twitter spoke) to have private chats and group chats, and to automatically tweet messages or media in your X account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

X spoke v2.3.0 is the latest version.

Supported versions

API version v1.1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- X developer account
- X developer app to access the X APIs
- Access token and secret of your X developer app
- Consumer key and secret from your X developer app

See the X Developers documentation for instructions on creating the developer application and gathering the required details.

Spoke actions

The X spoke provides actions to automate tweeting when events occur in ServiceNow. Available actions include:

Action	Description
Tweet	Tweets a message or media. Messages and media are tweeted as per X limits. **Note:** If you wish to tweet media, use the Look Up Attachment Records action before this action in your custom flow to retrieve the required media.

Available AI agents

Install Now Assist for Spokes and start using the available AI agents. For more information, see Now Assist for Integration Hub.

The X Spoke provides AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance. For more information about AI agents, see Now Assist AI agents.

Available AI agents include:

AI Agent	Description
X Tweet management AI agent	This AI Agent posts tweets to the X handle that you had configured that contain text. **Note:** You must configure a valid X handle before using this AI Agent.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Note:
Two connection and credential alias records are needed for the X spoke. One for tweeting messages and other for tweeting media. Each alias should be associated with the respective X API.

For information about setting up the spoke, see Set up the X spoke.

Set up the X spoke

Integrate the ServiceNow instance and X account to authenticate the requests from ServiceNow.

Before you begin

- Request an Integration Hub subscription.
- Activate the X spoke.
- Role required: admin.

Obtain the token and secret values from the X developer account

Create an app in the X developer account and obtain the values of Access Token, Access Token Secret, Consumer key, and Consumer Secret for authenticating the requests.

Before you begin

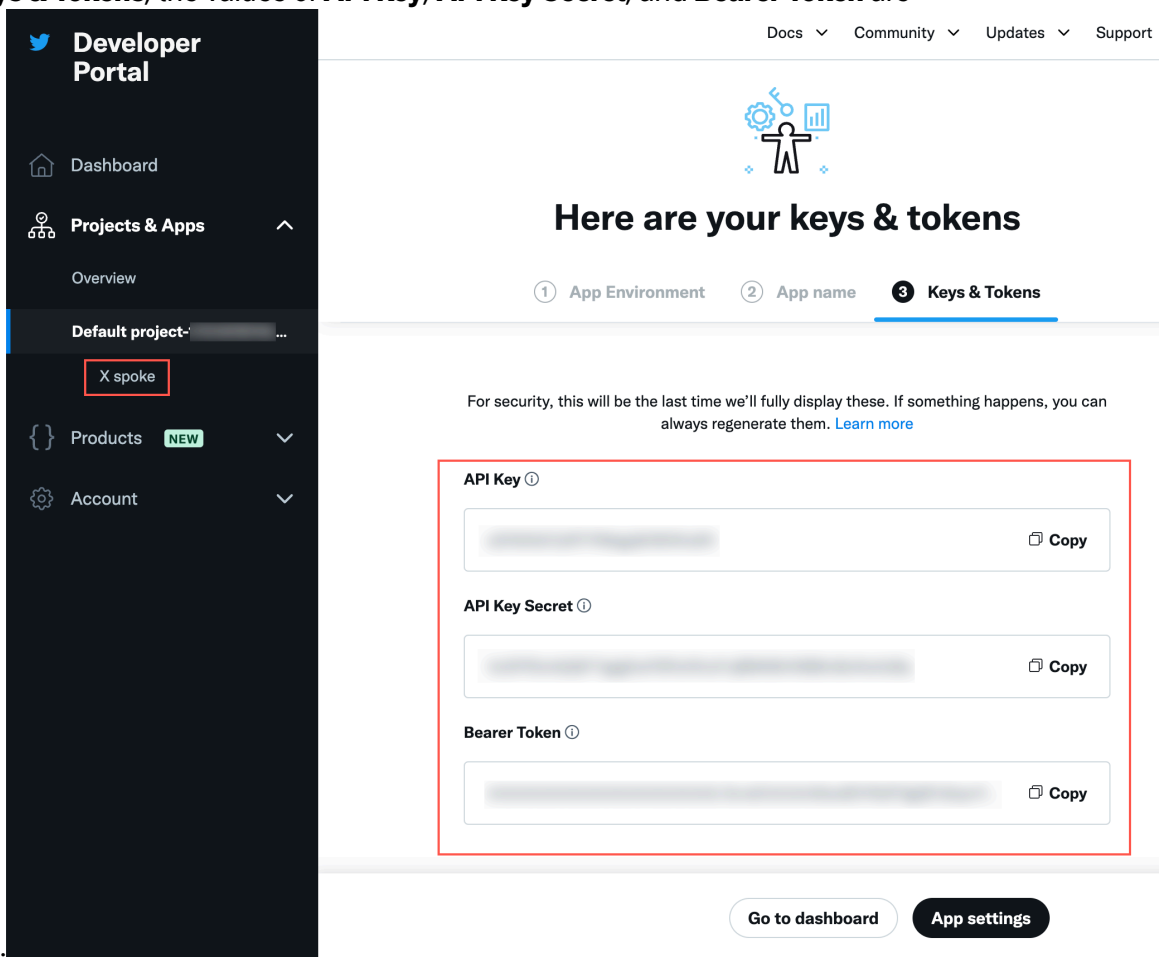
Role required: X admin.

Procedure

1. Log in to the Developer Portal - Twitter Developer - X (formerly Twitter).
2. Obtain the values of **API Key**, **API Key Secret**, and **Bearer Token**.
   a. Navigate to **Projects & Apps** > **Default project**.
   b. Under **Apps**, click **+Add App**.
   c. Under **App Environment**, choose the required environment and lick **Next**.
   d. Under **App name**, provide the app name in **DEVELOPMENT APP** and click **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Under **Keys & Tokens**, the values of **API Key**, **API Key Secret**, and **Bearer Token** are displayed.



e. Copy and record these values for later use.

3. Provide the required permissions for OAuth 1.0.

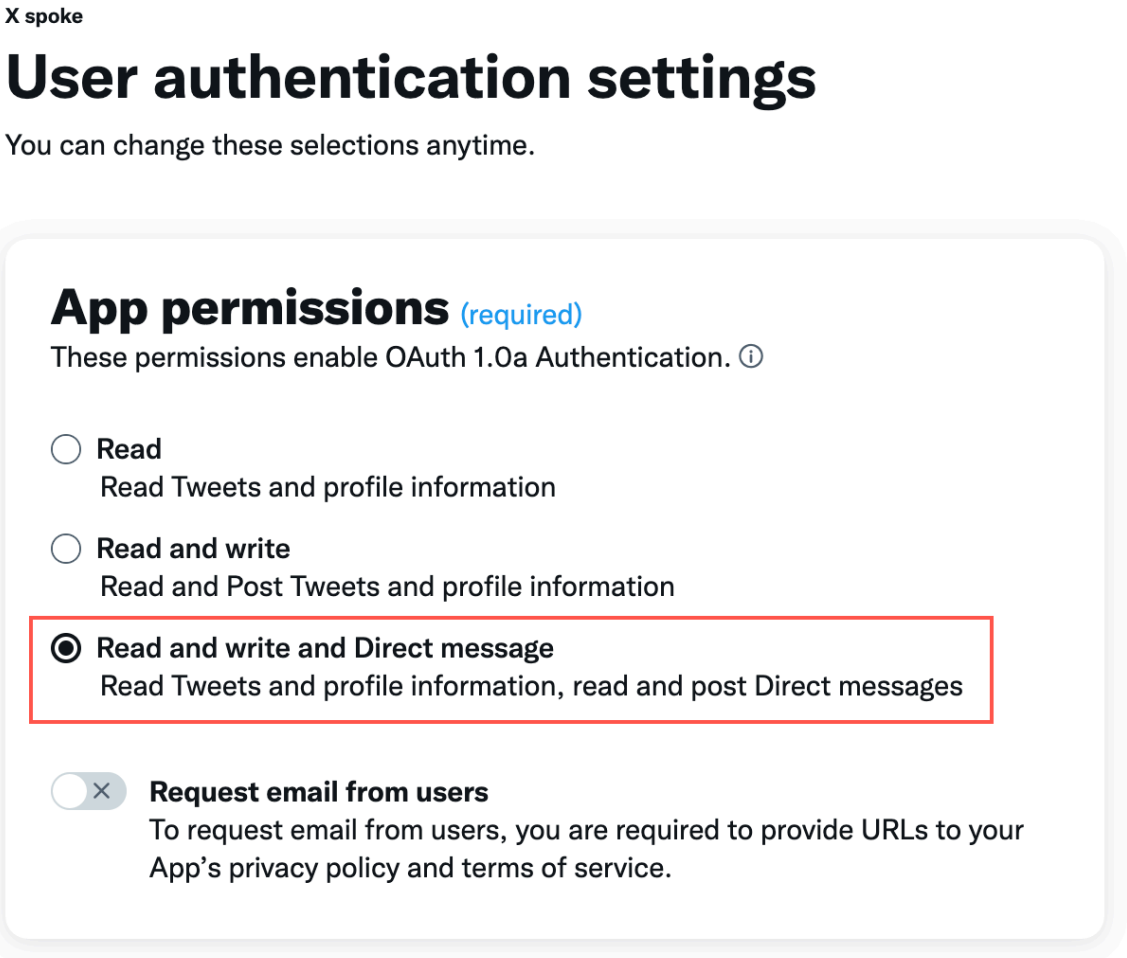
a. Navigate to **Projects & Apps** > **Default project**.

b. Navigate to the app you had created.

c. In the **Settings** tab, under **User authentication settings**, click **Set up**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. On the User authentication settings page, under **App permissions** select the **Read and write and Direct message**



option.

e. Click **Save**.
The systems prompts you to confirm the permissions.

f. Copy and record these values for later use.

g. Click **Done**.

4. Obtain the values of **Access Token** and **Access Token Secret**.

a. Navigate to **Projects & Apps** > **Default project**.

b. Navigate to the app you had created.

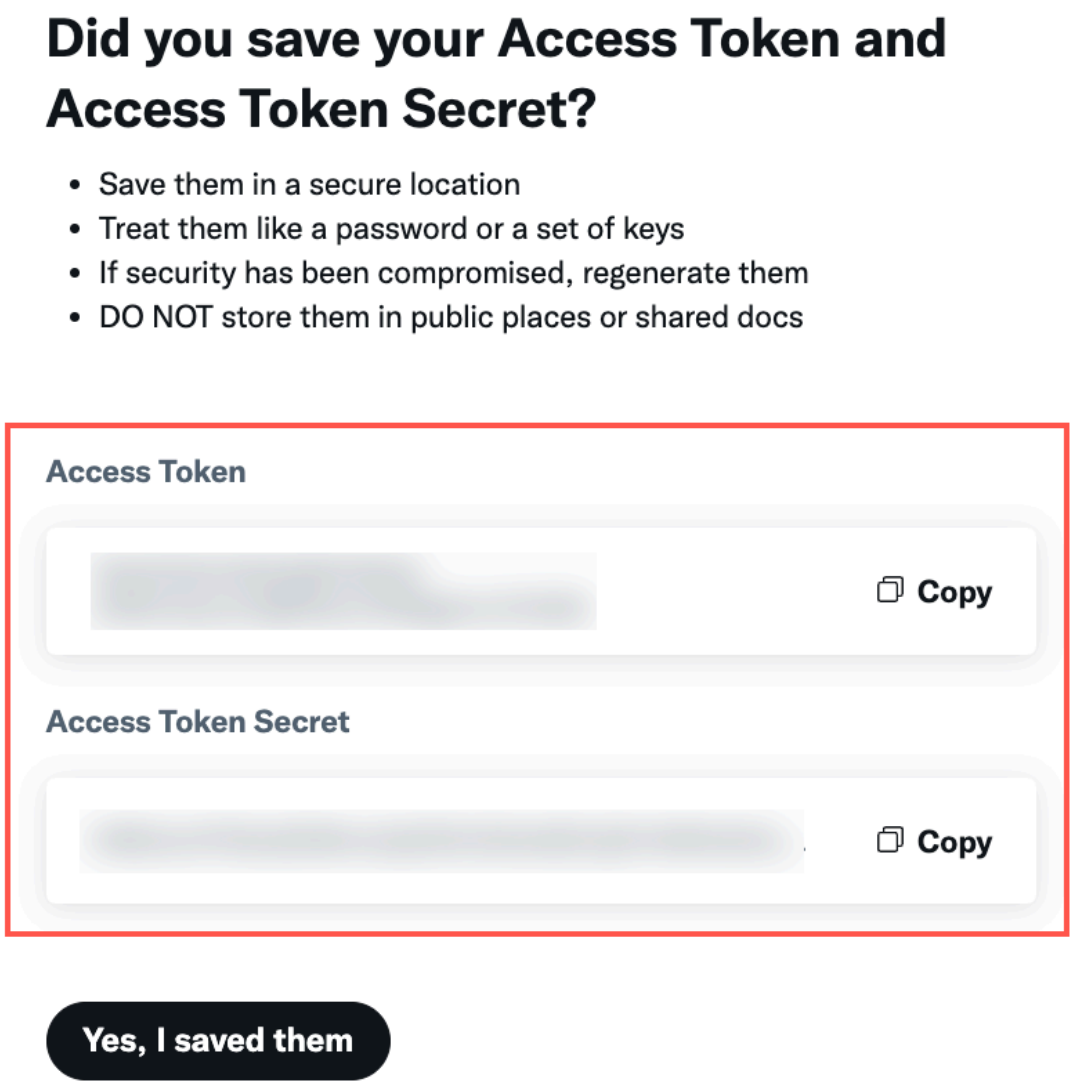
c. Click the **Keys and tokens** tab.

d. Under **Authentication Tokens**, click **Regenerate** for **Access Token and Secret**.
System prompts you to confirm.

e. Click **Yes, regenerate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The values of **Access Token** and **Access Token Secret** are



displayed.

f. Copy these values for later use.

Configure a connection for the X spoke (formerly Twitter spoke)

Add and configure the X connections to authenticate ServiceNow requests in the X spoke.

Before you begin

- Access Token and Access Token Secret of your X developer app.
- Consumer key and Consumer Secret of your X developer app.
- Ensure that the Application scope is X scope.
- Role required: ServiceNow admin

See the X Developers documentation for instructions on creating the developer application and gathering the required details.

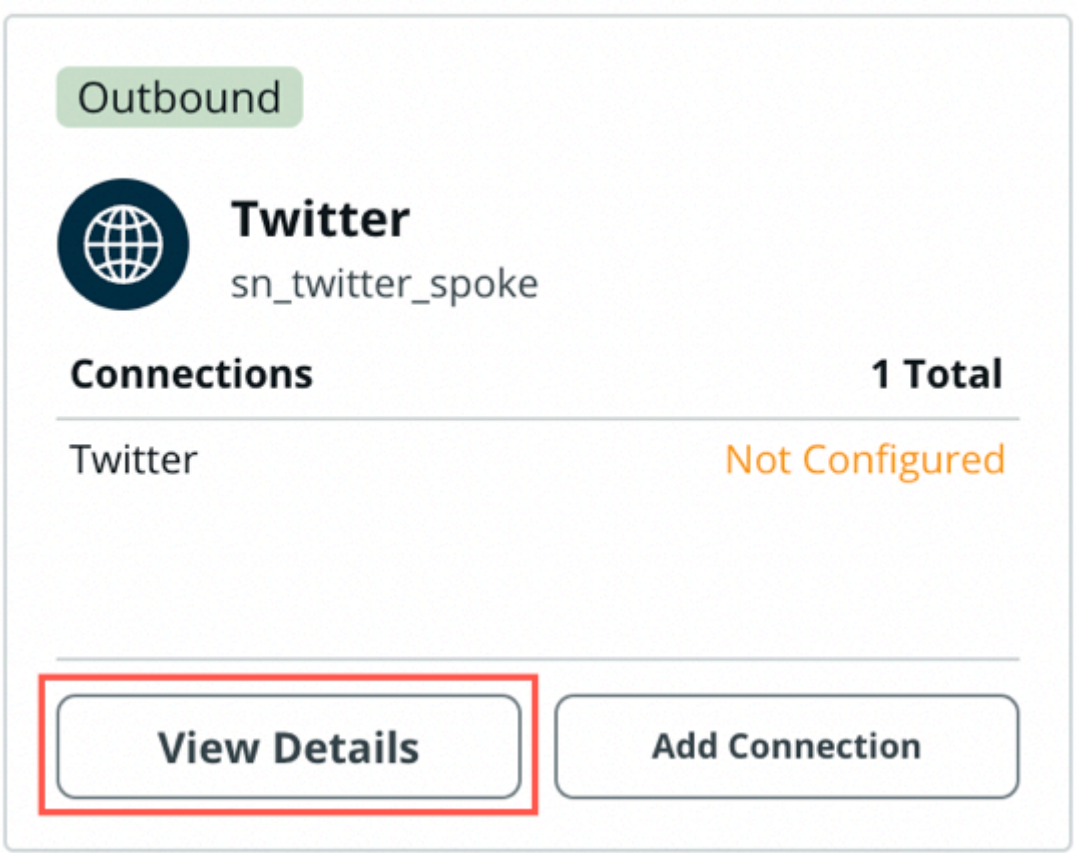
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Two connections, **Twitter** and **Twitter_Media**, are provided in the Flow Designer. You must configure both of these connections.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Select the **Connections** tab.
4. In the Search all connections field, enter `Twitter`.
5. On the Twitter tile, select **View Details**.



6. Select **Configure**.
7. On the **Configure Connection** form, fill in the fields.

Field	Description
Connection Name	Name to identify the Twitter connection alias record.
Connection URL	Enter `https://api.twitter.com`.
Consumer Key	Consumer key of your X developer app.
Consumer Secret	Consumer secret of your X developer app.
Access Token	Access token of your X developer app.
Access Token Secret	Access token secret of your X developer app.

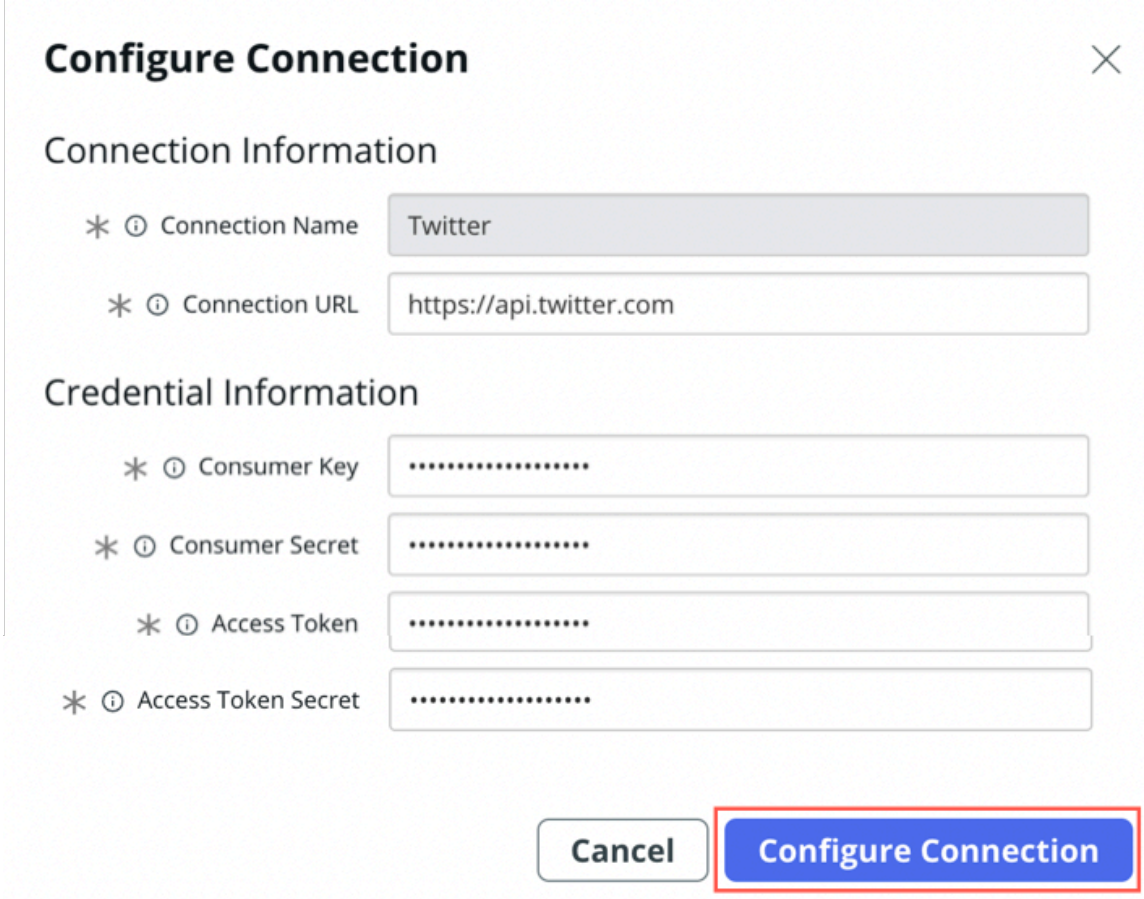
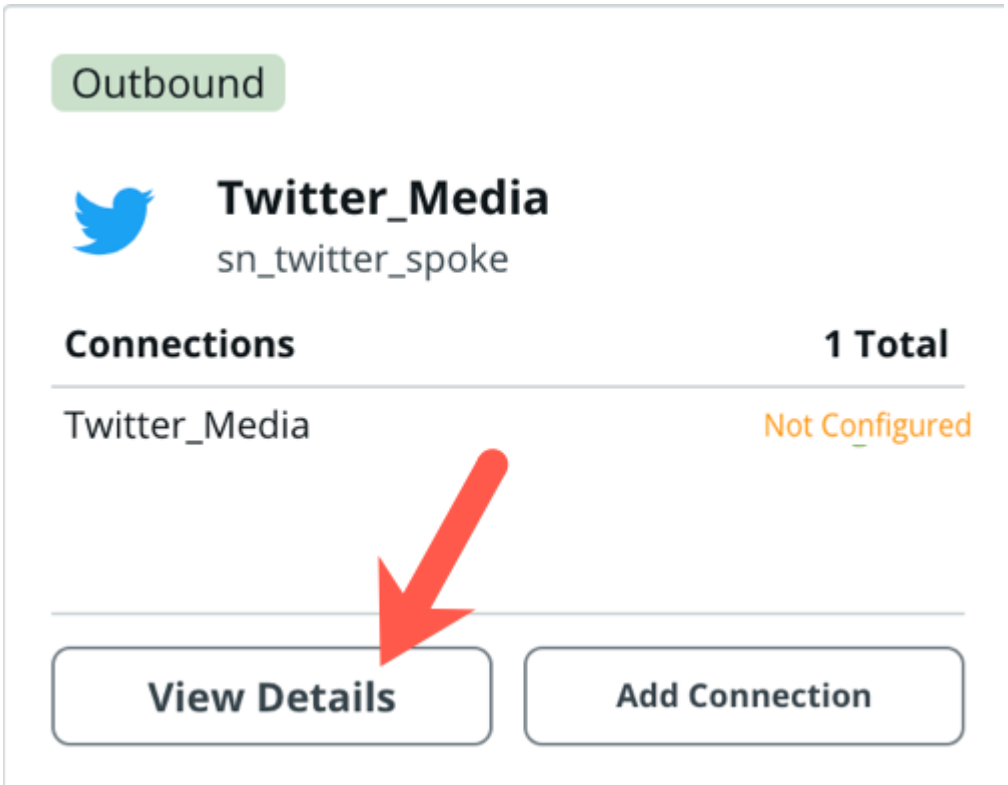
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Select **Create Connection**.
9. Configure the **Twitter_Media** connection alias.
   a. Navigate to **All** > **Process Automation** > **Workflow Studio**.
   b. Click the **Integrations** tab.
   c. Select the **Connections** tab.
   d. In the Search all connections field, enter `Twitter_Media`.
   e. On the Twitter_Media tile, select **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Select **Configure**.

g. On the **Create Connection** form, fill in the fields.

Field	Description
Connection Name	Name to identify the Twitter connection alias record.
Connection URL	Enter `https://upload.twitter.com`.
Consumer Key	Consumer key of your X developer app.
Consumer Secret	Consumer secret of your X developer app.
Access Token	Access token of your X developer app.
Access Token Secret	Access token secret of your X developer app.

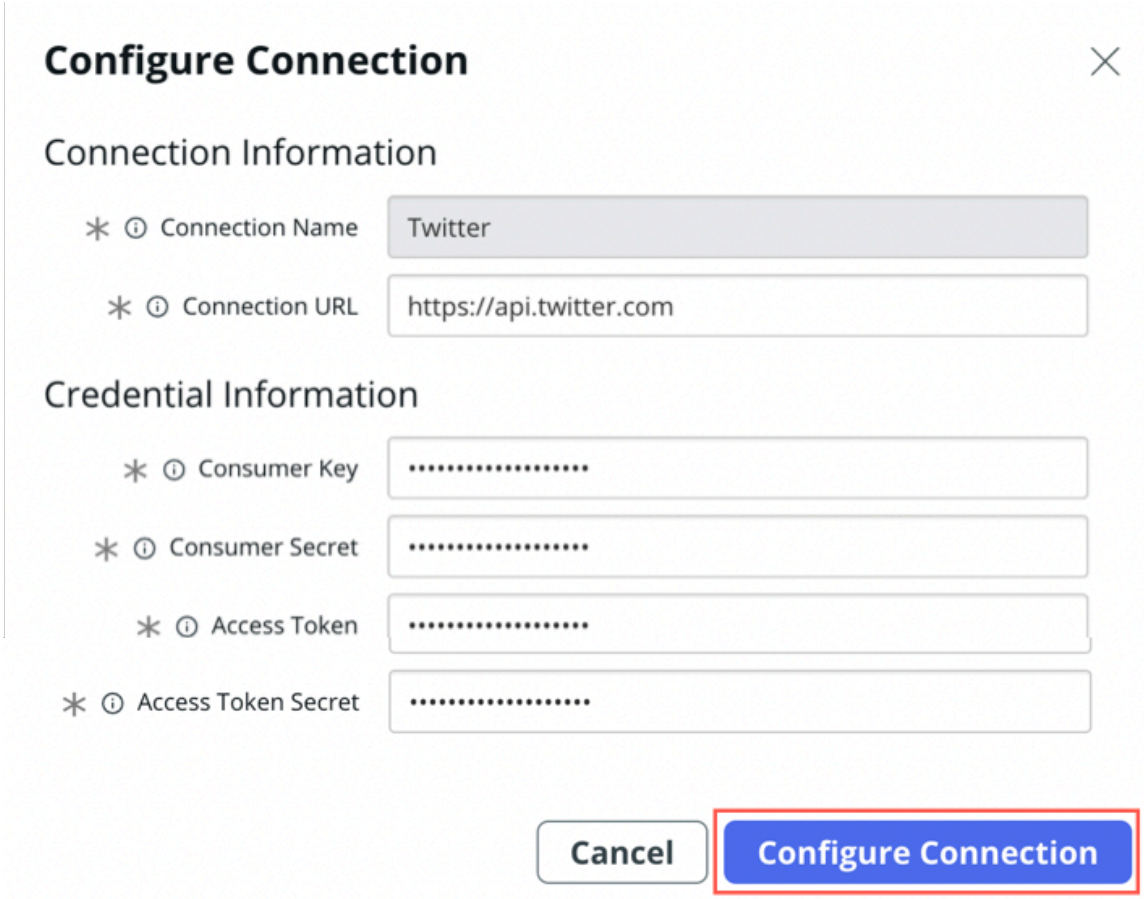
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



h. Select **Create Connection**.

YouTube Spoke

Manage your videos, channels, subscriptions, and playlists in YouTube account, and access analytics and statistics from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

YouTube spoke v1.0.5 is the latest version.

Supported versions

This spoke was built for these YouTube versions, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Reporting API version v1
- Data API version v3
- Analytics API version v2

YouTube spoke requirements

The YouTube spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you're having trouble installing the app, confirm that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The YouTube spoke provides actions to automate YouTube tasks when events occur in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Analytics	Audience Retention Statistics	Retrieves information about the audience retention statistics.
	Basic Statistics	Retrieves information about the basic statistics.
	Demographics	Retrieves information about the demographics. That is, details about the age, gender, and geographical location of your audience.
	Device/OS Statistics	Retrieves information about the devices from which your audience accesses your content.
	Get Country Codes (Metadata)	Retrieves details of countries and their ISO codes. **Note:** This action is a metadata action.
	Traffic Source Statistics	Retrieves information about the various traffic sources.
Captions	Delete Caption	Deletes captions on a video.
	Look up Captions	Retrieves information about the captions on a video.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Comments	Delete Comment	Delete the specified comment on a video.
	Look up Comments	Retrieves details about the top-level comments in a comment thread.
	Post Comment	Posts a top-level comment on a video.
	Reply to Comment	Posts a reply to a top-level comment on a video.
Groups	Create Groups	Creates a group for videos, channels, or playlists.
	Delete Group	Deletes the specified group.
	Delete Group Item	Deletes the specified group item.
	Insert Item into Group	Inserts an item in the specified group.
	Look up Group-Items	Retrieves information about all items in a group.
	Look up Groups	Retrieves information about the specified groups.
Playlist	Create Playlist	Creates a playlist in your YouTube account.
	Delete Playlist	Deletes a playlist from your YouTube account.
	Delete Playlist Item	Deletes the specified playlist item.
	Insert into Playlist	Inserts an item in the specified playlist.
Reports	Create Report Job	Creates a report job in YouTube account. YouTube generates the requested report within 24 hours.
	Get Report Types Choice (Metadata)	Retrieves information about the Report Types list.
	Look up Reports	Retrieves information about the reports generated for a job.
	View Report	Retrieves data in a report in CSV format.
Subscriptions	Look up Subscriptions	Retrieves information about the specified subscriptions.
	Subscribe Channel	Subscribes to the required channel.
	Unsubscribe Channel	Unsubscribes to the required channel.
Video	Delete Video	Deletes an uploaded video.
	Look up Video	Retrieves information about the specified video.
	Look up Videos	Retrieves information about the specified multiple videos.
	Rate/Unrate Video	Likes or dislikes the specified video. Also, remove the previous rating for a video.
	Search	Searches for the required video, channel, or playlist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Set Thumbnail to Video	Sets a thumbnail image for an uploaded video.
	Set Video Metadata	Sets the metadata of a video.
	Upload Video	Uploads a video to your channel in YouTube.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the YouTube spoke.

Set up the YouTube spoke

Integrate the ServiceNow instance and YouTube account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the YouTube spoke.
- Role required: admin.

Configure the YouTube application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the YouTube spoke.

Before you begin

Role required: admin.

About this task

Complete the Create a Google Cloud project steps from the Google Cloud Platform. See the Creating and managing projects product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.cloud.google.com.
   b. Create a project with your administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create the credentials.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
4. Select the application type **OAuth client ID**.
5. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. Copy your client ID and client secret to a text file so that you can use them when you Register YouTube as an OAuth provider.

Tip:
You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register YouTube as an OAuth provider

Use the information generated during the YouTube application configuration to register YouTube as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record, **Youtube**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the YouTube application.
Client Secret	Client Secret of the YouTube application.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

4. Ensure that these scopes are available in the **OAuth Entity Scopes** tab.

Name	OAuth scope
YouTube Partner	`https://www.googleapis.com/auth/youtubepartner`
YouTube Reporting S1	`https://www.googleapis.com/auth/yt-analytics.readonly`
YouTube Reporting S2	`https://www.googleapis.com/auth/yt-analytics-monetary.readonly`
YouTube Scope	`https://www.googleapis.com/auth/youtube`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	OAuth scope
YouTube Scope Force SSL	`https://www.googleapis.com/auth/youtube.force-ssl`

5. Right-click the form header, and click **Save**.

Create a credential record for the YouTube spoke

Create a credential record for the YouTube application. The YouTube spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credential Aliases**.
2. Open record for the YouTube spoke, for example, `YouTube`.
3. In the **Credentials** tab, click **New**.
4. Select **OAuth 2.0 Credentials**.
5. Enter a unique name for the credential, for example, `Youtube_Cred`.
6. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you configured when you registered the YouTube service as an OAuth provider.
   See Register YouTube as an OAuth provider for more information.
7. Right-click the form header and click **Save**.
8. Click **Get OAuth Token**.

Zendesk Spoke

The Zendesk spoke provides actions to view and analyze meaningful usage data for Zendesk software subscriptions. Analyze usage for your Zendesk account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Zendesk spoke v1.8.0 is the latest version.

Supported versions

This spoke was built for Zendesk version 11015, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

Zendesk admin account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Zendesk spoke provides the Upsert Zendesk Tickets flow to check if a new ticket has been created in the Zendesk Ticket table or if an existing ticket has been updated, and accordingly synchronizes it in Zendesk. To customize a sample flow, copy it to a new application scope.

Spoke subflows

The Zendesk spoke provides sample subflows to demonstrate automating tasks. To customize the sample subflow, copy it to a new application scope. Available subflows include:

Subflow	Description
Create Zendesk Webhook	Creates a webhook in Zendesk whene a request is received from the Webhook Registries [sn_zendesk_spoke_webhook_registries] table.
Process Zendesk Webhook	Inserts and updates records in the Zendesk Tickets table based on the changes happening in Zendesk.
Update Zendesk Webhook	Updates the webhook tokens and synchronizes them both in ServiceNow and Zendesk.

Spoke actions

The Zendesk spoke provides actions to automate Zendesk tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Activity Management	Look up Activities Stream	Retrieves details of the ticket activities. Ticket activities include assigning a ticket to the agent, increasing the priority of a ticket assigned to the agent, or adding a comment to a ticket assigned to the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Activity by ID	Retrieves details of the specified ticket activity. Activities include assigning a ticket to the agent, increasing the priority of a ticket assigned to the agent, or adding a comment to a ticket assigned to the agent.
Attachment Management	Look up Attachment by ID	Retrieves attachment details by value of the Attachment ID.
	Upload Attachment	Uploads a file you want to attach.
Group Management	Look up Group by ID	Retrieves information about the specified group.
	Look up Groups Stream	Retrieves the list of all groups within an account.
Organization Management	Look up Organization by ID	Retrieves information about the specified organization.
	Look up Organizations Stream	Retrieves the list of all organizations.
Request Management	Create Request	Creates a request by setting one or more properties.
	Look up Comment by ID	Retrieves the comment added to the request corresponding to the Request ID and the Comment ID.
	Look up Comments by Request ID Stream	Retrieves the comments added to the request related to the Request ID that you sent through the input.
	Look up Request by ID	Retrieves the request details by value of the Request ID.
	Look up Requests by Organization ID Stream	Retrieves all the requests in an account corresponding to the Requester ID.
	Look up Requests by Requester ID Stream	Retrieves all the requests in an account corresponding to the Requester ID.
	Look up Requests Stream	Retrieves all the requests in an account based on the state of the request.
	Update Request by ID	Updates the request with a comment or collaborators (cc's).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Role Management	Look up Custom Role by ID	Retrieves information about the specified custom role.
	Look up Custom Roles	Retrieves the list of all custom roles within an enterprise account.
Search	Search Entities by Parameter Stream	Retrieves all tickets, requests, and users in an account related to the query.
	Search Requests by Keyword Stream	Retrieves all requests in an account related to the search string.
Suspended Tickets Management	Delete Multiple Suspended Tickets by IDs	Deletes multiple suspended tickets. A list of suspended ticket IDs should be provided.
	Delete Suspended Ticket by ID	Deletes a specific suspended ticket.
	Look up Suspended Ticket by ID	Searches for a specific suspended ticket by its ID.
	Look up Suspended Tickets Stream	Retrieves the details of suspended tickets.
	Recover Suspended Ticket by ID	Recovers the details of the specified suspended ticket.
Ticket Audit	Look up Audit by ID	Retrieves the audit details of a ticket specific to an audit.
	Look up Audit Log by ID	Retrieves the audit log details of a ticket specific to an audit.
	Look up Audit Logs Stream	Retrieves the audit log displaying the various changes in a Zendesk account since the account creation.
	Look up Audits Stream	Retrieves the list of audits for all the tickets.
	Look up Ticket Audits Stream	Retrieves the audits for the specified ticket.
	Update Audit as Private	Updates a comment from public to private for a ticket specific to an audit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Ticket Comment Management	Look up Comments by Ticket ID Stream	Retrieves the comments added to the specified ticket.
Ticket Management	Create Multiple Tickets	Creates multiple tickets with the provided details, at a time.
	Create Ticket	Creates a ticket in the Zendesk instance.
	Create Ticket Async	Creates a ticket in the Zendesk instance. Ticket creation can sometimes take a while because of the complex business rules. Asynchronous creation enables you to get the response back quickly and queues a background job to do the actual work.
	Look up Job Status by ID	Retrieves the status record created when a user starts a job.
	Look up Multiple Tickets Stream	Retrieves details of multiple tickets.
	Look up Ticket by ID	Retrieves details of the specified ticket.
	Look up Tickets Stream	Retrieves the ticket properties.
	Recover Multiple Suspended Tickets by IDs	Recovers the specified suspended tickets.
	Update Multiple Tickets	Updates details of multiple tickets.
	Update Ticket	Updates the specified properties of a ticket.
Ticket Metric Management	Look up Metric by ID	Retrieves a specific metric, or the required metrics of a ticket.
	Look up Metrics by Ticket ID	Retrieves the metric details of the specified ticket.
	Look up Ticket Metric Events Stream	Retrieves the ticket metric events that occurred on or after the start time.
	Look up Tickets Metric Stream	Retrieves a list of tickets, along with their metrics.
User Management	Delete User	Deletes the specified user and associated records from an account. Deleted users cannot be recovered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		To comply with General Data Protection Regulation (GDPR), you must use the additional Permanently Delete User action to permanently delete the user after deleting the user.
	Create User	Creates a user with the specified details.
	Look up Deleted Users Stream	Retrieves the list of all deleted users, including permanently deleted users, within an account.
	Look up User by ID	Retrieves the specified user's details.
	Look up Users Stream	Retrieves the list of all users within an account.
	Permanently Delete User	Permanently deletes the specified user from an account. Before you can permanently delete the user, you must first delete the user using the Delete User action.
	Update User	Modifies details about the specified user.
Webhook Management	Create Webhook	Creates a webhook with the provided details.
	Delete Webhook	Deletes the specified webhook.
	Look up Webhook Details by ID	Retrieves details of the specified webhook.
	Look up Webhook Signing Secret by ID	Retrieves signing secret of the required webhook.
	Look up Webhooks Stream	Retrieves details of all the available webhooks.
	Reset Webhook Signing Secret by ID	Resets the signing secret of the specified webhook.
	Update Webhook	Updates details of the specified webhook.

Note:
This spoke has a Look up User action and Software Asset Management related actions only.

Integration Hub imports

The Zendesk spoke adds the Import Zendesk Users Integration Hub imports to your ServiceNow instance. The Integration Hub imports help you import the users' data from Zendesk account to your ServiceNow instance in an automated way. For more information about Integration Hub imports, seeIntegration Hub - Import.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke modules

The Zendesk spoke adds the Zendesk Spoke application to your ServiceNow instance. The Zendesk Spoke application includes these modules:

Module	Description
Users	Stores the details of the Zendesk users. These details are imported using the Import Zendesk Users Integration Hub imports.
Remote table	
Request	Retrieves and displayes the details of the requests raised by the specified requestor. For this, you must provide the value of **Requester ID**.
Webhook	
Webhook Registries	Stores the webhook registries. The webhook registries register a Zendesk webhook in ServiceNow to notify ServiceNow when certain events occur in Zendesk.
Routing Policies	Stores the details of the webhook.
Tickets	Stores detailf of the tickets created or updated in Zendesk.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Zendesk spoke.

Set up the Zendesk spoke

Integrate the ServiceNow instance and Zendesk by creating a custom OAuth application in Zendesk to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Zendesk spoke.
- Role required: admin.

Create a Zendesk OAuth client

Create an OAuth client for authenticating Zendesk API requests.

Before you begin

Role required: Zendesk admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From a web browser, open Zendesk.
2. Log in using your admin credentials.
   The Zendesk Agent Workspace opens.
3. On the left navigation menu of the Zendesk Agent Workspace, select the Admin icon (⚙).
   The Admin menu opens.
4. From the Admin menu, navigate to **Channels** > **API**.
   The Zendesk API page opens.
5. Select the **OAuth Clients** tab and then click **Add OAuth client**.
6. The Create a new OAuth client form opens.
7. On the form, fill in the fields.

Create a new OAuth client form

Field	Description
Client name	Name of the OAuth client.
Description	Brief description of the OAuth client.
Company	Name of the company whose data the OAuth client grants access to through the Zendesk API. The company name is displayed during authentication of your Zendesk API requests. This field populates automatically based on the company that your Zendesk account is associated with. However, you can modify the company name as needed.
Logo	Logo that is displayed during authentication of your Zendesk API requests. Click the green square to locate and select the logo that you want to display.
Unique identifier	Unique identifier for the OAuth client. This field populates automatically based on the OAuth client name that you specified in the **Client name** field. However, you can modify the unique identifier as needed. **Note:** The unique identifier is used only in the Zendesk code.
Redirect URLs	URL of the OAuth provider that users are redirected to after authentication. Enter `https://instance.service-now.com/oauth_redirect.do`, where <*instance*> is the name of your ServiceNow instance.

8. Click **Save**.
   The Please store the secret that will appear dialog box opens.
9. On the dialog box, click **OK**.
   The dialog box closes and the form reloads.
10. Copy the value in the **Secret** field.
    Save this in a secure location for later use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a Zendesk connection

Create a connection between your Zendesk applications and your ServiceNow instance so that your instance can retrieve user data from your applications.

Before you begin

Role required: ServiceNow admin

Procedure

1. From your ServiceNow instance, navigate to **Process Automation** > **Flow Designer**.
   The Flow Designer launches in a new tab.
2. Select the **Connections** tab.
3. Locate your Zendesk connection and then click **Add Connection**.
   The Create Connection dialog box opens.
4. On the dialog box, fill in the fields.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the Zendesk connection. This field populates automatically.
Connection URL	URL for the connection. Enter `https://<subdomain>.zendesk.com`, where <*subdomain*> is your organization subdomain.
Credential Information	
OAuth Client ID	Unique identifier for your Zendesk OAuth client. Enter the same unique identifier that you specified in Create a Zendesk OAuth client.
OAuth Client Secret	Secret that is assigned to your Zendesk OAuth client. Enter the same secret that you copied in Create a Zendesk OAuth client.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the redirect URL that you specified in Create a Zendesk OAuth client.

5. Click **Create and Get OAuth Token**.
   The Zendesk OAuth authorization dialog box opens.
6. On the dialog box, click **Authorize**.
   The OAuth access token becomes available for authorizing your Zendesk connection.
7. In your ServiceNow instance, add OAuth entity profile scope.
   a. Navigate to **System OAuth** > **Application Registry**.
   b. Open the record for the Zendesk spoke. For example, **Zendesk OAuth**.
   c. In the **OAuth Entity Profiles** tab, open the default record, for example, **Zendesk.OAuthProfile**.
   d. Insert a new row with these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
OAuth Entity Scope	users:write read
OAuth scope	write read

Set up a webhook

Configure a webhook to subscribe to Zendesk with a ServiceNow callback URL.

Before you begin

Role required: admin

Procedure

1. Register a Zendesk webhook in ServiceNow to notify ServiceNow when certain events occur in Zendesk.

   a. Log in to your ServiceNow instance as an admin.

   b. Navigate to **Zendesk Spoke** > **Webhook Registries**.

   c. Click **New**.

   d. Provide a name to identify the webhook registry record for **Name**.

   e. Click the Generate Token related link.
   A secret token is generated and displayed. This values is also updated in **Token**.

   f. Right-click the form header and click **Save**.

   g. Click **Create Webhook**.
   A confirmation message is displayed that the webhook creation is initiated and value of **Webhook ID** is populated.

2. In the Zendesk account, set up event-based rules that run every time a ticket is created or updated.

   a. Log in to the Zendesk account.

   b. Navigate to Zendesk Admin Center.

   c. Navigate to **Objects and rules** > **Business rules** > **Triggers**.

   d. Click **Add trigger**.

   e. On the form, fill these values.

Field	Description
Trigger name	Name to identify the trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Category	Required event category. Select **Tickets**.
Conditions	Trigger conditions. Under **Meet ANY of the following conditions**, provide these conditions: Actions	Select **Notify active webhook** for **Notifications** and select the ServiceNow webhook. In **JSON body**, enter: `{ "id":"{{ticket.id}}", "priority":"{{ticket.priority}}", "status":"{{ticket.status}}", "subject":"{{ticket.title}}", "description":"{{ticket.description}}", "due_at":"{{ticket.due_date}}", "requester":"{{ticket.requester.name}}" }`

f. Click **Create**.
A confirmation message is displayed that the trigger is created.

Result

The webhook is setup. When a ticket is created or updated in Zendesk, the details are stored in your ServiceNow instance. To access the Zendesk tickets in your ServiceNow instance, navigate to **Zendesk Spoke** > **Webhook** > **Tickets**.

Zoom Spoke

Create and manage Zoom meetings with the Zoom spoke from your ServiceNow instance. With this spoke, you can add participants, retrieve details, end or delete a meeting, or fetch the participant details of a conference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Zoom spoke v4.6.2 is the latest version.

Supported versions

Zoom API version v2.0.

Spoke dependencies

If you're having trouble installing the app, make sure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Key Management Framework (com.glide.kmf.global)
- NOW Platform Encryption (com.glide.now.platform.encryption)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

Spoke flows

This spoke has no sample flows.

Spoke subflows

The Zoom spoke provides sample subflows for processing inbound events that are related to meetings, recordings, webinars, and users. Available sample subflows are described in the following table.

Spoke subflows

Subflow	Description
Zoom Process Meeting Events	Handles Zoom meeting webhook events.
Zoom Process Recording Events	Handles Zoom recording webhook events.
Zoom Process User Events	Handles Zoom user webhook events.
Zoom Process Webinar Event	Handles Zoom webinar webhook events.
Create Zoom Meeting	Creates a Zoom meeting and provides the Zoom meeting URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows (continued)

Subflow	Description
	This subflow is used by the Meeting scheduler AI agent in the Now Assist for Integration Hub application.

Spoke modules

The Zoom spoke adds the Zoom application to your instance and includes the modules in the following table.

Spoke modules

Module	Description
Phone Numbers	Displays a list of Zoom Phone numbers.
Zoom Webhook Registries	Displays a list of webhook registries that are associated to Zoom.

Spoke actions

The Zoom spoke provides you with actions so that you can automate Zoom tasks when events occur in the ServiceNow AI Platform. Th available actions are described in the following table.

Spoke actions

Category	Action	Description	Granular scope needed
Cloud Recording Management	Look up meeting recording settings	Retrieves the settings of the meeting's cloud recordings. **Note:** The meeting password is retrieved and displayed as plain text.	cloud_recording:read:recording_settings:admin
	Look up meeting recordings	Retrieves all the recorded meetings for the specified meeting ID.	cloud_recording:read:list_recording_files:admin
	Look up recordings stream	Lists all the recorded meetings of the specified user.	cloud_recording:read:list_user_recordings:admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description	Granular scope needed
Phone Management	Assign calling plan To User	Assigns a calling plan to a user.	phone:write:calling_plan:admin
	Assign phone number to user	Assigns a phone number to a user who has already enabled Zoom Phone.	phone:write:user_number:admin
	Get country codes (metadata)	Retrieves the metadata of countries and their ISO codes.	
	Look up account call logs stream	Retrieves the call logs for an account.	phone:read:list_call_logs:admin
	Look up calling plans	Retrieves a list of calling plans.	phone:read:list_calling_plans:admin
	Look up phone number details	Retrieves the details of a specified phone number in a Zoom account.	phone:read:numbers:admin
	Look up phone numbers stream	Retrieves the list of phone numbers.	phone:read:list_numbers:admin
	Look up phone users stream	Retrieves all the users that are associated to an account with assigned Zoom Phone licenses.	phone:read:list_users:admin
	Look up user call logs stream	Retrieves the call logs of a user's Zoom Phone.	phone:read:list_call_logs:admin
	Look up user phone profile	Retrieves a Zoom Phone user's profile.	phone:read:user:admin
	Look up user recordings stream	Retrieves a Zoom Phone user's recordings.	phone:read:list_recordings:admin
	Look up user phone settings	Retrieve a user's Zoom Phone profile.	phone:read:user_setting:admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description	Granular scope needed
	Look up user voicemails Stream	Retrieves a Zoom Phone user's voicemails.	phone:read:list_voicemails:admin
	Unassign user calling plan	Unassigns a calling plan to a user who has enabled Zoom Phone.	phone:delete:users_calling_plan:admin
	Unassign user phone number	Unassigns a phone number to a user who has enabled Zoom Phone.	phone:delete:user_number:admin
	Update main company number	Updates the main company number of an account.	
	Update user phone profile	Updates a user's Zoom Phone profile.	phone:update:user:admin
	Update user phone settings	Updates the settings of a specific Zoom Phone user.	phone:update:user_setting:admin
Meeting Management	Add meeting registrant	Registers a participant for a specific meeting.	meeting:write:meeting:admin
	Create meeting	Creates a meeting for a user using their Zoom user ID or the email address and other details such as start time, type of meeting, and agenda. The action can also include in the meeting details one or more alternative hosts' email ID.	meeting:write:meeting:admin
	Download Meeting Transcript	Downloads the meeting transcript for	cloud_recording:read:recording:admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description	Granular scope needed
		the specified transcript ID.	
	Delete meeting	Deletes a specific meeting by using its meeting ID.	meeting:delete:meeting:admin
	End meeting	Ends an ongoing meeting.	meeting:delete:meeting:admin
	Look up meeting Details	Gets details of a specific meeting by its meeting ID.	meeting:read:meeting:admin
	Update Meeting	Identifies a meeting by its ID and then updates its details such as start time, duration, and topic.	meeting:update:meeting:admin
	Look up ended meeting instances	Lists all the meeting instances that were ended.	meeting:read:list_meetings:admin
	Look up live meetings by user stream	Lists all the live or ongoing meetings for a specific user.	meeting:read:list_meetings:admin
	Look up Meetings Stream	Lists the given user's meetings.	meeting:read:list_meetings:admin
	Look up Past Meeting Participants Stream	Lists information on participants from a past meeting.	meeting:read:list_past_participants:admin
User Management	Create user	Creates a user in your account.	user:write:user:admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description	Granular scope needed
		Note: A Zoom pro plan or later is required for this action. You must enable pre-provisioning for SSO users in your Zoom account.	
	Delete user	Deletes a specific user from your account.	user:delete:user:admin
	Disassociate user	Unlinks a specific user from your account.	user:delete:user:admin
	Look up user details	Gets the details of a specific user on your account by using their user ID.	user:read:user:admin
	Look up users stream	Retrieves all the users that are associated to your account.	user:read:list_users:admin
	Update user settings	Updates the settings of a specific user.	user:update:user:admin
Chat Management	Add members to channel	Adds members to a Zoom channel.	team_chat:write:members:admin
	Create channel	Creates a Zoom channel.	team_chat:write:user_channel:admin
	Look up channel	Retrieves the details of a Zoom channel.	team_chat:read:user_channel:admin
	Look up channel members stream	Retrieves the details of the members in a Zoom channel.	team_chat:read:list_members:admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description	Granular scope needed
	Look up user chat message stream	Retrieves the details of a member's chats in a Zoom channel.	team_chat:read:list_user_messages:admin
	Look up user channels stream	Retrieves the names of theZoom channels.	team_chat:read:list_user_channels:admin
	Remove member from channel	Removes a member from a Zoom channel.	team_chat:delete:member:admin
	Send chat message	Sends a chat message to a Zoom channel.	team_chat:write:user_message:admin
	Update channel	Updates a Zoom channel's details.	team_chat:update:user_channel:admin
Utility Actions	Copy chat message attachment to record	Copies the attachment that contains the chat message to the incident record.	team_chat:read:user_message:admin

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
Zoom user management AI agent	Looks up the details of a user, and creates, deletes, and disassociates a user.
Zoom meeting management AI agent	Creates, ends, and deletes meetings, looks up meeting details, and adds a meeting registrant.
Zoom cloud recording management AI agent	Looks up meeting recordings and meeting recording settings.
Zoom chat management AI agent	Enables users to create and manage chat channels, send and update messages, and handle member-related operations.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Zoom spoke requirements

These actions use REST calls, which can run on an instance or Zoom spoke See Building flows for more information. Use the connection record that is associated with the Zoom alias to configure where actions run and set Zoom spoke selection attributes. For more information about the alias, see Connection and credential alias.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Zoom Connection & Credential Alias record to authorize actions. For information about setting up the spoke, see Set up the Zoom spoke.

Set up the Zoom spoke

Integrate your Zoom account with your ServiceNow instance so that you can use the Zoom spoke to perform various actions on your Zoom account. You can also create a custom OAuth application in the Zoom account so that it can authenticate requests from your instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Zoom spoke .
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a connected app in Zoom

Create a connected app in your Zoom account to establish an OAuth 2.0 level of authentication between the Zoom APIs and the Zoom spoke on the ServiceNow AI Platform. After creating the connected app, you can add scopes that enable you to perform different actions from the Zoom spoke.

Before you begin

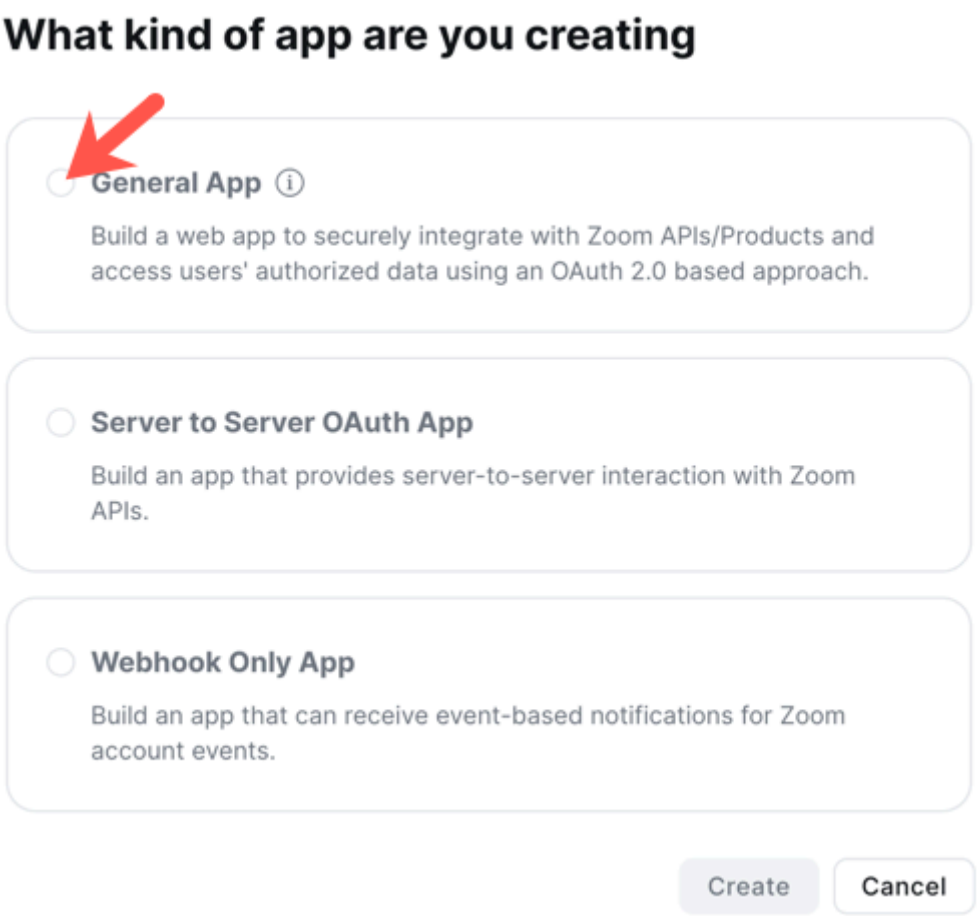
1. Create a Zoom account
2. Role required: Zoom admin

About this task

Creating the connected app is a one-time activity.

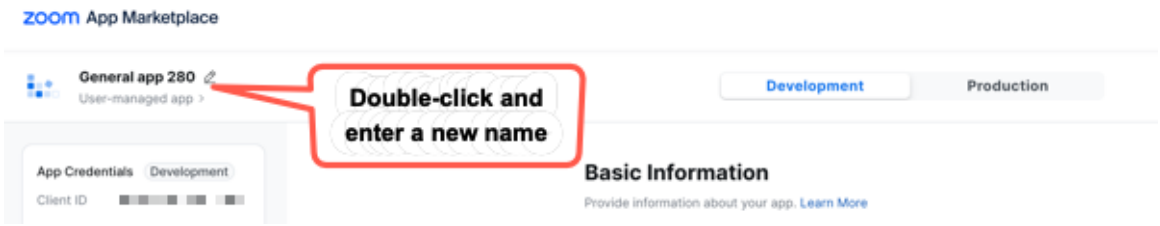
Procedure

1. Log in to Zoom marketplace.
2. Navigate to **Develop** > **Build App**.
3. Select **General App**.

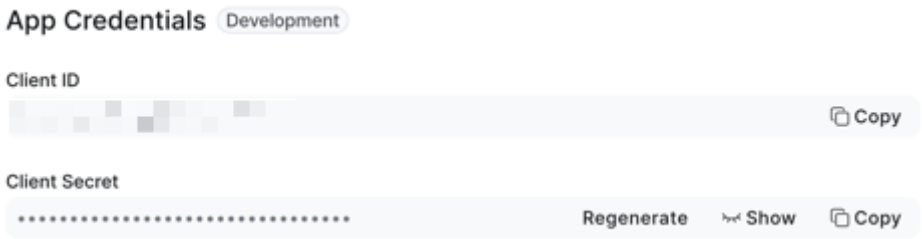


4. Select **Create**.
5. **Optional:** Double-click the default name of the app and update the name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Admin-managed**.
7. Select **Save**.
8. Under the App Credentials section, copy the Client ID and Client secret and store them at a secure place.



9. Under the OAuth Information section, do the steps.

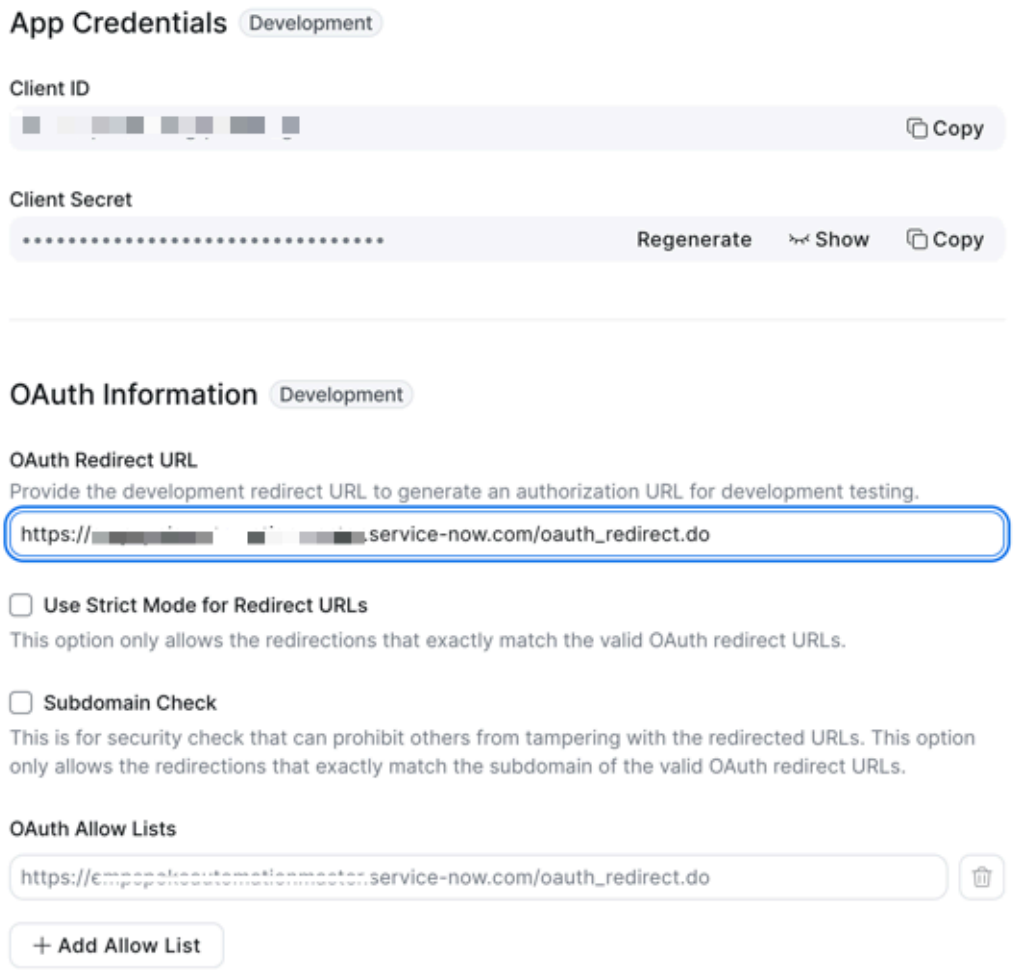
   a. In the **OAuth Redirect URL** field, enter the redirect URL in this format: `https://<ServiceNow-Instance-Name>.service-now.com/oauth_redirect.do`.

   b. Under the **OAuth Allow List**, add a ServiceNow instance redirect URL in this format: `https://<ServiceNow-Instance-Name>.service-now.com/oauth_redirect.do`.
   A token is generated. This token is used by the OAuth app to give the Zoom spokes access to the Zoom APIs.

   c. **Optional:** To add another URL to the allow list, click **Add New List**.
   The following example shows the screen that you use to generate the credentials for the OAuth app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

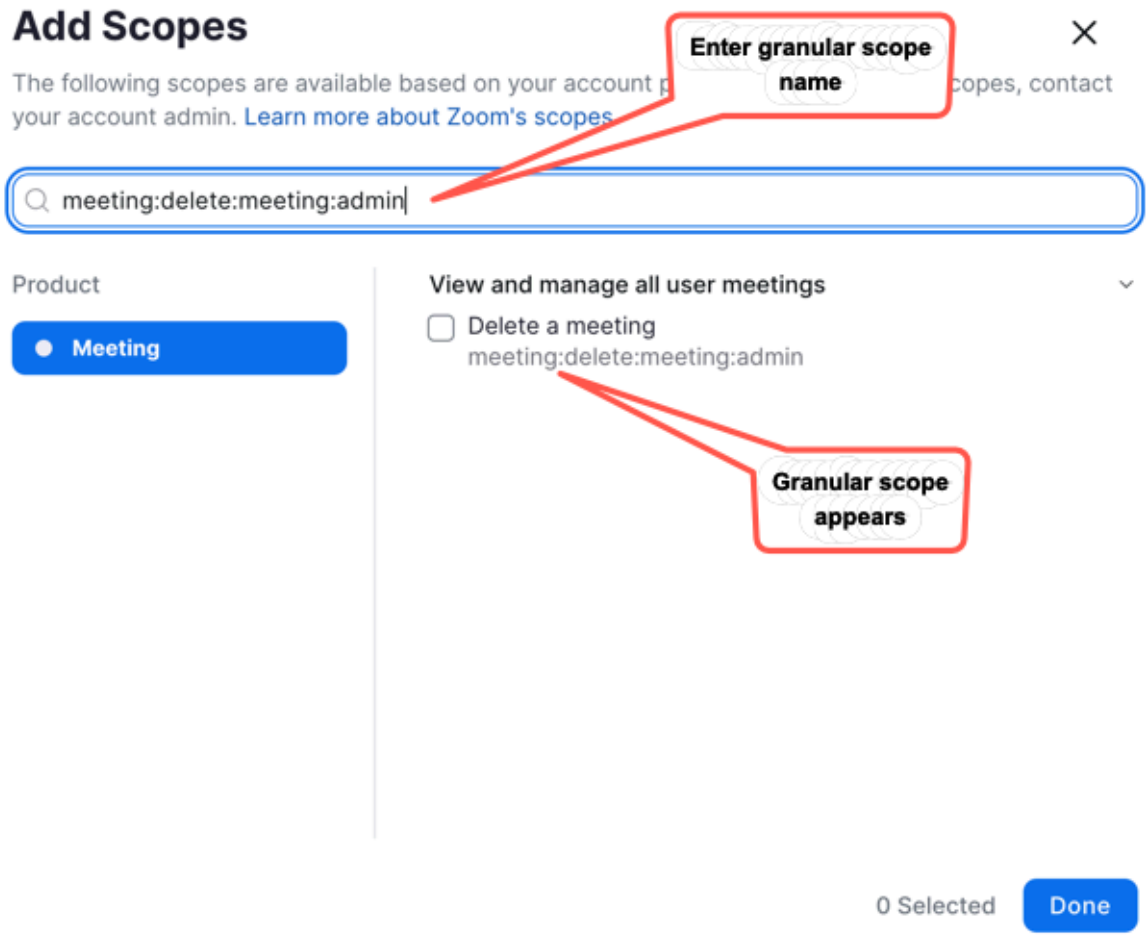
OAuth credentials configuration for Zoom spokes



Note:
To know the difference between the Redirect URL for OAuth and the URL that is mentioned in the OAuth allow list, see Zoom Developer Forum.

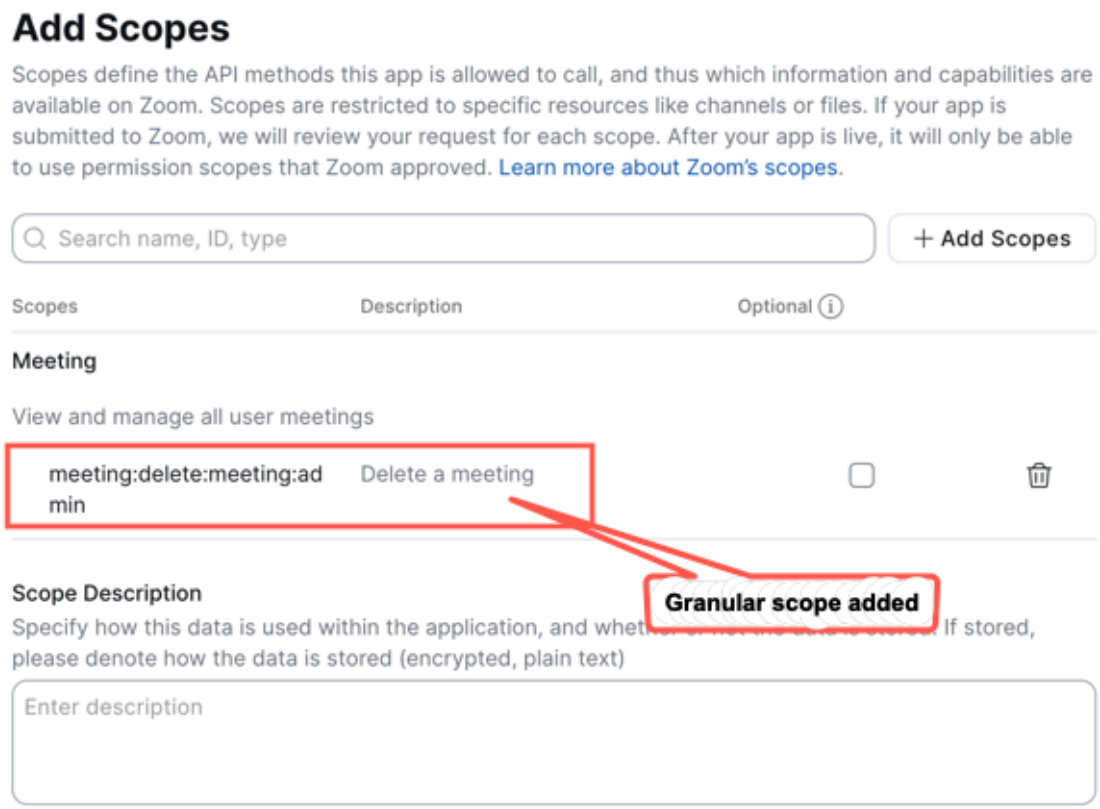
10. On the left panel, select Access.
11. Under the Access section, copy the Secret Token and Verification Token.
12. On the left panel, select **Scopes**.
13. Select **+ Add Scopes**.
14. In the Search scope field, enter the granular scope.
    An example of a granular scope is `meeting:delete:meeting:admin`.
    The granular scope appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



15. Select the scope and then select **Done**.
The granular scope is added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



16. **Optional:** Repeat the steps to add more granular scopes.

Add Zoom connection in ServiceNow instance

Use the information generated during Zoom account configuration to register Zoom spoke as an OAuth provider and allow the instance to request OAuth 2.0 tokens. Add the Zoom connection in Workflow Studio to perform actions in Zoom.

Before you begin

Role required: admin

Procedure

1. From your ServiceNow instance, navigate to **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. In the Search all connections field, enter `Zoom`.

> **Note:**
> The **Outbound** tab is selected by default. Confirm that the **Outbound** tab is already selected.

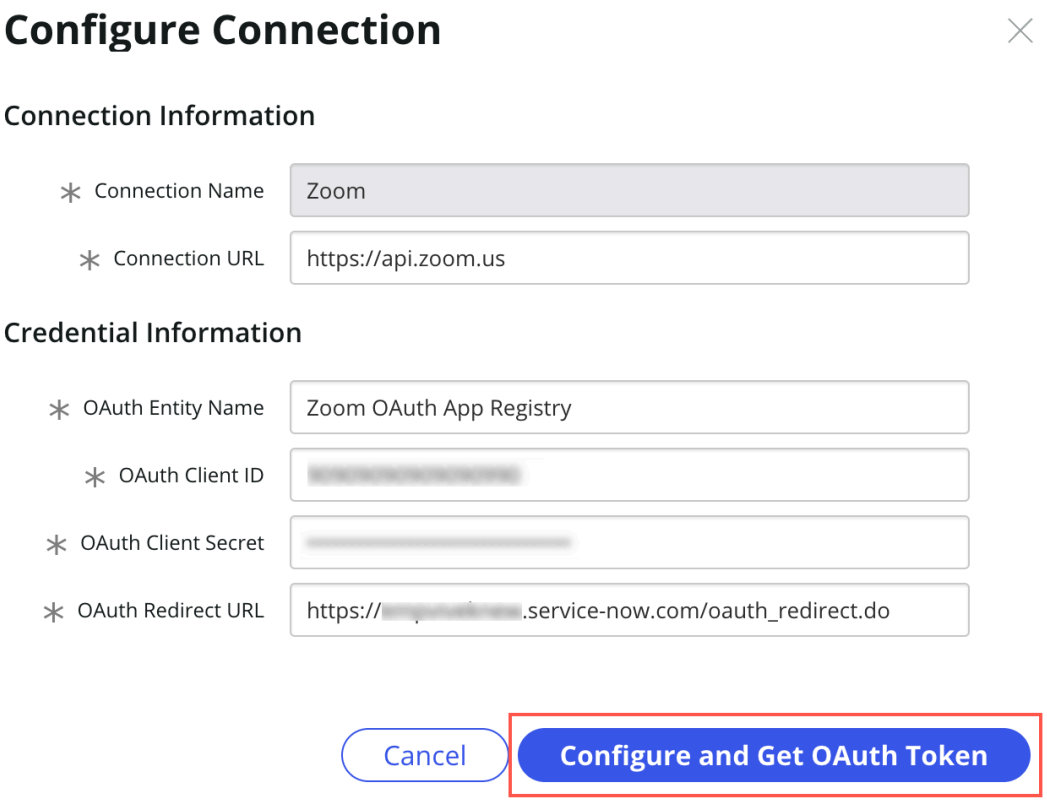
4. In the Zoom card, select **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Zoom spoke, click **View Details**.
   - To manage more than one Zoom spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, select **Configure**. Otherwise, click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

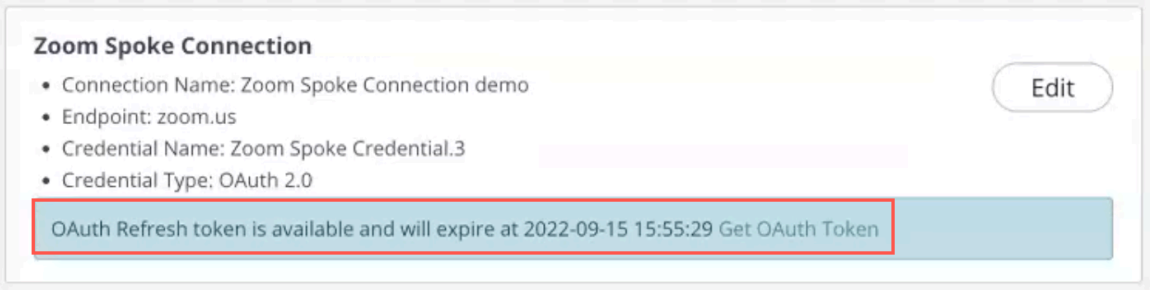
5. On the form, fill these values.

Field	Description
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to your Zoom instance. Enter `https://api.zoom.us`.
OAuth Entity Name	Name to identify the application registry record.
OAuth Client ID	Client ID created during application registration.
OAuth Client Secret	Client secret created during application registration.
OAuth Redirect URL	OAuth callback endpoint. Enter `https://<instance-name>.service-now.com/oauth_redirect.do`.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **Configure and Get OAuth Token**.
   A confirmation message is displayed that the token is available.



Set up a bi-directional webhook for Zoom spoke

Configure a webhook to subscribe to Zoom with a ServiceNow callback URL.

Before you begin

- Request an Integration Hub subscription.
- Activate the Zoom spoke.
- Role required: admin.

Add an endpoint URL in Zoom account

Specify an endpoint URL in your Zoom account to create a webhook for Zoom spoke.

Before you begin

Role required: admin

Procedure

1. Log in to your Zoom account.
2. Create a webhook app according to your requirements.
   For more information about Zoom webhook only app, see Create a Webhook-only App.
3. Generate a secret token and record the token value.
4. Create a webhook validation for Zoom spoke.

a. Log in to your ServiceNow instance.

b. Navigate to **Zoom spoke** > **Zoom Webhook Validations.**

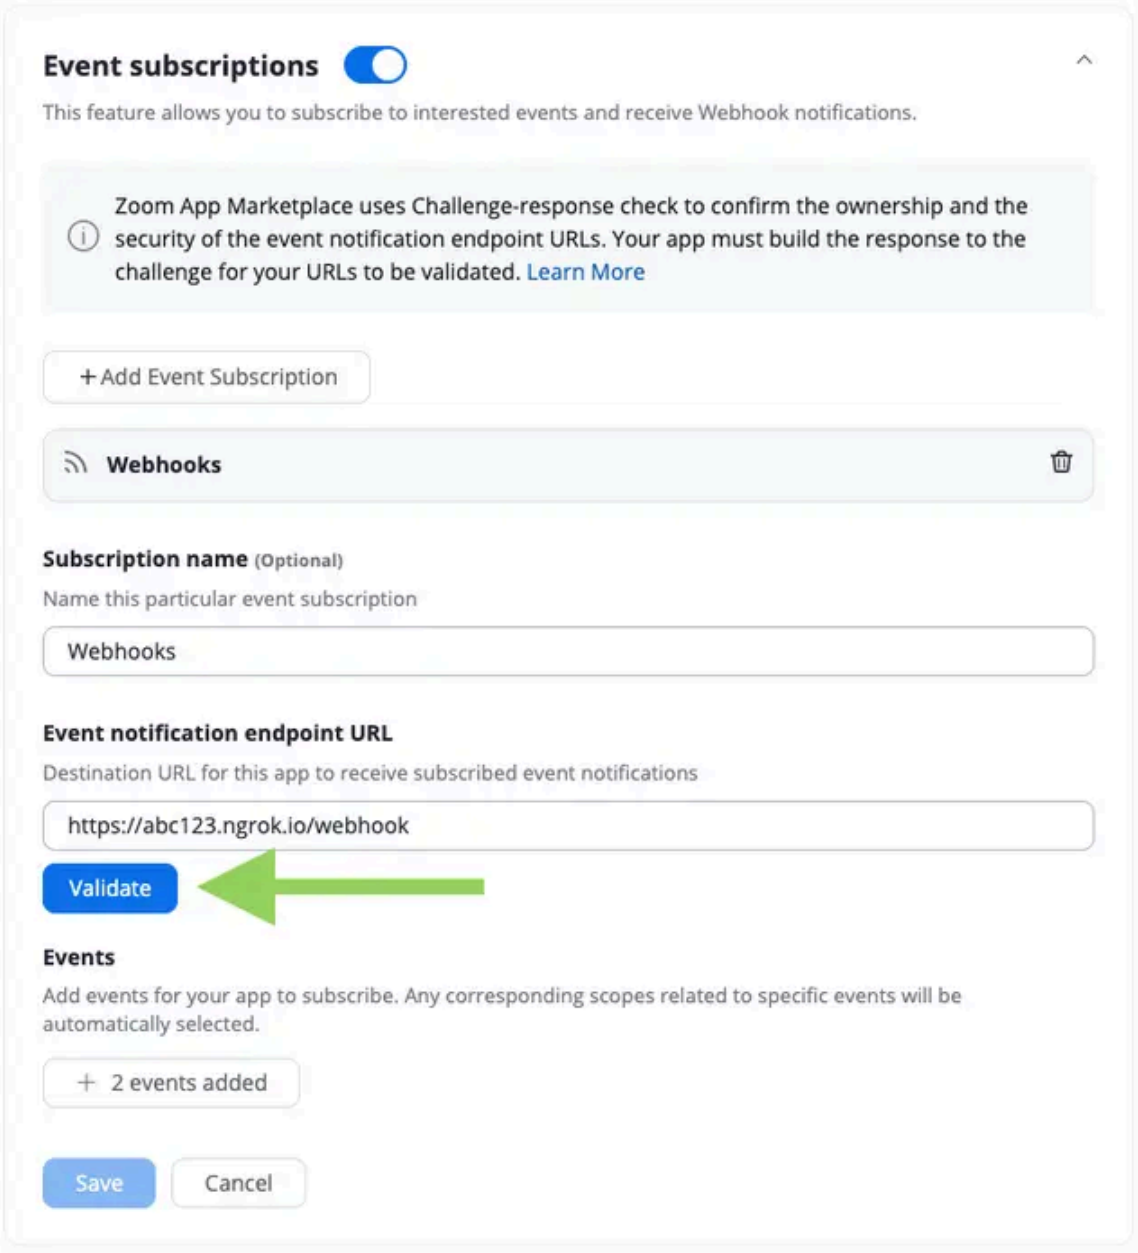
c. On the form, fill in the fields:

Field	Description
Name	Unique name to identify the webhook validation record. For example, Zoom spoke webhook validation.
Secret Token	Secret token of the app in your Zoom account.

d. Click Submit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Enable Event Subscriptions and enter the Event notification endpoint URL in the following format.
   `https://<instance-name>.service-now.com/api/sn_zoom_spoke/zoom_webhook_endpoint/webhook`
6. Validate the event notification endpoint URL.
   For more information, see Validate your webhook endpoint.



7. Specify the Event Types according to your requirement.

Result
The endpoint URL is added in your Zoom account. You can create webhook registries and subflows according to your requirements.

Register a Zoom webhook in ServiceNow

Register a Zoom webhook in ServiceNow to notify the ServiceNow app when certain events occur in Zoom.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **Zoom Spoke** > **Zoom Webhook Registries**.
2. Click **New**.

> **Note:**
> If you want to use an out-of-the-box webhook registry, open the registry and update the secret token.

3. On the form, fill in the fields:

Zoom Webhook Registry

Field	Description
Trigger Type	Type of the Zoom event that triggers the subflow.
Secret Token	Secret token from your Zoom account used for validating event notification. **Note:** If you are using an earlier version of the spoke or the default registry, update the registry to replace the verification token with the secret token.
Subflow Name	Subflow which is to be triggered when the specified conditions are met.
Input	Input for the webhook registry.
Trigger Object	Zoom object which is used to trigger the subflow.
Name	Name of the webhook registry.

Set up MID Server for a spoke

Configure MID Server settings on your ServiceNow instance that enables it to integrate with a third-party application via MID Server after you have set up the connection record for a spoke.

https://player.vimeo.com/video/1123289430?h=f4f6cff258&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin
Role required: admin

Confirm that you have set up the connection record for the spoke.

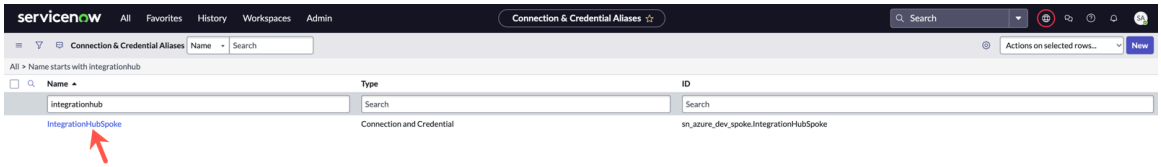
About this task
Setting up MID Server may be mandatory or optional for the spoke that you set up. For example, configuring MID Server is required for Microsoft Active Directory v2 Spoke but optional for the Jira Spoke. Use this procedure to set up the MID Server for your spoke after you have set up your spoke by filling the default connection alias form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

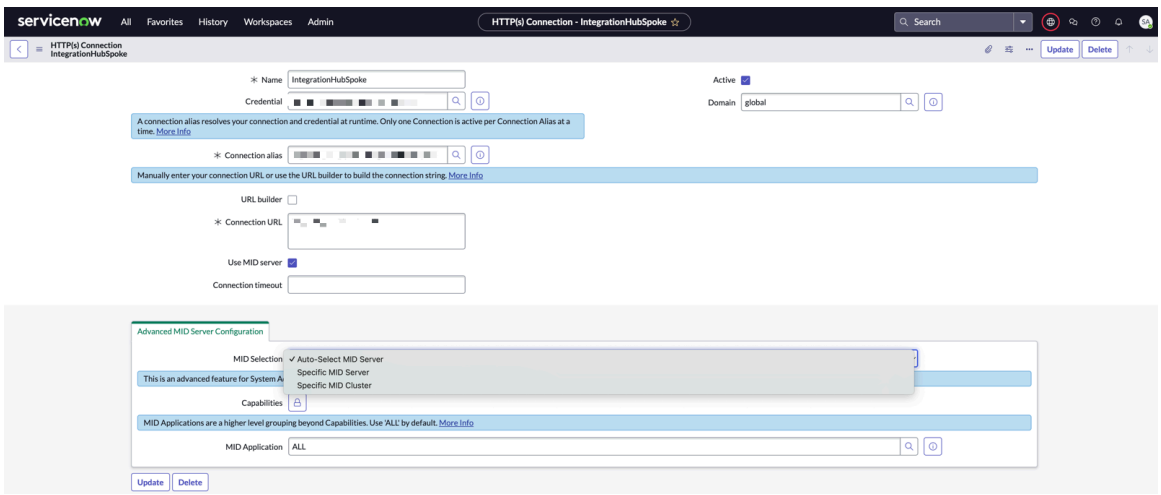
1. Navigate to **All** > **IntegrationHub** > **Connection & Credential Alias**.
2. Find the connection and credential alias of the spoke.
   Search the alias by entering its name in the **Name**

   field.
3. Under the **Name** column, select the connection and credential alias.



4. In the **Connections** tab, select the default connection record for the spoke.

5. Select **Use MID server**.
   The **Advanced MID Server Configuration** tab is enabled.



6. Fill the form under the **Advanced MID Server Configuration** tab.

Field	Description
MID Selection	Option to select a specific MID Server or MID Cluster. Choose any one of the following options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Auto-Select MID Server**: Your ServiceNow instance selects the MID Server without manual input. ○ **Specific MID Server**: Your ServiceNow instance uses MID Server that you specify. ○ **Specific MID Cluster**: Your ServiceNow instance uses the MID Cluster that you specify. A MID Cluster is a group of MID Servers that enables your ServiceNow instance to handle multiple integrations, and improve integration speed. For more information, see Configure a MID Server cluster.
Capabilities	The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if **Use MID server** is selected. Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection. **Note:** This field is visible only when **Auto-Select MID Server** is selected from the MID Selection list.
MID Application	The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if **Use MID server** is selected, and then **Auto-Select MID Server** is selected in the MID Selection list. To learn more about how a MID Server is selected during runtime, see MID Server selection. **Note:** This field is visible only when **Auto-Select MID Server** is selected from the MID Selection list.

7. Select **Update**.
   The MID Server is enabled on the connection form of the spoke.

What to do next

Confirm that the spoke connection form has the Use MID option.

Now Assist in Conversational Spokes

Use Now Assist in Conversational Spokes application to start utilizing the conversational ability of Integration Hub Spoke actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store.

Capabilities

Perform business actions through conversational interface like Now Assist. Unlock the interactive conversational experience to automate your business workflows. This feature requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

For information about configuring the conversational settings, see Conversational actions. For information about the Integration Hub Spoke actions that are currently conversational ready, see Available conversational actions.

Supported versions

The Now Assist in Conversational Spokes application is supported on Xanadu Patch 3 and later releases.

Activation of the conversational actions

Now Assist in Conversational Spokes application offers generative AI capabilities to make the spoke actions conversational. This application requires these subscriptions:

- Now Assist for Platform (sn_genai_platform) subscription
- One of these Workflow Data Fabric subscriptions:
  - Integration Hub Professional V4 SKU
  - Workflow Data Fabric Professional V5 SKU
  - Workflow Data Fabric Enterprise V4 SKU
  - Workflow Data Fabric Enterprise UU V4 SKU

After installing the Now Assist in Conversational Spokes application, you can configure the available conversational spoke actions.

- See Conversational subflows to learn more about configuring the conversational settings.
- See in Now Assist skills in the Platform workflow to learn more about conversation experience and skills.

Now Assist for Integration Hub

Use the ServiceNow Now Assist AI agents to mimic human-like intelligence by using Large Language Models (LLMs) to perform tasks that range from simple automated responses to complex problem-solving. Utilize the conversational ability of Integration Hub spoke actions.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store.

Capabilities

AI agents are autonomous systems that interact with their environment to gather data, make decisions, and complete tasks that would otherwise need to be completed by a human. Now

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assist products provide AI agents that are tailored to meet the needs of users in different workflows. You can take actions to drive towards a specific goal, such as resolving an incident or a case by providing a set of instructions to the AI agents.

Perform business actions through conversational interface like Now Assist. Unlock the interactive conversational experience to automate your business workflows.

Dependency

Before using Now Assist for Integration Hub, confirm that you are using the latest Now Assist for platform version.

Supported version

The Now Assist for Integration Hub application is supported on Xanadu Patch 7 and later releases.

Important:
Ensure that you install the latest available version of the Now Assist for Integration Hub application.

Application version

Now Assist for Integration Hub v2.2.0 is the latest version.

Activation of the application

The Now Assist for Integration Hub application requires these subscriptions:

- Now Assist for Platform (sn_genai_platform) subscription
- An Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

After installing the Now Assist for Integration Hub application, you can use the available AI agents and configure the available conversational spoke actions.

- See Now Assist AI agents to learn about AI agents.
- See Conversational subflows to learn more about configuring the conversational settings.
- See Conversational actions to learn more about creating and configuring the conversational skill from Workflow Studio.
- See in Now Assist skills in the Platform workflow to learn more about conversation experience and skills.

Available AI agents

This application provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

Available AI agent includes, Meeting scheduler AI agent that can be used to organize Zoom or Teams meetings and create regular calendar events. This AI agent retrieves details of available rooms, details of the relevant users you want to invite such as, email address and timezone, finds an available time slot, creates a calendar event, and generates a Zoom URL for the meeting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role masking

Role masking enables users to limit the roles and privileges of agentic workflows during tool execution. Agentic workflows and their AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

Available AI agents for Integration Hub

Now Assist AI agents are provided with some of the Integration Hub spokes or plugins that are preconfigured and are callable from interfaces such as AI Agent Studio and Virtual Agent.

Spoke or plugin	AI agent
Now Assist for Integration Hub	Meeting scheduler AI agent **Important:** To use this AI agent, ensure that you have activated the Microsoft Exchange Online Spoke and configured the client credential alias. To generate Zoom URL for the meeting, you must activate and configure the Zoom Spoke.

Meeting scheduler AI agent

Now Assist for Integration Hub application provides standalone AI agent that mimics human-like intelligence to perform tasks in your ServiceNow instance. Meeting scheduler AI agent that can be used to organize Zoom or Teams meetings and create regular calendar events.

This AI agent retrieves details of available rooms, details of the relevant users you want to invite such as, email address and timezone, finds an available time slot, creates a calendar event, and generates a Zoom URL for the meeting. The logged-in user who runs the AI agent is marked as the meeting's organiser or host. This AI agent can create 3 types of events:

- A regular calendar event: This is a meeting placeholder with no URL and location.
- Teams event: This a meeting where attendees can join Microsoft Teams meeting.
- Zoom event: This a meeting where attendees can join the meeting using Zoom URL.

Important:
To use this AI agent, ensure that you have activated the Microsoft Exchange Online Spoke and configured the client credential alias. To generate Zoom URL for the meeting, you must activate and configure the Zoom Spoke.

In this example, Manish (the logged-in user) uses the Meeting scheduler AI agent from Now Assist panel to schedule a meeting with Vivek and provides details about the date, place, and meeting agenda. In this case, the AI agent schedules the meeting with most relevant user (based on collaboration and organizational context) named Vivek. If the AI agent is not able to retrieve

details of the most relevant user from Microsoft Exchange Online, details of all users whose names match Vivek are retrieved from the ServiceNow User table [sys_user] and displayed, and logged-in user Manish can choose the required user.

AI agent then displays the list of available time slots. Manish can select the feasible time slot. You can also view the AI steps. If a time slot at the mentioned time is unavailable, AI agents expands the search window to 2 days and displays the list of available slots.

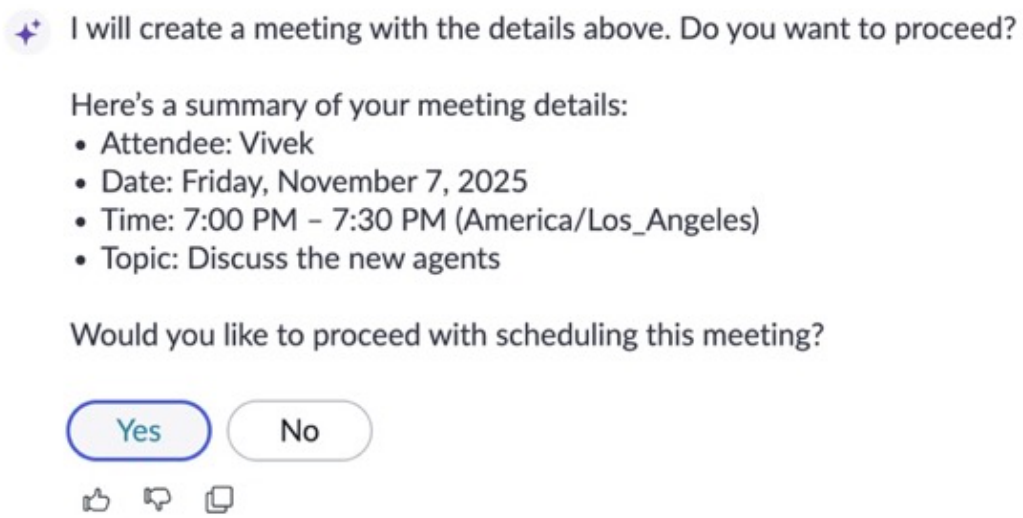
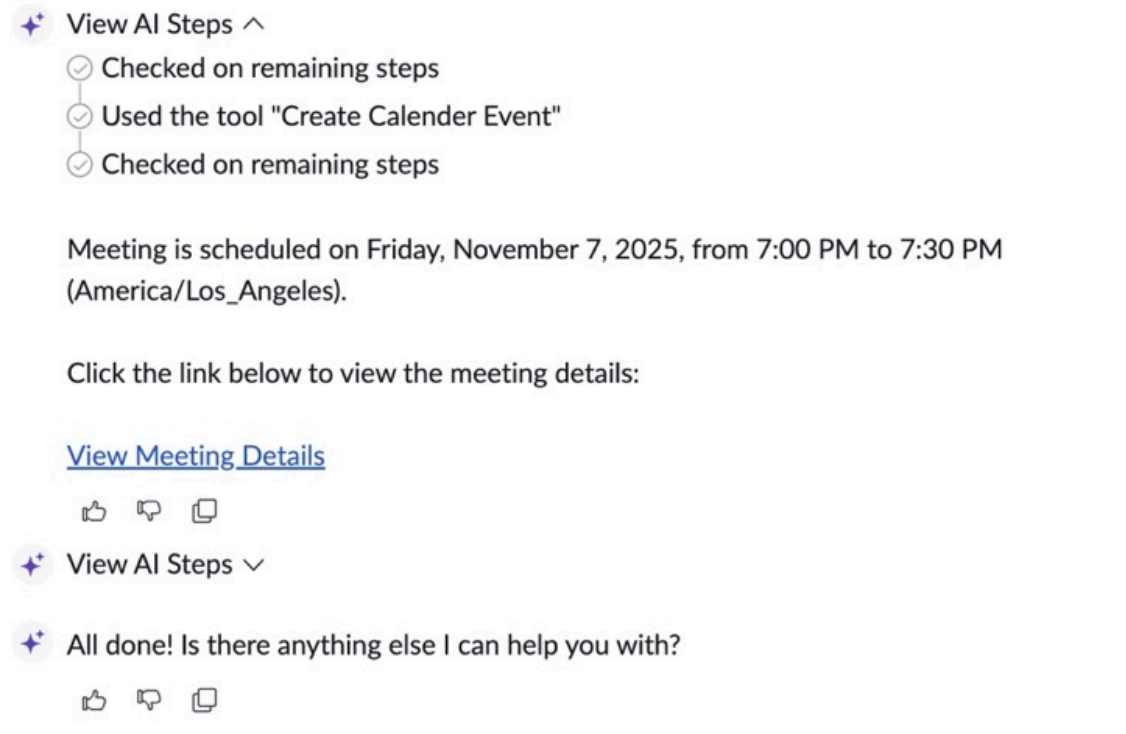
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manish can review the meeting details and proceed with scheduling the meeting.



Once the meeting is created, the details are displayed.



The event is added to your Outlook calendar and you can also view the meeting details in Outlook.

Using AI agent, Manish can also modify the meeting by adding room of the required capacity and in a specified location, adding more attendees, changes date or time, and so on.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Integration Hub available solutions

Automate typical business processes with Integration Hub solutions. Solutions combine pre-built flows, actions, and other integration-specific content into one package, for quicker, simpler process automation.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Available solutions

Access Management Automation

Automates access management request fulfilment using the Service Catalog or Service Portal. The catalog items and flows support requests in Okta, Microsoft Entra ID, and Microsoft Active Directory.

Client Software Distribution using Integration Hub

Use Client Software Distribution (CSD) to distribute software from the Service Catalog using third-party management systems.

Client Software Distribution 2.0 application

Client Software Distribution 2.0 application (CSD 2.0) application enables administrators to distribute software from the service catalog using third-party management systems.

Cloud Deployment Automation

Automates the deployment and provisioning of the AWS CloudFormation services using Service Catalog or Service Portal.

Microsoft AD Spoke for Password Reset

The Microsoft AD Spoke for Password Reset extends the ServiceNow Password Reset solution to provide password management into Microsoft Active Directory environments.

Microsoft Azure AD Spoke for Password Reset

The Microsoft Entra ID Spoke for Password Reset extends the ServiceNow Password Reset solution to provide password management into Microsoft Azure Active Directory environments.

Password Reset integration with Google Directory

Enables end users to reset their Google passwords using Password Reset and Google Directory spoke.

Password Reset integration with Okta

Use Okta to manage users, passwords, and groups.

Retry Handler Framework

Framework that retries a failed HTTP request when the API rate limits are exceeded and the 429 Too Many Requests status code is returned. The retry-after time HTTP header is used to retry the request again after that specified retry-after time.

ServiceNow Kafka Consumer

Integrates your ServiceNow instance with Kafka Consumer and stores data in the ServiceNow tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

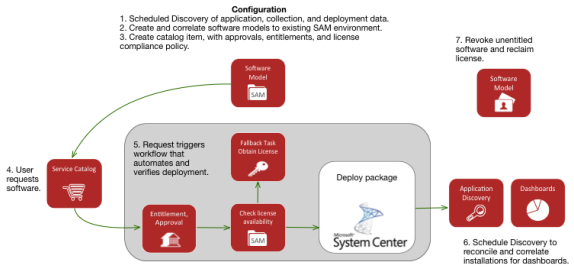
Client Software Distribution using Integration Hub

Use Client Software Distribution (CSD) to distribute software from the Service Catalog using third-party management systems.

Create all the records necessary to deploy software from Service Catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using the Microsoft SCCM spoke. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Integration Hub flows, subflows, and actions.

Integrates with Software Asset Management to manage license counts for deployed software.

CSD process flow using SCCM



Request client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Integration Hub.

Before you begin

Role required: admin

About this task

The Client Software Distribution plugin activates the System Center Configuration Manager plugin that contains the Microsoft SCCM spoke actions to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution.

Note:
The Client Software Distribution plugin runs in its own application scope.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Click **Request Plugin**.
3. On the form, fill in the fields.

Field	Description
Target Instance	Instance on which to activate the plugin.
Plugin Name	Name of the plugin to activate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Specify the date and time you would like this plugin to be enabled	Date and time that must be at least two business days from the current time. **Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.
Reason/Comments	Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.

4. Click **Submit**.

Components installed with client software distribution

Several types of components are installed with client software distribution (CSD).

Tables installed

These tables are installed with the Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

Client software distribution tables

Table	Description
Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item]	Contains all catalog items created for client software distribution. This table extends the Catalog Item [sc_cat_item] table.
Client Software Distribution Software Request [sn_client_sf_dist_req_software]	Contains all requested software, and their statuses.
Client Software Distribution Application [sn_client_sf_dist_application]	Contains all discovered CSD applications.
Client Software Distribution Provider [sn_client_sf_dist_provider]	Contains all software distribution providers.
Client Software Distribution Extension Key [sn_client_sf_dist_extension_key]	Contains the predefined CSD extension keys.
Client Software Distribution Extension Point [sn_client_sf_dist_extension_point]	Contains the customization script for the extension keys.
Client Software Distribution Software Configuration [sn_client_sf_dist_software_config]	Base table for all software provider configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution tables (continued)

Table	Description
SCCM Server Instance [sn_client_sf_dist_cmdb_ci_sccm_server]	Contains all SCCM server instances. This table extends the Configuration Item [cmdb_ci] table.
SCCM Application [sn_client_sf_dist_sccm_application]	Contains all discovered SCCM applications. This table extends the Client Software Distribution Application [sn_client_sf_dist_application] table.
SCCM Application Catalog Item [sn_client_sf_dist_sccm_app_cat_item]	Contains all catalog items created for SCCM applications. This table extends the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table.
SCCM Collection [sn_client_sf_dist_sccm_collection]	Contains all discovered SCCM collections. Contains all discovered SCCM collections.
SCCM Deployment [sn_client_sf_dist_sccm_deployment]	Contains all discovered SCCM deployments. Contains all discovered SCCM deployments.
SCCM Configuration [sn_client_sf_dist_sccm_config]	Contains the SCCM application, install and uninstall collections, and Discovery model. This table extends the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config]

Plugins installed

These plugins are installed with the Client Software Distribution plugin, if they are not already active.

For instructions on requesting activation of Client Software Distribution (CSD) see Request client software distribution.

Plugins for Integration Hub - Client Software Distribution

Plugin	Description
Orchestration - System Center Configuration Manager (com.snc.orchestration.sccm_mgnt)	Installs the custom SCCM Orchestration activities that do work on the SCCM target host.
Orchestration - Asset Lease Management (com.snc.orchestration.asset_lease_management)	Installs the lease functionality for software distributed through the Service Catalog. This includes starting, stopping, and extending leases.
Service Catalog Scoped API (com.glideapp.servicecatalog.scoped.api)	Installs the API to support application creation in the Service Catalog.
Software Asset Management Core (com.snc.sam.core)	Provides the base tables for software asset management. Includes software installations, usages, suite calculations, and discovery models.
ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)	Enables execution of IntegrationHub actions and flows.
Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer)	Provides support for Workflow Studio in Service Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins for Integration Hub - Client Software Distribution (continued)

Plugin	Description
Microsoft SCCM Spoke for IntegrationHub (com.sn.sccm.spoke)	Provides actions in Workflow Studio that a Process Analyst can use to automate the management of user collections, device collections, and application deployments.
Software Asset Management Spoke (com.sn_sam_spoke)	Provides actions in Workflow Studio for Software Asset Management activities.
Responsive Dashboards (com.glideapp.dashboard)	Creates, modifies, and shares dashboards using responsive and dynamic widget layouts.
Outbound Tracking (com.glide.outbound_tracking)	Tracks outbound requests.

Roles installed

These roles are installed with the Client Software Distribution plugin.

Roles for Integration Hub - Client Software Distribution

Role title [name]	Description	Contains Roles
Client software distribution admin [sn_client_sf_dist.csd_admin]	Administrator role for managing client software distribution application.	• sam • agent_admin • report_admin • catalog_admin • itil • workflow_admin

Script includes installed

These script includes are installed with the Client Software Distribution plugin.

Script includes for Client Software Distribution

Script include	Description
CSDExtensionPoint	Execute the CSD provider's specific code
CSDUtil	Utility functions for the CSD application.
RefQualsCSD	Reference qualifier filter. This script provides the filter functions for the CSD providers, devices, SCCM application, install collections, and uninstall collections.
SCCMCatItemHandler	Sets the field values of specific SCCM catalog items. These values are the SCCM catalog item table name, catalog item name, SCCM provider, and SCCM software configuration.
SoftwareCatItemCreator	Creates software catalog items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes for Client Software Distribution (continued)

Script include	Description
CSDCatItemHandler	Base class for CSD catalog item creation. This script is used by the Create Catalog Item UI action to create and application catalog.
CSDDemoDataUtil	Populates demo data.
CSDDemoDataUtilAjax	Populates demo data.

Properties installed

Properties for client software distribution (CSD) manage the installation status of requested software deployments and configure scheduled Discoveries.

To access CSD properties, navigate to **Client Software Distribution** > **Properties**. The following properties are available:

Client software distribution properties

Property	Name	Description
Status check expiration interval (days)	sn_client_sf_dist.softwareInstallExpDays	Controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. Installation statuses are: • **Not installed**: User has not installed requested software prior to the expiration of the configured time limit. • **Installed**: Software was installed within the configured time limit. • **Status check expired**: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment. • **Revoked**: Software was revoked by the administrator. • **Type**: integer • **Default value**: 30
Reconcile software installation status interval (hours)	sn_client_sf_dist.softwareInstallIntervalHour	Determines when the scheduled job runs that determines the installation status. By default, the system checks the installation status every hour.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution properties (continued)

Property	Name	Description
		• **Type**: integer • **Default value**: 24
Set scheduled application Discovery interval (days).	sn_client_sf_dist.discoveryExeDay	Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value. • **Type**: integer • **Default value**: 5
Set lease execution schedule job interval (minutes)	sn_client_sf_dist.lease_execution_interval	Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend. • **Type**: integer • **Default value**: 1
Set time prior to lease end to notify requester (days)	sn_client_sf_dist.lease_end_notification	Determines how many days prior to the end of a software lease to notify the requester. If lease extensions are allowed, ensure that this period provides enough time for the approval process to complete before the lease expires. • **Type**: integer • **Default value**: 5

Flows and subflows installed

These flows and subflows are installed with the Client Software Distribution plugin.

Flows installed with client software distribution

Flow	
Order Client Software	Schedules the installation of an ordered application on the selected device. The request requires approvals based on the user input in the catalog item configuration.
Deploy Client Software	Deploys a software by executing provider-specific subflow. Creates catalog tasks if there is a failure in the execution of the provider subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows installed with client software distribution

Subflow	Description
Discover And Store SCCM Data	Retrieves lists of applications, collections, and deployments from SCCM servers using Microsoft SCCM spoke actions. An administrator runs this subflow from a UI action in a SCCM Server Instance record.
Deploy SCCM Application	Triggered by the Order Client Software flow to deploy software through SCCM server. This subflow adds either the user or the device into the SCCM collection.
Revoke Client Software	Begins the software revocation process for software deployed by an external provider. Administrators run this subflow from a UI action on the Requested Software record and the Installed Software Not Entitled record. This subflow triggers the appropriate provider subflow that performs the actual revocation. For example, this subflow triggers the Revoke SCCM Application subflow for applications in SCCM uninstall collections.
Revoke SCCM Application	Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software subflow triggers this subflow to revoke software deployed by an SCCM server. This subflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.
CSD Lease End Notification	Notifies user about the lease end date of the software and send link to extend lease end date.
CSD Deploy Software Post Processing	Performs post processing after the software deployment is successful. The Deploy Client Software flow triggers this subflow.
CSD Lease End Notification	Notifies user about the lease end date of the software and sends link to extend lease end date.
Prepare Revocation Data	Prepare data required for the revocation flow.

Create licenses and counters for distributed software

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

Before you begin

Role required: sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license **Valuation** is greater than 0, and the license type is **Not allocated**, CSD assumes that the license is available for the software.

Procedure

1. Navigate to **All** > **Software Asset** > **Software Licenses**.
2. Add a new software license for the software model you used in CSD.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Navigate to **Software Asset** > **Reconciliation** > **Software Counters**.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

Client software distribution ordering process

Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.

Lease start and end dates

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Asset Lease Management plugin that is activated automatically with CSD. The system pre-populates the **Lease start** field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the **Lease end** field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The **Lease end** field is not mandatory and can be left blank to order software with no end date.

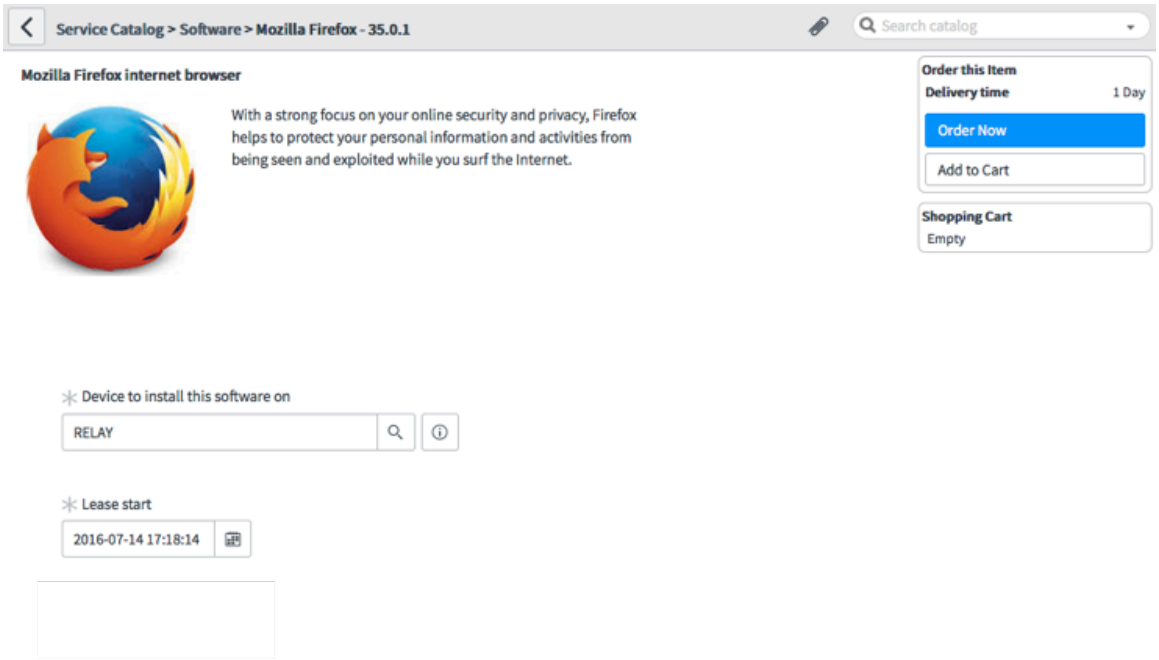
Note:
For systems deploying software from Microsoft System Center Configuration Management (SCCM), the **Lease end** field is only available if the Define an SCCM configuration specifies an uninstall collection.

Software offered only to the logged in user

If the software catalog item is configured with the **Order on behalf of** check box cleared, the **User** field does not appear on the order form. The logged in user selects the device on which to deploy the software from the **Device to install this software on** field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for the assigned computer. User selects the machine from a list of devices and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the **Lease end** field is not available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Software ordered on behalf of another user

If the software catalog item is configured with the **Order on behalf of** check box selected, the **User** field appears on the form. The logged in user can select any user from this field. The **Device to install this software on** field only lists the devices assigned to the user selected in the **User** field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the **User** field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.

© 2026 ServiceNow, Inc. All rights reserved.

Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Before you begin

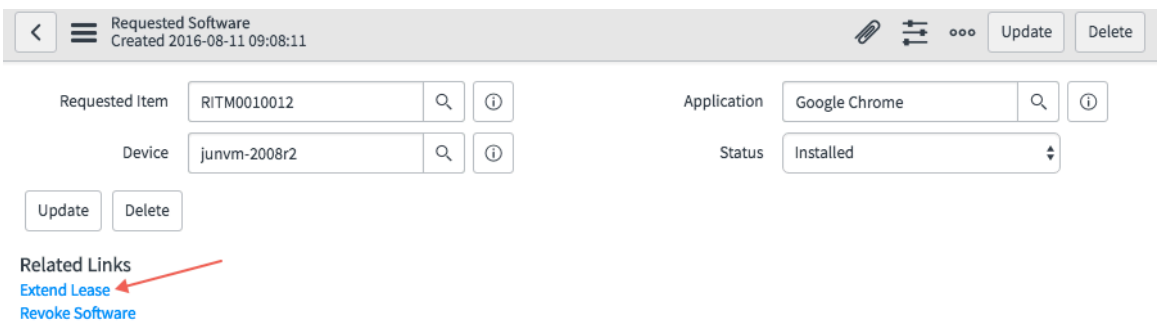
Role required: Any system user

About this task

If your software has a lease end date defined, and the software status is **Installed**, you can request an extension of the lease, pending any approvals your organization requires.

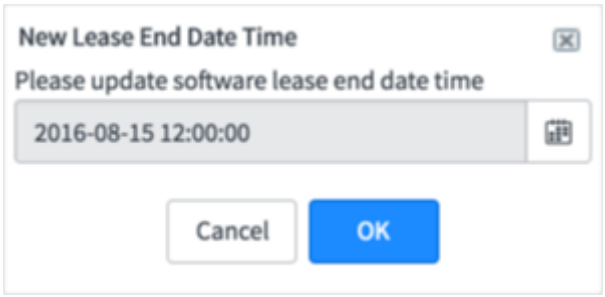
Procedure

1. Navigate to **All** > **Service Catalog** > **My Requested Software**.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under **Related Links** click **Extend Lease**.



4. In the dialog box that appears, select a new lease end date in the calendar and click **OK**.
   You must select a date later than the current date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

Important:
If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.

Client software distribution from SCCM

Use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The Microsoft SCCM spoke contains actions that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

Configuring SCCM

Follow the SCCM configuration procedures in the order shown.

Note:
Ensure that user must be able to establish remote PowerShell sessions with the MECM server. The spoke scripts use *`Microsoft.PowerShell32`* configuration for creating sessions. For user permissions, see User permissions in Microsoft Learn.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

Before you begin
Role required: SCCM Application Administrator.

About this task
These instructions are for Microsoft 2012 R2 Server.

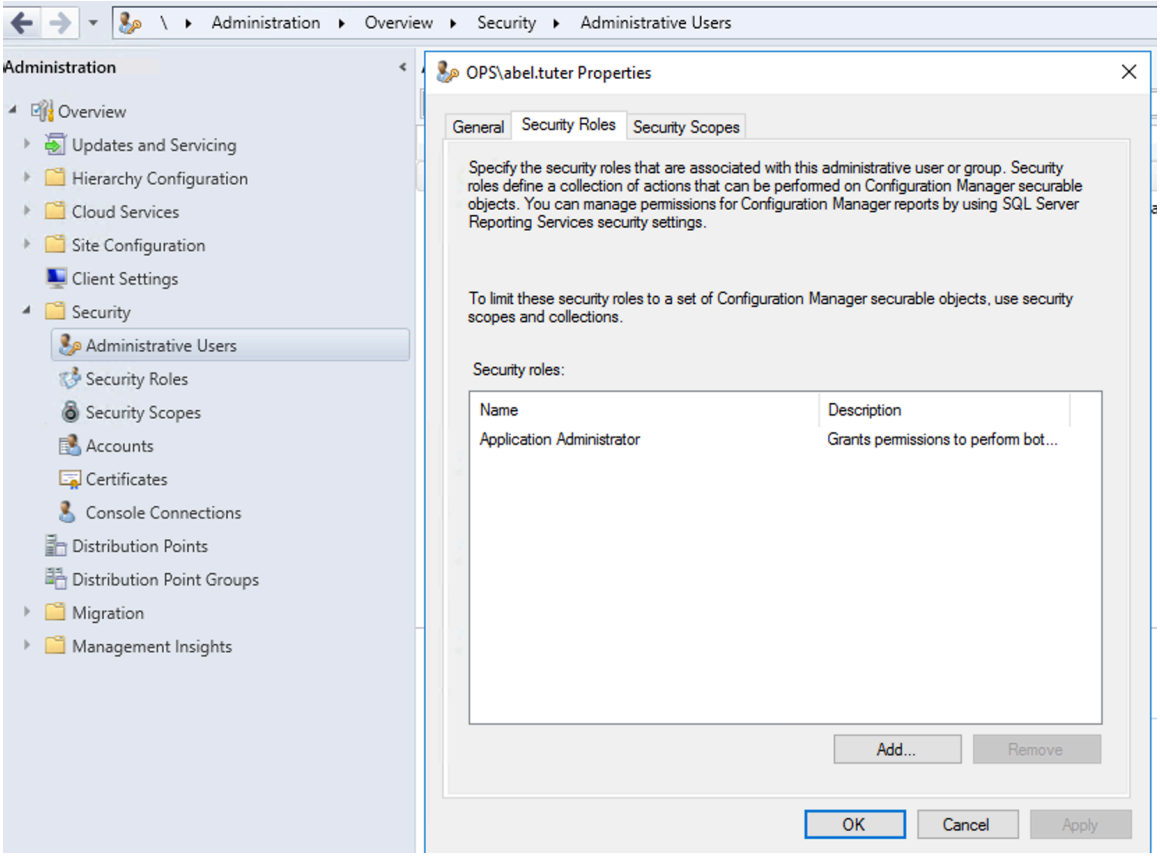
Procedure

1. In the System Center Configuration Manager console, navigate to **Administration** > **Security** > **Administrative Users**.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select **Properties** from the drop-down menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Properties dialog box, select the **Security Roles** tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click **Add**, select this role from the list, and click **OK**.

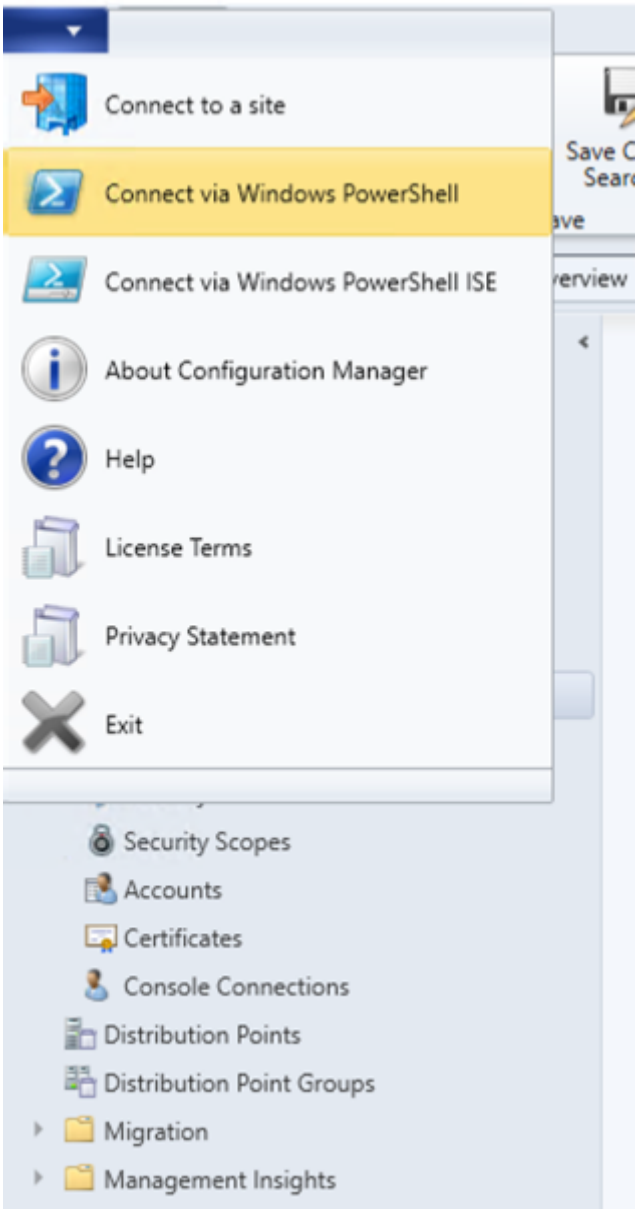
Granting the Application Administrator role on the SCCM server



7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect to PowerShell



9. Ensure that the user can access the CM console.
   This action establishes the environment path to PowerShell for the logged in Application Administrator user.

Update the SCCM cmdlet libraries

Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

Before you begin

Role required: Either current user or system administrator, depending on settings.

About this task

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
WARNING: An update to the System Center 2012 Configuration
 Manager Cmdlet
Library is available. Please go to
'http://go.microsoft.com/fwlink/?LinkId=528947' to download the
 latest version.
Running cmdlet version: 5.0.8231.1004 Latest cmdlet version:
 5.0.8328.1155
```

Download the latest version of the cmdlet library from http://go.microsoft.com/fwlink/?LinkId=528947. For installation instructions, see https://technet.microsoft.com/en-us/library/dn958404(v=sc.20).aspx.

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

Procedure

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
3. Select **Connect via Windows PowerShell**.
4. Run one of these commands to disable the update check:
   - **Per-user**: *`Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`*
   - **Per-system**: *`Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`*

   Important:
   The per-system cmdlet must run in an elevated Windows PowerShell session.
5. Run the *`Get-CMCmdletUpdateCheck`* command to refresh the console and check the settings.
6. Ensure that the value of the *`IsEnabled`* configuration variable has changed to **False**. This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the *`-IsUpdateCheckEnabled 1`* command for either the current user or for the system.

Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Before you begin

Role required: admin.

Procedure

1. In the navigation filter, enter **cmdb_ci_dns_name.list**.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

Create Connection and Credential alias for SCCM deployments

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

Before you begin

Role required: sn_client_sf_dist.csd_admin or admin

About this task

Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Click **New**.
3. On the form, fill in the fields.

Connection & Credential Aliases form

Field	Description
Name	Name to uniquely identify the alias. For example, `CSD Alias`.
ID	System generated unique ID.
Application	Application scope that contains this record.
Type	Alias type. Select **Connection and Credential**.
Connection type	Connection type. Select **Basic**.
Support Multiple Active Connections	Option to specify if the alias supports multiple active connections.
Default Retry Policy	Default retry policy associated with **Connection Alias**.
Configuration Template	Template that defines the inputs required to set up the spoke.

4. Right-click the form header, and click **Save**.
5. Click the **Create New Connection & Credential** related link.
6. On the form, fill in the fields.

Create Connection and Credential form

Field	Description
SCCM Server Instance Name	Name to uniquely identify the SCCM server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Host	Fully qualified domain name of the target host where the SCCM server is installed.
Credential Name	Credential record associated with the connection and credential alias.
User Name	User name with access to the target Windows host.
Password	Password for the account.

7. Click **Create**.

Result
Connection record and SCCM Server Instance are created and associated with the connection and credential alias.

Retrieve SCCM data for client software distribution

Retrieve the collections and the list of applications available for deployment from your SCCM servers.

Before you begin
Role required: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:

- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- Configure the Application Administrator role on the SCCM server with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
- Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

About this task
To populate the Client Software Distribution application with SCCM data:

Procedure
1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Server Instance**.
2. Click **New**.
3. In the SCCM Server Instance form, identify the server by name and select the connection and credential alias.

   Note:
   Leave the **Fully qualified domain name** field empty.

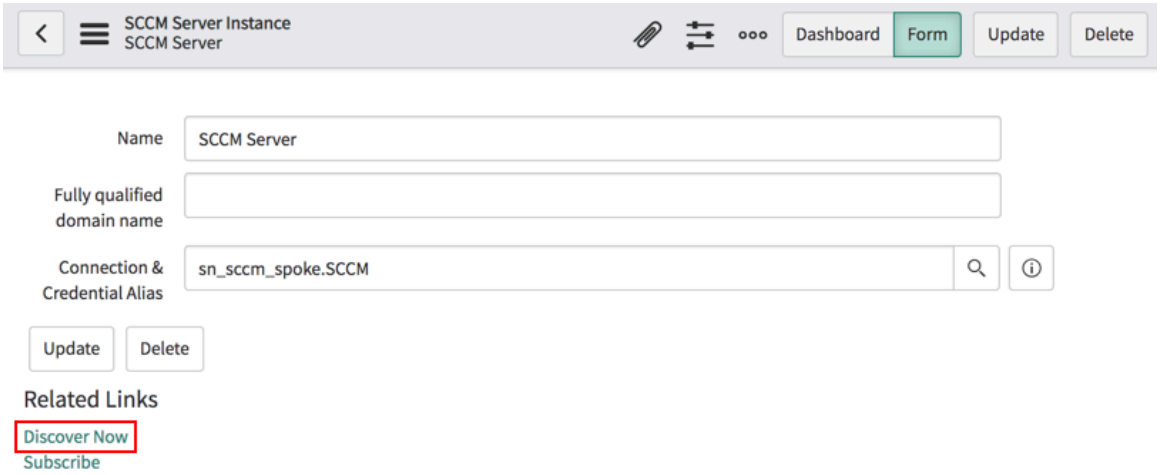
4. Click **Submit**.

   The new SCCM server appears in the list.

5. Open the new SCCM record and click **Discover now** under **Related links**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system runs the Discover SCCM flow that retrieves the application, collection, and deployment data from the SCCM server.



SCCM server Discovery for client software distribution

Discovery flow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the **Discover SCCM** flow from an SCCM Server Instance record to populate the following ServiceNow tables:

SCCM data populated in ServiceNow tables

Table	Fields
SCCM Application [sn_client_sf_dist_sccm_application]	• name • publisher • version • model • sccm_server
SCCM Collection [sn_client_sf_dist_sccm_collection]	• name • type • sccm_server
SCCM Deployment [sn_client_sf_dist_sccm_deployment]	• application • collection • type

Note:
For details about the actions used in this flow to extract data from an SCCM server, see Microsoft SCCM spoke .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Before you begin

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution for details.

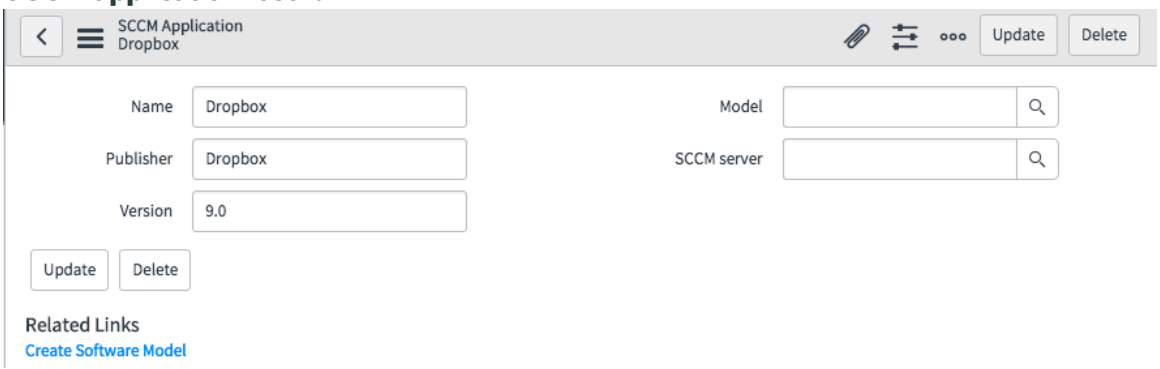
About this task

You can link an SCCM application to an existing software model or create a new model.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Applications**.
   A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the **Model** field and select a model from the list.

SCCM application record



4. To create a model, click **Create Software Model** under **Related Links**.

   a. Complete the software model fields.
   See for details.

   b. Click **Submit**.
   The view returns to the SCCM Applications form.

Define an SCCM configuration

To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you begin

Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin.

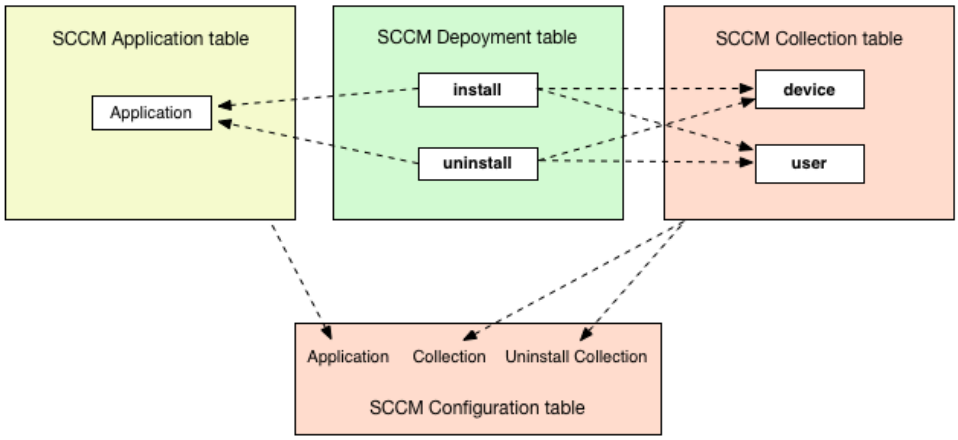
About this task

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

with an **install** deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an **uninstall** collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.

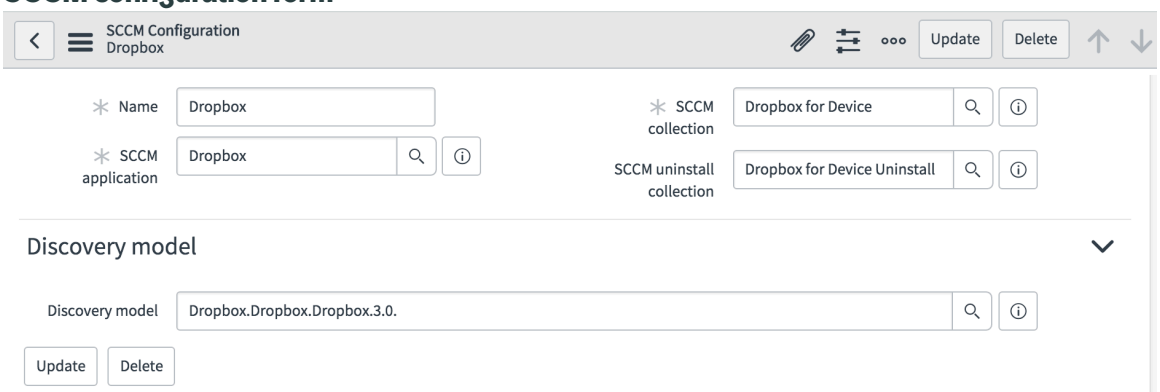
SCCM table references



Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Applications**.
2. Open an application that has a configured software model.
3. Under **Related Links**, click **Create Software Configuration**.
4. Complete the form, using the fields in the table.

SCCM configuration form



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SCCM configuration fields

Field	Description
Name	Recognizable name for this SCCM software configuration.
SCCM application	Name of an application hosted on the SCCM server.
SCCM collection	Name of the collection associated with the **install** deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.
SCCM uninstall collection	Name of the collection associated with the **uninstall** deployment for the selected application on the SCCM server. You must specify an uninstall collection to: ○ Define a lease end date for deployed software. ○ Allow lease extensions. ○ Revoke software from a user's machine.
Discovery model	Discovery model that links the unentitled software installation with the SCCM configuration. From the SCCM configuration record, Client Software Distribution can determine which collection to use to revoke the software. Unentitled software is software found on the user's machine that the user is not entitled to use.

Create a catalog item for an SCCM application

Create a catalog item for an application you want to offer for distribution from the service catalog using the applications discovered on the SCCM server.

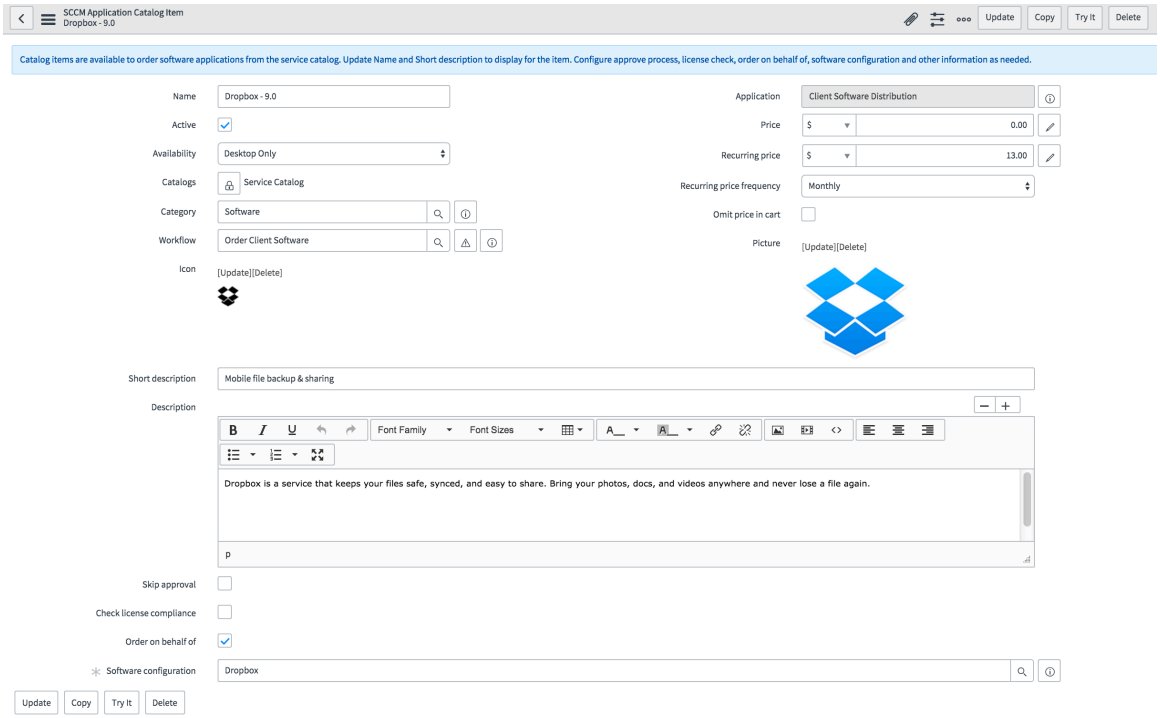
Before you begin

Role required: sn_client_sf_dist.csd_admin or admin
Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Applications**.
   A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
3. Under **Related Links**, click **Create Catalog Item**.
   A new SCCM Application Catalog Item record appears with preconfigured information. .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table by the Client Software Distribution plugin:

SCCM fields in the catalog item form

Field	Description
Skip approval (skip_approval)	Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the **Order on behalf of** field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items. **Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the **Skip approval** check box to determine if the software item requires approval by the requester's manager.
Check license compliance (check_license_compliance)	Check box that forces the system to determine if deploying this item is allowed under the current license.
Order on behalf of	Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	approvals are required for this type of deployment by clearing the **Skip approval** check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information: ○ **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list. ○ **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list. ○ **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time.
SCCM configuration	Name of the Define an SCCM configuration for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server.

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the**Approved By Group** related list.
   By default, the Service Catalog Request flow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this flow skips approval altogether and ends. The system then runs the Order Client Software flow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.
6. Click **Update**.
   The view returns to the SCCM Applications list.
7. To see all client software distribution (CSD) catalog items, navigate to **Client Software Distribution** > **Maintain Items** > **Software Items**.

SCCM deployment process

Order an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software flow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software flow sends the catalog request to the requesting user's manager for approval.
2. If the **Check license compliance** check box is selected in the software catalog item, the flow performs a software license check. If there is no license available, the flow creates a catalog task to procure more licenses and assigns the task to the CSD Administrators group.
3. The Order Client Software flow triggers the Deploy SCCM Application flow as a subflow. This subflow adds either the user or the device to the SCCM collection using the Add to User Collection or Add to Device Collection actions in the Microsoft SCCM Spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If the software configuration specifies **SCCM uninstall collection** in the software catalog item, the Deploy SCCM Application subflow checks if the user or device exists in the uninstall collection. The flow uses the Is Device in Collection or Is User in Collection in the Microsoft SCCM Spoke. If the user or device exists in the uninstall collection, the flow removes the device or user. The subflow uses the Remove from Device Collection or Remove from User Collection action in the Microsoft SCCM Spoke before adding it to the SCCM install collection.

Client software distribution validation process

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.
- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses CSD property settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the *sn_client_sf_dist.softwareInstallExpDays* property.
- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

SCCM software revocation

Revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

Revoke software deployed through the service catalog

Software deployed by SCCM can be revoked, but only when the status of software is **Installed** and the application associated with the software configuration has an uninstall collection configured.

Before you begin

- Create an Define an SCCM configuration for the application that names an appropriate uninstall collection.
- Associate the CSD catalog item for the application with the SCCM configuration that specifies the uninstall collection.

Role required: sn_client_sf_dist.csd_admin or admin

A subflow called Revoke SCCM Application moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **Reports** > **Requested Software**.
2. Open the record for the SCCM software package you want to revoke.
   The package must have a **Status** of **Installed** to be revocable.
3. Under **Related Links**, click **Revoke software**.

   This action runs the Revoke Client Software flow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoke unentitled software

Revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

Before you begin

To revoke software using SCCM, you must create an Define an SCCM configuration for the application, in which the appropriate software Discovery model is defined. See Software discovery models Discovery models and software installations.

Role required: sn_client_sf_dist.csd_admin or admin

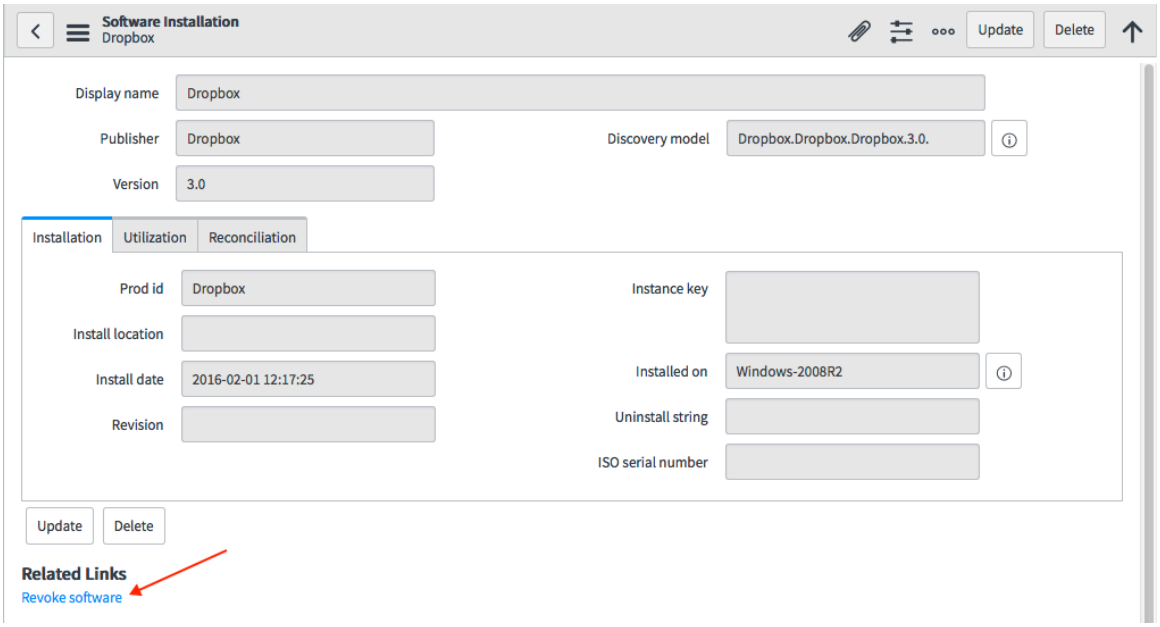
Client Software Distribution (CSD) uses Software Asset Management to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **Reports** > **Installed Software Not Entitled**.
2. Select the record for the installation that has unentitled users.
3. Under **Related Links**, click **Revoke software**.
   This action runs the Revoke Client Software flow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.



SCCM software revocation flow

The Revoke SCCM Application flow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation subflow to run, the software package must have a status of Client software distribution validation process and must be pre-configured for an appropriate uninstall collection. See Revoke software deployed through the service catalog for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application subflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The subflow employs two custom actions in the Microsoft SCCM Spoke, Remove from User Collection and Remove from Device Collection, to remove either the user or the device from its original collection. The subflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the Add to User Collection or Add to Device Collection activity.

Note:
This subflow is triggered by the Revoke Client Software subflow.

Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

CSD dashboard

To access the CSD dashboard, navigate to **Client Software Distribution** > **Requested Software** > **Dashboard**.

Software Requested Item Stage Report	Displays the sum of all requested items, grouped by the requested item's stage, for each month. • **Type**: Line reports • **Table**: Requested Software [sn_client_sf_dist_req_software]
License Counts Available	Displays the license counts for all available applications. • **Type**: Create a basic list report • **Table**: SCCM Application Catalog Item [sn_client_sf_dist_sccm_app_cat_item]

Usage Overview dashboard

Navigate to **Client Software Distribution** > **Usage Overview** to view the current transaction count for your instance.

Client software distribution extension framework

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.

Important:
The use of CSD extension points is an advanced procedure intended for use by experienced ServiceNow AI Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

Configure client software distribution providers

Identify the provider and specify the flows, subflows. and extension points for a customized software distribution process.

Before you begin

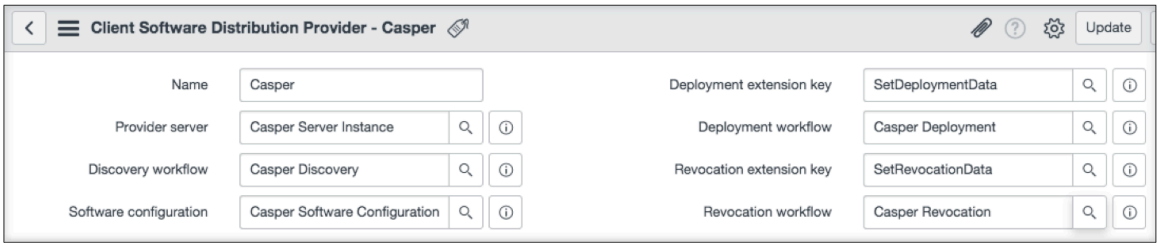
Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

Procedure

1. Navigate to **All** > **Client Software Distribution** > **Extensions** > **Providers**.
2. Click **New**.
3. Complete the form using the fields in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Client software distribution provider fields

Field	Description
Name	Descriptive name of the provider.
Provider server	Table name of the provider server. You must create this table as an extension of the Configuration Item [cmdb_ci] table. For example, you might call your table Casper Server Instance [cmdb_ci_casper_server_instance].
Discover And Store SCCM Data subflow	Subflow that discovers the provider server and returns the data from that server back to the instance. This is the subflow you create with custom activities that query the provider server.
Software configuration	Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config] table. For example, you might create a table called Casper Software Configuration [sn_client_sf_dist_casper_sf_config].
Deployment extension key	The **SetDeploymentData** key provided with CSD. This key sets up the data for the software ordering and deployment flow.
Deploy Client Software flow	Flow that deploys software from the provider server. This is the flow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.
Revocation extension key	The **SetRevocationData** key provided with CSD. This key sets up the data for installation revocation.
Revoke SCCM Application subflow	Subflow that revokes an installation from a provider server. This is the subflow you created with custom activities that tells the provider which application to remove from a device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution extension keys

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for flows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment flow.
- **SetRevocationData**: Generates the input variables for the revocation flow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

Client software distribution extension points

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation flows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

SetDeploymentData

The script associated with this extension key must set the *csdExtensionResult* object with these attributes:

- *deploymentWorkflowInputs* : Object that specifies the deployment flow input variables.
- *softwareModel*: Software model sys_id.
- *deploymentType*: An integer. Use **1** for deployment to a user and **2** for deployment to a device.
- *softwareApplication*: Software application sys_id.

CheckRevocable

The script associated with this extension key gets the input parameter *csdExtensionInputs.softwareConfiguration*, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the *csdExtensionResult* object to **true** or **false**, depending on whether the software configuration specifies uninstallation.

SetRevocationData

The script associated with this extension key gets the input parameter *csdExtensionInputs.softwareConfiguration*, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the *csdExtensionResult* object with these attributes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *revocationWorkflowInput* : Object that specifies the revocation flow input variables.
- *softwareModel*: Software model sys_id.
- *deploymentType*: An integer. Use **1** for deployment to a user and **2** for deployment to a device.

Client Software Distribution 2.0 application

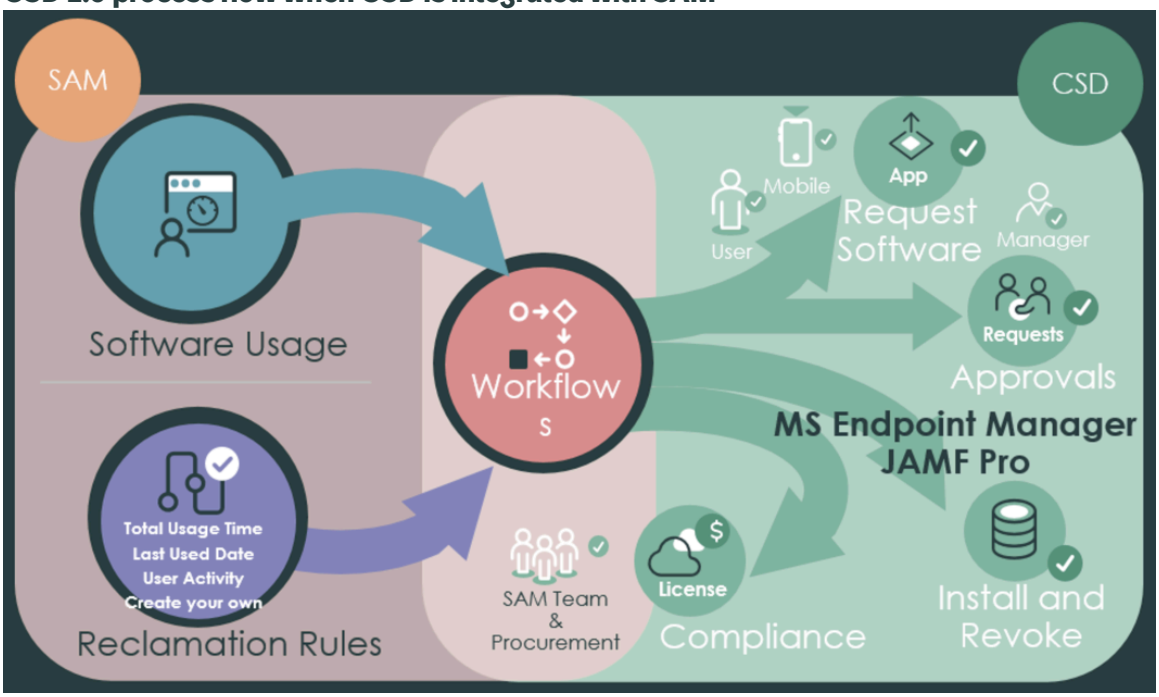
Client Software Distribution 2.0 application (CSD 2.0) application enables administrators to distribute software from the service catalog using third-party management systems.

CSD 2.0 enables an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD 2.0 application to automate the deployment and revocation of software from a third-party software provider using the custom flows. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using provider-specific spoke flows, subflows, and actions. For example, deployment is accomplished using Microsoft Endpoint Configuration Manager spoke.

CSD 2.0 also integrates with Software Asset Management (SAM Professional or SAM Foundation) to manage license information of the deployed software.

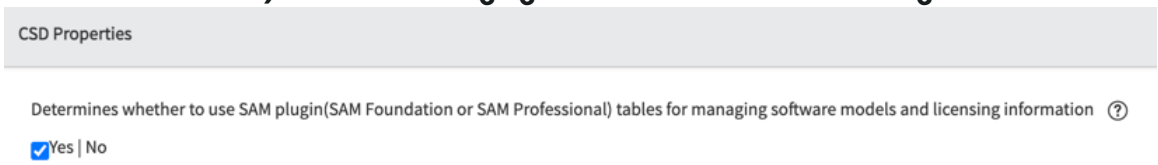
Note:
CSD 2.0 is different from Client Software Distribution using Integration Hub. CSD 2.0 is available on ServiceNow Store.

CSD 2.0 process flow when CSD is integrated with SAM



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To integrate CSD 2.0 with SAM, navigate to **Client Software Distribution 2.0** > **Properties** and select the check box for **Determines whether to use SAM plugin(SAM Foundation or SAM Professional) tables for managing software models and licensing information**.



Important considerations

Ensure that you are aware of these differences between CSD and CSD 2.0:

	CSD	CSD 2.0
Supported providers	Microsoft System Center Configuration Management (SCCM).	Microsoft Endpoint Configuration Manager, Jamf, and Microsoft Intune.
Procedure to add new provider	User must write extension point scripts.	User can use subflows in Workflow Studio. This is easier than writing extension point scripts in CSD.
License compliance check and entitlements	Tightly coupled with the SAM license data.	Flexibility to choose either the SAM tables or CSD 2.0 tables.
Data discovery	Microsoft SCCM provider uses PowerShell cmdlets for data discovery.	Microsoft Endpoint Configuration Manager spoke is updated to use the REST protocol for data discovery. This improves the performance and reduces load on MID Server as REST supports pagination.
Software revocation	CSD can revoke software requested using the CSD catalog. CSD can also uninstall software using SCCM when revocation is triggered from the reclamation candidates for SCCM provider.	CSD 2.0 can revoke software requested using the CSD 2.0 catalog. CSD 2.0 can also uninstall software using Microsoft Endpoint Configuration Manager, Microsoft Intune, and Jamf when revocation is triggered from the reclamation candidates.

Application version

CSD 2.0 v1.5.0 is the latest version.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This application provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

AI agent	Description
Catalog item creation AI agent	Automates the creation of catalog items for applications provided by service providers like Microsoft Intune and Jamf. The agent also manages software models, configurations, group associations, and catalog item generation. **Note:** This version of CSD 2.0 supports Microsoft Intune and Jamf providers only.
Microsoft Endpoint Configuration Manager collection creation management AI agent	Creates collections in Microsoft Endpoint Configuration Manager. The agent prompts for required collection details, validates inputs, and requests confirmation before creating the collection. The agent also handles common errors and reports the outcome of the operation.
Microsoft Endpoint Configuration Manager collection deletion management AI agent	Deletes collections in Microsoft Endpoint Configuration Manager. The agent collects the required inputs, checks for dependencies, and requests confirmation before deletion. The agent also attempts to resolve dependencies automatically and reports the result.
Microsoft Endpoint Configuration Manager collection membership addition AI agent	Adds collections as deployment targets for applications in Microsoft Endpoint Configuration Manager. The agent gathers the required information, confirms the action, and handles errors that occur during the operation.
Microsoft Endpoint Configuration Manager collection membership removal AI agent	Removes device or user members from collections in Microsoft Endpoint Configuration Manager. The agent guides users through the required inputs, confirms

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
	the action before execution, and handles errors during the process.
Microsoft Endpoint Configuration Manager application targets addition AI agent	Adds device or user targets to collections in Microsoft Endpoint Configuration Manager. The agent prompts for the required details, validates inputs, requests confirmation, and reports the result of the operation.
Microsoft Endpoint Configuration Manager application targets removal AI agent	Removes collections as targets from applications in Microsoft Endpoint Configuration Manager. The agent gathers the required inputs, confirms the action, and handles errors while performing the removal.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Note:
To access data or perform operations on data in the table that is associated with the AI agent, users must have the CSD Admin role.

Available sample agentic workflows

Install Now Assist for Integration Hub and start using the available sample agentic workflows and AI agents. For more information, see Now Assist for Integration Hub.

In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. Use the available sample agentic workflow in AI Agent Studio so that AI agents can coordinate to solve complex problems. To modify the available sample agentic workflow as per your requirement, see Modify an agentic workflow.

Sample agentic workflow	Description	AI agents used	Always ON by default?
Microsoft Endpoint Configuration Manager Collection Management Agentic Flow	Manages Microsoft Endpoint Configuration Manager device and user collections and their application assignments. This agentic workflow interprets user requests, separates them into discrete collection and deployment tasks, and coordinates the	• Microsoft Endpoint Configuration Manager collection deletion management AI agent • Microsoft Endpoint Configuration Manager application targets removal AI agent • Microsoft Endpoint Configuration	No **Note:** To activate the workflow, see Activate an agentic workflow template.

Request the CSD 2.0 application

Client Software Distribution 2.0 application plugin (com.sn.csd) is available on ServiceNow Store and can be used with a subscription to Integration Hub.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The CSD 2.0 application can be integrated with Microsoft Endpoint Configuration Manager using the Microsoft Endpoint Configuration Manager spoke flow, subflows, and actions to deploy or revoke software using an Endpoint server.

Note:

- The CSD 2.0 plugin runs in its own application scope.
- If you're having trouble installing the app, ensure that these dependent plugins are installed:
  - Complex Object (com.glide.cobject)
  - ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
  - Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer)
  - Service Catalog Scoped API (com.glideapp.servicecatalog.scoped.api)
- See Legal schedules - IntegrationHub overview for more information about the required Integration Hub subscription.

Components installed with CSD 2.0

Several types of components are installed with the CSD 2.0 application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

These tables are installed with the Client Software Distribution 2.0 application plugin (com.sn.csd).

CSD 2.0 tables

Table	Description
Client Software Distribution Provider [sn_csd_provider]	Contains all software distribution providers.
CSD Catalog Item Fulfillment Configuration [sn_csd_cat_item_fulfilment_config]	Contains additional configuration information required for ordering a catalog item using CSD 2.0.
Client Software Distribution Software Configuration [sn_csd_software_config]	Base table for all software provider configurations.
Client Software Distribution Lease Execution [sn_csd_lease_execution]	Contains scripts that are scheduled to run the subflows and flows associated with deployment, revocation, and lease management.
Device Entitlement [sn_csd_entitlement_asset]	Contains information about the license allocation for devices.
Client Software Distribution Application [sn_csd_application]	Base table for all software provider applications.
Client Software Distribution Lease Manager [sn_csd_lease_manager]	Links the requested item with the required lease execution and schedule.
User Entitlement [sn_csd_entitlement_user]	Contains information about the license allocation for users.
License Entitlement [sn_csd_entitlement]	Parent table for the device and user entitlement tables.
Client Software Distribution Lease Schedule [sn_csd_lease_schedule]	Contains the schedule entries for deployment, lease and revocation.
Software Entitlement [sn_csd_license]	Contains licensing information of the required software model.
Software Model [sn_csd_software_product_model]	Contains details of the required software. The. details include display name, manufacturer, and so on.
Requested Software [sn_csd_req_software]	Contains all requested software, and their statuses.

Roles installed

These roles are installed with the CSD 2.0 application.

Roles for Integration Hub - CSD 2.0

Role title [name]	Description
CSD Admin	Administrator role for managing CSD 2.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles for Integration Hub - CSD 2.0 (continued)

Role title [name]	Description
[sn_csd.CSD Admin]	
CSD User [sn_csd.CSD User]	Role to order catalog items from the catalog using CSD 2.0 and to perform actions such as revoke software, extend lease, and so on.

Properties installed

Properties for CSD 2.0 manage the installation status of requested software deployments and configure scheduled Discoveries.

To access CSD 2.0 properties, navigate to **Client Software Distribution 2.0** > **Properties**. The following properties are available:

Client software distribution properties

Property	Name	Description
Status check expiration interval (days). Configure the number of days the system should wait before ignoring the software installation status.	sn_csd.softwareInstallExpDay	Controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. • **Type**: integer • **Default value**: 30 Installation statuses are: • **Not installed**: User has not installed requested software prior to the expiration of the configured time limit. • **Installed**: Software was installed within the configured time limit. • **Status check expired**: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment. • **Revoked**: Software was revoked by the administrator. • **Not Synced**: Installation status is not synchronized with the status in the server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution properties (continued)

Property	Name	Description
		Note: If SAM is used along with CSD 2.0, the status is updated automatically. Else, the admin should change the status manually.
Reconcile software installation status interval (hours). Set the repeat interval for the scheduled job that determines the installation status.	sn_csd.softwareInstallIntervalHour	Determines when the scheduled job runs that determines the installation status. By default, the system checks the installation status every hour. • **Type**: integer • **Default value**: 24
Set scheduled application Discovery interval (days).	sn_csd.discoveryExeDay	Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value. • **Type**: integer • **Default value**: 5
Set lease execution schedule job interval (minutes)	sn_csd.lease_execution_interval	Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend. • **Type**: integer • **Default value**: 1
Set time prior to lease end to notify requester (days).	sn_csd.lease_end_notification	Determines how many days prior to the end of a software lease to notify the requester. If lease extensions are allowed, ensure that this period provides enough time for the approval process to complete before the lease expires. • **Type**: integer • **Default value**: 5
Determines whether to use SAM plugin(SAM Foundation or SAM Professional) tables for managing	sn_csd.useSAMPlugin	Option to use SAM plugin along with CSD 2.0 and choose SAM tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution properties (continued)

Property	Name	Description
software models and licensing information		

Flows, subflows, and actions

These flows, subflows, and actions are with the CSD 2.0 application.

Flows available with CSD 2.0

Flow	
Order Client Software	Schedules the installation of an ordered application on the selected device. The request requires approvals based on the user input in the catalog item configuration.
Deploy Client Software	Deploys a software by executing provider-specific subflow. Creates catalog tasks if there is a failure in the execution of the provider subflow.

Subflows available with CSD 2.0

Subflow	Description
Assign License	Creates an entitlement record.
Client Software Lease Extend	Extends the lease end date of the required software.
CSD Deploy Software Post Processing	Performs post processing after the software deployment is successful.
CSD Lease End Notification	Notifies user about the lease end date of the software and send link to extend lease end date.
Delete Lease Records	Deletes the lease schedule, lease execution, and lease manager records associated with the requested item.
Deploy Application Template	Flow template for the Deploy Application flow.
Look up Configuration Data Template	Flow template for the Look up Configuration Data flow.
Revoke Application Template	Flow template for the Revoke Application flow.
Revoke License	Removes the specified entitlement record.
Revoke Client Software	Revokes software from the provider server.
Look Up Applications	Returns the list of application details found for each software provider.
Look up SAM Software Models	Returns the list of SAM software models related to the specified application.
Configure SAM Software Model	Configures the SAM software model of the specified application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows available with CSD 2.0 (continued)

Subflow	Description
Configure CSD Software Model	Configures the CSD software model of the specified application.

Actions available with CSD 2.0

Action	Description
Get CSD Record URL	Generates link for the requested software.
Is Date Empty	Verifies if the input date is empty.
License Validation	Checks the license availability and retrieves the license information if available.
Update Lease End on Requested Item	Updates the lease end date of the requested item record.

Create licenses for distributed software using CSD 2.0

Licenses are associated with the software model and must be created if you want to track the license for software deployed by CSD 2.0.

Before you begin

Role required: sn_csd.CSD Admin

You can create software licenses in CSD 2.0 for software items deployed from the service catalog by CSD 2.0. CSD 2.0 depends on the allocations available to determine if the license is available for the requested software. If **Allocations Available** is greater than 0, CSD 2.0 assumes that the license is available for the software.

Procedure

1. Navigate to **Client Software Distribution 2.0** > **Software Entitlements**.
2. Click **New**.
3. On the form, fill these values.

Field	Description
Display Name	Name to identify the license record.
Software Model	Software model from the CSD 2.0 table.
Rights	Total number rights.
Allocation Type	Type of license entitlement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ For Microsoft Endpoint Configuration Manager: ▪ If **Install Collection** specified in **Software Configuration** (that is linked with catalog item) is of type **Device**, the license check is performed on software entitlements with **Allocation Type** as **Device**. ▪ If **Install Collection** specified in **Software Configuration** (that is linked with catalog item) is of type **User**, the license check is performed on software entitlements with **Allocation Type** as **User**. ○ For : ▪ If **Group** specified in **Software Configuration** (that is linked with catalog item) is of type **Mobile** or **Computer**, the license check is performed on software entitlements with **Allocation Type** as **Device**. ▪ If **Group** specified in **Software Configuration** (that is linked with catalog item) is of type **User**, the license check is performed on software entitlements with **Allocation Type** as **User**.

4. Click **Submit**.
   The license is created with the required rights.

Create entitlements for distributed software using SAM

Entitlements are associated with the software model and must be created if you want to track the license for software deployed by CSD 2.0 using SAM.

Before you begin
Role required: sam_admin or sam_user
For information about software reconciliation, see Software reconciliation for compliance.

Client software distribution ordering process

Software deployed by CSD 2.0 can be ordered from the service catalog by individual users or by approved users on behalf of others.

CSD 2.0 catalog items have different options, depending on how ordering is configured.

Lease start and end dates

All software deployed by CSD 2.0 requires users to specify the beginning date for the lease.

If the catalog item is configured for revocation (uninstall), the form displays the **Lease end** field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The **Lease end** field is not mandatory and can be left blank to order software with no end date.

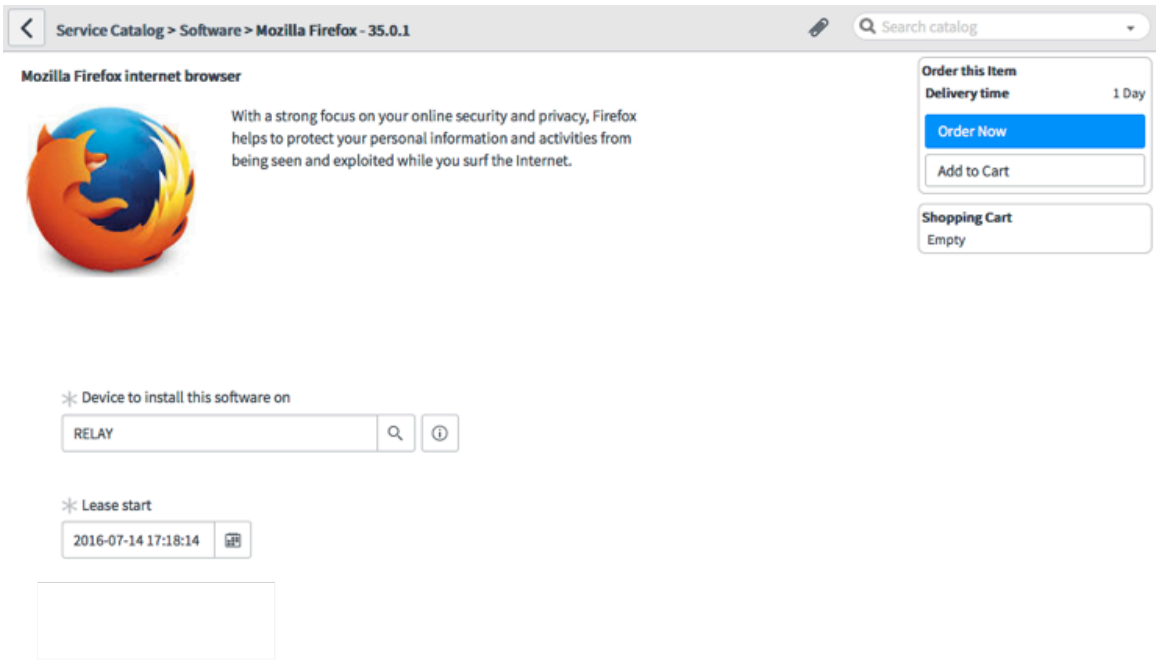
Software offered only to the logged in user

If the software catalog item is configured with **Access Type** as **Restricted**, the **User** field does not appear on the order form. The logged in user selects the device on which to deploy the software

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

from the **Device to install this software on** field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Google Chrome for the assigned computer. User selects the machine from a list of devices and selects the date and time the lease should begin.

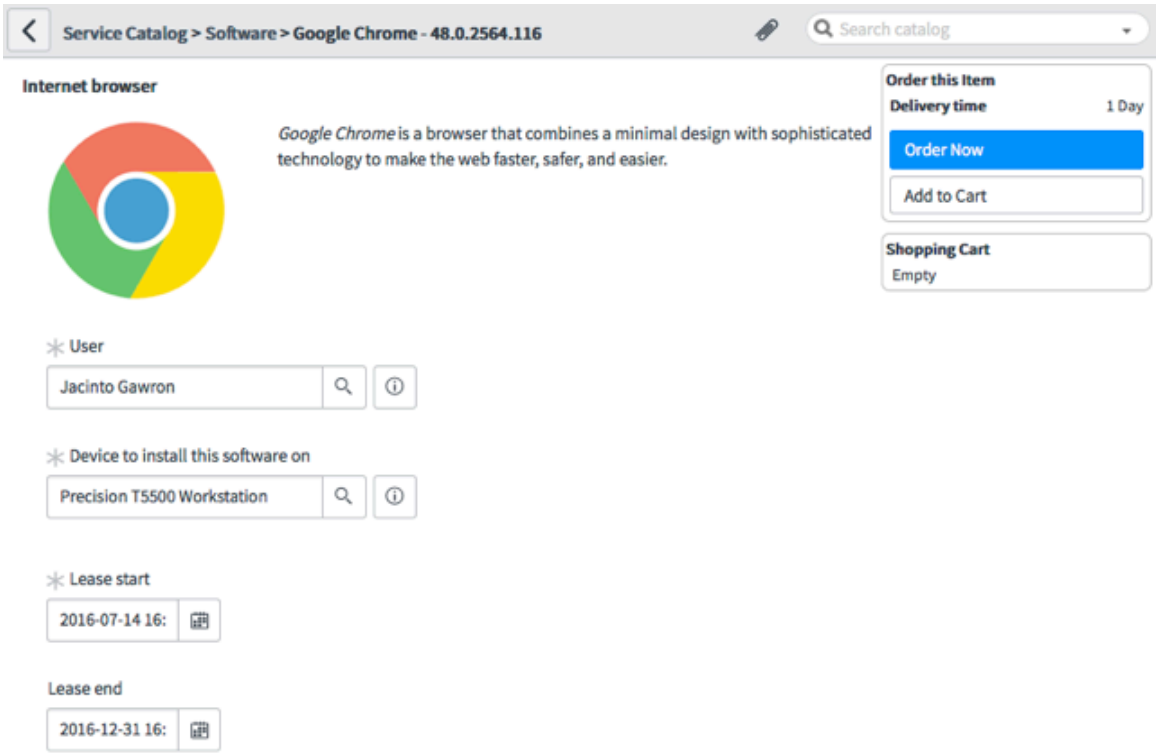


Software ordered on behalf of another user

If the software catalog item is configured with **Access Type** as **Delegated**, the **User** field appears on the form. The logged in user can select any user from this field. The **Device to install this software on** field only lists the devices assigned to the user selected in the **User** field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the **User** field and then chooses a computer from the list of devices assigned to the contractor. This software has a Microsoft Endpoint Configuration Manager uninstall collection configured, which enables the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, Microsoft Endpoint Configuration Manager automatically uninstalls the software from the device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:

- For Jamf, the device must have its serial number populated in the device table.
- For Microsoft Endpoint Configuration Manager, the name must be populated.

Extend a software lease

Users of software deployed by CSD 2.0 can request the extension of a lease window, if the software is revocable by a software distribution system.

Before you begin

Role required:

Note:
Ensure that the user has one of the two mentioned set of roles.

- itil and sn_csd.CSD Admin
- itil and sn_csd.CSD User

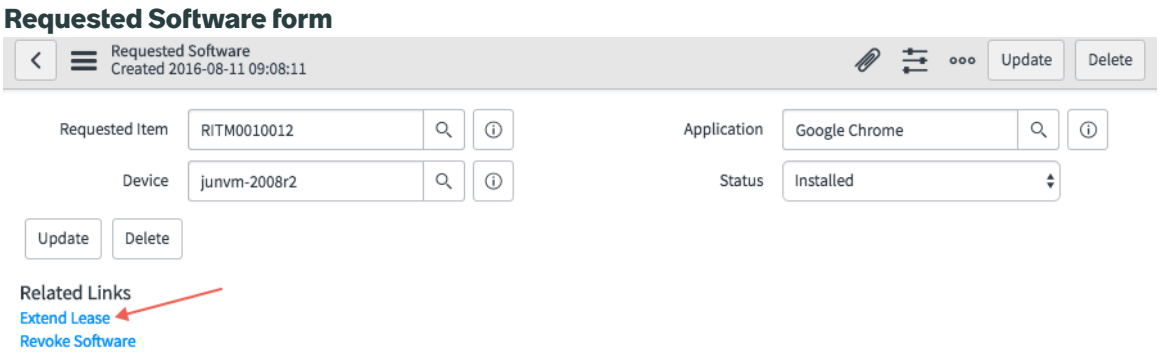
About this task

If your software has a lease end date defined, and the software status is **Installed** or **Not Synced**, you can request an extension of the lease, pending any approvals your organization requires.

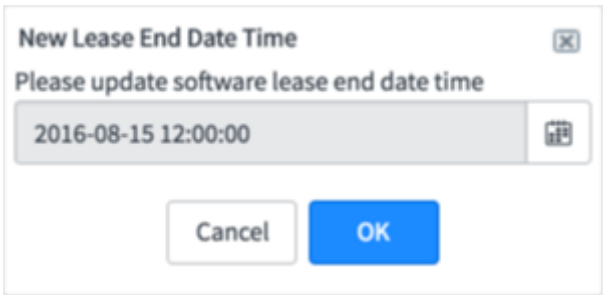
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Client Software Distribution 2.0** > **Requested Software**.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under **Related Links** click **Extend Lease**.



4. In the dialog box that appears, select a new lease end date in the calendar and click **OK**.
   You must select a date later than the current date.



If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD 2.0 sends an immediate end-of-lease notification.

Important:
If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.

CSD 2.0 for Microsoft Endpoint Configuration Manager

Use the CSD 2.0 along with the Microsoft Endpoint Configuration Manager spoke to deploy and revoke software deployments from Microsoft Endpoint Configuration Manager and manage distributions on hosts.

To use the Microsoft Endpoint Configuration Manager spoke with CSD 2.0, you must activate Microsoft Endpoint Configuration Manager spoke and CSD 2.0.

The Microsoft Endpoint Configuration Manager spoke contains actions that CSD 2.0 uses to deploy software from a service catalog request and manage user and device collections on Microsoft Endpoint Configuration Manager servers. In addition, CSD 2.0 can manage license counts for deployed software, revoke software deployed by Microsoft Endpoint Configuration Manager without user interaction, and manage lease periods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For systems deploying software from Microsoft Endpoint Configuration Manager, the **Lease end** field is only available if the configuration specifies an uninstall collection.

Verify the Microsoft Endpoint Configuration Manager spoke records

Verify that the spoke is integrated with CSD 2.0 after setting up and configuring the Microsoft Endpoint Configuration Manager spoke and create server instance record to use Microsoft Endpoint Configuration Manager spoke with CSD 2.0.

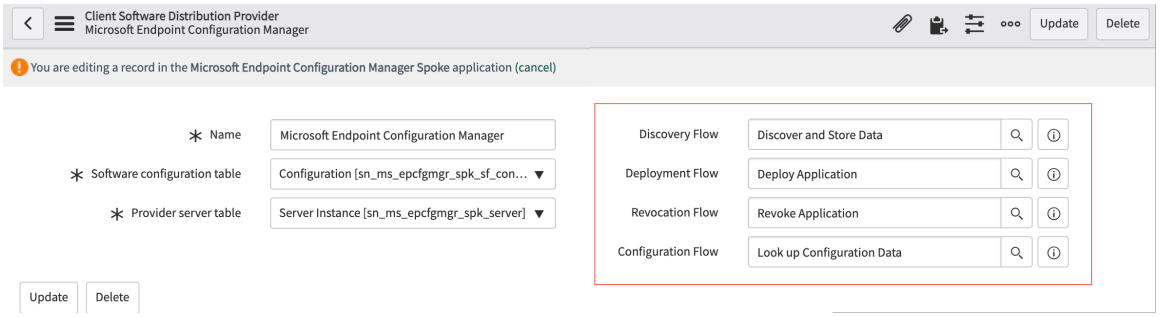
Before you begin

- Activate the Microsoft Endpoint Configuration Manager spoke and set up the spoke. For more information about the spoke setup, see Set up the Microsoft Endpoint Configuration Manager spoke.
- Activate the CSD 2.0 application.
- Role required: admin

Procedure

1. Verify that these modules are available.
   - Applications
   - Configurations
   - Server Instances
   - Deployments
   - Collections
2. Navigate to **System Definition** > **Tables** and verify that these table are available.
   - Deployment [sn_ms_epcfgmgr_spk_deployment]
   - Configuration [sn_ms_epcfgmgr_spk_sf_config]
   - Collection [sn_ms_epcfgmgr_spk_collection]
   - Server Instance [sn_ms_epcfgmgr_spk_server]
   - Application [sn_ms_epcfgmgr_spk_application]
3. Verify that the flows are configured correctly in the provider record.
   a. Navigate to **Client Software Distribution 2.0** > **Providers**.
   b. Open the record **Microsoft Endpoint Configuration Manager**.
   c. Verify that the flows are configured correctly in the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
You can configure the default flows as per your requirement.

Store details of the provider server

Create a server instance record to discover applications and store details of the provider server.

Before you begin
Role required: admin

Procedure

1. Navigate to **Microsoft Endpoint Configuration Manager** > **Server instances**.
2. Click **New**.
3. On the form, fill there values.

Field	Description
Name	Name to identify the server instance record.
Powershell Connection & Credential Alias	Powershell connection and credential alias you had configured while setting up the Microsoft Endpoint Configuration Manager spoke. For example, **Microsoft Endpoint Configuration Spoke**.
JDBC Connection & Credential Alias	JDBC connection and credential alias you had configured while setting up the Microsoft Endpoint Configuration Manager spoke. For example, **Microsoft Endpoint Configuration JDBC**.

Note:
You can use only the default connection and credential alias records that have been shipped along with the Microsoft Endpoint Configuration Manager Spoke.

4. Right-click the form header and click **Submit**.
5. Click the **Discover Now** related link to discover all applications and retrieve data from the server.
   The Discover and Store Data subflow is triggered. Data is retrieved and in stored in the Microsoft Endpoint Configuration Manager Spoke tables.

Set up a software model for the Microsoft Endpoint Configuration Manager application

Using the applications discovered on the Microsoft Endpoint Configuration Manager server, set up a software model to manage licenses.

Before you begin

Role required:

Note:
Ensure that the user has one of the two mentioned set of roles.

- sn_ms_epcfgmgr_spk.Microsoft Endpoint Manager Admin and sn_csd.CSD Admin
- admin

Before creating software models, you must discover the applications available for deployment on the Microsoft Endpoint Configuration Manager server. See CSD 2.0 for Microsoft Endpoint Configuration Manager for more information.

About this task

You can link a Microsoft Endpoint Configuration Manager application to an existing software model or create a new model.

Procedure

1. Navigate to **Microsoft Endpoint Configuration Manager** > **Applications**.
   A list of applications discovered on the Microsoft Endpoint Configuration Manager server appears.
2. Open an application record.
3. To link to an existing model, click the magnifying glass icon in the **CSD software model** field and select a model from the list.
4. To create a model, click **Create Software Model** under related link.
   a. Complete the software model fields.
   b. Click **Submit**.
      The view returns to the Microsoft Endpoint Configuration Manager Applications list.

Define the Microsoft Endpoint Configuration Manager configuration

Associate that software with a collection through a Microsoft Endpoint Configuration Manager configuration to create catalog items for Microsoft Endpoint Configuration Manager software deployment or to configure your instance to revoke software through Microsoft Endpoint Configuration Manager.

Before you begin

Before you create a Microsoft Endpoint Configuration Manager configuration record, make sure you have discovered the Microsoft Endpoint Configuration Manager applications, collections, and deployments, and set up the necessary software models.

Role required: sn_ms_epcfgmgr_spk.Microsoft Endpoint Manager Admin or admin

About this task

The Microsoft Endpoint Configuration Manager configuration process associates software with Microsoft Endpoint Configuration Manager collections. To deploy software from a Microsoft Endpoint Configuration Manager server, the user or device must be a member of a Microsoft Endpoint Configuration Manager collection associated with an install deployment. CSD 2.0

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

enables you to revoke unentitled software using the Microsoft Endpoint Configuration Manager server when that software can be removed using an uninstall collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.

Procedure

1. Navigate to **Microsoft Endpoint Configuration Manager** > **Configurations**.
2. Click **New**.
3. On the form, fill these values.

Field	Description
Name	Name to identify the Microsoft Endpoint Configuration Manager software configuration record.
Application	Name of an application hosted on the Microsoft Endpoint Configuration Manager server.
Install Collection	Name of the collection associated with the install deployment for the selected application on the Microsoft Endpoint Configuration Manager server. Only those collections associated with the application are available for selection.
Uninstall Collection	Name of the collection associated with the uninstall deployment for the selected application on the Microsoft Endpoint Configuration Manager server. Only those collections associated with the application are available for selection. You must specify an uninstall collection to: ○ Define a lease end date for deployed software. ○ Enable lease extensions. ○ Revoke software from a user's machine.

4. Click **Submit**.

Create a catalog item for the Microsoft Endpoint Configuration Manager application

Create a catalog item for an application you want to offer for distribution from the service catalog using the applications discovered on the Microsoft Endpoint Configuration Manager server.

Before you begin

Role required:

Note:
Ensure that the user has one of the two mentioned set of roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- sn_ms_epcfgmgr_spk.Microsoft Endpoint Manager Admin, catalog_admin, and sn_csd.CSD Admin
- admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

Procedure

1. Navigate to **Microsoft Endpoint Configuration Manager** > **Applications**.
   A list of applications discovered on the Microsoft Endpoint Configuration Manager server appears.
2. Open a record for the Microsoft Endpoint Configuration Manager application.
3. Click the **Create Catalog Item** related link.
4. On the form, fill the required values.

Field	Description
Name	Name to identify the record.
Access Type	If **Delegated** is selected, enables the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order Microsoft Endpoint Configuration Manager deployments for other users in the system. By default, this feature is disabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the **Skip approval** check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information: ○ **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list. ○ **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list. ○ **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time. If **Restricted** is selected, the **User** field is not displayed on the order form.

5. Right-click the form header and click **Save**.
6. **Optional:** In the **CSD Catalog Item Fulfillment Configuration** tab, open the default record and provide these values as per your requirement.

Field	Description
Software configuration	Name of the configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	for all deployments, revocations, and leases performed by the Microsoft Endpoint Configuration Manager server.
Skip approval (skip_approval)	Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the **Access Type** field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items. **Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the **Skip approval** check box to determine if the software item requires approval by the requester's manager.
Check license compliance (check_license_compliance)	Check box that forces the system to determine if deploying this item is allowed under the current license.

Note:
If the catalog item requires approval because of cost, be sure to configure an approval group in the**Approved By Group** related list. By default, the Service Catalog Request flow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this flow skips approval altogether and ends. The system then runs the Order Client Software flow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.

7. Click **Update**.
   Catalog item is created and is available for ordering from Service Catalog.
8. **Optional:** To see all CSD 2.0 catalog items, navigate to **Client Software Distribution 2.0** > **Software Items**.

Note:
If you are unable to see any of the mentioned fields or tabs, configure the table's form view or related lists accordingly.

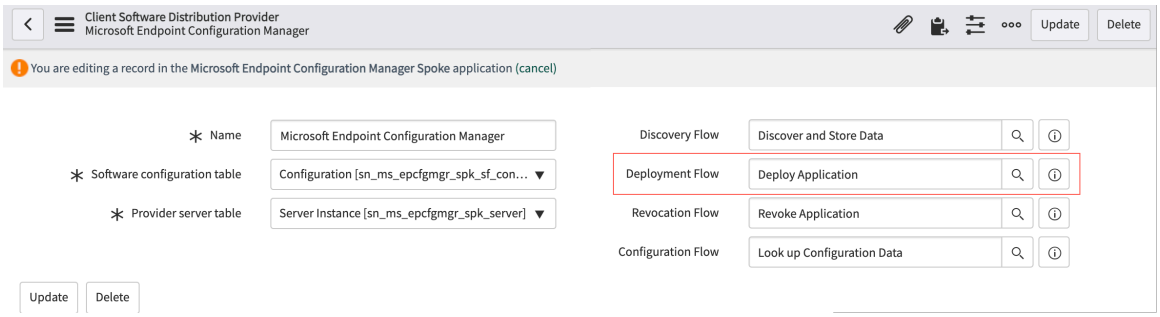
Deployment process

Order an application from a CSD 2.0 catalog item in the service catalog triggers the Order Client Software flow.

This process deploys an application to a user or device through a service catalog order:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software flow sends the catalog request to the requesting user's manager for approval.
2. If the **Check license compliance** check box is selected in the software catalog item, the flow performs a software license check from SAM or CSD 2.0 depending on your configuration. If there is no license available, the flow creates a catalog task to procure more licenses and assigns the task to the CSD Administrators group.
3. The Order Client Software flow triggers the Deploy Client Software flow that in turn triggers the provider-specific **Deployment Flow** that is specified in the provider record.



CSD 2.0 for Jamf

Use the CSD 2.0 along with the Jamf spoke to deploy and revoke software deployments from Jamf and manage distributions on hosts.

To use the Jamf spoke with CSD 2.0, you must activate Jamf spoke and CSD 2.0.

The Jamf spoke contains actions that CSD 2.0 uses to deploy software from a service catalog request and manage user and device collections on Jamf servers. In addition, CSD 2.0 can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by Jamf without user interaction, and manage lease periods.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This application provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance. The agents guide you through the required details, confirms actions for safety, and attempts to handle errors while performing operations.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See Now Assist AI agents for information about AI agents.

Available AI agents include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
Jamf group membership addition AI agent	Enables users to add members to static groups in Jamf.
Jamf group deletion management AI agent	Enables users to delete groups in Jamf.
Jamf application targets addition AI agent	Enables users to add static groups as targets to applications in Jamf.
Jamf application targets removal AI agent	Enables users to remove static groups as targets from applications in Jamf.
Jamf group creation management AI agent	Enables users easily and deterministically create groups in Jamf.
Jamf group membership removal AI agent	Enables users to remove members from static groups in Jamf.

Note:

- To access data or perform operations on data in the table that is associated with the AI agent, users must have the CSD Admin role.
- Ensure that you install the latest version of Jamf spoke.
- To use the AI agents, ensure that you are using the default connection that is available with the Jamf spoke.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Available sample agentic workflows

Install Now Assist for Integration Hub and start using the available sample agentic workflows and AI agents. For more information, see Now Assist for Integration Hub.

In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. Use the available sample agentic workflow in AI Agent Studio so that AI agents can coordinate to solve complex problems. To modify the available sample agentic workflow as per your requirement, see Modify an agentic workflow.

Available sample agentic workflow includes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample agentic workflow	Description	AI agents used	Always ON by default?
Jamf Group Management Agentic Flow	Sample agentic workflow that coordinates between multiple AI agents to handle tasks across various functionalities in Jamf.	• Jamf group creation management AI agent • Jamf group membership removal AI agent • Jamf application targets removal AI agent • Jamf application targets addition AI agent • Jamf group membership addition AI agent • Jamf group deletion management AI agent	No **Note:** To activate the workflow, see Activate an agentic workflow template.

Verify the Jamf spoke records

Verify that the spoke is integrated with CSD 2.0 after setting up and configuring the Jamf spoke and create server instance record to use Jamf spoke with CSD 2.0.

Before you begin

- Activate the Jamf spoke and set up the spoke. For more information about the spoke setup, see Set up the Jamf spoke.
- Activate the CSD 2.0 application.
- Role required: admin

Procedure

1. Verify that these modules are available.
   - Applications
   - Configurations
   - Server Instances
   - Deployments
   - Collections
2. Navigate to **System Definition** > **Tables** and verify that these table are available.
   - Configuration [sn_jamf_spoke_sf_config]
   - Server Instance [sn_jamf_spoke_server]
   - Policy [sn_jamf_spoke_policy]
   - Application [sn_jamf_spoke_application]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

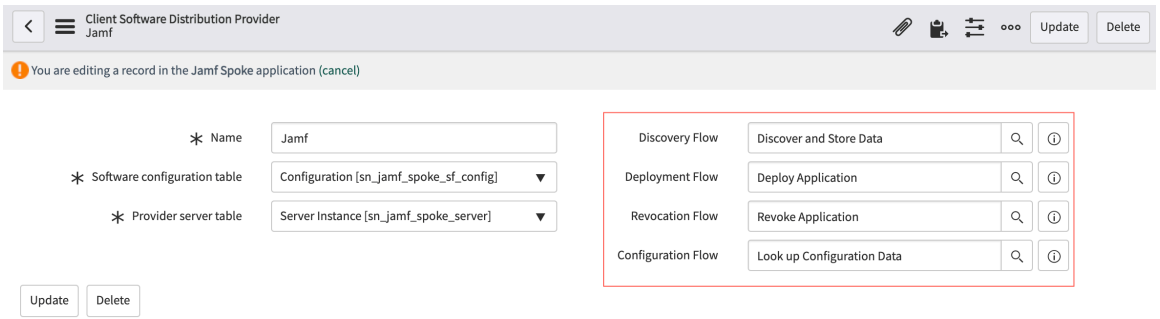
- Group [sn_jamf_spoke_group]
- Jamf Credential [sn_jamf_spoke_jamf_credential]

3. Verify that the flows are configured correctly in the provider record.

   a. Navigate to **Client Software Distribution 2.0** > **Providers**.

   b. Open the record **Jamf**.

   c. Verify that the flows are configured correctly in the record.



Note:
You can configure the default flows as per your requirement.

Store details of the Jamf server

Create a server instance record to discover applications and store details of the Jamf server.

Before you begin

Role required: admin

Procedure

1. Navigate to **JAMF** > **Server instances**.
2. Click **New**.
3. On the form, fill there values.

Field	Description
Name	Name to identify the server instance record.
Connection & Credential Alias	Connection and credential alias you had configured while setting up the Jamf spoke. For example, **Jamf**.

Note:
You can use only the default connection and credential alias records that have been shipped along with the Jamf Spoke.

4. Right-click the form header and click **Submit**.
5. Click the **Discover Now** related link to discover all applications and retrieve data from the server.
   The Discover and Store Data subflow is triggered. Data is retrieved and in stored in the Jamf Spoke tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up a software model

Using the applications discovered on the Jamf server, set up a software model to manage licenses.

Before you begin

Before creating software models, you must discover the applications available for deployment on the Jamf server. See CSD 2.0 for Jamf for more information.

Perform these steps when you set up a software model for the Jamf application and policy.

Role required: Ensure that the user has one of the two mentioned set of roles.

- sn_jamf_spoke.jamf_admin and sn_csd.CSD Admin
- admin

About this task

You can link a Jamf application to an existing software model or create a new model.

Procedure

1. Determine whether you are setting up a software model for the application or the policy.
   - If you are setting up a software model for the Jamf application, navigate to **Jamf** > **Applications**.
   - If you setting up a software model for the Jamf policy, navigate to **Jamf** > **Policies**.

   A list of applications or policies discovered on the Jamf server appears.
2. Open the required record.
3. Link to an existing model by clicking the magnifying glass icon in the **CSD software model** field and selecting a model from the list.
4. Create a model by clicking **Create Software Model** under related link.

   a. Complete the software model fields.

   b. Click **Submit**.
   The view returns to the Jamf Applications list.

Define the Jamf configuration

Associate that software with a group through a Jamf configuration to create catalog items for Jamf software deployment or to configure your instance to revoke software through .

Before you begin

Before you create a Jamf configuration record, make sure you have discovered the Jamf applications, groups, and deployments, and set up the necessary software models.

Role required: sn_jamf_spoke.jamf_admin or admin

About this task

The Jamf configuration process associates software with Jamf groups. To deploy software from a Jamf server, the user or device must be a member of a Jamf group associated with an install deployment. CSD 2.0 enables you to revoke unentitled software using the Jamf server when that software can be removed using the installation group by removing user or device from it. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.

Perform these steps for the Jamf applications and policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Jamf** > **Configurations**.
2. Click **New**.
3. On the form, fill these values.

Field	Description
Name	Name to identify the Jamf software configuration record.
Group	Name of the group associated with the selected application on the Jamf server. Same group can be used for both installation and uninstallation. Only those groups associated with the application are available for selection.

4. Click **Submit**.

Create a catalog item for the Jamf application

Create a catalog item for an application you want to offer for distribution from the service catalog using the applications discovered on the Jamf server.

Before you begin

Role required: Ensure that the user has one of the two mentioned set of roles.

- sn_jamf_spoke.jamf_admin, catalog_admin, and sn_csd.CSD Admin
- admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

Perform these steps for the Jamf applications and policies.

Procedure

1. Create a catalog item for the application or the policy.
   - If you are creating a catalog item for the Jamf application, navigate to **Jamf** > **Applications**.
   - If you are creating a catalog item for the Jamf policy, navigate to **Jamf** > **Policies**.

   A list of applications or policies discovered on the Jamf server appears.
2. Open the required record.
3. Click the **Create Catalog Item** related link.
4. On the form, fill the required values.

Field	Description
Name	Name to identify the record.
Access Type	If **Delegated** is selected, enables the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order Jamf deployments for other users in the system. By default, this feature is disabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the **Skip approval** check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information: ○ **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list. ○ **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list. ○ **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time. If **Restricted** is selected, the **User** field is not displayed on the order form.

5. Right-click the form header and click **Save**.
6. **Optional:** In the **CSD Catalog Item Fulfillment Configuration** tab, open the default record and provide these values.

Field	Description
Software configuration	Name of the configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the Jamf server.
Skip approval (skip_approval)	Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the **Access Type** field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items. **Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the **Skip approval** check box to determine if the software item requires approval by the requester's manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Check license compliance (check_license_compliance)	Check box that forces the system to determine if deploying this item is allowed under the current license.

Note:
If the catalog item requires approval because of cost, be sure to configure an approval group in the**Approved By Group** related list. By default, the Service Catalog Request flow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this flow skips approval altogether and ends. The system then runs the Order Client Software flow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.

7. Click **Update**.
   Catalog item is created and is available for ordering from Service Catalog.
8. **Optional:** To see all CSD 2.0 catalog items, navigate to **Client Software Distribution 2.0** > **Software Items**.

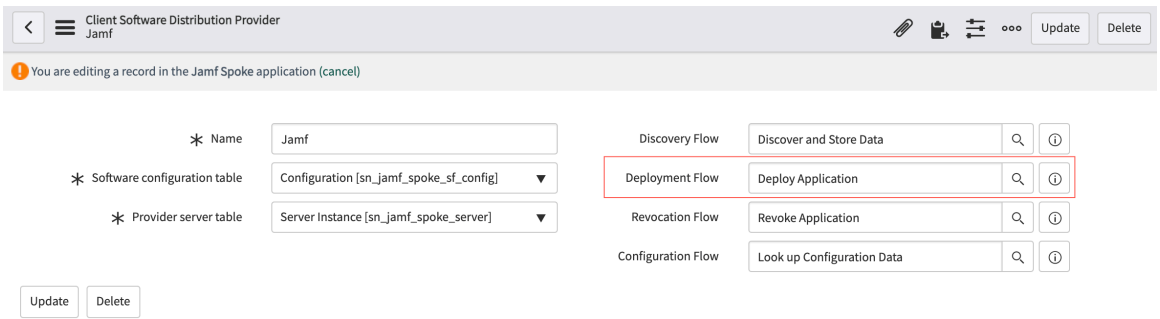
Note:
If you are unable to see any of the above fields or tabs, configure the table's form view or related lists accordingly.

Deployment process

Order an application from a CSD 2.0 catalog item in the service catalog triggers the Order Client Software flow.

This process deploys an application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software flow sends the catalog request to the requesting user's manager for approval.
2. If the **Check license compliance** check box is selected in the software catalog item, the flow performs a software license check from SAM or CSD 2.0 depending on your configuration. If there is no license available, the flow creates a catalog task to procure more licenses and assigns the task to the CSD Administrators group.
3. The Order Client Software flow triggers the Deploy Client Software flow that in turn triggers the provider-specific **Deployment Flow** that is specified in the provider record.



CSD 2.0 for Microsoft Intune

Use the CSD 2.0 along with the Microsoft Intune spoke to deploy and revoke software deployments, and manage distributions on hosts.

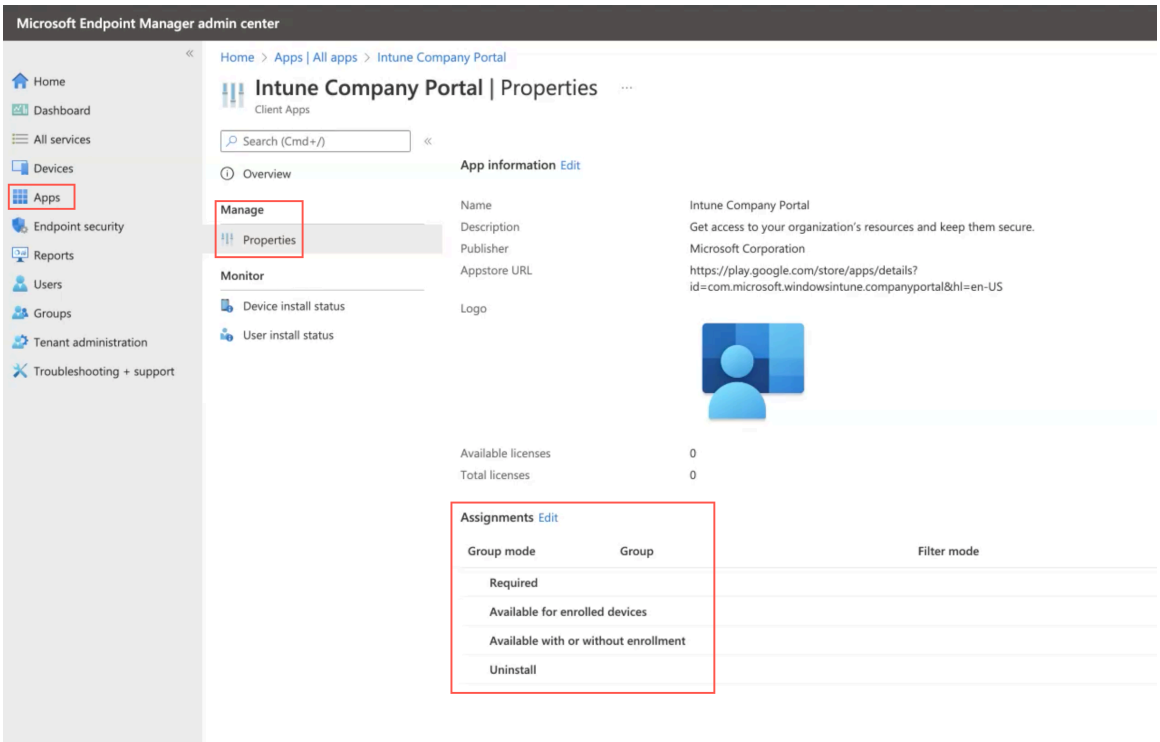
Configure group assignments

Configure group assignments for all the applications you want to deploy.

Before you begin
Role required: admin

Procedure

1. Log in to Microsoft Endpoint Manager admin center as an admin.
2. Navigate to **Apps** > **All apps**.
3. Click the application you want to deploy.
4. Click **Properties** under **Manage**.
5. Under **Assignments**, perform assignments for the groups you want to deploy.



Verify the Microsoft Intune spoke records

Verify that the spoke is integrated with CSD 2.0 after setting up and configuring the Microsoft Intune spoke and create server instance record to use Microsoft Intune spoke with CSD 2.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Activate the Microsoft Azure Active Directory spoke spoke and set up the spoke. For more information about the spoke setup, see Set up Microsoft Entra ID spoke.
- Activate the Microsoft Intune spoke and set up the spoke. For more information about the spoke setup, see Set up the Microsoft Intune spoke.
- Activate the CSD 2.0 application.
- Role required: admin

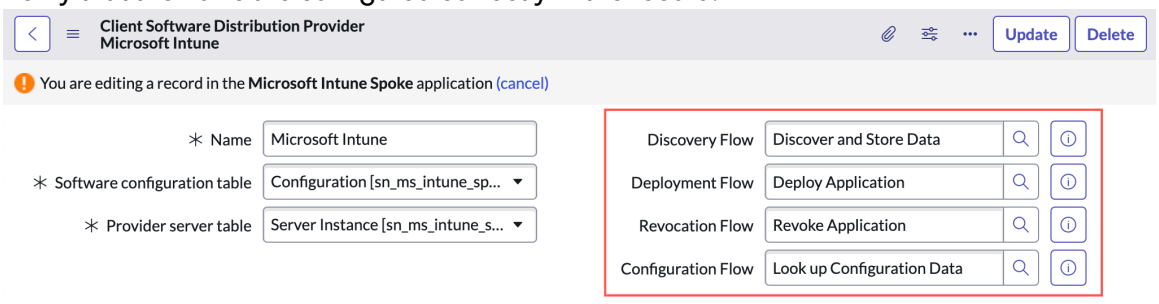
Procedure

1. Verify that these modules are available.
   - Applications
   - Configurations
   - Server Instances
   - Deployments
   - Groups
2. Navigate to **System Definition** > **Tables** and verify that these table are available.
   - Configuration [sn_ms_intune_spoke_sf_config]
   - Deployment [sn_ms_intune_spoke_deployment]
   - Server Instance [sn_ms_intune_spoke_server]
   - Application [sn_ms_intune_spoke_application]
   - Group [sn_ms_intune_spoke_group]
3. Verify that the flows are configured correctly in the provider record.

   a. Navigate to **Client Software Distribution 2.0** > **Providers**.

   b. Open the record **Microsoft Intune**.

   c. Verify that the flows are configured correctly in the record.



Note:
You can configure the default flows as per your requirement.

Store details of the Microsoft Intune server

Create a server instance record to discover applications and store details of the Microsoft Intune server.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Microsoft Intune** > **Server instances**.
2. Click **New**.
3. On the form, fill there values.

Field	Description
Name	Name to identify the server instance record.
Connection & Credential Alias	Connection and credential alias you had configured while setting up the Microsoft Intune spoke. For example, **Microsoft_Intune**.

Note:
You can use only the default connection and credential alias records that have been shipped along with the Microsoft Intune Spoke.

4. Right-click the form header and click **Submit**.
5. Click the **Discover Now** related link to discover all applications and retrieve data from the server.
   The Discover and Store Data subflow is triggered. Data is retrieved and in stored in the Microsoft Intune Spoke tables.

Set up a software model

Using the applications discovered on the Microsoft Intune server, set up a software model to manage licenses.

Before you begin

Role required: Ensure that the user has one of the two mentioned set of roles.

- sn_ms_intune_spoke.microsoft_intune_admin and sn_csd.CSD Admin
- admin

Before creating software models, you must discover the applications available for deployment on the Microsoft Intune server.

Perform these steps when you set up a software model for the Microsoft Intune application.

About this task

You can link a Microsoft Intune application to an existing software model or create a new model.

Procedure

1. Navigate to **Microsoft Intune** > **Applications**.
   A list of applications discovered on the Microsoft Intune server appears.
2. Open the required record.
3. To link to an existing model, click the magnifying glass icon in the **CSD software model** field and select a model from the list.
4. To create a model, click **Create Software Model** under related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Complete the software model fields.

b. Click **Submit**.
The view returns to the Microsoft Intune Applications list.

Define the Microsoft Intune configuration

Associate that software with a group through a Microsoft Intune configuration to create catalog items for Microsoft Intune software deployment or to configure your instance to revoke software through Microsoft Intune.

Before you begin

Before you create a Microsoft Intune configuration record, make sure you have discovered the Microsoft Intune applications, groups, and deployments, and set up the necessary software models.

Role required: sn_ms_intune_spoke.microsoft_intune_admin or admin

About this task

The Microsoft Intune configuration process associates software with Microsoft Intune groups. To deploy software from a Microsoft Endpoint Configuration Manager server, the user or device must be a member of a Microsoft Intune group associated with an install deployment. CSD 2.0 enables you to revoke unentitled software using the Microsoft Intune server when that software can be removed using an uninstall group. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.

Procedure

1. Navigate to **Microsoft Intune** > **Configurations**.
2. Click **New**.
3. On the form, fill these values.

Field	Description
Name	Name to identify the Microsoft Intune software configuration record.
Application	Name of an application hosted on the Microsoft Intune server.
Install Group	Name of the group associated with the install deployment for the selected application on the Microsoft Intune server. Only those groups associated with the application are available for selection.
Uninstall Group	Name of the group associated with the uninstall deployment for the selected application on the Microsoft Intune server. Only those groups associated with the application are available for selection. You must specify an uninstall collection to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Define a lease end date for deployed software. ○ Enable lease extensions. ○ Revoke software from a user's machine.
Deployment Type	Entity for which software deployment or revocation is needed.

4. Click **Submit**.

Create a catalog item for the Microsoft Intune applications

Create a catalog item for an application you want to offer for distribution from the service catalog using the applications discovered on the Microsoft Intune server.

Before you begin

Role required: Ensure that the user has one of the two mentioned set of roles.

- sn_ms_intune_spoke.microsoft_intune_admin, catalog_admin, and sn_csd.CSD Admin
- admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

Procedure

1. Navigate to **Microsoft Intune** > **Applications**.
   A list of applications discovered on the Microsoft Intune server appears.
2. Open a record for the Microsoft Intune application.
3. Click the **Create Catalog Item** related link.
4. On the form, fill the required values.

Field	Description
Name	Name to identify the record.
Access Type	If **Delegated** is selected, enables the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order Microsoft Intune deployments for other users in the system. By default, this feature is disabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the **Skip approval** check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list. ○ **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list. ○ **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time. If **Restricted** is selected, the **User** field is not displayed on the order form.

5. Right-click the form header and click **Save**.
6. **Optional:** In the **CSD Catalog Item Fulfillment Configuration** tab, open the default record and provide these values as per your requirement.

Field	Description
Software configuration	Name of the configuration record for this application. This record defines the install group and uninstall group for this application. This configuration is required for all deployments, revocations, and leases performed by the Microsoft Intune server.
Skip approval (skip_approval)	Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the **Access Type** field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items. **Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the **Skip approval** check box to determine if the software item requires approval by the requester's manager.
Check license compliance (check_license_compliance)	Check box that forces the system to determine if deploying this item is allowed under the current license.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the catalog item requires approval because of cost, be sure to configure an approval group in the**Approved By Group** related list. By default, the Service Catalog Request flow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this flow skips approval altogether and ends. The system then runs the Order Client Software flow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.

7. Click **Update**.
   Catalog item is created and is available for ordering from Service Catalog.
8. **Optional:** To see all CSD 2.0 catalog items, navigate to **Client Software Distribution 2.0** > **Software Items**.

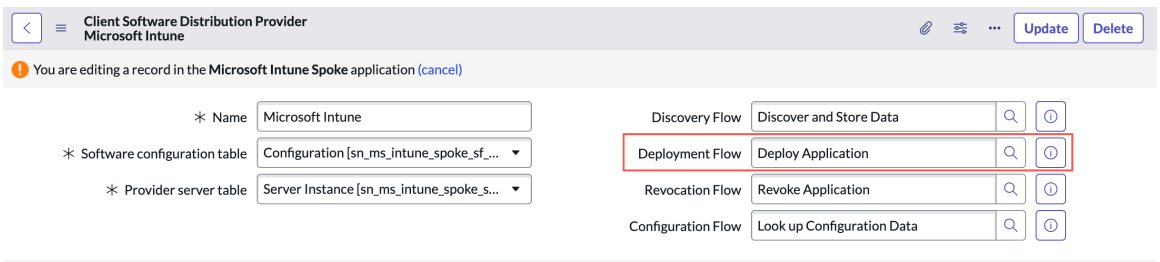
Note:
If you are unable to see any of the mentioned fields or tabs, configure the table's form view or related lists accordingly.

Deployment process

Order an application from a CSD 2.0 catalog item in the service catalog triggers the Order Client Software flow.

This process deploys an application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software flow sends the catalog request to the requesting user's manager for approval.
2. If the **Check license compliance** check box is selected in the software catalog item, the flow performs a software license check from SAM or CSD 2.0 depending on your configuration. If there is no license available, the flow creates a catalog task to procure more licenses and assigns the task to the CSD Administrators group.
3. The Order Client Software flow triggers the Deploy Client Software flow that in turn triggers the provider-specific **Deployment Flow** that is specified in the provider record.



CSD 2.0 validation process

After Microsoft Endpoint Configuration Manager deploys software to a target computer, CSD 2.0 detects the installation and validates its status.

Note:
This is applicable only if you are using SAM.

CSD 2.0 uses the following methods for detecting software installed on the target machine:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Discovery: CSD 2.0 is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.
- Microsoft Endpoint Configuration Manager Integration: You can import provider data into the CMDB using the features in the Integration - Microsoft Endpoint Configuration Manager plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the Microsoft Endpoint Configuration Manager integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD 2.0 runs a scheduled job called Reconcile Requested Software that uses CSD property settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** or **Not Synced** to **Installed**: The user has installed the requested software within the time limit configured in the *sn_csd.softwareInstallExpDays* property.
- **Not installed** or **Not Synced** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

Software revocation

Revoke software without any user interaction if the software can be revoked and has a lease end date using the provider-specific revocation flow.

Revoke software deployed through the service catalog

Software deployed by the software provider can be revoked when the application associated with the software configuration has an uninstall collection configured. CSD 2.0 can revoke software requested using the CSD 2.0 catalog. CSD 2.0 can also uninstall software using Microsoft Endpoint Configuration Manager, Microsoft Intune, and Jamf when revocation is triggered from the reclamation candidates.

Before you begin

- Create a provider-specific configuration record for the application that names an appropriate uninstall collection.
- Associate the CSD 2.0 catalog item for the application with the provider configuration that specifies the uninstall collection.

Role required: itil, sn_csd.CSD Admin, or sn_csd.CSD User

Procedure

1. Navigate to **Client Software Distribution 2.0** > **Requested Software**.
2. Open the record for the software package you want to revoke.
   The package must have a **Status** of **Installed** or **Not Synced** to be revocable.
3. Under **Related Links**, click **Revoke software**.

> **Note:**
> This action runs the Revoke Client Software flow, which triggers the provider-specific Revoke Application subflow.

Integrate CSD 2.0 with other software providers

Integrate CSD 2.0 with client software distribution providers, such as Casper, Altiris, or LANDesk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Extending CSD 2.0 is an advanced procedure intended for use by experienced ServiceNow AI Platform developers only.

Create provider tables

Identify and create tables to store discovered data from the provider server.

For example, Application, Collection, and Deployment tables are provided with the Microsoft Endpoint Configuration Manager spoke. Similarly, create tables to store the discovered data. You must create your application table that extends the Client Software Distribution Application (sn_csd_application) table.

- Create a provider server table that extends the Configuration Item [cmdb_ci] table.
- Create a software configuration table that extends Client Software Distribution Software Configuration [sn_csd_software_config] table.

Create subflows

Create subflows in Workflow Studio to discover and store data, and deploy application.

Create these subflows in Workflow Studio as per your requirement.

- Discover and Store Data Subflow:

  Subflow to discover the provider server, retrieve the data from provider server, and store that data in the ServiceNow instance. This data should be stored in the tables you had earlier created for storing the server data.

- Deploy Application Subflow:

  Subflow to deploy software from the provider server. This subflow provides information to the provider regarding deploying an application requested from the service catalog.

- Revoke Application Subflow:

  Subflow to revoke an installation from the provider server. This subflow that provides information to the provider regarding the user or device from which the application should be removed.

- Look up Configuration Data Subflow:

  Subflow to retrieve configuration data for the specified requested item or software configuration record.

The Deploy Application Template, Look up Configuration Data Template, and Revoke Application Template subflows are provided with CSD 2.0. You can use these subflows as reference and create subflows as per your requirement.

Create a provider record

Create a provider record to configure the flows.

Before you begin

Role required: admin

Procedure

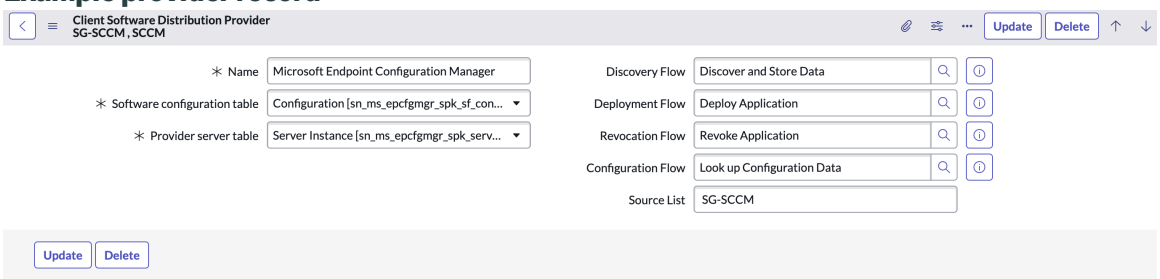
1. Navigate to **Client Software Distribution 2.0** > **Providers**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill these values.

Field	Description
Name	Name to identify the provider record.
Software configuration table	Software configuration table you had created. This table extends Client Software Distribution Software Configuration [sn_csd_software_config] table.
Provider server table	Provider server table you had created. This table extends the Configuration Item [cmdb_ci] table
Discovery Flow	Subflow you had created to discover the provider server, retrieve the data from provider server, and store that data in the ServiceNow instance.
Deployment Flow	Subflow you had created to deploy software from the provider server.
Revocation Flow	Subflow you had created to revoke an installation from the provider server.
Configuration Flow	Subflow you had created to retrieve configuration data for the specified requested item or software configuration record.
Source List	List of discovery sources separated by a comma.

Example provider record



4. Click **Save**.

Create UI actions

Create UI actions to discover data, create software model, create software configuration, and create catalog item.

Before you begin

Role required: admin

About this task

See UI actions for more information about creating a UI action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a UI action to discover data.

   a. Navigate to **System Definition** > **UI Actions**.

   b. Click **New**.

   c. On the form, fill these values.

Field	Description
Name	Name to identify the UI action record. For example, `Discover Now`.
Table	Provider server table you had created. This table extends the Configuration Item [cmdb_ci] table.
Script	Script to run when the UI action is executed. For example, enter `sn_csd.CSDUtil.startDiscovery(current);`

   d. Specify other fields as per your requirements.

   e. Click **Save**.

2. Create a UI action to create and link software model to your provider application or software.

   a. Navigate to **System Definition** > **UI Actions**.

   b. Click **New**.

   c. On the form, fill these values.

Field	Description
Name	Name to identify the UI action record. For example, `Create Software Model`.
Table	Application table you had created. This table extends the Client Software Distribution Application (sn_csd_application) table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can use either SAM or CSD 2.0 software model and license tables. Depending upon how the `Determines whether to use SAM plugin(SAM Foundation or SAM Professional) tables for managing software models and licensing information` system property (*sn_csd.useSAMPlugin*) is configured, use the corresponding software model table.
Condition	Defines the conditions that restrict when the UI action appears. For example, if software model is associated with the application or software, you may want to hide this UI action. So, enter `(gs.getProperty("sn_csd.useSAMPlugin") == 'true' && current.model=="" && (GlidePluginManager().isActive("com.snc.sa || GlidePluginManager().isActive("com.snc.sam || (gs.getProperty("sn_csd.useSAMPlugin") == 'false'&& current.csd_model=="").`

Script	Script to run when the UI action is executed. For example, enter
	`var newModel = '';`
	`var tableName = '';`
	`if (gs.getProperty("sn_csd.useSAMPlugin") == 'true' && current.model == "" && (GlidePluginManager().isActive("com.snc.sams") || GlidePluginManager().isActive("com.snc.samp.core"))) {`
	`tableName = 'cmdb_software_product_model';`
	`} else {`
	`tableName = 'sn_csd_software_product_model';`
	`}`
	`newModel = new sn_csd.CSDModelUtil().generateModel(current, tableName);`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`if (newModel != '') gs.setRedirect(tableName + ".do?sys_id=" + newModel);`

d. Specify other fields as per your requirements.

e. Click **Save**.

3. Create a UI action to create software configuration.

a. Navigate to **System Definition** > **UI Actions**.

b. Click **New**.

c. On the form, fill these values.

Field	Description
Name	Name to identify the UI action record. For example, `Create Software Configuration`.
Table	Application table you had created. This table extends the Client Software Distribution Application (sn_csd_application) table. **Note:** You can use either SAM or CSD 2.0 software model and license tables. Depending upon how the `Determines whether to use SAM plugin(SAM Foundation or SAM Professional) tables for managing software models and licensing information` system property (*`sn_csd.useSAMPlugin`*) is configured, use the corresponding software model table.
Condition	Defines the conditions that restrict when the UI action appears. For example, you may want to show the UI action only if the software model is configured. So, enter `(gs.getProperty("sn_csd.useSAMPlugin") == 'true' && current.model!="" && (GlidePluginManager().isActive("com.snc.sa || GlidePluginManager().isActive("com.snc.sam ||`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`(gs.getProperty("sn_csd.useSAMPlugin") == 'false' && current.csd_model!="").`

Script	Script to run when the UI action is executed. For example, enter
	`var softwareConfig = createConfig(current); action.setRedirectURL(softwareConfig);`
	`function createConfig(appGr) { var gr = new GlideRecord("<Provider-software-configuration-table>"); gr.initialize(); gr.application = appGr.sys_id; gr.name = appGr.display_name; gr.insert(); return gr; }`
	In this example, replace `<Provider-software-configuration-table>` with the provider server table you had created. This table extends the Configuration Item [cmdb_ci] table.

d. Specify other fields as per your requirements.

e. Click **Save**.

4. Create a UI action to create catalog item.

a. Navigate to **System Definition** > **UI Actions**.

b. Click **New**.

c. On the form, fill these values.

Field	Description
Name	Name to identify the UI action record. For example, `Create Catalog Item`.
Table	Application table you had created. This table extends the Client Software Distribution Application (sn_csd_application) table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can use either SAM or CSD 2.0 software model and license tables. Depending upon how the `Determines whether to use SAM plugin(SAM Foundation or SAM Professional) tables for managing software models and licensing information` system property (*sn_csd.useSAMPlugin*) is configured, use the corresponding software model table.
Condition	Defines the conditions that restrict when the UI action appears. For example, you may want to show this UI action only if software model is configured and there is at least one software configuration. So, enter `sn_csd.CSDUtil.isCSDSoftwareModelAndConfig("<provider software configuration table>", "<internal name of software configuration table's column that refers to provider's application table>")`.

Script	Script to run when the UI action is executed. For example, enter
	`var catItemHandler = new sn_csd.CSDCatItemHandler(current);`
	`var catItem = catItemHandler.createCatalogItem(current);`
	
	`//first parameter - provider's software configuration table`
	`//second paramter - internal name of software configuration table's column that refers to the provider's application table`
	`var sfConfig = catItemHandler.getSoftwareConfig('<provider software configuration table>', '<internal name of software configuration table's column that refers to provider's application table>);`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`var gr = new GlideRecord('sn_csd_cat_item_fulfilment_config'); gr.initialize(); gr.cat_item = catItem.sys_id; gr.provider = '<provider's Sys ID from sn_csd_provider table record>'; //provider's Sys ID from sn_csd_provider table record gr.software_config = sfConfig; //populating software configuration gr.insert(); action.setRedirectURL(catItem);`

d. Specify other fields as per your requirements.

e. Click **Save**.

Retry Handler Framework

Framework that retries a failed HTTP request when the API rate limits are exceeded and the 429 Too Many Requests status code is returned. The retry-after time HTTP header is used to retry the request again after that specified retry-after time.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Spoke requirements

Note:
The Retry Handler Framework app is available only as a part of Microsoft Exchange Online Spoke or Journey Accelerator app.

- Install Journey Accelerator app
- Microsoft Exchange Online spoke

Spoke flows

The Retry Handler Framework provides sample flows to demonstrate automating the Journey Accelerator tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Renew Subscriptions	Retrieves all the subscription records and renews the subscriptions that are about to expire.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
	Note: Subscriptions that have Being Deleted as status, will not be considered for renewal.
Clean up Queue Records	Removes the records from Request Retry Queue based on state, execution status, and last updated time.
Scheduled Job	Processes records from the Request Retry Queue table.

Spoke subflows

The Retry Handler Framework provides sample subflows to demonstrate automating Journey Accelerator tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Calendar Synchronization	Retrieves the events from Exchange Online Calendar Events Transformed Data table and updates the events in Microsoft Exchange Online Events table. Checks if a valid subscription exists. Creates a subscription if the subscription does not exist. **Note:** You must update the required details in the Exchange Online Calendar Events Transformed Data table before synchronizing events data.
Create or Update Subscription Record	Checks if a subscription with the specified details exists in Microsoft Exchange Online. If the subscription exists, then the subscription record is updated. Otherwise, a subscription is created in Microsoft Exchange Online and an associated record is created.
Delete Calendar Scheduling Event	Deletes the specified event in Microsoft Exchange Online and the associated record from events tables, attachments, records from event attendees and event to subscription m2m tables.
Event Lifecycle Management	Retrieves the event details and updates the record details of the event, attendees, and event to subscription m2m tables.
Look up and Update Attachments to Event Record	Retrieves the specified event's attachments from Microsoft Exchange Online and updates the retrieved details to the specified event's record.
Look up and Update Calendar Scheduling Change	Retrieves the event details from Microsoft Exchange Online and updates the details to the specified event's record. If a subscription already does not exist, this subflow creates a subscription and links it with the event record. If an event does not exist in Microsoft Exchange Online, all the related local records are deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Look up Calendar Details	Retrieves the calendar details. **Note:** This subflow cannot be reused as it is a part of the Event Lifecycle Management subflow.
Look up Event Details	Retrieves the event details. **Note:** This subflow cannot be reused as it is a part of the Update Calendar Scheduling Event subflow.
Recreate Removed Subscription	Recreates a removed webhook subscription using the details from the associated subscription record.
Renew Subscription	Renews a webhook subscription if a renewal is required based on the specified inputs.
Subscription Lifecycle Management	Demonstrates the process of subscription management for webhook subscriptions. This subflow creates an event and checks if a webhook subscription exists. If a webhook subscription does not exist, the subflow creates a webhook subscription, event, attendees, event to subscription m2m table records.
Sync up Events	Syncs the calendar view with the Exchange Online Calendar Events Transformed Data table. Use this subflow to manage missed life-cycle notifications for subscriptions. **Note:** You must update the Exchange Online Calendar Events Transformed Data table with the required information before syncing events data.
Update Calendar Scheduling Event	Updates the properties of an event object in Microsoft Exchange Online and the associated records in the events table.

Note:
Look up and Update Attachments to Event Record, Look up Calendar Details, Look up Event Details, Renew Subscription subflows are hidden from subflow picker.

ServiceNow Kafka Consumer

Integrates your ServiceNow instance with Kafka Consumer and stores data in the ServiceNow tables.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Confluent REST Proxy API v2.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Confluent Kafka REST Proxy Spoke
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - RTE (com.glide.hub.action_step.rte)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

ServiceNow Kafka Consumer uses the connection and credential alias of the Confluent Kafka REST Proxy Spoke.

Configure ServiceNow Kafka Consumer

Retrieve events pertaining to the specified topics and store it in the required ServiceNow tables.

Before you begin

- Request Integration Hub subscription.
- Activate and set up the Confluent Kafka REST Proxy Spoke.
- Activate ServiceNow Kafka Consumer.
- Define entities and mapping between entities. For information, see Robust Import Set Transformers.
- Role required: import_admin

Procedure

1. Navigate to **All** > **Process Automation** > **Kafka Consumer**.
2. Click **New**.
3. On the form, fill these values.

Field	Description
Name	Name to identify the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Broker Connection Alias	Connection alias of the Confluent Kafka REST Proxy Spoke.
Topic	Topic from which you want to retrieve the events.
Robust Transformer Definition	Robust Transformer Definition that is used for the event transformation and data storage in ServiceNow tables. For information, see Robust Import Set Transformers.
Offset Starting Point	Value of the Kafka Consumer auto.offset.reset. This specifies what the Kafka Consumer should do when there is no initial offset or if the current offset does not exist any more on the server. See the Kafka 2.7 documentation for more information.
Partitions per group	Number of partitions per consumer thread.
Page size (bytes)	Maximum size of a request.
Page limit	Maximum number of requests per iteration.
Embedded Format	Format of the Kafka message for the topic.
Request timeout (ms)	Value of the Kafka Consumer consumer.request.timeout.ms. This specified the maximum amount of time the client waits for the response of a request. See the Kafka 2.7 documentation for more information.
Stop Upon Transform Errors	Option to stop listening when transformation errors are encountered.
Verbose transformation	Option to log all the imported events to import set and produce additional debug logs for transformation.

Note:
You must create one Kafka Consumer record for each topic.

4. Click the **Start Sink Listener** related link.
   The Kafka Partition Group Listener States table is populated with the topic partition data.
5. **Optional:** If you want to stop listening, click the **Start Sink Listener** related link.
6. Navigate to **System Scheduler** > **Scheduled Jobs**.
7. Open the record, **Kafka Consumer Trigger**.
8. From the **Trigger Type** list, select **Interval**.
9. Click **Update**.

Data Stream actions and pagination

Send REST, SOAP, or JDBC requests from Workflow Studio to APIs that return a stream of response data larger than 10 MB, or that return paginated results. Parse stream data into a series of complex object outputs and use the data pills in other actions in a flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, create a Data Stream action to import a large quantity of employee data from a third-party HR site. The Data Stream action sends a REST request to the third-party site and processes the response to populate records in the User [sys_user] table.

Note:
Data Stream actions require an Integration Hub subscription. For more information, see Legal schedules - Integration Hub overview.

Benefits

Data Stream actions offer these benefits.

- Parse and format a stream of response data larger than 10 MB.
- Automatically send multiple requests to APIs that paginate results, if applicable.
- Can be used in Integration Hub - Import and to create a data source.
- Enable flow designers to process large requests without complex coding or configuration.
- Enable flow designers to process each object within a data stream using **For each** flow logic. For example, you might create a Data Stream action that imports document data from a third-party site. When you add the action to a flow, Workflow Studio automatically adds the action to a **For each** flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream. See Use a Data Stream action in a flow.
- Enable flow designers to reuse Data Stream actions in multiple flows, using the same source of data in multiple ways.

Running a Data Stream action

There are two ways to run a Data Stream action.

From a flow

You can process each object within a data stream using **For each** flow logic. For example, you might create a Data Stream action that imports document data from a third-party site. When you add the action to a flow, Workflow Studio automatically adds the action to a **For each** flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream. See Use a Data Stream action in a flow.

From a script

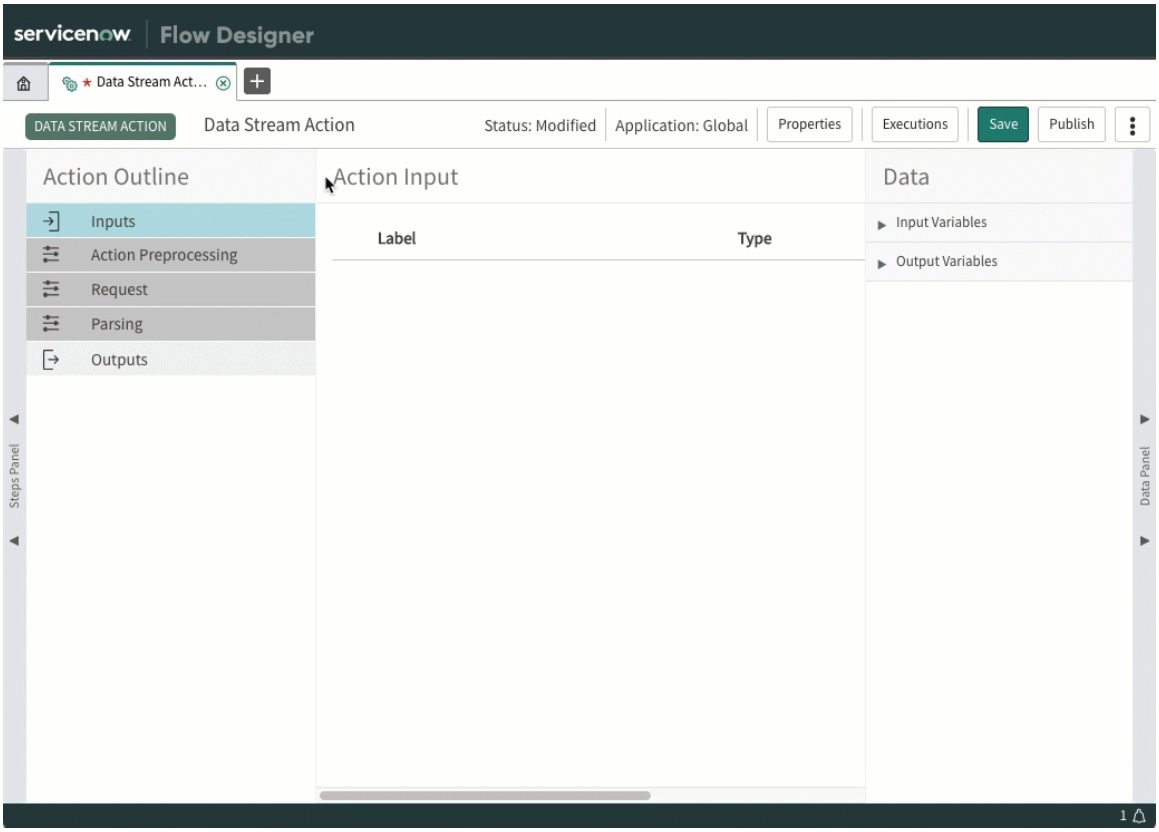
You can start a Data Stream using the executeDataStreamAction() method in the FlowAPI class. For more information, see FlowAPI.

Action outline

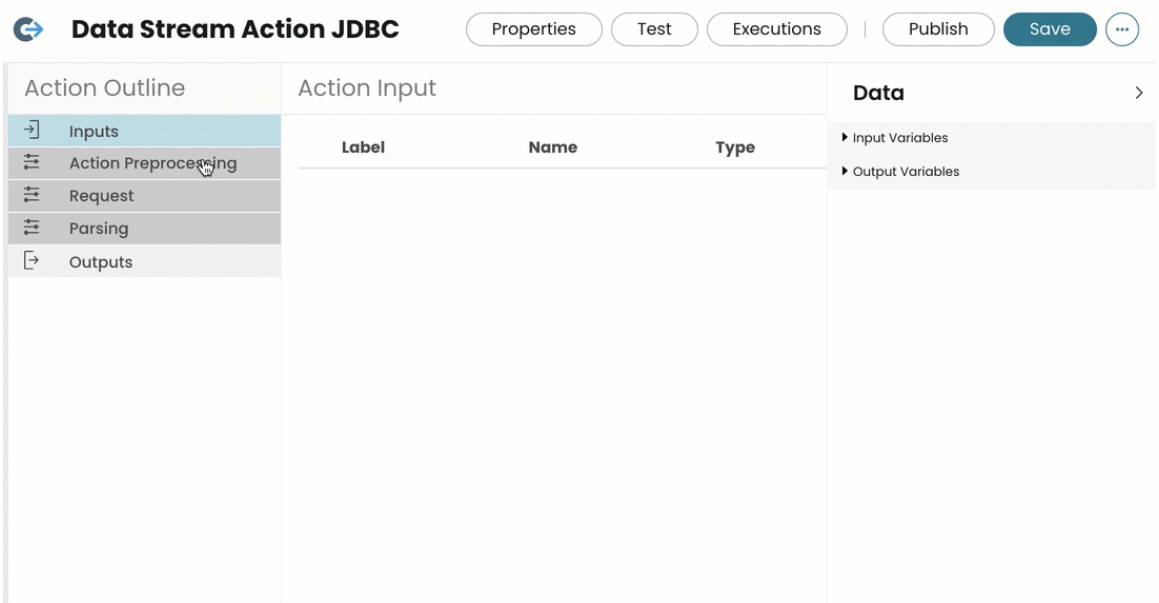
Data Stream actions follow a set structure. Follow prompts to add and remove steps from the action outline. You cannot manually add steps to a Data Stream action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

REST and SOAP Data Stream actions



JDBC Data Stream action



Note:
Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

Action error evaluation

Use error evaluation to catch step errors and specify the error behavior of each step you add to a data stream action. You can also create your own error conditions by specifying when an action returns an error state as well as the status codes and messages they return.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action Preprocessing

Use the Action Preprocessing category to retrieve connection and credential details or to run a preprocessing script.

Select **Retrieve connection info** to retrieve connection and credential details to use in your action. Selecting this option adds the Get Connection Info step as the first step in the action preprocessing. For more information, see Get Connection Info step.

Select **Enable preprocessing script** to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or set default values. Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

Preprocessing executes once per action, before the first API request.

This is an optional Data Stream action component that runs on either the instance or a MID Server.

Request

Use the Request category to configure how the action sends API requests. The Request section executes once per page of results. Request components provide these configuration options.

Pagination Setup step

Request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. Use the pagination setup step to set up pagination options required by the API. Configure the Pagination Setup step manually, or select a pre-built template to apply common configurations. For example, apply the **Limit / Offset** template to specify the number of items you want returned per page (limit), and the starting number for the first item (offset). After applying a template, update the values to ensure that the configuration complies with the API's requirements.

Note:
For licensing purposes, each request counts as one transaction, including each request for the next page of results.

The value of the reserved, read-only `getNextPage` variable determines whether to request another page of results. As long as the `getNextPage` variable is true and the previous page contains data, the action continues to send requests for the next page.

Note:
You must explicitly set the value to true in the script or it will default to false.

This is an optional Request component that only runs on the instance.

Note:
Pagination isn't applicable to the JDBC step.

Script step

Run a script before every request for the next page of results. Use this script for data validation and transformation when calling a paginated API. For example, generate a JSON payload for the next page request. Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This is an optional Request component that runs on either the instance or a MID Server.

REST or SOAP step

Send a REST or SOAP request to a third-party API. Select a data format to add an associated step to the Data Stream action. For more information, see REST step and SOAP step.

This is a mandatory Request component that runs on either the instance or a MID Server.

JDBC step

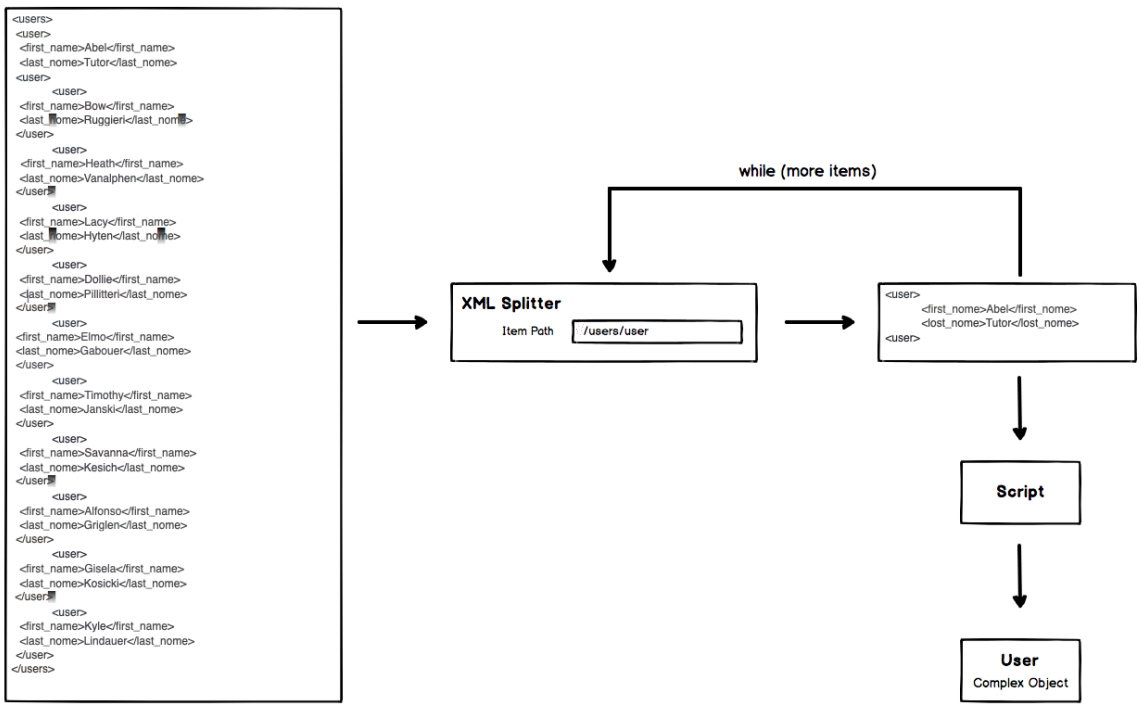
Send a JDBC request to a third-party API. Use transform script to format data and add an associated step to the Data Stream action. For more information, see JDBC step and Test JDBC step. All data is retrieved and pagination is not needed.

This is a mandatory Request component that runs on a MID Server.

Parsing in REST and SOAP steps

Use the Parsing category to configure how the action separates data stream elements into complex data objects. Use the Splitter step to identify and separate items from an XML or JSON stream, and use the Script Parser step to transform each item into a complex object. The Parsing section executes once per item in the stream. You can access outputs from previous steps in your data stream action using the `fd_data` object, excluding:

- REST or SOAP step Response Body, Stream, or Error Message outputs
- Splitter step outputs



For more information about complex data, see Complex data. Parsing components provide these configuration options.

Splitter step

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Identify the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.

Select a splitter type to identify and separate repeated items in an XML or JSON data stream.

- **JSON**: Identifies objects from a stream of JSON data. Use a JSONPath expression to identify a JSON array containing repeated data.
- **XML**: Identify objects from a stream of XML data. Use an XPath expression to identify an XML element containing repeated data.

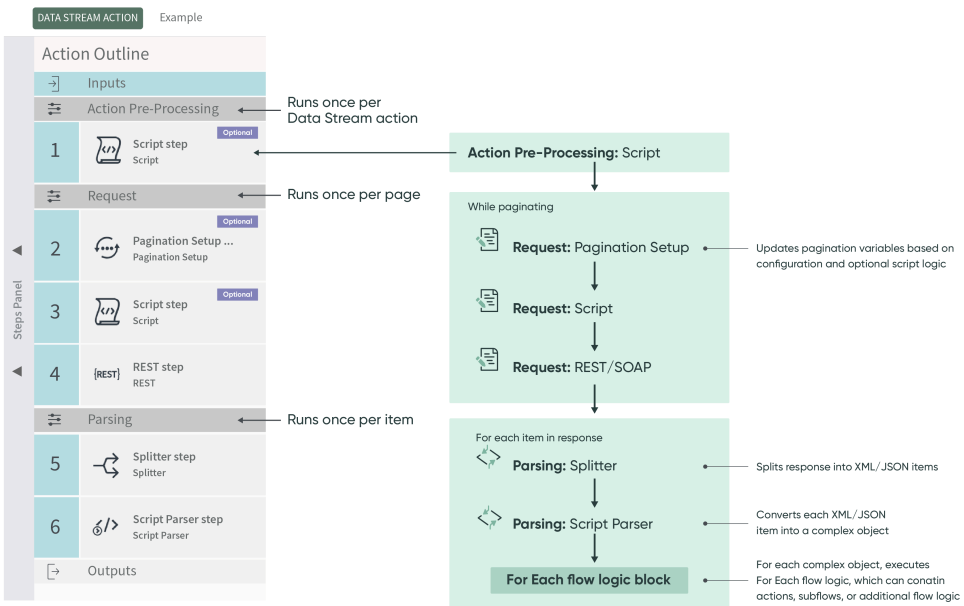
This is a mandatory Parsing component that only runs on the instance.

Script Parser step

Use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object. For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items. You can skip items in the stream by adding `outputs.state = 'SKIP'` wherever needed to the script section of the Script Parser step.

This is a mandatory Parsing component that only runs on the instance.

REST and SOAP Data Stream action overview



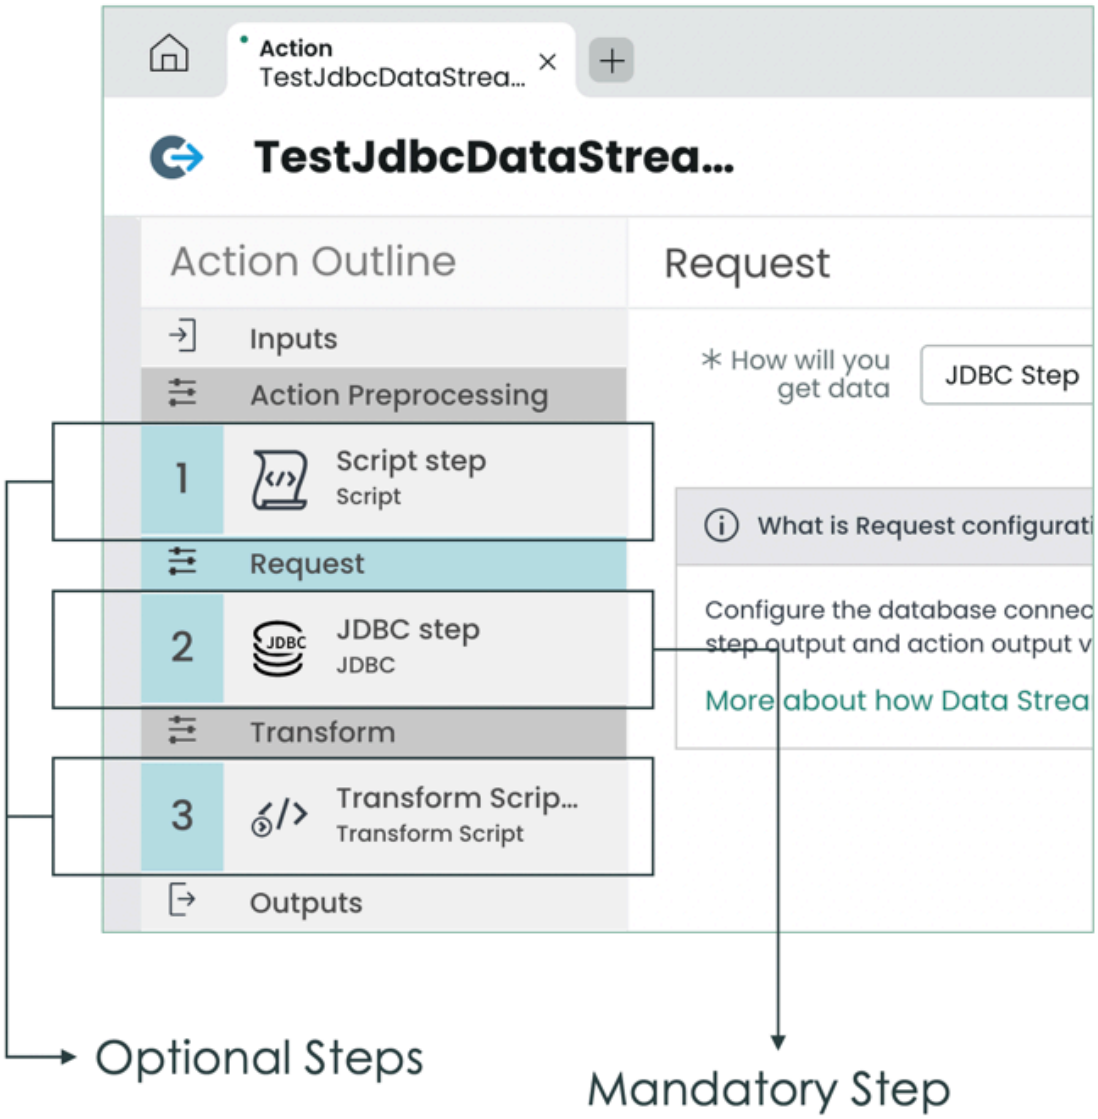
Transform script in JDBC step

JDBC data stream action doesn't require pagination. Also, splitter and parser steps aren't required.

The JDBC step generates a complex object for each of the retrieved record. Hence, action preprocessing and transform script in the JDBC data stream action are optional. When using the transform script, action designer must specify the internal name of the table columns in the transform script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JDBC Data Stream action overview



Data Stream outputs in SOAP and REST steps

When designing a Data Stream action, you must create a single output of type Object or Dynamic Object. The Script Parser step maps items in the stream to this object using the `targetObject` global object.

At runtime, the system splits and parses the stream of response data according to the Data Stream configuration. Each item in the stream maps to the complex object structure defined by the Script Parser step and the object output, resulting in a large series of complex objects. For more information about complex data, see Complex data.

Data Stream outputs in JDBC step

The output of JDBC steps is a complex object stream. Entire data is retrieved in one request only.

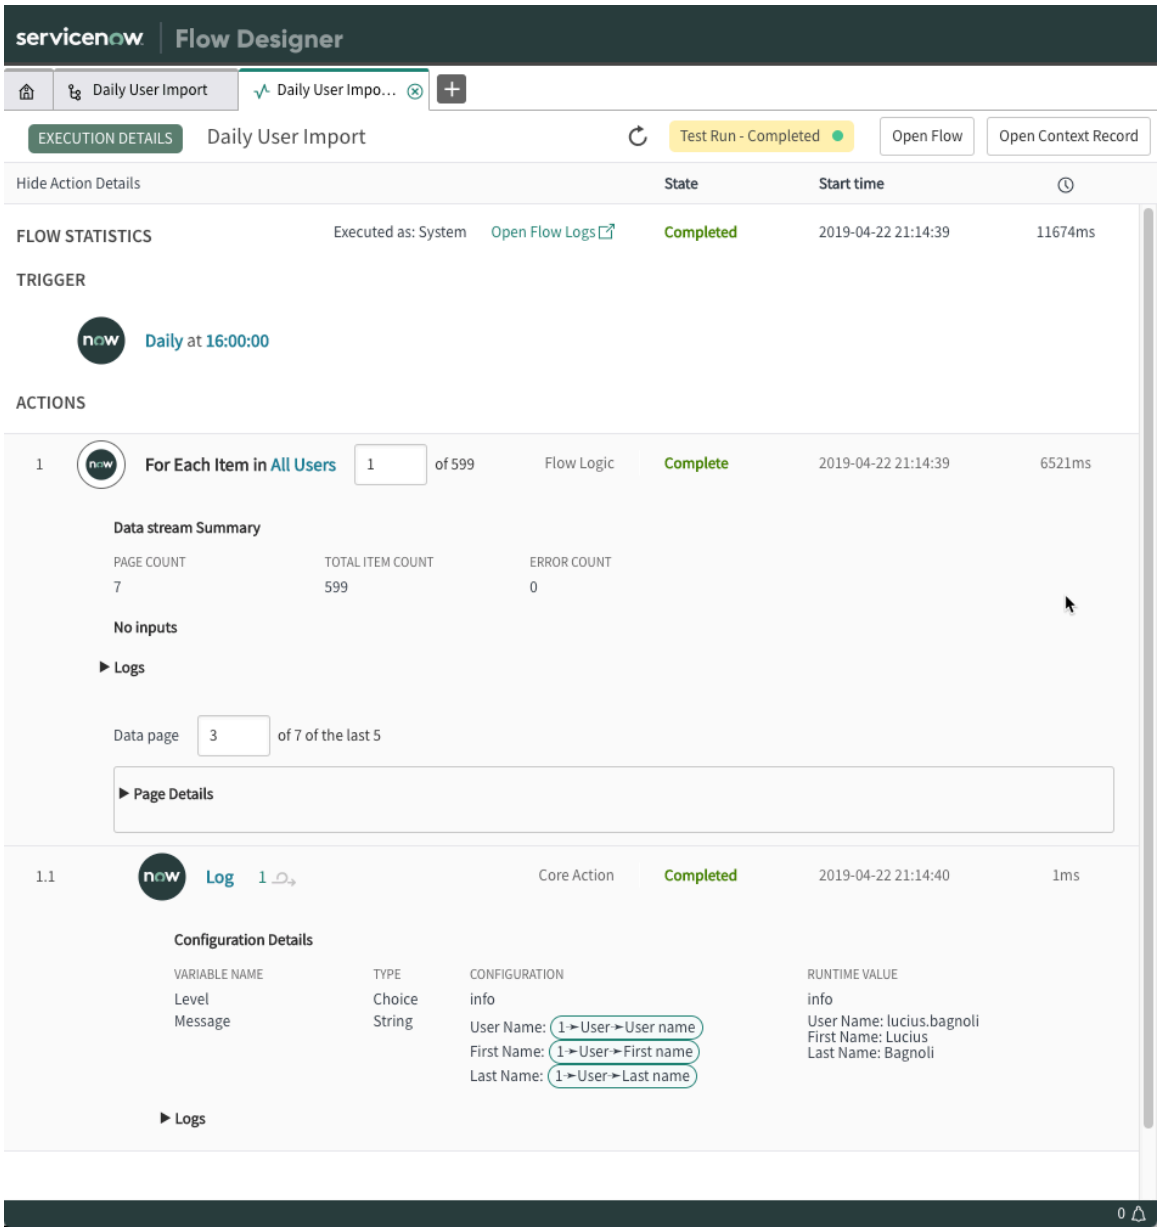
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- You can only retrieve data and can't update or delete records using the JDBC data stream action.
- The fields, **Maximum Row** and **Maximum Payload Size (KB)** that are available in JDBC step aren't available in the JDBC data stream action.

Execution details in REST and SOAP steps

View the configuration and runtime results for each item processed by a Data Stream action. Select a record number to see its configuration and runtime details. By default, the execution details include requests for the last 1000 items. To change the number of items in the execution details, update the *com.snc.process_flow.reporting.datastream.item.lastn* system property.



Data stream summary

View an overview of the execution that includes this information.

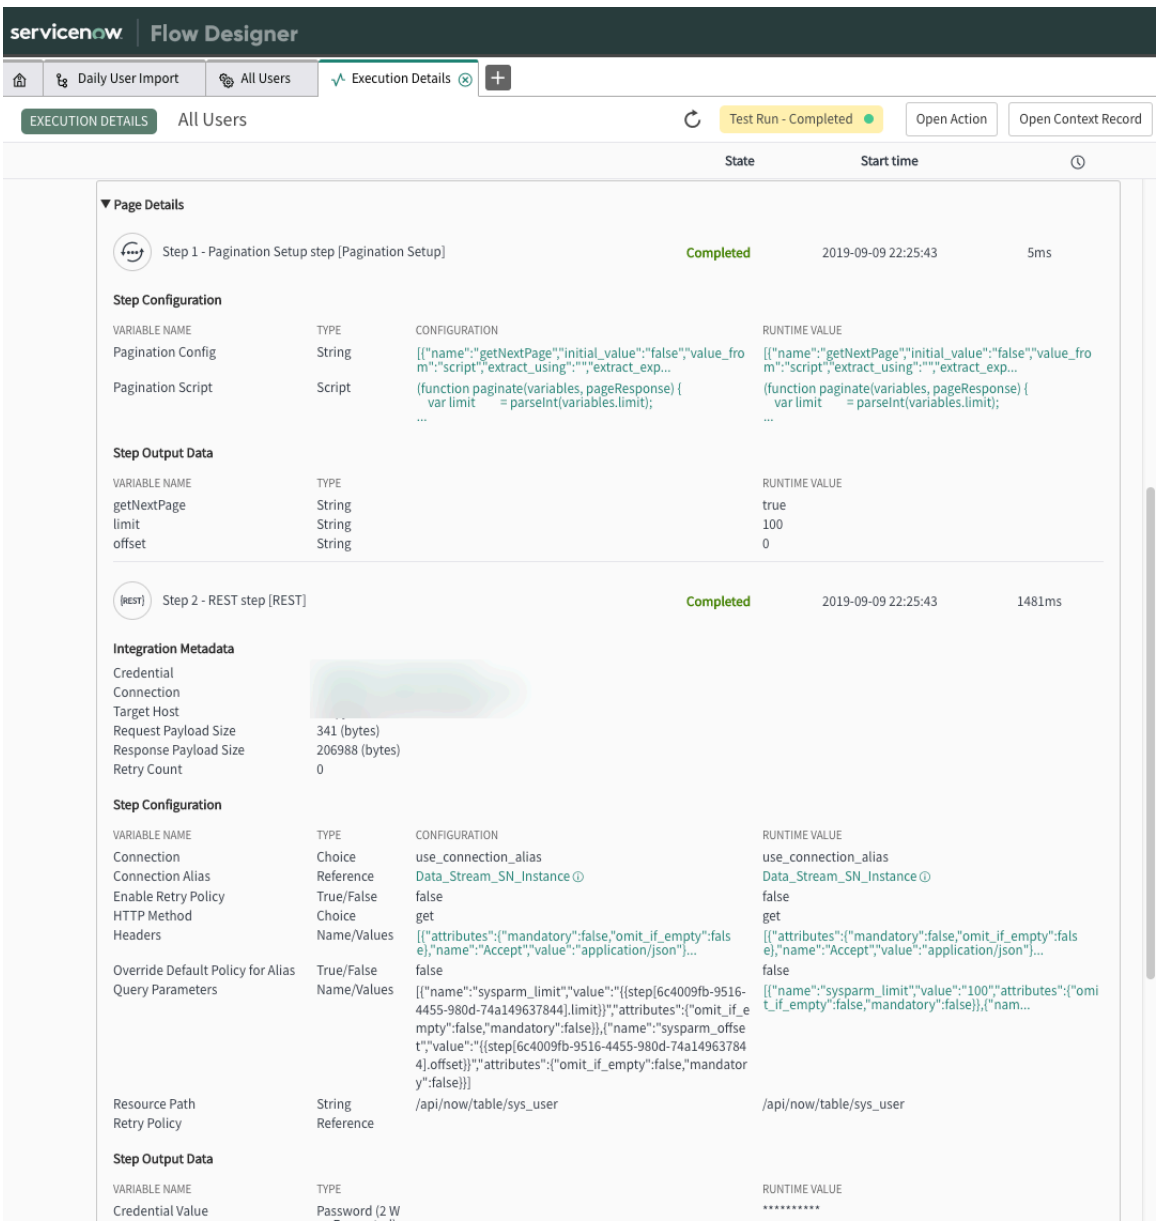
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Page count**: Number of pages returned by a paginated API.
- **Total item count**: Number of items in the response stream mapped to complex object outputs.
- **Error count**: Number of errors encountered.

Page details

View runtime data for each step within the Data Stream action. Select a page to view runtime details for each request to a paginated API. By default, the execution details include requests for the last five pages. To change the number of requests in the execution details, update the *com.snc.process_flow.page.reporting.lastn* system property. Set the value to `0` to remove pages from the execution details and `-1` to include all pages.

Note:
Including all pages can affect performance and is not recommended.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution details in JDBC step

Construction of the output complex object schema isn't needed for the JDBC data stream action. You can test the query and see the query result. See Test JDBC step for more information. Configure the MID Server properties *mid.jdbc.datastream.max.record.size* and *mid.jdbc.datastream.fail.when.attachement.limit.exceeded* to retrieve data as per your requirement. See MID Server properties for more information.

Data Stream action design considerations

Follow these considerations when creating a Data Stream action and when adding a Data Stream action to a flow to prevent errors and performance issues.

Considerations when creating a Data Stream action

Create Data Stream actions with these considerations in mind.

Write pagination logic according to third-party requirements

Evaluate and understand the format required by your third-party endpoint. For example, you may need to write a script that sets the built-in `getNextPage` variable to true as long as there is a `nextPage` token in the response. If the response does not contain the token, then set the variable to false. Access variables in script using bracket or dot notation. For example, `variables['getNextPage']`. This variable only accepts the Boolean data type. The default value is false.

Ensure that preprocessing scripts do not call a MID Server or pause the action.

Data Stream actions require a constant connection to the response stream. They do not support preprocessing scripts that pause the action to call a MID Server or pause the action to wait for a condition or duration. A preprocessing script that pauses the action for any reason returns an error message.

Convert pagination variable data types to perform math operations

Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.

```
variables['offset'] = (parseInt(variables['offset']) +
 parseInt(variables['limit'])).toString();
```

Ensure that the pagination script has an end condition

Avoid infinite loops in pagination requests by creating a condition that sets the `getNextPage` variable to false. Cancel any long-running flows. Always test Data Stream actions before using them in production.

Clear configuration page options carefully

Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

Consider the size of each page returned

When configuring pagination options, try to ensure that the size of each page returned is under one GB. This ensures that flow designers who use the action won't encounter size limit issues when retrieving data from a MID Server. If the action returns more than one GB of data per page, the flow designer may need to increase the attachment size limit. For more information, see MID Server support for Data Stream actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Nesting Data Stream actions is not supported.
- When using the retry policy, ensure that you are aware of these considerations:
  - Only a fixed time interval strategy is honoured for the data stream actions.
  - The total delay (count multiplied by the interval) can't exceed 30 seconds. For example, if you want retry for a maximum of 3 times, the maximum delay for each retry is 10 seconds.
  - Data stream step doesn’t go into the waiting state during retry.

Considerations when adding a Data Stream action to a flow

Add a Data Stream action to a flow with these considerations in mind.

Do not add actions with wait conditions to a Data Stream For Each logic block

You cannot add an action that pauses the flow to a Data Stream For Each flow logic block. Data Stream actions require a constant connection to the response stream. For example, you cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic.

Some actions and steps always pause a flow and cannot be added to Data Stream For Each flow logic blocks. However, some actions and steps may pause the flow depending on how they are configured. Check the action configuration to ensure it does not pause the flow at runtime.

Always pauses the flow (unsupported with Data Stream actions)	Ask for Approval action
	Ask for Approval step
	Wait for Condition action
	Wait for Condition step
May pause the flow depending on configuration	Create Catalog Task action
	Create Task action
	Create Task step

Do not add actions that run on the MID Server to a Data Stream For Each logic block

Some actions and steps always run on a MID Server and cannot be added to Data Stream For Each flow logic blocks. However, some actions and steps may run on a MID Server depending on how they are configured. Check the action configuration to ensure it does not run on the MID Server at runtime.

Always runs on a MID Server (unsupported with Data Stream actions)	JDBC step
	PowerShell step
	SSH step
May run on a MID Server depending on configuration	REST step
	Script step
	SOAP step

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Turn off reporting when consuming a large number of records in the For Each logic block

Iterating over a large number of records can be resource intensive, especially when the For Each logic block includes complex actions for each iteration. To avoid performance issues, turn off reporting using the *com.snc.process_flow.reporting.level* system property. For more information, see Workflow Studio flow system properties.

MID Server support for Data Stream actions

Get data through a ServiceNow® MID Server when running a Data Stream action.

When selected, the MID Server retrieves the data and sends each page to the instance as an attachment to process.

Important:
When running the Data Stream action within flow, the actions in the **For Each** block always run on the instance.

These steps can run on either the MID Server or the instance:

- Action Preprocessing Script
- Request Script step
- REST or SOAP step

Note:
Avoid shifting the execution environment between the instance and the MID Server multiple times. For example, you might configure the Request Script step to run on the MID Server, but the REST step to run on the instance. In this case, the system shifts environments between the instance and MID Server for every page of data, which may degrade performance.

To learn more about running a step on a MID Server, see Integration steps.

Size limits

If your system encounters a timeout or size limit issue, try making one of these adjustments:

Increase the REST transaction quota rule

If the connection between the instance and the MID Server slows down, you may encounter a timeout while waiting for a response from the REST step. Increase the default timeout by updating the *REST Attachment API request timeout* transaction quota rule.

- Default: 60 seconds
- Maximum: 300 seconds

Increase the instance timeout

By default, the instance waits for 600 seconds to retrieve a single page of data from a MID Server. If you encounter a timeout when running a Data Stream action through a MID Server, change this default by increasing the *datastream_alternative_env_fetch_page_timeout_seconds* system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Default: 600 seconds
- Maximum: 7200 seconds

Increase attachment size

The MID Server sends each page of data to the instance as an attachment. If a page of data is large, it may exceed the allowed attachment size. Increase the allowed size by updating the *com.glide.attachment.max_size* system property.

- Default: 1024 MB
- Maximum: None

Create a Data Stream action

Create a reusable action to process a stream of response data within a flow.

Before you begin

- Set up an application in Guided Application Creator to store Workflow Studio content.
- Disable any conflicting business rules or workflows before creating an action.
- Role required: action_designer or admin

About this task

Creating a custom application to contain your Workflow Studio content enables you to deploy it using the application repository or the ServiceNow Store.

Note:
Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

Procedure

1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Click the **Actions** tab and select **Data Stream**.
3. Fill in the Action Properties and click **Submit**.

Field	Description
Action name	Enter a unique name for your data stream action.
Description	Description of the data stream action.
Application	Application scope of the data stream action.
Domain	Domain scope of the data stream action. For more information about domain separation, see Domain separation explained.
Additional properties	
Accessible From	Accessible from all application scoped or only within the specified application scope.
Category	Defined category within the application scope for an action. Beginning with the Xanadu release, you can create a custom category to organize your data stream actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Protection	Select whether the data stream action is read-only. You can only select a value when you create the data stream action in an application scope you own. The default value is None.
Action annotation	Help text that appears under the data stream action title in Workflow Studio to help data stream action authors understand what the data stream action does when used in a flow.

An empty Data Stream action opens.

4. Define action inputs to make data available to the action steps.

   a. Select **+ Create Input** and complete the fields.
   Inputs are represented as data pills in the right-hand pane.

   For more information about action inputs, see Workflow Studio - Building custom actions.

5. Click **Action Preprocessing** in the Data Stream outline and configure the desired options.

   a. Select **Retrieve connection info** to add the Get Connection Info step as the first step in the action preprocessing.
   The Get Connection Info step enables you to retrieve connection and credential details to use in your action. For more information, see Get Connection Info step.

   b. Select **Enable preprocessing script** to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or set default values. Preprocessing executes once per action, before the first API request.

   Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

   Important:
   Data Stream actions require a constant connection to the response stream. They do not support preprocessing scripts that pause the action to call a MID Server or pause the action to wait for a condition or duration. A preprocessing script that pauses the action for any reason returns an error message.

6. Click **Request** in the Data Stream outline and configure the desired options.

   a. In the **How will you get data** field, select **REST Step**, **SOAP Step**, or **JDBC Step** to add the associated step to the Data Stream action.

   For more information, see REST step, SOAP step, and JDBC step .

   This section can run on either the MID Server or the instance. The environment is determined by the **Use MID server** field in the associated Connection [sys_connection] record.

   Note:
   - If you are using the JDBC step, you must test it. Upon successful execution, you can use the result to create the step output and data stream action output.
   - If you are using the REST step or SOAP step, you must manually create the data stream action output.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Enable pagination** to request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. This option adds a Pagination Setup step to the Data Stream outline.

> **Note:**
> For a JDBC step, pagination is not applicable. Each page can retrieve up to 1 GB data and one request can retrieve up to 8 GB data.

c. Select **Run a script before each request** to run a script before every request for the next page when calling a paginated API.

Example
For example, write a script to transform variable data types from the initial response before sending a request for the next page.

Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

> **Note:**
> For a JDBC step, this is not applicable.

This section can run on either the MID Server or the instance. The environment is determined by the script step's **Required Runtime** field.

> **Important:**
> Avoid shifting the execution environment between the instance and the MID Server multiple times. For example, you might configure the Request Script step to run on the MID Server, but the REST step to run on the instance. In this case, the system shifts environments between the instance and MID Server for every page of data, which may degrade performance.

7. Optional: If pagination is enabled, configure the Pagination Setup step.
Configure the Pagination Setup step manually, or select a pre-built template to apply common configurations. For example, apply the **Limit / Offset** template to specify the number of items you want returned per page (limit), and the starting number for the first item (offset). After applying a template, update the values to ensure that the configuration complies with the API's requirements.

a. Create pagination variables.
For example, if the third-party API takes a `limit` parameter in the request, create the `limit` variable and set the initial value to limit the number of results per page. The initial value is only used in the first request. `getNextPage` is a reserved, read-only variable. As long as the `getNextPage` variable is true and the previous page contains data, the action continues to send requests for the next page.

b. In the **Next Value From** field, define how pagination variables receive a value for subsequent requests.

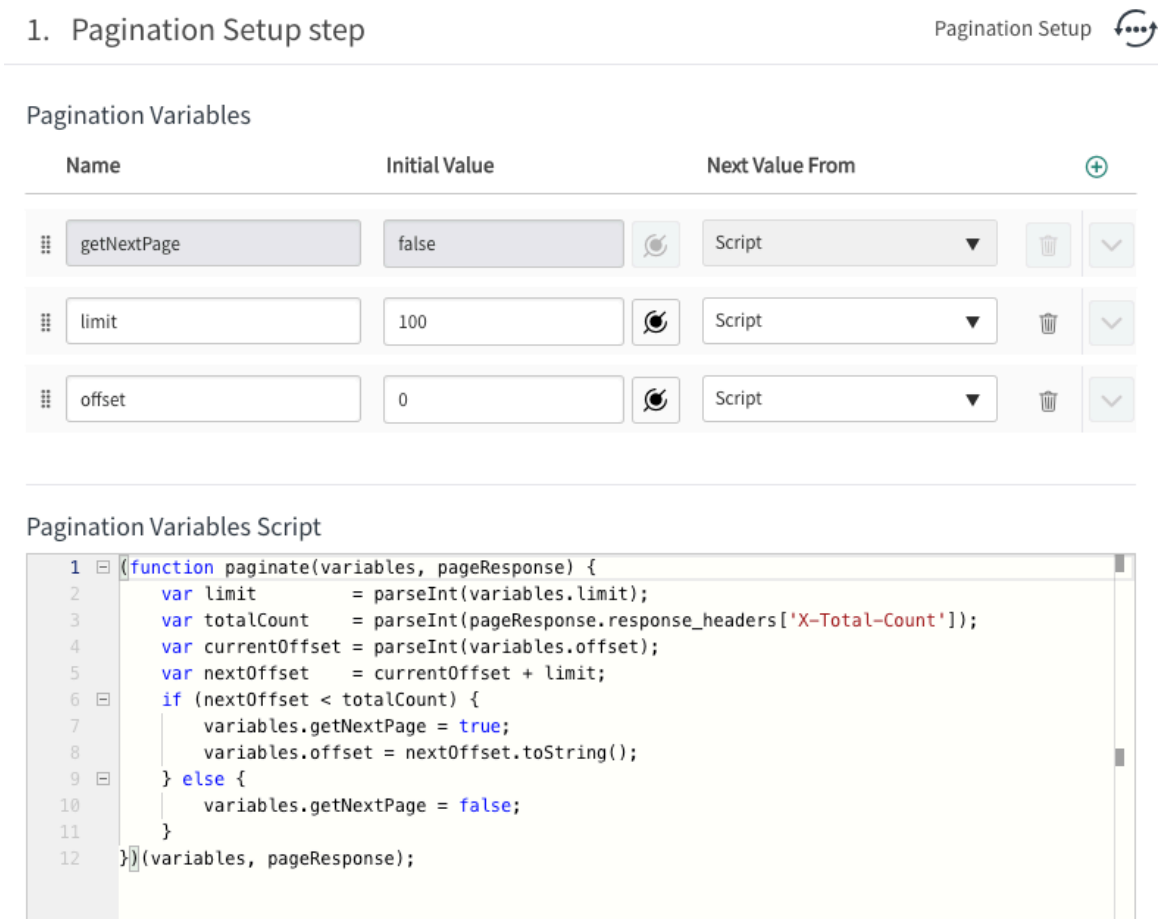
(Optional) Choose from:

- **Script**: Write a Pagination Variables Script to define how variables are populated. Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Response Body**: Use a value in the response from the previous request to populate the variable. If the response is JSON format, set **Extract value using** to **JSONPath Expression** and provide the path to the value in the **Expression** field. If the response is XML format, set **Extract value using** to **XPath Expression** and provide the path to the value.

Example
In this example, the `getNextPage` variable is true until the `nextOffset` variable reaches the total count value returned in the API response header. As long as the `getNextPage` variable is true and the previous page contains data, the action continues to send requests for the next page. This example includes a common limit/offset pagination configuration. The third-party APIs that your Data Stream action interacts with may use a page token or other method.



Important:
Avoid infinite loops in pagination requests by creating a condition that sets the `getNextPage` variable to false. Cancel any long-running flows. Always test Data Stream actions before using them in production.

8. Click **Parsing** in the Data Stream outline and configure the desired options.

Note:
For a JDBC step, this is not applicable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **How will you identify each record** field, select **JSON/XML Splitter** to add a Splitter step to the Data Stream outline.

b. In the **How will you parse each item into an object** field, select **Script Parser** to add a Script Parser step to the Data Stream outline.

9. Configure the Splitter step.

This step identifies the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.

Note:
For a JDBC step, this is not applicable.

a. In the **Source Format** field, select the format returned by the Request section.

- **JSON**: Identifies objects from a stream of JSON data. Use a JSONPath expression to identify a JSON array containing repeated data.
- **XML**: Identify objects from a stream of XML data. Use an XPath expression to identify an XML element containing repeated data.

b. In the **Item Path** field, define the absolute path to the item in the data stream you want to map to an object.

JSON

Identify the absolute path to an array of objects as a JSONPath expression. For example, use `$.result` to separate each item in a JSON `result` array into a `result` object.

Note:
If you select an array at the root node of a JSON data stream, the system displays the absolute path as `$.*` in execution details and error messages.

XML

Identify the absolute path to a repeating data object as a XPath expression. For example, use `/result` to separate each instance of a `result` XML element into a `result` object.

Note:
The Splitter step ignores XML namespaces.

Example
For example, suppose the REST Step returns a stream of JSON data. The item path `$.response.result.companies` returns each item in the `companies` array.

```
{
  "response": {
    "result": {
      "companies": [
        {
          "name": "company1"
        },
        {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          "name": "company2"
        },
        {
          "name": "company3"
        }
      ],
      "metadata": {
        "token": 1558666526
      }
    }
  }
}
```

Example

For example, suppose the REST Step returns a stream of XML data. The item path `/response/result/companies/company` returns each `company` element from the XML data.

```
<response>
  <result>
    <companies>
      <company>
        <!-- company 1 info -->
      </company>
      <company>
        <!-- company 2 info -->
      </company>
      <company>
        <!-- company 3 info -->
      </company>
      <company>
        <!-- company 4 info -->
      </company>
      <batch>10645C53D4BED73YQ</batch>
    </companies>
    <metadata>
      <timestamp>1558666526</timestamp>
    </metadata>
  </result>
</response>
```

10. In the Script Parser step, use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object.

    For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items.

    Note:
    For a JDBC step, this is not applicable.

    You can access outputs from previous steps in your data stream action using the *`fd_data`* object, excluding:

    - REST or SOAP step Response Body, Stream, or Error Message outputs.
    - Splitter step outputs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example
An example script that parses a JSON response.

```
(function parse(inputs, outputs) {
    var record = JSON.parse(inputs.sourceItem);
    outputs.targetObject.id=record.number;
    outputs.targetObject.name=record.short_description;
})(inputs, outputs)
```

Example
An example script that parses an XML response.

```
(function parse(inputs, outputs) {
    var xmlDoc = new XMLDocument(inputs.sourceItem, false);
    outputs.targetObject.id =
 xmlDoc.getNodeText("/result/number");
    outputs.targetObject.name =
 xmlDoc.getNodeText("/result/short_description");
})(inputs, outputs)
```

11. **Optional:** If you selected the JDBC step, click **Transform**.
    After successfully testing the JDBC step, click **Use Result** to create the step output and data stream action output. You can use this result or customize it using the transform script.
    a. Select the **Enable Transform Script** check box to transform and customize the default data stream output.
12. Create a complex object output.

    Note:
    For a JDBC step, this is not applicable.

    a. Select **Outputs** in the Action Outline and click **+** to create an output.

    b. Update the **Label** field to represent the object.

    Example
    For example, if the action parses a stream of company records, add the **Company** label.

    c. Update the **Type** field to **Object**.
    This is the complex object output represented by the `targetObject` global object in the Script Parser step.

    d. Add child fields to the complex object using the **+** icon.

    e. Make the name of each child field more user-friendly so that you can meaningfully refer to it in script.

    The value in the **Name** field is the internal name used in the Script Parser step.
    For example, to refer to the City output in the Script Parser step, you would use `outputs.targetObject.city`.

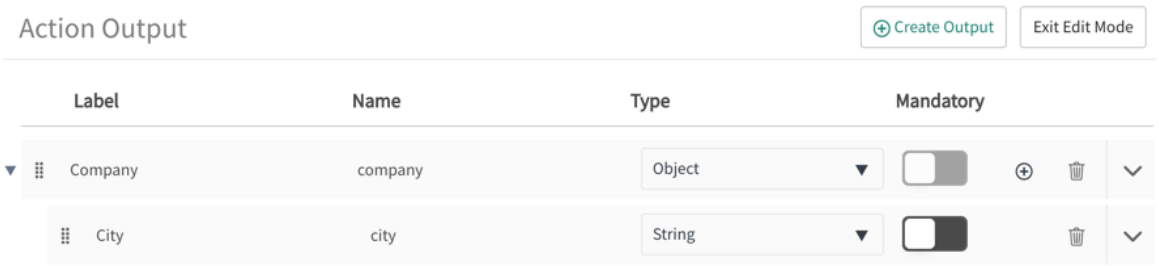
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Warning:
After saving the Data Stream action, you cannot change values in the **Name** field.

13. Click **Save**.
    Workflow Studio saves a draft of the action.

What to do next
Test a Data Stream action.

Test a Data Stream action

Test your Data Stream action to ensure that it works the way you expect before you add it to a flow.

Before you begin

- Create a Data Stream action
- Role required: action_designer or admin

About this task
Testing a Data Stream action returns the first 20 items by default. To change this value, add the *com.glide.hub.action_type.datastream.test_max_iterations* system property with a value between one and 50.

Procedure

1. Open the Data Stream action you want to test.
   a. Navigate to **Flow Designer** > **Designer**.
   b. Select the Actions tab.
   c. Select the row for the Data Stream action you want to test.
2. Select **Test**.
   The system displays the Test Action dialog. The contents of the Test Action dialog depend on the Data Stream action inputs.
3. In the Test Action dialog, provide values for any action inputs and select **Run Test**.
4. Open the Execution Details to ensure that the action executed as expected.
   The Execution Details **Runtime Value** returns the first 20 items returned by the Data Stream action.

What to do next
Use a Data Stream action in a flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use a Data Stream action in a flow

Data Stream actions use the **For each** flow logic option to process stream data in a flow. For example, suppose that you want to use a Data Stream action that imports document data from a third-party site. When added to a flow, the action appears as a **For each** flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream.

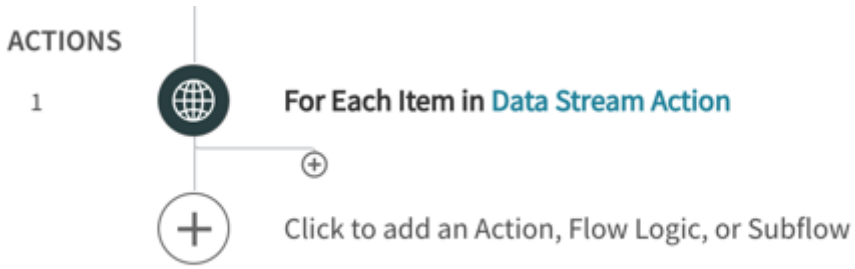
Before you begin

Data Stream actions require an Integration Hub subscription. For more information, see Legal schedules - Integration Hub overview.

Role required: flow_designer or admin.

Procedure

1. Open the flow you want to add the Data Stream action to.
2. Add the Data Stream action to the flow.
   The action appears as a **For Each** flow logic block.



3. Add a child action within the **For Each** flow logic block.

   This action runs on each object within the data stream.

   Note:
   You cannot add an action that pauses the flow to a Data Stream For Each flow logic block. Data Stream actions require a constant connection to the response stream. For example, you cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic. For more information, see Data Stream action design considerations.

4. Click **Save**.
   Workflow Studio saves a draft of the flow, trigger, and actions.

What to do next

Test the flow until it is ready to be activated.

Note:
The system only triggers active flows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditional and event-driven inbound integration

Integration Hub enables both conditional and event-driven inbound integration with third-party applications.

Set up an inbound integration with a third-party application by setting up flows and endpoints that external webhooks in the third-party application use. Set up a conditional and event-driven flow by selecting an external trigger from the new trigger picker and then setting the actions from the action picker on Workflow Studio. After that, set up endpoints that configure the external webhook from the third-party application. You perform all of these actions on your ServiceNow instance.

For example, you're setting an inbound integration between your ServiceNow instance and a third-party issue-tracking application. When you update a P1 priority issue on the issue-tracking application, an incident database record on the ServiceNow instance should be updated.

To set the integration, configure a flow by selecting an external trigger from the new trigger picker, set the priority as P1, and then setting the actions from the action picker on the Workflow Studio accordingly. The flow accepts the payload from the issue-tracking application and updates the incident table. Then, you generate an endpoint on a base system external event source on your ServiceNow instance from the Application tile in the Inbound Connections tab and provide the same endpoint in the external webhook of the issue-tracking application. Now, when you update a P1 issue on the issue-tracking application, its external webhook activates and acts as a trigger for the flow you had set on your ServiceNow instance. Before that, the ServiceNow instance authenticates the webhook based on the type of authentication the issue-tracking application supports. After successful authentication, the webhook triggers the flow and the flow executes.

Set up a flow with external trigger definition

Set up a flow that responds to an event-driven external trigger from a third-party system and executes.

Before you begin

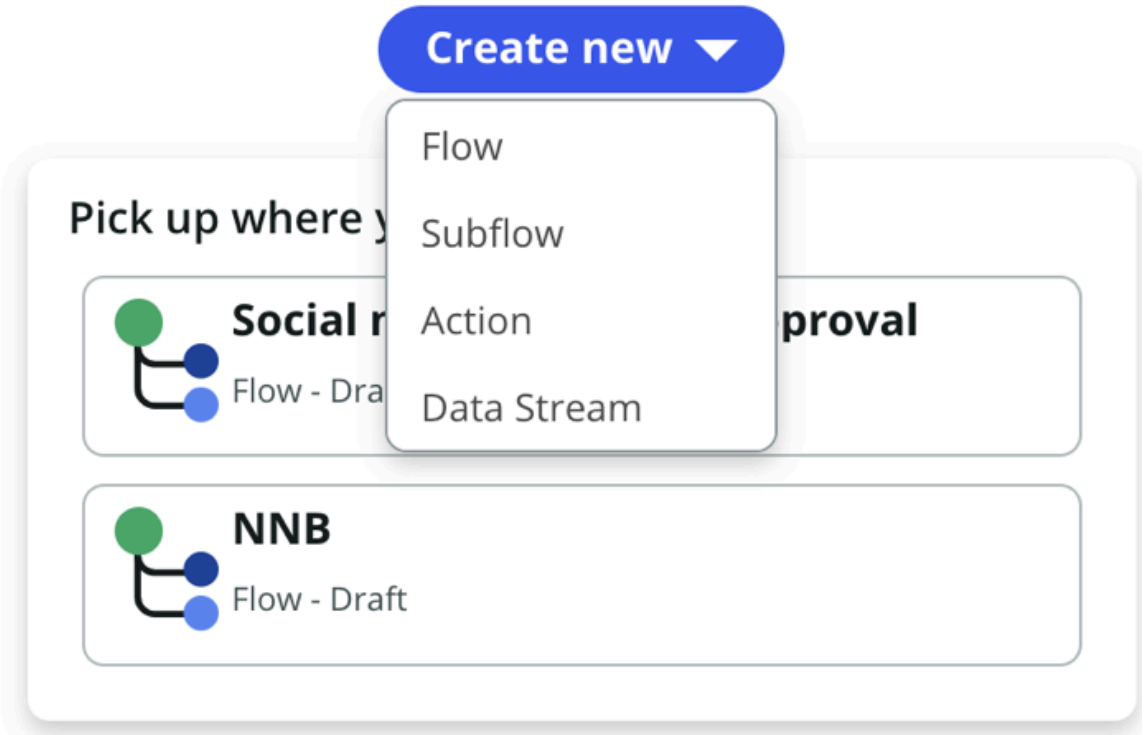
Role required: flow_designer

Subscription required: Integration Hub Enterprise pack

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select **Create New** > **Flow**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Fill out the **Flow properties** form.

Field	Description
Name	Name to uniquely identify your flow. The system creates the internal name of the flow from this name.
Description	Description of your flow.
Application	Application scope to create your flow in. Global is the default.
Protection	Specify if the flow is read-only. **Note:** This is an optional field with two values: None and Read-only. Choose read-only if the flow is within an application scope that you own.
Run as	Option to specify the user that runs the flow. You can select the system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, use this option when you want the incident record comments to come from the user who started the flow. Settings for the Run as option in a flow don't apply to child subflows. **Note:** By default, flows run as the user who initiates the session. To create a flow that can run with a personal OAuth token, select the user who initiates the session option. If the user who is running the flow has a personal OAuth token, the flow runs with that token. For more

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	information about creating a personal OAuth token, see OAuth 2.0 credentials. When flows run as the user who initiates the session, the system limits flow actions by user Access Control Rule (ACL) restrictions. Ensure that security restrictions don't prevent users who trigger the flow from performing flow actions. Flows run by the initiating user also respect user-specific settings such as date/time formats. **Note:** Inbound email flows ignore this setting and always run as the user who initiates the session. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.
Run with roles	Roles that the flow runs with. This option is only available when **Run as** is set to **user who initiates the session**.

4. Select **Submit**.

   Note:
   If this is your first time in Workflow Studio, a welcome screen appears. You can choose to either take the welcome tour or skip the tour.

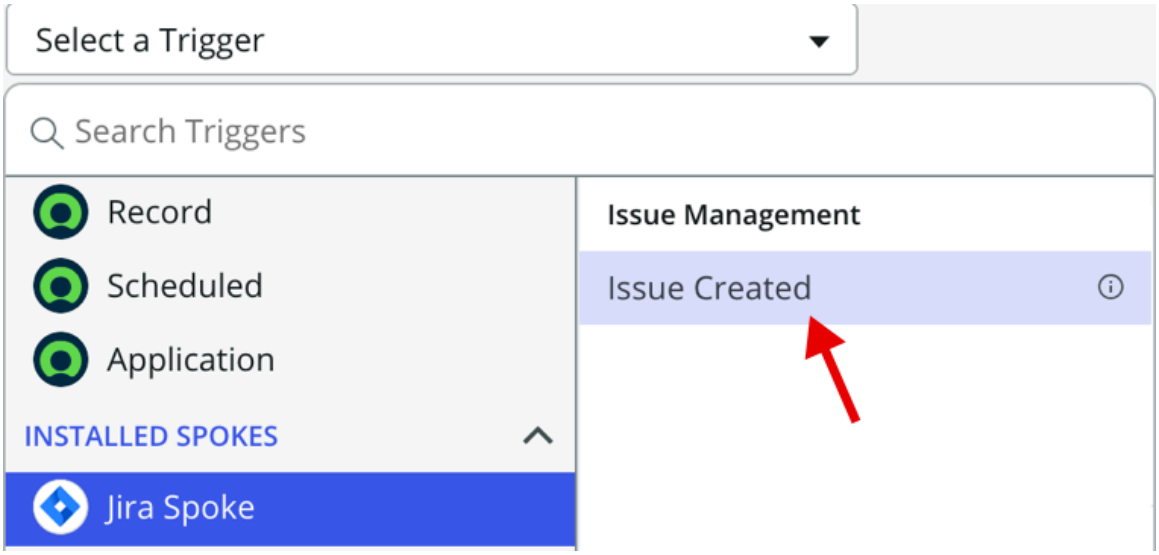
5. Add a trigger to your flow.

   a. Under the TRIGGER section, select **Add a trigger**.

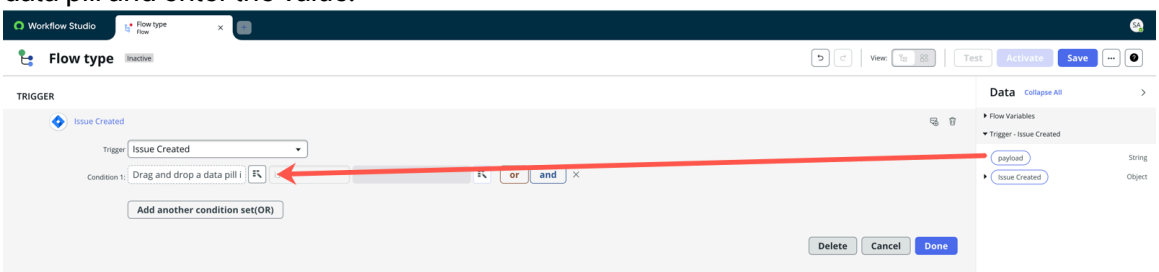
   b. Under the INSTALLED SPOKES heading, select a spoke from the Trigger list.

   c. Select the predefined external trigger definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. To define the conditions for the flow to execute, in the Condition 1 field, drag the appropriate data pill and enter the value.



e. Optional: To define an extra condition, select **OR** or **AND**.
A condition field is added.

f. Optional: In the condition field, drag the appropriate data pill and enter the value.

g. Select **Done**.
You've set up the trigger.

6. Set up the actions from the Action Picker.

a. Under ACTIONS, select ⊕.

b. Select **Action**.

c. Under INSTALLED SPOKES, select the spoke and then select the action.
You can also select an action from the Core Actions.

d. Provide the details for the action.

e. Select **Done**.

You've set up the flow.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up external trigger endpoints

Generate an endpoint that the external webhook in the third-party application uses to connect to your ServiceNow instance. You can deactivate or remove the configuration of the endpoint from the connection when you want the endpoint to no longer listen to the external webhook.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: This feature requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Ensure that you've installed the required spoke plugin.

About this task

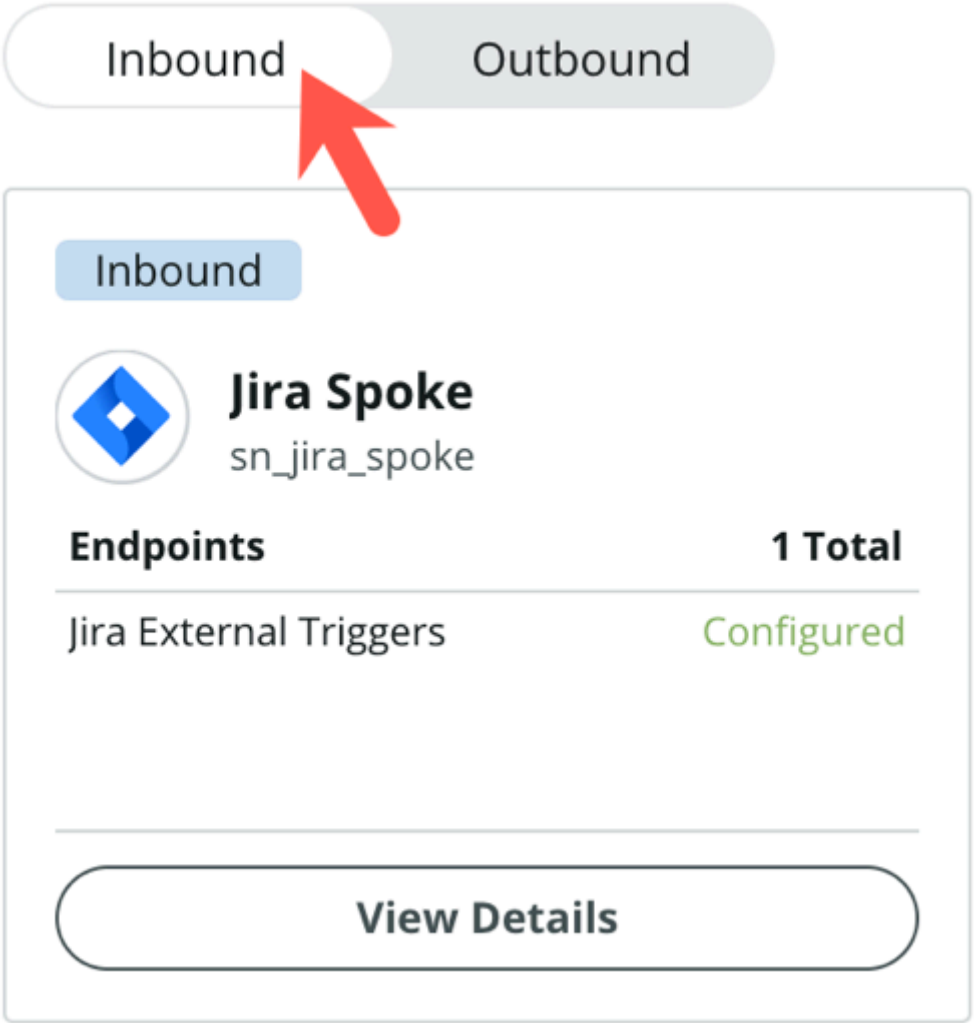
The connections that enable you to set up endpoints become available as base system contents on your ServiceNow instance when you install the spoke plugin from the ServiceNow store. After that, you can generate endpoints with basic authentication, token, or hash authentication mechanisms based on the type of authentication the third-party application supports. When the webhook attempts to connect with your ServiceNow instance, it's first authenticated with the authentication method set up in the endpoint connection.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select **Connections**.
3. In the Search all connections field, enter the name of the spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The spoke connection card appears with the **Inbound** tab selected by



default.

4. Select **View Details**.
5. Set up external trigger endpoints with different authentication types.
   a. Manage endpoint with Basic authentication support.
   b. Manage endpoint with Hash message support.
   c. Manage endpoint with Token support.
   d. Manage endpoint with OAuth 2.0 support

Manage endpoint with Basic authentication support

Generate endpoint for webhooks in third-party applications that support basic authentication. The endpoint enables webhooks to connect with your ServiceNow instance. You can deactivate or remove the configuration of the endpoint from the connection when you want the endpoint to no longer listen to the external webhook.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: This feature requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Ensure that you've installed the required spoke plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure endpoint with Basic authentication support

Configure the endpoint that listens to the webhook from a third-party application.

Before you begin

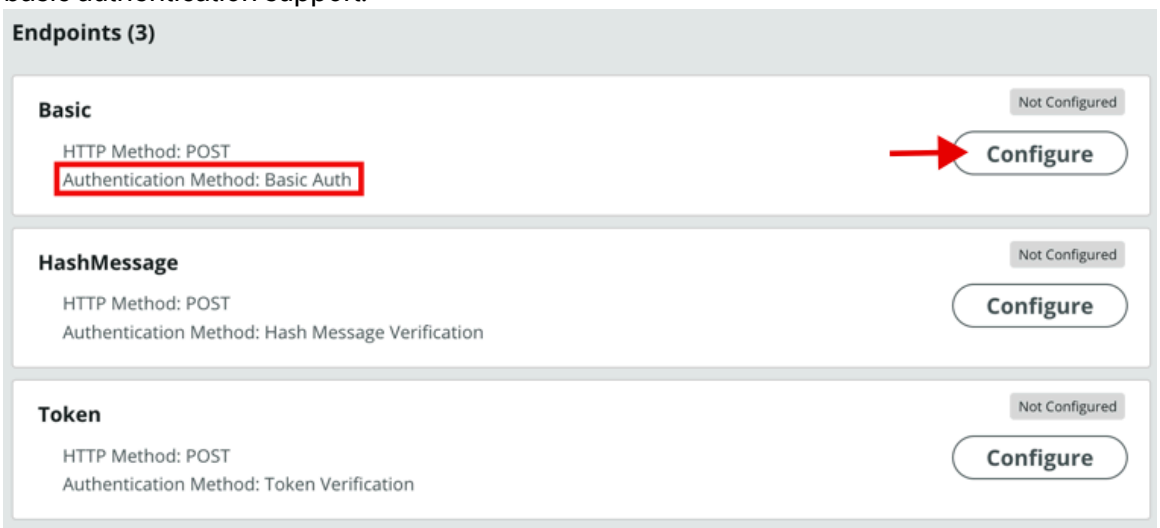
Role required: flow_designer and connection_admin

Subscription required: Integration Hub Enterprise pack

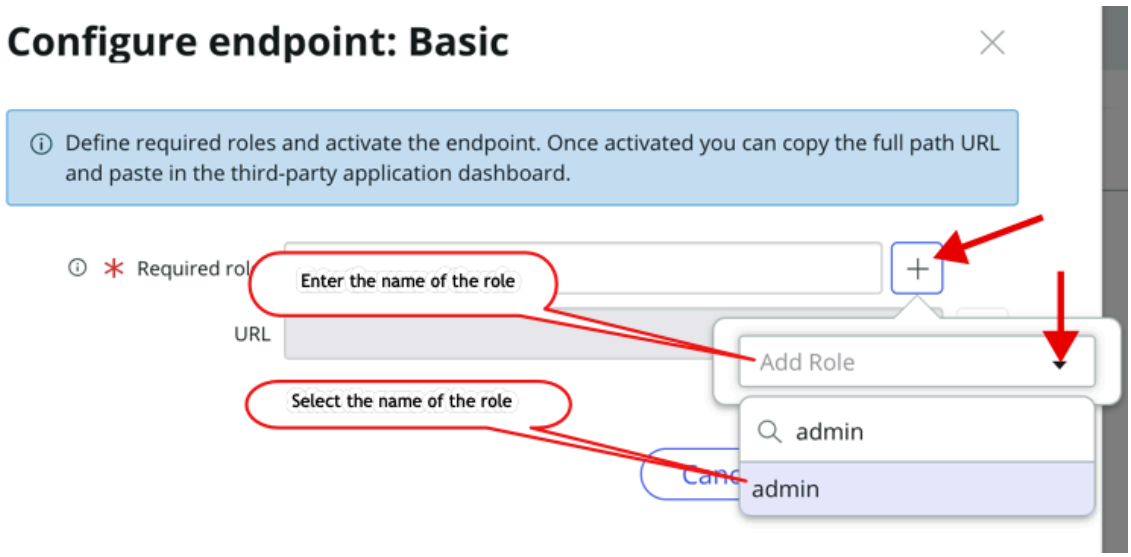
Ensure that you've installed the required spoke plugin.

Procedure

1. Under the Endpoints heading, select **Configure** for the connection to set up an endpoint with basic authentication support.

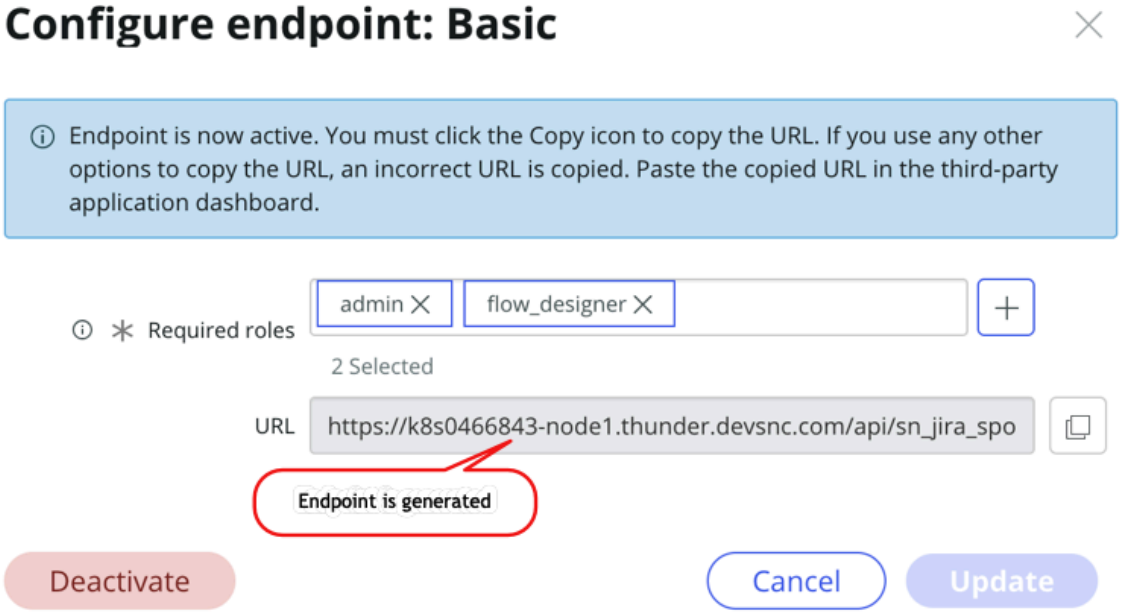


2. To display the Add Role field, select +.
3. To select one or more roles, select ▾ or enter the name of one or more roles.



4. Select **Activate**.
   The endpoint for the third-party application webhook is generated in the URL field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. To copy the endpoint, select the copy endpoint icon ( )

Tip:
Keep the endpoint at a secure place to use later at the third-party application webhook.

Deactivate endpoint with Basic authentication support

Deactivate the endpoint so that it stops listening to a webhook. However, you can activate it again.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: Integration Hub Enterprise pack

Ensure that you've installed the required spoke plugin.

Procedure

1. Select **Deactivate**.
2. To confirm deactivation, select **Deactivate**.
3. To activate again, on the connection record, select **Edit**.
4. Select **Activate**.

Deconfigure endpoint with Basic authentication support

Remove the configuration of the endpoint.

Before you begin

Role required: flow_designer and connection_admin

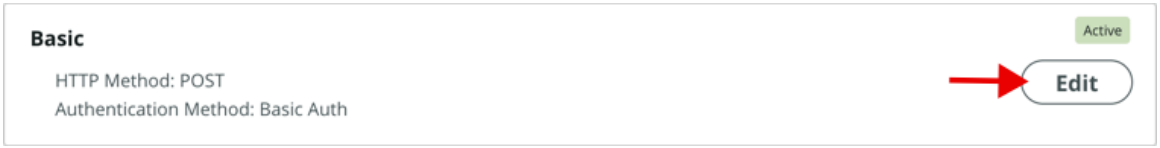
Subscription required: Integration Hub Enterprise pack

Ensure that you've installed the required spoke plugin.

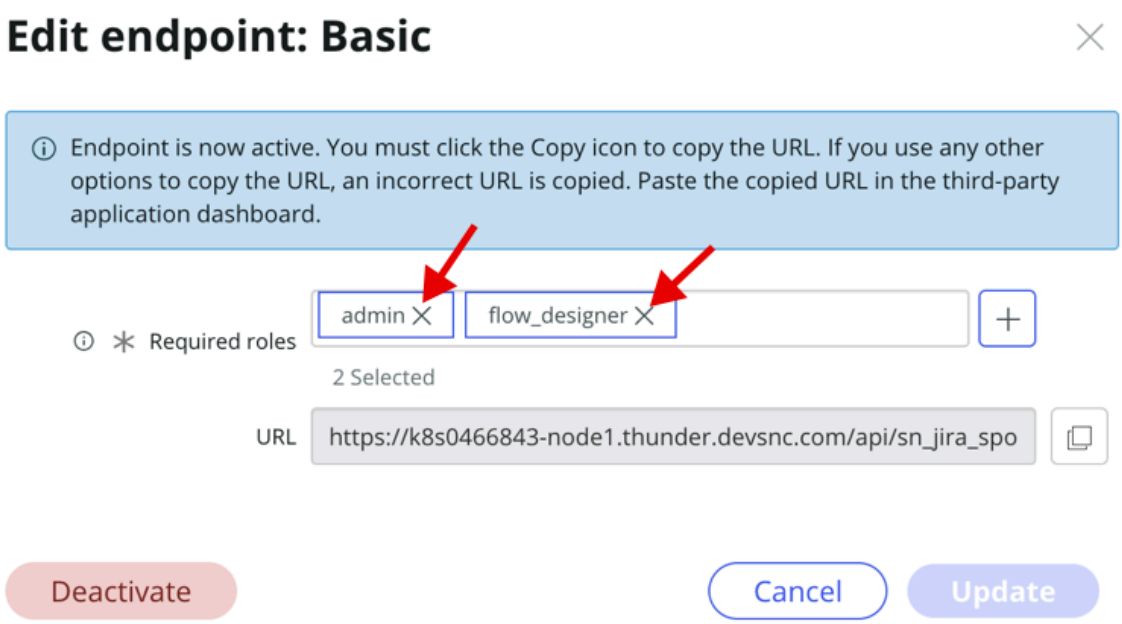
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select **Edit**.



2. Remove the roles.



3. Select **Update**.
4. Select **Deconfigure**.
   The configuration for the endpoint is removed from the connection.

Manage endpoint with Hash message support

Generate endpoint for webhooks in third-party applications that support hash message authentication. The endpoint enables webhooks to connect with your ServiceNow instance. You can deactivate or remove the configuration of the endpoint from the connection when you want the endpoint to no longer listen to the external webhook.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: This feature requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Ensure that you've installed the required spoke plugin.

Configure endpoint with Hash message support

Configure the endpoint that listens to the webhook.

Before you begin

Role required: flow_designer and connection_admin

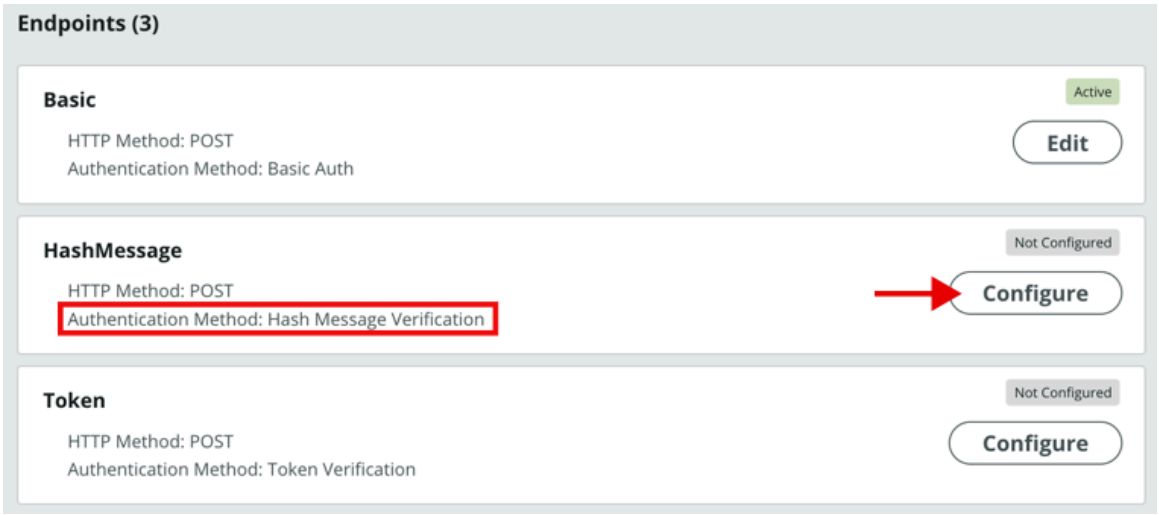
Subscription required: Integration Hub Enterprise pack

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

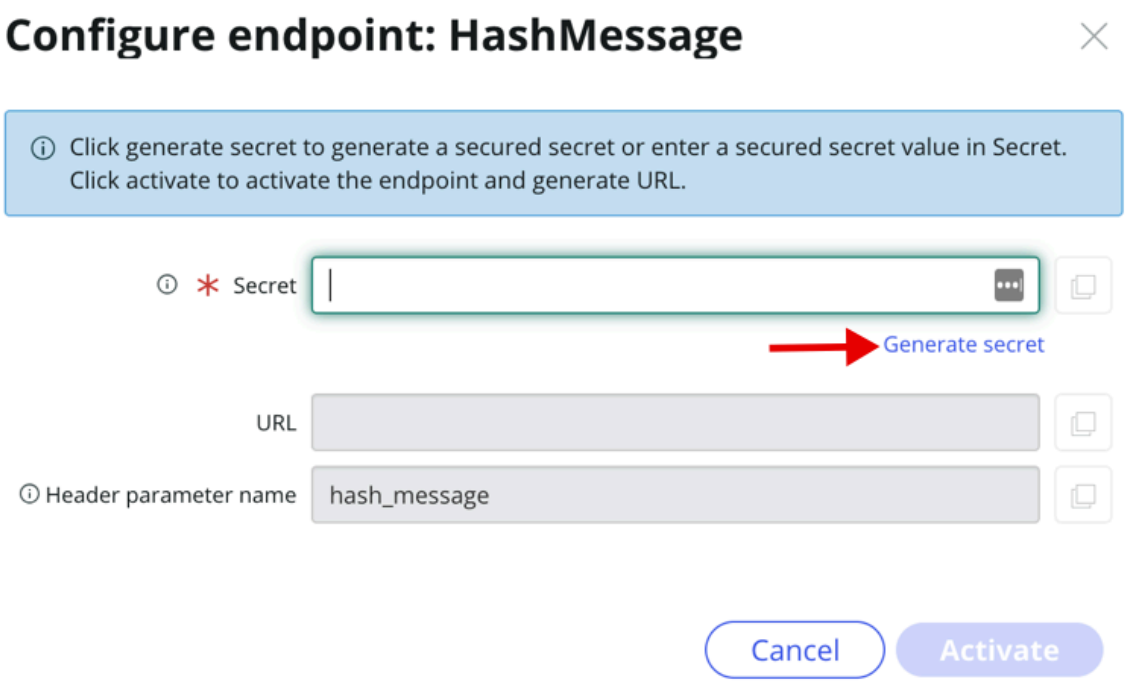
Ensure that you've installed the required spoke plugin.

Procedure

1. Under the Endpoints heading, select **Configure** for the connection to set up an endpoint with hash message authentication support.



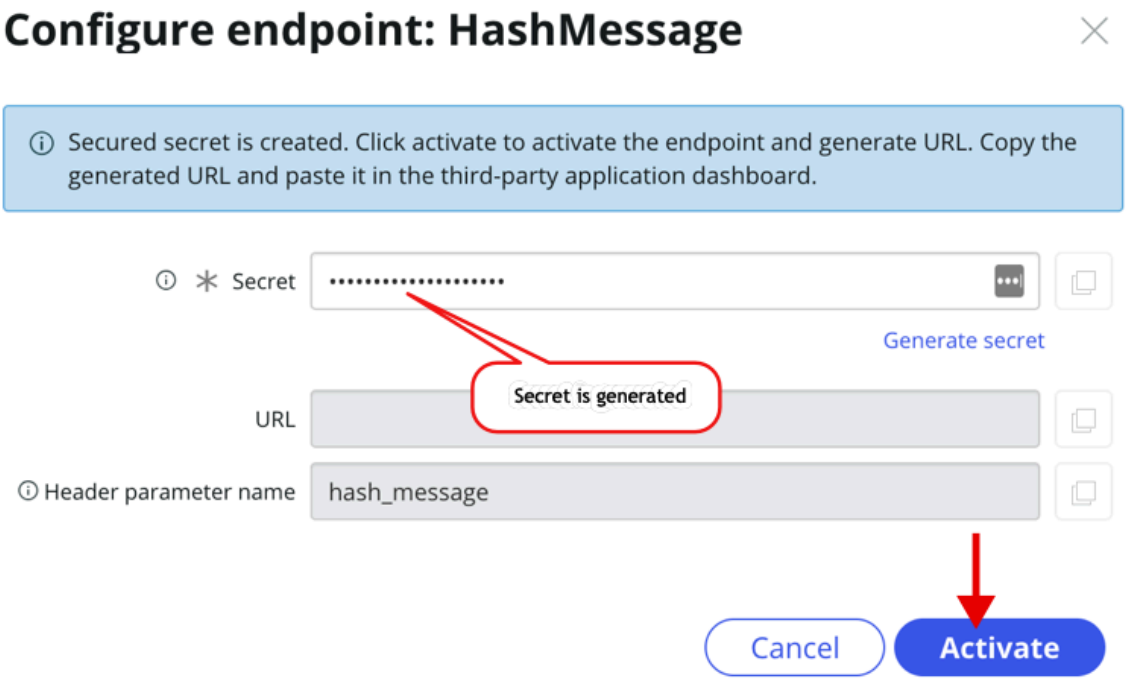
2. In the Configure endpoint form, select Generate secret.



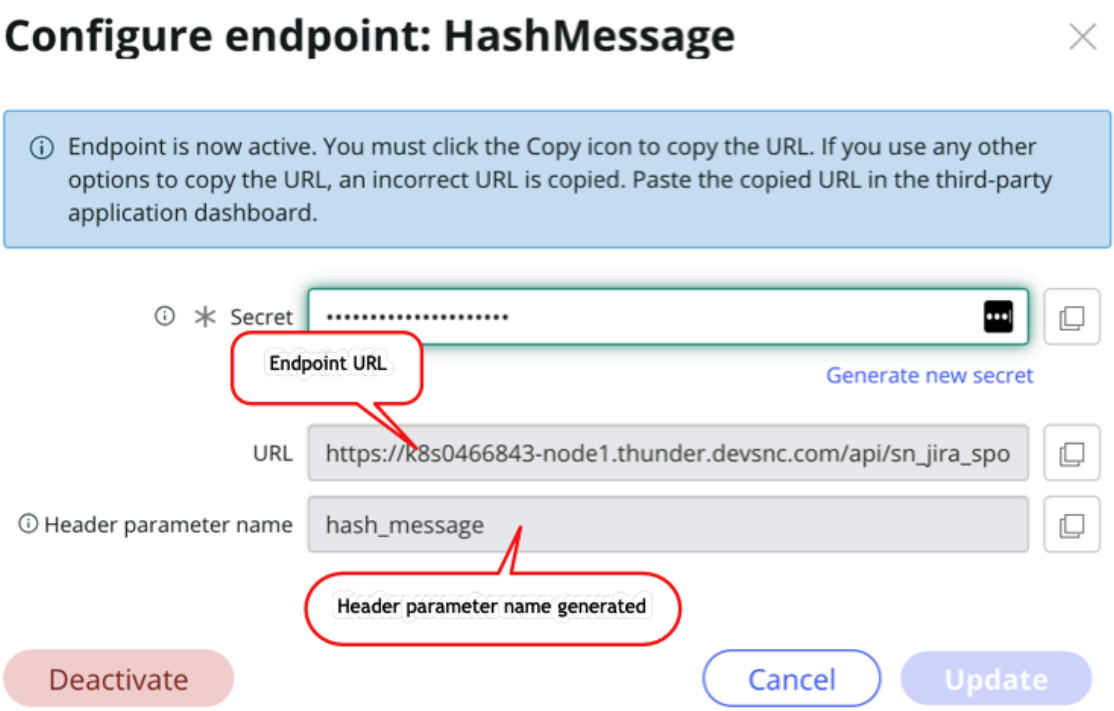
The secret is generated in the Secret field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To generate the endpoint that the external webhook uses to connect to your ServiceNow instance, select



Activate.
The value in the Header parameter name field becomes available after you generate the



endpoint.

4. To copy the endpoint, select the copy endpoint icon ( )

Tip:
Keep the endpoint at a secure place to use later at the third-party application webhook.

Deactivate endpoint with Hash message support

Deactivate the endpoint so that it stops listening to a webhook. However, you can activate it again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: Integration Hub Enterprise pack

Ensure that you've installed the required spoke plugin.

Procedure

1. To deactivate the endpoint, do the steps.
2. Select **Deactivate**.
3. To confirm deactivation, select **Deactivate**.
4. To activate again, on the connection record, select **Edit**.
5. Select **Activate**.

Deconfigure endpoint with Hash message support

Remove the configuration of the endpoint.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: Integration Hub Enterprise pack

Ensure that you've installed the required spoke plugin.

Procedure

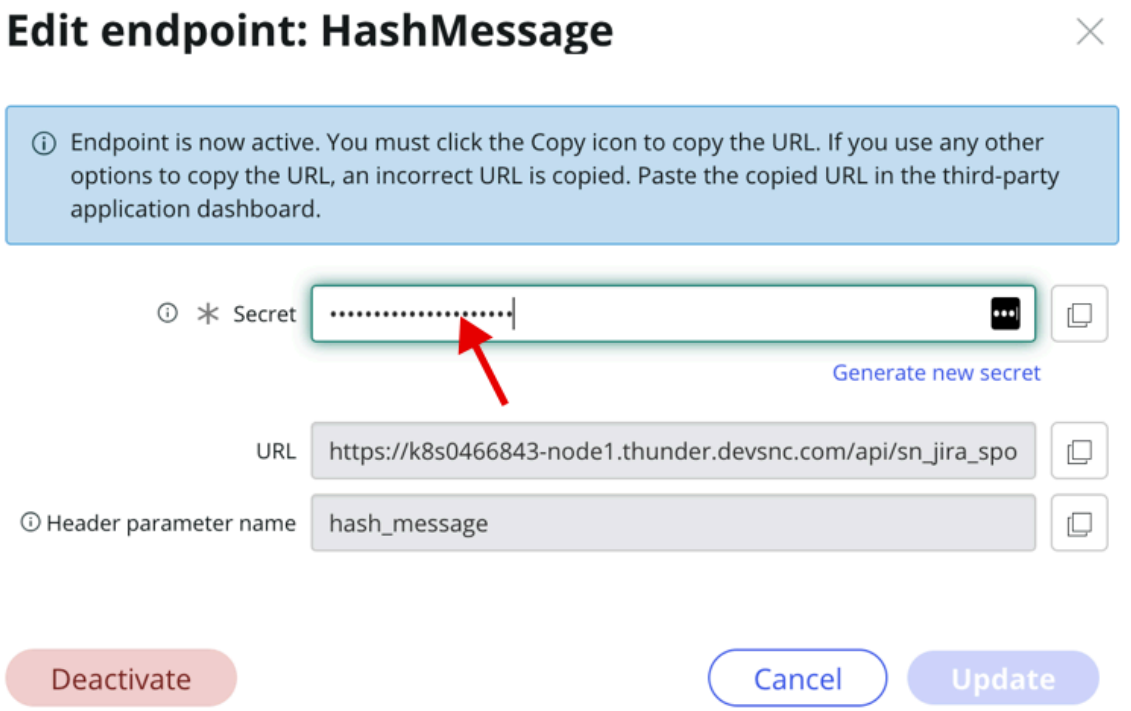
1. Select **Edit**.

   a. Select **Update**.

   b. Select **Deconfigure**.
   The configuration for the endpoint is removed from the connection.

2. Remove the secret.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Update**.
4. Select **Deconfigure**.

Manage endpoint with Token support

Generate endpoint for webhooks in the third-party applications that support token authentication. The endpoint enables webhooks to connect with your ServiceNow instance. You can optionally remove the configuration of the endpoint from the connection. You can deactivate or remove the configuration of the endpoint from the connection when you want the endpoint to no longer listen to the external webhook.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: This feature requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Ensure that you've installed the required spoke plugin.

Configure endpoint with Token support

Configure an endpoint that listens to the webhook.

Before you begin

Role required: flow_designer and connection_admin

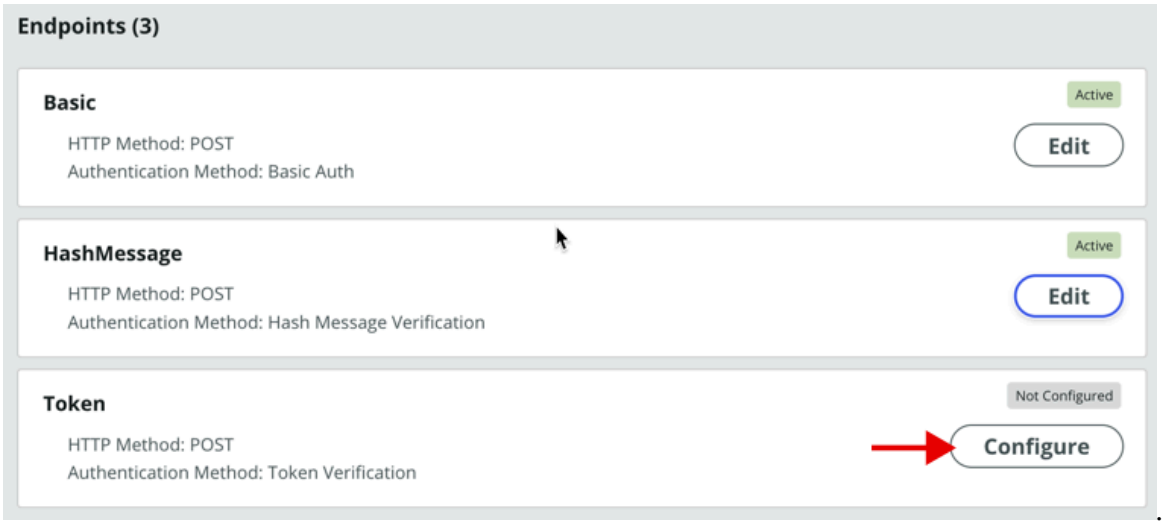
Subscription required: Integration Hub Enterprise pack

Ensure that you've installed the required spoke plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Under the Endpoints heading, select **Configure** for the connection to set up an endpoint with token authentication support.

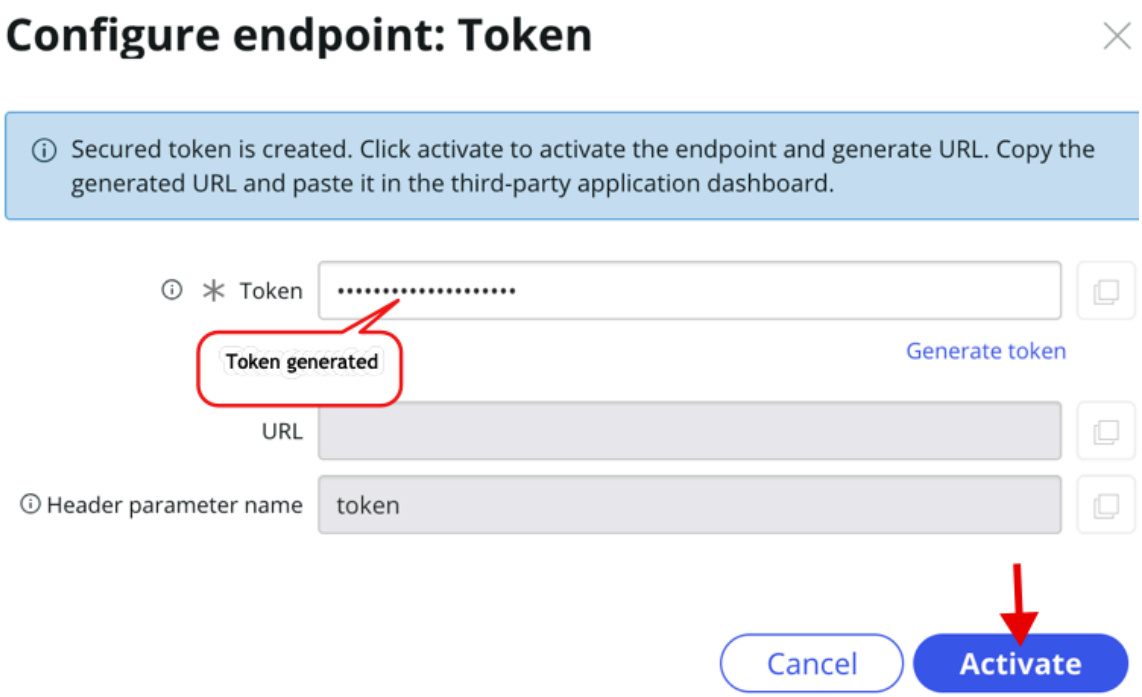


2. In the Configure endpoint form, select Generate token.

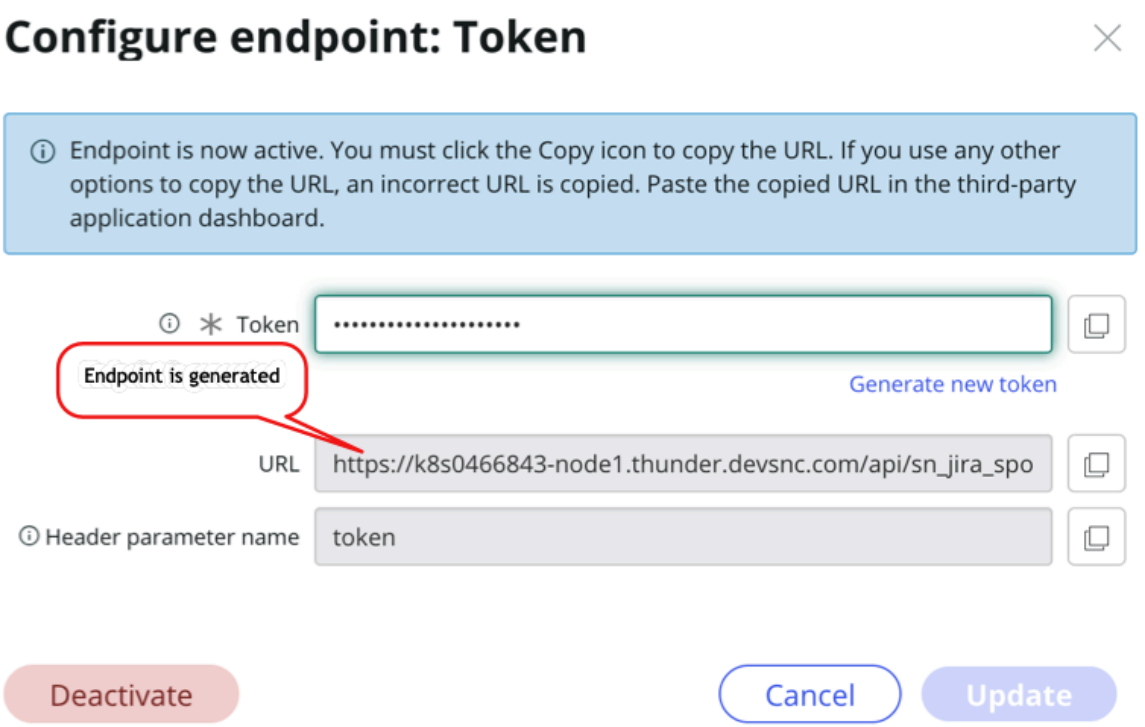
   The token is generated.

3. To generate the endpoint, select **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The endpoint URL is generated in the URL field.



4. To copy the endpoint, select the copy endpoint icon ( )

Tip:
Keep the endpoint at a secure place to use later at the third-party application webhook.

Deactivate endpoint with Token support

Deactivate the endpoint to disable it from listening to the webhook. You can activate it back.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: Integration Hub Enterprise pack

Ensure that you've installed the required spoke plugin.

Procedure

1. To deactivate the endpoint, do the steps.
2. Select **Deactivate**.
3. To confirm deactivation, select **Deactivate**.
4. **Optional:** To activate again, on the connection record, select **Edit**.
5. **Optional:** Select **Activate**.

Deconfigure endpoint with Token support

Remove the endpoint configuration.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: Integration Hub Enterprise pack

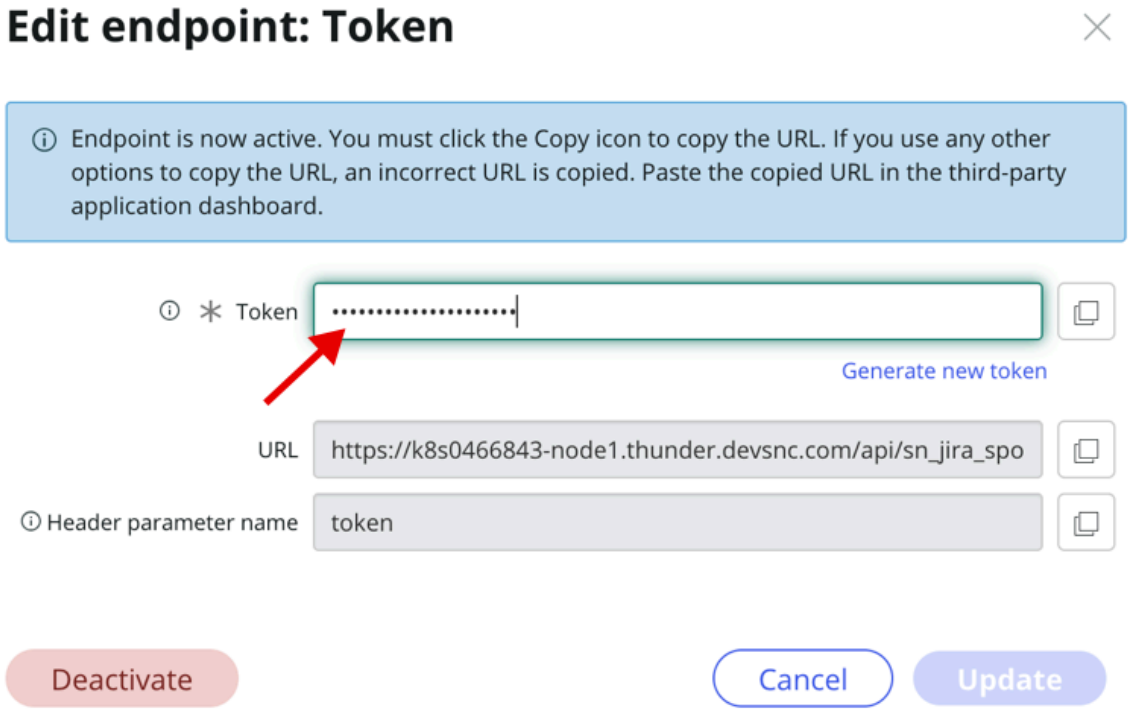
Ensure that you've installed the required spoke plugin.

Procedure

1. Select **Edit**.

2. Remove the token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Update**.
4. Select **Deconfigure**.
   The configuration for the endpoint is removed from the connection.

Manage endpoint with OAuth 2.0 support

Manage endpoint for webhooks in third-party applications that support the OAuth 2.0 authentication. The endpoint enables webhooks to connect with your ServiceNow instance.

Before you begin

Role required: flow_designer and connection_admin

Subscription required: This feature requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Ensure that you've installed the required spoke plugin.

Ensure that you have created an OAuth application endpoint for the external client applications to access the ServiceNow instance. For more information about creating an inbound OAuth application endpoint, see OAuth Inbound.

- If you want to create an OAuth application endpoint for external client applications to access the ServiceNow instance, see Create an endpoint for clients to access the instance.
- If you want to create an OAuth JWT API endpoint for external clients to access the ServiceNow instance, see Create an OAuth JWT API endpoint for external clients (machine to machine integration).

Configure endpoint with OAuth 2.0 support

Configure endpoint for webhooks in third-party applications that support the OAuth 2.0 authentication.

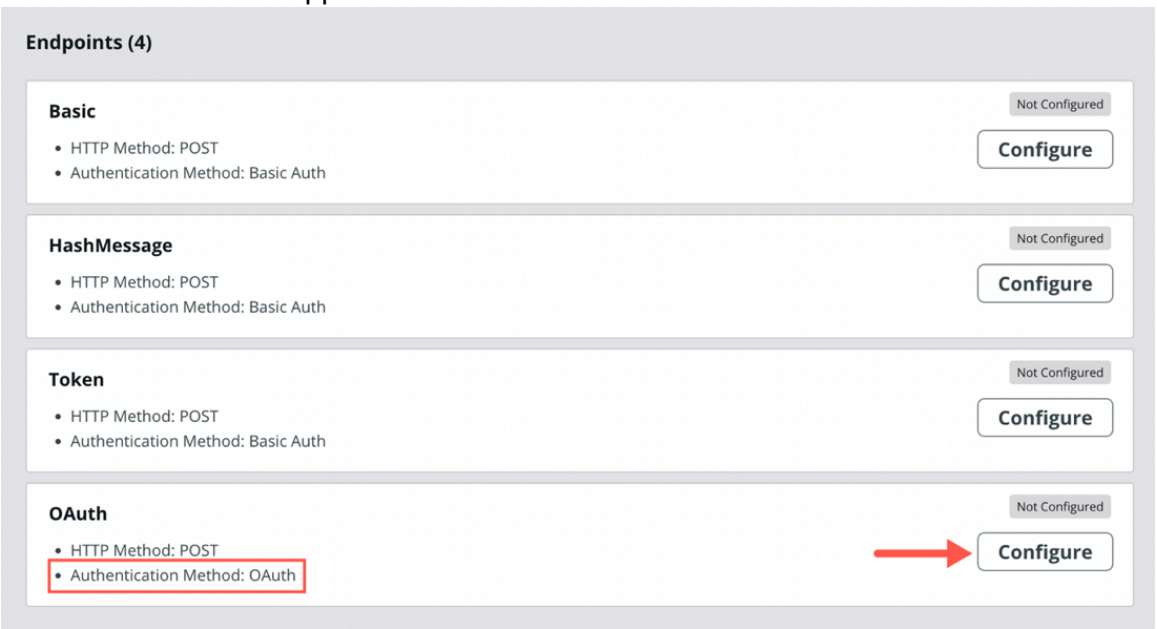
Before you begin

Role required: flow_designer and connection_admin

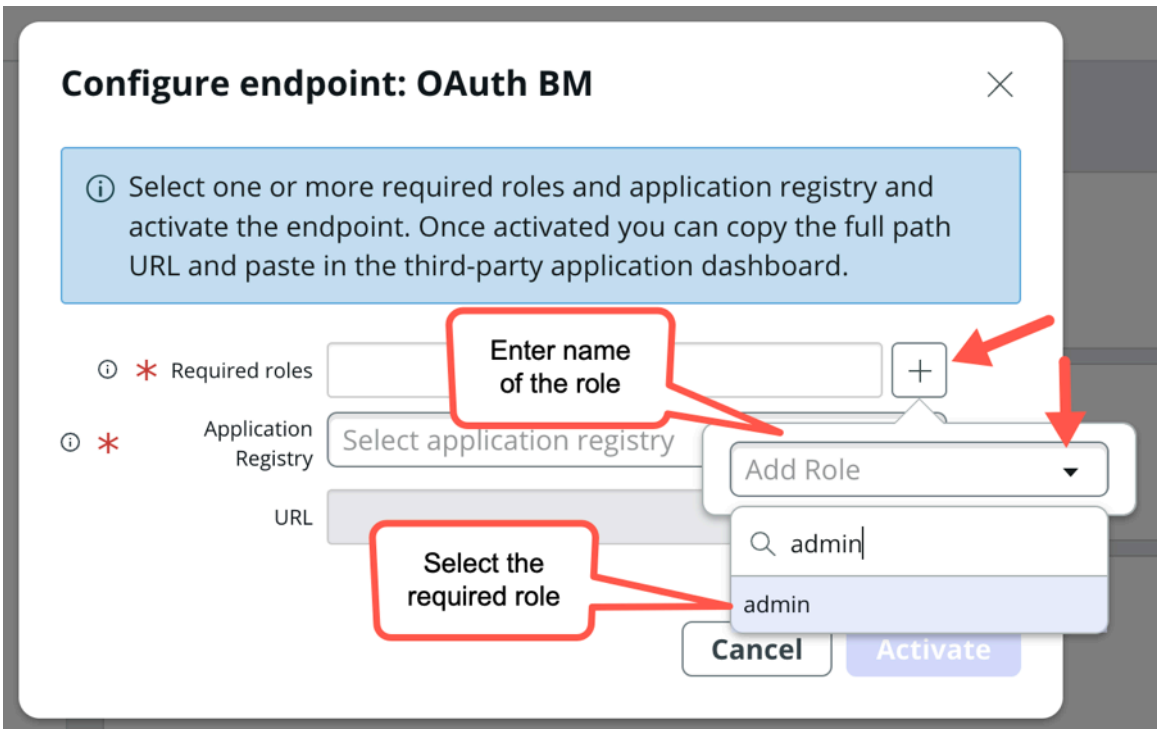
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Under the Endpoints heading, select **Configure** for the connection to set up an endpoint with OAuth authentication support.

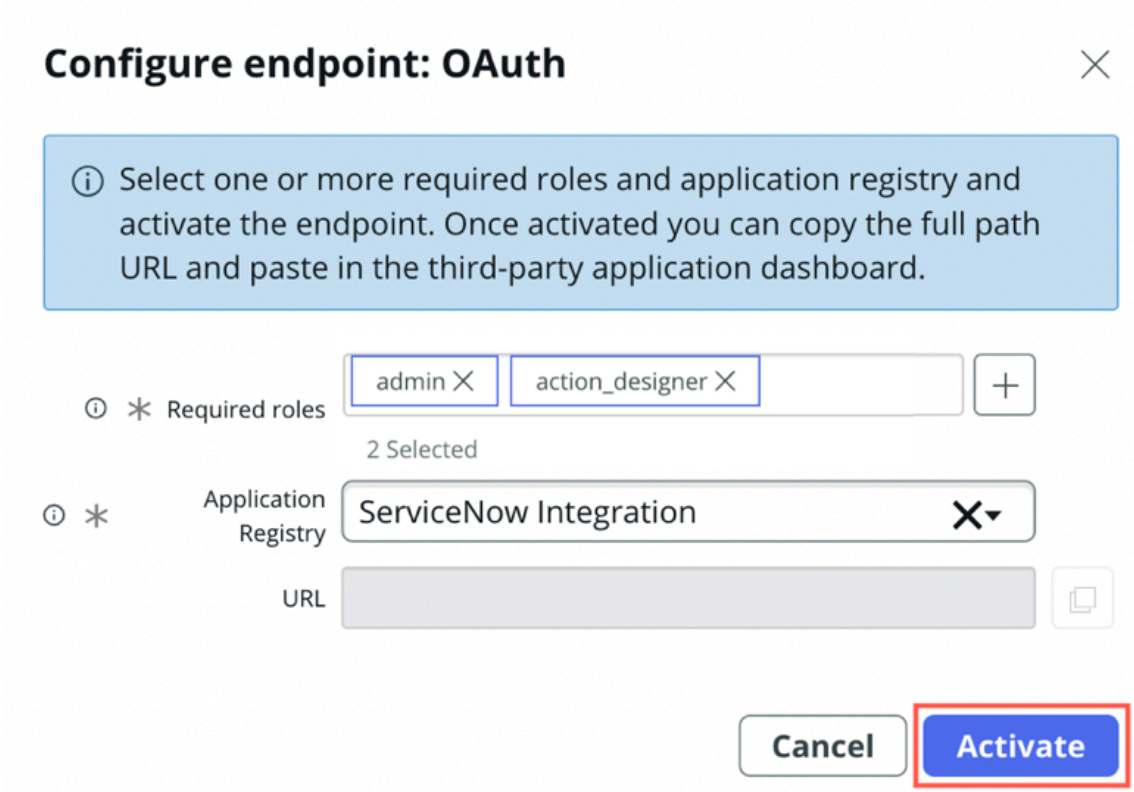


2. In the Configure endpoint form, click + to add role in **Required roles**.
To select one or more roles, select ▾ or enter the name of one or more roles.

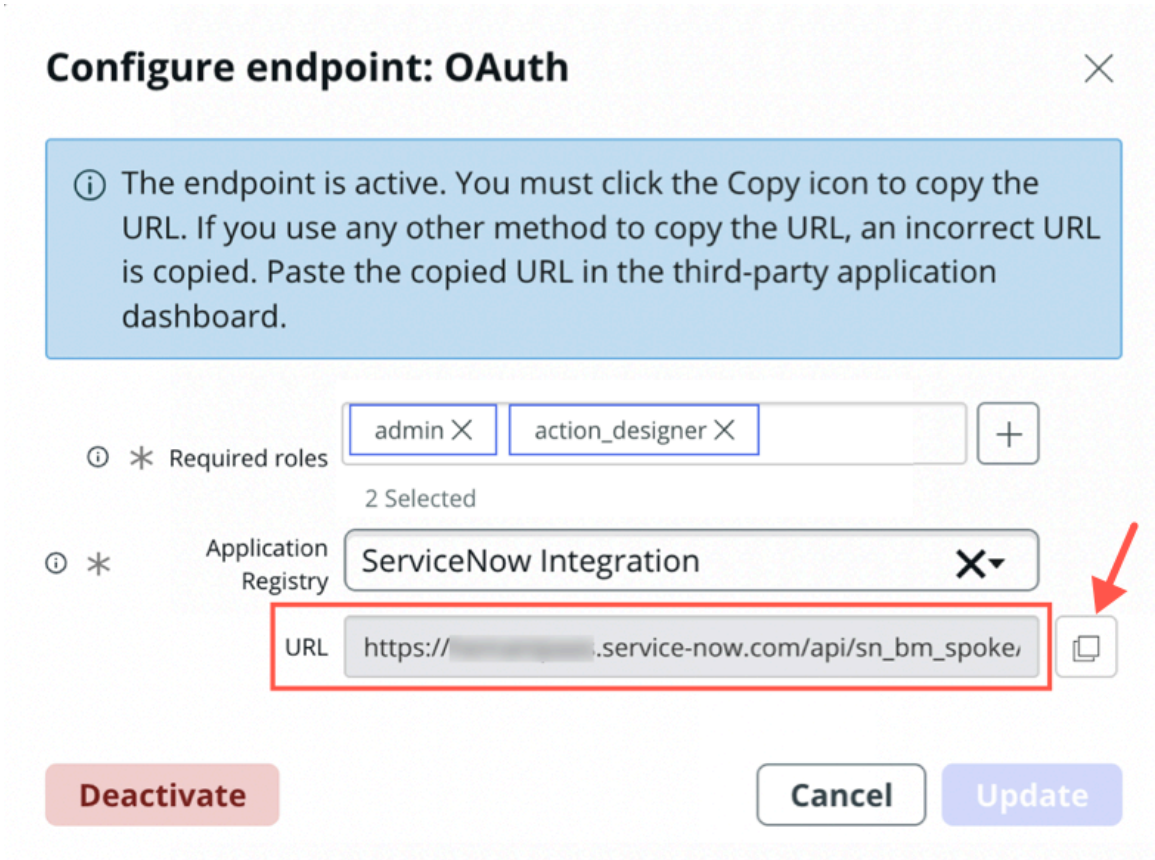


3. Select the required application registry record.
4. To generate the endpoint, select **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The endpoint URL is generated in **URL**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To copy the endpoint, select the copy endpoint icon ( )

Tip:
Keep the endpoint at a secure place to use later at the third-party application webhook.

Deactivate endpoint with OAuth 2.0 support

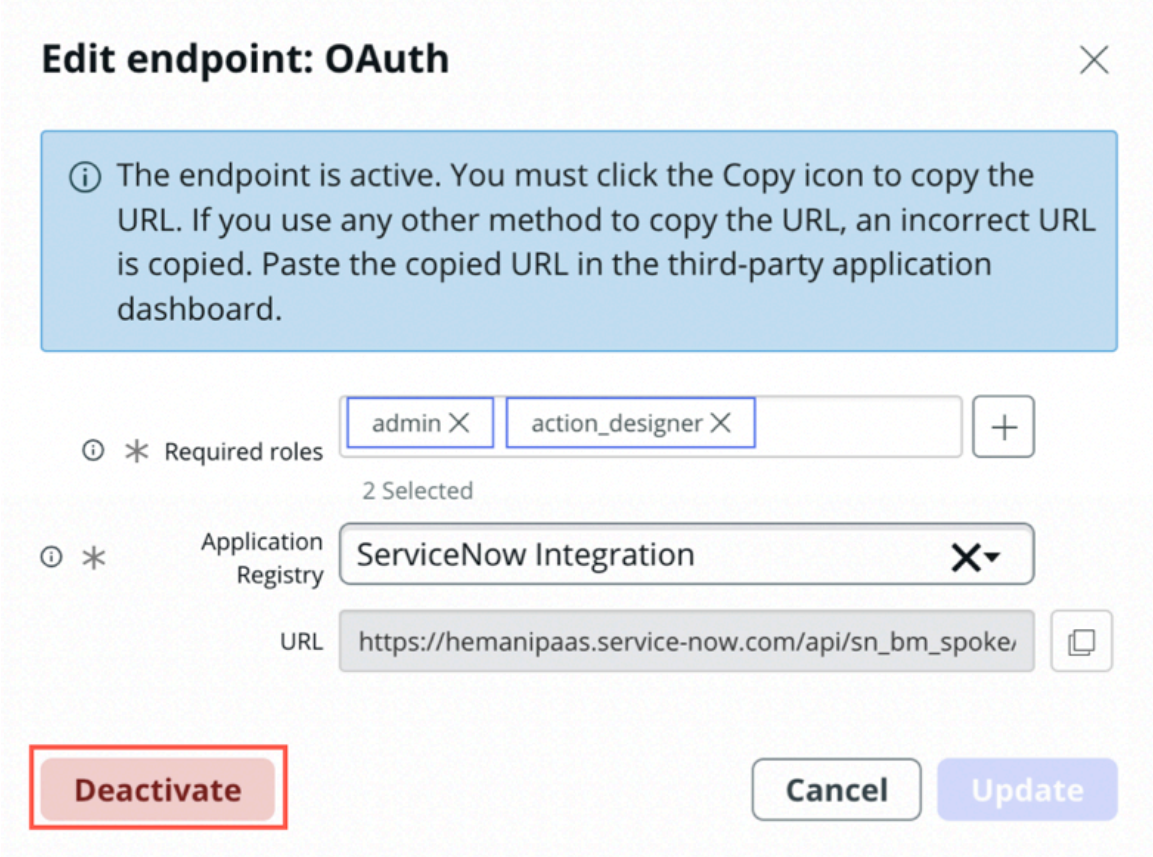
Deactivate an active endpoint with OAuth 2.0 support while retaining the configurations to activate it later when needed.

Before you begin

Role required: flow_designer and connection_admin

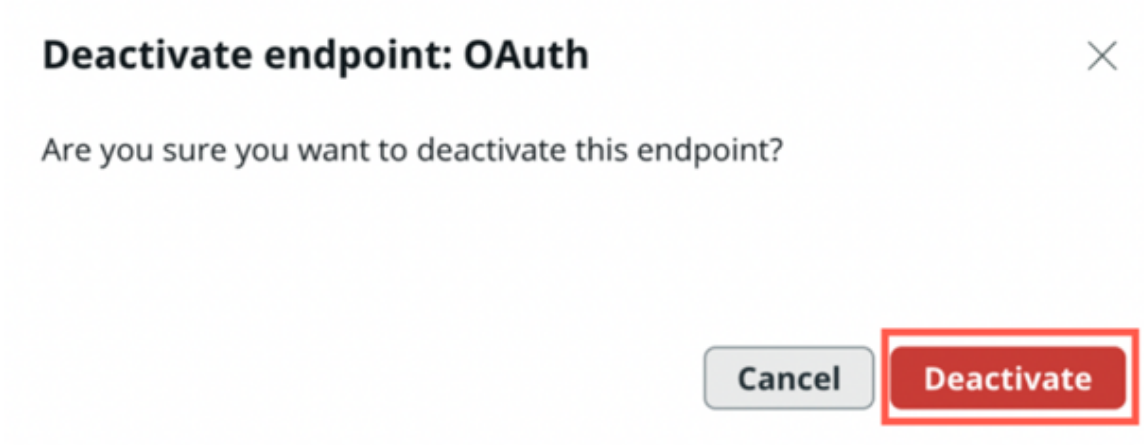
Procedure

1. Under the Endpoints heading, for the required endpoint, click **Edit**
2. Click **Deactivate**.

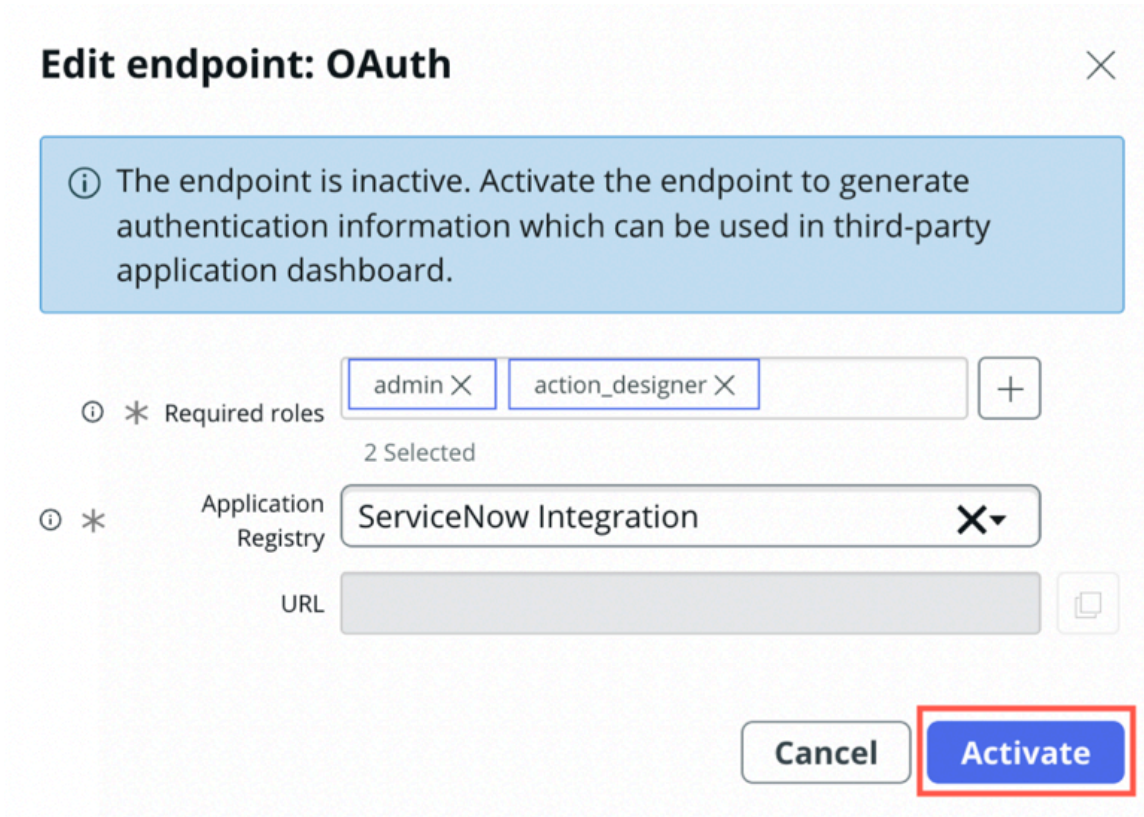


3. To confirm deactivation, select **Deactivate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. To activate again, on the connection record, select **Edit**.
5. Select **Activate**.



Deconfigure endpoint with OAuth 2.0 support

Deactivate an endpoint with OAuth 2.0 support to remove the existing configurations. Activate and configure the endpoint later when needed.

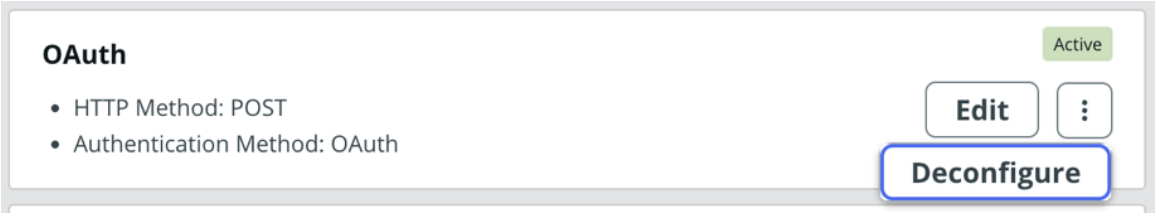
Before you begin

Role required: flow_designer and connection_admin

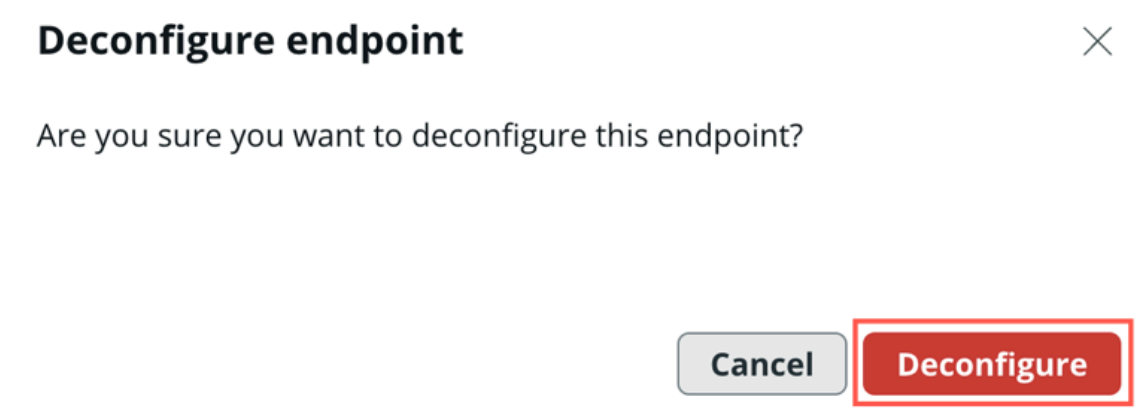
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Under the Endpoints heading, click the more options icon (⋮).



2. Click **Deconfigure**.
3. When prompted, confirm your choice to deconfigure.



The configuration for the endpoint is removed from the connection.

Integration steps

Enable custom actions to integrate with external systems by activating Integration Hub, which adds integration steps to the Workflow Studio interface.

Integration steps can run on the instance or a MID Server. A MID Server is required to communicate with or move data between a ServiceNow instance and external applications, data sources, and services in your network.

Note:
Only Flow Designer admin and Connection admin can execute flows using Integration Hub.

Steps that perform operations on record data run on the instance, while steps that integrate with systems in your network run on a MID Server. If a step requires a MID Server to run, the instance delegates flow processing to the appropriate MID Server by sending the process plan in a REST call. The MID Server executes the action or step in the process plan and returns results. View log messages and execution status from the instance or the MID Server.

Available integration steps

These integration steps are available from Workflow Studio - Building custom actions.

Integration step	Description	Step runs from
JDBC step	Create a reusable action to send SQL commands to a relational database.	MID Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration step	Description	Step runs from
JSON Builder step	Create a JSON payload to use in another step. Enter values or use data pills to produce a dynamic payload. This step supports several data types, including objects and arrays for nested structures.	Instance
Payload Builder step	Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.	• Instance • MID Server
PowerShell step	Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.	MID Server
REST step	Send an outbound REST web service request to an external system.	• Instance • MID Server
SOAP step	Enable action designers to send outbound SOAP web service requests to external systems.	• Instance • MID Server
SSH step	The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.	MID Server
XML parser step	Identify structured data from an XML payload without having to write script. Map incoming XML elements to a complex object output that you can use in other steps or actions. At runtime, values from an XML payload populate the complex object output.	• Instance • MID Server

Training

Complete a step-by-step training on using the REST step in the REST in IntegrationHub developer training.

Connection attributes

Define connection-specific variables that you can use in Integration Hub integration steps. When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to update the connection details once without having to reconfigure every action. Any action step

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

that uses an alias inherits the attributes associated with it. Workflow Studio displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter. For more information about connection attributes, see Create connection attributes for IntegrationHub.

MID Server connection aliases

Action designers can set MID Server selection attributes using a connection record associated with an alias and associate the alias with an integration step. When the flow runs, the system uses the attributes to determine which MID Server runs the step. Learn more about Introduction to credentials, connections, and aliases.

MID Server and MID Cluster selection

For most integration steps, you can specify a MID Server or MID Cluster for the step to use when it runs. For a MID Server, you can select one you've configured or have the system choose one by selecting **Auto-Select MID Server** from the step's MID Selection list. To learn more about how a MID Server is selected during runtime, see MID Server selection. For MID Clusters, you can select a load-balancing or fail-over cluster for the step. For more information on MID Clusters, see Configure a MID Server cluster. The Payload Builder step and XML Parser step do not support MID Server selection.

When specifying a MID Server, Flow designers should avoid shifting the execution environment from one MID Server to another when a flow runs. Either configure each MID Server to perform operations on multiple endpoints, or provide multiple capabilities to each MID Server in your network. You may need a user with the connection_admin role to update the connection records associated with an action, or a network administrator to update the MID Server network configuration.

Design considerations

Design integration steps using the following guidelines.

- Avoid shifting the execution environment between the instance and the MID Server multiple times. Where possible, group similar action steps. For example, group core steps that perform record operations and integration steps that run on the MID Server.
- When creating a spoke that uses an integration step, include a Connection and Credential alias record with the appropriate connection type. Before anyone can use the spoke, a user with the connection_admin role must associate the alias record to a connection record that supports the connection type. If defining the connection inline, use inputs to enable the process analyst to define the connection information when adding the action to a flow.
- The MID Server does not have access to all the values in a GlideRecord object, it only has access to the sys_id reference. Inputs of type Reference do not work on a MID Server. Instead, create action inputs that contain the necessary GlideRecord values.

Roles

To create integration steps, a user must have the action_designer or admin roles. If running steps on a MID Server, the MID Server user must have the connection_admin and credential_admin roles to access the connection and credential information associated with the step.

JDBC step

Create a reusable action to send SQL commands to a relational database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- This step requires an Integration Hub subscription. For more information, see Legal schedules - Integration Hub overview. After the required plugin is activated, the step is visible under Integrations.
- The JDBC step runs only on a ServiceNow® MID Server with JDBC step capabilities. Activate the plugin, Integration Hub Standard Pack Installer (com.glide.hub.integrations.standard) or later to use the JDBC capability for the MID Server.

Roles and availability

The JDBC step is available as an Workflow Studio action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user from executing malicious SQL statements that can result in SQL injection on your target database. When you use data pills in JDBC step SQL statements, sanitize them first using Sanitize SQL transform functions. This transform function category automatically appears when a data pill is dropped into the SQL Statement input.

SQL operations inclusion list

By default, you can run the following SQL operations.

- SELECT
- INSERT
- UPDATE
- DELETE
- SHOW
- DESCRIBE

To enable only some of these SQL operations that the JDBC step can perform, create a MID Server property, *mid.property.jdbc_operations* and enter the SQL operations, separated by comma. To learn more about MID Server properties, see MID Server properties.

Note:
Multiple SQL statements are not allowed. Stored procedures with output parameters are not supported.

Fields

Field	Description
Connection Details	
Connection	Type of connection to use. • **Define Connection Inline**: Define connection information within the action step. • **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases.
Connection Alias	Connection & Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. This field is available when **Use Connection Alias** is selected from the Connection list.
Credential Alias	Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. This field is available when **Define Connection Inline** is selected from the Connection list.
MID Selection	Option to select a specific MID Server or MID Cluster. Choose any one of the following options. • **Auto-Select MID Server**: Your ServiceNow instance selects the MID Server without manual input. • **Specific MID Server**: Your ServiceNow instance uses MID Server that you specify. • **Specific MID Cluster**: Your ServiceNow instance uses the MID Cluster that you specify. A MID Cluster is a group of MID Servers that enables your ServiceNow instance to handle multiple integrations, and improve integration speed. For more information, see Configure a MID Server cluster. This field is available when **Define Connection Inline** is selected from the Connection list.
MID Cluster	Data pill for the MID Cluster you want to use. This field is available when **Define Connection Inline** is selected from the Connection list, and **Specific MID Cluster** is selected from the MID Selection list.
Database Type	Database type for this connection. The choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **MySQL** • **Oracle** • **SQLServer** • **Custom** The default choice is **Custom**. This field is available when **Define Connection Inline** is selected from the Connection list.
JDBC Driver	Driver to use for this connection when it's not a default database type such as DB2 Universal and Sybase. The database Type is **Custom**. This field is available when **Define Connection Inline** is selected from the Connection list and **Custom** is selected from the Database Type list.
Connection URL	URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. This field is available when **Define Connection Inline** is selected from the Connection list and **Custom** is selected from the Database Type list.
MID Application	Application that the MID Server must support to be eligible for selection. This field is available when **Define Connection Inline** is selected from the Connection list.
Capabilities	Capability of the MID Server. Select**JDBC**. This field is available when **Define Connection Inline** is selected from the Connection list.
Connection Timeout	Maximum elapsed time, in seconds, for the activity to wait while attempting to connect to the target database. This field is available when **Define Connection Inline** is selected from the Connection list. **Note:** Avoid setting the **Connection Timeout** value to zero, as this may cause a stale connection.
Query Timeout	Maximum elapsed time, in seconds, that the query is allowed to run without a response. This field is available when **Define Connection Inline** is selected from the Connection list.
JDBC Configuration	
SQL Statement	SQL statement that the step executes. **Note:** When you use data pills in step SQL statements, sanitize them first using a preprocessing Script step. For more information, see Sanitizing inputs using the escape functions.
Maximum Rows	Maximum number of rows to be returned from the SQL statement. The default value is **1000**.
Maximum Payload Size (KB)	Maximum allowable payload size, in KB, to be returned from the SQL statement. The default payload size is **5120 KB**. The maximum payload size is **10 MB**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Test JDBC Step	Test the JDBC step. View test results directly in the Test JDBC Step window. For more information, see Test JDBC step.
Retry Policy	
Enable Retry Policy	Option to enable the retry policy. For more information, see Retry policy.
Override Default Policy for Alias	Option to override the default retry policy. This option is not applicable when **Define Connection Inline** is selected from the Connection list.
Retry Policy	Default retry policy associated with **Connection Alias**. If **Override Default Policy for Alias** is selected, you can override the default retry policy and select another existing retry policy based on your requirement.

Action error evaluation

If this step fails

Data type: *Choice*

Option to continue running the next step or go to error evaluation. To use the step status code or message for a custom action error condition, see Action error evaluation.

Test JDBC step

Test the JDBC step before testing or publishing an action that contains the JDBC step.

Before you begin
Role required: admin

About this task
It is mandatory that you test the JDBC step before testing the action. Testing ensures that the relevant complex object output schema is created from table columns, which can be used as data pills in subsequent steps.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Create an action with a JDBC step .
3. Click **Test JDBC Step**.
   The **Test JDBC Step** pop-up window is displayed.
4. If the JDBC step takes an action input or output of the previous step as its input, provide required input values in the**Step input pills** field to test the JDBC step.

   Note:
   Input values in the **Step input pills** fields are not needed when records are updated, inserted, or deleted.

5. Click **Run Test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When a SELECT query is executed, **Sample Result** is displayed in the **Test JDBC Step** pop-up window. **Sample Result** includes column names, columns types, and the values of the first row.
- When an UPDATE, INSERT, or DELETE query is executed, a message is displayed mentioning the number of rows affected.

6. To use the sample result as the JDBC step output, click **Use Result**.

> **Note:**
> **Use Result** is not displayed when records are updated, inserted, or deleted.

7. To retrieve schema of a different table when a SELECT query is executed in the JDBC step, enter the required value in the **Step input pills** field and click **Run Test**.

Result

When a SELECT query is executed in the JDBC step, **ResultSet** is displayed under **Outputs**. The relevant complex object output is populated. To learn more about complex objects, see Complex data.

What to do next

Test and publish the action.

JSON Builder step

Create a JSON payload to use in another step. Enter values or use data pills to produce a dynamic payload. This step supports several data types, including objects and arrays for nested structures.

Roles and availability

This step requires an Integration Hub subscription. For more information, see Legal schedules - Integration Hub overview. After the required plugin is activated, the step is visible under Integrations.

Available as an Workflow Studio action step. Users with the action_designer role can create a custom action with one or more action steps.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag and drop pills from the Data panel or select them from the pill picker.

Name

Data type: *String*

Name part of a name-value pair. Enter a value or use a data pill to produce a dynamic payload.

Value

Data type: *String*

Value part of a name-value pair. Enter a value or use a data pill to produce a dynamic payload. You can use a complex object pill to populate a row with an object data type, but doing so deletes any children the complex object pill already has.

Type

Data type: *Choice*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type for the name-value pair. If you're using a data pill for the name or value, make sure the data type for the pill matches the data type selected here. The options are:

- **String**
- **Object**
- **Number**
- **Boolean**
- **Array**

For arrays and objects, use the plus icon ( ) to add name-value pairs to the array or object.

In case of empty value

Data type: *Choice*

Option to specify what to do if a name-value pair has an empty or null value.

- **Leave as is**: Keeps the empty or null value as an empty string.
- **Omit property**: Excludes a name-value pair if the value is empty or null.
- **Set as null**: Returns an empty or null value as a null data type.
- **Throw error**: Returns an error if a name-value pair has an empty or null value.

Include Outer Structure

Data type: *True/False*

Option to include the curly braces for a top-level JSON container.

Omit Empty Structure

Data type: *True/False*

Option to omit an empty payload. Empty payloads can occur when you select **Omit property** for the **In case of empty value** input for every name-value pair and all name-value pairs in the payload produce empty values.

Structure

Data type: *Structure*

Read-only payload the step produces.

If this step fails

Data type: *Choice*

Option to continue running the next step or go to error evaluation. To use the step status code or message for a custom action error condition, see Action error evaluation.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your action.

Output

Data type: *String*

JSON payload as a string. If you want to use the payload as an object, you can use the JSON parser step to parse the string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step Status

Data type: *Object*

Object data pill containing runtime details about the step. Each step in an action returns a Step Status.

Step Status > Code

Data type: *Integer*

Integer data pill indicating whether the step produced an error. By default, a value of 1 indicates that the step produced an error. A value of 0 indicates that the step ran successfully. You can't customize these codes.

Step Status > Message

Data type: *String*

String data pill containing the error message produced by the step or system operation. You can't customize this message.

Generate a JSON Payload

Automatically generate a JSON payload with the **Add JSON for Payload** button. This button opens the Add Payload script editor where you can enter a JSON payload to be automatically de-serialized into structured input.

There are a few details to be aware of when using the JSON payload generator.

- If the JSON has empty keys, the payload is still generated.
- If there are duplicate keys in the script editor, the last key entry in the object overrides the value of any previous keys with the same name.
- If the root object is an array, the root array is wrapped into a root object.
- If an array contains multiple objects, all the keys in the objects are coalesced into one parent object.

The JSON payload generator doesn’t support the following.

- empty payloads
- non-complex object types
- invalid JSON
- empty root objects, such as an empty array
- payloads larger than 65,000 bytes

Note:
Generating a JSON payload overrides any existing structures in the JSON Builder step.

JSON parser step

Identify structured data from a JSON payload without having to write a script. Map incoming JSON content to a complex object output that you can use in other steps or actions. At runtime, values from a JSON payload populate the complex object output.

To learn more about complex objects, see Complex data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This step requires an Integration Hub subscription. For more information, see Legal schedules - Integration Hub overview. After the required plugin is activated, the step is visible under Integrations.

Roles and availability

Available as an Workflow Studio action step. Users with the action_designer role can create a custom action with one or more action steps.

Payload size limit

At runtime, JSON parser step supports payloads up to 10 MB. For larger payloads, create a Data Stream action. For more information on Data Stream actions, see Data Stream actions and pagination.

Fields

Field	Description
Source	In the **Source data** field, select or drag a data pill that contains the source JSON payload. For example, a REST step **Response Body** data pill. At runtime, values from the data source populate the complex object output. Under **Source data** and in the scripting window, enter an example payload to generate your complex object. For example, if parsing the response from a REST step that returns a list of users, enter the expected JSON object for a single user. You can create any example JSON payload with the following limitations: • Multidimensional arrays are not supported. • Hyphens, periods, spaces, double colons, and the @ symbol in JSON keys are not supported. • Your example payload can't exceed 2 MB.
Structured Payload View	View your example payload as regular JSON, or toggle **Structured Payload View** to view the payload in a structured node tree. Select a node in the tree to copy the element's JSONPath. If you add new elements in the **Target** field manually, you can paste this JSONPath under an element's advanced options.
Generate Target	Select **Generate Target** to create the step's output structure from your example payload. Your output data structure appears in the **Target** field. Child elements for each object are automatically generated as type String. Alternatively, you can manually create your target complex object by adding elements in the **Target** field.
Target	View or edit the JSON payload's output structure. Create a structured output by clicking **Generate Target**, or manually add elements. Each element contains the following information in the Edit Object view: • **Label**: Data pill label. By default, the system uses the JSON key name. • **Name**: Internal name for the output element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

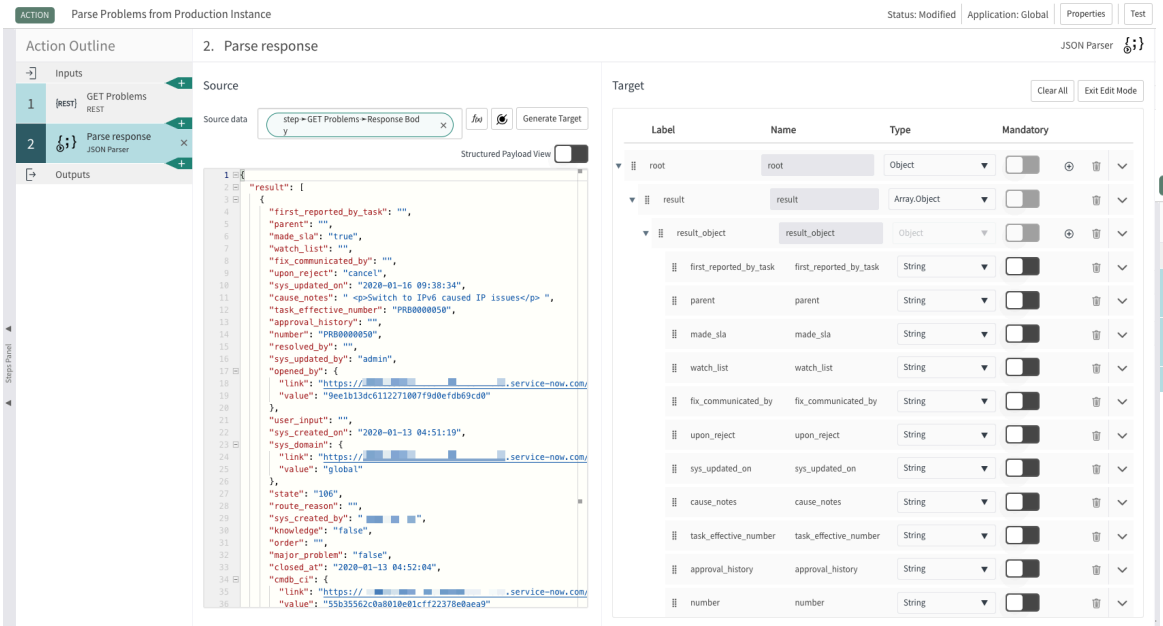
Field	Description
	Note: Exclamation marks, double colons, the @ symbol, or numbers only aren't valid values for an element's name. • **Type**: Data type, which must be String, Object, Array.String, or Array.Object. The top-level element must be an Object. • **Mandatory**: Toggle to make the element required. This only applies to elements of type String. • **Add child item**: Select the add child item icon (⊕) to add a nested child element. Elements of type Object contain the **Save as Template** advanced option, which allows you to save your object's structure as a complex object template. You can then use this template to define the schema of an Object output for your action. For elements of type String, you can also add a max length, hint, and default value as advanced options. In the Target header, select **Exit Edit Mode** when you're done making changes to your output's structure. You can then select the toggle advanced inputs icon (⌄) to view the **JSONPath** option. The JSONPath is the path to the element. Modify the JSONPath to change how your source data elements map to elements in your output. If manually adding elements, you can copy the JSONPath from a node in your example payload and paste it under an element's advanced options.

JSON parser step example

This example tracks newly created problems from a production instance as defects in a test instance. First, create a new action named *`Parse Problems from Production`*. Add a REST step to retrieve a list of problems from the production instance. Then, add the JSON parser step to parse the REST step's *`Response Body`* and provide a complex object output that represents the Problem [problem] table's schema. Finally, create an action output of type Object named *`Problems from Production`*. Drop the *`root`* data pill from the JSON parser step into this output's value field.

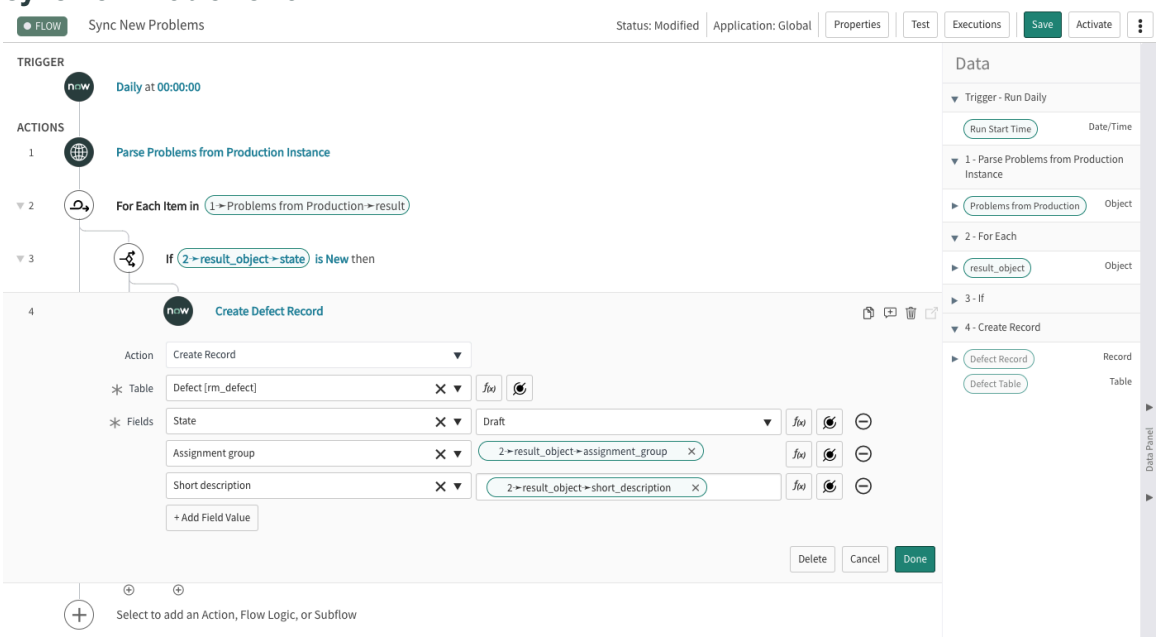
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parse Problems from Production action



Next, create a new flow named *`Sync New Problems`*, which is triggered daily at midnight. The first action in the flow is the *`Parse Problems from Production`* action. Then, add a *`For Each`* flow logic block and drop the **Problems from Production** > **response** data pill into the **Item** field. Within the **For Each** block, add an *`If`* flow logic block that checks if each problem's state is new, then creates a defect record in the test instance whose assignment group and short description is mapped to each new problem from the production instance.

Sync New Problems flow



Payload Builder step

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

Roles and availability

Available as an Workflow Studio action step. Users with the action_designer role can create a custom action with one or more action steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For JSON, this step is deprecated and replaced by the JSON Builder step.

Fields

Fields	Description

Name Value Pairs	The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads.
	
	The **Name** becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair.
	• **Name**: `short_description`
	• **Value**: `[action]->[short_description]`
	
	When the system formats the name-value pair as JSON:
	`"short_description": "[action]->[short_description]"`
	
	When the system formats the name-value pair as XML:
	`<short_description>[action]->[short_description]</short_description>`

Omit if empty	The option to exclude a name-value pair if the value is empty or null. **Note:** This field is only visible after clicking the down arrow to display advanced options.
Output Format	The payload file format. • **JSON**: Select to format the payload as a JSON document. • **XML**: Select to format the payload as an XML document.
Namespace	The XML namespace to apply to each element. For example, when the namespace is set to `incident`: `<incident:short_description>[action]->[short_description]</incident:short_description>` **Note:** This field is only visible when the **Output Format** is set to **XML**.
Include Outer Structure	The option to include or exclude a top level container appropriate to the output format. When the **Output Format** is JSON, curly braces contain the name-value pairs. When the **Output Format** is XML, a specified XML element contains the name-value pairs. For example, when the system formats the name-value pair as JSON: `{ "short_description": "[action]->[short_description]" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	When the system formats the name-value pair as XML: `<xml>   <short_description>[action]->[short_description]</short_description> </xml>`

Send Empty Structure	The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload.
	
	For example, when the system formats an empty structure as JSON:
	`{}`
	
	When the system formats an empty structure as XML:
	`<xml></xml>`
	
	Disable this option to produce an empty payload.
	
	Empty payloads can occur when you select the **Omit if empty** option for every name-value pair, and all name-value pairs in the payload produce empty values.

Parent Node	The name of the XML element that contains the name-value pairs. The default parent node element is `xml`. **Note:** This field is only visible when the **Output Format** is set to **XML** and the option to **Include Outer Structure** is enabled.
Preview	The read-only payload the step produces.

Action error evaluation

If this step fails

Data type: *Choice*

Option to continue running the next step or go to error evaluation. To use the step status code or message for a custom action error condition, see Action error evaluation.

PowerShell step

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 3.0 to 5.1. PowerShell 3.0 does not support Windows 2003 Server.

Note:
This step requires an Integration Hub subscription. For more information, see Legal schedules - Integration Hub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and availability

Available as an Workflow Studio action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

Field	Description
Connection	Type of connection to use. • **Define Connection Inline**: Define connection information within the action step. • **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases.
Connection Alias	Connection & Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. **Note:** This field is available when **Use Connection Alias** is selected from the Connection list.
Credential Alias	Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. **Note:** This field is available when **Define Connection Inline** is selected from the Connection list.
Host	Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is only visible when the **Connection** is **Define Connection Inline**.
Port	Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port. **Note:** This field is only visible when the **Connection** is **Define Connection Inline**.
MID Selection	Option to select a specific MID Server or MID Cluster. Choose any one of the following options. • **Auto-Select MID Server**: Your ServiceNow instance selects the MID Server without manual input. • **Specific MID Server**: Your ServiceNow instance uses MID Server that you specify. • **Specific MID Cluster**: Your ServiceNow instance uses the MID Cluster that you specify. A MID Cluster is a group of MID Servers that enables your ServiceNow instance to handle multiple integrations, and improve integration speed. For more information, see Configure a MID Server cluster. This field is available when **Define Connection Inline** is selected from the Connection list.
MID Application	Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application. If you use a data pill for this field, the pill must reference the MID Application's name, not the MID Application record. This field is available when **Define Connection Inline** is selected from the Connection list and **Auto-Select MID Server** is selected from the MID Selection list.
Capabilities	Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities. This field is available when **Define Connection Inline** is selected from the Connection list and **Auto-Select MID Server** is selected from the MID Selection list.
MID Server	Data pill containing a sys_id reference to a MID Server [ecc_agent_list] record. This field is available when **Define Connection Inline** is selected from the Connection list and **Specific MID Server** is selected from the MID Selection list.
MID Cluster	Data pill for the MID Cluster you want to use. This field is available when **Define Connection Inline** is selected from the Connection list, and **Specific MID Cluster** is selected from the MID Selection list.
Remoting Type	The location where the PowerShell script runs such as the MID or a remote server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **Explicit Remoting (Most Common)**: Establish a connection with and run the script on a remote server. • **Implicit Remoting (Advanced)**: Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the **Remote name prefix** and **Modules to import** fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server. • **Run on a MID Server or have your script establish a remote session**: Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default. **Note:** To invoke a function in a PowerShell script command or PowerShell script file, the command must define the function param block if the function has input parameters. This requirement applies to explicit and implicit remoting. For additional information on param block, see Microsoft's documentation on Windows Powershell parameters at https://technet.microsoft.com/.
Remote name prefix	The file path, excluding file names, to the modules to load from the remote server. **Note:** This field is only visible when the **Remoting Type** is **Implicit Remoting (Advanced)**.
Modules to import	The comma-separated list of modules to import from the remote server at the defined file path. **Note:** This field is only visible when the **Remoting Type** is **Explicit Remoting (Most Common)** or **Implicit Remoting (Advanced)**.
Test PowerShell Step	Button to test the configured credential for the PowerShell step. For more information, see Test a credential for the PowerShell step.
Script type	The type of script to run on the PowerShell host. • **Inline script**: Enter the script to run in the **Command** field of the step. • **MID Server Script File**: Select the PowerShell script to run from the MID Server Script Files [ecc_agent_script_file] table. This is the default value and separates scripting logic from the action, enabling you to update the script without having to modify and redeploy the action.
MID Server Script	Pre-defined PowerShell script from the MID Server Script Files table [ecc_agent_script_file].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is only available if the **Script type** is **MID Server Script File**.
Script path	Read-only path to the selected MID Server script. **Note:** This field is only visible when the **Script type** is **MID Server Script File**.
Input variables	The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable: • **Name**: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See **Reserved variables** in **PowerShell scripting variables**. • **Type**: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue. • **Value**: The value to map to the variable. Manually enter a value, or drag a data pill into the field.
Command	The inline PowerShell script to run on the target host. **Note:** This field is only visible when the **Script type** is **Inline script**.

Action error evaluation

If this step fails

Data type: *Choice*

Option to continue running the next step or go to error evaluation. To use the step status code or message for a custom action error condition, see Action error evaluation.

PowerShell scripting variables

To access input variables from the **Command** field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the **Remoting Type** is **Run on a MID Server or have your script establish a remote session**, some reserved variables are available in addition to input variables.

Input variable syntax

By default, prefix variable names with a `$` character. For example, if an input variable is named **message**, use `$message` to access the variable in script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the *mid.powershell.command.script.parameter_passing* parameter is set to false, prefix the variable name with *$env:SNC_*.
For example, if an input variable is named **message**, use *$env:SNC_message* to access the variable in script. To learn more about the *mid.powershell.command.script.parameter_passing* parameter, see MID Server parameters.

Reserved variables

When the **Remoting Type** is **Run on a MID Server or have your script establish a remote session**, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

Reserved variable	Description
$computer	Host IP address defined in the Connection alias record.
$cred	Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, `New-PSSession -credential $cred`.
$log_info	If the *mid.property.powershell.log_info* property is set to true, adds logging information to a PowerShell script.

The following variable names are reserved for internal processing and should not be used as input variables.

- *script*
- *useCred*
- *isMid*
- *isDiscovery*
- *debug*
- *user*
- *password*
- *executingScriptDirectory*
- *midScriptDirectory*
- *hresult*

Configure logging for the PowerShell step

Add log messages to the scripts in your PowerShell step. Use log levels for improved logging and debugging.

Before you begin

To add log messages to your script, you will need to use the *Write-SNCLog* function. This function is defined in the IH\Logging.psm1 module. Use PSScript.ps1 to import this module so inline scripts have access to *Write-SNCLog*. For more information, see MID Server PowerShell files.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **MID Server** > **Properties**.
2. Set *mid.property.powershell.log_info* to **true**.
   This property enables or disables logging. For more information, see PowerShell log property.
3. Set *mid.property.powershell.ih.log_level* to the desired log level.
   The log level specifies the threshold required to log a message. Messages are logged at the specified level or higher. For example, if this property is set to WARN, then messages with a level of WARN or ERROR are logged. Messages with a level of INFO, DEBUG, or TRACE are not logged. The levels, listed from low to high, are:
   - TRACE
   - DEBUG
   - INFO
   - WARN
   - ERROR

   The default value is INFO.
4. **Optional:** Configure a system property so that you can view the logs in the instance.
   a. Navigate to **All** > **Process Automation** > **Flow Designer** > **Properties**.
   b. Find **Specify the log level of system log entries to replicate to the flow log. The system only replicates log entries of the specified level or higher** and set it to **INFO** or **DEBUG**.

   (Optional) After the you build and execute the PowerShell script, the logs are available in the MID agent log. Configuring this property also enables you to view them directly in the instance.

   This step sets the *com.glide.hub.flow_engine.listener_trace.threshold* property. It replicates the logs to the Flow engine log entries [sys_flow_log] table.
5. In your PowerShell script, add log messages and levels with the *Write-SNCLog* function.

Write-SNCLog function and parameters

Name	Description
Write-SNCLog function	Log a message for the PowerShell step. *Write-SNCLog* has two parameters, *-Level* and *-Message*. Both parameters are required, but the parameter names are not. If the names are omitted, the position is used to determine the level and message. Examples: ○ `Write-SNCLog -Level WARN -Message "log warning"` ○ `Write-SNCLog WARN "log warning"` Both of these examples log `WARN: log warning`.
-Level parameter	Specify the level for the log message. Valid values are: ○ ERROR ○ WARN ○ INFO ○ DEBUG ○ TRACE This parameter is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
- *Message* parameter	Specify the message to log. Entered as a string. This parameter is required.

6. Continue building your action or flow, then test and run it.

What to do next

The new logs are available in the MID agent log and can be downloaded from the MID Server. For more information, see Download the MID Server files.

If you set the system property to view the logs in the instance, you can see them in the **Flow engine log entries** tab of the Flow engine context record. For more information, see Flow execution details.

Test a credential for the PowerShell step

Test a configured credential in the PowerShell step. Confirm the credential is working before building the rest of your step.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Open the action with the PowerShell step that has the credential you want to test.
   If you don't have a PowerShell step you're already working with, you can Create an action with a new PowerShell step.
3. In the Connection Details section, enter the connection information.
4. Click **Test PowerShell Step**.
5. If the step has data pills as input, provide the required input in the **Step input pills** field.
6. Click **Run Test**.

Result

When the test completes, you can view information about the tested credential in the Test Results section. This section shows the username and target for the credential, its validation status, and any error messages.

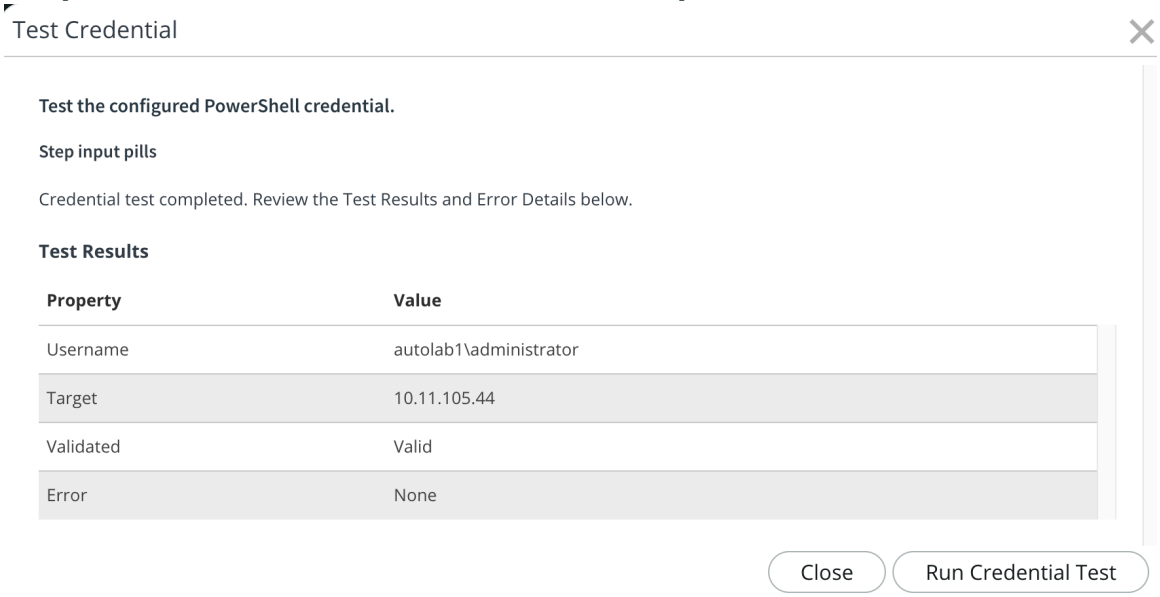
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample result of credential test in the PowerShell step



REST step

Send an outbound REST web service request to an external system.

> **Note:**
> REST step is not available in the base system and requires the ServiceNow® Integration Hub subscription. After the required plugin is activated, the step is visible under Integrations.

Outbound REST web service is a platform feature that enables you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

Roles and availability

Available as an Workflow Studio action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

Field	Description
Connection	Type of connection to use. • **Define Connection Inline**: Define connection information within the action step. • **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Alias	Connection & Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. **Note:** This field is available when **Use Connection Alias** is selected from the Connection list.
Credential Alias	Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. **Note:** This field is available when **Define Connection Inline** is selected from the Connection list.
Use MID	Option to use a ServiceNow® MID Server to run the REST step. Select this check box to display the **MID Application** and **Capabilities** fields. **Note:** The system doesn't log REST request, response, and parameter runtime data sent via a MID server in the same way that Outbound web services logging occurs. Instead, you can view this data in the Flow execution details.
Base URL	Base URL for the REST request. • If **Use Connection Alias** is selected, this field displays the base URL associated with the alias. You can override the base URL by clicking the lock icon ( ) and entering your own. • If **Define Connection Inline** is selected, enter a base URL for the connection.
Test REST Step	Button to test the REST step. To test, select the **Test REST Step** button. Enter any required input values and select the **Run Test** button. After the test runs, any step outputs or error messages are displayed in the Test Results section of the test window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Timeout	Number of milliseconds the system waits for a successful host connection. If the step does not make a successful connection during this time, the connection request times out. If **Define Connection Inline** is selected, enter a timeout value for the connection. Leave this field empty to use the system default connection timeout value. **Note:** Avoid setting the **Connection Timeout** value to zero, as this may cause a stale connection.
MID Selection	Option to select a specific MID Server or MID Cluster. Choose any one of the following options. • **Auto-Select MID Server**: Your ServiceNow instance selects the MID Server without manual input. • **Specific MID Server**: Your ServiceNow instance uses MID Server that you specify. • **Specific MID Cluster**: Your ServiceNow instance uses the MID Cluster that you specify. A MID Cluster is a group of MID Servers that enables your ServiceNow instance to handle multiple integrations, and improve integration speed. For more information, see Configure a MID Server cluster. This field is available when **Define Connection Inline** is selected from the Connection list, and **Use MID** is checked.
MID Application	Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities. This field is available when **Define Connection Inline** is selected from the Connection list, **Use MID** check box is enabled, and **Auto-Select MID Server** is selected from the MID Selection list.
Capabilities	Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities. This field is available when **Define Connection Inline** is selected from the Connection list, **Use MID** check box is enabled, and **Auto-Select MID Server** is selected from the MID Selection list.
MID Server	Data pill of the required MID Server. This field is available when **Define Connection Inline** is selected from the Connection list, **Use MID** check box is enabled, and **Specific MID Server** is selected from the MID Selection list.
MID Cluster	Data pill for the MID Cluster you want to use. This field is available when **Define Connection Inline** is selected from the Connection list, **Use MID** is checked, and **Specific MID Cluster** is selected from the MID Selection list.
Build Request	Option to create the request manually, import an OpenAPI Specification, or import a REST message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **Manually**: Create action inputs and complete the REST step form manually. • **From OpenAPI specification**: Import an OpenAPI Specification to generate action inputs and complete the REST step form. For more information, see OpenAPI support in the REST step. • **From REST Message**: Import a Platform REST message. For more information, see Import a REST message into a REST step.
API Source	Option to select an OpenAPI Specification used to construct the request, or select **Import OpenAPI** to import a new OpenAPI Specification. You can import specifications by providing a URL to the YAML or JSON, or copying and pasting content. **Note:** This field is available when you select **From OpenAPI specification** from the Build Request list.
API Operation	Option to select an operation from the list. Available operations are provided by the OpenAPI Specification in the **API Source** field. **Note:** This field is available when you select **From OpenAPI specification** from the Build Request list.
REST Message	Name of the REST message to import. Select a REST message from the list. **Note:** This field is available when you select **From REST Message** from the Build Request list.
REST Message Function	Name of the function to import from REST message. The available options are determined by the HTTP methods associated with the selected REST message. **Note:** This field is available when you select **From REST Message** from the Build Request list.
Import REST Message	Button to import the REST message. **Note:** This field is available when you select a REST message from the **REST Message** field.
Resource Path	Path for the resource.
HTTP Method	HTTP method used to process the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **GET** • **POST** • **PUT** • **PATCH** • **DELETE**
Query Parameters	Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value. Support REST step requests that contain duplicate query parameter names. If you create a REST request that contains duplicate query parameter names, Workflow Studio adds the query parameters to the request in the same order as you defined them. **Note:** When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.
Headers	Headers to send with the request. You can create headers manually, or drag input variables into the parameter fields, and then assign a value. Support REST step requests that contain duplicate request headers. If you create a REST request that contains duplicate request headers, the headers are sent in the same order as you defined them. **Note:** When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.
Request Type	Format of the request. Options include. • **Text**: A request in JSON, XML, or other text format. • **Binary**: A request in a binary file format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **Multipart**: A request consisting of multiple content types. • **Form URL-Encoded**: A request in a URL-encoded query. **Note:** This field is editable when the **HTTP Method** is **POST**, **PUT**, **PATCH**, or **DELETE**.
Request Body [Text]	Body of the request in JSON or XML format. The flow execution details display the response body as either a link to the embedded text viewer or the sys_id of the attachment record containing the response. **Note:** This field is editable if you select **Text** from the Request Type list.
Attachment	Attachment record that contains the request. You can look up or create this record in a prior step and define it as an input variable. Create it by using the JSONStreamingBuilder and XMLStreamingBuilder APIs in the Script step. **Note:** This field is available when you select **Binary** from the Request Type list.

Name, Part Type, Value	Content of a multipart request. For each part, specify its name, part type, and value either using the fields individually or using an inline script for all the parts. You can specify the multipart values by clicking the toggle scripting icon ( ) and editing the script. For more information about inline scripting, see Inline scripts.
	
	• **Name**:The name of the part. It can be any valid string.
	• **Part Type**: The type of the part. Select either **Text** or **File**.
	  ○ **Text**:The text for the part. Once **Text** is selected, you can specify the content type.
	  ○ **File**:The file for the part. When **File** is selected, the **Value** must be the sys_id of the attachment record containing the content. You can look up this record in a prior step or define it as an input value. Once **File** is selected, you can specify the file name and content type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ For **Set Filename**, select **From Attachment** to use the attached record's file name, or select **From Filename input** to enter your own. ▪ For **Set Content Type**, select **From Attachment** to use the attached record's content type, or select **From Content Type input** to enter your own. • **Value**: The content of the part. For text, the value is the text content. For a file, the value is the sys_id of the attachment record containing the content. **Note:** These fields are available when you select **Multipart** from the Request Type list.
Name, Value	Content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair using the fields individually or using an inline script for all parts. You can specify the form URL-encoded values inline script by clicking the toggle scripting icon( ) and editing the script. For more information about inline scripting, see Inline scripts. **Note:** This field is available when you select **Form URL-Encoded** from the Request Type list.
Enable Retry Policy	Option to enable the retry policy. For more information, see Retry policy.
Override Default Policy for Alias	Option to override the default retry policy. This check box is not applicable when **Define Connection Inline** is selected from the Connection list.
Retry Policy	Default retry policy associated with **Connection Alias**. If **Override Default Policy for Alias** is selected, you can override the default retry policy and select another existing retry policy based on your requirement.
Save As Attachment	Option to specify whether to save the response as a record in the Attachment [sys_attachment] table.
Attachment File Name	Name of the attachment created by the REST response. For example, `rest-response.txt`. **Note:** This field is available when **Save As Attachment** is selected.
Attachment File Record	Target record to which the attachment is associated. The target record must be a data pill of type **Record**. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the sys_id of the associated record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is available when **Save As Attachment** is selected.

Action error evaluation

If this step fails

Data type: *Choice*

Option to continue running the next step or go to error evaluation. To use the step status code or message for a custom action error condition, see Action error evaluation.

REST response size limits

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the *glide.pf.rest.response_payload_max_size* system property. This system property supports a maximum value of 10240 KB, which limits the REST response to 10 MB in size.

Parsing a REST response

REST API calls return data in the Response Body. The response body data is usually structured in JSON or XML format. You can use a Script step to parse the structured data into variables to use elsewhere in the action or in a flow. There is also an XML parser step to parse a response body that's in an XML format.

The general strategy to get extracted data from the response is to do the following.

1. Review the response body to select the data to return.
2. Create input and output variables in the Script step.
   - Create an input variable to pass in the Response Body from the REST step.
   - Create output variables to return data from the response.
3. Create a script to parse and map data.
   - Use the `JSON.parse()` method in a Script step to parse a JSON response body.
   - Map the parsed data to the output variables.
4. Create action outputs for the output variables to make the data available to a flow.

For a detailed example, see the section on Parsing a REST Response in the REST in IntegrationHub developer training (Yokohama).

Import a REST message into a REST step

Transfer data from an existing Platform REST message into a REST step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- This import is done from within a REST step in Workflow Studio. To create a REST step, Create an action and add a REST step to it.
- The REST step uses Connection and Credential aliases for authentication details. If your REST message stores authentication details, create a Connection and Credential alias for them. For more information, see Create a Connection and Credential alias.
- Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. On the Workflow Studio landing page, select **Actions** and open the action that has the REST step you want to use for the import.
3. In the REST step, locate the **Build Request** field and select **From REST Message**.
4. In the **REST Message** field, select the REST message to import.
5. In the **REST Message Function** field, select the function.
   The available options are determined by the HTTP methods associated with the selected REST message.
6. Select the **Import REST Message** button.
   The Import ServiceNow REST Message window displays the data from the selected REST message.
7. Select the **Configure step** button.

Result

The data from the REST message is loaded into the REST step. No future changes to the REST message are copied to the derivative REST steps. Rather than maintain two versions of your REST logic, you should only maintain and update the REST step.

If the imported REST message has a MID Server configured in any of its functions, the **Use MID** check box in the Connection Details section is checked and a data pill provided for the MID Server.

What to do next

Fill in any other required fields and test the step with the **Test REST step** button.

OpenAPI support in the REST step

Populate REST step fields and action inputs with information imported from an OpenAPI Specification. Import specifications by providing a URL to the YAML or JSON, or copying and pasting content.

Benefits

OpenAPI support in the REST step offers these benefits.

- Use information imported from an OpenAPI Specification to configure REST step operations, HTTP methods, parameters, request body, path, and headers.
- Review available API operations without leaving the Flow Designer interface.
- Generate inputs required for the REST step to send valid requests to an OpenAPI service and add them to the REST step in the correct location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Always review REST step values imported from an OpenAPI Specification before sending a request. Remove parameters, headers, and inputs that the API does not require.

Generated inputs

When you import an OpenAPI Specification, the system creates any required inputs and adds them to the REST step form where appropriate. At runtime, the system sends a REST request that contains input values provided to the action. For example, if an API requires a name parameter passed in the request, the system creates a **name** input and adds it to the REST step. When you add the action to the flow, name becomes an input to the action.

The system maps OpenAPI data types to Workflow Studio data types. For example, if the OpenAPI Specification requires a user object, then the system creates a complex data object as input. For more information, see Complex data.

Specification size limit

By default, the system can import OpenAPI Specifications up to 10 MB. To increase the import size, update the *glide.rest.openapi.max_request_size* system property. The maximum value is 100 MB.

Specification management

Import an OpenAPI Specification by selecting options in the REST step. For more information, see REST step. Importing an OpenAPI Specification creates a record in the OpenAPIs [sys_openapi] table. You can view or delete specification records directly from this table. To update a specification, delete it and import it again.

Design considerations

Create a REST step from an OpenAPI Specification with these considerations in mind.

Remove unnecessary REST step parameters
