When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.

Make input labels user-friendly

Ensure that input labels required for the REST step are clear and understandable. Clear labels enable flow designers to easily understand the required inputs when using the action in a flow.

Remove inputs that do not require flow designer configuration

When importing an OpenAPI Specification, the system adds all inputs present in the specification to the action input section. Remove any inputs that do not require a flow designer to configure. For example, if a REST step variable receives a value from another step in the action, an action input is not required.

Avoid changing the API operation

Changing the value of the **API Operation** field removes all values dependent on that operation. If you configure the OpenAPI Specification values in the REST step form, then change the operation, the system does not save your configuration. Values that are entered manually by a user are not affected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Limitations

Create a REST step from an OpenAPI Specification with these limitations.

Request body media types

The request body only supports JSON and XML-based media types. If the selected operation from the imported OpenAPI Specification contains a request body with a different media type, the system adds a data pill of type String to the **Request body** field.

OpenAPI 3.0 components

OpenAPI 3.0 adds new components to Swagger 2.0 to describe an API in further detail. OpenAPI support in the REST step supports some, but not all of these components. The REST step does not currently support these components.

- Schema Object: oneOf, anyOf properties
- Discriminator Object
- Info object: termsOfService, contact, license fields
- Example Object
- Link Object
- Callback Object
- Security Scheme Object
- Security Requirements Object
- Tag Object
- External Documentation Object
- Server Object
- Specification extensions
- Recursive references

More information on these components is available in the OpenAPI documentation. See OpenAPI Specification.

SOAP step

Enable action designers to send outbound SOAP web service requests to external systems.

Note:
SOAP step is not available in the base system and requires the ServiceNow® Integration Hub subscription. After the required plugin is activated, the step is visible under Integrations.

Roles and availability

- Available as an Workflow Studio action step. Users with the action_designer role can create a custom action with one or more action steps.
- Action designers need the web_service_admin role to perform these web services tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select WSDL
- Load new WSDL
- Select a WS-Security policy

- The ServiceNow® MID Server doesn't support WS-Security policies.

Fields

Field	Description
Connection Details	
Connection	The type of connection to use. • **Define Connection Inline**: Define connection information within the action step. • **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases.
Connection Alias	Connection & Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. **Note:** This field is available when **Use Connection Alias** is selected from the Connection list.
Credential Alias	Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. **Note:** This field is available when **Define Connection Inline** is selected from the Connection list.
Use MID	Option to use a MID Server to run the SOAP step. Select this check box to display the **MID Selection**,**MID Application**, and **Capabilities** fields. **Note:** This field is available when **Use Connection Alias** is selected from the Connection list.
Endpoint	The URL endpoint for the SOAP request. If **Use Connection Alias** is selected, this field is read-only and displays the endpoint URL associated with alias. If **Define Connection Inline** is selected, enter an endpoint URL for the connection.
Test SOAP Step	Button to test the SOAP step. To test, select the **Test SOAP Step** button. Enter any required input values and select the **Run Test** button. After the test runs, any step outputs or error messages are displayed in the Test Results section of the test window.
Connection Timeout	Number of milliseconds the system waits for a successful host connection. If the step does not make a successful connection during this time, the connection request times out. If **Define Connection Inline** is selected, enter a timeout value for the connection. Leave this field empty to use the system default connection timeout value. **Note:** Avoid setting the **Connection Timeout** value to zero, as this may cause a stale connection.
MID Selection	Option to select a specific MID Server or MID Cluster. Choose any one of the following options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **Auto-Select MID Server**: Your ServiceNow instance selects the MID Server without manual input. • **Specific MID Server**: Your ServiceNow instance uses MID Server that you specify. • **Specific MID Cluster**: Your ServiceNow instance uses the MID Cluster that you specify. A MID Cluster is a group of MID Servers that enables your ServiceNow instance to handle multiple integrations, and improve integration speed. For more information, see Configure a MID Server cluster. This field is available when **Define Connection Inline** is selected from the Connection list, and **Use MID** is checked.
MID Cluster	Data pill for the MID Cluster you want to use. This field is available when **Define Connection Inline** is selected from the Connection list, **Use MID** is checked, and **Specific MID Cluster** is selected from the MID Selection list.
Request Details	
Build Envelope	The method to use when building the SOAP envelope. • **From WSDL**: Select this option to display the **Select a WSDL** and **Operation** fields. • **Manually**: Select this option to manually enter or paste WSDL text.
Select a WSDL	The WSDL to use to build the SOAP envelope. Select an existing WSDL record or click **Load New WSDL** to download or manually enter a WSDL file. The selected WSDL populates the values of the **Operation**, **SOAP action**, and **SOAP Envelope** fields. **Note:** This field is available when you select **From WSDL** from the Build Envelope list.
Load New WSDL	Option to download or manually enter a WSDL file.
Operation	The operation to run from the selected WSDL. Each WSDL has its own list of available operations.
SOAP Action	The URL to run the SOAP action. If **Build Envelope** is set to **From WSDL**, this field is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	read-only and displays the URL to run SOAP action. If **Build Envelope** is set to **Manually**, enter a URL to run the SOAP action.
Request Type	Format of the request. Options include. • **Text**: A request in JSON, XML, or other text format. • **Binary**: A request in a binary file format.
SOAP Envelope	The XML text sent to the endpoint. If **Build Envelope** is set to **From WSDL**, the system adds the necessary XML for the **Operation** that you select. If **Build Envelope** is set to **Manually**, enter the XML text that you want to use. Enter record values in the appropriate SOAP envelope elements. For example, enter an incident short description in the `<short_description>` element. **Note:** This field is available when the **Request Type** is **Text**.
Attachment	Attachment record that contains the request. You can look up or create this record in a prior step and define it as an input variable. Create it by using the JSONStreamingBuilder and XMLStreamingBuilder APIs in the Script step. **Note:** This field is available when the **Request Type** is **Binary**.
Reset Envelope	Option to discard all manual changes that you made to the SOAP envelope. Select this check box to revert the SOAP envelope to its original state. **Note:** This field is available when you select **From WSDL** from the Build Envelope list.
New WSDL	
Name	The name of the WSDL record you want to create.
Import Method	The method to enter WSDL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **Download from URL**: Select to display the **WSDL URL**, **User name**, and **Password** fields to retrieve the WSDL from an external source, typically the web service provider. • **Manually Populate WSDL Content**: Select to display the **WSDL Content** field to manually enter or paste WSDL text.
WSDL URL	The URL to the SOAP web service. **Note:** This field is available when you select **Download from URL** from the Import Method list.
User name	The user name to authenticate with the SOAP web service. **Note:** This field is available when you select **Download from URL** from the Import Method list.
Password	The password to authenticate with the SOAP web service. The system always masks passwords in the user interface and prevents exporting them as plain text. **Note:** This field is available when you select **Download from URL** from the Import Method list.
WSDL Content	The XML document describing the SOAP web service and its operations. **Note:** This field is available when you select **Manually Populate WSDL Content** from the Import Method list.
Import	Option to add the SOAP web service WSDL to the instance.
WS-Security	
Enable WS-Security Policy	Option to restrict the SOAP web service to a security policy. Select this check box to display the **Policy** field.
Policy	The policy record that you want to use to restrict web service connections. Select an existing policy record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Retry Policy	
Enable Retry Policy	Option to enable the retry policy. For more information, see Retry policy.
Override Default Policy for Alias	Option to override the default retry policy. This check box is not applicable when **Define Connection Inline** is selected from the Connection list.
Retry Policy	Default retry policy associated with **Connection Alias**. If **Override Default Policy for Alias** is selected, you can override the default retry policy and select another existing retry policy based on your requirement.
Advanced Options	
Headers	The name-value pairs to include in the SOAP message as HTTP headers. Click the plus icon to add headers. Add a **Name** and **Value** for each HTTP header.
Headers > **Omit if empty**	Option to exclude a header if the value is empty or null. **Note:** This check box is available after clicking the down arrow to display the advanced options.

Action error evaluation

If this step fails

Data type: *Choice*

Option to continue running the next step or go to error evaluation. To use the step status code or message for a custom action error condition, see Action error evaluation.

SOAP response size limit

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the *glide.pf.soap.response_payload_max_size* system property. This system property supports a maximum value of 10 MB.

OpenAPI/Postman step

Import the OpenAPI specification or a Postman collection of a third-party outbound REST web service and build an integration to the web service. The request details for the underlying REST API operation are derived from the OpenAPI specification or Postman collection.

For JSON output response body, the system creates a complex data object output from the OpenAPI specification or Postman collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
OpenAPI/Postman step is not available in the base system and requires the ServiceNow® Integration Hub subscription. After the required plugin is activated, the step is visible under Integrations.

Roles and availability

Available as an Action Designer action step. Users with the action_designer and open_api_admin, or admin roles can create a custom action with one or more action steps.

Fields

Field	Description
Connection Alias	Connection & Credential alias record that the system uses to run the action step. Users with the action_designer and connection_admin, or admin roles can select an associated Connection alias record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases.
Base URL	Base URL from the Connection Alias for the REST request.
Toggle Advanced View	Option to view or hide the request details. When enabled, you can view and configure the resource path, HTTP method, query parameters, headers, and action outputs of the request.
API Source	Option to select an API from the list of available imported APIs.
Import Spec	Option that allows you to import an OpenAPI (v2.0 or v3.0) specification or a Postman collection (version 2.0.0 or 2.1.0). You can import an OpenAPI specification or Postman collection by providing a URL and credentials to the specification or collection, or manually copying and pasting JSON content.
API Operation	Option to select an operation from the list. Available operations are provided by the OpenAPI Specification or Postman collection in the **API Source** field.
Save As Attachment	Option to specify whether to save the response as a record in the Attachment [sys_attachment] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Resource Path	Path for the resource.
HTTP Method	HTTP method used to process the request. • **GET** • **POST** • **PUT** • **PATCH** • **DELETE**
Query Parameters	Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value. Support REST step requests that contain duplicate query parameter names. If you create a REST request that contains duplicate query parameter names, Workflow Studio adds the query parameters to the request in the same order as you defined them. **Note:** When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.
Headers	Headers to send with the request. You can create headers manually, or drag input variables into the parameter fields, and then assign a value. Support REST step requests that contain duplicate request headers. If you create a REST request that contains duplicate request headers, the headers are sent in the same order as you defined them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.
Attachment	Attachment record that contains the request. You can look up or create this record in a prior step and define it as an input variable. Create it by using the JSONStreamingBuilder and XMLStreamingBuilder APIs in the Script step. **Note:** This field is available when you select **Binary** from the Request Type list.
Enable Retry Policy	Option to enable the retry policy. For more information, see Retry policy.
Override Default Policy for Alias	Option to override the default retry policy. This check box is not applicable when **Define Connection Inline** is selected from the Connection list.
Retry Policy	Default retry policy associated with **Connection Alias**. If **Override Default Policy for Alias** is selected, you can override the default retry policy and select another existing retry policy based on your requirement.

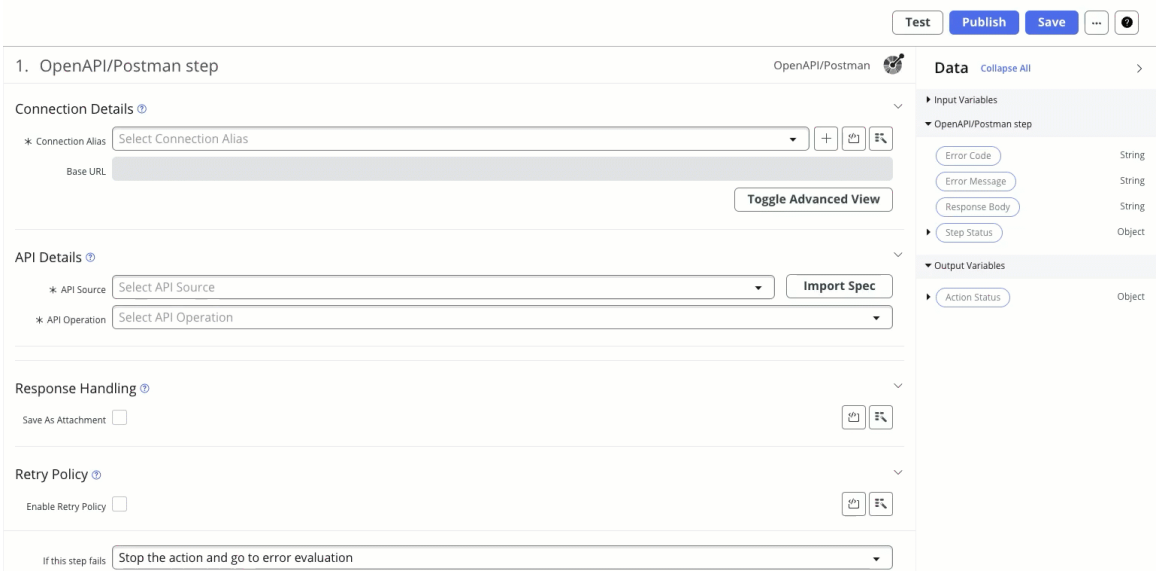
Action error evaluation

If this step fails

Data type: *Choice*

Option to continue running the next step or go to error evaluation. To use the step status code or message for a custom action error condition, see Action error evaluation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Action error evaluation

If this step fails

Data type: *Choice*

Option to continue running the next step or go to error evaluation. To use the step status code or message for a custom action error condition, see Action error evaluation.

Known limitations

Create a OpenAPI step from an OpenAPI Specification with these limitations.

Request body media types

The request body only supports JSON media types.

> **Note:**
> A string type output object is created when the OpenAPI schema has additionalProperties or no properties.

OpenAPI 3.0 components

OpenAPI 3.0 adds new components to Swagger 2.0 to describe an API in further detail. OpenAPI support in the OpenAPI step supports some, but not all of these components. The OpenAPI step does not currently support these components.

- Schema Object: additionalProperties properties
- Discriminator Object
- Info object: termsOfService, contact, license fields
- Example Object
- Link Object
- Callback Object
- Security Scheme Object
- Security Requirements Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Tag Object
- External Documentation Object
- Server Object
- Specification extensions
- Recursive references

More information on these components is available in the OpenAPI documentation. See OpenAPI Specification.

Maximum number of operations supported

The number of API operations is limited to 500 by default. However, using the system property *glide.rest.openapi.max_operation_limit*, you can configure the number of operations from 1 through 1000.

SSH step

The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.

Note:

- This step requires an Integration Hub subscription. For more information, see Legal schedules - Integration Hub overview.
- Integration Hub supports ServiceNow SSH only.

Roles and availability

The SSH step is available as an Workflow Studio action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user executing arbitrary commands on your target server. Escape and validate data pills before the command field uses them by sanitizing arguments using Sanitize shell arguments transform functions. This transform function category automatically appears when a data pill is dropped into the **Command** input.

Fields

Field	Description
Connection Details	
Connection	Type of connection to use. • **Define Connection Inline**: Define connection information within the action step. • **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases.
Connection Alias	Connection & Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. This field is available when **Use Connection Alias** is selected from the Connection list.
Credential Alias	Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data panel. This field is available when **Define Connection Inline** is selected from the Connection list. **Note:** The SSH step requires a credential record that supports either SSH private key credentials or SSH credentials. This step does not support Windows credentials where the **Use MID Server service account** option is selected.
Host	Host name or IP address of the target server. This field is available when **Define Connection Inline** is selected from the Connection list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Port	Port number to communicate with the server. This field is available when **Define Connection Inline** is selected from the Connection list. **Note:** Provide valid value between 1 and 65535. If you provide any other value, the value will be set 22 by default.
MID Selection	Option to select a specific MID Server or MID Cluster. Choose any one of the following options. • **Auto-Select MID Server**: Your ServiceNow instance selects the MID Server without manual input. • **Specific MID Server**: Your ServiceNow instance uses MID Server that you specify. • **Specific MID Cluster**: Your ServiceNow instance uses the MID Cluster that you specify. A MID Cluster is a group of MID Servers that enables your ServiceNow instance to handle multiple integrations, and improve integration speed. For more information, see Configure a MID Server cluster. This field is available when **Define Connection Inline** is selected from the Connection list.
MID Application	Option to use a MID Server to run the SSH step. This field is available when **Define Connection Inline** is selected from the Connection list and **Auto-Select MID Server** is selected from the MID Selection list.
Capabilities	Capability of the MID Server. Select **SSH**. This field is available when **Define Connection Inline** is selected from the Connection list and **Auto-Select MID Server** is selected from the MID Selection list.
MID Server	Data pill of the required MID Server. This field is available when **Define Connection Inline** is selected from the Connection list and **Specific MID Server** is selected from the MID Selection list.
MID Cluster	Data pill for the MID Cluster you want to use. This field is available when **Define Connection Inline** is selected from the Connection list, and **Specific MID Cluster** is selected from the MID Selection list.
SSH Configuration	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Working Directory	Optional target directory on the target host where the command is run.
Command	Command that runs on the target directory. The command can also include MID Server scripts. See Advanced SSH script options for more information. **Note:** Escape and validate data pills before the command field uses them by sanitizing arguments using a preprocessing Script step. For more information, see Sanitizing arguments using the escape class and function.
Long Running	Option to disable the SSH connection timeout for commands that might take longer than the default time of 120 seconds to run. When selected, the engine detaches from the execution thread until completion.
Sudo Mode	Option to elevate privileges to execute the script.

For more information, see SSH credentials.

Action error evaluation

If this step fails

Data type: *Choice*

Option to continue running the next step or go to error evaluation. To use the step status code or message for a custom action error condition, see Action error evaluation.

Advanced SSH script options

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `${syncFile()}` parameter. The system uses this parameter to locate the named script in the MID Server Script File [ecc_agent_script_file] table and run it on the target host. For example, a bash script can be expressed as:

```
bash ${syncFile("<MID script name>")} argument1 argument2
 argument3
```

A base script (`main_script.bash`) can reference another script (`my_include.bash`) as well as a separate file (`.my_profile`) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `${syncFile()}` parameter, to execute properly.

```
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A Python example with inline comments might look like this:

```
set $LIB_DIR=/usr/bin;.
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote
 package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well
 as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool
 myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

To see the list of available MID Server scripts, navigate to **MID Server** > **Script Files**.

XML parser step

Identify structured data from an XML payload without having to write script. Map incoming XML elements to a complex object output that you can use in other steps or actions. At runtime, values from an XML payload populate the complex object output.

To learn more about complex objects, see Complex data.

Note:
This step requires an Integration Hub subscription. For more information, see Legal schedules - Integration Hub overview. After the required plugin is activated, the step is visible under Integrations.

Roles and availability

Available as an Workflow Studio action step. Users with the action_designer role can create a custom action with one or more action steps.

Payload size limit

At runtime, XML parser step supports payloads up to 10 MB. For larger payloads, create a Data Stream action. For more information, see Data Stream actions and pagination.

At design time, XML parser step supports sample payloads up to 64,000 characters.

Fields

Field	Description
Source	In the **Source data** field, select or drag a data pill that contains the source XML data. For example, a REST step **Response Body** data pill. At runtime, values from the data source populate the complex object output. Under Source data and in the scripting window, enter an example payload to generate a complex object. For example, if parsing the response from a REST API step that returns a list of users, enter the expected XML for a single user. This field accepts XML with the following limitations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• XML namespaces are not applied to the complex object. More than one namespace in an XML file is not supported and generates an error message. • Multidimensional arrays are not supported. • Some special characters are not supported, such as hyphen and period. Double colons (::) are not supported in attribute values. • Payloads larger than 2 MB cannot be saved and generate an error message. However, if working with a large example, you can generate the complex object and delete the example payload before saving the step.
Structured Payload View	Select a view for the example payload. • **Raw (edit mode)**: Displays editable XML. • **Structured**: Displays XML in a tree view. Click an element in the tree to copy the element XPath. If creating complex data in the **Target** field manually, you can paste the XPath into the target XPath field.
Generate Target	Select **Generate Target** to create the step's output structure from your example payload. Your output data structure appears in the **Target** field. Child elements for each object are automatically generated as type String. Alternatively, you can manually create your target complex object by adding elements in the **Target** field.
Target	View or edit the XML payload's output structure. Create a structured output by clicking **Generate Target**, or manually add elements. Each element contains the following information in the Edit Object view: • **Label**: Data pill label. By default, the system uses the XML element's name. • **Name**: Internal name for the output element. **Note:** Exclamation marks, double colons, the @ symbol, or numbers only aren't valid values for an element's name. • **Type**: Data type, which must be String, Object, Array.String, or Array.Object. The top-level element must be an Object. • **Mandatory**: Toggle to make the element required. This only applies to elements of type String. • **Add child item**: Select the add child item icon (⊕) to add a nested child element. Elements of type Object contain the **Save as Template** advanced option, which allows you to save your object's structure as a complex object template. You can then use this template to define the schema of an Object output for your action. For elements of type String, you can also add a max length, hint, and default value as advanced options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	In the Target header, select **Exit Edit Mode** when you're done making changes to your output's structure. You can then select the toggle advanced inputs icon ( ) to view the **XPath** option. The XPath is the path to the element. Modify the XPath to change how source data elements map to complex data variables. If manually adding complex data variables, you can copy the XPath from the **Payload view** field and paste it in a complex data variable XPath field to ensure the correct hierarchy. Conditional XPath expressions are not supported.

REST API trigger

Start a flow from an inbound API call or webhook from an external system. Configure the trigger start conditions without having to write or maintain custom code.

For example, you can create a flow that starts when a third-party IT ticket tracking system sends an inbound request to the instance. You can then parse the data from the inbound REST request into a complex data object and use the values to open an Incident on your instance.

Once you activate the flow, the endpoint that you created appears in the API explorer under the namespace you created. You can use this page to help define the webhook in your third-party system and to test your flow.

To learn more about flow triggers, see Workflow Studio trigger types.

Note:

- Use the REST API Trigger to start flows from REST calls from external systems. To start a flow from a script or API call from the same instance, use a subflow, code snippet, or Workflow Studio API. See API access to Workflow Studio and Create code snippets for flows, sub-flows, and actions.

- ServiceNow has partnered with Boomi to deliver Boomi API Management, a cloud-based platform that enables customers to discover, manage, secure, and monetize their APIs. Boomi supports full lifecycle API management, including governance, analytics, and API security.

  Boomi provides documentation though their own portal, and customers requesting support with Boomi API Management will contact the Boomi support through their standard channels.

  To get started, see the Boomi API Management listing on the ServiceNow® Store, which includes information about entitlements and required plugins, as well as a link to the Boomi API Management documentation.

Available data pills

Depending on how you configure the endpoint, flow designers have access to these data pills from the trigger:

Path Parameters

An object containing path parameters in the inbound request.

Query Parameters

An object containing query parameters in the inbound request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request Headers

An object containing headers in the inbound request.

Request Body

Complex data object that defines the body structure of the inbound request. For more information on complex objects, see Complex data.

When setting up the trigger, define what the inbound data will look like. You can then use the associated data pills within the actions in your flow. When the system receives an inbound request that starts the flow, it uses the runtime values sent in the request.

Create a flow using the REST API trigger

Create a flow that starts when a third-party system sends a REST request to your instance.

Before you begin

Role required: flow_designer or admin.

This feature requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Procedure

1. Open Workflow Studio and create a flow.

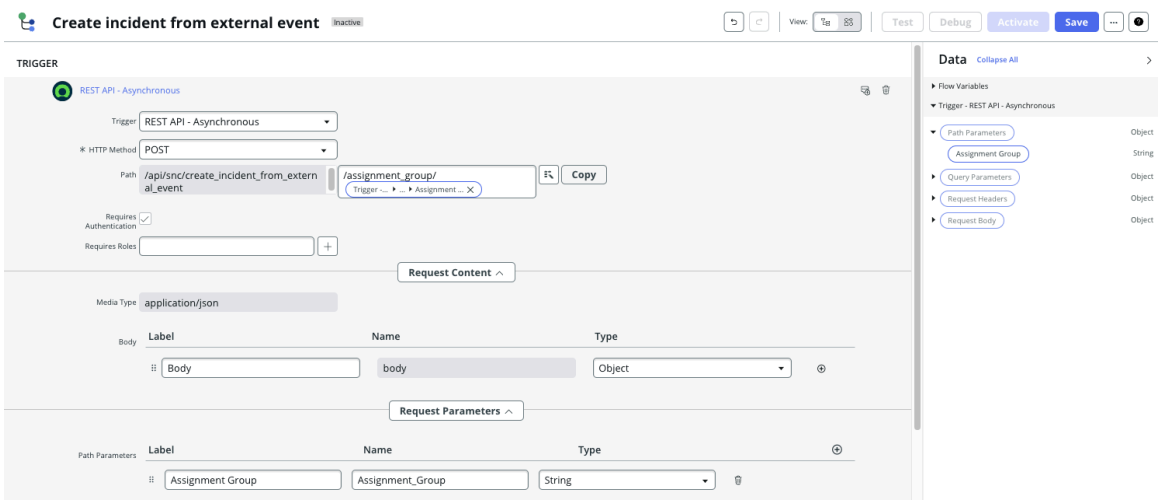
   See Create a flow.

   Keep in mind that the scope of your flow is included in the REST endpoint you create.

2. In the **TRIGGER** section, select the **REST API - Asynchronous** trigger.
3. In the **HTTP Method** field, set the HTTP method for the endpoint.
   Options include:
   - POST
   - GET
   - DELETE
   - PUT
   - PATCH
4. Create any path parameters required for the endpoint and add them to the relative path in the **Path** field.
   The relative path to the endpoint is in the format `/api/<flow-application-scope>/<flow-name>/<path-parameters>`.

   You can click **Copy** to copy the full path to the endpoint. Use this path when configuring the endpoint for the REST call in your third-party system.

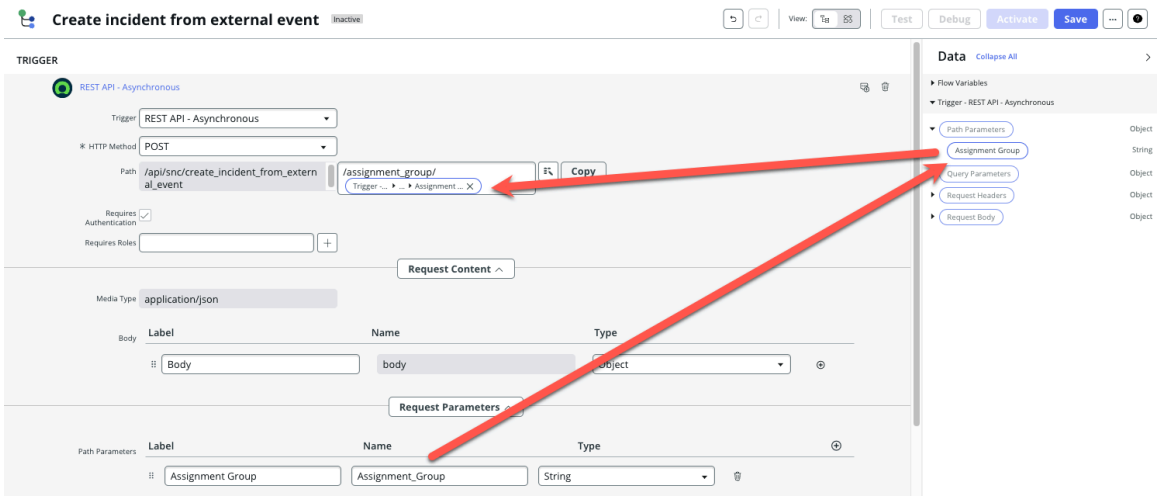
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. Create variables in the **Path Parameters** section.

b. Drag the data pill that represents the path parameter into the empty input in the **Path** field.

This field only accepts data pills from the **Path Parameters** section.



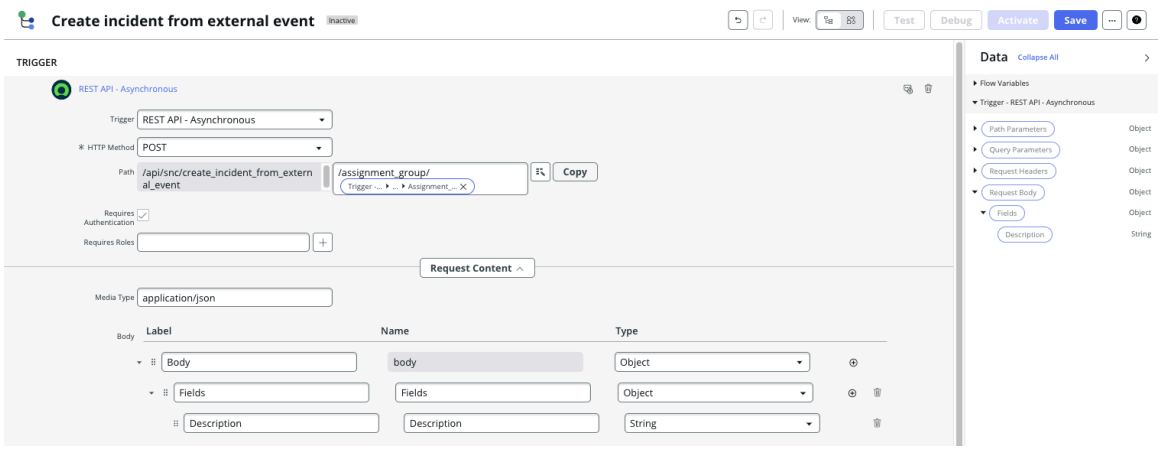
5. Select **Requires authentication** to require authentication headers in the inbound REST request.
6. If **Requires authentication** is selected, add the roles required to authorize the request in the **Requires roles** field.
7. In the **Body** field under the **Request Content** section, create a complex data object that defines the body structure of the inbound request.

   For more information on building a complex object, see Complex data.

   Note:
   The **Request Content** section only appears when the **HTTP Method** is POST, PUT, or PATCH.

   This example body finds the Description field in an inbound payload that contains ticket information from a third-party ticket-tracking system.

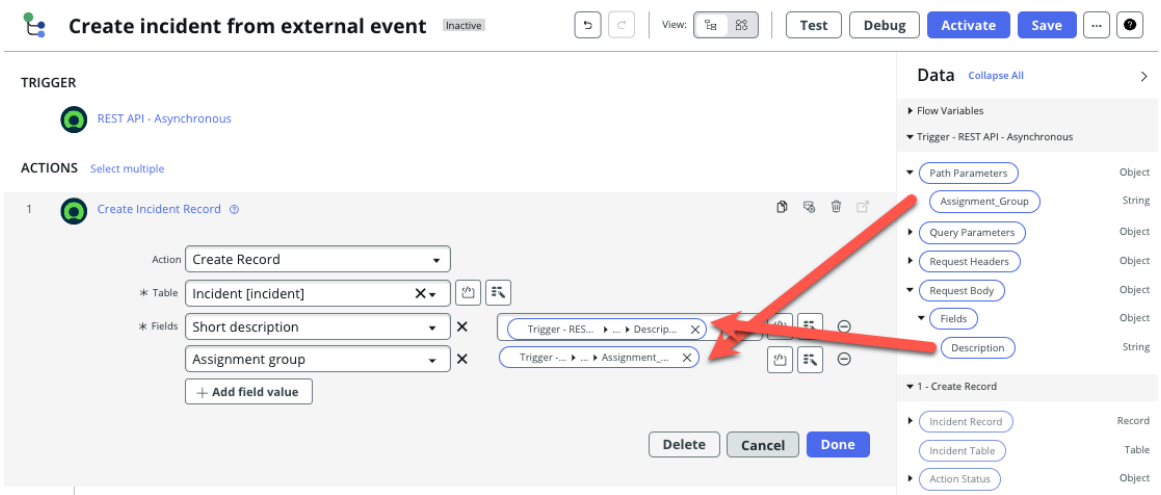
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. In the **Headers** field, define the headers to be sent in the inbound request.
   You can select **Required** to require that the inbound request include them.
9. In the **Query Parameters** field, define the query parameters to be sent in the inbound request.
   You can select **Required** to require that the inbound request include them.
10. Add actions to your flow that execute when the endpoint is called.

    You can use the data pills from the REST API trigger in your flow actions.

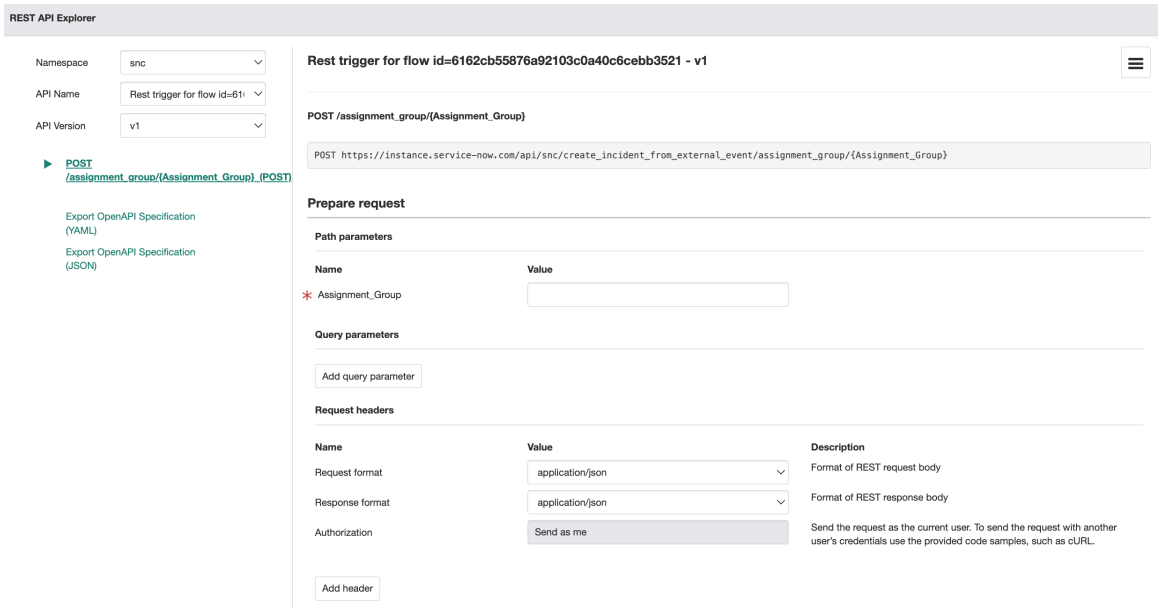
    This action creates an Incident record and maps the Description and Assignment Group fields from the incoming payload to the Incident.



11. Test and activate the flow.
    For more information, see Test a flow and Activate a flow.

    Once activated, the endpoint displays in the REST API Explorer. You can use this page to further test your endpoint, or configure the request from your third-party system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



12. Configure the REST request from your third-party system.

Example

For example, you can send this cURL request to trigger the flow defined in previous steps.

```
curl
 "https:your-instance.servicenow.com/api/snc/create_incident_fr
om_external_event/assignment_group/287ebd7da9fe198100f92cc8d1d2
154e" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
fields: {
   description: \"Major outage with data loss\"
   }
}" \
--user 'username':'password'
```

Result

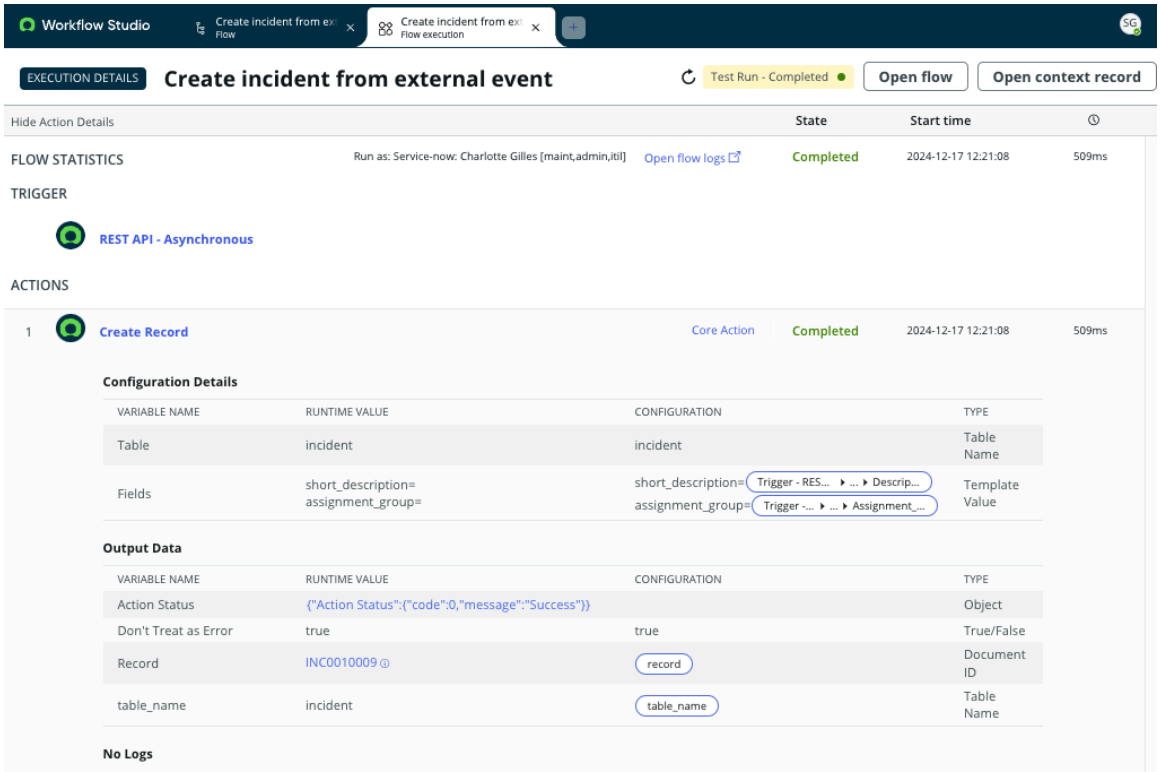
The flow executes and the REST request returns the execution ID.

```
{
  "result": {
    "executionId": "ndoxeRhshDSezldeGfbYlviFSeFnBjCO"
  }
}
```

What to do next

Copy the execution ID in the result and navigate to the Executions tab in Flow Designer. You can filter by execution ID to locate the execution details and view the status of the execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To troubleshoot issues, you can debug the REST query or check the flow execution details. See Debug REST queries and Flow execution details.

Password reset using Integration Hub

Create subflows in Integration Hub to automate and customize the password reset process for users managed by third-party applications such as Okta or Microsoft Entra ID.

Create subflows in Integration Hub to automate password reset processes. Use the Password Reset to enable an end user to use a self-service process to reset or change the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users. See Customize password reset processes and integrate third-party credential services for more information.

Password reset Integration Hubusage overview

Navigate to **Password Reset** > **Usage Overview** view the count of password reset transactions performed using Integration Hub for your instance.

Note:
Admin must activate the Password Reset - Orchestration Add-on (com.glideapp.password_reset.addon.orchestration) plugin to view the dashboard.

Importing and streaming data in Integration Hub

Import data with Integration Hub - Import or stream data from your Apache Kafka environment with Stream Connect.

Import data with Integration Hub - Import

Integration Hub - Import enables you to configure, run, and schedule your data imports all through a single simplified interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub - Import consolidates multiple data integration capabilities into a single environment, eliminating the need to create and manage several forms throughout the platform. Its step-by-step experience guides you through the configuration of data sources, target tables, and data mapping. You can schedule your data imports or run them on demand.

Stream data with Stream Connect

Stream Connect links your Kafka environment to your ServiceNow instance, enabling you to stream data between your instance and your external systems.

Stream Connect is integrated with Workflow Studio, so you can build flows that produce and consume Kafka events. Stream Connect also provides several consumers that enable you to stream and process data with scripts or by using your existing RTE or transform map configurations.

Integration Hub - Import

Automate data import tasks through a consolidated interface that provides a guided, step-by-step experience. Define external data sources, specify target tables, map how source data becomes target data, and schedule regular imports.

Managing imports through Integration Hub simplifies the process of importing data from external sources and transforming it to ServiceNow tables. You can configure, run, and schedule your data imports all through a single interface.

You can access Integration Hub - Import directly through App Engine Studio to build data integrations for your custom applications. For more information, see Adding data in App Engine Studio.

Benefits

Managing your imports through Integration Hub provides these benefits.

- Consolidates multiple data integration capabilities into a single environment, eliminating the need to create and manage several forms throughout the platform.
- Enables you to manage multiple integrations through a single interface.
- Guides you through the configuration of data sources and target tables.
- Enables you to map and transform data from a single simplified interface.
- Enables you to schedule data imports or manually import data on demand.
- Provides usage information about data imports run and details about imported rows, updates, and errors.

Overview of the import process

There are three steps to importing data.

1. **Configure a data source.**

   The data source specifies how and where to get the data to import. In Integration Hub, the data source uses an Excel file, a CSV file, or a Data Stream action to get data from an external source. A Data Stream action sends a REST, SOAP, or JDBC request to an API and returns a stream of data.

2. **Map the data to the target tables.**

   The target tables are the tables that you want to transform the data to. After you've selected the target tables, you can specify how the source data should be

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

transformed to them. Creating a data map outlines how to transform the data, the data isn't transformed until you run the import.

3. **Run or schedule the import.**

   After you've configured the data source and determined the data mapping, you can run the import. You can also schedule the import to run later. When the import runs, data is gathered from the source, moved to a staging table, and transformed to the target tables according to the specifications in your mapping.

For more details about how importing data works, see Import sets.

Integration Hub import environment

The Integration Hub import environment includes the following interfaces.

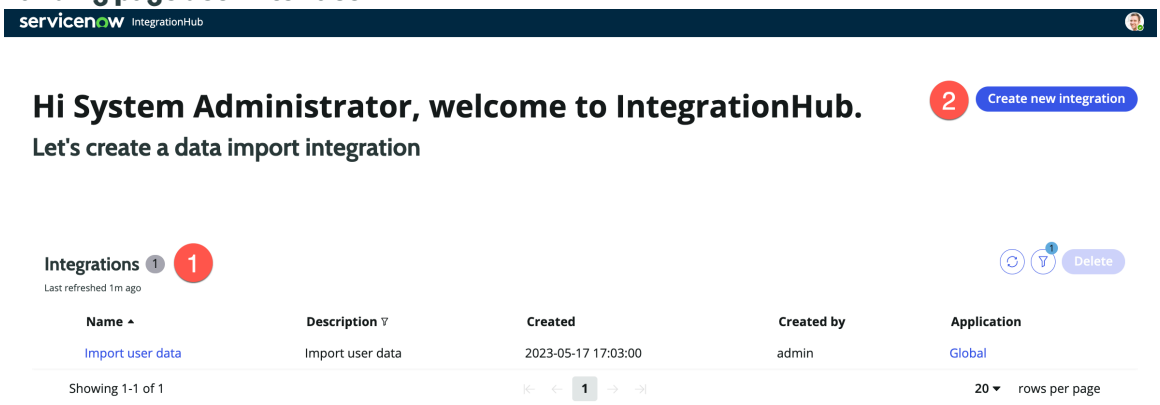
- Landing page
- Source configuration
- Map to target
- Schedule imports
- Execution details

The following sections explain each interface in greater detail.

Landing page

Create and access integrations through the landing page.

Landing page user interface



The landing page has these components.

1. **List of integrations**

   Integrations created through the Integration Hub import interface are accessible here.

2. **Create new integration button**

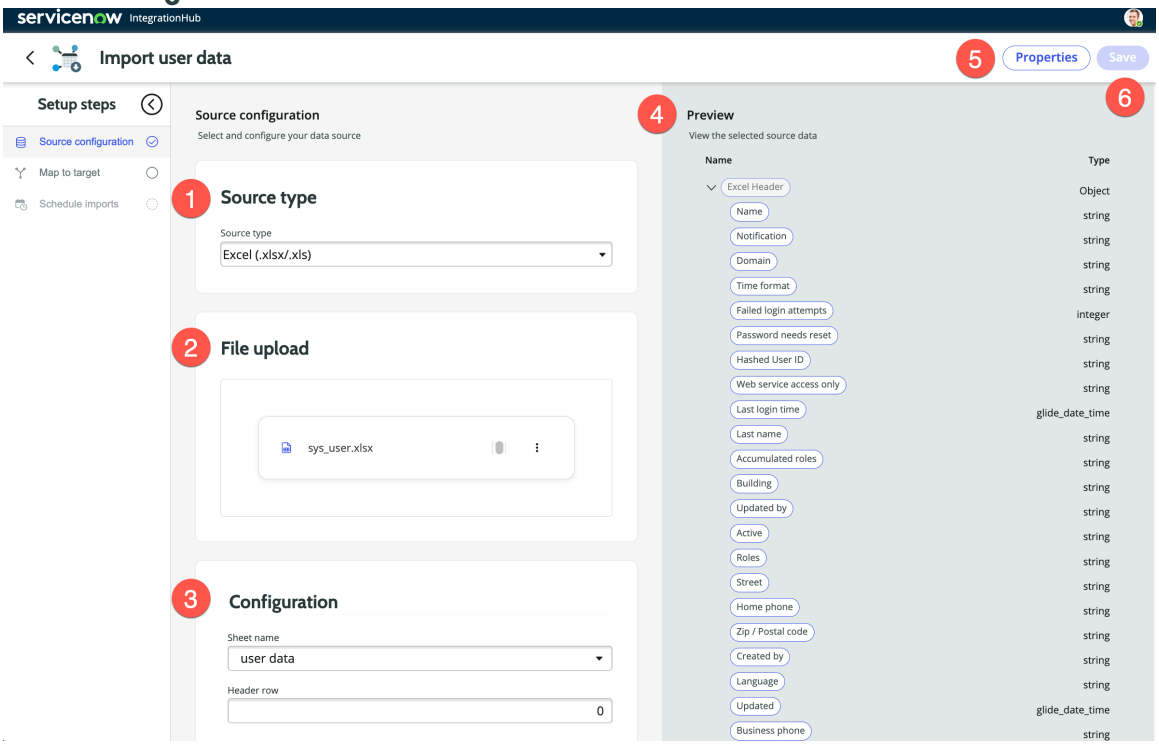
   Button to start building a new integration.

Source configuration

Define a data source for an import through the source configuration page. The data source must be an Excel file, a CSV file, or a Data Stream action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Source configuration section user interface



The source configuration section has these components.

1. **Source type selector**

   Menu to select the data source type. It has the following sections.

   - AD-HOC: Select an Excel or CSV file as a data source.
   - SPOKES: Select a Data Stream action as a data source. Displays active Data Streams organized by spoke and listed alphabetically.

2. **File upload or Connection section (the Connection section isn't shown)**

   If the data source is an Excel or CSV file, the File upload section appears here. You can drag a file over or browse to upload. Accepts XLSX, XLS, CSV, and ZIP files.

   If the data source is a Data Stream action, the Connection section appears here. For Data Stream actions that use a connection alias, you can override the default connection alias with any of its children's aliases. Select the connection alias from the menu. For more information, see Create a Connection and Credential alias.

3. **Configuration section**

   Section to configure the selected data source. The available fields depend on the type of data source that you're using.

   - For an Excel file, you can select the sheet and specify which row number to use for the header.
   - For a CSV file, select the delimiter.
   - For a Data Stream action, enter the inputs for it here. This section only appears if the Data Stream action has inputs. Data Stream actions with inputs have unique inputs, so the fields that appear here depend on which Data Stream action is selected and its configuration. Any default values already configured by the spoke inputs are pre-filled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Source data structure preview

Section that shows the structure of the source data. For an Excel or CSV file, the preview displays the column headers. For a Data Stream action, it displays the complex object output.

5. Properties button

Button to view the name of the integration, its description, and the application scope. You can edit the name and description at any time. The application scope can't be edited and must be selected when the integration is created.

6. Save button

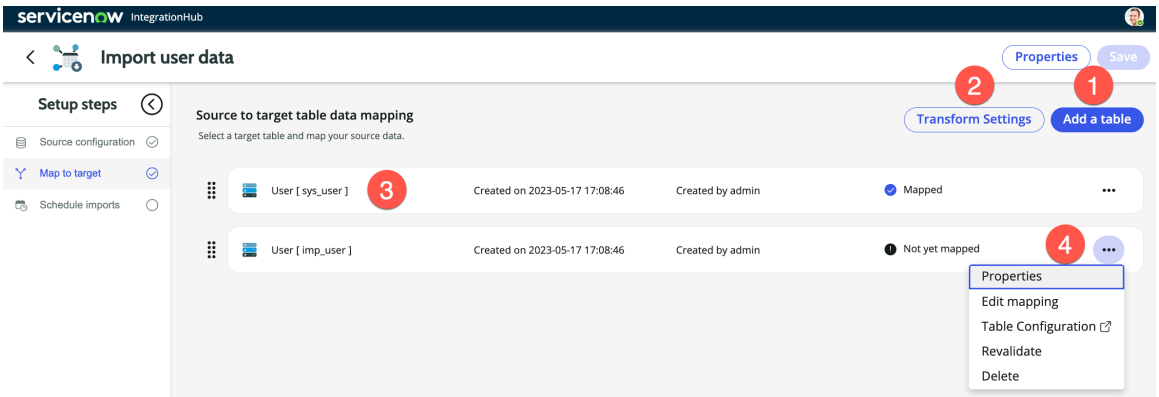
Button to save the source configuration. This button is only enabled when the source configuration is updated. When you select a source type, the structure of the source data is automatically loaded in the Source data structure preview pane. If you edit the source configuration, click **Save** to reload the source data. The data must be previewed at least once before you can map it to a target table.

Map to target

Select the target tables and determine how the source data is mapped to them. Map data by dragging data pills from the source to the target, using the pill picker, or selecting **Automap**. Transform the data in the target tables by applying transform functions.

The Map to target section has two parts. In the first part, select the target tables. In the second part, map the data to the target tables.

Table selection user interface



The table selection section has these components.

1. Add a table

Button to add target tables.

2. Transform Settings

Button to configure the transform settings for your integration. You can specify batch size and empty-field handling, enable verbose mode, or run a script before or after the integration. For more information, see Transform settings.

The **Transform Settings** button doesn't appear until you've added at least one target table.

3. Target table cards

Each card has the name of the target table, its creation details, and whether it's been mapped. Select the card to open the data-mapping interface.

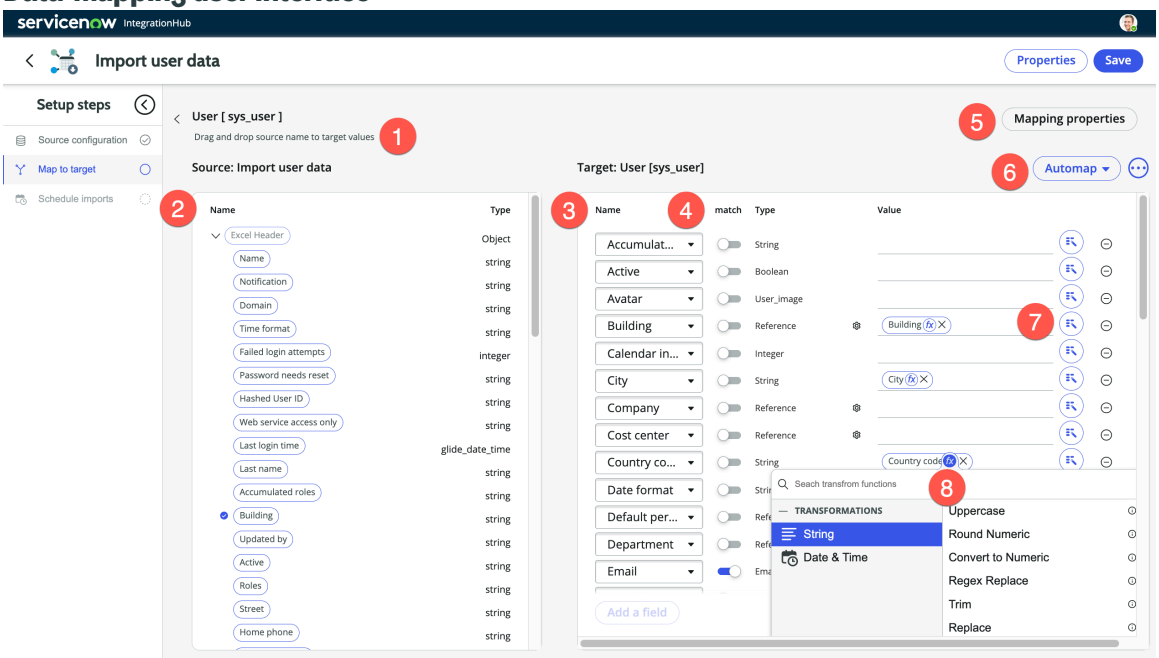
4. Target table drop-down list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of options for the target table. Includes the following.

- **Properties**: Opens the Mapping Properties window where you can view or edit the options to run the table's business rules when importing and to run the import synchronously.
- **Edit mapping**: Opens the data-mapping section where you can create or edit your data mapping.
- **Table Configuration**: Opens Table Builder where you can configure the target table. This option is only available if you have Table Builder installed. For more information, see Table Builder.
- **Revalidate**: Checks to see if there are any changes to the target entity schema. If changes are detected, the target table card displays a message saying the target schema has changed. Selecting the target table card opens a window where you can **Update** the target entity schema or **Cancel** to keep the schema the same. Revalidate your table whenever you edit the target table's configuration.
- **Delete**: Deletes the target table from the integration.

Data-mapping user interface



The data-mapping section has these components.

1. **Target table name**

   Name of the target table you're currently mapping to.

2. **Source data section**

   Section that displays the source data as data pills. To map the data, drag the data pills to the target table data section. You can also use the pill picker. After you map a source field to a target field, a small check mark icon ( ) appears next to the source field name. If you move your cursor to the check mark, the tooltip lists the target fields that source field has been mapped to, up to five fields.

3. **Target table data section**

   Section that displays how the source data maps to each field in the selected target table. You can display all the fields in the target table, or select individual fields with the **Add a field** button. For choice and reference fields, you can specify which column to map data to or you can use the default display column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Match toggle switch

Toggle switch to specify fields where the system should check for matching data and, if found, update existing records instead of creating new ones. In this image, the **Match** toggle switch is turned on for the **user id** field. If a record in the source data has a user id that matches the user id for a record in the target table, the system will update the existing record in the target table instead of creating a new one.

5. Mapping properties button

Button to view or edit the options to run the table's business rules when importing and to run the import synchronously.

6. Automap button

Button to automatically map source entities to similarly named target entities.

7. Data pill picker

Button to open the data pill picker. You can use the pill picker to map source data pills to field values in the target table.

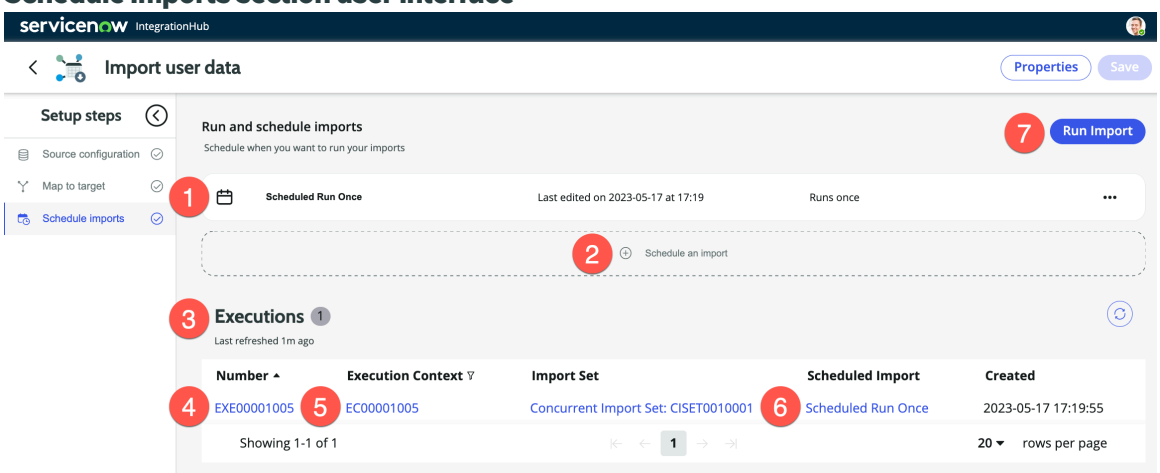
8. Transform function icon

Button to open the list of available transform functions. Use transform functions to change or modify your data. For example, the Trim transform function removes white space from the beginning and end of an input string.

Schedule imports

Run an import immediately, or schedule it to run at a specific time, at regular intervals, or after a parent import. Schedule large imports to run concurrently to reduce processing time.

Schedule imports section user interface



The schedule imports section has these components.

1. Scheduled imports

List of import schedules. Each import schedule appears in its own button.

2. Schedule an import button

Button to create an import schedule.

3. Executions section

Section with information about executed imports. Includes links to execution records, execution context records, and scheduled import records. This section only appears after an import is run.

4. Execution records

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of execution records. Each execution record provides information about an execution, including the imported rows, errors, and log messages.

5. Execution context records

List of execution context records. Each execution context record specifies the next scheduled import to use when processing a hierarchical scheduled import.

6. Scheduled import records

List of scheduled import records. Each record provides the name, data source, schedule, and partition method for the scheduled import.

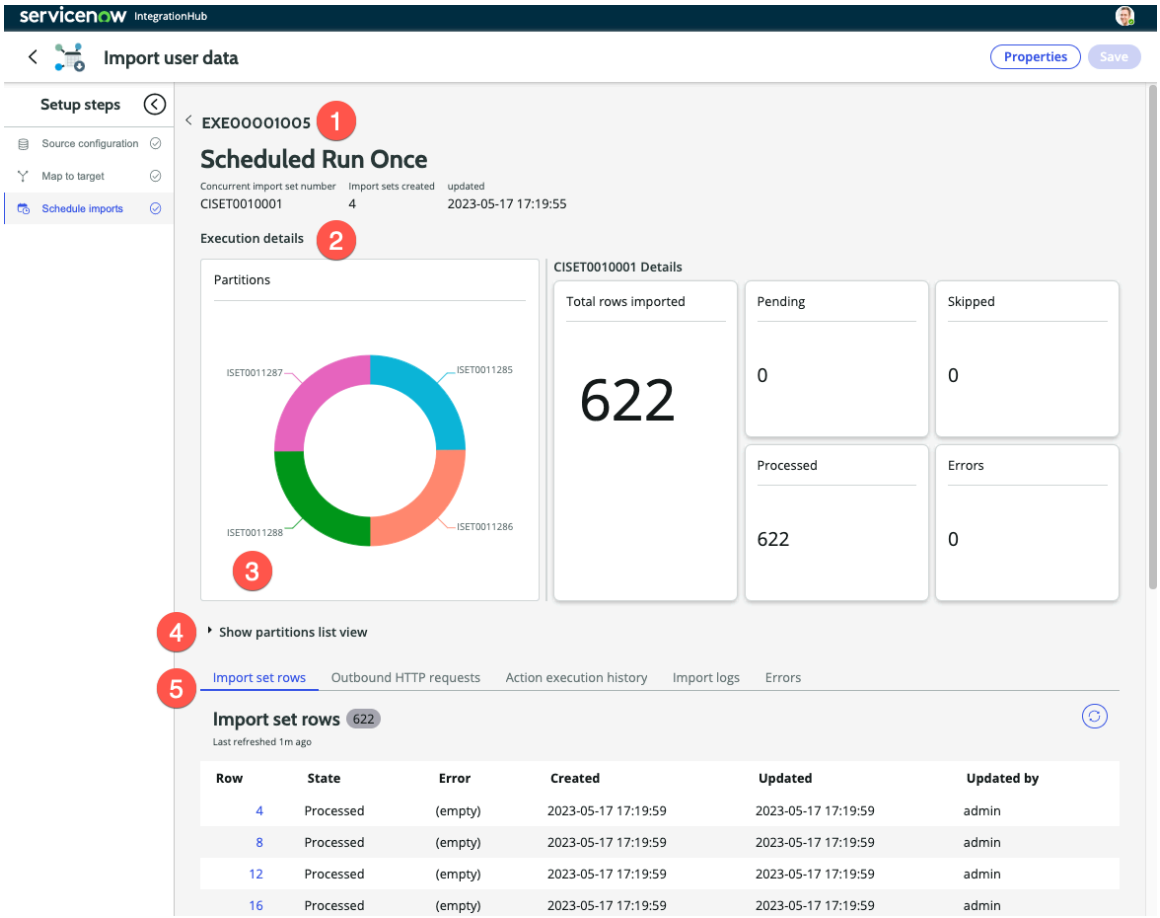
7. Run Import button

Button to run the import once.

Execution details

View details for each import, such as the execution time and date, and execution context. Open the import's execution records to view the import state and the imported rows, errors, and logs.

Execution details section user interface



The execution details section has these components.

1. Execution information

Section providing details about the execution, including the number of the execution record, the name of the scheduled import, the import set number, and the date it was updated.

2. Execution Details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Section with cards showing the total number of rows imported, processed, pending, or skipped, and the number of errors that occurred. If the import is processed concurrently, this section also includes a Partitions card. For more information, see Concurrent imports.

You can click the cards to filter the results. Filtered results display in the Import Set Rows tab toward the bottom of the page. For example, clicking the **Pending** card displays the pending rows. Clicking **Total rows imported** or **Clear Selection** clears the filters.

> **Note:**
> Card filtering is only available for import set rows. To see the filtered list, make sure you're on the Import Set Rows tab.

3. Partitions card

Graphical view of the import set partitions. The partitions card only appears for concurrent import sets. You can click a partition to view its details. You can also use the Execution Details cards for additional filtering. When you combine the partition filter with the card filters, the system uses an AND operation for filtering. For example, if you click a partition, then click the Errors card, the Import Set Rows tab displays only the errors for that partition.

4. Partitions list view

Option to view the details for each partition, including the import set number, and the type and state for each import set job. The partitions list view only appears for concurrent import sets. The partitions list view provides the same filtering capabilities as the Partitions card, so you can use either to filter a partition.

5. Import details

Section detailing the import set rows, outbound HTTP requests, action execution history, import logs, and errors for each execution record.

Integration Hub import terms

Imports in Integration Hub have these components.

Data source

A data source is a configuration record that defines the type of data to import and the endpoint where your instance can get it.

Data Stream action

A Data Stream action is an action that sends REST, SOAP, or JDBC requests from Workflow Studio to APIs and returns a stream of response data. Use Data Stream actions to retrieve data larger than 10 MB, or when working with APIs that return paginated results.

Target table

A target table is the table that you want your source data to be transformed to.

Transform function

A transform function is a function that changes or modifies your data. For example, a function that transforms an input string to all uppercase characters.

Execution

An execution is a run-time record that contains the execution details for a single import. Each execution provides import details for a specific target, including rows imported, log messages, and errors.

Execution context

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An execution context is a record that specifies the next scheduled import to use when processing a hierarchical scheduled import.

Import set

An import set is a set of run-time records that contain the raw data imported from a data source. The system stores imported records in an Import Set staging table.

Design considerations

Follow these guidelines to achieve the benefits offered by Integration Hub imports.

Create all Integration Hub imports from within Integration Hub

Only integrations created in the Integration Hub import environment are accessible there. For example, you can't configure a data source and mapping through platform forms, but then schedule the import from within Integration Hub. Only integrations created in Integration Hub appear on the landing page.

Don't alter configuration records outside of Integration Hub

Altering configuration records directly might change if and how data is imported and mapped. If you need to change the configuration of the data source, mapping, or import schedule, do so from within the Integration Hub import interface.

Avoid modifying Data Stream actions used in data sources

Modifying Data Stream actions used as data sources might change the mapping from source to target. When the output for a Data Stream action changes, the Map to target page displays a warning that the complex object schema has changed. You might need to reconfigure the mapping.

Configure a data source

Start importing data with Integration Hub by creating a data source. A data source specifies how and where to get the data you want to import.

Before you begin

- Imports in Integration Hub require the ServiceNow IntegrationHub Action Template - Data Stream [com.glide.hub.action_type.datastream] plugin. For more information, see Request IntegrationHub.
- A data source in Integration Hub uses an Excel file, a CSV file, or a Data Stream action. Data Stream actions have unique inputs, so if you plan to use one, make sure to familiarize yourself with it first. To learn more, see Data Stream actions and pagination. You can use Data Stream actions with dynamic outputs, but dynamic inputs aren't supported.
- Role required: admin or ih_import.

About this task

Configuring a data source is the first step to importing data in Integration Hub. After you set up the data source, you can select a target table, determine how data is transformed to the target table, and run and schedule the import.

Procedure

1. Navigate to **All** > **IntegrationHub** > **IntegrationHub - Import**.
2. Select **Create new integration**.
   The New Data Import Integration screen displays.
3. Configure your data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Fill in the fields for the data integration.

Field	Description
Name	Name of your integration.
Short description	Description of your integration.
Application	Name of the application scope for your integration.

b. Select **Save & Continue**.

c. Use the **Source type** menu to select a data source type.

- To choose an Excel or CSV file, select **AD-HOC** > > **File**, then either **Excel** or **CSV**. In the File upload section, upload an XLSX, XLS, CSV, or ZIP file.
- To choose a Data Stream action, select **Spokes**. Active Data Streams are organized by spoke and listed alphabetically. In the Connection section, select the connection alias. For Data Stream actions that use a connection alias, you can override the default connection alias with any of its children's aliases. For more information, see Create a Connection and Credential alias.

d. Configure the data source.

- To configure an Excel spreadsheet, specify which sheet to use and which row number to use for the header. Only one sheet and one header can be specified.
- To configure a CSV file, select the delimiter.
- To configure a data stream action, enter any required inputs. This section only appears if the Data Stream action has inputs to enter. Data Stream actions with inputs have unique inputs, so the fields in this section depend on which Data Stream action is selected and its configuration. Any default values already configured by the spoke inputs are pre-filled. You can view the details of the Data Stream action by clicking the information icon ( ) next to it. Clicking the icon opens the Data Stream action's configuration.

4. Select **Save**.

Result

The structure of the source data appears in the Source data structure preview pane. For an Excel or CSV file, the preview displays the column headers. For a Data Stream action, it displays the complex object output. If you edit the source configuration, click **Save** to reload the source data. The data must be previewed at least once before you can map it to a target table.

What to do next

Map your source data to target tables. See Map source data to a target table.

Map source data to a target table

Specify how source data is transformed to your target tables.

Before you begin

Configure a data source.

Role required: admin or ih_import.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **IntegrationHub** > **IntegrationHub - Import**.
2. On the landing page, select your integration.
3. On the left navigation panel, select **Map to target**.
4. Add your target tables.

   a. On the Source to target table data mapping page, select **Add a table**.

   b. In the Mapping Properties window, fill in the fields.

Field	Description
Target table	Name of the table to transform your data to.
Run table's business rules when importing	Option to run the target table's business rules when you import the data.
Run the import synchronously	Option to run the import synchronously. When data is transformed in parallel, and there are multiple source records with a specific coalesce value, checking this option ensures that only one record with that coalesce value is inserted at a time. For more information, see the Synchronized inserts section on the Concurrent imports page.

   c. Select **Save**.

   You can add multiple target tables to your integration. Repeat steps 4a through 4c for each target table you want to add.

   Tables are listed in the order they're added. You can change the order by using the drag icon to the left of each table card to drag the card to a different position. The order of the table cards determines the order in which data is transformed into the target tables at runtime.

   Note:
   You can't select the same table more than once, and you can't select an extended table or parent table of a table already in the integration.

5. Map the fields from your source data to a target table.

   a. On the Source to target table data mapping page, select the button with the target table you want to map to.
   This opens the data-mapping section for the table. The left side of the page shows the source data. The right side is for the target table.

   b. Use the **Add a field**, **Add all fields**, or **Automap** button to configure the target side and begin mapping data.
   - To add all the fields in the target table, select **Add all fields**. Fields are added alphabetically.
   - To add fields individually, select **Add a field** and choose the field name from the list. A field can only be added once.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To add fields and map them automatically, select **Automap**. Automap maps source entities to similarly named target entities. The **Automap** button has two options.
  - **All matching fields in the target table** adds all the fields and maps the ones that match.
  - **All unmapped fields in the target selection** maps only the fields that you've already added but haven't mapped yet. If you haven't added any fields yet, this option is not available.

- For a target entity that has already been mapped, selecting **Automap** doesn't change its value. An automapped field has a wand icon on its data pill.

  By default, Automap maps a maximum of one source entity to a target entity. You can change this by setting the *glide.ih.automap.extractone* property to false.

  Automap matches source to target entities by looking for column names that are at least an 80% match. You can modify this with the *glide.ih.automap.minimum.score* property. For example, to make matches based on a 60% similarity, you can set *glide.ih.automap.minimum.score* to 60.

c. Map data by dragging data pills from the source to the **Value** column on the target table.

You can also map data by using the pill picker ( ) on the right side of the target table. You can enter more than one value in the Value column, you can also enter text.

After you map a source field to a target field, a small check mark icon ( ) appears next to the source field name. If you move your cursor to the check mark, the tooltip lists the target fields that source field has been mapped to, up to five fields.

d. Optional: Use the **Match** toggle switch to specify fields where the system should check for matching data and, if found, update existing records instead of creating new ones.

(Optional) For example, if a target table has an **Order number** field and a record with an order number of 743, there are two options for handling potential matches.

- If the **Match** toggle switch for the **Order number** field is on, the system checks for matching data. If the source data has a record with the same order number, the system updates the existing record in the target table.
- If the **Match** toggle switch for the **Order number** field is off, the system doesn't check for matching data. If the source data has a record with the same order number, the system creates a new record in the target table. In this case, the target table will have two records, both with an order number of 743.

e. Optional: For choice and reference fields, specify the column to map data to.

i. Select the gear icon ( ).

ii. In **Field**, select the column to map to.

iii. In **If no matching record exists then do the following**, specify what to do if that column isn't available.

- **Create a new choice/record**: Creates the choice or record in the target table.
- **Ignore this field**: Ignores only the field in the target table.
- **Skip this record**: Skips the entire record in the target table.

iv. Select **Done**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. **Optional:** Change or modify your data by applying transform functions.
For example, you can use the Uppercase transform function to change an input string to all uppercase characters. For more information, see Transform functions.

Note:
Not all the transform functions available while creating flows and subflows are available in Integration Hub - Import.

i. Select the transform function icon ( ).

ii. Select a transform function from the menu, then select **OK**.

iii. To apply additional transform functions, select **Add a new transform**. Transform functions are applied in the order they're selected.

iv. After you've added all your transform functions, select **Done**.

6. When you're done with your mapping, select **Save**.
If you're mapping to more than one target table, repeat steps 5 and 6 for each table.

What to do next
Run or schedule a data import.

Run or schedule a data import

Specify when to run a data import by creating a schedule. Schedule an import to run at a specific time, at regular intervals, or after a parent import. You can also run your import immediately.

Before you begin
Configure a data source, then Map source data to a target table.

Role required: admin or ih_import.

Procedure
1. Navigate to **All** > **IntegrationHub** > **IntegrationHub - Import**.
2. On the landing page, select your integration.
3. On the left navigation panel, click **Schedule imports**.
4. On the Run and schedule imports page, click **Schedule an import**.
5. On the New schedule form, fill in the fields.

Field	Description
Scheduled Data Import	
Name	Name to uniquely identify the import schedule.
Data source	Data source for the import. This field is automatically set to the name of your integration.
Run as	Name of the user or user role the import executes with. For example, the import may run as the System Administrator, or it may run with the roles of a specified user.
Application	Application scope for the import schedule.
Run	Option to specify when the import runs. Select one of the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Daily**: Runs every day. ○ **Weekly**: Runs every week. ○ **Monthly**: Runs every month. ○ **Periodically**: Runs at regular intervals. ○ **After Parent Runs**: Runs after another import.
Day	Day of the week or month to run the import. Entered as a number. This field appears only when **Weekly** or **Monthly** is selected from **Run**.
Repeat interval	Amount of time to wait between imports. Entered in days, hours, minutes, and seconds. This field appears only when **Periodically** is selected from **Run**.
Parent	Name of the parent import. The parent import must finish before the current import begins. This field appears only when **After Parent Runs** is selected from **Run**.
Time	Time of day to run the import. Entered in hours, minutes, and seconds.
Active	Option to make the import schedule active.
Advanced	
Concurrent import	Option to divide the data into multiple import sets and process them concurrently.
Partition Method	Option to specify how to partition the data. Select one of the following. ○ **Custom size** ○ **Round Robin** This field appears only when **Concurrent import** is selected.
Partition Size	Number of records for the partition size. Must be greater than or equal to 1000. This field appears only when **Custom size** is selected from **Partition Method**.

6. Click **Save**.
7. **Optional:** To add a prescript or postscript, click the more options icon (⋯) and select **Advanced setup**.
   This option opens the form for the scheduled data import, where you can add a script to run before or after your import.
8. **Optional:** Run your scheduled import right away by clicking the **Run Import** button, and refresh the Executions list to view the execution record.

What to do next

Your import will run at the scheduled time. After it runs, an Executions section appears on the Run and schedule imports page. The Execution section has execution records where you can view details about your import, including its runtime, the number of imported rows, and any errors or log messages.

Transform settings

Configure the transform settings for your Integration Hub - Import integration. Specify batch size and empty-field handling, enable verbose mode, or run a script before or after the integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure transform settings

You can configure the transform settings for your integration by selecting the **Transform Settings** button at the top of the Map to target page in Integration Hub - Import.

Note:
The **Transform Settings** button doesn't appear until you've added at least one target table to the Map to target page. For more information, see Map source data to a target table.

Field	Description
General	
Batch Size	Number of items to transform in each batch. Default value: 10
Verbose	Option to enable transform logs with details on transform operations, transformer rules, and transforms with multiple target tables. Default value: false
Copy Empty Fields	Option to copy any empty values in the source fields to the target fields. When this field is selected, empty source values are copied. When it's not selected, empty source values are not copied to the target fields. Default value: true
Scripts	
Execute OnBefore Script	Option to run a script before inserting or updating data. Send notifications, modify data, or perform other actions before the integration begins. The onBefore script has three parameters. • *source*: The source data from the import record. • *target*: The transformed data from the import record. In the onBefore script, this parameter accesses transformed data before it's inserted into the target table. • *importLog*: The log that records information about data import activity. The onBefore script has two variables. • *ignore*. Type: Boolean. When **true**, the specified import set row is ignored. • *ignore_reason*. Type: String. Message describing why the import set row was ignored.
Execute OnAfter Script	Option to run a script after inserting or updating data. Send notifications, calculate summaries, or perform other actions after the integration completes. The onAfter script has three parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• *source*: The source data from the import record. • *target*: The transformed data from the import record. In the onAfter script, this parameter accesses transformed data after it's inserted into the target table. Once a record is inserted or updated, it has a sys_id. • *importLog*: The log that records information about data import activity.

Using Stream Connect for Apache Kafka

Connect your Apache Kafka environment to your ServiceNow instance with Stream Connect for Apache Kafka.

Apache Kafka is a distributed event-streaming platform that provides a unified way to exchange data across multiple systems. Stream Connect for Apache Kafka links your Kafka environment to your ServiceNow instance, enabling you to stream data between your instance and your external systems.

Note:
Stream Connect requires an Workflow Data Fabric subscription and a Stream Connect subscription. For more information, see https://www.servicenow.com/now-platform/workflow-data-fabric.html.

Benefits

- Publish and process Kafka events at scale. Publish events to your Kafka environment from your ServiceNow instance and consume Kafka events from your external systems at a high volume with low latency.
- Build flows that produce and consume Kafka events. Stream Connect is integrated with Workflow Studio, providing a low-code way to publish and process Kafka messages.
- Import data from your Kafka environment and process that data using your existing Robust Transform Engine (RTE) or transform map configurations.
- Configure a consumer that uses your own scripts to process data from a Kafka topic.
- Monitor your consumers' performance with detailed reporting of statistics and performance metrics.

Components

Stream Connect has the following components.

Producers

A producer publishes events to a Kafka environment. Stream Connect has two producers.

- Kafka Producer step in Workflow Studio
- ProducerV2 API

Consumers

A consumer reads and processes events from a Kafka environment. Stream Connect has several consumers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Kafka Message trigger in Workflow Studio
- Extract Transform Load (ETL) Consumer
- Transform Map Consumer
- Script Consumer

Topics and topic namespaces

Events are organized and stored in topics. A topic stores events of the same type. Topics are partitioned. Events have a key. Events with the same key are stored in the same partition.

Topics link to a topic namespace. You can use namespaces to organize topics in logical ways. For example, you can group topics together based on which Kafka cluster they come from. You can also use namespaces to configure which domains can access which topics on a domain-separated instance. For more information, see Managing namespaces and topics in Hermes.

Subscriptions

A subscription is a record associated with a consumer. It stores configuration information about the consumer, such as the name of the Kafka topic to consume messages from and the number of partitions the topic has. The subscription record is created when a Kafka stream is activated.

Each subscription record has several metrics that enable you to view the performance of the consumer reading from the topic. For more information, see Viewing Kafka subscriptions and statistics.

Partition groups

A partition group is a set of topic partitions. For example, if a topic has six partitions, they can be divided into three partition groups, with two partitions in each group.

Kafka consumer job

A job that regularly checks Hermes for any new events in a topic. The job picks a free partition group and retrieves its subscription. The subscription gives the topic name, and the job checks the partitions for messages for that topic.

Kafka streams

A Kafka stream is a record that defines the data stream for a consumer. If you're using the Kafka Message trigger in Workflow Studio, the Kafka stream is automatically created for you. If you're using a different consumer, you'll need to create one manually.

To link your Kafka environment to your ServiceNow instance, Stream Connect uses the Hermes Messaging Service. The Hermes Messaging Service enables your instance to produce and consume large volumes of Kafka events. It manages the flow of data between your Kafka environment and your instance. For more information, see Hermes Messaging Service.

The following diagram shows some of the key components of Stream Connect.

© 2026 ServiceNow, Inc. All rights reserved.

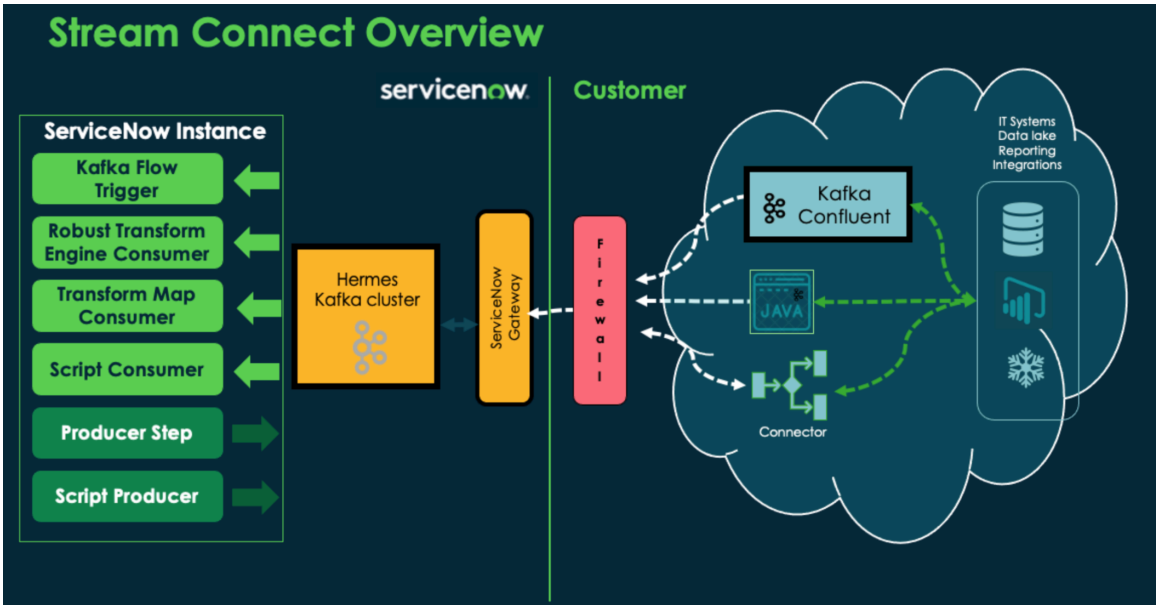
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stream Connect overview



Stream Connect and Workflow Studio

Build flows that produce and consume Kafka events with Stream Connect and Workflow Studio. Stream Connect has a flow trigger for consuming Kafka events and an action step for producing them.

Use the Kafka Message trigger to create flows that process Kafka events. You can build a flow that consumes data from Kafka and inserts it into a table, or uses spokes to communicate the data to third-party environments.

The trigger is enabled when the flow is activated. After it's activated, the trigger starts the flow whenever there's a message in the specified Kafka topic. When you use the Kafka Message trigger, you don't need to create a Kafka stream or subscription record. The system automatically creates both when the flow is activated. Messages are read from the topic as long as the flow is active.

Use the Kafka Producer step to create actions that publish events to a topic in your Kafka environment. For example, you can use the step to create a message about an update on an incident in ServiceNow, then push the message to a topic in your Kafka environment.

Stream Connect alerting

Receive alerts and alert notifications for Stream Connect integrations. Stream Connect uses both active and scheduled monitoring to detect events across multiple components. If an issue is detected, the system creates an alert, logs a message to the Stream Connect Log, and sends out an alert notification. For details, see Stream Connect alerting.

Support for messages in an Avro format

Import and create schemas to send and receive messages in an Apache Avro format. Using an Avro format can reduce the size of the payload and simplify your integration to your local Kafka instance.

You can import Avro schemas directly from the Confluent Registry, or you can create your own schemas using a JSON file or a JSON-formatted string. The schemas are stored in ServiceNow and enable your producers and consumers to convert plain-text messages to an Avro format and back. For details, see Schema management in Stream Connect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ETL, Transform Map, and Script Consumers

Import data from your Kafka environment using your existing RTE or transform map configurations. The Extract Transform Load (ETL) and Transform Map consumers simplify your data imports by providing an efficient way to take a payload from a Kafka message, transform the data, and insert or update a record in a table. You can switch from a scheduled data import to one using Stream Connect and process the data with the same configurations.

You can also use the Script Consumer to process data from your Kafka environment. The Script consumer is for more advanced use cases, such as when the data in the message isn't structured, or it requires data lookups using code.

When you Configure an Extract Transform Load (ETL) consumer, Configure a Transform Map consumer, or Configure a script consumer, you also need to Create a Kafka stream.

ProducerV2 API

Publish events to a Kafka topic with the ProducerV2 API.

Stream Connect Message Replication

You can replicate data between your Kafka environment and ServiceNow with Stream Connect Message Replication.

Stream Connect Message Replication enables you to configure and manage message replications directly from your ServiceNow instance. It uses a MID Server to run the data replications, so you don't need to configure or host additional replication services. It also simplifies the message replication setup by automatically generating the required certificates.

For more information, see Stream Connect Message Replication.

Unprocessed and undelivered messages

If a message can't be delivered, it's stored in the Kafka Undelivered Messages [sys_kafka_undelivered_messages] table. A scheduled job, Kafka Producer Retry, regularly reads this table and tries to redeliver any messages.

If a batch of messages can't be processed because it has timed out, it's stored in the Kafka Unprocessed Messages [sys_kafka_unprocessed_messages] table. The time-out for a message batch can be set with the *com.glide.kafka_consumer.timeout* property. The default value is 60 seconds. This table is a rotated table, so it cleans records automatically.

Producer compression formats

Specify a compression format for Stream Connect producers with the *com.glide.kafka_producer.compression_type* system property. It supports the following values:

- NONE
- GZIP
- LZ4

This property is not in the System Properties [sys_properties] table by default, so it must be added manually. This property sets the compression format for all Stream Connect producers.

Note:
To consume a compressed message, it must have been compressed using GZIP or LZ4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

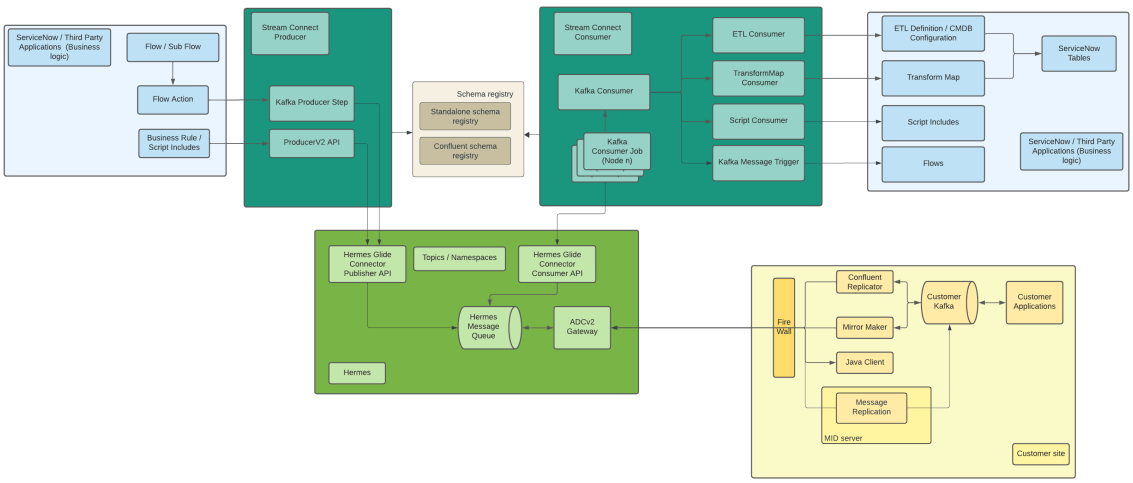
Domain separation

Use Stream Connect topic namespaces to configure which domains can access a Kafka topic on a domain-separated instance. Group topics into ServiceNow namespaces, then link the namespaces to specific domains. For more information, see Domain separation and Stream Connect.

Architecture diagram

The following diagram shows key components of Stream Connect, how they relate to ServiceNow and third-party applications, and how they connect to your Kafka environment through Hermes.

Stream Connect architecture diagram



Plugin

Stream Connect requires the ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer] plugin. This plugin enables the licensed components for working with message-based streaming data in Stream Connect.

Stream Connect Message Replication

Replicate data between your Apache Kafka environment and ServiceNow.

With Stream Connect Message Replication, you can configure and manage message replications directly from your ServiceNow instance.

Stream Connect Message Replication uses a MID Server to run the data replications, so you don't need to configure or host additional replication services. It also simplifies the message replication setup by automatically generating the required certificates.

Enabling a MID Server to replicate data

Stream Connect Message Replication uses a MID Server with a replicator extension to replicate data to and from your local Kafka. For instructions on how to configure the MID Server, see Configuring MID Servers.

The MID Server must be able to access Hermes endpoints through the firewall. Work with your network administrator to make sure that the following port ranges are open.

- Producer: 4000–4050
- Consumer1: 4100–4150
- Consumer2: 4200–4250

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring connections and credentials for Kafka

Stream Connect Message Replication uses a Connection & Credential alias to connect to your local Kafka. To configure a Connection & Credential alias:

1. Create Kafka SSL credentials with the authentication data required for the connection.
2. Configure a Kafka connection to connect to your Kafka environment.
3. Create a Connection & Credential alias, to associate the connection information and credential data. The Connection & Credential alias should have a **Connection type** of **Kafka** and must be accessible from the MID Server.

These steps are for configuring a Connection & Credential alias for connecting to Kafka. You don't need to set up connections or credentials for connecting to Hermes, because the MID Server automatically handles the creation of the required keystore, truststore, and certificates.

Creating message and topic replications

Message replication requires Message Replication records and Kafka Topic Replication records.

A Message Replication record represents a single Kafka cluster. For example, if you have two Kafka clusters, you would create two different Message Replication records, one for each cluster. A Message Replication record is the parent record for all the topics being replicated to or from that cluster. Message Replication records are stored in the Message Replications [sys_sc_message_replication] table.

A Kafka Topic Replication record specifies the replication from a single source topic to a single destination topic. You can't replicate a single source topic to multiple destinations. You can only replicate to each destination once. Kafka Topic Replication records are stored in the Kafka Topic Replications [sys_kafka_topic_replication] table.

For a step-by-step guide to creating message and topic replication records, see Create message and Kafka topic replications in Stream Connect.

Viewing message replication statistics

Once replications are running, the system creates a metrics record for each active topic replication every 60 seconds. Metrics records provide information about topic replications, including the **Message count**, which shows the number of messages replicated in each collection interval.

You can view metrics records on the Message Replication Statistics [sys_sc_channel_replication_metric] table. You can also view metrics records for a particular topic by checking the Message Replication Statistics on its Kafka Topic Replication record.

For a list of message replication metrics and their descriptions, see Viewing Stream Connect Message Replication statistics.

Required plugin

Stream Connect Message Replication requires the ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer] plugin.

Roles

The message_replication_admin role can create, modify, and delete records in all the message replication tables, including the connection and credential tables, and the message and topic replication tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The message_replication_user role can view records in the message replication tables.

Logging

Most issues are logged in the MID Server log. Additional debug logging can be enabled by setting the *glide.stream_connect.message_replication.debug* MID Server property to **true**.

Create message and Kafka topic replications in Stream Connect

Set up message and topic replications to replicate data between your Apache Kafka environment and ServiceNow.

Before you begin

- Role required: message_replication_admin
- This feature requires a subscription. For more information, see Using Stream Connect for Apache Kafka.
- Verify the Hermes Messaging Service and Instance PKI Certificate Generator are working.
  - Check the status of and connection to the Hermes Kafka cluster.
  - Check the Key Management Framework Health to verify that all three items in the Instance PKI section are operational.
- Configure and start a MID Server. For more information, see Configuring MID Servers. The MID Server must be able to access Hermes endpoints through the firewall. Work with your network administrator to make sure that the following port ranges are open.
  - Producer: 4000–4050
  - Consumer1: 4100–4150
  - Consumer2: 4200–4250
- Stream Connect Message Replication uses a Connection & Credential alias to connect to your local Kafka. Create a Connection & Credential alias with a **Connection type** of **Kafka**. A Connection & Credential alias requires a Kafka Connection and a Kafka SSL Credential.
- Stream Connect Message Replication requires the ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer] plugin.

About this task

This page shows you how to create a Message Replication record and an associated Kafka Topic Replication record.

A Message Replication record represents a single Kafka cluster. For example, if you have two Kafka clusters, you would create two different message replication records, one for each cluster. A Message Replication record is the parent record for all the topics being replicated to or from that cluster. Message Replication records are stored in the Message Replications [sys_sc_message_replication] table.

A Kafka Topic Replication record specifies the replication from a single source topic to a single destination topic. You can't replicate a single source topic to multiple destinations. You can only replicate to each destination once. Kafka Topic Replication records are stored in the Kafka Topic Replications [sys_kafka_topic_replication] table.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Stream Connect** > **Message Replications** and select **New**.
2. On the Message Replication form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message Replication form

Field	Description
Name	Name of the message replication.
Messaging service connection	Connection & Credential alias specifying which messaging service to connect to.
Status	Last known status of the message replication. This field is automatically set.
Error message	Error message based on the last known status of the message replication. This field is automatically set.
Application	Application scope for the message replication. This field is automatically set.
Active	Option to activate the message replication.

3. Select **Save**.
   After you save the form, the Kafka Topic Replications tab appears at the bottom of the page.
4. On the Kafka Topic Replications tab, select **New**.
5. On the Kafka Topic Replication form, fill in the fields.

Kafka Topic Replication form

Field	Description
Name	Name of the topic replication. The name is generated automatically based on the values in other fields. To generate the **Name**, enter the values for the **Direction**, **ServiceNow topic**, and **Topic name** fields, then select **Save**. When the **Direction** is **To ServiceNow**, the **Name** has the following format: `topic name [replication name] -> ServiceNow topic name [SN]`. When the **Direction** is **From ServiceNow**, the **Name** has the following format: `ServiceNow topic name [SN] -> topic name [replication name]`.
Direction	Direction of the topic replication. ○ **To ServiceNow** replicates a topic from your local Kafka environment to ServiceNow. ○ **From ServiceNow** replicates a topic from ServiceNow to your local Kafka environment.
ServiceNow topic	Reference to the Kafka Topics [sys_kafka_topic] table.
Replication	Message replication that manages this topic replication.
Topic name	Name of the topic in your local Kafka environment.
Active	Option to activate the topic replication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Status	Last known status of the topic replication. This field is automatically set.
Error message	Error message based on the last known status of the topic replication. This field is automatically set.
Track in current update set	When selected, the topic replication is added to the current update set, so it's simpler to promote it from sub-production to production instances. You may need to configure the form to add this field.

6. Select **Submit**.
7. Follow steps 1–6 to create message and topic replications for all your Kafka clusters and topics.

Result
After you've created all your message and topic replication records, messages should be replicating. You can check the **Status** and **Error message** fields on the Message Replication record for a general status of how the replication is working.

You can also check the **Status** and **Error message** fields on each individual Kafka Topic Replication record for the status of a specific topic replication.

Each Kafka Topic Replication record also has a related list named Message Replication Statistics. Once replications are running, this list displays metrics records, which are created every 60 seconds for each topic replication. Each metrics record has information about the topic replication, including the **Message count**, which shows the number of messages replicated in each collection interval.

What to do next
If you're replicating messages from your local Kafka into ServiceNow, you can configure a Script, ETL, or Transform Map consumer to process the messages or set up a Kafka Message trigger to start a flow.

If you're replicating messages from ServiceNow to your local Kafka, you can use a Kafka Producer step in Workflow Studio or use the ProducerV2 API to publish messages to the Hermes topic and your local Kafka.

Create Kafka SSL credentials

Configure SSL credentials for your Apache Kafka connection.

Before you begin
Role required: connection_admin or message_replication_admin

About this task
Configure connection and credential records for connecting to your local Apache Kafka environment.

- The connection record contains the information required for making the connection to your local Kafka. Connection records are stored in the Kafka Connections [kafka_connection] table.
- The credential record stores the authentication data required for the connection. Credential records are stored in the Kafka SSL credentials [kafka_ssl_credentials] table.

After you've created both the connection record and the credential record, you can Create a Connection & Credential alias, which links your connection information and the credential data under a single name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
3. On the form asking what type of credentials you would like to create, select **Kafka SSL credentials**.
4. On the Kafka SSL credentials form, fill in the fields.
   For a description of the fields, see Kafka SSL credentials fields.
5. Select **Submit**.

What to do next

Configure a Kafka connection.

Configure a Kafka connection

Configure a connection to your Apache Kafka environment.

Before you begin

- Role required: connection_admin or message_replication_admin
- Create Kafka SSL credentials.

About this task

Configure connection and credential records for connecting to your local Apache Kafka environment.

- The connection record contains the information required for making the connection to your local Kafka. Connection records are stored in the Kafka Connections [kafka_connection] table.
- The credential record stores the authentication data required for the connection. Credential records are stored in the Kafka SSL credentials [kafka_ssl_credentials] table.

After you've created both the connection record and the credential record, you can Create a Connection & Credential alias, which links your connection information and the credential data under a single name.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Connections**.
2. Select **New**.
3. On the form asking what type of connection you would like to create, select **Kafka Connection**.
4. On the Kafka Connection form, fill in the fields.

Kafka Connection form

Name	Name for the connection.
Credential	Name of the credential used to authorize this connection.
Application	Application scope for the message replication. This field is automatically set.
Active	Option to activate the connection.
Connection alias	Name of the connection alias to associate with this connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bootstrap servers	Comma-separated list in the format HOST:PORT,HOST:PORT. The list doesn't need to include all of the Apache Kafka cluster servers.
Consumer group id	Kafka consumer group.id. If not provided, the value is created with the format `{instance_name}-consumer-{kafka_connection.sys_id}`
Additional client properties	Any additional client properties that should be specified when connecting to Kafka. For a full list and description of the available properties, see the Kafka documentation at https://kafka.apache.org/documentation/ .
Use MID Server	Option to use a MID Server. This field is automatically selected.
Advanced MID Server Configuration	
MID Selection	Option to select the specific MID Server or MID Cluster. This field is automatically set to **Specific MID Server**.
MID Server	Name of the MID Server to use.

5. Select **Submit**.

What to do next

Create a Connection & Credential alias with a **Connection type** of **Kafka**.

Viewing Stream Connect Message Replication statistics

When message replications are running, the system creates a metrics record for each active topic replication every 60 seconds. Metrics records provide information about topic replications. You can view metrics records on the Message Replication Statistics [sys_sc_channel_replication_metric] table. You can also view metrics records for a topic by checking the Message Replication Statistics on its Kafka Topic Replication record.

Message Replication Statistics

Metric	Description
Collection time	Time the metric collection ended. Formatted as yyyy-MM-dd and HH:mm:ss.
Collection interval	Duration of the collection interval, given in seconds.
Channel replication	Reference to the Kafka topic replication record.
Message count	Number of messages replicated during the collection interval.
Byte count	Number of bytes replicated during the collection interval.
Lag messages	At the end of the collection interval, the number of messages remaining to be processed at the source.
Source	Name of the topic used as the source.
Destination	Name of the topic used as the destination.
Direction	Direction of the replication, either **To ServiceNow** or **From ServiceNow**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stream Connect quick start guide

This quick start guide gives you an overview of how to set up and use each of the six Stream Connect producers and consumers to exchange data between your ServiceNow instance and a Kafka environment.

Stream Connect has two producers that send data from ServiceNow to a Kafka environment.

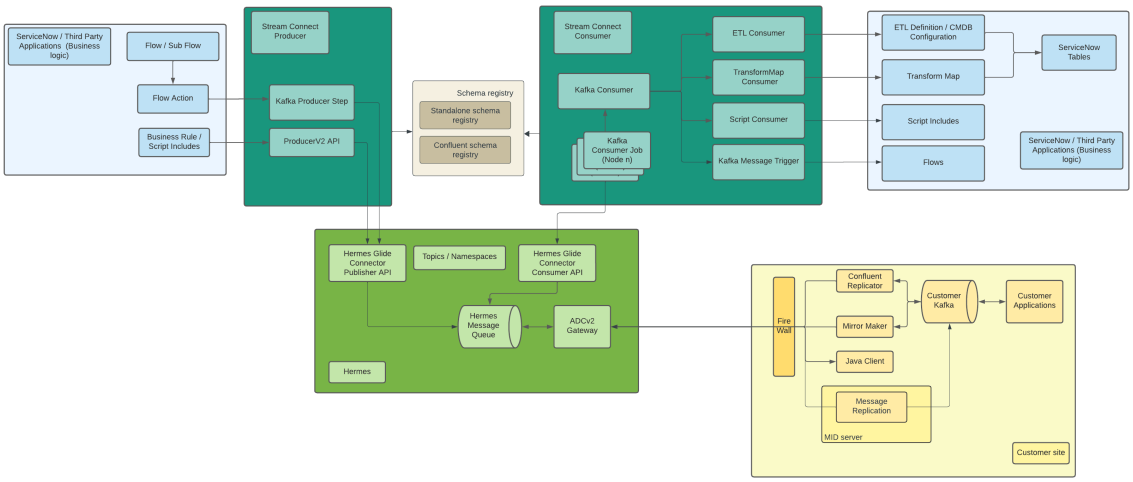
- Kafka Producer step in Workflow Studio
- ProducerV2 API

Stream Connect also has four consumers that retrieve data from a Kafka environment.

- Kafka Message trigger in Workflow Studio
- Extract Transform Load (ETL) consumer
- Transform Map consumer
- Script consumer

To link your ServiceNow instance to a Kafka environment, Stream Connect uses the Hermes Messaging Service. The following diagram shows each of the producers and consumers and how they connect to your Kafka environment, shown here as the customer site, through Hermes.

Stream Connect producers and consumers



For more information, see Using Stream Connect for Apache Kafka and the Hermes Messaging Service.

Getting started

To represent the customer site, this guide uses Apache Kafka command-line tools run in your computer. The configuration parameters used with this tool can be used to configure any client connection to the Application Delivery Controller, version 2 (ADCv2) gateway using the Kafka protocol.

All the given commands are tested with OpenSSL version (LibreSSL 2.8.3) and Apache Kafka binary distribution version kafka_2.13-3.4.0.tgz. However, all the commands should work with any version you have in your local environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Quick start steps

This quick start guide has five steps. Steps 1 and 2 cover how to set up and test a connection to Hermes. Steps 3 through 5 show you how to configure and use each of the Stream Connect producers and consumers to send and receive data.

1. The ADCv2 gateway uses mutual authentication to authenticate requests, so the first step is to create a keystore and truststore to use with your favorite Kafka client. The following page shows you how to create the required certificates: Set up a secure connection to the Hermes Messaging Service.
2. After you set up a secure connection to Hermes, verify the keystore and truststore have been correctly generated by Testing the connection to Hermes through the ADCv2 gateway.
3. Now you can Use the Kafka Message trigger and Script consumer to consume messages. The first part of this page shows you how to use the Kafka Message trigger in Workflow Studio to retrieve messages from Kafka. The second part shows you how to use the Script consumer to retrieve messages.
4. And Use the ETL and Transform Map consumers to import data. ETL definitions and transform maps specify the transformation logic to use when pulling data through scheduled imports. You can use the same ETL definitions and transform maps to transform the events received through Kafka.

   Note:
   To use the ETL consumer, you need a robust import set transformer. Likewise, to use the Transform Map consumer, you need a transform map.

5. Finally, you can Use the Kafka Producer step and the ProducerV2 API to publish messages. This page shows you how to use both the Kafka Producer step in Workflow Studio and the ProducerV2 API to push messages to Kafka.

Set up a secure connection to the Hermes Messaging Service

Secure your Kafka topics by generating a ServiceNow® instance-signed certificate.

Before you begin

Setting up the Hermes Messaging Service requires coordination with your network administrator and with your Kafka administrator. Work with your network administrator to obtain required security certificates and open the required ports. Work with your Kafka administrator to ensure that your Kafka environment is configured correctly and that your applications can connect to the Hermes Messaging Service using the standard Kafka protocol.

Make sure the following setup is in place:

- The Hermes Messaging Service is activated. See Hermes Messaging Service activation.
- The Key Management Framework plugin (com.glide.kmf.global) is activated.
- The Certificates [sys_kmf_certificate] table contains a ServiceNow instance root CA certificate.
- The instance isn't configured with a Custom URL. Custom URLs are not supported with the Instance PKI Certificate Generator.

Role required: hermes_admin, sn_kmf.cryptographic_manager, or admin

For details on assigning KMF roles, see Roles installed with Key Management Framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Certificate Generator** > **Instance PKI Certificate Generator**.
2. **Optional:** Control access to topics by configuring Access Control Lists (ACLs) at the namespace or topic-level.
   The bearer of the certificate is granted read or read/write access to the topics in the namespace or the existing topic that you selected.
3. Set up security for the Hermes Messaging Service.
   a. Navigate back to the Instance PKI Certificate Generator page.
   b. Enter a keystore password in the **Certificate Password** field.
   c. Select **Generate**.
   The system generates an instance-signed certificate in the Certificates [sys_kmf_certificate] table, creates a keystore, and creates a truststore.

   If Restricted Caller Access isn't allowed for the IPKI Certificate Generator, a cross scope access error appears. Contact Customer Service and Support for assistance with allowing Restricted Caller Access. To resolve this issue, Customer Service and Support can reference source_scope=76f9d51369115083f4ea77aab1677cc0 in the Restricted Caller Access Privileges [sys_restricted_caller_access] table.
4. Save a copy of the keystore by selecting **Download Keystore**.
5. Save a copy of the truststore by selecting **Download Truststore**.
6. Copy the keystore and truststore files to each producer and consumer client that will connect to the Hermes Messaging Service.

Result

You can now create a secure connection to the Hermes Messaging Service.

Note:
You must use the keystore that you generated using the Instance PKI Certificate Generator to connect to Hermes. Custom-generated keystores that aren't created according to the ServiceNow documentation aren't supported.

What to do next

Test the connection to Hermes through the ADCv2 gateway.

Test the connection to Hermes through the ADCv2 gateway

Verify the keystore and truststore have been correctly generated by testing the connection to Hermes through the ADCv2 gateway.

Before you begin

- Role required: integration_hub_admin
- This page is part of the Stream Connect quick start guide.
- This document covers how to test a connection to Hermes. To create the connection, see Set up a secure connection to the Hermes Messaging Service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Download and install Apache Kafka.

   a. Download the Apache Kafka binaries.

   b. Unzip the Kafka package by running the following command:

   ```
   tar -zxvf kafka_2.13-3.1.2.tgz
   ```

2. Navigate to the Kafka directory by running the following command:

   ```
   cd kafka_2.13-3.1.2
   ```

3. Configure a producer.

   a. Open the `config/producer.properties` file.

   b. Configure the following SSL properties:

   ```
   security.protocol=SSL

   ssl.truststore.password=<truststore password>

   ssl.truststore.location=<path to truststore.p12>

   ssl.truststore.type=PKCS12

   ssl.keystore.password=<keystore password>

   ssl.keystore.location=<path to keystore.p12>

   ssl.keystore.type=PKCS12

   ssl.key.password=<keystore password>
   ```

   Replace the following placeholder variables:

   - `<truststore password>` with your truststore password.
   - `<path to truststore.p12>` with the path to your truststore file.
   - `<keystore password>` with your keystore password.
   - `<path to keystore.p12>` with the path to your keystore file.

   After following steps 1 through 3, you should have downloaded Apache Kafka and configured the producer.properties correctly. All the commands given in next steps should run within the Apache Kafka home directory.

4. Copy the config/producer.properties file to config/bootcamp.properties.
   This example uses `bootcamp` as a generic name.

   ```
   cp config/producer.properties config/bootcamp.properties
   ```

5. Use the following command to list the topics.

   ```
   bin/kafka-topics.sh --list --command-config
    config/bootcamp.properties  --bootstrap-server
    <instance name>.service-now.com:4000,<instance
    name>.service-now.com:4001,<instance
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
name>.service-now.com:4002,<instance
name>.service-now.com:4003
```

Be sure to replace `<instance name>` with the name of your instance.
If there are topics in the instance, they should be listed here.

What to do next

Use the Kafka Message trigger and Script consumer to consume messages.

Use the Kafka Message trigger and Script consumer to consume messages

Retrieve messages from Hermes with the Kafka Message trigger in Workflow Studio and the Script consumer.

Before you begin

- Role required: integration_hub_admin
- This page is part of the Stream Connect quick start guide.
- This document shows you how to consume messages through your connection to Hermes. To set up and test your connection, see Set up a secure connection to the Hermes Messaging Service and Testing the connection to Hermes through the ADCv2 gateway.
- The first part of this page shows you how to use the Kafka Message trigger in Workflow Studio to consume messages. For more information about the trigger, see Create a flow with a Kafka Message trigger. For more information about Workflow Studio and configuring flows, see Workflow Studio.
- The second part of this page shows you how to use the Script consumer to consume messages. For more information, see Configure a script consumer.

Procedure

1. Create a topic to consume messages.

   a. Use the following command to create a topic in Hermes.

   ```
   bin/kafka-topics.sh --create --command-config
    config/bootcamp.properties  --bootstrap-server
    <instance name>.service-now.com:4000,<instance
    name>.service-now.com:4001,<instance
    name>.service-now.com:4002, <instance
    name>.service-now.com:4003 --topic snc.<instance
    name>.topic1
   ```

   Be sure to replace `<instance name>` with the name of your instance.

   b. To view the topic, log in to the instance and navigate to **All** > **IntegrationHub** > **Stream Connect** > **Topics**.

   Note:
   It takes approximately 10 minutes to create a topic.

2. Create a flow trigger to consume messages from the topic.

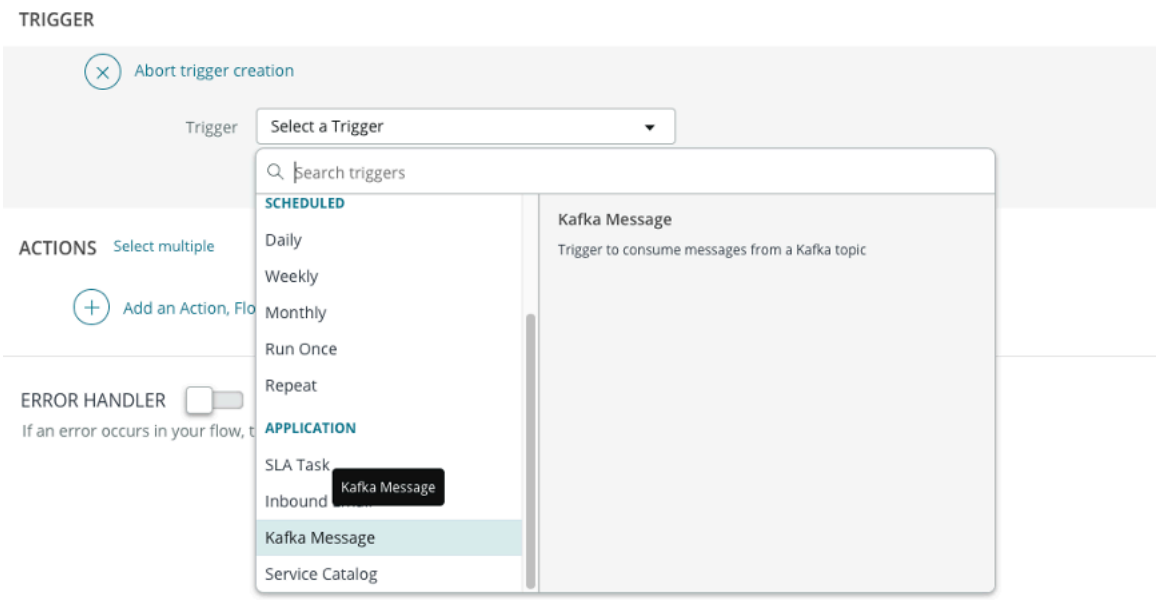
   a. Navigate to **All** > **Process Automation** > **Flow Designer**.

   b. Select **Create new** > **Flow**.

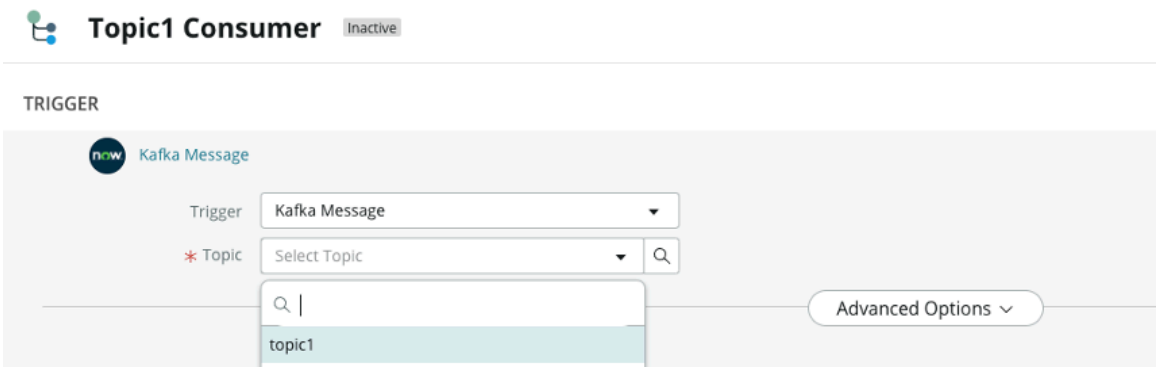
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the Flow properties form, enter a name for your flow, then enter **Submit**.
This example uses the name `Topic1 Consumer`.

d. In the trigger section, select **Add a trigger**, then select **Kafka Message** as the trigger type.



e. Select the Topic1 topic.



You can use the magnifying glass icon to see the list of available topics.

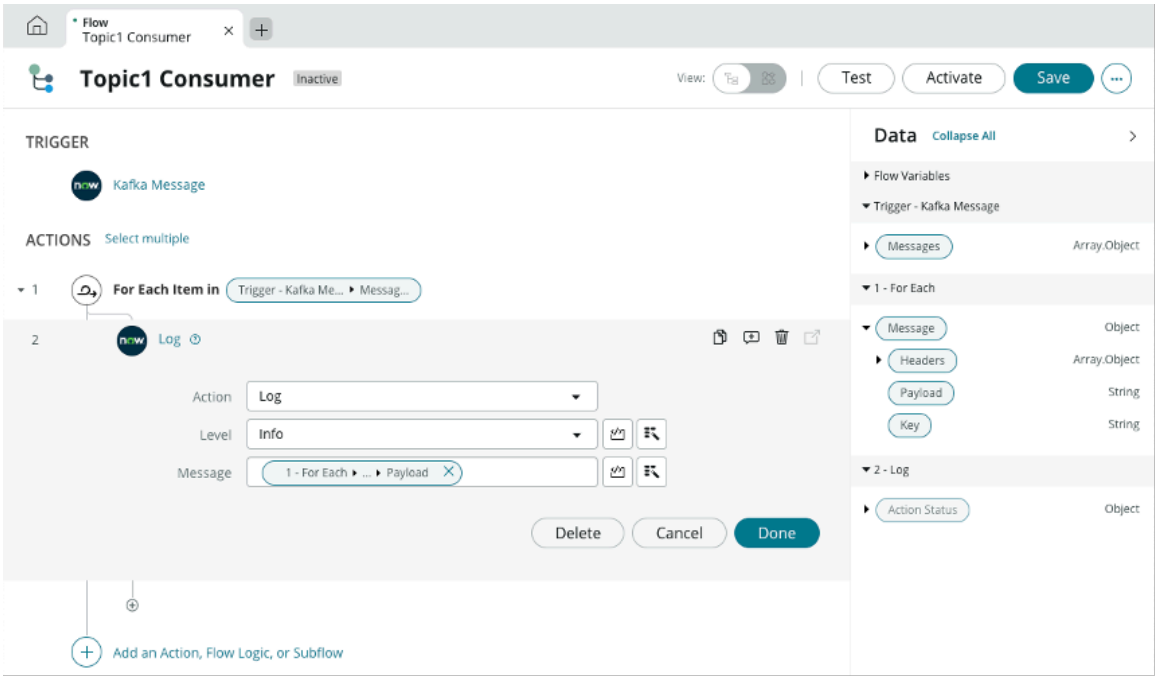
f. In the Actions section of the flow, navigate to **Add an Action, Flow Logic, or Subflow** > **Flow Logic** > **For Each**.

g. Drag the **Messages** data pill to the **Items** field, then select **Done**.

h. In the Actions section of the flow, navigate to **Add an Action, Flow Logic, or Subflow** > **Action** > **ServiceNow Core** > **Log**.

i. Drag the **Payload** data pill to the **Message** field, then select **Done**.

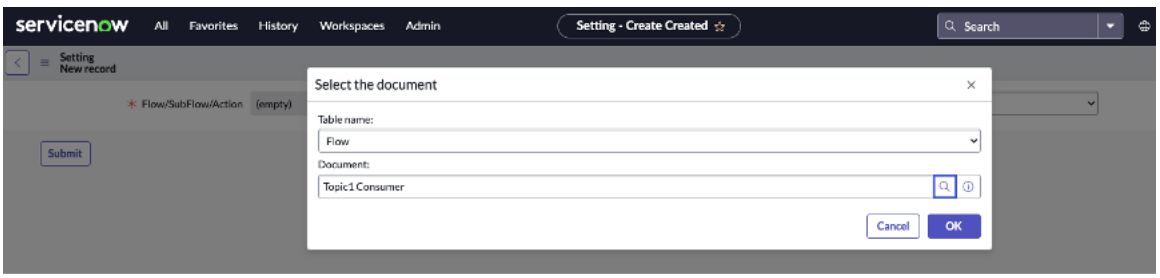
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



j. **Save** the flow trigger.

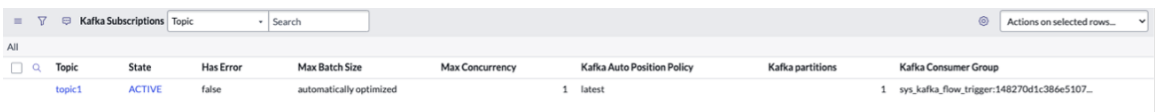
k. Go to the Settings [sys_flow_execution_setting] table to enable reporting for this flow.

l. Create a new entry and enable reporting to the flow created above.



m. Navigate back to your flow and select **Activate**.

n. To view your topic subscription, navigate to **All** > **Integration Hub** > **Stream Connect** > **Subscriptions**.



3. Publish messages to the topic using the Kafka command-line tool.

a. Run the following command to publish messages to the topic.

```
bin/kafka-console-producer.sh --topic
 snc.<instance name>.topic1  --producer.config
 config/bootcamp.properties  --bootstrap-server
 <instance name>.service-now.com:4000,<instance
 name>.service-now.com:4001,<instance
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
name>.service-now.com:4002,<instance
name>.service-now.com:4003
```

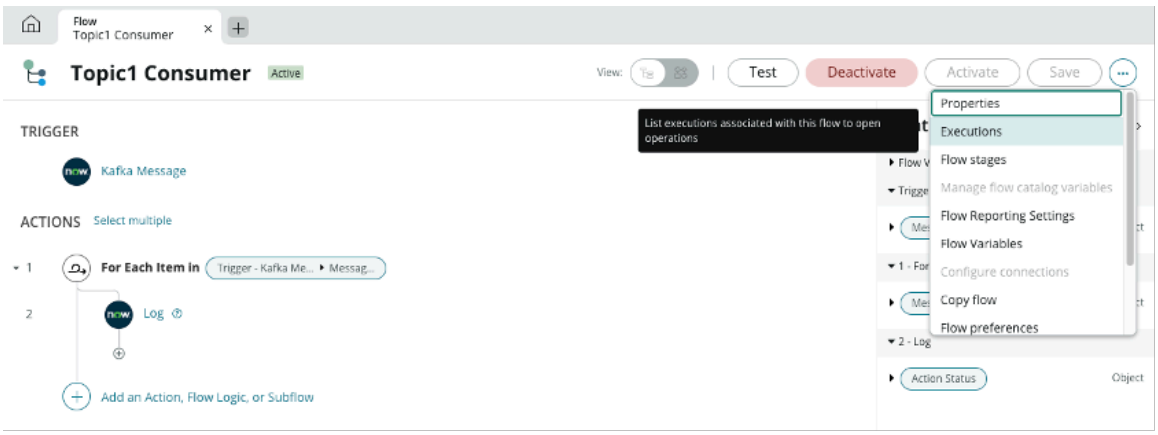
Be sure to replace `<instance name>` with the name of your instance.

This command prompts you for messages. Add a few sample messages. This example uses the following messages.

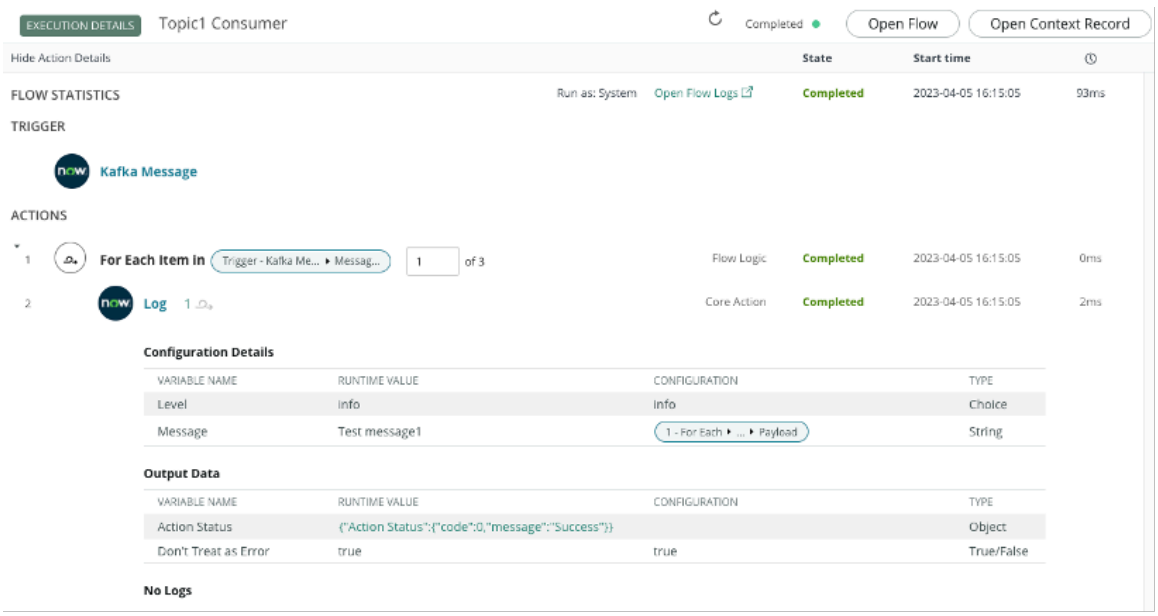
- Test message1
- Test message2
- Test message3

You should receive the messages in about a minute.

b. Navigate back to the flow and select **Executions**.

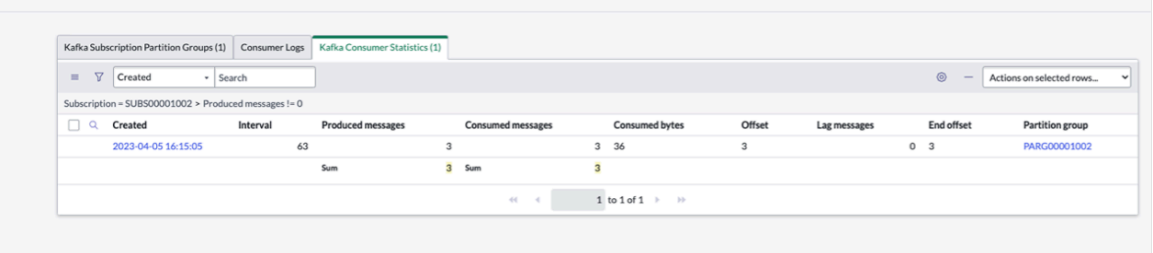


c. Open the flow execution.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. To view the statistics for this subscription, navigate to **All** > **Integration Hub** > **Stream Connect** > **Subscriptions**, open the subscription, and go to the statistics view.



4. Create a Script consumer to consume messages from the topic.

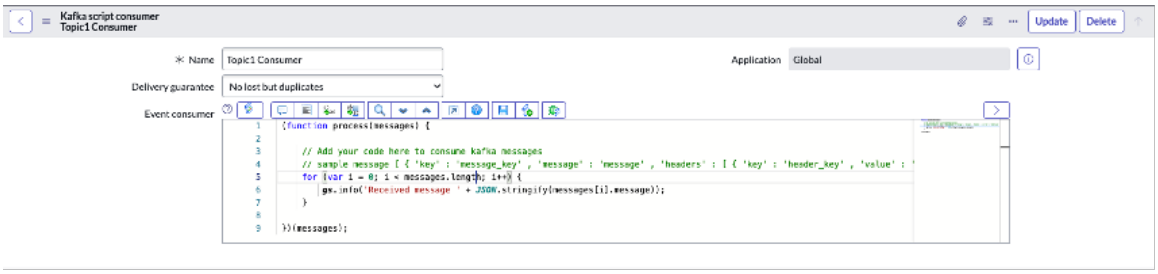
a. Navigate to **IntegrationHub** > **Consumers** > **Script Consumers**.

b. Select **New**.

c. In the **Name** field, enter a name for your script consumer.
This example uses `Topic1 Consumer`.

d. Set the script to log the message by adding the following logic in the script box.

```
for (var i = 0; i < messages.length; i++) {
      gs.info('Received message ' +
 JSON.stringify(messages[i].message));
 }
```



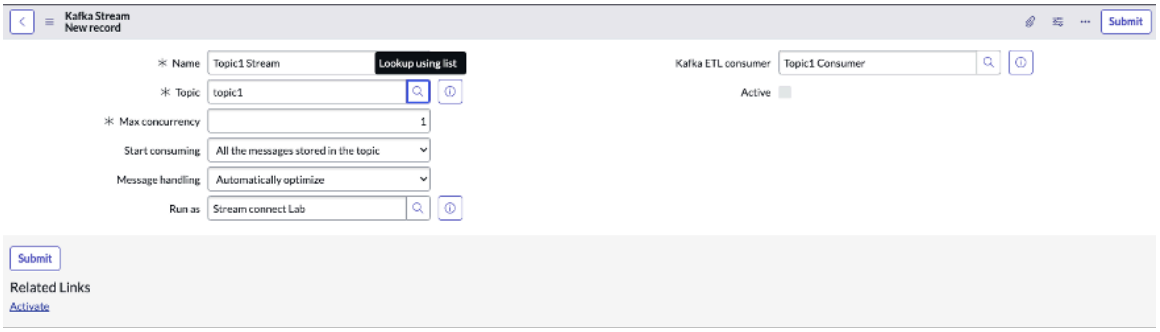
e. Save the form.

f. In the Related Links section, select **New** to add a Kafka stream to consume the messages.

g. On the Kafka Stream form, set the following field values.

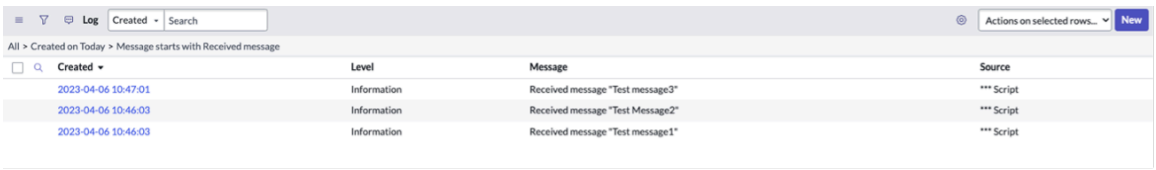
- **Name** to `Topic1 Stream`.
- **Topic** to the topic created earlier, topic1.
- **Max concurrency** to `1`.
- **Start Consuming** to **All the messages stored in the topic**. This option enables you to read the messages already published to this topic.
- **Message handling** to **Automatically optimize**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



h. Select the **Activate** link under Related Links.
You should be able to see the activated subscription.

i. To view the messages, navigate to **All** > **System logs** > **System log** and filter messages that start with Received message.



j. You should see all the messages after 1 minute.

What to do next

Use the ETL and Transform Map consumers to import data.

Use the ETL and Transform Map consumers to import data

Use ETL definitions and transform maps to process Kafka events. ETL definitions and transform maps specify the transformation logic to use when pulling data through scheduled imports. You can use the same ETL definitions and transform maps to transform the events received through Kafka.

Before you begin

- Role required: integration_hub_admin
- This page is part of the Stream Connect quick start guide.
- This document shows you how to consume messages through your connection to Hermes. To set up and test your connection, see Set up a secure connection to the Hermes Messaging Service and Testing the connection to Hermes through the ADCv2 gateway.
- The first part of this page shows you how to use the ETL Consumer to consume messages. To use the ETL consumer, you need a robust import set transformer.
- The second part of this page shows you how to use a Transform Map consumer to consume messages. To use the Transform Map Consumer, you need a transform map.

Procedure

1. Create a topic to consume ETL and transform map consumer messages.

a. Use the following command to create a topic in Hermes.
In this example, the topic name is topic2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
bin/kafka-topics.sh --create --command-config
 config/bootcamp.properties  --bootstrap-server
 <instance name>.service-now.com:4000,<instance
 name>.service-now.com:4001,<instance
 name>.service-now.com:4002, <instance
 name>.service-now.com:4003 --topic snc.<instance
 name>.topic2
```

Be sure to replace `<instance name>` with the name of your instance.

b. To view the topic, log in to the instance and navigate to **All** > **IntegrationHub** > **Stream Connect** > **Topics**.

> **Note:**
> It takes approximately 10 minutes to create a topic.

2. Create an ETL Consumer to consume data from the topic.

a. Navigate to **All** > **IntegrationHub** > **Consumers** > **ETL Consumer**.

b. Select **New**.

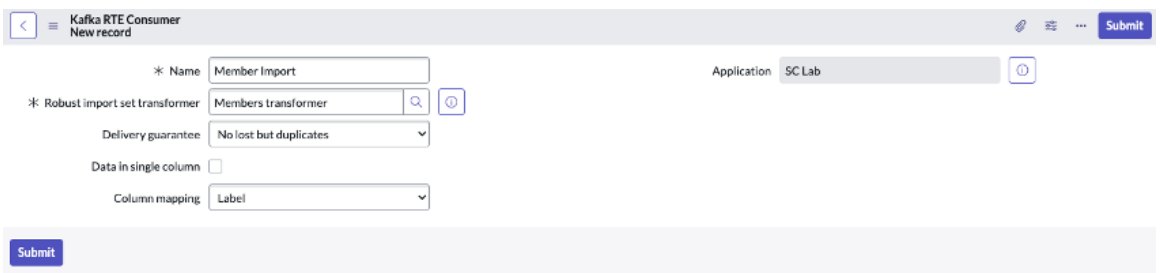
c. On the Kafka Consumer form, enter a name in the **Name** field.
This example uses the name Member Import.

d. For the **Robust import set transformer** filed, select an existing Robust import set transformer.
For the robust import set transformer, select one that is not using the option to store data in a single column. To be able to see the messages, make sure the robust import set transformer has the **Verbose** option enabled.

e. Deselect the **Data in single column** option.
This option should only be selected for import set tables with data in a single column.

f. Set the **Column mapping** to **Label**.

This means the input message's JSON keys are mapped to the column labels of the Import Set table.



g. Save the form.

h. Create a Kafka stream for the consumer.

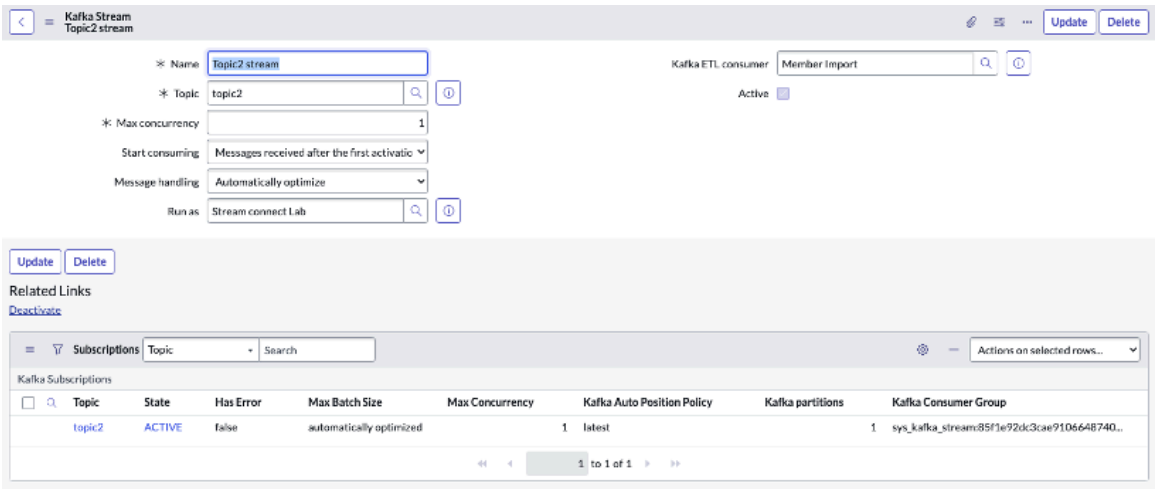
i. On the Kafka Stream form, set the following field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Name** to `Topic2 Stream`.
- **Topic** to the topic created earlier, topic2.
- **Max concurrency** to `1`.
- **Start Consuming** to **Messages received after the first activation**.
- **Message handling** to **Automatically optimize**.

j. Select the **Activate** link under Related Links.

You should be able to see the activated subscription.



3. Publish messages to topic2.

a. Run the following command to publish messages to topic2.

```
bin/kafka-console-producer.sh --topic
 snc.<instance name>.topic2  --producer.config
 config/bootcamp.properties  --bootstrap-server
 <instance name>.service-now.com:4000,<instance
 name>.service-now.com:4001,<instance
 name>.service-now.com:4002,<instance
 name>.service-now.com:4003
```

Be sure to replace `<instance name>` with the name of your instance.

This command prompts you for messages.

b. Send the following JSON message.

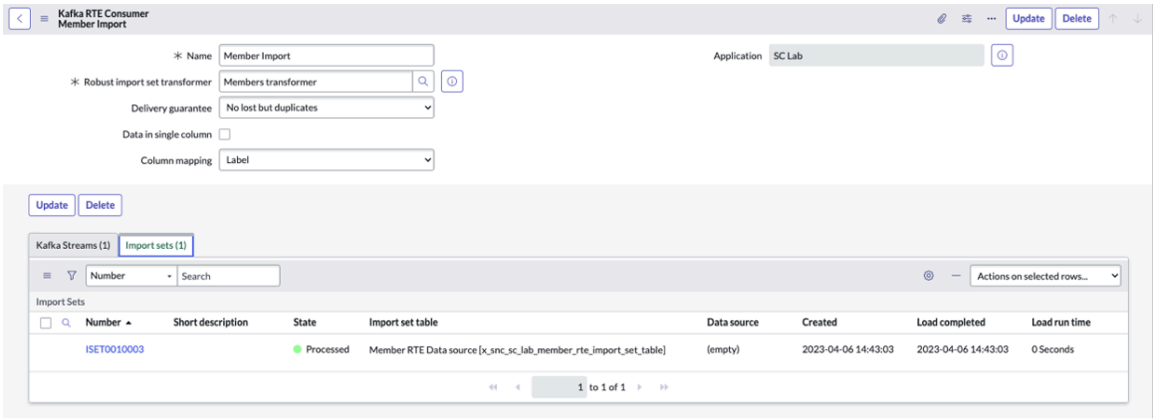
```
{"city":"San
 Diego","name":"Jhon","id":"SN001","state":"California"}
```

You can send this message with any values, but the JSON message key should match the Import Set table labels.

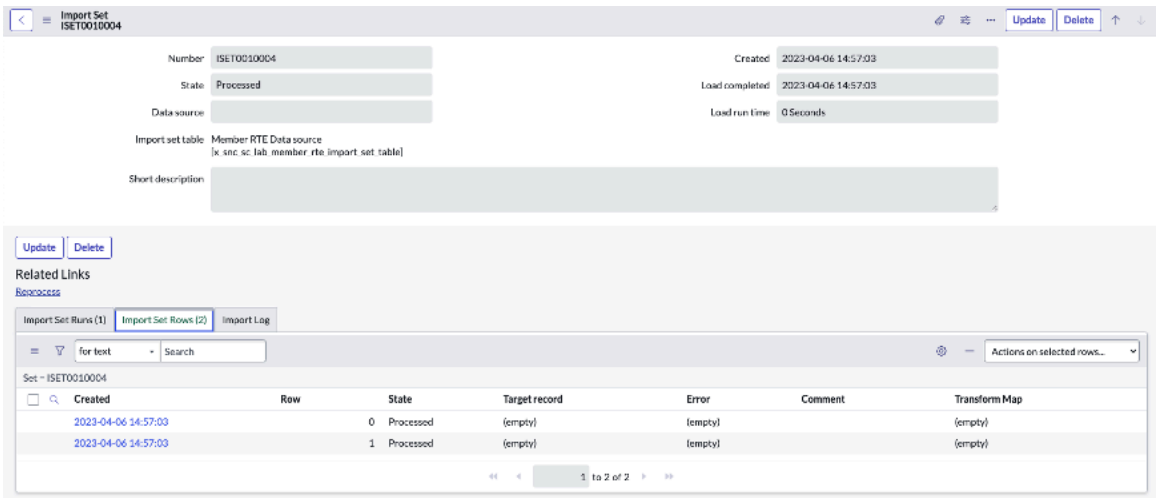
c. Navigate back to the ETL Consumer you created.

After about one minute, the data should have been imported through the import set.

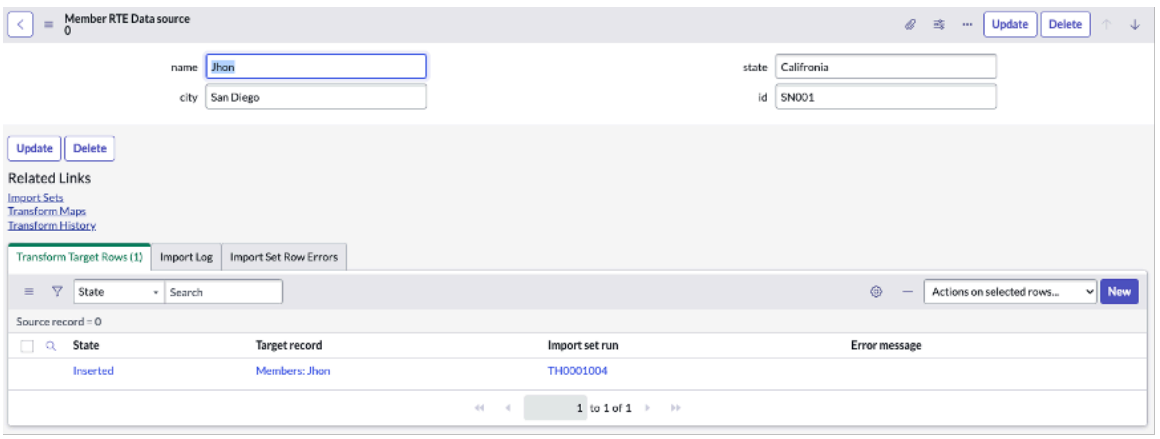
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. To view detailed information about the import set, select the import set number.



e. To view detailed information about an import set row, select the import set row number.



4. Create a Transform Map Consumer to consume data.

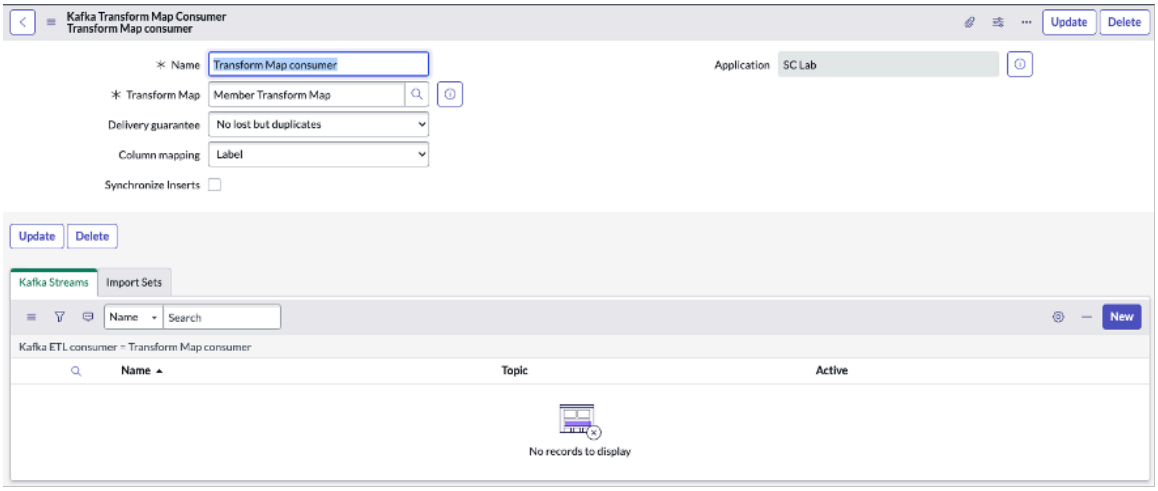
a. Navigate to **All** > **IntegrationHub** > **Consumers** > **Transform Map Consumer**.

b. Select **New**.

c. On the Kafka Transform Map Consumer form, enter a name in the **Name** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. For the **Transform Map** field, select an existing transform map.



e. Save the form.

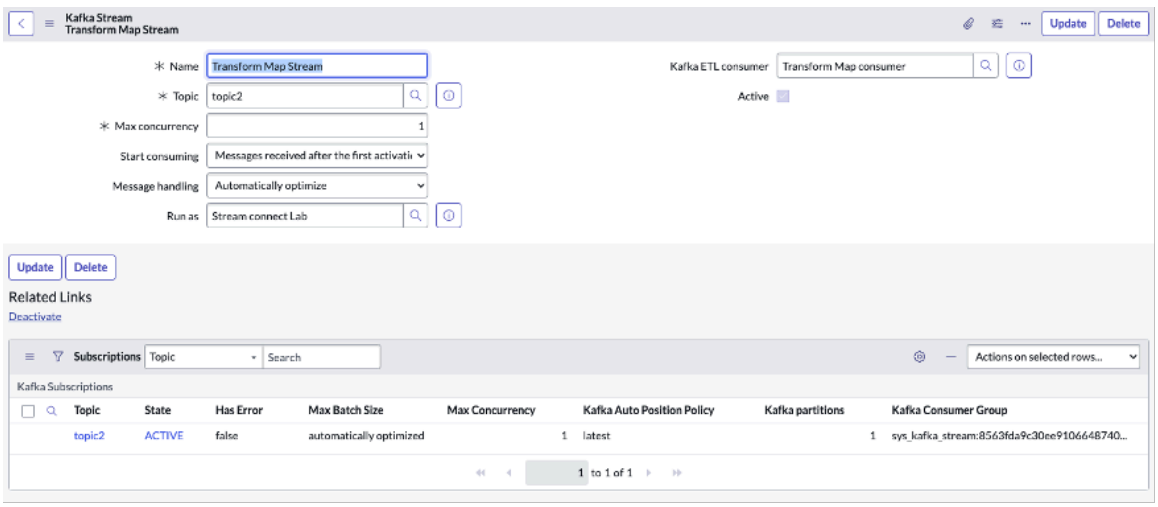
f. Create a Kafka stream for the consumer.

g. On the Kafka Stream form, set the following field values.

- **Name** to `Transform Map Stream`.
- **Topic** to the topic created earlier, topic2.
- **Max concurrency** to `1`.
- **Start Consuming** to **Messages received after the first activation**.
- **Message handling** to **Automatically optimize**.

h. Select the **Activate** link under Related Links.

You should be able to see the activated subscription.



5. Publish messages to topic2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Run the following command to publish messages to topic2.

```
bin/kafka-console-producer.sh --topic
 snc.<instance name>.topic2  --producer.config
 config/bootcamp.properties  --bootstrap-server
 <instance name>.service-now.com:4000,<instance
 name>.service-now.com:4001,<instance
 name>.service-now.com:4002,<instance
 name>.service-now.com:4003
```

Be sure to replace `<instance name>` with the name of your instance.

This command prompts you for messages.

b. Send the following JSON message.

```
{"city":"San
 Diego","name":"Jhon","id":"SN001","state":"California"}
```

You can send this message with any values, but the JSON message key should match the Import Set table labels.

c. Go to the Transform Map Consumer you created.
After about one minute, the data should have been imported through the import set.

d. To view detailed information about the import set, select the import set number as in step 3d above.

What to do next

Use the Kafka Producer step and the ProducerV2 API to publish messages.

Use the Kafka Producer step and the ProducerV2 API to publish messages

Push data from ServiceNow to Hermes so that the Kafka consumers can read them.

Before you begin

- Role required: integration_hub_admin
- This page is part of the Stream Connect quick start guide.
- This document shows you how to publish messages through your connection to Hermes. To set up and test your connection, see Set up a secure connection to the Hermes Messaging Service and Testing the connection to Hermes through the ADCv2 gateway.
- The first part of this page shows you how to use the Kafka Producer step in Workflow Studio to publish messages to Hermes. For more information about the step, see Kafka Producer step.
- The second part of this page shows you how to use the ProducerV2 API to publish messages. For more information, see ProducerV2 API.
- To receive all the messages, you need to run two consumers for different datacenters. See Consume test messages from a Hermes topic using the Kafka client for details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Start two consumers to receive messages.

   a. Run the following commands from the command line to receive the messages.

```
bin/kafka-console-consumer.sh --consumer.config
 config/bootcamp.properties --topic snc.<instance
 name>.topic1 --group snc.<instance name>.consumer_group1
 --from-beginning --bootstrap-server <instance
 name>.service-now.com:4100,<instance
 name>.service-now.com:4101,<instance
 name>.service-now.com:4102,<instance
 name>.service-now.com:4103
```

```
bin/kafka-console-consumer.sh --consumer.config
 config/bootcamp.properties --topic snc.<instance
 name>.topic1 --group snc.<instance name>.consumer_group1
 --from-beginning --bootstrap-server <instance
 name>.service-now.com:4200, <instance
 name>.service-now.com:4201, <instance
 name>.service-now.com:4202, <instance
 name>.service-now.com:4203
```

   Be sure to replace `<instance name>` with the name of your instance.

2. Publish messages from the instance using a flow step.

   a. Navigate to **All** > **Process Automation** > **Flow Designer**.

   b. Create a new action by selecting **Create new** > **Action**.

   c. In the Action properties form, give your action a name, then select **Submit**.
   This example uses the name Message Publisher.

   d. Add a **Kafka Producer** step to the action.

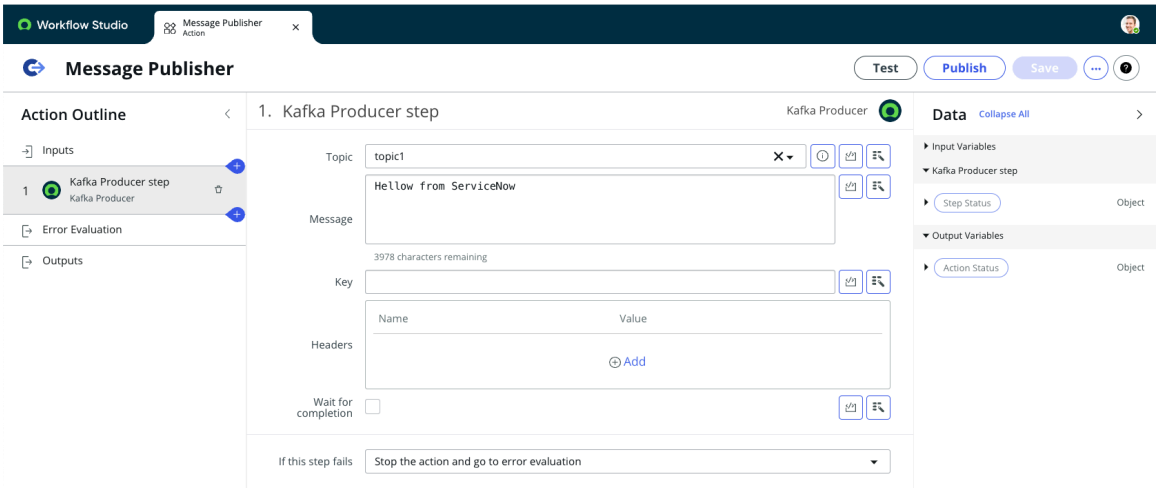
   To add an action step, select the plus sign between the **Inputs** and **Error Evaluation** in the Action Outline.

   e. In the step, set the **Topic** field to `topic1`.

   f. In the **Message** field, enter a message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You don't need to change any other fields.



g. Select **Save** to save the action.

h. Select the **Test** button to test the action.
Testing the action publishes the message to the topic.

i. To view the message, go to the command-line consoles created in step 1.
The message should be present in one of the terminals.

3. Publish messages from the instance using a script.

a. Run the following script using the scripts background to publish messages to this topic from the instance.

```
var producer = new sn_ih_kafka.ProducerV2();
producer.send('<sys id of the topic record>',
 gs.generateGUID(), 'Test message from ServiceNow', false,
 null);
```

Be sure to replace `<sys id of the topic record>` with the sys_id of the topic record.

b. To view the message, go to the command-line consoles created in step 1.
The message should be present in one of the terminals.

Stream Connect alerting

Receive alerts and alert notifications for Stream Connect integrations.

Stream Connect uses both active and scheduled monitoring to detect events across multiple Stream Connect components. If an issue is detected, the system creates an alert, logs a message to the Stream Connect Log, and sends out an alert notification.

Alerts

Stream Connect uses both event-type alerts and threshold alerts. Each type of alert has a set of alerting properties that specify how to handle the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event-type alerts (or real-time alerts) are created when there's an error in a Stream Connect component. For example, when a producer is unable to write to a topic, or a consumer is unable to read from a topic. These alerts are built into to the code and use the alerting properties to determine the severity level and when to send a notification. Event-type alerts are detected through active monitoring which uses various mechanisms to detect events across multiple Stream Connect components. The system caches the configuration and detects the events when they occur.

- Threshold alerts are created when a value transitions from below the threshold to at or above the threshold. For example, when the lag on a topic goes beyond a certain number of messages, or the processing time of the messages in a topic is above a specified value. When a threshold alert decreases from at or above a threshold to below it, the active flag on the alert is set to false. Threshold alerts are detected through scheduled monitoring, where a scheduled job runs scripted checks on Stream Connect integrations. An alert is generated for thresholds that meet the alert configuration specified by the alerting properties.

For a list and description of the alerts, or to configure alerting properties, see Stream Connect Alerting properties. You must have the Kafka Admin role to view or modify alerting properties.

Alert table

When an alert is triggered for the first time, an Alert [sys_sc_alert] record is added to the Stream Connect Alerts [sys_sc_alerts] table. If the same alert is triggered again, and the original alert record is still active, the record's **Last Detections [last_detection]** field is updated. If the original alert record is not active, a new record is added to the alerts table. An alert record is deactivated when the alert has not been triggered for a specified amount of time. This time interval varies depending on the type of alert and can be modified in the Stream Connect Alerting properties UI.

The Stream Connect alerts table shows if an alert is active and the alert's severity level, type, and updated date. It also displays:

- An alert's **Number**, which references the alert record. Each alert record contains detailed information about the alert, including the name of the affected component, the severity level, and the timestamp.
- An alert's **Affected Entity**, which references the target for an alert, for example, a Kafka Stream or a Kafka Flow Trigger.

You can view the Stream Connect Alerts table by navigating to **Integration Hub** > **Stream Connect** > **Alerts**.

Alerts are available for 30 days. A table cleaner job handles the retention period for the Stream Connect alerts table. Active alerts are deactivated if they don't reoccur within a specified duration. The duration is configured per alert type in the Stream Connect Alerting properties.

Alert logs

Log messages for Stream Connect alerts are written to the Stream Connect Log [sys_consumer_log]. This log has an Alert [sc_alert] field that references the associated Stream Connect Alert record.

Logs are available for 30 days. The log retention period is determined by the table rotation schedule for the Stream Connect Log.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notifications

Receive alert notifications via email, SMS, or the ServiceNow® mobile app. Notifications contain detailed alert information, including the alert number, level, and a description.

When an alert is triggered, a notification is also triggered, unless a notification for that same alert was recently triggered. Each alert has a time interval property that specifies the amount of time, in seconds, required between alert detections to have the detections count as two separate alerts. A notification is only triggered if the time since the last notification is greater than that time interval or, in the case of threshold-based alerts, if the severity for the alert has increased since the last detection. This helps ensure that you don't receive multiple rapid notifications for the same alert. The time interval property for each alert can be modified from the Stream Connect Alerting properties UI.

Administrators can configure notification settings based on alert types, user preferences, and alert severity levels. There are three alert severity levels in the Notifications [sysevent_email_action] table.

- Stream Connect Alert - INFO
- Stream Connect Alert - WARNING
- Stream Connect Alert - CRITICAL

You can opt in to different levels using the standard system notification capabilities on the platform. Administrators can also configure notification debounce settings, including the time interval and criteria for consolidating alerts. For notification details, see Notifications.

Notifications are sent to users who are members of the Stream Connect Alert Notifications group. The Stream Connect Alert Notifications group members inherit the Stream Connect Alert Viewer role so that everyone who receives notifications can use the link in the notification to see the alert record.

Roles

To view Stream Connect Alerts, you must have the Kafka Admin role or the Stream Connect Alert Viewer role.

- The Kafka Admin [kafka_admin] role can view Stream Connect alert records and logs, configure Stream Connect Alerting properties, and configure alert notification settings.
- The Stream Connect Alert Viewer [stream_connect_alert_viewer] role has read-only access to Stream Connect alert records and logs.

ACLs and domain separation

ACLs on the Stream Connect Alerts table enable a user with the Stream Connect Alert Viewer role to view the alerts table and the reports on that table. Users without that role can't read or report on that table. Only users with the Kafka Admin role can insert and update records on that table. ACLs make the Stream Connect Alerting properties page available only to Kafka Admins.

On a domain-separated instance, the properties that govern alerts can be overridden on a per-domain basis. See Domain separation application properties for details.

The domain used to look up properties is the domain of the topic or consumer. The Stream Connect Alerting properties UI for setting properties sets the global properties, not domain-specific overrides. There's no UI for setting domain-specific overrides. The sys_domain of the Stream Connect Alerts table should be the same as the domain of the consumer that triggered it, for consumer alerts, or the domain for the sys_kafka_topic record for producer alerts. For alerts where a consumer or topic isn't known, the sys_sc_alert domain is set to global.

Plugin

Stream Connect alerting requires the ServiceNow Stream Connect Alerting [com.glide.hub.stream_connect.alerting] plugin. This plugin is automatically activated when the ServiceNow Stream Connect Installer[com.glide.hub.stream_connect.installer] plugin is activated.

Stream Connect Alerting properties

Specify alert properties and how alerts are managed in Stream Connect.

Alerts

To view Stream Connect Alerting properties, navigate to **Integration Hub** > **Stream Connect** > **Alert Properties**. You must have the Kafka Admin role to view or modify alerting properties.

The Stream Connect Alerting UI has the following alerts.

- Producer Failed Alert. Triggered when a producer fails to produce messages to a topic.
- Queue Depth Processing Time Alert. Triggered when the estimated message processing time exceeds the specified value.
- Consumer Poll Failed Alert. Triggered when a consumer is unable to connect to a topic or read the messages in a topic. For example, if a topic is deleted from Hermes while the associated subscription is still active.
- Consumer Processing Alert. Triggered when a consumer fails to process messages from a topic.
- Topic Replication Failed Age Alert. Triggered when the topic replication status remains FAILED for longer than the specified value.
- Topic Replication Inactivity Alert. Triggered when topic replication is inactive for longer than the specified value.

Producer Failed Alert

Alert level	Severity level for the alert. The options are: • IGNORED • INFO • WARNING • CRITICAL Default: CRITICAL
Time interval, in seconds, required between two detections to have them count as separate events.	The minimum number of seconds to wait before sending another notification for the same alert. Detections within this time interval count as a single alert and are linked to the same alert record. Default: 3600 seconds

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Producer Failed Alert (continued)

Specifies the number of separate notifications to send when there's a Producer Failed Alert for multiple topics. Select **Global** to receive a single notification, or **Per Topic** to receive a notification for each topic.	Select **Per Topic** to create an alert for each topic, or **Global** to create one alert for all topics. Default: Global

Queue Depth Processing Time Alert

Threshold, in seconds, for the queue depth processing time estimate to be considered info.	If the estimated queue processing time is greater than this value, generate an alert with a severity of INFO. Default: 0 seconds A value of 0 disables the alert at the specified severity level. To completely disable the alert, set the value to 0 for all three severity levels (INFO, WARNING, and CRITICAL).
Threshold, in seconds, for the queue depth processing time estimate to be considered a warning.	If the estimated queue processing time is greater than this value, generate an alert with a severity of WARNING. Default: 14400 seconds
Threshold, in seconds, for the queue depth processing time estimate to be considered critical.	If the estimated queue processing time is greater than this value, generate an alert with a severity of CRITICAL. Default: 86400 seconds
Time interval, in seconds, required between two detections to have them count as separate events.	The minimum number of seconds to wait before sending another notification for the same alert. Detections within this time interval count as a single alert and are linked to the same alert record. Default: 3600 seconds
Specifies the number of separate notifications to send when there's a Queue Depth Alert for multiple consumers. Select **Global** to receive a single notification, or **Per Consumer** to receive a notification for each consumer.	Select **Per Consumer** to create an alert for each consumer, or **Global** to create one alert for all consumers. Default: Global

Consumer Poll Failed Alert

Alert level	Severity level for the alert. The options are: • IGNORED • INFO • WARNING • CRITICAL Default: CRITICAL
Time interval, in seconds, required between two detections to have them count as separate events.	The minimum number of seconds to wait before sending another notification for the same alert. Detections within this time interval count as a single alert and are linked to the same alert record. Default: 3600 seconds
Specifies the number of separate notifications to send when there's a Consumer Poll Failed Alert for multiple consumers. Select **Global** to receive a single notification, or **Per Consumer** to receive a notification for each consumer.	Select **Per Consumer** to create an alert for each consumer, or **Global** to create one alert for all consumers. Default: Global

Consumer Processing Alert

Alert level	Severity level for the alert. The options are: • IGNORED • INFO • WARNING • CRITICAL Default: WARNING
Time interval, in seconds, required between two detections to have them count as separate events.	The minimum number of seconds to wait before sending another notification for the same alert. Detections within this time interval count as a single alert and are linked to the same alert record. Default: 3600 seconds

Consumer Processing Alert (continued)

Specifies the number of separate notifications to send when there's a Consumer Processing Alert for multiple consumers. Select **Global** to receive a single notification, or **Per Consumer** to receive a notification for each consumer.	Select **Per Consumer** to create an alert for each consumer, or **Global** to create one alert for all consumers. Default: Per Consumer

Topic Replication Failed Age Alert

Threshold, in seconds, for the topic replication failed age estimate to be considered info.	If the topic replication status remains FAILED for longer than this value, generate an alert with a severity of INFO. Default: 0 seconds A value of 0 disables the alert at the specified severity level. To completely disable the alert, set the value to 0 for all three severity levels (INFO, WARNING, and CRITICAL).
Threshold, in seconds, for the topic replication failed age estimate to be considered a warning.	If the topic replication status remains FAILED for longer than this value, generate an alert with a severity of WARNING. Default: 1800 seconds
Threshold, in seconds, for the topic replication failed age estimate to be considered critical.	If the topic replication status remains FAILED for longer than this value, generate an alert with a severity of CRITICAL. Default: 3600 seconds
Time interval, in seconds, required between two detections to have them count as separate events.	The minimum number of seconds to wait before sending another notification for the same alert. Detections within this time interval count as a single alert and are linked to the same alert record. Default: 3600 seconds
Specifies the number of separate notifications to send when there's a Topic Replication Failed Alert for multiple topic replications. Select **Global** to receive a single notification, or **Per Topic Replication** to receive a notification for each topic replication.	Select **Per Topic Replication** to create an alert for each topic replication, or **Global** to create one alert for all topic replications. Default: Global

Topic Replication Inactivity Alert

Threshold, in seconds, for the topic replication inactivity estimate to be considered info.	If topic replication is inactive for longer than this value, generate an alert with a severity of INFO. Default: 14400 seconds
Threshold, in seconds, for the topic replication inactivity estimate to be considered a warning.	If topic replication is inactive for longer than this value, generate an alert with a severity of WARNING.
Threshold, in seconds, for the topic replication inactivity estimate to be considered critical.	If topic replication is inactive for longer than this value, generate an alert with a severity of CRITICAL.
Time interval, in seconds, required between two detections to have them count as separate events.	The minimum number of seconds to wait before sending another notification for the same alert. Detections within this time interval count as a single alert and are linked to the same alert record. Default: 3600 seconds
Specifies the number of separate notifications to send when there's a Topic Replication Inactivity Alert for multiple replications. Select **Global** to receive a single notification, or **Per Topic Replication** to receive a notification for each topic replication.	Select **Per Topic Replication** to create an alert for each topic replication, or **Global** to create one alert for all topic replications. Default: Per Topic Replication

Using the Stream Connect Dashboard

View detailed statistics for your Stream Connect integrations. Manage producers and consumers, and create or edit topics and replicators with the ServiceNow® Stream Connect dashboard.

The Stream Connect Dashboard combines several capabilities into a single environment, so you can:

- Manage multiple Stream Connect integrations through a single application.
- Gain insights into how your integrations use and process data with detailed charts, lists, and statistics.
- Edit topics, producers, consumers, and replicators through a simplified interface.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Workflow Data Fabric subscription

This application requires a Workflow Data Fabric subscription and a Stream Connect subscription. For more information, see https://www.servicenow.com/now-platform/workflow-data-fabric.html.

Stream Connect Dashboard organization

To view the dashboard, navigate to **All** > **Integration Hub** > **Stream Connect** > **Stream Connect Home**.

The dashboard has the following components.

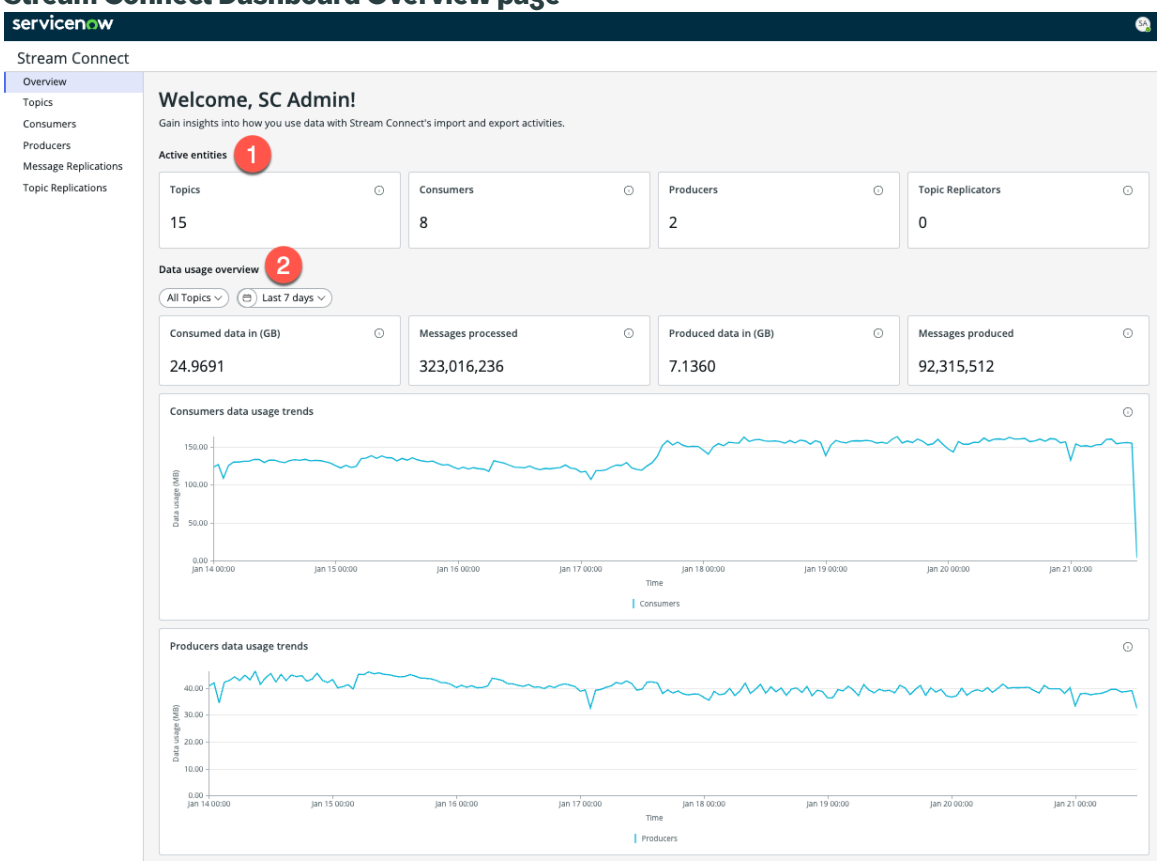
- Overview section
- Topics
- Consumers
- Producers
- Message Replications
- Topic Replications

The following sections explain each component in greater detail.

Overview section

View detailed information about your Stream Connect integrations.

Stream Connect Dashboard Overview page



The Overview has these components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Active entities section

Displays the number of topics, consumers, producers, and topic replicators created.

2. Data usage overview

Displays the following charts.

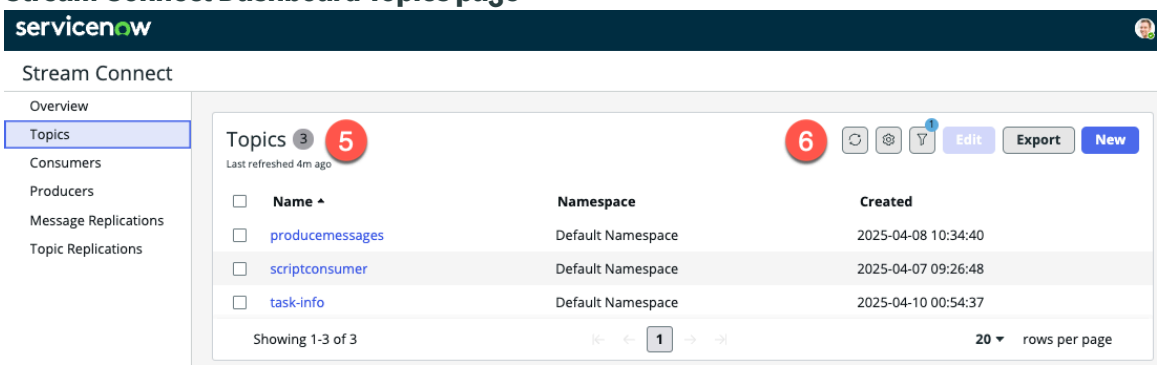
- Consumed data: The total amount of data consumed (in GB).
- Messages processed: The total number of processed messages.
- Produced data: The total number of data produced (in GB).
- Messages produced: The total number of produced messages.
- Consumers data usage trends: The amount of data (in MB) consumers used over the last seven days.
- Producers data usage trends: The amount of data (in MB) producers used over the last seven days.

You can view data for a single, selected topic, or for **All Topics** combined. You can also organize the data by time, viewing data for the **Last 24 hours**, **Last 2 days**, **Last 7 days**, or by setting a **Custom range**.

Topics

View topics and add, edit, or export a topic.

Stream Connect Dashboard Topics page



The Topics page has the following components.

3. Topics list

Displays all topics and each topic's name, namespace, and the date it was created.

4. Action buttons

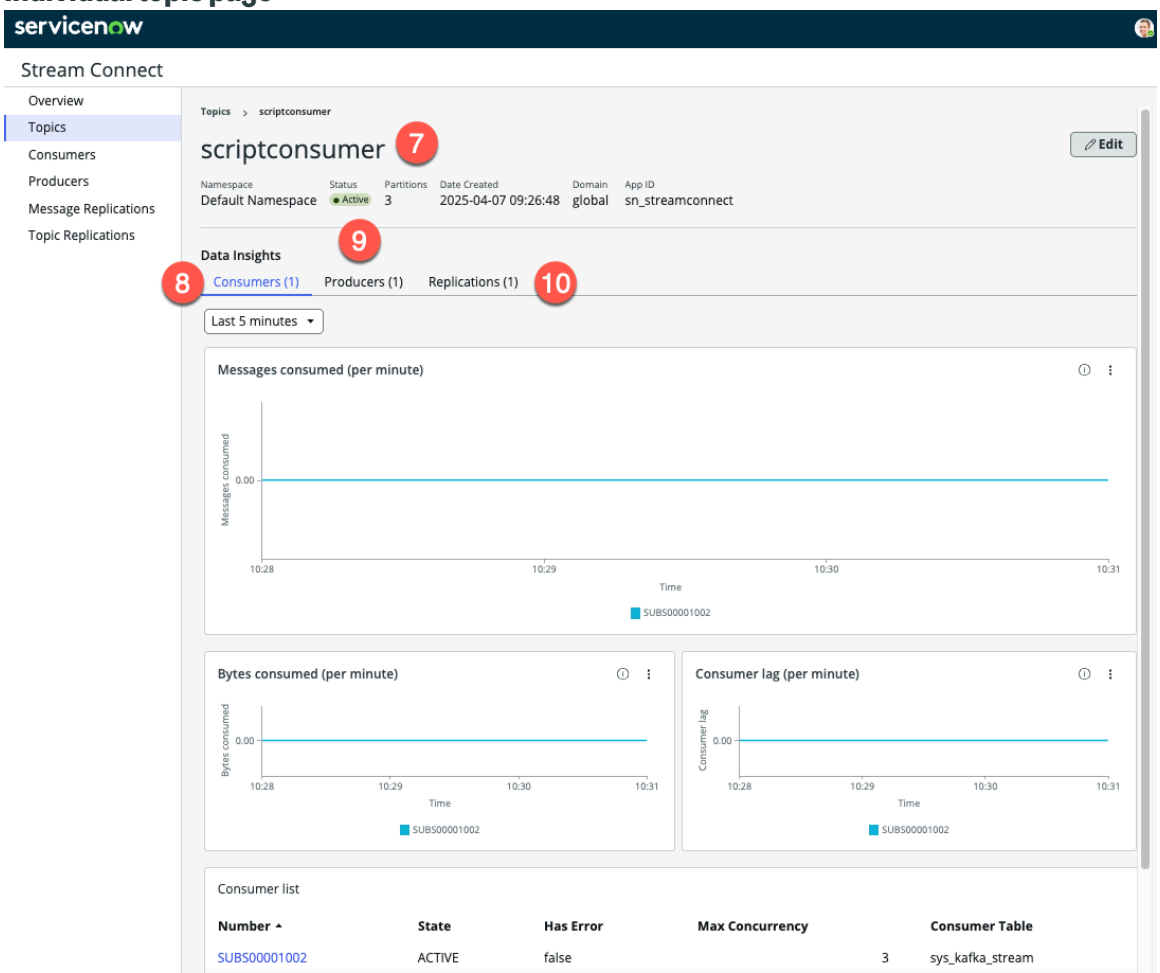
Contains several buttons that you can use to perform different tasks. Refresh the list of topics, edit the list columns or reset the column widths, and view or edit the list filters. There are also buttons to **Edit** a topic, **Export** a topic, and create a **New** topic.

- To edit a topic, select the topic from the list, select the **Edit** button, then fill in the fields on the Edit Kafka Topic form.
- To create a new topic, select **New**, then fill in the fields on the Create New Kafka Topic form.

You can select a topic from the list to view detailed information for that topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Individual topic page



Each individual topic page also has the following components.

5. Topic information section

Displays details about the topic, including its name, namespace, status, number of partitions, date created, domain, and app ID. There's also an **Edit** button so you can edit the topic directly from this page.

6. Consumers tab in the Data Insights section

Displays the following charts.

- Messages consumed (per minute): The total number of messages consumed by consumers in the selected topic.
- Bytes consumed (per minute): The total number of bytes consumed.
- Consumer lag (per minute): The consumer lag in this topic group, by consumer.

All three charts can be filtered to display data for the **Last 5 minutes**, **Last hour**, or **Last 24 hours**. When the **Last 24 hours** is selected, the data is displayed in five minutes increments instead of every minute.

The Consumers tab also has a Consumer list, which lists the consumers associated with the topic. Each consumer is listed with its number, state, error status, max concurrency, and consumer table. You can select the consumer number to view additional details for that consumer.

7. Producers tab in the Data Insights section

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Producers tab displays the following charts.

- Messages Produced: The total number of messages produced. Updated hourly.
- Bytes Produced in (bytes): The total number of bytes produced. Updated hourly.

Both charts can be filtered to display data for the **Last 2 days**, **Last 7 days**, **Today**, **Yesterday**, or a **Custom range**.

The Producers tab also has a Producer list, which lists the producers associated with the topic, and each producer's name, type, Id, table, and domain. You can select a producer to view additional details.

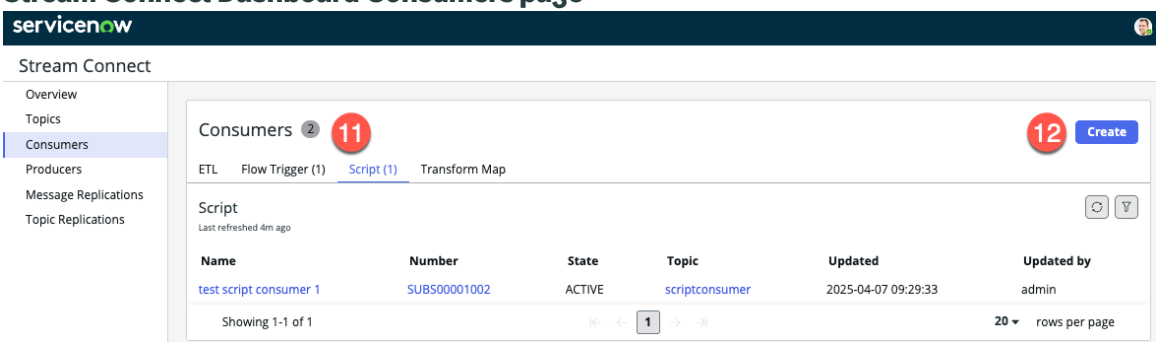
8. Replications tab in the Data Insights section

Displays the topic replications associated with the topic, and each replication's name, topic name, direction, status, whether it's active, and error message. You can select the replication name to view additional details for that topic replication.

Consumers

View and manage consumers.

Stream Connect Dashboard Consumers page



The Consumers page has the following components.

9. Consumer list

Displays all consumers, organized by type. The possible types are:

- ETL
- Flow Trigger
- Script
- Transform Map

Each consumer is listed with its name, number, state, associated topic, date updated, and who updated it.

10. Create button

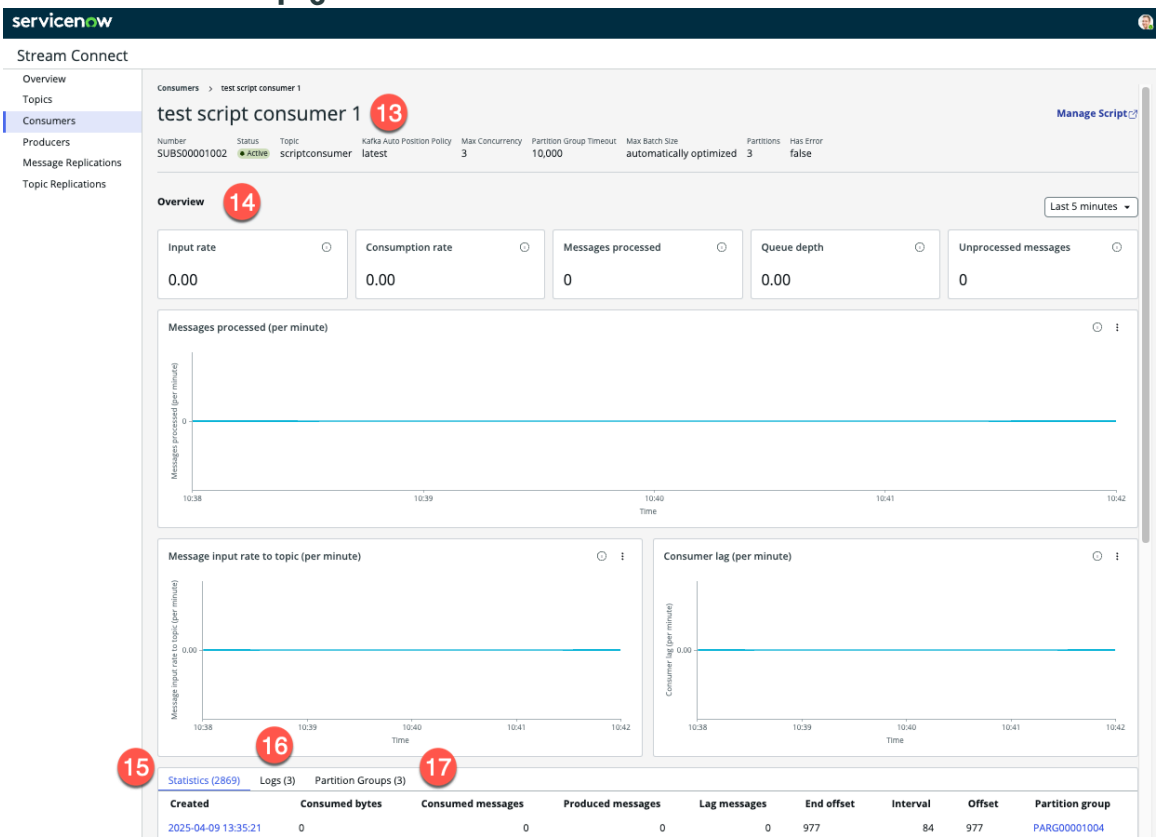
To **Create** a new consumer, select this button, then select the type of consumer you want to create, then fill in the fields on the consumer's form. For form field descriptions, see the ETL consumer, Transform Map consumer, or Script consumer page.

> **Note:**
> If you're creating a Flow Trigger consumer, there isn't a form to fill out. Instead, the dashboard opens Workflow Studio so you can build your flow trigger there. For a detailed guide, see Create a flow with a Kafka Message trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can select a consumer from the list to view detailed information for that consumer.

Individual Consumer page



Each individual consumer page has the following components.

11. Consumer information section

Displays details about the consumer, including its number, status, associated topic, Kafka auto position policy, max concurrency, partition group timeout, max batch size, partitions, and an error flag.

12. Overview

Displays the consumer's input and consumption rate, messages processed, queue depth, and any unprocessed messages. It also displays the following charts.

- Messages processed (per minute): The total number of processed messages.
- Message input to topic (per minute): The total number of messages input to the topic.
- Consumer lag (per minute): The lag for the selected consumer.

All three charts can be filtered to display data for the **Last 5 minutes**, **Last hour**, or **Last 24 hours**. When the **Last 24 hours** is selected, the data is displayed for every five minutes instead of every minute.

13. Statistics tab

Displays consumer statistics, including the date it was created, consumed bytes, consumed messages, produced messages, lag messages, end offset, interval, offset, and partition group.

14. Logs tab

Displays the created logs and each log's level, message, and source.

15. Partition Groups tab

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

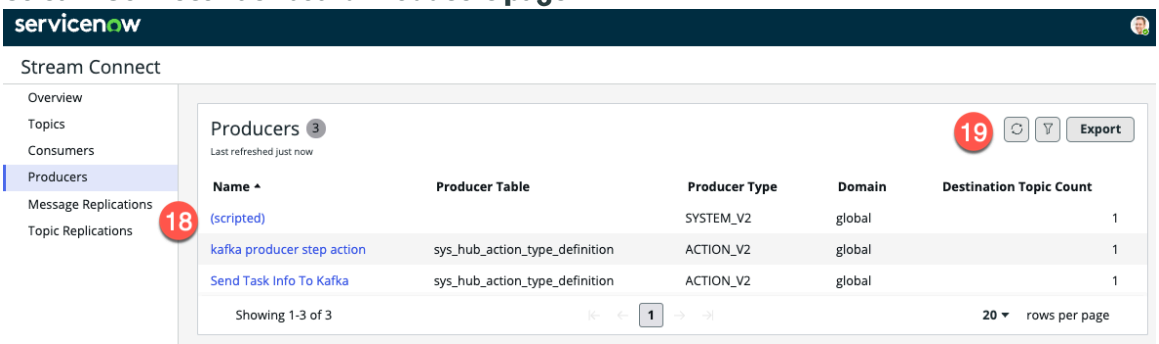
Displays partition groups with each one's number, first and last partition, poll time, number produced per sec, queue depth, and input rate.

For a detailed explanation of consumer data and statistics, including log, and partition group information, see Viewing Kafka subscriptions and statistics.

Producers

View, filter, and export producers.

Stream Connect Dashboard Producers page



The Producers page has the following components.

16. Producer list

Displays all producers and each producer's name, table, type, domain, and destination topic count.

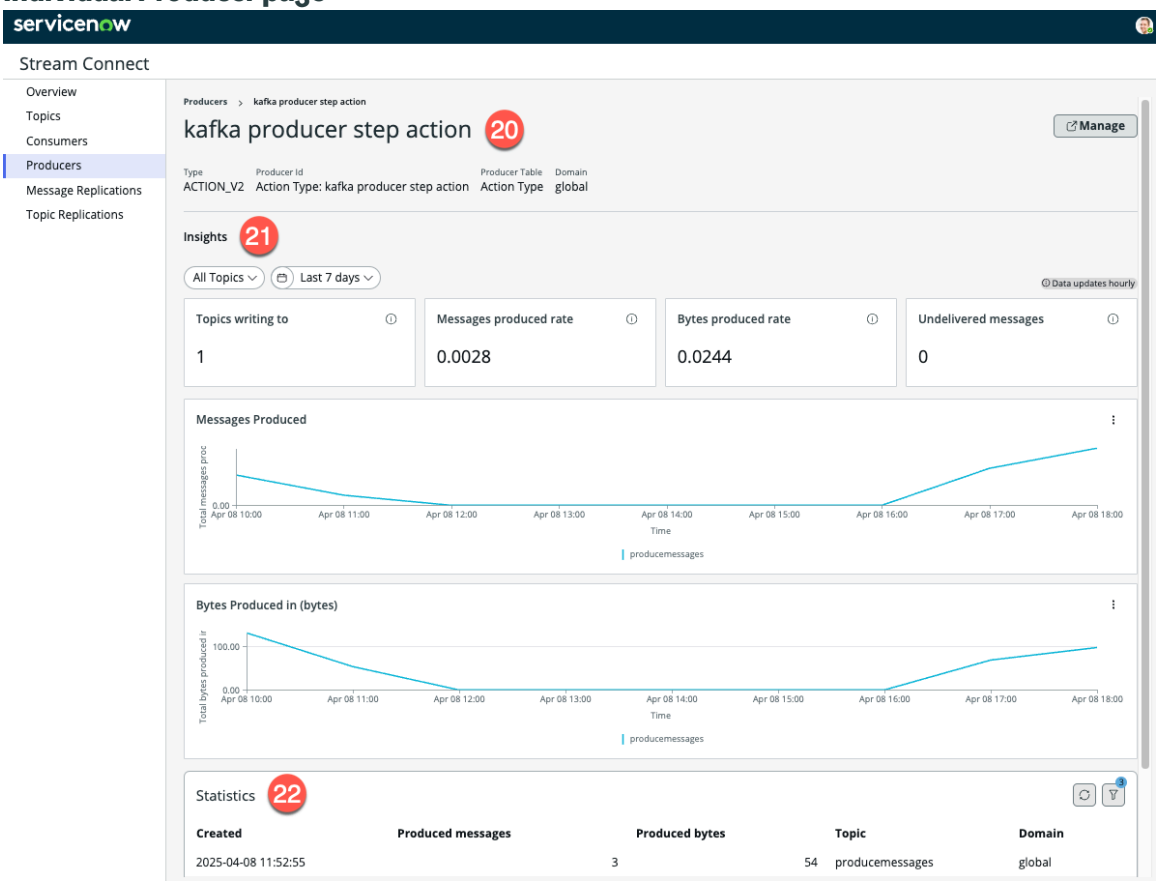
17. Action buttons

Contains several buttons you can use to refresh the list of producers, view or edit list filters, and **Export** a producer.

You can select a producer from the list to view detailed information for that producer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Individual Producer page



Each individual consumer page has the following components.

18. Producer information section

Displays details about the producer, including its type, ID, table, and domain. There's also a **Manage** button. The **Manage** button redirects to the corresponding entity that produced the messages. For example, entering **Manage** on a business rule producer opens the sys_script record. Entering **Manage** on a flow action opens that action in Workflow Studio. For background scripts, the **Manage** button is disabled because the script that was executed is not saved on the system anywhere.

19. Insights

Displays the following data.

- Topics writing to: The total number of topics the producer is writing to.
- Messages produced rate: The average number of messages produced per second.
- Bytes produced rate: The average number of bytes produced per second.
- Undelivered messages: The total number of undelivered messages for the producer.
- Messages produced: Shows the number of messages produced over the last seven days.
- Bytes Produced: Shows the number of bytes produced over the last seven days.

This data is updated every hour. The Messages produced and Bytes produced charts can be filtered to display data for the **Last 2 days**, **Last 24 hours**, **Last 7 days**, or a **Custom range**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

20. Statistics

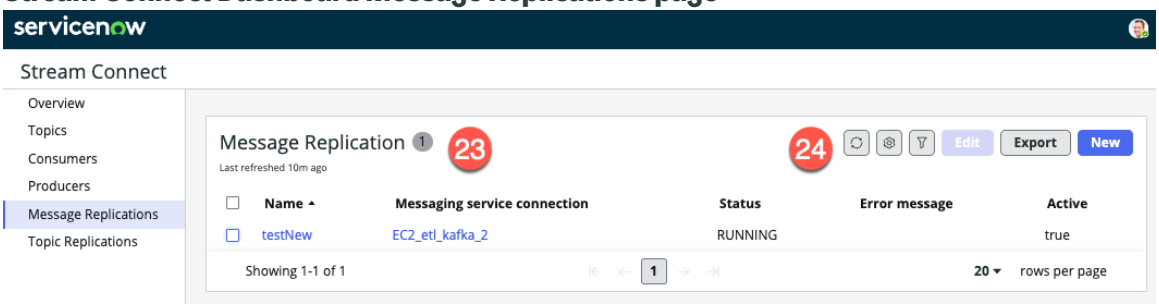
Displays producer statistics, including the date, number of produced messages and bytes, topic, and domain.

For a detailed description of Producer data and statistics, see Viewing producer statistics.

Message Replications

View message replications, and add, edit, or export a message replication.

Stream Connect Dashboard Message Replications page



The Message Replications page has the following components.

21. Message Replications list

Displays all message replications and each replication's name, messaging service connection, status, error message (if any), and whether it's active.

22. Action buttons

Contains several buttons that you can use to perform different tasks. Refresh the list of message replications, edit the list columns or reset the column widths, and view or edit the list filters. There are also buttons to **Edit** a message replication, **Export** a message replication, and create a **New** message replication.

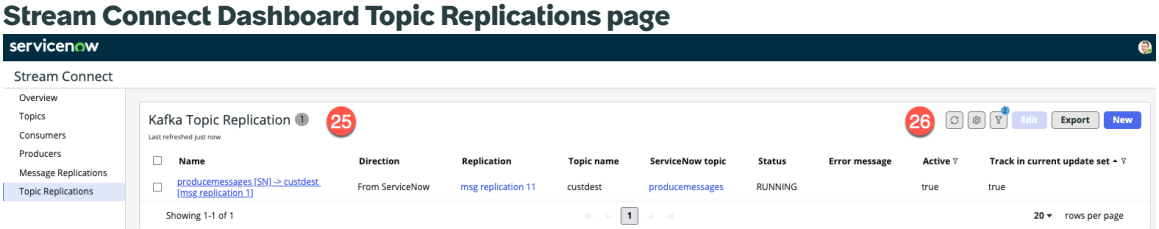
- To edit a message replication, select the replication from the list, select the **Edit** button, then fill in the fields on the Edit Message Replication form.
- To create a new message replication, select **New**, then fill in the fields on the Create New Message Replication form.

You can select a message replication to view the replication's name, messaging service connection, status, error message (if any), and if it's active. You can also see any associated Kafka Topic Replications.

Topic Replications

View topic replications, and add, edit, or export a topic replication.

Stream Connect Dashboard Topic Replications page



The Topic Replications page has the following components.

23. Topic Replications list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Displays all topic replications, and each replication's name, direction, replication, topic name, ServiceNow topic, status, error message (if any), whether it's active, and whether it's being tracked in the current update set.

24. Action buttons

Contains several buttons you can use to refresh the list of topic replications, edit the list columns or reset the column widths, and view or edit the list filters. There are also buttons to **Edit** a topic replication, **Export** a topic replication, and create a **New** topic replication.

- To edit a topic replication, select the replication from the list, select the **Edit** button, then fill in the fields on the Edit Topic Replication form.
- To create a new topic replication, select **New**, then fill in the fields on the Create New Topic Replication form.

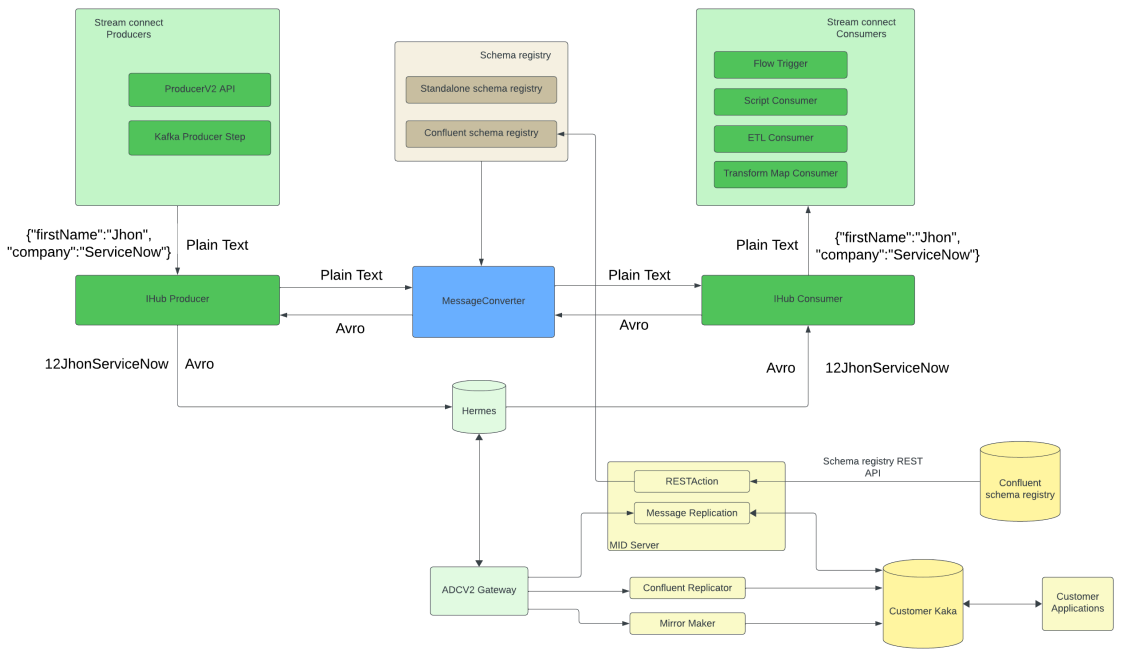
You can select a topic replication to view its name, direction, replication, topic name, ServiceNow topic, status, error message (if any), if it's active, and if it's being tracked in the current update set. You can also see any associated Message Replication statistics.

Schema management in Stream Connect

Import and create schemas to send and receive messages in an Apache Avro format. Using an Avro format can reduce the size of the payload and simplify your integration to your local Kafka instance.

Avro is an open-source data-serialization system that uses schemas to structure encoded data. With an Avro schema, data can be converted from plain-text JSON to an Avro binary format and back. You can store schemas in ServiceNow, so your Stream Connect producers and consumers can use the schemas to serialize Avro messages.

The following image shows an overview of schema management in Stream Connect. Schemas, stored in schema registries, enable messages in producers and consumers to be converted from plain text to an Avro format and back.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Schemas

You can import a schema from the Confluent registry or create your own standalone schema by uploading a JSON file or entering a schema directly as a JSON-formatted string.

After your schema is imported or created, you can see it on the Stream Connect Schemas [stream_connect_schema] table, which stores both Confluent and standalone schemas. Additionally, Confluent schemas are visible on the Confluent Stream Connect Schema [confluent_stream_connect_schema] table. Standalone schemas are on the Standalone Stream Connect Schema [standalone_stream_connect_schema] table.

All schemas have a schema ID, a globally unique identifier of the schema. For Confluent schemas, the schema ID is imported from the Confluent registry. For standalone schemas, the schema ID is generated locally and is unique on the instance. By default, the generated schema ID value is the next highest available schema ID on the instance. For example, if your schemas have ID numbers one through five, the next schema you create will have a schema ID of six. You can change the default value.

Schema IDs are unique per registry. For example, two schemas can both have an ID of one as long as they're in different registries.

Schema registries

Every schema belongs to a registry. There are two types of schema registries in ServiceNow: the Confluent Schema Registry and the Standalone Schema Registry.

Both schema registries have an option to **Track in the update set**. When this option is enabled, the schemas in that registry are saved to the update set. Saving the schemas to the update set makes it possible to move them from one environment to another. By default, this option is turned off for the Confluent Schema Registry because schema IDs may change from one environment to another. This option is enabled for the Standalone Schema Registry, because if you're creating schemas manually, the schema ID is less likely to change from one environment to another. To change the default setting for either registry, navigate to **All** > **IntegrationHub** > **Schema Registries**, select the registry, and change the **Track in the update set** option.

Wire-level message format

For interoperability, ServiceNow uses a wire-level message format similar to the ones used by other systems. The first byte is set to 0. The next 4 bytes are used for the schema ID. The remaining bytes are used for the data, serialized in an Avro format.

Byte 0	Magic byte.
Byte 1–4	Schema ID.
Remaining bytes	Data, serialized in an Avro format.

Producers and consumers

Stream Connect producers and consumers can be configured to use an Avro format.

When configuring a producer, simply specify which schema you want to use. Then when you run the producer, the message payload is generated in JSON and automatically converted to an Avro format using the specified schema. For more information on producers, see the Kafka Producer step or the ProducerV2 API.

Configuring a consumer is similar. Specify the serialization format as **Encoded** and select a schema registry. When the consumer receives a message in an Avro format, it's automatically

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

converted to JSON according to the schema for the schema ID received in the message. For more information, see the Kafka Message trigger or the ETL, Transform Map, or Script consumers.

Plugin

Schema management features require the ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer] plugin.

Import a schema from the Confluent Registry

Import a Schema from the Confluent Registry to enable your Stream Connect producers and consumers to send and receive Kafka messages in an Apache Avro format.

Before you begin

- Role required: kafka_admin
- This feature is part of schema management in Stream Connect. For more information, see Schema management in Stream Connect.
- The ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer] plugin is required.
- To import a schema, you need to have a Connection and Credential alias to connect to your Confluent registry. Navigate to **All** > **IntegrationHub** > **Schema Management** > **Configure Connection** to configure your alias. For instructions, see Create a Connection & Credential alias.

About this task

Stream Connect uses schemas to convert messages from plain text to an Avro format and back. Using an Avro format can reduce the size of the payload and simplify your integration to your local Kafka instance.

This document shows you how to import a schema from the Confluent registry. You can also Create a standalone schema in Stream Connect.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Schema Management** > **Import Schema from Confluent Registry**.
2. Select the **Subject** of the schema you want to import from the Confluent Registry.
3. Select the **Version** of the schema to import.
   The most recent version is the default.
4. Select **Submit**.
   On the Confluent Stream Connect Schema form, the **Schema** field has the JSON-formatted schema that you imported from the registry, and the **Schema ID** field has the schema's ID.

Result

Your schema is visible on the Stream Connect Schemas [stream_connect_schema] table and the Confluent Stream Connect Schema [confluent_stream_connect_schema] table.

What to do next

Use Stream Connect producers and consumers to send and receive messages in an Avro format.

Create a standalone schema in Stream Connect

Create a schema to enable your Stream Connect producers and consumers to send and receive Kafka messages in an Apache Avro format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Role required: kafka_admin
- This feature is part of schema management in Stream Connect. For more information, see Schema management in Stream Connect.
- The ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer] plugin is required.

About this task

Stream Connect uses schemas to convert messages from plain text to an Avro format and back. Using an Avro format can reduce the size of the payload and simplify your integration to your local Kafka instance.

This document shows you how to create your own standalone schema by uploading a JSON file or by entering a schema directly as a JSON-formatted string. You can also Import a schema from the Confluent Registry.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Schema Management** > **Create Standalone Schema**.

   On the form to create an Avro schema, the value of the **Schema ID** is automatically filled in. You can keep the suggested value or change it.

   All schemas have a schema ID, a globally unique identifier of the schema. For standalone schemas, the schema ID is generated locally and is unique on the instance. By default, the generated schema ID value is the next highest available schema ID on the instance. For example, if your schemas have ID numbers one through five, the next schema you create will have a schema ID of six. Schema IDs are unique per registry. For example, two schemas can both have an ID of one as long as they're in different registries.

2. In the **Source** field, select one of the following.

Option	Description
File	Select a JSON file to import the schema. Once imported, the contents of the file are visible in the **JSON schema** field.
Avro formatted String (JSON)	Enter a schema in a JSON-string format.

3. Select **Submit**.
   On the Standalone Stream Connect Schema form, the **Schema** field has the JSON-formatted schema that you uploaded or entered.

Result

Your schema is visible on the Standalone Stream Connect Schema [standalone_stream_connect_schema] table and the Stream Connect Schemas [stream_connect_schema] table.

What to do next

Use Stream Connect producers and consumers to send and receive messages in an Avro format.

Configure an Extract Transform Load (ETL) consumer

Import and process data from your Kafka environment using your existing Robust Transform Engine (RTE) configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Role required: integration_hub_admin
- This consumer requires a Stream Connect subscription. For more information, see https://www.servicenow.com/now-platform/workflow-data-fabric.html.
- The ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer] plugin is required.
- This consumer requires a robust import set transformer.

About this task

To configure a consumer, you need to create two records.

1. The consumer record, which specifies how to import and process data.
2. A record for the Kafka stream, which defines the stream of data to your consumer.

This task covers the consumer creation. For instructions on creating a Kafka stream, see Create a Kafka stream.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Consumers** > **ETL Consumer**.
2. Select **New**.
3. In the form, fill in the fields.

Kafka ETL Consumer

Field	Description
Name	Name of the ETL consumer.
Robust import set transformer	Name of the robust import set transformer to use to process data.
Delivery guarantee	If there's a node failure, option to specify the delivery guarantee for incoming messages. Select one of the following. ○ **No lost but duplicates**: All messages are delivered at least once. Some messages might be delivered more than once. ○ **Once or not at all**: A message isn't delivered more than once. Some messages might not be delivered at all.
Serialization format	The serialization format for the message. Select one of the following. ○ **Plain Text**: Select this option for any plain-text messages. This is the default format. ○ **Encoded**: Select this option for messages in an Apache Avro format. Converting plain-text messages to an Avro format requires a schema. Select the schema registry in the **Schema registry** field. For more information on schemas, see Schema management in Stream Connect.
Data in single column	Option to have the import set table store data in single column.
Column mapping	Option to specify whether the message's JSON key maps the data to the column's name or label in the import set table. Select one of the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Label** ○ **Column name** This field appears only when the **Data in a single column** check box is cleared.
Application	Application scope for the ETL Consumer.
Schema registry	Registry for the selected schema. Select one of the following. ○ **Standalone Schema Registry** ○ **Confluent Schema Registry** This field appears only when the **Serialization format** is set to **Encoded**. For the Confluent Schema Registry, if the received message's schema ID isn't in the schema table, the system imports the schema dynamically, using the configured REST connection.

4. Select **Save**.

What to do next

Create a Kafka stream for this consumer. After the stream is activated, you can start receiving messages from your Kafka environment.

Configure a Transform Map consumer

Import and process data from your Kafka environment using your existing transform map configurations.

Before you begin

- Role required: integration_hub_admin
- This consumer requires a Stream Connect subscription. For more information, see https://www.servicenow.com/now-platform/workflow-data-fabric.html.
- The ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer] plugin is required.
- This consumer requires a transform map.

Formatting Kafka message payloads

Use simple JSON payloads for Kafka messages. Each Kafka message should have just one, flat JSON object. Complex JSON payloads, such as those with lists and nested objects, are not supported.

Example of simple, valid JSON input, using a flat map of key-value pairs.

```
{"key1": "value1", "key2": "value2"}
```

Examples of complex, invalid JSON input. The first uses a list. The second uses nested objects.

```
[{"key1": "value1", "key2": "value2"}, {"key1": "value3",
 "key2": "value4"}]
```

```
{"key1": "value1", "key2": {"key3": "value3", "key4": "value4"}}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To configure a consumer, you need to create two records.

1. The consumer record, which specifies how to import and process data.
2. A record for the Kafka stream, which defines the stream of data to your consumer.

This task covers the consumer creation. For instructions on creating a Kafka stream, see Create a Kafka stream.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Consumers** > **Transform Map Consumer**.
2. Select **New**.
3. In the form, fill in the fields.

Kafka Transform Map Consumer

Field	Description
Name	Name of the Transform Map consumer.
Transform Map	Name of the transform map to use to process data.
Delivery guarantee	If there's a node failure, option to specify the delivery guarantee for incoming messages. Select one of the following. ○ **No lost but duplicates**: All messages are delivered at least once. Some messages might be delivered more than once. ○ **Once or not at all**: A message isn't delivered more than once. Some messages might not be delivered at all.
Serialization format	The serialization format for the message. Select one of the following. ○ **Plain Text**: Select this option for any plain-text messages. This is the default format. ○ **Encoded**: Select this option for messages in an Apache Avro format. Converting plain-text messages to an Avro format requires a schema. Select the schema registry in the **Schema registry** field. For more information on schemas, see Schema management in Stream Connect.
Column mapping	Option to specify whether the message's JSON key maps the data to the column's name or label in the import set table. Select one of the following. ○ **Label** ○ **Column name**
Synchronize Inserts	Option to guarantee there's only one record with unique coalesce field values by synchronizing record inserts.
Application	Application scope for the Transform Map Consumer.
Schema registry	Registry for the selected schema. Select one of the following. ○ **Standalone Schema Registry** ○ **Confluent Schema Registry** This field appears only when the **Serialization format** is set to **Encoded**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For the Confluent Schema Registry, if the received message's schema ID isn't in the schema table, the system imports the schema dynamically, using the configured REST connection.

4. Select **Save**.

What to do next

Create a Kafka stream for this consumer. After the stream is activated, you can start receiving messages from your Kafka environment.

Configure a script consumer

Use a script to import and process data from your Kafka environment.

Before you begin

- Role required: integration_hub_admin
- This consumer requires a Stream Connect subscription. For more information, see https://www.servicenow.com/now-platform/workflow-data-fabric.html.
- The ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer] plugin is required.

About this task

To configure a consumer, you need to create two records.

1. The consumer record, which specifies how to import and process data.
2. A record for the Kafka stream, which defines the stream of data to your consumer.

This task covers the consumer creation. For instructions on creating a Kafka stream, see Create a Kafka stream.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Consumers** > **Script Consumer**.
2. Select **New**.
3. In the form, fill in the fields.

Kafka script consumer

Field	Description
Name	Name of the Script consumer.
Delivery guarantee	If there's a node failure, option to specify the delivery guarantee for incoming messages. Select one of the following. ○ **No lost but duplicates**: All messages are delivered at least once. Some messages might be delivered more than once. ○ **Once or not at all**: A message isn't delivered more than once. Some messages might not be delivered at all.
Serialization format	The serialization format for the message. Select one of the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Plain Text**: Select this option for any plain-text messages. This is the default format. ○ **Encoded**: Select this option for messages in an Apache Avro format. Converting plain-text messages to an Avro format requires a schema. Select the schema registry in the **Schema registry** field. For more information on schemas, see Schema management in Stream Connect.
Event consumer	Script to use to consume the messages received from the Kafka topic.
Application	Application scope for the Transform Map Consumer.
Schema registry	Registry for the selected schema. Select one of the following. ○ **Standalone Schema Registry** ○ **Confluent Schema Registry** This field appears only when the **Serialization format** is set to **Encoded**. For the Confluent Schema Registry, if the received message's schema ID isn't in the schema table, the system imports the schema dynamically, using the configured REST connection.

4. Select **Save**.

Example:

This example shows a sample script for processing messages.

```
(function process(messages) {
 // Add your code here to consume kafka messages
 // sample message [ { 'key' : 'message_key' , 'message' :
 'message' , 'headers' : [ { 'key' : 'header_key' , 'value' :
 'header_value' } ] } ]

 for (var i = 0; i < messages.length; i++) {
     var message = JSON.parse(messages[i].message);
     gs.info('Number ' + message.number + ', short description '
 + message.short_description +
         ', headers ' + JSON.stringify(messages[i].headers));
 }
})(messages);
```

What to do next

Create a Kafka stream for this consumer. After the stream is activated, you can start receiving messages from your Kafka environment.

Create a Kafka stream

Define a data stream for an Extract Transform Load (ETL), Transform Map, or Script consumer. A Kafka stream defines the stream of data to your consumer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Role required: integration_hub_admin
- Kafka streams are part of Stream Connect which requires a Stream Connect subscription. For more information, see https://www.servicenow.com/now-platform/workflow-data-fabric.html.

About this task

You must create a Kafka stream to use an ETL, Transform Map, or Script consumer. After you configure a consumer, and create and activate a stream, you can start receiving messages from your Kafka environment.

Procedure

1. Open the record for your ETL, Transform Map, or Script consumer.
   To find a consumer record, navigate to **All** > **IntegrationHub** > **Consumers** and select **ETL Consumer**, **Transform Map Consumer**, or **Script Consumer**.
2. Locate the Kafka Streams section and select **New**.
3. In the form, fill in the fields.

Kafka Stream

Fields	Description
Name	Name of the Kafka stream.
Topic	Name of the topic to monitor for messages.
Max concurrency	Maximum number of parallel processors to use to consume messages, and the number of partition groups to create. Default value: 1
Relative weight	For each cycle, the maximum amount of time allocated to the consumer for processing messages, relative to other consumers. For example, a consumer with a relative weight that's twice as high as another consumer's gets twice as much time. Consumers that have the same relative weight get the same amount of time. The minimum value is 5. The maximum value is 2000. The default value is equal to the max concurrency multiplied by the value of the *glide.ih.kafka.consumer.max_seconds_per_partition_group* property. The *glide.ih.kafka.consumer.max_seconds_per_partition_group* property specifies the maximum time, in seconds, allocated to each partition group. Its default value is 10. The system uses the relative weight to calculate the partition group timeout for the subscription. The partition group timeout specifies the maximum time, in milliseconds, allocated to each partition group in a specific subscription. This field appears only when **Advanced** is selected.
Start consuming	Option to specify where to begin consuming messages from the topic. Select one of the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ **Messages received after the first activation**: Only consumes messages the topic received after the stream was activated. ○ **All the messages stored in the topic**: Consumes all the messages in the topic, even messages received before the stream was activated.
Message handling	Option to specify the number of messages processed per run or let the system decide the number of messages. Select one of the following. ○ **Automatically optimize**: The system determines the number of messages to process per run. ○ **Manually override**: You specify the number of messages to process per run. This field appears only when **Advanced** is selected.
Maximum messages	Maximum number of messages to process per run. This field appears only when **Manually override** is selected from **Message handling**.
Run as	Option to run the consumer with the credentials of a specified user.
Kafka ETL consumer	The name of the consumer to stream data to. This field is automatically set to the name of the consumer from which you started adding the stream.
Active	Option to make the stream active.
Advanced	Option to view the advanced fields **Relative weight** and **Message handling**.

4. Under Related Links, select **Activate**.
   After the stream is activated, the system automatically creates a Kafka subscription for the associated consumer.
5. Select **Submit**.

Result

When you activate the stream, the consumer begins looking for messages to process in the specified topic. You can view detailed information about the consumer and its performance by visiting its subscription page. For details, see Viewing Kafka subscriptions and statistics.

Viewing Kafka subscriptions and statistics

View detailed information about a Kafka consumer and its performance, including the number of records added to the topic, the number of records processed, and the number of records remaining to be processed.

A subscription is a record associated with a consumer. It stores configuration and performance details about the consumer. A subscription is created when a Kafka stream is activated.

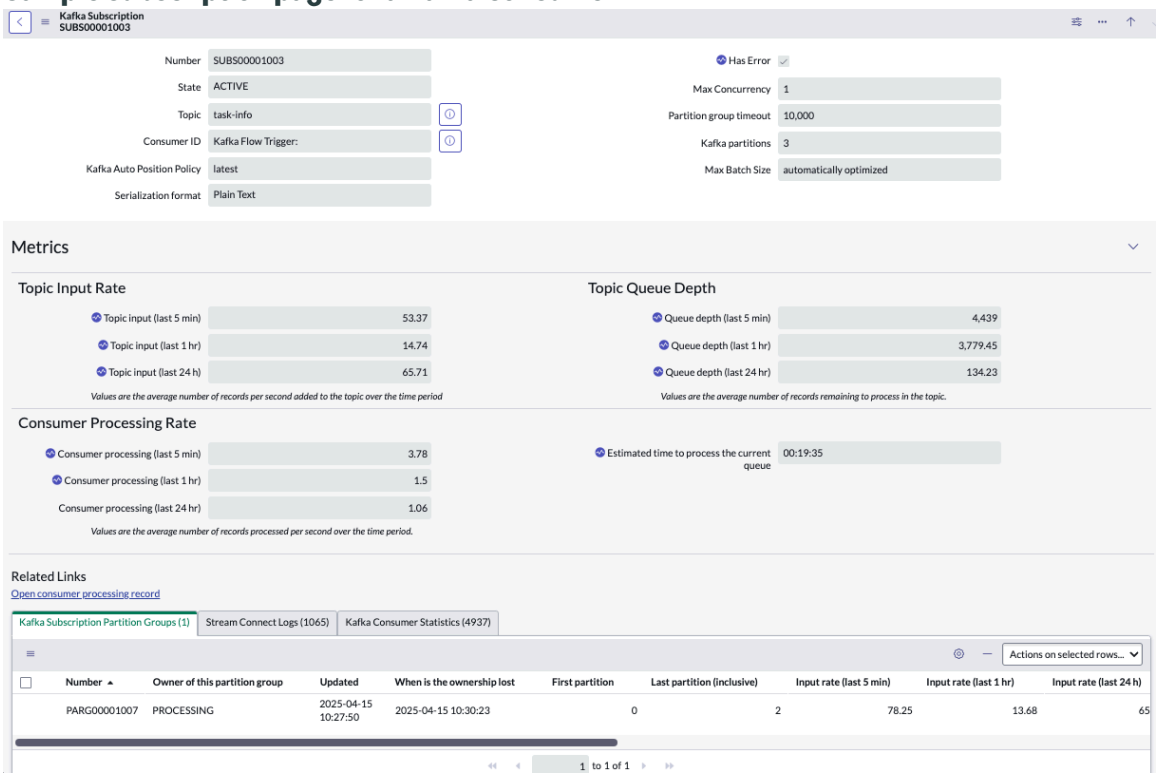
Each subscription page includes the following sections.

- Kafka subscription
- Metrics
- Kafka subscription partition groups
- Consumer logs
- Kafka consumer statistics

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view a subscription record, navigate to **IntegrationHub** > **Stream Connect** > **Subscriptions**. Select the info icon (ⓘ) for the subscription you want to view, then select **Open Record**.

Sample subscription page for a Kafka consumer



Kafka subscription

The Kafka subscription section shows configuration details for the consumer and subscription.

Field	Description
Number	Number of the subscription record.
State	State of the consumer. Options are: • ACTIVE • REFRESHING • STOPPING
Topic	Topic the consumer is processing messages from.
Consumer ID	Unique identifier for the consumer.
Kafka Auto Position Policy	Specifies where the consumer starts reading messages from the topic. Options are: • earliest: The consumer starts reading from the earliest available message in the topic. • latest: The consumer reads only the messages delivered to the topic after the consumer started.
Has Error	Indicates if the subscription has any errors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Max Concurrency	Maximum number of parallel processors used to consume messages and the number of partition groups.
Partition group timeout	Maximum time, in milliseconds, allocated to each partition group in the subscription.
Kafka partitions	Number of partitions in the topic.
Max Batch Size	Maximum number of messages processed per run. Options are: • automatically optimized: The system chooses the number of messages. • a number: The user manually selected a number.

Metrics

Each metric is measured over three time intervals: the previous five minutes, the previous hour, and the previous 24 hours.

- Topic Input Rate: The average number of records added to the topic per second.
- Consumer Processing Rate: The average number of records processed per second.
- Topic Queue Depth: The average number of records remaining to be processed in the topic.

Kafka subscription partition groups

The Kafka subscription partition groups tab shows the following details.

Field	Description
Number	Number for the partition group.
Owner of this partition group	Ownership state of the partition group. Options are: • NONE: The partition group isn't owned by any Kafka consumer jobs. It's available to pick up and process. • PROCESSING: The partition group is owned by a Kafka consumer job and is processing messages. • LOCKED: The partition group isn’t owned by a Kafka consumer job and isn’t available to pick up. When a Kafka consumer job is activated, it checks for the earliest updated record with an owner of NONE and picks one. Then the consumer job changes the owner to PROCESSING and processes it for 10 seconds. When it's done processing, the state is changed back to NONE, so it can be picked up and processed again later. If the consumer job processes all the messages, it sets the owner to LOCKED for 10 seconds, after which it's set to NONE again.
Updated	Date and time the partition group was last updated.
When is the ownership lost	Date and time that ownership is lost.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
First partition	Number of the first partition for the partition group.
Last partition (inclusive)	Number of the last partition for the partition group.
Input rate Given for the last five minutes, last hour, and last 24 hours.	Average number of records added to the partition group per second.
Consumer processing Given for the last five minutes, last hour, and last 24 hours.	Average number of messages consumed from the partition group per second.
Queue depth Given for the last five minutes, last hour, and last 24 hours.	Average number of records remaining to be processed in the partition group.

Consumer logs

The Consumer Logs tab displays the log entries for the associated consumer. It shows when each entry was created, its log level, the message, and the source. Consumer logs are stored in the Consumer Logs [sys_consumer_log] table.

You can increase the number of log messages added to the consumer logs by enabling the *glide.ih.kafka.debug.consume* property.

Kafka consumer statistics

The Kafka Consumer Statistics tab shows the following details.

Field	Description
Created	Date and time the consumer statistics record was created.
Interval	Duration for the consumer statistics record, given in seconds. You can change the length of the interval with the *glide.ih.kafka.consumer.log_interval* property. The default value is 60 seconds. You can specify whether to log messages to the consumer log when there are no produced or consumed Kafka messages during the interval with the *glide.ih.kafka.consumer.log_empty_stats* property. The default value is true.
Produced messages	Number of messages produced to the topic during the interval time.
Consumed messages	Number of messages processed by the consumer during the interval time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Consumed bytes	Number of bytes processed by the consumer during the interval time.
Offset	Sum of all the offsets for the partition group.
Lag messages	Difference between the end offset and the current offset.
End offset	Sum of all the end offsets for the partition group.
Partition group	Record for the partition group.

Viewing producer statistics

View detailed information about a Stream Connect producer and its performance, including the producer type and ID, and the total number of bytes and messages produced to a topic.

Stream Connect producers, including the Kafka Producer step and the ProducerV2 API, publish messages from ServiceNow to a Kafka topic. You can view detailed information and statistics for each producer.

Each producer has a record that stores information about that producer, such as its type and ID. A producer might also have an associated statistics record with information about the producer's performance, including the number of bytes and messages it's produced to a topic.

Producer details and statistics are covered in two tables.

- Kafka Producers [sys_kafka_producer] table
- Kafka Producer Statistics [sys_kafka_producer_statistics] table

Both tables require the Kafka Admin [kafka_admin] role to view. These tables are read only and the records in them can't be manually created, updated, or deleted.

Kafka Producers table

The Kafka Producers [sys_kafka_producer] table captures producer information per topic. You can view the Kafka Producers table by navigating to **All** > **Integration Hub** > **Stream Connect** > **Producers**.

Kafka Producers table fields

Field	Description
Number	Unique identifier for the producer. Links to the producer record.
Producer Type	Type and version number for the producer. Each producer type is followed by the version number of the producer. For example, if the producer is the ProducerV2 API, the type listed is SCRIPT_V2. Options are: • ACTION: Kafka Producer step. • SCRIPT_ACTION: A producer called from within a scripted step in Workflow Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kafka Producers table fields (continued)

Field	Description
	• SCRIPT: Producer API or ProducerV2 API. • SYSTEM: Any server-side execution in the ServiceNow Platform where the system can't identify any record associated with the execution.
Producer Table	Name of the table producing the record. For example, if the record is produced by a business rule, the table is Business Rule [sys_script]. If it's produced by the Kafka Producer step, it's Action Type [sys_hub_action_type_definition].
Producer ID	Reference to the record that produces the messages.
Topic	Reference to the Kafka topic record for the producer.
Domain	Name of the domain for the record producing the event.

Kafka Producer Statistics

The Kafka Producer Statistics [sys_kafka_producer_statistics] table captures producer statistics for each producer. Statistics are collected once per hour.

Kafka Producer Statistics table

Field	Description
Topic	Reference to the topic record for the producer.
Collection Time	Time the producer statistics were collected. Statistics are collected and reported every hour.
Produced bytes	Total number of bytes produced during the collection period.
Produced messages	Total number of messages produced during the collection period.
Domain	Name of the domain for the producer.

You can also view the statistics for a specific producer by selecting the producer's record from the table.

Sample producer record with statistics

Managing connections in Integration Hub

Create several connections to a single integration provider. View and configure connections in a simplified interface with the Connections dashboard.

Connections and credentials in Integration Hub

Integration Hub uses aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. Integration Hub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about credentials, connections, and aliases.

Support for multiple connections

Integration Hub supports multiple connections to a single integration provider. For example, you can have connections to several different Jira environments.

You can select which connection you want to use in a flow, and override preset connections for flows, subflows, and actions directly through Workflow Studio. When a flow is promoted to production, you can reestablish a connection to each account without needing to modify the flow.

You can also view, edit, and create connections for integration actions directly in Workflow Studio. Integration actions have one or more connection fields in the Action Properties section, simplifying connection management at the action-level.

Personal Authentication dashboard

Use your personal credentials to connect to third-party integrations with the Personal Authentication dashboard. View, authenticate, revoke, and renew your personal authentications through a simplified, consolidated interface.

The Personal Authentication dashboard provides a streamlined way to manage your personal authentication integrations. With personal authentication, multiple users can use Integration Hub without needing to share superuser credentials. It also enhances security by removing the need to manage ACLs for third-party systems.

Connections dashboard

You can view and configure your connection and credential aliases with the Connections dashboard. The Connections dashboard enables you to manage multiple connections through a single interface, and provides simplified processes for adding, editing, and configuring connections. With the Connections dashboard, you can view details about an alias and all associated child connections in a single location.

Use the mTLS protocol with a MID Server

Make outbound REST and SOAP calls through a MID Server using mTLS. Store mTLS credential and certificate information on the instance, in a configuration file, or in an external vault. The MID Server retrieves the credential and certificate information and makes outbound REST and SOAP calls using the mTLS protocol.

Supporting multiple connections

Support several connections to a single integration provider. Select connections for flows, subflows, and actions directly from a flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefits

Multiple connections support offers these benefits.

- Have more than one connection to the same integration provider. For example, you can establish connections to several different Jira environments.
- Select which connection you want to use in a flow. Override preset connections for flows, subflows, and actions directly through Workflow Studio.
- When a flow is promoted to production, reestablish a connection to each account without needing to modify the flow.

To learn more about connections, see Connections and Credentials.

Connection and credential aliases

Integration Hub uses aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. Integration Hub only requires an alias, which then resolves to use the correct credentials and connection information during runtime.

With connection and credential aliases, you can also create additional aliases or connections called child aliases. Child aliases enable you to create multiple connections within the same application integration. For more information, see Create a Connection and Credential alias.

Flow-level connection selection

You can choose a connection for a flow or subflow directly from the flow's main page. When you select a new connection, it overrides any preconfigured connection for that flow. To choose a connection, select the More Actions menu icon (⋮), and select the **Configure connections** option. This option opens the Configure Connections window, where you can select the connections for your flow. The Configure Connections window displays:

- All the aliases used in the flow.
- The icon and name for each alias.
- A list of the configured connections for each alias. The default connection is listed first. Other connections are listed alphabetically.
- An information icon for each alias. Selecting the icon opens the Connection & Credential Aliases record for the default connection shown in the list.
- A **Manage Connections** option that opens the connections dashboard.
- Options to **Cancel** connection selection or **Update** your connection choice.

Each alias has one entry in the Configure Connections window, regardless of how many actions or subflows may use that alias. When you select a connection at the flow level, the new connection applies to all the actions and subflows using that alias. For example, if a flow has several actions that use a Slack service, changing the connection for the Slack service changes the connection for all the Slack service actions within the flow.

You can see which parts of a flow a connection change affects by matching the alias icons in the flow to the ones in the Configure Connections window. An action that impacts a Slack service has a Slack icon next to the action in the flow. The Slack icon also appears next to the alias name in the Configure Connections window.

The Configure Connections window is automatically updated whenever you add or delete a flow component that has connections. When you add an action or subflow to a flow, the Configure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connections window displays the connections for the action or subflow that you just added. If you remove an action or subflow, the connection information is removed from the Configure Connections window.

You can choose whether to display the **Configure connections** option with the *sn_flow_designer.connections_override_enabled* system property. Setting the property to **true** displays the **Configure connections** option, while setting it to **false** hides it. If you delete the system property or it doesn't exist, the **Configure connections** option is displayed by default.

View which connection your flow ran with by examining the Step Configuration section of the flow's execution details. The connection alias listed in the CONFIGURATION column is the alias that the flow was originally designed to run with. The alias listed in the RUNTIME VALUE column is the one that the flow actually ran with.

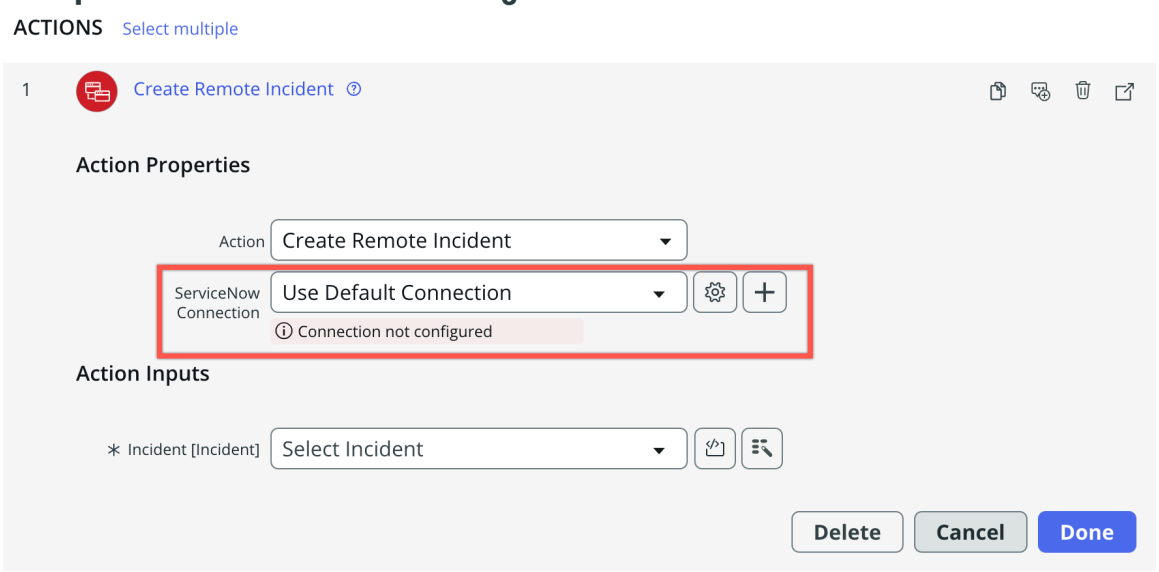
Execution details page

Action-level connection selection

You can select connections for individual integration actions within a flow. This functionality is useful if a flow must interact with multiple configurations of the same provider. For example, downloading a file from one configuration of a file storage provider then uploading the file to a different configuration of the same file storage provider.

Integration actions have one or more connection fields in the Action Properties section where you can edit or configure a connection. In the following example, the Create Remote Incident action has a connection field called **ServiceNow Connection**. The default connection hasn't been configured yet, so a `Connection not configured` message appears below the connection field. This message appears whenever the connection for the selected alias is not configured

Example of a connection field in an integration action



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the gear icon (⚙) to create or configure an alias.

- For connections using a configuration template, the gear icon opens a window where you can create or configure a connection.
- For connections without a configuration template, the gear icon opens the platform form for creating a connection and credential alias.

Use the plus icon (+) to add a new child connection alias. Use the pencil icon (✎, not shown in the image) to edit the selected connection.

Dynamic inputs

You can select connections for flows and subflows containing actions with dynamic inputs. When a connection override is specified at the flow level, the dynamic action uses the flow-level override. For example, in a flow with a data-gathering action, the action uses the flow's override connection for the data-gathering step rather than the action's default connection. If an override is specified at the action level, the dynamic action uses the action-level override.

Multiple overrides within a flow

When there is more than one override in a flow, they're applied according to the following rules:

- Action-level overrides always apply.
- Subflow-level overrides always apply to the subflow. The override also applies to actions within the subflow that don't have their own overrides configured.
- Flow-level overrides apply to subflows and actions that don't have their own overrides configured.

Flow promotion

When you move a flow to a production instance, the alias information is transferred with it, but the underlying connection information is not. An alias functions as a type of container for connections. The container moves with the flow, but the specific connection information doesn't. Any connections associated with the alias become unconfigured and must be reconfigured before you can use them in the new environment.

You can configure connections without having to modify the flow because you already have the base alias set up. To configure a connection:

- If the alias has a configuration template, configure the connection through the Connections dashboard. See Configure a connection in the Connections dashboard for instructions.
- If an alias doesn't have a configuration template, configure it through the platform user interface. For more information about configuring a connection without a template, see Getting started with connections.

Override a connection in a flow

Override a connection for a flow, subflow, or action.

Before you begin
For details about flow overrides, including how they affect actions with dynamic inputs and how multiple overrides are applied, see Supporting multiple connections.

Role required: flow_designer or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the flow or subflow that has the connection you want to modify.
3. Click the More actions icon ( ), and select **Configure connections**.
4. In the Configure Connections window, identify the alias associated with the connection that you want to override and select a new connection from the list.
5. Click **Update**.

> **Note:**
> If the option is enabled, you can also override a connection at the action level. Click **Advanced Options** below the action. Choose the new connection from the list, then click **Done**. This option is only available if the action has an overridable connection.

What to do next

Test the flow.

Using the Personal Authentication dashboard

Use your personal credentials to connect to third-party integrations. View, authenticate, revoke, and renew your personal authentications through a simplified, consolidated interface.

The Personal Authentication dashboard provides a streamlined way to manage your personal authentication integrations. With personal authentication, multiple users can use Integration Hub without needing to share superuser credentials. It also enhances security by removing the need to manage ACLs for third-party systems.

This feature requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

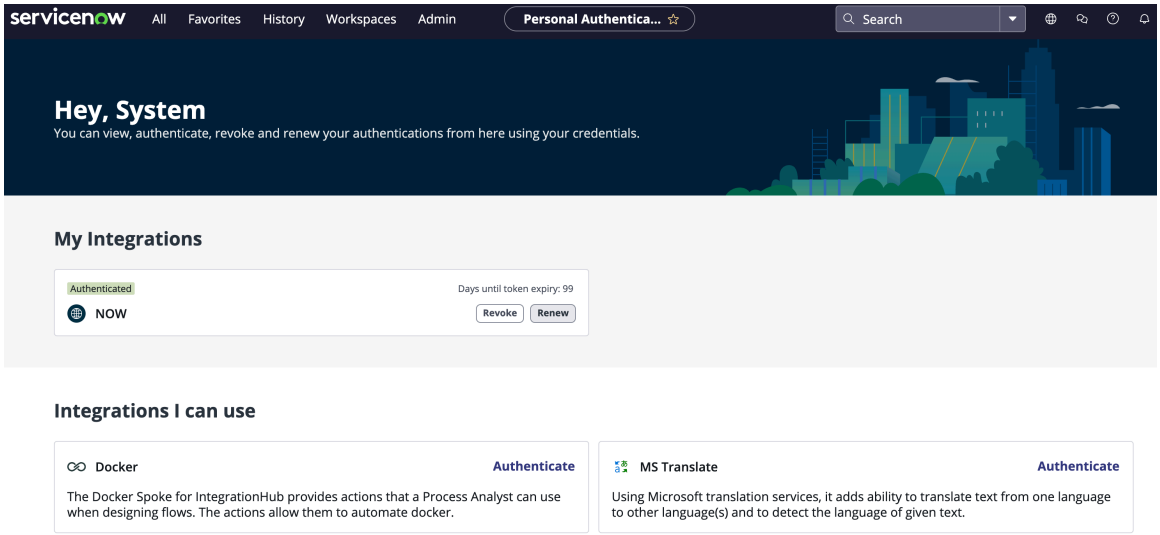
Dashboard overview

The Personal Authentication dashboard has two main sections.

- The My Integrations section at the top of the page, which shows your authenticated integrations.
- The Integrations I can use section at the bottom of the page, which shows the integrations available to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Personal Authentication dashboard



My Integrations section

Displays authenticated integrations. Each integration has its own card. From the card, you can **Revoke** or **Renew** the authentication.

When you revoke an authentication, you revoke any relevant access or refresh tokens for the personal authentication credential associated with the integration. Revoking invalidates the existing authentication. You can reauthenticate later to reestablish the connection. Once the authentication is revoked, the integration card moves to the Integrations I can use section of the dashboard.

Renewing an authentication renews the associated token and updates the expiration date. To renew, select the **Renew** button on the integrations card. This button opens a pop-up window where you can reauthenticate the credential. The contents of the pop-up window depend on the integration.

- For ServiceNow integrations, the pop-up window has fields where you can enter the **Username** and **Password** for the credential, then select **Get OAuth Token**.
- For all other integrations, the pop-up window displays your OAuth credential page for that application.

Integrations I can use section

Displays the integrations that are available but not authenticated. To authenticate, select the **Authenticate** button on the integration card. Authenticating opens the same pop-up window that opens when you **Renew** an integration: For ServiceNow integrations, the pop-up window has the **Username**, **Password**, and **Get OAuth Token** buttons. For all other integrations, the pop-up window displays your OAuth credential page for that application.

Once the credential is authenticated, the integration card moves to the My Integrations section at the top of the dashboard.

Required dashboard setup

If you're already using the personal authentication credential type, you can upgrade to the dashboard by installing the Personal Authentication [com.snc.sn_ihub_personal_auth] plugin. After installing the plugin, navigate to **All** > **IntegrationHub** > **Personal Authentication** > **Personal Integrations** to see the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The integrations on the dashboard all come from the Connection & Credential Aliases [sys_alias] table. Any alias where the credential has a personal integration type is displayed on the dashboard, according to the following guidelines.

- If the credential currently has a valid token, it's listed in the My Integrations section of the dashboard.
- If the credential doesn't currently have a valid token, it's listed in the Integrations I can use section of the dashboard.

If you're not already using the personal authentication credential type, you can configure one by creating a Connection & Credential Alias that uses an OAuth 2.0 credential with the **Integration Type** of **Personal**. For more details and instructions, see Create a Connection & Credential alias.

Token revocation URL

Revoking an authentication revokes all the related active tokens stored in the instance for the user that initiated the session. You can also enable token revocation on the OAuth Server by providing the server's token revocation endpoint in the **Token Revocation URL** field.

To enable authentication revocation at the OAuth Server, fill in the **Token Revocation URL** field in the Application Registries form for the integration's OAuth Provider. To fill in this field, follow these steps.

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select the form for the appropriate OAuth Provider from the Application Registries [oauth_entity] table.
3. In the **Token Revocation URL** field, enter the OAuth Server's token revocation endpoint.

Roles

The Personal Authentication dashboard requires the sn_personal_auth.personal_auth_user role.

Using the Connections dashboard

View and configure your connection and credential aliases through a simplified interface. Add new connections, edit existing connections, and view connection details.

Benefits

The Connections dashboard provides these benefits:

- Enables connection admins to manage multiple connections through a single interface.
- Provides simplified processes for adding, editing, and configuring connections.
- Displays details about an alias and all associated child connections in a single location.

Landing page

The dashboard landing page displays all the connection and credential aliases available on your instance. You can search for an alias by name, sort aliases by date created, or sort them alphabetically in ascending or descending order.

Each alias is displayed in a card format. Cards display the following:

- The application's icon.
- The name and scope of the parent alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A short description of the application associated with the alias. This option only appears when there are no connections.
- The total number of connections.
- A list of all the connections associated with the alias. The first connection is the default parent connection.
- A **View Details** option that displays specific information about the alias and any child connections.
- An **Advanced Setup** option. This option only appears when an alias doesn't have a configuration template.
- An **Add Connection** option. This option is only available when an alias has a configuration template.

Each page of the Connections dashboard displays a maximum of 12 aliases. Page through to see additional aliases.

Detailed view

View details about an alias and any child connections by clicking the **View Details** option on the alias card. The details page has two columns. The first column displays:

- The application's icon.
- The name and scope of the parent alias.
- An option to **View connection alias**, which opens the associated Connection & Credential Aliases record.

The second column of the detailed view displays:

- An **Add Connection** or **Advanced Setup** option, depending on whether the alias has a configuration template.
- The number of connections associated with the alias.
- A list of connections associated with the alias. The default connection is marked.

Connections that are not configured have a **Configure** option. Connections that are configured have an **Edit** option. Each configured connection displays the connection name, endpoint, credential name, and credential type.

If an alias uses an OAuth credential, the OAuth access or refresh token status is displayed with each connection. For connections that require a new token, you can request one by clicking **Get OAuth Token**.

Configuration templates

Configuration templates enable you to set up complex integrations using a single form. For example, an OAuth integration requires registering an OAuth provider, generating a token, and creating several connection and credential records. But if you use a configuration template to set up an OAuth integration, you only need to fill in one form. The system creates the associated records. To learn more about templates, see Connection and Credential configuration templates.

To add, edit, or configure connections directly through the dashboard, an alias must have a configuration template. Not all aliases have templates. Templates were first introduced in the Orlando release, so aliases from previous versions may not have them yet. An alias without a template displays an **Advanced Setup** option on both its dashboard and detailed view. Clicking

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced Setup opens the alias's connection and credential record, where you can set up the alias. For more information about working with aliases that don't have templates, see Create a Connection and Credential alias.

Unconfigured connections

When you transfer an alias or promote it to production, its underlying connection information doesn't get transferred with it. In this situation, the connection is in an unconfigured state and must be reconfigured before you can use it. You can reestablish the underlying connections either through the dashboard or through the platform user interface.

- If the alias has a template, you can configure the connection through the dashboard.
- If it doesn't have a template, configure it through the platform user interface. For more information about configuring a connection without a template, see Getting started with connections.

Roles

To access the Connections dashboard, you must have the connection_admin or admin role.

Add a connection in the Connections dashboard

Add a connection through the Connections dashboard.

Before you begin

Role required: connection_admin or admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer** and click the **Connections** tab.
2. Locate the alias you want to add a connection to and select **Add Connection**.
   If there isn't an **Add Connection** option, the alias doesn't have a configuration template. To add a connection through the dashboard, the parent alias must have a template. Not all aliases have templates. Templates were first introduced in the Orlando release, so aliases from previous versions may not have them yet. If yours doesn't, you can set up your alias through the platform user interface instead. Select the **Advanced Setup** option to get started. For more information, see Create a Connection and Credential alias. To learn more about templates, see Connection and Credential configuration templates.
3. On the form, fill in the fields.
   The fields that appear on the form depend on which configuration template the parent alias has. For details on each specific template, visit Connection and Credential configuration templates.
4. To submit the form, click **Create Connection**.

Result

The alias card displays the new connection under the Connections list.

Configure a connection in the Connections dashboard

Configure a connection through the Connections dashboard.

Before you begin

Role required: connection_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you transfer an alias or promote it to production, its underlying connection information doesn't get transferred with it. In this situation, the connection is in an unconfigured state and must be reconfigured before you can use it.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer** > and click the **Connections** tab.
2. Locate the alias that you want to add a connection to and click **View Details**.
3. In the detailed view, locate the connection that you want to configure and click **Configure**.
4. On the Configure Connection form, fill in the fields.
   The fields that appear on the form depend on which configuration template the parent alias has. For details on each specific template, see Connection and Credential configuration templates.

   Configuring a connection through the dashboard requires the parent alias to have a configuration template. If yours doesn't, clicking **Configure** opens the Connection and Credential Alias record for your alias instead of the Configure Connection form. For more information about configuring your connection in the Connection and Credential Alias record, see Create a Connection and Credential alias.
5. To submit the form, click **Configure**.

Result

The detailed view displays the new connection in the Connections list.

Using the mTLS protocol with a MID Server

Make outbound REST and SOAP calls through a MID Server using mTLS. Store mTLS credential and certificate information on the instance, in a configuration file, or in an external vault. The MID Server retrieves the credential and certificate information and makes outbound REST and SOAP calls using the mTLS protocol.

Mutual authentication using the Transport Layer Security protocol (mTLS) is a secure, certificate-based, authentication scheme where the server and the client authenticate each other. With mTLS, the client presents a certificate or certificate chain to the server, and the server authenticates the client in the same way that the client authenticates the server (mutual authentication).

You can use mTLS with a MID Server by defining a MID Protocol Profile for connections that use mutual authentication. The MID Protocol Profile specifies the mTLS credential and certificate information required for the connection. The MID Server uses the information in the MID Protocol profile to retrieve the keystore, register protocols with the HTTP Client, and make outbound calls with mTLS.

Note:
This feature requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Create a MID Protocol Profile to use mTLS on a MID Server

A MID Protocol Profile enables you to use the mTLS protocol with a MID Server. With a MID Protocol Profile, you can save your mTLS password and certificate information directly on the instance, in a configuration file, or in an external vault. The MID Server uses this information to make outbound REST and SOAP calls using mTLS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Role required: admin or action_designer.
- Configure and start a MID Server. For more information, see Configuring MID Servers.

About this task

This task is divided into four steps.

1. Create a Connection & Credential Alias. This task shows you how to create a basic Connection & Credential alias. For detailed information, see Create a Connection & Credential alias.
2. Create a connection. This task shows you how to create a basic HTTP(s) connection. For more details, see Create an HTTP(s) connection.
3. Create a MID Protocol Profile. The mTLS keystore and password may be stored on the instance (in the MID Protocol Profile), off the instance (in the MID Server's `config.xml` file), or in an external vault. ServiceNow supports CyberArk Password Vault for vault storage.
   - If you're storing them on the instance, the keystore and password must also be on the MID Server.
   - If you're storing them in the config.xml file, make sure you add the mTLS protocol parameters to the file before you configure the MID Protocol Profile. The `config.xml` is in the `/agent` directory, in the MID Server installation directory. See MID Server parameters.
   - If you're storing them in an external vault, make sure you set up your CyberArk integration configuration before creating a MID Protocol Profile.
4. Test your connection with a REST step. This step is optional.

Procedure

1. Create a Connection & Credential alias.
   a. Navigate to **All** > **IntegrationHub** > **Connection & Credential Alias** and select **New**.
   b. On the Connection & Credential Aliases form, enter a name in the **Name** field, and confirm that **Connection type** is set to **HTTP**.
   c. Select **Save**.
2. Create a connection.
   a. On the Connection & Credential Aliases form, in the Connections tab, select **New**.
   b. On the HTTP(s) Connection form, enter a **Name**.
   c. Select **URL builder**, **Mutual authentication**, and **Use MID server**.
   d. In the **MID protocol profile** field, use the magnifying glass icon to open the MID Protocol Profiles form and select **New**.
3. Create a MID Protocol Profile.
   a. On the form, fill in the fields.

MID Protocol Profile form

Field	Description
Protocol	Name for the protocol profile.
Keystore path	Path to the keystore on the MID host. The path can be absolute or relative.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If you're storing mTLS credential information on the instance, enter your keystore path in this field. The keystore must also be on the MID Server. If you're storing mTLS credential information in the `config.xml` file for the MID Server, leave this field empty. Make sure you have added the mTLS protocol parameters to the `config.xml` file.
Applies to	Determines whether this credential applies to all MID Servers or only select ones. Select one of the following. ▪ **All MID servers** ▪ **Specific MID servers**
MID servers	MID Servers this credential applies to. This field is only available when **Applies to** is **Specific MID servers**.
Default port	Default port for the protocol. Default value is 443.
External credential store	Option to use an external credential storage system. Select this option only if you're using CyberArk to store your credential information. You may need to configure the form layout to view this option.
Password	Password for the mTLS protocol. Stored in the database in encrypted form. If you're storing mTLS credential information on the instance, enter your password in this field. The password must also be on the MID Server. If you're storing mTLS credential information in the `config.xml` file for the MID Server, leave this field empty. Make sure you have added the mTLS protocol parameters to the `config.xml` file. If you're storing mTLS credential information in CyberArk, enter the CyberArk ID for the credential.

b. Select **Submit**.

c. On the HTTP(s) Connection form, enter the target host for the connection in the **Host** field and **Save** the Connection form.
On the HTTP(s) Connection form, the **Connection URL** field is filled in with the connection URL.

4. **Optional:** Test your connection with a REST step.

a. Navigate to **All** > **Process Automation** > **Workflow Studio**.

b. On the Workflow Studio landing page, select **New** > **Action**.

c. Give your action a name in the **Action name** field and select **Build action**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the Action Outline section, select **REST**.

e. In the REST step, in the **Connection** field, select **Use Connection Alias** and in the **Connection Alias** field, select the connection alias you created.
The **Base URL** field should be filled in with the connection URL created in step 2.

f. **Save** the REST step and select **Test**.

g. In the pop-up window, select **Run Test**.
After the test runs, the EXECUTION DETAILS page displays. In the ACTION section, expand the steps section. Scroll down to the Step Output Data section to view the Status Code. It should be **200**, showing that you were able to make a successful call to the MID using mTLS.

Integration Hub reference

Reference topics provide additional information about Integration Hub and domain separation.

Domain separation and Integration Hub

Domain separation is supported for Integration Hub. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard*

The support level is Standard but has some exceptions or special conditions.

- Includes all aspects of **Basic** level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must be able to configure minimum viable product (MVP) business logic and data parameters. This configuration is done per tenant, as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview

In general, IntegrationHub inherits the domain separation features of Workflow Studio. As each spoke (application) can have its own domain separation relationship, there is no one specific support level to associate with IntegrationHub. To learn more, see Domain separation and Flow Designer.

Related topics

Domain separation for service providers

Domain separation and Stream Connect

Domain separation is supported for Stream Connect. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Message replication

Records in the following Stream Connect Message Replication tables are domain separated.

- Message Replications [sys_sc_message_replication]
- Channel Replications [sys_sc_channel_replication]
- Message Replication Statistics [sys_sc_channel_replication_metric]
- Kafka Topic Replications [sys_kafka_topic_replication]

The domain for a message replication record is specified in the record's **sys_domain** field.

For channel replication and replication metrics records, the domain is determined by the *domain_master* attribute. The *domain_master* attribute uses a reference field's domain to determine the domain for the current record. A channel replication record gets its domain from the referenced message replication record. A replication metrics record gets its domain from the referenced channel replication record.

A Kafka topic replication record has the same domain as its associated channel replication record because the Channel Replications table is a parent of the Kafka Topic Replications table.

Topic namespaces

You can use topic namespaces to configure which domains can access a Kafka topic on a domain-separated instance. In ServiceNow, Kafka topics are linked to a namespace. Namespaces can be linked to ServiceNow domains. When a namespace is assigned to a specific domain, all the topics created with that namespace are also assigned to the namespace's domain. Users can only see and interact with the topics they have access to, based on domain visibility and access control lists (ACLs).

For more information, see Managing namespaces and topics in Hermes.

Producers and consumers

Stream Connect producers and consumers are also domain separated. For producers, you can produce data only to topics that are visible to the domain.

For consumers, all the tables used to keep runtime data are domain separated. These tables include the following.

- Kafka Streams [sys_kafka_stream]
- Kafka Subscriptions [sys_kafka_subscription]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Kafka Subscription Partition Groups [sys_kafka_partition_group]
- Kafka Consumer Statistics [sys_kafka_consumer_statistics]
- Kafka Unprocessed Messages [sys_kafka_unprocessed_messages]

Domain users can create domain-specific Kafka streams with the topics that are visible to the domain. When activating a Kafka stream, the subscription and partition groups are created within the same domain. At runtime, the domain of the partition group is set by the consumer thread so that all the data is imported to the correct domain. For more information on producers, consumers, and Kafka streams, see Using Stream Connect for Apache Kafka.

Schema management

Tables for schemas and schema registries are domain separated. These include the following.

- Stream Connect Schemas [stream_connect_schema]
- Standalone Stream Connect Schema [standalone_stream_connect_schema]
- Confluent Stream Connect Schema [confluent_stream_connect_schema]
- Stream Connect Schema Registry [stream_connect_schema_registry]
- Confluent Stream Connect Schema [confluent_stream_connect_schema]
- Standalone Stream Connect Schema [standalone_stream_connect_schema]

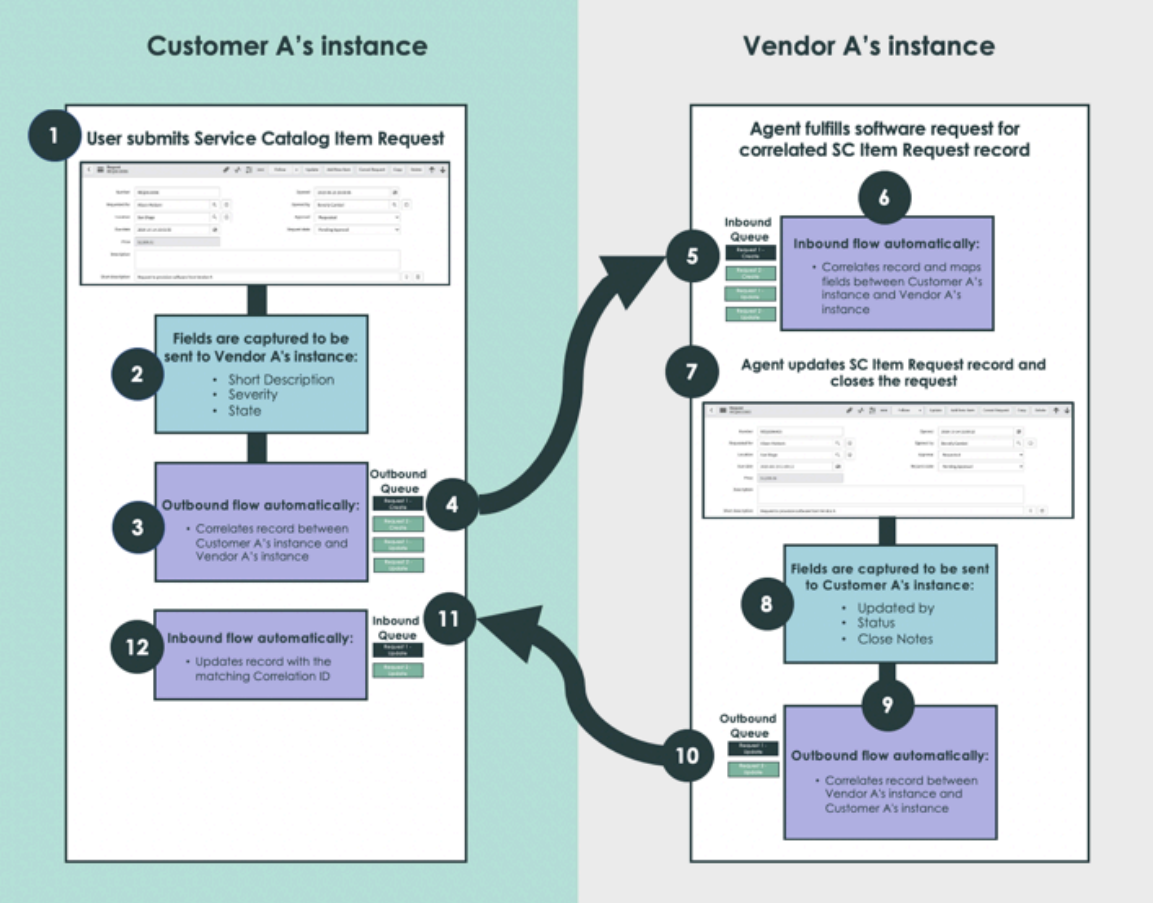
Integration Hub Remote Process Sync

Integration Hub Remote Process Sync enables you to set up one-way or bidirectional integrations among multiple ServiceNow instances, so that your process flows stay in sync.

Note:
Integration Hub Remote Process Sync requires an Integration Hub subscription. For more information, see Legal schedules - Integration Hub overview.

An Integration Hub Remote Process Sync integration lets you span automated workflows for your business process across multiple ServiceNow instances. As a service provider, keep multiple customer instances in sync automatically, using Workflow Studio subflows to automate your process's workflows for all of your customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Benefits

Integration Hub Process Sync provides you with these benefits:

- Automate cross-enterprise automated processes that span multiple instances, keeping various process stakeholders up-to-date
- Manage how to synchronize and correlate your record, attachment, and journal field data across multiple instances
- Ensure order delivery for data updates in remote instances, using a standalone correlation engine and queueing system
- Manage and troubleshoot errors and outages in your automated mutli-instance processes with the built-in execution engine in Workflow Studio.

Roles

By default, Remote Process Sync provides the following roles that you can assign to users:

Role	Users with this role can
ih_process_sync	Create, update, or delete process sync definitions and related records.
ih_process_sync_api	Access Remote Process Sync APIs only.
ih_process_sync_run_as	Run outbound and inbound flows associated with a process sync definition. This user must have access to the tables for which any records are created or updated in the flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation

You can use Remote Process Sync to synchronize process flows among multiple domain-separated instances. In a domain-separated environment, the following conditions apply:

1. When building your integration
   - Configuration tables have a sys_domain, and data is domain separated.
   - Configuration tables are meant to be in the same domain as the parent configuration record.
   - Subflows may be chosen from the current or any parent domain.
   - No tables have sys_overrides , and thus cannot override business rules or UI actions from parent domains.
2. When your integration runs
   - Only records from the configuration domain and associated child domains are captured.
   - Queue tables have a sys_domain. The outbound record is stored in the same domain as the captured source record. The inbound record is stored in the same domain as the Inbound API user in the Remote System record.
   - The outbound subflow runs in the same domain as the queued record.
   - The inbound subflow runs in the same domain as the user specified in the Remote System record's Run Inbound Flows as field.

Getting started

Before deciding to move forward with Remote Process Sync as your integration framework, consider how this framework compares to other multi-instance ServiceNow AI Platform® integrations. While solutions such as Instance Data Replication and the Remote Instance spoke support simple multi-instance integrations, Remote Process Sync supports more complex multi-instance integration use cases, focusing on integrating instances by high-level business processes.

Note:
Remote Process Sync replaces the eBonding spoke for integrating instances.

Comparison of Instance Data Replication, Remote Instance spoke, and Remote Process Sync

Instance Data Replication	Remote Instance spoke	Remote Process Sync

• Is optimized for **replicating an entire table** from one instance to another instance
• Supports **syncing of data in bulk** to build foundation for your integration
• Business rules can trigger **post-replication workflows**, such as send notifications or updating records
• Data that is in transit during a crash is **recoverable**
• Supports **data transformations and mapping**
	• Supports **ad-hoc integrations** in Flow Designer
	• Export, import, and manage data **in a single environment**
	• Queries data from remote instances **on-demand**
	• Interacts with **standard Platform APIs**, such as:
	  ◦ Import Set
	  ◦ Table
	  ◦ Attachment
	• **Requires full privileges** when local and remote instances connect
		• Is **process-oriented**
		• Supports data transformations and mapping **via Flow Designer**
		• Focuses on executing **cross-instance workflows**
		• Has a standalone correlation framework that supports **multi-record and multi-instance correlation**
		• Supports **domain separation**
		• **Minimizes integration privileges** for secure data exchange

		• Supports **domain separation**
		• **Minimizes integration privileges** for secure data exchange

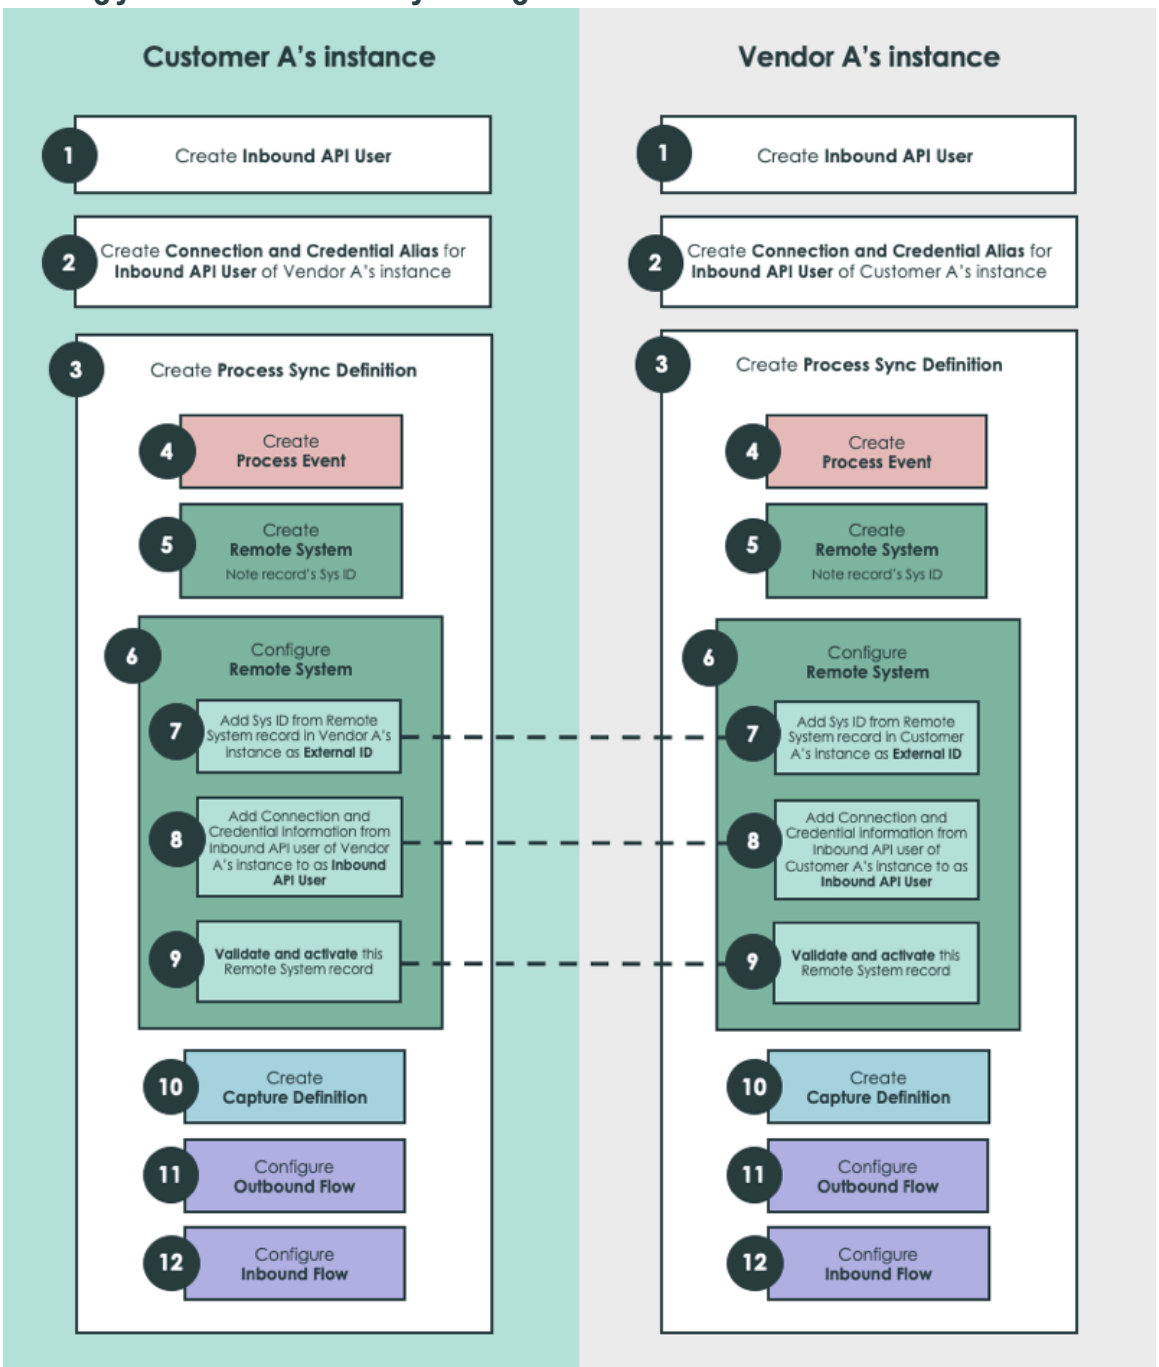
If you choose to use Remote Process Sync as your multi-instance integration framework, the next step is to learn about the difference between:

1. Building your integration, and
2. Managing your integration

Building your integration involves creating and configuring a process sync definition and its related records. For more information on how to get started with building your Remote Process Sync integration, either step through an example of how to Build your first Remote Process Sync integration, or learn about Process sync definitions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Building your Remote Process Sync integration



Managing your integration involves monitoring the outbound and inbound queues and checking for errors related to any triggered process sync definitions. For more information on how to monitor and check for errors with your Remote Process Sync integration, see Outbound queues and inbound queues and Monitoring and troubleshooting your integration. You may also want to periodically evaluate the outbound and inbound flows that run automatically for your integration and determine whether to make any changes to these flows in Workflow Studio.

Note:
Both building and managing a Remote Process Sync integration on your instance also requires that you collaborate effectively with users of the remote instance, or remote instances. Be sure to meet with the stakeholders involved in your integration regularly to plan, manage, and continually improve the automated business processes that your multi-instance integration handles.

© 2026 ServiceNow, Inc. All rights reserved.

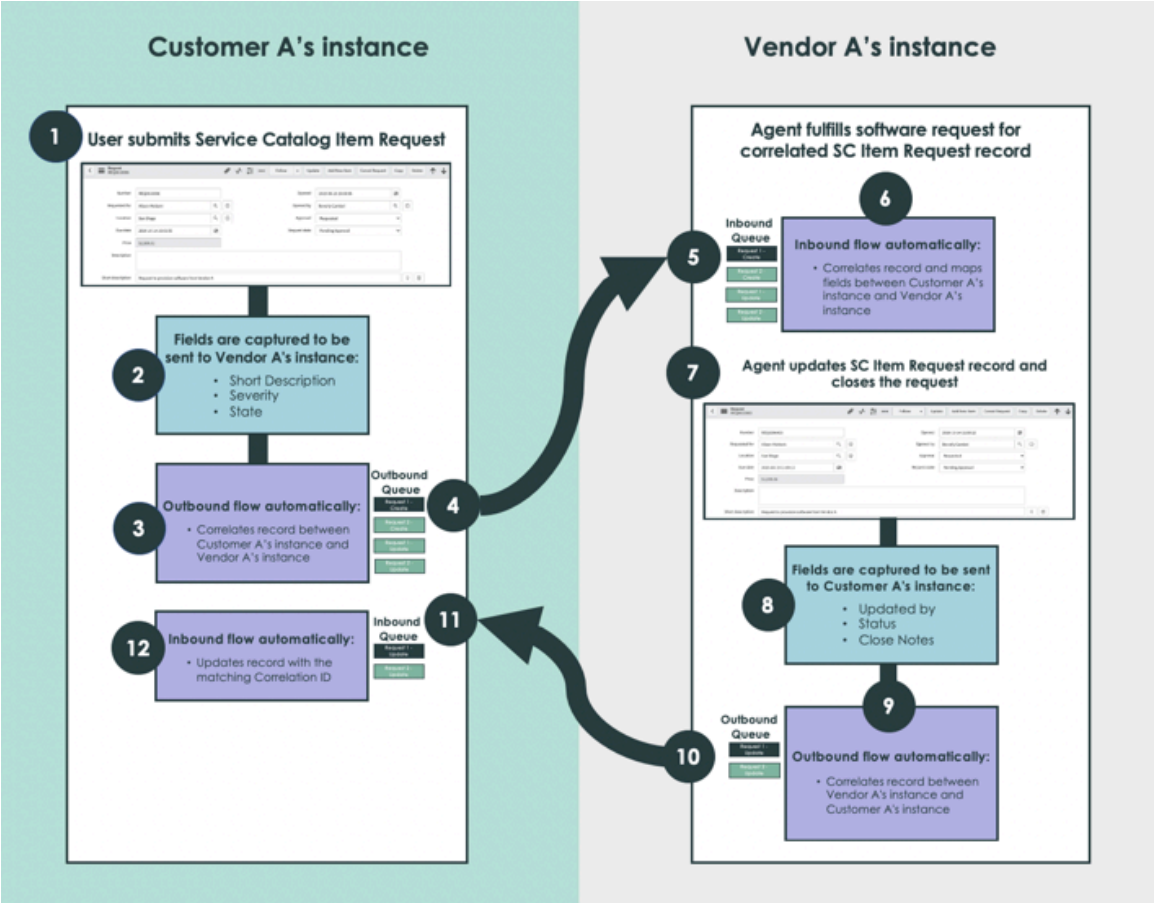
Managing your Remote Process Sync integration



Process sync definitions

A process sync definition contains all of the configurations for your Remote Process Sync integration. Start by creating a new Process Sync Definition record for your integration. Navigate to **IntegrationHub** > **Remote Process Sync** > **Process Sync Definitions**, and then click **New**. In the Process Sync Definition form, fill in the following fields:

Field	Description
Name	Enter a name that accurately describes which part of your business process your instance handles. For example, if users on your instance work to fulfill Service Catalog requests for your customers, enter a name such as Service Catalog Request Fulfillment.
Description	Optionally, describe which part of your business process that this process sync definition handles.
Application	Automatically set to your current application scope.
Domain	If your process relates to a specific domain, choose a domain other than `global`. For more information, see Domain separation for service providers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Click **Submit**, and then you can see your newly created Process Sync Definition record in the list. Next, select the Process Sync Definition record that you just created. You can see that your Process Sync Definition record has the following related lists:

- Capture Definitions
- Process Events
- Remote Systems
- Outbound Flows
- Inbound Flows

Refer to the following sections to learn how to set the configurations for each of these related items.

Capture definitions

A capture definition specifies when your instance should send data to a remote instance and what data your instance should send. A capture definition contains the configurations for your process sync definition's trigger and captured fields. The trigger specifies what record operation, such as creating, updating, or deleting a record, causes your instance to send data to a remote instance. When a Capture Definition is triggered, it creates an object from a source record, which contains captured fields. Then, the outbound flow starts running and correlates the captured fields from the source record to fields in a related record on the remote system.

A Capture Definition record has the following fields:

Field	Description
Process Event	In the Capture Definition form, use the lookup using list icon ( ) to choose the Process Event record that you want to associate with this capture definition. If no process event exists yet, enter a name for your process event, and the system automatically creates a Process Event record and associates the record with your capture definition. For more information, see Process Events.
State	Choose **Active** to activate this capture definition so that the parent process sync definition triggers when the conditions you set in this form's Trigger section are met.
Order	Enter a value for the order in which you want your capture definition to trigger relative to other capture definitions. Lower order values are honored before higher order values.
Application	Automatically set to your current application scope.
Domain	If your process relates to a specific domain, choose a domain other than `global`. For more information, see Domain separation for service providers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the Trigger section, choose an authorized source table whose records you want to trigger your process sync definition. You can also add field conditions that, when met, cause your process sync definition to trigger. When the conditions are met for the trigger specified in your capture definition, any outbound flows associated with your process sync definition start running. For more information, see Outbound flows and inbound flows.

Field	Description
Source Table Name	Choose an authorized table whose records will trigger your process sync definition every time the records are created, updated, and deleted.
Filter	Use the condition builder to add conditions that, when met, will trigger your process sync definition. For example, selecting **[State]** > **[is]** > **[Work In Progress]** causes your process sync definition to trigger every time a record in your selected table's State is updated to Work In Progress.

Lastly, in the Capture section, add fields to the Selected list that you want to include in the payload for your outbound flow.

Field	Description
Include fields	Add fields to the Selected list which you want to sync with fields in the remote instance every time your process sync definition triggers. Use the add item icon ( ) to add fields from the Available list to the Selected list. **Note:** • When your integration runs, the outbound payload that is sent to remote instances always contains these captured fields, regardless of whether they were updated or not. • You can map these captured fields to fields in the remote instance by configuring mappings in the remote instance's inbound flow that is associated with the same process event. For more information, see Outbound flows and inbound flows.
Include Attachments	If selected, any attachments that are associated with triggering records on your local instance will sync with attachments in correlated records on the remote instance. For more information, see

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
RPS captures both interactive and non-interactive changes. You can configure RPS to ignore non-interactive changes, such as changes made via a scheduled job, by setting the *glide.hub.process.sync.capture.non_interactive.changes* property to **false**. For more information, see the How to configure Remote Process Synchronization (RPS) framework to ignore non-interactive changes to records [KB1565025] article in the Now Support Knowledge Base.

Process events

A process event specifies which part of your business process begins in your local instance and ends in the remote instance. The Process Event record in your local instance and in the remote instance should have the same name because the process event signifies the link between these instances that allows them to share parts of the same business process. A Process Event record has the following fields:

Field	Description
Name	Enter a name that describes the part of your business process that begins in your local instance and ends in the remote instance. For example, if users in your instance request software that will be provisioned in the remote instance, you can name the process event `User requests software`. **Note:** An administrator for the remote instance, or remote instances, must also create a process event with the same name that you use here. Creating these process events in separate instances creates the logical link that allows you to integrate data among multiple instances.
Application	Automatically set to your current application scope.
Domain	If your process relates to a specific domain, choose a domain other than `global`. For more information, see Domain separation for service providers.

Remote systems

A remote system contains the configurations for the outbound and inbound connections related to another ServiceNow instance. A Remote System record has the following fields:

Field	Description
Name	Enter a name that describes the remote instance. For example, if the instance is managed by one of your customers, Customer A, enter `Customer A's Instance` in the name field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Optionally, enter more details that describe the remote instance's general purpose in your business process.
External ID	Enter the Sys ID for the Remote System record that shares the same process event with your instance. To get a record's Sys ID, select **Copy sys_id** from the context menu ( ) in the record's form view. For example, if your Remote Process Sync integration spans two instances, Instance A and Instance B, use the Sys ID from Instance A's Remote System record as the External ID in Instance B and vice-versa. Connecting the Sys IDs and External IDs in this way helps multiple instances know which instance to connect to when the automated outbound and inbound flows run.
Application	Automatically set to your current application scope.
Domain	If your process relates to a specific domain, choose a domain other than `global`. For more information, see Domain separation for service providers.
Error Subflow	Select the lookup using list icon ( ) to find and choose a subflow that you want to run when the connection to the remote instance fails. The subflow that you select will run whenever your local instance can't connect to the remote instance after your process sync definition triggers. You can view remote systems that your instance fails to connect to by navigating to **IntegrationHub** > **Remote Process Sync** > **Remote Systems - With Errors**.
Connection Alias	Select the lookup using list icon ( ) to find and choose a Connection & Credential Alias record that you want to use to authenticate with the remote instance. If you haven't set up a Connection & Credential Alias record for this purpose yet, create a new record with Connection and Credential in the Type field. For more information, see Create a Connection and Credential alias.
Outbound State	Set to `Disabled` by default. You can change this field's value to `Active` by selecting the **Validate and Activate Remote System** related link in this Remote System record's form view after you finish creating the record.
Inbound API User	User who can connect to the remote instance. This user must have credentials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	that match those of the user with the ih_process_sync_api role in the remote instance.
Run Inbound Flows as	Select the lookup using list icon ( ) to find and choose a user that you want to run the inbound flow for the associated process event. Option to specify the user that runs the flow. You can select the system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, use this option when you want the incident record comments to come from the user who started the flow. Settings for the Run as option in a flow don't apply to child subflows.
Inbound State	Set to `Disabled` by default. You can change this field's value to `Active` by selecting the **Validate and Activate Remote System** related link in this Remote System record's form view after you finish creating the record.

Note:
After creating a Remote System record with the appropriate fields filled in, you must then click the **Validate and Activate Remote System** related link. Clicking this link checks that you can successfully connect to the remote instance and then activates the outbound and inbound connections.

After creating a Process Event record and a Remote System record, you can then associate Workflow Studio subflows with these records so that automated actions run whenever your process sync definition triggers.

Outbound flows and inbound flows

An outbound flow specifies which Workflow Studio subflow your instance uses to:

1. Process local data, as fields captured in the capture definition, that will be sent to the remote instance
2. Correlate this data with data on the remote instance
3. Send this data to the remote instance

An Outbound Flow record has the following fields:

Field	Description
Process Event	Select the lookup using list icon ( ) to find and choose the Process Event record that you want to associate with this outbound flow. The process event that you select should logically relate to the automated actions that the outbound flow will run when your process sync definition triggers. For example, if your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	outbound flow maps fields from a Service Catalog Item Request record submitted by users in your local instance to related fields in the remote instance, then choose a process event related to users making Service Catalog item requests.
Outbound Subflow	Select the lookup using list icon ( ) to find and choose the Workflow Studio subflow that you want to run whenever your process sync definition triggers. Your instance provides you with a Remote Process Sync Outbound Flow Template - Basic subflow that you can use as a template in any Outbound Flow record. However, you can customize the Remote Process Sync Outbound Flow Template - Basic subflow so that it meets the needs of your business process. You can customize this subflow using the Remote Process Sync outbound actions. For more information, see Build your first Remote Process Sync integration.
Remote System	Select the lookup using list icon ( ) to find and choose the Remote System record that you want to connect to when your outbound flow runs automated actions that require authenticating with the remote instance. The Remote System record you choose should be the remote instance that handles the inbound part of your Remote Process Sync integration.
Application	Automatically set to your current application scope .
Domain	If your process relates to a specific domain, choose a domain other than `global`. For more information, see Domain separation for service providers .

An inbound flow specifies which Workflow Studio subflow your instance uses to:

1. Correlate data on the local instance with the data sent from the remote instance
2. Map fields sent from the remote instance to fields on the local instance
3. Process data sent from the remote instance to the local instance

An Inbound Flow record has the following fields:

Field	Description
Process Event	Select the lookup using list icon ( ) to find and choose the Process Event record that you want to associate with this inbound flow. The process event that you select should logically relate to the automated actions that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	the inbound flow will run when your local instance is ready to handle the payload sent by the remote instance. For example, if your inbound flow maps fields from a Service Catalog Item Request record that users in the remote instance submitted to related fields in your local instance, then choose a process event related to users making Service Catalog item requests.
Inbound Subflow	Select the lookup using list icon ( ) to find and choose the Workflow Studio subflow that you want to run whenever your instance handles data sent by a remote instance. Your instance provides you with a Remote Process Sync Inbound Flow Template - Basic subflow that you can use as a template in any Inbound Flow record. However, you can customize the Remote Process Sync Inbound Flow Template - Basic subflow so that it meets the needs of your business process. You can customize this subflow using the Remote Process Sync inbound actions. For more information, see Build your first Remote Process Sync integration.
Remote System	Select the lookup using list icon ( ) to find and choose the Remote System record that you want to connect to when your inbound flow runs automated actions that require authenticating with the remote instance. The Remote System record you choose should be the remote instance that handles the outbound part of your Remote Process Sync integration.
Application	Automatically set to your current application scope.
Domain	If your process relates to a specific domain, choose a domain other than `global`. For more information, see Domain separation for service providers.

Note:
Each outbound flow and inbound flow must always be associated with one process event and one remote system only.

Before simply choosing the system-provided Remote Process Sync Outbound Flow Template - Basic or Remote Process Sync Inbound Flow Template - Basic subflows for your process sync definition, you may want to customize these subflows in Workflow Studio.

Syncing attachments

you can choose to send attachments associated with your local record by using the Include Attachments option in your capture definition. However, Remote Process Sync handles

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

attachments differently from other data in your integration due to security and attachment file size issues:

- The first time that a record in your integration syncs, all attachments are sent in the outbound payload. Subsequent syncs can send either changes to attachments or all attachments.
- Attachment metadata is always sent with the outbound payload. This metadata includes an encrypted synthetic key, hash, file name, content type, and size.
- The remote instance decides which attachments to receive by comparing each hash and file name from the inbound payload to those on the instance. Then, the following process occurs:
  1. The originating system validates the key and pushes attachments to the correlation record.
  2. The originating system notifies the remote system that the attachments are complete.
  3. The remote system moves the attachments from the correlation record to the target record.

Syncing comments and work notes

In your integration, comments and work notes are synced among instances only when changes occur to those journal fields. Change metadata is included in payloads so that remote systems can identify which user created the comment or work note and when it was created.

Outbound queues and inbound queues

After building your Remote Process Sync integration by creating and configuring the records mentioned in the previous sections, you can then manage your integration by monitoring the outbound queue and inbound queue in your instance.

An outbound queue contains the status, error information, retry data, and flow context information for outbound subflows that ran for data that was sent out of your instance. To view the records in your outbound queue, navigate to **IntegrationHub** > **Remote Process Sync** > **Outbound Queue State**.

An Outbound Queue State record has the following fields:

Field	Description
Created	Date that the automated action in your integration occurred
Error info	Status message for the outbound payload
Process Event	Process event
Remote System	Remote System
Retry metadata	Metadata for any retry policies configured for your outbound payload
Status	Processing status of the payload in the outbound queue. Options include: • Ready • Processed • Error • Skipped

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Domain	Domain in which the automated action for your integration ran
Outbound Subflow Context	Sys ID of the execution record for the outbound flow that processed the payload

Note:
You can get more detailed troubleshooting information for outbound payloads in associated Outbound Queue records. To access these records, navigate to **IntegrationHub** > **Remote Process Sync** > **Outbound Queue**.

An inbound queue contains the status, processing sequence, and correlation information for inbound subflows that ran for data that was sent from a remote instance to your local instance. To view the records in your inbound queue, navigate to **IntegrationHub** > **Remote Process Sync** > **Inbound Queue**.

An Inbound Queue record has the following fields:

Field	Description
Sequence	Order in the queue. A lower number is processed before a higher number.
Status	Processing status of the payload in the inbound queue. Options include: • Ready • Processed • Error • Skipped **Note:** If an Inbound Queue record has an Error status, change the status to Ready to retry processing the inbound payload.
Process Event	Process event associated with the integration action
Operation	Type of record operation that the remote instance performed, which caused the remote instance to trigger and send data. Options include: • Create • Update • Delete
Transform Context	Sys ID of the execution record for the inbound flow that processed the payload
Local Correlation ID	Correlation ID on the local instance
Remote Correlation ID	Correlation ID on the remote instance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Remote System	Remote System record associated with the instance that sent the data
Domain	Domain in which the automated action for your integration ran
Payload	String as JSON payload for inbound data

Note:
Both the Outbound Queue and Inbound Queue tables are maintained by table cleaners that remove records from these tables every 30 days.

Monitoring and troubleshooting your integration

You can use the following tables to monitor your Remote Process Sync integration, once it is built and running:

Table	Description
XML Stats	View the *process_sync_queue* section for information about the outbound and inbound queues for your integration, including the size of the queue as well as error and processing rates.
Outbound Queue	View the capture data for records that are staged to be sent out of your instance.
Outbound Queue State	View the state of records in the Outbound Queue table.
Inbound Queue	View the combined inbound queue and record table.
Logs	Start by turning on debugging by setting the *glide.ih.process.sync.debug* system property to `true`. Then, scan the Logs for error messages beginning with `OutboundQueueDao` and `InboundQueueDao` to find log messages with more information about potential issues with your integration.

If an error occurs with your Remote Process Sync integration, begin by confirming whether the error is a connection error or a data processing error:

Connection errors

Outbound connection errors automatically retry several times before setting the Remote System record's Outbound State to Error. If errors keep occurring for an outbound connection, confirm that nothing has changed with the Remote System's Inbound API User, such as a change in the user's credentials. Then, validate and activate the Remote System record again.

Data processing errors

Data processing errors typically occur as a result of errors in an outbound flow or inbound flow. To troubleshoot these errors, you can add error handling actions to your flow, such as a Log action or Send Email action, when the flow's State changes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to Error. You can also add actions that reprocess or skip processing of records in the Outbound Queue or Inbound Queue tables if an error with the flow occurs.

Build your first Remote Process Sync integration

Step through an example of how to build a Remote Process Sync integration in order to link the automated processes of two ServiceNow® instances together.

Before you begin

- Activate Remote Process Sync on each instance in your integration by purchasing the Integration Hub Enterprise package. For more information, see Request Integration Hub.
- Activate the explicit roles security feature on each instance in your integration. For more information, see Explicit Role plugin.
- Learn about how to build and manage an Integration Hub Remote Process Sync integration by checking out Getting started with Remote Process Sync.
- Confirm the instances that you will link together in the following example are not production instances. It is recommended to test this example on sub-production instances only in order to avoid overwriting any important data on either instance. You might also want to use a Personal Developer Instance for testing this example integration.
- Confirm that you do not have any existing business rules, workflows, or Workflow Studio flows whose logic will conflict with the flows we will create in the following example.
- Role required: admin

About this task

In the following example, you will step through how to link two ServiceNow instances' automated processes together. The use case for this example is that a customer creates requests for hardware that are fulfilled by a vendor. We will refer to the customer's instance as Instance A, and the vendor's instance as Instance B. We will start by setting up credentials in each instance that can access the remote instance. We will also create a user in each instance that can run the outbound and inbound flows.

Procedure

1. In Instance A, ensure that your domain is set to `global`, and then navigate to **System Security** > **Users and Groups** > **Users**.
2. Select **New** to open a new User form view, and then fill in the following fields:

Field	Description
User ID	Enter `rps.api.instance.a`
First name	Enter `RPS API User for Instance A`

   Select **Save**.
3. While still on the User form, select **Set Password** to set a password.
   For details, see steps four and five in Configuring password for a user.
4. Reset the password for RPS API User for Instance A.
5. Navigate back to **System Security** > **Users and Groups** > **Users** and select the User record that you just created.

a. Navigate to and select the Roles related list.

b. Select **Edit...** to configure the user's roles.

c. In the search window above Collection, enter `ih_process_sync_api`.

d. Select **ih_process_sync_api** and **snc_external** from the Collection list, and then select the add button ( ) to add these roles to the Roles List.

> **Note:**
> The snc_external role restricts the access of external users to only the resources they have been explicitly granted access to.

e. Select **Save**.

6. Select **New** to open a new User form view, and then fill in the following fields:

Field	Description
User ID	Enter `rps.run.as`
First name	Enter RPS `Run as User A`

Select **Save**.

7. While still on the User form, select **Set Password** to set a password.
For details, see steps four and five in Configuring password for a user .
8. Reset the password for RPS Run as User A.
9. Navigate back to **System Security** > **Users and Groups** > **Users** and select the User record that you just created.
   a. Navigate to and select the Roles related list.
   b. Select **Edit...** to configure the user's roles.
   c. In the search window above Collection, enter `ih_process_sync_run_as`.
   d. Select **ih_process_sync_run_as** from the Collection list, and then select the add button ( ) to add that role to the Roles List.
   e. In the search window above Collection, enter `incident_manager`.
   f. Select **incident_manager** from the Collection list, and then select the add button ( ) to add that role to the Roles List.
   g. Select **Save**.
10. In Instance B, ensure that your domain is set to `global`, and then navigate to **System Security** > **Users and Groups** > **Users**.
11. Select **New** to open a new User form view, and then fill in the following fields:

Field	Description
User ID	Enter `rps.api.instance.b`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
First name	Enter `RPS API User for Instance B`

Select **Save**.

12. While still on the User form, select **Set Password** to set a password.
For details, see steps four and five in Configuring password for a user.
13. Reset the password for RPS API User for Instance B.
14. Navigate back to **System Security** > **Users and Groups** > **Users** and select the User record that you just created.
    a. Navigate to and select the Roles related list.
    b. Select **Edit...** to configure the user's roles.
    c. In the search window above Collection, enter `ih_process_sync_api`.
    d. Select **ih_process_sync_api** and **snc_external** from the Collection list, and then select the add button ( ) to add these roles to the Roles List.

    Note:
    The snc_external role restricts the access of external users to only the resources they have been explicitly granted access to.

    e. Select **Save**.
15. Select **New** to open a new User form view, and then fill in the following fields:

Field	Description
User ID	Enter `rps.run.as`
First name	Enter `RPS Run as User B`

Select **Save**.

16. While still on the User form, select **Set Password** to set a password.
For details, see steps four and five in Configuring password for a user.
17. Reset the password for RPS Run as User B from Instance B.
18. Navigate back to **System Security** > **Users and Groups** > **Users** and select the User record that you just created.
    a. Navigate to and select the Roles related list.
    b. Select **Edit...** to configure the user's roles.
    c. In the search window above Collection, enter `ih_process_sync_run_as`.
    d. Select **ih_process_sync_run_as** from the Collection list, and then select the add button ( ) to add that role to the Roles List.
    e. In the search window above Collection, enter `incident_manager`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Select **incident_manager** from the Collection list, and then select the add button ( ) to add that role to the Roles List.

g. Select **Save**.

19. In Instance A, navigate to **IntegrationHub** > **Connections & Credentials** > **Credentials**, and then select **New**.

a. From the list of connection options, select **Basic Auth Credentials**.

b. In the form, fill in the following fields:

Field	Description
Name	Enter RPS `Vendor Credentials`
User name	Enter `rps.api.instance.b`
Password	Enter the password for RPS API User for Instance B.

Note:
The credentials you enter must match the credentials for the RPS API User that you created in Instance B.

c. Select **Submit**.

20. While still in Instance A, navigate to **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**, and then select **New**.

a. In the Name field, enter RPS `Vendor Demo`.
Leave all other fields as they are, and then select **Submit**.

b. From the list, select the RPS `Vendor Demo` record that you just created.

c. In the Connections related list, select **New**.

d. In the form, fill in the following fields:

Field	Description
Name	Enter RPS `Vendor`.
Credential	Select the lookup using list icon ( ), and then select the RPS `Vendor Credentials` record from the list.
Connection URL	Enter the base URL of Instance B. The URL should begin with `https://` and end with `.service-now.com/`

e. Leave all other fields as they are, and then select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.

21. In Instance B, navigate to **IntegrationHub** > **Connections & Credentials** > **Credentials**, and then select **New**.

    a. From the list of connection options, select **Basic Auth Credentials**.

    b. In the form, fill in the following fields:

Field	Description
Name	Enter RPS `Customer Credentials`
User name	Enter `rps.api.instance.a`
Password	Enter the password for RPS API User for Instance A.

> **Note:**
> The credentials you enter must match the credentials for the RPS API User that you created in Instance A.

    c. Select **Submit**.

22. While still in Instance B, navigate to **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**, and then select **New**.

    a. In the Name field, enter RPS `Customer Demo`.
    Leave all other fields as they are, and then select **Submit**.

    b. From the list, select the RPS `Customer Demo` record that you just created.

    c. In the Connections related list, select **New**.

    d. In the form, fill in the following fields:

Field	Description
Name	Enter RPS `Customer`.
Credential	Select the lookup using list icon ( ), and then select the RPS `Customer Credentials` record from the list.
Connection URL	Enter the base URL of Instance A. The URL should begin with `https://` and end with `.service-now.com/`

    e. Leave all other fields as they are, and then select **Submit**.

    We've successfully created credentials that can be used to access each remote instance. Now, let's ensure that we can send and receive data between instances by configuring the Remote System record for a Process Sync Definition in each instance.

23. In Instance A, navigate to **IntegrationHub** > **Remote Process Sync** > **Process Sync Definitions**, and then select **New**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the form, fill in the following fields:

Field	Description
Name	Enter `Hardware Request Process`
Description	Enter `Process for requesting hardware and handling fulfilled hardware requests`

b. Leave all other fields as they are, and then select **Submit**.

c. From the list, select the `Hardware Request Process` record that you just created.

24. In the Remote Systems related list, select **New**.

a. In the form, fill in the following fields:

Field	Description
Name	Enter `Vendor Instance - Instance B`
Description	Enter `Vendor instance that fulfills hardware requests`
Connection Alias	Select the lookup using list icon ( ), and then select the RPS_Vendor_Demo record from the list.
Inbound API User	Select the lookup using list icon ( ), and then select the RPS API User for Instance A record from the list.
Run as	Select the lookup using list icon ( ), and then select the RPS Run as User record from the list.

b. In the context header, select the additional actions icon ( ) and then select **Copy sys_id**. You will need this Sys ID as the value for the External ID field of the Remote System record in Instance B.

c. Leave all other fields as they are, and then select **Submit**.

25. In Instance B, navigate to **IntegrationHub** > **Remote Process Sync** > **Process Sync Definitions**, and then select **New**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the form, fill in the following fields:

Field	Description
Name	Enter `Hardware Fulfillment Process`
Description	Enter `Process for fulfilling hardware requests`

b. Leave all other fields as they are, and then select **Submit**.

c. From the list, select the `Hardware Fulfillment Process` record that you just created.

26. In the Remote Systems related list, select **New**.

a. In the form, fill in the following fields:

Field	Description
Name	Enter `Customer Instance - Instance A`
Description	Enter `Customer instance that requests hardware`
External ID	Paste the value of the Sys ID that you copied from the Remote System record in Instance A.
Connection Alias	Select the lookup using list icon ( ), and then select the `RPS_Customer_Demo` record from the list.
Inbound API User	Select the lookup using list icon ( ), and then select the `RPS API User for Instance B` record from the list.
Run as	Select the lookup using list icon ( ), and then select the `RPS Run as User` record from the list.

b. Leave all other fields as they are, and then select **Submit**.

c. From the Remote Systems related list, select the `Customer Instance - Instance A` record.

d. In the context header, select the additional actions icon ( ) and then select **Copy sys_id**. You will need this Sys ID as the value for the External ID field of the Remote System record in Instance A.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

27. In Instance B, navigate to **IntegrationHub** > **Remote Process Sync** > **Remote Systems - All**, and then select the `Customer Instance - Instance A` record from the list.

    a. In the External ID field, paste the value of the Sys ID that you copied from the Remote System record in Instance A.

    b. Select Update to save your changes to the record.

    c. From the list, select the `Customer Instance - Instance A` record.

    d. In the Related links section, select **Validate and Activate Remote System**.
    You should see a message that displays `Remote system validated and activated successfully`. If you see an error message instead, go back and check the configuration for the Remote System record.

    We have successfully connected Instance A and Instance B together so that they can share data across their process workflows. Now, we will define how our integration will trigger and run automatically, as well as which fields we want to capture and sync between instances.

28. In Instance A, navigate to **IntegrationHub** > **Remote Process Sync** > **Process Sync Definitions**, and then select the `Hardware Request Process` record from the list.

29. In the Process Events related list, select **New**.

    a. In the Name field, enter `Request Hardware`.

    Note:
    This field is case-sensitive. It functions similarly to an API endpoint method name.

    b. Leave all other fields as they are, and then select **Submit**.

30. In the Process Events related list, select **New**.

    a. In the Name field, enter `Hardware Request Fulfilled`.

    b. Leave all other fields as they are, and then select **Submit**.

31. In the Capture Definitions related list, select **New**.

    a. In the form, fill in the following fields:

Field	Description
Process Event	select the lookup using list icon ( ), and then select the `Request Hardware` record from the list.
State	Select **Active**
Source Table Name	Select **Incident [incident]**
Filter	In the condition builder, select **Assignment Group** > **is** and then select the lookup using list icon ( ). Choose the `Hardware` record from the list.

Field	Description
	Note: When building your own integration, you can add Remote Process Sync actions to personalize this template subflow to your needs. To edit this template subflow in Workflow Studio, select the Configure Subflow icon ( ).
Remote System	Select the lookup using list icon ( ), and then select the `Vendor Instance - Instance B` record from the list.

b. Leave all other fields as they are, and then select **Submit**.

33. In Instance B, navigate to **IntegrationHub** > **Remote Process Sync** > **Process Sync Definitions**, and then select the `Hardware Fulfillment Process` record from the list.

34. In the Process Events related list, select **New**.

a. In the Name field, enter `Request Hardware`.

b. Leave all other fields as they are, and then select **Submit**.

35. In the Process Events related list, select **New**.

a. In the Name field, enter `Hardware Request Fulfilled`.

b. Leave all other fields as they are, and then select **Submit**.

Note:
Create Process Event records in both instances with names that match. This will help you keep track of the linked process workflows between instances.

36. In the Capture Definitions related list, select **New**.

a. In the form, fill in the following fields:

Field	Description
Process Event	select the lookup using list icon ( ), and then select the `Hardware Request Fulfilled` record from the list.
State	Select **Active**
Source Table Name	Select **Incident [incident]**
Filter	In the condition builder, select **Assignment Group** > **is** and then select the lookup using list icon ( ). Choose the `Hardware` record from the list. Then, select **AND** to add

Field	Description
	sends the captured payload to the remote instance. **Note:** When building your own integration, you can add Remote Process Sync actions to personalize this template subflow to your needs. To edit this template subflow in Workflow Studio, select the Configure Subflow icon ( ).
Remote System	Select the lookup using list icon ( ), and then select the `Customer Instance - Instance A` record from the list.

b. Leave all other fields as they are, and then select **Submit**.

We have successfully set up how our Remote Process Sync integration will trigger, and which fields will be captured and sent to either remote instance. In this final section, we will customize the inbound flows in Workflow Studio so that they properly transform inbound data.

38. In Instance B, navigate to **IntegrationHub** > **Remote Process Sync** > **Process Sync Definitions**, and then select the `Hardware Fulfillment Process` record from the list.

39. Make a copy of the `Remote Process Sync Inbound Flow Template - Basic` record.

a. Navigate to Workflow Studio and select the Subflows tab.

b. Filter the **Name** column to locate the `Remote Process Sync Inbound Flow Template - Basic` record and select it.

c. In the subflow, select the More Actions menu, then select **Copy subflow**.

40. In the subflow, update the Payload.

a. Expand the `Transform Payload from Inbound Sample` action.

b. In the Sample Payload field, enter the following sample payload:

```
{"capture_metadata":{"changed_by":"admin","timestamp":"2020-0
9-24 19:26:59"},
"changed_fields":[

 {"display_value":"","value":"incident","key":"sys_class_name
"},

 {"display_value":"","value":"552c48888c033300964f4932b03eb09
2","key":"sys_id"},
  {"display_value":"","value":"INC0040015","key":"number"},
  {"display_value":"","value":"","key":"short_description"},

 {"display_value":"Hardware","value":"9f5b572d9cd82010f877a5c
fd1fdce30","key":"assignment_group"},
  {"display_value":"","value":"1","key":"severity"},
  {"display_value":"","value":"2","key":"state"}]}
```

Note:
This payload is a complex object that represents the captured metadata and fields that are sent from Instance A to Instance B.

c. Select **Done**.

41. In the subflow, under the `Else` flow logic, select **Create Incident Record**.

a. Add the following fields and associated values:

Field	Value
Short description	Select the data pill picker icon (). Dot-walk to and then select **1 - Transform Payload from Inbound Sample** > **Changed Fields** > **short_description**.
Description	Select the data pill picker icon (). Dot-walk to and then select **1 - Transform Payload from Inbound Sample** > **Changed Fields** > **short_description**.
Assignment group	Select the data pill picker icon (). Dot-walk to and then select **1 - Transform Payload from Inbound Sample** > **Changed Fields** > **assignment_group**.
Urgency	Select the data pill picker icon (). Dot-walk to and then select **1 - Transform Payload from Inbound Sample** > **Changed Fields** > **severity**.
State	Select the data pill picker icon (). Dot-walk to and then select **1 - Transform Payload from Inbound Sample** > **Changed Fields** > **state**.

b. Select **Done**.

42. Under the `If` flow logic next to `then`, select **Update Incident Record**.

a. In the Fields input, add the following fields and associated values:

Field	Value
Short description	Select the data pill picker icon (). Dot-walk to and then select **1 - Transform Payload from Inbound Sample** > **Changed Fields** > **short_description**.
Description	Select the data pill picker icon (). Dot-walk to and then select **1 - Transform**

Field	Value
	Payload from Inbound Sample > **Changed Fields** > **short_description**.
Assignment group	Select the data pill picker icon ( ). Dot-walk to and then select **1 - Transform Payload from Inbound Sample** > **Changed Fields** > **assignment_group**.
Urgency	Select the data pill picker icon ( ). Dot-walk to and then select **1 - Transform Payload from Inbound Sample** > **Changed Fields** > **severity**.
State	Select the data pill picker icon ( ). Dot-walk to and then select **1 - Transform Payload from Inbound Sample** > **Changed Fields** > **state**.

b. Select **Done**.

43. **Publish** the subflow.

44. Back in the Hardware Fulfillment Process record, in the Inbound Flows related list, select **New**.

a. In the form, fill in the following fields:

Field	Description
Process Event	From the list, select **Request Hardware**.
Inbound Subflow	Select `Copy of Remote Process Sync Inbound Flow Template - Basic`.
Remote System	Select the lookup using list icon ( ), and then select the `Customer Instance - Instance A` record from the list.

b. Leave all other fields as they are, and then select **Submit**.

45. In Instance A, navigate to **IntegrationHub** > **Remote Process Sync** > **Process Sync Definitions**, and then select the `Hardware Request Process` record from the list.

46. Make a copy of the `Remote Process Sync Inbound Flow Template - Basic` record.

a. Navigate to Workflow Studio and select the Subflows tab.

b. Filter the **Name** column to locate the `Remote Process Sync Inbound Flow Template - Basic` record and select it.

c. In the subflow, select the More Actions menu, then select **Copy subflow**.

47. In the subflow, update the Payload.

Field	Value
	Payload from Inbound Sample > **Changed Fields** > **close_code**.

b. Select **Done**.

49. In the subflow, delete the `Else` statement.

50. **Publish** the subflow.

51. Back in the Hardware Fulfillment Process record, in the Inbound Flows related list, select **New**.

a. In the form, fill in the following fields:

Field	Description
Process Event	From the list, select **Hardware Request Fulfilled**.
Inbound Subflow	Select `Copy of Remote Process Sync Inbound Flow Template - Basic`.
Remote System	Select the lookup using list icon ( ), and then select the `Vendor Instance - Instance B` record from the list.

b. Leave all other fields as they are, and then select **Submit**.

Result

We've finished building our Remote Process Sync integration. The integration will now trigger whenever a user creates an Incident record with the Hardware assignment group in Incident A. When this happens:

- The fields specified in Instance A's Capture Definition are captured and stored in a local record.
- The local record is correlated with a remote record in Instance B.
- The captured fields are mapped to the fields we specified in Instance B's Inbound Flow.

Then, when a user resolves the correlated Incident record in Instance B:

- The fields specified in Instance B's Capture Definition are captured and stored in a local record.
- The local record is correlated with the remote record in Instance A.
- The captured fields are mapped to the fields we specified in Instance A's Inbound Flow.

What to do next

Test out your Remote Process Sync integration by creating an Incident record in Instance A with the Hardware assignment group. Then, resolve the correlated Incident record in Instance B. If your correlated records don't sync as expected, check your Inbound API User's credentials and Process Sync Definition configuration in each Instance. If you continue to experience issues with your example integration, refer to Monitoring and troubleshooting your integration.

Remote Process Sync actions

Learn how to use actions in outbound and inbound flows for your Integration Hub Remote Process Sync integration.

Remote Process Sync provides you with a collection of Workflow Studio actions that you can use to customize the default outbound and inbound flow templates. These actions let you:

- Create correlations between records on local and remote instances
- Manage attachments between local and remote instances
- Send captured payloads to a remote instance
- Transform inbound payloads to complex objects

Remote Process Sync action dependencies

Certain Remote Process Sync actions are dependent upon other actions, and thus are generally intended for you to use together. The following use cases describe situations in which you might consider using dependent Remote Process Sync actions in your outbound and inbound flows.

Correlate a record with a captured payload: Use these actions in the following order to automatically correlate a record with a captured payload to be sent to a remote system:

1. Look Up Correlation By Local Correlation ID - Use this action to determine if a correlated record exists between your staged local record and a record on the remote system.
2. Send Captured Payload to Remote System - Use the `Correlation Detail` output data pill from the **Look Up Correlation By Local Correlation ID** record as the value for the Correlation Detail input in this action. This enables you to correlate the local record containing the outbound payload to a record on the remote system.

> **Note:**
> The *`Remote Process Sync Outbound Flow Template - Basic`* provides you with these two actions so that you don't need to set up this correlation yourself.

Identify and request missing attachments from a remote system: Use these actions in the following order to automatically look up and request attachments from a remote system that don't exist in your local system:

1. Identify New Attachments - Use this action to look up any attachments that exist on the remote system but don't exist on your local system for correlated records.
2. Request Attachments from Remote System - Use this action to request the transfer of identified attachments from the remote system to your local system.

Create Correlation action

Create a correlation between a record on the local instance and a record on a remote instance. A correlation identifies a remote system and a local record to synchronize. Each instance maintains a copy of the correlation, which contains a set of shared correlation identifiers. Remote Process Sync actions and flows use the correlation identifiers to synchronize records.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag and drop pills from the Data panel or select them from the pill picker.

Remote Correlation ID

Data type: *String*

Globally unique ID of a correlation on a remote instance you are synchronizing processes with. This ID uniquely identifies the correlation for outbound transactions.

Local Correlation ID

Data type: *String*

Globally unique ID of a correlation on the local instance you are synchronizing processes with. This ID uniquely identifies the correlation for inbound transactions.

Remote System

Data type: *Record*

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

Local Record

Data type: *Record*

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Correlation Detail

Data type: *Object*

Object containing correlation information about a record. The object identifies the local and remote correlation IDs associated with a local record.

Status

Data type: *String*

Status code returned by the action.

Error

Data type: *String*

Error returned by the action.

Get Attachment Metadata for Local Record action

Get the list of attachments associated with a specified local record. Use the output of this action to synchronize the attachments of a local record with the attachments of a remote record.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Local Record

Data type: *Record*

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

Strategy

Data type: *Choice*

Level of attachment detail to gather. The available options are All or Deltas. Use the All option to gather all synchronized attachments. Use the Deltas option to gather only attachments that have changed since the last synchronization.

Remote System

Data type: *Record*

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

Correlation Detail

Data type: *Object*

Object containing correlation information about a synchronized record. The object identifies the local and remote correlation IDs associated with a local record.

Attachments

Data type: *Array of Objects*

Array containing a list of attachment objects to evaluate.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Attachments: Data type: *Array of Objects*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Array containing information about the attachments to synchronize.

Identify New Attachments action

Identify the attachments a local record already has to determine which remote attachments need synchronization. Use the output of this action to request missing attachments from a remote system.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag and drop pills from the Data panel or select them from the pill picker.

Attachments

Data type: *Array of Objects*

Array containing a list of attachment objects to evaluate.

Local Record

Data type: *Record*

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Attachments

Data type: *Array of Objects*

Array containing information about the attachments to synchronize.

Count

Data type: *Integer*

Number of attachments identified.

Look Up Correlation by Local Correlation ID action

Look up an active correlation by a specified local correlation ID. The local correlation ID identifies the correlation on the local instance. Remote Process Sync actions and flows use the returned correlation to synchronize a local record with a record on a remote system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Remote System

Data type: *Record*

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

Local Correlation ID

Data type: *String*

Globally unique ID of a correlation on the local instance you are synchronizing processes with. This ID uniquely identifies the correlation for inbound transactions.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Correlation Detail

Data type: *Object*

Object containing correlation information about a record. The object identifies the local and remote correlation IDs associated with a local record.

Status

Data type: *String*

Status code returned by the action.

Look Up Correlation by Local Record action

Look up an active correlation by a specified local record sys_id. The local record is the record the correlation synchronizes on the local instance. Remote Process Sync actions and flows use the returned correlation to synchronize a local record with a record on a remote system.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Remote System

Data type: *Record*

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

Local Record

Data type: *Record*

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Correlation Detail

Data type: *Object*

Object containing correlation information about a record. The object identifies the local and remote correlation IDs associated with a local record.

Status

Data type: *String*

Status code returned by the action.

Move Attachments action

Move attachments from a correlation record to the local record it synchronizes. This action looks up the correlation record by its sys_id.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Correlation ID: Data type: *String*

Globally unique ID of a correlation record on the local instance.

Outputs

This action has no outputs.

Request Attachments from Remote System action

Request the transfer of the identified attachments using the specified correlation. The system moves attachments associated with the record on the remote system to the local system.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Attachments

Data type: *Array of Objects*

Array containing a list of attachment objects to evaluate.

Remote System

Data type: *Record*

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

Correlation Detail

Data type: *Object*

Object containing correlation information about a synchronized record. The object identifies the local and remote correlation IDs associated with a local record.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Status: Data type: *String*

Status code returned by the action.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Send Captured Payload to Remote System

Generate a captured payload, and send it to a remote system. This action should follow a Look Up Correlation action. Remote Process Sync flows use the returned correlation to check if a new correlation should be created.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Remote System

Data type: *Record*

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

CRUD Operation

Data type: *Choice*

Database operation that triggered the process event. The available options are Create, Update, or Delete.

Process Event

Data type: *String*

Name of the process event to run. The name is the same on each instance that participates in process synchronization. For example, case-to-incident.

Payload

Data type: *Object*

Object containing changes generated by a capture definition. For example, a list of field changes for a case record on the local instance. The system transforms this object to a JSON string to send it to a remote instance.

Correlation Detail

Data type: *Object*

Object containing correlation information about a synchronized record. The object identifies the local and remote correlation IDs associated with a local record.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Status

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type: *String*

Status code returned by the action.

Error Message

Data type: *String*

Error returned by the action.

Local Correlation ID

Data type: *String*

Globally unique ID of a correlation on the local instance you are synchronizing processes with. This ID uniquely identifies the correlation for inbound transactions.

Remote Correlation ID

Data type: *String*

Globally unique ID of a correlation on a remote instance you are synchronizing processes with. This ID uniquely identifies the correlation for outbound transactions.

Transform Payload from Inbound Sample action

Transform a Remote Process Sync payload from a JSON string to a complex object. Generate the object structure from a sample of the inbound payload.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Payload

Data type: *String*

JSON string containing changes generated on a remote instance. For example, a list of field changes for a case record from a remote instance. The system transforms this JSON string to an object on the local instance.

Sample Payload

Data type: *String*

Portion of a JSON payload you want to use to generate an object structure. Select the elements of the JSON structure you want to map to elements of an object structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Capture Metadata

Data type: *Object*

Object containing information about the capture definition that created the payload.

Changed Fields

Data type: *Dynamic Object*

Object containing information about the field value changes. The system uses these changes to synchronize correlation and local records.

Attachment Metadata

Data type: *Array of Object*

Array containing information about the attachments to synchronize.

Error Message

Data type: *String*

Error returned by the action.

Update Correlation State action

Enable or disable synchronization of records by the specified correlation. Set an active correlation to inactive to disable synchronization of records. Set an inactive correlation to active to resume synchronization of records.

Roles and availability

Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Correlation Detail

Data type: *Object*

Object containing correlation information about a synchronized record. The object identifies the local and remote correlation IDs associated with a local record.

State

Data type: *Choice*

Synchronization state of records. The available options are Active or Inactive. Active records are being synchronized. Inactive records are not synchronized.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Correlation Detail

Data type: *Object*

Object containing correlation information about a record. The object identifies the local and remote correlation IDs associated with a local record.

Status

Data type: *Choice*

Synchronization state of records. The available options are Active or Inactive. Active records are being synchronized. Inactive records are not synchronized.

Error

Data type: *String*

Error returned by the action.

Remote Process Sync sample subflows

Copy and configure the sample subflows to synchronize processes between multiple instances. Use an inbound subflow to parse incoming record data. Use an outbound subflow to send record data to a remote instance.

Remote Process Sync provides you with sample inbound and outbound subflows for you to use as templates. These subflows let you:

- Receive record data from a remote instance and process it as incidents
- Send incident record data to a remote instance for processing

Remote Process Sync Inbound Flow Template - Basic

A sample Remote Process Sync subflow to process incoming payloads received from a remote instance. This subflow creates a correlation between a remote record and a local incident record. Copy this subflow and edit the actions that refer to the Incident table.

Roles and availability

Available as a Global Remote Process Sync subflow.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Wait for Completion

Data type: *True/False*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option to require the parent flow to wait for the subflow to complete. If enabled, the parent flow cannot proceed to the next action until the subflow completes.

Remote System

Data type: *Record*

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

Remote Correlation ID

Data type: *String*

Globally unique ID of a correlation on a remote instance you are synchronizing processes with. This ID uniquely identifies the correlation for outbound transactions.

Local Correlation ID

Data type: *String*

Globally unique ID of a correlation on the local instance you are synchronizing processes with. This ID uniquely identifies the correlation for inbound transactions.

Process Event

Data type: *String*

Name of the process event to run. The name is the same on each instance that participates in process synchronization. For example, case-to-incident.

Payload

Data type: *String*

JSON string containing changes generated on a remote instance. For example, a list of field changes for a case record from a remote instance. The system transforms this JSON string to an object on the local instance.

CRUD Operation

Data type: *Choice*

Database operation that triggered the process event. The available options are Create, Update, or Delete.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Error Message

Data type: *String*

Error returned by the action.

Status

Data type: *Choice*

Synchronization state of records. The available options are Active or Inactive. Active records are being synchronized. Inactive records are not synchronized.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remote Process Sync Outbound Flow Template - Basic

A sample Remote Process Sync subflow to send outgoing payloads to a remote instance. This subflow creates a correlation between a remote record and a local incident record. Copy this subflow and edit the input for the local record to the table of your choice.

Roles and availability

Available as a Global Remote Process Sync subflow.

Subscription requirements

This action requires an Integration Hub subscription. For more information, see Request Integration Hub and Legal schedules - IntegrationHub overview.

Role requirements

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Workflow Studio flows.

Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Wait for Completion

Data type: *True/False*

Option to require the parent flow to wait for the subflow to complete. If enabled, the parent flow cannot proceed to the next action until the subflow completes.

Local Record

Data type: *Record*

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

Remote System

Data type: *Record*

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

CRUD Operation

Data type: *Choice*

Database operation that triggered the process event. The available options are Create, Update, or Delete.

Trigger/Capture Definition

Data type: *Record*

Reference to the Capture Definition record that the system uses to create an outbound payload. The data pill contains all the field values for the specified record. For example, a capture definition for case records.

Process Event

Data type: *String*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name of the process event to run. The name is the same on each instance that participates in process synchronization. For example, case-to-incident.

Payload

Data type: *Object*

Object containing changes generated by a capture definition. For example, a list of field changes for a case record on the local instance. The system transforms this object to a JSON string to send it to a remote instance.

Outputs

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Status

Data type: *Choice*

Synchronization state of records. The available options are Active or Inactive. Active records are being synchronized. Inactive records are not synchronized.

Error Message

Data type: *String*

Error returned by the action.

Correlation

Establish a synchronization relationship between records that reside on separate instances.

A correlation identifies record data from a remote instance you want to use on a local instance. An integration can use data from a correlated remote record to update a local record. Typically, integrations correlate records to synchronize them and ensure that record changes propagate across instances.

There are two types of correlation available.

- Classic correlation field
- Integration Hub Correlation records

Classic correlation field

Prior to Integration Hub Remote Process Sync, you could only create correlations with a limited set of record types that had a Correlation ID field. By default, the Correlation ID field is only available to Configuration Item, Service, and Task records. The Correlation ID field stores the globally unique ID of a matching remote record. The Correlation ID identifies the remote record whose data values should be used to update the local record. For example, suppose incident record INC100001 correlates to problem record PRB123456 on a remote instance. Whenever changes are made to fields in remote problem PRB123456, the system uses the Correlation ID to identify that local incident INC100001 receives the same field updates.

A classic correlation creates a one-to-one relationship between a record on the local system and a record on a remote system. One local record can only ever correlate to one remote record. The correlation provides no information about the remote system nor the current state of the correlation. Administrators manually manage classic correlations from the records being updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample classic correlation field

Local Instance

Number	Short Description	State	Correlation ID
INC100001	Cannot connect to network	Work In Progress	sys_id of PRB123456

Remote Instance

Number	Short Description	State	Correlation ID
PRB123456	Cannot connect to network	Complete	sys_id of INC100001

Integration Hub Correlation records

Integration Hub Remote Process Sync extends the functionality of classic correlation with the introduction of dedicated Correlation [ih_sync_correlation] records.

A Correlation record contains these fields.

Local Correlation ID

The globally unique ID that identifies the correlation on the local system. By default, Integration Hub Remote Process Sync generates a unique sys_id value for this field. The distinct sys_id acts as an alias which prevents the correlation from breaking due to changes in the local record. When Integration Hub Remote Process Sync sends this ID value to a remote system, the receiving instance uses it as the Remote Correlation ID.

Remote Correlation ID

The globally unique ID that identifies the correlation on the remote system. By default, Integration Hub Remote Process Sync generates a unique sys_id value for this field. The distinct sys_id acts as an alias which prevents the correlation from breaking due to changes in the remote record. When Integration Hub Remote Process Sync sends this ID value to a remote system, the receiving instance uses it as the Local Correlation ID.

Local Table

The table where the correlation creates or updates records. An Integration Hub Remote Process Sync capture definition monitors this table for record changes. Integration Hub Remote Process Sync uses this field to find correlations by table name.

Local Record

The record created or updated by a correlation. This field stores the same value as the Correlation ID field from a classic correlation. When other business logic makes changes to this record, the changes do not overwrite the correlation.

Remote System

The remote instance where Integration Hub Remote Process Sync sends and receives record changes. Each correlation record can only refer to one remote instance. To correlate the same local record to multiple remote systems simultaneously, you can create multiple correlation records.

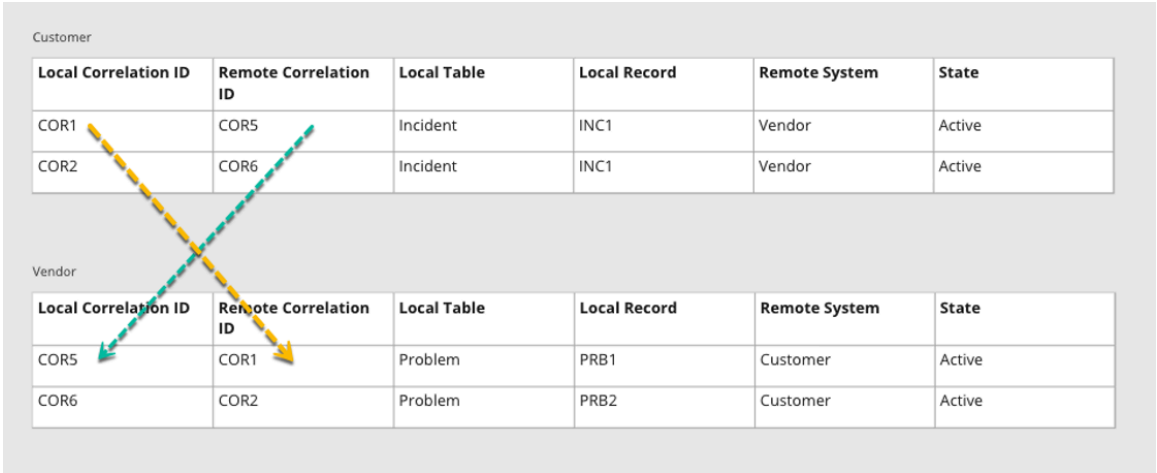
State

The synchronization state of the correlation. Active correlations receive additions and updates. Inactive correlations do not produce additions or updates, but can be queried for auditing purposes and reactivated as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Danger:
Integration Hub Remote Process Sync manages correlation records for you. Directly editing correlation records may prevent synchronization of records, and may result in data loss.

Sample Integration Hub Correlation record



Correlation records offer several advantages over a single correlation field.

- Allow management of correlations by Remote Process Sync
- Identify the remote system associated with a correlation
- Provide separate Correlation ID values for the local and remote systems
- Allow correlation of a single local record with multiple remote systems
- Allow correlations to be deactivated and reactivated as needed
- Allow Correlation ID values to be distinct from the sys_id of a remote record

Remote Process Sync system properties

Refer to the list of system properties for Remote Process Sync to learn how to manage your process-oriented, multi-instance integration.

To set Remote Process Sync system properties, navigate to **IntegrationHub** > **Remote Process Sync** > **Properties** or set them on the System Properties [sys_properties] table.

System Property	Description
glide.hub.process.sync.jobs.outbound.context_reporting	If set to `true`, outbound scheduled jobs: • Use the standard *`FlowAPI`* instead of the quick API (default) • Write flow contexts to the outbound queue • Write outbound records to the Outbound Queue States [ih_sync_outbound_record] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Property	Description
	• Default value: `false` • Minimum value: Not applicable • Maximum value: Not applicable
glide.hub.process.sync.jobs.inbound.context_reporting	If set to `true`, inbound scheduled jobs: • Use the standard *`FlowAPI`* instead of the quick API (default) • Write flow contexts to the inbound queue • Write inbound records to the Inbound Records [ih_sync_inbound_record] table • Default value: `false` • Minimum value: Not applicable • Maximum value: Not applicable
glide.hub.process.sync.jobs.outbound.process_maxtime	Maximum time, in seconds, that an outbound scheduled job runs before timing out. • Default value: 300 • Minimum value: 60 • Maximum value: 1800
glide.hub.process.sync.jobs.inbound.process_maxtime	Maximum time, in seconds, that an inbound scheduled job runs before timing out. • Default value: 300 • Minimum value: 60 • Maximum value: 1800
glide.hub.process.sync.jobs.outbound.subflow.execution_timeout	Time, in milliseconds, that an outbound subflow runs before timing out.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Property	Description
	• Default value: 30000 • Minimum value: None • Maximum value: None
glide.hub.process.sync.jobs.inbound.subflow.execution_timeout	Time, in milliseconds, that an inbound subflow runs before timing out. • Default value: 30000 • Minimum value: None • Maximum value: None
glide.hub.process.sync.retry.times	Number of times to retry processing of an outbound queue before setting the queue's state to Error. • Default value: 3 • Minimum value: 0 • Maximum value: 10
glide.hub.process.sync.retry.interval.seconds	Time interval, in seconds, between each retry attempt to process an outbound or inbound queue. • Default value: 60 • Minimum value: 0 • Maximum value: 300
glide.hub.process.sync.debug	If set to `true`, log entries will be created in **System Logs** > **System Log** > **All** for Remote Process Sync tables. • Default value: `false` • Minimum value: Not applicable • Maximum value: Not applicable
glide.hub.process.sync.record.successful.status	If set to `true`, the Status field for outbound queues will be updated to Success when there are no errors processing the record in the queue.

Robotic Process Automation (RPA) Hub

Use the ServiceNow® Robotic Process Automation (RPA) Hub to enable end-to-end automation for your organization. With a combination of UI interactions and element-based automations that interact between the various business applications, you can emulate user actions and eliminate mundane and repetitive human activities.

Watch this video to learn about the overview of RPA Hub.

Overview of RPA Hub

Watch this video to learn how to set up a workflow using automation components in the RPA Desktop Design Studio.

Exploring Robotic Process Automation (RPA) Hub

Learn about the Robotic Process Automation (RPA) Hub applications, types of automations, benefits, high-level architecture, and workflow.

Robotic Process Automation (RPA) Hub overview

The following Robotic Process Automation (RPA) applications operate and interact with each other in an enterprise environment to automate tasks efficiently.

RPA Hub

The ServiceNow® RPA Hub application provides a centralized orchestration to deploy, monitor, manage, measure, and verify compliance of all robots at an enterprise level.

Unattended Robot

The ServiceNow® Unattended Robot is a software agent that you install on a Windows machine. Unattended Robot can execute unattended automations without requiring any human intervention.

The ServiceNow® Unattended Robot Login Agent is a software agent that you install on a Windows machine with Unattended Robot. You can use this application to unlock or to perform a self-login to the robot machine when an unattended bot process is triggered.

Attended Robot

The ServiceNow® Attended Robot is a software agent that you install on a Windows machine. Attended Robot can execute attended automations that require human intervention.

RPA Desktop Design Studio

The ServiceNow® RPA Desktop Design Studio is a Windows native application that is used by RPA developers to design or configure automation workflows.

Types of automations

You can create two types of automations with RPA Desktop Design Studio and run them with Unattended Robot or Attended Robot:

Unattended automation

In this automation, tasks, processes, or workflows are carried out by the robots without the need for direct human intervention or supervision. You can use this type of automation to automate highly repetitive tasks.

For example, Report generation. In this use case, the reports are automatically generated and distributed to relevant stakeholders.

Unattended automation offer significant efficiency gains, reduced operational costs, and improved accuracy in organizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attended automation

Also known as human-assisted automation. In this automation, the robots work alongside human users to augment their tasks and activities. You can use this type of automation with human supervision.

For example, Customer service. In this use case, robots can assist customer service representatives by providing relevant information, suggesting responses, and automating data entry. The robots are installed on operator's workstations and are triggered by human operators on demand.

Attended automation is often suited for scenarios where a combination of automation and human judgment is required to handle complex, dynamic, or non-standard tasks.

Robotic Process Automation (RPA) Hub users

Robotic Process Automation (RPA) Hub users

User	Description
Release manager	Creates bot processes and robots in RPA Hub. Add developers to the Managed by group of the bot process so that they can customize the bot process. Configures and publishes the bot process.
Developer	Configures bot processes to assign business applications, robots, credentials, process parameters, schedules, and so on. Builds automation packages, tests the automation projects, and handles exceptions in RPA Desktop Design Studio. Publishes packages to RPA Hub. Creates and deploys automations in a low-code environment.
Robot user/Assisted user	Executes automations in the specified robot machine.

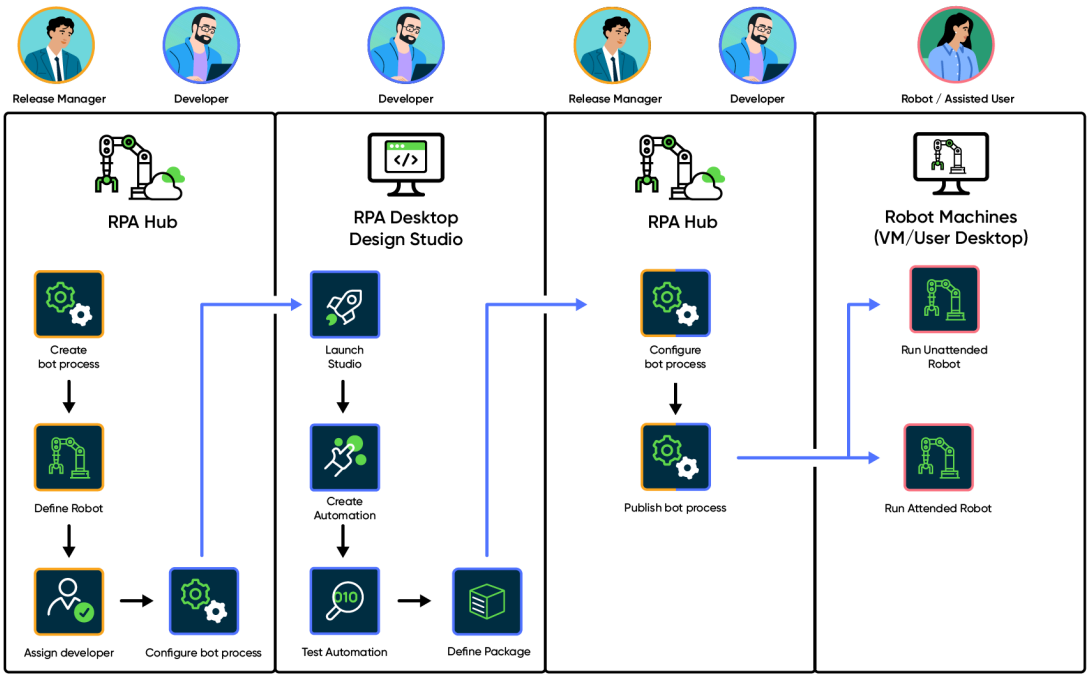
Robotic Process Automation (RPA) Hub workflow

The three main parts of a process workflow are RPA Hub, RPA Desktop Design Studio, and robot machines (virtual machine or user desktop).

The following diagram shows the process workflow of the Robotic Process Automation (RPA) Hub applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow of creating and executing automations using Robotic Process Automation (RPA) Hub applications



1. As a release manager, create a bot process, define robots, and assign a developer who would continue to configure the bot process.
2. As a developer, configure the bot process to associate a package, business applications, robots, parameters, and credentials so that robots can use them to run automations.
3. As a developer, build automation packages, tests the automation projects, and handles exceptions in RPA Desktop Design Studio.
4. As a developer, publish the configured bot process to execute, manage, and monitor automations.
5. As a robot user or assisted user, execute automations in the specified Windows machine where Attended Robot or Unattended Robot is installed.

RPA Hub Benefits

- Increases productivity and delivers higher operational efficiencies.
- Enhances accuracy by eliminating processing errors.
- Enhances customer service and meets highly varied customer demands.

Integration with Workflow Studio

Robotic Process Automation (RPA) Hub provides an integration with the Workflow Studio application. This integration enables you to integrate ServiceNow workflows with Robotic Process Automation by using ServiceNow components for Workflow Studio. For more information about RPA Hub actions and subflow, see RPA Hub actions and subflow.

Key Management Framework

RPA Hub uses the ServiceNow® Key Management Framework for all the sensitive data that is stored on the application. For more information, see Understanding the Key Management Framework.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important information for upgrading RPA Hub to Yokohama

Ensure that you upgrade the current installed Microsoft Software Installers (MSIs) (RPA Desktop Design Studio, Attended Robot, Unattended Robot, and Unattended Robot Login Agent), by downloading the RPA applications. For more information, see Download the RPA applications from RPA Hub.

Important:
The following upgrade steps are applicable only when you're upgrading from San Diego or Tokyo to Yokohama.

Based on the number of records in the application file table, you could experience a potential delay while upgrading the RPA Hub applications from Tokyo or before to Yokohama.

Before upgrading RPA Hub to Yokohama, you must set the value of the *glide.rollback.blacklist.TableParentChange.change* system property to **false**. If this property doesn't exist in the System Property [sys_properties] table, add the property and set its value to false.

After you upgrade to the Yokohama, the bot process definitions change to the new structure, that is, the bot process configuration. Although the bot process configuration doesn't replace the bot process completely. Most fields are moved from bot process to bot process configuration.

If you upgrade to the Utah version without updating the system property value, the tables don't extend the Application File table. Manually to update the table changes, see the Restructuring RPA Hub tables to sys_metadata in Utah article in the Now Support Knowledge Base.

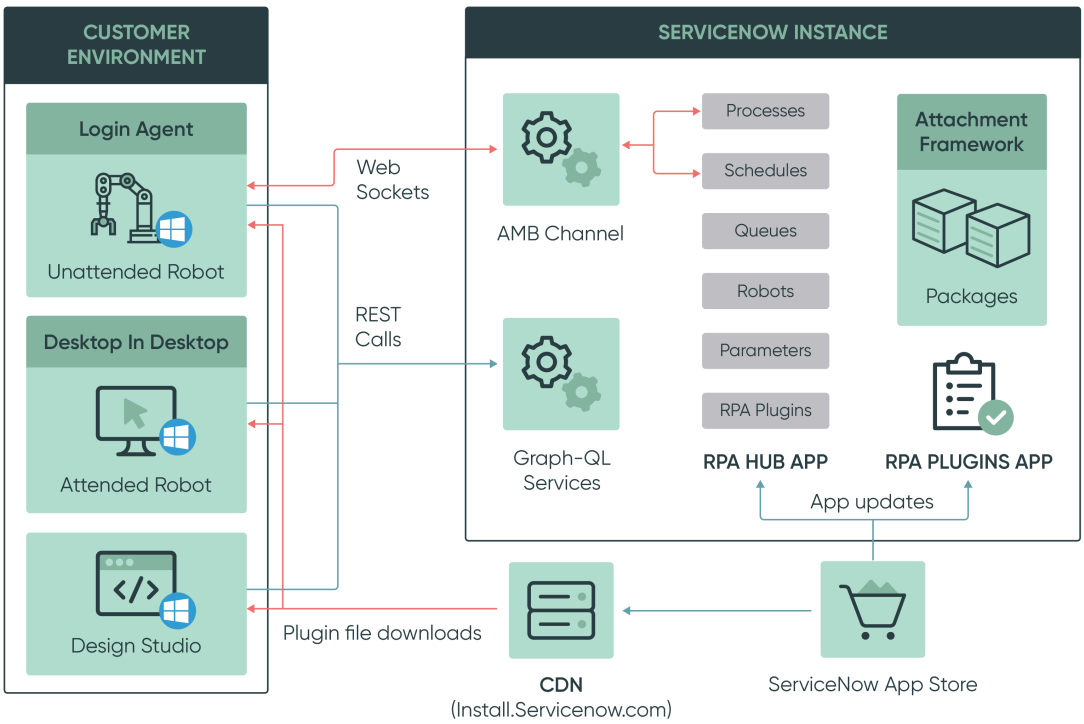
RPA Hub architecture

Learn about the Robotic Process Automation (RPA) Hub architecture.

The following diagram shows how the ServiceNow instance communicates with the customer environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

High-level architecture of the Robotic Process Automation (RPA) Hub application



ServiceNow, the ServiceNow logo, Now, Now Platform, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc. in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Various components make up the architecture of the Robotic Process Automation (RPA) Hub application:

- RPA Desktop Design Studio, Unattended Robot, and Attended Robot are the three applications that you install to form the customer environment.
- The Unattended Robot Login Agent is a software agent that you install on a Windows machine with Unattended Robot. You can use this application to unlock or to perform a self-login to the robot machine when an unattended bot process is triggered.
- Unattended robots work independently without any human intervention. They are installed on Windows machines or Virtual Desktop Infrastructures (VDIs). For example, to create an unattended robot, you need to mention the machine name on which the robot is installed on. The automation is executed from here.
- Attended robots work along with humans to improve the efficiency of a bot process. They are installed on user desktops.
- After the automation is built in the RPA Desktop Design Studio, a developer tests it locally and then publishes it to the ServiceNow® RPA Hub instance for further orchestration.
- RPA Hub is a scoped application in the ServiceNow instance. It is the command and control center for managing the robots, packages, and bot processes. For more information about these terms, see Robotic Process Automation (RPA) Hub glossary.
- The automation that is uploaded from the RPA Desktop Design Studio resides under the packages section, which also acts as a build repository.
- You can install the RPA Hub application and the plugins from the ServiceNow Store. The ServiceNow Store checks the Content Delivery Network (CDN) for updates. RPA plugins form the building blocks that are used to create an automation. The plugin files are delivered via the CDN application to RPA Desktop Design Studio, Unattended Robot, and Attended Robot. The plugin inventory is maintained inside the RPA plugin.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In a bot process record, you define the sequence of actions that a robot follows to accomplish a specific task, along with the schedule. This information is passed to the robots. When the automation is triggered, the automation executes.
- In the RPA Hub application, additional capabilities, like the queue. A queue is a structured data storage mechanism, used for managing and controlling the distribution of tasks, work items, or cases to different robots for processing.
- The entire scoped application is safeguarded with access control lists (ACLs).

RPA Hub

ServiceNow® Robotic Process Automation Hub (RPA Hub) is a powerful platform for orchestrating and managing your robotic workforce to execute various business processes efficiently.

Get started

Explore Learn about RPA Hub concepts and features.	**Configure** Install and set up RPA Hub.	**Use** Configure bot processes, robots, packages, queues, alert rules, and parameters.
Manage Execute, publish, retire bot processes, packages, and robots.	**Reference** Get details about RPA Hub components like fields, tables, and properties.

Exploring RPA Hub

Learn about the RPA Hub features that enable you to govern, manage, and supervise your digital workforce.

RPA Hub overview

Use RPA Hub to streamline automation processes, improve efficiency, monitor, and optimize your automation initiatives effectively.

By using multi-tenancy, you can create logical partitions to effectively manage your robots (unattended and attended) for different customers (internal or external) from a single instance. Each logical instance has its own access control list (ACL), robots, licenses, and execution logs.

RPA Hub users

Users

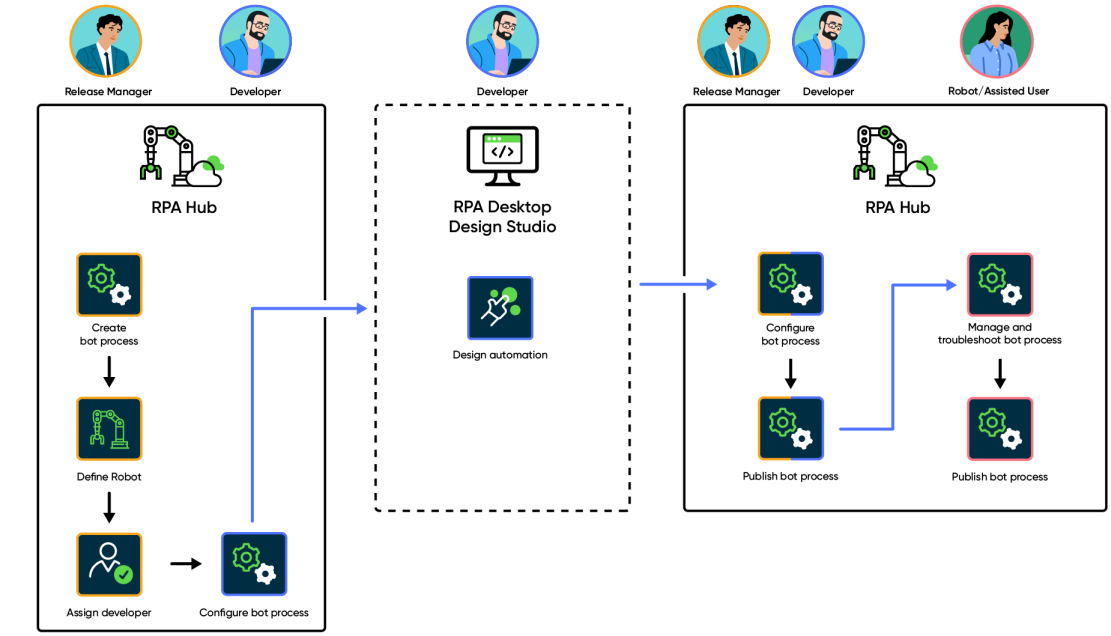
User	Description
Release manager	Creates bot processes and robots in RPA Hub. Add developers to the Managed by group of the bot process so that they can customize the bot process. Configures and publishes the bot process.
Developer	Configures bot processes to assign business applications, robots, credentials, process parameters, schedules, and so on. Creates and deploys automations in a low-code environment. Manages data, schedules, work items, and other configuration parameters.
Support user	Identifies, diagnoses, and resolves the issues that are related to bot processes. Performs first-level troubleshooting. Publishes and manages a bot process.

RPA Hub workflow

The following illustration describes the basic tasks involved in creating an attended or unattended automation using RPA Hub. For detailed instructions, see Configuring RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating automations using RPA Hub



1. As a release manager, create a bot process and define robots. Add developers to the Managed by group of the bot process so that the developer can continue to configure the bot process.
2. As a developer, configure the bot process to associate a package, business applications, robots, parameters, and credentials so that robots can use them to run automations.
3. As a developer, build automation packages, tests the automation projects, and handles exceptions in RPA Desktop Design Studio.
4. As a developer, publish the configured bot process to execute, manage, and monitor automations.
5. As a support user, diagnose, troubleshoot, and resolve issues with bot process and then publish the bot process.

RPA Hub benefits

- Enables you to deploy, monitor, manage, and verify the compliance of all robots at an enterprise level from a centralized location.
- Manages the metadata that includes robots, packages, bot processes, queues, schedules, shared parameters, and alerts. For more information about these terms, see Robotic Process Automation (RPA) Hub glossary.
- Triggers unattended robots with the execution details.
- Provides insights into the complete Robotic Process Automation (RPA) practice via a dashboard. From this dashboard, you can see the current execution status (jobs and queues) and event correlation between the various configuration items.

What to explore next

To learn more about configuring and managing RPA Hub, see:

- Configuring RPA Hub
- Using RPA Hub
- RPA Hub reference

Internationalization support for RPA Hub

You can customize the RPA Hub application for your international users by using a language plugin with the ServiceNow AI Platform. Internationalization is enabled for only for the RPA Hub instance on ServiceNow AI Platform, but not for thick client applications such as RPA Desktop Design Studio, Unattended Robot, and Attended Robot.

Internationalization support is automatically enabled and isn't configurable.

To view the full list of languages that are offered as ServiceNow AI Platform plugins and are supported in RPA Hub, see Activate a language.

RPA Hub Workspace

Learn about the digital workforce that you can manage all from the RPA Hub Workspace.

RPA Hub Workspace overview

ServiceNow® RPA Hub Workspace is a web-based platform that helps you orchestrate ServiceNow robots to execute ongoing business processes. Use attended and unattended robots in your environment to create, monitor, manage, and deploy a digital workforce.

RPA Hub is the default landing page of the RPA Hub Workspace. You can access this page in two ways:

- By navigating to **All** > **Robotic Process Automation** > **RPA Hub Workspace** and then selecting the home icon ( ).
- By navigating to **Workspaces** > **RPA Hub Workspace**.

This page contains descriptions about the following basic score card, lists, and reports that you can use to manage your digital workforce:

Bot process summary

Vertical bar charts of the incident records that involve bot processes or a robot. In the Insights section, view a donut report of robots states. You can also see an overview of the change records associated with the robots, bot processes, and business applications that are related to the bot processes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Robot utilization section

Chart legends of the highest and lowest utilized unattended and attended robots, over a period.

Process jobs summary

Donut report of the process jobs by status in the last 24 hours. For example, abandoned, canceled, failed, running, skipped, and success.

Spline report of the process job trend by status, over a period. Spline reports show how one or more values change over time by connecting a series of known data points with a curve that emphasizes the trend over individual data points.

List of the current running process jobs.

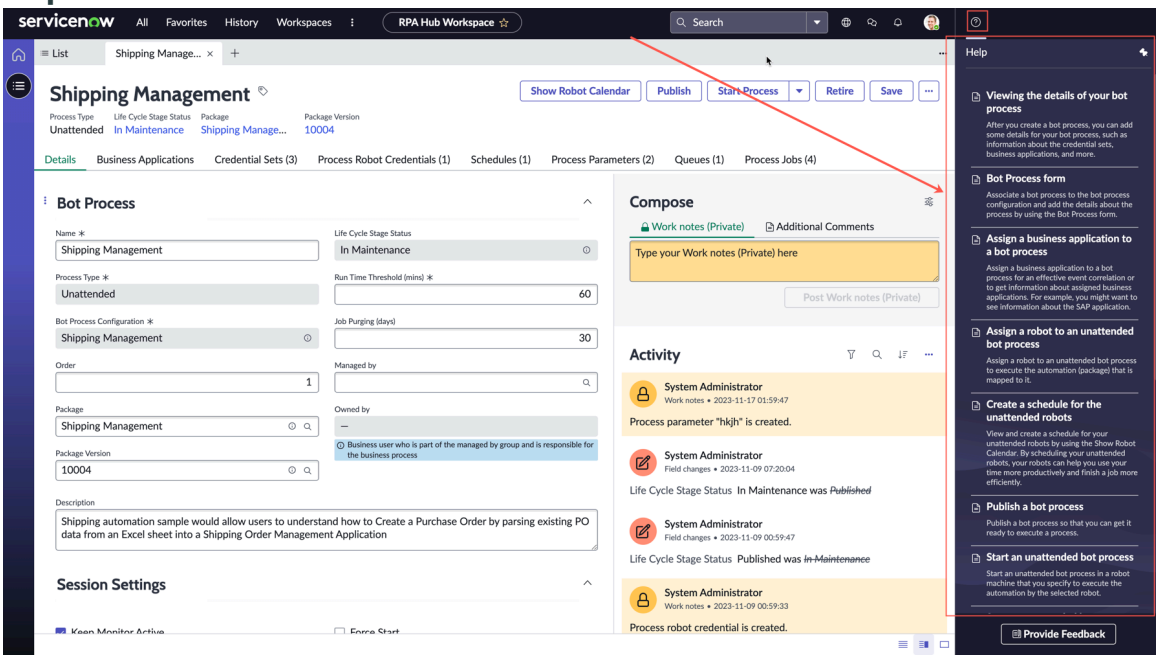
Help Center Icon View



Dark theme

Help alleviate eye strain by switching to a dark theme or mode available in the RPA Hub Workspace for RPA Hub landing page, Robot Calendar, Overview page, and RPA Hub system properties. For more information about the dark theme, see Exploring themes in Next Experience.

License distribution in RPA Hub

As an administrator, you can create a robot license distribution record to define the consumption and distribution of licenses in your organization. You can create only one robot license distribution record per domain in a domain separated instance. Once you create this record, you can edit it, but you can't delete it.

If the instance you are using is not domain separated, then you can create only one robot license distribution record in global domain.

For more information about creating a robot license distribution record, see Create a robot license distribution record in RPA Hub.

For more information about executing RPA scripts, see Execute RPA scripts to re-evaluate license distribution.

For unattended robots, licenses are available for the robot that is created in the current domain only. Release managers or administrators create unattended robots and associate them with Windows or virtual machines. An unattended robot is mapped to only one Windows or virtual machine.

For attended robots, licenses are available for the domain that is associated to the robot. Release managers or administrators create attended robots and associate them with users. If the auto assignment of Attended Robot property (sn_rpa_fdn.allow_rda_robot_auto_assignment) is enabled, the robot records are automatically created on a first-come, first-served basis. An attended robot is mapped to only one user.

To unassign a user, you must retire the associated attended robot. For more information, see Unassign an attended user or group from an attended bot process in RPA Hub. To remove a user from a group, contact your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To retire a robot if the robot machine is not working appropriately, retire the associated unattended robot. For more information, see Retire an RPA Hub robot.

You can update a robot license distribution record. For more information, see Update a robot license distribution record in RPA Hub.

Robots in RPA Hub

Mimic human actions to perform repetitive, rule-based tasks using robots in RPA Hub. These robots interact with user interfaces and automate tasks.

What is a robot

A robot runs a bot process (automation). Robots are designed to interact with software applications, data sources, and user interfaces like a human operator would, but in a more efficient, accurate, and consistent manner.

Types of robots in RPA Hub

These two types of robots serve different purposes and are designed to automate different types of tasks within an organization.

Unattended robots

These robots run unattended automations that don't require any human intervention. They work autonomously without human intervention. These robots are typically deployed on servers and can perform tasks without requiring a human user to be present. Unattended robots are best suited for tasks that are highly repetitive, rule-based, and do not require human decision-making during execution. For example, Invoice Processing for Finance Department.

Attended robots

These robots run attended automations that require human intervention. They work alongside humans to assist them in their tasks. These robots are typically deployed on the desktops of human users and collaborate with them in real-time. Attended robots are best suited for tasks that require human decision-making, involve interactions with user interfaces, or need input from employees. For example, Guided Data Entry and Validation for Order Processing.

Configuring robots

To configure attended or unattended robots, see Creating a robot in RPA Hub.

- Add assigned studio users to an unattended robot
- High density robots in RPA Hub

High density robots in RPA Hub

Execute multiple automations (bot processes) simultaneously and independently on a single Windows Server machine using high density robots.

High density robots overview

High density robots leverage the Remote Desktop Services to execute multiple automations simultaneously on the same Windows Server machine. High density robots can run the same

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

automation or run different automations in separate user sessions on the same machine. The machine must support multiple user sessions at the same time. This setup maximizes resource utilization by leveraging the machine's capacity to execute several bot processes in parallel.

While configuring unattended robot, you can select the **High Density Robot** option to create multiple robots with the same machine name. All the high density robots with the same machine name can have different screen resolutions. But it is ideal for all high density robots associated to the same bot process to have same screen resolution value. For more information about these fields, see Create an unattended robot in RPA Hub.

Note:

The machine that is associated with high density robots can't be associated with a non-high density robot. If there are multiple robots with the same machine name marked as high density robots, then none of the robot can be converted as a non-high density robot.

High density robots can't be added to the robot pool.

High density robots key features

- Runs multiple automations independently on the same machine.
- Reduces the number of machines required, lowering infrastructure costs.
- Enables each robot to operate in its isolated session, which helps preventing overlap or interference.

Configuring high density robots

To configure the high density robots, see Create an unattended robot in RPA Hub.

To convert existing unattended robots to high density robots, see Convert existing unattended robots to high density robots.

Set up Unattended Robot

Embedded Task Automation in RPA Hub

With the embedded task automation feature, trigger attended bot processes (attended automations) from the ServiceNow forms, apart from initiating them from the Attended Robot application.

Important:
The embedded task automation runs only for published attended bot processes.

Invoke Embedded Task Automation via API

To trigger a bot process (automation) from a Workspace, a playbook, or any other service portal, you can create corresponding actions and call the *RPAInstanceFormHooks* Application Programming Interface (API). For more information about invoking an embedded task automation via an API, see Invoke Embedded Task Automation via API.

Embedded Task Automation overview

Use the embedded task automation feature to initiate an automation seamlessly from ServiceNow screens in an attended mode. It provides users with a transparent view of the robot

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

executing tasks directly on their machines. This feature provides a user-friendly experience by enabling individuals to observe and monitor the automation process in real-time.

Why Embedded Task Automation

Since existing attended automations interact with forms that are built within the automation itself, form development is required. Use the Embedded Task Automation feature for attended automations that use the ServiceNow screens. The Embedded Task Automation feature enables the reuse of the existing ServiceNow screen without a need to develop forms with in automation.

How Embedded Task Automation works

Let's consider an employee badge creation use case.

1. In the Service Catalog, a request is created for an employee badge generation. Details such as **Requested for** and **Location** are included in this request form, for printing the badge on a third party application. After the badge is generated in the application, the badge ID is populated in the request form.
2. In RPA Desktop Design Studio, build an automation using the new components and publish it to the ServiceNow instance. For more information about the new components, see Forms. Ensure to use the Terminate component for each UI action automation logic that helps in completing the automation execution for the respective UI action. For more information about the component, Use the Terminate component.
3. In the RPA Hub, create an attended bot process (for example, Employee Badge Generation). For more information about creating an attended bot process, see Configuring a bot process record in RPA Hub.
4. To trigger this bot process (automation) from the ServiceNow form, select the **Enable Embedded Task Automation** check box in the associated attended bot process form. On enabling this check box, two additional tabs, Process Field Parameters and Attended Configuration, are available on the bot process form. For more information about the bot process form, see Bot Process form in RPA Hub.
5. On the Process Field Parameters tab, create dynamic parameters that are used in the automation. Process field parameters are used for setting the value or getting the value of a field on a particular form. Examples of process field parameters are the user's title, first name, last name, and location. These details are used in the automation workflow while generating a badge. For more information about creating process field parameters, see Create a process field parameter in RPA Hub.
6. In the RPA Hub, create an attended configuration record. For more information about creating an attended configuration record, see Create an attended configuration record in RPA Hub.
7. In this attended configuration record, select the table associated with the required form from the **Table** field, from where this bot process must be triggered. Then, define the criteria in the **Conditions** field, to trigger the bot process. In this example, set the conditions for approved requests that are required for badge generation. For more information about the Attended Configuration form, see Attended Configuration form in RPA Hub.
8. On the Field Parameter Mappings tab, map the form fields to the process field parameters that are used in the automations. This process enables an easy data flow during the execution of a bot process. For example, if "Full name" is the process field parameter used in the automation, then map it to the form's 'Name' field. For more information about mapping field parameters, see Map a table field to a bot process field parameter in RPA Hub.
9. On the Attended Configuration tab, the form is activated by selecting the **Activate** button. In the background, a UI action (button) is created on the corresponding request form. For more information about activating an attended configuration, see Activate an attended configuration record in RPA Hub.

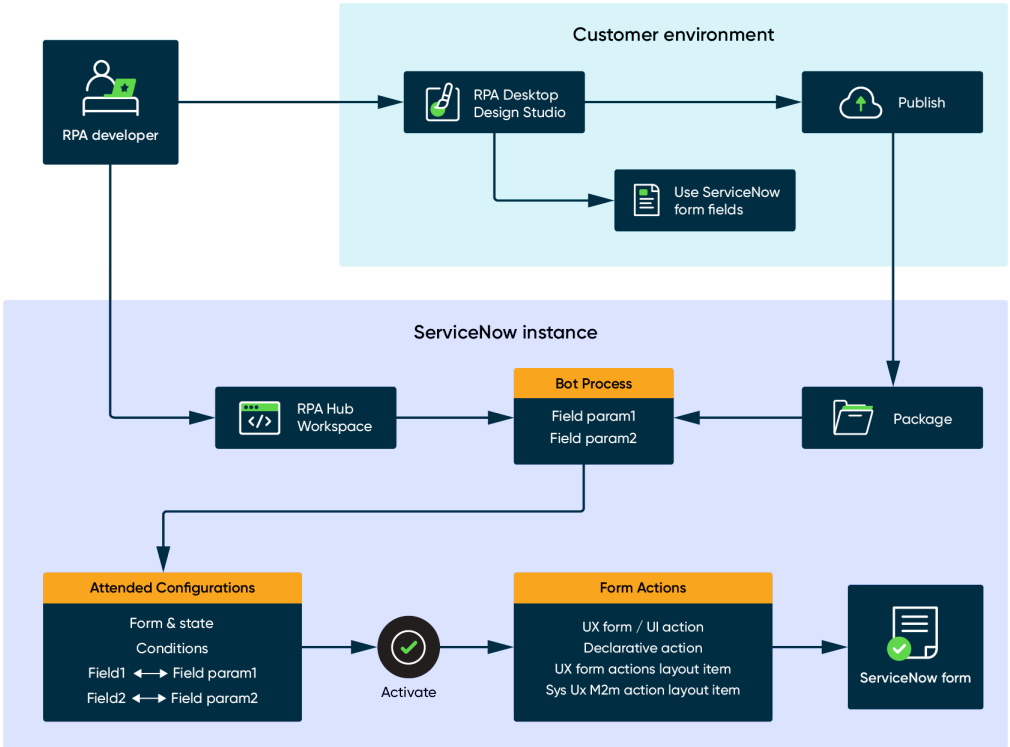
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Publish the bot process with the corresponding package published from the RPA Desktop Design Studio. For more information, see Publish an RPA Hub bot process.

    To publish the bot process, assign the user with RPA AU (RPA assisted user) in the **Assigned User** or **Assigned Group** field in the Attended Users/Groups tab of the attended bot process record. If the auto assignment system property *sn_rpa_fdn.allow_rda_robot_auto_assignment* is false, the attended robot record is available for the assigned RPA Assisted User. If the auto assignment system property is true, an attended robot license is available to auto create an attended robot at the time of triggering. For more information about this system property, see Configure RPA Hub properties.

11. Then, the assigned user can view the UI action (button) (for example, Generate Badge) on the corresponding ServiceNow form. Using this button, the user can trigger the attended bot process (attended automation). There are certain conditions to view this button (UI action). For more information, see Visibility conditions of the UI action (button).

Configuration of Embedded Task Automation in RPA Hub



Configuring Embedded Task Automation

To configure the embedded task automation, see List of steps for configuring embedded task automation.

New components for Embedded Task Automation in RPA Desktop Design Studio

The following four new components are added to the new **Forms** section in RPA Desktop Design Studio. These components are available under the new ServiceNow category in the Toolbox pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **AttendedConfigurations**: Segregate the execution of the automations in a single automation project and call the respective logic according to the action invoked. For more information, see Use the AttendedConfigurations component.
- **GetProcessFieldParameters**: Fetch the values of the ServiceNow form fields associated in the Field Parameter Mapping of the corresponding attended configuration record in RPA Hub. For more information, see Use the GetProcessFieldParameters component.
- **GetRecordContextID**: Fetch the current record sys_id of the ServiceNow form, from where the automation is triggered. For more information, see Use the GetRecordContextID component.
- **SetProcessFieldParameters**: Update the values of the ServiceNow form fields associated in the Field Parameter Mapping of the corresponding attended configuration record in RPA Hub. For more information, see Use the SetProcessFieldParameters component.

Terminate component in attended automations

Use the **Terminate** component in attended automations to complete the automation execution. For more information about the component, Use the Terminate component.

Launch attended automations from ServiceNow forms

Learn about the restrictions to launch an attended automation from the ServiceNow forms and launching the attended automations. For more information, see Attended Robot authentication journey and automation execution in Embedded Task Automation.

Attended Robot authentication journey and automation execution

Learn about the authentication process in the Attended Robot application and the automation execution. For more information, see Attended Robot authentication journey and automation execution in Embedded Task Automation.

Important:

If a new version exists to the existing automation, to reflect those changes the Attended Robot application must be closed. Until then, it continues to use the existing version, as the Attended Robot application is already launched and running.

If a new version of RPA Hub is installed on the instance, to reflect those changes the Attended Robot application must be closed. Until then, it continues to use the existing set of plugins, as the Attended Robot application is already launched and running.

Runtime Phase of the Embedded Task Automation

Learn more about the triggering of an attended automation from a ServiceNow form. For more information, see Runtime Phase of the Embedded Task Automation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Do the steps in the order that they're presented.

List of steps for configuring an embedded task automation

Task	Reference
1) Familiarize yourself with Embedded Task Automation concepts.	For more information, see Embedded Task Automation in RPA Hub.
2) Build an automation by using the new components in RPA Desktop Design Studio and publish it to the ServiceNow instance.	For more information about the new components, see Forms. For more information about publishing the automation RPA Desktop Design Studio, see Publish an automation project in RPA Desktop Design Studio.
3) Create an attended bot process. Associate it with the package that is published in step 2.	For more information, see Configuring a bot process record in RPA Hub.
4) Select the **Enable Embedded Task Automation** check box in the associated attended bot process form. On enabling this check box, two additional tabs, **Process Field Parameters** and **Attended Configuration**, are available on the bot process form.	For more information, see Bot Process form in RPA Hub.
5) On the Process Field Parameters tab, create dynamic parameters that are used in the automation.	For more information, see Create a process field parameter in RPA Hub.
6) Create an attended configuration record.	For more information, see Create an attended configuration record in RPA Hub.
7) On the Field Parameter Mappings tab, map the form fields to the process field parameters that are used in the automations.	For more information, see Map a table field to a bot process field parameter in RPA Hub.
8) Activate an attended configuration record to enable the UI action that triggers the attended automation on the associated ServiceNow form.	For more information, see Activate an attended configuration record in RPA Hub.
9) To trigger a bot process (automation) from a Workspace, a playbook, or any other service portal, you can create corresponding actions and call the *RPAInstanceFormHooks* Application Programming Interface (API).	For more information, see Invoke Embedded Task Automation via API.
10) To publish the bot process, assign the user with RPA AU (RPA assisted user) in the **Assigned User** or **Assigned Group** field in the Attended Users/Groups tab of the attended bot process record. If the auto assignment system property *sn_rpa_fdn.allow_rda_robot_auto_assignment*	For more information about assigning the user with RPA AU, see Assign an attended user or group to an attended bot process. For more information about this system property, see Configure RPA Hub properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of steps for configuring an embedded task automation (continued)

Task	Reference
is false, the attended robot record is available for the assigned RPA Assisted User. If the auto assignment system property is true, an attended robot license is available to auto create an attended robot at the time of triggering.	
11) Publish the bot process with the corresponding package published from the RPA Desktop Design Studio.	For more information, see Publish an RPA Hub bot process.
12) The assigned user can view the UI action (button) on the corresponding ServiceNow form. Using this button, the user can trigger the attended bot process (attended automation). There are certain conditions to view this button (UI action).	For more information about the visibility conditions, see Visibility conditions of the UI action (button).

Runtime Phase of the Embedded Task Automation

Learn more about the triggering of an attended automation from a ServiceNow form.

Workflow of the Runtime Phase of an Embedded Task Automation

Familiarize yourself with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

A user with RPA Assisted User role logs into the ServiceNow instance.

Navigates to the corresponding ServiceNow form from where the automation must be triggered.

The user selects the form action, that is created when you activate the attended configuration.

- If any changes are made on the ServiceNow form, a confirmation message is displayed to save before triggering the UI Action. If the user selects **Proceed** or **OK**, the form is saved. The automation is triggered. If the user selects **Cancel**, the automation is not triggered and the ServiceNow form is not saved.
- When the user selects the UI action, if it is successful, an attempt is made to start attended automation. Make sure that the Attended Robot is installed on the machine. If it is not successful, a connection to initiate the Attended Robot is not established. An information message is displayed to try again or contact system administrator.

A URL is generated that initiates the Attended Robot with details such as OAuth Entity ID, code challenge, ServiceNow form record SysID (from where the automation is triggered), Bot Process Sys ID, and Package SysID (Automation SysID).

Using these details, the Attended Robot makes a call to the OAuth to get the access and refresh token. Learn about the authentication journey in the Attended Robot application and the automation execution. For more information, see Attended Robot authentication journey and automation execution in Embedded Task Automation.

With these token details, the Attended Robot shares the session details with the ServiceNow form and starts executing the automation.

Using the robot calendar for RPA Hub

You can use the robot calendar in RPA Hub to view and create the schedule for the unattended robots. It's a simple, efficient, and interactive way to work with robots and schedules. By using the calendar, you can manage and plan a robot's schedule in a single view.

Note:

Robot calendar is applicable for unattended robots and unattended bot processes only.

Robot calendar overview

By using the robot calendar in RPA Hub, you get the following benefits:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Manage robots with multiple schedules across different time zones.
- Create and manage robot schedules.
- Check the robot availability, avoid potential conflicts, and schedule a run for the bot process.
- Perform robot capacity planning with better visibility and rich visual plotting in a single view.
- Optimize the robot utilization and avoid any potential issues related to scheduled maintenance windows.

Robot Calendar button

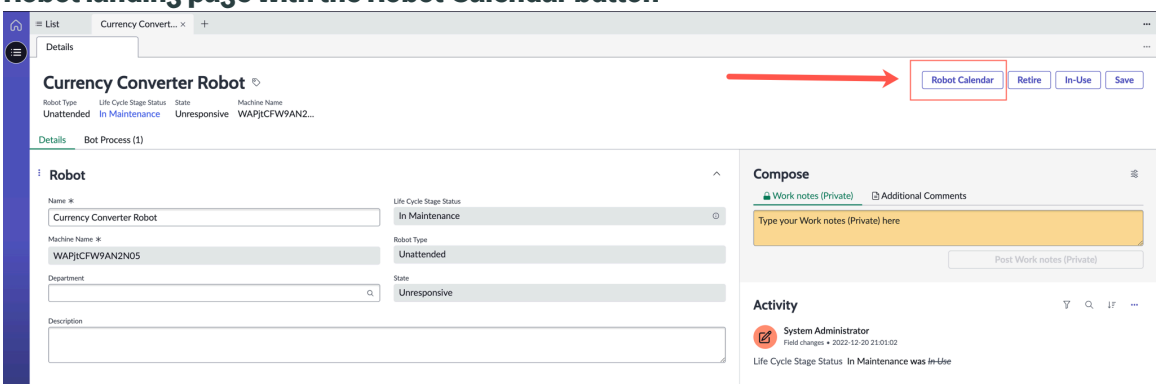
You can view the calendar from either a robot or a bot process in the workspace. If the robot is associated with a bot process that has active, inactive, or no schedules, you can view the **Robot Calendar** button.

The following roles are required to view the **Robot Calendar** button:

- sn_rpa_fdn.rpa_release_manager
- sn_rpa_fdn.rpa_business_user
- sn_rpa_fdn.rpa_developer
- sn_rpa_fdn.rpa_support_user
- sn_rpa_fdn.rpa_admin

The following example shows the robot landing page with the **Robot Calendar** button, when accessed from a robot.

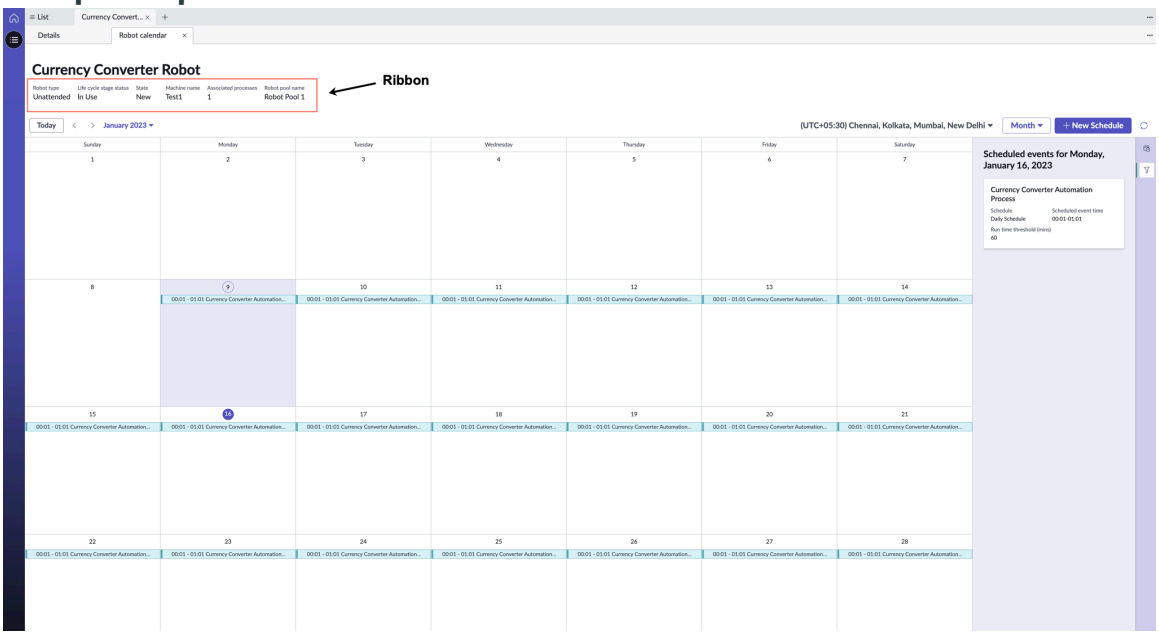
Robot landing page with the Robot Calendar button



On the ribbon of the robot calendar, you can see the robot type, life cycle stage status, robot state, machine name, the associated bot processes, and the associated robot pool name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

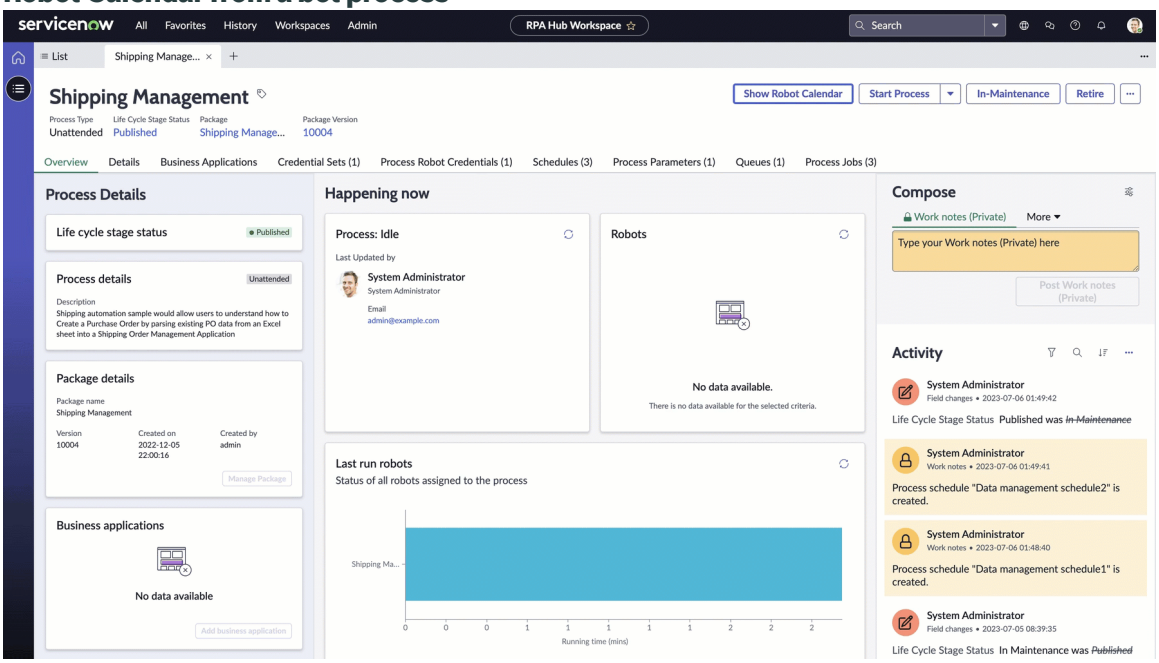
Example: Snapshot of the robot calendar ribbon



You can view the calendar from a bot process in the workspace, by selecting the **Show Robot Calendar** button. In the **Select the robot to view the calendar** dialog box, you can select a robot from the Robot list. Then, select **Continue**.

The following example shows the robot calendar when accessed from a bot process.

Robot Calendar from a bot process



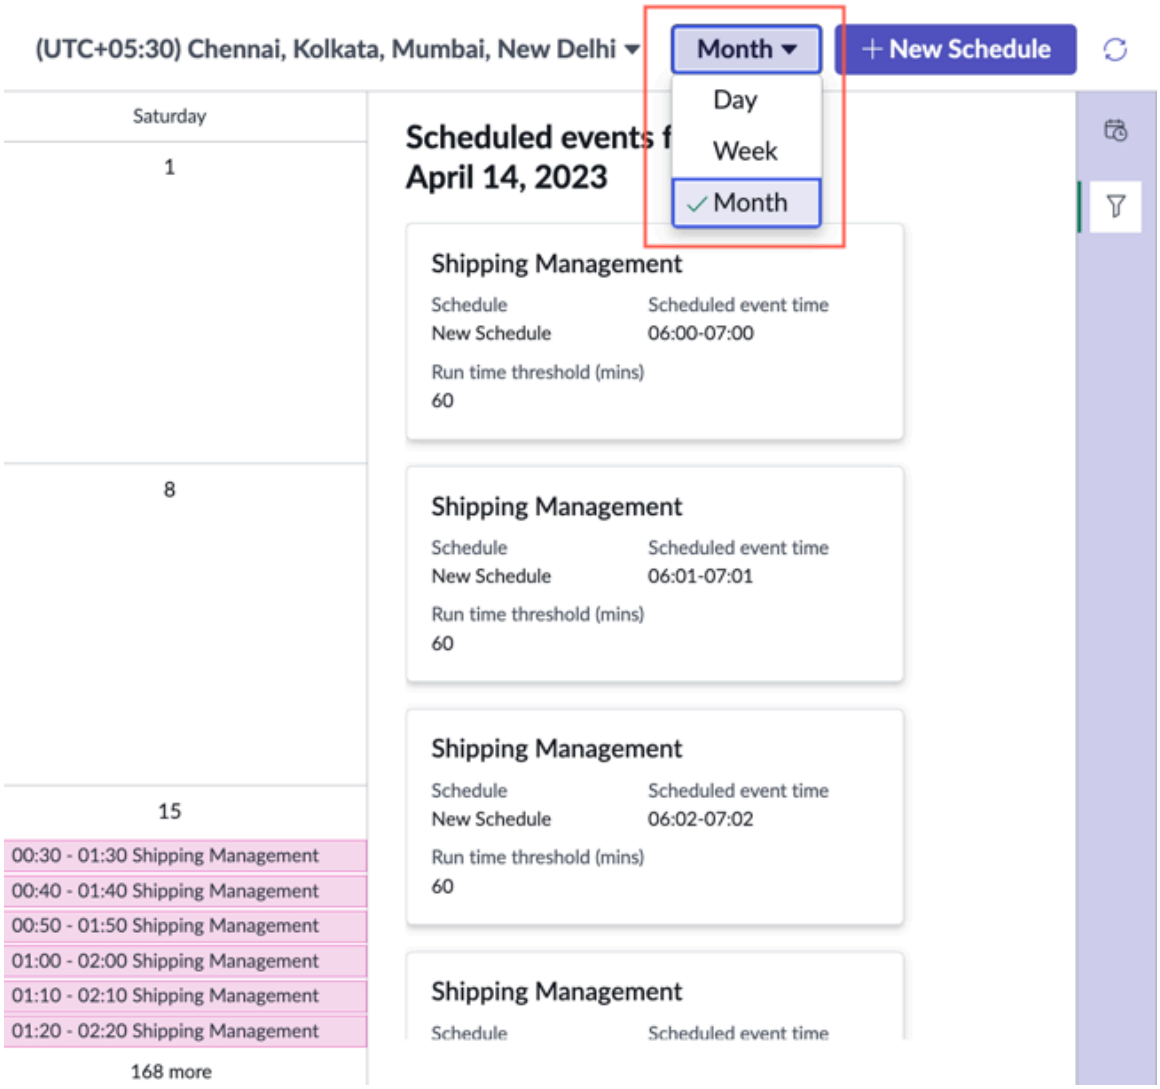
Robot calendar landing page

On the landing page of the robot calendar, you can view the events of the bot processes. The schedules are for different interval types such as minutes, hourly, daily, weekly, or monthly. For more information about viewing the robot events, see View robot events in RPA Hub. However, you can't see the past events on the robot calendar.

You can view the robot calendar by the day, week, or month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Robot calendar views - day, week, and month



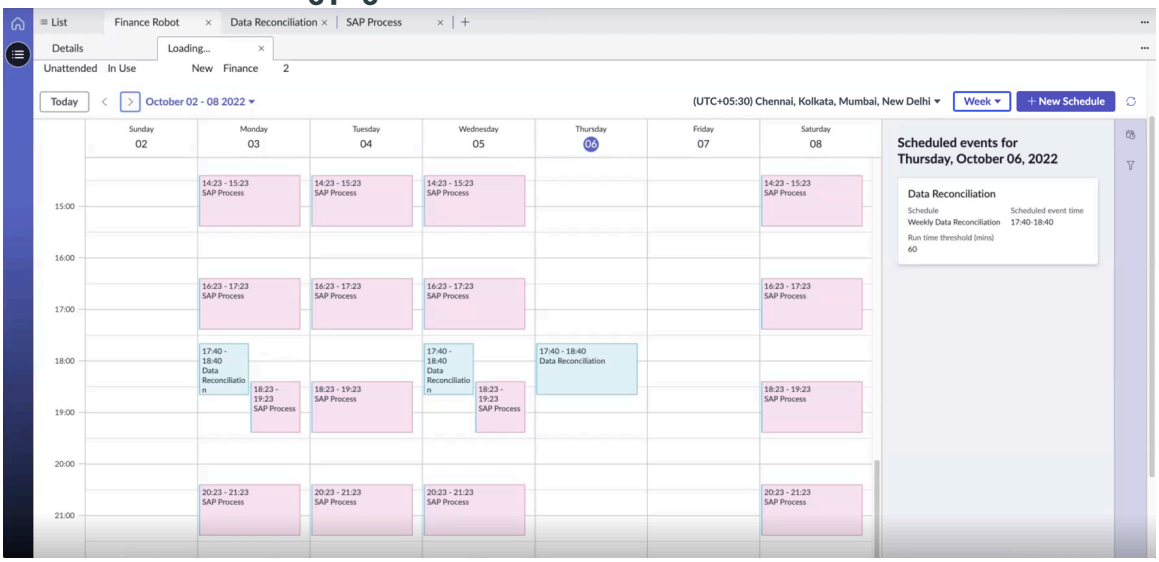
If the robot is associated with multiple bot processes, events of each bot process is differentiated with unique color.

Week view

The following example shows the week view of the landing page of the robot calendar, with two bot processes. The week view starts from Sunday to Saturday.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

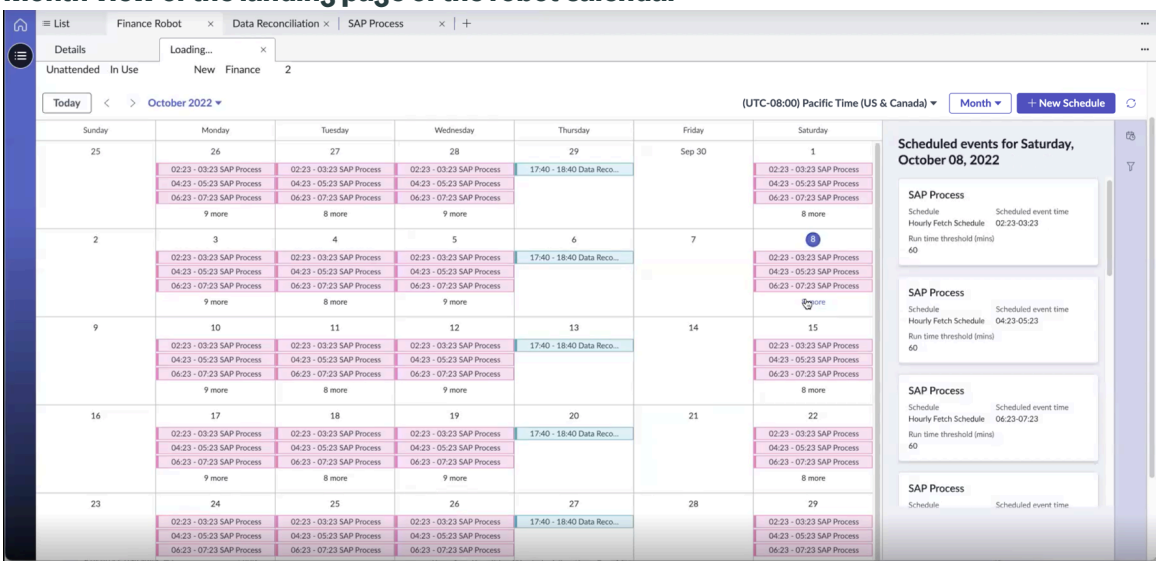
Week view of the landing page of the robot calendar



Month view

The following example shows the month view of the landing page of the robot calendar.

Month view of the landing page of the robot calendar



Manage schedules

You can create a schedule on the **Robot Calendar** tab in RPA Hub to execute unattended robots. You can also identify any conflicts in the schedule by selecting the **Preview** button. For more information, see Create a schedule on the robot calendar.

You can edit a robot schedule to resolve any scheduling conflicts or to modify the details on the schedule form. You can also delete an existing robot schedule that you no longer need. For more information, see Edit a robot schedule in RPA Hub and Delete a robot schedule in RPA Hub.

Scheduled maintenance days

You can track scheduled maintenance (SM) days on the robot calendar to manage your future automations. Robotic Process Automation (RPA) release managers and RPA admins have visibility to the potential impacts of current or future automation executions to take an

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

appropriate call to action, such as, either accepting or rejecting an associated SM event card on the robot calendar.

For more information, see Scheduled maintenance days in RPA Hub and Manage scheduled maintenance days in RPA Hub.

Plotting event duration

The value in the **Runtime Threshold (Mins)** field on the bot process form and the configuration in the related *sn_rpa_fdn.process.runtime_threshold* system property are used for plotting the event duration in the robot calendar. Based on value in the **Runtime Threshold (Mins)** field, the robot calendar shows as busy. For example, if this value is set to 60 (that is 1 hour), then in the robot calendar of this robot, it is displayed as blocked for that one hour.

For more information about the bot process form, see Bot Process form in RPA Hub.

For more information about the system property, see Configure RPA Hub properties.

Robot pool in RPA Hub

Create a robot pool in RPA Hub to distribute and manage the workload among multiple unattended robots for unattended bot processes.

Note:

After you enable the robot pool option for a bot process, you can't assign robots from the **Assign Robots** tab. It is hidden.

Robot pool feature is applicable for unattended robots only.

Types of robot assignment

There are two ways to assign robots:

- Manual robot assignment: After you create a bot process, assign robots from the **Assign Robots** tab. For more information, see Assign a robot to a bot process in RPA Hub.
- Robot Pool: On the Details tab of the bot process form, enable the robot pool option. For more information, see Enable robot pool for a bot process in RPA Hub.

Challenges with manual robot assignment

With the manual assignment of robots, RPA release managers need to anticipate the workload for a process and assign the robots accordingly.

If there is a change in the workload on specific days of the week, RPA release managers must reassign robots between different processes.

It can result in over consumption of resources or robots, irrespective of workload.

Benefits of robot pool

By using the robot pool in RPA Hub, you get the following benefits:

- Eliminates the need for manual reassignment, since robots are automatically assigned.
- Allocates robots per bot process based on pending workload and Average Handling Time (AHT).
- Maximizes robot utilization by automatically reallocating available robots in pool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Robot assignment process

The following diagram shows an example of assigning robots in RPA Hub.

If the robot pool option is not enabled, robots are assigned to a bot process directly from the **Assigned Robots** tab.

For example, in the Order Management bot process, even if the work items are less, the execution starts on all the robots. The workload is not taken into consideration.

Another example, if the Invoice Queue has a lot of work items. It runs only on two assigned robots, since there is no dynamic allocation of robots.

After the robot pool option is enabled, the execution starts with one robot initially. Based on the configuration of the allocation type (SLA or percentage reduction), the robots are automatically allocated depending on the workload.

For example, in robot pool RP1, there are two robots in Available state, R1 and R2. RP1 is used in two bot processes, Invoice Processing and Order Management. The Order Management bot process uses SLA based allocation type. When the **Start Process** button is selected for this bot process, two robots from the assigned robot pool execute the bot process. R1 and R2 are now in Running state.

The Invoice bot process also uses SLA based allocation type and has high priority invoices to be processed. Order Management bot process requires 2 robots to complete all the work items within SLA. To start the execution of invoices that are highest priority, one robot is required for Invoice Processing and one robot for Order Management. So with the help of graceful stop feature, you can stop the Order Management bot process. When you select the **Stop Process** button for the Order Management bot process, enable the **Graceful Stop** toggle switch, and select R1 robot to gracefully exit. Then, R1 gracefully exits the bot process after executing the current order processing.

After R1 gracefully completes Order Management bot process execution, it can be used to start the execution on Invoicing Processing. After all the invoices are processed, R1 can be considered again to execute the Order Processing bot process with the help of a new execution. That is, by triggering the Invoice Processing bot process via the **Start Process** action manually or via a schedule.

For more details about start process action, see RPA Hub actions and subflow. For more information about graceful stop and stopping a bot process, see Using Graceful Stop functionality in RPA Hub and Stop an unattended bot process in RPA Hub.

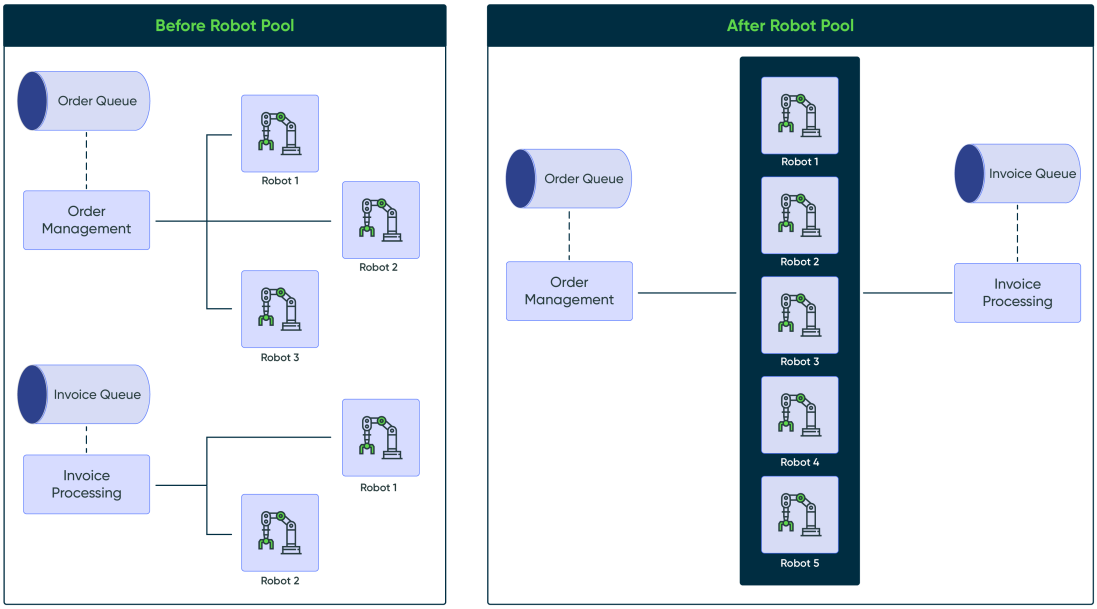
Robot assignment in RPA Hub



New fields on the Bot Process form related to Robot Pool

To enable the robot pool feature for a bot process in RPA Hub, do the following actions:

- Create a robot pool. For more information, see Create a robot pool in RPA Hub.
- Enable robot pool option for a bot process to map a bot process to the robot pool. For more information, see Enable robot pool for a bot process in RPA Hub.

Note:
A queue must be associated to a bot process for enabling robot pool. One queue is mapped to one bot process.

You can associate a queue to bot process from the related list. For more information, see Associate a queue to the bot process from the related list.

On the Bot Process form, as an Robotic Process Automation (RPA) release manager or an RPA admin, you can configure the following new fields in the Robot Pool section:

- **Enable Robot Pool**
- **Robot Pool**
- **Allocation Type**
- **Percentage Reduction** (if you select the **Allocation Type** as **Percentage Reduction**)

For more information about these fields, see Bot Process form in RPA Hub.

Robots calculation

You can calculate the number of robots required to complete a bot process execution by selecting the **Calculate** button on the Bot Process form.

New fields on the Queue form related to Robot Pool

On the Queue form, as an RPA release manager or an RPA admin, you can configure the following new fields in the Average Handling Time (AHT) - Work Items section:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Include All Work Items**
- **Work Item Count**

For more information about these fields, see Queue form in RPA Hub. Configure these fields to calculate the number of robots required in robot pool for a successful execution of a bot process.

Scheduled maintenance days in RPA Hub

Track the scheduled maintenance (SM) days on the robot calendar so that the bot processes can function optimally. If an issue occurs, you can take preventive measures. For example, you can know in advance about the days when the robot or the bot process is unavailable so that you can avoid the number of skipped process jobs.

Scheduled maintenance days overview

A scheduled maintenance (SM) day is when a configuration item (CI), such as, a robot or a bot process, is unavailable for execution. When a change request for a robot or a bot process is accepted by the Robotic Process Automation (RPA) release manager or RPA admin to create a scheduled maintenance day. Then the robot or the bot process can't be executed at that time.

An RPA support user, RPA developer, and RPA business user can view the scheduled maintenance days on the robot calendar. You can make sure that the RPA business user is also added to the Managed by Group list.

Scheduled maintenance days also apply to the robots that are in the robot pool.

Benefits of scheduled maintenance days

With the scheduled maintenance days on the robot calendar, you get the following benefits:

- Perform robot capacity planning with better visibility and rich visual plotting in a single view.
- Optimize the robot utilization and avoid any potential issues related to scheduled maintenance windows.
- Enables you to take proactive measures instead of being reactive for a configuration item (robot or a bot process).

Workflow

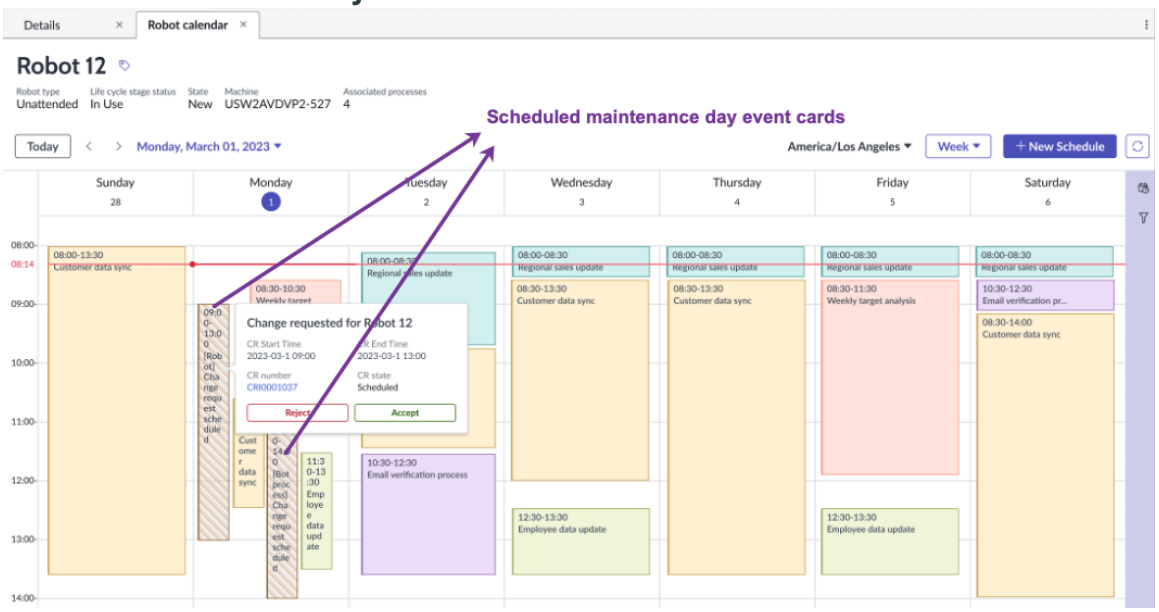
In RPA Hub, a Change Request (CR) with details of planned start and end dates along with time is created. This CR reflects as a scheduled maintenance day on the robot calendar, only when the change request is either in Scheduled, Implement, or Review states. For more information about the CR states, see State model and transitions.

An associated SM event card appears on the robot calendar to display the scheduled maintenance days.

See the following example for a snapshot of scheduled maintenance day event cards on the robot calendar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled maintenance day event cards on robot calendar

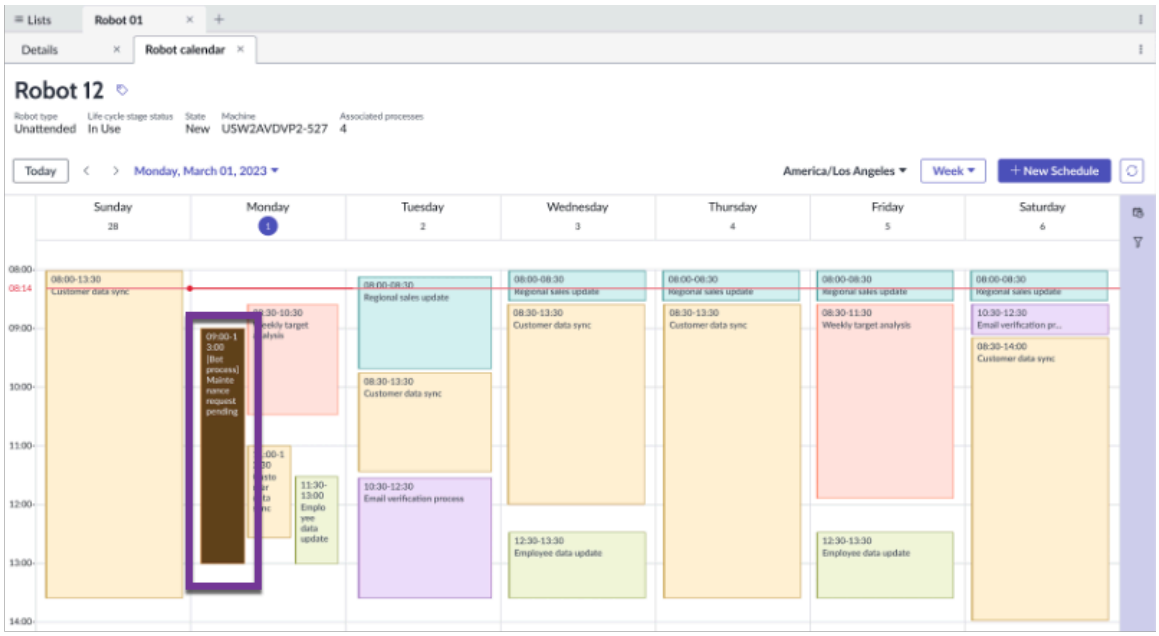


RPA business users, RPA release managers, RPA support users, RPA developers, and RPA admins have visibility to the potential impacts of current or future automation executions. RPA release managers and RPA admins can take an appropriate call to action, such as, either accepting or rejecting an associated SM event card for the CI on the robot calendar.

If the SM event card is accepted, a Maintenance Request (MR) is created on the robot calendar, with Pending state.

See the following example for a snapshot of an accepted SM day event card on the robot calendar.

Snapshot of an accepted scheduled maintenance day event card on the robot calendar

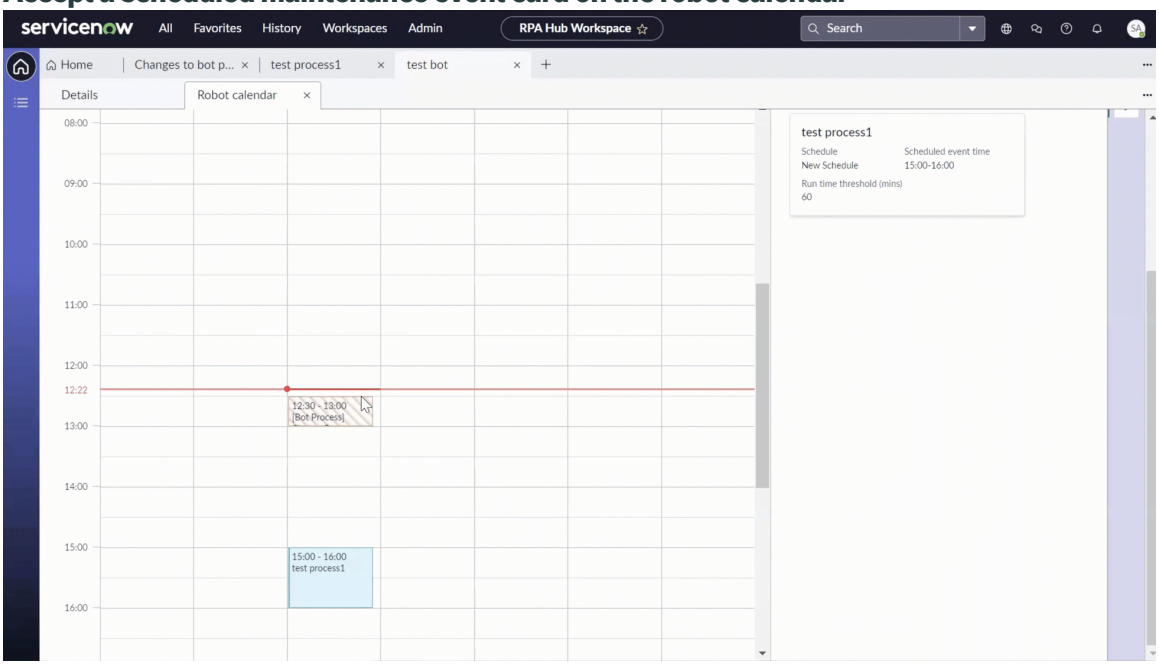


If the associated CI is in Published state, then the associated CI moves to In Maintenance state during the planned scheduled maintenance time frame. The executions are stopped until the CR is closed. Then, the CI automatically moves to the Published state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See the following example for a snapshot of accepting the SM event card when the associated CI (bot process) is in Published state.

Accept a scheduled maintenance event card on the robot calendar



If the SM event card is rejected, it does not reflect on the robot calendar. An MR is created with Rejected state.

You can view the maintenance request for tracking the state of the scheduled maintenance. For more information, see View maintenance requests in RPA Hub and Maintenance request form in RPA Hub.

For more information about managing scheduled maintenance days, see Manage scheduled maintenance days in RPA Hub.

Mapping between a change request and a maintenance request

A one-to-one mapping exists between a Change Request (CR) and a Maintenance Request (MR). If an existing MR is mapped to a CR and you want to create an MR for the same CR. Then, you must cancel the previous MR and create an MR for the same CR. For example, if CR1 is mapped to MR1 (CR1:MR1). To create MR2, you must cancel MR1 and map CR1 to MR2 (CR1:MR2).

If multiple or duplicate CRs are created for the same CI, then the MRs are considered against any one CR. The RPA release manager takes the decision.

Scheduled maintenance days behavior for various CR states

If the CR is in either Schedule, Implement, or Review states and the **Planned Start Date** and **Planned End Date** fields on the CR form are mentioned. Then, the scheduled maintenance day occurs as per these dates. The MR is updated in a sequence as follows:

- An MR is created with Pending state.
- The MR is then updated to In Progress state after the **Planned Start Date** is initiated.
- The associated CI moves to In Maintenance state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the CR is in either Schedule, Implement, or Review states and the **Planned Start Date** field on the CR form is empty. Then, the SM day doesn't reflect on the robot calendar and the existing MR isn't executed.

If the CR is in either Schedule, Implement, or Review states and the **Planned End Date** field on the CR form is empty. For example, the **Planned Start Date** is January 21. Then, the SM day reflects for only one day starting from the planned start date until 11:59PM on the same day. An MR is created for January 21. The CI is in In Maintenance state till the CR is closed, even if the date passed. But the schedule maintenance does not reflect on the robot calendar after the end date passes.

If the CR is in either Schedule, Implement, or Review states, the **Planned Start Date** and **Planned End Date** fields on the CR form are empty. Then the SM day doesn't reflect on the robot calendar and the existing MR isn't executed.

If the CR is in either Schedule, Implement, or Review states and the **Planned Start Date** and **Planned End Date** on the CR form are rescheduled. Then, the scheduled maintenance is updated to the rescheduled date automatically. The previous MR is canceled and the RPA release manager creates an MR for the rescheduled date by accepting the SM event card.

If the **On Hold** option on the CR form is selected, then the SM day doesn't reflect on the robot calendar and the existing MR isn't executed.

If the CR of the respective CI isn't in Closed state, however the CI is functional. Then, the RPA release manager can update the life cycle stage status of the CI to Published or In Use.

If the CR is closed, then the life cycle stage status of the respective CI is updated to Published or In Use.

If the CR is canceled and the MR is in Pending state, the MR isn't executed. If the MR is picked for execution, then cancel the MR. For more information, see Manage scheduled maintenance days in RPA Hub.

If the CR is canceled and the MR is in In Progress state. Then, the life cycle stage status of the CI moves to Published state and the MR is updated to complete state.

The following table shows the scheduled maintenance days behavior for various CR states.

Scheduled maintenance days behavior for various CR states

CR State	Planned Start Date	Planned End Date	Rescheduled Planned Start Date	Rescheduled Planned End Date	Applicable for Scheduled maintenance	MR State
Schedule/ Implement/ Review	21-Jan	22-Jan	Empty	Empty	Yes.	MR is created for January 21. On January 21, it moves to In progress. The CI is updated to In Maintenance.

Closed	21-Jan	22-Jan	Empty	Empty	Not applicable	The life cycle stage status of the respective CI is updated to Published or In Use
Canceled	21-Jan	22-Jan	Empty	Empty	Not applicable	If the MR is in Pending state, the MR isn't executed. If the MR is picked for execution, then cancel the MR. If the MR is in In Progress state. Then, the life cycle stage status of the CI moves to Published state and the MR is updated to complete state.

Using Graceful Stop functionality in RPA Hub

Graceful Stop functionality provides a capability for robots to exit the automation smoothly. You can define a secure termination point within an automation process. It also enables you to perform clean-up tasks such as closing in-use applications. It is applicable for assigned robots as well as robots in a robot pool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Challenges prior to Graceful Stop functionality

- Prior to Graceful Stop, when you select the **Stop Process** button on a bot process, the robots exit the automation abruptly leading to data inconsistency and data inefficiencies.
- RPA developers cannot perform the house-keeping activities.

Benefits of Graceful Stop functionality

- Data sanity is maintained as the robot completes the existing transaction items.
- RPA developers can perform the house-keeping activities, such as, closing the downstream application.

How Graceful Stop works

Let's consider a shipping order use case that contains 10 order detail records in a spreadsheet. These order details are populated into a downstream application, for example, Shipping Management application.

RPA developer builds an automation for this use case in the RPA Desktop Design Studio. Since the spreadsheet has 10 records, queues are used in the automation to synchronise the data to be populated into the Shipping Management application.

Each robot picks the work item, performs the logic, and pushes the data into the Shipping Management application.

If the bot process is stopped by selecting **Stop Process** for all or a subset of robots and the **Graceful Stop** is not enabled, then the robots end the automation execution abruptly. For example, if there are 6 columns in the spreadsheet, the robot stops at column C abruptly, without populating the information in columns D, E, and F. The application which is open, might not be closed.

In the RPA Hub, when you enable the **Graceful Stop** toggle switch in **Stop Process** section, the data in all the columns (D,E,F) are populated and the downstream application is closed. For more information, see Stop an unattended bot process in RPA Hub.

In the RPA Desktop Design Studio, when you use the **GracefulStop** component in your automation logic, it ensures that the automation is completed. For more information, see Use the GracefulStop component. It completes the existing work items, populates the data into the downstream application, and helps the developer to perform house-keeping activities such as closing the application.

New MSI for Unattended Robot

For the graceful stop functionality to be applicable on robots in a robot pool, upgrade to the latest Washington DC release specific Unattended Robot MSI. For more information, see Download the RPA applications from RPA Hub.

If the latest MSI is not installed and if the robot pool is enabled for a particular bot process, then the execution is stopped for all the robots of the robot pool. For these bot processes, you can't use a graceful stop for robots in a robot pool.

Execution priority of bot processes in RPA Hub

Learn how to prioritize bot processes efficiently and avoid triggering multiple automations on the same robot. The bot processes are organized by both robots and Windows user credentials.

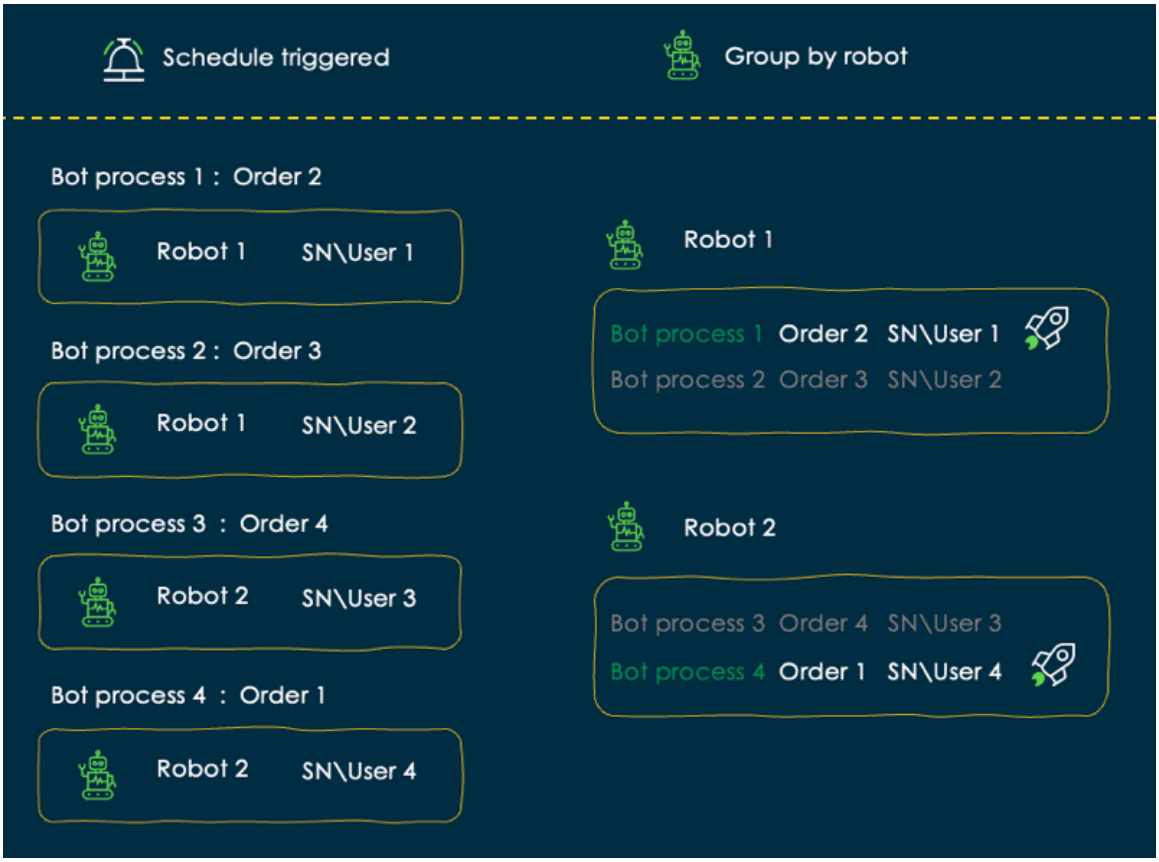
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled trigger

When multiple bot processes are scheduled to run at the same time, consider the following scenarios to understand how bot process execution is prioritized based on order number and Windows credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario 1: Robots with different Windows credentials



The following bot processes use robots 1 and 2 with different priority orders and the robots use different credentials to login to a Windows machine.

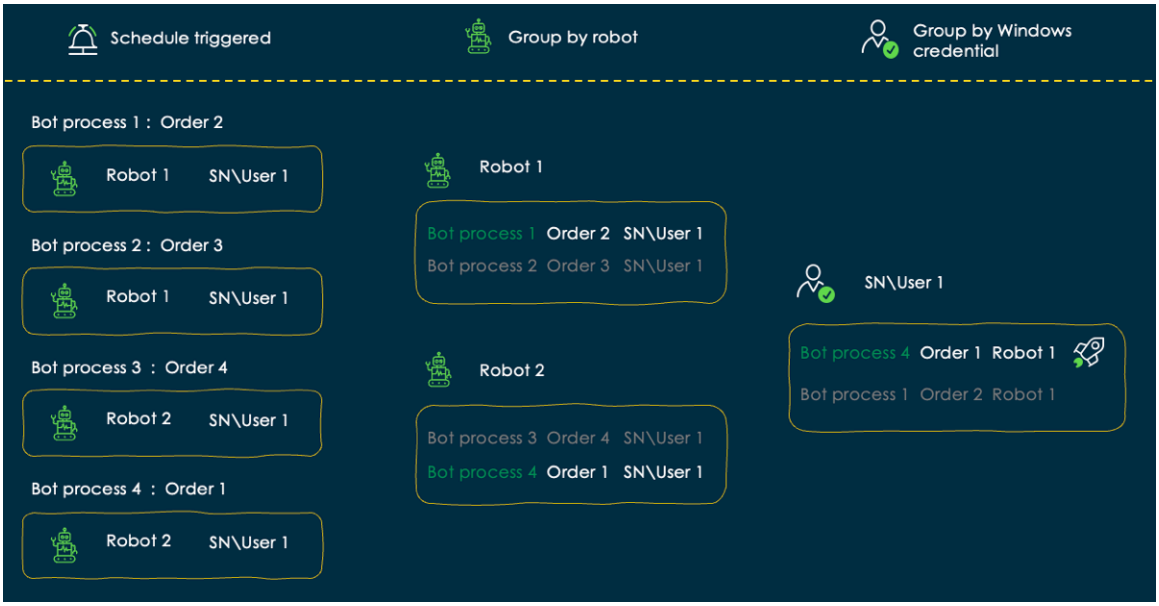
- Bot process 1
  - Robot: Robot 1
  - Order: 2
  - Windows credential: SN\User 1
- Bot process 2
  - Robot: Robot 1
  - Order: 3
  - Windows credential: SN\User 2
- Bot process 3
  - Robot: Robot 2
  - Order: 4
  - Windows credential: SN\User 3
- Bot process 4
  - Robot: Robot 2
  - Order: 1
  - Windows credential: SN\User 4

When all bot processes are scheduled to start simultaneously, execution is determined based on the following logic:

1. Bot processes are grouped by the robot.
2. Within each group, the bot process with the lowest priority number is executed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario 2: Robots with the same Windows credential



The following bot processes use high-density robots 1 and 2 with different priority orders and use same credentials to login to a Windows machine.

- Bot process 1
  - Robot: Robot 1
  - Order: 2
  - Windows credential: SN\User 1
- Bot process 2
  - Robot: Robot 1
  - Order: 3
  - Windows credential: SN\User 1
- Bot process 3
  - Robot: Robot 2
  - Order: 4
  - Windows credential: SN\User 1
- Bot process 4
  - Robot: Robot 2
  - Order: 1
  - Windows credential: SN\User 1

When all bot processes are scheduled to start simultaneously, priority is determined based on the following logic:

1. Bot processes are first grouped by the robot.
2. Within each group, the bot process with the lowest priority number is selected.

Intermediate priority results:

- Robot 1: Bot Process 1 (priority 2) is selected over Bot Process 2 (priority 3).
- Robot 2: Bot Process 4 (priority 1) is selected over Bot Process 3 (priority 4).

However, Bot Process 1 and Bot Process 4 cannot be launched in the same Windows session simultaneously due to shared credentials (SN\User1). To resolve

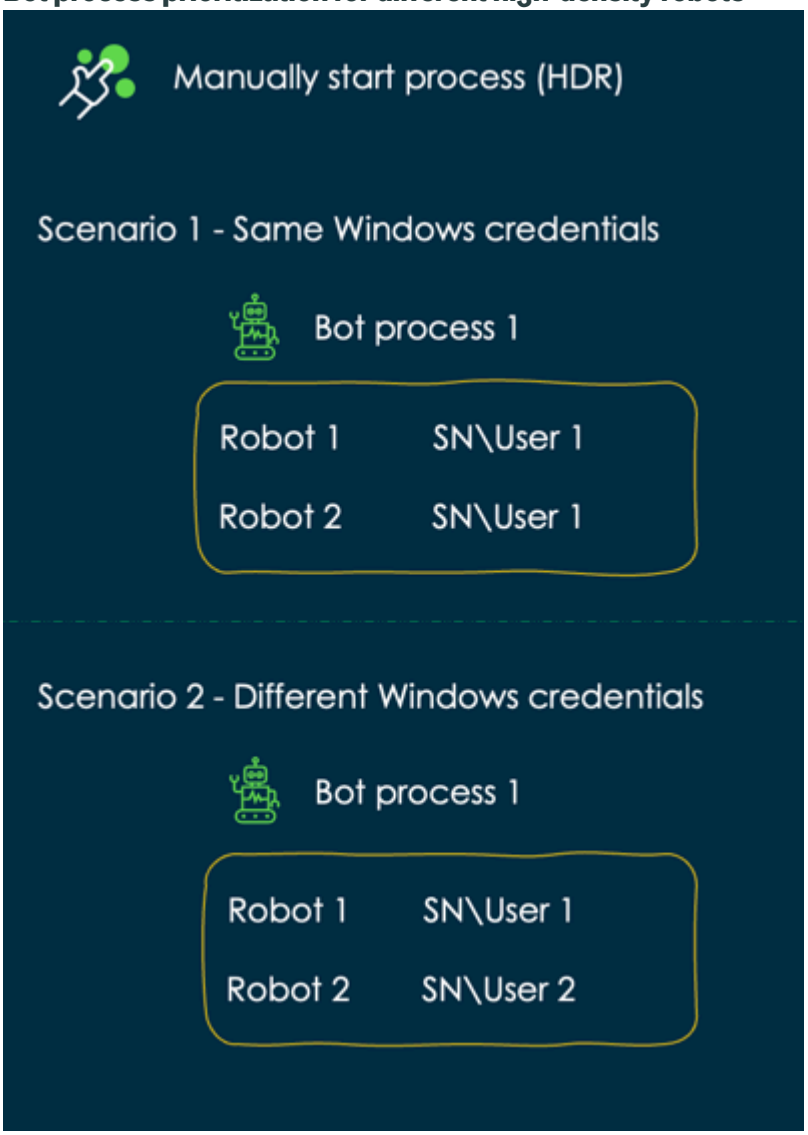
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc. in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manual trigger

When a bot process with multiple high-density robots is triggered using the **Start Process** button, consider the following scenarios to understand how bot process execution is prioritized for a robot.

Bot process prioritization for different high-density robots



Scenario 1: Robots with the same Windows credentials

The Bot process 1 uses high-density robots 1 and 2 with the same credentials to login to a Windows machine. When the **Start Process** button is clicked on the Bot process 1 for Robot 1 and Robot 2, any one robot is picked randomly to execute the bot process. The process job with the **Skipped** status is created for the other robot.

Scenario 2: Robots with different Windows credentials

The Bot process 1 uses high-density robots 1 and 2 with different credentials to login to a Windows machine. When the **Start Process** button is clicked on the Bot process 1 for Robot 1 and Robot 2, both the robots execute the bot process simultaneously.

Credential Management in RPA Hub

Streamline the credentials that robots use to perform the automation that you defined in the bot process. Instead of creating the same set of credentials for each bot process, you can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

create a credential group that includes a robot credential, application credentials, and external credentials. You can then associate the credential group to multiple bot processes.

Credential management overview

If you're an RPA release manager, RPA administrator, or RPA developer, you can create and associate credential groups to an unattended bot process. You can also set up an external credential vault to retrieve the robot credentials, application credentials, or a Time-based One-time Password (TOTP) seed from an external source. The seed is the secret key of the authenticator that is used to generate the TOTP. An external credential vault is a secure storage system often used to store and manage sensitive information such as user names, passwords, and other access credentials for various applications, services, or systems.

Benefits of credential management

With credential management, you can do the following tasks:

- Define the credentials once and reuse them in multiple bot processes to improve the overall productivity of your resources.
- Reduce the number of errors that occur when you're configuring the same credential groups for different bot processes.
- Improve how credentials are accessed with centralized credential management.
- Securely retrieve the credentials from an external storage system by configuring the external credential vault.

Robot credentials

By creating robot credentials, you can enable robots to log in to a Windows machine and perform the automation. For more information, see Create a robot credential in RPA Hub.

In the following table, learn what users with different roles can do or can't do.

Access control list for robot credentials

Role	Can do	Can't do
RPA release manager and RPA administrator	Create, view, update, or delete the robot credentials.	-
RPA developer	• Create the robot credentials. • View the robot credentials that are created by them or the robot credentials that are mapped to the bot processes that they're assigned to. • Update or delete the robot credentials that are created by them.	Can't view, update, or delete the robot credentials of the bot process that they aren't assigned to or robot credentials that aren't created by them.
RPA robot user	View all robot credentials.	Can't create, update, and delete the robot credentials.

TOTP authentication

By setting up Time-based One-time Password (TOTP) seeds, you can enable the unattended robots to authenticate seamlessly against multi-factor authentication (MFA)-enabled applications. MFA-enabled applications provide additional security for users and their accounts.

You can't edit a TOTP authenticator record. If changes are required to an existing TOTP authenticator record, you must retire an existing record and then create a TOTP authenticator record. For more information, see TOTP authentication in RPA Hub and Create a TOTP authenticator in RPA Hub.

In the following table, learn what users with different roles can do or can't do.

Access control list for TOTP authentication

Roles	Can do	Can't do
RPA release manager and RPA administrator	Create, view, or delete the TOTP authenticators.	Can't update the TOTP authenticators.
RPA developer	• Create the TOTP authenticators. • View the TOTP authenticators that are created by them or TOTP authenticators that are mapped to the bot processes that they're assigned to.	Can't update or delete the TOTP authenticators.
RPA robot user	View all TOTP authenticators.	Can't create, update, or delete the TOTP authenticators.

Credential groups

By configuring the credential groups, you can map the application credentials and a robot credential to one or more bot processes. For more information, see Create a credential group in RPA Hub.

In the following table, learn what users with different roles can do or can't do.

Access control list for credential groups

Roles	Can do	Can't do
RPA release manager and RPA administrator	Create, view, update, or delete the credential groups.	-
RPA developer	• Create the credential groups. • View the credential groups that are created by them or the credential groups that are mapped to the	Can't view, update, or delete the credential groups of the bot process that they aren't assigned to or the credential groups that aren't created by them.

	bot processes that they're assigned to. • Update or delete the credential groups that are created by them.	
RPA robot user	View all the credential groups.	Can't create, update, or delete the credential groups.
RPA support user	View the credential groups that are mapped to the bot processes that they're assigned to.	Can't create, update, or delete the credential groups.

External credential vault

By configuring an external credential vault, you can retrieve a robot credential, application credentials, or Time-based One-time Password (TOTP) seed from an external source instead of a ServiceNow credentials record. For more information, see External credential vault in RPA Hub and Create an external credential vault record in RPA Hub.

In the following table, learn what users with different roles can do or can't do.

Access control list for the external credential vault

Roles	Can do	Can't do
RPA release manager and RPA administrator	Create, view, or update the external credentials.	Can't delete external credentials.
RPA developers	View the external credentials.	Can't create, update, or delete the external credentials.
RPA support user	View the external credentials.	Can't create, update, or delete the external credentials.
RPA business user	View the external credentials.	Can't create, update, or delete the external credentials.

TOTP authentication in RPA Hub

You can configure the Time-based One-time Password (TOTP) fields in RPA Hub that enable the unattended robots to seamlessly authenticate against multi-factor authentication (MFA)-enabled applications.

Overview of TOTP authentication

An authenticator application is third-party software that generates temporary passcodes. Users can use these passcodes with their password to log in into an instance that requires multi-factor authentication (MFA).

TOTP authentication secures the seed storage of the authenticator at the instance level. The seed is the secret key of the authenticator that is used to generate the TOTP.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Familiarize yourself with multi-factor authentication (MFA) concepts. For more information, see Multi-factor authentication.

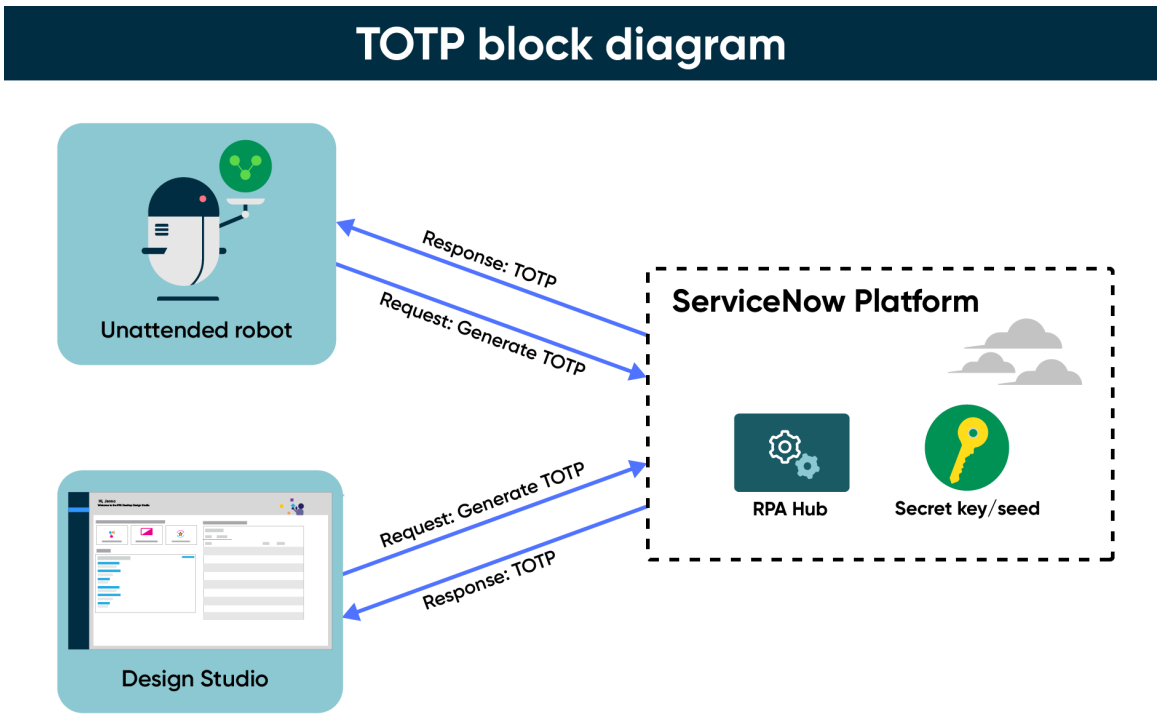
TOTP authentication architecture

The secret key (**Seed**) resides in the RPA Hub server.

The decrypted TOTP is passed to the Unattended Robot and RPA Desktop Design Studio through a secure channel.

The following diagram shows the architecture of the TOTP authentication in RPA Hub.

Architecture of the TOTP authentication in RPA Hub



New fields and tables configuration

To enable TOTP authentication in the RPA Hub, do the following actions:

- Create a multi-factor authentication (MFA) authenticator record in the classic environment. For more information, see Create an MFA authenticator in RPA Hub.
- Associate a TOTP authenticator to a robot credential with the secret key (Seed). You can do this task in the workspace and classic environment. For more information, see Create a TOTP authenticator in RPA Hub.

In the RPA Desktop Design Studio, as an RPA developer, you can define the GetTOTP component (previously known as the getOKTAtoken component) with AuthenticatorName as an input parameter. The authenticator name that you provide from the component is compared against the unique authenticator name in the TOTP record. If the comparison is successful, the TOTP password is generated. For more information, see Use the GetTOTP component.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External credential vault in RPA Hub

With the external credential vault feature, you can retrieve robot credentials, application credentials, or Time-based One-time Password (TOTP) seed.

External credential vault integration with RPA Hub

The following diagram shows the integration of an external credential vault with RPA Hub.

A robot resides in the customers' environment. If the robot requires sensitive data during the automation execution, then the robot makes a GraphQL Application Programming Interface (API) call to the RPA Hub. An example of the sensitive data is user name and password details while logging in to an SAP application.

Based on the input provided in the **External Credential** check box, either on a robot credential form, an application credential form, or a TOTP authenticator form:

- If the input is false (if the check box isn't selected), the credentials are saved or retrieved from the instance.
- If the input is true (if the check box is selected in the robot credential form, an application credential form), the credentials are fetched from a configured external credential vault. If the check box is selected in the TOTP authenticator form, the seed is fetched from a configured external credential vault.

For more information about configuring these fields, see Create a robot credential in RPA Hub, Create an application credential in RPA Hub, and Create a TOTP authenticator in RPA Hub.

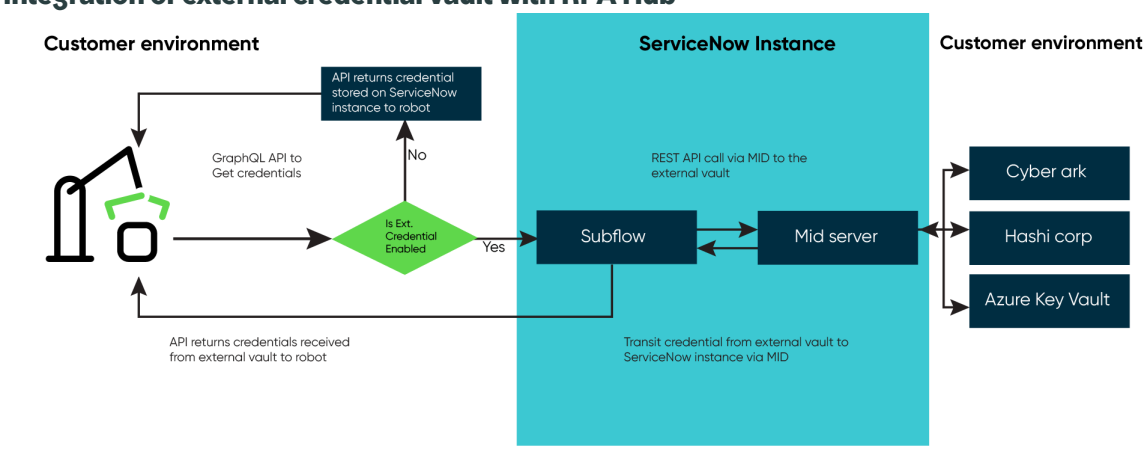
Examples of an external credential vault are CyberArk, Azure key Vault, and so on.

If the **External Credential** check box isn't enabled, the API returns the data stored in the **Password2** field of the ServiceNow instance and then the robot uses the sensitive data for the automation execution.

If the **External Credential** check box is enabled, the credentials are fetched from a configured external credential vault. In this scenario, the API internally triggers a subflow. This subflow makes a REST API call to the external credential vault. You can route this REST API call via MID Server. Or, you can directly establish a connection with the external credential vault. This implementation is dependent on your organizational requirements. The MID Server resides in the customers' environment. For more information about MID Server, see MID Server.

After the REST API call fetches the credential from the vault, the credentials are sent to the robot.

Integration of external credential vault with RPA Hub



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important information

You must configure the external credential settings appropriately, so that the data isn't stored or logged in the ServiceNow instance.

Verify that the value of the **Reporting** field is set to **Off** for the subflow of your external credential vault, for example **Demo CyberArk Subflow**. This setting verifies that the sensitive data isn't captured or logged. For more information about configuring this setting, see Activate flow reporting.

To configure the external credential vault in RPA Hub, see Steps to configure an external credential vault in RPA Hub.

Outbound request logging enables you to understand what third party services your instance accesses and the volume of outbound requests. Additionally, logging can provide valuable information when debugging outbound integrations. For more information about system logging or outbound logging, see Configure outbound logging and Outbound web service logging properties.

Steps to configure an external credential vault in RPA Hub

Use this list of steps to guide you through all the tasks of configuring an external credential vault in RPA Hub.

Complete all the tasks for a step before moving on to the next step.

Do the steps in the order that they're presented.

Steps to configure an external credential vault in RPA Hub

Task	Reference
1. Create a subflow to integrate your external credential vault. For more information, see Create a subflow in Workflow Studio.	For reference, see the sample **Demo CyberArk Subflow** in your ServiceNow instance.
1.A. Verify that the subflow that you're creating to integrate with the External Credential Vault, must have an input type as JSON. This input takes the value from the **Subflow Input** field of the Robot Credential, Application Credential, or Time-based One-time Password (TOTP) Authenticator. For example, the robot credential or application credential or TOTP authenticators that are using the **Demo CyberArk** external credential vault, must align with the following JSON format: `{ "appID" : "", "query" : "" }` Populate values for **appID** and **query**.	
1.B. You can use the REST Step in the subflow to connect with the external credential vault.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Steps to configure an external credential vault in RPA Hub (continued)

Task	Reference
You can also use other integration steps such as SOAP. For more information, see Workflow Studio steps.	
1.C. Verify that the output of your subflow must be aligned with the following JSON schema. `{ "$schema": "http://json-schema.org/draft-07/schema#", "type": "object", "properties": { "result": { "type": "object", "properties": { "status": { "type": "string", "enum": ["success", "failure"] }, "data": { "type": "object", "properties": { "username": { "type": "string" }, "sensitiveValue": { "type": "string" }, "additionalData": { "type": "object" } }, "required": ["sensitiveValue"] }, "error": { "type": "object", "properties": { "errorType": {`	This schema is used by the Robotic Process Automation (RPA) GraphQL APIs to validate the subflow output. If the output isn't aligned with this schema, an error is encountered. Error Message: `The JSON received from the subflow deviates from the expected JSON schema. Rectify the JSON structure by aligning it with the specified schema in the documentation.`

Task	Reference

<pre>"type": "string"
},
"errorMessage": {
"type": "string"
},
"additionalErrorData": {
"type": "object"
}
},
"required": ["errorMessage"]
}
},
"required":
["status"]
}
},
"required": ["result"]
};</pre>	

1.D. You can align with the expected JSON schema (mentioned in 1.C) by defining a JSON output with the name 'result' for the Subflow. For success status, this result output must be assigned with a JSON object of the following structure. Populate values for the keys defined in the JSON. The **status** and **sensitiveValue** keys are required.
<pre>{
"status":
"success", //Mandatory
"data": {
"username": "",
"sensitiveValue":
"" //Mandatory
"additionalData": {}
}
}</pre>For failure status, this result output must be assigned with a JSON object of the following structure. Populate values for the keys defined in the JSON. The **status** and **errorMessage** keys are required.

Steps to configure an external credential vault in RPA Hub (continued)

Task	Reference

<pre>{
"status":
"failure", //Mandatory
"error": {
"errorType": "",
"errorMessage":
"", //Mandatory
"additionalErrorData": {}
}
}</pre>	

2. Create an external credential vault record. For more information, see Create an external credential vault record in RPA Hub.	For reference, see the sample **Demo CyberArk** external credential vault in your ServiceNow instance.
3. Establish a connection with an external credential vault by using the ServiceNow Connections and Credentials. For more information about creating an active connection, see Create an HTTP(s) connection. While configuring the connection record, verify to align with your organizational security requirements.	For reference, see the sample **Demo CyberArk Subflow** that uses **RPA CyberArk** connection and credential alias. Create a connection record in this connection and credential alias to establish connection with your CyberArk external vault.
4. To use the external credential vault record, that you created in step 2, navigate to either robot credential, application credential, or TOTP authenticator and select the **External Credential** check box. Also, select a record in the **External Credential Vault** field and populate the **Subflow Input** field with a valid JSON object. The JSON must contain the necessary information for retrieving credentials from the external credential vault.	For more information about configuring these fields, see Create a robot credential in RPA Hub, Create an application credential in RPA Hub, and Create a TOTP authenticator in RPA Hub.

Queue implementation in RPA Hub

In RPA Hub, the queues are implemented to distribute the workload among various robots. Work Items (WI) within a queue are processed simultaneously by two or more robots.

Queue implementation overview

A queue is a repository that can hold a number of work items. Work items can store multiple types of data, such as transaction information, customer details, or information from a document.

A queue refers to a structured data storage mechanism used to manage and control the distribution of tasks, work items, or cases to different robots for processing. RPA queues play a crucial role in orchestrating the execution of automated processes and ensuring that tasks are processed efficiently, accurately, and in the desired order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Queues facilitate task distribution, coordination, and efficient processing across multiple bots or processes. Queues are particularly useful in scenarios where automation needs to handle a dynamic workload with different tasks arriving at different times, such as processing incoming emails, customer orders, or data entries.

In RPA Hub, you cannot delete a queue that is associated to a published bot process.

Work item lifecycle

The State transition of a work item guides you through the stages of its life cycle.

1. Work items are created from upstream systems using the **Add WorkItem to Queue** flow action or by robots, using the **CreateStringWorkItem** or **CreateJSONWorkItem** component.
2. Using the **PickWorkItem** component, robots pick a work item for processing.
3. After a work item is picked, the robot is stamped on the work item.

   Note:
   No other robot can pick this work item.

4. Work items are processed by the criteria that you specified. There are various conditions to determine which item must be picked and it varies for each automation. This criterion is the input for the **PickWorkItem** component.
5. After a work item is picked, the robot updates it multiple times while processing it using the **UpdateWorkItem** component.

   This robot can also release this work item by partially processing it, so that other robots can pick it. This process is performed by the input in the **ReleaseMode** field, in the **UpdateWorkItem** component.

6. After the robot completes the processing, it updates the work item to complete using the **UpdateWorkItem** component and picks the next work item that is Step 2.

The following diagram shows the lifecycle of work items (WI) in RPA Hub application.

Lifecycle of work items (WI) in RPA Hub

Work item form in RPA Hub

Queue

Using auto-retry functionality for your failed work items in RPA Hub

You can use auto-retry functionality in RPA Hub to retry the failed items automatically in your work queue. The retry functionality is based on the **Application** exception type only.

Auto-retry overview

Usually, in an existing Robotic Process Automation (RPA) work queue, the items are processed by the criteria that you specified. The items in this type of work queue are picked by the robots for execution.

Let's consider a scenario where the first item in your work queue is processed successfully, and the status is updated to success. But, when the robot picks the second item in the work queue for execution, it isn't processed successfully and the status is updated to failure.

By using auto-retry functionality instead in this scenario, the work items are retried automatically based on the value in the **Exception Type** field on the Work Item form, and based on the values that you enter in the **Maximum Attempts** field and the **Attempt Delay** field on the Queue form.

There are two exception types: application and business.

In the Work Item form, if the value of the **Exception Type** field is **Application**, the value of the **Maximum Attempts** field is greater than 1, and the current value in the **Attempts Count** field is less than the value in the **Maximum Attempts** field, the failed item in the work queue is automatically retried.

Note:
If the value in the **Exception Type** field is **Business**, the auto-retry functionality isn't enabled.

Queue fields and system property configuration

To enable auto-retry functionality, you must define the values in the *sn_rpa_fdn.queue.maximum_attempts_max_value* system property. For more information about these values, see Configure RPA Hub properties.

You can enable auto-retry functionality by configuring the following fields on the Queue form:

- **Maximum Attempts**
- **Attempt Delay (mins)**

In the **Maximum Attempts** field, you define the number of attempts for the failed work items. In the **Attempt Delay (mins)**, you define the maximum delay, in minutes, before the work item is attempted again. For more information about these fields, see Queue form in RPA Hub and Create a queue in RPA Hub.

You can view the following fields that are related to the auto-retry functionality on the Work Item form:

- **Exception Type**
- **Attempts Count**

Based on the value in the **Exception Type** field, the auto retry functionality retries the work items. In the **Attempts Count** field, you can view the number of times the work item is picked for auto retry. For more information about these fields, see Work item form in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-retry workflow

When the status of the work item that is selected in the automation is **In progress**, the auto-retry workflow is as follows:

- If the **Exception Type** field is Application, the **Attempts Count** field is incremented by 1, and the current value in the **Attempts Count** field is equal to the value in the **Maximum Attempts** field, the status of the work item is updated to **Failed** and the **Exception Type** field is updated to Application. The work item isn't available for auto-retry.
- If the **Exception Type** field is Application, the **Attempts Count** field is incremented by 1, and the current value in the **Attempts Count** field is less than the value in the **Maximum Attempts** field, the status of the work item is updated to **In progress** and the **Exception Type** is updated to Application. The work item is available for auto-retry only after you set the duration (if any) in minutes in the **Attempts Count** field.
- If the **Exception Type** field is Business and the **Attempts Count** field is incremented by 1, the status of the work item is updated to **Failed**, and the **Exception Type** field is updated to Business. The work item isn't available for auto-retry.
- When there's no value in the **Exception Type** field and the **Attempts Count** field isn't incremented by 1, the status of the work item is updated to **In progress**. The **Exception Type** isn't updated. The work item is available for auto-retry only after you set the duration (if any) in minutes in the **Attempts Count** field.

Note:
If the value in the **ReleaseMode** field is locked, then you can't increment the value in the **Attempts Count** field because the robot is still executing the work item. The value in the **Attempts Count** field must be incremented only when the value in the **ReleaseMode** field is release. The value in the **Attempts Count** field is incremented when an item is released by the robot or when an item's status is set to **Failure**.

The following table shows the auto-retry workflow for an **In progress** work item.

Auto-retry workflow for an In progress work item

Exception Type	Attempts Count (Increment by 1)	Condition	Status updated to	Exception Type updated to
Application	Yes	If the current value in the **Attempts Count** field is equal to the value in the **Maximum Attempts** field.	Failed	Application
Application	Yes	If the current value in the **Attempts Count** field is less than the value in the **Maximum Attempts** field.	In progress	Application
Business	Yes	<No condition>	Failed	Business
<empty>	No	<No condition>	In progress	<No update>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the status of a work item that is selected in the automation is **Success**, the auto-retry workflow is as follows:

- If the **Exception Type** field is Application and the **Attempts Count** field is incremented by 1, the status of the work item is updated to **Success** and the **Exception Type** is updated to blank. The work item isn't available for auto-retry.
- If the **Exception Type** field is Business and the **Attempts Count** field is incremented by 1, the status of the work item is updated to **Success**. The **Exception Type** is updated to blank, and the work item isn't available for auto-retry.
- If there's no value in the **Exception Type** field and the **Attempts Count** field is incremented by 1, the status of the work item is updated to **Success**. The **Exception Type** field is updated to blank, and the work item isn't available for auto-retry.

The following table shows the auto-retry workflow for a **Success** work item.

Auto-retry workflow for a Success work item

Exception Type	Attempts Count (Increment by 1)	Status updated to	Exception Type updated to
Application	Yes	Success	<blank>
Business	Yes	Success	<blank>
<blank>	Yes	Success	<blank>

When the status of work item that is selected in the automation is **Failed**, the auto-retry workflow is as follows:

- If the **Exception Type** is Application, the **Attempts Count** field is incremented by 1, and the current value in the **Attempts Count** field is less than the value in the **Maximum Attempts** field, the status of the work item is updated to **In progress**. The **Exception Type** field is updated to Application, and the work item is available for auto-retry only after the duration that you set in the **Attempts Count** field.
- If the **Exception Type** field is Application, the **Attempts Count** field is increment by 1, and the current value in the **Attempts Count** field is equal to the value in the **Maximum Attempts** field, the status of the work item is updated to **Failed**. The **Exception Type** field is updated to Application, and the work item isn't available for auto-retry.
- If the **Exception Type** is Business, the **Attempts Count** field is incremented by 1, the status of the work item is updated to **Failed**. The **Exception Type** field is updated to Business, and the work item isn't available for auto-retry.
- If there's no **Exception Type** field and the **Attempts Count** field is incremented by 1, the status of the work item is updated as **Failed**. The **Exception Type** field isn't updated, and the work item isn't available for auto-retry.

The following table shows the auto-retry workflow when the **Failed** status is selected in the automation.

Auto-retry workflow for a Failed work item

Exception Type	Attempts Count (Increment by 1)	Condition	Status updated to	Exception Type updated to
Application	Yes	If the current value in the **Attempts Count**	In progress	Application

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-retry workflow for a Failed work item (continued)

Exception Type	Attempts Count (Increment by 1)	Condition	Status updated to	Exception Type updated to
		field is less than the value in the **Maximum Attempts** field.		
Application	Yes	If the current value in the **Attempts Count** field is equal to the value in the **Maximum Attempts** field.	Failed	Application
Business	Yes	<No condition>	Failed	Business
<empty>	Yes	<No condition>	Failed	<No update>

Note:
The value in the **Deferred Till** field is obtained from the component. This field always takes precedence over the **Attempt Delay (mins)** field. The **Deferred Till** field is a read-only field on the work item form. For more information, see Work item form in RPA Hub.

Queue implementation in RPA Hub

Code quality check in RPA Hub

A code quality check refers to the process of evaluating the automation file or script to assess its adherence to coding standards, best practices, maintainability, and overall quality.

Code quality check overview

Code quality checks are essential in RPA development life cycle, to ensure that the automation file is robust, efficient, and free from common issues that could lead to errors or difficulties in the future.

RPA release managers or RPA admins select code quality check rules from a pre-defined set of rules in the RPA Hub instance.

Then, the RPA Desktop Design Studio performs an in-built code quality check before publishing a package. RPA developers can also perform pro-active code quality check on a package in the RPA Desktop Design Studio by inspecting an activity or a complete automation project for any issues, using the **Code Quality Check** feature.

The issues and their details are displayed in the **Code Quality Check Results** window. Double-click an individual entry to view the component that has displayed an error or a warning. Troubleshoot the issues before you publish the automation project to RPA Hub. For more information on how to perform Code Quality Check in RPA Desktop Design Studio, see Code quality check in RPA Desktop Design Studio.

If an error or a warning occurs in the automation, a decision is derived if the package can be published successfully or not, based on the system property [*sn_rpa_fdn.restrict_package_by_severity*] configuration (error, warning, or no

© 2026 ServiceNow, Inc. All rights reserved.

restrictions). For more information about compliance rules for RPA Desktop Design Studio, see Code quality check compliance for RPA Desktop Design Studio.

If a package version is marked with code quality result as error or warning, a decision is derived if the bot process can be published successfully or not, based on the system property [*sn_rpa_fdn.restrict_package_by_severity*] configuration (error, warning, or no restrictions). For more information about compliance rules for RPA Hub, see Code quality check compliance for RPA Hub.

View a list of the pre-defined code quality rules in the RPA Hub instance. For more information, see Code quality rules list in RPA Hub.

View a code quality rule form along with the type and description. For more information, see Code quality rule form in RPA Hub.

In the code quality rule form, RPA release managers and admins can edit the **Severity**, **Regular Expression**, **Active**, and **Value** fields.

View the result of the code quality check, in the **Code Quality Result** field of an associated package version in RPA Hub. For more information, see Package Version form in RPA Hub.

Configuration

To enable the code quality check at the instance level, ensure that you mark the new system property *sn_rpa_fdn.enable_code_quality_check* as true.

Additionally, configure the following system properties:

- *sn_rpa_fdn.restrict_package_by_severity* - To set a restriction on publishing a package from RPA Desktop Design Studio and publishing a bot process in RPA Hub.
- *sn_rpa_fdn.code_quality_check_timeout* - To enter a maximum duration, in minutes, for the completion of the code quality check.

These system properties are effective only when code quality check feature *sn_rpa_fdn.enable_code_quality_check* is enabled. For more information about these properties and values, see Configure RPA Hub properties.

Migrating the bot process configuration in RPA Hub

In RPA Hub, you can migrate the bot process configuration and associated assets for an attended or unattended bot process from one environment to another environment. With this feature, you can create an automation and test it in a lower environment and then migrate it to a higher or production environment.

Bot process migration overview

You can migrate the bot processes from any environment to any environment. For example, when a bot process is ready to be migrated from a developer's environment to a UAT environment, an RPA developer or RPA administrator can select the **Ready for Migration** button on a published bot process. This action enables the **Migrate** button to appear. This button is only visible when the bot process migration isn't in progress. Then, an RPA release manager or RPA administrator can initiate the migration process by selecting the **Migrate** button. After the bot process and associated assets are migrated, a release manager can make any necessary changes (such as creating more process parameters, shared parameters, or credential mapping), create and associate credentials, create an associated bot process record, and publish the bot process on the UAT (target) environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What's migrated with the bot process

In an unattended bot process migration, the following records and associated assets are also migrated:

- Bot process configuration
- Packages
- Package versions with attachments
- Process parameters
- Shared process parameters, if assigned to the bot process
- Schedules
- Queues
- Associated skills

In an attended bot process migration, the following records and associated assets are also migrated:

- Bot process configuration
- Packages
- Package versions with attachments
- Process parameters
- Shared process parameters, if assigned to the bot process
- Process field parameters, if Embedded Task Automation (ETA) is enabled
- Attended configurations, if ETA is enabled
- Queues
- Associated skills

What's not migrated with the bot process

The robot credentials, application credentials, and credential group that are associated with the bot process configuration aren't migrated. After the bot process configuration is migrated, the credentials must be created or updated in the target environment.

If any shared parameters or process parameters are marked as sensitive in the bot process, the sensitive values that are stored in these parameters aren't migrated and the parameter values are empty in the target environment.

Only the default field values are migrated. The custom field values aren't migrated.

Restructured RPA Hub tables (Tokyo and earlier releases)

For Tokyo and earlier releases, you must restructure the RPA Hub tables before migration. For more information, see Restructuring RPA Hub tables.

Process job states in RPA Hub

A process job represents the execution of a bot process on a robot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process job state scenarios

State	Scenario
Running	When a bot process is being executed by a robot, the status of the process job is updated to **Running**.
Canceled	When a bot process execution is canceled manually, the process job status is updated to **Canceled**. If Bot process 1 is already executing, and Bot process 2 with force start enabled is triggered, then the process job status of Bot process 1 is updated to **Canceled**, and the process job status of Bot process 2 is updated to **Running**.
Success	After a bot process is executed successfully by a robot, the process job status is updated to **Success**.
Failed	When a bot process execution fails to complete, the process job status is updated to **Failed**.
Skipped	Consider the following scenarios when more than one bot processes are triggered for the same unattended robot: • If Bot process 1 is already executing and Bot process 2 with force start disabled is triggered, then the process job status of Bot process 2 is updated to **Skipped**. • If two bot processes, BP1 and BP2, are scheduled to run on the same robot at the same time and BP2 has lower priority (higher priority order number), then the process job status of BP2 is updated to **Skipped**. • If two bot processes, BP1 and BP2, with the same priority order are scheduled to run on the same robot at the same time, then only one of the bot process would be selected randomly for running and the process job status of the other one is updated to **Skipped**. • If Bot process 1 is triggered and robot is waiting to login, and in the mean time Bot process 2 is triggered, then process job status of Bot process 2 is updated to **Skipped**. • The **Start process** action is invoked for Bot process 1. Until the execution starts, if other bot processes are triggered then the process jobs of all other start process requests are updated to **Skipped**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process job state scenarios (continued)

State	Scenario
	• When a robot comes back to responsive state, it will start to receive start process requests that were triggered when the robot was in the unresponsive state. The latest request which falls under the configured threshold is updated to **Running** and all the older requests are updated to **Skipped**.
Abandoned	• For any robot type, if a bot process was previously executing and the process job status was not updated to **Completed**, and a new process job is created, then the status of the previously executing process job is updated to **Abandoned**. • When a process job is running, the robot state is moved from **Busy** state to any other state. For example, when a process job is executing locally in the robot machine, a robot may fail to update RPA Hub with its heartbeat call due to network failure, certificate authentication failure, machine user profile corruption, and so on. In all such scenarios, when the robot calls the RPA Hub after an interruption, and then updates its status from **Busy** or **Disconnected** to **Available**, then the status of the last known process job is changed to **Abandoned**.

Smart Card in RPA Hub

Smart card login for a Windows machine is a secure method of logging into the system using a physical smart card instead of a username and password. It's commonly used in organizations to enhance security, particularly in environments with high security requirements.

With Robotic Process Automation (RPA), you can run unattended automations on the machines that use smart cards for authentication. While configuring a robot credential, you can store the smart card username and password to allow the unattended robot to log in to machines that use smart card. For more information about configuring Smart Card for an unattended robot, see Create a robot credential in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Smart Card limitations

- Authentication support - Smart Card certificate-based authentication is supported only for single unattended RPA sessions. Smart Card authentication is not supported in high-density (multi-session) environments.
- Credential type consistency - If a robot runs multiple processes, all Windows logins must use the same credential type—either Smart Card or Windows username and password.
- Execution timing - Allow adequate time between process executions, including time for logout, to ensure proper session initialization and prevent authentication conflicts.

Configuring RPA Hub

You can plan and configure an RPA Hub implementation in your organization.

Configuration overview

Perform the following tasks for configuring RPA Hub:

1. Install Robotic Process Automation (RPA) Hub.

   Install the Robotic Process Automation (RPA) Hub application (sn_rpa_fdn) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

2. (Optional) Restructure RPA Hub tables.

   Restructure the Robotic Process Automation (RPA) tables to an application file, so that changes that you make to these tables are captured in the update sets and can be moved seamlessly across environments. With this process, you don't have to re-create the data records in the targeted environment.

3. (Optional) Migrating your data from a lower environment to a higher environment in RPA Hub.

   Use the update set capability to migrate your data from a lower (non-production) environment to a higher (production) environment for real-time use.

4. Set up client authentication and code signing certificates.

   You can generate a client authentication and a code signing certificate in two ways. You can either generate and install user certificates or export active directory certificates.

   - Generate and install user certificate from KeyStore Explorer.

     Generate a client authentication certificate for authentication purposes in the Unattended Robot application. Generate a code signing certificate for publishing an automation project from RPA Desktop Design Studio.

   - Export Active Directory certificates.

     You can export Microsoft Active Directory certificates, such as root, intermediate, and a client authentication certificate, for authentication purposes. You can then register the exported root and intermediate certificate in the ServiceNow instance and map the exported client authentication certificate to the user.

5. Applying the CSDM guidelines to RPA Hub.

   Apply Common Service Data Model (CSDM) guidelines to define configuration items (CIs) and relationships between CIs in the CMDB. This process ensures that your data resides in the appropriate CMDB tables for maximum value from your ServiceNow AI Platform applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Create a robot license distribution record in RPA Hub.

   In the classic environment, define the consumption and distribution of licenses for parent and child domains, or global domain by creating a robot license distribution record in RPA Hub.

7. Configure RPA Hub properties.

   In the classic environment, configure RPA Hub properties, such as auto assignment of robots or defining the authentication mechanism to customize the experience.

Using Guided Setup to implement RPA Hub

Guided Setup provides a sequence of tasks that help you configure RPA Hub on your ServiceNow® instance. With Guided Setup, keep track of what you have completed, so you can stop and start again where you left off. To open Guided Setup for RPA Hub, navigate to **All** > **Robotic Process Automation** > **Administration** > **Guided Setup**.

For more information about using the guided setup interface, see Using guided setup.

Using Guided Tours to get help related to a configuration task

Guided Tours provide step-by-step instructions on your ServiceNow® instance to help you complete a task. For more information about using guided tours, see Use Guided Tours in RPA Hub.

Related topics

Configuring RPA Desktop Design Studio

Install Robotic Process Automation (RPA) Hub

You can install the Robotic Process Automation (RPA) Hub application (sn_rpa_fdn) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the RPA Hub application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Robotic Process Automation (RPA) Hub:

- Roles
- Scheduled jobs
- Tables
- Actions and subflow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Components installed with RPA Hub and RPA Hub actions and subflow.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Robotic Process Automation (RPA) Hub application (sn_rpa_fdn) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Robotic Process Automation (RPA) Hub.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

What to do next

Use the Robotic Process Automation (RPA) Guided Setup to configure the application on your instance.

To access Robotic Process Automation (RPA) Guided Setup, navigate to **All** > **Robotic Process Automation** > **Administration** > **Guided Setup**. For more information about using the guided setup interface, see Using guided setup.

Restructuring RPA Hub tables

Starting with the Utah release, the Robotic Process Automation (RPA) tables are restructured to an application file, so that changes that you make to these tables are captured in the update sets and can be moved seamlessly across environments. With this process, you don't have to re-create the data records in the targeted environment.

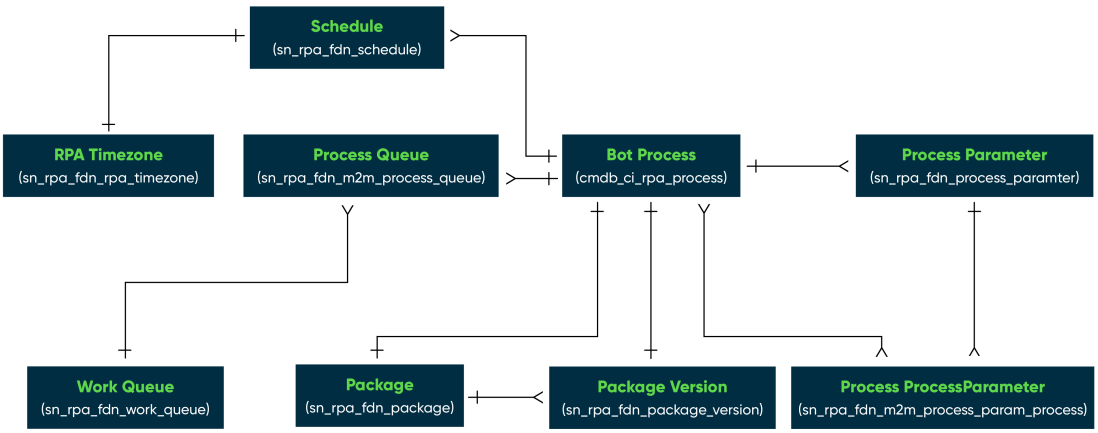
The table architecture that supports the RPA Hub application has been restructured to extend the Application file (sys_metadata). This action automatically captures all the data into the update sets.

If you are upgrading from Tokyo or older to Yokohama, the bot process definitions change to the new structure, that is the bot process configuration.

The following diagram shows the tables of RPA Hub before restructuring.

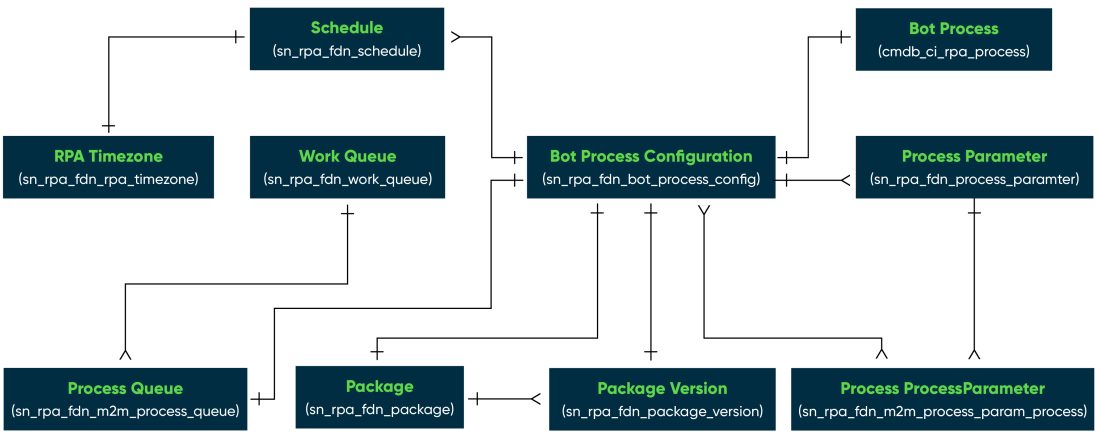
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RPA Hub tables before restructuring



The following diagram shows the tables of RPA Hub after restructuring.

RPA Hub tables after restructuring



For detailed information about the script that restructures the tables during an upgrade, see the Restructuring RPA Hub tables to sys_metadata in Utah article in the Now Support Knowledge Base.

Migrating your data from a lower environment to a higher environment in RPA Hub

As a system administrator, after you restructure the RPA Hub tables to extend the Application file (sys_metadata), you can use the update set capability to migrate your data from a lower (non-production) environment to a higher (production) environment for real-time use.

There are two ways you can migrate your data from a lower environment to a higher environment:

- Using the update set capability described in this page for migrating your data from one environment to another environment
- Using the **Migrate** button in RPA Hub

  In RPA Hub, you can migrate the bot process configuration and associated assets from one environment to another environment with a click of a button. After the migration is complete, you will have to create a bot process record, create credentials, make necessary changes, and then publish the bot process. For more information, see Migrating the bot process configuration in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Restructured RPA Hub tables (Tokyo and earlier releases)

For more information about the restructuring of the RPA Hub tables, see Restructuring RPA Hub tables.

For more information about update sets, see Get started with update sets.

Functionality

The metadata of the automation (package, package version, schedules, and so on) is captured in the update set. System administrator then moves the update set to a higher (production) environment.

The metadata records are moved to the higher (production) environment but the package version does not contain an automation zip file.

RPA release manager manually downloads the zip file from the lower (non-production) environment and then uploads it to a higher (production environment). RPA admin can also perform this action. However, this task is restricted to classic environment.

RPA release manager automatically imports package version attachments by selecting the **Import Attachment** button on a package version. RPA admin can also perform this action. A flow is then triggered asynchronously and pulls the attachment from the configured connection using API. The automation zip file is attached to the package version and HashCode validation is performed automatically. An email is also sent to the user who performs the import attachment action.

To execute the orchestration of RPA Hub update sets from third-party tools, it is essential to recreate bot process on the higher environment. The **Change Life Cycle Stage Status of a Bot Process** action in Workflow Studio helps in ensuring the deployment and enablement of RPA Hub process is automated. For more information about this action, see RPA Hub actions and subflow.

List of steps for the migration tasks

Use this list of steps to guide you through all the tasks of the migration.

Complete all the tasks for a step before moving on to the next step.

Do the steps in the order that they're presented.

Checklist

Task	Environment
1. Create and select an update set as the current set.	Lower (non-production) environment
2. Create a bot process configuration record in RPA Hub.	Lower (non-production) environment
3. Adding details for your bot process in RPA Hub.	Lower (non-production) environment
4. Mark your current update set complete.	Lower (non-production) environment
5. Export to XML.	Lower (non-production) environment
6. Download a package version in RPA Hub.	Lower (non-production) environment

© 2026 ServiceNow, Inc. All rights reserved.

Checklist (continued)

Task	Environment
Perform this task, if you are manually migrating the package attachment (automation zip file) from a lower (non-production) to a higher (production) environment. You can skip step 12.	
7. Switch to higher instance. Retrieve an update set.	Higher (production) environment
8. Preview a remote update set.	Higher (production) environment
9. Commit an update set.	Higher (production) environment
10. Associate a bot process to a bot process configuration record.	Higher (production) environment
11. Verify the associated schedules, parameters, packages, and queues in RPA Hub.	Higher (production) environment
12. If the instance connection is established with a required lower (non-production) instance, perform this import task. To establish an instance connection, create an active connection in the **RPA Automation Package** connection and credential alias. Ensure to provide the lower (non-production) environment in the **Connection URL** field. For more information, see Create an HTTP(s) connection. Perform this task if you are automatically migrating the package attachment (automation zip file) from a lower (non-production) to a higher (production) environment. Import a package version attachment in RPA Hub. You can skip step 13 and 14.	Higher (production) environment
13. Upload an automation package attachment in RPA Hub. Perform this task in classic environment.	Higher (production) environment
14. Verify the HashCode of a package version in RPA Hub.	Higher (production) environment
15. Assign a business application with a bot process.	Higher (production) environment
16. Create a credential group in RPA Hub.	Higher (production) environment

Checklist (continued)

Task	Environment
17. Assign a robot to a bot process in RPA Hub.	Higher (production) environment
18. Assign a process robot credential within a bot process.	Higher (production) environment
19. Assign an attended user or group to an attended bot process.	Higher (production) environment

Obtaining client authentication and code signing certificates

Use mTLS authentication for client authentication and verify authenticity of the automation packages by generating a code signing certificate.

Client authentication

Client authentication enables mutual TLS (mTLS) authentication between the Unattended Robot application and the ServiceNow server while making a connection.

You can either generate and install user certificates or export active directory certificates.

Code signing certificate

A code signing certificate is used for signing and verifying the automation packages from RPA Desktop Design Studio. This certificate detects any tampering or corruption of scripts before they're run.

The code signing certificate is validated during the Unattended Robot and Attended Robot executions.

If you set the *sn_rpa_fdn.code_signing_required* system property to true in the RPA Hub scoped application, a code signing certificate is required while publishing an automation project. For more information, see Configure RPA Hub properties and Publish an automation project in RPA Desktop Design Studio.

Explore the following topics to generate a client authentication and a code signing certificate.

Generating and installing user certificates

You can generate and install a user certificate for client authentication and code signing in your Windows machine, if you have the admin role.

Client authentication

Client authentication enables mutual TLS (mTLS) authentication between the Unattended Robot application and the ServiceNow server while making a connection.

You can either generate and install user certificates or export active directory certificates.

Code signing certificate

A code signing certificate is used for signing and verifying the automation packages from RPA Desktop Design Studio. This certificate detects any tampering or corruption of scripts before they're run.

The code signing certificate is validated during the Unattended Robot and Attended Robot executions.

If you don't have the active directory certificates, do the tasks in the following topics to generate and install user certificates. For more information, see Exporting Microsoft Active Directory certificates.

Generate a user certificate from KeyStore Explorer

Generate a user certificate for secure client authentication and code signing in your Windows machine using the KeyStore Explorer application. This reference procedure is one of many methods to generate a user certificate.

Before you begin

Do this task in your Windows machine.

If user certificates are generated by your organization, then you can skip this procedure. You can proceed with installing the user certificate.

If user certificates are not generated by your organization, you can either use this procedure or any other procedure to generate a client authentication certificate.

Role required: admin

About this task

Important:
The following procedure is for reference only. The steps may vary, depending on how certificates used within your organization are generated. Consult your IT administrator for more details.

You can install the KeyStore Explorer application in your Windows machine and then generate a client authentication and code signing certificate from the KeyStore Explorer application. Skip this task, if you already have these certificates.

Generate a client authentication certificate for authenticating the Unattended Robot application.

Generate a code signing certificate for publishing an automation project from RPA Desktop Design Studio.

Procedure

1. Navigate to https://keystore-explorer.org/downloads.html.
2. Download the latest setup.exe file for the Windows machine.
3. To install the KeyStore Explorer, do the following actions:
   a. Open the downloaded setup.exe file.
   b. In the Select Setup Language dialog box, select a language to use during the installation and select **OK**.
   c. In the Welcome to the KeyStore Explorer Setup Wizard dialog box, select **Next**.
   d. In the Select Destination Location dialog box, select a folder to install the KeyStore Explorer and select **Next**.
   e. In the Select Start Menu Folder dialog box, to create shortcuts of the program in the default folder, select **Next**.
   f. In the Select Additional Tasks dialog box, select the additional tasks that you would like the setup to perform while installing the KeyStore Explorer and then select **Next**.
   g. In the Ready to Install dialog box, select **Install**.
   h. After the installation is complete, select **Finish** to exit.
4. From your desktop, double-click the KeyStore Explorer icon and select **Create a new KeyStore**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the New KeyStore Type dialog box, select **JKS** as a type of the new KeyStore and select **OK**. The new KeyStore appears as an additional **Untitled** tab.
6. On the **Untitled** tab, right-click the screen and select **Generate Key Pair**.
7. In the Generate Key Pair dialog box, select **OK**.
8. In the Generate Key Pair Certificate dialog box, enter a name for the certificate.
9. Generate a user certificate.
10. In the Generate Key Pair Certificate dialog box, select the book icon against the **Name** field, and then do the following actions:
    a. In the Name dialog box, fill in the details of your organization.
    b. Select **OK**.
11. In the Generate Key Pair Certificate dialog box, select **OK**.
12. In the New Key Pair Entry Alias dialog box, enter an alias name in the **Enter Alias** field and select **OK**.
13. In the New Key Pair Entry Password dialog box, do the following actions to generate a key pair:
    a. In the **Enter New Password:** field, enter a new password for the key pair.
    b. In the **Confirm New Password:** field, confirm the new password.
    c. Select **OK**.
    d. After the key pair is generated, select **OK**.
14. On the **Untitled** tab, right-click this key, select **View Details**, and then select **Certificate Chain Details**.
15. In the Certificate Details for Entry dialog box, select the **PEM** button.
16. In the Certificate PEM dialog box, select **Export**.
17. Select a location to save this file as a `.pem` file and select **Save**.
    Use this file to upload in the instance for creating a Certificate Authority (CA) chain record and user record.
18. After the PEM is exported successfully, select **OK** and close all the tabs.
19. On the **Untitled** tab, do the following actions to generate a `.p12` file:
    a. Right-click the key entry, select **Export**, and then select **Export Key Pair**.
    b. In the Export Key Pair from KeyStore Entry dialog box, enter a password in the **Password for Output File:** field.
    c. In the **Confirm Password** field, confirm the password.
    d. Select **Export**.
    This file is saved as `.p12` file and is used in Unattended Robot for authentication.
    e. After the key pair is exported successfully, in the Export Key Pair dialog box, select **OK**.

What to do next

Activate the certificate-based authentication plugin, if you have the admin role. It is a prerequisite for registering the certificates on the instance. For more information, see Activate the certificate-based authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register user-generated client authentication certificate to make it available for authentication. For more information, see Register the CA certificate.

Map the user-generated client authentication certificate to the user. For more information, see Map the PEM certificate to user.

Install the generated client authentication and code signing certificate. For more information, see Install the user-generated certificates.

Install the user-generated certificates

Install the user generated (client authentication and code signing) certificates in your Windows machine, if you have the admin role.

Before you begin

Generate a client authentication and a code signing certificate. For more information, see Generate a user certificate from KeyStore Explorer.

Activate the certificate-based authentication plugin, if you have the admin role. It is a prerequisite for registering the certificates on the instance. For more information, see Activate the certificate-based authentication.

Register user-generated client authentication certificate to make it available for authentication. For more information, see Register the CA certificate.

Map the user-generated client authentication certificate to the user. For more information, see Map the PEM certificate to user.

Role required: admin

About this task

Important:
The following procedure is for reference only. The installation steps may vary, depending on how certificates used within your organization are generated. Consult your IT administrator for more details.

Procedure

1. Double-click the certificate file to open the Certificate Import Wizard dialog box.
2. From the Store Location list, select one of the following options:
   - If you're installing a client authentication certificate, select **Local Machine** to store a location for the certificate.
   - If you're installing a code signing certificate, select **Current User** to store a location for the certificate.
3. Select **Next**.
4. In the File to import dialog box, specify the file that you want to import in the **File name** field.
5. Select **Next**.
6. In the Private key protection dialog box, enter a password in the **Password** field for the private key.
7. In the Import options section, select the **Include all extended properties** option.
8. Select **Next**.
9. In the Certificate Store dialog box, select the **Automatically select the certificate store based on the type of certificate** option, to enable the Windows machine to automatically select a certificate store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Select **Next**.
11. In the Completing the Certificate Import Wizard dialog box, select **Finish**.
12. In the Confirmation dialog box, select **OK**.

What to do next
Add the user to manage private keys. For more information, see Add user to manage private keys.

Add user to manage private keys

Add the user to manage private keys in your Windows machine, if you have the admin role, to complete the certificate generation.

Before you begin
Install the user-generated (client authentication and code signing) certificates in your Windows machine, if you have the admin role. For more information, see Install the user-generated certificates.

Role required: admin

Procedure
1. In your Windows machine, from the Search menu, enter `Manage computer certificates`.
2. In the Certificate Manager tool, navigate to **Certificates - Local Computer** > **Personal** > **Certificates**.
3. In the Certificate Import Wizard dialog box, right-click the installed certificate and then navigate to **All Tasks** > **Manage Private Keys**.
4. In the Permissions dialog box, select **Add**.
5. In the Select Users, Computers, Service Accounts, or Groups dialog box, in the **Enter the Object names to select** field, enter the user account that is used by the robot to log in to the machine.
6. Select **Check Names**.
7. Select the user account and then select **OK**.
8. In the Permissions dialog box, select the added user, select the **Read** check box, and clear the **Full control** check box.
9. Select **Apply** and then select **OK**.

What to do next
Select the installed certificate in the **Certificate** field to do either of the following actions:

- To set up the Unattended Robot. For more information, see Set up Unattended Robot.
- To publish an automation project in RPA Desktop Design Studio. For more information, see Publish an automation project in RPA Desktop Design Studio.

Exporting Microsoft Active Directory certificates

You can export Microsoft Active Directory certificates, such as root, intermediate, and a client authentication certificate, for authentication purposes. You then register the exported root and intermediate certificate in the ServiceNow instance and map the exported client authentication certificate to the user.

You must do these tasks in your Windows machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you don't have the user-generated certificates (client authentication and code signing), do the tasks in the following topics to export active directory certifications. For more information, see Generating and installing user certificates.

Export a root certificate

Export an active directory (AD) root certificate in your Windows machine to register the exported certificate on the ServiceNow instance.

Before you begin

Do this task in your Windows machine.

Role required: admin

Procedure

1. In your Windows machine, from the Search menu, enter `Manage computer certificates`.
2. To export the root certificate, do the following actions:
   a. In the Certificate Manager tool, navigate to **Certificates - Local Computer** > **Personal** > **Certificates**.
   b. Double-click the required client authentication-based certificate.
   c. On the **Certification Path** tab, double-click the root certificate.
   d. On the **Details** tab, verify the serial number and select **OK**.
   e. Navigate to **Certificates - Local Computer** > **Trusted Root Certification Authorities** > **Certificates**.
   f. To match the root certificate with the serial number, double-click a root certificate.
   g. On the **Details** tab, verify that the serial number matches and select **OK**.
   Repeat this step until you find a match.
   h. After you identify the root certificate, right-click the root certificate, select **All Tasks**, and then select **Export...**.
   i. In the Welcome to the Certificate Export Wizard dialog box, select **Next**.
   j. In the Export File Format dialog box, select the **Base-64 encoded X.509 (.CER)** file format, and then select **Next**.
   k. In the File to Export dialog box, select the file name location in the **File name** field or select **Browse** to save the certificate file, and then select **Next**.
   l. In the Completing to the Certificate Export Wizard dialog box, select **Finish**.
   m. After the export is complete, in the Certificate Export Wizard dialog box, select **OK**.
3. To rename the file extension of the exported root certificate, do the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Locate the exported certificate file.

b. Right-click the certificate file and select **Rename**.

c. In the file name, rename the file extension from **.cer** to **.pem**.
For example, change the Root CA.cer file name to `Root CA.pem`.

d. In the confirmation dialog box, select **Yes**.

What to do next
Register the root certificate to make it available for authentication. For more information, see Register the CA certificate.

Export an intermediate certificate

Export an active directory (AD) intermediate certificate in your Windows machine to register the exported certificate on the ServiceNow instance.

Before you begin
Do this task in your Windows machine.

Role required: admin

About this task
If your organization doesn't require an intermediate certificate, skip this task.

Procedure
1. In your Windows machine, from the Search menu, enter `Manage computer certificates`.
2. To export the intermediate certificate based on your business requirement, do the following actions:

   a. In the Certificate Manager tool, navigate to **Certificates - Local Computer** > **Personal** > **Certificates**.

   b. Double-click the required client authentication-based certificate.

   c. On the **Certification Path** tab, double-click the intermediate certificate.

   d. On the **Details** tab, verify the serial number and select **OK**.

   e. Navigate to **Certificates - Local Computer** > **Intermediate Certification Authorities** > **Certificates**.

   f. To match the intermediate certificate with the serial number, double-click an intermediate certificate.

   g. On the **Details** tab, verify that the serial number matches and select **OK**.
   Repeat this step until you find a match.

   h. After you identify the intermediate certificate, right-click the intermediate certificate, select **All Tasks**, and then select **Export...**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. In the Welcome to the Certificate Export Wizard dialog box, select **Next**.

j. In the Export File Format dialog box, select the **Base-64 encoded X.509 (.CER)** file format, and select **Next**.

k. In the File to Export dialog box, select the file name location in the **File name** field or click **Browse** to save the certificate file, and then select **Next**.

l. In the Completing to the Certificate Export Wizard dialog box, select **Finish**.

m. After the export is complete, in the Certificate Export Wizard dialog box, select **OK**.

3. To rename the file extension of the exported intermediate certificate, do the following actions:

a. Locate the exported certificate file.

b. Right-click the certificate file and select **Rename**.

c. In the file name, rename the file extension from **.cer** to **.pem**.
For example, change the Intermediate CA.cer file name to `Intermediate CA.pem`.

d. In the confirmation dialog box, select **Yes**.

What to do next

Register the intermediate certificate to make it available for authentication. For more information, see Register the CA certificate.

Export a client authentication (active directory) certificate

Export an active directory (AD) client authentication certificate in your Windows machine to map the exported certificate to the user on the ServiceNow instance.

Before you begin

Do this task in your Windows machine.

Role required: admin

Procedure

1. In your Windows machine, from the Search menu, enter `Manage computer certificates`.
2. To export the client authentication certificate, do the following actions:
   a. In the Certificate Manager tool, navigate to **Certificates - Local Computer** > **Personal** > **Certificates**.
   b. Right-click the client authentication certificate, select **All Tasks**, and then select **Export...**.
   c. In the Welcome to the Certificate Export Wizard dialog box, select **Next**.
   d. In the Export File Format dialog box, select the **Base-64 encoded X.509 (.CER)** file format, and then select **Next**.
   e. In the File to Export dialog box, select the file name location in the **File name** field or select **Browse** to save the certificate file, and then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. In the Completing to the Certificate Export Wizard dialog box, select **Finish**.

g. After the export is complete, in the Certificate Export Wizard dialog box, select **OK**.

3. To rename the file extension of the exported client authentication certificate, do the following actions:

   a. Locate the exported certificate file.

   b. Right-click the certificate file and select **Rename**.

   c. In the file name, rename the file extension from **.cer** to **.pem**.
   For example, change the User CA.cer file name to `User CA.pem`.

   d. In the confirmation dialog box, select **Yes**.

What to do next

Map the PEM certificate to the user. For more information, see Map the PEM certificate to user.

Applying the CSDM guidelines to RPA Hub

Apply Common Service Data Model (CSDM) guidelines to RPA Hub.

CSDM is the data framework that you follow when you set up ServiceNow products and applications. You adhere to the CSDM guidelines when you define configuration items (CIs) and relationships between CIs in the CMDB. This process ensures that your data resides in the appropriate CMDB tables for maximum value from your ServiceNow AI Platform applications.

CSDM is the data model standard for all products that use the Configuration Management Database (CMDB).

- The CSDM guidelines ensure unified data access for ServiceNow AI Platform products.
- The CSDM gives you clear direct prescriptive guidelines for service modeling within the CMDB.
- CSDM terms and definitions ensure consistent and accurate service reporting.
- The CSDM data model supports multiple configuration strategies and includes guidelines for using base-system tables and relationships.
- You can use the CMDB query builder to create reports showing CMDB configuration items (CIs) and their relationships.

For more information about the CSDM, see Common Service Data Model.

For more information about implementing the CSDM framework in stages, see Implementing the CSDM framework in stages.

RPA Hub and CSDM tables

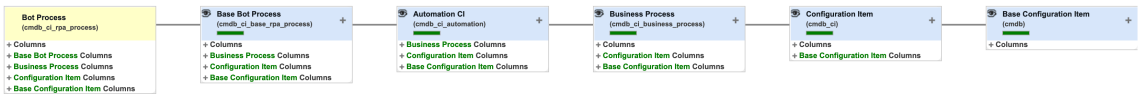
RPA Hub manages and uses CSDM tables. Several ServiceNow products benefit from and add value to RPA Hub.

CSDM tables managed by RPA Hub

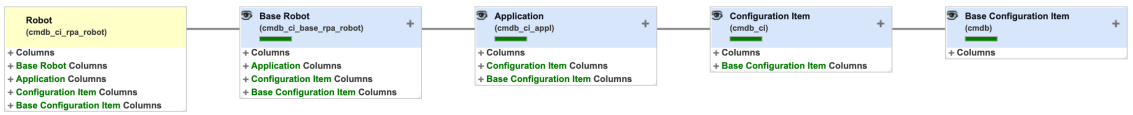
1. Bot Process [cmdb_ci_rpa_process]
2. Robot [cmdb_ci_rpa_robot]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Bot Process table (cmdb_ci_rpa_process) contains the configuration details of a process that runs on a robot. This table extends from the Base Bot Process table (cmdb_ci_base_rpa_process). The following image is a visual depiction of the bot process table hierarchy.



The Robot table (cmdb_ci_rpa_robot) contains the details of a software agent that runs a bot process (cmdb_ci_rpa_process) that is built in the RPA Desktop Design Studio. This table extends from the Base Robot table (cmdb_ci_base_rpa_robot table). The following image is a visual depiction of the robot table hierarchy.



The bot process and the robot are associated with each other using CI relationship ‘Runs On::Runs’.

CSDM tables used by RPA Hub

1. Business Application [cmdb_ci_business_app] - For associating business applications to bot processes and later, defining the application credentials for the same.

   For more information about assigning a business application to a bot process, see Assign a business application with a bot process.

2. Hardware [cmdb_ci_hardware] - For the machine name lookup feature on a robot record.

   For more information about machine name field, see Create an unattended robot in RPA Hub.

Products that add value to RPA Hub

When you use RPA Hub with any of the following ServiceNow products, you increase the value you get from RPA Hub:

- Workflow Studio
- Integration Hub
- Automation Center
- Document Intelligence
- Adoption Services

Products that benefit from RPA Hub

The following ServiceNow products gain value from RPA Hub:

- Automation Center
- Document Intelligence
- ITSM

© 2026 ServiceNow, Inc. All rights reserved.

Create a robot license distribution record in RPA Hub

Define the consumption and distribution of licenses by creating a robot license distribution record in RPA Hub.

Before you begin

You must do this task in the classic environment.

Familiarise yourself with license distribution in RPA Hub concepts. For more information, see License distribution in RPA Hub.

Install the RPA Hub. For more information, see Install Robotic Process Automation (RPA) Hub.

Role required: admin

About this task

If the instance you are using is not domain separated, then create the license distribution record in the global domain.

If the instance you are using is domain separated, create a license distribution record in a top-down approach, starting with the top-level or primary domain. Do not create the license distribution record in the global domain. If the parent domain does not have a license distribution record, you can't create a license distribution record for child domains.

You can create only one license distribution record per domain.

A license distribution record is necessary to create any robots in the instance, for each domain.

For example, a domain separated instance with top domain and two child domains has 20 unattended robot licences and 45 attended robot licences. In each domain, you could assign 5 unattended robot licences and 15 attended robot licences. The **Available from Parent** field will show 10 unattended robot licences and 15 attended robot licences that are not yet assigned. When a robot is created in a child domain, a license is automatically utilized in that domain. In a license distribution record of a child domain, the **Utilized** field will show the value as 1 and the **Available to use or distribute** field will show the value as 4, which is remaining assigned licenses that are not yet utilized.

If you have more robots than the assigned licenses, then the instance or the specific domain (and its child domains) gets locked. Then, the robots do not execute automations in the current and child domains.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Administration** > **Robots License Distribution**.
2. Select **New**.
3. On the form, fill in the fields.

Robot License Distribution form

Field	Description
Number	Auto-generated robot license distribution record number. This is a read-only field.

The **Available from Parent** field will show 10 unattended robot licences and 15 attended robot licences that are not yet assigned. When a robot is created in a child domain, a license is automatically utilized in that domain. In a license distribution record of a child domain, the **Utilized** field will show the value as 1 and the **Available to use or distribute** field will show the value as 4, which is remaining assigned licenses that are not yet utilized.

If you have more robots than the assigned licenses, then the instance or the specific domain (and its child domains) gets locked. Then, the robots do not execute automations in the current and child domains.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Administration** > **Robots License Distribution**.
2. Open the license record that you want to update.
3. Update the following fields as appropriate.

Robot License Distribution form

Field	Description
Assigned (Unattended)	Total number of the assigned licenses for unattended robots in the current domain. This value must not exceed the value in the **Available from Parent (Unattended)** field.
Assigned (Attended)	Total number of the assigned licenses for attended robots in the current domain. This value must not exceed the value in the **Available from Parent (Attended)** field.

4. Select **Update**.

Set the default value of the Screen Resolution field on the Robot form for high density robots. sn_rpa_fdn.robot_screen_resolution	Defines the default value of the **Screen** the Robot form for high density robots. • Type: string • Default value: 1920x1080
Bypass Legal Notice sn_rpa_fdn.bypass_legal_notice	Enables the unattended robot to clear message set by the system-level policy a legal notice is not displayed during th process. • Type: Yes | No • Default value: No

Using RPA Hub

Developers, release managers, and administrators can use the RPA Hub application to configure a bot process and associate a package, robots, business applications, credentials, and process parameters for configuring automations.

Perform the following tasks for configuring automations using the RPA Hub application.

1. Download the RPA applications from RPA Hub.

   Download and install the Robotic Process Automation (RPA) applications in your Windows machine from RPA Hub.

2. Add the ServiceNow RPA Chrome extension.

   Add the ServiceNow RPA Chrome extension to your Chrome browser to establish an interaction with the applications that are opened in this browser.

3. Create a package to assign to a bot process.

   Create an unattended or attended package that contains automation logic and is assigned to a bot process to execute an automation.

4. Create a robot in RPA Hub.

   Create an attended or an unattended robot to run the attended or unattended bot process respectively.

5. Configure a bot process record.

   Configure a bot process by creating a bot process configuration record and assigning assets. A bot process is a predefined sequence of actions that a robot follows to accomplish a specific task or achieve a particular goal.

   For configuring unattended bot process, perform the following tasks:

   a. Configure credentials in RPA Hub.

      Create an application credential for a robot to log in to an application and a robot credential to log in to a system to execute an automation. Create Time-based One-time Password

© 2026 ServiceNow, Inc. All rights reserved.

(TOTP) seeds for unattended robots to seamlessly authenticate against multi-factor authentication (MFA)-enabled applications.

b. Assign a business application with a bot process.

Assign a business application to a bot process for an effective event correlation or to get information about assigned business applications.

c. Associate a credential group to a bot process.

Map a credential group to an unattended bot process to enable a robot to log in to a system and applications to perform an automation.

d. Assign a robot to a bot process in RPA Hub.

Assign a robot to an unattended bot process to execute the automation (package) that is mapped to it.

e. Assign a process robot credential within a bot process.

Assign a process robot credential within an unattended bot process so that the selected robot can perform the automation in the Windows machine.

f. (Optional) Create a robot pool in RPA Hub.

Create a robot pool for an optimum utilization of robots to execute the bot processes.

g. (Optional) Create a process parameter within a bot process in RPA Hub.

Create a process parameter to store the variables that are used within a bot process. The process parameter that you just created can only be used by this bot process.

For configuring attended bot process, perform the following tasks:

a. Assign a business application with a bot process.

Assign a business application to a bot process for an effective event correlation or to get information about assigned business applications.

b. Assign an attended user or group to an attended bot process.

Assign an attended user or group to an attended bot process, so that your user or group can access and execute this automation on Windows machines.

c. (Optional) Create an attended configuration record in RPA Hub.

Create an attended configuration record to trigger an attended bot process that is enabled with embedded task automation.

6. (Optional) Create a shared parameter in RPA Hub.

Create a shared parameter so that you can store the global variables or configurable items in one place and use them across bot processes.

7. (Optional) Create a queue in RPA Hub.

Create a queue to manage the work items that you want the robot to process.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Publish an RPA Hub bot process.

   After you have configured a bot process and assigned a package and robots to it, you can publish the bot process to execute the automation.

Download the RPA applications from RPA Hub

Download the Robotic Process Automation (RPA) applications in your Windows machine from RPA Hub as a prerequisite for installing the applications or upgrading them.

Before you begin

You must do this task in the classic environment.

You need to have access to the RPA Hub instance for downloading the RPA applications.

Role required: admin, sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_business_user, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

About this task

Do this task to download the following RPA applications:

- RPA Desktop Design Studio
- Unattended Robot
- Unattended Robot Login Agent
- Attended Robot

Important:
Ensure to upgrade the current installed MSIs (RPA Desktop Design Studio, Attended Robot, and Unattended Robot), if any by downloading the RPA applications.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Administration** > **Downloads**.
2. In the RPA Downloads page, do any of the following actions to download the required application:
   - Select the download icon ( ).
   - Select the copy link ( ). In a browser, right-click and select **paste and go** option.

   A dialog box might prompt you to save or open the zip file.

   Note:
   Depending on your browser setting, the browser might automatically save the file to your Downloads folder.

3. From the downloaded zip file, extract the application installation file (.msi file).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Install RPA Desktop Design Studio. For more information, see Install RPA Desktop Design Studio.

To run an unattended bot process, install Unattended Robot and install Unattended Robot Login Agent. For more information, see Install Unattended Robot and Install Unattended Robot Login Agent.

To run an attended bot process, install Attended Robot. For more information, see Install Attended Robot.

Add the ServiceNow RPA Chrome extension to your Chrome browser to launch the Robotic Process Automation (RPA) applications in this browser and to establish a browser interaction. For more information, see Add the ServiceNow RPA Chrome extension.

Use Guided Tours in RPA Hub

Use Guided Tours in RPA Hub to get instructions on how to perform a task. Guided Tours use a series of steps that may span multiple pages. The tour includes links to detailed documentation.

Before you begin

You must do this task in the classic environment.

Role required: Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

Guided Tours help train and onboard users within the RPA Hub user interface (UI). Each tour contains a series of interactive steps that help you complete a specific task or a process within the same browser window. If needed, administrators can create more tours. For more information, see Guided Tours.

When you visit a page that has a guided tour for the first time, a welcome screen appears. You can choose to either begin the tour or skip the tour.

The guided tour isn't yet available when Next Experience is enabled.

In RPA Hub, guided tours are currently available for creating queues and configuring a bot process and associated assets.

Procedure

1. Navigate to **All** > **Robotic Process Automation**.
2. Select the feature that you want to configure.

   Example
   For example, select **Build** > **Queues** to use the guided tour for creating queues.
3. Select the **Show help** icon ( ).
4. **Optional:** Select **Pin Help Center menu** icon to pin the Help Center side panel on the page.
5. Select **Take a Tour**.
6. Take the necessary action and select **Next** to progress through the tour.
   For ending the tour at any point, you can select **End Tour** in the side panel or select the Close icon in the pop-up window and confirm to end the tour.
7. Select **Complete** after the tour is ended.

Execute RPA scripts to re-evaluate license distribution

Run the Robotic Process Automation (RPA) script on demand to validate and unlock the robots in a domain and its child domains.

Before you begin

Familiarise with license distribution in RPA Hub concepts. For more information, see License distribution in RPA Hub.

To unlock the robots in a domain, ensure that the license entitlement and consumption is compliant.

A schedule script runs every 12 hours to evaluate the utilized robots.

You must do this task in the classic environment.

Role required: admin

About this task

An RPA script is a scheduled job that is executed on demand.
If you want to execute this script on demand, follow the steps in this topic.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Administration** > **RPA Scripts**.
2. Select **Re-evaluate License Distribution**.
3. Select **Execute Now**.
   A scheduled job runs to reevaluate the distribution of attended and unattended robots across different domains. If there is any discrepancy, it locks that particular domain and related child domains.

Add the ServiceNow RPA Chrome extension

Add the ServiceNow RPA Chrome extension to your Chrome browser to establish an interaction with the applications that are opened in this browser.

Before you begin

Role required: none

Procedure

1. Navigate to https://chrome.google.com/webstore/detail/servicenow-rpa-chrome-ext/bnaofpgjajbimmicdiipemhmheafhgkb.
2. Select **Add to Chrome**.
3. In the Add ServiceNow RPA Chrome Extension dialog box, select **Add extension**.
4. To verify if the extension is added, do the following actions:
   a. Select **Extensions**.
   b. In the Extensions dialog box, select **Manage Extensions**.
   c. Verify if the ServiceNow RPA Chrome Extension is enabled.
   d. **Optional:** To enable it, slide the toggle switch.

Result

You can see the ServiceNow RPA Chrome Extension on the Extensions page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Restart the Chrome browser and the RPA Desktop Design Studio application.

Create a package to assign to a bot process

Create an unattended or attended package in RPA Hub to assign it to a bot process to execute an automation.

Before you begin
(Optional) Configure the system properties related to **Activity Stream**, to add or remove the fields. The changes to these fields are captured in the work notes. For more information, see Configure the system properties for an activity stream in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, or sn_rpa_fdn.rpa_admin

About this task
A package refers to a set of workflows, scripts, configurations, and dependencies that are designed to automate specific tasks or processes. These packages can be published or imported onto the RPA platforms to quickly deploy automation solutions.

Packages are used to encapsulate functionalities, libraries, or applications, making it simpler for developers or RPA administrators to deploy software components.

You can create a package in two ways. Follow this procedure to create a package from RPA Hub.

To create a package from RPA Desktop Design Studio while you're publishing an automation file, follow the steps as mentioned in Publish an automation project in RPA Desktop Design Studio.

Procedure
1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Packages**.
4. Select **New**.
5. On the form, fill in the fields.

Package form

Field	Description
Name	Unique name of the published package.
Package Type	Type of the package: ○ **Unattended**: Unattended automation ○ **Attended**: Attended automation ○ **Skill**: Reusable automation ○ **Unattended Template**: Template for creating unattended automations in RPA Desktop Design Studio ○ **Attended Template**: Template for creating attended automations in RPA Desktop Design Studio

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application	[Auto generated] Application containing this record. Role required to view this field: admin.
Mark As Default	Option to enable this package as a default package for the current domain. Only one package can be selected as a default package for any domain. This field appears only when **Unattended Template** or **Attended Template** is selected from the Package Type field. Roles required to edit this field: RPA admin.
Description	Description of the package.

6. Select **Save**.
7. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Result

After a package is created, the RPA developer publishes an automation from RPA Desktop Design Studio. This process results in a new package version.

Creating a robot in RPA Hub

You can create an attended or an unattended robot in RPA Hub to run the bot process, if you have the RPA admin role or RPA release manager role.

Configuration tasks

Task	Description
Create an unattended robot	Create unattended robots to run the unattended bot processes for tasks that are highly repetitive, rule-based, and do not require human decision-making during execution. For example, invoice processing for the Finance department.
Create an attended robot	Create attended robots to run the attended bot processes for tasks that require human decision-making, involve interactions with user interfaces, or need input from employees.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration tasks (continued)

Task	Description
	For example, guided data entry and validation for order processing.
Add assigned studio users to an unattended robot	Assign one or more users (RPA developers or RPA admins) to an unattended robot, so that the users can access the specific robot in the **Assigned Bot Process** section of the RPA Desktop Design Studio application.

Create an unattended robot in RPA Hub

Create an unattended robot in RPA Hub to run the unattended bot process.

Before you begin

Configure the related system property to view the activity stream. For more information, see Display an activity stream for bot processes and robots in RPA Hub.

Make sure that the *sn_rpa_fdn.enable_unattended_robot_user_mapping* system property is set to True to allow only the authorized users to access the robot and robot assets. This system property enables the **User** field on the Unattended Robot form. If you have the admin role, you can edit this system property. By default, this property is set to True.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

A robot runs a bot process, which is an automation.

An unattended robot can execute an unattended bot process, which is an automation that requires no human intervention.

By using the Unattended Robot application, you can enable an unattended robot to execute an unattended bot process that is triggered either by a schedule, API, or manually set.

You can map multiple unattended robots as high density robots to one virtual machine. For more information, see High density robots in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Create an unattended robot from either the list icon or from the plus icon.
3. On the form, fill in the fields.

Robot form

Field	Description
Name	Unique name of the unattended robot.
Robot Type	Type of the robot. **Unattended**: Robot for an unattended automation.
Machine Name	Computer name of the physical or virtual machine on which the Unattended Robot application is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field appears only when **Unattended** is selected from the **Robot Type** field. The machine name is a string-type field that you use when you don't want to enable the *sn_rpa_fdn.enable_unattended_robot_machine_name_lookup* system property. If you enable the *sn_rpa_fdn.enable_unattended_robot_machine_name_lookup* system property, this string type field changes to a reference type field on the robot form. The machine name fetches the unique value references from the Configuration Item (CI) tables that are defined in the *sn_rpa_fdn.machine_name_reference_fields* system property. The bot process table (cmdb_ci_rpa_process) and robot table (cmdb_ci_rpa_robot) are excluded from the search results when you provide the names of the CI tables to reference the unattended robot's machine name in the *sn_rpa_fdn.machine_name_reference_fields* system property. The *Machine Lookup value change* scheduled job validates the values in the *Machine Name Lookup* field and *Machine Name* field. For more information, see the Scheduled jobs installed section in Components installed with RPA Hub and Configure RPA Hub properties.
High density robot	Option to create multiple robots with the same machine name. The machine must support multiple user sessions at the same time so that you can run multiple automations simultaneously. This field appears only when **Unattended** is selected from the **Robot Type** field.
Screen resolution	Screen resolution used by a high density robot while establishing the RDP connection before executing the automation. High density robots can operate with different screen resolutions for each robot on the same machine without any issues if they are running different bot processes. However, if all high density robots on the same machine are executing the same process and utilizing Computer Vision actions, they must maintain the same resolution. Otherwise, the automation may fail. This field appears only when the robot is marked as high density robot. **Note:** You can change the default value of the screen resolution using the *sn_rpa_fdn.robot_screen_resolution* RPA Hub system property.
User	Authorized user who can access this robot. If you're upgrading to Xanadu, the **User** field is automatically mapped with the user name (the user) who has recently created the process job for the selected unattended robots. If no process jobs are found for a selected robot, the robot

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	is moved to the In Maintenance status. An RPA release manager must manually map the appropriate users to the robots. **Note:** This field appears when the *sn_rpa_fdn.enable_unattended_robot_user_mapping* system property is enabled.
Department	Associated department of the robot. This field is automatically filled in with the information that is based on the department in the associated Attended Robot User's record. The value in this field corresponds to the value at the time that the Robot record is created and isn't based on real-time data.
Description	Brief description of the robot.

4. Select **Save**.
5. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

What to do next
Install Unattended Robot. For more information, see Install Unattended Robot

Set up the Unattended Robot application. For more information, see Set up Unattended Robot.

Create a bot process. For more information, see Configuring a bot process record in RPA Hub.

Create an attended robot in RPA Hub
Create an attended robot in RPA Hub to run the attended bot process.

Before you begin
Configure the related system property to view the activity stream. For more information, see Display an activity stream for bot processes and robots in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager, or sn_rpa_fdn.rpa_admin

About this task
A robot runs a bot process (automation).

Attended robots can execute attended automations that require human intervention. Using the Attended Robot application, you can run an attended robot to execute the attended bot process (attended automations).

An attended robot is mapped to only one user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Create a robot by doing one of the following actions.
3. On the form, fill in the fields.

Robot form

Field	Description
Name	Unique name of the attended robot.
Robot Type	Type of the robot. **Attended**: Robot for an attended automation.
Attended Robot User	Assigned user for the attended robot. The assigned user must have the RPA assisted user role (sn_rpa_fdn.rpa_assisted_user). This field appears only when **Attended** is selected from the **Robot Type** field.
Department	Associated department of the robot. This field is automatically filled in based on the department information in the associated Attended Robot User's record. The value in this field corresponds to the value at the time that the Robot record is created and is not based on real-time data.
Description	Brief description of the robot.

4. Select **Save**.
5. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

What to do next

Install Attended Robot. For more information, see Install Attended Robot.

Set up the Attended Robot application. For more information, see Set up Attended Robot.

Create a bot process. For more information, see Configuring a bot process record in RPA Hub.

Add assigned studio users to an unattended robot

In RPA Hub, assign one or more users (RPA developers or RPA admins) to an unattended robot, so that the users can access the specific robot in the **Assigned Bot Process** section of the RPA Desktop Design Studio application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Familiarise yourself with the Assigned Bot Process feature in RPA Desktop Design Studio. For more information, see Assign bot process to an automation project.

Only users with RPA developer or RPA admin roles can be associated to a robot.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

The Assign Bot Process feature provides a capability for the users to access the bot process information (such as queues, process parameters, and so on) in RPA Hub and debug the automation in the RPA Desktop Design Studio. The users listed in the **Assigned Studio Users** tab can utilize the robots from RPA Desktop Design Studio, depending on the associated bot process access.

This helps in impersonating as a robot, so that the following benefits are achieved from the RPA Desktop Design Studio:

- Get the process and shared parameters
- Interact with work items and other RPA Hub related components (wherever applicable).

You can select a robot for impersonating as a robot in two ways. One way is by enabling *sn_rpa_fdn.restrict_robots_in_assign_bot_process_by_machine_name* system property. Then, the robots assigned to the bot process are filtered based on the robot machine name, where the RPA Desktop Design Studio is launched. For example, if the user launches the RPA Desktop Design Studio from the ABC robot machine, then the user can access only the ABC robot machine.

For more information about this system property, see Configure RPA Hub properties.

Important:

The users listed in the **Assigned Studio Users** tab are purged based on the time interval defined. The default time interval is 4 hours.

To change the time interval, enter `sys_auto_flush.LIST` in the navigation filter and search for the **sn_rpa_fdn_assigned_studio_user** table name. Modify the value in the **Age in seconds** field. To deactivate this setting, clear the **Active** check box. Only admins can access the `sys_auto_flush.LIST` table.

The other way is by adding one or more users to an unattended robot from the **Assigned Studio Users** tab in RPA Hub. To do so, perform this task.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Robots**.
4. Open the robot that you want to associate a studio user to.
5. On the **Assigned Studio Users** tab, select **Add**.
6. On the **Available Studio Users** tab, select the required user.
7. Select **Add**.
8. Select **Save**.

Configuring a bot process record in RPA Hub

In RPA Hub, you can create a bot process configuration record and assign assets to associate it with a bot process. Or you can just save the bot process configuration record, however it won't be associated to a bot process. It remains orphaned.

What is a bot process

A bot process is a predefined sequence of actions that a robot follows to accomplish a specific task or achieve a particular goal.

Let's say that you have an Accounting System Update bot process. The associated robot logs in to your company's accounting system, such as SAP. The robot enters the extracted invoice data, which creates the entries for your accounts payable. The robot then attaches the original invoice to the accounting system for reference.

Benefits of a bot process

A bot process enables you to do the following:

- streamline operations
- enhance efficiency
- improve overall productivity

What is a bot process configuration

A bot process configuration is a record that contains the bot process settings. The bot process configuration record is mapped to a bot process record. It is a one to one mapping.

You assign a package and schedule the bot process run that will be executed by the robot. You can add other details that pertain to the bot process, such as business applications, credential groups, robots, process robot credentials, process parameters, attended users, or groups. For more information about these terms, see Robotic Process Automation (RPA) Hub glossary.

Create a bot process configuration record in RPA Hub

Create a bot process configuration record in RPA Hub so that you can define the preliminary fields for a bot process record.

Before you begin

Create a package. For more information, see Create a package to assign to a bot process.

Create a robot. For more information, see Creating a robot in RPA Hub.

Configure the related system property to view the activity stream. For more information, see Display an activity stream for bot processes and robots in RPA Hub.

Before you can access a bot process, ensure that the RPA business user (sn_rpa_fdn.rpa_business_user), RPA developer (sn_rpa_fdn.rpa_developer), or the RPA support user (sn_rpa_fdn.rpa_support_user) are in the Managed by Group list.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

A bot process is a predefined sequence of actions that a robot follows to accomplish a specific task or achieve a particular goal.

A bot process configuration record contains the bot process settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The bot process configuration record is mapped to a bot process record. It is a one to one mapping.

When you associate the bot process configuration record with a bot process record, you can't dissociate the mapping, regardless of the life-cycle stage status of the bot process.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Create a bot process configuration record from either the list icon or from the plus icon.
3. On the form, fill in the fields.
   For a description of the field values, see Bot process configuration form in RPA Hub.
4. Save the configuration record only or create a configuration record and bot process and then associate the record with the bot process.

What to do next

You can add other details to the bot process, such as the business applications, credential groups, robots, process robot credential sets, schedules, process parameters, attended users, or groups. For more information, see Adding details for your bot process in RPA Hub.

(Optional) On the bot process configuration record, select the **Bot Process** button to navigate to the Overview tab of the bot process. You can't view this Bot Process button if the bot process configuration record is not associated to any bot process.

Associate a bot process to a bot process configuration record

Select a bot process configuration record to associate it with a bot process. This action creates a bot process record in RPA Hub.

Before you begin

Create a package. For more information, see Create a package to assign to a bot process.

Create a robot. For more information, see Creating a robot in RPA Hub.

Configure the related system property to view the activity stream. For more information, see Display an activity stream for bot processes and robots in RPA Hub.

Before you can access a bot process, ensure that the RPA business user (sn_rpa_fdn.rpa_business_user), RPA developer (sn_rpa_fdn.rpa_developer), or the RPA support user (sn_rpa_fdn.rpa_support_user) are in the Managed by Group list.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

A bot process is a predefined sequence of actions that a robot follows to accomplish a specific task or achieve a particular goal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A bot process configuration record contains the bot process settings. The bot process configuration record is mapped to a bot process record. It is a one to one mapping. You can only select one bot process record to associate with a bot process configuration record. You can't edit a bot process configuration record that is associated with a bot process.

When you retire a bot process record, you can't associate the related bot process configuration record to other bot processes.

You can create a bot process configuration record in two ways. The first way is when you create and save a bot process configuration record.

The second way is when you move an update set from a lower environment to a higher environment, an orphan bot process configuration record is created. After you select the **Assign Configuration** button and its record, the bot process record that is associated to the bot process configuration is created.

For more information about migrating your metadata from a lower environment to a higher environment, see Migrating your data from a lower environment to a higher environment in RPA Hub.

Procedure

You can associate a bot process to a bot process configuration record by choosing one of these options.

What to do next

You can add other details that pertain to the bot process, such as the business applications, credential groups, robots, process robot credential sets, schedules, process parameters, attended users, or groups. For more information, see Adding details for your bot process in RPA Hub.

Adding details for your bot process in RPA Hub

After you create a bot process in RPA Hub, you can add some details for your bot process, such as information about the credential groups, business applications, and more.

You can add the following details that pertain to the bot process:

- Business applications
- Process credential mappings
- Robots or Robot Pool
- Process robot credentials
- Schedules
- Process parameters

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Attended users or groups
- Queues
- Skill overrides

Depending on what you selected for the **Process Type** field on the Bot Process Configuration form, you can add related details to the bot process.

If you can't view the activity stream, configure the system property to display the activity stream. For more information, see Display an activity stream for bot processes and robots in RPA Hub.

For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

Get a snapshot of a bot process

Get a snapshot of both your unattended and attended processes in one view.

Before you begin

Configure the related system property to view the activity stream. For more information, see Display an activity stream for bot processes and robots in RPA Hub.

Verify that the life-cycle stage of the bot process is either **Published**, **In Maintenance**, or **Retired**. For more information, see Bot Process form in RPA Hub.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_business_user, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

About this task

For more information about the overview tab, see Using the Overview tab to view the bot processes in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open a bot process.
5. On the **Overview** tab, view the summary details of the bot process.
6. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Assign a business application with a bot process

Assign a business application to a bot process for an effective event correlation or to get information about assigned business applications. For example, you might want to see information about the SAP application.

Before you begin

Create a bot process. For more information, see Configuring a bot process record in RPA Hub.

Verify that the business application exists on this ServiceNow instance. To add a new business application, navigate to **All** > **Self-service** > **Business Applications**.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can add any credentials for assigned business applications. If you remove a business application, the associated application credentials are also removed.

You can't remove or edit an associated business application for a published or a retired bot process.

An RPA business user [sn_rpa_fdn.rpa_business_user] can view the business applications.

Procedure
1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process that you want to associate a business application to.
5. On the **Business Applications** tab, select **Add**.
6. On the **Available Business Applications** tab, select the required business application.
7. Select **Add**.
8. Select **Save**.
9. **Optional:** To remove a business application, select the business application, and select **Remove**.

Associate a credential group to a bot process

Enable a robot to perform an automation in RPA Hub by mapping a credential group to an unattended bot process.

Before you begin
Do this task only when you select the **Process Type** field as **Unattended** on the Bot process configuration form while you're creating a bot process. For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

Create a bot process. For more information, see Configuring a bot process record in RPA Hub.

Create a credential group. For more information, see Create a credential group in RPA Hub.

You can associate the credential group to an unattended bot process that doesn’t have the life-cycle stage status set to **Retired** or **Published**. For more information, see Life-cycle stage statuses of a bot process in RPA Hub.

You can't edit the **Process Credential Mappings** record when the life-cycle stage status of the associated bot process is set to **Published**.

Only the RPA developers who have created the credential groups can associate credential groups to a bot process.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task
A credential group includes application credentials and a robot credential.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you're upgrading to Xanadu and have customized the bot process related-list tabs, the **Process Credential Mappings** tab might not appear to you. However, you can add this tab in the bot process record by navigating to **Additional actions** > **Configure** > **Related Lists** in the classic environment.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Select the bot process that you want to map a credential group to.
5. On the **Process Credential Mappings** tab, select **Add**.
6. Select the required credential groups.
7. Select **Add**.
8. Provide access to authorized users.
   For more information, see Provide users with access to a credential group.
9. Select **Save**.

Assign a robot to a bot process in RPA Hub

Assign a robot to an unattended bot process to execute the automation (package) that is mapped to it.

Before you begin

Ensure that the **Enable Robot Pool** option isn't selected in the Robot Pool section of the Details tab of the bot process.

Familiarize yourself with robot pool concepts. For more information, see Robot pool in RPA Hub.

You can assign robots with a life cycle stage status of **In Use** to a bot process.

Do this task only when you select the **Process Type** field as **Unattended** on the Bot process configuration form while you're creating a bot process. For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

If the bot process has enabled the robot pool option, then you can't assign robots. The **Assigned Robots** tab is hidden.

To assign robots via robot pool, enable the robot pool option on the bot process form. For more information, see Enable robot pool for a bot process in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process that you want to associate a robot to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Assigned Robots** tab, select **Add**.
6. On the **Available Robots** tab, select the required robot.
7. Select **Add**.
8. Select **Save**.

Assign a process robot credential within a bot process

Assign a process robot credential within an unattended bot process so that the selected robot can perform the automation in the Windows machine.

Before you begin

Do this task only when you select the **Process Type** field as **Unattended** on the Bot process configuration form while you're creating a bot process. For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

Assign a robot to the bot process. For more information, see Assign a robot to a bot process in RPA Hub.

Create a credential group. For more information, see Create a credential group in RPA Hub.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager, or sn_rpa_fdn.rpa_admin

About this task

One credential group can be associated to more than one robot, but one robot can't have more than one credential groups. All the robots assigned to the bot process must be mapped to a process robot credential record. After the mapping is done, if you delete the credential group or robot, the process robot credential record is also deleted.

If a robot is a part of a robot pool, ensure to map process robot credentials for each robot in the robot pool.

If any robot in the robot pool is deleted, then the associated process credentials for all the related bot processes are also deleted.

If the bot process using the robot pool is deleted or if the robot pool is deactivated on the bot process, then all the process credentials for that bot process are also deleted.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process that you want to assign the credentials to a robot to.
5. On the **Process Robot Credentials** tab, select **New**.
6. On the form, fill in the fields.

Process Robot Credential form

Field	Description
Credential Group	Credential group to be associated with this bot process and the assigned robot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Robot	Robot to associate with this bot process and the credential group combination.
Process	Name of the bot process. This field is read-only.

7. Select **Save**.
8. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Create a schedule within a bot process in RPA Hub

Create a schedule within an unattended bot process to enable users to execute jobs in a planned manner at regular intervals. More than one schedule can be associated with one bot process.

Before you begin

Do this task only when you select the **Process Type** field as **Unattended** on the Bot process configuration form, while you are creating a bot process. For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

(Optional) Configure the system properties related to **Activity Stream**, to add or remove the fields. The changes to these fields are captured in the work notes. For more information, see Configure the system properties for an activity stream in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

About this task

You cannot delete a schedule that is associated to a published bot process.

You can also create a schedule from the Robot Calendar tab. For more information, see Create a schedule on the robot calendar.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process that you want to create and associate a schedule to.
5. On the **Schedules** tab, select **New**.
6. On the form, fill in the fields.
7. Select **Save**.
8. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Create a process parameter within a bot process in RPA Hub

Create a process parameter to store the variables that are used within a bot process. The process parameter that you just created can only be used by this bot process.

Before you begin

Create a bot process. For more information, see Configuring a bot process record in RPA Hub.

Before you can access a bot process, ensure that the RPA business user (sn_rpa_fdn.rpa_business_user), RPA developer (sn_rpa_fdn.rpa_developer), or the RPA support user (sn_rpa_fdn.rpa_support_user) are in the Managed by Group list.

(Optional) Configure the system properties related to **Activity Stream**, to add or remove the fields. The changes to these fields are captured in the work notes. For more information, see Configure the system properties for an activity stream in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

You cannot delete a process parameter that is associated to a published bot process.

Note:
To use a variable in multiple processes, create a shared parameter. For more information, see Create a shared parameter in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process that you want to create and associate a process parameter to.
5. On the **Process Parameters** tab, select **New**.
6. On the form, fill in the fields.
7. Select **Save**.
8. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Assign an attended user or group to an attended bot process

Assign an attended user or group to an attended bot process in RPA Hub, so that your user or group can access and execute this automation on Windows machines.

Before you begin

Do this task only when you select the **Process Type** field as **Attended** on the Bot process configuration form, while creating a bot process. You can't perform this task unless you select that field. For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Assign users or groups to an attended bot process. You must assign only those users who have the RPA assisted user role (sn_rpa_fdn.rpa_assisted_user).

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process that you want to assign an attended user or a group to.
5. On the **Attended Users/Groups** tab, select **New**.
6. On the form, fill in the fields.

Attended User Group form

Field	Description
Process	Name of the associated bot process.
Assigned User	Assigned user for the attended bot process.
Assigned Group	Assigned group for the selected assigned user.

7. Select **Save**.

Create a process field parameter in RPA Hub

Define process field parameters (dynamic parameters) that are required in the automation (bot process).

Before you begin

Familiarize yourself with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Verify that you've completed the tasks that are related to configuring the Embedded Task Automation in RPA Hub. For more information, see List of steps for configuring embedded task automation.

Create an attended bot process. For more information about creating an attended bot process, see Configuring a bot process record in RPA Hub.

Verify that the **Enable Embedded Task Automation** check box is selected in the associated attended bot process form. For more information about the bot process form, see Bot Process form in RPA Hub.

Important:
After selecting the **Enable Embedded Task Automation** check box, if the **Process Field Parameters** tab isn't displayed on the bot process, then it's possible that your related lists are customized. Add the related list manually.

Verify that the RPA developer (sn_rpa_fdn.rpa_developer) is in the Managed by Group list of the associated bot process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, or sn_rpa_fdn.rpa_admin

About this task

Process field parameters are used for setting the value or getting the value of a field on a particular form.

You can create a process field parameter in two ways. Perform this task to create it from a bot process.

Otherwise, create it while mapping the field parameters by selecting the **Create parameter** button from the **Field Parameter Mappings** tab. For more information, see Map a table field to a bot process field parameter in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open an attended bot process that you want to create and associate a process field parameter to.
5. On the **Process Field Parameters** tab, select **New**.
6. On the form, fill in the fields.

Process Field Parameter form

Field	Description
Name	Unique name of the process field parameter for the associated bot process. For example, Location, First Name, Title
Description	Brief description of the parameter.

7. Select **Save**.
8. **Optional:** To delete a process field parameter record, select the record and then select **Delete**.

Note:
If a parameter is mapped in the attended configuration record, then you must delete the mapping to delete the parameter. You can't delete a parameter, if the associated bot process is published.

Associate a queue to the bot process from the related list

Associate a queue to a bot process in RPA Hub so that the bot process can interact with this queue. You can associate a bot process to multiple queues. If the bot process is enabled for robot pool, then only one queue (that is not associated with any other bot process) can be mapped to the current bot process.

Before you begin

Ensure the bot process is not in published state.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

To assign a bot process to a queue from the Queues menu, see Assign a bot process to a queue from Queues menu.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process that you want to assign a queue to.
5. On the **Queues** tab, select **New**.
6. In the **Work Queue** field, select the required queue.
7. Select **Save**.

View skill package versions in a bot process

View a list of skill package versions used in a bot process in RPA Hub to make sure that you're using the correct version.

Before you begin

You can only see skill package versions in the Skill Overrides tab when the attended or unattended packages have the skill package associated to them.

For upgrading customers, to view the existing skill package versions in the Skill Overrides tab of a bot process, publish the attended or unattended package again and associate the package to the bot process.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_business_user, or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Open a bot process that you want to view a skill package version for.
5. On the **Skill Overrides** tab, view a list of skill package versions associated to your bot process.

Related topics

Override a skill version for a bot process in RPA Hub

Override a skill version for a bot process in RPA Hub

Override a skill package version in RPA Hub to use a specific version of a skill package for a bot process. When the bot process executes, it uses the selected version instead of the version that you defined in the automation.

Before you begin

Verify that the life-cycle stage status of the bot process isn't set to **Published**. For more information, see Life-cycle stage statuses of a bot process in RPA Hub.

You can see the skill package versions in the **Skill Overrides** tab of the bot process when the attended or unattended packages have the skill package associated with them. For more information, see Create a package to assign to a bot process.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

You can use different versions of the skill for different bot processes based on your specific requirements.

To use the latest version of a skill package, you can override the skill package version in RPA Hub without publishing the attended or unattended package again from RPA Desktop Design Studio.

If you're upgrading to Xanadu and can't view the existing skill package versions in the **Skill Overrides** tab, then publish the attended or unattended package again and associate the package with the bot process.

In the skill package version, you can select the bot processes that you want the skill package version to override. For more information, see Override a skill package version for multiple bot processes in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open a bot process that you want to override a skill package version for.
5. On the **Skill Overrides** tab, select the skill version that you want to override.
6. In the **Overridden version** field, select the version to override.

View the process jobs of a bot process

View a list of execution logs of a bot process in RPA Hub.

Before you begin

Create a bot process. For more information, see Configuring a bot process record in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_business_user, or sn_rpa_fdn.rpa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A process job represents the execution of a bot process on a robot.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open a bot process to view the related process jobs.
5. On the **Process Jobs** tab, select the process job that you want to view.
   For more information, see Process job states in RPA Hub.
6. Open a process job record to view an associated automation log.
7. In the Automation Logs tab, view the details

Using the Overview tab to view the bot processes in RPA Hub

By using the **Overview** tab in RPA Hub, you can quickly view the bot process details in one place.

Introduction of the Overview tab

The **Overview** tab appears after a bot process is in published, in maintenance, or a retired stage. You can see the status of all life-cycle stages (but not for the Build stage) for both the attended and unattended bot processes.

Sections of the Overview tab

The **Overview** tab is divided into the following six sections:

- Process information
- Happening now
- Upcoming changes
- Performance
- Work queues
- Contacts

Note:
The descriptions of these sections are in a table later in this topic.

Roles required

To access the **Overview** tab, you must have one of the following roles:

- RPA developer
- RPA release manager
- RPA business manager

Visualized overall data on the Overview tab (continued)

Visualization	Descriptions and action
	This state is for both the published and in-maintenance bot process, when the process job is in the idle state.
Upcoming changes	Upcoming changes to the associated robots, business applications, and bot processes. This state is only for a published bot process.
Changes	Changes to the associated robots, business applications,and bot processes. This state is only for an in-maintenance bot process.
Performance	Performance of the associated process jobs.
Work queues	Associated work queues for both published and in-maintenance bot processes. To view additional details about the queue, select **View details**.
Contacts	Contact card details of the IT Owner, Business Owner, Release Manager, and Support User.
Compose	
Additional Comments or Work notes (Private)	Additional comments or work notes that you can add.
Activity	Activity of the form, work notes, and additional comments that you can view. Configure the related system property to view the activity stream. For more information, see Display an activity stream for bot processes and robots in RPA Hub.

Create a shared parameter in RPA Hub

Create a shared parameter so that you can store the global variables or configurable items in one place. These variables are used across bot processes.

Before you begin

(Optional) Configure the system properties related to **Activity Stream**, to add or remove the fields. The changes to these fields are captured in the work notes. For more information, see Configure the system properties for an activity stream in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

Instead of hard-coding these values directly into each individual bot process, the shared parameters are stored in a central location, making it easier to update them universally and avoid duplication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You cannot delete a shared parameter that is associated to a published bot process.

Shared parameters offer numerous benefits such as consistency, centralized management that contributes to efficient and maintainable development practices.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Shared Parameters**.
4. Select **New**.
5. On the form, fill in the fields.
6. Select **Submit**.
7. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.
8. **Optional:** To delete a shared parameter, select the three-dot icon next to the **Save** button and select **Delete**.

Note:
Verify that the shared parameter is not associated to any bot process. You can delete a shared parameter which is associated to a retired bot process.

Create a queue in RPA Hub

Create a queue in RPA Hub to manage the work items that you want the robot to process.

Before you begin

To access a queue, an RPA business user or a support user must be a part of **Managed by Group** and must have relevant roles such as RPA business user, RPA developer, RPA support user.

(Optional) Configure the system properties related to **Activity Stream**, to add or remove the fields. The changes to these fields are captured in the work notes. For more information, see Configure the system properties for an activity stream in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

Queues are used in automations to distribute transactional data or the workload among different robots.

A queue is a repository that can hold a number of work items. Work items can store multiple types of data, such as transaction information, customer details, or information from a document.

You can't delete a queue that is associated to a published bot process.

For more information on queues implementation in RPA Hub, see Queue implementation in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use the guided tour to get instructions on how to create a queue in the classic environment. For more information, see Use Guided Tours in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Queues**.
4. Select **New**.
5. On the form, fill in the fields.
6. Select **Save**.
7. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.
8. **Optional:** To delete a queue, select the three-dot icon next to the **Save** button and select **Delete**.

> **Note:**
> Verify that the queue is not associated to any bot process. You can delete a queue which is associated to a retired bot process. Deleting a queue also deletes the associated work items.

Create an attended configuration record in RPA Hub

Create an attended configuration record in RPA Hub to trigger an attended bot process that is enabled with embedded task automation.

Before you begin

Familiarize yourself with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Verify that you've completed the tasks that are related to configuring the Embedded Task Automation in RPA Hub. For more information, see List of steps for configuring embedded task automation.

Create an attended bot process. For more information about creating an attended bot process, see Configuring a bot process record in RPA Hub.

Verify that the **Enable Embedded Task Automation** check box is selected in the associated attended bot process form. For more information about the bot process form, see Bot Process form in RPA Hub.

Verify that the Robotic Process Automation (RPA) developer (sn_rpa_fdn.rpa_developer) is in the Managed by Group list of the associated bot process.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, or sn_rpa_fdn.rpa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. Create an attended configuration record from either the menu list or from an attended bot process record's related list.
4. On the Attended Configuration form, fill in the fields.
   For more information, see Attended Configuration form in RPA Hub.
5. Select **Save**.

Map a table field to a bot process field parameter in RPA Hub

Map form fields of the associated attended configuration table (**Table** field) to the process field parameters used in the automations. For example, if "`First name`" is the process field parameter used in the automation, then it's mapped to the form's '`requested_for.first_name`' field.

Before you begin

Familiarize yourself with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Verify that you've completed the tasks that are related to configuring the Embedded Task Automation in RPA Hub. For more information, see List of steps for configuring embedded task automation.

Create an attended bot process. For more information about creating an attended bot process, see Configuring a bot process record in RPA Hub.

Verify that the **Enable Embedded Task Automation** check box is selected in the associated attended bot process form. For more information about the bot process form, see Bot Process form in RPA Hub.

Create an attended configuration record. For more information, see Create an attended configuration record in RPA Hub.

Create process field parameters that are used in the automations.

- For more information about creating process field parameters from a bot process, see Create a process field parameter in RPA Hub.
- You can create a process field parameter by performing step 7 of this task. Verify that the associated bot process isn't published. Also verify that the associated attended configuration record is either in **Draft** or **Inactive** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify that the RPA developer (sn_rpa_fdn.rpa_developer) is in the Managed by Group list of the associated bot process that is assigned to an Attended Configuration record. Verify that the Attended Configuration record that is assigned to the given field parameter mapping, must be either in **Inactive** or **Draft** state.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, or sn_rpa_fdn.rpa_admin

About this task

Field parameter mapping enables an easy data flow during the execution of a bot process.

You can’t map the same process field parameter with multiple fields. A process field parameter, for example, Name, can't be mapped with more than one field, for example, First name and Last name.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. Map a field parameter from either the Attended Configuration menu list or from an attended bot process record's related list.
4. On the **Field Parameter Mappings** tab, select **New**.
5. On the Field and parameter mapping dialog box, fill in the fields.

Field parameter mapping dialog box

Field	Description
Table	[Auto-generated] Associated attended configuration table.
Process Field Parameter	Select a process field parameter to set or get the value of a field from the particular ServiceNow form. For example, if you select 'BadgeID' in the **Process Field Parameter** field, select '`Badge Id`' in the **Field**. To set the value in the "Badge Id" field of the request table, you can update the value of the "BadgeID" process field parameter. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Process field parameters that are already mapped to the fields are unavailable for mapping.
Field	Select a form field to map with a process field parameter.

6. Perform any of the following tasks to save the mapping.

7. To create a process field parameter that can be used in the automation, perform the following steps:

   a. On the **Field Parameter Mappings** tab, select **Create parameter**.

   b. On the create a parameter dialog box, fill in the fields.

Create a parameter dialog box

Field	Description
Name	Unique name of the form process field parameter. Process field parameters are used for setting the value or getting the value of a field on a particular form.
Description	Brief description of the process field parameter.

   c. Select **Create**.

   d. Refer to step 5 to map this process field parameter to the form field.

   e. Select **Save**.

8. **Optional:** Repeat steps 5 and 6 to map more field parameters.

What to do next

Activate an attended configuration record. For more information, see Activate an attended configuration record in RPA Hub.

Related topics

- Attended Configuration form in RPA Hub
- Deactivate an attended configuration record in RPA Hub
- Delete an attended configuration record in RPA Hub
- Invoke Embedded Task Automation via API

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a robot pool in RPA Hub

Create a robot pool in RPA Hub for an optimum utilization of robots to execute the bot processes.

Before you begin

Familiarize yourself with robot pool concepts. For more information, see Robot pool in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

Robot pool is used to distribute the workload among multiple robots.

To add or remove robots from the pool that are associated with one or more published bot processes, move the bot process to In Maintenance state.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Robot Pool**.
4. Select **New**.
5. On the form, in the **Name** field, enter a unique robot pool name for a domain.
6. Select **Save**.
7. To assign robots to the robot pool, do the following steps:

   a. On the Robots tab, select **Add**.

   b. On the **Available Robots** tab, select the required robot.

   Note:
   You can add an unattended robot (whose life cycle stage status isn't Retired) to an existing robot pool at any time. Robots that aren't associated to any bot process or robot pool are displayed in the **Available Robots** tab.

   The high density robots and attended robots aren't displayed in the **Available Robots** tab.

   c. Select **Add**.

   d. Select **Save**.

   e. To remove a robot, select the robot and select **Remove**.

   Note:

   If you associate a robot pool to a bot process, you can't remove that robot if it's the only robot in the pool.

   Robots with process jobs in running state must not be removed from the Robot Pool until the process job is either completed or cancelled.

8. **Optional:** To delete a robot pool, select the three-dot icon next to the **Save** button and select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Verify that the robot pool isn't associated to any bot process.

9. In the **Activity** and **Compose** fields, view the activity of the robot pool and robot, work notes, and additional comments.

What to do next

Enable robot pool option for a bot process to map a bot process to the robot pool. For more information, see Enable robot pool for a bot process in RPA Hub.

(Optional) Calculate the number of robots required to allocate those robots from the selected pool to execute the bot process. For more information, see Calculate the number of robots in RPA Hub.

Enable robot pool for a bot process in RPA Hub

Enable robot pool for a bot process in RPA Hub to effectively allocate robots for it's execution and for distribution of work load.

Before you begin

Familiarize yourself with robot pool concepts. For more information, see Robot pool in RPA Hub.

Create a bot process. For more information, see Configuring a bot process record in RPA Hub.

Create a robot pool. For more information, see Create a robot pool in RPA Hub.

Associate a queue to the bot process. For more information, see Associate a queue to the bot process from the related list.

If an RPA developer and RPA support user are a part of the Managed by Group, then they can view and edit these fields.

RPA business user can view these fields.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open a bot process.
5. On the **Details** tab, in the Robot Pool section, fill in the fields.

Bot Process form

Field	Description
Enable Robot Pool	Option to enable the robot pool for the bot process. On enabling this option, the **Assign Robots** tab on the bot process is hidden. For more information about robot pool, see Robot pool in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Robot Pool	Robots that you can allocate dynamically from a selected robot pool. Select a robot pool from a list of existing robot pool names. This field appears only when the **Enable Robot Pool** option is selected.
Allocation Type	Robots that you can allocate based on the Service Level Agreement (SLA) of the work items or the percentage of efficiency gain. Select the allocation type: ○ **SLA Based**: Allocation of robots from the pool based on the SLA of the work item. The work items are sorted and prioritized based on the SLA. If you select the allocation type as SLA Based, ensure that the work items must contain a Service Level Agreement (SLA). ○ **Percentage Reduction**: Allocation of robots from the pool based on the efficiency percentage. The default value is SLA Based. This field appears only when **Enable Robot Pool** option is selected.
Percentage Reduction	This field appears only when **Percentage Reduction** is selected from the **Allocation Type** field. Reduce the total execution time of a bot process by allocating more robots by a selected percentage. For example, if there are 100 work items assigned to a bot process. It might take 100 minutes to execute the bot process. If you want to reduce that time to 75 minutes, you define a value 25 in this field. After you provide a value in this field, multiple robots are allocated to distribute the work load. Thus, the automation performs faster by that percentage. The default value is 25. Robots are allocated to distribute the workload, based on the percentage you select: ○ If you select a value from 5 to 50, 2 robots are allocated. ○ If you select 55, 60, or 65, 3 robots are allocated. ○ If you select 70 or 75, 4 robots are allocated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ If you select 80, 6 robots are allocated. ○ If you select 85, 7 robots are allocated.

Calculate the number of robots in RPA Hub

Calculate the number of robots that you need to complete an unattended bot process execution that is based on the allocation type, for example, the SLA Based and Percentage Reduction.

Before you begin

Familiarize yourself with robot pool concepts. For more information, see Robot pool in RPA Hub.

Create a robot pool. For more information, see Create a robot pool in RPA Hub.

Enable robot pool for the bot process. For more information, see Bot Process form in RPA Hub.

Associate a queue to the bot process. For more information, see Associate a queue to the bot process from the related list.

Define Average Handling Time (AHT) details on the queue form. For more information, see Queue form in RPA Hub.

Ensure that multiple queues are not associated to a bot process.

Ensure that the pending work items are available in the queue.

If you select the allocation type as SLA Based on the Bot Process form, ensure that the work items must contain a Service Level Agreement (SLA).

If you select the **Percentage Reduction** allocation type on the Bot Process form, make sure that you define a value in the **Percentage Reduction** field.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

If the value of the calculation is in decimals, the value is rounded off to the next higher value. For example, if the calculation result is 2.2 robots, the result that is displayed is 3. That means that 3 robots are required to execute the bot process.

queryConditions included in the PickWorkItem component are considered for calculating the number of robots required to complete an unattended bot process execution, if the bot process is enabled with robot pool. For more information about PickWorkItem component, see Queue connector methods.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open a bot process.
5. In the form header, select the down arrow in the **Start Process** button.
6. Select **Calculate**.
   A message is displayed about the number of robots that are required to execute the bot process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring credentials in RPA Hub

In RPA Hub, you can create application credentials, robot credentials, and Time-based One-time Password (TOTP) authentications and link them to multiple bot processes through a credential group. Set up external credential vault to retrieve robot credentials, application credentials, or Time-based One-time Password (TOTP) seed.

Under credential management, you can create the following:

- Application credentials for unattended robots to log in to the application.
- Robot credentials for the unattended robots to log in to the system.
- Time-based One-time Password (TOTP) seeds for unattended robots to seamlessly authenticate against multi-factor authentication (MFA)-enabled applications.
- Credential groups for mapping application credentials and robot credentials to one or more bot processes.
- External credential vault for retrieving robot credentials, application credentials, or Time-based One-time Password (TOTP) seed from an external source instead of a ServiceNow credentials record.

Create a robot credential in RPA Hub

Create a robot credential so that the unattended robot can log in to a Windows machine and perform the automation.

Before you begin

Familiarize yourself with the credential management concept. For more information, see Credential Management in RPA Hub.

Do this task only when you select the **Process Type** field as **Unattended** on the Bot process configuration form while you're creating a bot process. For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

For Smart Card, ensure that the latest MSIs for Unattended Robot and Unattended Robot Login Agent (version 10.1.0) are installed.

External credentials are not supported for smart cards.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager, or sn_rpa_fdn.rpa_admin

About this task

You can't delete a robot credential if it’s associated with any credential group. For more information, see Create a credential group in RPA Hub.

You can't edit the **Robot Username** field when the life-cycle stage status of the associated bot process is set to **Published**. You can edit the password irrespective of what the life-cycle stage is of the associated bot process. For more information, see Life-cycle stage statuses of a bot process in RPA Hub.

You can't edit the **External Credential** field when the life-cycle stage status of the associated bot process is set to **Published**.

If a robot credential uses an external credential vault, you must make sure that the associated external credential vault is active.

In RPA Hub, you can retrieve the robot credentials, application credentials, or a Time-based One-time Password (TOTP) seed in two ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- From a ServiceNow credentials record (application credential, robot credential, or TOTP authenticator).
- From an external credential vault. For more information, see External credential vault in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Credential Management**, select **Robot Credentials**.
4. Select **New**.
5. On the form, fill in the fields.

Robot Credentials form

Field	Description
Name	Unique name of the robot credential.
Authentication Type	The type of authentication for the robot login: ○ **Windows Credentials** - Uses Windows username and password for robot authentication. ○ **Smart Card** - Uses user principle name (UPN) and smart card PIN for robot authentication.
Robot Username	For **Windows Credentials** - User name of the Windows machine to be used by the robot. Enter the user name in the `DOMAIN\Username` format. For **Smart Card** - User principle name (UPN) to be used by the robot. This field doesn't appear if the **External Credential** option is selected.
Robot Password	For **Windows Credentials** - Password for the Windows machine to be used by the robot. For **Smart Card** - Smart card PIN to be used by the robot. This field doesn't appear if the **External Credential** option is selected.
External Credential	Option that you can select to fetch the credentials from the external credential vaults. External credential is not supported for Smart Card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
External Credential Vault	External credential vault record that is used for fetching the credentials from an external credential vault. Use the search icon to select an external credential vault record. For example, DemoCyberArk. Only active external credential vault records are listed here. This field appears only when the **External Credential** option is selected.
Subflow Input	JSON that acts as an input to the subflow mapped in the selected external credential record. This JSON is used by the Subflow REST Step and must contain the necessary information for retrieving the credentials from the external credential vault. The value must be in a JSON format. You can't enter an empty JSON value. For more information about the JSON, see Steps to configure an external credential vault in RPA Hub. This field appears only when the **External Credential** option is selected.

6. Select **Save**.
7. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Create a TOTP authenticator in RPA Hub

Map a multi-factor authentication (MFA) authenticator record with a seed in a robot credential. This mapping results in creating a Time-based One-time Password (TOTP) authenticator record in RPA Hub.

Before you begin

Familiarize yourself with multi-factor authentication (MFA) concepts. For more information, see Multi-factor authentication.

Familiarize yourself with the TOTP authentication in RPA Hub. For more information, see TOTP authentication in RPA Hub.

Create an MFA authenticator record. For more information, see Create an MFA authenticator in RPA Hub.

Create a robot credential. For more information, see Create a robot credential in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Do this task only when you select the **Process Type** field as **Unattended** on the Bot process configuration form while you're creating a bot process. For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

Verify that the life-cycle stage status of the associated bot process is set to either **Build** or **In Maintenance**.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

A seed is a secret key of the authenticator that is used to generate the TOTP.

An authenticator application is a third-party software that generates temporary passcodes. Users can use these passcodes with their password to log in to an instance that requires multi-factor authentication (MFA).

With TOTP authentication, you can store the seed of the authenticator at the instance level so that your unattended robots can seamlessly authenticate against MFA-enabled applications.

If a TOTP authenticator is using external credential vault, then ensure that the associated external credential vault is active.

In RPA Hub, you can retrieve robot credentials, application credentials, or TOTP seed in two ways:

- From ServiceNow credentials record (application credential, robot credential, or TOTP authenticator).
- From an external credential vault. For more information, see External credential vault in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Credential Management**, select **Robot Credentials**.
4. Select the robot credential record that you want to associate an MFA authenticator record to.
5. On the **TOTP Authenticators** tab, select **New**.
6. On the form, fill in the fields.

TOTP Authenticator form

Field	Description
Authenticator	MFA authenticator to be mapped to this robot credential. Alternatively, you can select the search icon and select the MFA authenticator. For example, Okta.
Seed	Secret key of the authenticator that is used to generate the TOTP.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field does not appear if the **External Credential** check box is selected.
External Credential	Select this check box to fetch the seed from external credential vaults.
External Credential Vault	Select an external credential vault record that is used for fetching the seed from an external credential vault. Use the search icon to select an external credential vault record. For example, DemoCyberArk. Only active external credential vault records are listed here. This field appears only when the **External Credential** check box is selected.
Subflow Input	Provide a JSON that acts as an input to the subflow mapped in the selected external credential record. This JSON is used by the Subflow REST Step and must contain the necessary information for retrieving seed from the external credential vault. The value must be in JSON format. You cannot enter an empty JSON value. For more information about the JSON, see Steps to configure an external credential vault in RPA Hub. This field appears only when the **External Credential** check box is selected.

7. Select **Save**.
8. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

What to do next

Use the GetTOTP component in the RPA Desktop Design Studio to generate TOTP.

Related topics

Delete a TOTP authenticator in RPA Hub

Retire an MFA authenticator in RPA Hub

Create an application credential in RPA Hub

Create an application credential to add the application user name and password. An unattended robot can use this application credential to log in to an application when the automation is executed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Familiarize yourself with the credential management concept. For more information, see Credential Management in RPA Hub.

Do this task only when you select the **Process Type** field as **Unattended** on the Bot process configuration form while you're creating a bot process. For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_business_user, or sn_rpa_fdn.rpa_admin

About this task

You can't delete an application credential when the life-cycle stage status of the associated bot process is set to **Published**. For more information, see Life-cycle stage statuses of a bot process in RPA Hub.

You can't edit the **Name** and **Application Name** fields when the life-cycle stage status of the associated bot process is set to **Published**. You can edit the application password irrespective of what the life-cycle stage is of the associated bot process.

You can't edit the **External Credential** field when the life-cycle stage status of the associated bot process is set to **Published**.

If an application credential uses an external credential vault, make sure that the associated external credential vault is active.

In RPA Hub, you can retrieve the robot credentials, application credentials, or a Time-based One-time Password (TOTP) seed in two ways:

- From ServiceNow credentials record (application credential, robot credential, or TOTP authenticator).
- From an external credential vault. For more information, see External credential vault in RPA Hub.

If the **External Credential** check box is selected in an application credential record, then the **SetApplicationCredential** component in RPA Desktop Design Studio doesn't set the credentials and an error is displayed. For more information about the component, see Use the SetApplicationCredential component.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Credential Management**, select **Application Credentials**.
4. Select **New**.
5. On the form, fill in the fields.

Application credentials form

Field	Description
Name	Unique name of this application credential.
Application Name	Name of the business application.

Create a credential group in RPA Hub

Create a credential group to include a robot credential and application credentials that you can reuse in multiple bot processes. Unattended robots leverage the credential group to perform an automation that you defined in the associated bot process.

Before you begin

Familiarize yourself with the credential management concept. For more information, see Credential Management in RPA Hub.

Create a robot credential. For more information, see Create a robot credential in RPA Hub.

Create one or more application credentials. For more information, see Create an application credential in RPA Hub.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager, or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Credential Management**, select **Credential Groups**.
4. Select **New**.
5. On the form, fill in the fields.

Credential Group form

Field	Description
Name	Unique name of the credential group.
Robot Credential	Robot credential to be associated with this credential group. Robots use the robot credentials to authenticate on a system.

6. Select **Save**.
7. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Related topics

- Associate a credential group to a bot process
- Assign a process robot credential within a bot process

Associate an application credential to the credential group

Associate one or more application credentials to the credential group in RPA Hub so that a robot can perform automation by logging in to the applications.

Before you begin

Familiarize yourself with the credential management concept. For more information, see Credential Management in RPA Hub.

Create a credential group. For more information, see Create a credential group in RPA Hub.

Create application credentials. For more information, see Create an application credential in RPA Hub.

Developers can only associate application credentials that are created by them to the credential group.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager, or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Credential Management**, select **Credential Groups**.
4. In the Credential Groups list, select a credential group to associate an application credential to.
5. On the **Application Credential** tab, select **Add**.
6. Select one or more application credentials to associate with this credential group.
7. Select **Add**.
8. Select **Save**.

Associate a bot process to a credential group

Associate one or more unattended bot processes to a credential group in RPA Hub so that the associated robot can perform automation using the credential group.

Before you begin

Familiarize yourself with the credential management concept. For more information, see Credential Management in RPA Hub.

Create a credential group. For more information, see Create a credential group in RPA Hub.

Create a robot credential. For more information, see Create a robot credential in RPA Hub.

Create an unattended bot process. For more information, see Configuring a bot process record in RPA Hub.

You can't edit the **Process Credential Mappings** record when the life-cycle stage status of the associated bot process is set to **Published**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only the developers who are part of the managed by group can associate the bot process to the credential group.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager, or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Credential Management**, select **Credential Groups**.
4. In the Credential Groups list, select a credential group to create a process credential mapping for.
5. On the **Process Credential Mappings** tab, select **Add**.
6. Select one or more bot processes from the list to associate with this credential group.

   The list displays all the unattended bot processes that don't have the life-cycle stage status set to **Published** or **Retired**.

   After selecting the bot processes and selecting **Add**, the process credential-mapping records for all corresponding bot processes are created.
7. Select **Save**.
8. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.
9. **Optional:** To remove a process credential mapping, select the process credential mapping, and select **Remove**.
   You can't remove process credential mappings that are associated with a published bot process.

What to do next

For providing access to this credential group to all users in the Managed by group or to specific users, see Provide users with access to a credential group.

Provide users with access to a credential group

Provide access to either all users or specific users in the Managed by group of the associated bot processes in RPA Hub. This way, you can make sure that the correct users have access to the credentials.

Before you begin

Familiarize yourself with the credential management concept. For more information, see Credential Management in RPA Hub.

Create a credential group. For more information, see Create a credential group in RPA Hub.

Add a bot process in the **Process Credential Mapping** tab of the credential group. For more information, see Associate a bot process to a credential group.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

Provide all users from the Managed by group of the associated bot process with access to a credential group by selecting the **Shared** option. Provide specific users from the Managed by group of the associated bot process with access to a credential group to by clearing the **Shared** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the **Shared** option isn't selected, the **Authorized Users** tab appears. You can add the users from the Managed by group of the associated bot process in the **Authorized Users** tab. These authorized users can create the process robot credentials in the associated bot process.

By selecting the **Shared** option, you grant access to all the users in the Managed by group. If **Shared** is selected on the Process Credential Mapping record, you can't add users in the **Authorized Users** tab.

If you remove an authorized user from the list, the Process Robot Credential record that was created by the user is deleted.

You can't edit the **Shared** option and add or remove the users in the **Authorized Users** tab when the life-cycle stage status of the associated bot process is set to **Published**.

Important:
If you're upgrading to Yokohama, the **Shared** option is pre-selected. When you clear the **Shared** option, the Process Robot Credential records that were created by an RPA release manager and an RPA administrator are retained. However, the Process Robot Credential records that were created by the developers from the Managed by group are deleted.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Credential Management**, select **Credential Groups**.
4. In the Credential Groups list, select the credential group.
5. On the **Process Credential Mappings** tab, select the record that you want to modify.
6. Provide access to users.
7. Select **Save**.

Create an external credential vault record in RPA Hub

Create an external credential vault record in RPA Hub to register your external credential vault for further usage by the robot.

Before you begin

Familiarize yourself with the external credentials concepts. For more information, see External credential vault in RPA Hub.

Verify that you've completed the tasks that are related to configuring the external credentials in RPA Hub. For more information, see Steps to configure an external credential vault in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

An external credential vault is a secure storage system often used to store and manage sensitive information. For example, user names, passwords, and other access credentials for various applications, services, or systems.

To edit an existing external credential vault record, clear the **Active** check box.

You can't deactivate an external credential vault record, if it's associated with a published bot process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Credential Management**, select **External Credential Vaults**.
4. Select **New**.
5. On the External Credential Vault form, fill in the fields.

External Credential Vault form

Field	Description
Name	Unique name of the external credential vault. For example, Demo CyberArk.
Subflow	Associated subflow that fetches the credentials from the external credential vault. Only published and active subflows are listed here, that aren't associated with any existing External Credential Vault record. Subflow and External Credential Vault names have a one-on-one mapping.
Active	Option to activate the external credential vault. Clear the **Active** check box to edit an existing external credential vault record.
Description	Brief description of the external credential vault.

6. Select **Save**.
7. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Create an MFA authenticator in RPA Hub

Define the authenticator and token length that acts as an enabler for the Time-based One-time Password (TOTP) authentication in RPA Hub so that the unattended robots can seamlessly authenticate against multi-factor authentication (MFA)-enabled applications.

Before you begin

Familiarize yourself with multi-factor authentication (MFA) concepts. For more information, see Multi-factor authentication .

Familiarize yourself with the TOTP authentication in RPA Hub. For more information, see TOTP authentication in RPA Hub.

You must do this task in the classic environment.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

An authenticator application is a third-party software that generates temporary passcodes. Users can use these passcodes along with their password to log in to an instance that requires multi-factor authentication (MFA). For example, the following applications support Time-based One-time Passwords (TOTP):

- Google Authenticator
- Microsoft Authenticator
- Okta Verify

For more detail on these applications, see Authenticator Applications.

The MFA authenticator record acts as an input to the Time-based One-time Password (TOTP) authenticator.

After you create an MFA authenticator record, all the fields are read-only.

You can't edit an MFA authenticator record. If changes are required to an existing MFA record, you must retire an existing record and then create an MFA authenticator record.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Administration** > **Authenticators**.
2. Select **New**.
3. On the form, fill in the fields.

MFA Authenticator form

Field	Description
Name	Unique name of the MFA authenticator. For example, Google Authenticator.
Token Length	Length of the generated Time-based One-time Password (TOTP) that depends on the authenticator you have selected: ○ **6**- The minimum length of the TOTP that is generated. ○ 7 ○ 8 ○ **9**- The maximum length of the TOTP that is generated.
Life Cycle Stage Status	Status of the life-cycle stage of the MFA authenticator: ○ **In Use**- This value is the default. ○ **Retired**

4. Select **Submit**.

What to do next

Create a TOTP authenticator. For more information, see Create a TOTP authenticator in RPA Hub.

Create an alert rule to generate custom notifications in RPA Hub

Create an alert rule to generate custom notifications for robots, schedules, process jobs, and other RPA Hub related tables.

Before you begin

You must do this task in the classic environment.

Role required: sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_developer, or sn_rpa_fdn.rpa_admin

About this task

Alert rules are configurations that define conditions in which an alert or a notification must be triggered. These rules help in managing and responding to issues identified in automations. These alert rules specify the condition or set of conditions that must be met for the alert to be triggered. For example, a trigger condition could be a certain error message, a performance metric exceeding a threshold, or the absence of expected data.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Monitor** > **Alert Rules**.
2. Select **New**.
3. On the form, fill in the fields.
4. Select **Save**.

Related topics

Alert rule form in RPA Hub

Create an alert variable for an alert rule in RPA Hub

Create a variable to configure the messages of an alert rule.

Before you begin

You must do this task in the classic environment.

Create an alert rule. For more information, see Create an alert rule to generate custom notifications in RPA Hub.

Role required: sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_developer, or sn_rpa_fdn.rpa_admin

About this task

Alert variable refers to a variable or parameter associated with alerts of RPA Hub. It serves as a dynamic token within alert messages, and its value can be linked to a table's field or determined through conditional scripting.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Monitor** > **Alert Rules**.
2. Open an alert rule that you want to create and associate an alert variable to.
3. In the Alert Variables related list, select **New**.

Publish an RPA Hub bot process

Publish a bot process so that you can get it ready to execute a process.

Before you begin

Ensure that the associated package version complies with the code quality check system property *sn_rpa_fdn.restrict_package_by_severity*, to verify if the code quality check is enabled in the RPA Hub instance. For more information about the system property, see Configure RPA Hub properties. For more information about the compliance rules, see Code quality check compliance for RPA Hub.

Ensure that you complete the following tasks to publish an unattended bot process in the order that they're presented.

1. Create a bot process. For more information, see Configuring a bot process record in RPA Hub.
2. Associate a credential group. For more information, see Associate a credential group to a bot process.
3. Assign a robot to a bot process. For more information, see Assign a robot to a bot process in RPA Hub.
4. Assign a process robot credential within a bot process. For more information, see Assign a process robot credential within a bot process.
5. Verify that all the assigned robots are mapped to a credential group.

Ensure that you complete the following tasks to publish an attended bot process in the order that they're presented.

1. Create a bot process. For more information, see Configuring a bot process record in RPA Hub.
2. Assign an attended user or group to an attended bot process. For more information, see Assign an attended user or group to an attended bot process.

If you are publishing an unattended bot process that is assigned to a robot pool, then ensure that the following conditions are met:

- Associate a queue to the bot process. For more information, see Associate a queue to the bot process from the related list.
- The queue is not associated to another bot process.
- The bot process is not associated with multiple queues.
- Assign a process robot credential to each robots of the robot pool within a bot process. For more information, see Assign a process robot credential within a bot process.

If you are publishing a bot process that is enabled with external credential, then ensure that the associated external credential vault is active. This scenario is valid if one or more Robot Credentials, Application Credentials, or TOTP Authenticators are associated with inactive External Credential Vault record. For more information about the external credential settings in Robot Credentials, Application Credentials, and TOTP Authenticators, see Create a robot credential in RPA Hub, Create an application credential in RPA Hub, and Create a TOTP authenticator in RPA Hub.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

About this task

Publishing a bot process is one of the life-cycle stages of a bot process. For more information, see Life-cycle stage statuses of a bot process in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open a bot process that you want to publish.

   Tip:
   To modify the details of a bot process, change the life cycle stage of the bot process to **In-maintenance**. For more information, see Edit a bot process in RPA Hub.

5. In the form header, select **Publish**.

   Warning:
   After you publish a bot process, you can't change or delete the entries in the bot process form, associated business applications, robots, process credential mappings, process robot credential sets, and schedules.

Result

After you publish a bot process, the added schedule (if any) takes effect.

If there is no schedule, the published bot process is ready to be triggered by the API.

Managing RPA Hub

Developers, support users, release managers, and administrators can use the RPA Hub application to start and stop a bot process, launch a bot process in the RPA Desktop Design Studio, execute skills, view the HashCode of a package version, and retire a bot process, package, and a robot.

Assign a bot process to a queue from Queues menu

Assign a bot process to a queue in RPA Hub so that it can interact with this queue. You can assign more than one bot process to a queue. Any robot that is associated with the assigned bot process can insert the work item, pick the work item, and update the work item.

Before you begin

Create a bot process. For more information, see Configuring a bot process record in RPA Hub.

Create a queue. For more information, see Create a queue in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

If the bot process is enabled for robot pool, then only one queue (that is not associated with any other bot process) can be mapped to the current bot process.

To associate a queue to a bot process from the bot process related list, see Associate a queue to the bot process from the related list.

View robot events in RPA Hub

View the current robot events on the **Robot Calendar** tab in RPA Hub for unattended robots. By using the calendar, you can manage and plan a robot's schedule in a single view.

Before you begin

Create an unattended robot. On the robot form, ensure that you select the **Robot Type** field as **Unattended**. For more information, see Creating a robot in RPA Hub.

Establish the robot connection to an unattended bot process. For more information, see Assign a robot to a bot process in RPA Hub.

Create a schedule within an unattended bot process to view some schedules on the robot calendar. Ensure that one or more active schedules are associated with the robot. For more information, see Create a schedule within a bot process in RPA Hub.

Verify that the life-cycle stage of the associated bot process isn't set to **Retired**.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_business_user, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If a robot is associated to multiple bot processes, the landing page of the robot calendar is the schedule view of a published bot process. There can be more than one published bot process associated with a robot.

To view more robot events, add the appropriate **Life Cycle Stage Status** filter in the Robot Calendar.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. View a robot calendar either from a robot or from a bot process.
4. On the **Robot Calendar** tab, perform any of the following actions.

Create a schedule on the robot calendar

Create a schedule on the **Robot Calendar** tab in RPA Hub to execute unattended robots. You can also identify any conflicts in the schedule by selecting the **Preview** button.

Before you begin

Perform the following tasks before you create a schedule on the robot calendar:

- Ensure you are familiar with robot calendar concepts. For more information, see Using the robot calendar for RPA Hub and View robot events in RPA Hub.
- Create an unattended robot. On the robot form, ensure that you select the **Robot Type** field as **Unattended**. For more information, see Creating a robot in RPA Hub.
- Establish the robot connection to an unattended bot process. For more information, see Assign a robot to a bot process in RPA Hub.
- Verify that the life-cycle stage of the associated bot process isn't set to **Retired**.
- Ensure that the RPA developer (sn_rpa_fdn.rpa_developer) or the RPA support user (sn_rpa_fdn.rpa_support_user) are in the Managed by Group list of the associated bot process.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

About this task

To create a schedule within an unattended bot process, see Create a schedule within a bot process in RPA Hub.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. View a robot calendar either from a robot or from a bot process.
4. To create a new schedule, perform any of the following tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- On the **Robot Calendar** tab, select **New Schedule**.
- Right-click an empty slot of the calendar. Then, select **New Schedule**.
- Double-click an empty slot of the calendar.

The **Create a new schedule** contextual side panel opens.

5. **Optional:** To view more bot processes, select the filter icon ( ) and add the appropriate **Process Name** filter and **Life Cycle Stage Status** filter.
6. In the **Create a new schedule** contextual side panel, select a bot process that you want to create a schedule for.
7. Select one of the following options, depending on what the life cycle stage status is of your bot process:
   - If the life cycle stage status of the bot process is either Build or In Maintenance, select **Continue**.
   - If the life cycle stage status of the bot process is Published, to change the status to In Maintenance, in the Confirmation dialog box, select **Continue**.
8. On the schedule form, update the fields as appropriate.
   For more information, see Schedule form in RPA Hub.
9. **Optional:** To identify any conflicts in the schedule or preview the schedule, select **Preview**.

   (Optional) To edit or delete a schedule, see Edit a robot schedule in RPA Hub and Delete a robot schedule in RPA Hub.
10. **Optional:** To view more details about an event, perform any of the following tasks:
    - Select the view event details icon ( ) on the event pop-up window.
    - Right-click an event and select **View event details**.

    An event card with details of the schedule appears in the contextual side panel.
11. **Optional:** To view the bot process details in a new tab, select the view bot process details icon ( ) on the event pop-up window.
12. Perform any of the following tasks to save the schedule.

Edit a robot schedule in RPA Hub

Edit a robot schedule of a bot process on the **Robot Calendar** tab in RPA Hub to resolve any scheduling conflicts or to modify the details on the schedule form.

Before you begin

Perform the following tasks before you edit a robot schedule:

- Ensure you are familiar with robot calendar concepts. For more information, see Using the robot calendar for RPA Hub and View robot events in RPA Hub.
- Create an unattended robot. On the robot form, ensure that you select the **Robot Type** field as **Unattended**. For more information, see Creating a robot in RPA Hub.
- Establish the robot connection to an unattended bot process. For more information, see Assign a robot to a bot process in RPA Hub.
- Create a schedule for a unattended bot process to view some schedules on the robot calendar. For more information, see Create a schedule on the robot calendar or Create a schedule within a bot process in RPA Hub.

- Verify that the life-cycle stage of the associated bot process isn't set to **Retired**.
- Ensure that the RPA developer (sn_rpa_fdn.rpa_developer) or the RPA support user (sn_rpa_fdn.rpa_support_user) are in the Managed by Group list of the associated bot process.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. View a robot calendar either from a robot or from a bot process.
4. **Optional:** To view more bot processes, select the filter icon ( ) and add the appropriate **Process Name** filter and **Life Cycle Stage Status** filter.
5. To edit a schedule, perform any of the following tasks.
6. **Optional:** If the life-cycle stage status of the bot process is set to **Published** and you want to change the status to **In Maintenance**, select **Continue** in the Confirmation dialog box.
7. On the Edit schedule form, update the fields as appropriate.
8. **Optional:** To identify any further conflicts in the schedule or preview the schedule, select **Preview**.
9. Perform any of the following tasks to save the schedule:
   - To save the schedule, select **Save**.
   - To save the schedule and publish the bot process, select the down arrow in the **Save** button and select **Save and Publish**.

Manage scheduled maintenance days in RPA Hub

Track scheduled maintenance days on the **Robot Calendar** tab to manage your current and future automations.

Before you begin

Ensure you're familiar with scheduled maintenance days concepts. For more information, see Scheduled maintenance days in RPA Hub.

Create a change request from the **Change** module. For more information, see Create a change request . Ensure to do the following tasks while creating a change request:

- On the Change Request (CR) form, in the **Configuration item** field, select the associated bot process, robot, or machine (for which the robot is associated when a machine name look up is enabled). Also, select an assignment group.
- On the Schedule tab, enter the planned scheduled maintenance start and end dates along with time, in **Planned start date** and **Planned end date** fields, respectively. Ensure that the **Planned start date** is not empty.
- After you save the change request, select **Request Approval** to move it to the Assess state.
- Next, approve the change request. For more information, see Process a change request . To view the scheduled maintenance on a robot calendar, the change request can either be in either Scheduled, Implement, or Review states.

Ensure to enable the *sn_rpa_fdn.enable_unattended_robot_machine_name_lookup* system property, to map the robot to the virtual machine.

Ensure to map the logged-in user timezone in the RPA timezone for scheduled maintenance reflection on the robot calendar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. On the RPA Hub workspace home page, select a change request depending on the configuration item (CI):
   - If the CI is a robot, select a change request from the **Changes to robots** section.
   - If the CI is a bot process, select a change request from the **Changes to bot processes** section.
3. From the Configuration Item column, select the associated robot or the bot process.
   The associated robot form or the bot process form opens.
4. Navigate to the robot calendar from the form header, depending on the CI:
   - If the CI is a robot, select **Robot Calendar**.
   - If the CI is a bot process, select **Show Robot Calendar**.
5. **Optional:** If the CI is a bot process, in the **Select the robot to view the calendar** dialog box, select a robot from the Robot list and then, select **Continue**.
   If the robot pool feature is enabled, all the robots associated to that pool appear in the Robots list. Else, all the robots in the assigned robots appear in the Robots list.
6. On the **Robot Calendar** tab, perform any of the following tasks:

Option	Action	Result
To create a scheduled maintenance on the robot calendar, if the associated CI is either in Build or In Maintenance state.	Select a scheduled maintenance (SM) event card and select **Accept**.	A maintenance request (MR) is created with Pending state. The executions are stopped until the CR is closed.
To create a scheduled maintenance on the robot calendar, if the associated CI is in Published state.	○ Select an SM event card and select **Accept**. ○ In the **Do you want to accept the CR?** confirmation dialog box, select **Accept**.	An MR is created with Pending state. The associated CI moves to In Maintenance state during the planned scheduled maintenance time frame. The executions are stopped until the CR is closed. Then, the CI automatically moves to the Published state.
To remove a scheduled maintenance from the robot calendar.	Select an SM event card and select **Reject**.	An MR is created with Rejected state.
To cancel a scheduled maintenance day on the robot calendar.	○ Select an accepted SM event card and select **Cancel Maintenance**. ○ In the **Cancel Maintenance Request?** confirmation dialog box, select **Cancel**.	If the MR is In Progress state, it is updated to complete state. If the MR is in Pending state, it is canceled, then the CI moves to Published state automatically.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** To view the maintenance request for tracking, select the maintenance request.
8. **Optional:** To view the updates of the CI, perform the following steps:
   a. Navigate to the CI (robot or bot process).
   b. Open the record.
   c. In the **Activity** and **Compose** fields, view the notifications of the source of the CI from where it is published or is in use.

View a list of the pre-defined code quality check rules along with their active status and severity.

Before you begin

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_business_user, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_robot, or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Code Quality Rules**.
4. Open a rule to view the details.

Related topics

Code quality rule form in RPA Hub

Download a package version in RPA Hub

Download a package version in RPA Hub so that it can be opened from the RPA Desktop Design Studio to build, debug, or modify the automation.

Before you begin

Create a package. For more information, see Create a package to assign to a bot process.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_robot, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_assisted_user, or sn_rpa_fdn.rpa_admin

About this task

Package version file is an iBot file that contains the automation logic that you can open in RPA Desktop Design Studio. To view this automation file (ibot), install the RPA Desktop Design Studio application in your machine. For more information, see Install RPA Desktop Design Studio.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Packages**.
4. Open a package whose package version you want to download.
5. On the **Package Versions** tab, select a version that you want to download.
6. In the Attachments section, select an attachment, select the three-dot menu, and select **Download**.
7. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Upload an automation package attachment in RPA Hub

Upload a zip file of the automation package in RPA Hub to manually migrate the package from a lower (non-production) to a higher (production) environment.

Before you begin

You must do this task in the classic environment.

Ensure that you've completed the tasks that are related to migrating your data from a lower environment to a higher environment. For more information, see Migrating your data from a lower environment to a higher environment in RPA Hub.

Download the package version attachment from a lower instance. For more information, see Download a package version in RPA Hub.

Ensure that the *sn_rpa_fdn.allow_manual_upload_of_automation_package* system property is marked as true. If you have the admin role, you can edit this system property.

Verify that the life-cycle stage of the package version isn't set to **Retired**.

Ensure that there's no valid attachment that is associated with the package version record.

For a quick integrity check, verify that the HashCode of a package version is correct. If the validation fails, remove the incorrect attachment that you previously uploaded by selecting

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage Attachments. Then, proceed with this task to upload a correct attachment. For more information about verifying the HashCode, see Verify the HashCode of a package version in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager

About this task

You can upload the valid attachment only one time. The **Upload Attachment** button to upload attachments is turned off after you upload a valid attachment.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Build** > **Packages**.
2. Open a package that you want to upload a package version for.
3. On the **Package Versions** tab, select a version.
4. In the form header, select **Upload Attachment** to upload a zip file of the automation package.
5. In the Confirmation dialog box, select **Choose file**.

What to do next

For a quick integrity check, verify the HashCode of a package version again. For more information, see Verify the HashCode of a package version in RPA Hub.

Import a package version attachment in RPA Hub

Import package version attachments automatically instead of manually uploading a package version attachment, by selecting the **Import Attachment** button on a package version.

Before you begin

Perform the following tasks before you import a package version attachment:

- Ensure that you've completed the tasks that are related to migrating your data from a lower environment to a higher environment. For more information, see Migrating your data from a lower environment to a higher environment in RPA Hub.
- Ensure that the *sn_rpa_fdn.allow_manual_upload_of_automation_package* system property is marked as true. If you have the admin role, you can edit this system property.
- Ensure that there is no valid attachment associated to the package version.
- Verify that the life-cycle stage of the package version isn't set to **Retired**.
- Create an active connection in the **RPA Automation Package** connection and credential alias. Ensure to provide the lower (non-production) environment in the **Connection URL** field. For more information, see Create an HTTP(s) connection.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

The maximum package size is determined by the *com.glide.attachment.max_size* system property. For more information about this system property, Maximum allowed attachment size [Updated in Security Center 1.3].

Perform this task if you are automatically migrating the package attachment (automation zip file) from a lower (non-production) to a higher (production) environment.

Another way to import package version attachments automatically is via triggering the **Import Package Version Attachment** Subflow in Workflow Studio. For more information, see RPA Hub actions and subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Packages**.
4. Open a package whose package version you want to import.
5. On the **Package Versions** tab, select a version that you want to import.
6. Select **Import Attachment**.
7. In the Confirmation dialog box, select **Import Attachment**.

Result

After the attachment is uploaded successfully or if an error occurs while uploading the attachment, an email notification is sent to the user who performs this import attachment action.

What to do next

For a quick integrity check, verify the HashCode of a package version again. For more information, see Verify the HashCode of a package version in RPA Hub.

Override a skill package version for multiple bot processes in RPA Hub

Override a skill package version in RPA Hub for multiple bot processes that are associated with the same attended or unattended package. You can select the latest version of the skill package without publishing the attended or unattended package again from RPA Desktop Design Studio.

Before you begin

If you're upgrading to Xanadu, to view the associated bot processes in the **Bot Process** tab of the Skill Package Version form, publish the attended or unattended packages again and associate the packages to the bot processes.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

In the **Bot Process** tab of the Skill package version form, you can override a skill package version for multiple bot processes instead of overriding the version individually for each bot process.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Packages**.
4. Select the skill package.
5. On the **Package Versions** tab, select the version that you want to override.
6. On the **Bot Process** tab, select **Edit**.
7. Select the bot processes from the list that you want to override this skill version.
   The list shows the bot processes for the attended or unattended packages that are associated with the selected skill package.

Verify the HashCode of a package version in RPA Hub

Verify the HashCode of a package version in RPA Hub so that you can validate the HashCode of the manually uploaded automation zip file with the associated package version record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You must do this task in the classic environment.

Ensure that you've completed the tasks that are related to migrating your data from a lower environment to a higher environment. For more information, see Migrating your data from a lower environment to a higher environment in RPA Hub.

Ensure that the *sn_rpa_fdn.allow_manual_upload_of_automation_package* system property is marked as true. If you have the admin role, you can edit this system property.

Upload an automation package. For more information, see Upload an automation package attachment in RPA Hub.

Verify that the life-cycle stage of the package version isn't set to **Retired**.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

A HashCode is a unique, auto-generated alphanumeric value of a published package version that is used to validate the integrity of the package version. The system verifies the HashCode of the first attachment that is uploaded on the package version record. To ensure a successful validation, upload only the correct attachment.

Another way to verify the HashCode of a package version is via triggering the **Verify HashCode of a Package Version** Action in Workflow Studio. For more information, see RPA Hub actions and subflow.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Build** > **Packages**.
2. Open a package to view the HashCode.
3. On the **Package Versions** tab, select a version.
4. In the form header, select **Verify Hash Code**.

What to do next

If the HashCode validation fails, remove the invalid attachment and upload the correct automation package. For more information, see Upload an automation package attachment in RPA Hub.

Edit an unattended robot in RPA Hub

Edit an existing unattended robot in RPA Hub to modify a few details of the robot, convert the robot to a high density robot, and view the robot state.

Before you begin

Create an unattended robot. Ensure to select the **Robot Type** field as **Unattended**. For more information, see Creating a robot in RPA Hub.

You cannot edit an attended robot.

Verify that the life-cycle stage of the robot is **In Maintenance** on the robot form.

When changing the robot type from high density robot to standard or vice-versa, you must reconnect the unattended robot to ensure seamless execution of automations.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Robots**.
4. Select the unattended robot that you want to modify.
5. On the **Details** tab, update the following fields as appropriate.

Robot form

Field	Description
Name	Name of the robot.
Department	Associated department of the robot. This field is auto-populated based on the department information in the associated Attended Robot User's record. The value in this field corresponds to the value at the time the Robot record is created and not on real-time data.
Description	Brief description of the robot.
High density robot	Option to create multiple robots with the same machine name. The machine must support multiple user sessions at the same time so that you can run multiple automations simultaneously. **Note:** If you change the robot type from high density robot to standard or vice-versa, you must reconnect the unattended robot to ensure seamless execution of automations.
Screen resolution	Screen resolution used by a high density robot while establishing the RDP connection before executing the automation. You can have different screen resolutions for different high density robots that use the same machine name. But, it is ideal for all high density robots associated to the same bot process to have same screen resolution value. This field appears only when the robot is marked as high density robot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can change the default value of the screen resolution using the *sn_rpa_fdn.robot_screen_resolution* RPA Hub system property.
User	Authorized user who can access this robot. If you're upgrading to Xanadu, the **User** field is automatically mapped with the user name (the user) who has recently created the process job for the selected unattended robots. If no process jobs are found for a selected robot, the robot is moved to the In Maintenance status. An RPA release manager must manually map the appropriate users to the robots. **Note:** This field appears when the *sn_rpa_fdn.enable_unattended_robot_user* system property is enabled.

6. On the form, view the states of the unattended and attended robots.

Robot states form

State	Description for Unattended Robot	Description for Attended Robot
New	Default value when a new robot is created or saved.	Default value when a new robot is created or saved.
Available	Robot is connected to the Unattended Robot application.	Attended user is connected to the Attended Robot application.
Busy	Robot has executed executing the automation.	Attended user started the automation by selecting the run icon ( ) or desktop in desktop icon ( ).
Disconnected	Robot is disconnected from the Unattended Robot application.	Either the attended user closed or logged out from the Attended Robot application.
Unresponsive	Robot runtime isn't responding. This state occurs when the difference between current time and last heart beat time equals or greater than the value specified in the *sn_rpa_fdn.robot.unresponsive* property.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Save**.
8. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Edit a package in RPA Hub

Edit an existing package in RPA Hub to modify the details such as the name or description.

Before you begin

Create a package. For more information, see Create a package to assign to a bot process.

Ensure that the package isn't associated to a bot process. Verify that the life-cycle stage of the package is **In-maintenance** on the package form.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager, or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Packages**.
4. Open the package that you want to edit.
5. Update the following fields as appropriate:
   - Name
   - Description
6. Select **Save**.
7. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Bot Process form in RPA Hub

Start an unattended bot process in RPA Hub

Start an unattended bot process in the specified robot machine to execute the automation by the selected robot.

Before you begin

Associate a package and a package version to the bot process. For more information, see Configuring a bot process record in RPA Hub.

Verify that the life cycle stage status of the bot process is either in **Published**, **In Maintenance**, or **Build**. For more information, see Bot Process form in RPA Hub.

If the **External Credential** check box is selected in a robot credential record, then ensure that the associated external credential vault record is active. For more information, see Create a robot credential in RPA Hub.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_business_user, or sn_rpa_fdn.rpa_admin

About this task

If robot pool is enabled, after you select the **Start Process** button, a certain number of robots from the assigned robot pool execute the bot process based on the following conditions:

- Based on the value selected in the **Allocation Type** field on the Bot Process form.
- Based on the pending work items and average handling time of previous successfully completed work items, calculate the number of robots needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Minimum value of calculated robots is 1.
- Maximum value of calculated robots is equal to the number of robots in the pool.

Note:
When a bot process is either in the **In Maintenance** or **Build** life-cycle stage status and is using a robot pool, new robots are not deployed for dynamic allocation. Dynamic allocation in the robot pool is only activated for published bot processes.

Only robots with an assigned credential group and in the **Available** and **Busy** states are displayed here to facilitate process job queuing. A job queue contains processes that are executed in a defined order.

You can also run an unattended automation using the Unattended Robot. For more information, see Run an automation using Unattended Robot.

Another way to start an unattended bot process is via triggering the **Start Process** Action in Workflow Studio. For more information, see RPA Hub actions and subflow.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process to execute the unattended automation.
5. In the form header, select **Start Process**.
6. Select the robot that is assigned to the current bot process that you want to start.
   The robots that are in the **In Maintenance** life-cycle stage status are not displayed in the list.
7. Select **Start Process**.
   Your organisation's security policy may flag or prevent the automation from executing. To avoid that, consider allow listing the folders that store the binaries, user plugins, and script connectors on your computer. For example,
   - For binaries, you can allow list the ServiceNowRPA folder in the path `Users\<username>\AppData\Local`
   - For user plugins, you can allow list the user plugins folder in the path `<project folder name>\UserPlugins\<User plugin name>`
   - For script connectors, you can allow list the Dependencies folder in the path `<project folder name>\Dependencies`

Start a bot process. For more information, see Start an unattended bot process in RPA Hub.

Verify that the life cycle stage status of the bot process is either in **Published**, **In Maintenance**, or **Build**. For more information, see Bot Process form in RPA Hub.

Verify that the life cycle stage status of the assigned robot is **In Use** and the state of the robot is **Busy**.

Ensure you are familiar with graceful stop concepts. For more information, see Using Graceful Stop functionality in RPA Hub.

To use the **Graceful Stop** toggle, ensure the Graceful Stop component is used in the selected package version in RPA Desktop Design Studio. Graceful stop is applicable for assigned robots as well as robots in robot pool.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_business_user, or sn_rpa_fdn.rpa_admin

About this task

Another way to stop an unattended bot process is via triggering the **Stop Process** Action in Workflow Studio. For more information, see RPA Hub actions and subflow.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. To stop the unattended automation, open the bot process.
5. In the form header, select the down arrow in the **Start Process** button.
6. Select **Stop Process**.
7. **Optional:** To terminate the bot process gracefully, enable the **Graceful Stop** toggle switch.
8. Select the robot that is assigned to the current bot process that you want to stop.

   Note:
   Only the robots that are assigned to the current bot process and execute the same bot process are displayed.

9. Select **Stop Process**.

6. Select **Launch In Studio**.
7. Select one of the following options depending on whether you are on a remote or local machine.

Unassign an attended user or group from an attended bot process in RPA Hub

Unassign an attended user or a group from an attended bot process if the user is moving out of the business process.

Before you begin

Do this task only when you select the **Process Type** field as **Attended** on the Bot process configuration form, while creating a bot process. You can't perform this task unless you select that field. For more information, see Configuring a bot process record in RPA Hub, Bot process configuration form in RPA Hub, and Bot Process form in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open an attended bot process that you want to unassign an attended user or a group from.
5. On the **Attended Users/Groups** tab, do one of the following actions.

Invoke Embedded Task Automation via API

Invoke an attended bot process (attended automation) from the UI experiences by creating an action.

The limitation to trigger the attended bot process (attended automation) from other UI experiences such as playbook can be resolved by performing the following customisation. By

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

default, the UI action is created for classic or workspace experience to trigger the attended bot process (attended automation) when attended configuration is activated.

To create a UI action or edit an existing one, see Create a UI action.

In the corresponding action, verify that the action visibility is `new sn_rpa_fdn.RPAInstanceFormHooks().canTriggerAutomation(current,'<attended_cor`

Populate the `<attended_config_sys_id>` with the associated Attended Configuration Sys ID.

The following code must be added to the **Script** section of the corresponding Action form:

```
var rpaFormHooks = new
 GlideAjax('sn_rpa_fdn.RPAInstanceFormHooks');

rpaFormHooks.addParam('sysparm_name',
 'generateRuntimeLaunchUrl');

rpaFormHooks.addParam('attendedConfigId',
 '<attended_config_sys_id>');

rpaFormHooks.addParam('recordId', g_form.getUniqueValue());

rpaFormHooks.getXMLAnswer(function(response) {

var result = JSON.parse(response);

if (!result.error)

top.window.open(result.url);

});
```

Deactivate an attended configuration record in RPA Hub

Deactivate an attended configuration to move the record to inactive state.

Before you begin

Ensure you are familiar with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Create an attended configuration record. For more information, see Create an attended configuration record in RPA Hub.

Ensure that the RPA developer (sn_rpa_fdn.rpa_developer) is in the Managed by Group list of the associated bot process that is assigned to an Attended Configuration record.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, or sn_rpa_fdn.rpa_admin

About this task

Deactivating an attended configuration record moves the state from **Active** to **Inactive**, opens the form for editing, and the configuration disconnects from the associated ServiceNow form. The created UI action on the associated ServiceNow form will not be visible.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. Navigate to the Attended Configuration record either from the Attended Configuration menu list or from an attended bot process record's related list.
4. In the form header, select **Deactivate**.

Edit an attended configuration record in RPA Hub

Edit an existing attended configuration record in RPA Hub to modify a few details of the record.

Before you begin

Ensure you are familiar with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Create an attended configuration record. For more information, see Create an attended configuration record in RPA Hub.

Ensure that the attended configuration record is in **Active** state.

Ensure that the RPA developer (sn_rpa_fdn.rpa_developer) is in the Managed by Group list of the associated bot process that is assigned to an Attended Configuration record.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, or sn_rpa_fdn.rpa_admin

About this task

Editing an attended configuration record moves the state from **Active** to **Inactive**, opens the form for editing, and the configuration disconnects from the associated ServiceNow form.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. Navigate to the Attended Configuration record either from the Attended Configuration menu list or from an attended bot process record's related list.
4. In the form header, select **Edit**.
5. In the confirmation dialog box, select **Edit**.
6. Update the following fields as appropriate.
   Table, **Bot Process Configuration**, **Action Label** fields cannot be edited.
7. Select **Save**.

Delete an attended configuration record in RPA Hub

Delete an attended configuration record that you no longer need.

Before you begin

Ensure you are familiar with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Create an attended configuration record. For more information, see Create an attended configuration record in RPA Hub.

Ensure that the attended configuration record is either in **Draft** state or **Inactive** state.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

If you delete an attended configuration record, the associated mapping records and the UI Actions (if any) that are created for the ServiceNow form upon activation are also deleted. The created UI action on the associated ServiceNow form will not be visible.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. Navigate to the Attended Configuration record either from the Attended Configuration menu list or from an attended bot process record's related list.
4. In the form header, select **Delete**.

View a package version in RPA Hub

View a package version in RPA Hub so that it can be opened from the RPA Desktop Design Studio to build, debug, or modify the automation.

Before you begin

Create a package. For more information, see Create a package to assign to a bot process.

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_robot, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_assisted_user, or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Packages**.

View installed RPA Hub plugins

View a list of available RPA Hub plugins, the plugin versions, and dependency packs to verify the availability of a specific version that you want to install and use on the RPA Desktop Design Studio.

Before you begin

Role required: sn_rpa_fdn.rpa_release_manager, sn_rpa_fdn.rpa_business_user, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_robot, or sn_rpa_fdn.rpa_admin

About this task

Plugin is a software component that adds a specific feature for an interaction with third party applications such as Microsoft Office 365, Google Chrome, Windows, and so on.

These Plugins are automatically downloaded from via APIs and then used in the automation. They are downloaded as zip files which contain the required DLLs.

Robotic Process Automation (RPA) plugins are beneficial as they reduce the development efforts, error rates, and implementation time. These plugins extend the capability of the RPA product. For example, RPA Chrome Plugin enables the RPA application to automate tasks on the Google Chrome browser. Similarly, RPA Excel plugin enables RPA applications to interact with excel files.

View RPA Hub process jobs for all bot processes

View a list of execution logs for all bot processes.

Before you begin

Role required: sn_rpa_fdn.rpa_business_user, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_robot, or sn_rpa_fdn.rpa_admin

About this task

A process job represents the execution of a bot process by a robot.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Monitor**, select **Process Jobs**.
4. Open a process job to view the details.
   For more information, see Process job states in RPA Hub.
5. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

Related topics

View automation logs in RPA Hub

Automation logs is series of succession stages or a series of checkpoints that occur during the execution of a bot process. It enables monitoring and auditing the automation process. These logs are generated from the robot for unattended and attended bot processes.

Before you begin

Ensure that the **Track Automation Logs** check box on the Bot Process form is enabled. For more information, see Bot Process form in RPA Hub.

Ensure to use the log component in the associated automation and populate the required details in RPA Desktop Design Studio. For more information about the component, see Use the Log component.

Role required: sn_rpa_fdn.rpa_business_user, sn_rpa_fdn.rpa_support_user, sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_release_manager, or sn_rpa_fdn.rpa_admin

About this task

Automation logs help in tracking the execution state of robots ensuring that automation processes run smoothly. The detailed logs show each step completed by the robot and any errors encountered. Reports are generated in real-time.

For example, when a robot executes an Invoice Processing bot process, view the following messages in the **Message** field of an automation log:

- Bot started the invoice processing automation.
- Emails retrieved successfully.
- Invoice data extraction in progress.
- Invoice categorization initiated.
- Update to accounting system in progress.
- Invoice processed successfully.

The automation logs store up to 8,000 records that are latest. Every 5 minutes, older records beyond this limit are automatically deleted.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).

Delete a TOTP authenticator in RPA Hub

Delete a Time-based One-time Password (TOTP) authenticator record in RPA Hub so that you can dissociate it from a bot process.

Before you begin

Familiarize yourself with multi-factor authentication (MFA) concepts. For more information, see Multi-factor authentication.

Familiarize yourself with the TOTP authentication in RPA Hub. For more information, see TOTP authentication in RPA Hub.

Create a multi-factor authentication (MFA) authenticator record. For more information, see Create an MFA authenticator in RPA Hub.

Map a TOTP authenticator to a robot credential in RPA Hub. For more information, see Create a TOTP authenticator in RPA Hub.

Verify if the life-cycle stage status of the associated bot process is either set to **Build** or **In Maintenance**.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Credential Management**, select **Robot Credentials**.
4. Open the robot credential record that you want to dissociate the TOTP authenticator record from.
5. On the **TOTP Authenticators** tab, select the TOTP authenticator that you want to delete.
6. Select **Delete**.

Retire an MFA authenticator in RPA Hub

Retire an MFA authenticator in RPA Hub

Retire a multi-factor authentication (MFA) authenticator in RPA Hub so that you can turn off the authentication. After you retire an MFA authenticator, it can't be used again.

Before you begin

Familiarize yourself with multi-factor authentication (MFA) concepts. For more information, see Multi-factor authentication.

Familiarize yourself with the TOTP authentication in RPA Hub. For more information, see TOTP authentication in RPA Hub.

You must do this task in the classic environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an MFA authenticator record. For more information, see Create an MFA authenticator in RPA Hub.

Verify that the MFA authenticator record isn't associated to a bot process whose life-cycle stage status is **Build**, **Published**, or **Retired**. If it's not associated to one of those statuses, dissociate it to retire the MFA authenticator.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Administration** > **Authenticators**.
2. Open the MFA authenticator that you want to retire.
3. In the form header, select **Retire**.
4. In the Confirmation dialog box, select **Retire**.

Related topics

Retire an RPA Hub bot process

Retire an RPA Hub bot process

Retire a bot process to turn it off. It's one of the life-cycle stages of a bot process. After you retire a bot process, you can't use it anymore.

Before you begin

Create a bot process. For more information, see Configuring a bot process record in RPA Hub.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

If you are retiring an attended bot process that is enabled with Embedded Task Automation, then the following configurations are deleted:

- All the associated attended configurations.
- Corresponding buttons (UI actions) that are associated to the attended configuration on the related forms.

For more information, see Embedded Task Automation in RPA Hub.

If you are retire an unattended bot process, the associated credential groups and process robot credential mappings are removed.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process that you want to retire.
5. In the form header, select **Retire**.
6. In the Confirmation dialog box, select **Retire**.

Retire an RPA Hub package

Retire a package to turn it off. It is one of the life-cycle stages of a package. After you retire a package, it cannot be used further.

Before you begin

Create a package. For more information, see Create a package to assign to a bot process.

Verify that the package and associated package versions are not assigned to any other bot process.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

Warning:
When you retire a package, all the associated package versions are also retired automatically.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Packages**.
4. Open the package that you want to retire.
5. In the form header, select **Retire**.
6. In the Confirmation dialog box, select **Retire**.

Related topics

Retire a package version in RPA Hub

Retire a package version in RPA Hub

Retire a package version in RPA Hub so that the version can't be used again. After a package version is retired, it can’t be used again.

Before you begin

Create a package. For more information, see Create a package to assign to a bot process.

Verify that the package and associated package versions aren’t assigned to any non-retired bot process.

For a skill package version, verify that the version is not associated to any attended or unattended package versions or a bot process.

Role required: sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin

About this task

You can retire a package in two ways:

- Retire a package and all the associated package versions are also retired automatically. For more information about retiring a package, see Retire an RPA Hub package.
- Retire only the package version, by following the steps mentioned in this task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Packages**.
4. Open the package to retire the related package version.
5. In the form header, select **Retire**.
6. When you see the confirmation prompt, select **Retire**.

Retire an RPA Hub robot

Retire a robot to turn it off. It is one of the life-cycle stages of a robot. After you retire a robot, it cannot be used further.

Before you begin

Create a robot. For more information, see Creating a robot in RPA Hub.

Verify that the robot is not assigned to any bot process or robot pool.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

Retiring an attended robot removes the associated user from all the associated bot processes.

If the associated user is a part of a bot process in the assigned users, that record gets deleted.

If there are no attended assigned users or groups associated to an attended robot, the life cycle stage status of the associated bot process is moved from Publish to In-Maintenance.

You cannot retire an unattended robot if it is associated to an unattended bot process.

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Robots**.
4. Open the robot that you want to retire.
5. In the form header, select **Retire**.
6. In the Confirmation dialog box, select **Retire**.

Enable the client callable option on an RPA Hub flow or subflow

Enable a client script to trigger an RPA Hub flow or subflow.

Before you begin

You must do this task in the classic environment.

Make sure that you're familiar with the RPA Hub actions and subflow. For more information, see RPA Hub actions and subflow.

Invoke a flow or a subflow from Workflow Studio by using the InvokeFlow component or InvokeSubFlow component. For more information, see Use the InvokeFlow component and Use the InvokeSubFlow component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the flows, subflows, and actions can only be called by the FlowAPI within a server script. Flow and action designers can make individual flows, subflows, or actions available to client calls by enabling the Client callable option during design.

Consider the implications of making a flow or subflow client callable, such as whether it exposes protected data or bypasses validation logic.

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Open the flow or subflow that you want to make the client callable on.
3. In the More Actions menu, select **Manage security**.
4. Select **Callable by Client API**.
5. Add the RPA Flow Designer ACL record that you created earlier to the **ACLs** field.
6. Select **Update**.

Configure the system properties for an activity stream in RPA Hub

Configure the system properties for an activity stream of work queues, schedules, packages, process parameters, and shared parameters in RPA Hub. You can add or remove the fields that are captured in the work notes of an activity stream.

Before you begin
You must do this task in the classic environment.

Role required: admin

About this task
You can view work notes captured for few fields, that are configured by default.

Procedure

1. In the **All menu** filter, enter `sys_properties.LIST`.
2. In the search bar, search for the system properties that are listed in the following table.

System properties

System Property	Description	Existing Values (in .csv format)
sn_rpa_fdn.work_queue_work_note_fields	List of work queue fields that are captured in the work notes.	name,is_queue_item_name_unique,max_atte

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Property	Description	Existing Values (in .csv format)
sn_rpa_fdn.process_schedule_work_note_fields	List of process schedule fields that are captured in the work notes.	name,start_date,end_date,active,start_time,w
sn_rpa_fdn.package_work_note_fields	List of package fields that are captured in the work notes.	name
sn_rpa_fdn.process_parameter_work_note_fields	List of process parameters fields that are captured in the work notes for the shared parameters and process parameters.	name,value,is_sensitive

3. Select the system property that you want to modify.
4. On the System Property form, add or remove the values in the **Value** field.

   For example, to display the changes for the **Interval Type** field on the Schedule form, open the *sn_rpa_fdn.process_schedule_work_note_fields* system property, and then add the `interval_type` value in the **Value** field.

   Ensure that the values are added in the CSV (Comma-Separated Values) format in the **Value** field.

5. Select **Update**.

Configuring a bot process record in RPA Hub

Display an activity stream for bot processes and robots in RPA Hub

Configure the system property to display an activity stream for bot processes and robots in RPA Hub.

Before you begin

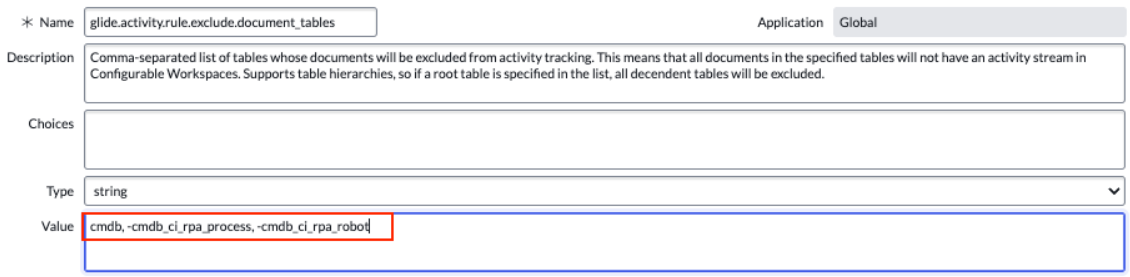
You must do this task in the classic environment.

Role required: admin

Procedure

1. In the **All menu** filter, enter `sys_properties.list`.
2. In the **Name** column, search for the *`glide.activity.rule.exclude.document_tables`* system property.
3. In the **Value** field, add the table names `-cmdb_ci_rpa_process` and `-cmdb_ci_rpa_robot` separated by a comma.
   Adding prefix (-) to the table name includes the documents of the table in the activity stream.

   Example

4. Select **Update**.

Verify the associated schedules, parameters, packages, and queues in RPA Hub

Verify that the bot process has the associated schedule, process parameters, shared parameters, package, package version, and work queues in RPA Hub. You do this task when you're migrating your data from a lower (non-production) environment to a higher (production) environment.

Before you begin

Role required: sn_rpa_fdn.rpa_release_manager or admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Open the bot process that you want to verify and select one or more of the following options.

5. To verify the queues, do the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the **Lists** tab, under **Build**, select **Queues**.

b. Open the queue that you want to verify.

c. On the **Bot Process Configuration** tab, verify the association.

6. To verify the shared parameters, do the following actions:

a. On the **Lists** tab, under **Build**, select **Shared Parameters**.

b. Open the shared parameter that you want to verify.

c. On the **Bot Process Configuration** tab, verify the association.

Mark the bot process as ready for migration

Mark the bot process as ready for migration in RPA Hub so that the bot process configuration and associated assets can be migrated to another environment. With this feature, you can create an automation and test it in a lower environment and then migrate it to a higher or production environment.

Before you begin

Familiarize yourself with the bot process migration concept. For more information, see Migrating the bot process configuration in RPA Hub.

Verify that you've completed the tasks that are related to setting up the target environment. For more information, see Set up the ServiceNow Remote Instance spoke.

Verify that the life-cycle stage status of the bot process in the source environment is set to **Published**. For more information, see Life-cycle stage statuses of a bot process in RPA Hub.

Verify that the Robotic Process Automation (RPA) developer (sn_rpa_fdn.rpa_developer) is in the Managed by Group list of the bot process.

Role required: sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Select the bot process that you want to mark as ready for migration.
5. In the form header, select **Ready for Migration**.
   You can't see the **Ready for Migration** button when the bot process migration is in progress.

Migrate the bot process configuration to another environment

Migrate the bot process configuration and associated assets to another environment in RPA Hub. With this feature, you can create an automation and test it in a lower environment and then migrate it to a higher or production environment.

Before you begin

Familiarize yourself with the bot process migration concept. For more information, see Migrating the bot process configuration in RPA Hub.

Verify that you've completed the tasks that are related to setting up the target environment. For more information, see Set up the ServiceNow Remote Instance spoke.

The bot process must be marked ready for migration. For more information, see Mark the bot process as ready for migration.

Verify that the life-cycle stage status of the bot process in the source environment is set to **Published**. For more information, see Life-cycle stage statuses of a bot process in RPA Hub.

When you re-migrate, verify that the life-cycle stage status of the bot process in the target environment isn't set to **Published** or **Retired**. If **Published**, the values are overridden in the target environment.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **RPA Hub Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **Bot Process**.
4. Select the bot process that you want to migrate.
5. In the form header, select **Migrate**.
   You can't see the **Migrate** button when the bot process migration is in progress.
6. In the Confirmation dialog box, select **Migrate**.

Result

After the migration is completed successfully or if an error occurs, an email notification is sent to the user who performs the migration. To receive the email notification, the email address of the user must be added to the user profile.

What to do next

- Associate a bot process to a bot process configuration record
- Configuring credentials in RPA Hub
- Adding details for your bot process in RPA Hub
- Publish an RPA Hub bot process

Convert existing unattended robots to high density robots

Run multiple unattended automations simultaneously on a single machine by batch converting one or more existing robots to high density robots using the **Actions on selected rows** option.

Before you begin

You must do this task in the classic environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Familiarise yourself with the high density robot concept in RPA Hub. For more information, see High density robots in RPA Hub.

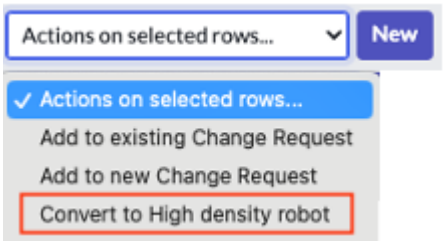
Only the unattended robots that are in **New** or **Disconnected** states and are not associated with any robot pool can be converted to high density robots.

When changing the robot type from high density robot to standard or vice-versa, you must reconnect the unattended robot to ensure seamless execution of automations.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

Procedure

1. Navigate to **All** > **Robotic Process Automation** > **Administration** > **Robots**.
2. Select one or more unattended robots from the list.
   The selected robots must be in **New** or **Disconnected** states and must not be associated with any robot pool.
3. From the **Actions on selected rows** drop-down menu, select **Convert to High density robots**.



4. In the **Machine Name** field, enter the computer name of the physical or virtual machine that supports multiple user sessions and on which the Unattended Robot application is installed.
5. In the **Screen Resolution** field, select the screen resolution for the user sessions used by the high density robots.

Result

The unattended robots are converted to high density robots with the state set to **New**.

RPA Hub reference

Reference topics provide additional information about the lists and forms that you use to configure and administer RPA Hub.

Components installed with RPA Hub

Several types of components are installed with the activation of the RPA Hub plugin, including tables, user roles, and scheduled jobs.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this plugin.

Roles installed

Note:
RPA role requires access to the cmdb_rel_ci table. If there are any customizations to the cmdb_rel_ci ACLs, provide the relevant read access role to the following RPA roles.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
RPA admin [sn_rpa_fdn.rpa_admin]	Sets up RPA Hub application configurations and manages RPA Hub system property settings in various environments.	• fd_read • itil • sn_rpa_fdn.rpa_user • cmdb_read • sn_nowassist_admin.user
RPA assisted user [sn_rpa_fdn.rpa_assisted_user] **Note:** Assisted user is attended user.	Executes attended automations.	None
RPA business user [sn_rpa_fdn.rpa_business_user]	Manages data like work items, credentials, and so on. Extracts reports.	• sn_rpa_fdn.rpa_user • cmdb_read
RPA developer [sn_rpa_fdn.rpa_developer]	Builds automation packages, tests the automation projects, and handles exceptions in the RPA Desktop Design Studio. Publishes packages to RPA Hub. Creates and deploys automations in a low-code environment.	• fd_read • sn_rpa_fdn.rpa_user • cmdb_read • sn_nowassist_admin.user
RPA elevated privileges [sn_rpa_fdn.rpa_elevated_privileges]	Users with this role and along with other roles (RPA developer, RPA support user, or RPA admin) can access sensitive logs that are captured in Process Execution Log table.	None
RPA release manager [sn_rpa_fdn.rpa_release_manager]	Manages data, schedules, and other configuration parameters.	• itil • sn_rpa_fdn.rpa_user • cmdb_read
RPA robot [sn_rpa_fdn.rpa_robot]	Role that is assigned to a service account for the unattended robot	cmdb_read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
	to successfully execute automations.	
RPA support user [sn_rpa_fdn.rpa_support_user]	Identifies, diagnoses, and resolves the issues that are related to bot processes. Performs first-level troubleshooting.	• sn_rpa_fdn.rpa_user • cmdb_read
RPA user [sn_rpa_fdn.rpa_user]	Qualifier role that is required for users to access to RPA Hub.	• canvas_user • sn_change_read • fd_read • uxframework_user

Scheduled jobs installed

Scheduled job	Description
Machine Lookup value change	Validates the values in the **Machine Name Lookup** field and **Machine Name** field. If the value is different, the schedule job updates the **Machine Name** (String field) with the value of the **Machine Name Lookup** field. Schedule runs every 3 hours and runs only when the *sn_rpa_fdn.enable_unattended_robot_machine_name_lookup* system property is set to **Yes**. When the schedule job updates the **Machine Name** field, the life cycle stage status of the robot is moved to **In Maintenance**.
RPA: Purge Process Jobs	Schedule runs every day to purge process jobs and associated execution logs that are based on the information from a job's purging days and created date.
RPA: Purge Work Items	Schedule runs every day to purge queue items that are based on a queue's purge after days and the purge status. Purge after days is the number of days after which the work items get purged based on the created date.
RPA: Purge Alert Rule Triggers	Schedule runs every day to purge alert rule trigger records.
RPA: Purge Alerts	Schedule runs every day to purge alerts.
Re-evaluate License Distribution	Schedule runs on demand to validate the distribution of license records. For more information, see Execute RPA scripts to re-evaluate license distribution.

Tables installed

Table	Description	Extends
Alerts [sn_rpa_fdn_alert]	Contains the alerts that are generated from the alert rules and the information about the alert message, the associated alert rule name, and the trigger type.	
Alert Rule [sn_rpa_fdn_alert_rule]	Contains the rules that are defined for the alerts to be generated and the information about the type and priority of the alert rule, the alert trigger, and the alert message.	Application file
Application Credentials [sn_rpa_fdn_application_credentials]	Contains the user name and password of business application used by the bot process at the time of execution on a robot.	Credentials
Attended Configuration [sn_rpa_fdn_attended_configuration]	Contains the details like the associated bot process name, table, action label, and conditions to trigger the attended bot process (automation) from the corresponding ServiceNow form.	Application file
Attended User Group [sn_rpa_fdn_rda_user_group]	Contains the details like the associated bot process name, the assigned user for the attended bot process, and the assigned group for the selected assigned user.	
Authorized User [sn_rpa_fdn_authorized_user]	Contains details of mapping between process credential mapping and an authorized user who can access the associated credential group.	
Automation Log sn_rpa_fdn_automation_log	Contains the live log and give real-time visibility of the status of the running process jobs.	
Assigned Studio User sn_rpa_fdn_assigned_studio_user	Defines if a robot is available for impersonation in RPA Desktop Design Studio for an assigned user.	

© 2026 ServiceNow, Inc. All rights reserved.

Table	Description	Extends
	RPA release manager and RPA admin can create this record and add assigned user.	
Bot Process Configuration [sn_rpa_fdn_bot_process_config]	Contains the bot process settings.	Application file
Bot Process [cmdb_ci_rpa_process]	Contains the configuration details of a process that runs on a robot. Details include the package, package version, assigned robots, process credential mappings, process robot credential sets, assigned business applications, process parameters, and attended users or groups.	Base Bot Process
Credential Group [sn_rpa_fdn_credential_group]	Contains details like the credential group name and the associated robot credentials.	
Credential Group Application Credential [sn_rpa_fdn_m2m_credential_group_application]	Contains details like the credential group and the associated application credentials.	
Code Quality Rule [sn_rpa_fdn_code_quality_rule]	Contains the details of compliance rules for code quality check feature.	
External Credential Vault [sn_rpa_fdn_external_credential_vault]	Contains the details that enable you to register your external credential vault for further usage by the unattended robot.	
Field Parameter Mapping [sn_rpa_fdn_field_parameter_mapping]	Contains the details that enable you to map ServiceNow form fields of the associated attended configuration table to the process field parameters used in the attended automations.	Application file
Installed RPA Plugin [sn_rpa_fdn_rpa_plugin]	Contains the details of the plugins that are available on the instance which can be used with RPA Desktop Design Studio, Attended Robot, and Unattended Robot.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Table	Description	Extends
Installed RPA Plugin Version [sn_rpa_fdn_rpa_plugin_version]	Contains the details of the different versions that are available for the installed RPA plugins.	
Maintenance Request [sn_rpa_fdn_maintenance_request]	Contains the details that tracks the status of the scheduled maintenance days on the robot calendar.	
MFA Authenticator [sn_rpa_fdn_mfa_authenticator]	Contains the details of the authenticator and token length that acts as an enabler for the Time-based One-time Password (TOTP) authentication.	
Package [sn_rpa_fdn_package]	Contains a set of resource files that include the robot files required for an automation execution.	Application file
Package Version [sn_rpa_fdn_package_version]	Contains the version details of a package.	Application file
Process Credential Mapping [sn_rpa_fdn_process_credential_mapping]	Contains details of a credential group and associated bot process.	
Process Execution Log [sn_rpa_fdn_execution_log]	Contains the execution type and associated process job details.	
Process Job [sn_rpa_fdn_process_job]	Contains the details of the execution of a process on a robot. Details include the process job name, the state of the process job, the associated bot process name, the assigned robot of the bot process, the execution log status, the start and end time, and the date of the process job.	
Process Field Parameter [sn_rpa_fdn_process_field_parameter]	Contains the details that enable you to create dynamic parameters that are required in the attended automations.	Application file
Process Parameter [sn_rpa_fdn_process_parameter]	Contains the details of the variables that are used within a bot process and across bot processes.	Application file
Process Robot Credential	Contains the details of a credential group that a

Table	Description	Extends
[sn_rpa_fdn_process_robot_cred]	robot uses to perform the automation for the given bot process.	
Process Schedule [sn_rpa_fdn_schedule]	Contains the details that enable users to execute jobs in a planned manner at regular intervals. Details include the name and interval type of the schedule and the start and end date of the schedule.	Application file
Process Skill Mapping [sn_rpa_fdn_m2m_process_skill_mapping]	Contains details about mapped package version and overridden version of the skill package for a bot process configuration.	
Robot [cmdb_ci_rpa_robot]	Contains the details of a software agent that runs a bot process that is built in the RPA Desktop Design Studio. Details include the name, type, and department of the robot, the machine name that is used to install the Unattended Robot, and the attended user.	Base Robot
Robot Credentials [sn_rpa_fdn_credentials_set]	Contains the login credentials that the robot uses to log in to a Windows machine and perform the automation.	Credentials
Robots License Distribution [sn_rpa_fdn_license_distribution]	Contains the details of consumption and distribution of licenses in your organization.	
Robots Pool [sn_rpa_fdn_robot_pool]	Contains the details of the number of robots selected for robot pool option.	
Skill Mapping [sn_rpa_fdn_m2m_package_version_skill_mapping]	Contains attended and unattended package version and associated skill package version details.	
TOTP Authenticator [sn_rpa_fdn_totp_authenticator]	Contains the details of MFA authenticator and seed which is the secret key of the authenticator that is used to generate the TOTP.	
Work Queue	Contains the details of a repository that can	Application file

Table	Description	Extends
[sn_rpa_fdn_work_queue]	hold a number of work items. Details include the name, department, and description of the work queue, and purge-work item details.	
Work Item [sn_rpa_fdn_work_queue_item]	Contains the details about the multiple types of data that are stored, such as the transaction information, the customer details, or the information from a document. Details include the name, status, and priority of the work item, and associated work queue name.	

RPA Hub actions and subflow

Two-way integration of actions and subflows in Workflow Studio and RPA Hub for a seamless robot execution.

Flows and actions overview

The flows and actions are built using ServiceNow Workflow Studio, so make sure you're familiar with the Building actions in Workflow Studio and Building subflows in Workflow Studio basics.

Invoke flows or subflow

Invoke the flow or subflow via RPA Desktop Design Studio, Unattended Robot, or Attended Robot. For more information, see the topics listed in Flow Designer components.

Enable the client callable option for a flow or subflow

Enable a client script to trigger an RPA Hub flow or subflow. For more information, see Enable the client callable option on an RPA Hub flow or subflow.

RPA Hub actions

The following table shows the detailed descriptions, action inputs, and action outputs of RPA Hub actions.

RPA actions

Action	Description	Action inputs	Action outputs
Add WorkItem to Queue Action	Adds WorkItem in a specified queue in the RPA Hub application and returns the WorkItem ID.	• **Queue Name**: Record • **Name**: String • **Content**: String • **Type**: String • **Priority**: String.Choice	• **Action Status**: Object • **WorkItemID**: GUID • **IsNameExists**: Boolean • **status**: String • **message**: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RPA actions (continued)

Action	Description	Action inputs	Action outputs
		• **Stage**: String • **SLA**: Date/Time The maximum limit for **Content** field (Request Content and Response Content) is 8000 characters. If the **Is Work Item Name Sensitive** check box on the associated work queue form is selected, the data in the **Request Content** field is encrypted. Sensitive data with encryption is stored in the work item, so that it can be passed to the RPA Desktop Design Studio or robots.	
Assign User to Attended Automation Process Action	Assigns a user to the attended automation process.	• **Process Name**: Record • **Username**: Record	• **Action Status**: Object • **status**: String • **Message**: String
Assign User to Attended Robot Action	Assigns a user to the attended robot.	**Username**: Record	• **Action Status**: Object • **status**: String • **Message**: String
Change Life Cycle Stage Status of a Bot Process Action	Changes the life cycle stage status of a bot process that is not retired. If a bot process is in **Build** life cycle stage status, if you have the required role, you can update it to **Published** state, but you cannot update it to **In Maintenance**. If a bot process is in **Published** life cycle stage status,	• **Process name**: Record • **Life cycle stage status**: Choice	• **result**: String • **message**: String • **Action Status**: Object

Domain separation and Robotic Process Automation (RPA) Hub

Domain separation is supported for RPA Hub. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation overview

The goal of RPA Hub is to enable end-to-end automation for your organization. Domain separation is enabled in all the features.

You should have either a flat hierarchy or a single-tier hierarchy and at least one primary or top-level domain.

Related topics

Domain separation for service providers

Alerts form in RPA Hub

Use the Alerts form to view the notifications that are generated by the alert rules.

Alerts form

Field	Description
Number	Number of the alert.
Alert Type	Type of alert: • **Info** • **Warning** • **Error**
Source Record	Name of the bot process.
Alert Rule	Name of the alert rule.
Alert Priority	Priority of the alert: • **Critical** • **High**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts form (continued)

Field	Description
	• **Medium** • **Low**
Alert Message	Message that describes the alert.

Related topics

View alerts in RPA Hub

Alert rule form in RPA Hub

Use the Alert rule form to create an alert rule.

Alert rule form

Field	Description
Name	Unique name of the alert rule.
Active	Option to verify the usability of the alert rule. On clearing this option, the notifications will not be generated from this alert rule.
Application	Field that indicates which applications can use this alert rule. Role required to view this field: admin.
Alert Priority	Priority of the alert: • **Critical** • **High** • **Medium** • **Low** The default value is set to **Medium**.
Alert Type	Type of alert: • **Info** • **Warning** • **Error**
Description	Brief description of the alert rule.
Alert Trigger	
Applies To	Table that the alert rule is applied on. For example, Bot Process [cmdb_ci_rpa_process].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert rule form (continued)

Field	Description
	Based on the table selected, after saving the record, a new related tab appears in the related list. For example, if you select a bot process related table in this field, the **Bot process** tab appears in the related list.
Trigger Type	Trigger type of the alert rule: • **Check Periodically**: The alert rule is triggered periodically, based on the settings in the Time duration (hours) list. • **When something happens**: The alert rule is triggered when something happens on a record that is selected in the Applies to table. For example, if **Bot process** is selected from the Applies To list, an alert rule is triggered when a record is updated in the bot process.
Time Duration (hours)	Frequency, in hours, at which the alert rule is triggered. For example, if **Bot process** is selected from the Applies To list, an alert rule is triggered when a record is updated in the bot process every **24** hours. This field appears only when **Check Periodically** is selected from the Trigger Type list.
Trigger Conditions	Conditions at which the alerts are triggered. Select a table from the Applies To list before modifying this field. Within the **Trigger Conditions** section, you can use the **Add Filter Condition** to add a trigger condition. For example, you might want to generate an alert rule when the life-cycle stage status of a bot process is not retired. In that case, select **Life Cycle Stage Status** from the – choose field – list, **is not** from the – oper – list, and **Retired** from the – value – list. **Selected filter condition to trigger alert rule**
Apply Threshold	Option to verify the usability of the threshold.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert rule form (continued)

Field	Description
	For example, if a **Process job** is selected from the Applies To list and a percentage or a number of process jobs fail in a given time period, to trigger an alert rule for the failure message, this option must be selected for the configuration of the threshold condition.
Threshold Type	Type of threshold: • **Count** • **Percentage** This field appears only when the **Apply Threshold** option is selected.
Set Condition (Threshold)	Threshold conditions to trigger alerts. Select a table from the Applies To list before modifying this field. This field appears only when **Percentage** is selected from the Threshold Type list. For example, you might want to generate an alert rule when a percentage of process jobs fail in a given time period. In that case, select **Created** in the – choose field – list, **on** in the – oper – list, and **Today** in the – value – list. **Set threshold condition to trigger alerts**
Comparison	Qualifier to trigger alerts: • **Is equal to** • **Is less than** • **Is more than** • **Is less than or equal to** • **Is more than or equal to** This field appears only when the **Apply Threshold** option is selected.
Threshold Value	Value to determine if an alert rule must be triggered based on the qualifier selected in the **Comparison** field. For example, if a few process jobs fail in a day. To set a condition, select **Count** in the Threshold Type list, **Is more than** in the

Alert rule form (continued)

Field	Description
	Comparison list, and **10** in the Threshold Value list. This field appears only when the **Apply Threshold** option is selected.
Alert Message	
Message	Alert message. For example, `{0}% of process jobs failed in a day.` To configure the variables, such as {0}, see Create an alert variable for an alert rule in RPA Hub.
Send Email	Option to send an email notification of the alert message.
Users	Users who can receive the alert message email. This field appears only when you select the **Send Email** option.
Groups	Groups who can receive the alert message email. This field appears only when you select the **Send Email** option.

Related topics

Alert variable form in RPA Hub

Use the Alert variable form to create a variable for an alert rule message configuration.

Alert variable form

Field	Description
Variable Name	Name of the alert variable.
Alert Rule	Name of the alert rule.
Index	Order of the alert variables in the message. Default sort order for alert variables is ascending order.
Is Scripted	Option to verify the usability of the script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert variable form (continued)

Field	Description
	This option adds an advanced data fetch script.
Is Threshold value	Option to verify the usability of the threshold value.
Table	Field that indicates the table that is selected for this alert variable. For example, the bot process.
Field	Field of the table to be mapped. For example, the name of the bot process.
Script	Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting. For example, to return a value that is data for an alert variable, enter `data` as follows: `return { value: data};` . This field appears when the **Is Scripted** option is selected.

Attended Configuration form in RPA Hub

Use the Attended Configurations form to associate the table form, from where the automation must be initiated, associate the respective attended bot process, and other related conditions.

Attended Configuration form

Field	Description
Name	Name of the attended configuration.
Bot Process Configuration	Select an attended bot process that executes the automation. Attended bot processes that aren't retired and also have the **Enable Embedded Task Automation** option selected in the bot process form are displayed here.
Table	Select the table for the form, from where the automation (bot process) is triggered on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attended Configuration form (continued)

Field	Description
	For example, Request [sc_request]. Then the automation (bot process) is triggered from the Request form.
Action Label	Provide a label for the action (UI button) that the users would view on the associated table form. The value you entered in the **Name** field is the default value. The Action Label must be unique for a table, in a particular domain, if the instance is domain separated.
Description	Brief description of the attended configuration.
Define Trigger Provide the criteria details that activate the action (UI button) on the associated table form that triggers bot process only when the following conditions are met. If criteria are not defined, automation can be triggered from all associated table forms.	
Set Conditions	Define the criteria that activate the UI action on the associated table form that is selected in the **Table** field. Build a filter by adding conditions that contain a field, operator, and values. For example, to view the UI action when the associated form is active. In that case, select **Active** from the **Select field** list, **is** from the **Select operator** list, and **true** from the **Enter value** list. Within the **Condition** section, you can use the **+New condition set** to add a new condition. After you build a filter, select **Set**. **Example: Selected filter condition to activate the UI action**

Automation Logs form in RPA Hub

Use the Automation Logs form to view a list of the automation logs captured for a bot process.

Automation logs overview

Automation logs help in tracking the execution state of robots ensuring that automation processes run smoothly. The detailed logs show each step completed by the robot and any errors encountered. Reports are generated in real-time.

Automation Log form

Field	Description
Log Level	Type of log level: • Error • Exception • Info • Warning
Sequence Number	Auto generated number as per the order of the automation log record, created during the current process job execution across all process jobs. For example, an automation log created for process job PJ1 is 1 and the automation log created for process job PJ2 is 2.
Message	Message from the automation logs.
Created	Date and time at which the automation log record is created in RPA Hub.
Process Job	Associated Process Job number.

Bot process configuration form in RPA Hub

Use the Bot Process Configuration form to define the preliminary fields for a bot process record.

Bot Process Configuration form

Field	Description
Name	Unique name of the bot process configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bot Process Configuration form (continued)

Field	Description
	The name of the bot process configuration is reused for the bot process that is associated with this configuration record.
Process Type	Type of the bot process: • **Unattended**: Automations that don't require any human intervention. • **Attended**: Automations that require human intervention.
Order	Execution priority of the bot process: • **1**: Highest priority • **999999**: Least priority The default value is set to 1. RPA business user can view this field. This field appears only when **Unattended** is selected from the **Process Type** field.
Package	Associated package of the bot process. For an unattended bot process, associate an unattended type package. For an attended bot process, associate an attended type package. Only published packages can be associated.
Package Version	Version of the active package in use. Only published package versions can be associated. Ensure that the version belongs to the populated package.
Application	Application that contains this record. This field is auto-generated. Role required to view this field: admin.
Run Time Threshold (mins)	Expected duration for the bot process to run. The default value is 60 minutes. RPA business user can view this field. This field appears only when **Unattended** is selected from the **Process Type** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bot Process Configuration form (continued)

Field	Description
	This is a required field.
Job Purging (days)	Number of days after which the job data is deleted.
Description	Description of the bot process.

Bot Process form in RPA Hub

Use the Bot Process form to associate it to the bot process configuration and populate the remaining fields required for a bot process.

Bot process form

Field	Description
Bot Process	
Name	Unique name of the bot process.
Process Type	Type of the bot process: • **Unattended**: Automations that don't require any human intervention. • **Attended**: Automations that require human intervention.
Bot Process Configuration	[Auto-generated] Associated bot process configuration of the bot process.
Order	Priority order of execution for the bot process. • **1**: Highest priority • **999999**: Least priority If more than one unattended bot process is scheduled to start at the same time, the one with the highest priority runs, and the others are marked as **Skipped**. If multiple bot processes have the same priority and schedule, one bot process is chosen at random to run.For more information, see Execution priority of bot processes in RPA Hub. The default value is set to `1`. RPA business user can view this field. This field appears only when **Unattended** is selected from the **Process Type** field.
Package	Associated package of the bot process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bot process form (continued)

Field	Description
	For an unattended bot process, associate an unattended type package. For an attended bot process, associate an attended type package. Only published packages can be associated.
Package Version	Version of the active package in use. Only published package versions can be associated.
Life Cycle Stage Status	[Auto-generated] Life cycle stage status of bot process configuration.
Run Time Threshold (mins)	Expected duration for the bot process to run. The default value is 60 minutes. This field appears only when **Unattended** is selected from the **Process Type** field. RPA business user can view this field. This field is required.
Job Purging (days)	Number of days after which the job data is deleted.
Managed by	IT owner of the business process. This field appears only for an existing record. Roles required to edit this field: RPA release manager and RPA admin.
Owned by	Business user who is part of the managed by a group and is responsible for the business process. This field appears only for an existing record. This field depends on what you entered in the **Managed By Group** field. If an entry in the **Managed By Group** field is populated, then only those users who are a part of the **Managed By Group** field and have an RPA business user role can be added to the **Owned By** field. If the **Managed by Group** field is empty, then the **Owned By** field is read-only. Roles required to edit this field: RPA release manager and RPA admin.
Enable Embedded Task Automation	Option to trigger the attended bot process (automation) from the associated ServiceNow form that is mapped in the attended configuration record. For more information about the attended configuration record, see Attended Configuration form in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bot process form (continued)

Field	Description
	On enabling the **Embedded Task Automation** check box, two additional tabs, **Process Field Parameters** and **Attended Configuration**, are displayed on the bot process form. For more information about Embedded Task Automation, see Embedded Task Automation in RPA Hub.
Description	Description of the bot process.
Session Settings	
Keep Monitor Active	Option to keep the monitor active of the machine where the robot is running the bot process. This field appears only when **Unattended** is selected from the **Process Type** field.
Auto Session Restore	Option to restore the state of the robot to the initial stage before the automation is executed. This field appears only when **Unattended** is selected from the **Process Type** field.
Force Start	Option to force start a bot process on a robot to override any other bot process already running on it. If the **Force Start** option is enabled for a bot process P1 and if bot process P2 is running on the same robot, P2 stops and P1 executes. Then, the process job of P2 moves to **Canceled** state. The **Force Start** option does not override the **Order** field. The **Force Start** option is applicable for the existing running bot processes and is not applicable for the bot processes that are yet to be launched. This field appears only when **Unattended** is selected from the **Process Type** field.
Enable Desktop In Desktop	Option to enable attended automation to run in Desktop In Desktop window. This option creates a new session on the same machine and the automation can be executed on this session without interrupting actual manual work on the main session. On enabling this option, the **End Desktop In Desktop on Complete** check box is also selected. This field appears only when **Attended** is selected from the **Process Type** field.
End Desktop In Desktop on Complete	Option to close the Desktop In Desktop window after the bot process execution is completed. This option is automatically selected when you select **Enable Desktop In Desktop**. To leave the Desktop In Desktop window open after the bot process completes, clear the check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bot process form (continued)

Field	Description
	This field appears only when **Attended** is selected from the **Process Type** field.
Screen Resolution	Screen resolution for the Desktop In Desktop window. This field appears only when **Attended** is selected from the **Process Type** field.
Log Settings	
Track Execution Logs	Option to enable the tracking of process execution logs. After you enable this check box, the logs are captured when an automation is executed by either an attended or an unattended robot. These logs help in understanding the errors and the end-to-end logging of automation execution. If process jobs are purged, then the corresponding execution logs are purged. By using the Attach feature in RPA Desktop Design Studio, these execution logs can be used to replay the automation to understand where the automation has failed. For example, at which component the automation has failed or details of the inputs passed to that component. **Note:** The **Attach** feature doesn't support Flat file output type.
Synchronize Execution Logs (seconds)	Frequency, in seconds, for execution logs to synchronize. This field appears only when the **Track Execution Logs** option is selected. If you select **Robot Machine** in the **Storage** field, then this field is hidden.
Storage	**Note:** This field appears only when the **Track Execution Logs** option is selected. Storage location options for the execution logs: • **Instance**: Only error information is logged in the execution log, on the instance. If you select **Instance**, then the value for the **Log Level** field is set to Error and it can't be edited. • **Robot Machine**: The log files are stored in the robot machine where the automation is executed. If you select **Robot Machine**, then you can view two options to select from the **Log Level** field - **Error** or **Verbose**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bot process form (continued)

Field	Description
	To view the end-to-end execution logs of all the components, select **Robot Machine** from the **Storage** field and then select **Verbose** from the **Log Level** field. For optimum utilization of disk space in the robot machine, the existing logs are purged, based on the *sn_rpa_fdn.purge_client_logs* system property setting. If you select **Robot Machine**, then • **Synchronize Execution Logs** field is hidden. • The execution logs are stored in the machine on which the attended or unattended robot is installed.
Output Type	Output type of the execution log file. This log file is generated during the robot execution on the machine. There are two types of output: • **DB File**: Default value. It's a lite database file that stores the process job metadata and the process automation execution details. After the process job completion, you can attach the DB file using the **Attach** option in the RPA Desktop Design Studio project to replay the automation on the design surface. • **Flat File**: It's a file format that stores the process job metadata and the process automation execution details in plain text. It stores the execution data in a JSON format. This **Output Type** field appears when the **Track Execution Logs** option is selected and when the **Robot Machine** is selected from the **Storage** field. If a bot process, with Flat File as the Output Type, is triggered, then the execution log file is added to the process job folder in .txt format in the given locations. Similarly, for DB output type you will view .db format in the given locations. The location of both the flat files and the DB files is in the machine on which the attended or unattended robot is installed. • During execution: `Users\<Userprofile>\ServiceNow RPA Logs\.executionlogs\{InstanceName}\{ProcessJob number}`. For example, `Users\john.smith\ServiceNow RPA Logs\.executionlogs\{InstanceName}\PJB0001165`. • After execution is complete: `Users\<Userprofile>\ServiceNow RPA Logs\.executionlogs\{InstanceName}\.archive\{ProcessJob number}`. For example: `Users\john.smith\ServiceNow RPA Logs\.executionlogs\{InstanceName}\.archive\PJB0001165`.

Bot process form (continued)

Field	Description
	The content in the flat files is in JSON format. The following image gives the content structure. When you choose the **Flat File** option to store the execution logs, two flat files are generated and stored in the locations given. • `ExecutionJobMetadata.txt`: Contains information on the process job such as the Process ID, Robot ID, and the log level. The image shows the structure of the content in the file. **Structure of content in Flat File** • File name in the format `ddMMMyyyy HHmmss.txt` (For example, `28Dec2023 125036.txt`): Contains the execution log entries. For example, the file gives the name of the Activity, component execution start and end time, duration, and the result in boolean, if applicable. The flat files follow the rules on data purging set in the *`sn_rpa_fdn.purge_client_logs`* system property. For more information about the system property, see Configure RPA Hub properties. **Important:** In RPA Desktop Design Studio, if you mark one or more input or output ports of one or more components or methods in an automation as **Mark Data as Sensitive**, the flat file does not log the execution data of its corresponding process job. Instead, in the JSON file the data corresponding to the port appears as **SENSITIVE**. The following image gives an example. **Port indicated as sensitive** For more information about marking an input or output port as **Mark Data as Sensitive**, see Configure port properties Since the actual data for the execution logs contain abundant data, the required data is only preserved. The content in text file is JSON type. To modify the value of this field for an existing bot process, ensure that the associated bot process is **In Maintenance** state.
Log Level	Select a log level to capture: • **Error**- Only error information is stored during automation execution. • **Verbose**- Error information and end-to-end component execution logs, such as inputs and outputs and execution steps with timestamps are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bot process form (continued)

Field	Description
	stored during automation execution. When you select **Verbose**, the flat files record details of the execution of all components in the automation. If the size of the flat file exceeds 10 MB while the process job executes, the flat file continues to split into multiple flat files with the log sequence appended in the file-naming convention until it executes the complete automation. The naming conventions of such files are `<timestamp>_<LogSequence>`. This option appears only when Robot machine is selected as storage type. This field appears only when the **Track Execution Logs** option is selected.
Track Automation Logs	Track automation logs that are generated by the robot. The robot logs the automation execution in automation logs. The logs help the RPA users to track the automation progress. For more information about viewing the automation logs, see View automation logs in RPA Hub. To view automation logs of a bot process, in RPA Desktop Design Studio, use the Log component in the associated automation and populate the required details. For more information about the Log component, see Use the Log component.
Access	
Managed by Group	Group that can access the bot process.
Robot Pool Roles required to edit this field: RPA release manager and RPA admin. If an RPA developer and RPA support user are a part of the Managed by Group, then they can view and edit these fields. RPA business user can view these fields.	
Enable Robot Pool	Option to enable the robot pool for the bot process. On enabling this option, the **Assign Robots** tab on the bot process is hidden. For more information about robot pool, see Robot pool in RPA Hub.
Robot Pool	Robots that you can allocate dynamically from a selected robot pool. Select a robot pool from a list of existing robot pool names. This field appears only when the **Enable Robot Pool** option is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bot process form (continued)

Field	Description
Allocation Type	Robots that you can allocate based on the Service Level Agreement (SLA) of the work items or the percentage of efficiency gain. Select the allocation type: • **SLA Based**: Allocation of robots from the pool based on the SLA of the work item. The work items are sorted and prioritized based on the SLA. If you select the allocation type as SLA Based, ensure that the work items must contain a Service Level Agreement (SLA). • **Percentage Reduction**: Allocation of robots from the pool based on the efficiency percentage. The default value is SLA Based. This field appears only when **Enable Robot Pool** option is selected.
Percentage Reduction	This field appears only when **Percentage Reduction** is selected from the **Allocation Type** field. Reduce the total execution time of a bot process by allocating more robots by a selected percentage. For example, if there are 100 work items assigned to a bot process. It might take 100 minutes to execute the bot process. If you want to reduce that time to 75 minutes, you define a value 25 in this field. After you provide a value in this field, multiple robots are allocated to distribute the work load. Thus, the automation performs faster by that percentage. The default value is 25. Robots are allocated to distribute the workload, based on the percentage you select: • If you select a value from 5 to 50, 2 robots are allocated. • If you select 55, 60, or 65, 3 robots are allocated. • If you select 70 or 75, 4 robots are allocated. • If you select 80, 6 robots are allocated. • If you select 85, 7 robots are allocated.
Compose	
Work notes (Private)	Work notes for the bot process. View the changes executed on the associated package, package version, process parameter, shared parameter, queue, and schedule.
Additional Comments	Additional comments that are related to the bot process.

Code quality rule form in RPA Hub

Use the Code quality rule form to view a rule along with description and type.

Code quality rule form

Name of the rule	Description
Code	Unique number of the rule.
Name	Short description of the rule.
Type	Type of the rule. • Regular Expression • Integer • None
Active	Sets the rule as active or inactive. On clearing this option, the **Code Quality Check** feature in RPA Desktop Design Studio will not consider this rule while inspecting an automation or an activity for a code quality check.
Severity	Severity type of the rule. • Error • Warning • Information
Regular Expression	Expression to define naming conventions. This field appears only when the type is **Regular Expression**.
Value	Value based on the type of the rule and description.

Code quality rules list in RPA Hub

View a list of pre-defined rules that RPA admins can set for the RPA developers to follow as a code quality standard.

Code quality rule list

	Name of the rule	Description
CQR0011	Activity naming convention	Inspects if the activities naming convention is as per the defined Regular expression.
CQR0002	Empty activities	Inspects if there are any empty activities in the automation.
CQR0005	Hard-coded passwords	Inspects if there are any hard-coded passwords in the automation.
CQR0009	Infinite loop	Inspects the possibility of an infinite loop sequence in the automation.
CQR0012	Nested activities	Inspects if the depth of nested activities is as per the defined value. Activities are nested when you add another activity within the activity. For example, if 'Activity A' calling 'Activity B', 'Activity B' calling 'Activity C', and so on.
CQR0006	Startup activity	Inspects if an activity is marked as the start activity for the automation.
CQR0001	Try Catch - Exception handling	Inspects if the 'On Error' and 'Error Message' output ports of the Try Catch component are not used in the automation.
CQR0003	Unreferenced activities	Inspects if there are any activities that are not referenced in the automation.
CQR0004	Unused components	Inspects if there are any components that are not referenced in the automation.

Installed RPA plugins form

Use the installed RPA plugins form to view a list of available RPA Hub plugins, the plugin versions, and dependency packs to verify the availability of a specific version that you want to install and use on the RPA Desktop Design Studio.

Installed RPA plugins form

Field	Description
Name	Name of the installed RPA plugin.
Latest Installed Version	Latest version of the installed RPA plugin.
Available to Project Type	Type of the installed RPA plugin.
Author	Author of the installed RPA plugin.
Install Order	Order of the installation of the installed RPA plugin.
Load Default	Option if the installed RPA plugin is loaded by default.
Obsolete	Option if the installed RPA plugin is supported.
Demised	Option if the installed RPA plugin is not available.
Visible	Option if the installed RPA plugin is visible.
Mandatory	Option if the installed RPA plugin is required.
Description	Description of the installed RPA plugin.

Life-cycle stage statuses of a bot process in RPA Hub

The State transition of a bot process guides you through the stages of its life cycle.

Bot process life-cycle stage status

Life-cycle stage status	Description
Build	Default value for a new bot process.
Published	The bot process is ready to be active.
In Maintenance	When changes are to be done in the bot process. If a bot process is in **In Maintenance** status, you cannot start or stop a bot process or launch a bot process in RPA Desktop Design Studio.
Retired	Bot process is inactive. After you retire a bot process, you cannot change the stage.

Maintenance request form in RPA Hub

Use the Maintenance request form to track the status of the scheduled maintenance (SM) days on the robot calendar. After a scheduled maintenance event card is accepted or rejected on the robot calendar by an RPA release manager or an admin, then a maintenance request is created for tracking.

Maintenance request form

Field	Description
Number	Auto-generated number of the maintenance request.
Change request	Associated change request.
Planned Start Date	Planned start date and time of the scheduled maintenance.
Planned End Date	Planned end date and time of the scheduled maintenance.
State	State of the maintenance request: • **Pending** - An MR is created when you accept the associated SM event card. • **In Progress** - When the planned start date begins, the MR is executed. The life cycle stage status of the configuration item (robot or bot process) moves to In Maintenance state. • **Complete** - When the MR completes execution of the configuration item (robot or bot process). When the associated CR is closed, then the life cycle stage status of the Configuration Item (CI) moves to Published state. • **Canceled** - When an MR is canceled. For more information about canceling an MR, see Scheduled maintenance days in RPA Hub and Manage scheduled maintenance days in RPA Hub. • **Failed** - When a CI (robot or bot process) fails due to any issue.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Maintenance request form (continued)

Field	Description
	When the system tries to update the CI to either in Published or In Maintenance, but unable to update. Then the MR fails. • **Rejected** - When you reject the associated SM event card.
Configuration Item	Name of the associated bot process or robot.
Class	Type of the configuration item. For example, bot process or robot.

Note:
Maintenance Request (MR) is unique for Change Request (CR), except for **Canceled** and **Failed** states.

Package Version form in RPA Hub

Use the Package Version form to view the code quality result.

Package Version form

Name of the rule	Description
Package	Associated package of the package version.
Version	Version number that identifies the set of components uploaded in a package
Application	Application that contains this record. This field is auto-generated. Role required to view this field: admin.
Life Cycle Stage Status	Life-cycle stage statuses of a package version.
Active	Option to set this package version as active. The active version of the template is used when a template is selected for creating automation in RPA Desktop Design Studio. Only one package version can be set as active. This field is applicable only for **Unattended Template** and **Attended Template** package types. For more information about package types, see Create a package to assign to a bot process. Roles required to edit this field: RPA admin and RPA release manager.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Package Version form (continued)

Name of the rule	Description
Code Quality Result	Indicates if the **Code Quality Check** feature in RPA Desktop Design Studio has detected any errors, warnings, or information in the package. • **Error** - If a package that is published from RPA Desktop Design Studio with the code quality check as error. If a package has both error and warning, then the code quality check result is error. If a package has both error and info, then the code quality check result is error. • **Warning** - If a package that is published from RPA Desktop Design Studio with the code quality check as warning. If a package has both warning and info, then the code quality check result is warning. • **Pass** - If a package that is published from RPA Desktop Design Studio without any code quality check error or warning or info. If the Code Quality Check feature is not enabled, then the value in this field is **Not Applicable**. Code quality status of package versions are set with highest severity. To review the error or warning, open the package version file in RPA Desktop Design Studio. For more information about code quality check feature, see Code quality check in RPA Hub.
Comments	Brief description of the package version.

Process job form in RPA Hub

Use the Process job form to view a list of the execution logs of a bot process.

Process job form

Field	Description
Name	Name of the process job.
Process	Name of the associated bot process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process job form (continued)

Field	Description
Robot	Assigned robot that is running on the bot process.
State	State of the process job: • Success • Failed • Running • Skipped • Canceled • Abandoned For more information about process job states and their scenarios, see Process job states in RPA Hub.
Storage	Storage location of the logs: • **Instance** • **Robot Machine**
Triggered By	Source of the trigger. • **Schedule**- If the automation is triggered via a schedule. • **API**- If the automation is triggered by a flow • **Manual**- If the attended automation is triggered by a user or if the unattended automation is triggered by **Start Process**. • **Embedded Task Automation**- If the attended automation is triggered from the ServiceNow form. For more information, see Embedded Task Automation in RPA Hub.
Execution Log Status	Status on the availability of the execution logs: • **No Logs** • **Sync in progress** • **Complete** The available logs are viewed on the RPA Desktop Design Studio.
Graceful Stop	Indicates whether the Graceful Stop is executed or not.

Work Queue form

Field	Description
Name	Name of the work queue.
Is Work Item Name Unique	Option to select if the name of each item in this queue is unique.
Application	[Auto generated] Application containing this record. Role required to view this field: admin.
Maximum Attempts	Number of attempts for failed work items. Enter a value between 1 and 99 [maximum value from system properties]. The default value is 1. Roles required to edit this field: RPA release manager and RPA admin.
Attempt Delay (mins)	Maximum delay, in minutes, before the work item is attempted again. The default value is 0. Roles required to edit this field: RPA release manager and RPA admin. This field appears only when the value of the **Maximum Attempts** field is more than 1.
Description	Brief description of the work queue.
Purge-Work Items	
Purge Status	Status of the work items that need to get purged.
Purge After (days)	Number of days after which the work items get deleted based on the date of creation.
Average Handling Time (AHT) - Work Items Work items with Success status and that are not purged, are included for AHT calculation.	
Include All Work Items	Successful work items that are considered for the Average Handling Time (AHT) calculation. For more information about robot pool, see Robot pool in RPA Hub.
Work Item Count	Number of recent successful work items that are considered for the Average Handling Time (AHT) calculation. Enter a value between 20 and 1000. The default value is 100.

Schedule form in RPA Hub

Use the Schedule form to create a schedule within a Unattended Robot bot process. A schedule enables the users to execute jobs in a planned manner at regular intervals. More than one schedule can be associated with one bot process.

Schedule form

Field	Description
Process Schedule	
Name	Name of the process schedule.
Start Date	Start date of the schedule.
Active	Option to activate the schedule. On clearing this option, the schedule becomes inactive.
Application	[Auto generated] Application containing this record. Role required to view this field: admin.
Bot Process Configuration	Name of the associated bot process.
End Date	End date of the schedule.
Frequency & Time	
Interval Type	Schedule execution interval:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Schedule form (continued)

Field	Description
	• **Minutes**: The bot process executes every n minutes that are specified in the **Frequency** field. • **Hours**: The bot process executes every n hours that are specified in the **Frequency** field. • **Daily**: The bot process executes every day at the time that is specified in the **Start time** field. • **Weekly**: The bot process executes on the specific days that are selected in the **Weekdays** field at a specified time in the **Start time** field. • **Monthly**: The bot process executes every n days at t time based on the value that is selected in the **On** field. "t" is the time that is specified in the **Start time** field. "n" is the value of the **Frequency** field. The default value is set to `Daily`.
Frequency	Frequency of the schedule execution interval. This field appears only when **Minutes**, **Hours**, or **Monthly** is selected from the **Interval Type** field. If the frequency is too low, the performance in the Robot Calendar can be impacted.
Weekdays	Specific days of the week for the robot to run. For example, if the robot must run on Monday, select **Monday** in this field. This field does not appear if you select either **Days of Month** or **Week Occurrence** in the **On** field. This field appears only when **Minutes**, **Hours**, **Weekly**, or **Monthly** is selected from the **Interval Type** field.
Workstation Timezone	Option to consider the robot machine time zone. On enabling this option, the **Timezone** field does not appear.
Timezone	Time zone of the schedule.
Start Time	Time of the day to start the schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Schedule form (continued)

Field	Description
End Time Required	Option to consider if the robot is not supposed to pick up a new job after a specific time. On enabling this option, the **End Time** field appears. This option appears only when either **Minutes** or **Hours** is selected from the **Interval Type** field.
End Time	Time of the day to end the schedule. The bot process triggered before this time will continue execution. This option appears only when the **End Time Required** field is selected.
On	Frequency of the execution: • Weekdays • Days of Month • Week Occurrence This field appears only when **Monthly** is selected from the **Interval Type** field.
Days of Month	Specific days of the month for the schedule to run. For example, if the robot must run on the 5th, 6th, and 7th day of the month, select **5**, **6**, and **7** in this field. This field appears only when **Days of Month** is selected from the **On** field.
Occur On	Specific week of a month for the robot to run. For example, if the robot must run on the first Friday of a month, select **First** in this field. This field appears only when **Week Occurrence** is selected from the **On** field.
Day	Specific day of a month for the robot to run. For example, if the robot must run on the first Friday of a month, select **Friday** in this field. This field appears only when **Week Occurrence** is selected from the **On** field.

Schedule form (continued)

Field	Description
Work notes (Private)	Work notes for the process schedule.
Additional Comments	Additional comments related to the schedule.

Related topics

Create a schedule within a bot process in RPA Hub

Work item form in RPA Hub

Use the Work item form to view more details of the executed work items.

Work Item form

Field	Description
Name	Name of the work item.
Work Queue	Name of the queue.
Status	Status of the work item.
Exception Type	Type of the exception: • **Application** - For example, if an issue persists with an associated application such as SAP. • **Business** - For example, if an issue requires a manual intervention to fix it. The auto retry functionality retries the work items based on the exception type. If the **Exception Type** field is **Application**, then the work item is auto retried. Roles required to edit this field: RPA robot.
Started On	Start date and time of the work item.
Completed On	Completion date and time of the work item.
Attempts Count	Number of times the work item is picked for auto retry. The minimum value is 0.
Details	
Priority	Priority of the work item: • **Critical** • **High** • **Medium** • **Low**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Work Item form (continued)

Field	Description
	The assigned robot executes the bot process as per the defined priority in the work queue.
Type	String field to define the type of work item.
Stage	Custom field for the robot to maintain different stages of the transaction.
SLA	Time and date that the SLA was started.
Robot	Name of the robot that is assigned to the work queue.
Created	Creation date and time of the work item.
Last Started Time	Last start time of the work item.
Deferred Till	Work item that is not picked until the specified date and time.
Completed By	Name of the robot who has completed the work item.
Remarks	Remarks updated by the robot runtimes.
Content	
Request Content	Non sensitive content which is displayed in plain text in the Work Item form and can be used for work item processing.
Sensitive Request Content	Sensitive request content which is encrypted and masked in the Work Item form and can be used for work item processing. When the work item is picked, the sensitive data is decrypted and passed to the RPA Desktop Design Studio or robots. With this option, you can pass sensitive information through queues. For example, credit card details are encrypted.
Response Content	Content that is added or updated when a work item is picked after the transaction.
Transaction Activity	
Work notes	Work notes for the work item.
Additional Comments	Comments for updating this work item.
Activity	Transaction logs for the selected work item.

Visibility conditions of the UI action (button)

Ensure the following conditions are met to view the UI action (button) on the corresponding ServiceNow form, for the associated table that is selected in the Attended Configuration record.

For other screens such as workspaces, playbook, the UI action must be created manually. For more information, see Invoke Embedded Task Automation via API.

Familiarize yourself with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

List of conditions to view the UI action (button)

Condition	Reference
The life cycle stage status of the associated bot process selected in the Attended Configuration record is **Published**. You cannot view the associated UI action on the ServiceNow form if the associated bot process is not available or is in **In Maintenance** state.	For more information, see Bot Process form in RPA Hub.
The **Enable Embedded Task Automation** check box must be selected in the associated attended bot process record.	For more information, see Bot Process form in RPA Hub.
The Attended Configuration record must be activated.	For more information, see Activate an attended configuration record in RPA Hub.
User must have the RPA Assisted user role.	For more information, see Components installed with RPA Hub.
Robot record for that user must be available if the auto assignment system property *sn_rpa_fdn.allow_rda_robot_auto_assignment* is false.	For more information about this system property, see Configure RPA Hub properties.
If the auto assignment system property *sn_rpa_fdn.allow_rda_robot_auto_assignment* is true, you must have the license to create an attended robot.	For more information about this system property, see Configure RPA Hub properties. For more information about license, see License distribution in RPA Hub and Create a robot license distribution record in RPA Hub.
User must be associated to **Assigned Users/Groups** tab of the corresponding attended bot process selected in the Attended Configuration record.	For more information about license, see Assign an attended user or group to an attended bot process.
Existing ServiceNow form record must match the conditions selected in attended configuration record.	For more information about creating an attended configuration record, see Create an attended configuration record in RPA Hub.

Exploring Unattended Robot

Learn about the Unattended Robot features that enable you to run unattended automations.

Unattended Robot overview

The ServiceNow® Unattended Robot is a software agent that you install on a Windows machine. Unattended Robot can execute unattended automations without requiring any human intervention.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ServiceNow® Unattended Robot Login Agent is a software agent that you install on a Windows machine with Unattended Robot. You can use this application to unlock or to perform a self-login to the robot machine when an unattended bot process is triggered.

Unattended Robot benefits

- Executes defined automation in a bot process independently without human intervention.
- Gets triggered either by a schedule, API, or manually.

What to explore next

To learn more about configuring and using Unattended Robot, see:

- Configuring Unattended Robot
- Using Unattended Robot

High density robots in Unattended Robot

Execute multiple automations simultaneously and independently on a single Windows Server machine using high density robots.

Familiarize yourself with high density robots concepts in RPA Hub. For more information, see High density robots in RPA Hub.

How a high density robot works

- The robot can start one automation for each Windows user session at any given time. You can run the same automation on all robots simultaneously. You can also run different automations on all robots at the same time.
- In a scenario, where, a user A is connected to a server via Remote Desktop Protocol (RDP) where a high density robot is connected. If an execution is triggered for the same user A, the manually connected session is disconnected and transferred to the robot. However, the user can reconnect to view the execution after the robot starts its automation.
- When changing the robot type from High Density Robot to standard or vice-versa, you must reconnect the unattended robot to ensure seamless execution of automations. For more information about creating an unattended robot, see Create an unattended robot in RPA Hub.

List of steps for configuring high density robots

Perform the following tasks to configure high density robots:

1. Set up the environment for high density robots on a Windows Server machine by installing a Remote Desktop Session Host. Then, add users who can establish RDP connection to the Windows Server machine. For more information, see Set up Windows Server machine for high density robots.
2. Restart the Windows Server machine after the installation is complete.
3. Enable the high density robot option in RPA Hub. For more information, see Create an unattended robot in RPA Hub.
4. Install Unattended Robot.
5. Add user profiles in the Unattended Robot application, so that multiple robots can execute jobs concurrently. For more information, see Set up Unattended Robot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Troubleshooting

- RDP logon errors are recorded in the service logs. Although some logs may lack detailed explanations, utilize the code to search for relevant information in Disconnect reason code and Extended disconnect reason code.
- The underlying application process names used in automations may vary between the server environment and the development environment. To avoid discrepancies, ensure they are correctly specified in the automations based on the target machine.

Limitations

- The Unattended Robot user interface is accessible by only one user at a time.
- The latest version of the Unattended Robot must be installed after upgrading the RPA Hub to the newest version.
- High density robots are not a part of robot pool.

Configuring Unattended Robot

You can plan and configure an Unattended Robot and Unattended Robot Login Agent implementation in your organization.

Configuration overview

Perform the following tasks to download the installation package of Unattended Robot and Unattended Robot Login Agent and configure the Unattended Robot after installation.

1. Download Unattended Robot from RPA Hub.

   Select and download the Unattended Robot application in your Windows machine from RPA Hub as a prerequisite for installing the application.

2. Install Unattended Robot

   You can install the Unattended Robot application in your Windows machine if you have the admin role.

3. Install Unattended Robot Login Agent

   You can install the Unattended Robot Login Agent application in your Windows machine if you have the admin role.

4. Set up Unattended Robot

   Set up the Unattended Robot application to establish a connection between a robot and the ServiceNow® RPA Hub instance.

5. Set up Windows Server machine for high density robots

   Set up the environment for high density robots on a Windows Server machine by installing a Remote Desktop Session Host.

Using Guided Setup to implement Unattended Robot and Unattended Robot Login Agent

Guided Setup provides a sequence of tasks that help you configure Unattended Robot and Unattended Robot Login Agent. With Guided Setup, keep track of what you have completed, so

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

you can stop and start again where you left off. To open Guided Setup for RPA Hub, navigate to **All** > **Robotic Process Automation** > **Administration** > **Guided Setup**.

For more information about using the guided setup interface, see Using guided setup.

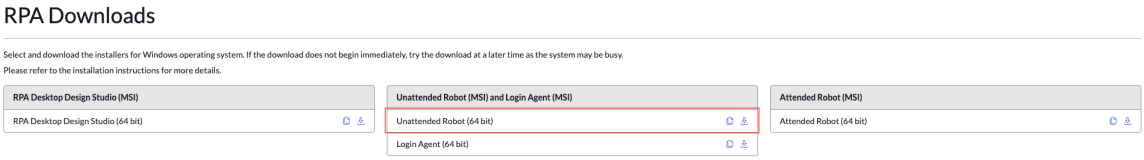
Install Unattended Robot

You can install the Unattended Robot application in your Windows machine if you have the admin role.

Before you begin

Download and unzip the installation file for the Unattended Robot application. For more information, see Download the RPA applications from RPA Hub.

Download Unattended Robot application



Ensure that you follow the hardware and software requirements. For more information, see Requirements for Unattended Robot.

Ensure that you meet the following set up requirements:

- An unattended robot is mapped to only one machine. This is applicable for standard robot.
- The Windows machine or the Virtual Machine (VM) is persistent and constantly on to run unattended robots.
- If connected via Citrix, the Windows machine or the VM must not go to sleep mode.
- The idle timeout setting is turned off for the VDI pool.
- Communication with the ServiceNow instance host is enabled.
- Verify that the *glide.cometd.websocket.enabled* system property is set to true in the ServiceNow instance, to ensure that the robot is connected to the instance via websocket.
- Verify that the websockets are also enabled on the client machine where the unattended robot runs.

Role required: admin

Procedure

1. Locate and open the `Unattended Robot.msi` file.
2. In the Welcome to the Unattended Robot Setup Wizard dialog box, select **Next**.
3. In the Select Installation Folder dialog box, do one of the following actions to choose a folder:
   - To install the application in the default folder, select **Next**.
   - To install the application in a different folder, select the folder location in the **Folder** field or select **Browse** to select the folder, and then select **Next**.
4. In the Confirm Installation dialog box, select **Next** to start the installation.
5. After the installation is complete, in the Installation Complete dialog box, select **Close** to exit.

Result

You can see the Unattended Robot icon on your desktop.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The installation of the Unattended Robot application is configured to function on a per-machine basis, with the default directory as `%ProgramFiles%\ServiceNow\Unattended Robot`.

What to do next

Set up the Unattended Robot application. For more information, see Set up Unattended Robot.

Install Unattended Robot Login Agent

You can install the Unattended Robot Login Agent application in your Windows machine if you have the admin role.

Before you begin

Ensure that you meet the following set up requirements:

- An unattended robot is mapped to only one machine.
- The Windows machine or the Virtual Machine (VM) is persistent and constantly on to run unattended robots.
- If connected via Citrix, the Windows machine or the VM must not go to sleep mode.
- Login agent clears the legal notice message if the *sn_rpa_fdn.bypass_legal_notice* system property is selected.

  For more information about this property, see Configure RPA Hub properties.

  If you don't want the unattended robot to clear the legal notice, turn off the legal notice by turning off through the Active Directory Organizational (AD OU) policy. This ensures that the Unattended Robot Login Agent can log in seamlessly.
- Unattended Robot Login Agent can handle only login-related screens, such as #the Ctrl+Alt +Del screen and the User Name and Password screen.
- The idle timeout setting is turned off for the VDI pool.
- Communication with the ServiceNow instance host is enabled.

Download and unzip the installation file for the Unattended Robot application. For more information, see Download the RPA applications from RPA Hub.

Role required: admin

About this task

The Unattended Robot Login Agent is a software agent that you install on a Windows machine with Unattended Robot.

This login agent application is used to unlock or self-log in to the robot machine when an unattended bot process is triggered.

Unattended Robot Login Agent does not support Multi-Factor Authentication (MFA) login.

Procedure

1. Locate and open the `Unattended Robot Login Agent.msi` file.
2. In the Welcome to the Unattended Robot Login Agent Setup Wizard dialog box, select **Next**.
3. After the installation is complete, in the Installation Complete dialog box, select **Close** to exit.

Result

You can see the following image on your Windows lock screen after installation.

© 2026 ServiceNow, Inc. All rights reserved.

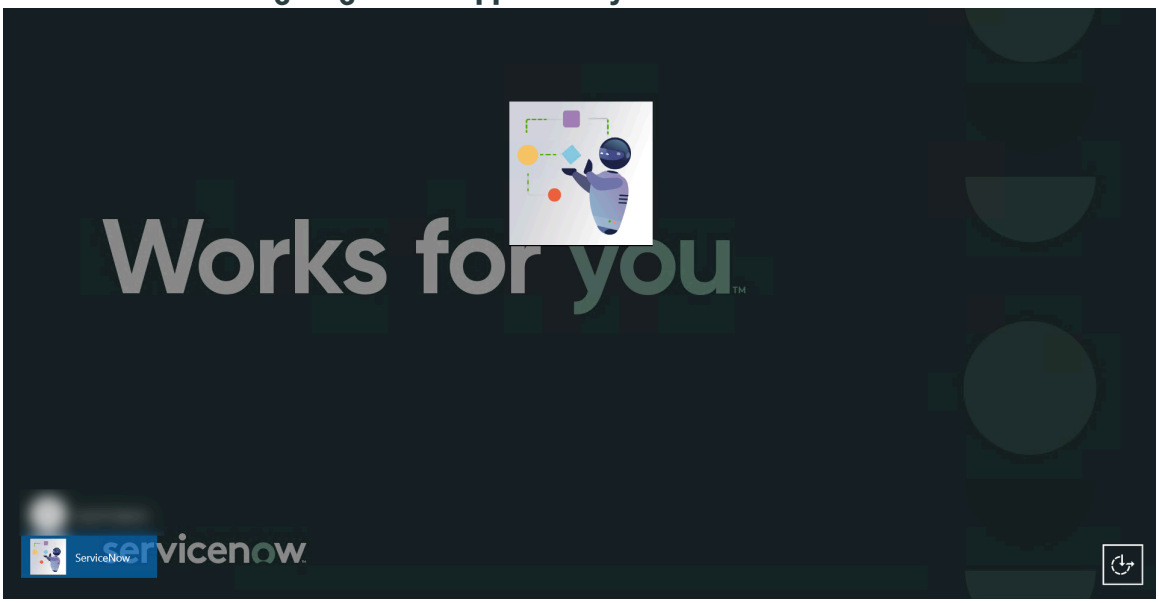
Unattended Robot Login Agent that appears on your Windows lock screen



What to do next

Set up the Unattended Robot application. For more information, see Set up Unattended Robot.

Set up Unattended Robot

Set up the Unattended Robot application to establish a connection between a robot and the ServiceNow RPA Hub instance.

Before you begin

Install the Unattended Robot. For more information, see Install Unattended Robot.

Install the Unattended Robot Login Agent. For more information, see Install Unattended Robot Login Agent.

If you are selecting **mTLS** as the type of the authentication in the following task, install a user certificate, if you have the admin role. For more information, see Install the user-generated certificates.

For high density robots, ensure that the following requirements are met:

- Set up the environment for high density robots on a Windows Server machine. For more information, see Set up Windows Server machine for high density robots.
- Familiarize yourself with high density robots concepts. For more information, see High density robots in Unattended Robot and High density robots in RPA Hub.

Role required: sn_rpa_fdn.rpa_robot (for connection); sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin (for setup)

About this task

Do this task when you're setting up the Unattended Robot application for the first time, unless you're changing the RPA Hub instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From your desktop, to open the Unattended Robot, do either of the following tasks:
   - Double-click the Unattended Robot icon ( ).
   - In the notification area (system tray) in the taskbar, select and hold (or right-click) the Unattended Robot icon ( ) and select **Settings**.

   The Unattended Robot dialog is displayed.
2. In the ServiceNow Unattended Robot dialog box, under the RPA Hub section, fill in the fields.

Unattended Robot dialog box

Field	Action
Instance URL	Enter the ServiceNow RPA Hub instance URL. For example, `https://<instance name>.service-now.com/`.
Authentication	Select the type of authentication that you want to use: ○ **mTLS**: Mutual Transport Layer Security. As a prerequisite, install the user certificate. ○ **Basic**: Authentication happens based on the user name and password. If the robot is connected using the **Basic** authentication type, a warning icon is displayed in the taskbar.
High density robots	Select this option to add multiple high density robots user profiles. High density robots leverage the Remote Desktop Services to execute multiple automations simultaneously in separate user sessions on the same Windows server machine. For more information on high density robots, see High density robots in RPA Hub and High density robots in Unattended Robot. You must set up Windows server for high density robots. For more information, see Set up Windows Server machine for high density robots.
Add profile	Select **Add profile** to connect the robots by adding the users associated to them. After a profile is added successfully, it fetches the associated robot for that user. Depending on your selection for the **Authentication** field, the respective fields appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Action
	When a new robot is created for a user who is already connected to the Unattended Robot, a connection is automatically established within a few minutes. However, if the user is not already connected, you must disconnect the Unattended Robot, add the new user, and then try connecting. This field appears only when the **High density robots** option is selected.
Certificate	Perform the following actions to select a certificate: **a.** Select the three-dot menu (...) next to the **Certificate** field. **b.** Select the installed client authentication certificate. **Note:** You can only select a certificate that has the intended purpose as client authentication. If you select a certificate with any other intended purpose, an error is displayed. **c.** Select **OK**. This field appears only when **mTLS** is selected from the **Authentication** field.
Username	Enter your user name. This user must have a robot role for establishing connection. This field appears only when **Basic** is selected from the **Authentication** field.
Password	Enter the password. This field appears only when **Basic** is selected from the **Authentication** field.

3. **Optional:** To add the settings for an internet connection as per your company policies, do the following steps:

   a. In the ServiceNow Unattended Robot dialog box, under the Proxy Settings section, fill in the fields.

Unattended Robot dialog box

Field	Action
Server Address	Enter the proxy server URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Action
Name	Enter your user name.
Password	Enter the password.

b. Select **Save**.

4. Select **Connect**.

What to do next

Run an unattended robot to execute the unattended bot process. For more information, see Run an automation using Unattended Robot.

Install the user-generated certificates

Set up Windows Server machine for high density robots

Set up the environment for high density robots on a Windows Server machine by installing a Remote Desktop Session Host. Then, add robot user names who can connect to the machine. It enables them to establish Remote Desktop Protocol (RDP) connection to the Windows Server machine.

Before you begin

Familiarize yourself with high density robots concepts. For more information, see High density robots in Unattended Robot and High density robots in RPA Hub.

The Remote Desktop Session Host service requires a valid license.

Ensure that you follow the hardware and software requirements. For more information, see Requirements for Unattended Robot.

Role required: admin

Procedure

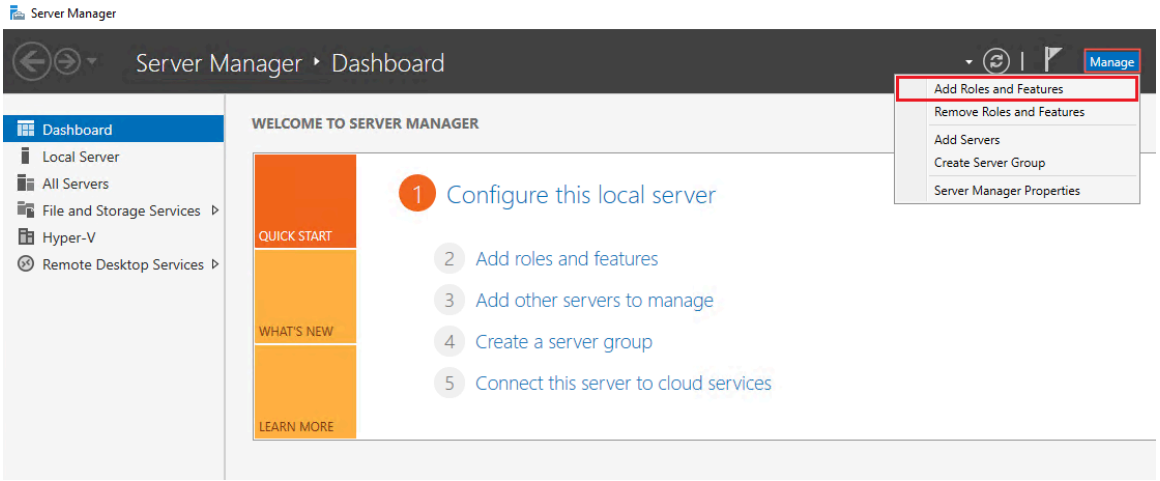
1. Perform the following steps in your Windows Server machine to install the Remote Desktop Session Host.

a. Open Server Manager.

b. In the Dashboard panel, select **Manage** and then select **Add Roles and Features**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Server Manager Dashboard panel

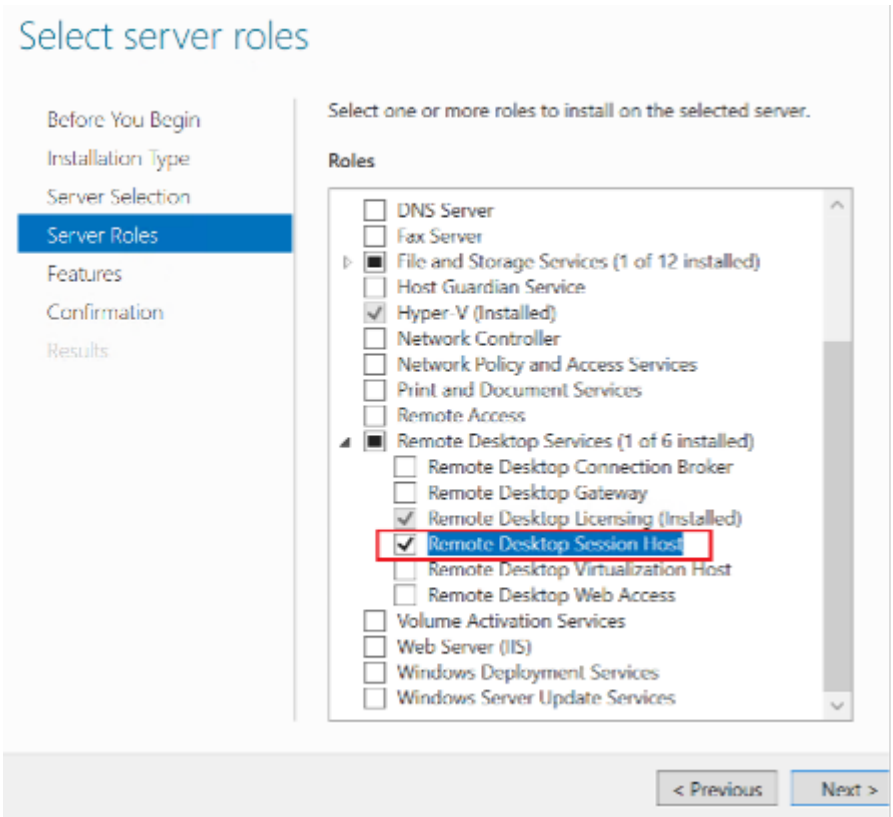


The **Add Roles and Features Wizard** opens.

c. Follow the steps in the wizard until you reach the **Select server roles** window.

d. In the Roles section, from the Remote Desktop Services list, select the **Remote Desktop Session Host** option.

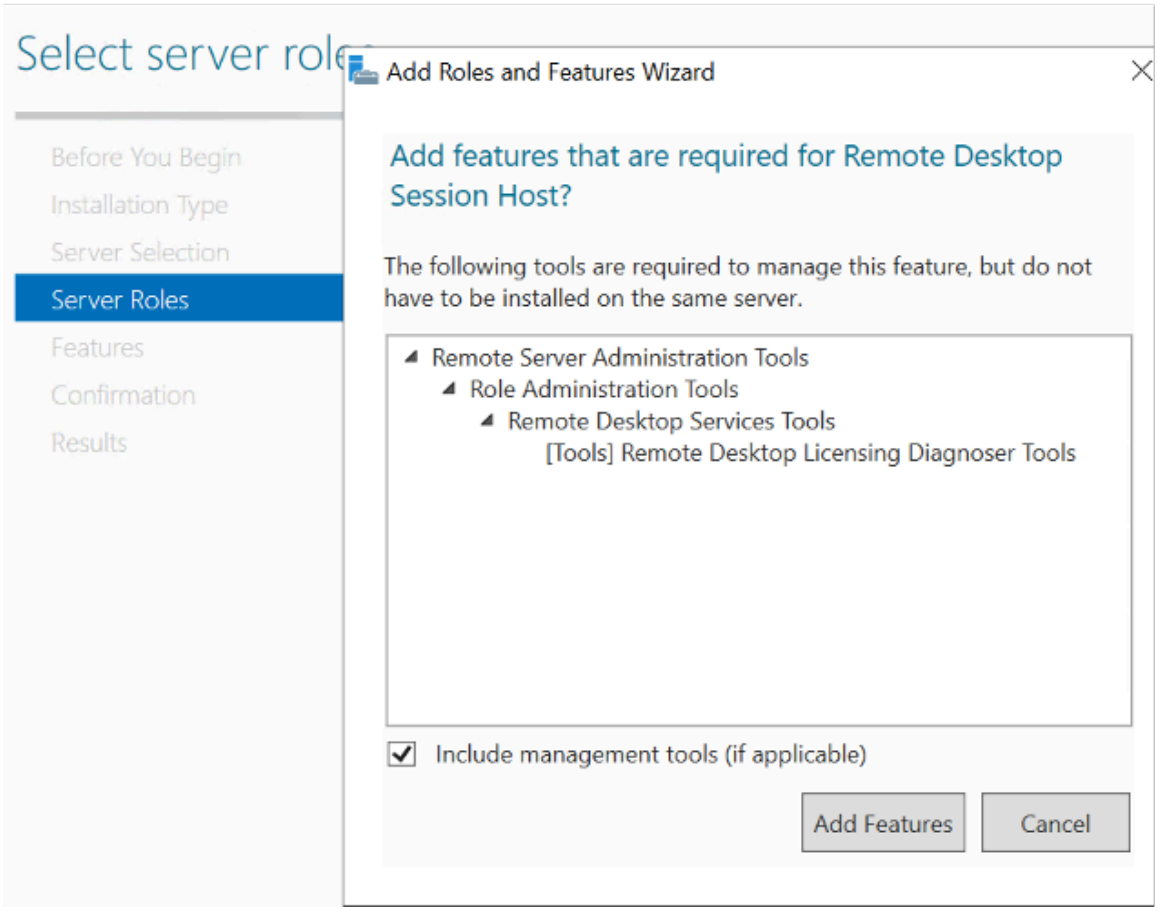
Select server roles



e. In the Add Roles and Features Wizard dialog box, select **Add Features**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add Roles and Features Wizard dialog box



It returns to the wizard.

f. Follow the steps in the wizard until you reach the **Confirm installation selections** window.

g. Select **Install**.

2. Configure the following settings to add users and edit policies:

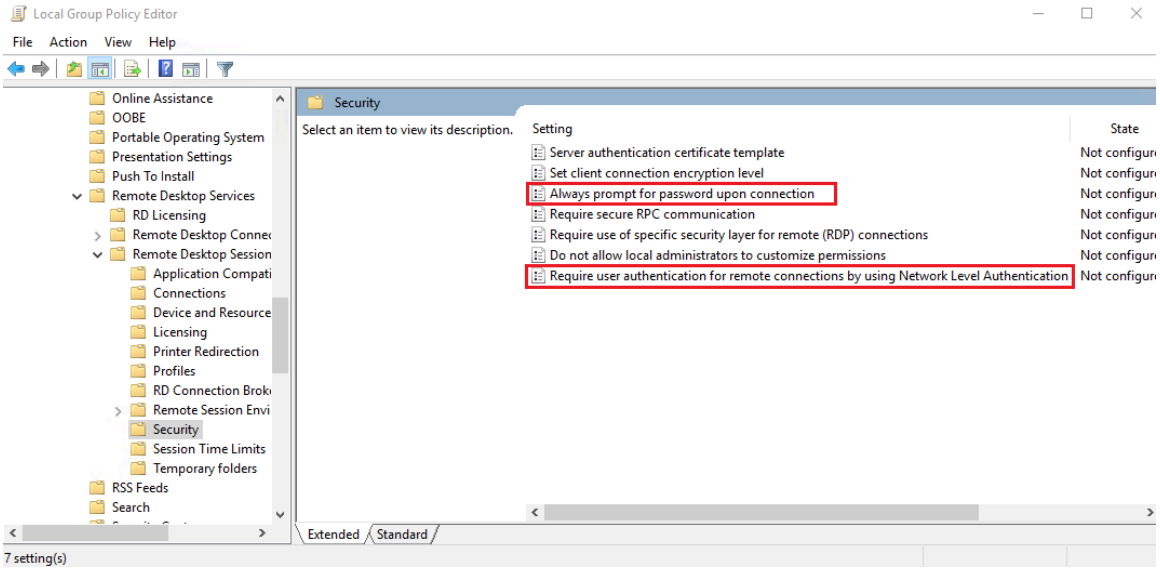
a. Navigate to the **Local Group Policy Editor** and then, navigate to **Computer Configuration** > **Administrative Templates** > **Windows Components** > **Remote Desktop Services** > **Remote Desktop Session Host** > **Security**.

b. Disable the **Always prompt for password upon connection** policy.

c. Enable the **Require user authentication for remote connections by using Network Level Authentication** policy for enhanced security and always authenticate prior establishing session to RDP.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure policies in the Local Group Policy Editor



d. Ensure that the Windows user mapped to the robots in the Process Robot Credentials tab of the bot process must be in the **Remote Desktop Users** group.

What to do next

Restart the Windows Server machine after the installation is complete.

Enable the high density robot option in RPA Hub. For more information, see Create an unattended robot in RPA Hub.

Install Unattended Robot.

Add user profiles in the Unattended Robot application, so that multiple robots can execute jobs concurrently. For more information, see Set up Unattended Robot

Using Unattended Robot

You can use the Unattended Robot application to execute unattended automations that are triggered either by a schedule, API, or manually.

Triggered By field on the Process Job form determines if a bot process is triggered via Schedule, Manual or API. For more information, see Process job form in RPA Hub.

Run an automation using Unattended Robot

Run an unattended robot to execute the unattended automations that are triggered either by a schedule, API, or manually.

Before you begin

Create a package. For more information, see Create a package to assign to a bot process.

Create a robot. For more information, see Creating a robot in RPA Hub.

Create a bot process. Select the **Process Type** field as **Unattended** on the Bot process form, while you're creating a bot process. For more information, see Configuring a bot process record in RPA Hub and Bot Process form in RPA Hub.

Ensure that the following conditions are met to execute a robot:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The life cycle stage status of the associated bot process must be **Published**.
- The life cycle stage status of the executing robot must be **In-Use**.

(Optional) To run your bot process on regular intervals, create a schedule within a bot process. For more information, see Create a schedule within a bot process in RPA Hub.

Create a credential group and assign it to a bot process. For more information, see Create a credential group in RPA Hub and Associate a credential group to a bot process.

Assign a robot to a bot process. For more information, see Assign a robot to a bot process in RPA Hub.

Assign a process robot credential within a bot process. For more information, see Assign a process robot credential within a bot process.

Ensure that the licenses are available. For more information, see License distribution in RPA Hub.

Establish a connection between a robot and ServiceNow RPA Hub instance. For more information, see Set up Unattended Robot.

(Optional) Create a process parameter within a bot process. For more information, see Create a process parameter within a bot process in RPA Hub.

Role required: sn_rpa_fdn.rpa_robot and snc_internal

Note:
If the Attended Robot tries to connect to an Federal Information Processing Standards (FIPS)-enabled instance, the robot user must have the `snc_internal` role.

About this task

You can also start an unattended bot process manually from the RPA Hub. For more information, see Start an unattended bot process in RPA Hub.

In this task, you can run an unattended robot in two ways.

Procedure

To run an unattended robot, do any one of the following actions.

Important:
A process job record gets created as soon as the unattended robot starts initiating the bot process in the robot machine. The **Message** field is updated during the different stages of the process that provides insight and visibility regarding the status of your bot process. For more information on the different fields of a process job record, see Process job form in RPA Hub.

Requirements for Unattended Robot

Ensure that you meet the following hardware and software requirements before you install the Unattended Robot application.

Hardware requirements

Hardware requirements for standard robots

Resource	Minimum	Recommended
CPU	2 cores of Intel 1.8 GHz 64-bit processor	4 cores of Intel 2.4 GHz 64-bit processor
RAM	4-GB RAM	8-GB RAM
Disk space	Minimum 50-GB free disk space after installing the OS, patches, and base software	Minimum 100-GB free disk space after installing the OS, patches, and base software

Hardware requirements for high density robots

For a high density robot, where multiple robots execute jobs concurrently on the same Windows Server machine, you must multiply the minimum and recommended hardware requirements by the number of runtimes.

For example, with three users concurrently executing jobs, the minimum requirements are:

- 6 cores of Intel 1.8GHz 64-bit (6 cores of 1.8GHz 64-bit per runtime)
- 12 GB of RAM (4 cores per runtime)

Software requirements

Software requirements for standard robots

For a standard robot, the software requirements are:

- Operating system: Microsoft Windows 10 or Windows 11, Windows Server 2016, Windows Server 2019, Windows Server 2022
- NET framework: Windows 4.7.1 or greater.
- DPI scaling setting must be deactivated.

Software requirements for high density robots

For a high density robot, the software requirements are:

- Operating system: Windows Server 2022
- NET framework: Windows 4.7.1 or greater.
- DPI scaling setting must be deactivated.

Attended Robot

Use the ServiceNow® Attended Robot application to execute attended automations. Attended Robot, which is a software agent that you install on a Windows machine, requires human intervention to execute automations.

Exploring Attended Robot

Learn about the Attended Robot features that enable you to run attended automations.

Attended Robot overview

The ServiceNow® Attended Robot is a software agent that you install on a Windows machine. Attended Robot can execute attended automations that require human intervention.

Attended automations are typically triggered manually.

Attended Robot benefits

- User can start the automation by clicking a button that triggers a bot process on the same Window's machine.
- Executes tasks in real time with a human in the loop for complex or subjective decisions as required.

What to explore next

To learn more about configuring and using Attended Robot, see:

- Configuring Attended Robot
- Using Attended Robot

Attended Robot authentication journey and automation execution in Embedded Task Automation

Learn about the authentication process in the Attended Robot application and the automation execution, when the automation is triggered from ServiceNow® forms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Embedded Task Automation feature

With the embedded task automation feature, you can trigger attended bot processes (attended automations) from the ServiceNow forms, apart from initiating them from the Attended Robot application. For more information, see Embedded Task Automation in RPA Hub.

Attended Robot authentication journey in Embedded Task Automation

After you install the Attended Robot application in a Windows machine, it registers a URL schema 'snrdaforms' with Attended Robot, starting from the Washington DC release. This URL schema is used whenever a redirect occurs from OAuth. For more information about OAuth, see OAuth Inbound and Outbound authentication.

RPA assisted user selects the form action and this action redirects the user to the OAuth authentication.

After successful authentication, it generates the Callback URL that includes the information required for the bot process to launch. For example, for a bot process that is associated with an attended configuration, this information is passed to the Callback URL.

The Callback URL initiates the Attended Robot. The Attended Robot receives all the information sent by the Callback URL. In the Connection Manager, a profile (instance details like host name, instance URL) is created locally, if it doesn't exist. It's required for synchronizing the plugins and it establishes the user context for further authentication purposes.

There are three scenarios for the user context.

- If the Attended Robot application is already launched with embedded task automation and the same user, for example, User A, is used to retrigger the automation. Then, the next automation runs without restarting the Attended Robot application. The Attended Robot application doesn't close.
- If the Attended Robot application is already launched with embedded task automation by User A. Then, the different user, User B, and same instance are used to retrigger the automation. Then, it continues to use the Attended Robot application, logs out User A and reconnects with the User B, without closing and relaunching the Attended Robot application.
- If the Attended Robot application is already launched with embedded task automation from Instance1 and user tries to launch embedded task automation from Instance2. Then, the Attended Robot application is relaunched.

If a default profile saved in the Connection Manager window of Attended Robot application, the robot still uses the URL profile from where the automation is triggered.

If a new version exists to the existing automation, to reflect those changes the Attended Robot application must be closed. Until then, it continues to use the existing version, as the Attended Robot application is already launched.

If a new version of RPA Hub is installed on the instance, to reflect those changes the Attended Robot application must be closed. Until then, it continues to use the existing set of plugins, as the Attended Robot application has already launched.

Attended Robot is then ready to launch automations and doesn't prompt with the Connection Manager of Attended Robot when automation invoked from the ServiceNow® form.

If the RPA assisted user directly launches Attended Robot, the Connection Manager is displayed to verify instance and login details.

In the Connection Manager, when the user tries to connect to an instance for the first time, then an alert is displayed, that the user hasn't used that instance before.

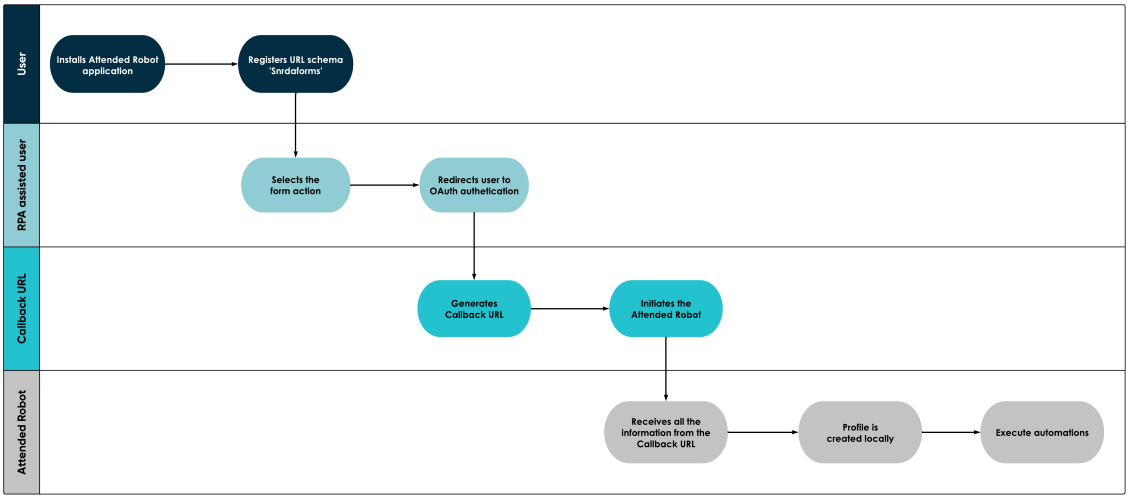
Attended Robot authentication journey



Automation execution in a local session and a bot session

After the authentication, the process configuration is retrieved from RPA Hub.

If the **Enable Desktop In Desktop** check box isn't selected on the bot process form, the automation execution starts in a local session. After the execution is complete, the Attended Robot application remains active on the machine and waits for the upcoming automation triggers. For more information, see the **Launch an attended automation from ServiceNow forms** section in the following sections. For more information about the **Enable Desktop In Desktop** and **End Desktop In Desktop On Complete** check boxes, see Bot Process form in RPA Hub.

If the **Enable Desktop in Desktop** check box is selected on the bot process form, the automation execution starts in a bot session. After the execution is complete, depending on the **End Desktop In Desktop On Complete** setting, either of the following occurs:

- If the **End Desktop In Desktop On Complete** check box is selected, the Attended Robot application closes the bot session, and the Attended Robot application remains with all the UI buttons disabled.

  The Attended Robot application won't be closed after the execution is complete or when user selects the **Stop** button, or any error occurs during automation initiation.

  After the execution is completed, the robot moves from **Busy** to **Available** state.

- If the **End Desktop In Desktop On Complete** check box isn't selected, the user must close the session. Until the user closes the session, the Attended Robot application runs and the associated robot state shows as **Busy**. After the user closes the bot session, the Attended Robot application remains open.

  If the Attended Robot login user session expires, the Attended Robot instance is closed along with the bot session.

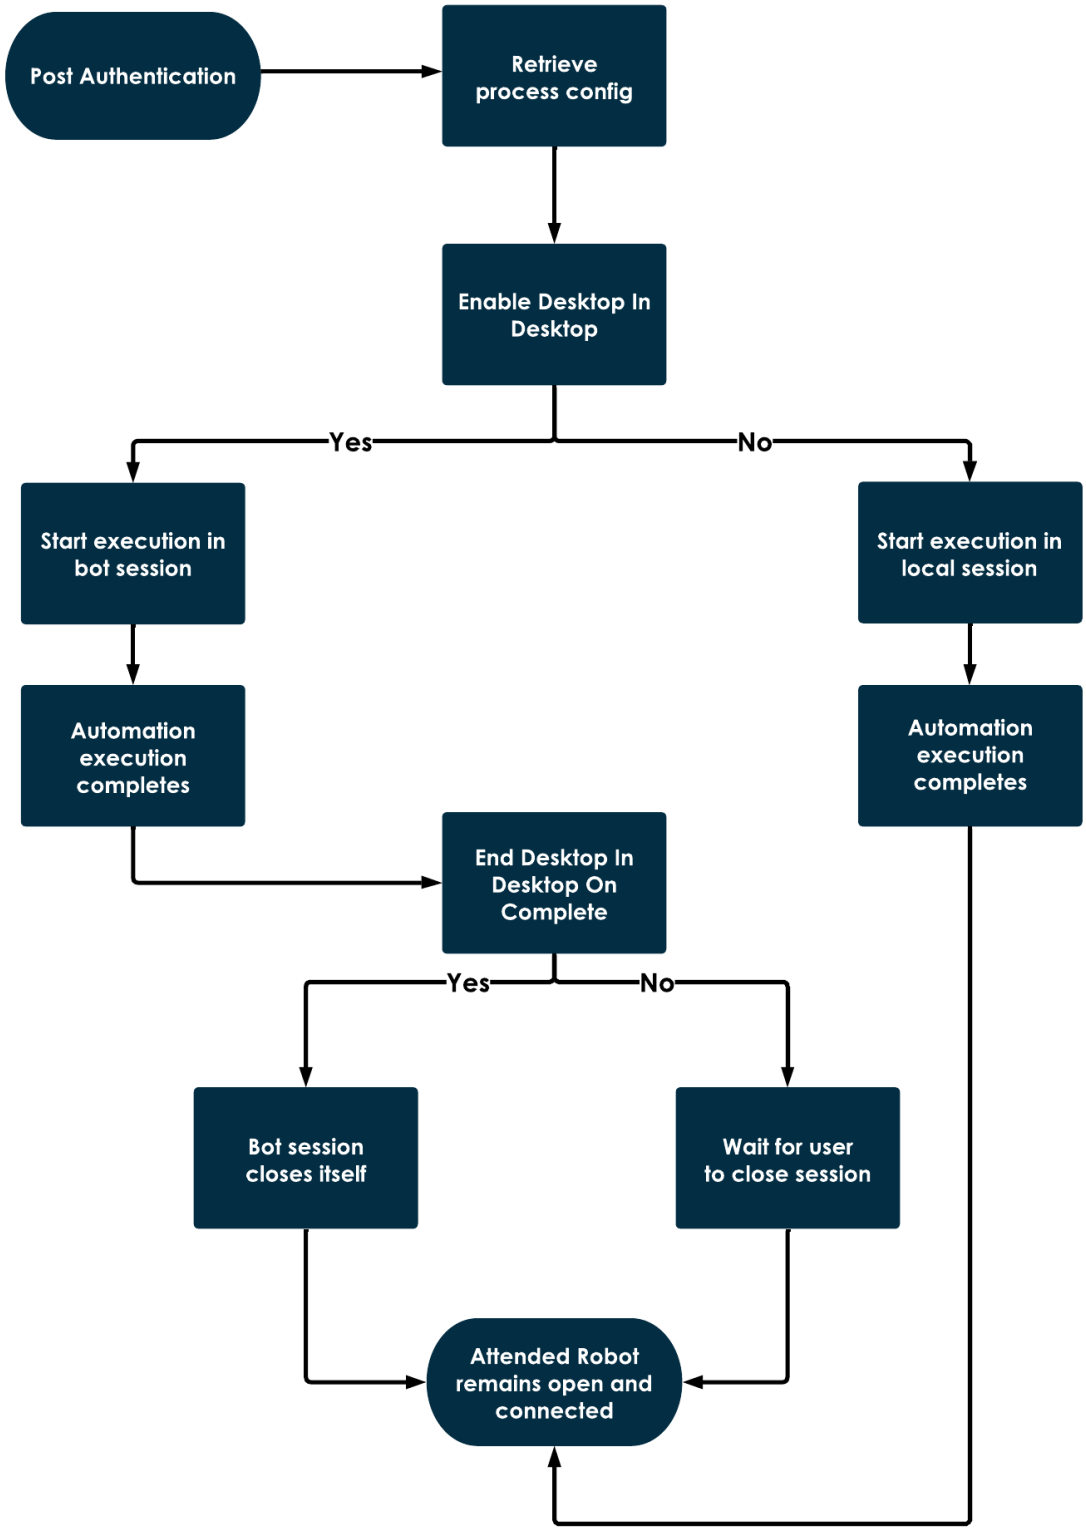
Automation execution in a local session and a bot session



Launch an attended automation from ServiceNow forms

Attended Robot executes attended automation when triggered from ServiceNow forms. For more information, see Runtime Phase of the Embedded Task Automation. For more information about invoking an attended automation across other types of forms, see Invoke Embedded Task Automation via API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If your organization is configured with proxy settings, the prerequisite for this task is to configure the proxy. In the Proxy Settings section of the Connection Manager, configure the proxy, when you launch Attended Robot from ServiceNow forms, for the first time. For more information about connection manager, see Connect to an RPA Hub instance from Attended Robot. For more information about setting a proxy, see Set up Attended Robot.

On successful authentication, the following scenarios occur:

1. Moves the associated robot state to **Available**, if it is not in Available state already.
2. Creates a **Running** state process job record.

   In the process job record, the **Triggered By** field is updated by **Embedded Task Automation** value.
3. Moves the associated robot state to **Busy**, starts synchronizing, and downloads the package, if not available locally.
4. Initiates the automation in a local session or bot session, based on the option selected in the **Enable Desktop in Desktop** check box.
5. After the automation execution is complete, the robot status is then updated as **Available**.
6. After the automation execution is initiated, if the user selects the **Stop** button on the Attended Robot, it terminates the automation, and the robot state is set to **Available**. The process job record is marked as **Canceled** state.
7. After the automation execution is initiated, if the user selects the **Close** button on the Attended Robot, after performing few pre-validations, it halts the bot process, logs out the user session, and closes the Attended Robot. For more information about stop and close actions, see Run an automation using Attended Robot.

© 2026 ServiceNow, Inc. All rights reserved.

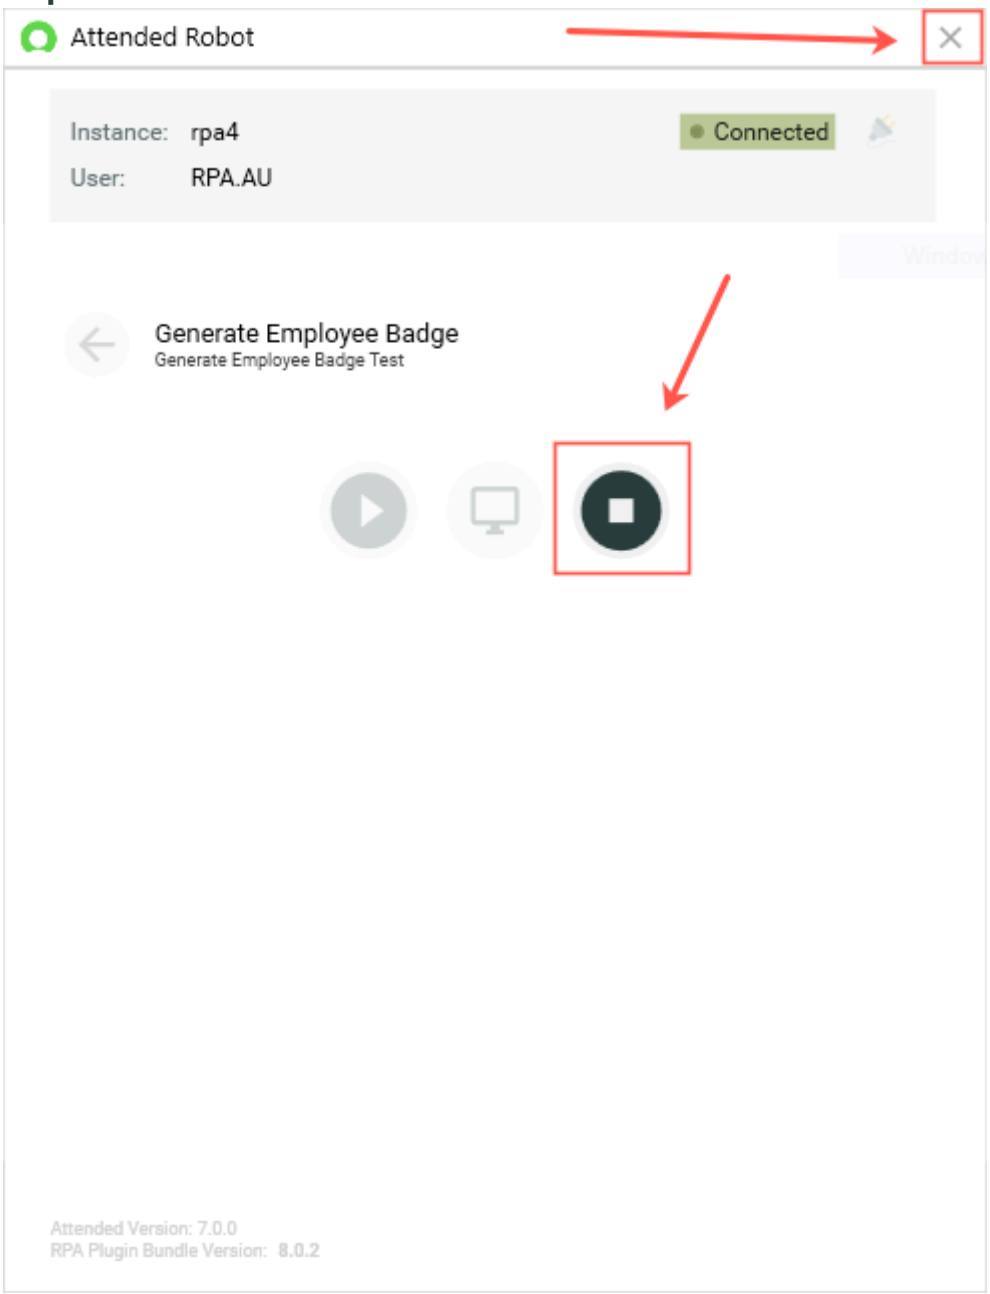
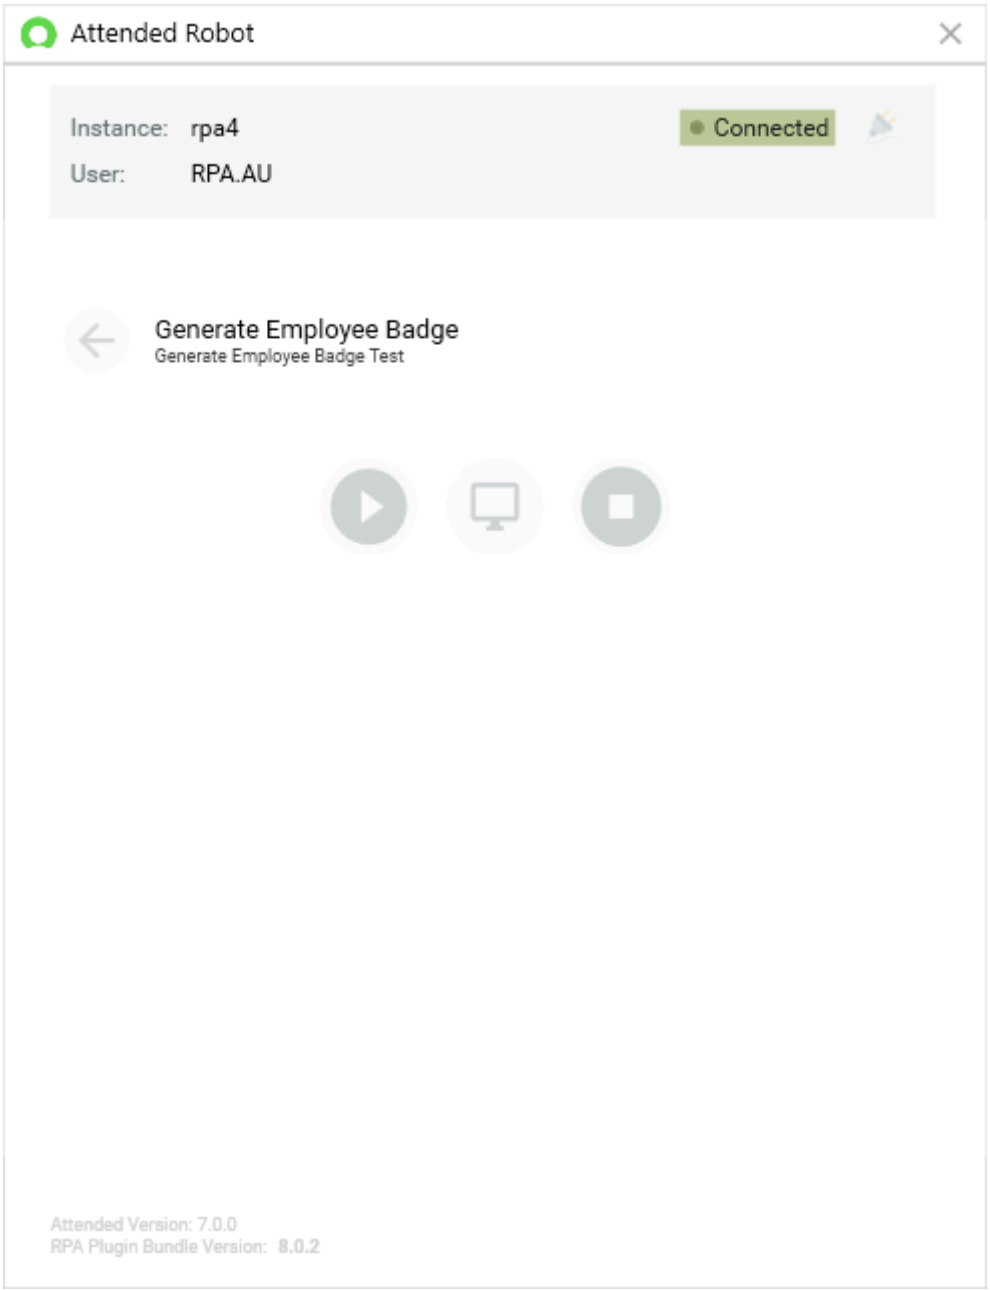
Stop and Close actions in the Attended Robot



8. After the automation is executed, the process job record is marked as success or failure after the automation flow ends.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Post automation execution screen in Attended Robot



9. Shuts down the Attended Robot, if the session is timed out.

If the authentication fails, an error is displayed: `Unable to execute the automation as authentication has failed. Contact your system administrator.`

Use the **Terminate** component in attended automations to complete the automation execution. For more information about the component, Use the Terminate component.

To view detailed product logs, refer to the product logs.

Restrictions to launch an attended automation from ServiceNow forms

In the following scenarios, the execution of attended automations via ServiceNow forms are restricted when you select the UI action from the ServiceNow form:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When an automation is executing
- When an active child session (Desktop In Desktop) exists.
- If the automation is triggered by the same user and same bot process, local cache is used. If a change is made, close the Attended Robot application and relaunch it, so that the new change is reflected.

Configuring Attended Robot

You can plan and configure an Attended Robot implementation in your organization.

Configuration overview

Perform the following tasks to download the installation package and configure the Attended Robot after installation.

1. Download Attended Robot from RPA Hub.

   Select and download the Attended Robot application in your Windows machine from RPA Hub as a prerequisite for installing the application.

2. Install Attended Robot

   You can install the Attended Robot application in your Windows machine if you have the admin role.

3. Set up Attended Robot

   Establish a connection between the Attended Robot and the ServiceNow RPA Hub instance.

4. Connect to an RPA Hub instance from Attended Robot

   Establish a connection between the Attended Robot and ServiceNow RPA Hub instance to connect to an RPA Hub instance in three ways by using Connection Manager.

Using Guided Setup to implement Attended Robot

Guided Setup provides a sequence of tasks that help you configure Attended Robot. With Guided Setup, keep track of what you have completed, so you can stop and start again where you left off. To open Guided Setup for RPA Hub, navigate to **All** > **Robotic Process Automation** > **Administration** > **Guided Setup**.

For more information about using the guided setup interface, see Using guided setup.

Install Attended Robot

You can install the Attended Robot application in your Windows machine if you have the admin role.

Before you begin

Download and unzip the installation file for the Attended Robot application. For more information, see Download the RPA applications from RPA Hub.

Ensure that you meet the hardware and software requirements.

The following hardware specifications list the minimum and recommended resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hardware requirements

Resource	Minimum	Recommended
CPU	Intel Processor (1vCPU)	Intel Processor (4vCPU)
RAM	4-GB RAM	8-GB RAM
Disk space	Minimum 20-GB free disk space after installing the OS, patches, and base software	Minimum 50-GB free disk space after installing the OS, patches, and base software

Software requirements

The software requirements are:

- Operating system: Microsoft Windows 10 or Windows 11 or Windows Server 2016 or Windows Server 2019
- NET framework: Windows 4.7.1 or greater.
- DPI scaling setting must be deactivated.

Microsoft Edge WebView2 Runtime is a prerequisite for the ServiceNow login screen to work with RPA users. The Microsoft Edge WebView2 Runtime is installed by default with only specific releases of Windows 10 OS. If it is not available, ensure to install the Microsoft Edge WebView2 Runtime.

For more information about the Microsoft Edge WebView2 Runtime, see Delivering Microsoft Edge WebView2 Runtime to managed Windows 10 devices. For more information about downloading the Microsoft Edge WebView2 Runtime MSI, see Microsoft Edge WebView2.

Role required: admin

About this task

An attended robot is mapped to only one user.

Procedure

1. Locate and open the `Attended Robot.msi` file.
2. In the Welcome to the Attended Robot Setup Wizard dialog box, select **Next**.
3. In the Select Installation Folder dialog box, do one of the following actions to choose a folder:
   - To install the application in the default folder, select **Next**.
   - To install the application in a different folder, select the folder location in the **Folder** field or select **Browse** to select the folder, and then select **Next**.
4. In the Confirm Installation dialog box, select **Next** to start the installation.
5. After the installation is complete, in the Installation Complete dialog box, select **Close** to exit.

Result

You can see the Attended Robot icon on your desktop.

What to do next

Set up the Attended Robot application. For more information, see Set up Attended Robot.

Set up Attended Robot

Establish a connection between the Attended Robot and the ServiceNow RPA Hub instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Watch this video to learn about the configuration of Attended Robot.

https://player.vimeo.com/video/1031638416?h=fef777a493&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Install the Attended Robot. For more information, see Install Attended Robot.

Role required: none

About this task

Do this task when you're setting up the Attended Robot for the first time unless you're changing the RPA Hub instance.

If the Attended Robot is launched when the RPA Desktop Design Studio is open in your Windows machine and a new profile is added to the Attended Robot Connection Manager, it does not reflect in the RPA Desktop Design Studio Connection Manager. If a new profile is added to the RPA Desktop Design Studio Connection Manager, the entry that you added in the Attended Robot Connection Manager is overwritten. In such scenarios, restart RPA Desktop Design Studio when a profile is added in the Attended Robot Connection Manager.

Procedure

1. From your desktop, double-click the Attended Robot icon ( ).
2. In the Connection Manager dialog box, to add a new RPA Hub, select **Add New**.
   Do this step when you're setting up the Attended Robot for the first time unless you're changing the RPA Hub instance.
3. In the Add ServiceNow Instance Details dialog box, fill in the fields.

ServiceNow Instance Details dialog box

Field	Action
Name	Name of your ServiceNow RPA Hub instance. For example, `New Instance`
URL	Enter the ServiceNow RPA Hub instance URL. For example, `https://<instance name>.service-now.com/`.
Mark as default	Option to enable this instance as the default instance. Clearing this option opens the Connection Manager dialog box each time you double-click the Attended Robot icon.
Launch in default browser	Option to launch the login screen in the default browser. The Attended Robot is successfully connected to the instance after you have authenticated using the username and password.

4. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** To add the settings for an internet connection as per your company policies, do the following steps:

   a. In the Connection Manager dialog box, in the Proxy Settings section, fill in the fields.

   Connection Manager dialog box

Field	Action
Server Address	Enter the proxy server URL.
Name	Enter your user name.
Password	Enter the password.
Save Password	Option to save the password.

   b. Select **Save**.

6. In the Connection Manager dialog box, in the RPA Hub section, select an RPA Hub instance.
7. In the ServiceNow dialog box, do any of the following actions:
   - To set up the Attended Robot for the first time, select **Proceed**.
   - To change the RPA Hub instance, select **Connect**.
8. Enter your user name and password.
   If you have selected the **Launch in default browser** option, the login screen appears in the default browser.
9. **Optional:** From the Domain list, select a domain.
10. Select **Log in**.
11. In the Connection Manager dialog box, set the permission for the Attended Robot application to connect to your ServiceNow instance and access data.
    - To allow Attended Robot to connect to your ServiceNow instance and access data, select **Allow**.
    - To prevent Attended Robot from connecting to your ServiceNow instance and accessing data, select **Deny**. You won't be able to proceed further.

What to do next

Run an Attended Robot to execute the attended bot process. For more information, see Run an automation using Attended Robot.

Connect to an RPA Hub instance from Attended Robot

Connect to an RPA Hub instance in three ways by using the Connection Manager so that you can establish a connection between the Attended Robot and ServiceNow RPA Hub instance.

Before you begin

Establish a connection between the Attended Robot and ServiceNow RPA Hub instance. For more information, see Set up Attended Robot.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To connect to an RPA Hub instance, do any of the following actions in the Connection Manager dialog box.

2. In the Connection Manager dialog box, set the permission for the Attended Robot application to connect to your ServiceNow instance and access data.
   - To allow Attended Robot to connect to your ServiceNow instance and access data, select **Allow**.
   - To prevent Attended Robot from connecting to your ServiceNow instance and accessing data, select **Deny**. You won't be able to proceed further.

Disconnect from an RPA Hub instance in Attended Robot

Disconnect anytime from an RPA Hub instance while using the Attended Robot.

Before you begin

Connect to an RPA Hub instance. For more information, see Connect to an RPA Hub instance from Attended Robot.

Role required: none

Procedure

In the Attended Robot dialog box, select **Disconnect**.

Using Attended Robot

You can use the Attended Robot to execute the attended automations.

Run an automation using Attended Robot

Run an attended robot to execute the attended bot process (attended automations).

Before you begin

Create a package. For more information, see Create a package to assign to a bot process.

Ensure that the licenses are available. For more information, see License distribution in RPA Hub.

If the auto assignment system property `sn_rpa_fdn.allow_rda_robot_auto_assignment` is false, the attended robot record must be available for the assigned RPA Assisted User. If the auto assignment system property is true, attended robots license must be available to auto create attended robot record at the time of automation execution. For more information about this system property, see Configure RPA Hub properties.

Create a bot process. Select the **Process Type** field as **Attended** on the Bot process form, while you are creating a bot process. For more information, see Configuring a bot process record in RPA Hub and Bot Process form in RPA Hub.

Ensure that the following conditions are met to execute a robot:

- The life cycle stage status of the associated bot process must be **Published**.
- The life cycle stage status of the executing robot must be **In-Use**.

Assign an attended user or a group to an attended bot process. For more information, see Assign an attended user or group to an attended bot process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Establish a connection between the Attended Robot and ServiceNow RPA Hub instance. For more information, see Set up Attended Robot.

Ensure that you meet the infrastructure requirements for running the Desktop In Desktop:

The minimum requirements are as follows:

- Intel Processor (1vCPU)
- 8-GB RAM
- Minimum 20-GB free disk space (after installing OS, patches, and base software).
- Microsoft Windows 10 or Windows Server 2016 or Windows Server 2019
- .NET Framework 4.7.1 or higher
- DPI scaling setting must be deactivated.

The recommended requirements are as follows:

- Intel Processor (4vCPU)
- 16-GB RAM
- Minimum 50-GB free disk space (after installing OS, patches, and base software).
- Microsoft Windows 10 or Windows Server 2016 or Windows Server 2019
- .NET Framework 4.7.1 or higher
- DPI scaling setting must be deactivated.

Role required: sn_rpa_fdn.rpa_assisted_user and snc_internal

Note:
If the Attended Robot tries to connect to an Federal Information Processing Standards (FIPS)-enabled instance, the robot user must have the `snc_internal` role.

About this task

You can run an automation using an attended robot in two ways. Do these tasks after you establish a connection between the Attended Robot and ServiceNow RPA Hub instance. For more information, see Set up Attended Robot.

Procedure

1. In the Attended Robot dialog box, select the attended bot process that you want to run.
   Bot processes with Embedded Task Automation enabled are not displayed in this list. For more information, see Embedded Task Automation in RPA Hub.
2. To run an attended robot, do any one of the following actions.

3. **Optional:** To stop an attended robot, do the following actions:
   a. Select the stop icon ( ).
   b. In the Confirmation dialog box, select **Yes**.

Now Assist for RPA Hub

Use the Now Assist for RPA Hub application to transform your automation development process. You can create automations, activities, and automation logic additions from text instructions and preview options.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available LLMs

You can use Now LLM Service, Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for RPA bot generation skill. You can set skill-level preferences in the Now Assist Admin console. For more information, see Large language models on the ServiceNow AI Platform®.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about scripts (and associated script records) in which Now Assist for code generation is called. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Now Assist for Creator

Exploring Now Assist for RPA Hub

With the Now Assist for RPA Hub application, your RPA Desktop Design Studio users can create and edit automations, activities, and automation logic additions from text instructions and preview options.

Now Assist for RPA Hub overview

The Now Assist for RPA Hub application offers generative AI capabilities to transform your automation development process. The following generative AI capabilities are available for RPA Desktop Design Studio users:

- Build simple, brand-new automations quickly and efficiently.
- Easily add new activities to existing automations, ensuring modularity and scalability.
- Enhance the automation logic with text instructions, either in an empty activity or by selecting a component in an existing one.

Both new and experienced users can develop and build faster automation by using the Now Assist for RPA Hub application.

Now Assist for RPA Hub skills

The Now Assist for RPA Hub application includes the generative AI skills that enable RPA Desktop Design Studio users to create or edit automations, activities, and add automation logic from text instructions and preview options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RPA bot generation skill

The RPA bot generation skill helps users to build an automation that is based on text input.

The skill enables citizen developers to participate in the automation development process. Citizen developers can contribute their domain expertise and knowledge of business processes to create automation flows. A citizen developer can quickly and easily create automation flows by describing the task or process in natural language via text. No in-depth technical knowledge of Robotic Process Automation (RPA tools) or programming languages is needed, which makes automation accessible to a wider audience.

The RPA bot generation skill streamlines the process of creating workflows, reducing the time and effort required to implement RPA solutions. An automation flow can be generated in minutes rather than hours or days, accelerating the time-to-value.

By generating automation flows through text-based descriptions, RPA becomes more approachable for individuals and businesses who may not have prior experience with automation or coding.

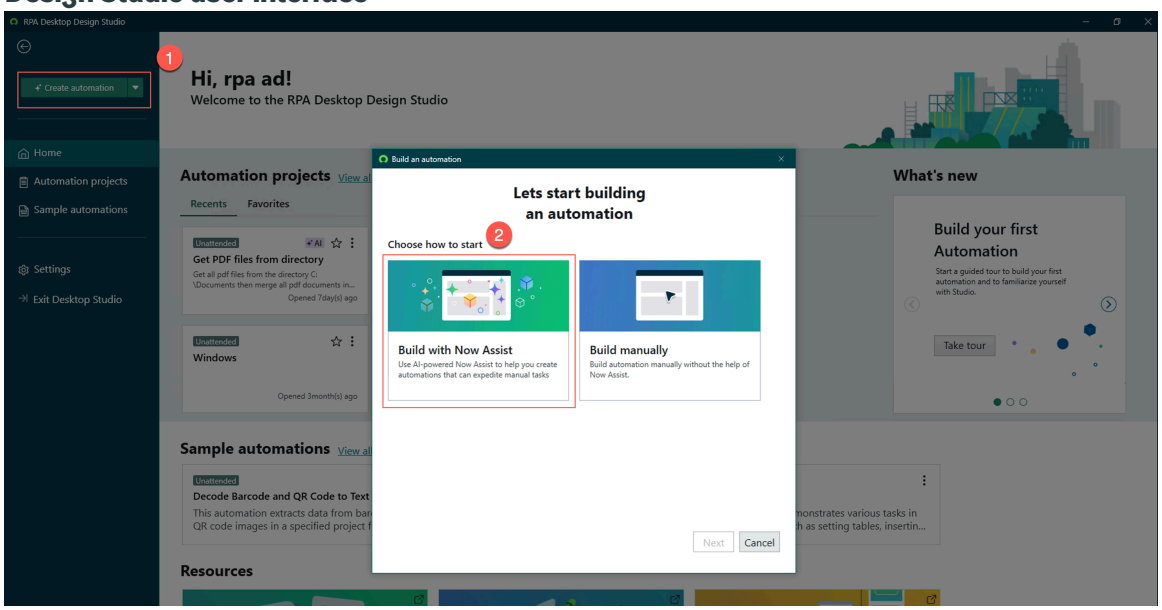
Access the RPA bot generation skill from the RPA Desktop Design Studio user interface.

By using the RPA bot generation skill, your users can perform the following tasks:

- Create an automation from text instructions and preview the options from the RPA Desktop Design Studio user interface. First, your user selects the **Create automation** option and then selects the **Build with Now Assist** option to get started. For more information, see Create an automation with Now Assist.

  The following example shows how an automation is created with the Now Assist in the RPA Desktop Design Studio user interface.

  Create an automation with Now Assist from the RPA Desktop Design Studio user interface

- Create an activity from the text instructions and preview options. For more information, see Create an activity with Now Assist.

Supporting information for Now Assist for RPA Hub

Get a quick overview of the important information that is related to the Now Assist for RPA Hub application.

Supported versions

Now Assist for RPA Hub 3.2 is supported from Yokohama release 13.1.

Now Assist for RPA Hub 2.1 is supported from Xanadu release 10.2.

Supported user interfaces

To build automations using Now Assist, install the Now Assist for RPA Hub and then activate the RPA bot generation skill. For more information, see Configure Now Assist for RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Now Assist for RPA Hub application includes the skills that are listed in the following table.

Now Assist for RPA Hub skills supported interfaces

Interface	Skill supported
RPA Desktop Design Studio - Create an automation with Now Assist	RPA bot generation
RPA Desktop Design Studio - Create an activity with Now Assist	
RPA Desktop Design Studio - Build an automation with Now Assist	

Licensing requirements

The Now Assist for RPA Hub application requires a Workflow Data Fabric (previously known as Automation Engine) license and a Now Assist for Creator license.

Application information

Activate the Now Assist for RPA Hub store app (com.sn_rpa_na) to use the RPA bot generation skill.

This store app has the following dependencies:

- RPA Hub (com.sn_rpa_fdn)
- Now Assist for Creator (com.sn_now_creator)

Robotic Process Automation (RPA) bot generation

Use the RPA bot generation skill to create automations, activities, and automation logic additions from text instructions and preview options. RPA developer (sn_rpa_fdn.rpa_developer) or RPA admin (sn_rpa_fdn.rpa_admin) roles are required to use this skill.

These roles contain the Now Assist Admin user role (sn_nowassist_admin.user).

Activation

Install the Now Assist for RPA Hub application from the ServiceNow Store website. For more information, see Configure Now Assist for RPA Hub.

Then, turn on the RPA bot generation skill to use generative AI for creating automations and activities, and extending automation logic. For more information, see Turn on the RPA bot generation skill.

You must have a subscription for Now Assist for Creator and RPA Hub applications. For more information, see Supporting information for Now Assist for RPA Hub.

Example instructions

The following examples show how you can create automations, activities, and automation logic additions.

Example instruction 1: Retrieve and process meeting emails

You can use this instruction to create an automation for retrieving and processing meeting emails in Microsoft Outlook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Retrieve a list of meeting-related emails from the
'Calendar' folder in Outlook. For each email, store
all attachments in a separate folder named 'Meeting
Attachments'. Lastly, mark the email as read.
```

Example instruction 2: Split and convert PDF pages to excel

You can use this instruction to create an automation for splitting and converting PDF pages to Microsoft Excel.

```
Split each page of a PDF into a separate PDF files into
the folder path 'C:\Users\Input', then retrieve all files
from this folder, now iterate over each file then convert
each PDF document into an Excel.
```

Example instruction 3: Add property to JSON object

You can use this instruction to create an automation for adding a property to a JSON object.

```
I have a sample JSON object represented as a string as
follows: { "name": "Jane Doe", "id": 12345" } I want to
add a new property called "Designation" and set its value
to "Engineer".
```

Example instruction 4: Find and replace text in a Word document

You can use this instruction to create an automation for finding and replacing text in a Microsoft Word document.

```
Open a word document, find and replace the value #NAME
with 'ServiceNow' in the word document. Save the word
document at 'C:\Users\Desktop\test.docx'.
```

Example instruction 5: Modify and export data as CSV

You can use this instruction to create an automation for modifying and exporting data as a CSV file.

```
Load a DataTable from the list, set the name of the
first column to 'Name', and update the row data. Finally,
export the table as a CSV file.
```

Example instruction 6: Generate and send excel data as PDF

You can use this instruction to create an automation for generating and sending the Microsoft Excel data as a PDF in an email via Microsoft Outlook.

```
Open Excel from 'C:\Reports\Sales
\Monthly_Sales_Data.xlsx'. Generate a chart based on
sales data in sheet named Saleschart and then save
this excel sheet as a PDF document at 'C:\Reports\Sales
\Reports\Monthly_Sales_Data.pdf'. Now send an email to
team@xyz.com using Outlook.
```

Example instruction 7: Extract and summarize work emails with attachments

You can use this instruction to create an automation for extracting and summarizing work emails with attachments.

```
Extract a list of work related emails from outlook
with attachments from the 'Projects' folder. Save
all the attachments to a designated folder on your
system. Generate a summary email listing all the saved
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
attachments and their respective emails. Send this email
to the project manager.
```

Example instruction 8: Split and read PDF pages

You can use this instruction to create an automation for splitting and reading PDF pages.

```
Load a PDF file from the 'C:\input\test.pdf', split the
PDF file, save them to 'C:\output folder', generate one
PDF for each page, and then read the text from the first
page.
```

Example instruction 9: Fetch and save unread emails

You can use this instruction to create an automation for fetching and saving unread emails.

```
Fetch all the unread mails from the 'AI-inbox' folder of
the email account. Iterate through each email and save
the mail to the folder 'C:\Mails'.
```

Example instruction 10: Retrieve and set application credentials

You can use this instruction to create an automation for retrieving and setting application credentials.

```
From the ServiceNow instance, get the application
credentials for the app named 'SAP' application. Now,
set the value into the Username field and password field.
Then, click on the login element.
```

General guidelines

Follow these general guidelines when writing Now Assist instructions:

Be clear and specific

State exactly what you want. Use direct and clear sentences for the expected actions.

Avoid vague language

Don't use jargon or abbreviations. Avoid ServiceNow jargon, such as FD - Flow Designer. For example, avoid instructions such as `Trigger a FD action named 'Action1', retrieve its output, and insert it into an existing Word`. Instead, use the phrase `Trigger a flow designer action named 'Action1', retrieve its output, and insert it into an existing Word file located at 'C:\Users\Worddocs\wordoc1.doc'`.

Avoid ambiguity

Be specific for the context related to methods. For example, avoid instructions such as `Open file from file path 'C:\Users\Analysis\DataAnalysis.xlsx'`. Instead, use the phrase `Open an excel file from file path 'C:\Users\Analysis\DataAnalysis.xlsx'`.

Set expectations and constraints

Specify component parameters wherever possible. For example, avoid instructions such as `Read the content of the file located in C drive and copy that content as the body of an email and then send it to 'email@ss.ss'`. Instead, use the phrase `Read the content of the file 'c:/d/f1/txt', and use the content as body to`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
compose an outlook email with subject "my email text",
and send this email to 'email@ss.ss'.
```

Use step-by-step instructions

Break down complex tasks into smaller, manageable steps. For example, use the phrase, `Open a Microsoft Word document located at 'C:\Marketing\Templates\Promo_Letter_Template.docx.', delete a specific page based on its index, add a new column to a table at a particular position, and close the document with changes saved` to make it clear and simple.

Limitations of the RPA bot generation skill

For more information about the limitations of the Robotic Process Automation (RPA) bot generation skill, see Limitations of Robotic Process Automation (RPA) bot generation skill.

Accessing the generative AI capability in RPA Desktop Design Studio

If you log in to the RPA Desktop Design Studio with either RPA Developer or RPA Admin after enabling the RPA bot generation skill, the generative AI capability is available. In this scenario, you can create and edit automations, activities, and extend automation logic flow through text instructions and preview options.

If you log in to the RPA Desktop Design Studio with a role other than RPA Developer or RPA Admin after enabling the RPA bot generation skill, the generative AI capability will not be available. In this scenario, you will not be able to create and edit automations, activities, or extend automation logic flow through text instructions and preview options.

If you log in to the RPA Desktop Design Studio with a role other than RPA Developer or RPA Admin and then switch to one of these roles, you won't be able to access the generative AI capability. Restart the RPA Desktop Design Studio and log in with RPA Admin or Developer.

If you log in to the RPA Desktop Design Studio with either RPA Developer or RPA Admin, and then switch to any other user roles apart from these, you will encounter an error message when attempting to access the generative AI capability.

Related topics

Configure Now Assist for RPA Hub

If you have the admin role, you can configure the Now Assist for RPA Hub application so that your human agents or users can get started with developing automations faster.

Before you begin

- Review the Now Assist for RPA Hub application listing in ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Perform these steps in your ServiceNow instance.
- Role required: admin

About this task

Important:
The Now Assist for RPA Hub requires a separate subscription to Now Assist for Creator.

Refer to the Now Assist Overview to see the prebuilt skills that exist and are currently available for purchase in ServiceNow Now Assist packages and to review the number of assists consumed.

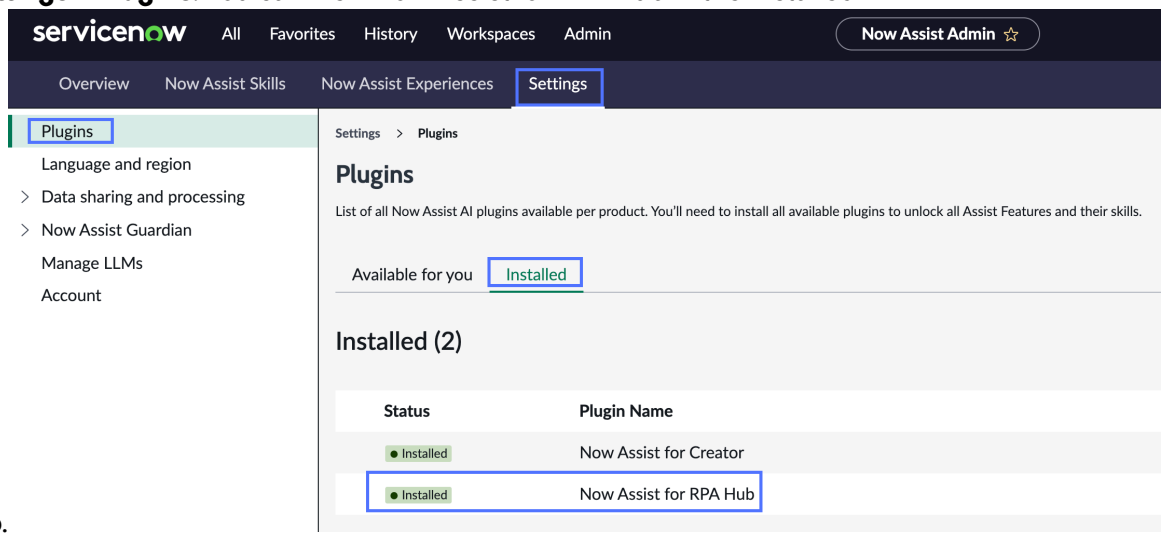
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

Perform any of the following tasks to install the Now Assist for RPA Hub application.

Result

To view the installed plugins, navigate to **All** > *Now Assist Admin* > **Settings** > **Plugins**. You can view Now Assist for RPA Hub in the Installed tab.



What to do next

If you are upgrading to the Yokohama Patch 3 release, reindex the data source. For more information, see Perform a full table index or reindex for multiple AI Search indexed sources. In the step 2 of this procedure, select the indexed source as RPA Component [sn_rpa_na_rpa_component].

Turn on the Robotic Process Automation (RPA) bot generation skill to use generative AI to create automations, activities, and automation logic additions from text instructions and preview options. For more information, see Turn on the RPA bot generation skill.

Turn on the RPA bot generation skill

Turn on the Robotic Process Automation (RPA) bot generation skill to use generative AI to create automations, activities, and automation logic additions from text instructions and preview options.

Before you begin

- Install the Now Assist for RPA Hub application to add the generative AI capability. For more information, see Configure Now Assist for RPA Hub.
- Perform these steps in your ServiceNow instance.
- Role required: sn_nowassist_admin.nsa_admin or sn_skill_builder.admin

About this task

Important:
The Now Assist for RPA Hub requires a separate subscription to Now Assist for Creator.

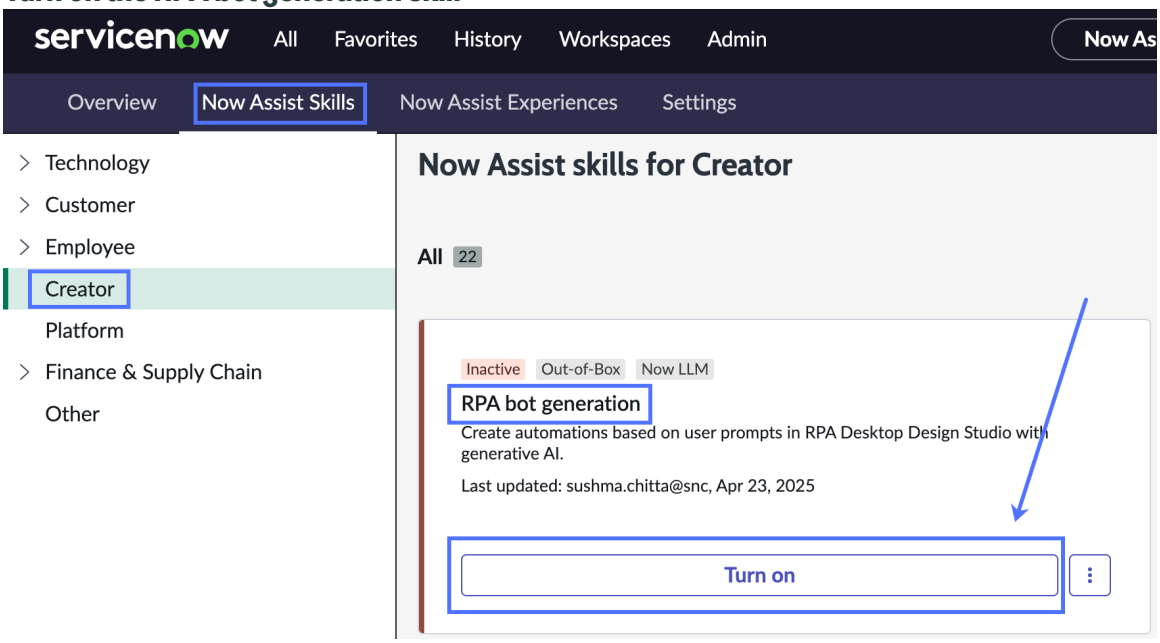
Procedure

1. Navigate to **All** > *Now Assist Admin* > *Now Assist* **Skills**.
2. In the workflow list, select **Creator**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the RPA bot generation card, select **Turn on**.

Turn on the RPA bot generation skill



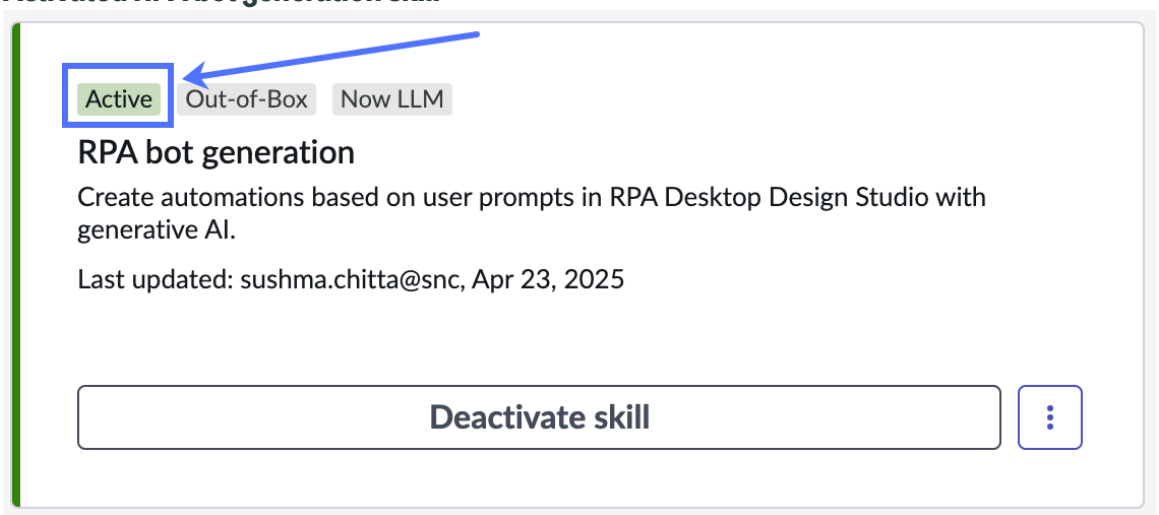
You view a dialog box with the message "Successfully activated".

4. On the Successfully activated dialog box, select **Back to skills**.
5. On the RPA bot generation card, verify that the RPA bot generation skill is activated.

Result

The following example shows that the RPA bot generation card displays the skill as active.

Activated RPA bot generation skill



What to do next

After activating the RPA bot generation skill, RPA Desktop Design Studio users must relaunch the RPA Desktop Design Studio application to apply the modified settings.

Using Now Assist for RPA Hub

If you're a RPA Desktop Design Studio user, you can create automations, activities, and automation logic additions from text instructions and preview options by using the Now Assist for RPA Hub application.

Perform the following tasks by using the RPA Desktop Design Studio application.

1. Create an automation with Now Assist.

   Create automations from text instructions and preview options by using generative AI.

2. Create an activity with Now Assist.

   Create activities from text instructions and preview options by using generative AI. Activities provide modularity to an automation project in RPA Desktop Design Studio.

3. Build an automation with Now Assist.

   Enhance the automation logic, starting from the components or from an empty design surface, that is based on text instructions by using generative AI.

Create an automation with Now Assist

Create an automation from text instructions and preview options by using the Now Assist for RPA Hub application.

Before you begin

Set up the RPA Desktop Design Studio application and add the ServiceNow instance details. For more information, see Set up RPA Desktop Design Studio.

To access the Now Assist for RPA Hub feature in RPA Desktop Design Studio, perform the following steps:

- Install the Now Assist for RPA Hub application to add the generative AI capability. For more information, see Configure Now Assist for RPA Hub.
- Turn on the RPA bot generation skill to use the generative AI capability. For more information, see Turn on the RPA bot generation skill.
- After activating the RPA bot generation skill, relaunch the RPA Desktop Design Studio application to apply the modified settings.

If you skip these steps, the Now Assist for RPA Hub feature doesn't appear in RPA Desktop Design Studio.

Familiarize yourself with the RPA bot generation skill concepts. For more information, see Robotic Process Automation (RPA) bot generation.

Role required: sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin

About this task

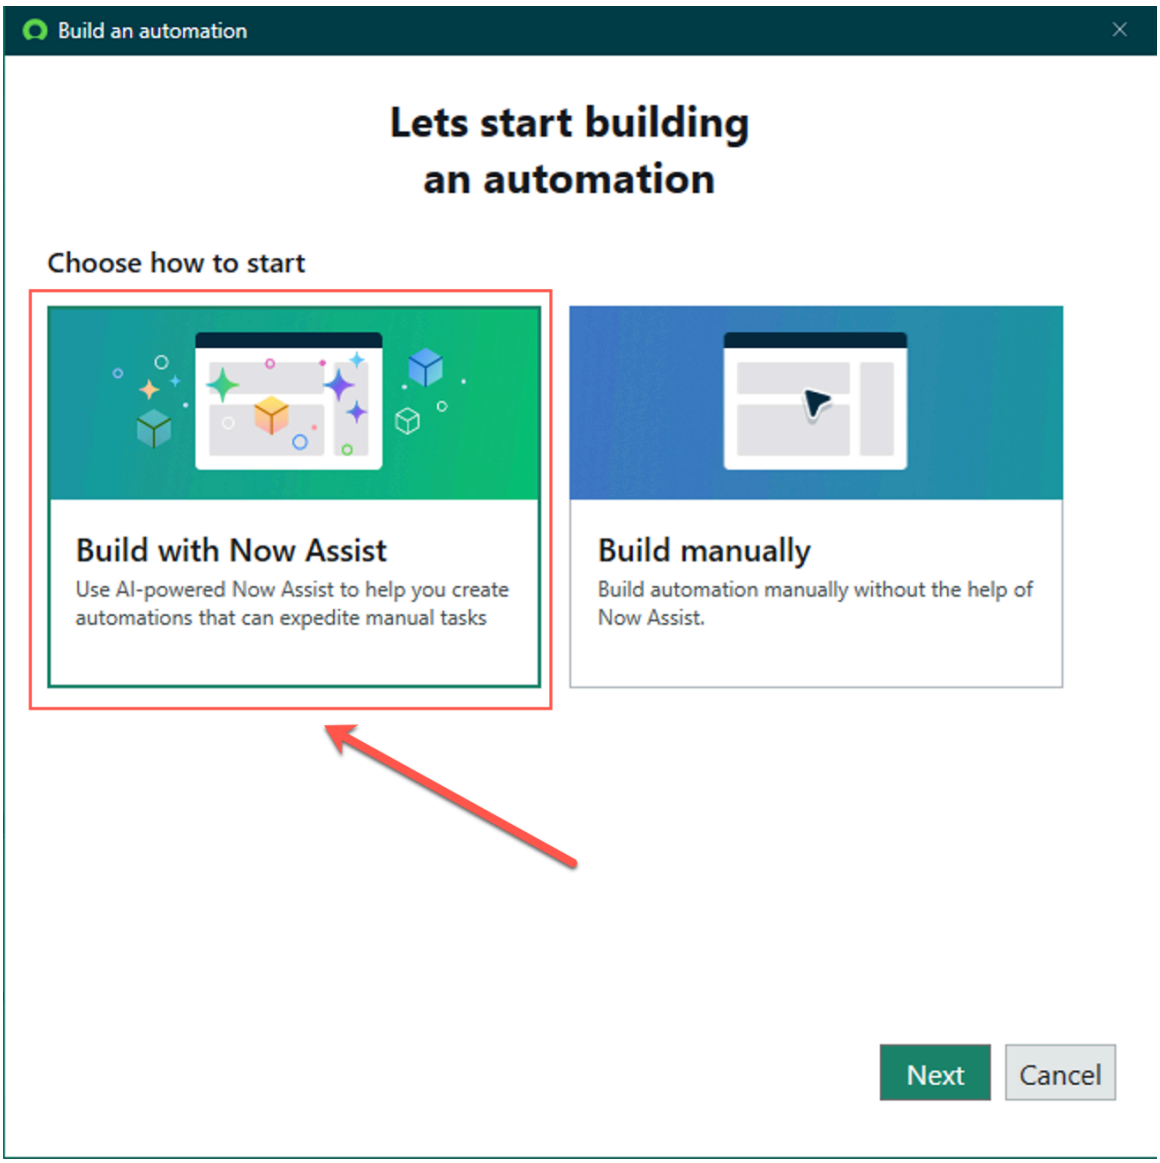
To create an automation project manually, see Create an automation project manually.

Procedure

1. On the RPA Desktop Design Studio home page, select **Create Automation**.
2. In the Build an automation window, select the **Build with Now Assist** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Build with Now Assist



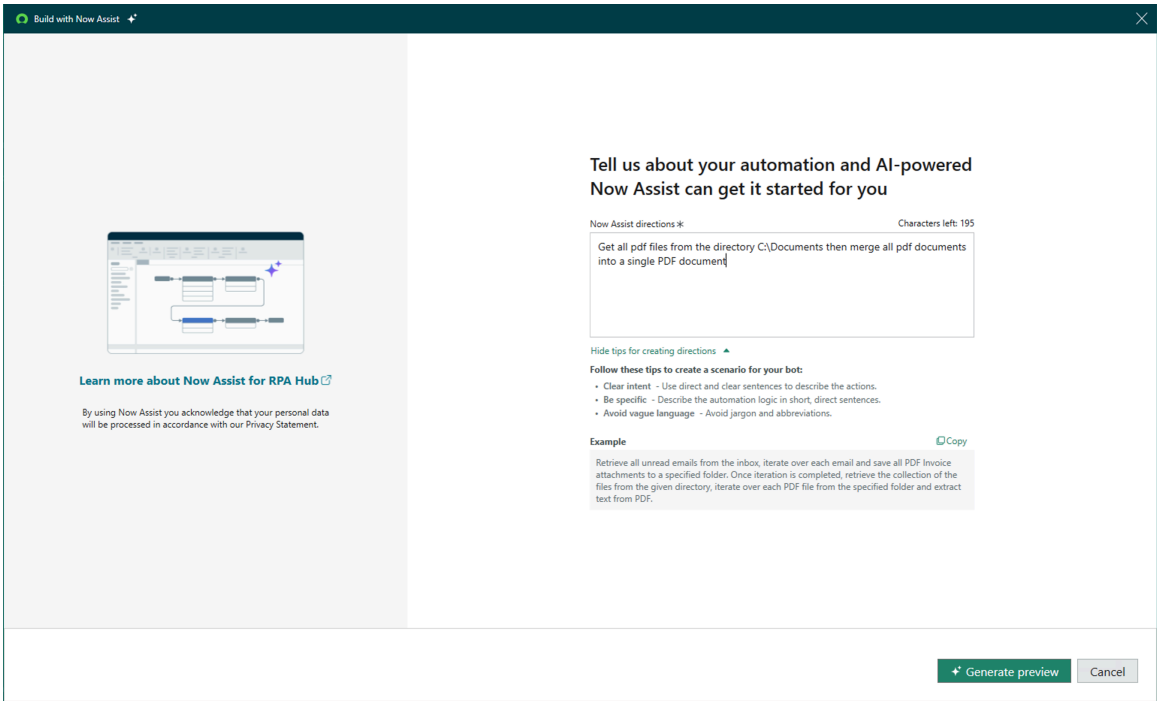
3. Select **Next**.
4. In the Build with Now Assist window, enter the Now Assist instructions.

   The instruction text is used by the RPA bot generation skill to create your automation. Use short, direct, and clear sentences to describe the expected actions. Be specific and provide detailed descriptions of the automation logic. Avoid jargon and abbreviations.

   The following example shows that the Now Assist instructions are provided so that you can build an automation to get PDF files from a location and then merge all PDF documents into a single PDF document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Build with Now Assist window



An example instruction is displayed for your reference.

Note:

For more information on example instructions and general guidelines for writing Now Assist instructions, see Robotic Process Automation (RPA) bot generation. For more information about the limitations of the RPA bot generation skill, see Limitations of Robotic Process Automation (RPA) bot generation skill.

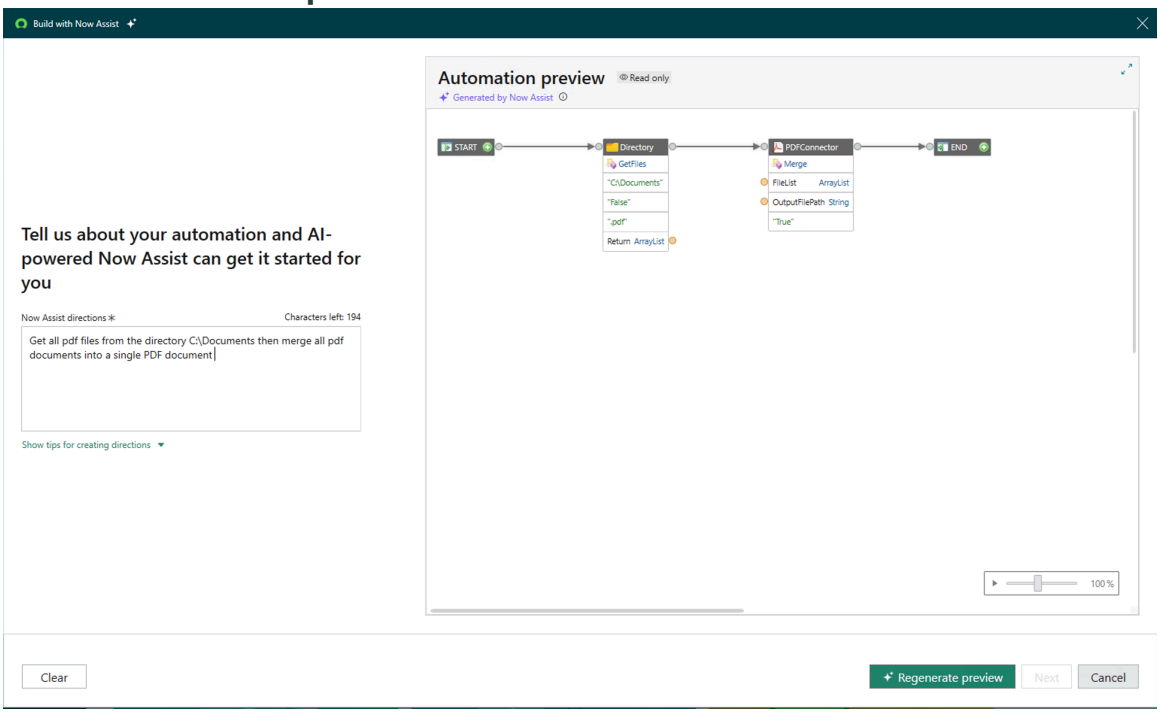
5. Select **Generate preview**.
6. **Optional:** In the Build with Now Assist window, regenerate a preview, clear the workflow, stop creating an automation, or select next if you like the automation preview.

Note:

You can't make any changes In the Automation preview screen because it's read-only. You can maximize it and use the scroll options to view the entire generated automation workflow.

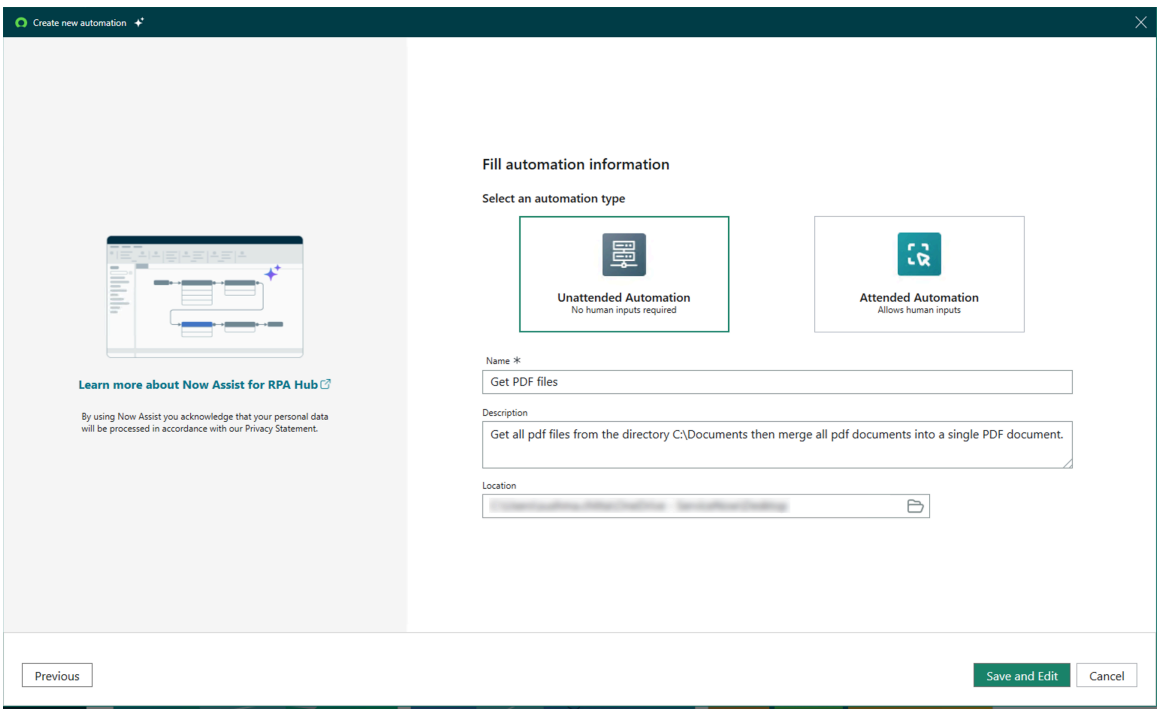
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Build with Now Assist options



7. In the Create new automation window, fill in the fields.

Create new automation window



Note:

If your instruction generates a workflow with components that aren't compatible with the selected automation type, those components show up as unknown in the generated workflow. For example, if your workflow includes a GracefulStop component and you select **Attended Automation**, the GracefulStop component appears as unknown because it's not supported in the attended automations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an automation form

Field	Description
Select an automation type	Type of automation. Select either **Unattended Automation** or **Attended Automation**. An unattended automation doesn't require human supervision and can be used for highly repetitive tasks. For example, an unattended robot can seamlessly perform copy and paste operations into a Microsoft Excel file, streamlining data entry in a Customer Relationship Management (CRM) system without any human input. An attended automation requires human supervision. For example, in a contact center, robots are used as user assistants. They're installed on an operator's workstation and are triggered by human operators on demand.
Name	Name of the unattended or attended automation project.
Description	Description of the unattended or attended automation project.
Location	Location of the automation project or the default location.

8. Select **Save and Edit**.

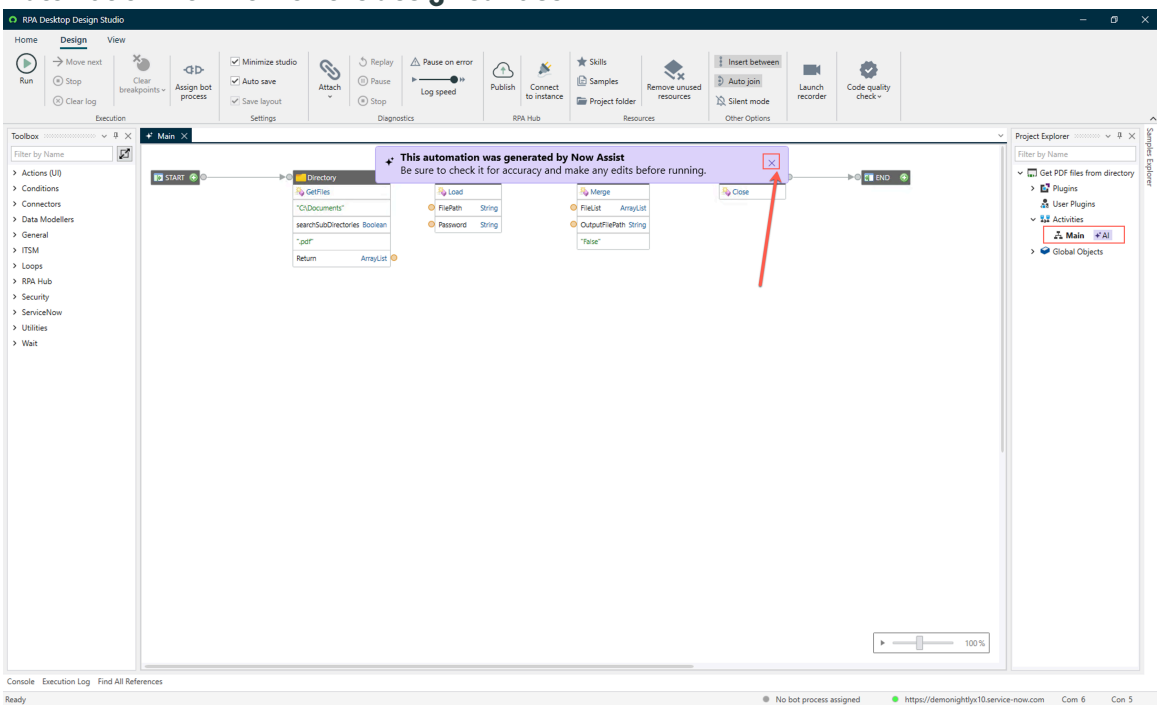
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The automation is generated by Now Assist. Be sure to check it for accuracy and make any edits before running.

Close the displayed message for a clearer view.

Automation workflow on the design surface



Result

The automation flow is launched on the design surface and it's added as a Main activity in Activities.

Create an activity with Now Assist

Create activities from text instructions and preview options by using the Now Assist for RPA Hub application. Activities provide modularity to an automation project in RPA Desktop Design Studio.

Before you begin

Set up the RPA Desktop Design Studio application and add the ServiceNow instance details. For more information, see Set up RPA Desktop Design Studio.

To access the Now Assist for RPA Hub feature in RPA Desktop Design Studio, perform the following steps:

- Install the Now Assist for RPA Hub application to add the generative AI capability. For more information, see Configure Now Assist for RPA Hub.
- Turn on the RPA bot generation skill to use the generative AI capability. For more information, see Turn on the RPA bot generation skill.
- After activating the RPA bot generation skill, relaunch the RPA Desktop Design Studio application to apply the modified settings.

If you skip these steps, the Now Assist for RPA Hub feature doesn't appear in RPA Desktop Design Studio.

Familiarize yourself with the RPA bot generation skill concepts. For more information, see Robotic Process Automation (RPA) bot generation.

Role required: sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin

About this task

Activities are a reusable set of instructions that are designed for an automation on the Design surface of RPA Desktop Design Studio. Activities are used to segregate the entire automation into smaller chunks for easier comprehension of the automation logic.

You can design automation workflows in an activity on the Design surface by using various components.

Each activity contains two components by default: Start and End. These components can't be deleted because they're the starting and ending points of the activity.

You can reuse each activity multiple times within the same automation project by dragging the activity to the Design surface. You can also import activities in different automation projects.

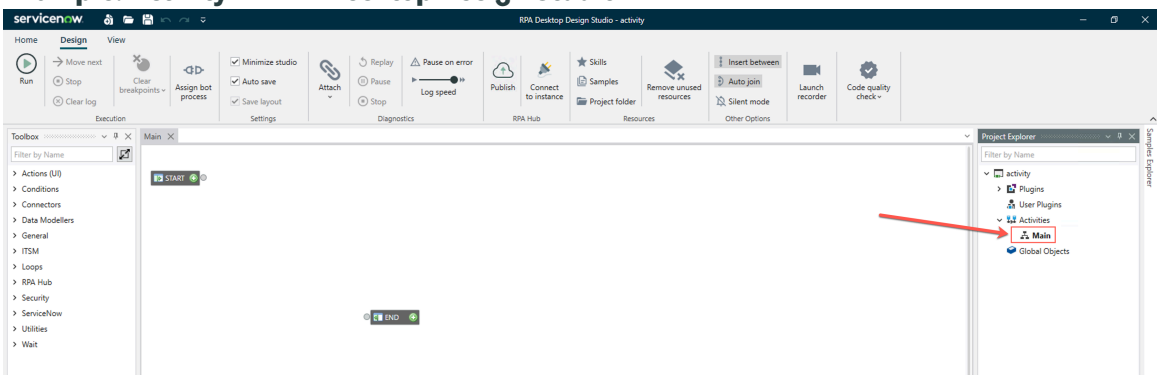
To create an activity manually, see Create and use an activity in RPA Desktop Design Studio.

Procedure

1. In the Project Explorer pane of RPA Desktop Design Studio, navigate to **Activities**.

   The Activities section lists all the activities that are created in each project. By default, a Main activity is created when a new project is initiated. The automation execution starts from the startup activity, in this case, Main activity, as shown in the following example.

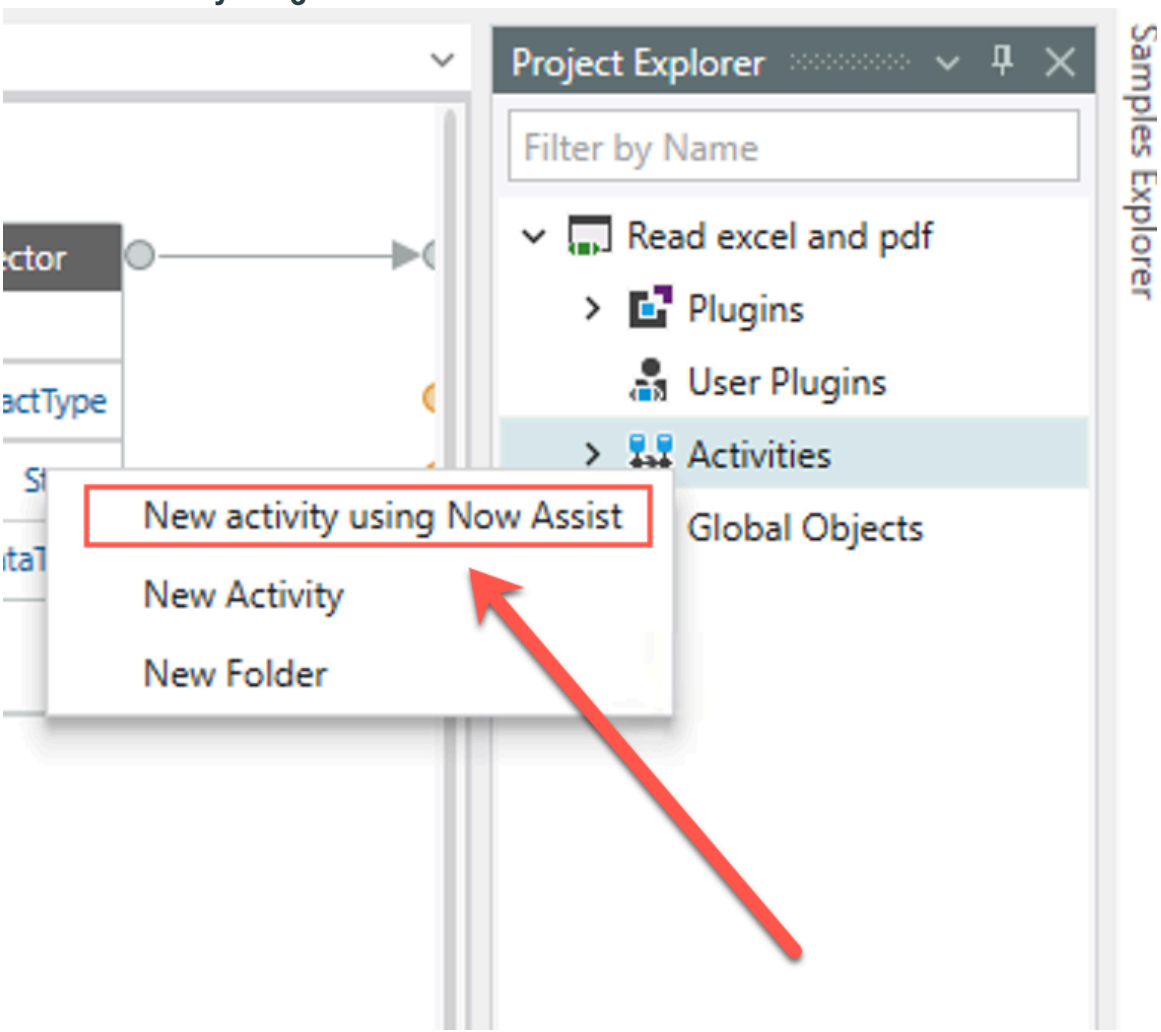
   Example: Activity in RPA Desktop Design Studio

2. In the Project Explorer pane, right-click **Activities** and select **New activity using Now Assist**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an activity using Now Assist



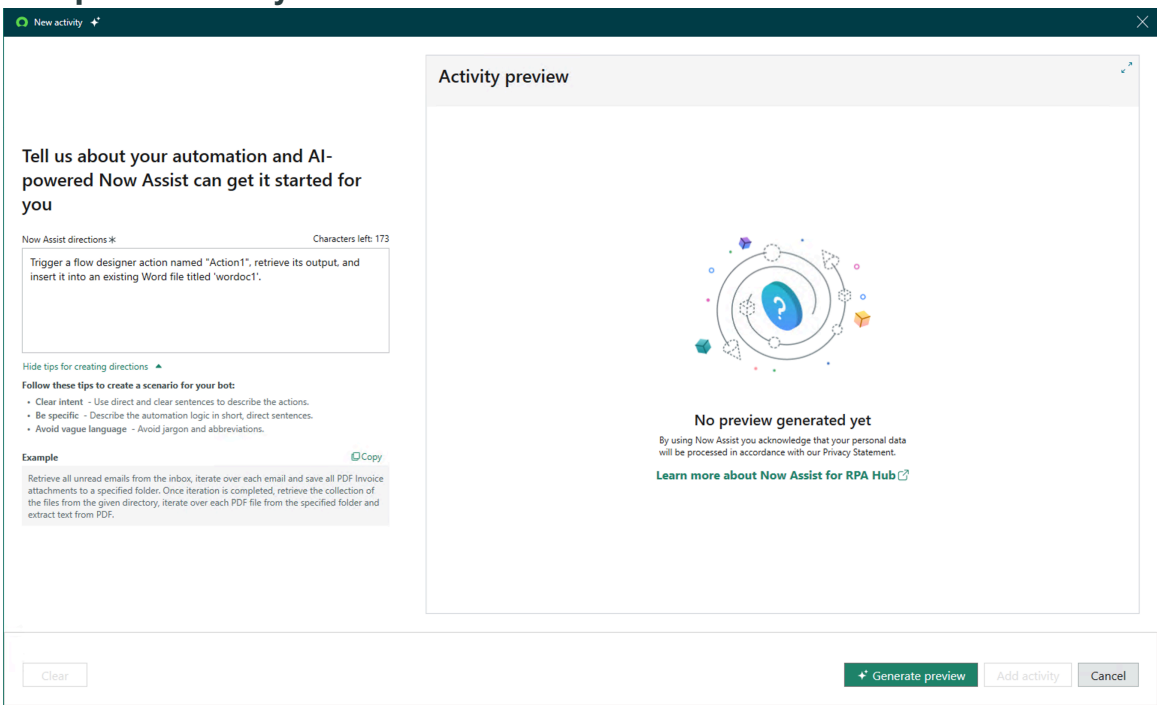
3. In the New activity window, enter the Now Assist instructions.

   The instruction text is used by the RPA bot generation skill to create your automation. Use short, direct, and clear sentences to describe the expected actions. Be specific and provide detailed descriptions of the automation logic. Avoid jargon and abbreviations.

   The following example shows that the Now Assist instructions are provided to build an automation to trigger a flow designer, retrieve the output, and insert it into an existing Microsoft Word document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: New activity window



Note:

For more information on example instructions and general guidelines for writing Now Assist instructions, see Robotic Process Automation (RPA) bot generation. For more information about the limitations of the RPA bot generation skill, see Limitations of Robotic Process Automation (RPA) bot generation skill.

4. Select **Generate preview**.
5. **Optional:** In the New Activity window, regenerate a preview, clear a workflow, cancel an automation, or add an activity.

Note:

(Optional) You can't make any changes In the Activity preview screen because it's read-only. You can maximize it and use scroll options to view the entire generated automation workflow.

If your instruction generates a workflow with components that aren't compatible with the current project type, those components show up as unknown in the generated workflow. For example, if your workflow includes a GracefulStop component and if the current project is attended automation, the GracefulStop component appears as unknown because it's not supported in the attended automations.

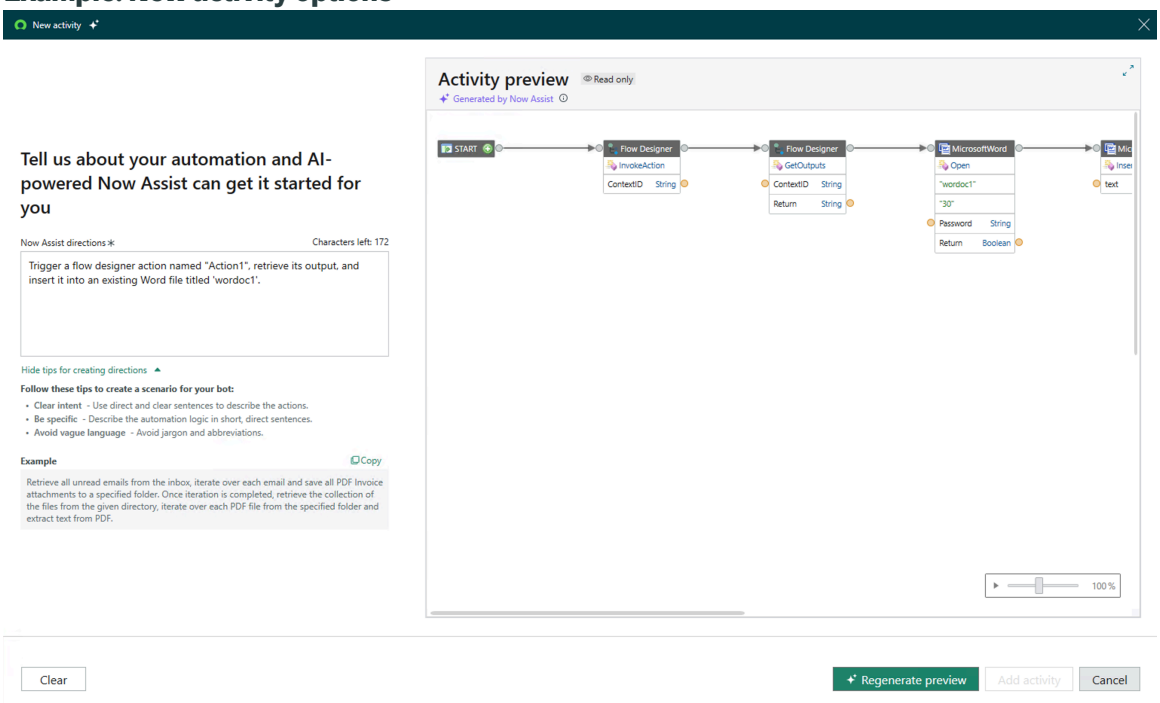
Example: New activity options



Result

The automation flow is added as a New Activity in Activities.

What to do next

For more actions on the activity, see Create and use an activity in RPA Desktop Design Studio.

Build an automation with Now Assist

Enhance the automation logic with text instructions, either in an empty activity or by selecting a component in an existing one by using the Now Assist for RPA Hub application.

Before you begin

Set up the RPA Desktop Design Studio application and add the ServiceNow instance details. For more information, see Set up RPA Desktop Design Studio.

To access the Now Assist for RPA Hub feature in RPA Desktop Design Studio, perform the following steps:

- Install the Now Assist for RPA Hub application to add the generative AI capability. For more information, see Configure Now Assist for RPA Hub.
- Turn on the RPA bot generation skill to use the generative AI capability. For more information, see Turn on the RPA bot generation skill.
- After activating the RPA bot generation skill, relaunch the RPA Desktop Design Studio application to apply the modified settings.

If you skip these steps, the Now Assist for RPA Hub feature doesn't appear in RPA Desktop Design Studio.

Familiarize yourself with the RPA bot generation skill concepts. For more information, see Robotic Process Automation (RPA) bot generation.

Role required: sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin

© 2026 ServiceNow, Inc. All rights reserved.

About this task

The **Build automation** option (or the in-line prompting feature) with the AI icon ( ), appears only for those components that contain control output ports. For example, the AI icon doesn't appear for components such as END or Break.

On the design surface, if you select multiple components and the AI icon ( ), the in-line prompting trigger appears for the first component that you select.

If there are multiple control output ports for a component, the generated automation workflow is attached to the default or first control output port.

Procedure

1. In the RPA Desktop Design Studio, extend the automation logic with in-line prompting from the component level or from the design surface.

2. In the Build automation with Now Assist window, enter the Now Assist instructions and select the enter icon ( ).

   For example, `Launch www.servicenow.com from location 'C:\Program Files\Google\Chrome\Application\chrome.exe'`.

   The instruction text is used by the RPA bot generation skill to create your automation. Use short, direct, and clear sentences to describe the expected actions. Be specific and provide detailed descriptions of the automation logic. Avoid jargon and abbreviations.

   The following example shows that the Now Assist instructions are provided to build an automation to launch the ServiceNow website with Google Chrome.

   Build with Now Assist window

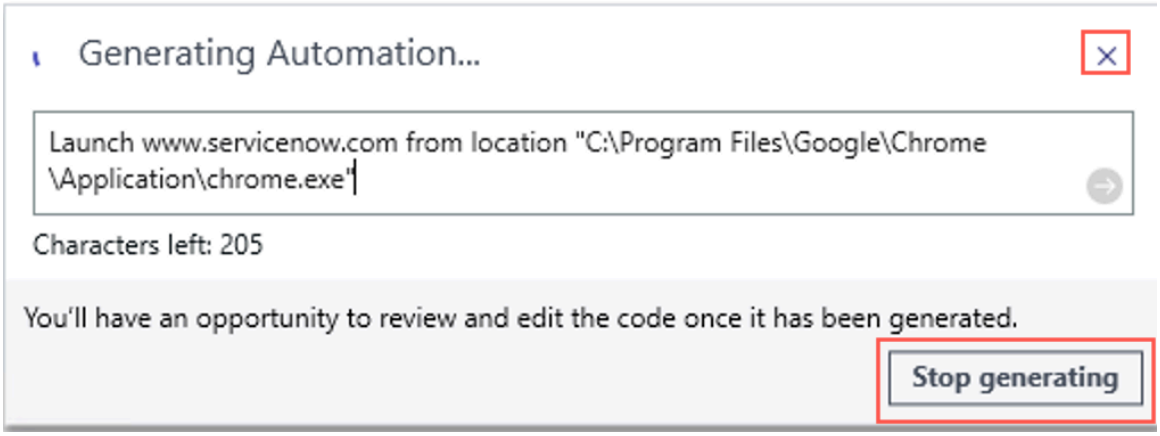
   
   Note:

   For more information on example instructions and general guidelines for writing Now Assist instructions, see Robotic Process Automation (RPA) bot generation. For more information about the limitations of the RPA bot generation skill, see Limitations of Robotic Process Automation (RPA) bot generation skill.

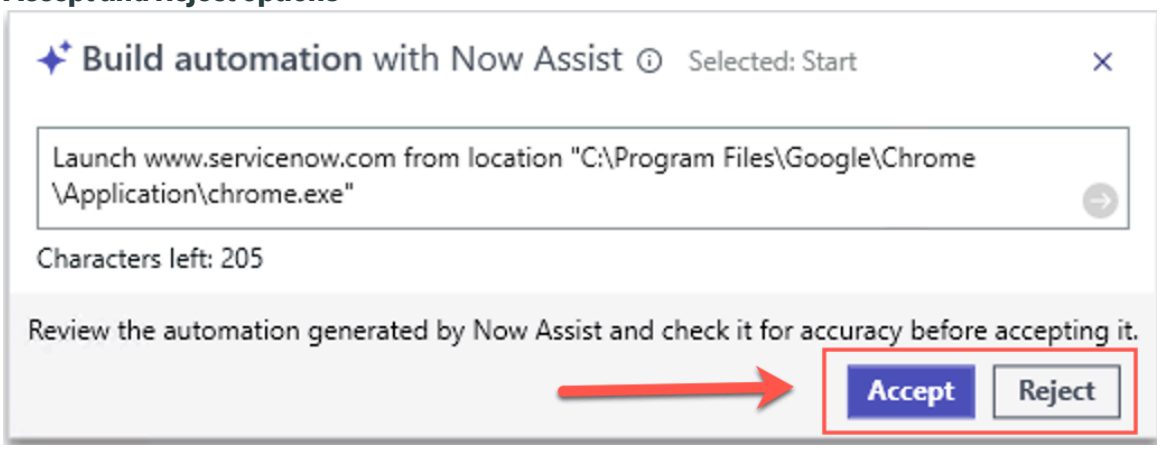
3. In the Build with Now Assist window, close the window, cancel the workflow generation, reject an automation, or accept the automation preview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Close and Stop generation options



Accept and Reject options



Result

The automation workflow that is generated by Now Assist is displayed on the design surface.

Generated automation workflow on the design surface

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Now Assist for RPA Hub reference

Reference topics include information about the limitations of the Robotic Process Automation (RPA) bot generation skill.

Limitations of Robotic Process Automation (RPA) bot generation skill

The limitations of the RPA bot generation skill are as follows.

AI Search and LLM timeout

The RPA bot generation skill relies on AI Search and large language models (LLM) to understand the user instructions and flow creation. The timeout limits and rate-limiting behavior of these APIs collectively apply to the RPA bot generation skill. For more information about AI search system properties, see AI Search system properties. For more information about API rate limits, see Inbound REST API rate limiting. For more information about configuring rate limiting for providers, see Configure rate limiting for providers.

Component scope in Yokohama release

The initial version supports few components. Components outside this scope don't appear in the generated automation workflow. For example, if you provide an instruction, such as `Capture a screen shot and save it in the location at 'C:\Users\Screens'`, the generated automation workflow might not contain the Capture component because it isn't included in the initial version components list. For more information about the list of supported components, see Supported components and connectors for Now Assist for RPA Hub in Yokohama release.

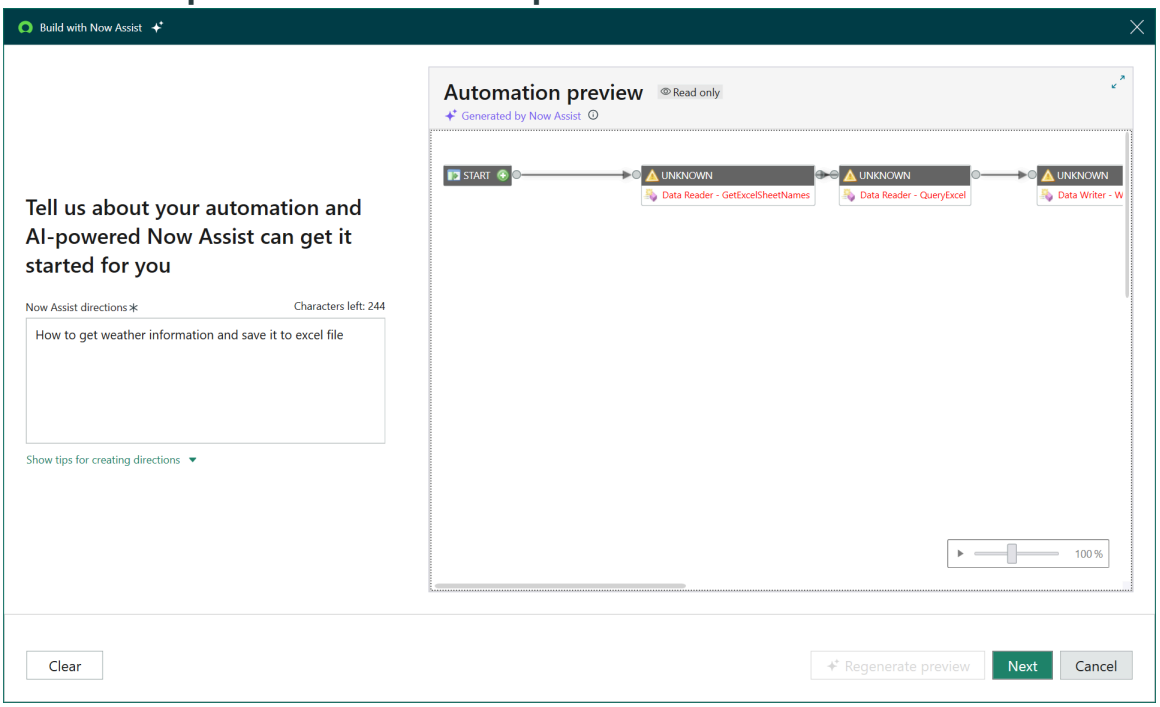
Plugin version compatibility

The feature uses Yokohama version plugins. If the large language model (LLM) returns a method that doesn't exist in the loaded plugin version, then such methods are displayed as unknown components in the generated automation workflow. For example, if you're using Washington DC version plugins within an existing automation project and provide an instruction to set or get values from an application, then the SetValue, GetValue, or Click methods of the Universal App connector are displayed as unknown components in the generated automation workflow.

In the following example, to get the weather information, data reader components are required. Since they are not available in the current scope, they appear as UNKNOWN components in the automation preview.

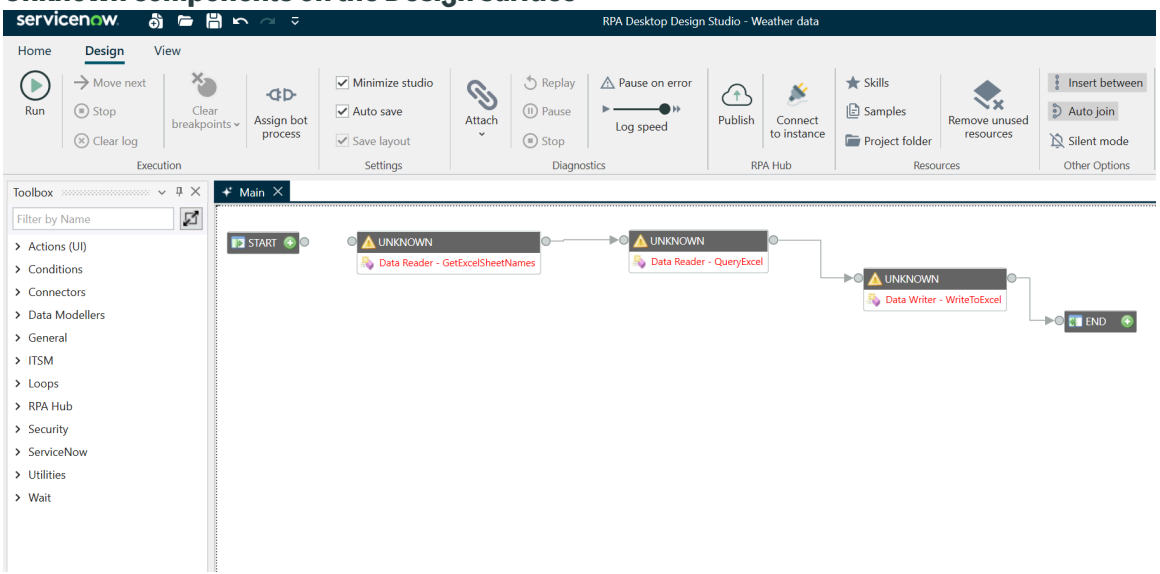
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unknown components in the Automation preview



If you select **Next** in the previous screen, the automation appears as follows on the Design surface.

Unknown components on the Design surface

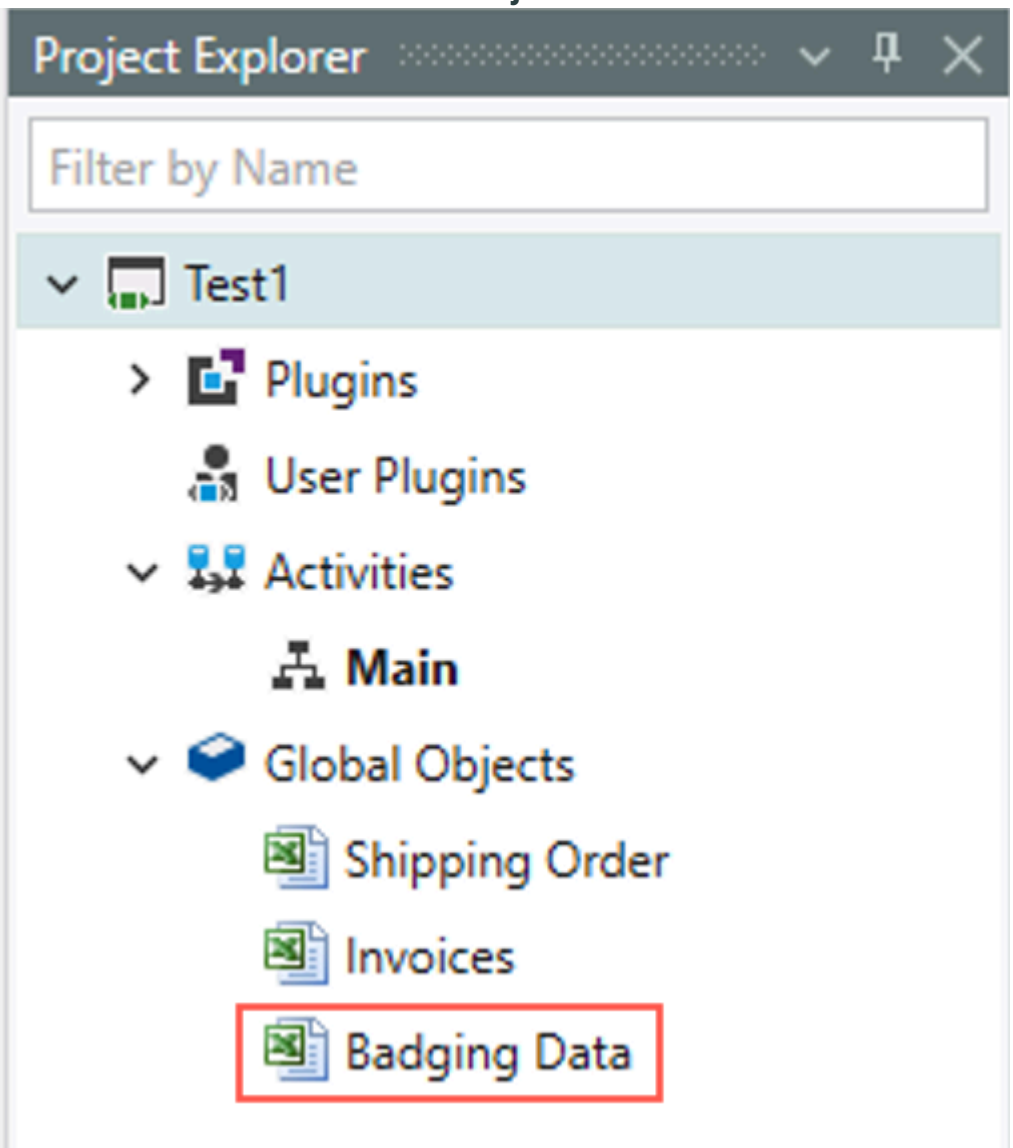


Usage of existing connectors in new activity using Now Assist or build automation context menu options

During the automation workflow creation, if a method, such as the AddNewWorksheet method of Microsoft Excel connector is created, RPA Desktop Design Studio checks for an existing global object of the same connector type and uses the most recent one. In the following example, the Badging Data Microsoft Excel connector is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Excel connectors in Global Objects



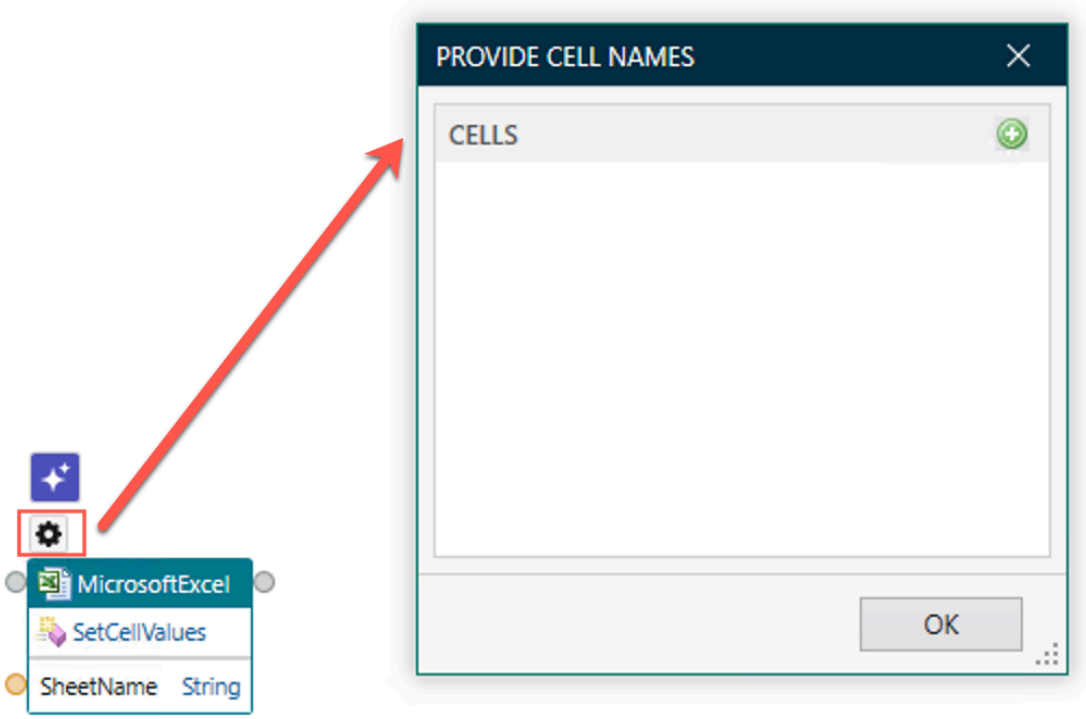
Dynamic configuration

Dynamic configuration for supported components isn't available in the Yokohama release. You can configure components manually. For example, you must give inputs in the configuration window for the Microsoft Excel connector's SetCellValues method. Select the settings icon ( ) to view the configuration window.

Data in the parameter values might not be populated in the large language model (LLM) generated components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration window for SetCellValues method



Automation for Windows, Java, or browser applications

For automating Windows, Java, or browser-based applications, RPA Desktop Design Studio suggests generic UI actions such as SetValue, GetValue, or Click. These actions are a part of the Universal app connector. You must configure these actions manually, including capturing screens and adding elements via the field window. For more information about these methods, see Universal app connector.

Expression-based components

For components that require expressions, such as Decision or Expression, and so on, expressions in these components aren't automatically populated in the Yokohama release.

Hallucinated components

If the large language model (LLM) returns a method that doesn't exist in the RPA Desktop Design Studio, then such methods are displayed as unknown components in the generated automation workflow.

RPA Desktop Design Studio

Use the ServiceNow® Robotic Process Automation (RPA) Desktop Design Studio, which is a low-code Integrated Development Environment (IDE) where you can design or configure automation workflows by dragging and dropping components to the Design surface. RPA Desktop Design Studio is a Windows native application.

RPA Desktop Design Studio benefits

- Provides a wide assortment of pre-designed components that you can use to create and design automations.
- Provides ease-of-use, scalability, and efficiency.
- Enables you to design automations in a code-free environment.
- Provides explanations about the errors and displays in simple-to-understand notifications.

What to explore next

Design surface

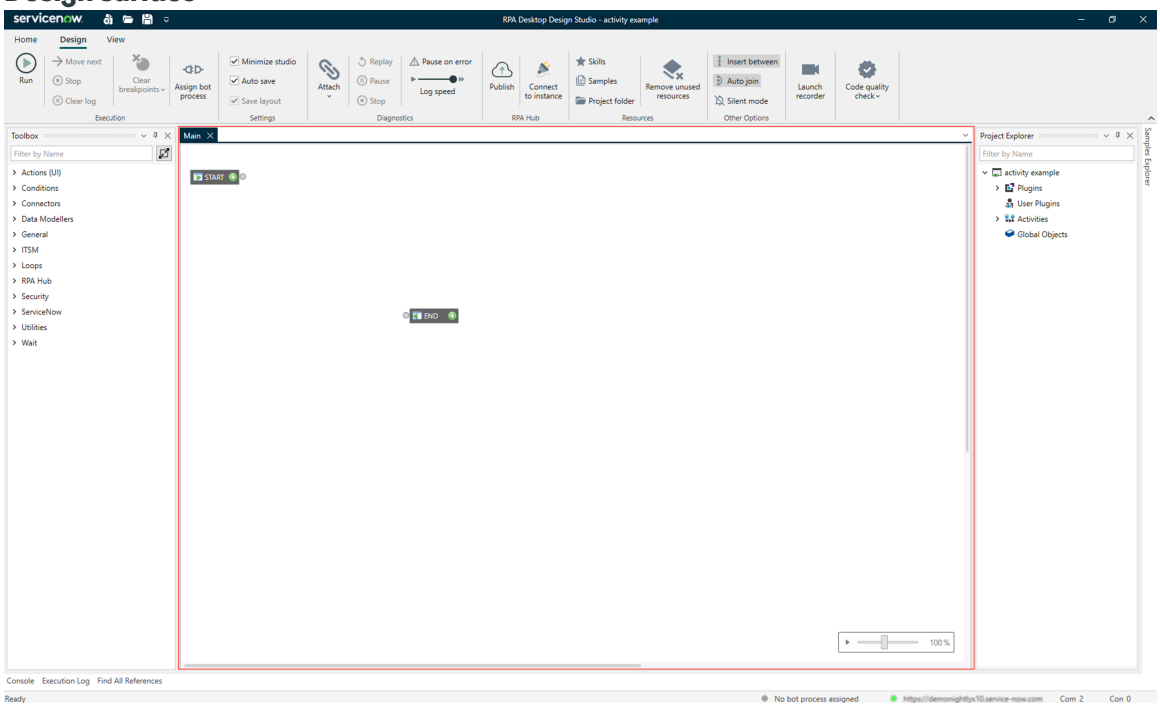
The area marked in red in the following example is the Design surface. You create automations by dragging the components from the Toolbox pane to the Design surface.

You can also create automations by dragging the activities and variables from the Project Explorer pane or by dragging methods and events from the Object Explorer pane.

Create automations, activities, and automation logic additions from text instructions and preview options using the Now Assist for RPA Hub. For more information, see Using Now Assist for RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Design surface



The Start and End components are the default components in every activity. They're the starting and ending point of an activity. You can't delete these components.

Enhance the automation logic with text instructions, either on the design surface or by selecting a component or by using the Now Assist for RPA Hub application. For more information, see Build an automation with Now Assist.

When you close this application, you're logged out of the RPA Desktop Design Studio and the ServiceNow instance.

Here's a list of actions that you can do on the Design surface:

Select multiple components

To select multiple components, you can select one or more components by pressing and holding the **Ctrl** key and then selecting the title bar of the component.

Alternatively, you can select the mouse device and drag it across the set of components that you want to select.

Copy, paste, and cut components or methods

You can copy or cut, and paste components or methods by using the keyboard shortcuts or the context menu.

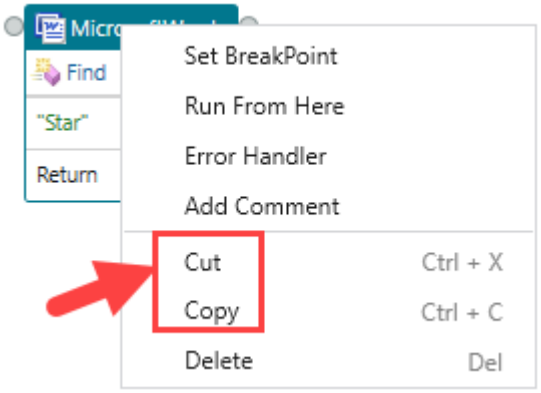
To use the keyboard shortcuts, do the following actions.

- Select the components that you want to copy and press the Ctrl +C keys followed by the Ctrl + V keys.
- Select the components that you want to cut and press the Ctrl +X keys followed by the Ctrl + V keys.

To use the context menu, do the following actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Select the components that you want to copy or cut.
2. Right-click on the component bar of any of the components.



3. Select **Cut** or **Copy**.

To paste the components at the same position on the Design surface from where they're copied, use the Ctrl + V shortcut.

You can also copy and paste components between different activities and instances of the RPA Desktop Design Studio.

Alternatively, after copying the components, you can right-click and select **Paste** to paste the components at the position that you choose.

Delete components

To delete components, select the components that you want to delete, right-click any of the selected components, and select **Delete**.

Alternatively, after selecting the components, press the **Delete** key to delete the components. In the Confirmation dialog box, click **Yes**.

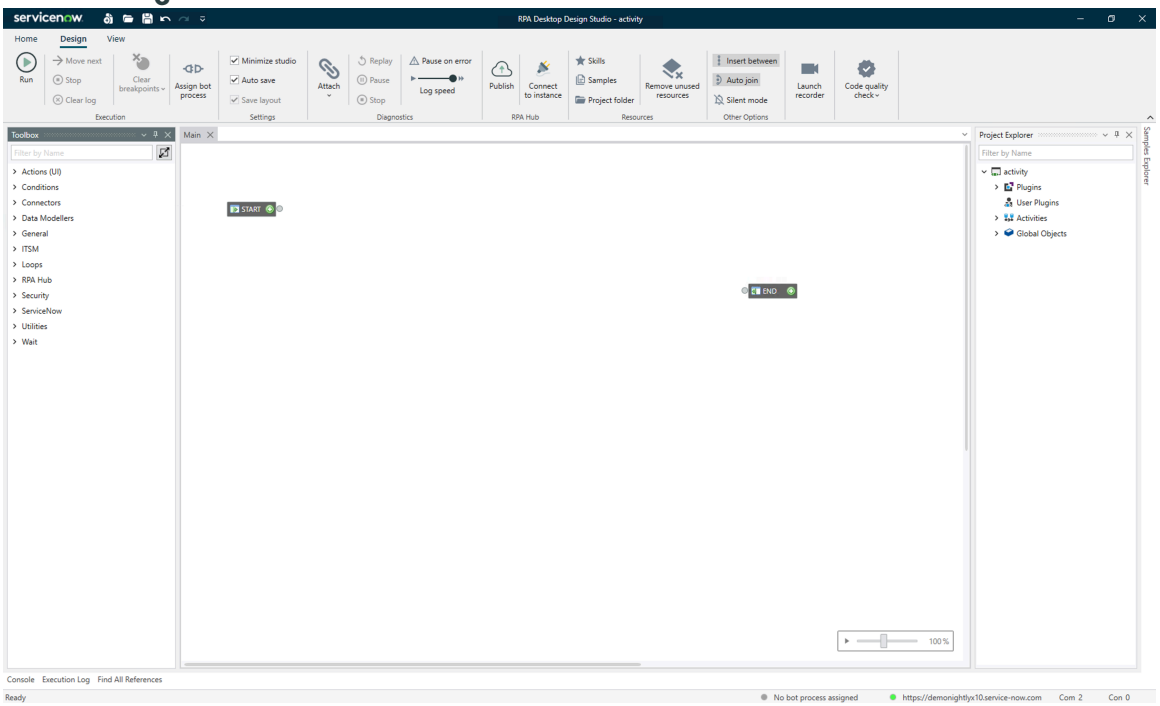
Use the zoom settings

On the Design surface, you can zoom in and zoom out to increase or decrease your view of a specific activity.

The zoom settings are in the bottom-right corner of the Design surface as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zoom settings



To zoom out, drag the bar to the left. To zoom in, drag the bar to the right.

Alternatively, you can also use the scroll up and down key with your mouse wheel or track pad while holding the **Ctrl** key to adjust the zoom settings.

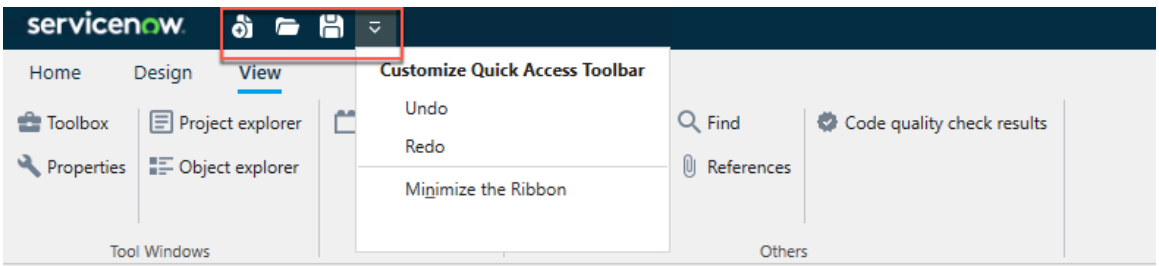
Scroll shortcut

To scroll horizontally on the Design surface, press the **Shift** key and scroll using the mouse.

Quick Access Toolbar

The Quick Access Toolbar, which is shown in the following example, enables you to create, open, save, undo, and redo your automation projects. You can also minimize the ribbon or change the position of the ribbon by using the options that are provided in the toolbar.

Quick access toolbar

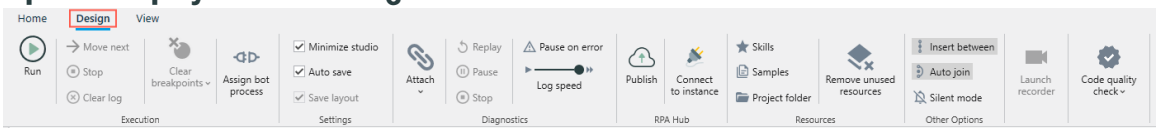


Design tab

The **Design** tab provides you with options that enable you to execute an automation, configure the settings of the RPA Desktop Design Studio, help you with diagnostics, publish options, connect to a ServiceNow instance, and access some other resources such as launching recorder. The following example shows you the options that are displayed with the **Design** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Options displayed on the Design tab



You can access the following sections by using the **Design** tab in RPA Desktop Design Studio:

Sections on the Design tab

Field	Description
Execution section	
Run	Use the **Run** button to start the workflow execution of an automation project.
Move next	Use the **Move next** button to move to the next component where a breakpoint is hit. This option is enabled only when the execution flow hits a breakpoint.
Stop	Use the **Stop** button to stop the workflow execution of an automation project.
Clear log	Use the **Clear log** button to clear the runtime log.
Clear breakpoints	Use the **Clear breakpoints** button to remove all the breakpoints from the automation. This option is enabled when at least one breakpoint is set. Click the down arrow button next to the **Clear Breakpoints** button and select **Find all** to locate the specific breakpoints in the Find All References section.
Assign bot process	Assign the automation package to a bot process and utilize the resources of the automation. For more information on how to assign a bot process, see Assign bot process to an automation project.
Settings section	
Minimize studio	Select the **Minimize studio** check box to minimize the RPA Desktop Design Studio during an automation execution. You can minimize the RPA Desktop Design Studio when you select the **Run** button to run the automation.
Auto save	Select the **Auto save** check box to save your automation project file automatically as you work.
Save layout	Select the **Save layout** check box to save the pane layout of the RPA Desktop Design Studio.
Diagnostics section	
Attach	You can review the execution logs of a process that is already executed. To review, use the **Attach** button to attach either a local execution log file or a remote execution log file that is saved in the ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sections on the Design tab (continued)

Field	Description
	To find a remote execution log, specify your criteria or use the pagination to navigate to the required page on the **Open Log** window.  After specifying the criteria, do the steps. 1. Select **Fetch Logs** to fetch and display the remote execution logs. 2. To play the log, select the required log and then select **Play log**. The following process job records are not displayed in the Attach log window: • Process job records with no logs. • Process job records that are stored in the robot machine.
Replay	Use the **Replay** button to replay the attached log execution.
Pause	Use the **Pause** button to pause the attached log execution.
Stop	Use the **Stop** button to stop the attached log execution.
Pause on error	Use the **Pause on error** button to pause the attached log execution if an error occurs during the execution.
Log speed	Adjust the **Log speed** slider to control the speed when you replay the automation using logs. By default, the slider is adjusted to the center where it takes one second to execute each component. If you decrease the log speed, each component takes the same amount of time it took during the execution. If you increase the log speed, all the components get executed instantly on replay.
RPA Hub	
Publish	Use the **Publish** button to publish the automation project to RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sections on the Design tab (continued)

Field	Description
Connect to instance	Use the **Connect to instance** button either to connect to an existing ServiceNow instance or to add ServiceNow instance details.
Resources section	
Skills	Use the **Skills** button to view the skill automation projects in the Skill Explorer pane. You can reuse these skill automation projects by dragging the skill automation project from the Skill Explorer pane to the Design surface. It's displayed as a Remote Activity.
Samples	Select the **Samples** button to refer to the sample automations in the Samples Explorer pane. A sample automation demonstrates how the RPA Desktop Design Studio executes an automation project. The sample automations are classified into **Beginner**, **Intermediate**, **Advanced**, **References**, and **Attended** categories based on the complexity and use cases of the automations. For more information, see Use sample automations in RPA Desktop Design Studio.
Project folder	Use the **Project folder** button to open the current automation project folder.
Remove Unused resources	Use the **Remove unused resources** button to remove unused variables, references, and user plugins.
Other Options section	
Insert between	Use the **Insert between** button to connect to the nearest component with a free Control port to the left of the newly dropped component.
Auto join	Use the **Auto join** button to remap the connections between the two components when a component is deleted.
Silent mode	Use the **Silent mode** button to execute the automation project without opening further activity tabs.
Launch recorder	Capture your actions from your desktop or web applications and convert them into an automation flow by using the recorder option. For more information on recording automations, see Recording automations.
Code quality check	Inspect an activity or completion automation project for any automation issues that prevents the automation from progressing by using the Code quality check feature. For more information on how to perform Code quality check in RPA Desktop Design Studio, see Code quality check in RPA Desktop Design Studio.

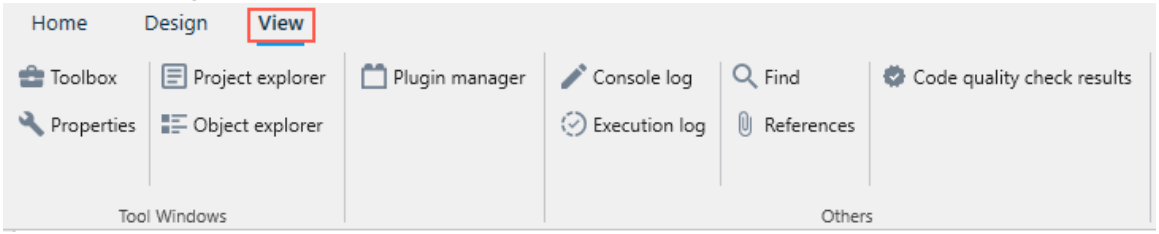
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View tab

The **View** tab, which is shown in the following example, enables you to view the Tool Windows when they're closed, install extra plugins by using the plugin manager option, view the console log and execution log, find components, and find all references.

Options displayed on the View tab



You can access the following sections when you use the **View** tab in RPA Desktop Design Studio:

Sections on the View tab

Section or field	Description
Tool Windows section	Click each pane of the tool window (Toolbox, Project explorer, Properties, and Object explorer) to reopen these panes when they're closed.
Plugin manager	Use the **Plugin manager** button to install extra plugins to design automations that are required for creating automation projects. For more information, see Manage plugins in RPA Desktop Design Studio.
Others section	
Console log	Use the **Console** button to open the console section, if closed. This section has the information that is related to the Console Log component.
Execution log	Use the **Execution log** button to open the Execution Log section, if closed. You can view the error logs of the automation execution in this section, when you attach the logs.
Find	Use the **Find** button to find components within the automation project.
References	Use the **References** button to show the navigation pane, if it's closed.
Code quality check results	Displays the details of the code quality check execution.

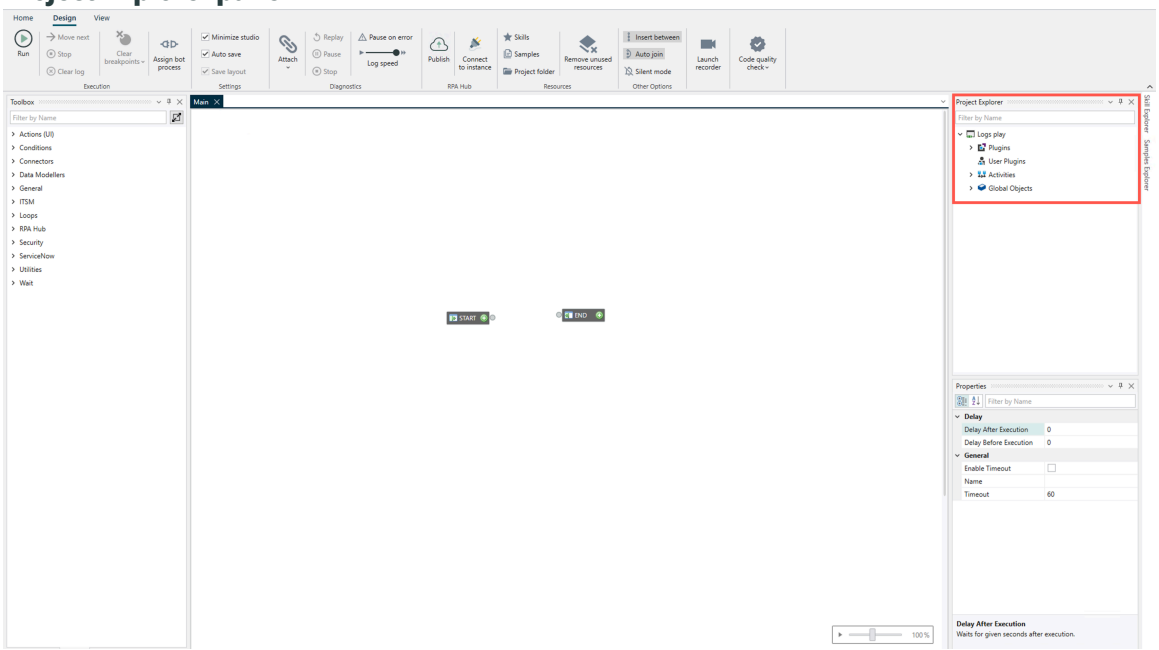
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Project Explorer pane

The area marked in red in the following example is the Project Explorer pane. You can see all the artifacts that are used in the current automation project in this pane. Artifacts include activities, plugins, user plugins, global objects, and forms (if you're creating an attended automation project).

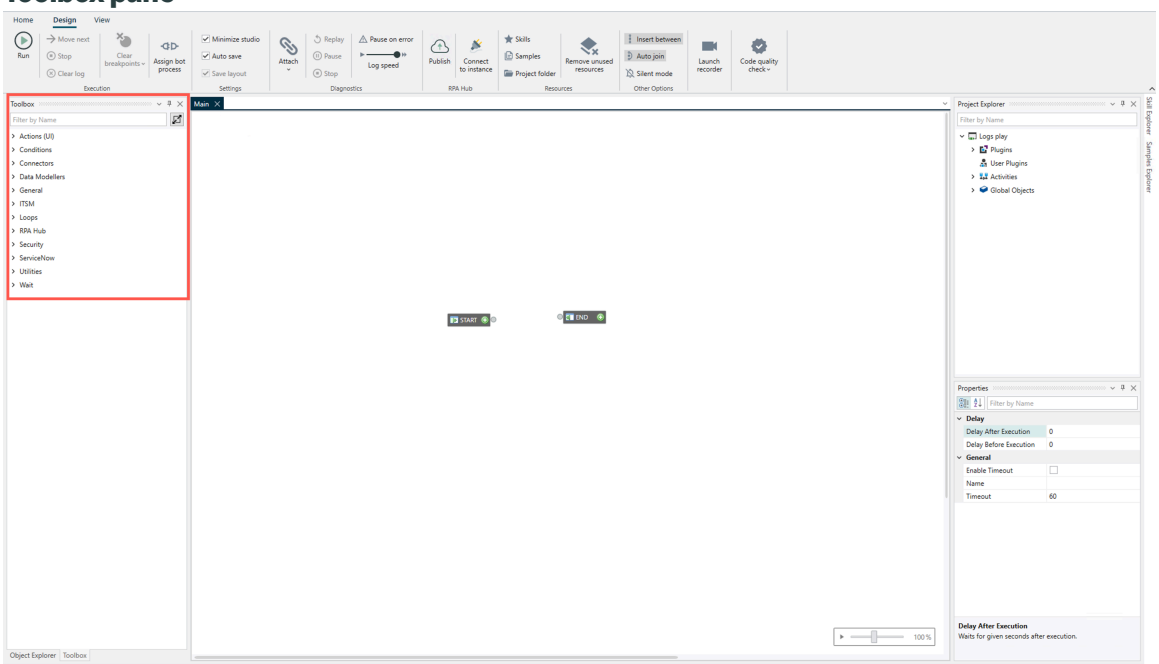
Project Explorer pane



Toolbox pane

The area marked in red in the following example is the Toolbox pane. You can use this pane to see all the available components and connectors in the RPA Desktop Design Studio.

Toolbox pane



Components are listed under multiple categories. You can expand each component group to reveal individual components that can be used on the Design surface.

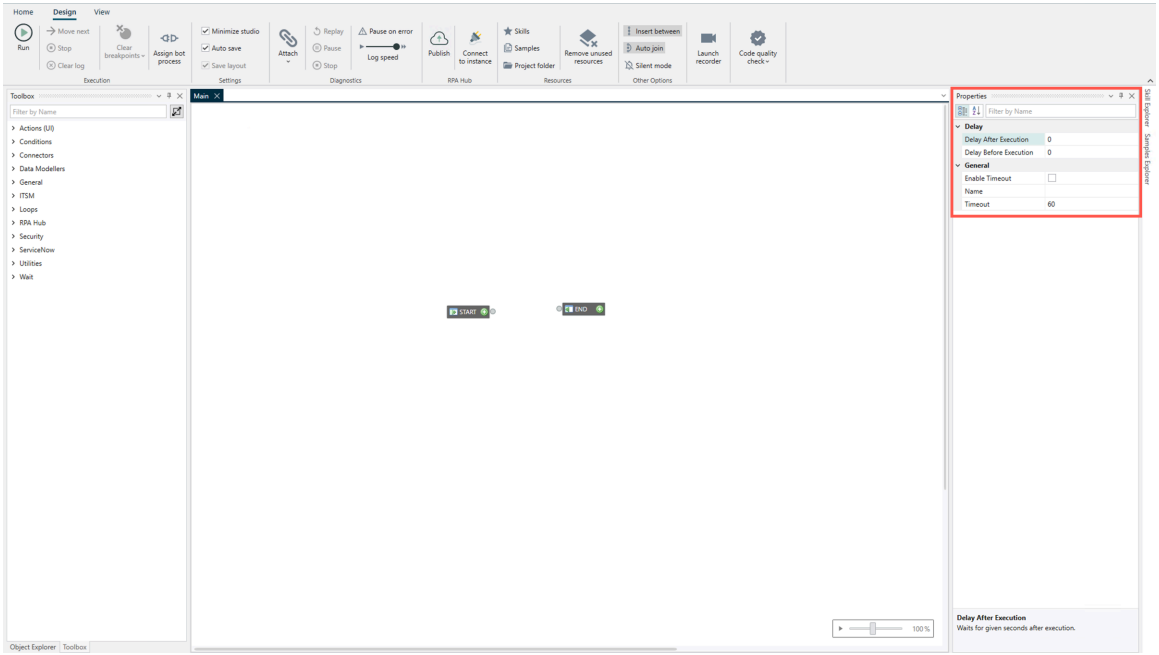
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search for the components that are available within the Toolbox by entering the text in the **Filter by Name** field.

Properties pane

The area marked in red in the following example is the Properties pane. Each component, connector, activity, or global object has multiple properties that appear in the Properties pane.

Properties pane

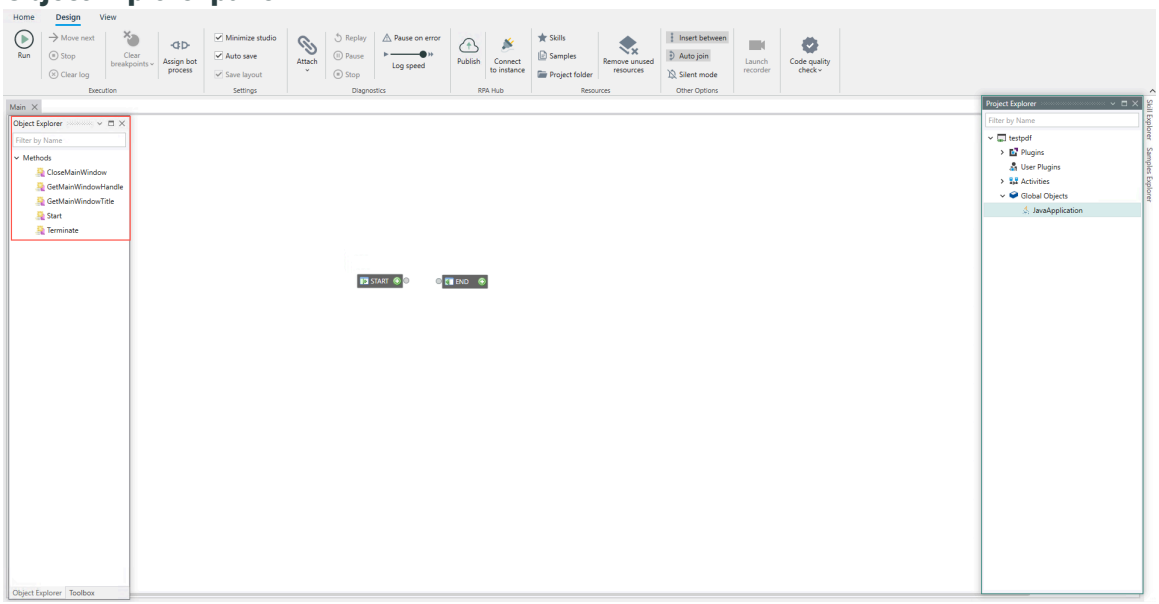


Properties help you fine-tune the functionality of the objects.

Object Explorer pane

The area marked in red in the following example is the Object Explorer pane. The methods and events that are associated with the objects in the Project Explorer pane appear in this pane.

Object Explorer pane



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Double-click the specific object in the Project Explorer pane to view its associated methods and events.

For example, you can click a List connector that you added in the Global Objects node to view the associated methods in the Object Explorer pane.

Global Objects is a section in the Project Explorer pane that is a placeholder for objects that are accessible across all activities like connectors and global variables. You can further organize the objects by creating folders within global objects.

RPA Desktop Design Studio keyboard shortcuts

You can use keyboard shortcuts to perform the following actions quickly in the RPA Desktop Design Studio.

RPA Desktop Design Studio keyboard shortcuts

Action	Windows keyboard shortcut
Create a project	Ctrl+N
Open a project	Ctrl+O
Save a project	Ctrl+S
Build an automation	Ctrl+Enter This option is available only when the Now Assist for RPA Hub is enabled. For more information, see Build an automation with Now Assist.
Undo	Ctrl+Z
Redo	Ctrl+Y
Run	F5
Global Run	Ctrl+F5
Global Stop	Ctrl+Shift+F5
Clear logs	Ctrl+F8
Step over	Ctrl+F10
Copy	Ctrl+C
Cut	Ctrl+X
Paste	Ctrl+V
Select All	Ctrl+A
Project Explorer	Ctrl+R
Object Explorer	Ctrl+Alt+J
Toolbox	Ctrl+Alt+X
Properties	F4
Find window	Ctrl+F
Delete	Del

Configuring RPA Desktop Design Studio

You can plan and configure an RPA Desktop Design Studio implementation in your organization.

The ServiceNow® RPA Desktop Design Studio is a Windows native application that is used by RPA developers to design or configure automation workflows.

Important information

Refer to the List of components compatible with latest version topic, for a list of components that are executed in their latest versions in the RPA Desktop Design Studio and robots, irrespective of the version they were used during the automation design.

Configuration overview

Perform the following tasks to download the installation package and configure the RPA Desktop Design Studio after installation.

1. Install RPA Desktop Design Studio

   You can install the RPA Desktop Design Studio application in your Windows machine if you have the admin role.

2. Set up RPA Desktop Design Studio

   Set up RPA Desktop Design Studio to add your ServiceNow® RPA Hub instance details in Connection Manager and to start using the application.

3. Connect to an RPA Hub instance from RPA Desktop Design Studio

   Establish a connection between the RPA Desktop Design Studio and ServiceNow® RPA Hub instance to connect to an RPA Hub instance in three ways using Connection Manager.

4. For the upgrade scenario, if your instance is installed with a hot fix and later upgraded to a newer release, verify to install the required hotfix for the respective plugins on the new plugin bundle. The system overrides it by default. Failing to do so, the hotfix will not be applied and you might encounter the same issue again. For more information, see Post requisites after installing a hot fix.

Using Guided Setup to implement RPA Desktop Design Studio

Guided Setup provides a sequence of tasks that help you configure RPA Desktop Design Studio. With Guided Setup, keep track of what you have completed, so you can stop and start again where you left off. To open Guided Setup for RPA Hub, navigate to **All** > **Robotic Process Automation** > **Administration** > **Guided Setup**.

For more information about using the guided setup interface, see Using guided setup.

Install RPA Desktop Design Studio

Install the RPA Desktop Design Studio application in your Windows machine if you have the admin role.

Before you begin

Download and unzip the installation file for the RPA Desktop Design Studio application. For more information, see Download the RPA applications from RPA Hub.

Ensure that you meet the hardware and software requirements.

The following hardware specifications list the minimum and recommended resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hardware requirements

Resource	Minimum	Recommended
CPU	Intel Processor (At least, Core i5)	Intel Processor (Core i7).
RAM	4-GB RAM	8-GB RAM
Disk space	Minimum 20-GB free disk space after installing the OS, patches, and base software	Minimum 50-GB free disk space after installing the OS, patches, and base software

Software requirements

The software requirements are:

- Operating system: Microsoft Windows 10 or Windows 11 or Windows Server 2016 or Windows Server 2019.
- NET framework: Windows 4.7.1 or greater.
- Monitor with 1920x1080p resolution.
- DPI scaling setting must be deactivated.

Microsoft Edge WebView2 Runtime is a prerequisite for the ServiceNow login screen to work with RPA users. The Microsoft Edge WebView2 Runtime is installed by default with only specific releases of Windows 10 OS. If it is not available, ensure to install the Microsoft Edge WebView2 Runtime.

For more information about the Microsoft Edge WebView2 Runtime, see Delivering Microsoft Edge WebView2 Runtime to managed Windows 10 devices. For more information about downloading the Microsoft Edge WebView2 Runtime MSI, see Microsoft Edge WebView2.

Role required: admin

Procedure

1. Locate and open the `Robotic Process Automation Desktop Design Studio.msi` file.
2. In the Welcome to the RPA Desktop Design Studio Setup Wizard dialog box, click **Next**.
3. In the Select Installation Folder dialog box, do one of the following actions to choose a folder:
   - To install the application in the default folder, click **Next**.
   - To install the application in a different folder, select the folder location in the **Folder** field or click **Browse** to select the folder. Then, click **Next**.
4. In the Confirm Installation dialog box, click **Next** to start the installation.
5. After the installation is complete, in the Installation Complete dialog box, click **Close**.

Result

You can see the RPA Desktop Design Studio icon on your desktop.

What to do next

Set up the RPA Desktop Design Studio application. For more information, see Set up RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up RPA Desktop Design Studio

Set up RPA Desktop Design Studio to add your ServiceNow RPA Hub instance details in Connection Manager and to start using the application.

Watch this video to learn about the configuration of RPA Desktop Design Studio.

https://player.vimeo.com/video/1031641086?h=06a646eaf2&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Install RPA Desktop Design Studio. For more information on how to install it, see Install RPA Desktop Design Studio.

Role required: none

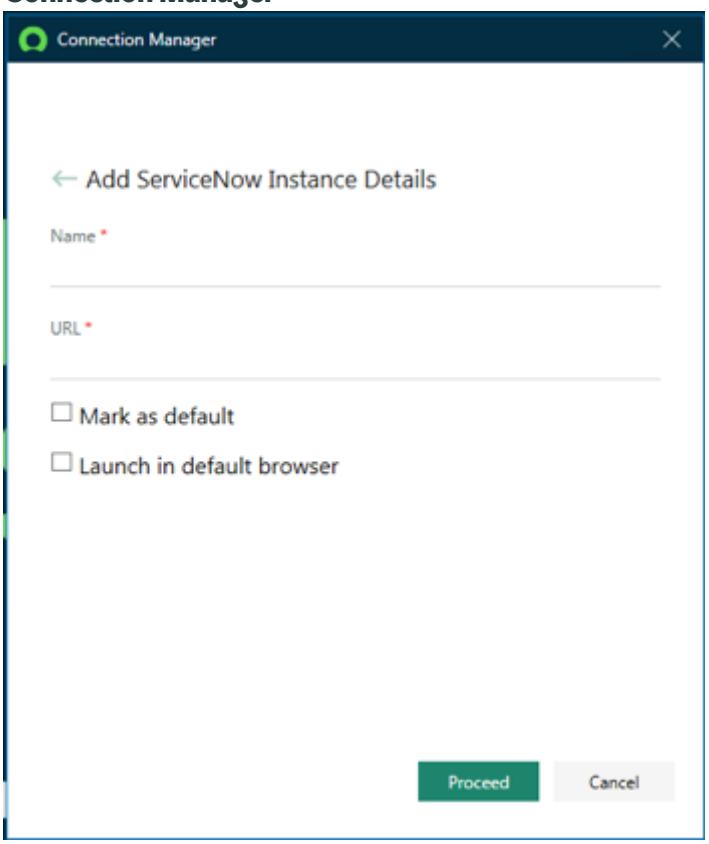
About this task

You can do this task when you're setting up RPA Desktop Design Studio for the first time or when you're adding an RPA Hub instance.

Procedure

1. From your desktop, double-click the RPA Desktop Design Studio icon ( ).
   If you're using RPA Desktop Design Studio for the first time, you can add the instance details in the Connection Manager dialog box.

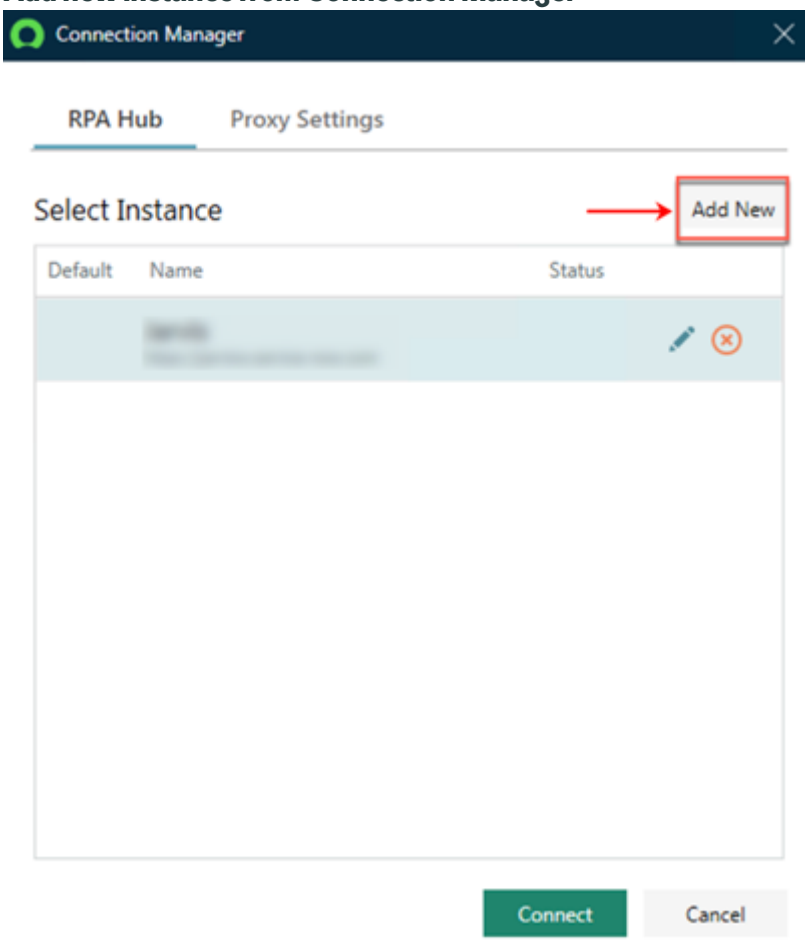
Connection Manager



2. **Optional:** When you start using RPA Desktop Design Studio and want to add an instance from Connection Manager, select **Add New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add new instance from Connection Manager



3. On the form, fill in the fields.

Add ServiceNow Instance Details form

Field	Description
Name	Name of your ServiceNow RPA Hub instance for easy identification of the instance. For example, `Dev instance`.
URL	ServiceNow RPA Hub instance URL. For example, `https://<instance name>.service-now.com/`.
Mark as default	Option for enabling this instance as the default. RPA Desktop Design Studio launches each time by using this default instance. Clearing this option opens the Connection Manager dialog box each time you double-click the RPA Desktop Design Studio icon ( ).
Launch in default browser	Option for launching the instance in the default browser of your machine.

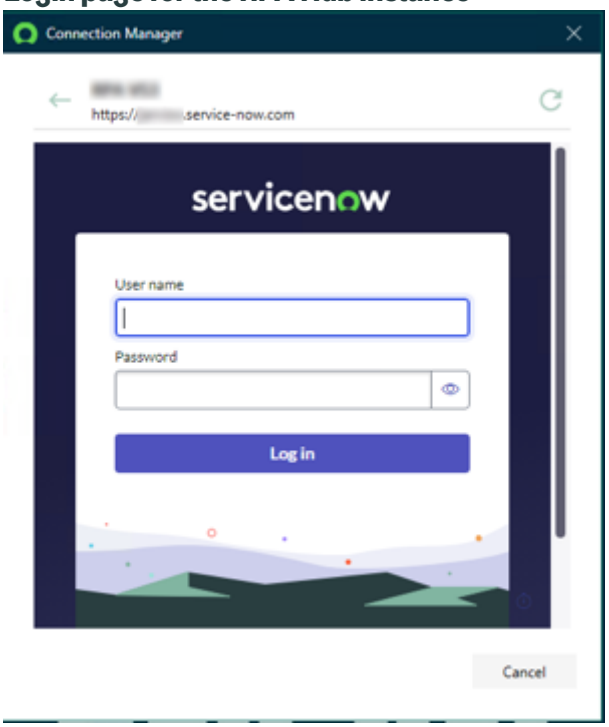
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** If you want to add proxy settings for your internet connection according to the company policies, do the following actions:
   a. In the **Proxy Settings** tab of the Connection Manager dialog box, fill in the fields for the server address, user name, password, and select the **Save Password** check box to save the password.
   b. Select **Save**.
5. Select **Proceed** and the plugins from the RPA Hub instance download to your machine.

Downloading plugins from the RPA Hub instance

When the plugins download, the login page of your RPA Hub instance is displayed.

Login page for the RPA Hub instance

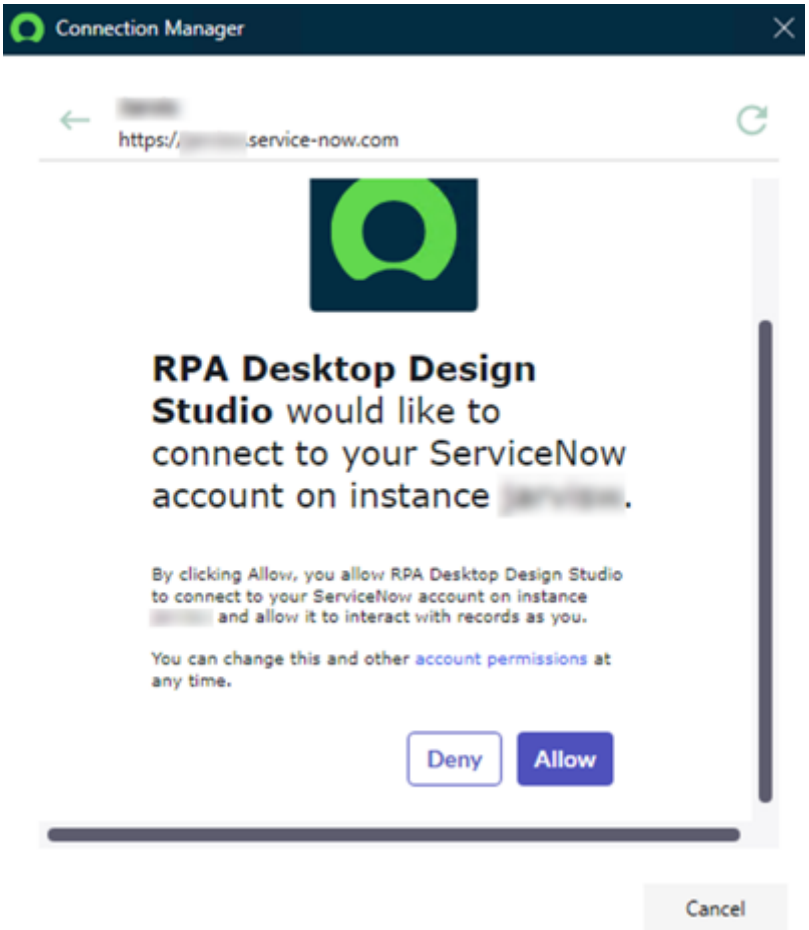


Note:
If the error `Connection failed. Verify if the RPA Plugins are available in the ServiceNow instance.` is displayed when you start RPA Desktop Design Studio, select **OK** and configure a ServiceNow instance URL that has the RPA plugins installed. Restart RPA Desktop Design Studio and try again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Authenticate your connection by entering the user name and password of your RPA Hub instance and then select **Log in**.
   The RPA Hub instance authentication page is displayed.

RPA Hub instance authentication



Important:

- When you enter credentials in the Connection Manager dialog box but don't select the **Allow** button in the next screen, the session times out.
- You must authenticate your RPA Hub instance each time that you launch RPA Desktop Design Studio. If you don't authenticate and cancel the login operation, RPA Desktop Design Studio doesn't launch.

7. Select **Allow**.
   The authentication is complete and the home page of RPA Desktop Design Studio is displayed.

What to do next

You can start creating automations from the RPA Desktop Design Studio home page. For more information on how to create automations, see Create an automation project manually or Create an automation with Now Assist.

Connect to an RPA Hub instance from RPA Desktop Design Studio

Connect to an RPA Hub instance in three ways using the Connection Manager so that you can establish a connection between the RPA Desktop Design Studio and ServiceNow RPA Hub instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Set up the RPA Desktop Design Studio application to add ServiceNow instance details. For more information, see Set up RPA Desktop Design Studio.

Open an automation project. For more information, see Open a local automation project in RPA Desktop Design Studio and Open a cloud automation project in RPA Desktop Design Studio.

Role required: none

About this task
After you launch the RPA Desktop Design Studio, you can connect to the same instance using different credentials.

You cannot connect to a different instance after the RPA Desktop Design Studio is launched.

To connect to a different instance, you must close and reopen the RPA Desktop Design Studio application.

Procedure
1. To connect to an RPA Hub instance, do any of the following actions in the Connection Manager dialog box.

2. In the Connection Manager dialog box, set the permission for the RPA Desktop Design Studio application to connect to your ServiceNow instance and to access the data:
   - To enable RPA Desktop Design Studio to connect to your ServiceNow instance and access the data, select **Allow**.

     Note:
     When you enter credentials in the Connection Manager dialog box but do not select the **Allow** button, an error occurs after 30 minutes. Close the Connection Manager dialog box and reopen.

   - To prevent RPA Desktop Design Studio from connecting to your ServiceNow instance and accessing the data, select **Deny**. You won't be able to proceed further.

Disconnect from an RPA Hub instance in RPA Desktop Design Studio

Disconnect a connected RPA Hub instance while you're using the RPA Desktop Design Studio. You can then log in to the same instance with different credentials. For example, you might want to switch credentials when you use the Assign Bot Process feature.

Before you begin
Connect to an RPA Hub instance. For more information, see Connect to an RPA Hub instance from RPA Desktop Design Studio.

Role required: none

About this task
You can't disconnect from an RPA Hub connected instance and then connect to a different RPA Hub instance when you're using Connection Manager in RPA Desktop Design Studio. If you want to connect to the same RPA Hub instance with another user role, you can select the **Disconnect** option in Connection Manager to disconnect from the instance. For example, let's consider a scenario where you were connected to the RPA Hub instance as a developer user. If you want to connect to the instance as an admin user, you can select the **Disconnect** option in Connection Manager and then log in to the same instance by using the admin user credentials.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the **Design** tab, select **Connect to instance**.
   The Connection Manager dialog box is displayed.
2. Disconnect from the connected instance by selecting **Disconnect**.

What to do next

Log in with new credentials. For more information about connecting to an instance, see Connect to an RPA Hub instance from RPA Desktop Design Studio.

Related topics

Assign bot process to an automation project

Building automations

Create automation projects, use components, and create the activities and variables that are required to design automations in RPA Desktop Design Studio.

Create an automation project manually

Create an attended or unattended automation project manually in RPA Desktop Design Studio that enables you to automate tasks. You can create an automation project that is based on a prebuilt template and targeted at a use case, or you can create an automation project without using a template.

Before you begin

Set up the RPA Desktop Design Studio application and add the ServiceNow instance details. For more information, see Set up RPA Desktop Design Studio.

Role required: none

About this task

An unattended automation doesn't require human supervision and can be used for highly repetitive tasks. For example, in a Customer Relationship Management (CRM) system, an unattended robot can perform the copy and paste tasks to a Microsoft Excel file without any human inputs.

An attended automation requires human supervision. For example, in a contact center, robots are used as user assistants. They're installed on an operator's workstation and are triggered by human operators on demand.

To create automation projects, you can use the default templates that RPA Desktop Design Studio provides or the custom automation templates that you have created and published to the RPA Hub. An automation template caters to a use case and provides a framework of automation. For example, automate a manual employee onboarding process. The default templates that the RPA Desktop Design Studio provides are `Unattended Non-Transactional Workflow`, `Unattended Transactional Workflow`, and `Attended Workflow`. You can also create automations with no template.

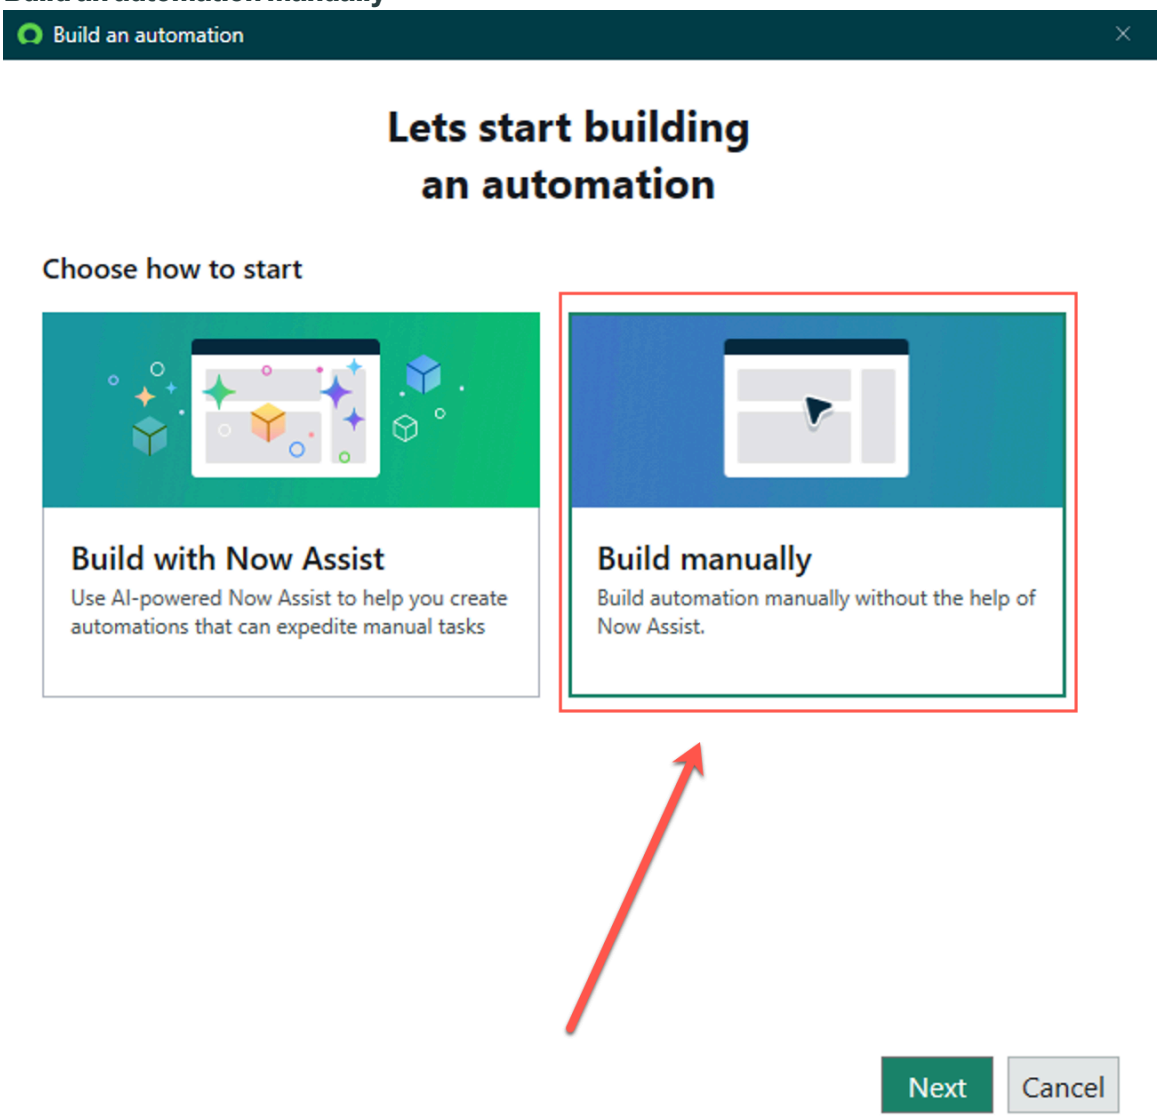
To create an automation project using Now Assist, see Create an automation with Now Assist.

Procedure

1. On the RPA Desktop Design Studio home page, select **Create Automation**.
2. In the Build an automation window, select **Build manually**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Build an automation manually



3. Select **Next**.
4. In the Create new automation window, select either **Unattended Automation** or **Attended Automation**.
5. In the **Name** field, enter the name of the unattended or attended automation project.
6. **Optional:** In the **Description** field, enter the description of the unattended or attended automation project.
7. In the **Location** field, enter the location of the automation project or retain the default location.
8. Select **Next**.
9. In the Do you want to select a template dialog box, you can perform either of the tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To create an automation without a template, select **Use a blank canvas**.
- To create an automation based on a template, select **Select a template** and choose from the default templates.

> **Note:**
>
> By default, the RPA Desktop Design Studio provides the latest versions of certain plugins with the automation project that you create. You can add more plugins after you create the project. In the Create new automation window, view the default plugins by selecting **View**.
>
> You can choose from the default templates that the RPA Desktop Design Studio provides or the custom templates that you have created and published to the RPA Hub. This template is built on the loaded plugin versions.

10. Select **Create**.

Related topics

Create a skill project in RPA Desktop Design Studio

Create an automation project from a template

Create an automation project from the default automation templates that RPA Desktop Design Studio provides or the templates that you have designed on the RPA Desktop Design Studio and published to the RPA Hub. An automation template caters to a use case and provides a framework of automation.

Before you begin

Role required: none

About this task

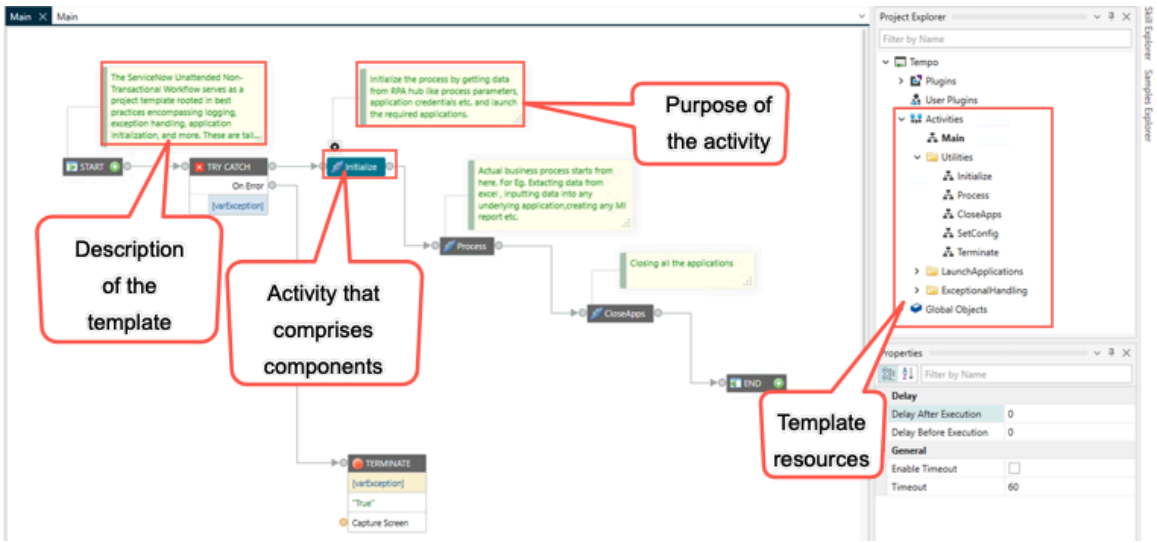
The default templates that the RPA Desktop Design Studio provides are RPA Desktop Design Studio provides are `Unattended Non-Transactional Workflow`, `Unattended Transactional Workflow`, and `Attended Workflow`. Use these templates as a framework for your automation projects. You can also create an automation project and publish it to the RPA Hub as a template so that it's available as an automation framework.

Procedure

1. On the RPA Desktop Design Studio home page, select **Create Automation**.
2. In the Build an automation window, select **Build manually**.
3. Select **Unattended Automation** or **Attended Automation**.
4. In the **Name** field, enter the name of the unattended or attended automation project.
5. **Optional:** In the **Description** field, enter the description of the unattended or attended automation project.
6. In the **Location** field, enter the location of the automation project or retain the default location. Ensure that the automation project file is in a separate folder. All the files and folders in the current project file location are published to the RPA Hub.
7. Select **Next**.
8. In the Do you want to select a template dialog box, select **Select a template**.
   The screen shows both the default templates that the RPA Desktop Design Studio provides and custom templates, if any. This template is built on the loaded plugin versions.
9. Choose a template from the default templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Select **Create**.
    The automation project is created.



Create a skill project in RPA Desktop Design Studio

Create a skill automation project in RPA Desktop Design Studio that can be reused in other automations.

Before you begin

Set up the RPA Desktop Design Studio application and add the ServiceNow instance details. For more information, see Set up RPA Desktop Design Studio.

Role required: none

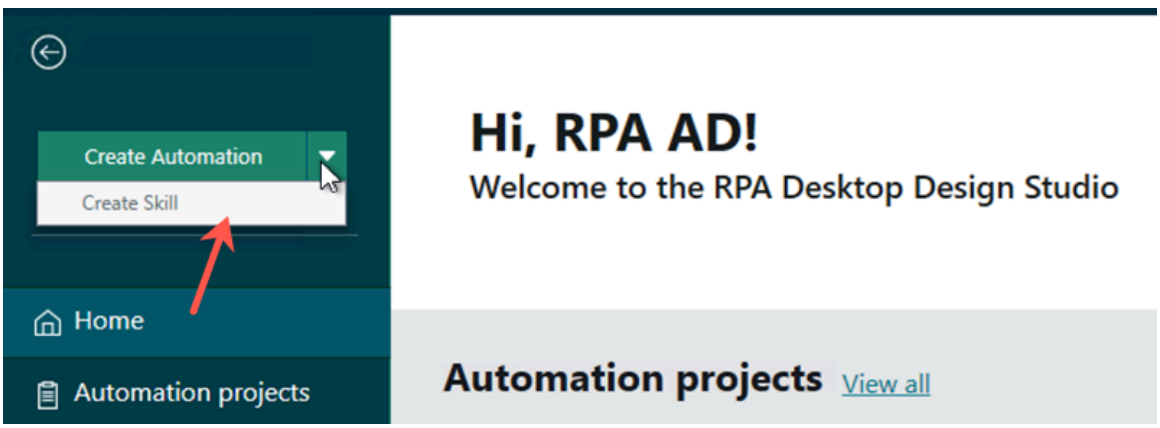
About this task

A skill automation is a reusable component. You can build a skill so that you can provide prebuilt capabilities for other automation processes. For example, if a login functionality is used in four different automations, that login functionality can be created as a skill that you can reuse across automations.

Procedure

1. On the RPA Desktop Design Studio home page, select the down arrow in the **Create Automation** button.
2. Select **Create Skill**.

Create Skill automation button



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Name** field, enter the name of the skill automation project.
4. **Optional:** In the **Description** field, enter the description of the skill automation project.
5. In the **Location** field, enter the location of the skill automation project or retain the default location.

> **Note:**
> By default, the RPA Desktop Design Studio provides the latest versions of certain plugins with the automation project that you create. You can add more plugins after you create the project. In the Create new skill window, view the default plugins by selecting **View**, next to **Using latest plugins**.

6. Select **Create**.

Before you begin

Make sure that the package (automation project) that you're trying to open is published on RPA Hub. For more information, see Publish an automation project in RPA Desktop Design Studio.

Role required: sn_rpa_fdn.rpa_developer, sn_rpa_fdn.rpa_support_user, or sn_rpa_fdn.rpa_admin

Procedure

1. In the RPA Desktop Design Studio, navigate to **Home** > **Automation projects**.
2. Select **Open cloud project**.
   If the selected ServiceNow instance session has expired, add the ServiceNow instance details. For more information, see Set up RPA Desktop Design Studio.
3. In the Open Project dialog box, select a package name and a version.
4. Select **Open**.
5. Save the ServiceNow project in the default location by selecting **Save**.
6. **Optional:** If the plugin versions that are used in the project aren't found in the local framework, go to the Choose Plugin Version dialog box, select the plugin versions to be used, and select **OK**.

> **Important:**
> When you open an older automation project in the latest version of Set up RPA Desktop Design Studio, the Upgrade Plugin Version dialog box is displayed. If you proceed to upgrade the plugin version and any automation components are unavailable after the upgrade, then these components are marked as Unknown in the automation project.

Manage plugins in RPA Desktop Design Studio

Install, update, or remove plugins to design automations while you're creating unattended and attended automation projects in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

An RPA plugin is a bundle of Windows library files that are consumed by the RPA Desktop Design Studio application. These plugins extend the capability of the Robotic Process Automation (RPA) product. For instance, the Universal App Connector plugin enables the RPA application to automate tasks on a Google Chrome browser.

Internet Explorer, Essential Connectors, Essential Toolkit, and Universal App Connector plugins are available in the RPA Desktop Design Studio project by default.

Install, update, or remove all plugins from a RPA Desktop Design Studio project from the **Plugin manager** under the **View** tab or the **Plugins** node under **Project Explorer** in the RPA Desktop Design Studio.

The following table lists the RPA plugins and their descriptions.

RPA plugins

Plugin Name	Description
Internet Explorer	A connector that enables automating web applications inside Microsoft Internet Explorer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RPA plugins (continued)

Plugin Name	Description
	For more information about the IE connector, see IE connector.
SSH	Connector for interacting with server via Secure Shell (SSH). For more information about the SSH connector, see Secure Shell (SSH) connector.
Essential Toolkit	An essential toolkit for developing unattended and attended projects.
FTP	Connector to transfer files between a client and server on a network. For more information about the FTP connector, see FTP.
Windows	Enables automation of Windows desktop applications. For more information about the Windows connector, see Windows connector.
Barcode Reader	Provides barcode or QR code reading components. For more information about the Barcode connector, see Use the ReadBarcode component.
Universal App Connector	Connector for interacting with Google Chrome, Edge, Java, and Windows based applications. For more information about the Universal App connector, see Universal app connector.
Java	Connector for interacting with Java based applications. For more information about the Java connector, see Configure the Java connector.
Essential Connectors	An essential set of connectors for developing unattended and attended projects.
Scripting	A connector that enables developers to code in Python, VB.NET, C#, and Javascript languages. For more information about the C#, VB.NET, and Javascript connectors, see Configure the Python connector, Configure the C#.Net connector, Configure the JavaScript

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RPA plugins (continued)

Plugin Name	Description
	connector, and Configure the VB.Net connector.
Terminal (Mainframe)	Connector that interacts with Mainframe applications through IBM Personal Communications (PCOMM) and Rocket BlueZone emulators. For more information about the Terminal connector, see Configure the Terminal connector.
Chromium	A connector that enables automating web applications inside Google Chrome or Microsoft Edge. For more information about the Chromium connector, see Chromium connector.
SAP	Connector for interacting with SAP applications. For more information about the SAP connector, see Configure the SAP connector.

Procedure

1. To navigate to the Plugins Manager window to the RPA Desktop Design Studio project, do either of the steps.
   - Navigate to **View** > **Plugin manager**.
   - Right-click **Plugins** in the **Project Explorer** pane and select **Add Plugin**.

   The **Available** tab shows the plugins that you can install and the **Installed** tab shows the plugins that are available to the current RPA Desktop Design Studio project.
2. To add a plugin, on the Plugins Manager window, select the **Available** tab.
3. Select the plugin you want to add.

   Tip:
   To find the plugin, enter the name of the plugin in the Filter field.

4. Select **ADD**.
   By default, the RPA Desktop Design Studio displays the latest version of the plugin. To view the previous versions, select the drop-down.
   The plugin is added to the current RPA Desktop Design Studio project and appears under the **INSTALLED** tab of the Plugins Manager window.
5. Select **OK**.
6. **Optional:** To add more plugins, repeat the procedure.
7. Perform the following steps for more plugin options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create user plugins for RPA Desktop Design Studio

Create user plugins by using Microsoft Visual Studio to enable RPA developers to use complex .NET components or libraries in RPA Desktop Design Studio in a seamless way.

Before you begin

Use either Microsoft Visual Studio Pro, Community, or Enterprise version to perform this task.

Role required: none

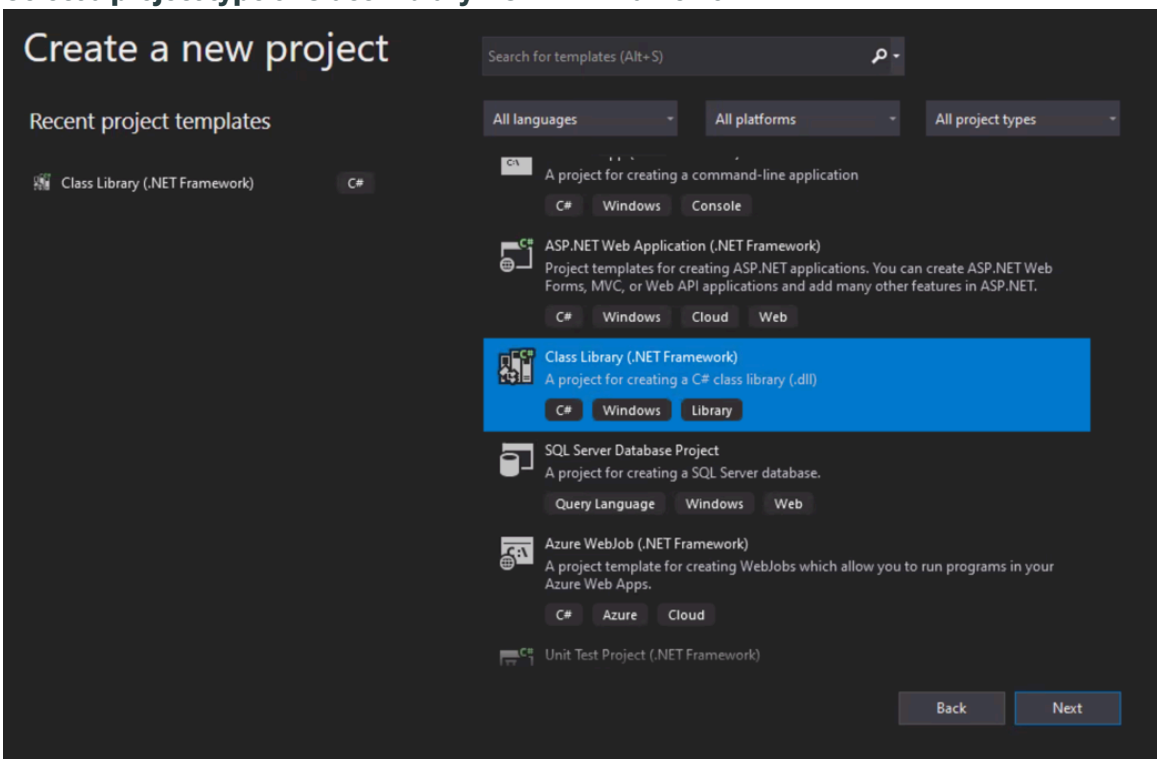
About this task

The following procedure describes how to create a user plugin using C#.NET.

Procedure

1. Open Microsoft Visual Studio and click **Create a new project**.
2. In the Create a new project dialog box, select the Class Library (.NET Framework) template.

Select a project type of Class Library DOT NET Framework



3. Click **Next**.
4. In the Configure your new project dialog box, fill in the following fields:

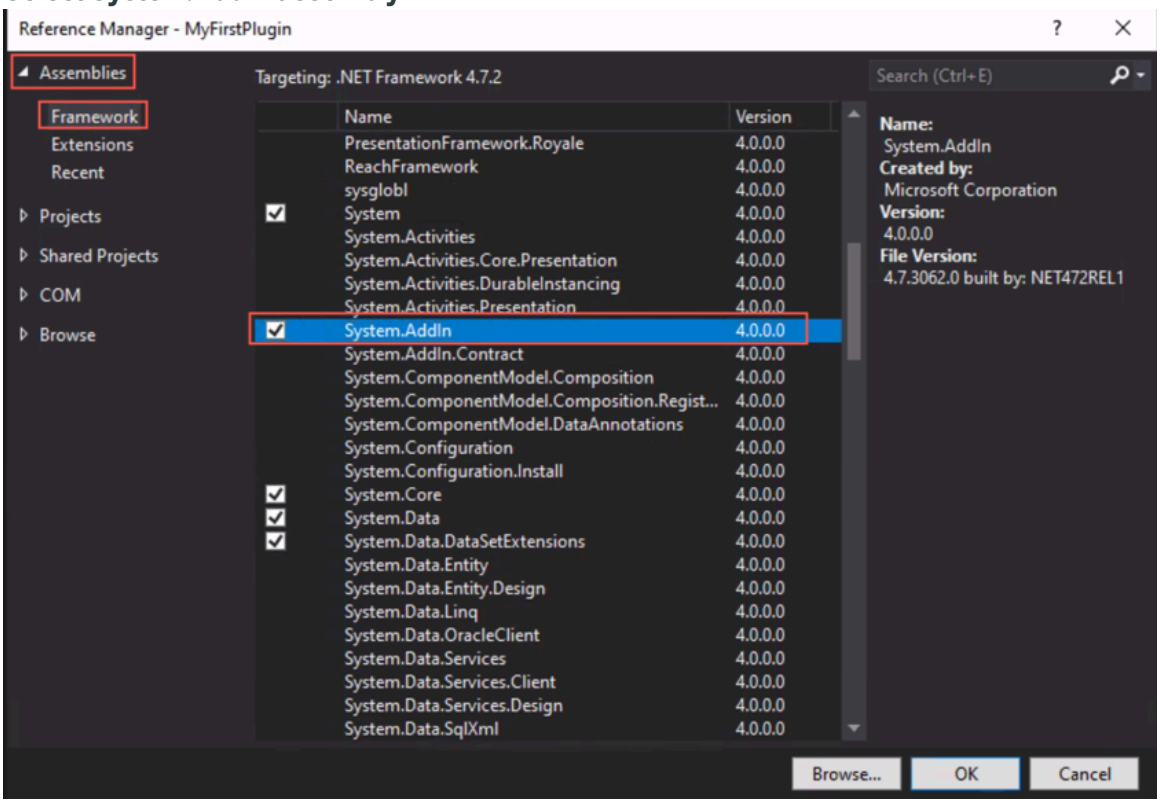
Field	Description and action
Project name	Name of your project. For example, `MyFirstPlugin`.
Location	Location of your project. Select a disk location.
Solution name	Name of your project's solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description and action
Framework	Select a framework version. Select **.NET Framework 4.7** version.

5. Click **Create**.
   The Class1.cs file opens.
6. In the Solution Explorer pane, right-click **References** and select **Add Reference**.
7. In the Reference Manager dialog box, navigate to **Assemblies** > **Framework**.
8. Select the **System.AddIn** assembly to add an annotation of this addin.

Select System.AddIn assembly



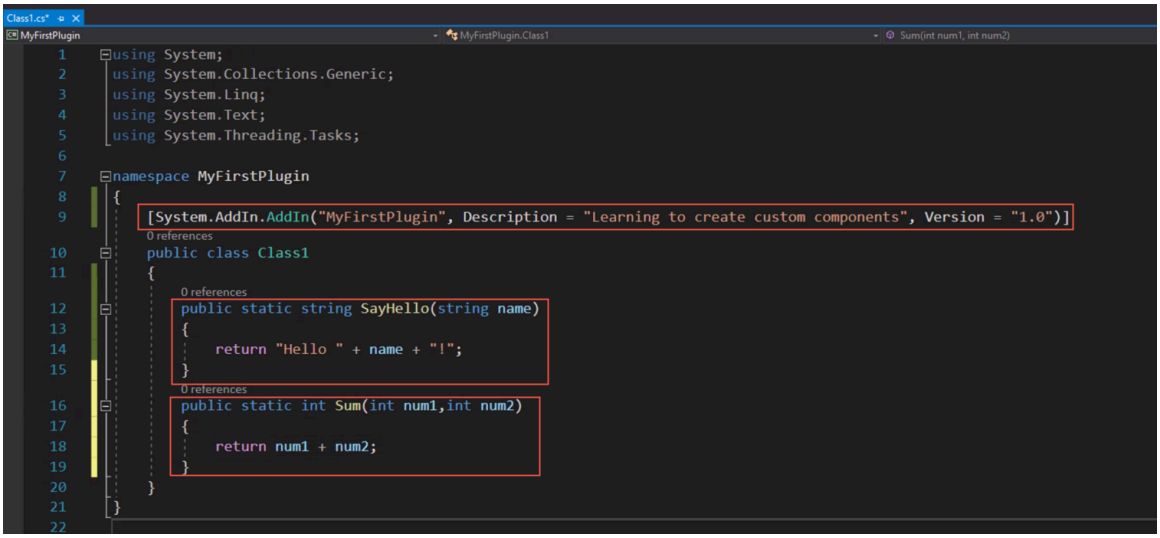
9. Click **OK**.
10. In the Class1.cs file, add the `System.AddIn.AddIn("MyFirstPlugin", Description = "Learning to create custom components", Version = "1.0")` code snippet above the class.
11. In the Class1.cs file, create one or more public static methods to your code.

    In this example, two methods are added to the code:

    - **SayHello** method: The name is taken as the input and returns "Hello" with a name and followed by an exclamation mark. For example, if the input is `User`, it returns "Hello User!".
    - **Sum** method: Two numbers are taken as the input and returns the sum of these two numbers. For example, if the inputs are `5` and `12`, it returns "17".

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Public static methods



12. Click **Save**.
13. In the Solution Explorer pane, right-click your project and select **Build**.
14. After the build is successful, do the following actions to copy and paste the .dll files:

    a. In the Solution Explorer pane, right-click your project and select **Open Folder in File Explorer**.

    b. Navigate to **bin** > **Debug** and copy the .dll files.

    c. Go to your RPA Desktop Design Studio automation project folder and create a new folder as **UserPlugins**.

    > **Important:**
    > Ensure that the spelling of this folder is entered correctly.

    d. In the UserPlugins folder, create a folder and enter a name for the folder.

    Example
    For example, `My First Plugin`.

    e. Paste the .dll files in this folder.

15. In the RPA Desktop Design Studio, do the following actions to add the plugin to your automation project:

    a. In the Project Explorer pane, right-click **User Plugins** and select **Add User Plugin**.

    b. In the Available User Plugins dialog box, select the plugin.

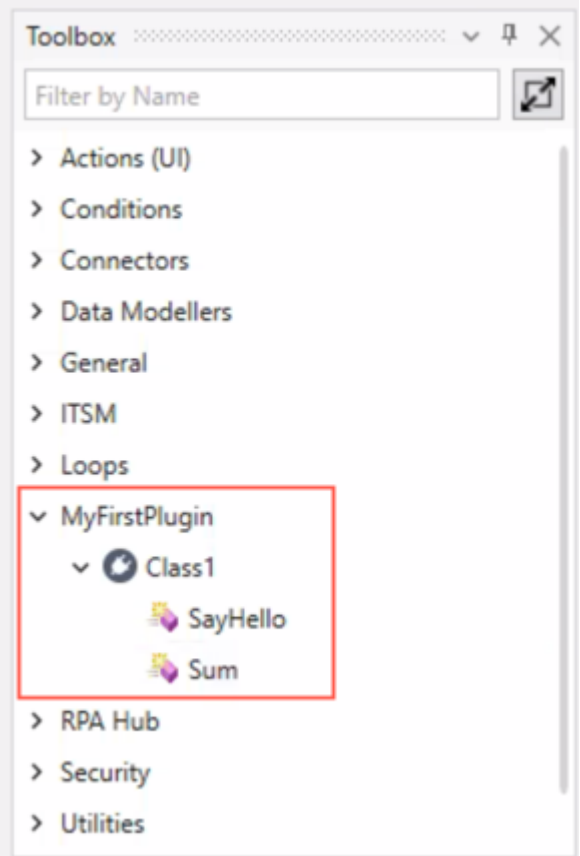
    c. Click **OK**.
    In the Toolbox pane, the user plugin you created appears.

16. Do the following actions to use the user plugin:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Toolbox pane, navigate to the user plugin component category to select a method.

Two methods that appear in the user plugin component category



b. Drag a method to the Design surface.

c. To provide the input parameter value manually, double-click the input parameter field under the method, and enter the value.

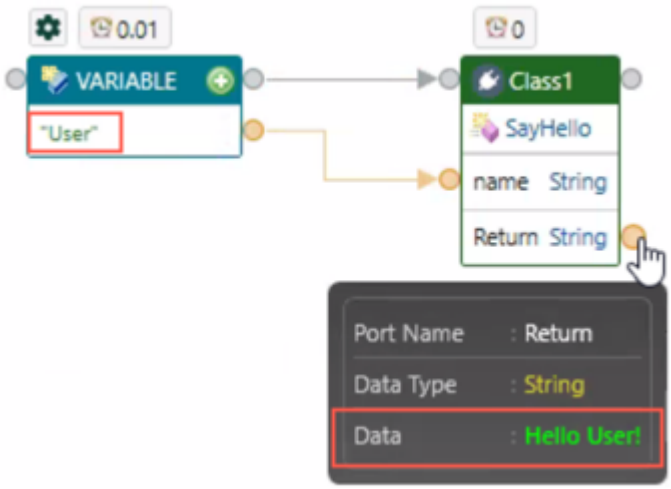
d. To provide the input parameter value from another method or component, connect the Data In port of the method to the Data Out port of another method or component.

e. Connect the control ports of the method to the corresponding ports of another method or component.

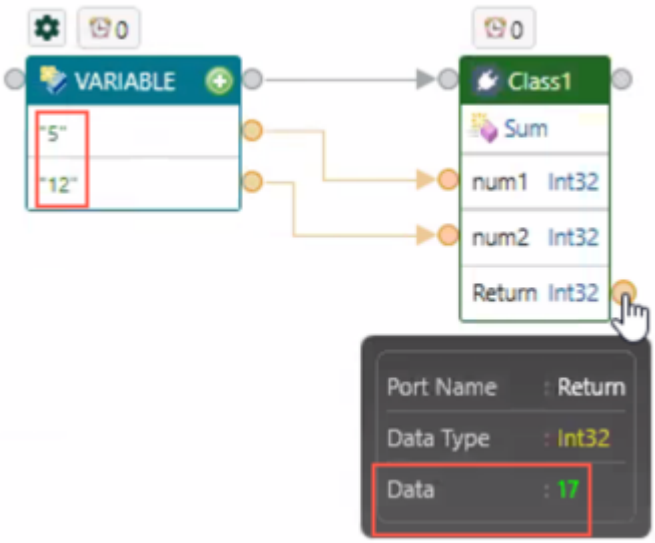
f. On the Design surface, right-click the title bar of the component from where you want to start the execution and select **Run From Here**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output of the SayHello method



Output of the Sum method



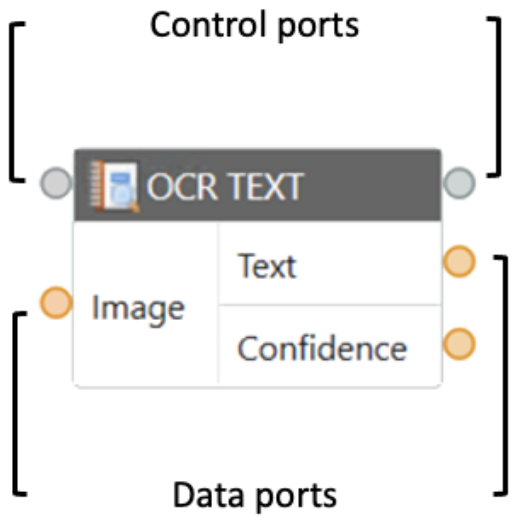
RPA Desktop Design Studio ports

Components in the RPA Desktop Design Studio have ports that are used while creating an automation workflow.

The ports are categorized as Control ports and Data ports.

The gray ports are called the Control ports and the orange ports are called the Data ports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The ports are subcategorized into input ports and output ports.

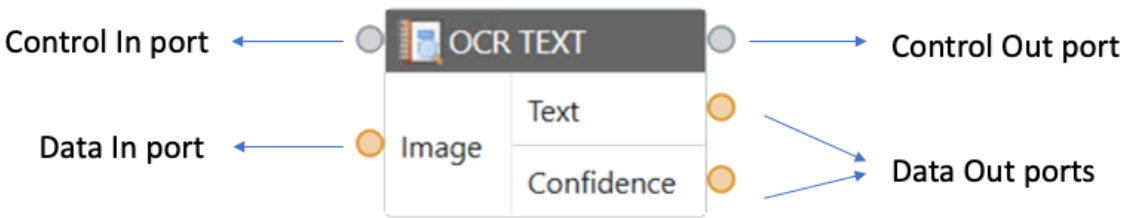
Control ports are subcategorized into Control In and Control Out ports. Control ports decide the flow of the automation execution (which component to execute next).

Data ports are subcategorized into Data In and Data Out ports. Data ports transfer data between components.

Arrow heads on the connection lines indicate the flow of the direction.

Input ports always appear on the left of the component and output ports appear on the right of the component.

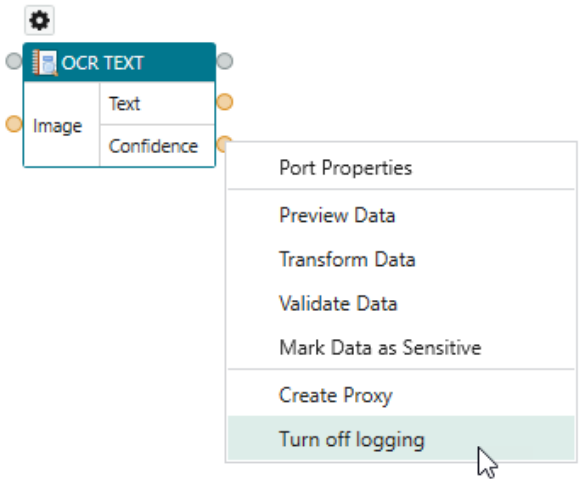
Hover over the port to see the function of the port.



A Data port turns red when you turn off the logging on that port. For example, select this option if you don't want to log sensitive information such as password or banking

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

details. To do that, right-click the Data In or Data Out port and select **Turn off logging**.



To turn on the logging, right-click the inactive Data port and select **Turn on logging**.

A Data port turns green when the data is transformed. For example, it turns green when it converts any information existing within a Data port from one format to another. To do that, right-click the Data In or Data Out port and select **Transform Data**. For more information, see Transform the data in RPA Desktop Design Studio.

Create and use an activity in RPA Desktop Design Studio

Create and use an activity to provide modularity to an automation project in RPA Desktop Design Studio.

Before you begin

Set up the RPA Desktop Design Studio application and add the ServiceNow instance details. For more information, see Set up RPA Desktop Design Studio.

Role required: none

About this task

Activities are a reusable set of instructions that are designed for an automation on the Design surface of RPA Desktop Design Studio.

You can design automation workflows in an activity on the Design surface by using various components.

Each activity contains two components by default: Start and End. These components can't be deleted because they are the starting and ending points of the activity.

You can reuse each activity multiple times within the same automation project by dragging the activity to the Design surface. You can also import activities in different automation projects.

To create an activity using Now Assist, see Create an activity with Now Assist.

Procedure

1. In the Project Explorer pane, navigate to **Activities**.

   The Activities section lists all the activities that are created under each project. By default, a Main activity is created when a new project is initiated. The automation execution starts from the startup activity, in this case, Main activity as shown in the following example.

Handle errors in RPA Desktop Design Studio

Create and use a variable in RPA Desktop Design Studio

Create and use a variable in RPA Desktop Design Studio

Create a variable in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

There are two types of variables:

- Local: This variable is declared within an activity and can be used only within the declared activity.
- Global: This variable is declared at a project level and can be used in any activity within the automation workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

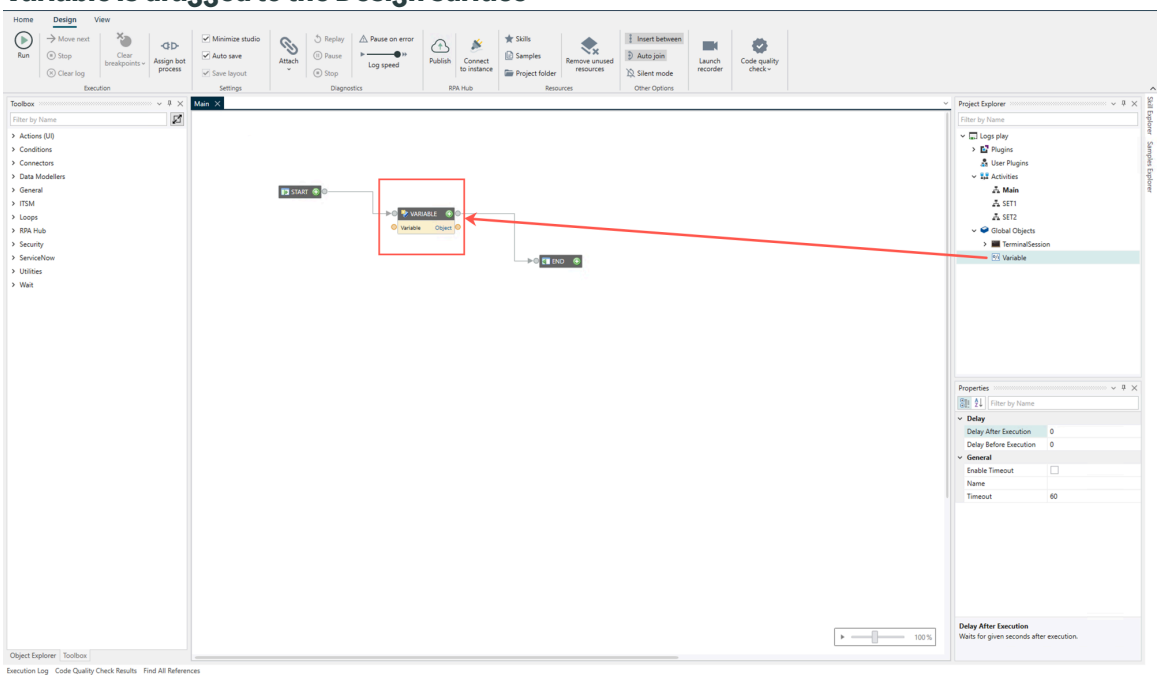
Variables have four attributes and they're assigned during an automation execution at different times:

- Identifier
- Data Location
- Type
- Value

Procedure

1. To create a local variable, perform either of the following actions:
   - In the Toolbox pane, navigate to **General** and drag the Variable component to the Design surface.
   - In the Toolbox pane, navigate to **General** and drag the Variable component onto the activity under the Project Explorer pane.
   - In the Project Explorer pane, right-click the desired activity and select **Create a Variable**.
2. To create a global variable, perform either of the following actions:
   - In the Project Explorer pane, right-click **Global Objects** and select **Create a Variable**.
   - In the Toolbox pane, navigate to **General** and drag the Variable component to **Global Objects** onto the Project Explorer pane.
3. **Optional:** If you want to convert a local variable to global, right-click the local variable from Project Explorer and select **Convert to global**.
   You can use this option if you have created a variable as local.
4. After the variable is created, drag the variable to the Design surface as shown in the following example.

Variable is dragged to the Design surface



5. Connect the data and control ports of the variable to the corresponding ports of the other components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** To assign a variable to either the Data In or the Data Out port, perform the following actions:

   a. On the Design surface, right-click the Data In or Data Out port of the variable and select **Override**.

   b. In the PORT PROPERTIES dialog box, click **Select** next to the **Mapped Variable** field to choose a required variable.

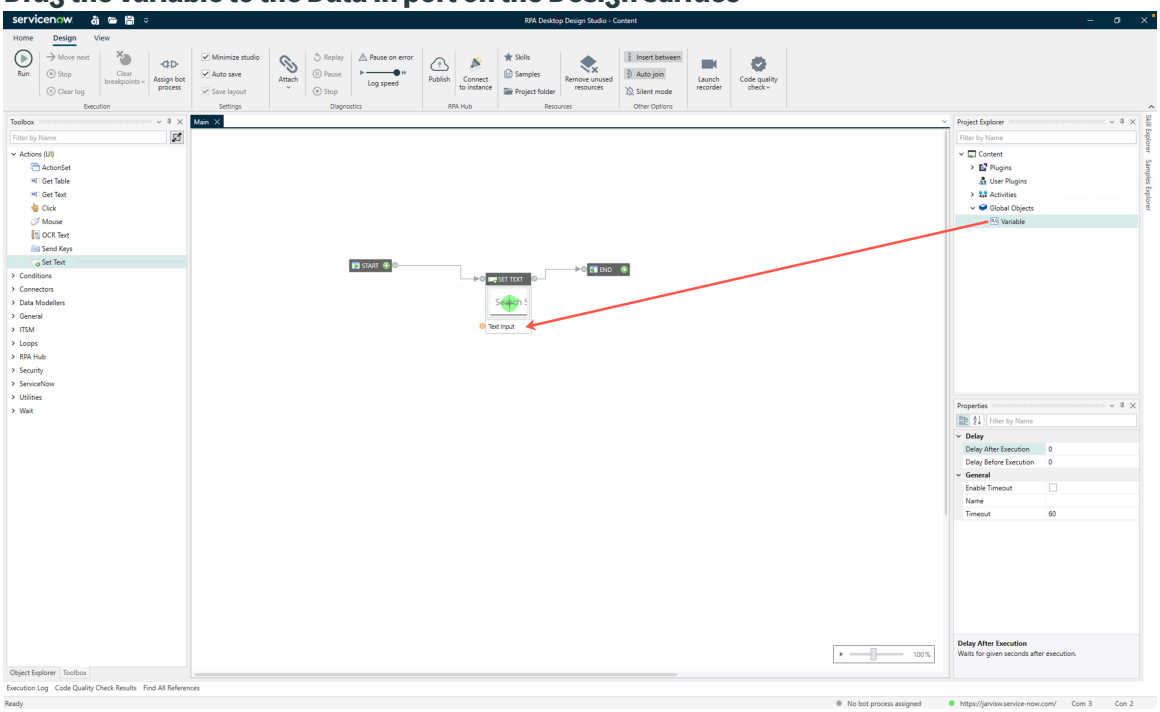
   > **Note:**
   > If you select this option, the Data In port on the component disappears and the variable name appears on the port.

   c. In the CHOOSE VARIABLE dialog box, choose a mapped global or a local variable to read or store data depending on whether you want to override the Data In or the Data Out port.

   d. Click **OK**.

7. **Optional:** To use variables in either a Data In or a Data Out port, drag the variable onto the Data In or Data Out port on the Design surface as shown in the following example.

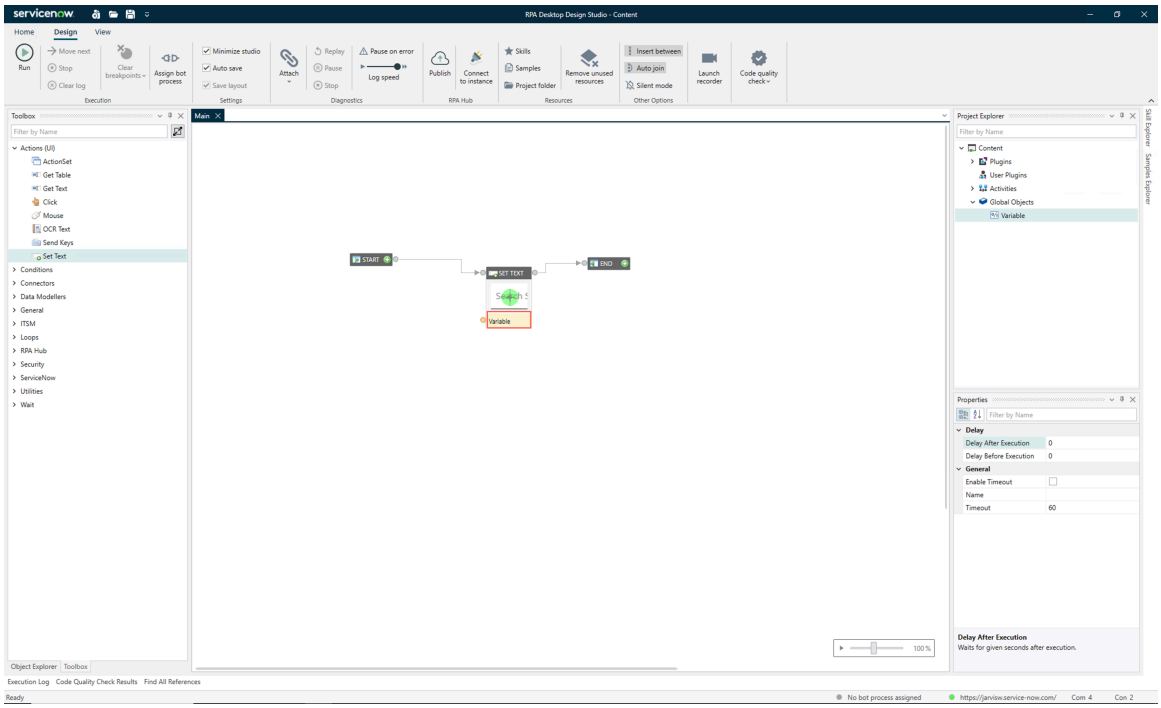
Drag the variable to the Data In port on the Design surface



The following example shows the output when the variable is dragged to the Data In port.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output when the variable is dragged to the Data In port



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
You might come across the following behaviours when you drag and drop an automation component from the Toolbox, Object explorer, Project explorer, and Skills explorer to the Design surface:

- If you drag and drop a component to the same component in the Design surface, then the new component replaces the existing component. For example, if you already have the **ActionSet** component on the Design surface and you drag and drop another **ActionSet** component to the existing **ActionSet**, then the new version replaces the existing component.

  All the connections (control and data connections), variables, or static data associated to the existing component gets associated to the newly dropped component if the port name and the port data type are the same.

- If you drag and drop a new component to a different component or method in the Design surface then the new component replaces the existing component.

  (Optional) All the connections, variables, or static data associated to the existing component gets associated to the newly dropped component if the port names and the port data types are the same.

- If you drag and drop a component between two components that are already connected in the Design surface, then the component is placed between the existing components. You may come across the following behaviours when you drag and drop a component between two components:
  - If port names and the port data types of the newly dropped component match with the connected components, then the data connections are created.
  - If the port names are the same and the port data types are different, then the data connections are created only if the port data type is can be converted (the source port data must be converted to target data type. This is known as typecasting or type conversion. For more information on type casting, see Java Type Casting). For example, integer to object but not object to integer.
  - If the port names are the same and the port data type can be converted, but there is already an existing data connection between the two components, then no new data connection is created.

Create an attended automation form in RPA Desktop Design Studio

Design attended automations by creating an attended user interface (UI) form in RPA Desktop Design Studio.

Before you begin

Ensure that the project type is **Attended Automation**. For more information, see Create an automation project manually.

Role required: none

About this task

An attended automation form is a container for all the elements that make up the UI. A form is a custom interface that you can use to interact with multiple applications within the RPA Desktop Design Studio. You can use forms to insert various elements and arrange them in layouts.

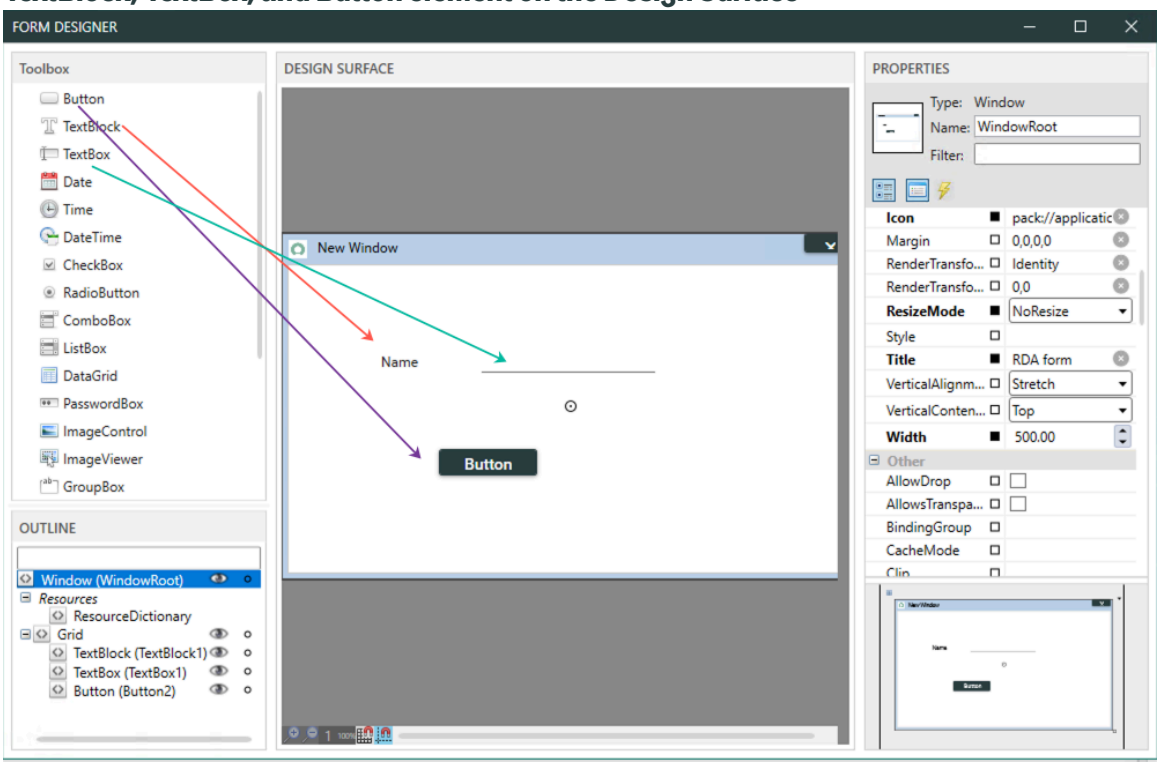
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the RPA Desktop Design Studio, from the Project Explorer pane, navigate to **Forms** and expand it.
2. Choose an option and complete the action.
3. In the Form Designer, from the Toolbox pane, select an element that you want to add to your form and draw it on the Design surface.

   Example
   For example, to draw a text block on the form, select the TextBlock element from the Toolbox pane and draw it on the Design surface. Similarly, select the TextBox and Button element and draw them on the Design surface, as shown in the following example.

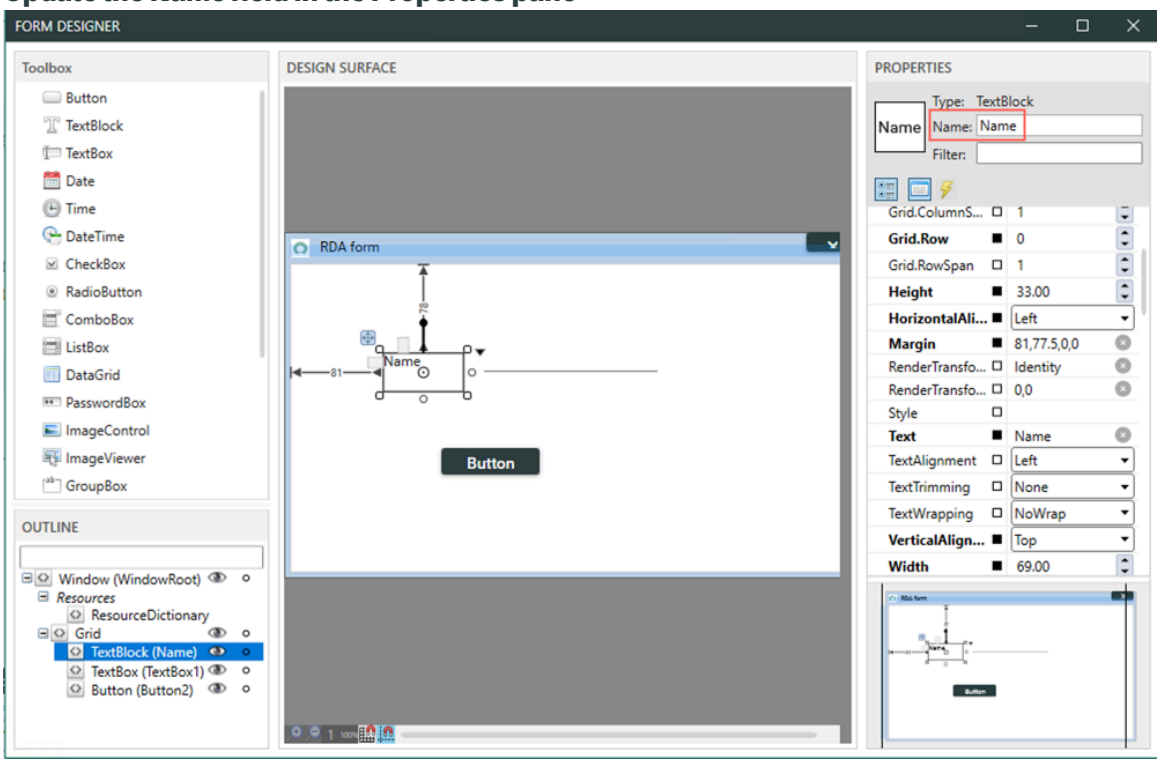
   TextBlock, TextBox, and Button element on the Design Surface



4. In the Form Designer, from the Properties pane, update the name of an element in the **Name** field, as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update the Name field in the Properties pane



5. Choose an option and complete the action.

Form designer for building attended automation forms

Form designer is an Integrated Development Environment (IDE) for building attended automation forms in RPA Desktop Design Studio.

Form designer overview

A form is a custom interface to interact with multiple applications by using the Forms functionality within the RPA Desktop Design Studio. Forms can be used to insert various elements and arrange them as per the desired layout.

Access the Form Designer

To access the Form Designer, right-click the desired form in the Project Explorer pane and select **Design**.

Sections of the Form Designer

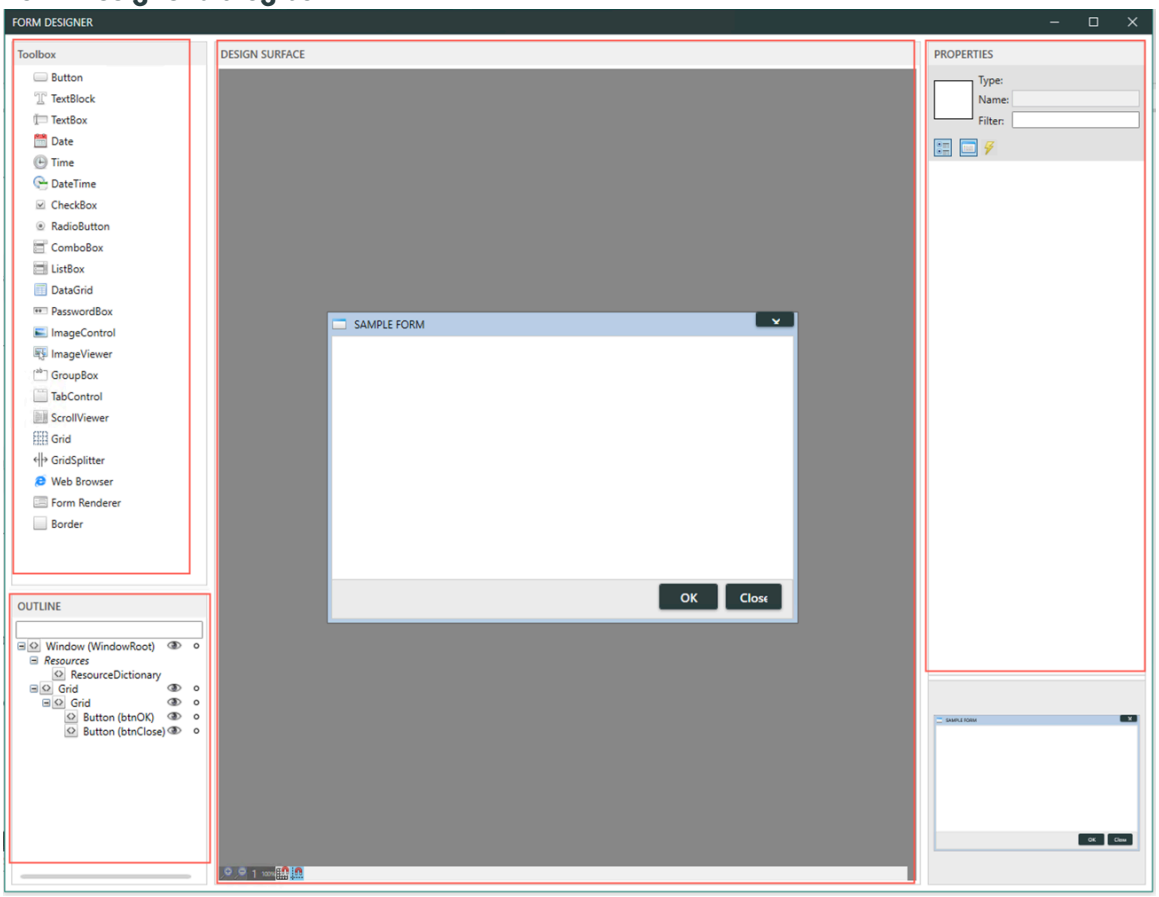
Form Designer has four parts as shown in the following example:

- Toolbox pane: The elements used for designing the form are displayed in the example.
- Outline pane: Lists the elements and resources in the form. You can view and focus on a specific element of the form, as you are designing the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Design surface: Create designs by selecting elements from the Toolbox pane and drawing on the form within the Design surface.
- Properties pane: View and edit the properties of an element or a window in the form that help to fine-tune its functionality. The important properties are highlighted in bold.

Form Designer dialog box



Details of the Toolbox pane elements

The following elements from the Toolbox pane can be used to design the form.

Toolbox pane elements

Element	Description
Button	Helps you to add one or more buttons on the form. Enables the user to click it to perform an action.
TextBlock	Helps you to add a label on the form. Enables the user to view a text block as read-only information.
TextBox	Helps you to add a text box to the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Toolbox pane elements (continued)

Element	Description
	Enables the user to provide information to the form within a text box.
Date	Helps you to provide a date picker on the form. Enables the user to select a specific date on the form.
Time	Helps you to provide a time picker on the form. Enables the user to select a specific time on the form.
DateTime	Helps you to provide a date and time picker on the form. Enables the user to select a specific date and time on the form.
CheckBox	Helps you to present yes, no, true, or false selections. You can also use the check box element in groups to display multiple choices in a form.
RadioButton	Enables you to select a choice from the group of choices.
ComboBox	Displays the data in a drop-down combination box. By default, the ComboBox element appears in two parts. The top part is a text box that enables you to type a list item. The second part is a list box that displays a list of items that you can select from.
ListBox	Displays a list of items that you can select one or more Items from.
DataGrid	Enables you to display and manipulate the tabular data.
PasswordBox	Displays placeholder characters while you type a string.
ImageControl	Displays images in the form.
ImageViewer	Enables you to open and view image files including JPEG, GIF, WMF, and other image formats.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Toolbox pane elements (continued)

Element	Description
	It also provides options to stretch the images, shrink the images, and rotate the images at different angles through all axis.
GroupBox	Provides an identifiable grouping for other elements. Typically, you use group boxes to subdivide a form by function.
TabControl	Helps you add one or more tabs in your form.
ScrollViewer	Enables you to add a scrolling functionality to the form.
Grid	Defines a flexible grid area that consists of columns and rows.
GridSpiltter	Helps you to split a grid element into multiple parts.
Web Browser	Hosts web pages and provides web browsing capabilities to your application.
Form Renderer	Helps you build forms quickly with the following controls: • TextBox • ComboBox • CheckBox • RadioButton • ToggleButton • Date • Time • PasswordBox
Border	Enables you to draw a border, background, or both with the form.

Configure the form fields for the Form Renderer element

Configure the form fields in the Form Renderer element while you are building an attended automation form in RPA Desktop Design Studio.

Before you begin

Create an attended automation form in RPA Desktop Design Studio. For more information, see Create an attended automation form in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensure that your attended automation form contains a Form Renderer element. For more information, see Form designer for building attended automation forms.

Role required: none

About this task

The Form Renderer element helps you to build forms quickly with the available controls.

Procedure

1. In the RPA Desktop Design Studio, from the Project Explorer pane, navigate to **Forms** and expand it.
2. Right-click the Form Renderer element and select **Configure** to configure the form fields.
3. In the CONFIGURE FORM FIELDS dialog box, click the add icon (+) to add a new **Field** tab.
4. In the Fields section, expand a Field option and fill in the following details:

Field form

Field	Description
Name	Name of the field that appears as a label name on the form.
Type	Type of the field: ○ TextBox ○ ComboBox ○ CheckBox ○ RadioButton ○ ToggleButton ○ Date ○ Time ○ PasswordBox
Required	Option for enabling this field as a required field on the form.
Read Only	Option for enabling this field as a read-only field on the form.
Field Help	Help information for the field: ○ None ○ Text ○ Link
Help Text	Help text information for the field. This field appears only when **Text** is selected from the **Field Help** field.
Help Link	Help link URL for the field. This field appears only when **Link** is selected from the **Field Help** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **OK**.
6. Repeat steps 3 to 5 to add a new field.
7. **Optional:** To delete a field, do the following actions:
   a. Expand the field option that you want to delete and click the delete icon ( ).
   b. In the Confirmation dialog box, click **Yes**.
8. In the Form Settings section, fill in the fields.

Form Settings form

Field	Description
Name	Title of the form.
Field Help	Help information for the form: ○ None ○ Text ○ Link
Help Text	Help text information for the form. This field appears only when **Text** is selected from the **Field Help** field.
Help Link	Help link URL for the form. This field appears only when **Link** is selected from the **Field Help** field.
Show Popups Inside	Option for enabling pop-up windows inside the form.

9. Click **OK**.

Open Service and Runtime logs

Logs record events that occur during the execution of an automation process. These logs are crucial for debugging and monitoring the performance of the robots.

Before you begin

Close the existing Unattended Robot or Attended Robot window.

Role required: none

About this task

Logs provide detailed information about the actions performed by the robot, including any errors or exceptions that occur. These logs help developers understand the robot's behavior and identify areas for improvement.

There are types of logs - service logs and runtime logs. Service Logs has the windows service-related operation logs. Runtime Logs has the automation-related logs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unattended Robot has a windows service for the core operations such as invoking an automation, updating the robot status, creating process jobs. This windows service runs in a system context. All the logs that are captured in that context are saved in a program data location. Verify to unhide the Program Data folder in your Windows machine.

Each log has a naming convention. If it's a runtime-related log, the log name starts with Runtime. If it's a RPA Desktop Design Studio related log, the log name starts with Studio.

Procedure

1. In the notification area (system tray) in the taskbar, select and hold (or right-click) the Unattended Robot icon ( ).
2. Select **View Logs** and select either **Service Logs** or **Runtime Logs**, to view the related logs.

Post requisites after installing a hot fix

Perform these tasks after installing a hot fix for either Universal App Connector (UAC) or Chromium connector on your instance to verify the hot fix is accurately downloaded.

Before you begin

Install the hot fix in your RPA Hub instance. An admin access might be required, to do this task.

Take a backup of the iBot project file that you're trying to open.

Close RPA Desktop Design Studio and any open browser tabs on your machine.

Role required: sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin

About this task

For example, if you created a project using the UAC plugin version 6.1, and a hot fix is installed on your instance for the same version. In this scenario, the following steps are required only for the first time when you either launch the RPA Desktop Design Studio, Unattended Robot, or Attended Robot after installing a hot fix.

This procedure is applicable if you are using Google Chrome, or Edge applications.

Procedure

1. In your Windows machine, navigate to the Task Manager.
2. Perform any of the following tasks to close the *`chrome.exe`*, *`msedge.exe`*, and *`msedgewebview2.exe`* processes (dependent tasks).
   - Locate the running *`chrome.exe`*, *`msedge.exe`*, *`msedgewebview2.exe`*, *`UTL.RPA.ChromeNativeMessaging.exe`*, and *`UTL.RPA.EdgeNativeMessaging.exe`* processes and select and hold (or right-click) **End task**.

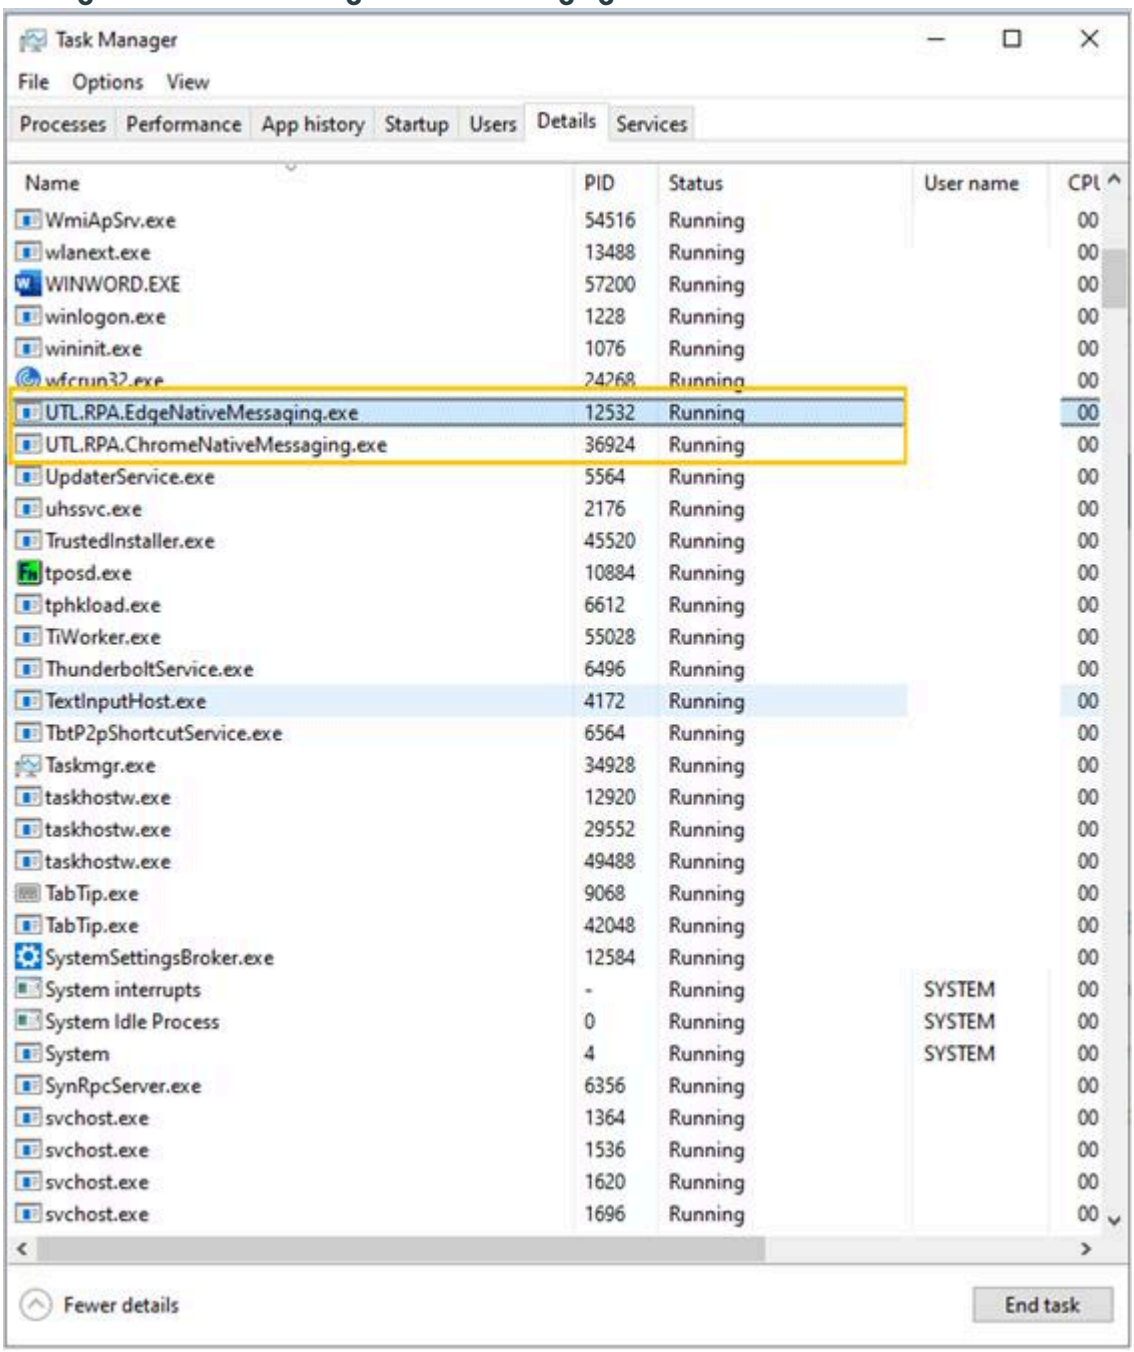
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ending Chrome and MS Edge Native Messaging exe files



- Use the following commands with elevated access to terminate all dependent tasks.
  - taskkill /f /im msedge.exe
  - taskkill /f /im msedgewebview2.exe
  - taskkill /f /im UTL.RPA.EdgeNativeMessaging.exe
  - taskkill /f /im chrome.exe
  - taskkill /f /im UTL.RPA.ChromeNativeMessaging.exe

3. Verify that the browser tabs or the mentioned executable files aren't running.
4. Launch either RPA Desktop Design Studio, Unattended Robot, or Attended Robot and proceed.

Using automations

You can preview, transform, and validate data on the automations. You can also run, publish, and review automations in RPA Desktop Design Studio.

Use a component in RPA Desktop Design Studio

Design automation projects by using components in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

Components are reusable blocks that are used for designing automations and to abstract functionality.

RPA Desktop Design Studio hosts a wide range of components that you can use while you're creating automation projects.

Each component has ports that are used while creating an automation workflow. For more information, see RPA Desktop Design Studio ports.

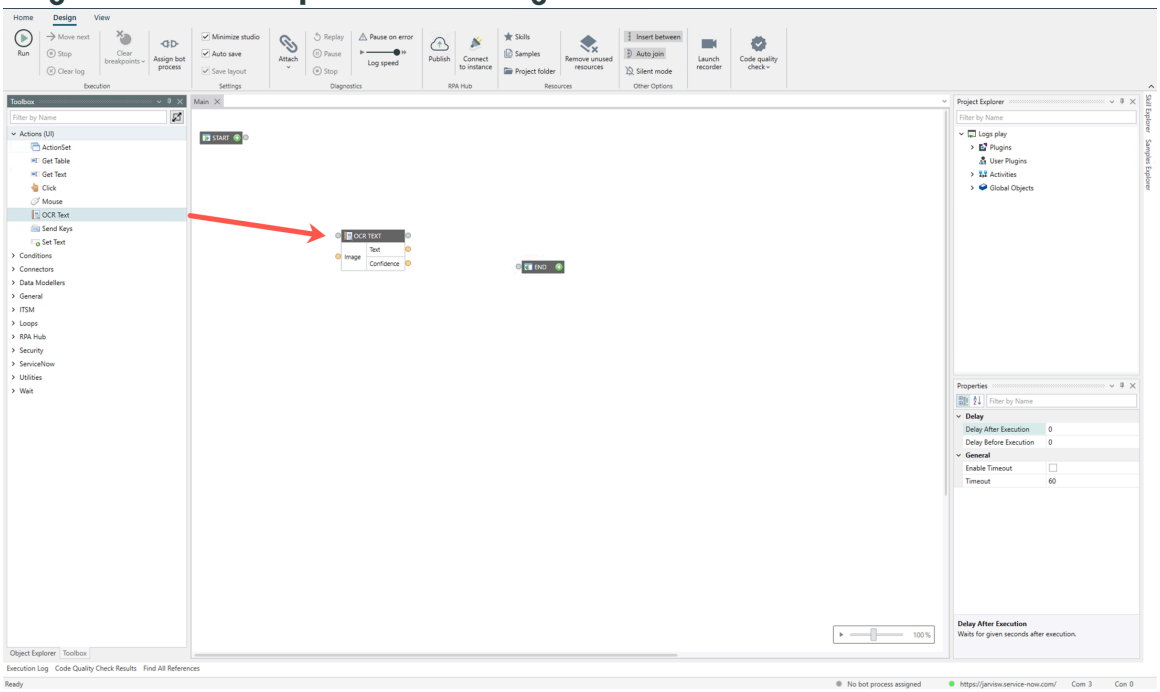
Enhance the automation logic with text instructions, either in an empty activity or by selecting a component in an existing one by using the Now Assist for RPA Hub application. For more information, see Build an automation with Now Assist.

Procedure

1. In the RPA Desktop Design Studio, from the Toolbox pane, navigate to a parent component category to select a component.
2. To use a component, drag a component to the Design surface as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Drag the OCR Text component to the Design surface



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
You might come across the following behaviours when you drag and drop an automation component from the Toolbox, Object explorer, Project explorer, and Skills explorer to the Design surface:

- If you drag and drop a component to the same component in the Design surface, then the new component replaces the existing component. For example, if you already have the **ActionSet** component on the Design surface and you drag and drop another **ActionSet** component to the existing **ActionSet**, then the new version replaces the existing component.

  All the connections (control and data connections), variables, or static data associated to the existing component gets associated to the newly dropped component if the port name and the port data type are the same.

- If you drag and drop a new component to a different component or method in the Design surface then the new component replaces the existing component.

  All the connections, variables, or static data associated to the existing component gets associated to the newly dropped component if the port names and the port data types are the same.

- If you drag and drop a component between two components that are already connected in the Design surface, then the component is placed between the existing components. You may come across the following behaviours when you drag and drop a component between two components:
  - If the port names and the port data types of the newly dropped component match with the connected components, then the data connections are created.
  - If the port names are the same and the port data types are different, then the data connections are created only if the port data type is can be converted (the source port data must be converted to target data type. This is known as typecasting or type conversion. For more information on type casting, see Java Type Casting). For example, integer to object but not object to integer.
  - If the port names are the same and the port data type can be converted, but there is already an existing data connection between the two components, then no new data connection is created.

3. Connect the following ports:
   a. Connect the Control In port of the OCR Text component with the Control Out port of another component.
   b. Connect the Control Out port of the OCR Text component with the Control In port of the next component.
   c. Connect the Data In (Bitmap) port of the OCR Text component with the Data Out port of another component.
   d. Connect the Data Out (String) with the Data In port of another component.
4. Do any of the following options for a desired action.

5. **Optional:** To search for a component that is available within the Toolbox, enter the text in the **Filter by Name** field.

Use a connector in RPA Desktop Design Studio

Connect to the various data sources and tools to create automation by using a connector in RPA Desktop Design Studio.

Before you begin

Ensure that the connector plug-in is installed and added to the RPA Desktop Design Studio application. For more information, see Manage plugins in RPA Desktop Design Studio.

Role required: none

About this task

For a list of connectors and their methods, see Connectors in RPA Desktop Design Studio.

For details on the issues related to connectors, see KB article KB1123555.

Procedure

1. Right-click **Global Objects** in the Project Explorer pane and select **Add Connectors**.
   The Add Connector dialog box is displayed.
2. Select the required connectors and click **Add Connectors**.
   The connectors are added to Global Objects. You can also drag and drop the required connector from the Toolbox pane to Global Objects.

   Note:
   If you add multiple instances of the same connector to Global Objects, each duplicate instance is appended with the numerical value of the duplication. For example, if you add 3 instances of the Email connector to Global Objects, they appear as Email, Email_2, and Email_3.

3. To provide the connector a custom name, perform the following steps.
   a. Double-click the connector under Global Objects.
   b. Enter a custom name of the connector in the Name field under the Properties pane.
4. In the Project Explorer pane, double-click the connector under Global Objects.
   Some connectors provide additional levels and methods for each level. To know more about the levels, see Understand levels of connector methods.
   The Object Explorer lists all methods of the connector.
5. Drag a method to the Design surface.
6. Configure the input fields.
   For more information, see Configure port properties.
7. Connect the control ports of the method to the corresponding ports of another method or component.

Use connector method

Expose and then use the methods within a connector to perform all the actions that the connector can do.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You must install the connector plugin. To install, see Manage plugins in RPA Desktop Design Studio.

To navigate to connectors, open an activity.

Role required: None

Procedure

1. In the Toolbox pane, navigate to **Connectors**.
2. Drag a connector under Global Objects in the Project Explorer pane.
3. Expose the methods, as given.
   Some connectors expose the methods at the connector level while the others expose the methods at multiple levels. For the latter, you must first configure the connector. To find a connector that needs configuration first, right-click the connector and see if the context-menu displays the **Configure** option.
   The methods are exposed under the Object Explorer pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Drag the method to the Design surface.

Important:
You might come across the following behaviours when you drag and drop an automation component from the Toolbox, Object explorer, Project explorer, and Skills explorer to the Design surface:

- If you drag and drop a component to the same component in the Design surface, then the new component replaces the existing component. For example, if you already have the **ActionSet** component on the Design surface and you drag and drop another **ActionSet** component to the existing **ActionSet**, then the new version replaces the existing component.

  All the connections (control and data connections), variables, or static data associated to the existing component gets associated to the newly dropped component if the port name and the port data type are the same.

- If you drag and drop a new component to a different component or method in the Design surface then the new component replaces the existing component.

  All the connections, variables, or static data associated to the existing component gets associated to the newly dropped component if the port names and the port data types are the same.

- If you drag and drop a component between two components that are already connected in the Design surface, then the component is placed between the existing components. You may come across the following behaviours when you drag and drop a component between two components:
  - If port names and the port data types of the newly dropped component match with the connected components, then the data connections are created.
  - If the port names are the same and the port data types are different, then the data connections are created only if the port data type is can be converted (the source port data must be converted to target data type. This is known as typecasting or type conversion. For more information on type casting, see Java Type Casting). For example, integer to object but not object to integer.
  - If the port names are the same and the port data type can be converted, but there is already an existing data connection between the two components, then no new data connection is created.

Connectors in RPA Desktop Design Studio

Learn about the connectors that you can use in RPA Desktop Design Studio to create an automation.

Connectors

Important:

For more information about connectors, see Connectors.

The following table lists the connectors that are available in the RPA Desktop Design Studio.

Connectors

Connector	Methods
Chromium Connector	Chromium connector methods

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connectors (continued)

Connector	Methods
Counter	Counter connector methods
C#.Net	C# connector methods
Email	Email connector methods
EventLog	EventLog connector event and methods
FTP	FTP connector methods
IdleTimer	IdleTimer connector methods and events
IE Connector	IE Connector methods
Java Connector	Java connector methods
JavaScript	JavaScript connector methods
KeyValuePair	KeyValuePair connector methods
List	List connector methods
Microsoft Excel	Microsoft Excel connector methods
Microsoft Outlook	Microsoft Outlook connector methods
Microsoft Word	Microsoft Word connector methods
PDF	PDF connector methods
Python	Python connector methods
SAP Connector	SAP Connector methods
Secure Shell (SSH) Connector	Secure Shell (SSH) connector methods
StringBuilder	StringBuilder connector methods
Table	Table connector methods
Terminal (Mainframe) Connector	Terminal connector methods
Timer	Timer connector methods
Universal App Connector	Universal app connector
VB.Net	VB connector methods
Windows Connector	Windows Connector methods

Understand levels of connector methods

Some connectors in the RPA Desktop Design Studio provide methods that interact with various applications at different levels. For example, the Chrome connector provides methods that interact with applications and their elements open in a Google Chrome browser to perform specific Robotic Process Automation tasks.

Connectors with different levels of methods

The RPA Desktop Design Studio provides connectors that interact with various applications at different levels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connectors with different levels of methods

Connector name	What does it do?
Chrome	Provides methods that interact with applications open in the Google Chrome browser.
Internet Explorer (IE)	Provides methods that interact with applications open in the IE browser.
Java	Provides methods that interact with Java-based applications.
Windows	Provides methods that interact with Windows applications.
Terminal (Mainframe)	Provides methods that interact with Mainframe applications.

Know the different levels of methods

The methods in the connectors interact at different levels in the applications.

Understand the method levels

Method level	What does it do?	Example
Connector	Interacts with the connector.	The Chrome connector interacts with the connector under the Global Objects in the Project Explorer and exposes the methods.
Screen	Interacts with the application.	The ServiceNow website opened in the Google Chrome browser.
Element	Interacts with elements in the application.	A text box in the ServiceNow website open in the Google Chrome browser.

Configure the connectors

To access the various methods, you must first configure the connectors.

- Configure the Chromium connector
- Configure the Internet Explorer connector
- Configure the Java connector
- Configure the Terminal connector
- Configure Windows connector

Expose the methods at different levels

After configuration, you can expose the methods at different levels. The methods appear in the Object Explorer pane.

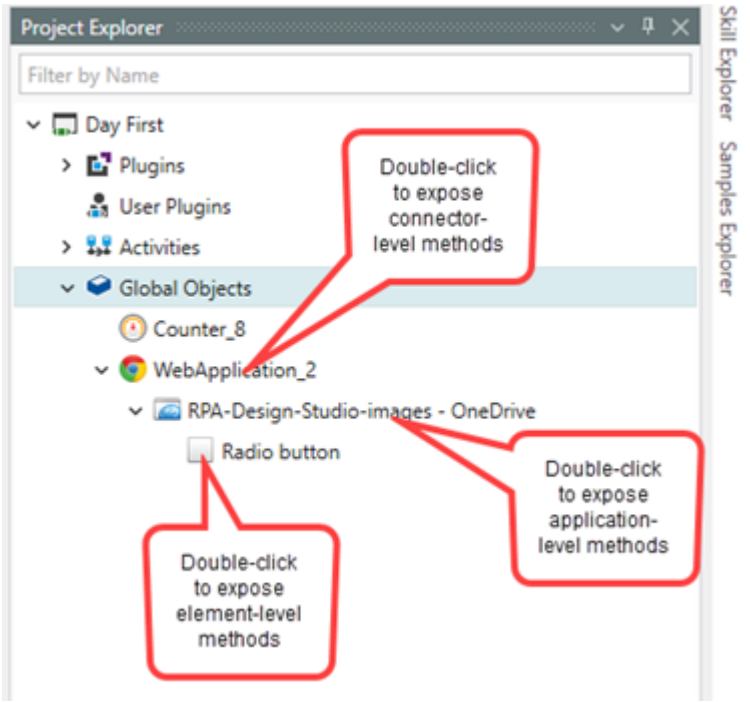
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Use sample automations in RPA Desktop Design Studio

Use a sample automation, which is a prebuilt automation, that shows how different components are configured for a specific use case.

Before you begin

Set up the RPA Desktop Design Studio application and add the ServiceNow instance details. For more information, see Set up RPA Desktop Design Studio.

Role required: none

About this task

The RPA Desktop Design Studio provides multiple sample automations that cater to different use cases. For example, extracting data from a PDF and insert into an Excel file.

The sample automations are classified into **Beginner**, **Intermediate**, **Advanced**, **References**, and **Attended** categories based on the complexity and use cases of the automations.

Procedure

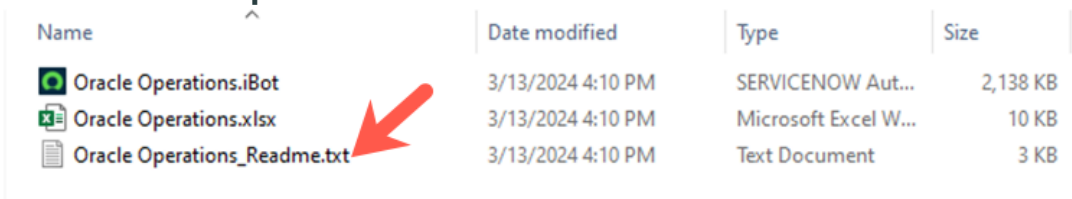
1. In the RPA Desktop Design Studio, from the Resources section, select **Samples**.
2. To access the sample automations in the **Beginner**, **Intermediate**, **Advanced**, **Reference**, or **Attended** categories, perform the following tasks:
   a. In the Samples Explorer, expand any of those folders.
   b. Double-click the sample automation.
   c. Under the Design tab, select **Run**.
3. To view the project files for the respective sample automation in the **Advanced**, **Reference**, or **Attended** categories, perform the following tasks:
   a. In the Samples Explorer, expand any of those folders.
   b. Double-click the sample automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Resources section, select **Project folder**.

d. Open the Readme file to view the detailed information of the sample automation and follow the instructions.
For example, the following image shows the ReadMe file for the sample automation on Oracle operations.

ReadMe file for sample automation



Sample automations

The RPA Desktop Design Studio provides multiple sample automations that cater to different use cases.

Sample automations descriptions

A sample automation is a prebuilt automation that shows how different components are configured for a specific use case.

Use the following unattended and attended sample automations that were added to the Sample Automations page of RPA Desktop Design Studio. You can also view them in the Sample Explorer section.

Unattended sample automations

Sample automation	Description
Add Word Footer	This automation downloads Word files from a specified URL. The robot further adds a footer to each page, using dynamically retrieved information from an Excel file.
Automate Offer Letters	This automation streamlines the process of generating offer letters for selected candidates. It extracts data from an Excel file, populates a predefined offer letter template, and distributes the letters via email, ensuring accurate and efficient candidate communication.
City Weather Reports	This automation retrieves weather information (temperature, wind, cloudiness, humidity) for various cities and countries listed in an Excel file. The automation loops through each city-country pair, fetches the corresponding weather details from Weather.com, and updates the relevant data fields in the Excel file. This data is collated into a comprehensive weather report, with all the information organized and populated in the same Excel sheet for easy reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unattended sample automations (continued)

Sample automation	Description
Clear Browser Cache	This automation clears the all-time cookies, other site data, cached images, and files from the browsers like Microsoft Edge and Google Chrome.
Consolidated Invoices	This automation extracts information from each Excel file within the Invoice Data folder and consolidates all the data into a single Excel file.
Convert Excel to Json	This automation reads data from an Excel file (including password-protected ones) and converts the Excel file into a JSON file.
DataTable extraction from PDF to Excel	This automation efficiently identifies and extracts the first table from a PDF document. Once the table is extracted, the script seamlessly converts the data into a structured format and writes it to an Excel file.
Date Delta Across Apps	This automation calculates the delta between two dates and updates the relevant systems or documents accordingly.
Decision Component	This automation takes the provided input as a number, checks whether the number is greater than 100 using the Decision component, and displays the corresponding text in a message box in the provided format.
Decode Barcode and QR Code to Text	This automation extracts data from barcode or QR code images in a specified project folder, stores the information in an organized Excel file, and ensures accurate and efficient capture for easy access and analysis.
Download attachments from outlook	This automation monitors email accounts for messages with specific subjects, ensuring that only relevant emails are processed. On identifying an email that matches the criteria, it downloads the attachments and saves them to a designated local project folder.
Download File from URL	This automation simplifies the file download process from a web application. It provides a consistent and reliable method for downloading files from any URL, saving them to a specified local folder, and sending an email with the downloaded file as an attachment, ensuring you have a seamless and efficient experience.
Email Archiving or Deletion	This automation archives or deletes emails based on provided parameters: MailID, Sender, Subject, and FolderName on Outlook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unattended sample automations (continued)

Sample automation	Description
	The solution streamlines the process, reduces errors, and saves time.
Excel Conversion	This automation reads data from an Excel file and converts it into an XML file. It facilitates the transfer of data from the Excel table into a SQL database table.
Excel Operations	This automation demonstrates various tasks in Microsoft Excel, including searching for text, creating pivot tables, and exporting charts. It showcases a sequential flow to help users understand seamless integration within an automation workflow.
Expression Component	This automation performs addition using the Expression component and displays the result in a message box.
Extract Data from a Table and Saving to Excel	This automation is customized for a specific website because the elements that must be captured on different websites vary. When creating comparable automations for different websites, this automation can be used as a guide.
Extract Data from JSON to Excel	This automation streamlines data handling by efficiently extracting and logging JSON data into structured formats, reducing manual intervention. The bot creates work items in a designated queue, retrieves those items, and extracts JSON values based on specific property names. The extracted values are then organized and updated into an Excel sheet, ensuring accurate and easy access to the data.
Extract Excel Table to Embed in Email Body	This automation extracts the data from the specified sheet in the Excel file and sends an Microsoft Outlook email to the recipient with the Excel data included in the body of the email.
ExtractDataFromPDF	This automation extracts table data from a PDF and generates an Excel file with the extracted information.
Fetch contact info from email	This automation identifies relevant emails based on specific subjects and updates the extracted information (FirstName, LastName, and EmailAddress) into an Excel spreadsheet. This automation enhances data management efficiency and reduces manual data entry errors.
File Operations	This automation checks whether the provided file exists or not. If file exists, automation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unattended sample automations (continued)

Sample automation	Description
	provides a new incremental filename which doesn't exist already. Ex: If a file "C:\Users \Public\XYZ.txt" already exists, automation returns the filename as C:\Users\Public \XYZ_1.txt and so on.
File Ops Copy, Delete, Move	This automation copies, moves, and deletes files according to user-defined rules. It enhances file management by minimizing manual effort and errors and can be customized to handle specific conditions such as file type, timestamps, or folder locations, ensuring improved organization and efficiency.
For Each Component	This automation sets a list of values, retrieves each item's value using the For Each component, displays the item value in a message box, and checks whether the item value is equal to the provided value. If it's equal, the automation breaks out of the For Each loop.
For Loop	This automation obtains each index value using the For Loop component with provided inputs for "From" and "To," and then displays the index values in a message box.
Format Text	This automation accepts the provided input and displays the text in a message box using the specified format.
Health Check Bot	This automation verifies system prerequisites on Remote Desktop Protocol (RDP) machines before executing specific tasks. It ensures all necessary system conditions are met, reducing the risk of process failures due to configuration issues.
Highlight Excel Rows	This automation highlights rows in an Excel sheet based on information extracted from a Word document. It's useful for tasks such as data validation, report generation, and automating document processing involving both Excel and Word.
HTML to CSV	This automation converts multiple HTML table data files into a single CSV file, storing the converted files in the specified output folder path.
Invoice Data Extraction to Excel	This automation extracts the necessary data from invoices, populates the extracted information into an Excel sheet, and sends the Excel file as an email attachment to designated recipients. By streamlining the process, it reduces errors and enhances

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unattended sample automations (continued)

Sample automation	Description
	efficiency, ensuring accurate and timely data management.
Merge CSV files	This automation merges two or more same CSV files into 1 main CSV with all the required details.
Merge Excel Sheets	This automation merges two or more Excel files into one main Excel file, with all the required details. To use the automation, you need to provide the folder path containing the Excel files as input and then execute the automation. It automatically merges all the .xlsx files into the main Excel file.
OneDrive Operations	This automation includes various activities that perform actions like 'Upload,' 'Download,' and 'Share'. The Upload activity uploads a local file specified in the process parameter to the ServiceNow® table or uploads a file to OneDrive using the OneDrive action. The Download activity downloads file from OneDrive to the local folder. The Share activity generates a link of a OneDrive file and shares it via email.
Oracle EBS Password Reset	This automation resets passwords for third-party applications or systems. The RPA Oracle Password Reset subflow queues the password reset request, which is automatically created from the Password Reset Request to the queue. The Update Password Reset subflow updates the status as Completed with Success.
Oracle Operations	This automation enables you to define employees in the Oracle EBS ERP system. Employment of a candidate is confirmed when the recruitment process is completed. If the recruitment of a candidate is performed through a manual system such as email, spreadsheets, and so on, you can use this automation to define employees from the manual system to the Oracle EBS ERP system. You can also use this automation if the recruitment process is performed through a different ERP system and then define the employees in the Oracle EBS ERP system.
PDF Text to Images	This automation searches for a specific text within a PDF file and saves the corresponding pages as images in a designated folder. Supported image formats include JPEG, JPG, and PNG. Provide the text to be searched, the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unattended sample automations (continued)

Sample automation	Description
	path to the PDF file, and the destination folder path where the images must be saved.
PDF to Word	This automation converts multiple PDF files into separate Word files. Provide the path to the folder containing the PDF files, and the automation converts them to the Word file format.
Resume Skill Matcher	This automation automates the resume screening process, saving recruiters valuable time and effort.
Shipping Orders	This automation retrieves details from an Excel file, opens a Windows application, inputs the details into the application, submits the information, and finally, once all details are processed, closes the Windows application.
Start App	This automation launches a webpage in the Chrome application with the provided URL.
Streamlining Report Data Analysis	This automation extracts tables from the Word document and creates sheets in Excel.
Summarize Sales Data	This automation summarizes sales data using Excel Macros and sends the results to the recipient via email as an unattended automation.
Tiff to PDF	This automation converts multiple TIFF images into a single PDF file. It processes TIFF files from a specified input location and generates a consolidated PDF document. After completing the conversion, the resulting PDF file is automatically saved in the designated output folder, for easy access. This process streamlines document handling by combining multiple image files into a single, organized PDF output.
Universal Timezone Converter	This automation converts time from one-time zone to another using the VB.Net Connector, ensuring accurate adjustment to the specified target time zone.
User Creation in Badging App	This automation streamlines the interaction with BadgeTool application by using the Universal App Connector to automate user management tasks based on data from an Excel file.
V_LookUp	This automation reads data from the Department Excel file, retrieves values from column A, and adds them to a list. It then reads Employee Excel file, takes column A values one by one, and compares them with the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unattended sample automations (continued)

Sample automation	Description
	department list values. If a match is found, it retrieves the corresponding row details from the Employee Excel file and sets the values into the Department Excel file.
While Loop	This automation reads values from a variable, checks a condition using the While Component and Decision Component, and displays formatted text in a message box. If the decision matches, the automation breaks out of the while loop.
Word Operations	This automation demonstrates various tasks in Microsoft Word, such as setting tables, inserting tables and pictures, and exporting Word to PDF. It showcases a sequential flow to help you understand seamless integration within an automation workflow.
Word to PDF Converter	This automation converts multiple Word files (.docx) from the Source folder path (default Project folder) to separate PDF files and stores them in the same location.
XML to Excel Conversion	This automation converts multiple XML files to separate XLSX files. Converted XLSX files are stored in the processed folder path.
Zip and UnZip files	This automation streamlines file management by providing compress and decompress functionalities.

Attended sample automations

Sample automation	Description
Copying a Range from One Excel File to Another	This automation copies a range of data from one Excel file to another. The automation is designed to identify the specific range of cells in the source Excel file, extract the data, and then paste it into the designated range in the destination Excel file. This use case is useful for tasks such as data consolidation, report generation, and data migration, where manual copying and pasting can be time-consuming and prone to errors.

Recording automations

Capture your actions from your desktop or web applications and convert them into an automation flow by using the recorder option in the RPA Desktop Design Studio application. You can record attended and unattended automations by using this capability. When you record an automation, you don't have to create it manually by using connectors or components.

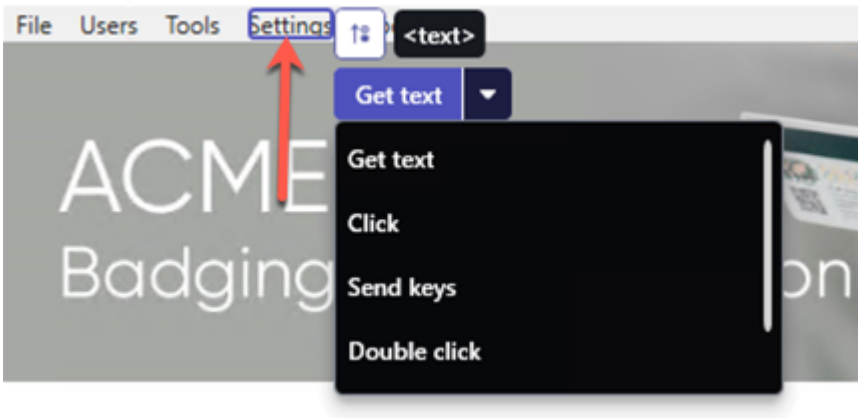
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The recorder feature supports the applications which can be interrogated using the Universal App Connector.

Highlighting an element

When you use the recorder, you can highlight the different elements in an application. These highlights enable you to differentiate the different type of elements. You can then perform the required action for each element. Each element has a default action and a list of sub-actions.

Highlighting an element by using the recorder



Recorded actions pane

The action that you perform on each element is captured in the Recorded actions pane. The recorded action in the Recorded actions pane displays the type of action and the element on which the action is performed. The recorded actions are also listed according to the application screens.

Automation flow generation

When a recording is saved, the RPA Desktop Design Studio application generates an automation flow as an activity to the automation project. The recording is also automatically configured as an object and listed under the **Global Objects** option in the Project Explorer pane. You can improve the generated automation flow from the Design surface by adding further components.

Configuring the screen match rules

The screens and elements of the recording are also configured as objects to **Global Objects**. You can configure the screen match rules and the element attributes based on your preference, by using the Universal App Connector. For more information on how to use the Universal App Connector, see Universal app connector.

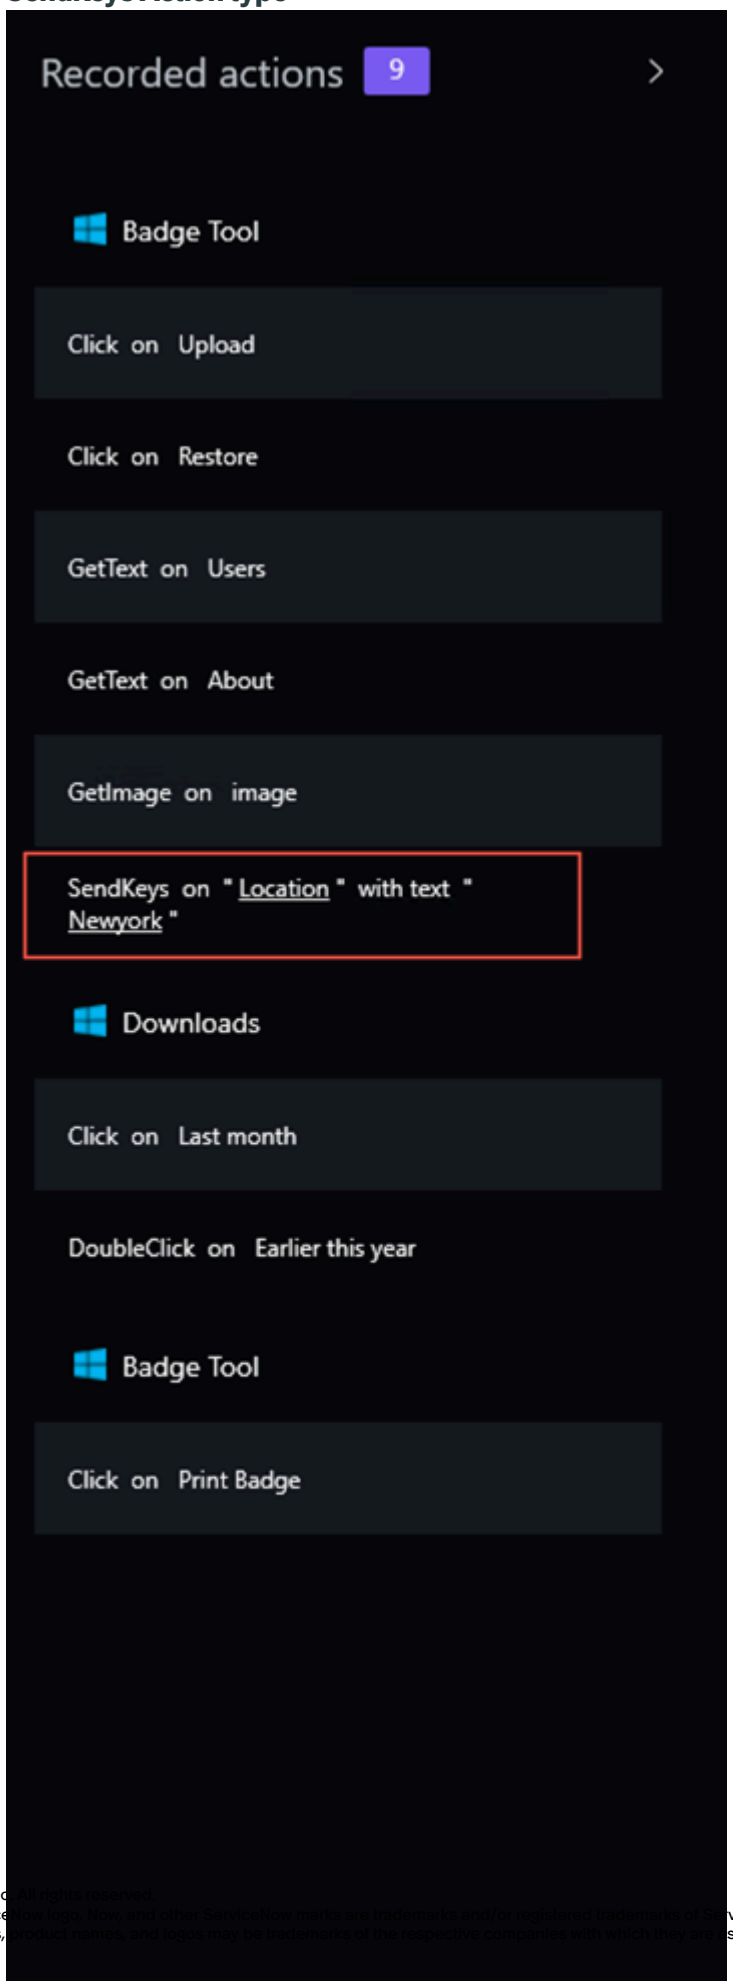
Enhanced element interrogations

Populate element name

When you record an action in the application, the element name is automatically filled in the Recorded actions pane. The element name is captured from the target application. In the following example, while recording the SendKeys action, the element name "Location" is automatically filled, followed by "with text" and the keys or text value that is inputted by the user during the recording phase. If no default element name is available in the target application, the type of element is used as the name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SendKeys Action type



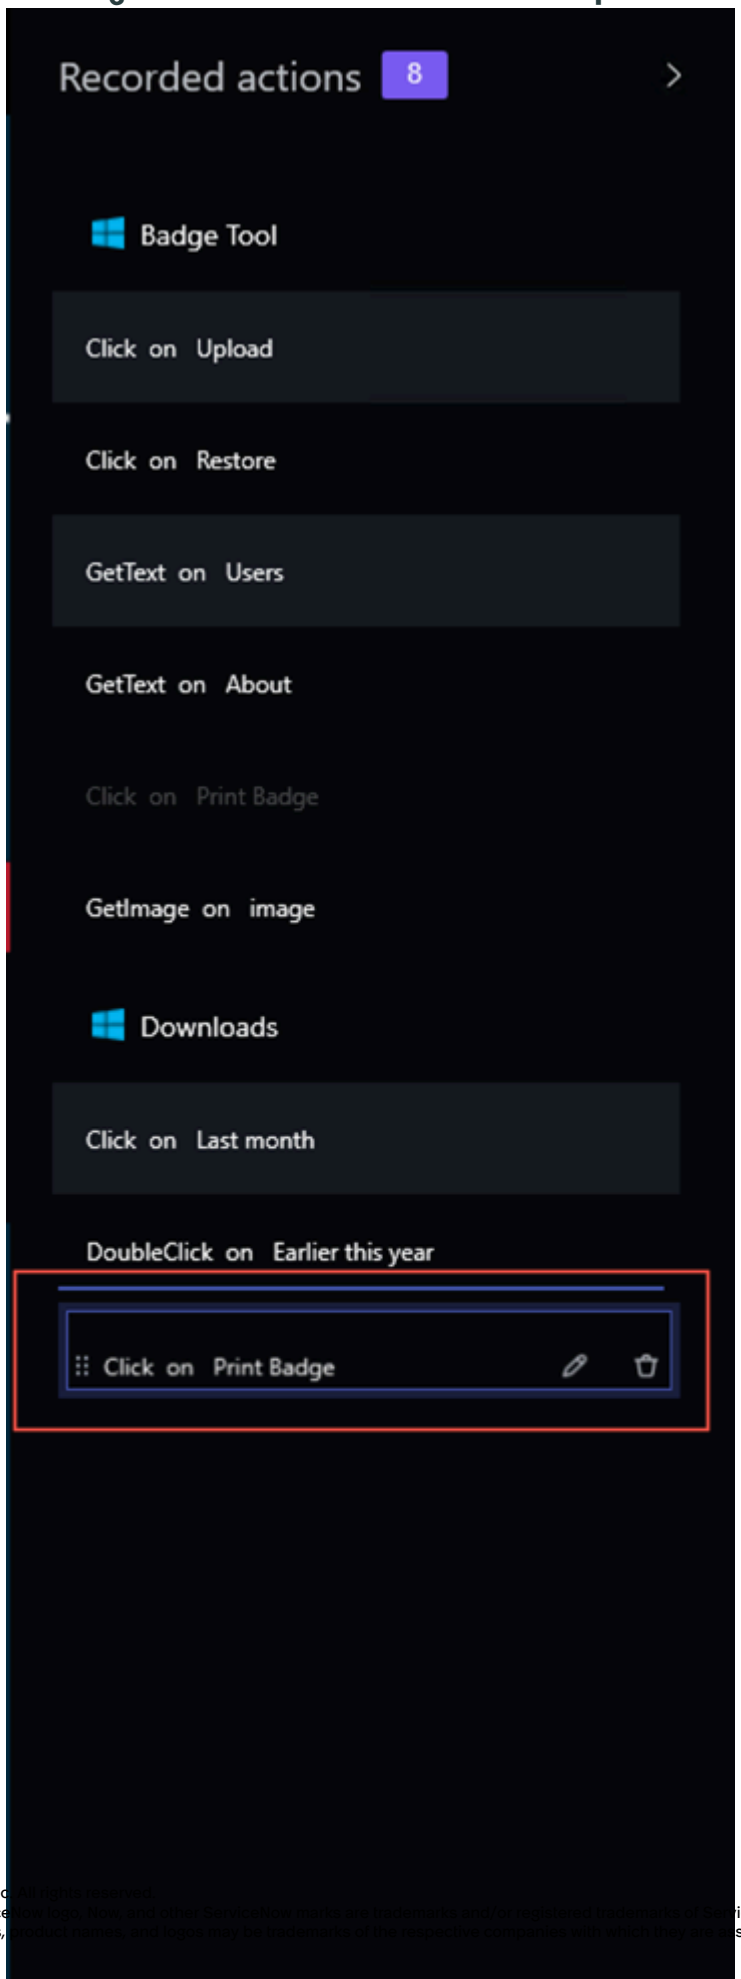
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rearrange recorded actions

You can move and position your recorded actions and screens in the Recorded actions pane. You can also rearrange recorded elements in the Recorded actions pane. The recorded screen segment is split when a recorded action from a screen segment is dropped on to a different screen segment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

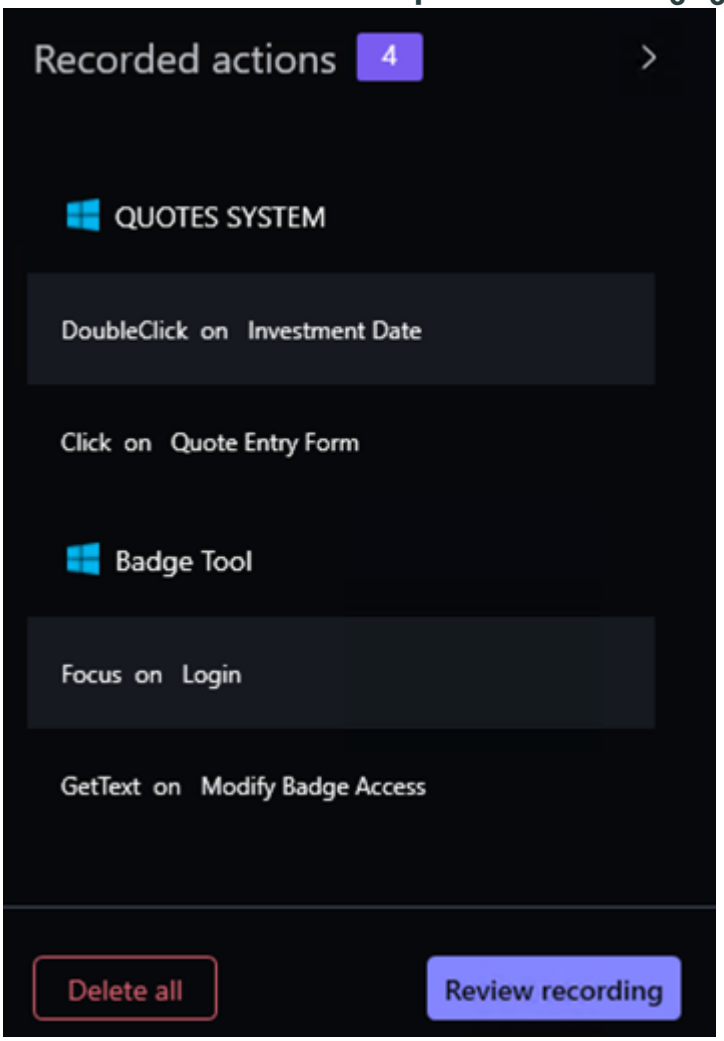
Rearranged elements in the Recorded actions pane



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, when you record two actions of the QUOTES SYSTEM application, (DoubleClick and Click) and two actions of the Badge Tool application (Focus and GetText). Then, the list of actions are displayed in the Recorded actions pane, in the order in which they are recorded.

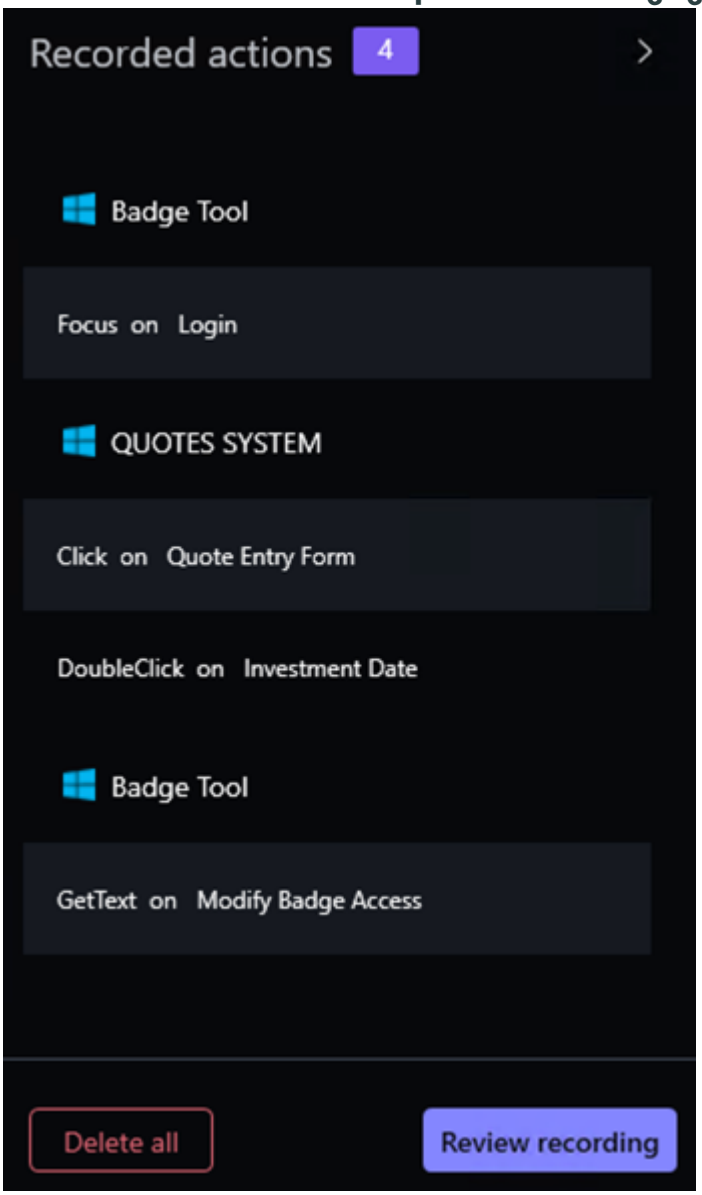
Actions in the Recorded actions pane before rearranging



When you move the Focus action from the Badge Tool application to the top of the list and above the QUOTES SYSTEM application. Then, the list of actions are displayed as follows in the Recorded actions pane, after the hierarchy is rearranged. The recordings of the QUOTES SYSTEM application are split.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions in the Recorded actions pane after rearranging



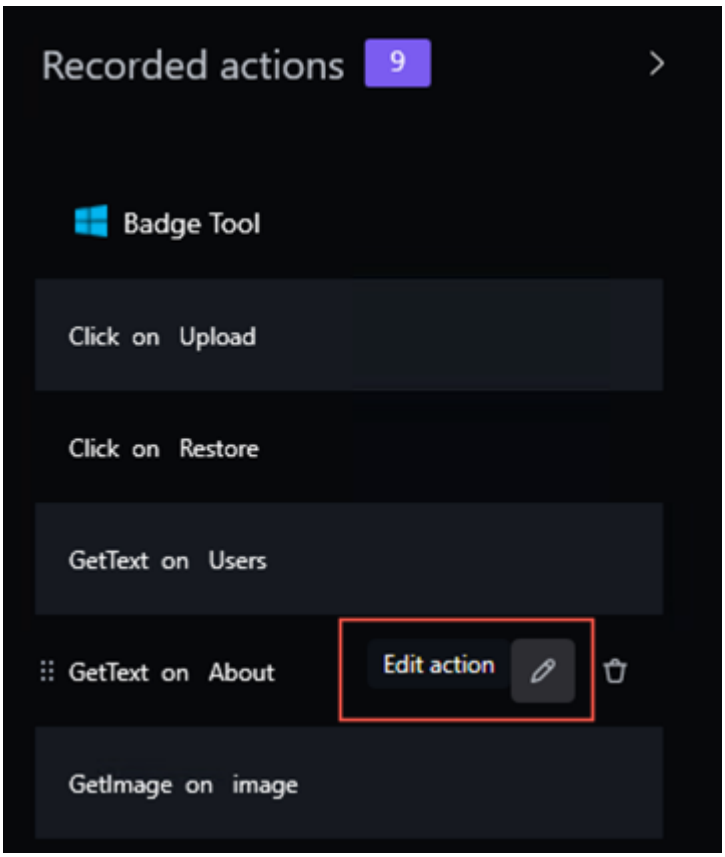
When you save the recording, the automation is generated accordingly. The automation flow is generated based on the new sequence of actions in the Recorded actions pane.

Editing a recorded action

Instead of deleting and re-recording an action, you can update the action type or element details by editing the recorded action, using the Edit action icon, in the Recorded actions pane. For example, you can edit the "GetText" action type on "About" element name in the following image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

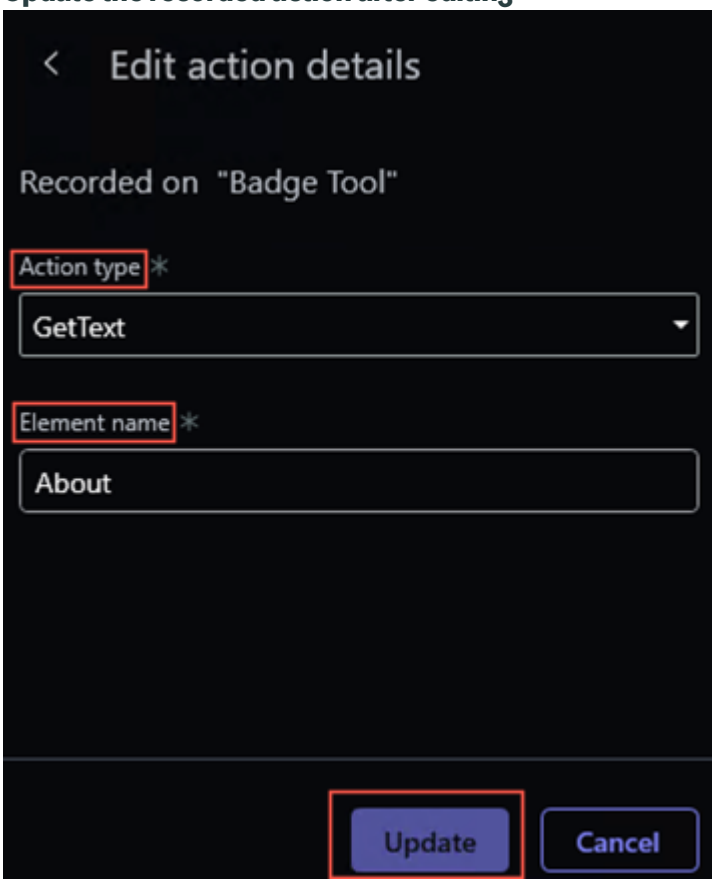
Edit a recorded action



After selecting the edit action, you can change the action type to "SetText" or element name to "Tools" from "About" and select **Update**, as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update the recorded action after editing



Launch application

On the design surface, the component to launch an application is now added automatically to the automation flow that is generated by the recorder.

Benefits of creating automations with the recorder

Using a recorder to create an automation provides the following benefits:

- Low-code users can create automations more easily. Manually creating an automation with a connector or component is complicated.
- There's less time and effort needed to create an automation with the recorder.

Limitations

For information on the known issues and limitations for recording automations, see Known issues and limitations of RPA Desktop Design Studio for recording automations [KB1225708].

Record an automation

Record an automation by using the recorder option in the RPA Desktop Design Studio application. The actions that you perform on the application elements can be saved as an automation flow to the automation project.

Before you begin

You must do the following actions before you start recording an automation with the recorder for the first time:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Install and enable the ServiceNow RPA Chrome extension to your Google Chrome browser. For more information on adding the RPA Google Chrome extension, see Add the ServiceNow RPA Chrome extension.
- Install and enable the ServiceNow RPA Edge extension to your Microsoft Edge browser. For more information on adding the RPA Edge extension, see Add the ServiceNow RPA Edge extension.
- Ensure that the option **Allow this extension to read and change all your data on websites that you visit** to **On all sites** is enabled in the Site access pane of the ServiceNow RPA Google Chrome and Microsoft Edge browser extensions.
- Enable Java Access Bridge from your Windows machine. For more information on how to enable Java Access Bridge, see Enabling and Testing Java Access Bridge.

Ensure to configure the following settings and tasks before you record a web application:

- Set the zoom level of the browser to 100%.
- Close the developer tools of the browser.
- Wait for the web page to load completely to the browser.

Role required: None

Procedure

1. Select **Launch recorder** from the toolbar of the **Design** tab.
   The RPA Desktop Design Studio window is minimized and the recorder panel is launched.

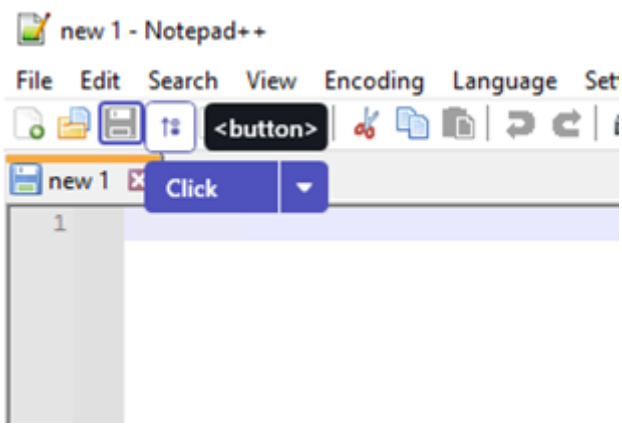
   Important:
   If the Universal App Connector (UAC) plugin is unavailable or removed from the automation project, the **Launch recorder** button is greyed out in RPA Desktop Design Studio.

2. Open the application that you want to record and select the **Start recording** icon ( ).
3. Point to the element where you want to perform an action.

   The default action that is related to the type of element is displayed.

   For example, if you point to the **Save** button in Notepad++, the element type is displayed as <button> and the default action for this item is **Click**.

Element type and default action for Save button



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the drop-down button against the default action to view the list of related actions for the element.

   For example, the list of related actions for the button element type are SendKeys, GetText, DoubleClick, and Focus.

   For more information on the different types of actions and elements, see Types of elements and actions for the recorder.

5. Select the required action to be performed on the element.
   Each action that you perform is captured sequentially in the Recorded actions pane.
6. Do any of the following options for a desired action.

7. Select **Review recording**.
8. On the Review app path and URL pane, review the list of applications and their application paths.
9. Select **Continue**.
10. On the Save recording pane, fill in the fields.

Save recording pane

Field	Description
Activity name	Name of the automation activity to which the recorded actions are saved as an automation flow. **Note:** Ensure that you don't give the name of an existing activity.
Save global object to	Option to save the recorded elements to an existing UAC object or a new UAC global object. If you select **New global object**, you must enter the name for the object in the **Global object name** field. If you select the **Existing global** object, you must select an existing UAC global object from the Select from existing global objects list.

11. Select **Save recording**.
    The recorded actions are saved as an automation activity to the automation project. You can modify the recorded automation activity from the design surface.

What to do next

You can view the recorded elements as a UAC object in **Global Objects** in Project Explorer. Expand the UAC objects and view all the screens and elements that are captured by the recorder. Do the following actions if you want to change the screens and element match rules in UAC:

1. Right-click the generated UAC object in **Global Objects** and select **Configure**.

   The Configure screens and elements window is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Configure the screens and the elements of the recording from the Screens and elements pane.

   For more information on how to configure the screen and element match rules, see Use the Universal App Connector.

Types of elements and actions for the recorder

The actions are the activities that you can perform on an application element such as a text box, button, hyperlinks, and so on. By using these actions, you can build an automation flow in the RPA Desktop Design Studio recorder.

Type of elements and their actions

Type of element	Actions
Button	• Click (default) • SendKeys • GetText • DoubleClick • Focus
Table	• GetTable (default) • Click • SendKeys • GetText • DoubleClick • Focus
Hyperlink	• Click (default) • SendKeys • GetText • DoubleClick • Focus
Textbox	• SetText (default) • GetText • SendKeys • DoubleClick • Focus
Text area	• SetText (default) • GetText • SendKeys

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type of elements and their actions (continued)

Type of element	Actions
	• DoubleClick • Focus
Drop-down list	• SelectItem (default) • Click • SendKeys • GetText • DoubleClick • Focus
Check box	• Check (default) • Uncheck • Click • SendKeys • GetText • DoubleClick • Focus
Radio button	• Click (default) • SendKeys • GetText • DoubleClick • Focus
Image	• GetImage (default) • SendKeys • GetText • DoubleClick • Focus

Definition of actions

Action	Description
Click	Performs the left-click mouse device operation on an element.
Check	Performs the select operation on a check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Definition of actions (continued)

Action	Description
DoubleClick	Performs the double-click mouse device operation on an element. If the element has a double-click event that is related to it, then the double-click action is performed.
Focus	Sets the focus to the element.
GetImage	Retrieves the image from an image element. For example, an icon image.
GetTable	Retrieves the table data in a tabular format from a table element.
GetText	Retrieves the text from an element. For example, text from the house address field in a web page.
SendKeys	Simulates the keyboard key or key combinations that are performed on an element.
SelectItem	Selects the item in an element.
SetText	Sets the specified text to the element.
Uncheck	Clears a check box element.

Override a data port

Override a data port of a component in RPA Desktop Design Studio so that you can change the default behavior of the Data In and Data Out ports. By overriding a data port, you can simplify the automation workflow development and testing.

Before you begin

Configure a component. For more information, see Use a component in RPA Desktop Design Studio.

Role required: none

Procedure

1. In the RPA Desktop Design Studio, on the Design surface, right-click the Data In or Data Out port of a component that you want to override and select **Port Properties**.
2. In the PORT PROPERTIES dialog box, edit the details as needed.

PORT PROPERTIES dialog box

Field	Description
Port Name	Name of the port. You can't edit this field.
Data Type	Input or output data type of the component: ○ **Object** ○ **String** ○ **Integer** ○ **Long** ○ **Boolean**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Float** ○ **Double** ○ **DateTime** ○ **Image** ○ **List** ○ **Table** ○ **Secure String**
Sensitive Data	Option to hide the data from the default view on the Design surface. You can also mark the data as sensitive by doing the following steps: **a.** Right-click the Data In or Data Out Port. **b.** Click **Mark Data as Sensitive**.
Read Data From	Field that appears for the Data In ports only. There are three options: ○ **Connection**: Pass the data from another component. ○ **Static**: Define a static value or select a static option that is associated with the component. If you select this option, the Data In port on the component disappears. ○ **Variable**: Map a global or a local variable from where the data must be read. If you select this option, the Data In port on the component disappears and the variable name appears on the port. For more information, see Create and use a variable in RPA Desktop Design Studio.
Write Data From	Field that appears for Data Out ports only. There are two options: ○ **Connection**: Pass the data to another component. ○ **Variable**: Map a global or a local variable from where the data must be written. If you select this option, the Data Out port on the component disappears and the variable name appears on the port. For more information, see Create and use a variable in RPA Desktop Design Studio.
Static Value	Value of the specific Data port. This field appears when you select **Static** in the **Read Data From** field.

3. Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preview the data of a data port in RPA Desktop Design Studio

Preview the data of a Data port in RPA Desktop Design Studio to view and verify if the result of a port is correct and is as expected.

Before you begin

Ensure that the component for which you want to view the data for is executed. For more information, see Run an automation in RPA Desktop Design Studio.

Role required: none

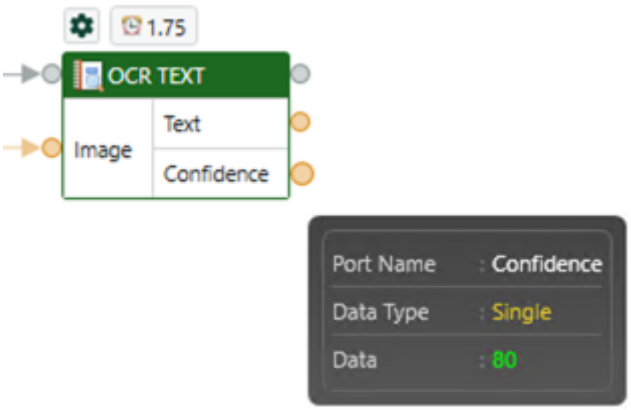
Procedure

In the RPA Desktop Design Studio, on the Design surface, do any of the following actions to preview the data:

- If the data type is simple text, hover over the Data Out port of a component as show in the following example.

  Partial data is visible in the tooltip.

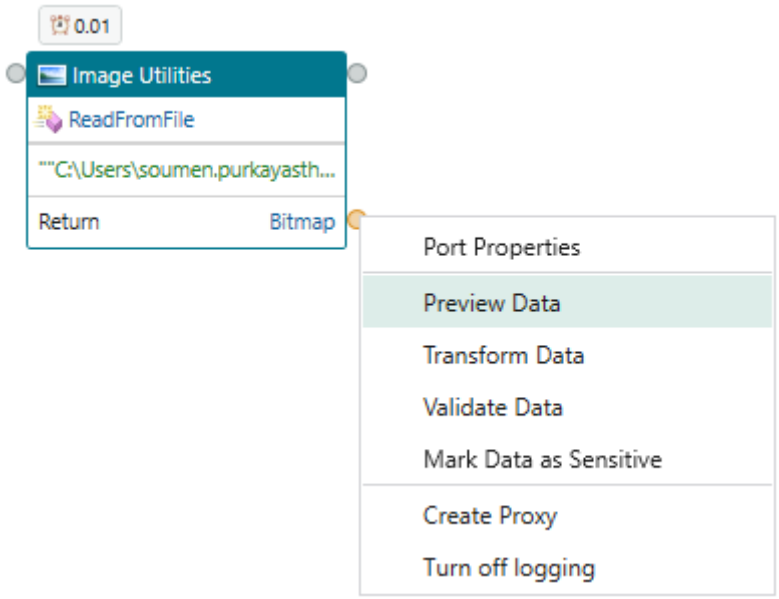
  Hover over option on the Data Out port



- To view the complete data output, right-click the Data port that you want to view data for and select **Preview Data** as shown in the following example.

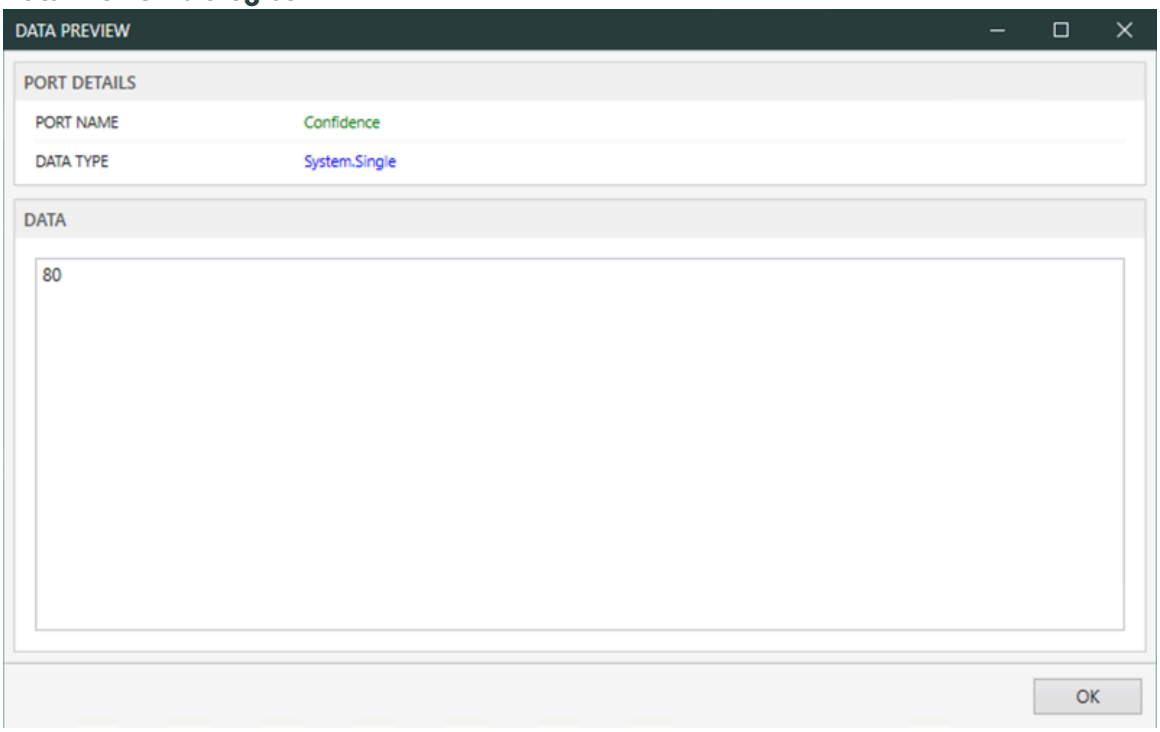
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preview Data option



A DATA PREVIEW dialog box is displayed, as shown in the following example.

Data Preview dialog box



You can view the name of the port, the data type, and the data in this dialog box.

Transform the data in RPA Desktop Design Studio

Transform the data in RPA Desktop Design Studio by using the **Transform Data** option at a component level. With this option, you can edit the output value of the Data port by using VB.NET, C#.NET, or JavaScript.

Before you begin

Configure a component. For more information, see Use a component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: none

About this task

The **Transform Data** option can be used to modify any data that comes from the Data In port or is returned from the Data Out port.

Procedure

1. In the RPA Desktop Design Studio, on the Design surface, right-click either the Data In or Data Out port that you want to transform and select **Transform Data**.
2. In the DATA TRANSFORMATION EDITOR dialog box, select the **Enabled** check box to enter the code in the Script section.
   The Data port turns green to verify the data transformation in the automation flow.
3. From the following SCRIPT LANGUAGE list, select your preferred scripting language to write the code for the data transformation:
   - **VB.NET**
   - **C#**
   - **Javascript**
4. In the Script section, enter the code.
   You can use the Value variable to use the incoming data for the Data In port or the outgoing data for the Data Out port in your script.
5. After entering the script, click **OK**.
   The system validates the script.
6. If there are any errors in the Script section, resolve the errors that are displayed in the ERRORS section and then click **OK**.

Validate the data in RPA Desktop Design Studio

Validate your data by using the **Validate Data** option at a component level in RPA Desktop Design Studio.

Before you begin

Configure a component. For more information, see Use a component in RPA Desktop Design Studio.

Role required: none

About this task

You can ensure that the data coming from a Data Out port is not null by using the NotNullValidation validation type. You can also write custom validations by using a script.

Procedure

1. In the RPA Desktop Design Studio, on the Design surface, right-click either the Data In or Data Out port of a component and select **Validate Data**.
2. In the VALIDATIONS dialog box, from the Validator list, select either of the following validation types:

Type	Description and action
NotNullValidation	Checks if the given input is null. A custom message can be inputted for validation and error handling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Description and action
	a. Click the plus icon ( ) to add a validation. **b.** In the text box next to **[NOT NULL]**, enter the custom error message as shown in the following example. **Text box for entering the error message**  **c.** Click **OK**.
ScriptValidation	Enables you to choose from a list of programming languages and write a validation script to ensure the data that flows in or out of the Data port is validated against the mentioned conditions. Otherwise, it stops execution and throws an error. **a.** Click the plus icon ( ) to add a validation. **b.** Click the script icon ( ) to open the SCRIPT VALIDATION dialog box. **c.** From the following SCRIPT LANGUAGE list, select your preferred scripting language to write your custom validation: ▪ **VB.NET** ▪ **C#** ▪ **Javascript** **d.** In the Script section, enter the code. For example, `Return Value > 300`. **e.** Click **OK**. **f.** In the text box next to **[SCRIPT]**, enter the custom error message as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Description and action
	Field for entering the error message  **g.** Click **OK**.

3. **Optional:** To delete a validation rule, click the delete icon ( ) and in the Confirmation dialog box, click **Yes**.

Create a proxy in RPA Desktop Design Studio

Create a proxy at a component level in RPA Desktop Design Studio to extract the additional properties of that component.

Before you begin

Configure a component. For more information, see Use a component in RPA Desktop Design Studio.

Role required: none

About this task

Use the **Create Proxy** option to add or modify some functionalities of an already-existing class.

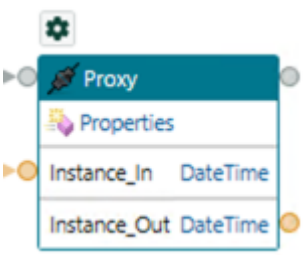
Procedure

1. In the RPA Desktop Design Studio, on the Design surface, right-click either the Data In or Data Out port of a component and select **Create Proxy**.

   Example

   For example, the proxy of the DateTime component appears as shown in the example.

   Proxy component

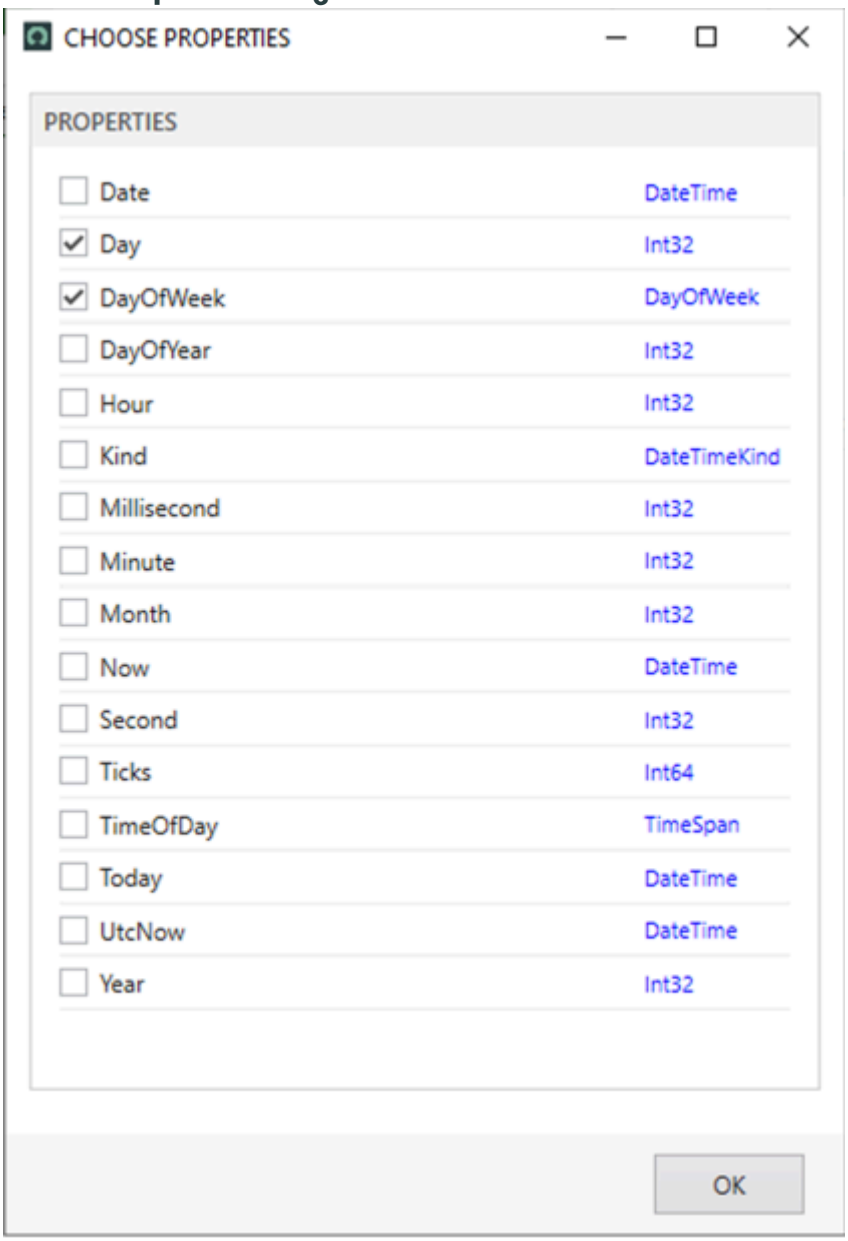
   


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Double-click the proxy component title bar to open the CHOOSE PROPERTIES dialog box.
3. In the CHOOSE PROPERTIES dialog box, select the applicable check boxes for the properties to be used.

Example
For example, select the Day and DayOfWeek properties as shown in the example.

Choose Properties dialog box

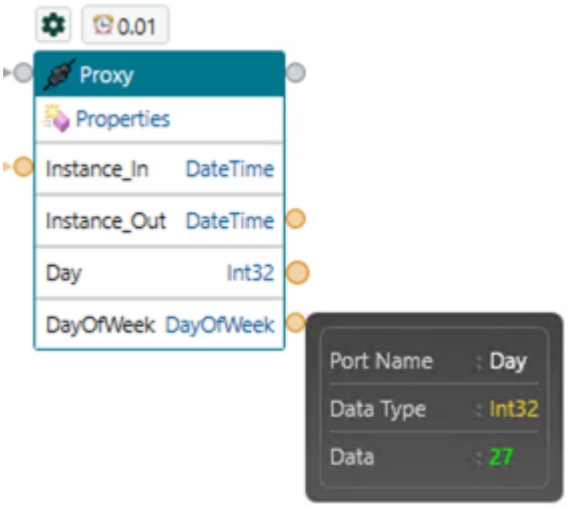


4. Click **OK**.

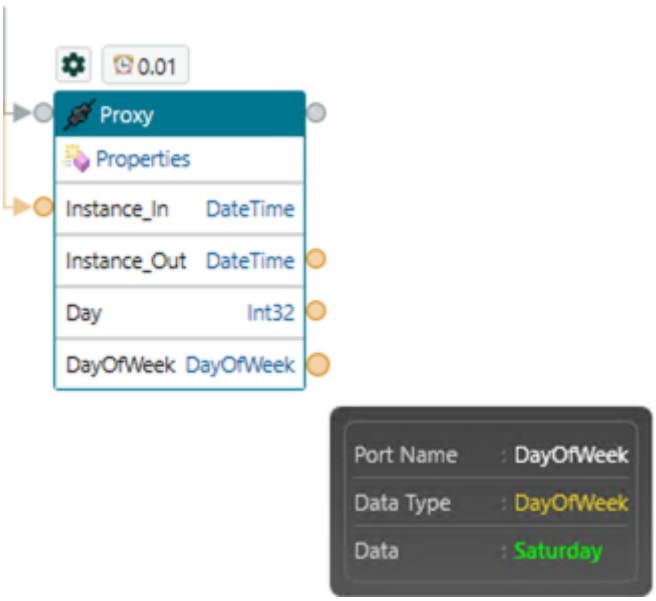
Example
If you hover over the Data Out port of the DateTime component after executing the component, you can see the Day as 27 and the DayOfWeek as Saturday in the following examples.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Day as 27 in the DateTime component



DayOfWeek as Saturday in the DateTime component



Set a breakpoint to pause a component in RPA Desktop Design Studio

Set a breakpoint on a component in RPA Desktop Design Studio so that you can pause it for debugging purposes during an automation execution. You can set a breakpoint for any number of components.

Before you begin

Ensure that the component or components where you want to set a breakpoint in are a part of your automation.

Configure a component. For more information, see Use a component in RPA Desktop Design Studio.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

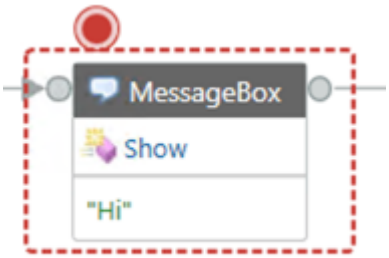
1. In the RPA Desktop Design Studio, on the Design surface, right-click the title bar of the component where you want to set the breakpoint and then select **Breakpoint**.

   After a breakpoint is set on a component, you can see a red icon as shown in the following example.

   Red icon that appears after a breakpoint is set on a component

   During the automation execution, when the robot reaches a component that has a breakpoint, the execution pauses and the component is highlighted with a red border, as shown in the following example.

   Red border that appears when the robot reaches a component that has a breakpoint

2. Choose an option and complete the action.

Start a workflow execution from a selected component in RPA Desktop Design Studio

Start a workflow execution from a component instead of at the beginning of the workflow by using the **Run From Here** option in RPA Desktop Design Studio. This functionality allows you to rapidly develop and test the automation workflows.

Before you begin

Configure a component. For more information, see Use a component in RPA Desktop Design Studio.

Role required: none

Procedure

1. In the RPA Desktop Design Studio, on the Design surface, right-click the title bar of the component from where you want to start the execution.
2. Select **Run From Here**.

Run an automation in RPA Desktop Design Studio

Run an automation to execute the workflow in RPA Desktop Design Studio.

Before you begin

Create an automation project. For more information, see Create an automation project manually or Create an automation with Now Assist.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The **Run** option starts the execution from the Start component of the activity that is marked as startup.

Procedure

1. In the RPA Desktop Design Studio, navigate to the **Design** tab.
2. Click **Run**.
3. **Optional:** To clear the runtime log, click **Clear Log**.

Code quality check in RPA Desktop Design Studio

You can use code quality check in RPA Desktop Design Studio to proactively find the issues in an automation activity or the complete automation project. When you publish an automation project, an in-built code quality check is also performed. Code quality check enables you to reduce the number of errors and prevent potential issues that may hinder your automation.

Code quality check overview

Code quality check in RPA Desktop Design Studio is based on the pre-defined set of rules that are enabled from the RPA Hub instance. You must connect to the instance that has Code quality check to RPA Desktop Design Studio before you start using Code quality check. For more information on how to configure Code quality check from RPA Hub, see Code quality check in RPA Hub RPA Desktop Design Studio. For more information on the pre-defined set of rules, see Code quality rules list in RPA Hub.

When you check an activity or the complete automation project by using Code quality check, the issue results and details are displayed as a list of entries in the Code Quality Check Results window. The following example shows the window.

Code Quality Check Results window

Code Quality Check Results

All | Search Code, Name, Affected Item, Affected Parent

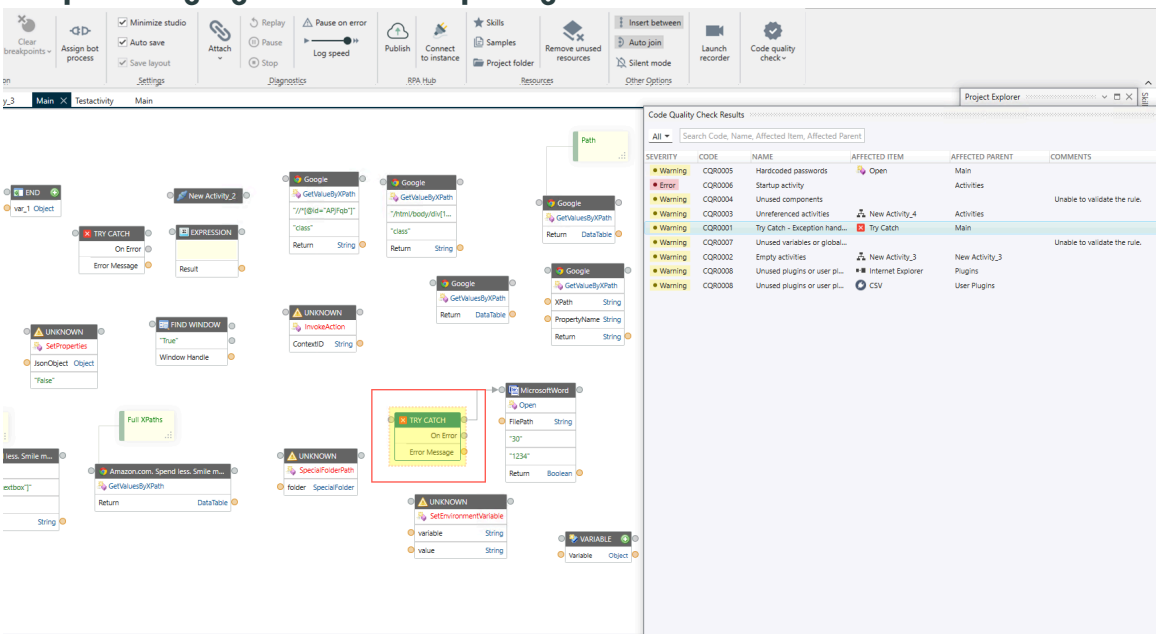
SEVERITY	CODE	NAME	AFFECTED ITEM	AFFECTED PARENT	COMMENTS
Warning	CQR0005	Hardcoded passwords	Open	Main	
Error	CQR0006	Startup activity		Activities	
Warning	CQR0004	Unused components			Unable to validate the rule.
Warning	CQR0003	Unreferenced activities	New Activity_4	Activities	
Warning	CQR0001	Try Catch - Exception hand...	Try Catch	Main	
Warning	CQR0007	Unused variables or global...			Unable to validate the rule.
Warning	CQR0002	Empty activities	New Activity_3	New Activity_3	
Warning	CQR0008	Unused plugins or user pl...	Internet Explorer	Plugins	
Warning	CQR0008	Unused plugins or user pl...	CSV	User Plugins	

You can double-click the result entries for components in the Code Quality Check Results window for the following scenarios:

- If an affected component is in the current activity, it's highlighted in the current activity.
- If the affected component is in a different activity, you can navigate to the activity. The component gets highlighted. See the following example to see the component highlight in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component highlight in RPA Desktop Design Studio



Code quality check in publishing an automation project

Code quality check is automatically performed when you publish the automation project. If your project has code quality check issues, the Code Quality Check Results window is displayed with the result entries. For more information on how to publish an automation project, see Publish an automation project in RPA Desktop Design Studio in RPA Desktop Design Studio.

Note:
You can publish a package with errors or a combination of errors and warnings only if the property *sn_rpa_fdn.restrict_package_by_severity* is set as **No restriction** in RPA Hub. For more information on this property, see Configure RPA Hub properties. For more information on the compliance rules that the Code Quality Check feature follows if a package is published from RPA Desktop Design Studio, see Code quality check compliance for RPA Desktop Design Studio in RPA Desktop Design Studio.

You can view the list of active and inactive rules from the View Rules window. You can filter the rules by their severity level from this window.

Fix automation issues with Code quality check in RPA Desktop Design Studio

Fix the automation issues in your automation activity or complete an automation project proactively by using the Code quality check feature in RPA Desktop Design Studio.

Before you begin

Connect to the RPA Hub instance that has the Code quality check feature enabled. For more information on how to connect to an RPA Hub instance, see Connect to an RPA Hub instance from RPA Desktop Design Studio.

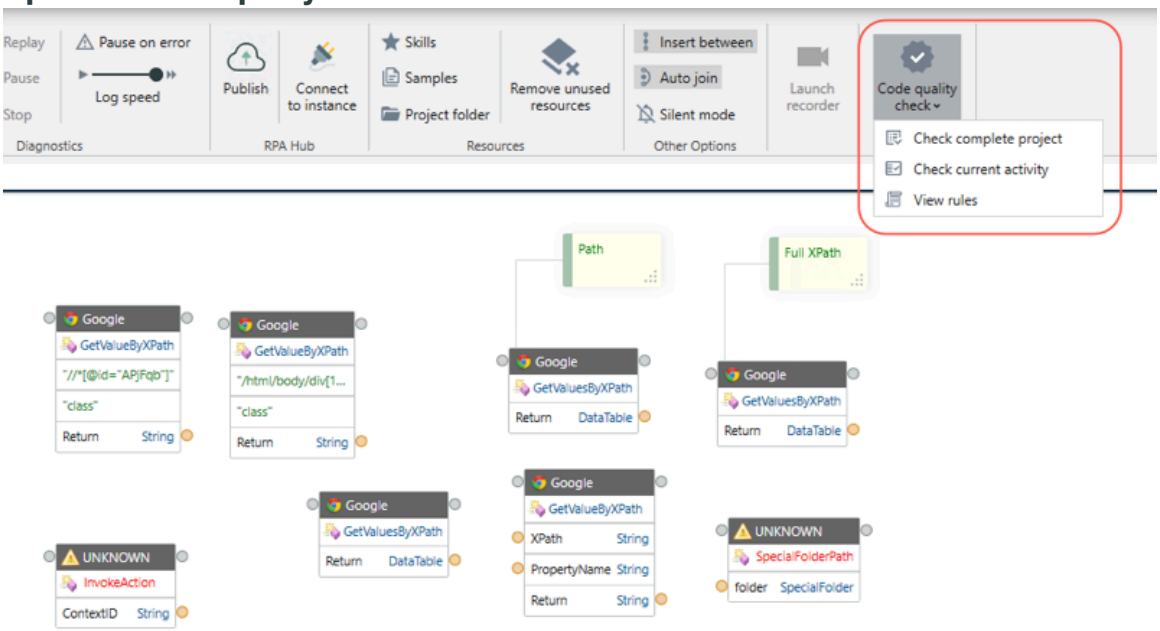
Role required: RPA Developer

Procedure

1. On the toolbar of the **Design** tab in RPA Desktop Design Studio, select **Code quality check**. The **Code quality check** options are displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Options for Code quality check



Note:
If you aren't connected to an instance and you select the **Code quality check** option, the Connection Manager window is displayed. For more information on how to connect to an RPA Hub instance, see Connect to an RPA Hub instance from RPA Desktop Design Studio.

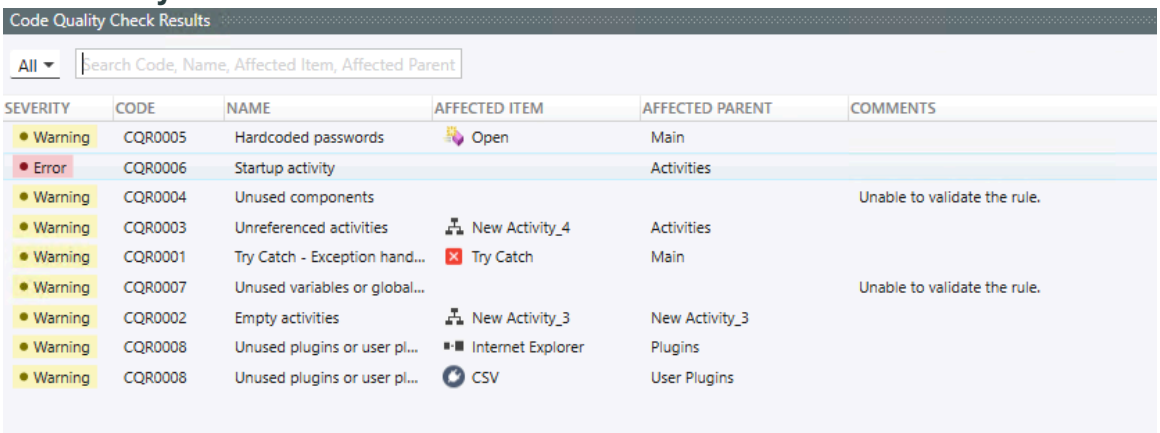
2. Do Code quality check for the following options.
The results are displayed in the Code Quality Check Results window.

Note:
If you select the option **Check complete project** or the option **Check current activity** and there's a connectivity issue, a timeout error is displayed. Contact your RPA administrator for more information.

3. In the Code Quality Check Results window, view the issue results and their details as a list. The results are classified as error, warning, and information based on the severity that is set by the RPA administrator or release manager. You can filter the results by the severity level by selecting the **All** button. The **Name** field indicates the type of issue that is based on the code quality rules configured in RPA Hub. For more information on the list of code quality rules, see Code quality rules list in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

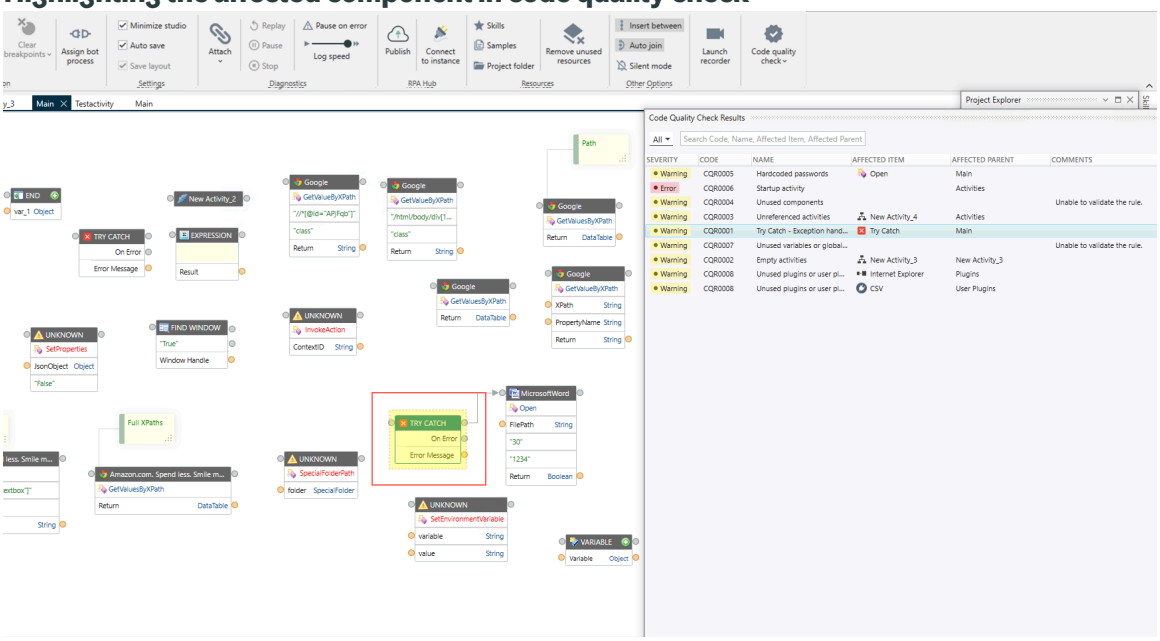
Code Quality Check Results window



You can double-click the result entries for components in the Code Quality Check Results window for the following scenarios:

- If an affected component is in the current activity, it's highlighted in the current activity.
- If the affected component is in a different activity, you can navigate to that activity. The affected component is highlighted.

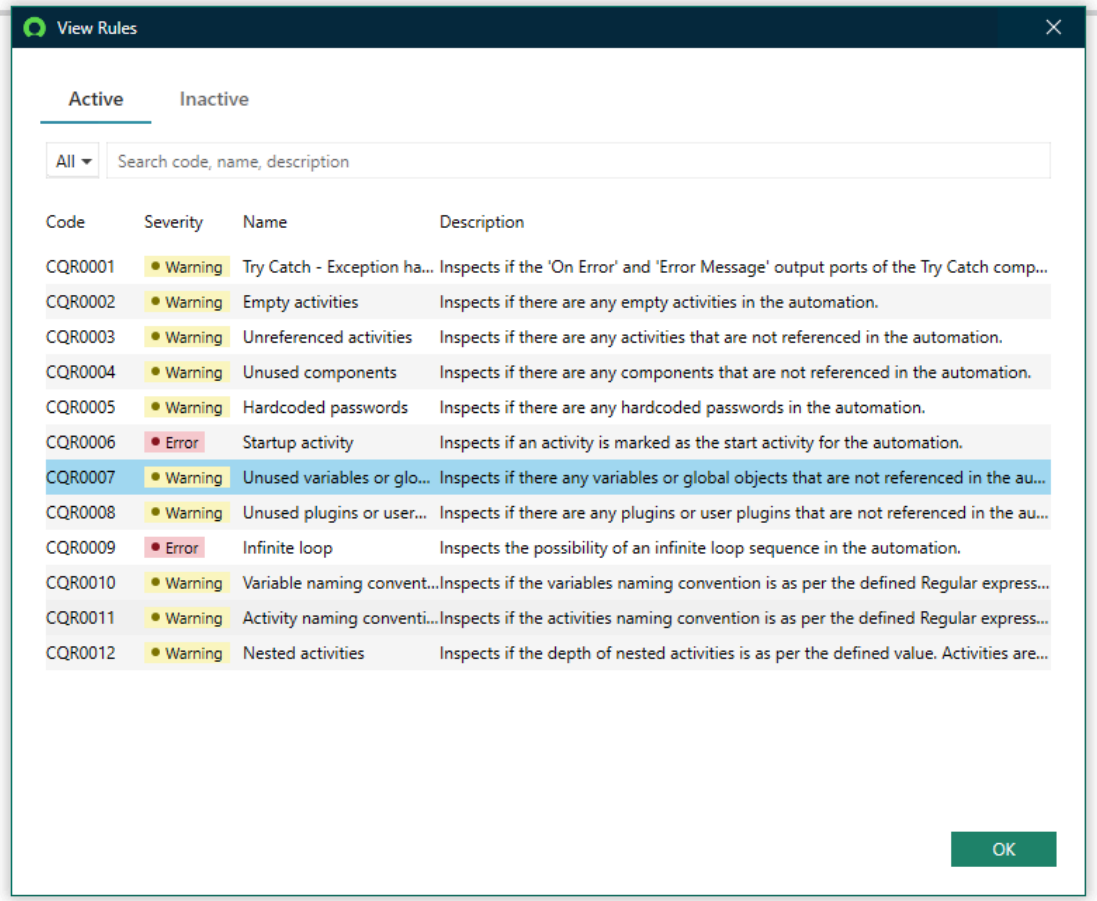
Highlighting the affected component in code quality check



4. View the list of active and inactive rules that are configured from the RPA Hub instance by selecting **View Rules**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View Rules window for Code Quality Check



5. Fix the issues that pertain to the code quality check and your automation project is ready to be published.

What to do next

The automation project is ready to be published. Code quality check is also performed automatically when you publish a project. For more information on how to publish a project, see Publish an automation project in RPA Desktop Design Studio.

Assign bot process to an automation project

Assign a bot process to an automation project in RPA Desktop Design Studio to start using the bot process resources.

Before you begin

Role required: sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin, if running from RPA Desktop Design Studio

About this task

The Assign Bot Process feature is enabled for all automation projects including skills. It shows both attended and unattended bot processes in the **Bot process** field.

To access resources (Queues, Process Parameters, and so on) limited to a specific bot process within the automation from RPA Desktop Design Studio, the **Assign bot process** option helps in selecting the bot process and there by accessing resources to successfully run the automation in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From the **Design** tab of RPA Desktop Design Studio, select **Assign bot process**.
   The Assign Bot Process dialog box is displayed.
2. Select the required bot process from the **Bot Process** list.

   Note:
   The users who are a part of the Managed by Group for the respective bot process, those bot processes are also displayed in this list.

3. If the selected bot process is enabled with Embedded Task Automation, fill in the following required fields.

   Assign Bot Process

Attended Config	The attended configurations that are associated with the selected bot process in step 2, are displayed here. Select an attended configuration.
Record Context	Enter the Sys ID or URL of the ServiceNow form record. This helps you to fetch field values using GetProcessFieldParameters component and update field values using SetProcessFieldParameters component of the selected Sys ID. For more about getting the Sys ID or URL, see Unique record identifier (sys_id).

   Note:
   For more information about Embedded Task feature, see Embedded Task Automation in RPA Hub.

4. **Optional:** For unattended bot process, select the required robot from the **Robot** list.

   (Optional) You can select the robots that are assigned to the bot process.

   Note:
   Starting from the Vancouver release of RPA Desktop Design Studio, for unattended automations, you can view only those robots from the bot process that are mapped to your user role. The robot must also have your machine name where RPA Desktop Design Studio is running. If there are no robots associated to the bot process, then an error is displayed.

5. Select **OK**.
   If one or more skills are overridden in the bot process, the automation uses the updated skill version during current execution. For more information about overridden skill versions, see Override a skill version for a bot process in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Publish an automation project in RPA Desktop Design Studio

Publish an automation project to RPA Hub from RPA Desktop Design Studio as a package or as a template. After publication, you can quickly deploy automation solutions in the RPA platforms by using the packages or by using a template as a framework to create automations.

Before you begin

Ensure that the automation project file is open in RPA Desktop Design Studio. For more information, see Open a local automation project in RPA Desktop Design Studio.

Ensure that the automation project file is in a separate folder. All the files and folders in the current project file location are published to the RPA Hub.

Verify the connection manager setup in the RPA Desktop Design Studio. For more information, see Set up RPA Desktop Design Studio.

Role required: sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin

About this task

Publishing an automation project as a package enables the RPA Hub to execute a process job that executes the workflow in the automation project. You can publish an automation project as a new package or as the version of an existing package.

Publishing an automation project as a template makes it the framework for creating automation projects later. You can publish an automation project as a new template or as the version of an existing template.

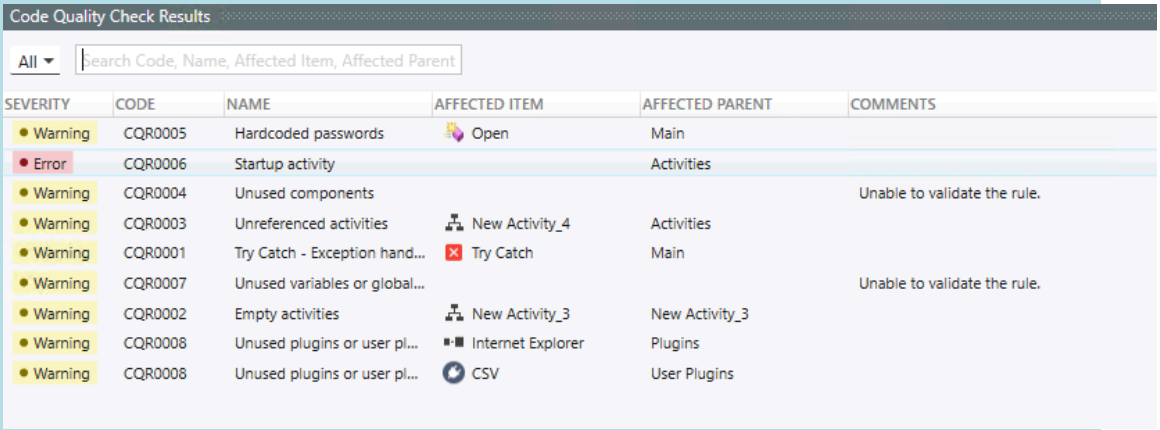
Procedure

1. In the RPA Desktop Design Studio, open the automation project that you want to publish.
2. On the **Design** tab, select **Publish**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

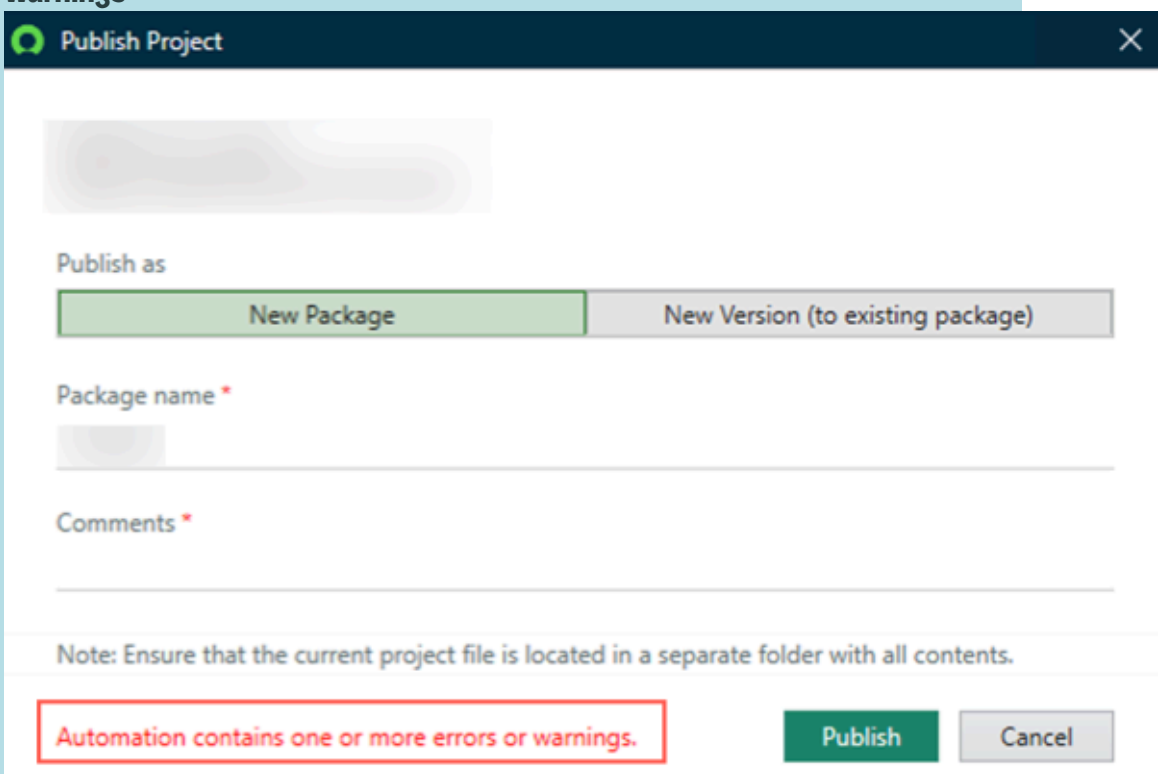
Important:

- If the Code quality check feature is enabled from your RPA Hub instance and your automation project has Code quality check issues, the Code Quality Check Results window displays an error message.



You can publish a package with errors or with both errors and warnings only if the property *sn_rpa_fdn.restrict_package_by_severity* is set as **No restriction** in RPA Hub. For more information, see Configure RPA Hub properties. As shown in the following example, these packages are highlighted with the message `Automation contains one or more errors or warnings` when you begin to publish a project.

Error displayed when you're publishing a project with errors or warnings



For more information on the compliance rules that the Code quality check follows when a package is published from RPA Desktop Design Studio, see Code quality check compliance for RPA Desktop Design Studio.

- When you enable the *sn_rpa_fdn.code_signing_required* system property on the instance, it impacts the existing bot processes that are associated with the packages on the same instance because you didn't enable code signing on them earlier while you were publishing from RPA Desktop Design Studio to RPA Hub. As a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Publish an automation project as a package or template.

4. **Optional:** If code signing is mandated by your organization and you're publishing the automation project as a package, do the following actions:

   a. In the **Certificate location** field, select either **File** or **Cert Store** as the location of the certificate.

   b. Select the three-dot menu (...) next to the **Certificate** field.

   c. Select the installed code signing certificate.

   Note:
   You can only select a certificate that has the intended purpose as code signing. If you select a certificate with any other intended purpose, an error is displayed.

   d. Select **OK**.

Note:
This step is applicable only if you're publishing the automation project as a package.

Resolve conflicts when merging changes from multiple sources of the same activity

Resolve conflicts when merging changes from multiple sources of the same activity by using the **Source Control** option in RPA Desktop Design Studio.

Before you begin

If you're not connected to a ServiceNow instance, click the Connection Manager icon under the **Design** tab to connect to an existing instance. For more information, see Set up RPA Desktop Design Studio.

Create an activity. For more information, see Create and use an activity in RPA Desktop Design Studio.

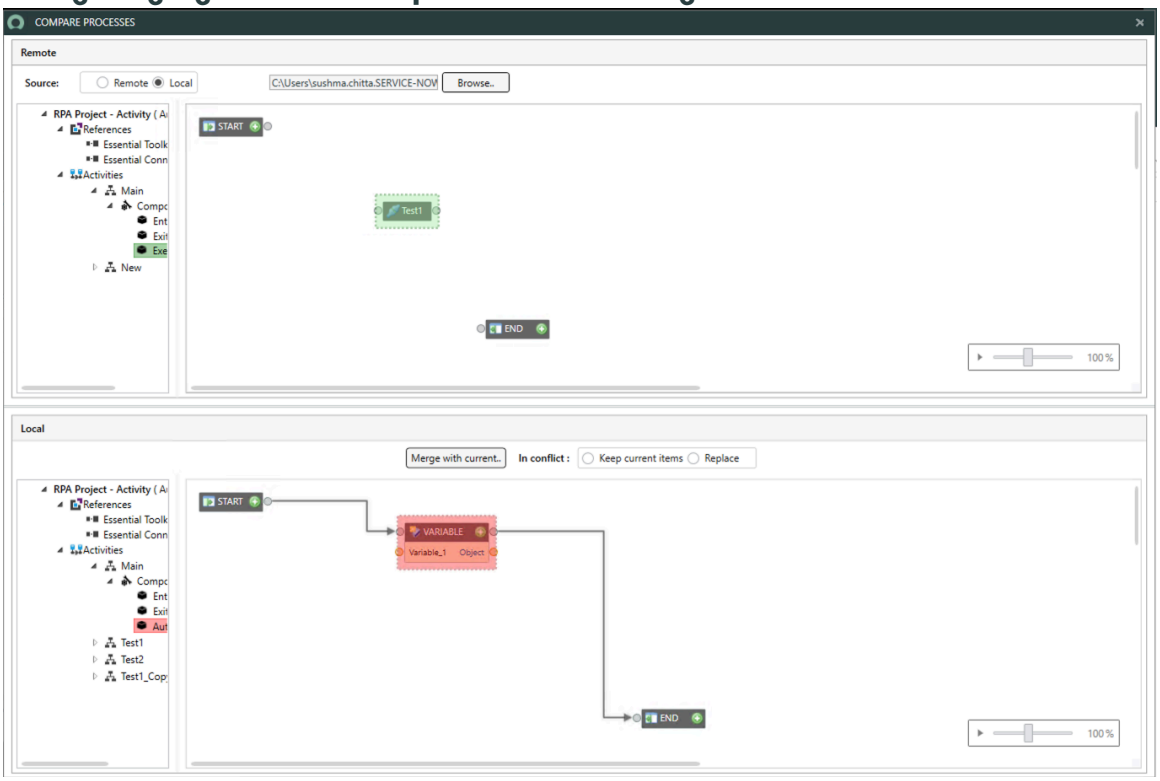
Role required: none

Procedure

1. Open the project that has the activity that you want to resolve conflicts in.
2. In the Project Explorer pane, navigate to **Activities**.
3. Right-click the activity and select **Source Control**.
4. In the COMPARE PROCESSES dialog box, under the Remote section, select any of the following source types to open the automation project from the **Source** field.
   The changes are highlighted in the COMPARE PROCESSES dialog box as shown in the following example. If changes are added, they appear in green. If the changes are removed, they appear in red. If the changes are modified, they appear in yellow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Changes highlighted in the Compare Processes dialog box



5. Under the Local section, select any of the following options for resolving conflicts from the **In conflict** field:
   - Select **Keep current items** to retain the changes in the Local section.
   - Select **Replace** to replace the highlighted changes in the Local section with the highlighted changes in the Remote section.
6. In the CONFIRM dialog box, click **OK**.
7. Click **Merge with current**.

Import project in RPA Desktop Design Studio

Import a project to reuse resources, such as activities, variables, attended automation forms, and other global objects from a different automation project in RPA Desktop Design Studio.

Before you begin

Create an automation project. For more information, see Create an automation project manually.

Create an activity. For more information, see Create and use an activity in RPA Desktop Design Studio.

Create a variable. For more information, see Create and use a variable in RPA Desktop Design Studio.

Create an attended automation form. For more information, see Create an attended automation form in RPA Desktop Design Studio.

Install plugins to design automations. For more information, see Manage plugins in RPA Desktop Design Studio.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the project that you want to reuse resources from a different automation for.
2. In the Project Explorer pane, right-click the project and select **Import**.
3. To select a project that contains the resources that need to be imported, go to the Import Project dialog box, and click the three-dot menu next to **Project File (.iBot)**.
4. Click **Open**.
5. Click **Load**.
6. In the Project Items section, select the check boxes next to the options that you want to import so that you can merge or override conflicts.
   If a conflict occurs with any resource that you're importing, select an option to either merge or override it with the conflict in your project.
7. Click **OK**.

Handle errors in RPA Desktop Design Studio

Handle errors at the component level and activity level in RPA Desktop Design Studio. You can use the **Error Handler** option to handle the errors that occur during an automation execution.

Before you begin

Configure a component. For more information, see Use a component in RPA Desktop Design Studio.

Create an activity. For more information, see Create and use an activity in RPA Desktop Design Studio.

Role required: none

Procedure

1. In the RPA Desktop Design Studio, select one of the following options to handle errors either at a component level or at an activity level.
2. In the ERROR HANDLER dialog box, from the On Error list, select any one of the following error handler types:

Type	Description
Inherit	Inherits the error handling settings that are configured at the parent level. Within a component, an activity that the component belongs to, is the parent. Within an activity, the parent is the activity where the activity is being called from. This option is the default for error handling at component level.
Stop	Stops the execution if error occurs. This option is the default for error handling at the activity level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Description
Continue	Continues the execution if an error occurs.
Retry	Retries the execution of the component where the error occurs. After selecting the **Retry** option, the following fields appear: ○ In the **Max Retries** field, you can define the number of retries. ○ In the **Retry Delay** field, you can define the delay between each retry. The automation stops with an error if the Maximum retires count is exhausted during an execution. In the **On Error After Retry** field, you can select an option such as **Inherit**, **Stop**, and **Continue** to provide further steps if an error persists after a defined retry has failed.

3. Click **OK**.

Configure port properties

Configure how data is passed to the input fields of a component or method in RPA Desktop Design Studio.

Before you begin

Role required: none

Procedure

1. On the Design surface, right-click a port or the associated field of a method or component.
2. Click **Port Properties**.
3. In the Port Properties dialog box, configure the port properties.

PORT PROPERTIES dialog

Field	Description
Data Type	Specifies the data type of the input that you are passing to the component or method. This option is enabled when the input field requires that you pass a variable or parameter to the field.
Sensitive Data	Option to hide the data from view on the Design surface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	You can also set this option by right-clicking the port and selecting **Mark Data as Sensitive**. Read Data From	The **Read Data From** field appears only for Data In ports, and includes the following options: ○ **Connection**: Pass the data from another component. ○ **Static**: An unchanging value that is associated with the component. Use data specified in the Static Value field of this dialog box. When you select this option, the Data in port on the component disappears. **Note:** This option does not appear in some components and methods. ○ **Variable**: A global or a local variable from where the data must be read. When you select this option, the Data in port on the component disappears and the variable name appears on the port. For more information about variables, see Create and use a variable in RPA Desktop Design Studio.
Write Data To	The **Write Data To** field appears only for Data Out ports and includes the following options: ○ **Connection**: Send data to another component. ○ **Variable**: Use data from a global or a local variable. When you select this option, the variable name appears on the port, and the Data Out port is not present. For more information about variables, see Create and use a variable in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Static Value	The value that is attached to the port. This field appears when you select **Static** in the **Read Data From** field.
Mapped Variable	The variable that is mapped to the port. This field appears when you select **Variable** in the **Read Data From** field.

Configure output port properties

Configure the ways the output ports or fields of components or methods return output in the RPA Desktop Design Studio.

Before you begin

Role required: none

Procedure

1. Right-click the output field or Data out port of the component or method.
2. Click **Override**.
3. Configure how the method or component processes the output as given in the table.

PORT PROPERTIES dialog box

Field	Description
Sensitive Data	Option to hide the data from the default view on the Design surface.
Write Data To	Field that appears for Data Out ports only. There are two options: ○ **Connection**: Pass the data to another component. ○ **Variable**: Map a global or a local variable from where the data must be written. If you select this option, the Data Out port on the component disappears and the variable name appears on the port. For more information, see Create and use a variable in RPA Desktop Design Studio.

Automation components

Design automations using various components in RPA Desktop Design Studio.

Make sure you're familiar with the basics of using a component, connector, activity, variable, and the various actions using automations. For more information, see the topics listed in Building automations and Using automations.

List of components compatible with latest version

Learn about the list of components that are executed in their latest versions in the RPA Desktop Design Studio and robots, irrespective of the version they were used during the automation design.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Backward compatibility of plugins overview

Robotic Process Automation (RPA) solution is built with backward compatibility of plugins.

An automation built using the earlier plugin versions are compatible with a latest version. For example, if an automation is built using an earlier version of a plugin, 1.0, the RPA Desktop Design Studio, Attended Robot, and Unattended Robot applications run the automation by loading the plugin version 1.0.

If any newer version of a component is no longer compatible with its older versions, they're documented in the release notes. For more information, see RPA Hub release notes and RPA Plugin Bundle release notes.

Additionally, any automation component interacting with RPA Hub APIs are only compatible with its own RPA Hub version. For example, if the component is released as part of Utah 4.1, then it's compatible only for that version.

During the infrastructure upgrade for every family or store release (Vancouver, for example), use the MSI packages corresponding to the respective releases.

The following table lists the matrix defining the backward compatibility. In this table, N depicts the latest release version of the software and N-2 depicts two versions prior to it.

Matrix defining the backward compatibility

Plugins	Backward compatibility	Comments
RPA Desktop Design Studio	N	
Unattended Robot	N	
Attended Robot	N	
Essential Toolkit	N-2	Except for RPA Hub components
Essential Connectors	N-2	Except for RPA Hub components
Windows	N-2	
Java	N-2	
Chromium (Google and Edge)	N-2	
Mainframe (PCOMM)	N-2	
FTP	N-2	
Barcode Reader	N-2	
Scripting	N-2	
Universal app connector	N-2	

Few fundamental components that are essential to build the automation logic are excepted as these components are part of the RPA Desktop Design Studio.

List of components

The following list of components are executed in their latest versions in the RPA Desktop Design Studio and robots, irrespective of the version they were used during the automation design.

	For Each
	For Loop
	While
RPA Hub	Log
Security	DPAPI
Utilities	Debug
Internal	ExecutionPoint
	Start
	End
	UnknownComponent
	RemoteActivity
	VariableContainer

Actions (UI)

The Actions (UI) group of components work on and with browsers, browser elements, applications, and the desktop in the RPA Desktop Design Studio.

You can, for example, perform the following actions.

- Execute a JavaScript on a web page
- Extract text using the Optical Character Recognition (OCR) technology
- Simulate the mouse device clicks
- Extract data from a table

Using Actions (UI) components, your automation can interact with browsers, forms, applications, and objects in a way that is similar to how a user might interact with them using a mouse and keyboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the ActionSet component

The ActionSet component lets an automation interact with Windows applications (such as web browsers) and with Citrix applications. Using this single component in RPA Desktop Design Studio, you can click, drag, read and set text, interact with tables, and more, combining several user actions into a single task.

Before you begin

Role required: none

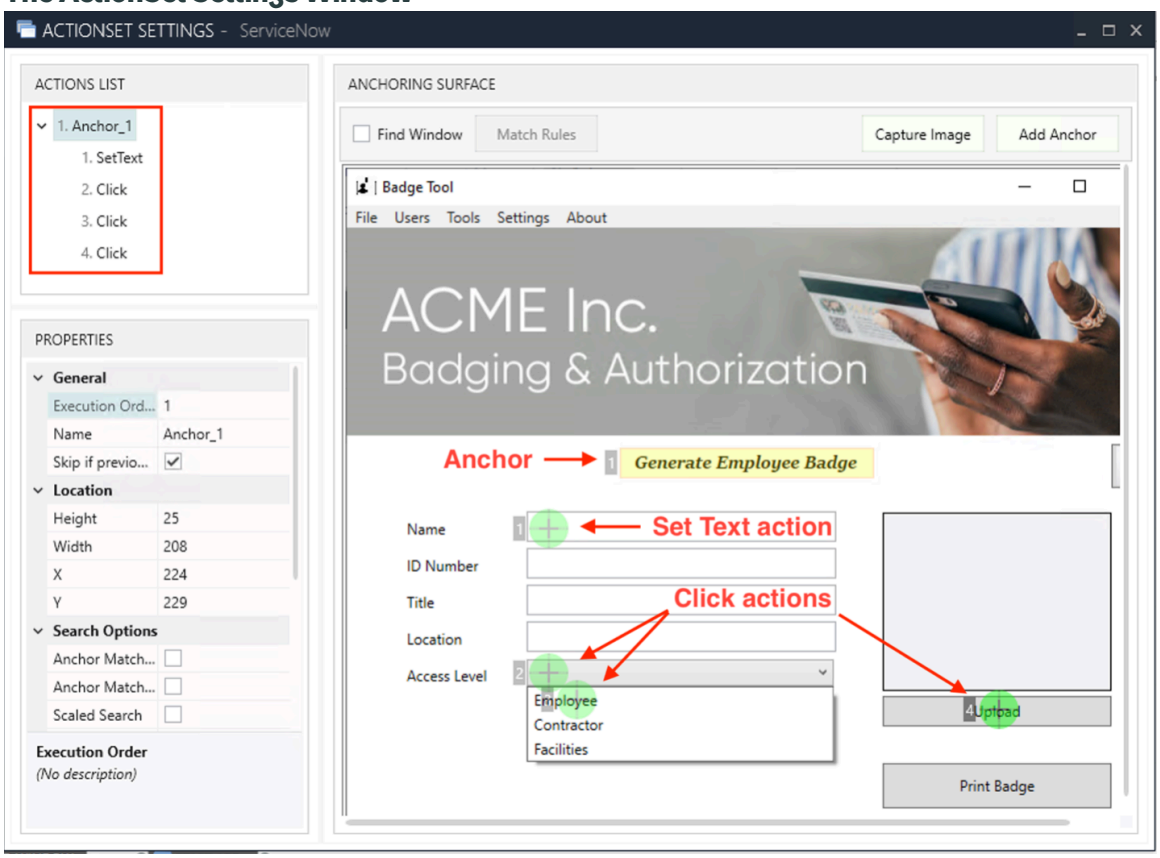
About this task

Using the ActionSet component, you can simulate a user interaction in an automation by specifying multiple user actions.

You can configure the properties for the ActionSet component settings. For more information about these properties, see Properties of Actions (UI) components.

Using the controls in the window, you capture an area of an application window, set one or more anchors, and define the user interactions that you want to simulate in that window. An anchor helps specify the target area for the interaction by defining a static area from which actions can be defined at a relative distance. For more information about anchors, see Anchor.

The ActionSet Settings Window



Note:
The ActionSet component is compatible with the Internet Explorer browser, Windows, and Citrix applications.

Procedure

1. In the Toolbox pane, navigate to **Actions (UI)** > **ActionSet**.
2. Drag the ActionSet component to the Design surface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click the component settings icon ( ), or, double-click the header of the component.
   The ACTIONSET SETTINGS window appears.
4. Do the following actions:
   Capture the area of the external application's window that you want the automation to interact with. For example, capture the area surrounding a button or a text field in a web browser.

   a. Click **Capture Image**.
      The `Press "CTRL+SHIFT" for selection` message appears.

   b. Switch to the external application.

   c. Press the **Ctrl + Shift** keys at the same time, then release them.
      The mouse device turns into a crossover icon ( ).

   d. Drag the mouse device over the element on which you want the ActionSet component to perform an action and its surrounding area and release.
      For example, if you want the component to click a button, drag the mouse device to capture the button and its surrounding areas.
      The selected area is captured as an image in the ACTIONSET SETTINGS window.

      All ActionSet actions take place in the selected window. To run actions in more than one window, use more than one ActionSet component in your workflow.

5. To add one or more anchors, follow these steps:

   a. Return to RPA Desktop Design Studio and in the ACTIONSET SETTINGS window, click **ADD ANCHOR**.
      The anchor appears as a yellow rectangle with red borders.

   b. If necessary, move the anchor to a part of the captured image that will not change.
      For example, move the anchor to a title or field label.

      If the area under the anchor does not exactly match the corresponding area of the captured image, the anchor will not be recognized, and the ActionSet component will not work as intended. Choose a static area of the image to set your anchor.

      You can define more than one anchor. Multiple anchors let you define the geographical relationship between anchor and target with greater accuracy when targeting different locations in the image.

6. Right-click the anchor and select an action to perform in the contextual menu.
7. To do the actions that the ActionSet component can perform, see the following steps in the appropriate topic to configure the action:

ActionSet component actions

Action	Reference
Simulate a mouse click	Use the ActionSet Click action.
Enter text in a field	Use the ActionSet SetText action.
Capture text from a window or web page	Use the ActionSet GetText action.
Capture a table	Use the ActionSet Get Table action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Reference
Select, copy, or delete text	Use the ActionSet Text Selection action.
Read text in an image	Use the ActionSet OCR Read Text action.
Read a table in an image	Use the ActionSet OCR Read Table action.
Read text in an image and click it when found	Use the ActionSet OCR Read Text action.
Simulate a key press or a key function	Use the ActionSet SendKeys action.
Simulate an alternative mouse action (for example, right-click, drag, scroll, or paste)	Use the ActionSet Mouse action.

8. **Optional:** To add more actions, repeat step 6 and 7.
9. **Optional:** To delete the anchor, right-click the anchor and click **Delete**.
10. **Optional:** Connect the data and control ports of the ActionSet component to the corresponding ports of the other components as described in the following table.

    (Optional) The ActionSet component has one optional parameter, which you can use to specify the handle of the window where the action takes place. A window handle may identify a specific window more quickly than is possible using image matching. You can also specify match rules to help the automation find the target window by testing available windows against the rules you specify.

    To specify the window handle, connect the Window Handle Data Out port of another component (such as the Start App component) to the Window Handle Data In port of the ActionSet component. For more information about the Window Handle parameter, see the following table.

Port type	Port name	Data type	Purpose of connection	Notes
Data In	Window Handle	Integer	The numeric handle of the window where the action will be performed. This must be the window from which the image in the ACTIONSET SETTINGS window was captured.	You must provide the handle of the window from which you have captured the image of the screen.

Use the ActionSet Click action

Simulate a simple left-click on the target area as part of a series of actions in the ActionSet component.

Before you begin

Capture an image of the target application window and create an anchor. For information about how to do this, see Use the ActionSet component.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The ActionSet Click action simulates a manual click at the area you specify in the ActionSet Settings window. You can use it to click a button, open a menu, select an object, or perform any action typically performed by a mouse click.

You can configure the properties for the Click action. For more information about these properties, see ActionSet Click properties.

Procedure

1. Right-click the anchor.
   For more information about an anchor, see Anchor.
2. Click **Click**.
3. Drag and place the green plus icon ( ) to the location where you want to simulate a click.
4. **Optional:** In the Properties pane of the ActionSet Settings window, configure the properties of the Click action.
   For example, you can set a delay or change the name of the action.
5. Close the ACTIONSET SETTINGS window.
6. **Optional:** Connect the port to let its input determine whether the Click action is performed, if you exposed the Click parameter's port in Step 4.

   (Optional) The Click parameter is described in the following table.

Port type	Port name	Data type	Purpose of connection	Notes
Data In	Click	Boolean	Determines whether the click action is performed. If the value of the Click parameter is True, the action is performed. If the value is False, the action is not performed.	The Data In port is available if you enable the Expose Port check box in the Properties section. The default Boolean value is True.

7. To test the component, under the **DESIGN** tab, click **Run**.

Use the ActionSet SetText action

Set text to fields on the Windows applications or the Internet Explorer browser by using the Set Text action in RPA Desktop Design Studio.

Before you begin

Capture an image of the target application window and create an anchor. For information about how to do this, see Use the ActionSet component.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The ActionSet Set Text action enters text in a field that you specify in the ActionSet Settings window. You can use it to enter any text data such as a user name, an address, a survey response, or in any situation where text entry is accepted.

You can configure the properties for the GetText component. For more information about these properties, see ActionSet-Get Text properties.

Procedure

1. Right-click the anchor.
   To learn about the anchor, see how to use the Anchor.
2. Click **Get Text**.
3. Drag the green plus icon ( ) to the location where you want to enter text.
4. **Optional:** In the Properties pane of the ActionSet Settings window, configure the properties of the Set Text action.
   For example, you can set a delay or change the name of the action.
5. Close the ACTIONSET SETTINGS window.
6. **Optional:** If you didn't hide the port for the SetText parameter in Step 4, connect the port so the action can receive the text to send to the target application.

   (Optional) The SetText parameter is described in the following table.

Port type	Port name	Data type	Purpose of connection
Data In	SetText	String	Receives text from another component.

7. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Use the ActionSet GetText action

Capture text from the Windows applications, and web pages on the Internet Explorer browser by using the Get Text action in RPA Desktop Design Studio.

Before you begin

Capture an image of the target application window and create an anchor. For information about how to do this, see Use the ActionSet component.

Role required: none

About this task

The ActionSet Get Text action captures text from an area that you specify in the ActionSet Settings window. You can use it to receive text in the target area when it is in text format. To capture text from an image, see Use the ActionSet OCR Read Text action.

You can configure the properties for the GetText component. For more information about these properties, see ActionSet-Get Text properties.

Procedure

1. Right-click the anchor.
   To learn about the anchor, see how to use the Anchor.
2. Click **Get Text**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Drag the green plus icon ( ) to the field where you want to capture text.
4. **Optional:** In the Properties pane of the ActionSet Settings window, configure the properties of the Get Text action.
   For example, you can set a delay or change the name of the action.
5. Close the ACTIONSET SETTINGS window.
6. **Optional:** If you didn't hide the port for the GetText parameter in Step 4, connect the port so the action can transmit the captured text for use.

   (Optional) The GetText parameter is described in the following table.

Port type	Port name	Data type	Purpose of connection
Data out	Get Text	String	Sends the captured text to another component.

7. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Use the ActionSet Text Selection action

Select, copy, or delete text from the Desktop and Windows applications, and the Internet Explorer browser by using the Text Selection action in RPA Desktop Design Studio.

Before you begin

Capture an image of the target application window and create an anchor. For information about how to do this, see Use the ActionSet component.

Role required: none

About this task

In addition to selecting text, the ActionSet Text Selection action can copy or delete text in a targeted application window. You can also set the action to trim leading or trailing white space from the captured text.

You can configure the properties for the Text Selection component. For more information about these properties, see ActionSet Text Selection- Properties.

Procedure

1. Right-click the anchor.
   To learn about the anchor, see how to use the Anchor.
2. Click **Text Selection**.
3. Drag the green rectangle icon ( ) over the area that contains the text that you want to select, copy, or delete.
4. **Optional:** To increase or decrease the area on the captured image covered by the green rectangle icon ( ), drag its edges.
5. **Optional:** In the Properties pane, select **Copy** or **Delete** from the Type list in the General section.
   For example, you can set a delay or change the nature of the action. By default, the action selects text.
6. Close the ACTIONSET SETTINGS window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** If you didn't hide the port for the TextSelection parameter in Step 4, connect the port so the action can send the captured text for use.

   (Optional) The TextSelection parameter is described in the following table.

Port type	Port name	Data type	Purpose of connection
Data Out	TextSelection	String	Sends the captured text to another component.

8. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Use the ActionSet Get Table action

Capture a table from the Windows applications, and web pages on the Internet Explorer browser by using the Get Table component in RPA Desktop Design Studio.

Before you begin

Capture an image of the target application window and create an anchor. For information about how to do this, see Use the ActionSet component.

Role required: none

About this task

The ActionSet Get Table action captures an entire table from a location that you specify in the ActionSet Settings window. You can choose to ignore the table header by setting the Ignore Header property in Step 4 of the procedure.

Important:

For the action to successfully capture table data, the target data must already be in table form. The action cannot convert ordinary text to table data.

You can configure the properties for the Get Table action. For more information about these properties, see ActionSet- Get Table properties.

Procedure

1. Right-click the anchor.
   To learn about the anchor, see how to use the Anchor.
2. Click **Get Table**.
3. Drag the green plus icon ( ) to the area in the target window that contains a table that you want to capture.
4. **Optional:** In the Properties pane of the ActionSet Settings window, configure the properties of the Get Table action.
5. Close the ACTIONSET SETTINGS window.
6. **Optional:** If you didn't hide the port for the Table action in Step 4, connect the port so the Table parameter can pass on the extracted table data.

   (Optional) The Table parameter is described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Port name	Data type	Purpose of connection	Notes
Data Out	Table	DataTable	Returns the extracted table data.	The Data Out port is enabled by default. You can disable it in the PROPERTIES pane.

7. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Use the ActionSet GetImage action

Capture images from the desktop, Windows applications, and web pages on the Internet Explorer browser by using the GetImage component in RPA Desktop Design Studio.

Before you begin

Capture an image of the target application window and create an anchor. For information about how to do this, see Use the ActionSet component.

Role required: none

About this task

The ActionSet Get Image action captures an image from the area that you specify in the ActionSet Settings window. For example, you can use it to capture a product image or a user's profile picture.

You can configure the properties for the GetImage component. For more information about these properties, see ActionSet- Get Image properties.

Procedure

1. Right-click the anchor.
   To know about the anchor, see how to use the Anchor.
2. Click **Get Image**.
3. Drag the green rectangle icon ( ) over the location of the image that you want to capture.
   If necessary, adjust the size of the selection rectangle by dragging its edges.
4. **Optional:** In the Properties pane of the ActionSet Settings window, configure the properties of the Get Image action.
   For example, you can set a delay or change the name of the action.
5. **Optional:** To change the default area in the image covered by the green rectangle icon ( ), do the following steps.

   a. Place the mouse device along the edges of the green rectangle icon ( ).
      The mouse device turns into a two-sided arrow ( ).

   b. Drag the edges of the green rectangle icon ( ).

6. Close the ACTIONSET SETTINGS window.
7. **Optional:** If you didn't hide the port for the GetImage parameter in Step 4, connect the port so the action can transmit the captured image for use.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) The GetImage parameter is described in the following table.

Port type	Port name	Data type	Purpose of connection
Data Out	Table	Bitmap	Sends the captured image to another component.

8. **Optional:** To test the component, right-click the component bar and click **Run From Here**.

Use the ActionSet OCR Read Text action

Extract text from images in the desktop, Windows applications, and the Internet Explorer browser by using the OCR Read Text action in RPA Desktop Design Studio.

Before you begin

Capture an image of the target application window and create an anchor. For information about how to do this, see Use the ActionSet component.

Role required: none

About this task

The ActionSet OCR (optical character recognition) Read Text action can capture text from images and return it in standard text format.

You can configure the properties for the OCR Read Text component. For more information about these properties, see ActionSet OCR Read Text properties.

Procedure

1. Right-click the anchor.
   To know about the anchor, see how to use the Anchor.
2. Navigate to **OCR** > **Read Text**.
3. Drag the green rectangle icon ( ) over the area that contains the text that you want to capture.
   If necessary, adjust the size of the selection rectangle by dragging its edges.
4. **Optional:** In the Properties pane of the ActionSet Settings window, configure the properties of the OCR Read Text action.
   In addition to properties that are common to all ActionSet actions, including the option to set a delay before or after performing the action, several properties let you improve text recognition by adjusting or scaling the captured image, or by setting the options of the text recognition engine.
5. **Optional:** To change the area in the image covered by the green rectangle icon ( ), do the following steps.
   a. Place the mouse device along the edges of the green rectangle icon ( ).
      The mouse device turns into a two-sided arrow ( ).
   b. Drag the edges of the green rectangle icon ( ).
6. Close the ACTIONSET SETTINGS window.
7. **Optional:** If you didn't hide the port for the OCR parameter in step 4, connect the port so the action can send the extracted text for use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) The OCR parameter is described in the following table.

Port type	Port name	Data type	Purpose of connection
Data out	OCR	String	Returns the text from the image.

8. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Use the ActionSet OCR Read Table action

Extract a table from images in the desktop, Windows applications, and web pages on the Internet Explorer browser by using the OCR Read Table action in RPA Desktop Design Studio.

Before you begin

Capture an image of the target application window and create an anchor. For information about how to do this, see Use the ActionSet component.

Role required: none

About this task

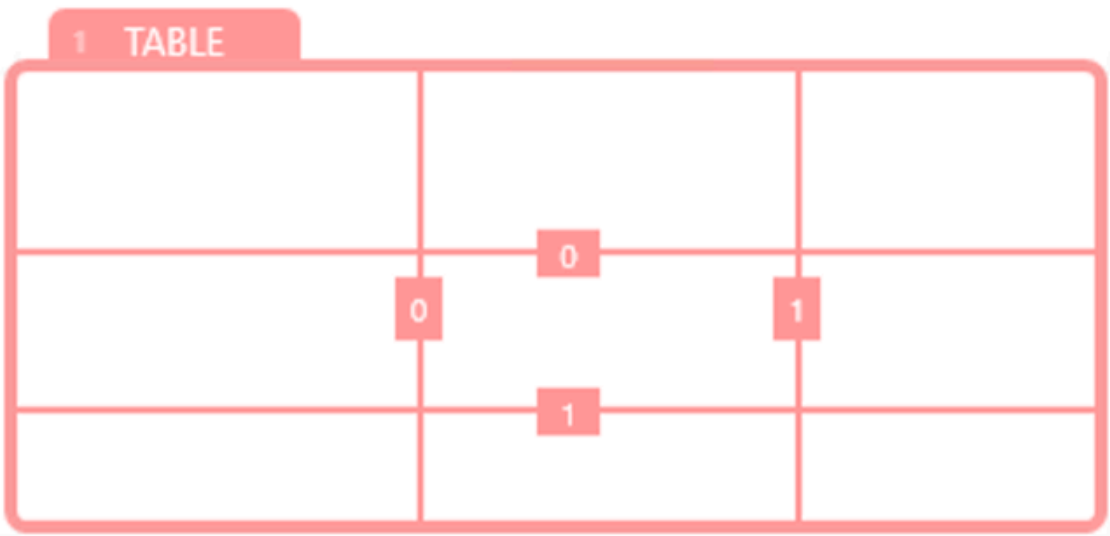
The ActionSet OCR (optical character recognition) Read Table action can capture a table even when it appears in an image instead of in a text-based format.

You can configure the properties for the OCR Read Table action. For more information about these properties, see ActionSet OCR Read Table properties.

Procedure

1. Right-click the anchor.
   To know about the anchor, see how to use the Anchor.
2. Navigate to **OCR** > **Read Table**.
3. Click **Read Table**.
4. Click the OCR read table icon ( ) and drag the indicator over the area that contains the table that you want to capture.

TABLE tab of the selection indicator



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Drag the lines that mark the cell boundaries to match the table, taking care to define the cells as accurately as possible and perform the following steps.
   The components returns OCR results from the individual cell areas.
   a. Adjust the size of the selection indicator by dragging its edges.
   b. Right-click an empty space within the selection indicator, and then select **Add Row** or **Add Column** to add rows and columns as necessary to match the table.
   c. Drag the row and column division lines inside the selection area to match the table.
6. **Optional:** Configure the properties of the OCR Read Table action in the Properties pane of the ACTIONSET SETTINGS window.

   (Optional) For example, you can choose to consider the first row of the table as a table header.

   For more information about these properties, see ActionSet OCR Read Table properties.
7. Close the ACTIONSET SETTINGS window.
8. **Optional:** If you didn't hide the port for the OcrTable action in Step 6, connect the port so the action can return the text of the extracted table.

   (Optional) The OcrTable parameter is described in the following table.

Port type	Port name	Data type	Purpose of connection
Data out	OcrTable	String	Returns text from the extracted table.

9. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Use the ActionSet OCR ClickText action

Perform a mouse device action on a text in an image in the Internet Explorer browser or Windows applications by specifying the text using the OCR ClickText action.

Before you begin
Role required: none

About this task
You can configure the properties for the OCR ClickText action. For more information about these properties, see OCR Click Text.

Procedure
1. Right-click the anchor.
   To know about the anchor, see how to use the Anchor.
2. Navigate to **OCR** > **Click Text**.
3. Drag the OCR read table icon ( ) over the captured image to the location where the component will perform an action.
4. To increase or decrease the area on the captured image covered by the green rectangle icon ( ), drag its edges.
5. In the Properties pane, select the required action from the Type list in the General section.
6. Close the ACTIONSET SETTINGS window.
7. Connect the data and control ports of OCR ClickText to the corresponding ports of other components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Port name	Data type	Purpose of connection	Mandatory?
Data In	OCR Click	String	Takes the text that the action matches in the application.	Yes

8. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Use the ActionSet SendKeys action

Set text or perform keyboard shortcuts on fields and elements on the desktop, Windows applications, and web pages on the Internet Explorer browser using the ActionSet Send Keys action in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
Configure the properties for the ActionSet SendKeys action. For more information about these properties, see ActionSet Send Keys properties.

Procedure

1. Right-click the anchor.
   To know about the anchor, see Anchor.
2. Click **Send Keys**.
3. Drag and place the Green plus icon ( ) on the location in the captured image where the component will perform an action.
4. Close the ACTIONSET SETTINGS window.
5. **Optional:** Connect the data port of the ActionSet Send Keys component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection	Mandatory?	Notes
Data In	SendKeys	String	Takes the string or keyboard shortcuts.	No. Connecting the port is optional.	

6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ActionSet Mouse action

Do various mouse device actions on the desktop, Windows applications, and web pages on the Internet Explorer browser using the ActionSet Mouse action in RPA Desktop Design Studio.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Configure the properties for the ActionSet Mouse action. For more information about these properties, see ActionSet-Mouse Action properties.

Procedure
1. Right-click the anchor.
   To know about the anchor, see Anchor.
2. Click **Mouse Action**.
3. Drag and place the green plus icon ( ) to the location on the captured image where the component will perform an action.
4. **Optional:** To specify a mouse device action, select the action from the Type list in the PROPERTIES pane.
   The default action is LeftClick.
5. Close the ACTIONSET SETTINGS window.
6. **Optional:** Connect the data port of the ActionSet Mouse action to the corresponding port of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection	Mandatory?	Notes
Data In	MouseAction	Boolean	If True, the Mouse action is performed, else, it is not performed.	No. Connecting the port is optional.	This port is exposed if the Expose Port option is enabled in the PROPERTIES pane.

7. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Get Table component
Extract and display data and the count of rows from the grids, lists, combo boxes, and HTML tables, by using the Get Table component in the RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
Many properties of the Get Table component are common with other Actions UI components, to configure these properties, see Properties of Actions (UI) components.

The properties unique to the Get Table component are given.

Get Table component properties

Property	Description
Ignore Header	Option to specify whether the automation captures or ignores the header of the table. The default value is False.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Actions (UI)** > **Get Table**.
2. Drag the Get Table component to the Design surface.
3. In the Get Table component, click the camera icon ( ).
   The `Press "CTRL+SHIFT" for selection` message appears.
4. Press the **Ctrl + Shift** keys.
   The mouse device turns into a crossover icon ( ).
5. Drag the mouse device over the application to cover the table and release.
   The selected area of the element is captured as an image in the Get Table component.
6. Drag the green plus icon ( ) over the captured image and place on the location where you want the component to perform an action.
7. **Optional:** Add an anchor to the captured image by doing the following actions:
   An anchor is a unique identifier that enables the Get Table component to identify the application where the component will perform an action. Although adding an anchor is a good approach, it's optional. If you don't add an anchor, the Get Table component treats the whole captured image as an anchor. To know more about an anchor, see the steps to use the Anchor.

   a. In the Get Table component, right-click the image and click **Add Anchor**.
      The anchor appears as a yellow rectangle with red borders.

   b. Drag and place the anchor on the captured image.

   Tip:

   (Optional) To change the dimensions of the anchor, position the mouse device along the edge of the anchor until the mouse device turns into a diagonal two-sided arrow ( ) and then drag the anchor.

8. **Optional:** Capture alternate images by doing the following actions:
   Alternate images prevent an execution failure when the Get Table component doesn't find the image that was captured first. In that case, the Get Table component then searches for alternate images to execute. You can add as many alternate images as you need.

   a. In the ALTERNATE IMAGES window, click the add image icon ( ).

   b. Click the camera icon ( ).
      The `Press "CTRL+SHIFT" for selection` message appears.

   c. Drag the mouse device over the application to cover the table and release.
      The selected area is captured as an image in the ALTERNATE IMAGES window.

   d. Drag the green plus icon ( ) over the captured image and place on the location where you want the component to perform an action.

   e. To close the ALTERNATE IMAGES window, click **OK**.

9. **Optional:** To configure the ways that the output fields show the output, see Configure output port properties.

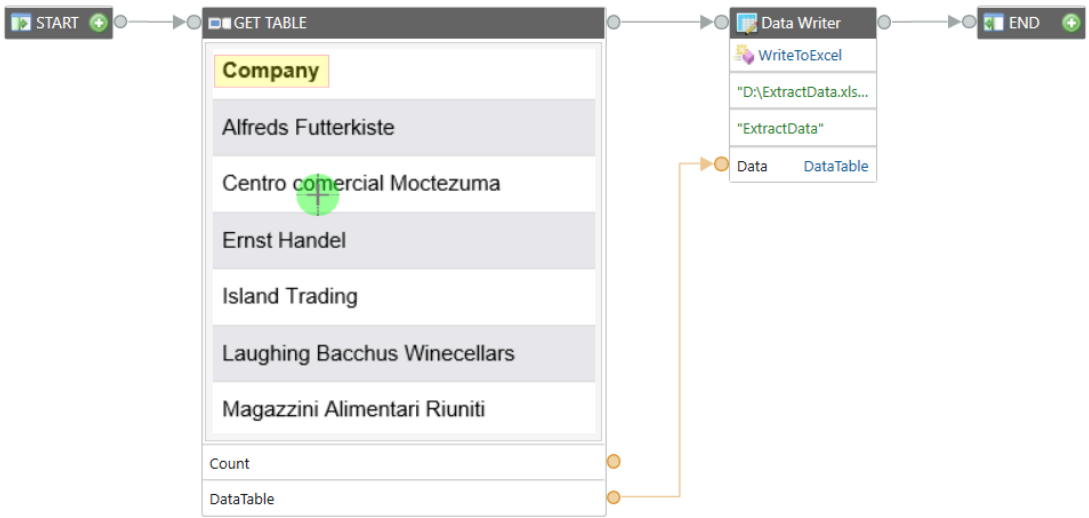
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. **Optional:** Connect the ports as described in the following table.

Port type	Port name	Data type	Purpose of connection	Mandatory?
Data out	Count	Integer	Returns the total count of rows.	Not applicable
Data out	DataTable	Not applicable	Returns the table.	Not applicable.

11. To test the component, right-click the component bar and then click **Run From Here**.

Example: Extract data from an HTML table to an Excel file



The Get Table component extracts data from an HTML table and passes the data through the DataTable Data Out port. The data is passed through the Data In port of the WriteToExcel component (To use the WriteToExcel component, see Use the WriteToExcel component). The data is written to the sheet specified in the `SheetName` field of the Excel document specified in the `Filepath` field

.

Use the Get Text component

The Get Text component captures text from an area that you specify in the target application. You can use it to receive data that exists in text format. To capture text from an image, see Use the OCR Text component.

Before you begin

Role required: none

About this task

The properties of the Get Text component are common with other Actions UI components, to configure these properties, see Properties of Actions (UI) components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Actions (UI)** > **Get Text**.
2. Drag the Get Text component to the Design surface.
3. In the Get Text component, click the camera icon ( ).
   The `Press "CTRL+SHIFT" for selection` message appears.
4. Switch to the application that you want to capture text from, and press the **Ctrl + Shift** keys.
   The mouse device turns into a crossover icon ( ).
5. Drag the cursor to capture the area where you want the component to capture text.

   Note:
   For best results, include a part of the image that does not change in your selection. This can help the automation find the capture area when the unchanging part is used as an anchor. To designate an anchor, see Step 7.

   The selected area is captured as an image in the Get Text component.
6. Drag the green plus icon ( ) to the area in the captured image where you want to capture the text.
7. **Optional:** Add an anchor to the captured image by doing the following actions:
   An anchor is a unique subset of the captured image that helps the Get Text component identify where the component will perform an action. Although adding an anchor is a good approach, it's optional. If you don't add an anchor, the Get Text component treats the whole captured image as an anchor. To know more about an anchor, see the steps to use the Anchor.

   a. In the Get Text component, right-click the image, and click **Add Anchor**.
      The anchor appears as a yellow rectangle with red borders.

   b. To identify the part of the image for the Get Text component, drag and place the anchor at the unique location on the image.

      Tip:

      (Optional) To change the dimensions of the anchor, position the mouse device along the edge of the anchor until the mouse device turns into a diagonal two-sided arrow ( ) and then drag the anchor.

8. **Optional:** Capture one or more alternate images by doing the following actions:
   Alternate images let the component continue when the Get Text component doesn't find the first image that was captured. When this happens, the Get Text component searches for an alternate image. You can add as many alternate images as you need. The component searches for alternate images in the same order as they were added.

   a. In the ALTERNATE IMAGES window, click the add image icon ( )

   b. Click the camera icon ( ).
      The `Press "CTRL+SHIFT" for selection` message appears.

   c. Press the **Ctrl + Shift** keys.
      The mouse device turns into a crossover icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Drag the mouse device over the application to capture the area where you want the component to perform an action and release.
The selected area is captured as an image in the ALTERNATE IMAGES window.

e. Drag the green plus icon ( ) over the captured image and place on the location where you want the component to perform an action.

f. To close the ALTERNATE IMAGES window, click **OK**.

9. **Optional:** To configure the ways that the output fields show the output, see Configure output port properties.
10. **Optional:** Connect the Data Out and control ports of the Get Text component to the corresponding ports of other suitable components within the automation.

    (Optional) The Extracted Data port, which sends the extracted text to another component for display or further processing, is described in the following table.

Port type	Port name	Data type	Purpose of connection
Data out	Extracted Data	String	Sends the captured text to another component

11. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Example: Extract a line of text from a window and display with the Show component

The Get Text component extracts the text "The world works with ServiceNow" and passes the text through its Data Out port to the Show component (To use the Show component, see Use the Show component). The Show component displays the same text in a pop-up window.

Use the Click component

Simulate the click actions of a mouse device by using the Click component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
The Click component uses the Inter-Process Communication (IPC) to send the click events to an application. Use it to click buttons, controls, or anything that typically expects a mouse click.

The properties of the Click component are common with other Actions UI components, to configure these properties, see Properties of Actions (UI) components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Actions (UI)** > **Click**.
2. Drag the Click component to the Design surface.
3. In the Click component, click the camera icon ( ).
   The `Press "CTRL+SHIFT" for selection` message appears.
4. Press the **Ctrl + Shift** keys.
   The mouse device turns into a crossover icon ( ).
5. Drag the mouse device over the application to capture the area where the action will be performed and then release.

   Tip:
   Include a part of the image that does not change in your selection. This can help the automation find the capture area when the unchanging part is used as an anchor. To designate an anchor, see Step 7.

   The selected area is captured as an image in the Click component.
6. Drag the green plus icon ( ) over the captured image and place on the location where the component will perform an action.
7. **Optional:** Add an anchor to the captured image by doing the following actions.
   An anchor is a unique identifier that enables the Click component to identify the content where the mouse device actions are simulated. Although adding an anchor is a good approach, it's optional. If you don't add an anchor, the Click component treats the whole captured image as an anchor. For more information on anchor, see the steps to use the Anchor.

   a. In the Click component, right-click the image, and click **Add Anchor**.
      The anchor appears as a yellow rectangle with red borders.

   b. Drag and place the anchor at the unique location on the captured image.

      Tip:
      To change the dimensions of the anchor, position the mouse device along the edge of the anchor until the mouse device turns into a diagonal two-sided arrow ( ) and then drag the anchor.

8. **Optional:** Capture alternate images by doing the following actions:
   Alternate images prevent an execution failure when the Click component doesn't find the image that was captured first. In that case, the Click component then searches for alternative images to execute. You can add as many alternate images as you need.

   a. In the Click component, click the component settings icon ( ).

   b. In the ALTERNATE IMAGES window, click the add image icon ( ).

   c. Click the camera icon ( ).
      The `Press "CTRL+SHIFT" for selection` message appears.

   d. Press the **Ctrl + Shift** keys.
      The mouse device turns into a crossover icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

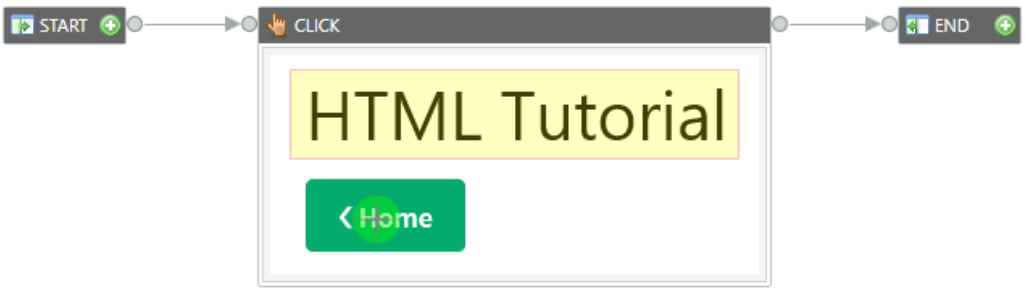
e. Drag the mouse device over the application to capture the area where you want the component to perform an action and release.
The selected area is captured as an image in the ALTERNATE IMAGES window.

f. Drag the green plus icon ( ) over the captured image and place on the location where you want the component to perform an action.

g. To close the ALTERNATE IMAGES window, click **OK**.

9. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Example: Automate the clicking of an HTML button



The Click component automates the clicking of the **Home** HTML button on the window. As a result, the user navigates to the home screen or window.

Use the Mouse component

Simulate a mouse action, including alternative mouse device buttons, moves, drags, scrolls, and paste operations.

Before you begin
Role required: none

About this task
The Mouse component uses hardware interrupts to simulate the actions of a computer mouse. You can use it to simulate a manual click, drag, move, scroll, or paste operation at an area that you specify in the ActionSet Settings window. Additionally, you can use it to interact with files, objects, menus, or any other items that typically respond to mouse input.

Many properties of the Mouse component are common with other Actions UI components, to configure these properties, see Properties of Actions (UI) components.

The properties unique to the Mouse component are given.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mouse component properties

Property	Description
Mouse Action Type	Type of mouse device action that the component will perform. The default action is Left Click.

Procedure

1. In the Toolbox pane, navigate to **Actions (UI)** > **Mouse**.
2. Drag the Mouse component to the Design surface.
3. In the Mouse component, click the camera icon ( ).
   The `Press "CTRL+SHIFT" for selection` message appears.
4. Press the **Ctrl + Shift** keys.
   The mouse device turns into a crossover icon ( )
5. Drag the cursor over the application to capture the area where you want the component to perform an action.

   Tip:
   Include a part of the image that does not change in your selection. This can help the automation find the capture area when the unchanging part is used as an anchor. To designate an anchor, see Step 7.

   The selected part of the program is captured as an image in the Mouse component.
6. Drag the green plus icon ( ) over the captured image and place on the location where the component will perform an action.
7. **Optional:** In the Properties pane, select the mouse device action from the Type list.
   The Type list located under the Misc. heading. The default Mouse action is LeftClick.

   You can also select one of the following actions:
   - LeftDoubleClick
   - MiddleClick
   - RightClick
   - RightDoubleClick
   - Move
   - Drag
   - Drop
   - ScrollDown
   - ScrollUp
   - Paste

   Note:
   To copy an item to the clipboard for pasting, use a Clipboard action.
8. **Optional:** Add an anchor to the captured image by doing the following actions:
   An anchor is a unique identifier that enables the Mouse component to identify the application where the component will perform an action. Although adding an anchor is a good approach,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

it's optional. If you don't add an anchor, the Mouse component treats the whole captured image as an anchor. To know more about the anchor, see the steps to use the Anchor.

a. In the Mouse component, right-click the image and click **Add Anchor**.
The anchor appears as a yellow rectangle with red borders.

b. To identify the content for the Mouse component, drag and place the anchor at the unique location on the image.

Tip:

(Optional) To change the dimensions of the anchor, position the mouse device along the edge of the anchor until the mouse device turns into a diagonal two-sided arrow ( ) and then drag the anchor.

9. **Optional:** Capture alternate images by doing the following actions:
Alternate images prevent an execution failure when the Mouse component does not find the image that was captured first. In that case, the Mouse component then searches for alternate images to execute. You can add as many alternate images as you need.

a. In the Mouse component, click the component settings icon ( ).

b. In the ALTERNATE IMAGES window, click the add Image icon ( ).

c. Click the camera icon ( ).
The `Press "CTRL+SHIFT" for selection` message appears.

d. Press the **Ctrl + Shift** keys.
The cursor turns into a crossover icon ( ).

e. Drag the cursor over the part of the application program on which you want to perform a mouse device action and then release.
The selected part of the program is captured as an image in the Mouse component.

f. Drag the green plus icon ( ) over the captured image and place on the location where the component will perform an action.

g. Navigate to the Properties pane.

h. In the Misc heading, select the mouse device action from the Type list.

i. Click **OK**.

10. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

© 2026 ServiceNow, Inc. All rights reserved.

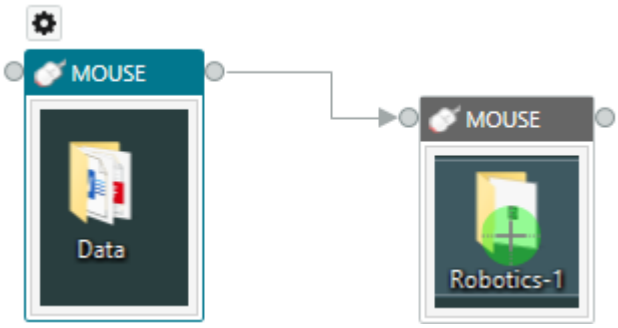
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Drag a folder to another folder

Two Mouse components are used in this example. The first identifies the folder and drags it. The second identifies the destination folder and moves the folder inside.



Use the OCR Text component

Extract the text from an image by using the OCR (Optical Character Recognition) Text component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

Important:

Starting with the Yokohama release, the RPA Desktop Design Studio utilizes the latest version of the Tesseract OCR engine. This update improves image pre-processing, and performance optimizations. When updating older automations that include the OCR text component, you may notice slight differences in the output. Therefore, it's important to validate your automations after the update.

Many properties of the OCR Text component are common with other Actions UI components, to configure these properties, see Properties of Actions (UI) components.

The properties unique to the OCR Text component are given.

OCR Text component properties

Property	Text
Image Source	Source from which the component takes the image.

Procedure

1. In the Toolbox pane, navigate to **Actions (UI)** > **OCR Text**.
2. Drag the OCR Text component to the Design surface.
3. **Optional:** To configure the settings, click the component settings icon ( ).
   The component has default settings that you may review and use.
4. **Optional:** Configure the settings as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OCR Settings

Field	Description
Engine	Engine name that is used for extracting the OCR fields.
Language	Teseract engine that can support multiple languages. The user can select any language that is listed here.
Line Height Tolerance	Font line height.
ChangeDPI	Changes the Dots Per Inch (DPI) of Image as mentioned in the DPI property.
DPI	DPI value.
Extract Words	Text that is extracted in a word format. Otherwise, it's plain text.
Invert	Image color that is inverted. For example, it inverts black to white.
Language	Language that is used to extract.
Scale Image	Scales the image by the given number.
Threshold	Image that is converted out of Grayscale image or noise that is removed as per the threshold value.
Threshold Value	Threshold value.
Timeout	Time after which the component operation times out.

5. To close the OCR Settings window, click **OK**.
6. To configure the input, see Configure port properties.
7. To configure the output, see Configure output port properties.
8. **Optional:** Connect the ports as described in the following table.

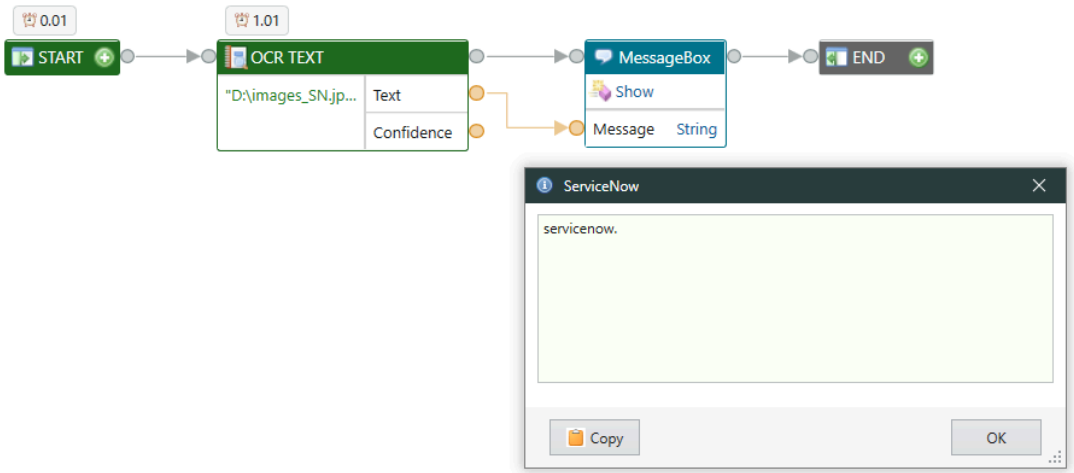
Port Type	Port name	Data type	Purpose	Notes
Data In	Image/File Path	Bitmap/String	Takes the image or the path to the image.	The input depends on the option selected from the **Image Source**option in the Properties. ○ **Port**: The data type is Bitmap. ○ **File Path**: The data type is String.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port Type	Port name	Data type	Purpose	Notes
Data Out	Text	String	Returns the extracted text from the image.	
Data Out	Confidence	Single	Returns the extracted text accuracy figure.	

9. To test the component, right-click the component bar and then click **Run From Here**.

Example: Extract text from images and display with the Show component



The OCR Text component takes a path to an image. The image comprises the text "servicenow". The component extracts the text from the image and passes the string to the Show component (To use the Show component, see Use the Show component). The Show component takes the text through the Message Data In port and then displays the text in a window.

Use the Send Keys component

Send text to fields in web pages, Windows applications, or the Windows desktop using the Send Keys component in RPA Desktop Design Studio. Use the component to enter data to fields such as text boxes and lists and to send special keys such as Shift, Control, F1, and F2.

Before you begin

Role required: none

About this task

You can use the Send Keys component in situations where the Set Text component does not work or in any application where you need to send keyboard shortcuts or special functions via the keyboard.

You can use the Action Set Send Keys action to send keyboard shortcuts, regular text, or a combination of both. Enter key combinations in one set of square brackets per key combination as shown below. Any keys used in combination will be sent together as if simultaneously pressed. Keys outside brackets are sent in the order they appear in the input string. For example, the following sequence replaces text in a text box by selecting all the text (CTRL + A), sending the delete key, and then entering the regular text “ServiceNow”: `[ctrl+a][del]ServiceNow`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To see all the supported special keys and functions, click Supported keys and functions.

Many properties of the Send Keys component are common with other Actions UI components, to configure these properties, see Properties of Actions (UI) components.

The properties unique to the Send Keys component are given.

Properties of the Send Keys component

Property	Description
Input Type	Type of keyboard input sent to the application. The default input is SendInput. • **SendInput**: Simulates key strokes to the target application. • **SendKeys**: Simulates key strokes to the target application but has certain limitations. For example, it doesn't work with RDP sessions.

Procedure

1. In the Toolbox pane, navigate to **Actions (UI)** > **Send Keys**.
2. Drag the Send Keys component to the Design surface.
3. Click the camera icon ( ).
   The `Press "CTRL+SHIFT" for selection` message appears.
4. Press the **Ctrl + Shift** keys.
   The mouse device turns into a crossover icon ( ).
5. Drag the mouse device over the application to capture the area where the component will perform an action and release.

   Tip:
   Include a part of the image that does not change in your selection. This can help the automation find the capture area when the unchanging part is used as an anchor. To designate an anchor, see Step 7.

   The selected area is captured as an image in the Send Keys component.
6. Drag the green plus icon ( ) over the captured image and place at the location where the Send Keys component will perform an action.
7. **Optional:** Add an anchor to the captured image by doing the following actions:
   An anchor is a unique identifier that enables the Send Keys component to identify the part where the component will perform an action. Although adding an anchor is a good approach, it's optional. If you don't add an anchor, the Send Keys component treats the whole captured image as an anchor. To view how to use the anchor, see the steps to use the Anchor.

   a. In the Send Keys component, right-click the image, and click **Add Anchor**.
      The anchor appears as a yellow rectangle with red borders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. To identify the part of the image for the Send Keys component, drag and place the anchor at the unique location on the image.

Tip:

(Optional) To change the dimensions of the anchor, position the mouse device along the edge of the anchor until the mouse device turns into a diagonal two-sided arrow ( ) and then drag the anchor.

8. **Optional:** Capture alternate images by doing the following actions:
Alternate images prevent an execution failure when the Send Keys component doesn't find the image that was captured first. In that case, the Send Keys component searches for alternative images to execute. You can add as many alternate images as you need.

   a. In the ALTERNATE IMAGES window, click the add image icon ( )

   b. Click the camera icon ( ).
   The `Press "CTRL+SHIFT" for selection` message appears.

   c. Press the **Ctrl + Shift** keys.
   The mouse device turns into a crossover icon ( ).

   d. Drag the mouse device over the part of the area where you want the component to execute and then release the mouse device.
   The selected area is captured as an image in the Send Keys component.

   e. Drag the green plus icon ( ) over the captured image and place at the location where the Send Keys component will perform an action.

   f. Click **OK**.

9. **Optional:** On the Properties pane, under **General**, select **SendInput** or **SendKeys** from the Input Type list.
The default action is **SendInput**.
10. To set the keys in the **Text Input** field, see Configure port properties.
11. Connect the control ports of the Send Keys component to the control ports of the preceding and next components in the automation.

    Optionally, connect the Data In port of the Send Keys component to the Data Out port of a preceding component. The Text Input parameter of the Data In port is described in the following table.

Port type	Port name	Data type	Purpose of connection
Data In	Text Input	String	Receives key strokes to send from another component.

12. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

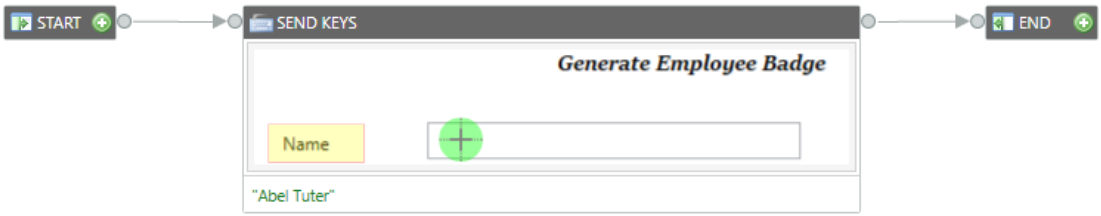
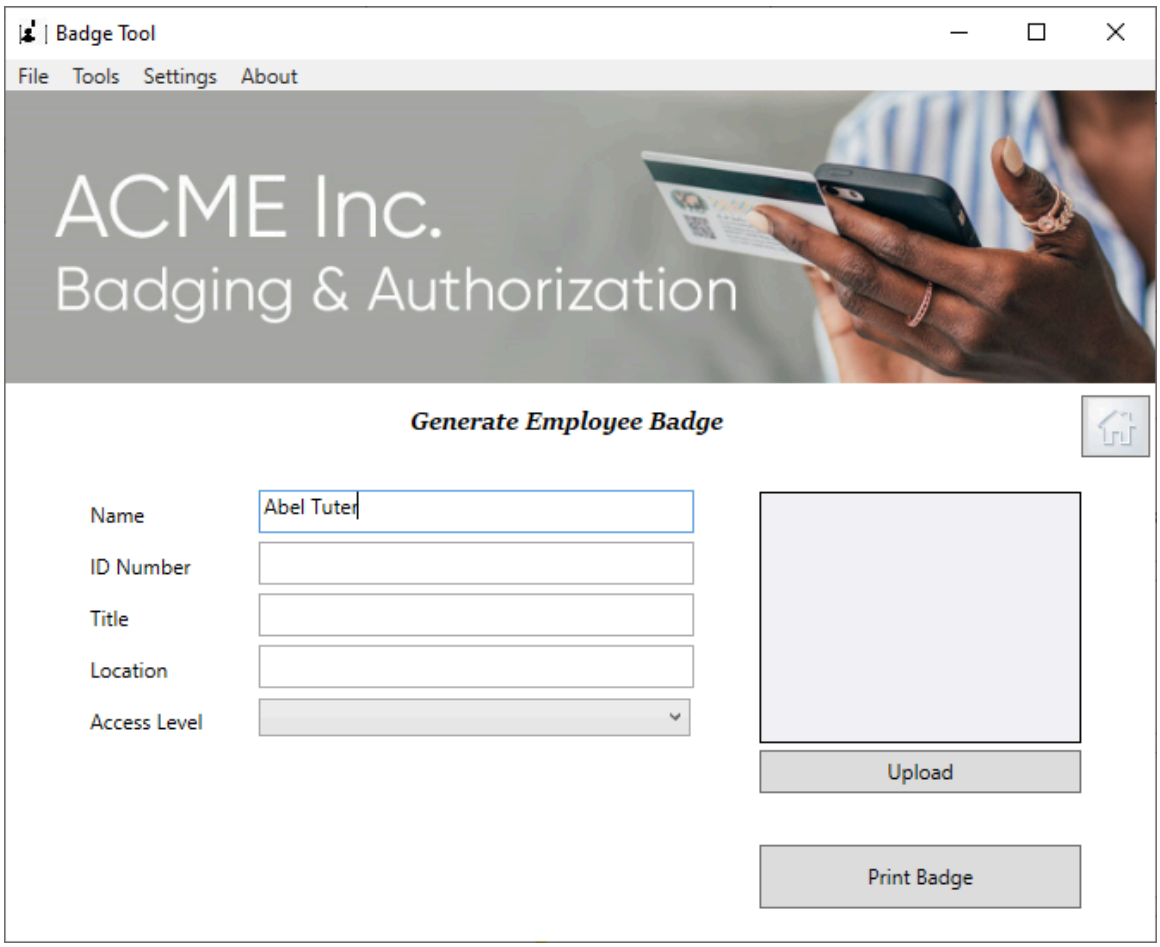
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Submit employee name in a badging app

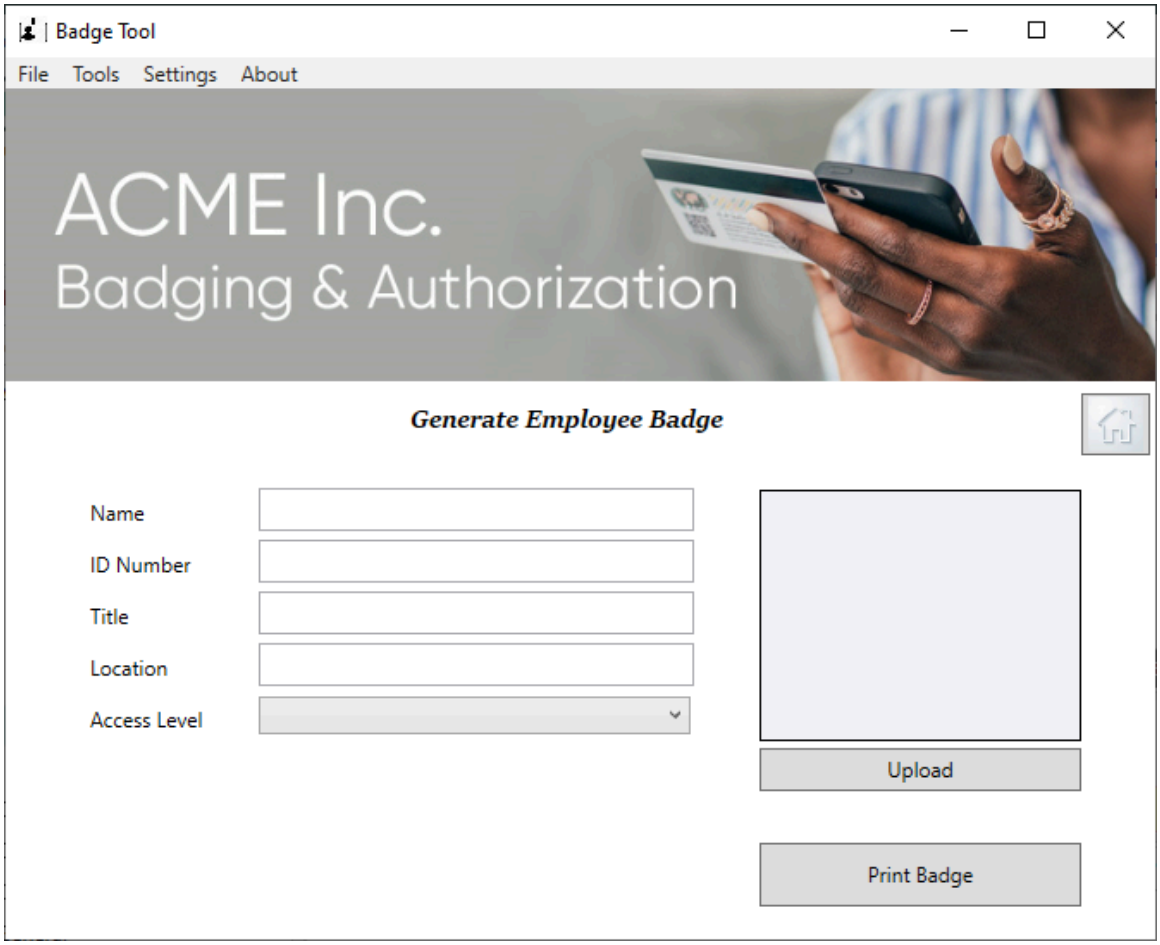


The Send Keys component has captured the Badging app image. Now, the user sends the keys "Abel Tuter" to the component. The green plus icon ( ) is the location where the text will be entered. Now, run the component.



As the user runs the component, the text "Abel Tuter" are typed in the Name field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Use the Send Keys component to click the **Print Badge** button and run the component. The employee name is submitted for badging.

Use the Set Text component

Set text in text boxes and drop-down lists within applications, check boxes, radio button controls, web pages on Internet Explorer browser or Windows applications by using the Set Text component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

The Set Text component uses inter-process communication (IPC) to interact with application controls. You can use it to enter any text data, such as a user name, an address, or a survey response, in any situation where text entry is accepted.

You can configure the properties for the Set Text component. For more information about these properties, see Properties of Actions (UI) components.

Procedure

1. In the Toolbox pane, navigate to **Actions (UI)** > **Set Text**.
2. Drag the Set Text component to the Design surface.
3. In the Set Text component, click the camera icon ( ).
   The `Press "CTRL+SHIFT" for selection` message appears.
4. Press the **Ctrl + Shift** keys.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The mouse device turns into a crossover icon ( ).

5. Drag the mouse device over the application to capture the area where the action will be performed and then release.

   Tip:
   Include a part of the image that does not change in your selection. This can help the automation find the capture area when the unchanging part is used as an anchor. To designate an anchor, see Step 7.

   The selected area is captured as an image in the Set Text component.

6. Drag the green plus icon ( ) over the captured image and place on the location on the captured image where the component will perform an action.

7. **Optional:** Add an anchor to the captured image by doing the following actions:
   An anchor is a unique identifier that enables the Set Text component to identify the location where the text is set. Although adding an anchor is a good approach, it's optional. If you don't add an anchor, the Set Text component treats the whole captured image as an anchor. For more information on anchor, see Anchor.

   a. In the Set Text component, right-click the image, and click **Add Anchor**.
      The anchor appears as a yellow rectangle with red borders.

   b. To identify the location for the Set Text component, drag and place the anchor at the unique location on the image.

      Tip:

      (Optional) To change the dimensions of the anchor, position the mouse device along the edge of the anchor until the mouse device turns into a diagonal two-sided arrow ( ) and then drag the anchor.

8. Capture alternate images by doing the following actions:
   Alternate images prevent an execution failure when the Set Text component does not find the image that was captured first. In that case, the Set Text component then searches for alternate images to execute. You can add as many alternate images as you need.

   a. In the Set Text component, click the component settings icon ( ).

   b. In the ALTERNATE IMAGES window, click the add Image icon ( ).

   c. Click the camera icon ( ).
      The `Press "CTRL+SHIFT" for selection` message appears.

   d. Press the **Ctrl + Shift** keys.
      The mouse device turns into a crossover icon ( ).

   e. Drag the mouse device over the part of the application where the Set Text component appends text.
      The selected area is captured as an alternate image in the Set Text component.

9. To configure the text input, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

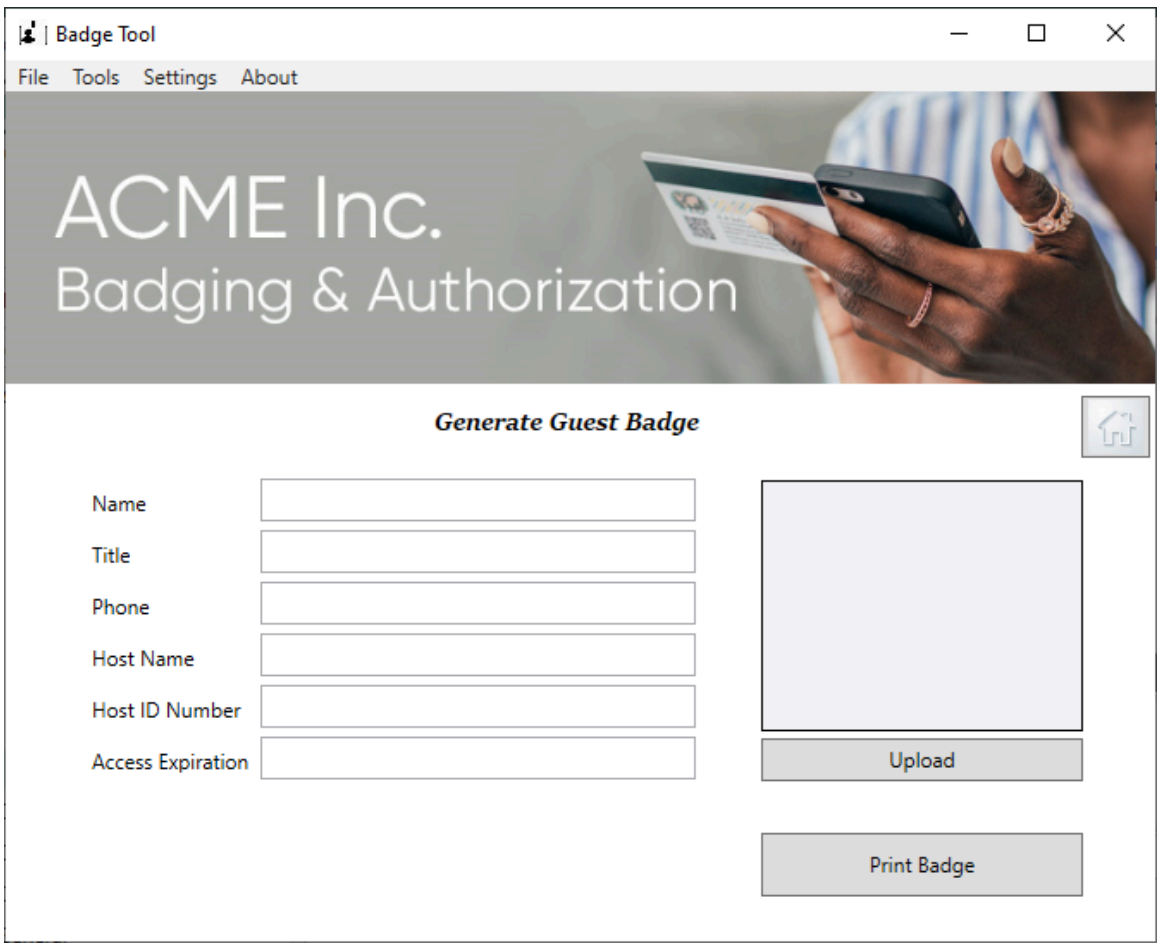
10. Connect the data and control ports of the Set Text component to the corresponding ports of the other components as described in the following table.

    To receive the text to send from another component in your automation, connect a Data Out port from the component that provides the text to the Data In port of the Set Text component. The Text Input parameter of the Data In port is described in the following table.

Port type	Port name	Data type	Purpose of connection
Data In	Text Input	String	Receives text from another component.

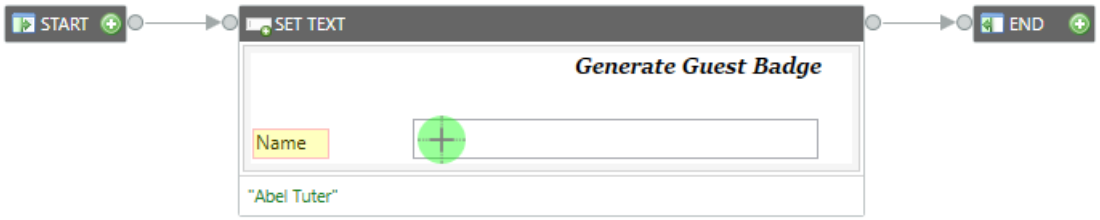
11. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Example: Enter a name in the Name field of a badging app



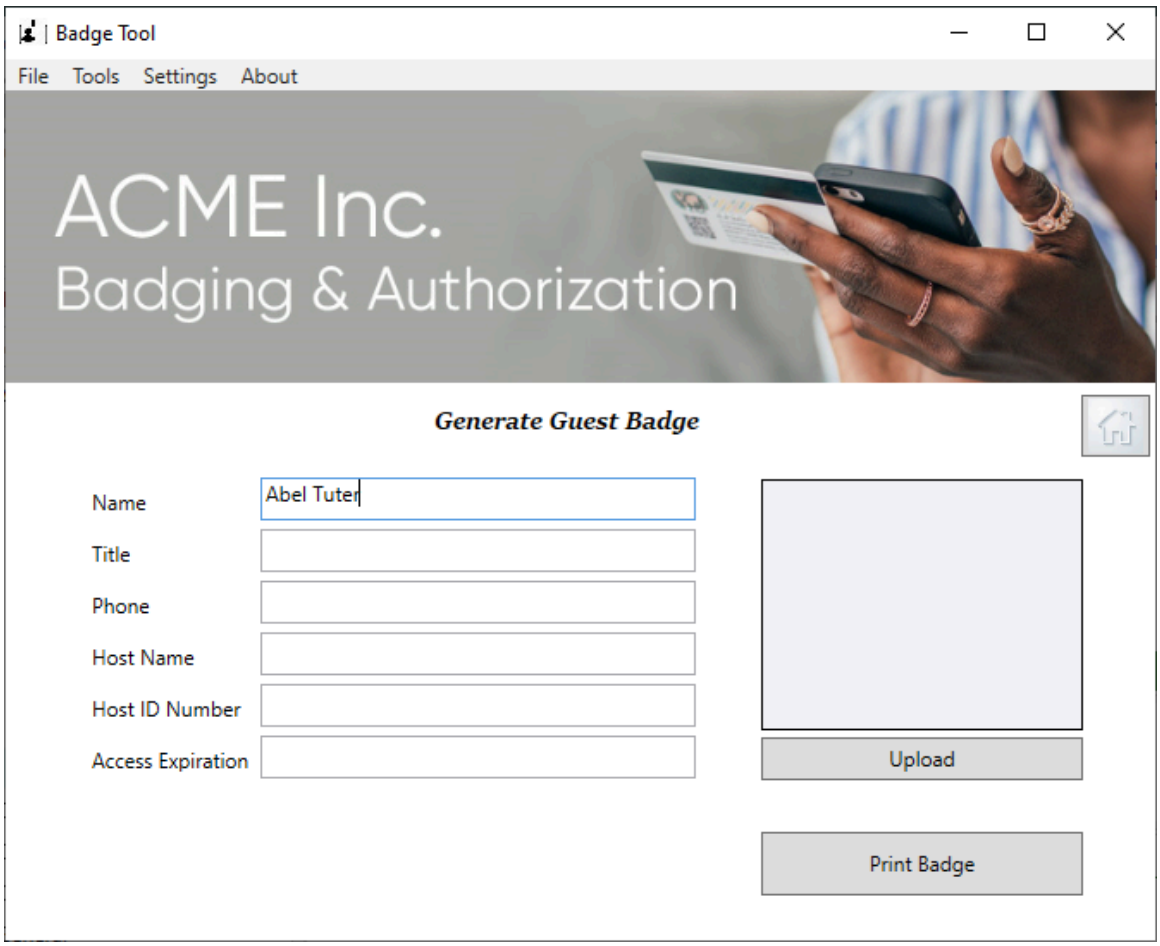
In this example, the Set Text component will be used to enter a name in the Name field of the badging app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Set the name in the Text Input field, as shown in the image and run the component.

The name is set in the Name field, as shown in the image.



Supported keys and functions

The Send keys component in the RPA Desktop Design Studio supports multiple keys, special keys, and functions. The keyboard keys must be enclosed within []. For example, [Back].

Supported keys and functions

Supported Keyboard keys	Description
A	A key
AbntC1	ABNT_C2 (Brazilian) key.
Add	Add key.
Apps	Application key (Microsoft Natural Keyboard).

Properties of Actions (UI) components

Learn about the properties of the Actions (UI) group components. All components under the Actions (UI) group have both unique and common properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common Properties of the Actions UI components

Property	Description
Delay after execution	Option to specify a delay in seconds after the component executes. The automation will wait until the specified time elapses before executing the next component.
Delay before execution	Option to specify a delay in seconds before the component executes. The automation will wait until the specified time elapses before executing the component.
Name	Name of the component.
X	Location of the green plus icon ( ) on the component along the X-axis.
Y	Location of the green plus icon ( ) on the component along the Y-axis.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.
Scaled Search	Option to specify whether the component will scale the target image before trying to match the source image. The scaling is done in an increment of 10% each between 100% and 150%. The default option is False.
Search As Gray Scale Image	Option to define and search the captured area as a grayscale image. By default, the option is enabled.
Target Platform	Option to select the application platform.
Threshold	Specifies the accuracy in matching the image captured before the component performs an action. The value of 1 defines a 100% match while 0.5 defines 50% match. The default value is 0.9 or 90% match.
Max Wait Time in Seconds	Defines the number of seconds to wait for the image or application to appear on the screen.
Wait After Image Found	Specifies the wait time (in seconds) after the image or application appears on the screen.
Wait For Create	Option to specify if the component will wait for the image to appear on the screen. The default value is True.

ActionSet actions properties

The ActionSet component performs multiple actions and each action has distinct properties. You can update the properties to modify the behavior of the actions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Click

Click properties

Property	Description
After Delay in Seconds	Specified delay after the Click action sets in.
Before Delay in Seconds	Specified delay before the Click action sets in.
Execution Order	Order in which the action is executed when multiple actions are set up. This order is assigned when you add an action from the anchor. You can change the order by dragging and placing the action under its anchor at the desired order on the ACTIONSET SETTINGS window.
Expose Port	Option to expose a Data In port that takes the Boolean value. If True, the Click action is performed, else, if False, the Click action is not performed. By default, the option is not selected.
Name	Option to update the default name of the action. The default name is Click. The updated name reflects in the ACTIONS LIST section of the ACTIONSET SETTINGS window.
X	Option to set the custom location of the green plus icon ( ) along the X-axis relative to the anchor.
Y	Option to set the custom location of the green plus icon ( ) along the Y-axis relative to the anchor.

After Delay in Seconds	Specified delay after the action sets in.
Before Delay in Seconds	Specified delay before the action sets in.
Execution Order	Order in which the action is executed when multiple actions are set up. This order is assigned when you add an action from the anchor. You can change the order by dragging and placing the action under its anchor at the desired order on the ACTIONSET SETTINGS window.
Expose Port	Option to disable the Data Out port that returns the extracted text. By default, the port is enabled.
Name	Option to update the default name of the action. The default name is OCR. The name reflects in the ACTIONS LIST section of the ACTIONSET SETTINGS window.
Height	Option to specify the height of the green rectangle icon ( ).
Width	Option to specify the width of the green rectangle icon ( ).
X	Option to specify the location of the green rectangle icon ( ) along the X-axis relative to the anchor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OCR Read Text properties (continued)

Property	Description
Y	Option to specify the location of the green rectangle icon ( ) along the Y-axis relative to the anchor.
Engine	Engine name that is used for extracting the OCR fields.
Language	Teseract engine that can support multiple languages. You can select any language listed here.
Line Height Tolerance	Font line height.
ChangeDPI	If this is enabled, it changes the Dots Per Inch (DPI) of Image as mentioned in DPI property.
DPI	DPI value.
Extract Words	Text that is extracted in words format. Else, it's plain text.
Invert	Image color that is inverted. For example, it inverts black to white.
Language	Language used to extract.
Scale Image	Scaled image by the given number.
Threshold	Converted image out of Grayscale image or noise that is removed as per the Threshold value.
Threshold Value	Threshold value.
Timeout	Time after which the operation times out.

OCR Read Table

Get Image properties

Property	Description
After Delay in Seconds	Specified delay after the action sets in.
Before Delay in Seconds	Specified delay before the action sets in.
Execution Order	Order in which the action is executed when multiple actions are set up. This order is assigned when you add an action from the anchor. You can change the order by dragging and placing the action under its anchor at the desired order on the ACTIONSET SETTINGS window.
Expose Port	Option to expose the Data Out port that returns the captured table as an output. By default, the port is enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get Image properties (continued)

Property	Description
Name	Option to update the default name of the action. The default name is OcrTable. The name reflects in the ACTIONS LIST section of the ACTIONSET SETTINGS window.
Height	Option to specify the height of the OCR Read table icon ( ).
Width	Option to specify the width of the OCR Read table icon ( ).
X	Option to specify the location of the OCR Read table icon ( ) along the X-axis relative to the anchor.
Y	Option to specify the custom location of the OCR Read table icon ( ) along the Y-axis relative to the anchor.
FirstRowHeader	Option to specify whether the first row of the captured table is a header.
Engine	Engine name that is used for extracting the OCR fields.

OCR Click Text

OCR Click Text properties

Property	Description
Type	Type of action the mouse device performs after the text is identified.
After Delay in Seconds	Specified delay after the action sets in.
Before Delay in Seconds	Specified delay before the action sets in.
Execution Order	Order in which the action is executed when multiple actions are set up. This order is assigned when you add an action from the anchor. You can change the order by dragging and placing the action under its anchor at the desired order on the ACTIONSET SETTINGS window.
Expose Port	Option to expose the Data Out port that returns the captured table as an output. By default, the port is enabled.
Name	Option to update the default name of the action. The default name is OCR Click. The name reflects in the ACTIONS LIST section of the ACTIONSET SETTINGS window.
Height	Option to specify the height of the OCR Click Text icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

OCR Click Text properties (continued)

Property	Description
Width	Option to specify the width of the OCR Read table icon.
X	Option to specify the location of the OCR Click Text icon along the X-axis relative to the anchor.
Y	Option to specify the location of the OCR Click Text icon along the Y-axis relative to the anchor.
Engine	Engine name that is used for extracting the OCR fields.

Text Selection

Text Selection properties

Property	Description
After Delay in Seconds	Specified delay after the action sets in.
Before Delay in Seconds	Specified delay before the action sets in.
Execution Order	Order in which the action is executed. This order is assigned when you add an action from the anchor in the ACTIONSET SETTINGS window. You can change the order by dragging and placing the action at the desired order.
Expose Port	Option to expose the Data In port that passes the Boolean value to enable or disable the Set Text action.
Name	Option to update the default name of the action. The default name is TextSelection. The name reflects in the ACTIONS LIST section of the ACTIONSET SETTINGS window.
Trim	Option to trim the spaces at the start and end of the text.
Type	Type of action to perform.
Height	Option to specify the height of the green rectangle icon ( ).
Width	Option to specify the width of the green rectangle icon ( ).
X	Option to specify the location of the green rectangle icon ( ) along the X-axis.
Y	Option to specify the location of the green rectangle icon ( ) along the Y-axis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Send Keys

Send Keys properties

Property	Description
After Delay in Seconds	Specified delay after the action sets in.
Before Delay in Seconds	Specified delay before the action sets in.
Delay between each keypress (Seconds)	Specified delay between each key press action.
Clear Existing Value	Option to specify if the action will clear the existing value on a field before setting the text.
Execution Order	Order in which the action is executed when multiple actions are set up. This order is assigned when you add an action from the anchor. You can change the order by dragging and placing the action under its anchor at the desired order on the ACTIONSET SETTINGS window.
Expose Port	Option to enable or disable the Data In port that takes the string. By default, the port is enabled.
Input Type	You can choose from the following options: • SendInput: Sets text in the fields. • SendKeys: Sends the keyboard shortcuts.
Name	Option to update the default name of the action. The default name is SendKeys. The name reflects in the ACTIONS LIST section of the ACTIONSET SETTINGS window.
Use mouse click to focus	Option to use the mouse device click to focus on the area in the application where the mouse device inputs will be passed.
X	Option to specify the location of the green plus icon ( ) along the X-axis relative to the anchor.
Y	Option to specify the location of the green plus icon ( ) along the Y-axis relative to the anchor.

Mouse Actions

Mouse Actions properties

Property	Description
After Delay in Seconds	Specified delay after the action sets in.
Before Delay in Seconds	Specified delay before the action sets in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mouse Actions properties (continued)

Property	Description
Execution Order	Order in which the action is executed when multiple actions are set up. This order is assigned when you add an action from the anchor. You can change the order by dragging and placing the action under its anchor at the desired order on the ACTIONSET SETTINGS window.
Expose Port	Option to enable or disable the Data In port that takes the Boolean value. If True, the Mouse Action is performed, else, if False, the Mouse Action is not performed. By default, the option is not checked.
Name	Option to update the default name of the action. The default name is MouseAction. The name reflects in the ACTIONS LIST section of the ACTIONSET SETTINGS window.
Type	Type of mouse device action. For example, paste.
X	Option to specify the location of the green plus icon ( ) along the X-axis relative to the anchor.
Y	Option to specify the location of the green plus icon ( ) along the Y-axis relative to the anchor.

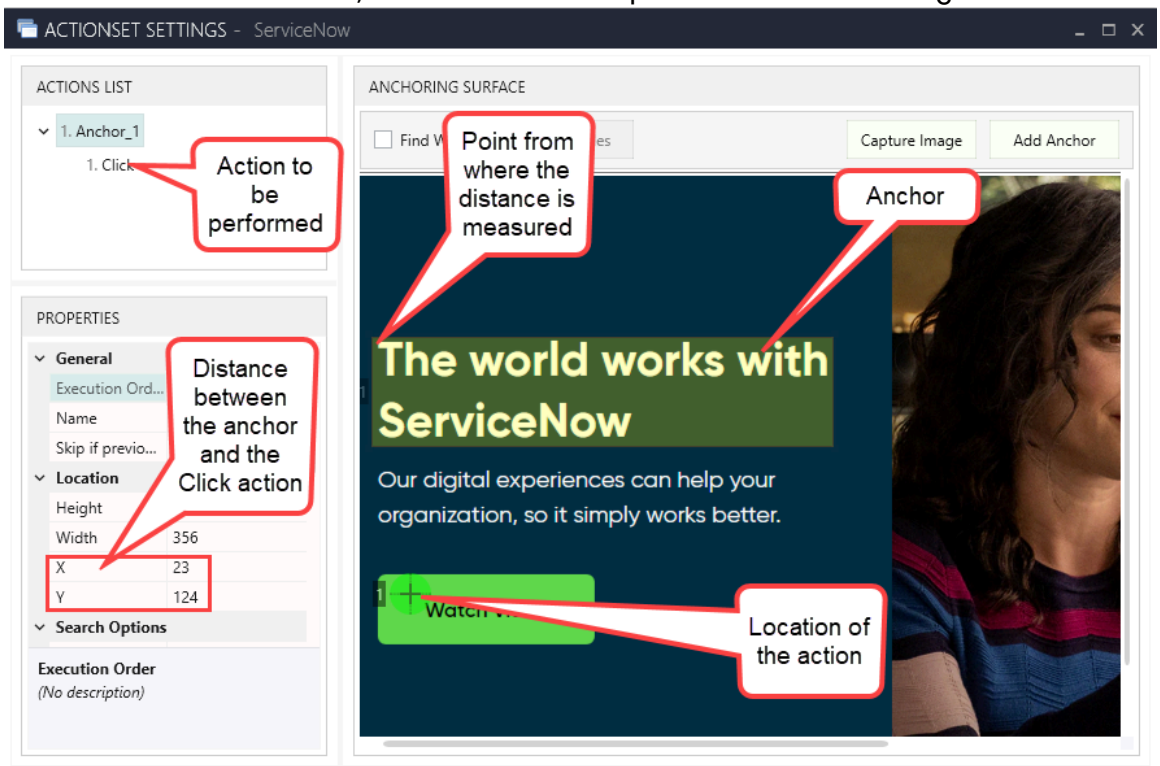
Anchor

An anchor is a unique identifier which is identified on the screen. It helps specify the target area for a simulated user interaction by defining a static area from which actions can be defined at a relative distance. The position of actions is calculated based on the anchor and the actions are performed relative to it.

In the following image, the anchor is a rectangle that identifies the location of the text “The world works with ServiceNow.” The target template where the action is to take place shows as a rectangle whose position is relative to the top left corner of the anchor’s rectangle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the action is executed, the center of the template is identified and targeted for action.

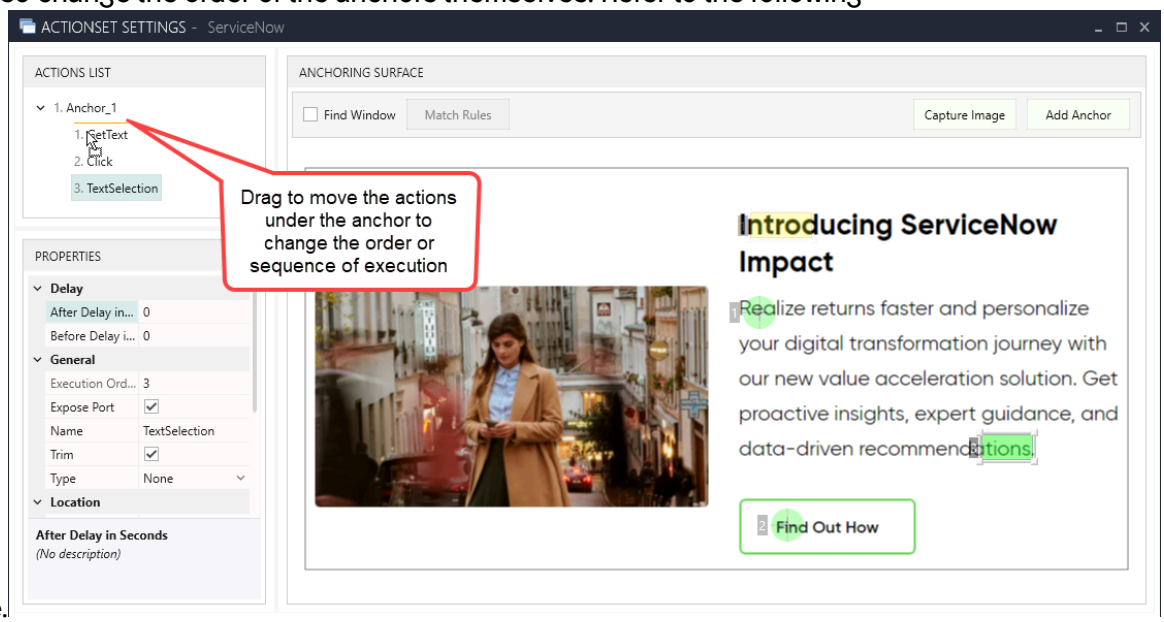


You can use a single anchor to perform multiple actions, each with its own relative distance from the anchor.

When multiple actions are configured, they are executed in the order they were added.

However, if the location of the element on which an action is performed changes, the action may occur at the wrong place. To help prevent this, you can use multiple anchors.

When you add multiple actions, the component performs the actions in the order that they are added. Likewise, when you add multiple anchors, the actions connected to each anchor execute before the actions connected to the next anchor. You can change the order of the actions connected to each anchor. You can also change the order of the anchors themselves. Refer to the following image.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To reorder an action or an anchor, drag it to its new position. As you move it, its new location is indicated by a line (—).

To delete an anchor, in the Anchoring Surface pane of the ActionSet Settings dialog, right-click the anchor, and then select **Delete**.

Conditions

The Conditions is a group of components that you can use to automate decision making. These decisions are based on the value, input, or data matches with conditions or multiple values.

You can use the components in the Conditions group to do the following actions:

- Match an input or data with a condition to find out whether the input satisfies the condition.
- Match a value with multiple values until an exact match is found and on not finding an exact match, specify a different action.

Use the Decision component

Automate the decision-making process by using the Decision component in RPA Desktop Design Studio.

Watch this video to learn how to use the Decision component.

https://player.vimeo.com/video/1075850510?h=c6d1eea462&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Role required: none

About this task

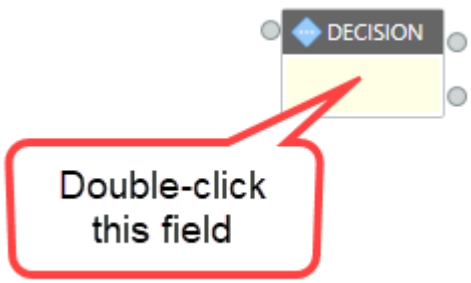
You can specify a conditional expression in the component. If the expression contains any parameters, they appear as input ports. If the expression is correct based on the inputs provided, then the True Output Port takes control. Else, the False Output port takes control and executes the automation.

For defining conditions, the Decision component provides many functions, operators, and expressions. For more information, see Functions, data types, and operators.

To configure the properties for the Decision component, see Properties of the Conditions components.

Procedure

1. In the Toolbox pane, navigate to **Conditions** > **Decision**.
2. Drag the Decision component to the Design surface.
3. Double-click the field under the DECISION component



bar.

4. Enter the condition in the field, such as a=5 where "a" is the parameter.
   A Data In port is dynamically created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

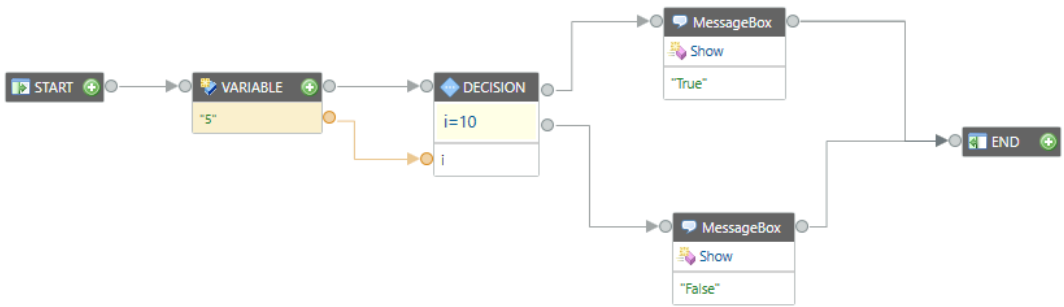
5. To enter a value in the Data In field, see Configure port properties.
6. Connect the data and control ports of the Decision component to the corresponding ports of the other components.

Port type	Port name	Data type	Purpose of connection	Default Value
Data In	The name is the same as the name of the parameter. For example, in the condition a=5, "a" will be the port name.	Object	Takes the input or data for the parameters that are created in the condition.	None

7. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Example: Accept an input and match with a condition

In the DECISION component, a conditional expression "i=10" is set. Since "i" is the parameter, an input port is dynamically created in the component. The Variable (Create and use a variable in RPA Desktop Design Studio) component provides the input "5" to the Decision component which is False. Hence, the False Output port takes control and the Show (Use the Show component) component shows the message "False."



Use the Switch component

Find the exact match of a value among multiple values as part of an automation Workflow by using the Switch component in RPA Desktop Design Studio.

Watch this video to learn how to use the Switch component.

https://player.vimeo.com/video/1072300125?h=d8635f4d4c&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin
Role required: none

About this task
The Switch component enables you to set multiple values that are matched with the value that it takes from another component or method. It switches between values until it finds an exact match. If no match is found, it enables you to execute an alternate action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Switch component can work with other components or methods to execute an automation Workflow.

You can configure the properties for the Switch component. For more information on these properties, see Properties of the Conditions components.

Procedure

1. In the Toolbox pane, navigate to **Conditions** > **Switch**.
2. Drag the Switch component to the Design surface.
3. To set the values for matching, do the following actions:

   a. Click the add value icon ( ).

   b. **Optional:** Repeat Step 3 to add as many fields for the values as you need. Data In ports are dynamically created to accept

   values.

   c. To configure the input method to the fields, see Configure port properties.

4. Connect the data and control ports of the Switch component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection
Data In	Comparison Data	Object	Takes the value that is matched with the values set up in the component.
Data In	Value	String	Takes the value that is matched with the value that is passed through the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Port name	Data type	Purpose of connection
			Comparison Data port.
Data Out	ELSE	Not applicable	If there is no match, the component passes the control to the next component.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Functions, data types, and operators

The Decision component supports certain functions and operators described in the topic. Use this topic as a reference.

Supported functions and operators

Supported functions and operators

Type	Example	Evaluated as
Values	• Integer • Floating point number • Date and time • Boolean • String • Function • Parameter	Not applicable
Integers	Represented using numbers. Example, 443, 124, and 665.	Int32
Floating point numbers	221.12, 43.76, and 5.9	Decimal
Scientific notation	You can use the e to define the power of 10 (10^). • 1.22e1 • 1e2 • 1e+2 • 1e-2 • .1e-2 • 1e10	Double
Dates and Times	Must be enclosed between `sharps`. #2008/01/31# // for en-US culture	DateTime

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported functions and operators (continued)

Type	Example	Evaluated as
Boolean	True or False	Boolean
Strings	Any character between single quotes ' is evaluated as String.	'ServiceNow'
Parameters	A parameter as a name, and can be optionally contained inside brackets. 2 + x, 2 + [x]	
Function	A function is made of a name followed by braces, containing optionally any value as arguments. Abs(1), doSomehting(1, 'dummy')	
Operators	Expressions can be combined using operators. Each operator as a precedence priority. Here is the list of those expression's priority. **1.** primary **2.** unary **3.** power **4.** multiplicative **5.** additive **6.** relational **7.** logical	
Logical	These operators can do some logical comparison between other expressions: • or - || • and - && • true or false The and operator has a higher priority than the or, thus in the example above, false and true are evaluated first.	
Relational	Relational operators are used to compare values. These operators always result in a boolean value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported functions and operators (continued)

Type	Example	Evaluated as
	• =, ==, !=, <> • <, <=, >, >= • 1 < 2	

Properties of the Conditions components

Learn about the properties for the Conditions components in RPA Desktop Design Studio.

Properties

The properties in the following table apply to the Conditions components.

Conditions components properties

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Name	Name to identify the component. Choose a name that corresponds to the application field that you're working with.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Connectors

The Connectors provide specialized abilities, such as automating tasks with Microsoft Excel spreadsheets and Microsoft Word documents. Connectors are different from components because they expose multiple methods and they are used differently.

Connectors reside in the ServiceNow® app store and become available to you when the RPA Desktop Design Studio connects to the appropriate RPA Hub instance.

Some connectors are available by default under the Toolbox pane while you must install the rest. To install, see Manage plugins in RPA Desktop Design Studio.

When set up, Connector methods work just like the components. You connect methods with connectors and vice versa to create an automation.

An example of a connector is Google Chrome. The Chrome connector performs various tasks on the Chrome browser.

When you set up a connector, it exposes multiple methods that perform specific functions. For example, the Google Chrome connector exposes the following methods, and more:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Get the screenshot of a web page open on the Google Chrome.
- Set a focus on a Google Chrome window that is inactive or running in the background.

The example shows the Microsoft Word connector and its methods.

To use a connector, see

- Manage plugins in RPA Desktop Design Studio
- Use a connector in RPA Desktop Design Studio
- Use connector method

Chromium connector

The Chromium connector enables you to interact with various elements in web applications running on Google Chrome or Microsoft Edge Edge and build automations around them.

To use the Chromium connector, do the following actions:

- Enable the latest versions of the ServiceNow RPA Edge Extension and the ServiceNow RPA Chrome Extension. To enable, see Add the ServiceNow RPA Chrome extension and Add the ServiceNow RPA Edge extension.
- Ensure you have installed the Chromium plugin on the RPA Desktop Design Studio. To install, see Manage plugins in RPA Desktop Design Studio.
- To use the Chromium connector, see Use a connector in RPA Desktop Design Studio.
- To configure the Google Chrome connector, see Configure the Chromium connector.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.
- If you've installed a hot fix for Chromium connector, to verify that the hot fix is accurately downloaded to your machine, perform the post requisite steps. For more information, see Post requisites after installing a hot fix.

Chrome connector methods are available at the following levels:

- Application
- Screen
- Element

Types of Chrome connector methods

Method level	Description
Application	These methods can open a website on the Google Chrome browser. The connector sets

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of Chrome connector methods (continued)

Method level	Description
	up the browser and application for the other methods to execute.
Screen	These methods perform various actions on the screens that you have configured. For example, click a button.
Element	These methods perform various tasks on the various elements on the screen.

Note:
Automation support for frameset-based pages isn't available through the Chromium connector.

Configure the Chromium connector

Capture one or more web pages from the Google Chrome or Microsoft Edge browser and then the elements on the web pages by configuring the Chromium connector.

Before you begin

Software prerequisites: The ServiceNow, Inc. RPA Google Chrome and the ServiceNow® Store RPA Microsoft Edge extensions are added. To add the extensions, see:

- Add the ServiceNow RPA Edge extension.
- Add the ServiceNow RPA Chrome extension.

Ensure you have installed the Chromium plugin on the RPA Desktop Design Studio. To install, see Manage plugins in RPA Desktop Design Studio.

Ensure that at least one website or application is open or active on both the Microsoft Edge and the Google Chrome browsers.

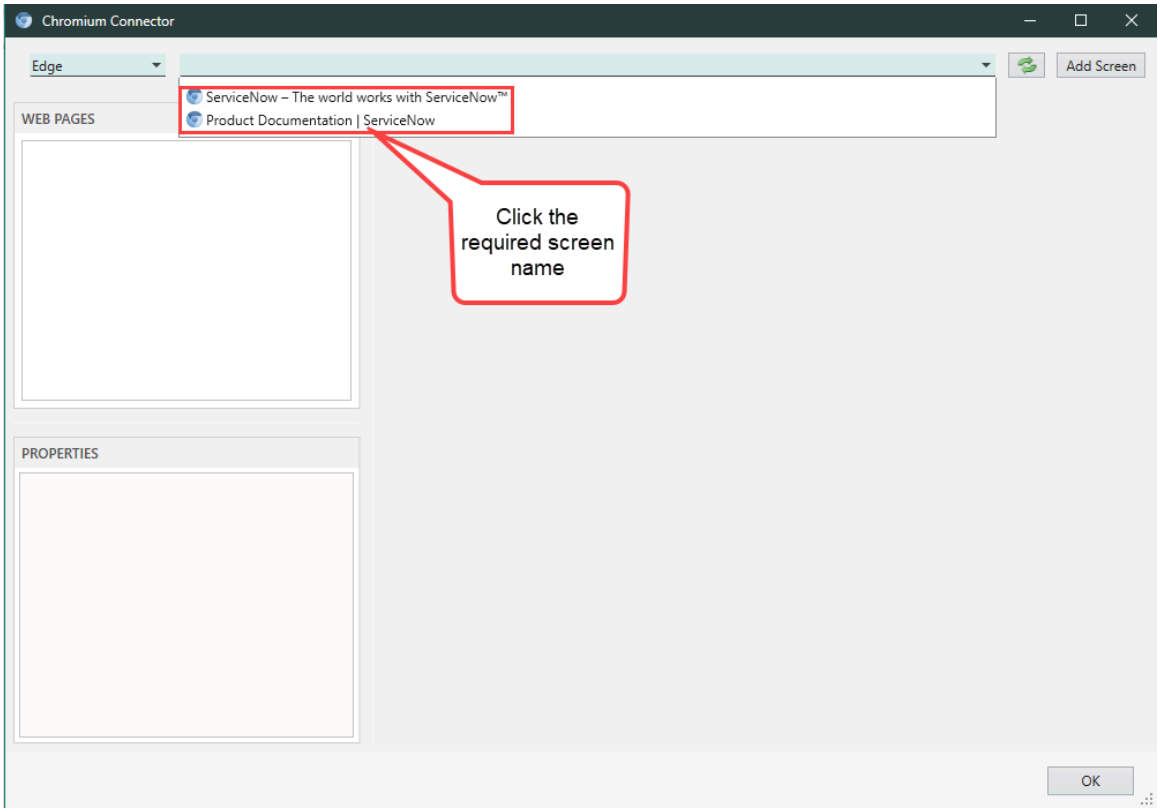
Frame set automation is not supported when using the Chromium connector (Google Chrome/Microsoft Edge).

Role required: none

Procedure

1. Navigate to **Connectors** > **Chromium Connector**.
2. Drag the Chromium connector under Global Objects in the Project Explorer pane.
3. Under the Global Objects, right-click the Chromium connector.
4. Click **Configure**.
5. In the Chromium Connector window, select **Edge** or **Chrome**.
6. To load the window, click the refresh icon ( ).
7. In the list, select the required screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Click **Add Screen**.
   The screen is captured in the WEB PAGES section.
9. Under the WEB PAGES section, right-click the name of the web page.
10. Click **Capture Element**.
11. Use the context dialog to capture the elements.
    To use the context dialog, see Use the Capture element dialog.

Use the Capture element dialog

Identify and capture the elements on a web-based, Java, or Windows application screen by using the Capture element dialog.

Before you begin

The Capture element dialog is available in the following connectors:

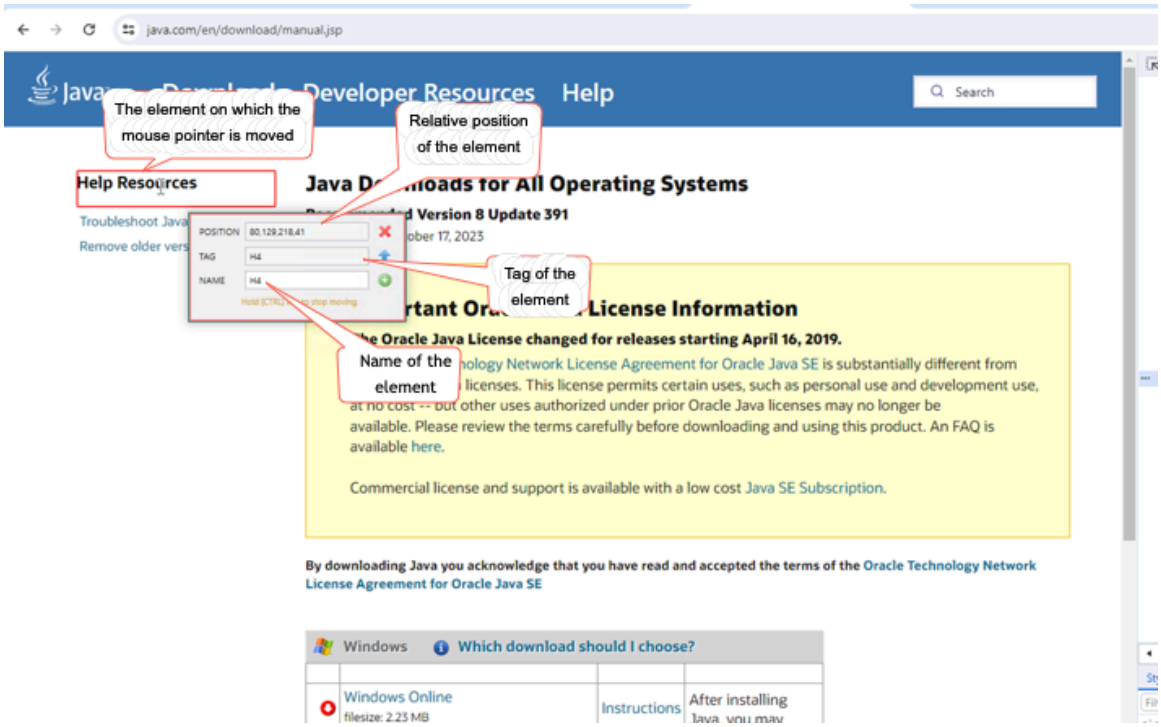
- Java
- Chromium
- IE
- Windows
- Universal App Connector

Role required: none

Procedure

1. Move the mouse device to the element that you want to capture.
   The Capture element dialog shows information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
By default, the name of the element appears in the **Name** field of the Capture element dialog. If the name of the element is not available, its Id appears in the **Name** field. Otherwise, the element type appears in the **Name** field.

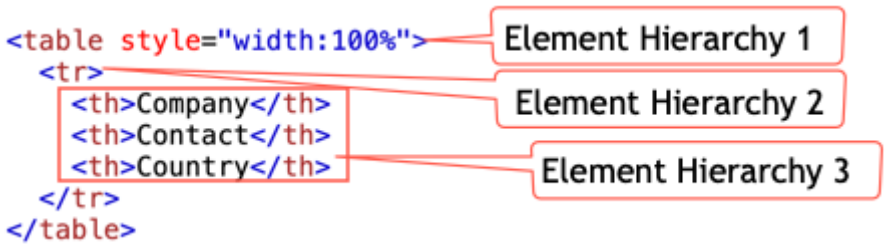
2. To capture the element, select the Add element icon ( ).

Note:

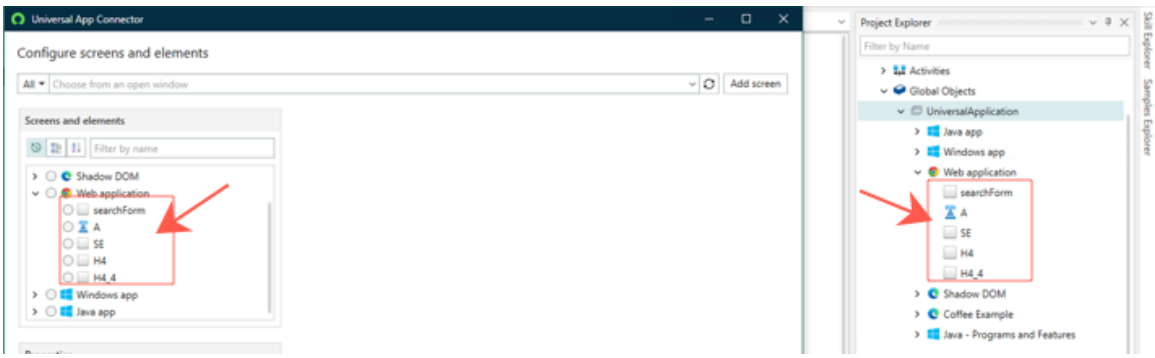
- To prevent the Capture element dialog from moving after you have moved the mouse pointer over the screen element you want to capture, press the CTRL key.
- You can optionally provide a custom name to the element in the **NAME** field. In that case, the element is captured with the custom name in both the **Screens and elements** pane and under the Connector object in the Global Objects. Else, it's captured with the default name the target application provides.
- If you capture the same element multiple times, the Capture Dialog provides a unique name to each instance of the element. For example, if you capture an H4 element three times, its naming convention can be like H4, H4_1, and H4_2.

3. **Optional:** To capture elements that are higher in the hierarchy of the current element, select the move to parent element icon ( ).
For example, the elements in an HTML table elements appear in a hierarchical order. The `table` element is the highest and `th` is lowest. If you try to capture an HTML table elements, the Capture element dialog will move from `th` to `tr` to the `table` element. The image shows the hierarchy of elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. **Optional:** To capture more elements, move the mouse pointer over other elements and repeat the previous steps.
5. To close the Capture element dialog, select the close Capture element dialog icon .
   The captured elements appear in both the **Screens and elements** pane and under the Connector object in the Global Objects.



Chromium connector methods

The Chromium connector methods do different tasks on the applications, screens, and the elements on the screens of the Google Chrome and the Microsoft Edge browsers.

Returns the title of the web page captured.

GetTitle method parameter

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
Return	Returns the title of the web page captured.	Data out	String	No default value	Not applicable

GetURL

Returns the URL of the web page that was captured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetURL method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
Return	Returns the URL of the web page that was captured.	Data out	String	No default value	Not applicable

GetValueByXPath

Returns the value within an XML node from the specified XML path.

To provide inputs to the fields see Configure port properties.

GetValueByXPath method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
XPath	XPath of the web page captured.	Data In	String	No default value	No
Return	Returns the value from the XML node.	Data out	String	Not applicable	Not applicable

IsCreated

Returns the Boolean value based on whether the screen is rendered successfully on the web application.

To provide inputs to the fields see Configure port properties.

IsCreated method parameters

Parameter	Description	Data Port type	Data type	Default type	Mandatory?	Notes
MatchAllChildren	If True, before the screen is rendered, the method attempts to match all captured elements. Else, if False, no match is done.	Data In	Boolean	No default value	No	You can find the captured elements in the MATCH CHILDREN section of the Chromium Connector window.
Return	If True, the screen is rendered successfully.	Data out	Boolean	Not applicable	Not applicable	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IsCreated method parameters (continued)

Parameter	Description	Data Port type	Data type	Default type	Mandatory?	Notes
	Else, if False, the screen has failed to render successfully.					

Element level methods

Click

Performs a click operation on the element.

Focus

Sets the focus on the element.

To provide inputs to the fields see Configure port properties.

Focus method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
scrollIntoView	If True, the method uses the scrollbar to navigate to the captured element on the web page. Else, if False, it doesn't scroll to the captured element.	Data In	Boolean	No default value	No
Return	If True, the method sets focus on the element. Else, if False, the method has failed to set focus on the element.	Data Out	Boolean	Not applicable	Not applicable

GetInnerHTML

Returns the inner HTML of the captured element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetInnerHTML method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
Return	Returns the inner HTML of the captured element.	Data Out	String	No default type	Not applicable

GetInnerText

Returns the inner text in the captured element.

GetInnerText method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
Return	Returns the inner text in the captured element.	Data Out	String	Not applicable	Not applicable

GetOuterHTML

Returns the HTML element and its attributes, start, and end tags of the captured element.

GetOuterHTML method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
Return	Returns the outer HTML of the captured element.	Data out	String	No default value	Not applicable

GetOuterText

Returns the text content of the captured element.

GetOuterText method parameters

Parameter	Description	Data Port Type	Data type	Default value	Mandatory?
Return	Returns the text content of the captured element.	Data out	String	No default value	Not applicable

IsCreated

Returns the Boolean status of whether the captured element has loaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IsCreated method parameter

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
Return	If True, the captured element has loaded. Else, if False, the captured element has failed to load.	Data out	Boolean	No default value	Not applicable

SetPassword

Automate entering password securely in the password field of a web-based application, for example securely enter password in the password field of a login form.

To provide inputs to the fields see Configure port properties.

SetPassword method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?	Notes
Password	Accepts the password as a secured string.	Data In	Secured string	None	Yes	Since it accepts the password as a secured string, it only shows the length of the string when you right-click on the parameter and then click **Preview Data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetPassword method parameters (continued)

Parameter	Description	Data Port type	Data type	Default value	Mandatory?	Notes
UseSendKeys	SendKeys is a method used to send keyboard inputs such as characters, numbers, and symbols to text boxes inside an application.	Data In	Boolean	False	Yes	**Tip:** If the **SetPassword** method fails to input the password in the password field, set the value to **True** and execute the method again.

SendKeys

Passes shortcut keys to the captured element.

To provide inputs to the fields see Configure port properties.

SendKeys method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
Keys	Takes the shortcut keys.	Data In	String	No default value	No
ClearExistingValue	If True, the method clears any existing value in the field. Else, if False, it doesn't clear the existing value.	Data In	Boolean	No default value	No
TypeDelay	Sets the typing delay between each key.	Data In	Double	No default value	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetInstanceCount

Returns a count of the number of instances where the element is available.

GetOuterHTML

Gets the outer HTML of the captured element.

SendKeys

Simulates keystrokes on web pages and windows.

Inputs

ClearExistingValue

TypeDelay

SimulateMouseEvent

Simulates the mouse event you specify on an element on a web-based application. For example, simulate a right mouse-click on an element.

> **Important:**
> To simulate a mouse event on an element, it must already have that specific event defined in the web page HTML. For example, to simulate the `contextmenu` event on an element, the element must already have the `contextmenu` event defined in the HTML.

To provide inputs to the fields see Configure port properties

SimulateMouseEvent method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?	Notes
MouseEvent	Mouse event that occurs on the captured web page element. At the time of the mouse event occurring on a web page element, that element must already have the mouse event defined in the HTML.	Data In	MouseEventType	click	Yes	The method supports these mouse events. • click • dblclick • mousedown • mouseup • mouseover • mousemove • mouseout • contextmenu

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SimulateMouseEvent method parameters (continued)

Parameter	Description	Data Port type	Data type	Default value	Mandatory?	Notes
MouseButton	Simulates the mouse button click on the captured web page element.	Data In	MouseButtonType	Left	Yes	The method supports these mouse button actions. • left • middle • right

SimulateEvent

Simulates the HTML event that you specify on a Google Chrome page or an element on the page.

To provide inputs to the fields see Configure port properties

SimulateEvent method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
EventName	Name of the HTML event. The method supports the events provided and you must enter the name of the event exactly as specified. HTML events • load • unload • abort • error • select • change • submit • reset • focus • blur	Data In	String	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SimulateEvent method parameters (continued)

Parameter	Description	Data Port type	Data type	Default value	Mandatory?
	• resize • scroll				

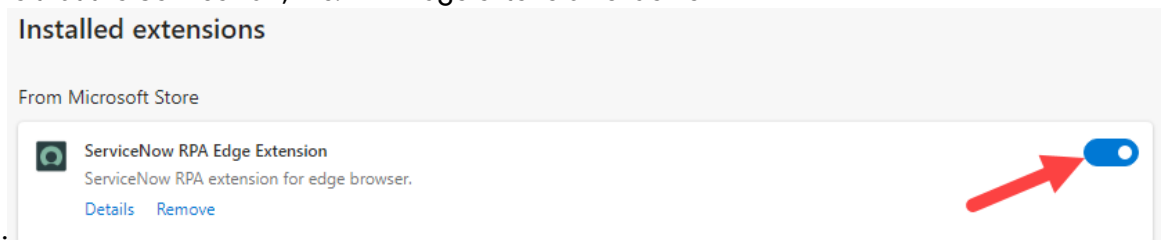
Add the ServiceNow RPA Edge extension

Add the ServiceNow RPA Edge extension to your Edge browser to enable the Chromium connector to interact with the elements on the web applications that are opened in this browser.

Before you begin
Role required: none

Procedure

1. Navigate to https://microsoftedge.microsoft.com/addons/detail/servicenow-rpa-edge-exten/cdbeoliogepmegmacldfbklgboifhkhg.
2. Click **Get**.
3. In the Add " ServiceNow, Inc. RPA Edge Extension" to Microsoft Edge dialog box, click **Add extension**.
4. To verify if the extension is added, do the following actions:
   a. Open the Edge browser.
   b. On the top-right corner, click the three dots icon (···).
   c. Click **Extensions**.
   d. In the Extensions pop-up window, click **Manage extensions**.
   e. Make sure that the ServiceNow, Inc. RPA Edge extension slider is enabled.



Counter

The Counter connector increments or decrements integers as part of an automation Workflow in RPA Desktop Design Studio.

- To use the Counter connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Counter connector methods

The Counter connector methods increment, decrement, or reset integers as part of an automation Workflow in RPA Desktop Design Studio. All methods have properties that you can update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Up

Increments an integer by the value that you specify.

To provide input, see Configure port properties.

Up method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Value	Custom integer value	Data In	Integer	1	Yes

To view or update the properties, see Counter method properties.

Down

Decrements an integer by the value that you specify. The default integer is 1.

To provide input, see Configure port properties.

Up method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory
Value	Custom integer value	Data In	Integer	1	Yes

To view or update the properties, see Counter method properties.

Value

Returns the value after incrementing or decrementing an integer in the Up or Down methods.

Note:
You must execute the Up or Down method before executing the Value method.

Up method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory
Return	Incremented or decremented value	Data Out	Integer	0	Yes

To update the properties, see Counter method properties.

Reset

Resets the current value in the Value method to `null`.

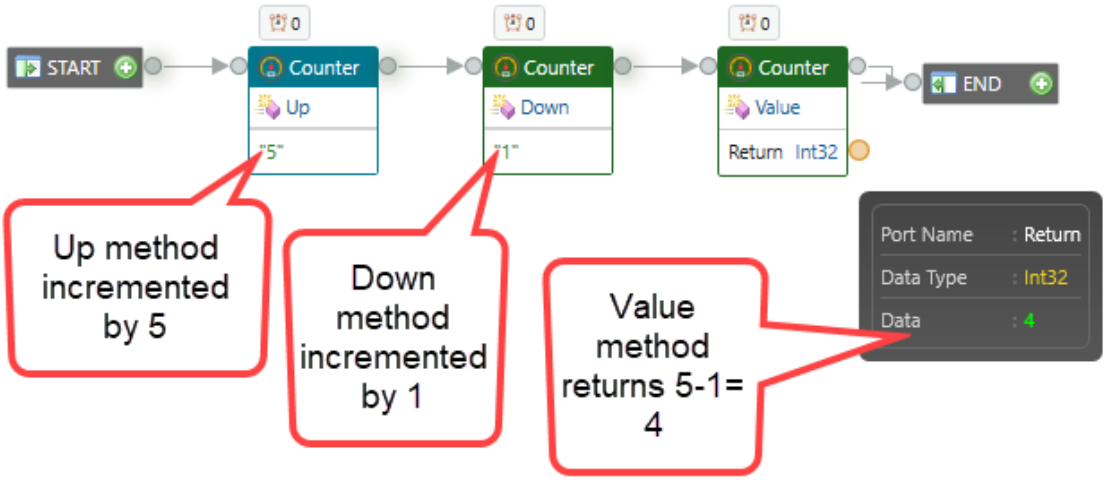
Note:
You must execute the Reset method after executing the Value method.

To view or update the properties, see Counter method properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

The following example shows the use of the Counter connector



methods.

Counter method properties

View or update the Counter method properties.

Counter method properties

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

C#.Net

The C#.Net connector enables you to create and execute custom C#.Net scripts by setting custom classes and methods and include them as part of an automation in the RPA Desktop Design Studio.

- To install the C#.Net connector, see Manage plugins in RPA Desktop Design Studio.
- To use the C#.Net connector, see Use a connector in RPA Desktop Design Studio.
- To configure the C#.Net connector, see Configure the C#.Net connector.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Configure the C#.Net connector

Write and validate custom C#.Net scripts and execute them as part of your automation by using the C#.Net connector in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

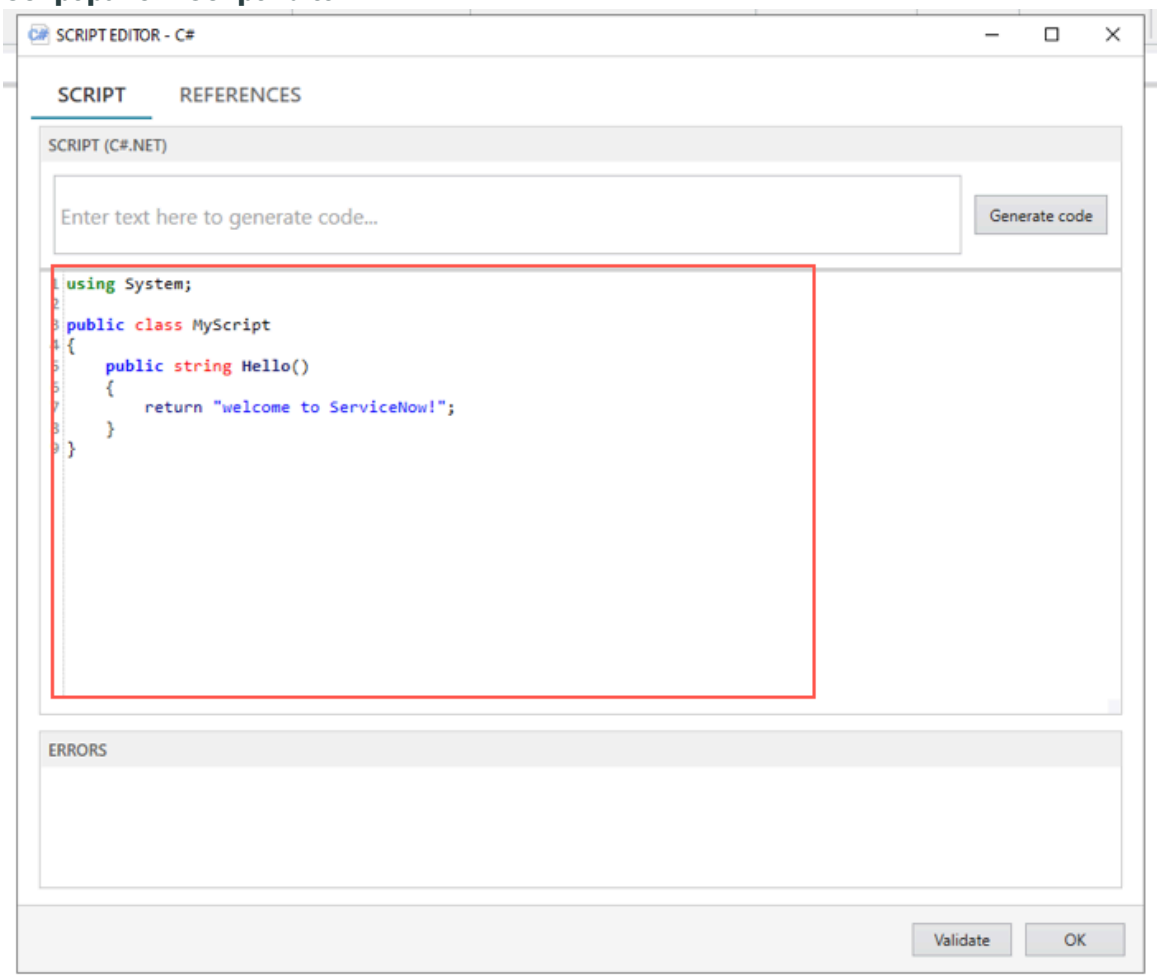
Ensure you have installed the Scripting plugin on the RPA Desktop Design Studio. To install, see Manage plugins in RPA Desktop Design Studio.

Role required: Developer

Procedure

1. In the Toolbox pane, navigate to **Connectors** > **C#.NET**.
2. Drag the C#.Net connector to **Global Objects** in the Project Explorer pane.
3. Right-click the C#.Net connector in **Global Objects** and select **Configure**.
   The Script Editor window is displayed.
4. Enter the custom script in the Script pane.

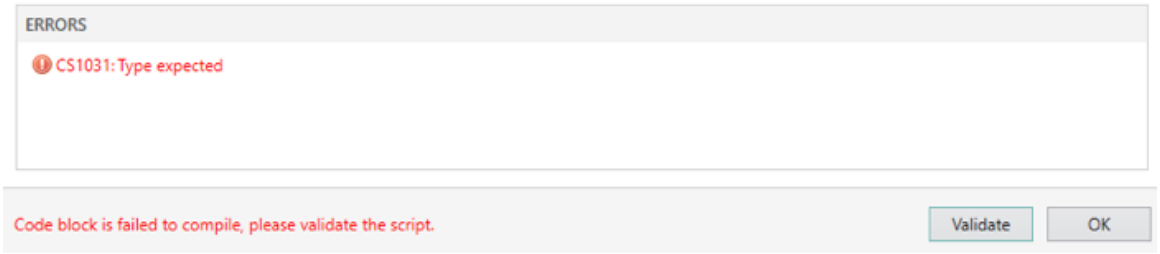
Script pane in Script Editor



5. **Optional:** Select **Add Reference** from the **References** tab section if you want to add Dynamic-link library (DLL) references to your custom script.
   You can select the references from the Reference Manager window and also from your computer.
6. Select **Validate**.
   If your custom script has any errors, it is displayed in the Errors pane. Resolve the errors and select **Validate** to check for errors again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error pane for Script Editor



7. Click **OK**.
   If you want to save the changes, select **Yes**. An error validation is performed again and the changes are saved. If you want to discard the changes, select **No**.

What to do next

The custom script you created by using the C#.Net connector is now ready to be used in your automation.

C# connector methods

The C# connector method enables you to execute the custom C# scripts you had written while configuring the C#.Net connector.

Execute

Executes C# scripts set up in the configuration window. Before executing the method, you must configure the connector. See Configure the C#.Net connector.

To execute, do the following steps.

1. Click the method settings icon ( ).
2. From the **Classes** list, select the class defined during the configuration of the C#.NET connector.
3. From the **Methods** list, select the method defined during the configuration of the C#.NET connector.
4. Click **OK**.

   A Data Out port is created to return the output.
5. To test the method, under the **DESIGN** tab, click **Run**.

Execute method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory
Result	Returns the output of the script.	Data Out	String	Not applicable	Not applicable

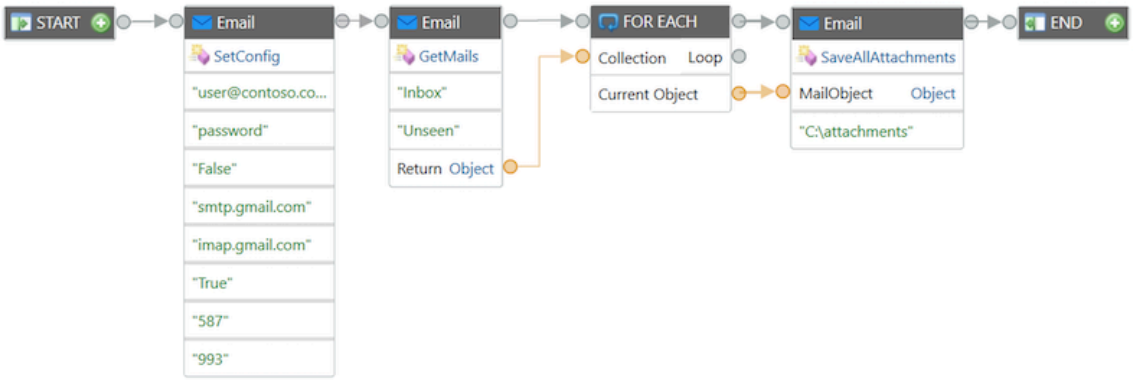
Email connector

The Email connector lets an RPA Desktop Design Studio automation work with email. For example, an automation can send, retrieve, and reply to email messages, and can automatically download attachments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Email connector works only with IMAP mail servers, including Microsoft Outlook, Yahoo! Mail, and many others. It is not possible to access Gmail at this time.

Example automation using the Email connector



In this example automation, the SetConfig method of the Email connector logs in to the mail server using the account holder's credentials. The GetMail method then retrieves all the unread messages from the inbox of the account. By using a For Each loop, the automation iterates through the retrieved messages and saves each message's attachments to a specified location on the local drive.

- For information about using connectors in RPA Desktop Design Studio, see Use a connector in RPA Desktop Design Studio.
- For information about making connector methods visible in RPA Desktop Design Studio, see Use connector method.
- To learn how to use connector methods, see Use a component in RPA Desktop Design Studio.

Email connector methods

The methods in the Email connector retrieve, send, and reply to email messages, and can download attachments. Use the SetConfig method first to set up the connection to your mail server.

Use the SetConfig method to configure the mail server properties and access credentials. This method must precede all the other Email connector methods in the automation.

The GetMails method retrieves messages from the mail server and passes them to other methods as an object that contains one or more messages. The ReadMail, ReplyMail, and SaveAllAttachments methods operate on a single message at a time. When these methods receive an object that contains more than one message, the automation must use a For Each or For Loop method to iterate each message in the collection.

- For information about how to use the For Each method, see Use the For Each component.
- For information about how to use the For Loop method, see Use the For Loop component.

SetConfig

Sets up the connection to the mail server so that the automation can work with messages.

Note:
You must run this method before running any other methods in the Email connector.

For information about how to set the parameters, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetConfig method parameters

Parameter	Description	Data port type	Data type	Default value	Required?	Notes
Username	User name to log in to the mail server	Data In	String	(none)	Yes	
Password	Password to log in to the mail server	Data In	String	(none)	Yes	
UseDefaultCredentials	Use the default credentials of the currently logged-in user to the SMTP server.	Data In	Boolean	False	No	
SmtpMailServer	Name of the SMTP server	Data In	String	smtp.gmail.com	No	Access to Gmail by using the Email connector is not currently supported. Make sure to change the default value.
ImapMailServer	Name of the IMAP server	Data In	String	imap.gmail.com	No	Access to Gmail by using the Email connector is not currently supported. Make sure to change the default value.
SSL	Use the Secure Socket Layer protocol	Data In	Boolean	True	No	
SmtpPort	SMTP port number	Data In	Integer	587	No	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetConfig method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Required?	Notes
ImapPort	IMAP port number	Data In	Integer	993	No	

GetMails

Returns messages from the mail server for use by other methods. You can set the method to retrieve either read (seen) or unread (unseen) messages and specify the folder that they're gathered.

For information about how to set the parameters, see Configure port properties.

GetMails method parameters

Parameter	Description	Data port type	Data type	Default value	Required?	Notes
FolderName	Name of the IMAP folder that the method fetches the collection (for example, **Inbox**)	Data in	String	Inbox	Yes	To specify a nested IMAP folder, enter the folder hierarchy by using backslashes (for example, Project \Meetings)
Filter	Set to get only unread (**Unseen**) or read (**Seen**) messages	Data in	FilterMode	Unseen	Yes	
Return	Returns the mail collection as an object	Data out	Object	Object	Yes	

MarkAsRead

Marks messages from a specified folder as read.

For information about how to set the parameters, see Configure port properties.

MarkAsRead method parameters

Parameter	Description	Port type	Data type	Default value	Required?	Notes
MailObject	The email object	Data in	Object	Object	Yes	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MarkAsRead method parameters (continued)

Parameter	Description	Port type	Data type	Default value	Required?	Notes
	based on which the corresponding message is marked as read					
FolderName	Name of the IMAP folder that the email object is fetched	Data in	String	Inbox	Yes	To specify a nested IMAP folder, enter the folder hierarchy by using backslashes (for example, Project \Meetings)

MarkAsUnread

Marks messages from a specified folder as unread.

For information about how to set the parameters, see Configure port properties.

MarkAsRead method parameters

Parameter	Description	Port type	Data type	Default value	Required?	Notes
MailObject	The email object based on the corresponding email that is marked as unread.	Data in	Object	Object	Yes	
FolderName	Name of the IMAP folder that the email object is fetched.	Data in	String	Inbox	Yes	To specify a nested IMAP folder, enter the folder hierarchy by using backslashes (for example, Project \Meetings)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ReadMail

Reads a message and returns its details, including subject, body, sender (from), recipients in the CC field, recipients in the BCC field, and the number of attachments.

For information about how to set the parameters, see Configure port properties.

ReadMail method parameters

Parameter	Description	Data port type	Data type	Default value	Required?
MailObject	MailObject that gives the details of the last message received	Data in	Object	Object	Yes
Subject	Subject of the message	Data out	String	None	No
Body	Body of the message	Data out	String	None	No
Sender	Sender of the message	Data out	String	None	No
CC	Recipients marked in CC	Data out	String	None	No
BCC	Recipients marked in BCC	Data out	String	None	No
AttachmentsCount	Number of attachments in the message	Data out	Integer	None	No

ReplyMail

Automatically replies to a message. Use the parameters to set the body of the message and other details. You can include attachments.

For information about how to set the parameters, see Configure port properties.

ReplyMail method parameters

Parameter	Description	Data port type	Data type	Default value	Required?	Notes
MailObject	Message object containing the message details	Data in	Object	Object	Yes	
ReplyToAll	Replies to all recipients	Data in	Boolean	False	No	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ReplyMail method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Required?	Notes
	in the To and CC fields of the message					
BCC	Replies to all recipients in the BCC field of the message	Data in	String	None	No	
Body	Body of the reply message	Data in	String	None	No	
IsHtmlBody	Option to indicate whether the reply body is in HTML format	Data in	Boolean	False	No	
Attachments	Attachments to the reply message	Data in	String	None	No	To attach a file: 1. Paste the path to the file in the field. 2. Remove the quotes enclosing the path. To include multiple attachments, separate the paths by commas.

SaveAllAttachments

Saves all attachments from a message to the local drive.

For information about how to set the parameters, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SaveAllAttachments method parameters

Parameter	Description	Data port type	Data type	Default value	Required?
MailObject	Message that the method downloads the attachments from	Data In	Object	Object	Yes
FolderPath	Path of the directory to which the attachments are downloaded	Data In	String	None	Yes

SendMail

Sends a message. Use the parameters to set the body of the message and other details. You can include attachments.

Note:
Use the SetConfig method to set the From address.

For information about how to set the parameters, see Configure port properties.

SendMail method parameters

Parameter	Description	Data port type	Data type	Default value	Required?	Notes
ToAddress	Address to which to send the message	Data in	String	None	Yes	
CC	Addresses to include in the CC field	Data in	String	None	No	
BCC	Addresses to include in the BCC field	Data in	String	None	No	
Subject	Message subject	Data in	String	None	No	
Body	Message body	Data in	String	None	No	
IsHtmlBody	Option to indicate whether the reply body is in HTML format	Data in	String	False	No	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SendMail method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Required?	Notes
Attachments	Message attachments	Data in	String	None	No	To attach a file: 1. Paste the path to the file in the field. 2. Remove the quotes enclosing the path. To include multiple attachments, separate the paths by commas.

Email method properties

The following properties can be set for each of the Email connector methods. To set the properties, double-click a method and enter the values in the *Properties* pane.

Email method properties

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Eventlog

The Eventlog connector listens from different sources and writes events and custom messages to the Microsoft Event Viewer.

The Eventlog connector provides methods and events to listen and write events and messages to the Microsoft Event Viewer and a method to unsubscribe to events.

- To use the Eventlog connector and event, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EventLog connector event and methods

The Eventlog connector provides methods and an event to listen to events from sources and write them to the Microsoft Event Viewer as part of an automation. The methods and events have properties that you can update.

OnEntryWritten

This is a predefined event that occurs when an entry is written to the event log of your local computer.

Event output

Type

Source

Message

Write

Writes a warning, information, or error to the Microsoft Event Viewer, which includes a message and the source of the event.

Inputs

Type

Source

Message

Dispose

When you execute the Write method, an object to the Microsoft Event Viewer is written and a connection is established with the RPA Desktop Design Studio. When you connect the Dispose method with the Write method, the object is disconnected.

ListenEvents

Listens to the events that are specified in the OnEntryWritten event.

UnsubscribeToEvents

Discontinues listening to the events from the OnEntryWritten event.

OnEntryWritten

Provides as outputs the event type, descriptive message, and the source of the event.

Parameters of the EventLog connector methods

Learn about the parameters of the EventLog connector methods in RPA Desktop Design Studio.

Parameters of the Eventlog connector methods

Parameter name	Description	Mandatory?
Type	Type of events that can be logged. All events have defined common information	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the Eventlog connector methods (continued)

Parameter name	Description	Mandatory?
	and can include event-specific data. Three types of information are written: • Information • Error • Warning	
Message	Descriptive message for each event that is logged in the Microsoft Event Viewer.	Yes
Source	The name of the software that logs the event.	Yes

Enter inputs for parameters

To enter inputs for the parameters, see Configure port properties.

FTP

The FTP connector enables you to perform various actions on FTP servers. For example, you can upload or download files from an FTP server. The connector provides multiple methods that perform these actions as part of an automation in the RPA Desktop Design Studio.

Add the FTP plugin from the Plugins Manager before using the connector. For more information about adding the SSH plugin, see Manage plugins in RPA Desktop Design Studio.

To use the FTP connector, see Use a connector in RPA Desktop Design Studio.

To use the methods in the FTP connector, see Use connector method.

To expose the methods, see Use connector method.

To use the methods, see Use a component in RPA Desktop Design Studio.

FTP connector methods

The FTP connector methods perform various actions on the File Transfer Protocol server as part of an automation. To enable the methods, you must provide appropriate parameters.

SetConfiguration

Sets the File Transfer Protocol server access details. You must execute this method first.

To provide inputs to the parameters, see Configure port properties.

SetConfiguration method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Url	URL of the File Transfer Protocol	Data in	String	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetConfiguration method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Username	Username to access the File Transfer Protocol server.	Data in	String	None	Yes
Password	Password to access the File Transfer Protocol server.	Data in	String	None	Yes

CreateFolder

Creates a folder on the File Transfer Protocol server.

To provide inputs to the parameters, see Configure port properties.

CreateFolder method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
FolderName	Path in the File Transfer Protocol server where the folder will be created with the folder name.	Data in	String	None	Yes
Return	Returns True if the folder is created, else, returns False.	Data out	Boolean	None	Not applicable

DeleteFile

Deletes a file in the FTP server.

To provide inputs to the parameters, see Configure port properties.

DeleteFile method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
RemoteFilePath	Path to the file you want to remove in the File Transfer Protocol server.	Data in	String	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DeleteFile method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns True if the file is deleted, else, returns False.	Data out	Boolean	Not applicable	Not applicable

DeleteFolder

Deletes the specified folder in the File Transfer Protocol server.

To provide inputs to the parameters, see Configure port properties.

DeleteFolder method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
RemoteFolderPath	Path to the folder in the File Transfer Protocol server including the folder name.	Data in	String	None	Yes
Return	Returns True if the folder is deleted, else, returns False.	Data out	Boolean	Not applicable	Not applicable

DownloadFile

Downloads a file from the File Transfer Protocol server to the local drive.

To provide inputs to the parameters, see Configure port properties.

DownloadFile method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
RemoteFile	Path to the file in the File Transfer Protocol and the name of the file.	Data in	String	None	Yes
LocalFile	Path in the local drive where the file will be downloaded.	Data in	String	None	Yes
TimeOut	Time after which the request to the	Data in	Integer	None	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DownloadFile method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Mandatory?
	File Transfer Protocol server times out.				
Return	Returns True if the file is downloaded, else, returns False.	Data out	Boolean	None	Not applicable

DownloadFolder

Downloads a folder from the File Transfer Protocol server to the local drive.

To provide inputs to the parameters, see Configure port properties.

DownloadFolder method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
RemoteFolderPath	Path to the folder in the File Transfer Protocol and the name of the folder.	Data in	String	None	Yes
LocalFolderPath	Path in the local drive where the folder will be downloaded.	Data in	String	None	Yes
TimeOut	Time after which the request to the File Transfer Protocol server times out.	Data in	Integer	None	No
Return	Returns True if the folder is downloaded, else, returns False.	Data out	Boolean	None	Not applicable

GetFileList

Returns the list of files in a folder in the File Transfer Protocol server.

To provide inputs to the parameters, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetFileList method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
RemoteFolderPath	Path to the folder in the File Transfer Protocol and the name of the folder.	Data in	String	None	Yes
Return	Returns the list of files in the folder.	Data out	String	Not applicable	Not applicable

RenameFile

Renames a file in the File Transfer Protocol server.

To provide inputs to the parameters, see Configure port properties.

RenameFile method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
RemoteFilePath	Path to the file in the File Transfer Protocol server and the name of the file.	Data in	String	None	Yes
NewNameofFile	Path to the file in the File Transfer Protocol server and the new name of the file.	Data in	String	None	Yes
Return	Returns True if the name of the file is changed, else, it returns False.	Data out	Boolean	Not applicable	Not applicable

RenameFolder

Renames a folder in the File Transfer Protocol server.

To provide inputs to the parameters, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RenameFolder method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
RemoteFolder	Path to the folder in the File Transfer Protocol server and the name of the folder.	Data in	String	None	Yes
NewNameofFolder	Path to the folder in the File Transfer Protocol server and the new name of the folder.	Data in	String	None	Yes
Return	Returns True if the name of the folder is changed, else, it returns False.	Data out	Boolean	Not applicable	Not applicable

UploadFile

Uploads a file from the local drive to the File Transfer Protocol server.

To provide inputs to the parameters, see Configure port properties.

UploadFile method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
LocalFilePath	Path to the file in the local drive.	Data in	String	None	Yes
RemoteFilePath	Path to the location in the File Transfer Protocol server.	Data in	String	None	Yes
Return	Returns True if the file is uploaded, else, returns False.	Data out	Boolean	Not applicable	Not applicable

UploadFolder

Uploads a folder from the local drive to the File Transfer Protocol server.

To provide inputs to the parameters, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UploadFolder method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
LocalFolderPath	Path to the folder in the local drive.	Data in	String	None	Yes
RemoteFolderPath	Path to the location in the File Transfer Protocol server.	Data in	String	None	Yes
Return	Returns True if the folder is uploaded, else, returns False.	Data out	Boolean	Not applicable	Not applicable

FTP method properties

View or update the FTP method properties.

FTP method properties

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

IdleTimer connector

The IdleTimer connector sets, starts and ends an idle time within an attended automation.

You must first use and then expose the methods in the IdleTimer connector to use its methods.

- To use the connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

IdleTimer connector methods and events

Learn about the IdleTimer connector methods and events.

Start method

Sets the maximum idle time in seconds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Start method parameters

Parameter name	Port type	Data type	Description	Mandatory?
MaxIdleTime	Data In	Integer	Maximum idle time in seconds.	Yes

Stop method

Stops the timer.

OnIdleStart

Triggers the automation when the Start method is executed.

OnIdleStop

Stops the automation when the Start method is executed.

IE connector

The Internet Explorer (IE) connector enables you to perform various actions on the IE browser, applications, and their screen elements on the browser. For example, you can execute a method to open a website. You perform the actions through the methods.

You must first use, configure, and then expose the methods in the IE connector to use its methods.

- To use the IE connector, see Use a connector in RPA Desktop Design Studio.
- To configure the IE connector, see Configure the Internet Explorer connector.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

IE connector methods are available at the following levels:

- Connector
- Screen
- Element

Types of IE connector methods

Method level	Description
Connector	These methods can open a website on the IE browser. It sets up the browser and application for the other methods to execute.
Screen	These methods perform various actions on the screens you have configured. For example, click a button.
Element	These methods perform various tasks on the various elements on the screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Automation support for frameset-based pages isn't available through the Chromium connector.

Configure the Internet Explorer connector

Access the IE connector methods at all levels by configuring the IE connector. When you configure the IE connector, you capture a screen and its elements.

Before you begin

Add the Internet Explorer plugin from the Plugins Manager. For more information about adding the SSH plugin, see Manage plugins in RPA Desktop Design Studio.

Ensure that at least a website or an application on the Internet Explorer browser window is open or active.

Role required: none

Procedure

1. Navigate to **Connectors** > **IE Connector**.
2. Drag the IE Connector under Global Objects in the Project Explorer pane.
3. Under the Global Objects, right-click the IE connector.
4. Click **Configure**.
5. In the AVAILABLE WEB PAGES list, select the required web page.

   Tip:
   If the window doesn't appear in the list, click the refresh icon ( ).

6. Click **Add Screen**.
   The web page appears under the WEB PAGES section.
7. Under the WEB PAGES section, right-click the name of the web page.
   The screen is captured.
8. Click **Capture Element**.
   For more information on the context dialog, see Use the Capture element dialog.
9. Move the mouse device over the web page to capture the element.
   As the mouse device moves over the web page, the context dialog displays the following information of each element it passes.
   - POSITION: Position of the element in the web page.
   - TAG: Name of the element tag.
   - NAME: Custom name of the element that the user enters. This field is used when an element is captured.

   
   As you place the mouse device over an element, a red boundary icon ( ) indicates the element.
10. In the context window, enter a custom name of the element in the **NAME** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
To stop the context window from moving, press and hold the **Ctrl** key.

11. To add the custom name, click the add name icon ( ).
The element is captured.
12. To close the context window, click the close icon ( ).
Methods at the connector, application, and element levels are captured.
13. To view the methods at the connector, application, and element levels, double-click the required connector level under the Global Objects in the Project Explorer pane.
14. Repeat the steps to capture multiple elements.

IE Connector methods

The IE connector methods perform different tasks on the IE connector, screens, and the elements on the screens. The methods are available at the connector, screen, and the element levels and you can expose the methods by completing appropriate steps.

IE connector method levels

Connector level methods

Screen level methods

Element level methods

Connector level methods

Navigate

Opens a web page based on the URL you specify and returns the Boolean response.

Input

URL

Output

Return (Boolean)

WaitForAnyScreen

The method executes a wait period before a screen loads up. You can specify a timeout after which the method times out the request.

Input

MatchAllChildren

Timeout

Screen level methods

DownloadFile

Downloads a file from the screen or web page based on the URL and file name you specify.

Input

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Url

fileName

Output

Return (Boolean)

ExecuteJavaScript

Executes custom JavaScript on an application or website open on the IE browser. You must configure the method before executing.

To configure the JavaScript, do the following steps.

1. Click the method settings icon ( ).
2. Enter the custom script under the JAVA SCRIPT section.
3. To add parameter to the script, click the add parameter icon ( ) under the PARAMETER heading.

   Note:
   A Data In port is added with each parameter.

4. Click **OK**.

Input

Parameter

Output

Return (Object)

GetValueByXPath

Converts an XPath and returns the output as a string.

Input

XPath (String)

Output

Return (String)

GetValuesByXPath

Returns the values within columns based on the specified XPath expression.

Input

You must configure the XPath expressions before executing the method. To configure, do the following steps.

1. Click the method settings icon ( ).
2. Update the name of the column.
3. Define the XPath expression.
4. Click **OK**.

Output

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns the data table after the operation.

Hide

Hides the active browser window.

Restore

Restores the browser window hidden using the Hide method.

GetURL

Returns the URL of the website or web page.

Output

Return (String)

WaitForCreate

Sets a delay before a web page or a window loads.

Inputs

timeoutInSeconds

MatchAllChildren

Outputs

Return (Boolean)

SetFields

Sets the data in form field types.

SendKeys

Simulates the keystrokes on web pages and windows.

Inputs

Keys

MatchAllChildren

TypeDelay

Minimize

Minimizes the window.

Maximize

Maximizes the window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IsReady

Returns the Boolean response to the request to check whether the website is ready to accept requests from methods.

Output

Return (Boolean)

MatchChildren

Matches all elements of a web page that you have captured and returns a Boolean response accordingly. You can configure whether the method should match all children.

Input

matchAllChildren

Output

Return (Boolean)

IsCreated

Returns the Boolean response to the request to find whether a website on an Internet Explorer browser is open. You can optionally have the method check whether all captured elements of the website matches.

Inputs

MatchAllChildren

Output

Return (Boolean)

Refresh

Reloads the contents of the active web page.

SaveAs

Saves the active web page to the local disk.

Print

Prints the active web page in the browser.

Input

NoPrompt

GetPageSource

Returns the page source of the active window open on the IE browser.

Output

Return (String)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetScreenShot

Returns the screen shot of a window or area in a window.

Output

Return (Bitmap)

GetTitle

Returns the title of a window open in the IE browser.

Output

Return (String)

GetFields

Accesses data in the forms returns the data as output. You must configure the method before executing.

To configure, do the following steps.

1. Click the method settings icon ( ).
2. Select the form elements.
3. Update the form element data type.
4. Click **OK**.

Output

Form field

Focus

Sets the focus on a window that is running in the background or minimized and makes it active.

Output

Return (Boolean)

Close

Closes the active window.

Element level methods

These methods are exposed when you double-click an application element under the Global Objects in the Project Explorer.

Click

Performs a click operation on the element.

GetInnerHTML

Gets the inner HTML of the element.

Output

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Return (String)

GetInnerText

Gets the inner text of an element.

Output

Return (String)

GetOuterHTML

Gets the outer HTML of the element.

Output

Return (String)

GetURL

Gets the URL of the element.

Output

Return (String)

Parameters of the IE connector methods

Learn about the parameters of the Microsoft IE Connector (Internet Explorer) methods in RPA Desktop Design Studio.

Parameters of the IE connector methods

Parameter Name	Description	Mandatory?
MatchAllChildren	Option to indicate in Boolean values whether before loading a screen, the method will match all the captured children screens and elements with the screen. You can find the children screens and elements under the MATCH CHILDREN section of the configuration window.	No
Return (String)	Returns the value.	Not applicable
Return (String)	Returns the URL of the web page or website.	Not applicable
Return (String)	Returns the title of the web page.	Not applicable
XPath	XPath value.	Yes
Return (Bitmap)	Returns the screenshot of the web page in Bitmap format.	Not applicable
Return (Boolean)	Boolean response to the request for setting focus on a window and making it active.	Not applicable
Form fields	Returns the data in the forms.	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the IE connector methods (continued)

Parameter Name	Description	Mandatory?
Return	Returns the page source of the web page.	Not applicable
Return (Object)	Returns the output as an object after executing the JavaScript.	Not applicable
url	URL of the file to download.	Yes
fileName	Name of the file to download.	Yes
Return (Boolean)	Boolean response to the request for file download.	Not applicable
Parameter	Value of the parameter you added when configuring the method.	No
Return (Boolean)	Boolean value to indicate whether the website or screen on the IE browser is ready to accept requests from methods.	Not applicable
Timeout	Time in seconds after which the request for wait times out. The default value is 30 seconds.	No
GetOuterHTML	Returns the outer HTML in a string format,	Not applicable
Return (String)	Returns the inner HTML of the element in a string.	Not applicable
Return (String)	Returns the URL of the element in a string format.	Not applicable
Return (Boolean)	Boolean response to whether the method waited for the screen to load.	Not applicable
Keys	Gives the keys that will operate on the web page open in the browser.	Yes
GetInnerText	Returns the inner HTML of the element in a string.	Not applicable
MatchAllChildren	Boolean option to indicate whether the method will match all children elements of the web page before sending keys.	No
TypeDelay	Delay before the method sends the request.	No
timeoutInSeconds	Time indicated in seconds before the request times out.	Yes
NoPrompt	Boolean option to indicate whether a prompt is passed through the method to print the web page.	Yes
matchAllChildren	Boolean option to indicate whether the method will match all children elements of the screen.	Not applicable
Return (Boolean)	Returns the Boolean response to the request of opening a web page.	Not applicable
URL	Address of a web page to open.	Yes
Return (Boolean)	Boolean response to the request to check whether a website or screen is open on the browser.	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the IE connector methods (continued)

Parameter Name	Description	Mandatory?
Return (Boolean)	Boolean response to indicate whether all children elements were matched.	Not applicable
XPath (String)	Option to provide the XPath that the method converts to string.	Yes
Return (String)	Returns the converted XPath as a String.	Not applicable

Enter inputs for parameters

To enter inputs, see Configure port properties.

Java

The Java connector enables you to perform various actions on Java applications as part of an automation in the RPA Desktop Design Studio

Important:
Java connector uses Oracle Java Access Bridge internally to interact with applications built for Windows desktop. Any known issue or limitation published by Oracle for this library are applicable.

In the context of RPA Desktop Design Studio, a Java application has three levels- connector, screen, and element. The Java connector exposes methods at all three levels and these methods enable you to perform various actions at all three levels. For example, one method might click a minimized screen and bring it back to focus and then another method could click a button on the screen to submit data in that order.

To use the Java connector, do the following steps:

1. Use the Java connector. See Use a connector in RPA Desktop Design Studio.
2. Configure the connector. See Configure the Java connector.
3. Expose the methods. See Use connector method.
4. Use the methods. See Use a component in RPA Desktop Design Studio.

Java connector methods are available at the following levels:

- Connector
- Screen
- Element

Types of Java connector methods

Method level	Description
Connector	These methods perform various actions on the Java application. For example, you can set the working directory of the application.
Screen	These methods perform various tasks on the screen of the Java application. For example,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of Java connector methods (continued)

Method level	Description
	a method can click a minimized screen and bring it back to focus.
Element	These methods perform various tasks on the elements in the screen of the Java application. For example, a method could click a button.

Warning:
The Java connector doesn't work on machines with Java 32-bit installations.

As a workaround, copy the WindowsAccessBridge-64.dll available on the Oracle website for the particular Java version to C:\Windows\System32 folder on the target machine.

Configure the Java connector

Configure the Java connector to set up the Java application screens and elements on which the automation will be performed. After setting up, you can expose methods at the connector, screen, and element levels.

Before you begin

Ensure you have installed the Java plugin on the RPA Desktop Design Studio. To install, see Manage plugins in RPA Desktop Design Studio.

Ensure that Java is installed on the computer.

Ensure that at least one Java application window is active or open.

Role required: none

Procedure

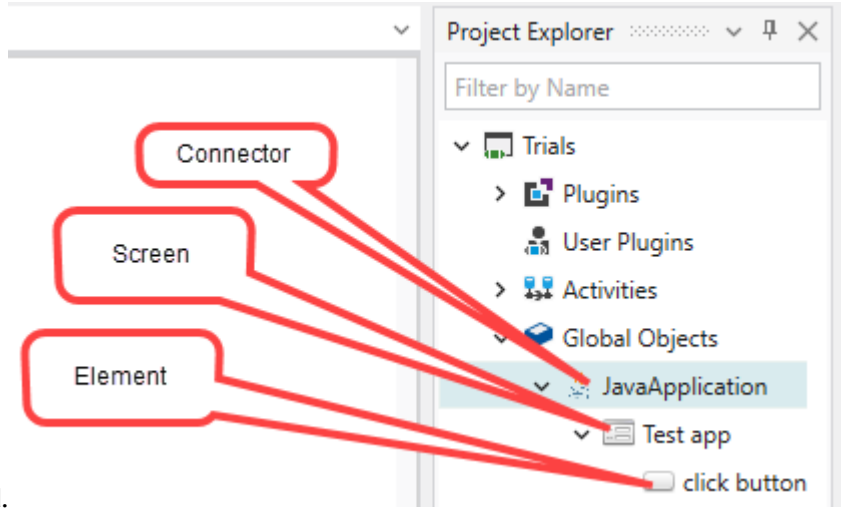
1. Navigate to **Connectors** > **Java Connector**.
2. Drag the Java connector under Global Objects in the Project Explorer pane.
3. Under Global Objects, right-click the Java connector.
4. Click **Configure**.
5. In the AVAILABLE WINDOWS list, select a Java application.

   Tip:
   If the window doesn't appear in the list, click the refresh icon ( ).

6. Click **Add Window**.
   The screen is captured under the WINDOWS section.
7. **Optional:** To add more applications, repeat the steps.
   To know more about the Java Connector window, see
8. Under the WINDOWS section, right-click the name of the window.
9. Click **Add Element**.
10. To capture elements, use the context dialog.
    To use the context dialog, see Use the Capture element dialog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. To close the Java Connector window, click **OK**.
    The connector, screen and its elements are



configured.

Java connector methods

The Java connector exposes methods at the connector, screen, and element levels. While all types of elements have common methods, they also have different methods.

Connector level methods

Start

Starts the Java application from its location and brings it to focus.

Note:
You must execute this method first.

To provide inputs to the parameters, see Configure port properties.

Start method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Path	Path to the Java application in the local drive.	Data in	String	None	Yes
Args	Arguments for the path.	Data in	String	None	No

GetMainWindowHandle

Returns the window handle of the Java application launched by the Start method.

GetMainWindowHandle method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the Window	Data out	Integer	None	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetMainWindowHandle method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Mandatory?
	handle of the application.				

GetMainWindowTitle

Returns the title of the Java application window.

GetMainWindowTitle method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the title of the window of the application.	Data out	String	None	Not applicable

CloseMainWindow

Closes the main Java application window.

Terminate

Terminates the main Java application window.

Screen level methods

Close

Closes the active Java application window.

Focus

If the Java application window is minimized or running in the background, the method restores the focus.

GetFields

Gets the data from the text fields in a Java application. You must first configure the text fields. To configure, do the following steps.

1. Configure the Java connector and capture one or more text fields.
2. Expose the screen level methods. See Use connector method.
3. From the Object Explorer pane, drag the GetFields method to the Design surface.
4. Click the method settings icon ( ).
5. Select one or more text fields.
6. Update the data type of the text field.
7. To close the CHOOSE FORM ELEMENTS window, click **OK**.

   A Data Out port is created for each text field you select.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The GetFields method can now return the data contained in the text fields.

GetInstanceCount

Returns the total number of instances of the Java application open.

GetInstanceCount method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the total number of instances of the Java application open.	Data out	Integer	None	Not applicable

GetScreenShot

Captures and returns the screenshot of the Java application screen.

GetInstanceCount method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the screenshot of the Java application screen.	Data out	Bitmap	None	Not applicable

GetWindowHandle

Returns the Windows handle number of the Java application screen window.

GetInstanceCount method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the Windows handle number of the Java application screen window.	Data out	Integer	None	Not applicable

IsCreated

Returns the Boolean response based on whether the rules for a configured window match. When you configure a Java application screen, the MATCH RULES section of the Java connector window shows certain rules that match the screen configured. The method matches the same rules.

To provide inputs to the parameters, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IsCreated method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?	Notes
MatchAllChildren	Returns the Boolean response after matching the rules of the elements of the screen.	Data in	Boolean	None	No	This parameter is relevant if you capture one or more elements.
Return	Returns the Boolean response to whether the rules of the Java application screen you configured matched.	Data out	Boolean	Null	Not applicable	

Maximize

Maximizes the Java application window.

Minimize

Minimizes the Java application window.

MouseAction

Performs different mouse device actions on the Java application such as left-click, right-click, and middle-click.

To provide inputs to the parameters, see Configure port properties.

MouseAction method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Action	Specifies the mouse device action.	Data in	Mouse device input	None	Yes
ClickMiddle	Whether a middle-click will be performed.	Data in	Boolean	None	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resize

Changes the width, height, and the position of the Java application window along the X and Y axis.

To provide inputs to the parameters, see Configure port properties.

Resize method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
xPos	Position of the window on the screen along the X-axis.	Data in	Integer	None	No
yPos	Position of the window on the screen along the Y-axis.	Data in	Integer	None	No
Width	Width of the window.	Data in	Integer	None	No
Height	Height of the window.	Data in	Integer	None	No

Restore

Restores the original dimensions of the Java application window. You can use the method after you have executed methods like Maximize and Minimize.

SendKeys

Send any data or keyboard input to the active field on the Java application. For example, you can send a string data "RPA" or a keyboard input [Space] to clear a check box.

To provide inputs to the parameters, see Configure port properties.

WaitForCreate method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Keys	Sends the data or keyboard input to the active field.	Data in	String	None	Yes
ClearExistingVal	Before sending any data or keyboard input, clears any existing value in the active field.	Data in	Boolean	None	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WaitForCreate method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Mandatory?
TypeDelay	Sets a delay before sending any data or keyboard input to the active field.	Data in	Integer	None	No

SetFields

Set custom text in the text field elements captured from the Java application screen.

To use the method, do the following steps.

1. From the Object Explorer, drag the SetFields method to the Design surface.
2. Click the method settings icon ( ).
3. Select one or more text fields.
4. Update the data type of the text field.
5. Click **OK**.

   A Data In port is created for each text field you select. You can pass the string to set in the fields of the Java application.

   To provide inputs to the parameters, see Configure port properties.

WaitForCreate

Each screen you configure in the Java connector is identified by some rules, displayed under the MATCH RULES section of the Java Connector window. The method returns a Boolean response based on whether the rules of the screen you had configured matches.

To provide inputs to the parameters, see Configure port properties.

WaitForCreate method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
timeoutinSeconds	Time after which the operation of the method times out.	Data in	Integer	None	No
MatchAllChildren	Returns the Boolean response after matching the rules of the elements of the screen.	Data in	Boolean	None	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WaitForCreate method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the Boolean response to whether the rules of the Java application screen you configured matched.	Data out	Boolean	None	No

Element level methods

GetAccessibleActions

Returns the list of actions that you can perform on an element. For example, for a button, it returns `Click`.

GetText method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the list of actions that you can perform on an element.	Data out	List	None	Not applicable

GetInstanceCount

Returns the total count of an element type in the Java application. For example, if there are three text boxes in an application, the instance count is 3.

GetText method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the instance count of an element type in the application.	Data out	Integer	None	Not applicable

GetText

Returns the text from the captured text box element in the Java application. To capture multiple texts from multiple text boxes, you must configure multiple text box elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetText method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Text	Returns the text contained in the text box of the Java application.	Data out	String	None	Not applicable

IsCreated

Returns the Boolean response depending on whether the rules of the element you had configured match.

IsCreated method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the Boolean response depending on whether the rules of the element you had configured match.	Data out	Boolean	null	Not applicable

MouseClick

Performs a left mouse-click on the captured element.

PerformAction

Performs the specified action on an element. For example, click on a button. Each element allows a set of actions that you can get by executing the GetAccessibleActions method.

To provide inputs to the parameters, see Configure port properties.

IsCreated method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?	Notes
Action	Accepts the action to be performed on the element.	Data in	String	None	Yes	You must specify the action exactly in the format as given by the GetAccessibleActions method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IsCreated method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Mandatory?	Notes
Return	Returns True if the action was performed, else, False.	Data out	Boolean	None	Not applicable	

SetPassword

Automate entering password securely in the password field of a Java application.

To provide inputs to the fields see Configure port properties.

SetPassword method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?	Notes
Password	Accepts the password as a secured string.	Data In	Secured string	None	Yes	Since it accepts the password as a secured string, it only shows the length of the string when you right-click on the parameter and then click **Preview Data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetPassword method parameters (continued)

Parameter	Description	Data Port type	Data type	Default value	Mandatory?	Notes
UseSendKeys	SendKeys is a method used to send keyboard inputs such as characters, numbers, and symbols to text boxes inside an application.	Data In	Boolean	False	Yes	**Tip:** If the **SetPassword** method fails to input the password in the password field, set the value to **True** and execute the method again.

Java connector properties

View or update Java connector properties.

Java connector properties

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

JavaScript

The JavaScript connector enables you to execute custom JavaScript by writing custom classes and methods and include them as part of you automation in the RPA Desktop Design Studio.

To use the connector, you must first configure it by writing and validating custom classes and methods. After that, you must use the method the connector exposes. Use the links.

- To use the JavaScript connector, see Use a connector in RPA Desktop Design Studio.
- To configure the JavaScript connector, see Configure the JavaScript connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Configure the JavaScript connector

Configure the JavaScript connector by writing custom script and validating custom classes and functions. Then you execute the script by providing values for the functions.

Before you begin

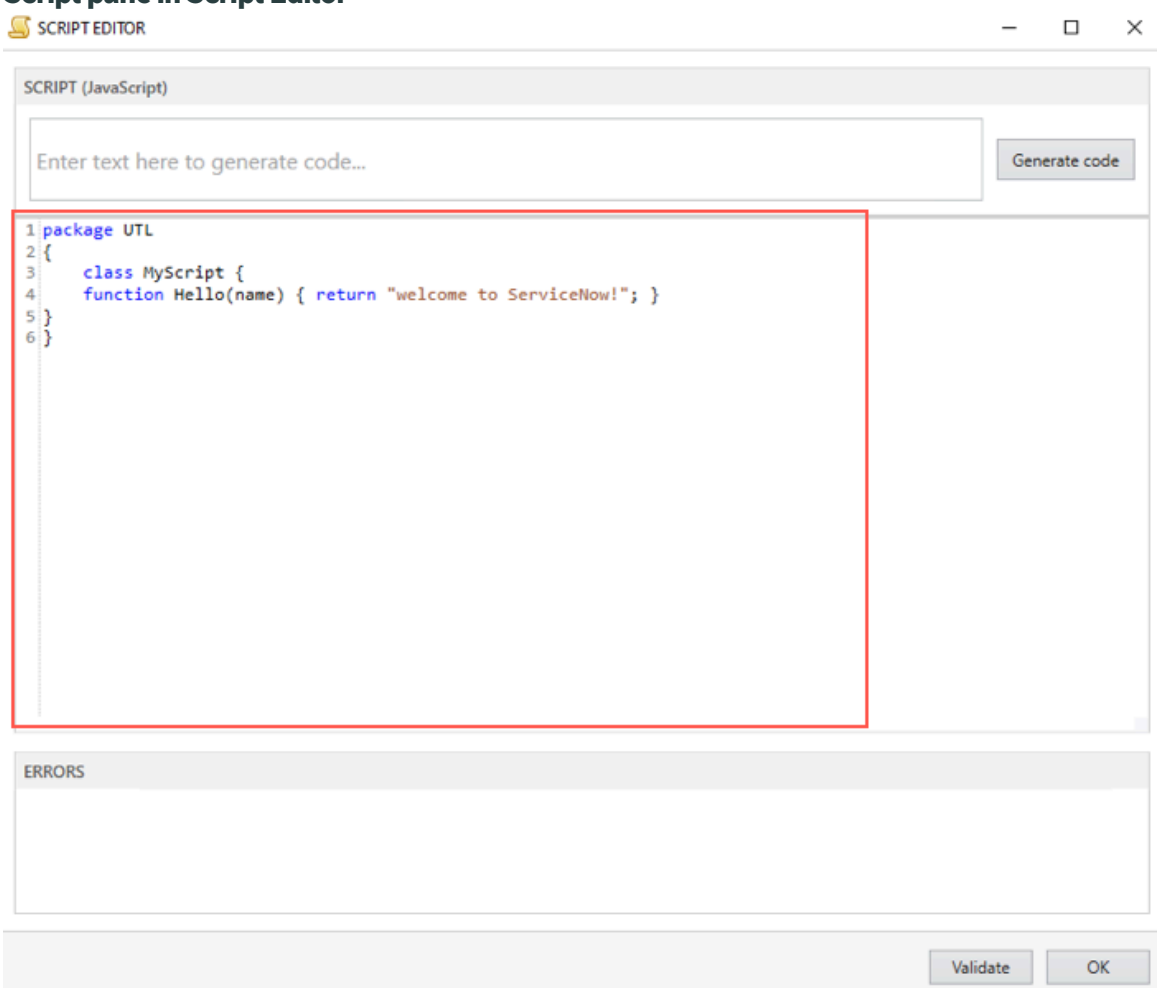
Ensure you have installed the Scripting plugin on the RPA Desktop Design Studio. To install, see Manage plugins in RPA Desktop Design Studio.

Role required: Developer

Procedure

1. In the Toolbox pane, navigate to **Connectors** > **JavaScript** .
2. Drag the **JavaScript** connector to **Global Objects** in the Project Explorer pane.
3. Right-click the **JavaScript** connector in **Global Objects** and select **Configure**.
   The Script Editor window is displayed.
4. Enter the custom JavaScript in the Script pane.

Script pane in Script Editor

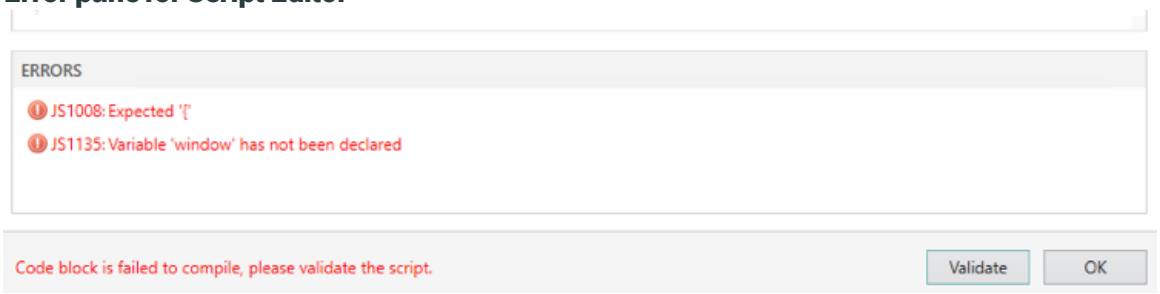


5. Select **Validate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If your custom script has any errors, it is displayed in the Errors pane. Resolve the errors and select **Validate** to check for errors again.

Error pane for Script Editor



6. Click **OK**.
   If you want to save the changes, select **Yes**. An error validation is performed again and the changes are saved. If you want to discard the changes, select **No**.

What to do next

The custom script you created by using the JavaScript connector is now ready to be used in your automation.

JavaScript connector methods

Execute custom JavaScript with the Execute method as part of an automation in the RPA Desktop Design Studio.

Execute

Executes the custom JavaScript you have written. Before executing,

- Configure the JavaScript connector before executing the method. To configure, see Configure the JavaScript connector.
- Configure the Execute method.

Configure the Execute method

1. Click the method settings icon ( ).
2. Select the class from the **Classes** list as set in the custom JavaScript you had written.
3. Select the method from the **Methods** list as set in the custom JavaScript you had written.
4. Click **OK**.

   A Data In port is created to accept the value for the function you have created.

Execute method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Function value	Accepts the value for the function you have created.	Data in	Object	None	Yes
Result	Returns the output of the custom	Data out	String	None	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execute method parameters (continued)

Parameter	Description	Data port type	Data type	Default value	Mandatory?
	JavaScript execution.				

Keyvalue pair

The KeyValuePair connector enables you to do multiple actions on key value pairs as part of an automation in the RPA Desktop Design Studio. For example, you can create, search, count, or delete key value pairs.

The Keyvalue pair connector exposes methods to do various actions on keyvalue pairs. These methods can work in conjunction with other methods or components in an automation.

- To use the Keyvalue pair connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

For details on the issues related to the Keyvalue pair component, see KB article KB1123557.

KeyValuePair connector methods

The Keyvalue pair connector methods perform various actions on key value pairs. In an automation flow, the methods are connected with other methods and components. To use the methods, you must first expose them.

Add

Adds a keyvalue pair.

To provide inputs to the parameters, see Configure port properties.

Add method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Key	Name of the key.	Data in	String	None	Yes
Value	Value of the key.	Data in	Object	None	Yes
IgnoreDuplicates	If the value is True, the method ignores a duplicate key. Else, if the value is False, the method returns an error message.	Data in	Boolean	None	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Clear

Clears all keyvalue pairs.

ContainsKey

Returns True if the specified key exists, else, returns False.

To provide inputs to the parameters, see Configure port properties.

ContainsKey method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Key	Name of the key.	Data in	String	None	Yes
Return	Returns True if the specified key exists, else, returns False.	Data out	Boolean	Not applicable	Not applicable

ContainsValue

Returns True if the specified key value exists, else, returns False.

To provide inputs to the parameters, see Configure port properties.

ContainsValue method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Value	Name of the key value.	Data in	String	None	Yes
Return	Returns True if the specified key value exists, else, returns False.	Data out	Boolean	Not applicable	Not applicable

Count

Returns the total count of keyvalue pairs.

Count method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the total count of keyvalue pairs.	Data out	Integer	Not applicable	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete

Removes the specified key.

To provide inputs to the parameters, see Configure port properties.

Delete method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Key	Name of the key.	Data in	String	None	Yes

GetItem

Returns the value of the specified key.

To provide inputs to the parameters, see Configure port properties.

GetItem method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Key	Name of the key.	Data in	String	None	Yes
Return	Returns the value of the key.	Data out	Object	Not applicable	Not applicable

GetItems

Returns the values of multiple keys. You must first configure the keys in the method.

To configure, do the following steps.

1. Click the method settings icon ( ).
2. Click the add keys icon ( ).
3. Enter the key name.
4. Update the key data type from the list.
5. Repeat the steps to set multiple key names.
6. Click **OK**.

   A Data out port is created with each key name you set.

GetItems method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Key	Returns the value of the key.	Data out	Object	Not applicable	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetItemsByIndex

Returns the key values based on their index. You must first configure the indexes in the method.

To configure, do the following steps.

1. Click the method settings icon ( ).
2. Click the add indexes icon ( ).
3. Enter the key index.
4. Update the key data type from the list.
5. Repeat the steps to set multiple key indexes.
6. Click **OK**.

   A Data out port is created with each key index you set.

GetItemsByIndex method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Key index	Returns the value of the key.	Data out	Object	Not applicable	Not applicable

ParseFromText

Parses the specified text into key value pairs. It can create multiple keyvalue pairs.

To provide inputs to the parameters, see Configure port properties.

ParseFromText method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Text	Text comprising the keys and values that the method parses.	Data in	String	None	Yes
ItemSeparator	Separator between two keyvalue pairs.	Data in	String	None	Yes
KeyValueSeparator	Separator between the key and its value.	Data in	String	None	Yes
ClearBeforeParse	If True, clears any existing keyvalue pair before parsing.	Data in	Boolean	None	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reverse

Reverses the key indexes.

Tip:
After executing the method, you can see the output by executing the GetItemsByIndex method.

SetData

Need information.

SetItem

Updates the value of a key.

To provide inputs to the parameters, see Configure port properties.

SetItem method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Key	Name of the key.	Data in	String	None	Yes
Value	Updated value of the key.	Data in	Object	None	Yes

Tip:
Test the updated value by executing the GetItemsByIndex method.

SetItems

Updates the values of the specified keys. You must first configure the keys in the method.

To configure the keys, do the following steps.

1. Click the method settings icon ( ).
2. Click the add keys icon ( ).
3. Enter the key name.
4. Update the key data type from the list.
5. Repeat the steps to set multiple key names.
6. Click **OK**.

   A Data in port is created with each key name you set.

To provide inputs to the parameters, see Configure port properties.

SetItems method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Key	Updated value of the key.	Data in	Object	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
Test the updated value by executing the GetItemsByIndex method.

SetItemsByIndex

Updates the values of the keys based on the specified indexes. You must first configure the indexes in the method.

To configure the indexes, do the following steps.

1. Click the method settings icon ( ).
2. Click the add indexes icon ( ).
3. Enter the key index.
4. Update the key data type from the list.
5. Repeat the steps to set multiple key indexes.
6. Click **OK**.

A Data in port is created with each key index you set.

SetItemsByIndex method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Key Index	Index of the key.	Data in	Object	None	Yes

Tip:
Test the updated value by executing the GetItemsByIndex method.

ToJSON

Renders the keyvalue pairs to the JSON format.

ToText

Renders the keyvalue pairs to the text format.

To provide inputs to the parameters, see Configure port properties.

ToText method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
ValuesOnly	If True, the method renders only the values of the keys, else, renders the keyvalue pair.	Data in	Boolean	None	No
Return	Returns the keyvalue pair to the text format.	Data out	String	Not applicable	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List

The List connector enables you to create, view, search, and do many more actions on list items as part of an automation in the RPA Desktop Design Studio. List items can comprise key value pairs or any regular list item such as a list of employee names.

The List connector exposes multiple methods that can perform actions on list items as part of an automation workflow.

- To use the List connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

List connector methods

The List connector methods perform various actions on list items as part of an automation workflow. You must first expose the methods before using.

Add

Adds a single list item.

To provide inputs to the parameters, see Configure port properties.

Add method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Item	Name of the list item.	Data in	Object	None	Yes

AddList

Adds a list of items.

To provide inputs to the parameters, see Configure port properties.

AddList method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?	Notes
List	List of items.	Data in	Object	None	Yes	You can pass the list items from a variable or an appropriate component.

Contains

Returns the Boolean value based on whether a list item exists.

To provide inputs to the parameters, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contains method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Item	Name of the list item that the method searches.	Data in	Object	None	Yes
Return	Returns True if list item found, else, returns False.	Data out	Boolean	Not applicable	Not applicable

Count

Returns the total count of list items added.

Count method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the total count of list items added.	Data out	Integer	Not applicable	Not applicable

FindByProperty

Finds a list item based on the specified key and value. You must create at least one key value pair list item before executing this method.

To provide inputs to the parameters, see Configure port properties.

FindByProperty method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Prop	The key in the key value pair.	Data in	String	None	Yes
Value	The value in the key value pair.	Data in	String	None	Yes
Found	Returns True if list item found, else, returns False.	Data out	Boolean	Not applicable	Not applicable
Item	if the Found parameter is True, the method returns the list item.	Data out	Object	Not applicable	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

FindText

Finds text or regex in the list items based on the specified filter and returns the total occurrences of the text and the text itself.

To provide inputs to the parameters, see Configure port properties.

FindByProperty method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
SearchText	Text that the method searches in the list items.	Data in	String	None	Yes
FindBy	Option to indicate whether the method searches a text or regex.	Data in	String	None	Yes
MatchType	Option to indicate whether the type of match will be: • An exact match • Match case • Containing the specified characters.	Data In	String	None	Yes
Count	Returns the total occurrences of the match.	Data out	Integer	Not applicable	Not applicable
Outlist	Returns the list of matches.	Data out	List	Not applicable	Not applicable

GetItem

Returns a list item based on its index value.

To provide inputs to the parameters, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetItem method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Index	Index value of the list item.	Data in	Integer	None	Yes
Return	Returns the list item.	Data out	Object	Not applicable	Not applicable

GetItems

Returns the list items based on their index values. You must configure the index values first.

To configure, do the following steps.

1. Click the method settings icon ( ).
2. Click the add index icon ( ).
3. Enter the index value.
4. Update the data type of the index value.
5. Repeat the steps to add more index values.
6. Click **OK**.

   A data out port is created with each index value. The data out port returns the list item corresponding to the index value.

GetList

Returns all list items and lists created.

GetList method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the list items and lists.	Data out	Array	None	Not applicable

Remove

Removes the specified list item.

To provide inputs to the parameters, see Configure port properties.

GetList method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Item	List item the method removes.	Data in	Object	None	Yes

RemoveAll

Removes all list items added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reverse

Reverses the order of the index values of the list items.

SetItems

Updates the values of the list items. To use the method, you must first configure the method.

To configure, do the following steps.

1. Click the method settings icon ( ).
2. Click the add index icon ( ).
3. Enter the index value.
4. Update the data type of the index value.
5. Repeat the steps to add more index values.
6. Click **OK**.

   A data in port is created with each index value.

To provide inputs to the parameters, see Configure port properties.

SetItems method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Item	Accepts the value of the list items.	Data in	Object	None	Yes

Sort

Sorts the list items.

ToArray

Returns the list items in the form of an array. You must add more than one list item before executing this method.

ToArray method parameters

Parameter	Description	Data port type	Data type	Default value	Mandatory?
Return	Returns the list items in the form of an array list.	Data out	Array list	Not applicable	Not applicable

List method properties

View or update the List method properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List method properties

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Microsoft Excel

The Microsoft Excel connector enables you to perform various actions on a Microsoft Excel document as part of a Robotic Process Automation. For example, open a Microsoft Excel file and export it to the PDF format.

The Microsoft Excel connector exposes methods to do various actions on Microsoft Excel documents. These methods can work in conjunction with other methods or components in an automation.

- To use the Microsoft Excel connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Note:
32 bit Microsoft Office installations are not supported.

Microsoft Excel connector methods

The Microsoft Excel connector methods perform various actions on Microsoft Excel documents. In an automation flow, the methods are connected with other methods and components. To use the methods, you must first expose them.

Open

Creates or opens an existing Microsoft Excel file depending on the inputs.

Note:
You must execute this method before any other method.

Open method parameters

Parameter	Description	Data port type	Data type
Filepath	Path to the existing file that the method opens. To create a file, you must set the value of the CreateNewFile parameter to True.	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Open method parameters (continued)

Parameter	Description	Data port type	Data type
	Note: The path must contain the filename.		
CreateNewFile	Specifies whether a new Excel file should be created if the specified file does not exist. If CreateNewFile parameter is set to true, a new file is created at the specified file path. If set to False, it will try to open the excel from the given file path.	Data in	Boolean
DisplayAlerts	Specifies whether Excel displays alerts or prompts during the opening process. If set to true, Excel displays alerts for issues such as file conflicts or compatibility warnings. If set to false, these alerts are suppressed.	Data in	Boolean
IsVisible	Specifies if the Excel application window is visible to the user when the file is opened or not. If set to true, the Excel window is displayed on the screen. If set to false, Excel runs in the background without a visible interface.	Data in	Boolean
ReadOnlyMode	Specifies if the Excel file should be opened in the read-only mode. If set to true, the file opens in the read-only	Data in	Boolean

Open method parameters (continued)

Parameter	Description	Data port type	Data type
	mode, preventing any changes from being made. If set to false, the file opens in the normal mode, allowing modifications.		
Password	Password required to open the Excel file if it is password-protected. If the file is not password-protected, this parameter can be left blank.	Data in	String
Return	Returns True orFalse value. If the value is True, the file is successfully opened or created.	Data out	Boolean

AddNewWorkSheet

Adds a new worksheet to the file. This method requires a sheet name as input parameter of type string that specifies the name of the new sheet.

Note:
You must execute the Open method before executing this method.

AddNewWorkSheet method parameters

Parameter	Description	Data port type	Data type
SheetName	Name of the new worksheet that the method adds to the file.	Data in	String

AutoFill

Automatically populates cells within a specified range based on the content of adjacent cells or a predefined pattern. This method is useful for copying data or formatting across multiple cells. Microsoft Excel analyzes the content of the initial selection and extrapolates it to fill the desired range. It can be used to extend a series of numbers, duplicate formulas, replicate text patterns, or perform any other data entry processing.

Note:
You must execute the Open method before executing this method.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AutoFill method parameters

Parameter	Description	Data port type	Data type
SheetName	Name of the worksheet that contains the source data.	Data in	String
SourceRange	Range of cells with the data or formulas to replicate.	Data in	String

GetSheetNames

Returns the names of all the sheets in the opened Microsoft Excel document.

Note:
You must execute the Open method before executing this method.

GetSheetNames method parameters

Parameter	Description	Data port type	Data type
Return	Returns the names of the sheets in the opened Microsoft Excel document.	Data Out	String

Close

Closes the active Microsoft Excel document if it is already opened and releases the memory. This method helps in memory handling.

Note:
You must execute the Open method before executing this method.

Close method parameters

Parameter	Description	Data port type	Data type
saveChanges	If the value is set to True, changes to the file are saved before closing. If set to False, no changes are saved.	Data in	Boolean

ColumnsCount

Returns the total number of columns in a specified worksheet of a Microsoft Excel file. This method requires the SheetName parameter to specify the worksheet, and then returns the column count for that sheet.

Note:
You must execute the Open method before executing this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ColumnsCount method parameters

Parameter	Description	Data port type	Data type
SheetName	Name of the sheet that the method uses to count the number of columns.	Data in	String
Return	Returns the count of columns in the worksheet.	Data out	Integer

Copy

Copies the contents from a range of cells in a worksheet.

Tip:
You can paste the copied contents with the Paste method.

Copy method parameters

Parameter	Description	Data port type	Data type
Sheetname	Name of the sheet that contains source data.	Data in	String
Cellrange	Range of cells to be copied.	Data in	String

Paste

Pastes the clipboard content into specific cells provided in the CellLocation parameter of a worksheet. It can also be a range of cells.

Note:
You must execute the Copy method before executing this method.

Paste method parameters

Parameter	Description	Data port type	Data type
Sheetname	Name of the sheet where the clipboard content will be pasted.	Data in	String
CellLocation	Indicates the location (cell reference) where the clipboard content will be pasted.	Data in	String

FillBlankValues

Fills empty cells in a specified column of a worksheet in a Microsoft Excel file with a given value. It requires the SheetName parameter to specify the worksheet, the ColumnName parameter to

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

identify the column, and the Value parameter to provide the replacement value for the empty cells.

Note:
You must execute the Open method before executing this method.

FillBlankValues method parameters

Parameter	Description	Data port type	Data type
Sheetname	Name of the sheet to fill blank values.	Data in	String
ColumnName	Name of the column in the worksheet that needs to be filled with a value. ColumnName is an Enum data type that represents Excel columns from A to AZ.	Data in	ColumnName
Value	Value to be filled in the column.	Data in	String

CreateChart

Creates a chart for a specific range in a specific worksheet. This method is used to automate creation of charts.

Note:
You must execute the Open method before this method.

CreateChart method parameters

Parameter	Description	Data port type	Data type
SheetName	Name of the sheet where the chart is created.	Data In	String
CellRange	Range of cells from which the chart is created.	Data In	String
ChartType	Specifies the type of chart to be created. The available chart types depend on the specific implementation of the Excel connector being used.	Data In	ExcelChartType
Return	If True, the chart is successfully created.	Data Out	Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CreateChart method parameters (continued)

Parameter	Description	Data port type	Data type
	If False, the chart creation is failed.		

CreatePivotTable

Generates a pivot table on the specified sheet, utilizing the settings configured in the 'Pivot Table Settings' window.

Note:
You must execute the Open method before this method.

CreatePivotTable method parameters

Parameter	Description	Data port type	Data type
SheetName	Name of the sheet from where the pivot table has to be created.	Data In	String
PivotTableName	Name of the pivot table.	Data In	String

DeleteColumn

Deletes a column in a given sheet based on the specified index of the column.

DeleteColumn method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the sheet from which the column is deleted.	Data In	String
ColumnIndex	Index of the column that must be deleted. In Excel, columns are labeled alphabetically (A, B, C, etc.), and each column has a corresponding numeric index (1 for column A, 2 for column B, and so on).	Data In	Integer
Return	Returns the Boolean value that indicates whether the column was deleted. If True, the column is deleted.	Data Out	Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DeleteColumn method parameters (continued)

Parameter	Description	Data Port Type	Data type
	If False, the column was not deleted.		

DeleteContentFromRange

Deletes contents from the specified range of cells.

DeleteContentFromRange method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the sheet from which the contents will be deleted.	Data In	String
CellRange	Specifies the range of cells from which data is deleted.	Data In	String
Return	Returns the Boolean value that indicates whether the content from range of cells was deleted. If True, the content is deleted. If False, the content is not deleted.	Data Out	Boolean

DeleteEmptyColumns

Deletes columns that have no content in a specified worksheet of a Microsoft Excel file. This method requires the SheetName parameter to identify the worksheet.

DeleteEmptyColumns method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the sheet containing the empty column.	Data In	String

DeleteEmptyRows

Deletes rows that have no content in a specified worksheet of a Microsoft Excel file. This method requires the SheetName parameter to identify the worksheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DeleteEmptyColumns method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the sheet containing the empty rows.	Data In	String

DeleteRow

Deletes a row from the worksheet based on the RowNumber parameter.

DeleteRow method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the sheet from which the row is deleted.	Data In	String
RowNumber	Indicates the number of the row that must be deleted.	Data In	Integer
Return	Returns the Boolean value that indicates whether the row is deleted. If True, the row is deleted. If False, the row is not deleted.	Data Out	Boolean

DeleteWorksheet

Deletes the specified worksheet. This method requires the SheetName parameter to identify the worksheet.

DeleteWorksheet method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the sheet which must be deleted.	Data In	String
Return	Returns the Boolean value that indicates whether the worksheet was deleted. If True, the worksheet is deleted. If False, the worksheet is not deleted.	Data Out	Boolean

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ExportChartAsImages

Exports and saves a chart present in a sheet into an image file that is saved in the specified path. This process separates the chart from the Excel workbook, providing a standalone visual representation that can be easily shared or inserted into various documents, presentations, or reports.

ExportChartAsImages method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the sheet that contains the chart.	Data In	String
SaveFolderpath	Specifies the folder path where the charts are saved as image files.	Data In	String

ExportToPDF

Exports an Excel file as a PDF file to the path location mentioned in the FilePath parameter.

ExportToPDF method parameters

Parameter	Description	Data Port Type	Data type
Filepath	Specifies the file path to which the PDF file is exported.	Data In	String

FindAndReplace

Locates the text given in the FindText parameter in a given worksheet specified by the SheetName parameter and replaces it with another text given in the ReplaceTo parameter.

FindAndReplace method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the text will be replaced.	Data In	String
FindText	The text that is searched for within the cells of the worksheet.	Data In	String
ReplaceTo	The desired text to replace the text found using the FindText parameter.	Data In	String
Return	Returns the Boolean value that indicates whether the text is	Data Out	Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

FindAndReplace method parameters (continued)

Parameter	Description	Data Port Type	Data type
	replaced. If True, the text is replaced. If False, the text is not replaced.		

GetActiveSheetName

Returns the name of the active worksheet.

GetActiveSheetName method parameters

Parameter	Description	Data Port Type	Data type
Return	Returns the name of the active worksheet in a string format.	Data Out	String

GetCellAddressIfRowHas

Searches a given text in the specified sheet. It scans through the specified column name, starting from the indicated row index. If the text is found, it returns true. Else, it returns false. Additionally, the matched cell address can be stored in the configured value.

Note:
Execute the Open method before executing this method.

GetCellAddressIfRowHas method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet to search within.	Data In	String
SearchText	The text to search for within the specified column.	Data In	String
SearchColumn	The column where the search will be conducted. ColumnName is an Enum data type that represents Excel columns from A to AZ.	Data In	ColumnName
StartRowIndex	The row index from which the search will begin.	Data In	Integer
Return	Returns a Boolean value indicating whether the	Data Out	Boolean

GetCellAddressIfRowHas method parameters (continued)

Parameter	Description	Data Port Type	Data type
	SearchText was found. If True, the text is found. If False, the text is not found.		

GetCellFormula

Retrieves the cell formula from a worksheet.

Note:
Execute the Open method before executing this method.

GetCellFormula method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet to retrieve the cell formula from.	Data In	String
CellName	Specifies the name or reference of the cell to retrieve the formula from.	Data In	String
Return	Returns the specified cell formula in a string format.	Data Out	String

GetCellValue

Retrieves the value of a cell from a worksheet specified by the CellName parameter.

Note:
Execute the Open method before executing this method.

GetCellValue method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet from which the cell value will be retrieved.	Data In	String
CellName	Returns the cell value or display text based on the configuration set in GetCellValue.	Data In	String
Return	Returns the value in a specified cell in the string format.	Data Out	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetCellValueIfRowHas

Searches the specified sheet for a given text. It scans through the specified column, starting from the indicated row index. If the text is found, it returns true. Else, it returns false. Additionally, the matched cell value can be stored in the configured value.

Note:
Execute the Open method before executing this method.

GetCellAddressIfRowHas method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet to search within.	Data In	String
SearchText	The text to search for within the specified column.	Data In	String
SearchColumn	The column where the search is conducted. ColumnName is an Enum data type that represents Excel columns from A to AZ.	Data In	ColumnName
StartRowIndex	The row index from which the search begins.	Data In	Integer
Return	Returns a Boolean value indicating whether the SearchText was found. If True, the text is found. If False, the text is not found.	Data Out	Boolean

GetCellValues

Returns the values of cells from a worksheet.

Note:
Execute the Open method before executing this method.

GetCellValues method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that contains the source data.	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetColor

Returns the RGB value of a cell specified in the CellName parameter from a worksheet.

Note:
Execute the Open method before executing this method.

GetColor method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet to retrieve the cell color from.	Data In	String
CellName	Name or reference of the cell to retrieve the color of.	Data In	String
Return	Returns the color of the specified cell in the string format.	Data Out	String

GetColumnNameByIndex

Returns the column name corresponding to the given column number, where, for example, 1 corresponds to 'A'.

Note:
Execute the Open method before executing this method.

GetColumnNameByIndex method parameters

Parameter	Description	Data Port Type	Data type
ColumnNumber	The column number that you want to retrieve the name of.	Data In	Integer
Return	Returns the name of the column in the string format.	Data Out	String

GetFilterData

Returns filtered data from a worksheet based on the specified filter criteria. Data is obtained starting from the row number provided in the RowNumber parameter.

Note:
Execute the Open method before executing this method.

GetFilterData method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetFilterData method parameters (continued)

Parameter	Description	Data Port Type	Data type
	contains the source data.		
RowNumber	The row number of the row that is the starting row for the extraction of data.	Data In	Integer
FirstRowAsHeader	Determines whether the first row of the filtered data should be treated as header row. If set to true, the first row will be considered as header row and not included in the extracted data rows. If set to false, the first row will be included as part of the extracted data rows.	Data In	Boolean
Return	Returns the filtered data in a table format. Operations can be performed on the rows and columns of this table.	Data Out	Data table

GetFilteredDataAddress

Returns the address of the filtered data in the worksheet provided in the SheetName parameter.

Note:
Execute the Open method before executing this method.

RowsCount method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet to retrieve the address of filtered data from.	Data In	String
Return	Returns a list or collection of strings where the strings are filtered data addresses.	Data Out	List(Of string)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetRowValues

Returns cell values from the specified SheetName parameter to extract the values from. By default, if RowNumber is not specified (or set to -1), it reads values from the last row. Additionally, you can include output parameters to add column names and store their values in the output.

Note:
Execute the Open method before executing this method.

GetRowValues method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Specifies the name of the worksheet to retrieve the values from.	Data In	String
RowNumber	The row to read values from. If set to -1, it defaults to the last row.	Data In	Integer

GetSelectedRange

Returns the currently selected range of cells from the worksheet specified in the SheetName parameter. Data is extracted from the specific areas of the worksheet that have been highlighted or chosen.

Note:
Execute the Open method before executing this method.

GetSelectedRange method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that contains the source data.	Data In	String
Return	Returns the range of cells selected in a sheet in the string format.	Data Out	String

GetSheetNames

Returns a list of all worksheet names present in an Excel file.

Note:
Execute the Open method before executing this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetSheetNames method parameters

Parameter	Description	Data Port Type	Data type
Return	Returns all the available sheet names in a string array format.	Data Out	String[]

GetUsedRange

Returns the range of used cells of the specified sheet.

Note:
Execute the Open method before executing this method.

GetUsedRange method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet to read the range from.	Data In	String
IncludeHeaders	Indicates whether headers should be included.	Data In	Boolean
Return	Returns the range of used cells in string format.	Data Out	String

GetValuesByColumn

Returns a list of values from a specified ColumnName in the given SheetName based on the Distinct, FirstRowAsHeader, and ValueType parameters criteria.

Note:
Execute the Open method before executing this method.

GetValuesByColumn method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that contains the source data.	Data In	String
ColumnName	Denotes the name of the column from which values are retrieved. ColumnName is an Enum data type that	Data In	ColumnName

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetValuesByColumn method parameters (continued)

Parameter	Description	Data Port Type	Data type
	represents Excel columns from A to AZ.		
FirstRowAsHeader	Indicates whether the first row in the specified column contains headers.	Data In	Boolean
Distinct	Specifies whether the retrieved values should be distinct or unique.	Data In	Boolean
ValueType	Extracts values based on visibility.	Data In	ValueT
Return	Returns the number of rows.	Data Out	Integer

InsertNewColumn

Inserts a new column at the index provided in the ColumnNumber parameter in the specified worksheet.

InsertNewColumn method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the column must be inserted.	Data In	String
ColumnIndex	Specifies the index of the column where the new column is inserted. For example, 1 is A, 2 is B, and so on.	Data In	Integer

InsertNewRow

Inserts a new row at the specified index in the specified worksheet.

InsertNewRow method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the row will be inserted.	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

InsertNewRow method parameters (continued)

Parameter	Description	Data Port Type	Data type
RowIndex	Index of the row. The row will be inserted at the specified index.	Data In	Integer
Return	Returns the Boolean value that indicates whether a row is inserted. If True, the row is inserted. If False, the row is not inserted.	Data Out	Boolean

InsertObject

Inserts an embedded object into a cell identified by the index value in the CellName parameter in the specified worksheet. The path to that embedded object is provided in the Filepath parameter. Example of an object could be an excel file, an image, or a PDF file.

Note:
Execute the Open method before executing this method.

InsertObject method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the method inserts the object.	Data In	String
CellName	Name of the cell where the method inserts the object. For example, A1.	Data In	String
Filepath	File path of the object that the method inserts.	Data In	String

IsOpen

Checks whether a Microsoft Excel workbook or file at the location provided in the Filepath parameter is open or not.

IsOpen method parameters

Parameter	Description	Data Port Type	Data type
Filepath	Path to the Excel file in the local drive.	Data In	String
Return	Returns the Boolean value that indicates whether the Excel file	Data Out	Boolean

IsOpen method parameters (continued)

Parameter	Description	Data Port Type	Data type
	is open. If True, the Excel file is open. If False, the Excel file is not open.		

MergeCells

Merges the cells specified in the range in the specified worksheet.

MergeCells method parameters

Parameter	Description	Data Port Type	Data type
Sheetname	Name of the worksheet on which the cells will be merged.	Data In	String
CellRange	Range of cells. All cells within the range are merged.	Data In	String

ReadFromRange

Retrieves data from a specified worksheet and returns it. You need to provide the worksheet name to indicate from which worksheet to extract the cell range, specify the cell range to determine the range of cells to read, and indicate whether the first row is a header in the FirstRowAsHeader parameter.

ReadFromRange method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet from where the method reads the data.	Data In	String
CellRange	Range of cells. The method reads data from these cells.	Data In	String
FirstRowAsHeader	Boolean value that indicates whether the method treats the first row as the header. If True, the first row is treated as a header. If False, the first row is not treated as a header.	Data In	Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ReadFromRange method parameters (continued)

Parameter	Description	Data Port Type	Data type
Return	Returns the data table that comprises the data from the cells.	Data Out	Data Table

ReadFromSheet

Extracts data from a worksheet and convert it into a structured format, such as a DataTable.

ReadFromSheet method parameters

Parameter	Description	Data Port Type	Data type
Sheetname	Name of the worksheet from which the method reads the data.	Data In	String
Return	Returns all the data in the specified worksheet.	Data Out	DataTable

RenameSheetName

Renames an existing worksheet.

RenameSheetName method parameters

Parameter	Description	Data Port Type	Data type
OldSheetName	The existing name of the worksheet.	Data In	String
NewSheetName	The new name of the worksheet.	Data In	String
Return	Returns the Boolean response that indicates whether the worksheet is renamed. If True, the worksheet is renamed. If False, the worksheet is not renamed.	Data Out	Boolean

RowsCount

Returns the count of rows in the specified worksheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RowsCount method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet from where the count of rows are returned.	Data In	String
Return	Returns the number of rows.	Data Out	Integer

RunMacro

Executes an existing macro in the Excel file. The method requires the name of the macro that the user intends to run.

RunMacro method parameters

Parameter	Description	Data Port Type	Data type
MacroName	The name of the Macro to execute.	Data In	String
Return	Returns boolean value indicating if macro was successfully run or not.	Data Out	Boolean

Resize

Changes Excel application window's width and height dimensions. Layout and appearance of the Excel application can be customized to accommodate specific display requirements.

RowsCount method parameters

Parameter	Description	Data Port Type	Data type
Left	This parameter specifies the horizontal position of the top-left corner of the Excel application window relative to the screen's left edge. It defines the distance, in pixels or points, from the left edge of the screen to the left edge of the Excel window.	Data In	Integer
Top	This parameter indicates the vertical position of the top-left corner of the Excel application window	Data In	Integer

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RowsCount method parameters (continued)

Parameter	Description	Data Port Type	Data type
	relative to the screen's top edge. It defines the distance, in pixels or points, from the top edge of the screen to the top edge of the Excel window.		
Width	This parameter specifies the width of the Excel application window in pixels or points. It determines the horizontal size of the window, extending from the left edge to the right edge.	Data In	Integer
Height	This parameter indicates the height of the Excel application window in pixels or points. It defines the vertical size of the window, extending from the top edge to the bottom edge.	Data In	Integer

RemoveFilter

Removes filters from a worksheet given in the SheetName parameter.

RemoveFilter method parameters

Parameter	Description	Data Port Type	Data type
Sheetname	Name of the worksheet from which the method removes the filters.	Data In	String

Save

Saves any updates, changes, additions, or deletions made to the data or formatting within a Microsoft Excel document to ensure that the work is preserved and that the Excel file reflects the most recent updates.

SaveAs

Saves an Excel file with a different name or format to a file path provided in the Filepath parameter. The file can also be password protected by providing the value in the Password parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SaveAs method parameters

Parameter	Description	Data Port Type	Data type
Filepath	The file path where the Excel file is saved with a different name or format.	Data In	String
Password	Password to protect the Excel file that will be saved. This parameter is optional and has a default value of an empty string.	Data In	String

SaveCopyAs

Saves a copy of the Excel file to a specified path that serves as a destination for the saved copy.

SaveCopyAs method parameters

Parameter	Description	Data Port Type	Data type
Filepath	The file path where the Excel file is saved with a different name or format.	Data In	String
Password	Password to protect the Excel file that is saved. This parameter is optional and has a default value of an empty string.	Data In	String

SelectRange

Specifies and highlights a range of cells within an Excel worksheet.

SelectRange method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that contains the source data.	Data In	String
CellRange	The range of cells that are selected within the specified worksheet. It defines the group of cells, typically identified by the starting	Data In	String

SelectRange method parameters (continued)

Parameter	Description	Data Port Type	Data type
	and ending cell references, that will be highlighted or activated.		

SelectRowByIndex

Selects the entire row based on the index provided in the RowNumber parameter in the worksheet.

SelectRowByIndex method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the row is selected.	Data In	String
RowNumber	The index of the row to be selected.	Data In	Integer

SetActiveWorksheet

Marks the worksheet specified in the Sheetname as the active worksheet.

SetActiveWorksheet method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet which needs to be set as active.	Data In	String
Return	Returns the boolean value indicating if the provided sheet has been set as active or not.	Data Out	Boolean

SetAlignment

Adjusts the alignment settings of cells given in the CellRange to control the presentation and appearance of data within the Excel worksheet and enhancing the visual appeal and readability of spreadsheet data, improving data presentation, and communication.

SetAlignment method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that	Data In	String

SetAlignment method parameters (continued)

Parameter	Description	Data Port Type	Data type
	contains the source data.		
CellRange	Range of cells to which the alignment settings or properties are applied.	Data In	String
HorizantalAlignment	Horizontal alignment of cell contents within the specified range. It determines how the content (such as text or numbers) is positioned within each cell horizontally. Possible values include left, center, right, justified, or distributed.	Data In	HorizantalAlignment
VerticalAlignment	Vertical alignment of cell contents within the specified range. It determines how the content is positioned within each cell vertically. Possible values include top, middle, bottom, or justified.	Data In	VerticalAlignment

SetCellColor

Sets a color given in the Color parameter on a particular cell specified in the CellName parameter in a worksheet.

SetCellColor method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the cell is located.	Data In	String
CellName	Indicates the name or reference of the cell for which the color will be set.	Data In	String
Color	Specifies the RGB color value to be applied to the cell.	Data In	ExcelRgbColor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetCellColor method parameters (continued)

Parameter	Description	Data Port Type	Data type
Return	Returns boolean value indicating if the formula is set for a particular cell provided.	Data Out	Boolean

SetCellFormula

Assigns a formula to a specified cell in the Excel file. This method requires the SheetName, CellName, and Formula parameters to determine the worksheet, cell, and formula to be set, respectively.

SetCellFormula method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the action will be performed.	Data In	String
CellName	The cell within the worksheet where the operation will take place.	Data In	String
Formula	The mathematical or logical expression to be applied to the specified cell.	Data In	String
Return	Returns boolean value indicating if the formula is set for the specified cell.	Data Out	Boolean

SetCellValue

Assigns a value to a specific cell in a worksheet, replacing any existing content in that cell.

SetCellValue method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that contains the source data.	Data In	String
CellName	This parameter indicates the reference or identifier of the target cell within the specified	Data In	String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetCellValue method parameters (continued)

Parameter	Description	Data Port Type	Data type
	worksheet. It can be represented by the cell address (e.g., 'A1', 'B2', 'C3').		
Value	Value that will be assigned to the specified cell which can be of any data type supported by Excel, including numbers, text, dates, formulas, or logical values.	Data In	String

SetCellValues

Sets values in multiple cells as configured in the method editor dialog within a specified sheet.

SetCellValues method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the cell values will be set.	Data In	String

SetCellValuesIfRowHas

Scans the specified sheet for a provided text, examining the designated column name from the indicated row index. If the text is found, it sets the value of the specified cell with the provided values. It returns true if the value was successfully set, otherwise false.

SetCellValuesIfRowHas method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet to search within.	Data In	String
SearchText	The text to search for within the specified column.	Data In	String
SearchColumn	The column where the search is conducted. ColumnName is an Enum data type that represents Excel columns from A to AZ.	Data In	ColumnName

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetCellValuesIfRowHas method parameters (continued)

Parameter	Description	Data Port Type	Data type
StartRowIndex	The row index from which the search begins.	Data In	Integer
Return	Returns True if SearchText is found in the specified column. Else, it returns False.	Data Out	Boolean

SetColumnType

Modify the data type of a specified column within a worksheet. For example, users can convert a column containing numeric values to a text format or change a column of text data to numeric format. It is possible to adjust the data format to better suit analysis or reporting needs, ensuring consistency and accuracy in data representation. Useful for tasks such as data conversion, formatting, and manipulation in Excel.

SetColumnType method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that contains the source data.	Data In	String
FormatType	The desired format type the column is converted to. This parameter determines how the data within the column is interpreted or displayed. Possible values may include numeric, text, date, time, currency, percentage, or custom formats.	Data In	String
Column	The column reference or identifier within the specified worksheet for which the data type is changed. It could be represented by the column letter (e.g., 'A', 'B', 'C').	Data In	String
Return	Returns boolean value identifying if the column type has been set or not.	Data Out	Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetColumnWidth

Sets the width of all the columns provided in the width parameter.

SetColumnWidth method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the column width is adjusted.	Data In	String
Width	The width in characters to which the column is set. Only integer value is accepted. Decimal values are not accepted.	Data In	Integer
Return	Returns boolean value identifying if the column type has been set or not.	Data Out	Boolean

SetFilter

Applies a filter to a specific column. This method finds the worksheet based on the given sheet name and then applies the provided filter value.

SetFilter method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the column is located.	Data In	String
ColumnName	Column where the filter is applied. ColumnName is an Enum data type that represents Excel columns from A to AZ.	Data In	ColumnName
FilterValue	The value to filter by within the identified column.	Data In	String

SetFilterByRow

Applies a filter to a specified column, starting from a given row number. This method finds the worksheet based on the given sheet name and then applies the provided filter value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetFilterByRow method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that contains the source data.	Data In	String
RowNumber	Indicates the row number within the specified worksheet where the filtering criteria are defined. It identifies the row containing the criteria that will be used to filter the data.	Data In	Integer
ColumnName	Name or identifier of the column based on which the filtering will be performed. It represents the column to which the filtering criteria apply. ColumnName is an Enum data type that represents Excel columns from A to AZ. The provided ColumnName refers to the column name relative to the starting column of your data. For example, if your data begins at column B in the Excel sheet, the relative column index A corresponds to column B, the relative column index B corresponds to column C, and so on.	Data In	ColumnName
FilterValue	Value or condition used as the filter criteria. It represents the specific value that the data in the designated column must match to be displayed after the filter is applied.	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetFontStyle

Formats the cells within a specified range by setting parameters such as Color, FontStyle, FontName, Bold, and Underline.

SetFontStyle method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the font style will be set.	Data In	String
CellRange	The range of cells for which the font style will be set.	Data In	String
Color	Specifies the RGB color value of the font.	Data In	ExcelRgbColor
FontSize	Specifies the size of the font. The default value is 11.	Data In	Integer
FontName	Specifies the name of the font. The default value is Calibri.	Data In	String
Bold	Indicates whether the font should be bold. The default value is False.	Data In	Boolean
Underline	Specifies the underline style for the font. The default value is None.	Data In	Underline

SetRowHeight

Modifies the height of a specific row within an Excel worksheet.

SetRowHeight method parameters

Parameter	Description	Data Port Type	Data type
SheetName	The name of the worksheet where the rows are located.	Data In	String
Height	Specifies the desired height.	Data In	Integer
StartIndex	The starting row index.	Data In	String
EndIndex	The ending row index.	Data In	String
Return	Returns boolean value indicating if the row height was set successfully or not.	Data Out	Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetRowValues

Sets values for a specific row in an Excel spreadsheet. By default, when the RowIndex parameter is set to -1, the function inserts the values at the end of the spreadsheet. This means that if you don't specify a specific row index, the values are appended to the bottom of the existing data in the spreadsheet.

SetRowValues method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that contains the source data.	Data In	String
RowNumber	Denotes row number where the values will be set or updated. In Excel, rows are numbered sequentially from top to bottom, starting with 1 by specifying the RowNumber, you indicate the specific row where the values should be placed. If -1 is passed as the RowNumber, it typically indicates that the values will be inserted at the end of the spreadsheet.	Data In	Integer

Sort

Organizes data within a specified cell range in either ascending or descending order.

Sort method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet where the data will be sorted.	Data In	String
CellRange	The range of cells containing the data to be sorted.	Data In	String
ColumnName	The name of the column by which the data will be sorted. ColumnName is an Enum data type that	Data In	ColumnName

Sort method parameters (continued)

Parameter	Description	Data Port Type	Data type
	represents Excel columns from A to AZ.		
SortingOrder	The sorting order (ascending or descending) for the data.	Data In	SortingOrder

VLookUp

Searches for a specific value in the first column of a specified cell range and then returns a corresponding value from a column you designate within the same row.

VLookUp method parameters

Parameter	Description	Data Port Type	Data type
Sheetname	Name of the worksheet to search within.	Data In	String
SearchText	The text to search for within the specified column.	Data In	String
LookupRange	Range to scan for the text.	Data In	String
ApproximateMatch	This is a logical value that specifies whether you want an exact match or an approximate match.	Data In	Boolean
Return	Returns boolean value indicating if macro was successfully run or not.	Data Out	Boolean

WrapText

Enable text wrapping for all cells in a specified row in an Excel worksheet. Text wrapping ensures that long text strings are displayed within the cell boundaries, automatically adjusting the row height to accommodate the wrapped text. By using the WrapText method, users can improve the readability of their data by ensuring that all text is fully visible within each cell, even if it extends beyond the cell's original width. This can be particularly useful for displaying lengthy text entries or multi-line content within spreadsheet cells.

WrapText method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet that	Data In	String

WrapText method parameters (continued)

Parameter	Description	Data Port Type	Data type
	contains the source data.		
RowNumber	The row number within the specified worksheet where text wrapping is set for all cells in that row.	Data In	Integer

WriteToRange

Writes a datatable provided in the Data parameter into a worksheet starting from the cell provided in the CellName parameter. Headers can also be included by setting the IncludeHeaders parameter.

WriteToRange method parameters

Parameter	Description	Data Port Type	Data type
SheetName	Name of the worksheet on which the data is written.	Data In	String
CellName	Name of the cell on which the data is written.	Data In	String
Data	Data that is written.	Data In	Data Table
IncludeHeaders	Boolean value that Indicates whether to include headers when writing the data. The default value is set to True.	Data In	Boolean

Parameters of the Microsoft Excel connector methods

Learn about the parameters of the Microsoft Excel connector methods in RPA Desktop Design Studio.

Parameters of the Microsoft Excel connector methods

Parameter Name	Description	Mandatory?
CellName	Cell name in a Microsoft Excel worksheet to perform an operation.	
ApproximateMatch	Boolean option to find an exact or an approximate match.	Not applicable
CellLocation	Cell location in a Microsoft Excel worksheet to perform an operation.	Yes
CellRange	Set of one or more continuous cells in a worksheet.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the Microsoft Excel connector methods (continued)

Parameter Name	Description	Mandatory?
	Example: A cell range of B2:E4 represents the cells from columns B through E and rows 2 through 4.	
SheetName	Name of the sheet from where the data is taken to create a chart.	Yes
ChartType	Type of chart you can create in a Microsoft Excel such as an area, bar, line, and pie.	Yes
Color	Color to set on a cell.	
SheetName	Name of the sheet from where the data is taken to create a Pivot table.	
SheetName	Name of the sheet from which the rows will be deleted.	Yes
SheetName	Name of the sheet from where the empty columns will be deleted.	Yes
ColumnIndex	Index number of the column. **Note:** Index number must be greater than zero.	Yes
ColumnName	Column name in a Microsoft Excel worksheet from which values are to be obtained.	Yes
CreateNewFile	Boolean values to indicate whether you want to create a file. If you choose • **True**: You must provide the filepath including the new file name. • **False**: You are not creating a file.	No
Return (Integer)	Returns the Boolean response on whether the column was deleted.	Not applicable
DisplayAlerts	Option to display alerts when the file is opened. If you choose: • **True**: Alert is displayed. • **False**: Alerts are not displayed.	No
Return	Returns the Boolean value that indicates whether a file was open or created. • **True**: A file was opened or created. • **False**: No file was opened or created.	Not applicable
Distinct	Option to get only unique values. Set to **True** to get only distinct values or to **False** to get all values from a cell range.	
EndColumnName	Name of the last column in a set of columns.	Yes

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the Microsoft Excel connector methods (continued)

Parameter Name	Description	Mandatory?
EndRowIndex	Last row number in a set of rows in a Microsoft Excel worksheet for a bulk operation such as to search, set values, or get values.	Yes
FileName	Name of the Microsoft Excel file.	Yes
Filepath	Path to the file including the file name. This parameter is used for both opening existing files or creating new files.	Yes
Filepath	Path where the exported PDF will be saved. You must provide the name of the file followed by the PDF extension.	Yes
FillType	One of the following fill types values: • xlFillFormats: Copy only the formats from the source range to the target range, and repeat if necessary. • xlFillSeries: Extend the values in the source range into the target range as a series (for example, '1, 2' is extended as '3, 4, 5'). Formats are copied from the source range to the target range, and repeat if necessary. • xlFillValues: Copy only the values from the source range to the target range, and repeat if necessary. • xlFillCopy: Copy the values and formats from the source range to the target range, and repeat if necessary. • xlFillDays: Extend the names of the days of the week in the source range into the target range. Copy the formats from the source range to the target range, and repeat if necessary. • xlFillWeekdays: Extend the names of the days of the workweek in the source range into the target range. Copy the formats from the source range to the target range, and repeat if necessary. • xlFillMonths: Extend the names of the months in the source range into the target range. Copy the formats from the source range to the target range, and repeat if necessary. • xlFillYears: Extend the years in the source range into the target range. Copy the formats from the source range to the target range, and repeat if necessary. • xlGrowthTrend: Extend the numeric values from the source range into the target range, assuming that the relationships between the numbers in the source range are multiplicative (for example, '1, 2,' is extended as '4, 8, 16' assuming that each number is a result of multiplying the previous number by some value). Copy the formats from the source range to the target range, and repeat if necessary. • xlLinearTrend: Extend the numeric values from the source range into the target range, assuming that the relationship	Yes

Parameters of the Microsoft Excel connector methods (continued)

Parameter Name	Description	Mandatory?
	between the numbers is additive (for example, '1, 2,' is extended as '3, 4, 5' assuming that each number is a result of adding some value to the previous number). Copy the formats from the source range to the target range, and repeat if necessary.	
FilterValue	Filter expression that consists of alphanumeric characters and one or more of the following operators: <, >, \, &, |, and =.	Yes
FindText	Text to search in a Microsoft Excel worksheet.	Yes
StartColumnName	Name of the first column in a set of columns.	Yes
FirstRowAsHeader	Option to indicate whether the first row in a Microsoft Excel worksheet is a header row.	Yes
FormatType	Format type that is supported in a Microsoft Excel. Example: Currency, Number, Long Date	Yes
Formula	Formula to be applied on a cell in a Microsoft Excel file.	Yes
Height	Height of a row in pixels.	Yes
HorizontalAlignment	Horizontal alignment formatting of the specified cells. Example: Left, Right, Center, Justify	Yes
IsVisible	Boolean value to indicate whether the file will be visible when it's open. If you choose: • **True**: The file is displayed. • **False**: The file is not displayed.	No
IncludeHeaders	Option to include the header row while getting a used cell range in a Microsoft Excel.	No
LookupRange	Range of columns of data. The values in the first column of the range are the values searched.	Yes
OldSheetName	Current name of the worksheet in a Microsoft Excel file that you want to rename.	Yes
MacroName	Name of the macro to run.	Yes
NewSheetName	New name of the worksheet in a Microsoft Excel file	Yes
Password	Password to open a protected file.	No
PivotTableName	Name of the new PivotTable.	
ReadOnlyMode	Boolean value to indicate whether the file will be opened or created in read-only mode. If you choose:	No

Parameters of the Microsoft Excel connector methods (continued)

Parameter Name	Description	Mandatory?
	• **True**: The file is opened or created in read-only mode. • **False**: The file is opened or created in write mode.	
DestinationRange	The range of cells to be filled in the Microsoft Excel file.	Yes
ReplaceTo	Text with which to replace the found text in a Microsoft Excel worksheet.	Yes
RowIndex	Index value of a row.	Yes
RowNumber	Row number in a Microsoft Excel worksheet to perform an operation.	Yes
SaveFolderpath	Folder path to save the file.	Yes
SearchColumn	Column name in a Microsoft Excel worksheet where to search the specified text.	Yes
Return (String)	Returns the name of the active or selected sheet.	Not applicable
SheetName	Name of the sheet that will be deleted.	Yes
SheetName	Name of the sheet from where data will be exported.	Yes
SheetName	The name of the sheet where the data will be filled.	Yes
SearchText	Text to search in a Microsoft Excel worksheet.	Yes
saveChanges	Boolean values to indicate whether the changes will be saved while closing. • **True**: The method requests inputs on whether to save changes. • **False**: The method closes the file and unsaved changes, if any, are lost.	Yes
SheetName	Name of the worksheet added to the file.	Yes
SheetName	Name of the sheet where the formula will be applied.	
SheetName	Name of the sheet from where the column will be deleted.	Yes
SortingOrder	Sorting order—ascending or descending—set on a column.	
SheetName	Name of the sheet from where the row will be deleted.	Yes
SheetName	Name of the sheet from where the cell data will be deleted.	Yes
StartRowIndex	First row number in a set of rows in a Microsoft Excel worksheet for a bulk operation, such as to search, set values, get values.	Yes
Sheetname	Name of the sheet from where the cells will be copied.	Yes
Return	Returns the integer value of the number of columns counted.	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the Microsoft Excel connector methods (continued)

Parameter Name	Description	Mandatory?
SheetName	Name of the sheet on which the column count will be performed.	Yes
Value	Value to be set on a cell.	Yes
VerticalAlignment	Vertical alignment formatting of the specified cells. Example: Top, Middle, Bottom	No
Width	Width of a column in a Microsoft Excel.	Yes
Password	Option to make the Excel file password-protected. Provide the password in string format.	No

Enter inputs for parameters

To enter inputs for the parameters, see Configure port properties.

Microsoft Outlook

The Microsoft Outlook connector enables you to automate standard actions on the Microsoft Outlook application as part of an automation. For example, you can automate sending or replying to emails.

The Microsoft Outlook connector exposes methods to automate the actions on Microsoft Outlook. These methods can work with other methods or components in an automation.

To use the Microsoft Outlook connector, see Use a connector in RPA Desktop Design Studio.

To expose the Microsoft Outlook methods, see Use connector method.

To use the Microsoft Outlook connector methods, see Use a component in RPA Desktop Design Studio.

Note:
32 bit Microsoft Office installations are not supported.

Microsoft Outlook connector methods

The Microsoft Outlook connector methods automate various actions on the Microsoft Outlook. In an automation flow, the methods are connected with other methods and components. To use the methods, you must first expose them.

The Microsoft Outlook connector enables the automation of routine tasks within the Microsoft Outlook application, integrating these functions into broader automated workflows.

You can automate processes such as sending or replying to emails without manual intervention. This connector provides various methods to facilitate the automation of actions within Microsoft Outlook. These methods can be seamlessly combined with other methods or components within an automation framework, enabling more complex and efficient workflow designs.

AddFolder

Adds a new folder within a specified hierarchy and, optionally, a sub folder to the Outlook account set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AddFolder method parameters

Parameter	Description	Data port type	Data type
MainFolder	Name of the folder that the method adds to the Outlook account. This parameter specifies the main folder where the new folder is added.	Data in	String
SubFolderName	Name of the sub folder that the method adds under the main folder. This parameter specifies the name of the new folder to be created. If you use this parameter, you must use the IsSubFolder parameter.	Data in	String
IsSubFolder	Option to indicate that the folder created in the SubFolderName parameter is a subfolder under the main folder. This parameter indicates whether the SubFolderName must be added as a subfolder within the main folder. Defaults to False, meaning SubFolderName is added directly under the main folder.	Data in	Boolean

Close

Closes the Microsoft Outlook explorer by specifying the profile name.

This method can be used as a cleanup activity after all automation tasks are completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Close method parameters

Parameter	Description	Data port type	Data type
ProfileName	This parameter specifies the Outlook profile name that you want to close.	Data in	String

DeleteFolder

Deletes the specified folder and all subfolders under it.

DeleteFolder method parameters

Parameter	Description	Data port type	Data type
FolderName	Name of the folder that the method deletes.	Data in	String

DeleteMail

Deletes one or more emails. Deletes an email based on its unique entry ID.

Tip:
Use the GetMails method to provide the emails the DeleteMail method will delete.

DeleteMail method parameters

Parameter	Description	Data port type	Data type
MailId	Takes the email from which the method deletes the emails. This parameter specifies the unique entry ID of the email that needs to be deleted.	Data in	String

ForwardMail

Forwards an email based on its unique entry ID to a specified email address (EmailID).

ForwardMail method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email that needs to be forwarded.	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ForwardMail method parameters (continued)

Parameter	Description	Data port type	Data type
EmailID	This parameter specifies the email address to which the email must be forwarded.	Data in	String
CC	This parameter specifies Email address to send a carbon copy (CC) of the forwarded email.	Data in	String
BCC	This parameter specifies Email address to send a blind carbon copy (BCC) of the forwarded email.	Data in	String
Subject	This parameter specifies the subject line of the forwarded email.	Data in	String
Return	This method returns a boolean value indicating whether the email was successfully forwarded. A return value of true signifies that the operation was successful.	Data out	Boolean

GetAttachmentNames

Retrieves a list of attachment names associated with an email specified by its unique entry ID.

GetAttachmentNames method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email for which attachment names are to be retrieved.	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetExistingAccounts

Retrieves information about configured accounts such as a list of configured accounts and their count.

This is helpful when there are multiple accounts configured in the outlook.

GetExistingAccounts method parameters

Parameter	Description	Data port type	Data type
Accounts	This parameter is passed by reference and is expected to be a List (Of String). Upon calling this method, it is populated with the list of configured account names.	Data out	List1
Count	This parameter is passed by reference. Upon calling this method, this parameter is populated with the count of configured accounts.	Data out	Int32

GetFolderNames

Retrieves and returns a list of folder names from the active outlook account.

GetFolderNames method parameters

Parameter	Description	Data port type	Data type
Return	Returns the list of folder names from the active outlook account.	Data out	List1

GetMail

Retrieves all details of an email, specified by its unique entry ID (MailId).

To specify additional criteria for retrieving all details of an email, on the GetMail method bar, click the method settings icon ( ), select the required mail items such as CC, BCC, Subject, Body, Sender, To, AttachmentsCount, ReceivedTime, EntryId.

GetMail method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique	Data in	String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetMail method parameters (continued)

Parameter	Description	Data port type	Data type
	entry ID of the email to retrieve details from.		

GetMails

Retrieves a list of mail entry IDs from a specified folder within an email system.

The GetMails method retrieves a list of mail entry IDs from a specified folder within an email system.

GetMails method parameters

Parameter	Description	Data port type	Data type
FolderName	This parameter specifies the name of the folder from which to retrieve mail entry IDs. Default value is "Inbox".	Data in	String
Filter	This parameter specifies a filter condition to apply when retrieving mail entry IDs.	Data in	String
NoOfMails	This parameter specifies the maximum number of mail entry IDs to retrieve. Default value is 10.	Data in	Int32
UnreadOnly	This parameter indicates whether to retrieve only unread mails (True) or all mails (False). Default is True.	Data in	Boolean
AvoidMeetingItems	This parameter specifies whether to exclude meeting items from the retrieved mail entry IDs. Default is True.	Data in	Boolean
FetchingOrder	This parameter specifies the order in which mails are fetched. For example,	Data in	FetchingOrder

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetMails method parameters (continued)

Parameter	Description	Data port type	Data type
	FIFO, LIFO. Default is FIFO.		
Return	This parameter returns a list of emails from the specified folder.	Data out	List1
Count	This parameter specifies total count of mail entry IDs retrieved.	Data out	Int32

GetSenderName

Retrieves the sender's email address associated with an email specified by its unique entry ID.

GetSenderName method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email for which the sender's email address is to be retrieved.	Data in	String
Return	This method returns a string value indicating sender name.	Data out	String

MarkAsRead

Marks an email as read based on its unique entry ID.

MarkAsRead method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email for which the sender's email address is to be retrieved.	Data in	String
Return	This method returns a boolean value indicating whether the email was successfully marked as read.	Data out	Boolean

MarkAsRead method parameters (continued)

Parameter	Description	Data port type	Data type
	A return value of true signifies that the operation was successful.		

MarkAsUnread

Marks an email as unread based on its unique entry ID.

MarkAsUnread method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email that needs to be marked as unread.	Data in	String
Return	This method returns a boolean value indicating whether the email was successfully marked as unread. A return value of true signifies that the operation was successful.	Data out	Boolean

MoveMail

Moves an email based on its unique entry ID from one folder to another folder within the email system.

MoveMail method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email that must be moved.	Data in	String
DestinationFolder	This parameter specifies the name or path of the destination folder where the email must be moved.	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ReadMsgFile

Reads the contents of a .msg file from the file system.

ReadMsgFile method parameters

Parameter	Description	Data port type	Data type
Filepath	This parameter specifies the path to the .msg file that must be read.	Data in	String
Body	This parameter is passed by reference (ByRef) and is populated with the body content of the .msg file after the method call.	Data out	String

Reply

Generates and sends a reply to an email specified by its unique entry ID.

Reply method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email to which the reply is sent.	Data in	String
CC	This parameter specifies Email address to send a carbon copy (CC) of the reply.	Data in	String
BCC	This parameter specifies email address to send a blind carbon copy (BCC) of the reply.	Data in	String
Subject	This parameter specifies the subject line of the reply email.	Data in	String
Body	This parameter specifies the body content of the reply email.	Data in	String
Attachments	This parameter specifies file paths of the attachments to	Data in	String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reply method parameters (continued)

Parameter	Description	Data port type	Data type
	include in the reply email. Multiple files can be separated by the pipe symbol or the vertical bar (|) to split the attachment file paths. When you upgrade automations to plugins above 13.0, update earlier automations that use "," or ";" with "|", when multiple file paths are passed. Use the pipe symbol or the vertical bar (|) to split the attachment file paths.		
IsHtmlBody	This parameter indicates whether the body content of the reply email is in HTML format. Default is False.	Data in	Boolean
Return	This method returns a boolean value indicating whether the reply was successfully sent. A return value of true signifies that the operation was successful.	Data out	Boolean

SaveAllAttachments

Saves all attachments from an email specified by its unique entry ID into a specified folder path.

SaveAllAttachments method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email from which	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.

SaveAllAttachments method parameters (continued)

Parameter	Description	Data port type	Data type
	attachments must be saved.		
FolderPath	This parameter specifies the path of the folder where attachments must be saved.	Data in	String

SaveAttachment

Saves specified attachment of a mail with given entry ID into a given file.

SaveAttachment method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email from which attachment must be saved.	Data in	String
AttachmentName	This parameter specifies the name of the attachment that must be saved.	Data in	String
Filepath	This parameter specifies the path of the file where attachment must be saved.	Data in	String

SaveMail

Saves an email specified by its unique entry ID (MailId) to a file at a specified file path.

SaveMail method parameters

Parameter	Description	Data port type	Data type
MailId	This parameter specifies the unique entry ID of the email to be saved.	Data in	String
Filepath	This parameter specifies the path where the email must be saved as a file	Data in	String
SaveType	This parameter specifies the format in	Data in	MsgSaveType

SaveMail method parameters (continued)

Parameter	Description	Data port type	Data type
	which the email must be saved. Default is MsgSaveType.olMSG, indicating Microsoft Outlook MSG format.		

SendMail

Sends an email to recipient. It offers various optional parameters to customize the email, including the ability to add images, set the sender's address, and specify CC and BCC recipients.

SendMail method parameters

Parameter	Description	Data port type	Data type
ToEmailId	This parameter specifies email address of the recipient.	Data in	String
Image	This parameter specifies an optional image to include in the email.	Data in	Drawing.Bitmap
From	This parameter specifies the email address of the sender. If not specified, the default sender's address is used.	Data in	String
CC	This parameter specifies Email address to send a carbon copy (CC) to.	Data in	String
BCC	This parameter specifies email address to send a blind carbon copy (BCC) to.	Data in	String
Subject	This parameter specifies the subject line of the email.	Data in	String
Body	This parameter specifies the body content of the email.	Data in	String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SendMail method parameters (continued)

Parameter	Description	Data port type	Data type
Attachments	This parameter specifies file paths of the attachments to include in the email. Multiple files can be separated by the pipe symbol (|) to split the attachment file paths. When you upgrade automations to plugins above 13.0, update earlier automations that use "," or ";" with "|", when multiple file paths are passed. Use the pipe symbol or the vertical bar (|) to split the attachment file paths.	Data in	String
IsHtmlBody	This parameter indicates whether the body of the email is in HTML format. Default is False.	Data in	Boolean
Return	This method returns a boolean value indicating whether the email was successfully sent. A return value of true signifies that the operation was successful.	Data out	Boolean

SentAs

Sends an email on behalf of another email account.

SentAs method parameters

Parameter	Description	Data port type	Data type
ToEmailId	This parameter specifies email address of the recipient.	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

SentAs method parameters (continued)

Parameter	Description	Data port type	Data type
SentOnBehalfEmailID	This parameter specifies email address on whose behalf the email will be sent.	Data in	String
Subject	This parameter specifies the subject line of the email.	Data in	String
Body	This parameter specifies the body content of the email.	Data in	String
Attachments	This parameter specifies file paths of the attachments to include in the email. Multiple files can be separated by the pipe symbol (|) to split the attachment file paths. When you upgrade automations to plugins above 13.0, update earlier automations that use "," or ";" with "|", when multiple file paths are passed. Use the pipe symbol or the vertical bar (|) to split the attachment file paths.	Data in	String
IsHtmlBody	This parameter indicates whether the body of the email is in HTML format. Default is False.	Data in	Boolean

SetAccount

Specifies the outlook account on which you want to perform operations for your automation tasks.

The SetAccount method must be used initially, before any other method of this connector, to specify or set the context or email account for subsequent methods to execute upon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetAccount method parameters

Parameter	Description	Data port type	Data type
AccountName	This parameter specifies the Outlook email account ID on which you want to perform operations.	Data in	String

Microsoft Word

The Microsoft Word connector enables you to perform various tasks on a Microsoft Word document through its methods. For example, you can add a footer to a document.

- To use the Microsoft Word connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Note:
32 bit Microsoft Office installations are not supported.

Microsoft Word connector methods

The Microsoft Word connector methods enable you to perform various day-to-day tasks with Microsoft Word documents and automate them. For example, add a page footer.

Open

Opens a Microsoft Word file saved on the local disk.

Note:
You must execute this method before executing any other method on the Microsoft Word connector.

Open method parameters

Parameter	Description	Data port type	Data type
Filepath	Specifies the path to the Microsoft Word file in the local disk.	Data in	String
Timeout	Specifies the time after which the operation times out.	Data in	Integer
Password	Use a password if the document is password protected.	Data in	String
Return	Returns the boolean value based on the outcome of the operation. If True, the file is opened. Else, if False, the file failed to open.	Data out	Boolean

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on the issues related to the Open method, see KB article KB1123558 and KB article KB1123548.

AddFooter

Adds a footer to the Microsoft Word document in the specified font size.

To use this method, provide the text to be added to the Text parameter and the font size in which the footer text needs to be displayed to the FontSize parameter. Default value of the FontSize parameter is 12.

Note:
You must execute the Open method before executing this method.

AddFooter method parameters

Parameter	Description	Data port type	Data type
Text	Specifies the text in the footer.	Data in	String
FontSize	Specifies the font size of the text in the footer. Default value is 12.	Data in	Integer

To provide inputs, see Configure port properties

AddHeader

Adds a header to a Microsoft Word document in specified font size.

To use this method, provide the text to be added to the Text parameter and the font size in which the header text needs to be displayed to the FontSize parameter. Default value of the FontSize parameter is 12.

Note:
You must execute the Open method before executing this method.

AddHeader method parameters

Parameter	Description	Data port type	Data type
Text	Specifies the text in the header.	Data in	String
FontSize	Specifies the font size of the text in the header. Default value is 12.	Data in	Integer

CellCopy

Copies the content of a table cell identified using the row index and column index of the table in a Microsoft Word document.

To use this method, provide the row index to the RowIndex parameter and column index to the ColumnIndex parameter. The default value for RowIndex and ColumnIndex is -1 each.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You must execute the SetTable method before executing this method.

CellCopy method parameters

Parameter	Description	Data port type	Data type
RowIndex	Index of the row of the cell that needs to be copied. The row index value must be equal or greater than zero. Default value is -1, which means there is no cell available.	Data in	Integer
ColumnIndex	Index of the column of the cell that needs to be copied. The column index must be equal to or greater than zero. Default value is -1 which means there is no cell available.	Data in	Integer

CellPaste

Pastes the copied table cell content into a table cell identified using the row index and column index of the table in a Microsoft Word document.

To use this method, provide the row index to the RowIndex parameter and column index to the ColumnIndex parameter. The default value for RowIndex and ColumnIndex is -1 each.

Note:
You must execute the SetTable and CellCopy methods before executing this method.

CellPaste method parameters

Parameter	Description	Data port type	Data type
RowIndex	Index of the row of the cell to which data needs to be pasted. The row index value must be equal or greater than zero. Default value is -1, which means there is no row available to paste data.	Data in	Integer
ColumnIndex	Index of the column of the cell to which data needs to be pasted. The column index must be equal to or	Data in	Integer

CellPaste method parameters (continued)

Parameter	Description	Data port type	Data type
	greater than zero. Default value is -1 which means there is no column available to paste data.		

Close

Closes the last opened Microsoft Word document. While closing the document, it is optional to save changes.

If modification done to the word document needs to be saved then set the saveChanges boolean parameter to True, else set it to False. By default the saveChanges boolean parameter is set to True.

Note:
You must execute the Open method before executing this method.

Close method parameters

Parameter	Description	Data port type	Data type
saveChanges	Specifies whether to save the changes made in the word document before closing. By default, it is set to True, meaning the changes will be saved before closing. If changes are not required to be saved before closing, set to False.	Data in	Boolean

DeleteColumn

Deletes a column from a table based on a specified index value of the column in a Microsoft Word document.

To use this method, provide the index of the column that needs to be deleted to the ColumnIndex parameter. Default value is -1.

Note:
You must execute the SetTable method before executing this method.

DeleteColumn method parameters

Parameter	Description	Data port type	Data type
ColumnIndex	Index of the column that needs to be deleted. The column	Data in	Integer

DeleteColumn method parameters (continued)

Parameter	Description	Data port type	Data type
	index must be equal to or greater than zero. Default value is -1 which means there is no column available to be deleted.		

DeletePage

Deletes a page based on a specified index value from a Microsoft Word document.

To use this method, provide the index value of the page that needs to be deleted to the PageIndex parameter.

Note:
You must execute the Open method before executing this method.

DeletePage method parameters

Parameter	Description	Data port type	Data type
PageIndex	Specifies the index number of the page that needs to be removed or deleted. If you don't provide any index number, the method deletes the first page by default.	Data in	Integer

DeleteRow

Deletes a row based on the specified index value from a table in a Microsoft Word document.

To use this method, provide the index of the row that needs to be deleted to the RowIndex parameter. Default value is -1.

Note:
You must execute the SetTable method before executing this method.

DeleteRow method parameters

Parameter	Description	Data port type	Data type
RowIndex	Index of the row that needs to be deleted. The row index value must be equal or greater than zero. Default value is -1, which means there is	Data in	Integer

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DeleteRow method parameters (continued)

Parameter	Description	Data port type	Data type
	no row available to be deleted.		

DeleteTable

Deletes a table from a Microsoft Word document.

If the document has multiple tables, the method deletes the first table in the document.

Note:
You must execute the SetTable method before executing this method.

ExportToPDF

Exports a Microsoft Word document to a PDF document at a specified path.

To use this method, provide the path where the PDF file needs to be extracted to the Filepath parameter.

Note:
You must execute the Open method before executing this method.

ExportToPDF method parameters

Parameter	Description	Data port type	Data type
Filepath	Specifies the folder path where the Word document is exported to PDF.	Data in	String

Find

Finds the text you specify in a Microsoft Word document and returns a Boolean response.

To use this method, provide the text that you want to find in the document to the Text parameter.

Find method parameters

Parameter	Description	Data port type	Data type
Text	Text to find in the Word document.	Data in	string
Return	Returns a true/false value indicating whether the text is found in the Word document.	Data out	Boolean

GetCellValueByIndex

Returns the value of a cell in a table in a Microsoft Word document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To use this method, provide the index of the cell to retrieve the cell value to the CellIndex parameter.

Note:
You must execute the SetTable method before executing this method.

GetCellValueByIndex method parameters

Parameter	Description	Data port type	Data type
CellIndex	Index of a cell to retrieve the value.	Data in	String
Return	Returns the value present in the required cell.	Data out	String

GetFooterText

Returns the footer text in a Microsoft Word document.

Note:
You must execute the Open method before executing this method.

GetFooterText method parameters

Parameter	Description	Data port type	Data type
Return	Returns the footer text in the string format.	Data out	String

GetHeaderText

Returns the header text in a Microsoft Word document.

Note:
You must execute the Open method before executing this method.

GetHeaderText method parameters

Parameter	Description	Data port type	Data type
Return	Returns the header text in the string format.	Data out	String

GetPageCount

Returns the total number of pages in a Microsoft Word document.

GetPageCount method parameters

Parameter	Description	Data port type	Data type
Return	Returns the integer number or numeric value of the total	Data out	Integer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetPageCount method parameters (continued)

Parameter	Description	Data port type	Data type
	pages in a Word document.		

GetRowIndexByValue

Returns the row index value of a row based on the specified value of a cell in the row.

To use this method, provide the document table to the Table parameter to retrieve the index of the row based on the value provided to the Value parameter.

Note:
You must execute the GetTable and SetTable methods before executing this method.

GetRowIndexByValue method parameters

Parameter	Description	Data port type	Data type
Table	Table object in the word document as a reference to perform further actions on it.	Data in	Object
Value	Search text that corresponds to a certain row in the table.	Data in	String

GetTable

Returns the data in a table of a Microsoft Word document as a table object and data table. If the document contains multiple tables, you can specify the table index to identify the table for the method. You can also specify the table type, if needed.

To use this method, provide the index of the expected table to the TableIndex parameter. Set the FirstRowIsHeader parameter to True if the first row needs to be treated as header, else it is set to False.

Depending on the table structure, you can optionally configure the table type for the method. To configure the table, do the following steps.

1. Click the method settings icon ( ).
2. Select the table type.
3. Click **OK**.

GetTable method parameters

Parameter	Description	Data port type	Data type
		Data in	
TableIndex	Index of a table in a Microsoft Word document.	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetTable method parameters (continued)

Parameter	Description	Data port type	Data type
FirstRowIsHeader	Boolean value to indicate whether the method should treat the first row as a header of the table. By default, it is set to True, which means that the first row is considered as a header. If first row is not header, then set this parameter to False.	Data in	Boolean
Table	Returns the data in a table as an object.	Data out	Object
Data	Returns the data in the table.	Data out	Data

GetTableCellValues

Returns the values in one or more table cells.

To use this method, provide the indices of the table cells whose value is required, in the configuration window.

To specify the number of cells, you must configure the index values of the cells. To configure, do the following.

1. Click the method settings icon ( ).
2. Click ( ).
3. Enter the index values for the cells.
4. Repeat the steps to add more index values.
5. Click **OK**.

GetTableCount

Returns the number of tables in a Microsoft Word document. You can optionally specify the type of table for the method to identify.

Select the table type from the config window. If you expect to receive total number of tables in a word document, then the table type is set to 'Default'. If a count of nested tables within a cell in a table is expected then set the table type to 'Nested'. Provide the index of table which has nested tables to the TableIndex parameter and table cell index from which count of nested tables is expected to CellIndex parameter.

To configure the type of table, do the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Click the method settings icon ( ).
2. Select the table type.
3. Click **OK**.

GetTableCount method parameters

Parameter	Description	Data port type	Data type
Return	Returns the integer value of total number of tables in word document.	Data in	Integer

GetTableRowData

Returns the values in one or more cells of a row in a Microsoft Word document. You can specify the index values of the cells of the row.

Note:
You must execute the SetTable method before executing this method.

You can configure the index values of the cells in a row. To configure, do the following steps.

1. Click the method settings icon ( ).
2. Click the add index value icon ( ).
3. Enter the index value of the cell.
4. Repeat the steps to add more index values.
5. Click **OK**.

GetTableRowData method parameters

Parameter	Description	Data port type	Data type
RowIndex	Index of the row from which data needs to be retrieved. Default value is 0, meaning the data will be fetched from the first row.	Data in	Integer

GetText

Returns all the text content in a Microsoft Word document.

GetText method parameters

Parameter	Description	Data port type	Data type
Return	Returns the complete document's text in a string format.	Data Out	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

InsertNewColumn

Inserts a new column in the first table in the document based on the specified index value.

To use this method, provide the index number at which a new column needs to be inserted to the ColumnIndex parameter. Default value is -1, which means that a column is inserted before the first column.

InsertNewColumn method parameters

Parameter	Description	Data port type	Data type
ColumnIndex	Index at which new column must be inserted. Default value is -1, which means there are no columns in the table.	Data in	Integer

InsertNewRow

Inserts a new row based on the index value.

To use this method, provide the index number at which a new row needs to be inserted to the RowIndex parameter. Default value is -1, which means a row is inserted before the first row.

InsertNewRow method parameters

Parameter	Description	Data port type	Data type
RowIndex	Index at which new row must be inserted. Default value is -1, which means there are no rows in the table.	Data in	Integer

InsertPicture

Inserts an image into Microsoft Word document from the file path provided at a particular bookmark.

To use this method, provide the file path of the image that needs to be inserted to the ImageFilePath parameter. Provide the identification place at which the image needs to be inserted in the Word document to the Bookmark parameter.

InsertPicture method parameters

Parameter	Description	Data port type	Data type
ImageFilePath	System folder path to the image that needs to be inserted.	Data in	String
Bookmark	Point at which the image needs to be added.	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

InsertTable

Inserts a table into a Microsoft Word document. You can optionally customize the document by configuring it before inserting.

To use this method, the point at which the table needs to be added is provided to the Bookmark parameter and the table that needs to be added should be passed to the Data parameter.

Note:
Before executing this method, you must execute the GetTable and SetTable methods.

To customize the table before inserting, do the following steps.

1. Click the method settings icon( ).
2. Select Include Headers.
3. Select border style and autofit behavior.
4. Select Include Empty Rows.
5. To ignore specific columns, click the add index value icon ( ).
6. Enter the index value of the column.
7. Click **OK**.

InsertTable method parameters

Parameter	Description	Data port type	Data type
Bookmark	Specific position in the Word document where the table will be inserted. Before inserting the table, you must add a bookmark.	Data in	String
Data	Table data that will be inserted at the bookmark point.	Data in	Data

InsertText

Inserts text in the beginning of the Microsoft Word document.

To use this method, provide a value that needs to be inserted to the text parameter.

InsertText method parameters

Parameter	Description	Data port type	Data type
text	Text value that needs to be inserted.	Data In	String

IsOpen

Checks whether a Microsoft Word document is open.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IsOpen method parameters

Parameter	Description	Data port type	Data type
Filepath	System folder path to word document or file.	Data in	String
Return	System folder path to word document or file.	Data Out	Boolean

MergeByCellIndices

Merges the range of cells specified in the form of index value range.

To use this method, provide the starting cell index value to the StartCellIndex parameter and ending cell index value to the EndCellIndex parameter.

MergeByCellIndices method parameters

Parameter	Description	Data port type	Data type
StartCellIndex	Index of starting cell point to start merging cells.	Data in	Integer
EndCellIndex	Index of ending cell point to end merging cells.	Data in	Integer

MergeByRowCol

Merges a range of cells of a table in a Microsoft Word document.

To use this method, provide the starting row index to the StartRowIndex parameter, ending row index to the EndRowIndex parameter, and starting column index to the StartColIndex parameter and ending column index to the EndColIndex parameter.

MergeByRowCol method parameters

Parameter	Description	Data port type	Data type
StartRowIndex	Index of starting row.	Data in	Integer
StartColIndex	Index of starting column.	Data in	Integer
EndRowIndex	Index of ending row.	Data in	Integer
EndColIndex	Index of ending column.	Data in	Integer

ReplaceBookmark

Replaces a bookmark in a Microsoft Word document with the specified text.

To use this method, provide the identification bookmark to Bookmark parameter with the text to be replaced given to the ReplaceText parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ReplaceBookmark method parameters

Parameter	Description	Data port type	Data type
Bookmark	Identification bookmark in the word document.	Data in	String
ReplaceText	Replace text at the bookmarked location with the new value provided.	Data in	String

ReplaceBookmarks

Finds and replaces multiple bookmarks in a Microsoft Word document with the specified text.

To use this method, provide value to the added field(s) which is the text with which the bookmark needs to be replaced.

Provide more details of the bookmark text to replace as follows:

1. Double-click the component.
2. In the PROVIDE LABELS/BOOKMARKS dialog box, click the click to add label icon ( ) and enter the bookmark to replace it.

   Repeat this step to add more bookmarks.
3. Click **OK**.

ReplaceBookmarks method parameters

Parameter	Description	Data port type	Data type
Text	Text to be replaced in a Microsoft Word document.	Data in	String

ReplaceFooterText

Finds and replaces the footer text in a Microsoft Word document with the specified text.

Provide the original footer text value that is present in the word document to the FindText parameter and the text with which original footer text has to be replaced to the ReplaceText parameter.

ReplaceFooterText method parameters

Parameter	Description	Data port type	Data type
FindText	Current value that is present in the footer.	Data in	String
ReplaceText	Value that is required to replace the FindText value with, in the footer.	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ReplaceHeaderText

Finds and replaces the header text in a Microsoft Word document with the specified text.

Provide the original header text value that is present in the word document to the FindText parameter and the text with which original header text has to be replaced to the ReplaceText parameter.

ReplaceHeaderText method parameters

Parameter	Description	Data port type	Data type
FindText	Current value that is present in the header.	Data in	String
ReplaceText	Value that is required to replace the FindText value with, in the header.	Data in	String

ReplaceStaticText

Finds and replaces the text in a Microsoft Word document with the specified text. Replaces bookmarks, headings, or any text based on the configuration.

To use this method, provide a value to the added field which is the text with which the label / bookmark needs to be replaced.

You must configure the method before executing. To configure, do the steps.

1. Click the method settings icon ( ).
2. Click the add text icon ( )
3. Enter the heading, bookmark, or text that you want to replace.
4. Repeat the steps to enter more text.
5. Click **OK**.

ReplaceText

Finds and replaces the text in a Microsoft Word document with the specified text.

Provide the original text value that is present in the word document to the FindText parameter and the text with which original text has to be replaced to the ReplaceText parameter.

ReplaceText method parameters

Parameter	Description	Data port type	Data type
FindText	Current value that is present in the Word document.	Data in	String
ReplaceText	Value that is required to replace the FindText value with, in the Word document.	Data in	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resize

Resizes the window of a Microsoft Word document according to the left, top, width and height parameters.

To use this method, specify the Left and Top margins and the Width and Height parameters for the content.

Resize method parameters

Parameter	Description	Data port type	Data type
Left	Left margin of content in word document.	Data in	Integer
Top	Top margin of content in word document.	Data in	Integer
Width	Width of the word document.	Data in	Integer
Height	Height of the word document.	Data in	Integer

Save

Saves the opened Microsoft Word document.

SaveAs

Saves a copy of the opened Microsoft Word document with another name at a location provided in the Filepath parameter.

To use this method, provide the new location to which the Microsoft Word document needs to be saved in the Filepath parameter. If the file needs to be password protected, pass the value to the Password parameter.

SaveAs method parameters

Parameter	Description	Data port type	Data type
Filepath	System folder path to the word document or file.	Data in	String
Password	Open a password protected word document with the password provided. The default value is empty.	Data in	String

SetTable

Sets a table in a Microsoft Word document.

To use this method, it is necessary to pass the table object to the Table parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetTable method parameters

Parameter	Description	Data port type	Data type
Table	Table that needs to be set in the word document.	Data in	Object

SetTableCellValues

Sets the content of a table cell in a Microsoft Word document.

To use this method, provide the indices of the table cells whose value needs to be set in the configuration window.

Provide one or more cell indexes and value types as follows:

1. Double-click the component.
2. In the PROVIDE CELL INDEXES dialog box, click the click to add cell index icon ( ) and enter a cell index and select a value type.

   Repeat this step to add more cell indexes and value types.
3. Click **OK**.

SetTableRowData

Sets the content in a row of a table in a Microsoft Word document.

To use this method, index of the table row at which the data needs to be set is passed to the RowIndex parameter.

Note:
You must execute the SetTable method before executing this method.

Input

RowIndex

Provide the column index as follows:

1. Double-click the component.
2. In the PROVIDE COLUMN INDEXES dialog box, click the click to add cell index icon ( ) and enter a column index.
3. Click **OK**.

SetTableRowData method parameters

Parameter	Description	Data port type	Data type
RowIndex	Index of row at which data needs to be set. Default value is 0, meaning the data will be set to the first row.	Data in	Integer

Parameters of the Microsoft Word connector methods

Learn about the parameters of the Microsoft Word connector methods in RPA Desktop Design Studio.

Parameters of the Microsoft Word connector methods

Parameter Name	Description	Mandatory?
Bookmark	Bookmark in a Microsoft Word document.	Yes
CellIndex	Index of a cell in a table.	Yes
ColumnIndex	Column sequence in a table.	Yes. The column index must be equal to or greater than zero.
Data	Table that contains data to add into a Microsoft Word document.	Yes
Filepath	Folder location including the name of the document.	Yes
EndCellIndex	Last cell number of a range.	Yes
ImageFilePath	The path to the image with the filename that you want to insert.	Yes
Filepath	location where the document will be exported as a PDF.	Yes. You must provide the filename and the PDF extension.
Bookmark	Exact location on the Word document where the image will be inserted. You must define a bookmark in the document first.	Yes
FilePath	Path to the Microsoft Word file including the filename.	Yes
EndColIndex	Last column number of a range for a bulk operation on a table, such as merging cells, searching text, and setting or getting values.	Yes
EndRowIndex	Last row number of a range for a bulk operation on a table, such as merging cells, searching text, and setting or getting values.	Yes
FirstRowIsHeader	Boolean value to indicate whether the method should treat the first row as a header of the table.	No
PageIndex	Page index value.	No.
Return (Boolean)	Boolean response to indicate whether the request was successful.	Not applicable
Timeout	Seconds after which the request to open the document will time out if no response is received.	No
StartCellIndex	First cell number of a range.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the Microsoft Word connector methods (continued)

Parameter Name	Description	Mandatory?
StartColIndex	First column number of a range for a bulk operation on a table, such as merging cells, searching text, and setting or getting values.	Yes
StartRowIndex	First row number of a range for a bulk operation on a table, such as merging cells, searching text, and setting or getting values.	Yes
RowIndex	Row sequence in a table in the document.	Yes. The row index value must be equal or greater than zero.
Table	The table data.	Yes
TableIndex	Index of a table in a Microsoft Word document.	No
Text Or, FindText Or, ReplaceText	Text to be added in a Microsoft Word document in the AddFooter, AddHeader, or InsertText methods. Text to be searched in the document in the Find method. Text to be replaced within the ReplaceBookmark, ReplaceFooterText, ReplaceHeaderText, or ReplaceText methods.	Yes
Value	Value in a cell.	Yes
Text	Text to be added to the footer.	Yes
FontSize	Font size of the footer text.	No
Text	Custom text to be added to the header.	Yes
FontSize	Font size of the header text.	Yes
Text	Text to find in the document.	Yes
Return (String)	Returns the footer text.	Not applicable
Return (Integer)	Returns the number of pages.	Not applicable
Return (String)	Returns the header text.	Not applicable
Return (String)	Returns the text content.	Not applicable
Text	Text that is inserted in the Word document.	Yes
Return (Boolean)	Returns the Boolean value to indicate whether a Word document is open.	Not applicable
saveChanges	Boolean response to indicate whether you want to save the changes before closing the document.	No
Return (Boolean)	Boolean response to whether the text was found in the document.	Not applicable
Table (Object)	Returns the data in a table as an object.	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the Microsoft Word connector methods (continued)

Parameter Name	Description	Mandatory?
Data (DataTable)	Returns the data in the table.	Not applicable
Cell Index (Object)	Returns the value of the cell.	Not applicable
Return (Integer)	Returns the total count of tables in the Microsoft Word document.	Not applicable
Row index (Object)	Returns the data in the cell based on the index value.	Not applicable
ColumnIndex	The index value of the column based on which the position of the new column is determined.	No.
RowIndex	Index value of the row based on which the position of the row is determined.	No
Bookmark	Specific position in the Word document where the table will be inserted. Before inserting the table, you must add a bookmark.	Yes
Data (DataTable)	Table that will be inserted.	Yes
FindText	Footer text that will be replaced.	Yes
ReplaceText	Text that will replace the footer text.	Yes
FindText	Header text that will be replaced.	Yes
ReplaceText	Text that will replace the header text.	Yes
Object	Text to replace the text in the document.	Yes
FindText (String)	Text to be replaced.	Yes
ReplaceText	Text that will replace the existing text.	Yes
Left	Resize value from the left margin.	Yes
Top	Resize value from the top margin.	Yes
Width	Resize width value.	Yes
Height	Resize height value.	Yes

Enter inputs for parameters

To enter inputs for the parameters, see Configure port properties.

PDF connector

Use the PDF connector to perform all your PDF operations from a single, unified space in RPA Desktop Design Studio. Use this connector to accelerate PDF processing for your document automation.

The PDF connector is available as a plugin by default in RPA Desktop Design Studio. Use the different methods available in the connector to perform activities such as converting, splitting, and combining PDFs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
RPA Desktop Design Studio still supports automation projects that are designed by using the older PDF methods in **Utilities** from Toolbox.

- To use a connector in RPA Desktop Design Studio, see Use a connector in RPA Desktop Design Studio.
- To understand the various methods in the PDF connector, see PDF connector methods.

PDF connector methods

Accelerate PDF processing for your document automation by using the various methods of PDF connector in RPA Desktop Design Studio.

Prerequisites for using the PDF connector

Use the Load method in PDF connector before using the other methods. Call this method with the full path to the PDF file (FilePath) and optionally provide a password (Password) if the PDF is protected.

Close

Closes the resources associated with the PDF document. Use this method to release any references and resources after using the Load method.

Call this method when you no longer need to use the PDF document or after completing operations with it.

ConvertToExcel

Converts a PDF document to a Microsoft Excel document. Optionally, only tables can be converted if specified.

Call this method with the file path where the converted Excel document must be saved, and optionally set **ConvertTablesOnly** to **True** if only tables must be converted.

Parameters of the ConvertToExcel method

Parameter	Description	Data type
ExcelFilepath	The file path where the converted Excel document (.xlsx) is saved. Ensure the file path includes the file name and extension.	String
ConvertTablesOnly	If set to **True**, only tables from the PDF document are converted to Excel. Default is **True**.	Boolean

ConvertToHTML

Converts a specified page of a PDF to HTML format. If the page number is less than or equal to 0, all pages of the PDF are converted to HTML.

Call this method with the page number of the PDF that you want to convert to HTML. If you pass a page number less than or equal to 0, the entire PDF will be converted to HTML. The method returns the HTML content as a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the ConvertToHTML method

Parameter	Description	Data type
PageNumber (Data In)	The page number of the PDF to be converted to HTML. If this parameter is less than or equal to 0, all pages of the PDF are converted to HTML. Page numbers typically start from 1.	Int32
Return (Data Out)	This method returns the HTML content as a string, representing the content of the PDF file.	String

ConvertToImage

Converts a specified page of a PDF document to an image. Optionally, specify the image path where the image is saved, DPI (dots per inch), and image quality.

Call this method with the page number of the PDF to convert, the file path where the image must be saved, and optionally adjust the DPI and image quality parameters.

Parameters of the ConvertToImage method

Parameter	Description	Data type
PageNumber	The page number of the PDF to be converted to an image. Page numbers typically start from 1.	Int32
ImagePath	The file path where the converted image is saved. Ensure the file path includes the file name and extension	String
Dpi	The DPI (dots per inch) resolution for the generated image. Default is 200 DPI.	Int32
Quality	The quality level of the generated image, ranging from 0 (lowest) to 100 (highest). Default is 95.	Int32

ConvertToImages

Converts a PDF document to images. Optionally, specify the folder path where the images are saved, DPI (dots per inch), image quality, and an optional list to store the generated file names.

Call this method with the folder path where the images must be saved. Optionally, adjust the DPI and image quality parameters. If you provide a list as the **FileNames** parameter, it is populated with the names of the generated image files.

Parameters of the ConvertToImages method

Parameter	Description	Data type
Folderpath	The folder path where the converted images will be saved. Ensure the folder exists and has appropriate write permissions.	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the ConvertToImages method (continued)

Parameter	Description	Data type
	For example, `/Users/Username/Documents/MyFolder`	
Dpi	The DPI (dots per inch) resolution for the generated images. Default is 200 DPI.	Int32
Quality	The quality level of the generated images, ranging from 0 (lowest) to 100 (highest). Default is 95.	Int32

ConvertToWord

Converts a PDF to a Microsoft Word document.

Call this method with the file path where the converted Word document must be saved. The method creates a Word document from the PDF content at the specified path.

Parameter of the ConvertToWord method

Parameter	Description	Data type
WordFilepath	The file path where the converted Word document (.doc) is saved. Ensure the file path includes the file name and extension.	String

ConvertToXml

Converts a specified page of a PDF document to Microsoft XML format. Optionally, only tables can be converted if specified.

Call this method with the page number of the PDF to convert, the file path where the XML output must be saved, and optionally set **ConvertTablesOnly** to **True** if only tables must be converted.

Parameters of the ConvertToXml method

Parameter	Description	Data type
PageNumber	The page number of the PDF to be converted to XML format. Page numbers typically start from 1.	Int32
XmlFilePath	The file path where the converted XML document will be saved. Ensure the file path includes the file name and extension	String
ConvertTablesOnly	If set to True, only tables from the specified page will be converted to XML. Default is True.	Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ExtractImages

Extracts images from specified pages of a PDF document. Optionally, specify the folder path where the images are saved and an output list to store the generated file names.

Call this method with the folder path where the images must be saved, the starting and ending page numbers from which to extract images, and an empty list to store the file names of the extracted images.

Parameters for the ExtractImages method

Parameter	Description	Data type
Folderpath	The folder path where the extracted images are saved. Ensure the folder exists and has appropriate write permissions.	String
FromPage	The starting page number from which to extract images. Page numbers typically start from 1.	Int32
ToPage	The ending page number up to which images must be extracted. This number must be greater than or equal to the **FromPage** number.	Int32
FileNames	An output parameter that stores the file names of the extracted images.	List`1

GetAllTables

Extracts all tables from a PDF document and returns them as a list of DataTables.

Use the **Return** parameter to retrieve the extracted table data as a list.

Call this method without any parameters to retrieve all tables from the PDF document. The method returns a list of DataTables, where each DataTable represents a table extracted from the PDF.

Parameter of the GetAllTables method

Parameter	Description	Data type
Return	This method returns list of DataTable that represents a tables extracted from the PDF file.	List`1

GetPageAsImage

Extracts data from a PDF document page and store it as an in-memory image.

Returns a specified page of a PDF document as an in-memory image.

Call this method with the page number of the PDF to retrieve the page as an image. The method returns the page as a System.Drawing.Image object.

Parameters of the GetPageAsImage method

Parameter	Description	Data type
PageNumber	The page number of the PDF to be converted to an image. Page numbers typically start from 1.	Int32

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the GetPageAsImage method (continued)

Parameter	Description	Data type
Return	This method returns an image that represents a specified page of the PDF file.	Drawing.Image

GetPageCount

Retrieves the total number of pages in a PDF document. You must use the **Return** parameter to retrieve the total page count in the PDF as an integer.

Parameter of the GetPageCount method

Parameter	Description	Data type
Return	This method returns an integer representing count of pages of the PDF file.	Int32

GetTable

Extracts a table from a PDF and returns it as a DataTable. The extraction method is specified by the **ExtractBy** parameter.

Call this method with the extraction type and the corresponding value. The method returns the extracted table as a DataTable.

Parameters of the GetTable method

Parameter	Description	Data type
ExtractBy	The method of extraction to use. This parameter must be ExtractType, which includes the following options: Index (0) - extract by page number, and ContainsText (1) - extract by matching text.	ExtractType
Value	The value corresponding to the extraction type. For example, if **ExtractBy** is Index, this would be the page number as a string; if **ExtractBy** is ContainsText, this would be the text to match.	String
Return	This method returns a DataTable that represents a table extracted from the PDF file.	Table

GetText

Retrieves text from the given range of PDF pages.

Call this method with the starting and ending page numbers to retrieve text from those pages. The method returns the extracted text as a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the GetText method

Parameter	Description	Data type
FromPage	The starting page number of the range from which to extract text. Page numbers typically start from 1.	Int32
ToPage	The page number to which you retrieve text from the start page. **Note:** Ensure that the ToPage value is higher than the **FromPage** value.	Int32
Return	This method returns a string representing the text content of the PDF file.	String

Load

Loads a PDF file for interaction, enabling further operations such as extracting content.

Call this method with the full path to the PDF file (FilePath) and optionally provide a password (Password) if the PDF is protected.

Parameters of Load method

Parameter	Description	Data type
FilePath	The full path to the PDF file to be loaded. This must include the file name and extension.	String
Password	The password for the PDF file if it is protected. If the PDF is not password-protected, this parameter can be an empty string.	String

Merge

Merges a list of PDF files into a single PDF file.

Call this method with a list of file paths of the PDFs to be merged, the output file path, and an optional overwrite flag.

Parameters of Merge method

Parameter	Description	Data type
FileList	A list of file paths for the PDF files to be merged. Each path must be a valid path to a PDF file.	ArrayList
OutputFilePath	The file path where the merged PDF is saved. This must include the file name and extension.	String
Overwrite	If set to **True**, the method overwrites the existing file at the output path if it exists. If set to **False**, the method does not overwrite the existing file. Default is **False**.	Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the PDF files are password protected or in an incorrect format in the **FileList** parameter, the automation displays an error.

Split

Splits a single PDF into multiple files, where each page in the PDF is saved as a separate file.

Call this method with the output folder path where the split PDF pages must be saved.

Parameter of Split method

Parameter	Description	Data type
OutputFolderPath	The path to the folder where the split PDF pages are saved. Ensure the folder exists or has appropriate permissions for writing files.	String

Python connector

Execute custom Python scripts or files as part of an automation workflow in the RPA Desktop Design Studio.

Ensure that the Scripting plugin on the RPA Desktop Design Studio is installed. For more information, see Manage plugins in RPA Desktop Design Studio.

Ensure that Python is installed on your machine.

Use the different methods available in the connector to perform activities such as writing scripts in configuration files or executing python scripts that are saved locally on your machine.

- To configure the Python connector in RPA Desktop Design Studio, see Configure the Python connector. Add the Python connector in the Global Objects.

  When the Python connector is added to the Global Objects, the python versions that are installed on the machine are loaded.

- To understand the various methods in the Python connector, see Python connector methods.
- To learn about the limitations of the Python script, see Limitations of Python script in Python connector.

Configure the Python connector

Write and validate custom Python scripts and execute them as part of your automation by using the Python connector in RPA Desktop Design Studio.

Before you begin

Ensure you have installed the Scripting plugin on the RPA Desktop Design Studio. To install, see Manage plugins in RPA Desktop Design Studio.

Ensure that a Python version is installed on your machine which is a part of the environment variables. For more information about environment variables, see Setting environment variables.

Familiarize yourself with the limitations of Python script. For more information, see Limitations of Python script in Python connector.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Connectors** > **Python**
2. Drag the Python component under the Global Objects in the Project Explorer pane.
3. Right-click the Python connector.
4. Click **Configure**.
   The Script Editor window is displayed.

   If Python is not installed on your machine, you will encounter an error message. Please install Python and reload the project again.

5. In the **Python Version** list, select a version that is installed or available on the end user's machine, can run the automation, and is the same or higher than the runtime version.

Note:

You view a list of installed python versions on your machine in the Python Version list.

Python versions 2.7 and above are supported. If your script is not validating or executing, ensure you are using version 2.7 or a higher version.

By default, the highest installed Python version is selected.

If you select version 2.x and have Python 3.x installed on your machine, the automation will run, but the Python script may not execute. The script will only execute if it is compatible with Python 3.x; otherwise, you may encounter an error.

During the execution of the automation, if you select a specific version, such as 3.15.3, and have Python 3.11.3 installed on your machine, the automation will not run, and you will encounter an error. To proceed, select the same version, 3.15.3, or a higher version of Python.

You can view the python version that is used for execution in the Studio logs, that is created in your user profile on your machine.

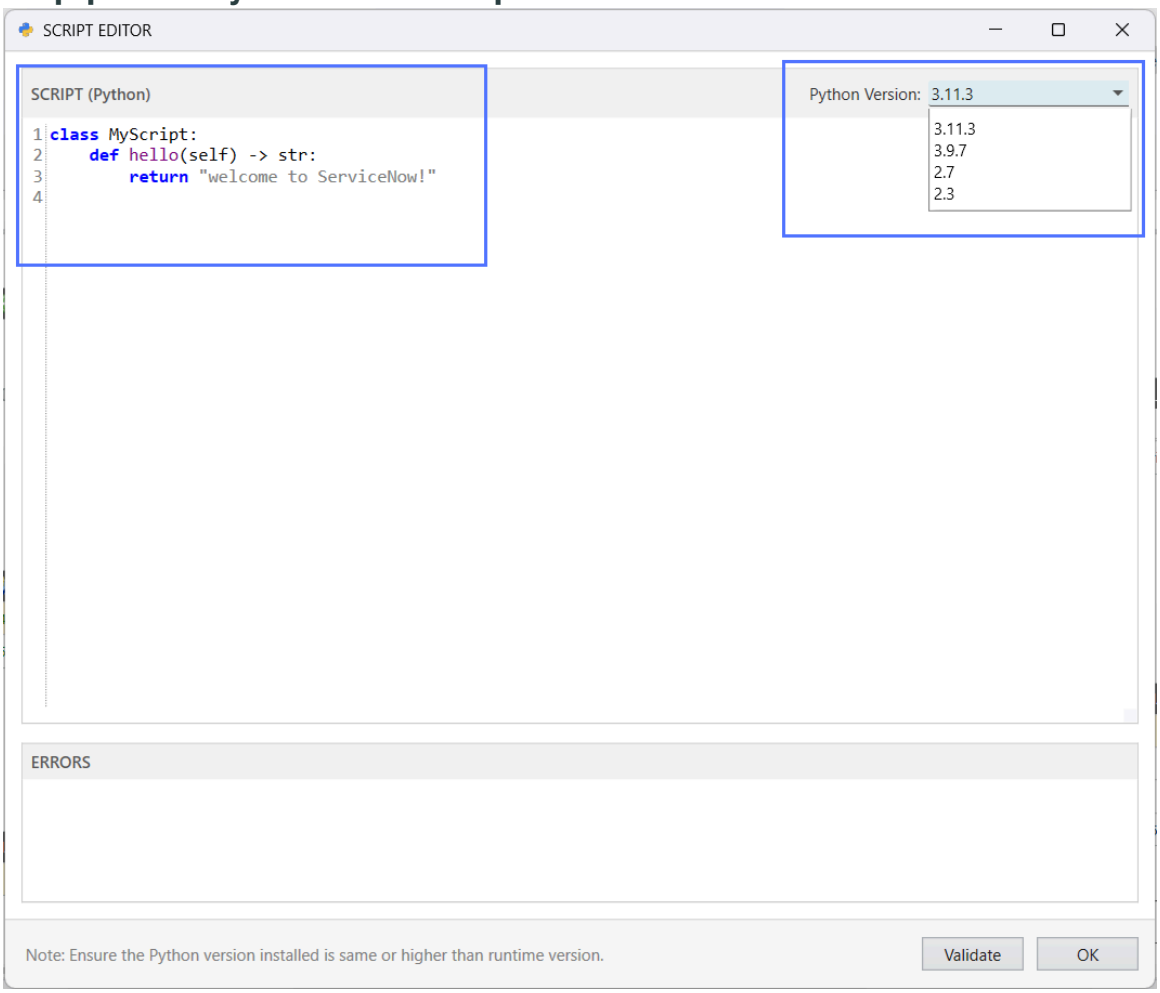
Script pane and Python Version in Script Editor



6. Enter the custom script in the Script pane.

Example script for temperature conversion and weather advice.

```
def celsius_to_fahrenheit(temp_c: float) -> float:
    """
    Convert a temperature from Celsius to Fahrenheit.
    Args:
        temp_c (float): Temperature in Celsius.
    Returns:
        float: Temperature in Fahrenheit.
    """
    return (temp_c * 9/5) + 32

class WeatherAdvisor:
    """
    A simple class that provides weather advice based on
 temperature and conditions.
    """

    def give_advice(self, city: str, temperature_c: float,
 is_raining: bool, wind_speed: int) -> str:
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        """
        Provide advice based on weather conditions.
        Args:
            city (str): The name of the city.
            temperature_c (float): Current temperature in
 Celsius.
            is_raining (bool): Whether it is raining.
            wind_speed (int): Wind speed in km/h.
        Returns:
            str: Weather advice message.
        """
        temp_f = celsius_to_fahrenheit(temperature_c)

        advice = f"In {city}, it is {temperature_c:.1f}°C
 ({temp_f:.1f}°F). "

        if is_raining:
            advice += "Take an umbrella. "
        else:
            advice += "No rain today. "

        if wind_speed > 30:
            advice += "It's quite windy, be cautious!"
        else:
            advice += "Winds are calm."

        return advice

# Example usage
if __name__ == "__main__":
    advisor = WeatherAdvisor()

    message = advisor.give_advice(
        city="London",
        temperature_c=18.5,
        is_raining=True,
        wind_speed=25
    )

    print(message)
```

7. Select **Validate**.
   If your custom script has any errors, it is displayed in the Errors pane. Resolve the errors and select **Validate** to check for errors again.
8. Click **OK**.
   If you want to save the changes, select **Yes**. The code is validated. If you want to discard the changes, select **No**.
9. Double-click the Python connector to expose the methods under the Object Explorer pane.
10. Drag the methods to the Design surface.
    For more information about Python connector methods, see Python connector methods.

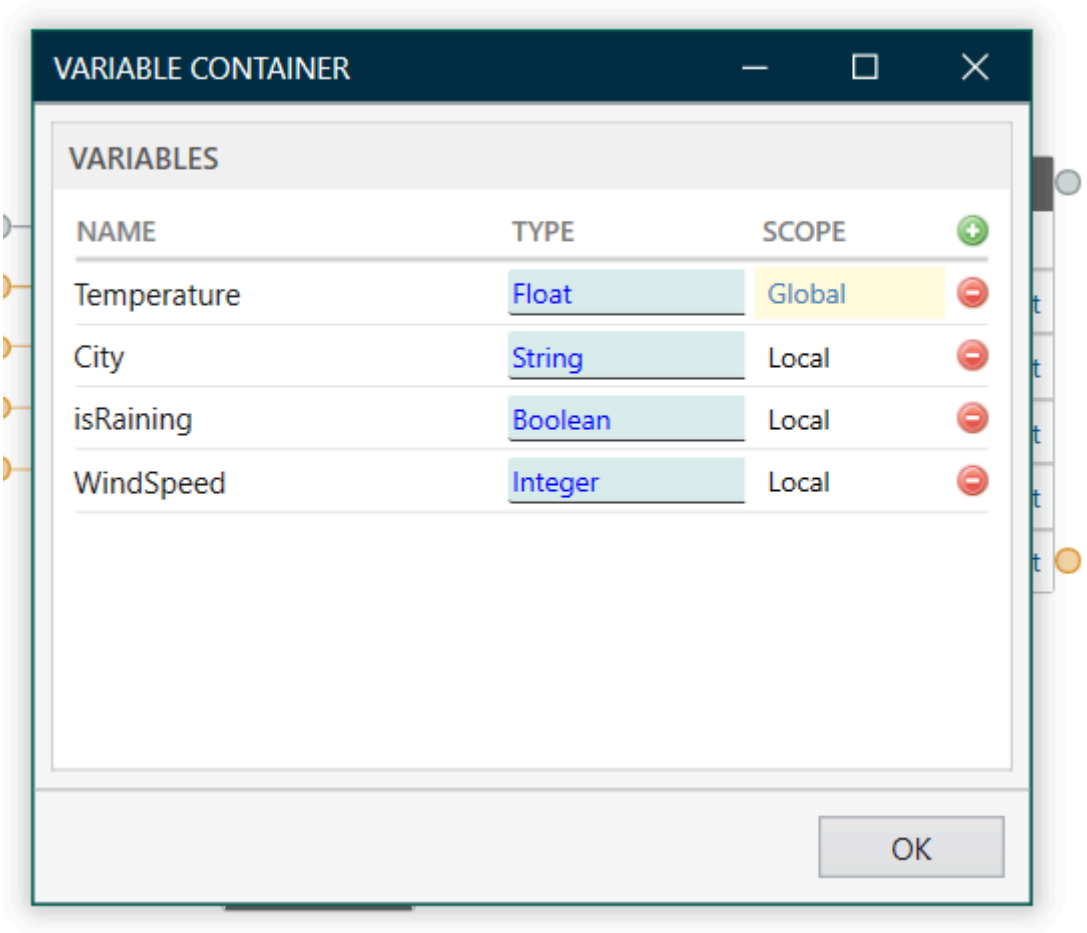
Example: Temperature conversion and weather advice

Perform the following steps to execute the automation for temperature conversion and weather advice.

1. In the Toolbox pane, navigate to **General** > **Variable**.
2. Drag Variable component to the design surface.
3. Double-click the Variable component and set these parameters as shown in the image.

Parameters for Variable Container



4. Double-click the Python connector in the Global Objects.
5. Drag the Execute method from Object Explorer to design surface.
6. Select the component and click the method settings icon ( ) or double-click the component head bar.
7. Select the **Show Functions** check box and select the **celsius_to_fahrenheit** function from the Functions list.
8. Select **OK**.
9. Drag the Execute method again from Object Explorer to design surface.
10. Select the **Show Functions** check box and select the **celsius_to_fahrenheit** function from the Functions list.
11. Select **WeatherAdvisor** option from the Classes list.

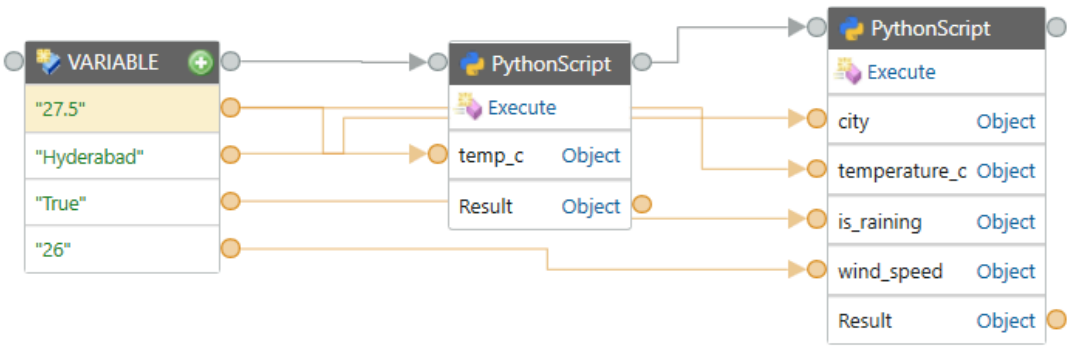
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. Select **give_advice** option from the Methods list.
13. Select **OK**.
14. Connect the ports of the components as shown in the following image.

Ports connection for Variable component and Execute methods



15. To test the component, right-click the Variable component and select **Run From Here**.

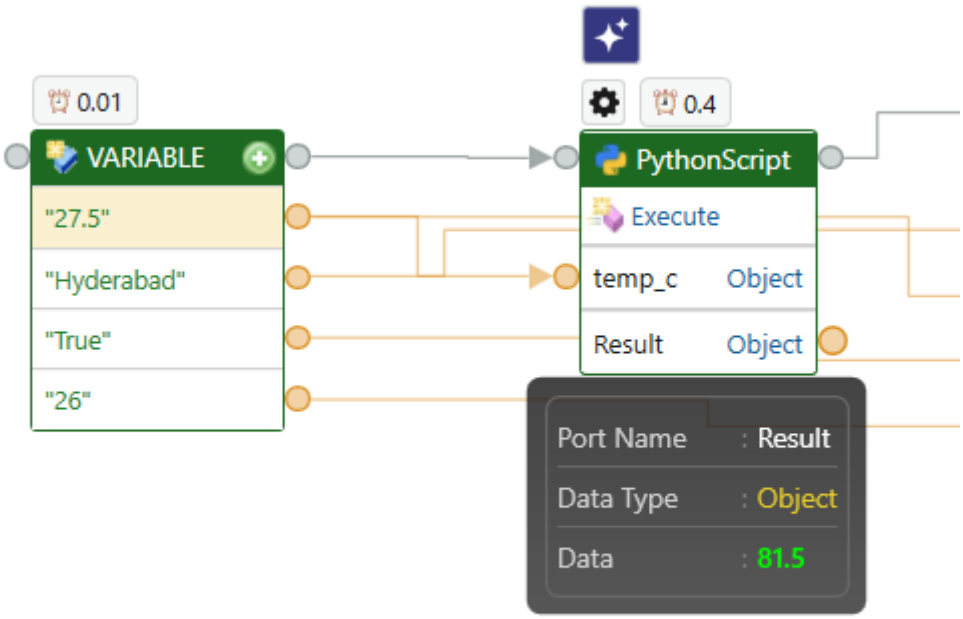
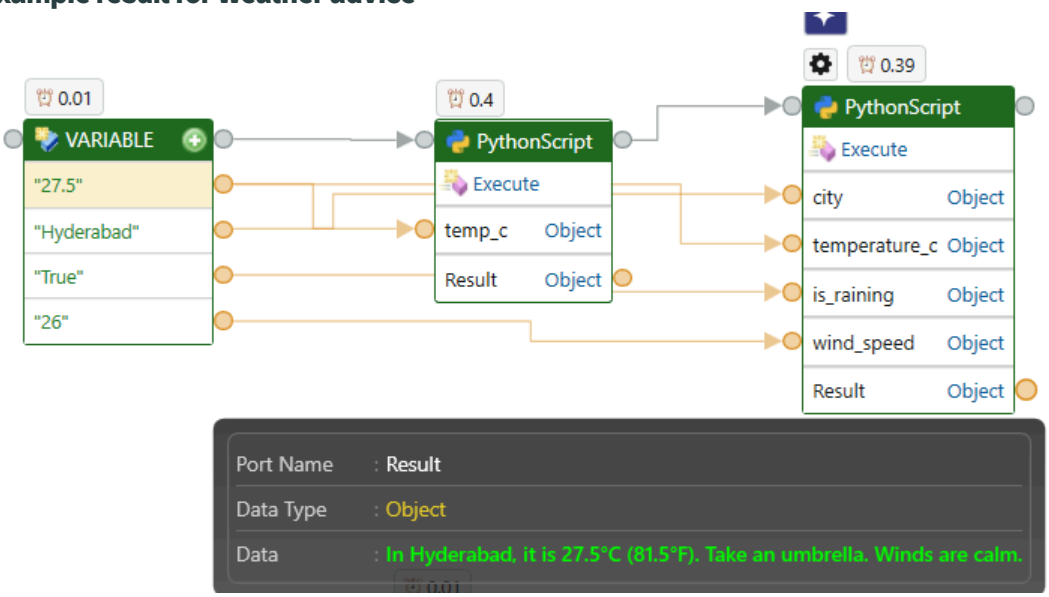
Example result for temperature



Example result for weather advice



Python connector methods

Execute custom Python scripts or files as part of an automation workflow by using the methods of Python connector in RPA Desktop Design Studio.

Prerequisites for using the Python connector methods

Configure the Python connector. For more information, see Configure the Python connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Familiarize yourself with the limitations of Python script. For more information, see Limitations of Python script in Python connector.

Execute

Executes Python scripts set up in the configuration window. Before executing the method, you must configure the connector. See Configure the Python connector.

To execute, do the following steps.

1. Select the component and click the method settings icon ( ) or double-click the component head bar.
2. From the **Classes** list, select the class defined during the configuration of the Python connector.

   For example, **Math**.
3. From the **Methods** list, select the method defined during the configuration of the Python connector.

   For example, **add**.
4. Select the **Show Functions** check box and select a function from the **Functions** list.

   Functions are those methods that are not written within a class. For example, banner.

Show Functions check box

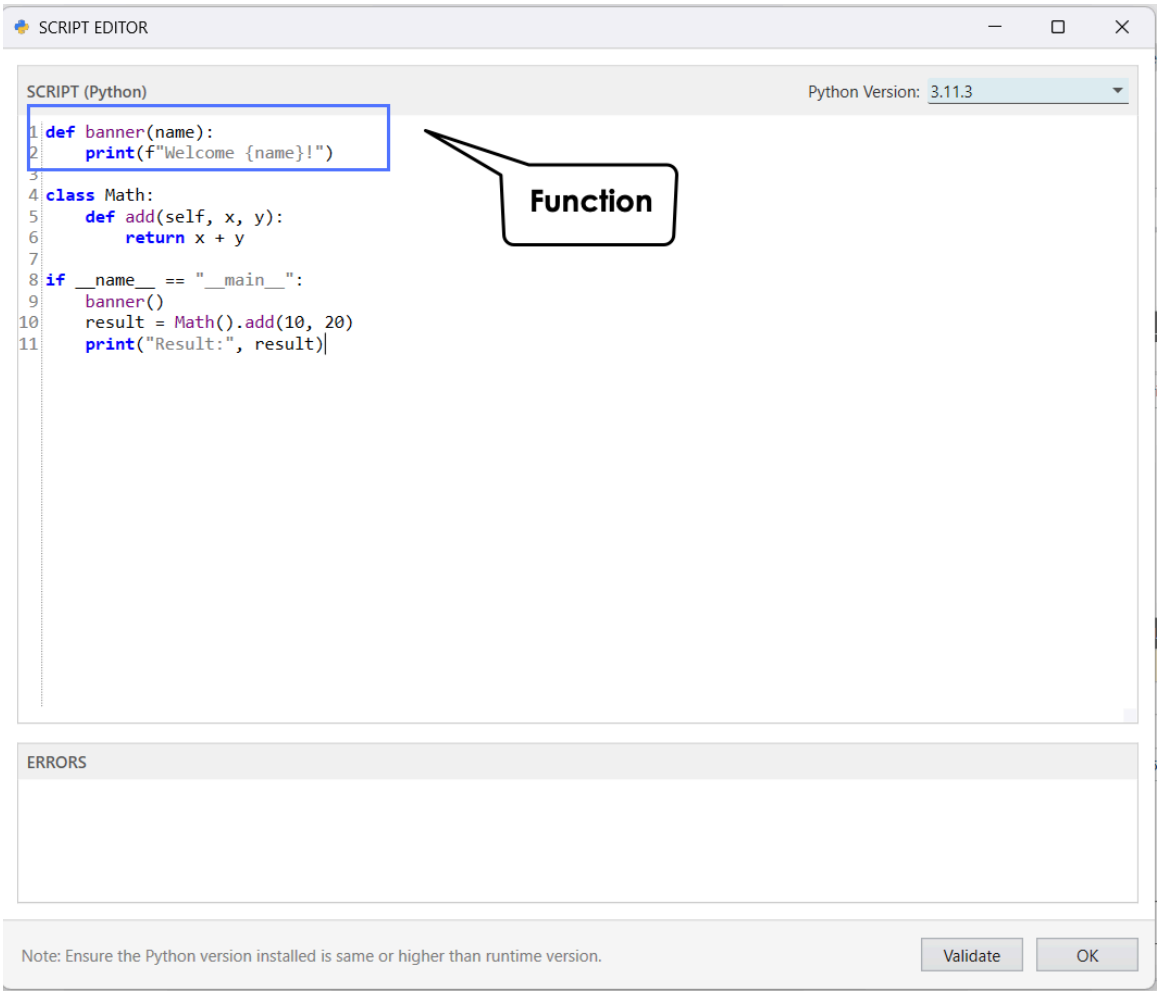
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Function in Execute Method



5. Click **Validate**.
6. Click **OK**.

   A Data Out port (Result) is created to return the output.

7. To test the method, right-click the Execute method and select **Run From Here**.

Execute method parameters

Parameter	Description	Data port type	Data type
Result	Returns the output of the script.	Data Out	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execute method parameters (continued)

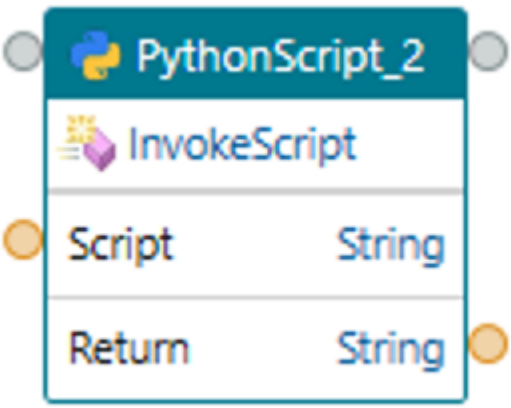
Parameter	Description	Data port type	Data type
	Result of the Execute method 		

InvokeScript

Runs the Python script on local computers and gets the output. Ensure that the Python file is available in the file path provided.

Ensure that a Python version is installed on your machine. You must ensure that the Python script is running without errors.

InvokeScript method



InvokeScript method parameters

Parameter	Description	Data port type	Data type
Script	Returns the output of the script.	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

InvokeScript method parameters (continued)

Parameter	Description	Data port type	Data type

	The command specified in the Script parameter for execution via the InvokeScript component is same as the command line that is used to run in a command prompt.
	
	Provide a file path for the Python script. For example, `python "C:\Users\abel.tutor\Downloads\utility_runner.py"`
	
	For example, `py -3 "C:\Python testing\project1\main.py" Abel` it has <python with version> <python file path> <arguments> format. For adding multiple arguments, use space.
	
	Example of a Python script that greets the user, returns current time, and performs calculations of add and multiply.
	`# utility_runner.py`
	
	`import datetime`
	
	`# Top-level function`
	`def greet_user(name):`
	`  print(f"Hello, {name}!")`
	
	`# Another top-level function`
	`def get_current_time():`
	`  print(f"Current time: {datetime.datetime.now().strftime('%Y-%m-%d %H:%M:%S')}")`
	
	`# Class with methods`
	`class Calculator:`
	`  def __init__(self, a, b):`
	`  self.a = a`
	`  self.b = b`
	
	`  def add(self):`
	`  print(f"Addition: {self.a + self.b}")`
	
	`  def multiply(self):`
	`  print(f"Multiplication: {self.a * self.b}")`
	
	`# Run all functions and methods in sequence`
	`def run_all():`
	`  greet_user("Abel.Tutor")`		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

InvokeScript method parameters (continued)

Parameter	Description	Data port type	Data type

	<pre> get_current_time()
	
	    calc = Calculator(5, 3)
	    calc.add()
	    calc.multiply()
	
	if __name__ == "__main__":
	    run_all()</pre>		

Return	Output of the script that is returned. **Result of the InvokeScript method** 	Data Out	

Limitations of Python script in Python connector

The limitations of the Python script in the Python connector are as follows.

SecureString data type

Python does not recognize `SecureString` since it is specific to .NET. Therefore, do not use `SecureString` data type. If you need to use a secure string, ensure you convert it to a plain string before passing it as input to a Python method.

user_input

If the code contains `user_input` (for prompting to enter input), it runs indefinitely and the RPA Desktop Design Studio must be restarted. Avoid including this in the script, especially when writing in the configuration window.

Interactive calls such as input()/user_input() (or any user prompt) cause the script to wait indefinitely for console input. Since the RPA Desktop Design Studio runs the script in a non-interactive execution environment (where there is no console to capture user input), the script gets stuck and never completes. This issue often requires a restart of the RPA Desktop Design Studio.

Output printing twice

In the following code, the output is printed twice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
class Called1:
def greet(self, name):
return "Hello, " + name

class Calling1:
def call_method(self, input_name):
        # Create an object of Called1
        obj = Called1()
        # Call Called1's method with parameter
        result = obj.greet(input_name)
return result

caller = Calling1()
output = caller.call_method("Abel")
print(output)
```

When the code is changed as follows, the output is printed once.

```
class Called1:
    def greet(self, name):
        return "Hello, " + name

class Calling1:
    def call_method(self, input_name):
        # Create an object of Called1
        obj = Called1()
        # Call Called1's method with parameter
        result = obj.greet(input_name)
        return result

if __name__ == "__main__":
    caller = Calling1()
    output = caller.call_method("Abel")
    print(output)
```

Mention the top level code within the script. For example, `if __name__ == "__main__":`. This is known as a `__name__` guard.

The method or function is imported from the module into the internal script. When importing, it's necessary to guard the top-level execution with `__name__` to ensure it understands whether the execution is from an import or a direct run. For more information, see __main__ — Top-level code environment.

SAP connector

The SAP connector automates workflows on the SAP Graphical user interfaces (GUI). For example, create and save a vendor entry. Create custom automations with the SAP connector on the RPA Desktop Design Studio. The SAP Connector is built by Bristlecone Inc.

To create automations using the SAP Graphical user interfaces (GUI), you must first configure the SAP connector.

To use the SAP connector, do the following steps:

- Enable the SAP connector. See Use a connector in RPA Desktop Design Studio.
- Configure the SAP connector. See Configure the SAP connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Expose the methods. See Use connector method.
- Use the methods. See Use a component in RPA Desktop Design Studio.

Configure the SAP connector

Capture one or more SAP application screens, UI elements on the screen, and then expose the methods at the application, screen, or element levels by configuring the SAP connector.

Before you begin

Ensure that the SAP plugin on the RPA Desktop Design Studio is installed. For more information, see Manage plugins in RPA Desktop Design Studio.

Ensure that at least one SAP application window is active or open on your machine.

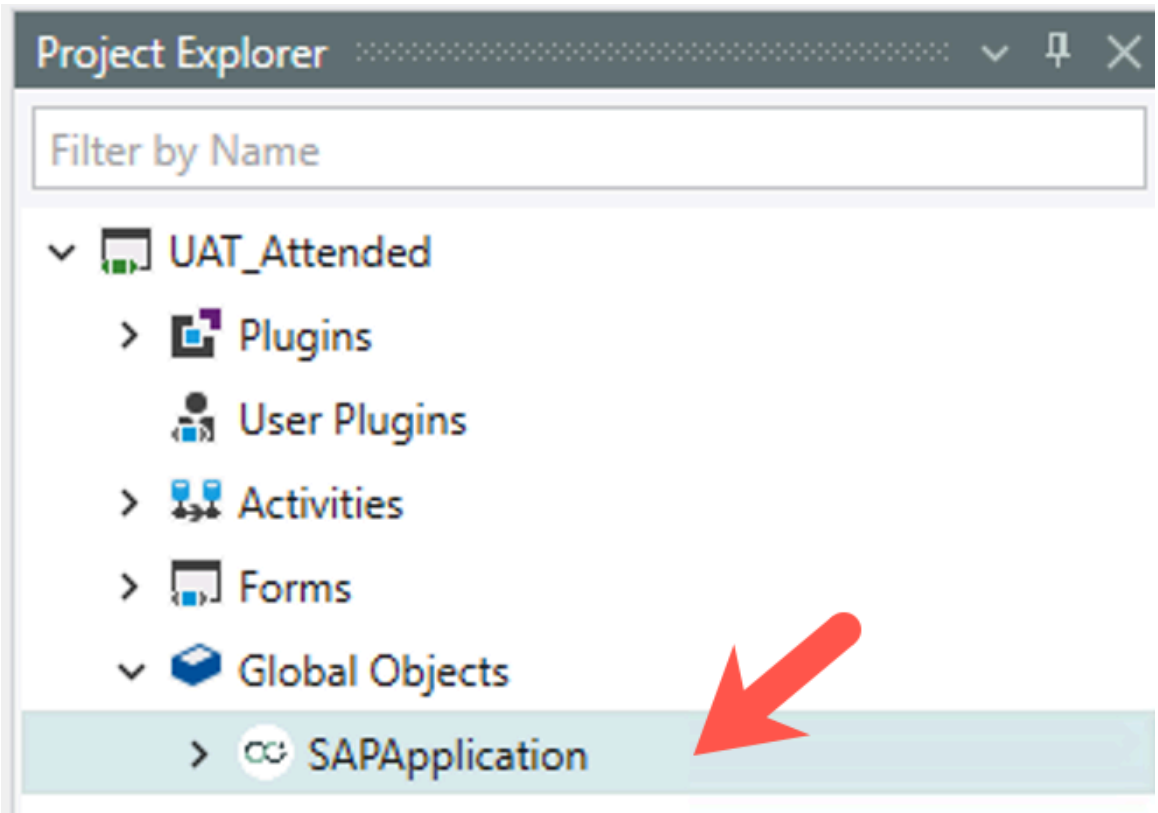
The SAP application must support these environments:

- Windows – Windows 10, Windows 11, Windows Server 2016, Windows Server 2019
- SAP ECC EH8 Client
- .Net 4.7.1

Role required: none

Procedure

1. Navigate to **Connectors** > **SAP**.
2. Drag the SAP connector under the Global Objects in the Project Explorer pane.
   To learn more about how to add the SAP connector, see Use a connector in RPA Desktop Design Studio.
   The SAP Application object is added under the Global Objects.



3. Under the Global Objects, right-click the SAP Application and select **Configure**.

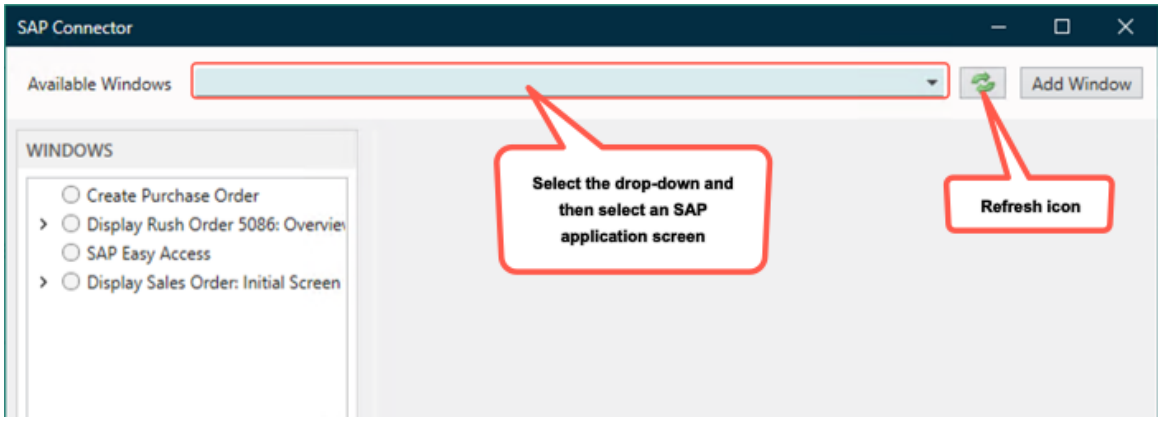
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

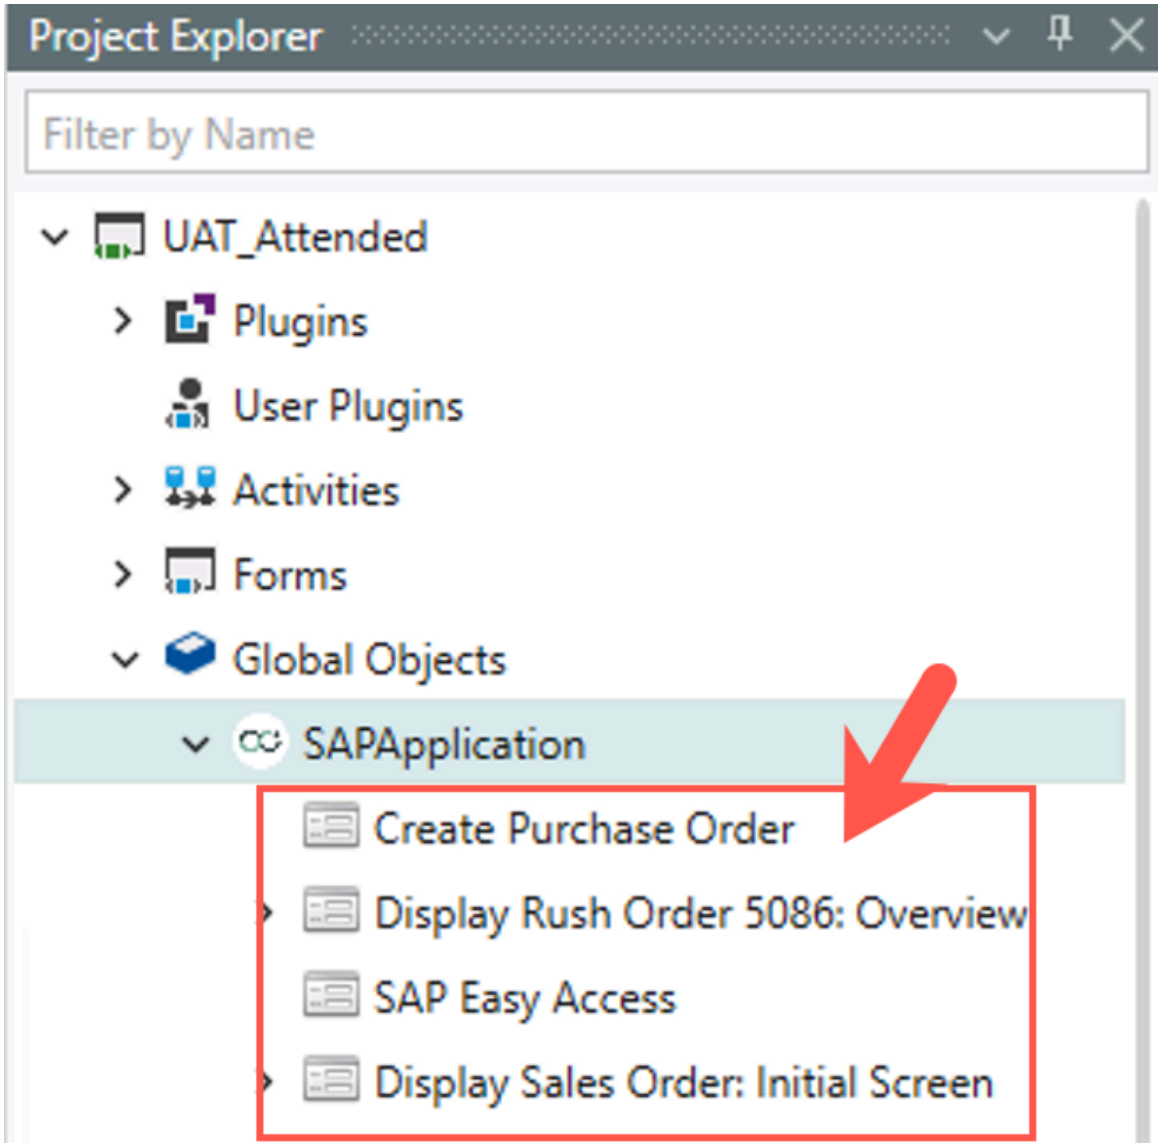
4. In the **SAP Connector** window, select the drop-down and then select the SAP application screen.



> **Note:**
> To load any SAP application window that you have opened after opening the **SAP Connector** window, select the Refresh icon ( ).

5. Select **Add Window**.
   The application screen appears in the WINDOWS pane.
6. To close the SAP Connector window, select **OK**.
   The SAP application screens that you added appear under the Global Objects in the Project Explorer pane.

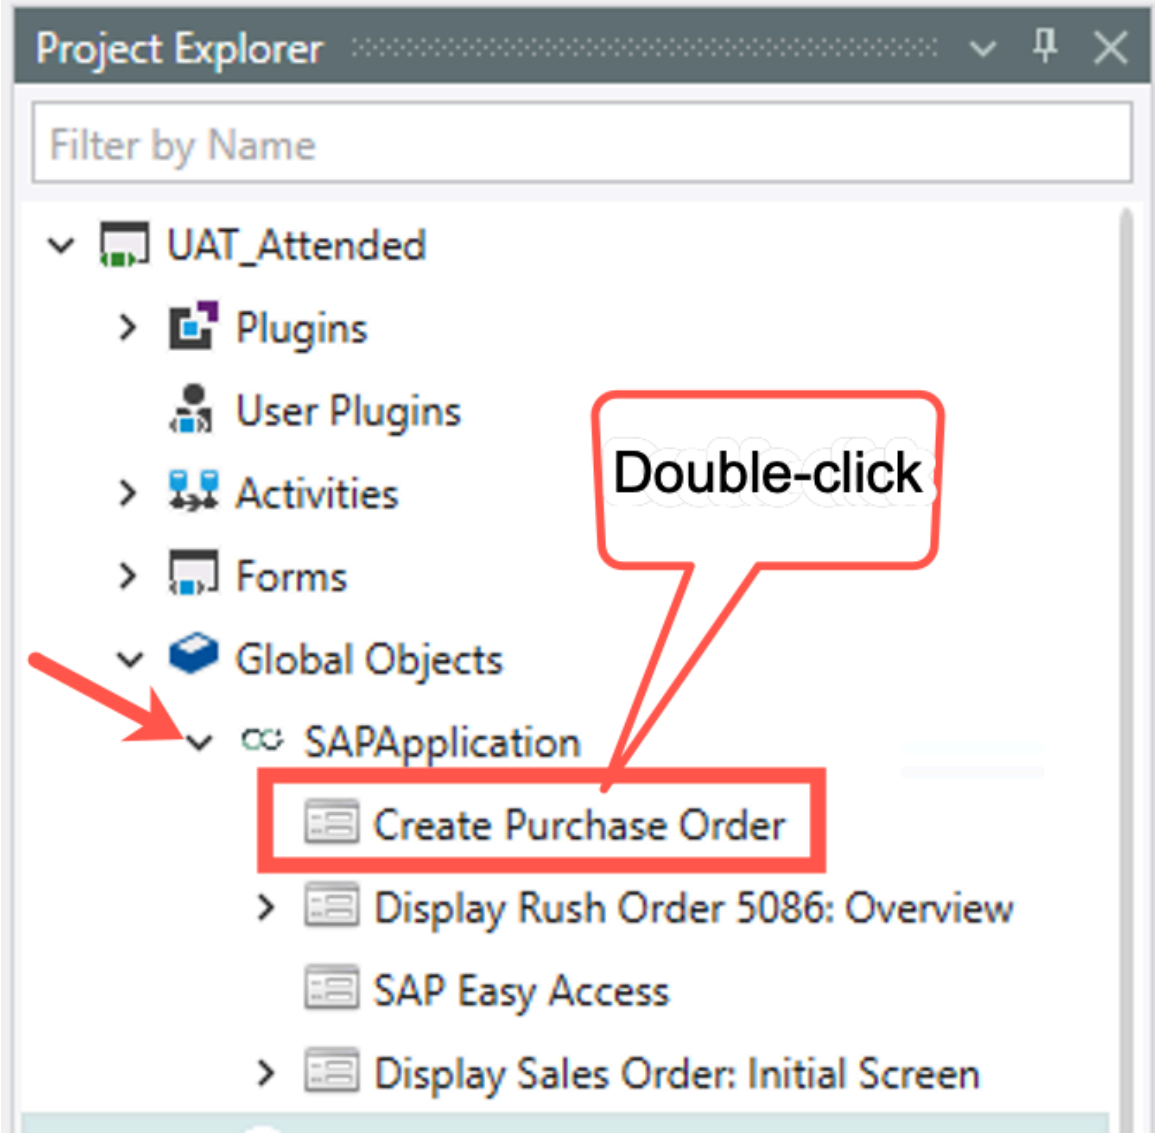
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. To expose the application-level methods, double-click the SAP application object under Global Objects in the Project Explorer pane.
   The application-level methods appear under the Object Explorer pane.

8. To expose the screen-level methods, select the SAP Application object expand icon (›) and double-click the SAP application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The screen-level methods appear under the Object Explorer pane.

9. To expose the element-level methods, do the following steps.

   a. In the Project Explorer pane, under Global Objects, right-click the SAP Connector object.

   b. Select **Configure**.

   c. In the **SAP Connector** window, in the WINDOWS pane, right-click the SAP application screen that you had added.

   d. Select **Add Element**.
   The Capture element dialog appears.

   e. Use the Capture element dialog to capture one or more SAP application screen elements. For more information about how to use the Capture element dialog, see Use the Capture element dialog.

   f. To expose the element-level methods, in the Project Explorer pane, expand the SAP Connector under Global Objects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. Under SAP Connector, expand the name of the screen you had captured.

h. Double-click the screen element that you had captured.
The screen element-level methods appear under the Object Explorer pane.

SAP Connector methods

The SAP connector provides various methods that you can use to automate workflows on SAP graphical user interface (GUI) interfaces. SAP connector methods are available at different levels - connector, screen, and element.

SAP Connector methods

The SAP Connector methods are available at three levels.

- **Application**: You can find these methods when you double-click the SAP connector object. To access these methods, do the following steps:
  1. Add the SAP connector under the **Global Objects** in the **Project Explorer** pane.

     For more information, see Configure the SAP connector.
  2. Double-click the SAP connector object.

     The methods appear in the Object Explorer pane.
- **Screen**: Use these methods to automate tasks on an SAP application screen that you have added. For example, automate the maximizing of an application window. To access these methods, do the following steps:
  1. Add one or more SAP application screens. To learn to configure, see Configure the SAP connector.
  2. Double-click the screen that you've added.

     The methods appear in the Object Explorer pane.
- **Element**: Use these methods to automate actions on the SAP screen UI elements, for example, a button or a check box. For example, automate the selecting of a button. To access these methods, do the following steps:
  1. Add one or more SAP application screens. To learn to configure, see Configure the SAP connector.
  2. Capture one or more screen elements. To learn to capture, see Use the Capture element dialog.

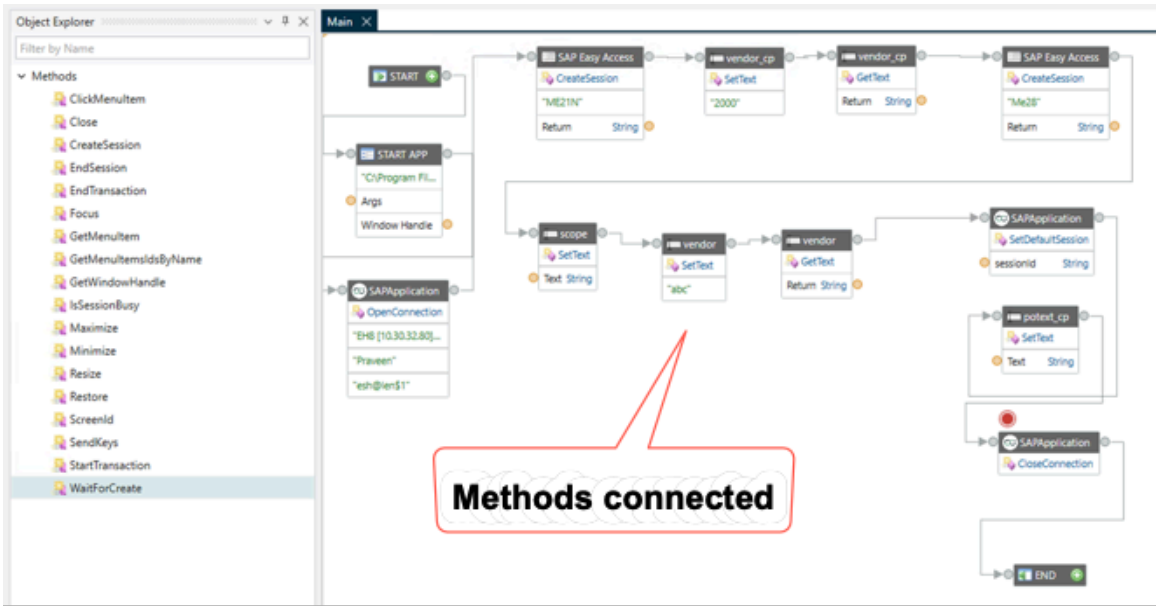
     The screen elements appear under the captured SAP screen.
  3. Double-click the screen element.

     The methods appear in the Object Explorer pane.

Use the methods

To create an automation by using the methods, drag them from the Object Explorer pane to the Design surface and connect them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Application-level methods

OpenConnection

Establishes a connection between the connector and the SAP application. You must first use this method before executing an automation.

OpenConnection method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
name	Name of the connection.	Data In	String	None	Yes
username	User name for making the connection.	Data In	String	None	Yes
password	Password for making the connection.	Data In	String	None	Yes

SetDefaultSession

Makes the selected session a default session.

SetDefaultSession method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
sessionId	Unique Id of the session that you want to set as default.	Data In	String	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CloseConnection

Closes the connection between the connector and the SAP application.

Screen-level methods

ClickMenuItem

Selects the menu item that you specify the ID of on the SAP screen.

ClickMenuItem method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
menuId	The ID of the menu that must be selected.	Data In	String	None	Yes

Close

Closes the session of the SAP screen.

CreateSession

Creates a session of the SAP screen.

CreateSession method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
tCode	Transaction code that enables you to access specific part of the SAP application.	Data In	String	NA	Yes
Return	Returns the Id of the session created.	Data Out	String	NA	NA

EndSession

Ends the open session.

EndTransaction

Ends a transaction.

Focus

Sets the focus on the open session.

GetMenuItem

Gets the name of the specified menu item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetMenuItem method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
menuId	ID of the menu item to get the name.	Data In	String	None	Yes
Return	Returns the name of the menu item	Data Out	String	None	NA

GetMenuItemsIdsByName

Retrieves the ID of the menu that you specify by its name.

GetMenuItemsIdsByName method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
menuItemName	Name of the menu item.	Data Out	List	None	NA

GetWindowHandle

Returns the window handle of the SAP application screen.

IsCreated

Returns `true` if the session is created, `false` if the session isn't created.

IsSessionBusy

Returns `true` if the session is busy, and `false` if the session isn't busy.

Maximise

Maximizes the SAP screen.

Minimise

Minimizes the SAP screen.

Resize

Resizes the SAP screen according to the dimensions specified.

Resize method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
xPos	Position of the screen along the X-axis.	Data In	Integer	None	Yes
yPos	Position of the screen along the Y-axis.	Data In	Integer	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resize method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
Width	Width of the screen.	Data In	Integer	None	Yes
Height	Height of the screen.	Data In	Integer	None	Yes

Restore

Restores the screen to its original dimensions.

ScreenId

Returns the ID of the SAP application screen as a string.

SendKeys

Sends the keyboard strokes to the SAP application screen.

SendKeys method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
Keys	Keyboard strokes that you want to send to the SAP screen.	Data In	String	NA	Yes

StartTransaction

Starts a transaction.

StartTransaction method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
tCode	Transaction code that enables you to access specific part of the SAP application.	Data In	String	NA	Yes

WaitForCreate

Waits for the specified duration while the screen is being created. This enables all the dynamic controls to load after the screen is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WaitForCreate method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
timeoutInSeconds	Duration after which the method times out.	Data In	Integer	None	Yes
MatchAllChildren	Option to indicate whether before loading the screen, the method matches all the captured children screens and elements with the screen.	Data In	Boolean	False	No

Element-level methods

In the SAP connector, you can use these element-level methods to identify elements, verify their presence on the screen, or define actions to be performed on the elements.

The following tables include elements and their available methods. For the description of these methods and their parameters, see SAP Connector methods.

SAP element-level method descriptions

The SAP connector provides various element-level methods that you can use to automate actions on the SAP screen UI elements, for example, a button or a check box.

Common methods

The following methods apply to all elements on the SAP screen.

Note:
Any other elements that you see on the SAP screen that aren't listed in this topic support only the common methods.

Highlight

Highlights the element on the SAP screen.

IsCreated

Returns `true` if the element is present on the SAP screen, and `false` if the element is not present.

MouseClick

Performs a mouse-click action on the element on the SAP screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MouseClick method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
clickType	Option to select the type of mouse click: left or right.	Data In	Enum	Left	No

SendKeys

Sends the keyboard strokes such as Enter or Ctrl, to the element on the SAP screen.

SendKeys method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
keys	Keyboard strokes that you want to send to the element.	Data In	String	NA	Yes
clearExistingValue	Option to specify whether to clear the existing value of the element before entering the keys value.	Data In	Boolean	False	No
typeDelay	Option to specify the time delay in seconds between each key stroke.	Data In	Double	0.09	No

SetFocus

Sets focus on the element on the SAP screen.

WaitForCreate

Waits for the specified duration while the element is being loaded. This enables all the dynamic controls to load.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WaitForCreate method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
timeoutInSeconds	Duration in seconds after which the method times out.	Data In	Integer	30 seconds	No

GuiButton methods

Click

Selects the button on the SAP screen.

GuiCheckbox methods

Check

Selects the check box on the SAP screen.

IsChecked

Returns `true` if the element is selected on the SAP screen, and `false` if the element isn't selected.

Uncheck

Clears the check box on the SAP screen.

GuiComboBox

Get

Gets the selected value of the combo box on the SAP screen.

GetIconName

Gets the property icon name of the element on the SAP screen.

GetList

Gets all the list of values from the combo box on the SAP screen.

Set

Sets the value of the combo box against the key passed.

Set method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
value	Value that you want to set for the combo box.	Data In	String	None	Yes
selectedItem	Option to specify whether you want to set the value	Data In	Enum	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
	for "Key" or "Value".				

GuiCtrlGridView

ClickButtonCell

Selects a button in the grid cell defined by the row number and the column code.

ClickButtonCell method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the grid.	Data In	Integer	None	Yes
columnCode	The column identifier of the grid cell.	Data In	String	None	Yes

ClickCell

Selects a grid cell defined by the row number and the column code.

ClickCell method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the grid.	Data In	Integer	None	Yes
columnCode	The column identifier of the grid cell.	Data In	String	None	Yes

DeselectAllRows

Deselects all the rows that are selected in the grid.

GetCellType

Retrieves the type of the grid cell defined by the row number and the column code.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetCellType method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the grid.	Data In	Integer	None	Yes
columnCode	The column identifier of the grid cell.	Data In	String	None	Yes

GetCellValue

Retrieves the value of the grid cell defined by the row number and the column code.

GetCellValue method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the grid.	Data In	Integer	None	Yes
columnCode	The column identifier of the grid cell.	Data In	String	None	Yes

GetColumns

Retrieves the list of active column headers of the grid.

GetColumnsKeyValuePair

Retrieves the column name and column code as key-value pair from the columns of the grid.

GetRowCount

Retrieves the number of the rows of the grid.

GetRows

Retrieves the number of grid rows defined in the rowNumber parameter, starting from the row defined in the startIndex parameter.

GetRows method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
startIndex	The starting row index to begin retrieving rows.	Data In	Integer	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetRows method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	Indicates the number of rows to retrieve from the grid	Data In	Integer	None	Yes

GetRowsByColumn

Retrieves a subset of rows from a specific column based on the startIndex, rowNumber, and columnCode parameters.

GetRowsByColumn method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
startIndex	The starting index of the row to begin retrieving the data in the specified column (columnCode).	Data In	Integer	None	Yes
rowNumber	The number of rows to retrieve starting from the startIndex.	Data In	Integer	None	Yes
columnCode	The column from which the row data is retrieved.	Data In	String	None	Yes

GetSelectedColumns

Retrieves the columns that are selected.

GetSelectedRows

Retrieves the rows that are selected.

GetSingleRow

Retrieves a specific row of the grid defined by the row number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetSingleRow method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index (or row number) specifying which row of the grid you want to retrieve data for.	Data In	Integer	None	Yes

GetVisibleRows

Retrieves the rows that are visible.

SelectAllRows

Selects all rows of the grid.

SelectCell

Selects the grid cell defined by the row number and the column code.

SelectCell method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the grid.	Data In	Integer	None	Yes
columnCode	The column identifier of the grid cell.	Data In	String	None	Yes

SelectContextMenuItemById

Selects the context menu item from the grid based on the ID that you specify.

SelectContextMenuItemById method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
Id	The unique identifier of the context menu item you want to select.	Data In	String	None	Yes

SelectContextMenuItemByPosition

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selects the context menu item from the grid based on the position that you specify.

SelectContextMenuItemByPosition method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
menuItemPosition	The position of the context menu item that you want to select.	Data In	String	None	Yes

SelectContextMenuItemByText

Selects the context menu item from the grid based on the text that you specify.

SelectContextMenuItemByText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
menuItemText	The text of the context menu item that you want to select.	Data In	String	None	Yes

SelectSingleRow

Selects the row of the grid defined by the row number.

SelectSingleRow method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row number that the method uses to select a row in the grid.	Data In	String	None	Yes

SelectToolbarMenuItemById

Selects the toolbar menu item from the grid based on the ID that you specify.

SelectToolbarMenuItemById method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
Id	The unique identifier of	Data In	String	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SelectToolbarMenuItemById method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
	the toolbar menu item you want to select.				

SelectToolbarMenuItemByPosition

Selects the toolbar menu item from the grid based on the position that you specify.

SelectToolbarMenuItemByPosition method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
menuItemPosition	The position (or index) of a menu item in the toolbar.	Data In	Integer	None	Yes

SelectToolbarMenuItemByText

Selects the toolbar menu item from the grid based on the text that you specify.

SelectToolbarMenuItemByText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
menuItemText	The text displayed on the toolbar menu item that you want to select.	Data In	String	None	Yes

SetCellValue

Sets the value of a cell in a grid defined by the row number and the column code.

SetCellValue method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
value	The value is set for the cell.	Data In	String	None	Yes
rowNumber	The row number of	Data In	Integer	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetCellValue method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
	the cell to modify.				
columnCode	The code (or identifier) for the column of the cell to modify.	Data In	String	None	Yes

GuiLabel

GetText

Retrieves the text of the label on the SAP screen.

GuiPassword

SetText

Sets a given value as a password in the Password element on the SAP screen.

GuiRadioButton

IsChecked

Returns `true` if the radio button is selected, and `false` if not selected.

Select

Select the radio button on the SAP screen.

GuiStatusBar

GetStatus

Retrieves the status information of a specific SAP screen.

GuiTab

SelectTab

Selects the tab on the SAP screen.

GuiTableControl

DeselectVisibleRow

Clears a visible row based on the row number that you specify.

DeselectVisibleRow method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of	Data In	Integer	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DeselectVisibleRow method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
	a cell in the table.				

DeselectAllVisibleRows

Clears all the selected rows.

DeselectRow

Clears a particular row based on the row number that you specify.

DeselectRow method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the table.	Data In	Integer	None	Yes

GetAllVisibleRows

Returns all the visible rows in the table.

GetColumnNames

Gets the list of active column headers in the table.

GetMaximumScrollOffset

Gets the maximum value up to which scrolling is possible within the table.

GetMaximumScrollOffset method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
type	Option to select the type of scroll: horizontal or vertical.	Data In	Enum	None	Yes

GetScrollPosition

Gets the current position of the scroll bar.

GetScrollPosition method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
type	Option to select	Data In	Enum	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetScrollPosition method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
	the type of scroll: horizontal or vertical.				

GetSingleRow

Retrieves a specific row of the table defined by the row number.

GetSingleRow method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the table.	Data In	Integer	None	Yes

GetTable

Fetches the entire table.

GetVisibleRowCount

Returns count of visible rows.

ScrollDownByOneRow

Scrolls down to move the focus to the next row.

ScrollToHorizontalPosition

Scrolls horizontally to move focus to the specified position.

ScrollToHorizontalPosition method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
position	Position of the scroll.	Data In	Integer	None	Yes

ScrollToNextPage

Scrolls down to move the focus to the next page.

ScrollToPreviousPage

Scrolls up to move the focus to the previous page.

ScrollToVerticalPosition

Scrolls vertically to move focus to the specified position.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ScrollToVerticalPosition method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
position	Position of the scroll.	Data In	Integer	None	Yes

ScrollUpByOneRow

Scrolls up to move the focus to the previous row.

SelectAllRows

Selects all the rows of the table, whether they are visible.

SelectSingleRow

Selects the row of the table defined by the row number.

GetRowsByColumn method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the table.	Data In	Integer	None	Yes

SelectCell

Selects a cell in the table defined by the row number and the column code.

SelectCell method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the table.	Data In	Integer	None	Yes
columnCode	Code number of the column in the cell.	Data In	String	None	Yes

SelectVisibleRow

Selects a visible row of the table defined by the row number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SelectVisibleRow method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
rowNumber	The row index or row number of a cell in the table.	Data In	Integer	None	Yes

GuiTextBox

GetText

Retrieves the text of the text box on the SAP screen.

SetCaretPosition

Sets the caret to the specified position in the text box on the SAP screen.

SetCaretPosition method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
position	Position of the caret.	Data In	Integer	None	Yes

SetText

Sets a given value in the text box on the SAP screen.

SetText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
text	Text value that you want to set in the text box.	Data In	String	None	Yes

GuiTree

Check

Selects a particular item in a node on the SAP screen.

Check method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific node within the tree.	Data In	String	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
column	The column name or identifier within the specified node.	Data In	String	None	Yes

ClickNodeItem

Clicks a particular item in a node on the SAP screen.

ClickNodeItem method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific node within the tree.	Data In	String	None	Yes
column	The column name or identifier within the specified node.	Data In	String	None	Yes

CollapseNodeItem

Collapses a particular node item on the SAP screen.

CollapseNodeItem method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific node within the tree.	Data In	String	None	Yes

DoubleClickNode

Performs a double-click mouse action on a particular node on the SAP screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DoubleClickNode method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific node within the tree.	Data In	String	None	Yes

DoubleClickNodeItem

Performs a double-click mouse action on a particular item in a node on the SAP screen.

DoubleClickNodeItem method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific node within the tree.	Data In	String	None	Yes
column	The column name or identifier within the specified node.	Data In	String	None	Yes

GetColumnsKeyValuePair

Retrieves the column name and column code as key-value pair from the columns of the tree.

GetTreeType

Retrieves the type of the tree, such as simple, list, or column. If the type isn't one of these, the method returns an empty value.

GetNodeKeyByPath

Retrieves the node key based on the path that you specify.

GetNodeKeyByPath method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
path	Route or hierarchy to find a specific node in the tree.	Data In	String	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetNodeKeyByText

Retrieves the node key based on the text that you specify.

GetNodeKeyByText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeText	The text value that you want to match with a node key. The value is matched to any node's text, ignoring case and extra spaces.	Data In	String	None	Yes

GetNodeItemText

Retrieves the text of the node item based on the key and name that you specify.

GetNodeItemText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
key	The key associated with the node. This key is the unique identifier of the node that you want to retrieve the text of.	Data In	String	None	Yes
name	The name of the specific item or property within the node, used to filter or further identify the node.	Data In	String	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetSelectedNodes

Retrieves the values of the selected nodes.

GetNodeItemCheckBoxState

Retrieves the state of a check box in a node item.

GetNodeItemCheckBoxState method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific node within the tree.	Data In	String	None	Yes
column	The column name or identifier within the specified node.	Data In	String	None	Yes

PressNodeItemButton

Clicks the button in a specified node item on the SAP screen.

PressNodeItemButton method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific node within the tree.	Data In	String	None	Yes
column	The column name or identifier within the specified node.	Data In	String	None	Yes

SelectNodeItem

Selects the specified node item on the SAP screen.

SelectNodeItem method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific	Data In	String	None	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SelectNodeItem method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
	node within the tree.				
column	The column name or identifier within the specified node.	Data In	String	None	Yes

SelectNode

Selects the specified node on the SAP screen.

SelectNode method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific node within the tree.	Data In	String	None	Yes

SelectContextMenuItemById

Selects a context menu item based on the ID that you specify.

SelectContextMenuItemById method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
type	The type of context menu (Tree,Node,Node Item).	Data In	Enum	None	Yes
menuId	The identifier of the context menu item that must be selected.	Data In	String	None	Yes
nodeKey	Unique identifier for a specific node in the tree on which the context	Data In	String	None	Yes

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SelectContextMenuItemById method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
	menu is to be invoked.				
ColumnName	The name of the column within the node. This helps narrow down which specific column in the node the context menu should apply to.	Data In	String	None	Yes

SelectContextMenuItemByText

Selects a context menu item based on the text that you specify.

SelectContextMenuItemByText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
type	The type of context menu (Tree,Node,Node Item).	Data In	Enum	None	Yes
menuText	The visible text of the context menu item that you want to select.	Data In	String	None	Yes
nodeKey	Unique identifier for a specific node in the tree on which the context menu is to be invoked.	Data In	String	None	Yes
ColumnName	The name of the	Data In	String	None	Yes

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SelectContextMenuItemByText method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
	column within the node. This name helps narrow down which specific column in the node the context menu should apply to.				

SelectContextMenuItemByPosition

Selects a context menu item based on the position that you specify.

SelectContextMenuItemByPosition method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
type	The type of context menu (Tree,Node,Node Item).	Data In	Enum	None	Yes
menuPosition	The position of the context menu item that you want to select. It could be the index or a string representing the position.	Data In	String	None	Yes
nodeKey	Unique identifier for a specific node in the tree on which the context menu is to be invoked.	Data In	String	None	Yes
ColumnName	The name of the	Data In	String	None	Yes

SelectContextMenuItemByPosition method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
	column within the node. This name helps narrow down which specific column in the node the context menu should apply to.				

Uncheck

Clears a particular item in a node from the SAP screen.

Uncheck method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
nodeKey	Unique identifier for a specific node within the tree.	Data In	String	None	Yes
column	The column name or identifier within the specified node.	Data In	String	None	Yes

GuiUserArea

ScrollToNextPage

Scrolls down to move the focus to the next page.

ScrollToPreviousPage

Scrolls up to move the focus to the previous page.

SetHorizontalScroll

Scrolls horizontally to a value that you specify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetHorizontalScroll method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
scrolVal	Numeric value for scroll bar.	Data In	Integer	None	Yes

SetVerticalScroll

Scrolls vertically to a value that you specify.

SetVerticalScroll method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?
scrolVal	Numeric value for scroll bar.	Data In	Integer	None	Yes

Secure Shell (SSH) connector

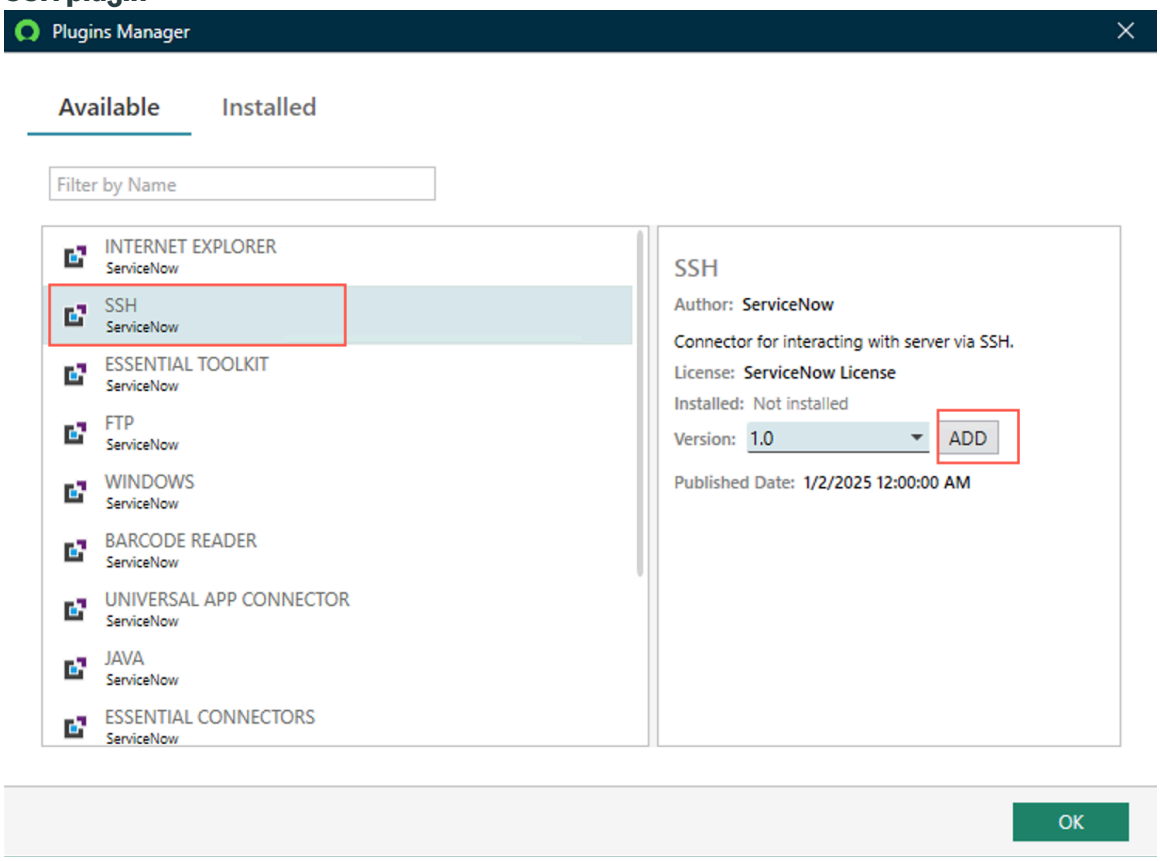
Secure Shell (SSH) connector helps establish an SSH connection to a remote server and execute commands.

In the UNIX environment, SSH is the preferred way to access remote systems. In an automation workflow, when you need to connect to a remote system and perform an operation, you can use SSH connector methods to accomplish the task efficiently.

The SSH connector is available as a plugin by default in RPA Desktop Design Studio from 12.0.X versions. Add the SSH plugin from the Plugins Manager. For more information about adding the SSH plugin, see Manage plugins in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH plugin

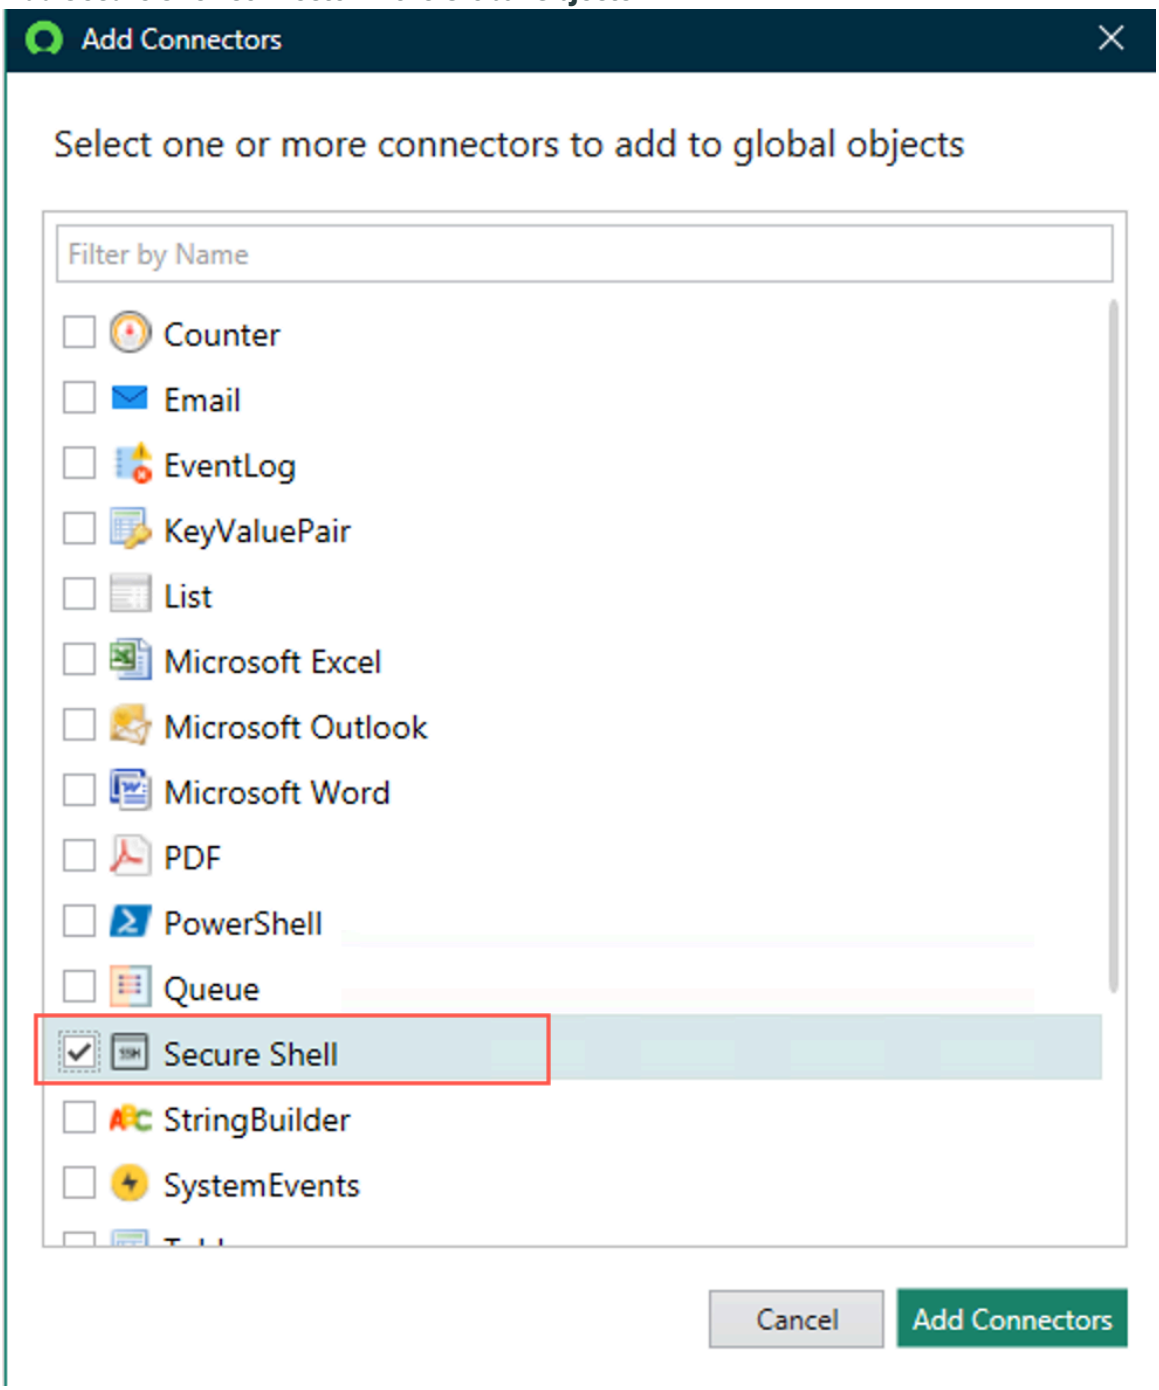


Use the different methods available in the connector to perform activities such as establishing an SSH connection, executing command over an established connection, and disconnecting the session that was established using Connect method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To use a connector in RPA Desktop Design Studio, see Use a connector in RPA Desktop Design Studio. Add the Secure Shell connector in the Global Objects.

Add Secure Shell connector in the Global Objects



- To learn more about the various methods in the SSH connector, see Secure Shell (SSH) connector methods.

Secure Shell (SSH) connector methods

The Secure Shell (SSH) connector methods establish an SSH connection, execute commands over the established connection, and disconnect the session.

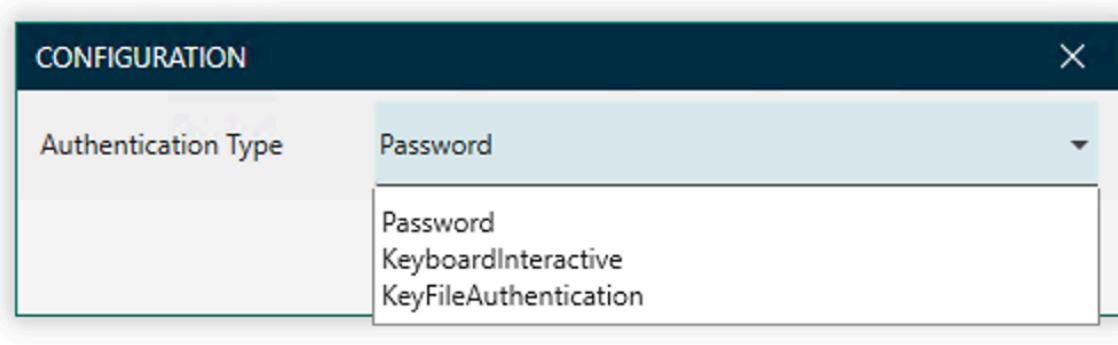
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect

Establishes an SSH connection. Provide the information required to connect to a remote machine.

Select the settings icon ( ) to choose the authentication type.

Supported authentication types are Password, KeyboardInteractive, and KeyFileAuthentication.



Password is the default authentication type.

Connect method parameters

Parameter	Description	Data Port Type	Data type
HostName	Host name of the remote server or IP address.	Data In	String
Username	User name of the SSH account.	Data In	String
Password	Secure string representation of the password. Password of the SSH account. You can use the SecureStringEncode component to encode the secure string password as mentioned in the following example. For more information, see Use the SecureStringEncode component.	Data In	SecureString

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect method parameters (continued)

Parameter	Description	Data Port Type	Data type
	Connect method with Password parameter  After you perform this task, you can connect to the remote server.		
Port	Optional. The port number for the SSH connection. Default value is 22.	Data In	Integer
CreateShell	Optional. If True, a shell stream is created on successful connection. Any command that is executing on this connection uses the shell. If False, any command that is executing on this connection does not the shell. Default value is True.	Data In	Boolean
KeyboardInteractiveAuth	Password as a challenge. If True, the server prompts the client for password to verify the user's identity. Value provided in the password parameter is shared	Data In	Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect method parameters (continued)

Parameter	Description	Data Port Type	Data type
	as a response from client. This parameter appears only when **KeyboardInteractive** is selected from the Authentication Type.		
KeyFilepath	Path of the private key. This parameter appears only when **KeyFileAuthentication** is selected from the Authentication Type.	Data In	String
Passphrase	Optional. If private key is encrypted using Passphrase, same value is provided inside the Passphrase parameter to use the private key. This parameter appears only when **KeyFileAuthentication** is selected from the Authentication Type.	Data In	String

RunCommand

After establishing an SSH connection, execute commands over the established connection using the RunCommand method.

RunCommand method parameters

Parameter	Description	Data Port Type	Data type
Command	Commands that must be executed on the remote SSH server, such as messages or scripts, can be valid shell commands or executable commands that the remote server can understand. For example, `echo hello`.	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

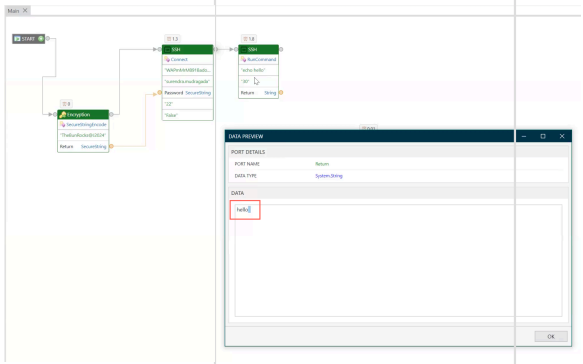
RunCommand method parameters (continued)

Parameter	Description	Data Port Type	Data type
	RunCommand method - Command parameter 		
Timeout	Optional. The parameter that specifies the maximum time (in seconds) to wait for the command's output from the SSH server when using an interactive shell. Default value is 30.	Data In	Integer
Return	The result of the executed command. For example, after executing the automation, in the Data Preview of Return parameter, "hello" is displayed.	Data Out	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RunCommand method parameters (continued)

Parameter	Description	Data Port Type	Data type
	Return parameter of RunCommand method		

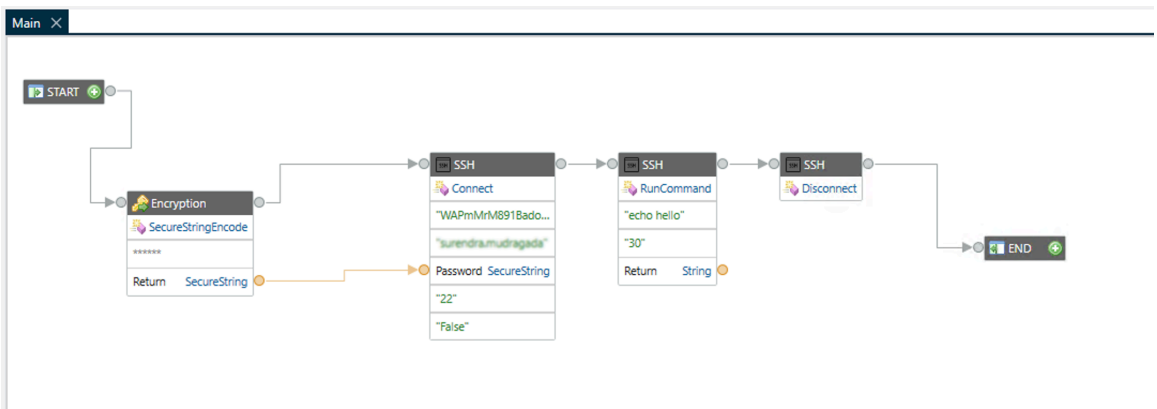


Disconnect

After executing commands, disconnect the established connection using the Disconnect method.

The following example shows the entire automation after adding the Disconnect method.

Disconnect method



StringBuilder

The StringBuilder connector enables you to create, append, update, replace, or remove strings as part of your automation Workflow in RPA Desktop Design Studio.

You must first use and then expose the methods in the StringBuilder connector to use its methods.

- To use the connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

StringBuilder connector methods

The StringBuilder connector methods enable you to create, append, update, replace, or remove strings in your automation workflow in RPA Desktop Design Studio.

Append

Adds string to an existing string. You can create multiple strings by using multiple copies of the method. To view the output, use the ToString method.

Note:
The method doesn't insert a line between the strings.

Append method parameters

Parameter name	Description	Data Port type	Data type
Value	The string to be appended to the existing content. **Example** Existing string: "Hello" Value: " World!" Output: Hello World!	Data In	String

AppendLine

Adds a string followed by a newline character (\n) automatically. When you add multiple strings using multiple copies of the method, it inserts a line between the strings. It functions exactly like the **Enter** key on a Microsoft Word document. To view the output, use the ToString method.

AppendLine method parameters

Parameter name	Description	Data Port type	Data type
Value	String to append followed by a line break. **Example** Existing string: "Hello" Value: "World!" Output: Hello	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AppendLine method parameters (continued)

Parameter name	Description	Data Port type	Data type
	World!		

Replace

Replaces a string with a string that you specify in both the Append and AppendLine methods.

Replace method parameters

Parameter name	Description	Data Port type	Data type
OldValue	Existing string that is replaced with a string specified in the **NewValue** field. **Example** OldValue: User	Data In	String
NewValue	String that replaces the **OldValue** string. **Example** NewValue: Abel Tutor	Data In	String

Clear

Clears the string content in the methods.

ToString

Returns the output of the Append and AppendLine methods.

ToString method parameters

Parameter name	Description	Data Port type	Data type
Return	Output that is returned after the execution of the Append and AppendLine methods. For examples, see Append and AppendLine parameters.	Data Out	String

Configure inputs for the parameters

To enter inputs for parameters, see Configure port properties.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Events

Track various system events such as creation of files or loss of the network with the System Events connector as part of your automation Workflow. The connector also enables you to stop tracking events, whenever needed.

The System Events connector provides methods for tracking various system events. See the table.

System Events methods and events

Method	Purpose
WatchFileSystem	Tracks the following events: • FileChanged • FileDeleted • FileCreated • FileRenamed • FileWatchError
WatchNetworkAvailability	Tracks the following events: • NetworkAvailable • NetworkUnavailable
WatchSessionEvents	Tracks the following events: • OnSessionLock • OnSessionUnlock • OnSessionRemoteControl • OnSessionLogoff
UnWatchFileSystem	Stops tracking the following events: • FileChanged • FileDeleted • FileCreated • FileRenamed • FileWatchError
UnWatchNetworkAvailability	Stops tracking the following events: • NetworkAvailable • NetworkUnavailable
UnWatchSessionEvents	Stops tracking the following events: • OnSessionLock • OnSessionUnlock

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Events methods and events (continued)

Method	Purpose
	• OnSessionRemoteControl • OnSessionLogoff

You must first use and then expose the methods in the SystemEvents connector to use its methods.

- To use the connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

SystemEvents connector methods

The SystemEvents connector methods watch various system events and, if needed, stop watching.

Methods

Provides the following methods and the events these methods track:

WatchFileSystem

Watches the following events.

File system events

Event	Description	Parameter
FileChanged	Update to the file.	• **Name**: Name of the file that is updated. • **Path**: Path to the file. • **ChangeType**: Type of update to the file.
FileCreated	New file created in the path watched by the WatchFileSystem method.	• **Name**: Name of the file created. • **Path**: Path to the file that was created.
FileDeleted	File deleted from the path watched by the WatchFileSystem method.	• **Name**: Name of the file deleted. • **Path**: Path to the file that was deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File system events (continued)

Event	Description	Parameter
FileRenamed	Name of the file changed.	• **OldName**: Previous name of the file. • **OldPath**: Previous path to the file, if path has also changed. • **NewName**: New name of the file. • **NewPath**: New path to the file, if applicable.
FileWatchError	WatchFileSystem method error.	

Input

Path

FileTypes

SubDirectories (Boolean)

WatchNetworkAvailability

Watches the network availability in the system. It uses the following events. You must execute the WatchNetworkAvailability method before executing any of the following events.

Network event availability

Event	Description	Parameter
NetworkAvailable	Watches the system when network is available.	
NetworkUnavailable	Watches the system when network is unavailable.	

WatchSessionEvents

Watches the following events.

Session events

Event	Description	Parameter
OnSessionLock	When a session is locked by the user.	
OnSessionUnlock	When a session is unlocked by the user.	
OnSessionRemoteControl	When a session is remote controlled by the user.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Session events (continued)

Event	Description	Parameter
OnSessionLogoff	When the session is logged off.	

UnwatchFileSystem

Stops or prevents the RPA Desktop Design Studio from watching the file system events. You can use this method before or after the WatchFileSystem method was already used.

UnwatchNetworkAvailability

Stops or prevents the RPA Desktop Design Studio watching the network availability events. You can use this method before or after the WatchNetworkAvailability method was already used.

UnwatchSessionEvents

Stops or prevents RPA Desktop Design Studio watching the network availability events. You can use this method before or after the WatchSessionEvents method was already used.

Parameters of the SystemEvent connector methods

Learn about the various parameters of the SystemEvent connector methods in RPA Desktop Design Studio.

Parameters of the SystemEvent connector methods

Parameter name	Description	Mandatory?
Path	Path to the folder or file that the WatchFileSystem method will track.	Yes
FileTypes	File types that WatchFileSystem will track.	Yes
SubDirectories (Boolean)	Option to indicate whether WatchFileSystem will track subdirectories.	No
Name	Name of a file that is tracked by a SystemEvent method changes.	Yes
Path	Path of a file that is tracked by a SystemEvent method.	Yes
ChangeType	Type of change.	Yes
Name	Name of the file created.	Yes
Path	Path of the file created.	Yes
Name	Name of the file deleted.	Yes
Path	Path of the file deleted.	Yes
OldName	File name before a name change.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the SystemEvent connector methods (continued)

Parameter name	Description	Mandatory?
OldPath	File path before a path change.	Yes
NewName	New file name.	Yes
NewPath	New file path.	Yes

Configure inputs for the parameters

To enter inputs for parameters, see Configure port properties.

Table

The Table connector enables you to perform various actions on a table of any kind. For example, you can create or delete columns or rows or get the values from the cells in a table as part of a Workflow in RPA Desktop Design Studio.

You must first use and then expose the methods in the Table connector to use its methods.

- To use the connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Table connector methods

The Table connector provides multiple methods that perform various actions on tabular data as part of an automation Workflow in the RPA Desktop Design Studio. For example, tasks such as getting a table, getting a row data, and removing empty rows.

SetTable

Inserts a table into the workflow. The SetTable method must be used before you do any other operations on a data table. You must provide the table object that needs to be set.

SetTable parameters

Parameter Name	Description	Data Port type	Data type
Table	Name of the table that you want to add or modify. **Example** DataTable	Data In	DataTable

AddColumn

Adds a column to a table. The position of the column is determined by the column index value that you specify. You must provide the name of the new column and the column index at which the new column needs to be added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AddColumn parameters

Parameter Name	Description	Data type
Name	Name of the new column that you want to add. **Example** Customer data	String
ColumnIndex	Index of the column where the new column needs to be added. By default, -1 is the index value that you can update. For example, 0, 1, 2 can indicate the positions of columns from the left to the right.	Integer

AddColumns

Adds multiple columns to a table by accepting column names from another method or component. To view the columns added, use the GetTable method. You must provide a list of names of new columns which needs to be added in the datatable.

AddColumns parameters

Parameter Name	Description	Data type
Names	Accepts names of columns in the form of an array, array list, or list. **Example** { "OrderID", "CustomerName", "OrderDate", "Status"};	IEnumerable

AddRow

Adds a row and its contents at the specified index. You must provide the RowIndex at which the row needs to be added.

To set the index values where you add the contents of the row, do the following actions:

1. Click the component settings icon ( ).
2. Click the add index icon ( ).
3. Enter the index.
4. Repeat the steps to add multiple indexes.
5. Click **OK**.

Note:
A Data In port is added with each row that you add.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AddRow parameters

Parameter Name	Description	Data Port type	Data type
RowIndex	Index of row at which the new row needs to be added.	Data In	Integer

GetTable

Returns the table that you created with the AddColumn, AddColumns, and AddRow methods.

Note:
You must execute this method after executing the AddColumn, AddColumns, and AddRow methods.

GetTable parameters

Parameter Name	Description	Data Port type	Data type
DataTable	Returns DataTable type representing underlying DataTable object.	Data Out	DataTable

ClearColumns

Clears all column values from a table.

ClearRows

Clears all row values from a table.

DeleteColumnByIndex

Deletes a column based on the index value that you specify. You must provide the index of the column to be deleted to the Index parameter.

DeleteColumnByIndex parameters

Parameter Name	Description	Data Port type	Data type
Index	Index value of the column that must be deleted.	Data In	Integer

DeleteColumnByName

Deletes a column based on the name that you specify. You must provide the name of the column that needs to be deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DeleteColumnByName parameters

Parameter Name	Description	Data Port type	Data type
Name	Name of the column that must be deleted.	Data In	String

DeleteRow

Deletes a row based on the index value provided. Before executing this method, you must assign custom index values to the rows. You must provide index of the row which needs to be deleted.

DeleteRow parameters

Parameter Name	Description	Data Port type	Data type
Index	Index of the row which needs to be deleted.	Data In	Integer

FilterAndSort

Filters and sorts the table based on a expression that you specify. You must provide the expression to calculate the value of a column, column name to be sorted in SortColumnName and Order. It returns the count of the rows available based on the criteria set and also returns the complete data table.

FilterAndSort parameters

Parameter Name	Description	Data Port type	Data type
Expression	Expression to calculate the value of a column. **Example** "Status = 'Pending'" - Based on this query expression, the data is filtered.	Data In	String
SortColumnName	Column name by which the method will sort the data. **Example** Date - The method will sort the data based on the Date column.	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

FilterAndSort parameters (continued)

Parameter Name	Description	Data Port type	Data type
Order	Order of the column name	Data In	String
DataTable	Returns the data table containing filtered data from the underlying DataTable object.	Data Out	DataTable
Count	Returns the count of rows after sort.	Data Out	Integer

FilterByRegEx

Filters the table data based on a regular expression or RegEx that you specify. You must provide the column index to ColumnIndex parameter and the regular expression to RegExpression parameter, which are used for filtering. This method returns the rows count and the data table.

FilterByRegEx parameters

Parameter Name	Description	Data Port type	Data type
ColumnIndex	Index of column on which filtering logic needs to be applied. The default index value is -1 for the first column. Providing a custom index value is optional. If the field receives no custom index value, the method automatically sets the order of the columns.	Data In	Integer
RegExpression	Regular expression which is used as a filtering logic.	Data In	String
Return	Returns a DataTable containing filtered data from the underlying DataTable object.	Data Out	DataTable
RowsCount	Returns the number of rows available based on the filter using RegExpression.	Data Out	Integer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

FindText

Finds the text in the table that you specify based on one or more criteria and returns cell value. You must provide the text to search in SearchText parameter, position from where the search should start in StartPosition and the type of match required.

FindText parameters

Parameter Name	Description	Data Port type	Data type
SearchText	Text to be searched in the table. **Example** "John Doe"	Data In	String
StartPosition	Position of the column from where the search should start.	Data In	Integer
MatchType	Type of match of the text: • **ExactMatch**: The specified text and the searched text must match exactly. This is a default value. • **MatchCase**: The specified text case should match the case of the searched text. • **Contains**: The specified text should contain one or more characters of the searched text.	Data In	MatchType
CellValue	Returns the value in the cell based on the search.	Data Out	Object
ColIndex	Returns the index of the column that has that searched text.	Data Out	Integer
RowIndex	Returns the index of the row that has that searched text.	Data Out	Integer

GetCellValue

Returns the value in a cell based on the row and column index values that you specify. You must provide the row number and column number of the cell from which value needs to be retrieved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetCellValue parameters

Parameter Name	Description	Data Port type	Data type
Row	Row number of the required cell.	Data In	Integer
Column	Column number of the required cell.	Data In	Integer
Return	Returns Object type representing cell value from underlying DataTable object.	Data Out	Object

GetCellValueIfRowHas

Returns True if the method finds the text that you specify and the row values based on the index values that you specify. You must provide the text to be searched. Perform the search on a particular column provided by SearchColumnIndex and start searching the text from a particular row provided to StartRowIndex. Default value is 1 meaning 1st row of the table.

To specify the row values, you must configure the method.

1. Click the method settings icon ( ).
2. Click the add row index icon ( ).
3. Update the row index value data type.
4. Enter the row index value.
5. Click **OK**.

GetCellValueIfRowHas parameters

Parameter Name	Description	Data Port type	Data type
SearchText	Text to be searched in the row. **Example** "John Doe"	Data In	String
SearchColumnIndex	Index of column in which the text needs to be searched.	Data In	Integer
StartRowIndex	Starting row from which the search needs to be performed.	Data In	Integer
Found	Returns True if the text matched.	Data Out	Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetCellValues

Returns values of the multiple cells based on the index values that you specify. You must provide the row index of the cell whose value needs to be retrieved. Additional row indexes can also be added to get those cell values using the config window.

To configure, do the following actions:

1. Click the method settings icon ( ).
2. Click the add row index icon ( ).
3. Update the row index value data type.
4. Enter the row index value.
5. Click **OK**.

GetCellValue parameters

Parameter Name	Description	Data Port type	Data type
RowIndex	Index of the row whose cell value is required.	Data In	Integer

GetCount

Returns the total count of rows and columns of a data table.

GetCount parameters

Parameter Name	Description	Data Port type	Data type
Row	Returns the total count of rows created.	Data Out	Integer
Column	Returns the total count of columns created.	Data Out	Integer

GetRowData

Returns row data based on the index value that you specify. You must provide the index value of the row from which data needs to be retrieved.

GetRowData parameters

Parameter Name	Description	Data Port type	Data type
RowIndex	Index value of the row from which data needs to be retrieved.	Data In	Integer
Return	Returns list Of Object type representing row data from underlying DataTable object. The **IEnumerable** data	Data Out	IEnumerable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetRowData parameters (continued)

Parameter Name	Description	Data Port type	Data type
	type accepts the row value data as array, list, or array list and returns as object.		

GetTableAsCSV

Saves the table data in the CSV format to the local drive. You must provide the file path to which the CSV file needs to be written to and also provide the separator between the two records.

GetTableAsCSV parameters

Parameter Name	Description	Data Port type	Data type
Filepath	Folder path in the local drive where the method saves the table data as CSV. In the file path, you must include the filename. **Example** D:\Projects\Customer data.csv	Data In	String
Delimiter	Delimiter that separates the table data. **Example** Comma (",")	Data In	String

GetTableAsHTML

Returns the table data in an HTML file format. Before you execute this method, you must create columns, rows, and data and then execute them with the GetTable method.

GetTableAsHTML parameters

Parameter Name	Description	Data Port type	Data type
Return	Returns the tabular data in the HTML format.	Data In	String

GetTableAsJson

Returns the table data in a JSON file format. Before you execute this method, you must create columns, rows, and data and then execute them with the GetTable method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetTableAsJson parameters

Parameter Name	Description	Data Port type	Data type
Return	Returns the tabular data as a JSON object.	Data In	String

LoadFromExcel

Imports the sheet or data from the specified Excel file to the data table. You must provide the path of the Excel file from which the data needs to be loaded. Give the sheet name or provide a query to SheetOrQuery parameter. If a query is provided, then set the IsQuery Boolean to True, and if a sheet name is provided, then set the IsQuery Boolean to False. You can test whether the data was imported correctly with the GetTable method.

LoadFromExcel parameters

Parameter Name	Description	Data Port type	Data type
FilePath	Path to the Excel file from which the data is imported. D: \Projects \Sales \Sales data.xlsx	Data In	String
SheetOrQuery	Indicates whether data is imported from a sheet in the Excel file or through a query to the file.	Data In	String
IsQuery	Boolean value to indicate whether the data is loaded through a query.	Data In	Boolean

MatchColumn

Matches another datatable's columns with the current table's column based on the column index. You must provide the datatable whose columns need to be matched provided in dtTable with the index of column in current table in ColumnIndex parameter. Before you execute this method, you must execute the GetTable method.

MatchColumn parameters

Parameter Name	Description	Data Port type	Data type
dtTable	Data table whose columns need to be matched.	Data In	DataTable

MatchColumn parameters (continued)

Parameter Name	Description	Data Port type	Data type
ColumnIndex	Index of the column with which it has to be matched.	Data In	Integer
Return	Returns a true or false value indicating whether the specified column is matched.	Data Out	Boolean

RemoveEmptyColumns

Removes all the empty columns in the table and returns the data table after the operation.

RemoveEmptyColumns parameters

Parameter Name	Description	Data Port type	Data type
Return	Returns the data table after removing the empty columns.	Data Out	DataTable

RemoveEmptyRows

Removes all the empty rows in the table and returns the data table after the operation.

RemoveEmptyRows parameters

Parameter Name	Description	Data Port type	Data type
Return	Returns the data table after removing the empty rows.	Data Out	DataTable

SetCellValue

Adds data to a cell based on column and row index values. You must provide the row number, column number and the value in Value parameter that needs to be set.

Before you execute this method, you must create columns, rows, and data and then execute them with the GetTable method.

SetCellValue parameters

Parameter Name	Description	Data Port type	Data type
Row	Index number of the row which the method will use to fill data.	Data In	Integer
Column	Index number of the column which the method will use to fill data.	Data In	Integer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetCellValue parameters (continued)

Parameter Name	Description	Data Port type	Data type
Value	Value that must be set in the cell.	Data In	Object

SetCellValueIfRowHas

Sets cell value(s) of a particular row if row contains specified text. You must provide the row index in the Row Index configuration dialog. The name of the row index parameter added is considered for setting the value and the value provide to that parameter is the actual value that will be set to the row of the table.

SetCellValueIfRowHas parameters

Parameter Name	Description	Data Port type	Data type
SearchText	Text to be searched in the row.	Data In	String
SearchColumnIndex	Index of the column in which the text needs to be searched.	Data In	Integer
StartRowIndex	Starting row from which the text needs to be searched.	Data In	Integer
Found	Returns True if the text matches.	Data Out	Boolean

SetColumnName

Updates a column name based on the column index and name that you specify. You must first create or import a table by using the SetTable method.

SetColumnName parameters

Parameter Name	Description	Data Port type	Data type
ColumnIndex	Index of the column which needs to be named.	Data In	Integer
Name	New name of the column.	Data In	String

SetJson

Converts a JSON object to a DataTable. Provide JSON data that needs to be converted to DataTable.

Tip:
To create a JSON object, use the GetTableAsJson method and then pass the values to the SetJson method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetJson parameters

Parameter Name	Description	Data Port type	Data type
JSON	JSON object needs to be converted to a DataTable.	Data In	String

SetList

Converts a list to a DataTable. Provide the data list that needs to be converted to table.

SetList parameters

Parameter Name	Description	Data Port type	Data type
Data	List type data that needs to be converted to table. The **IEnumerable** input data type accepts the data as array, list, or array list. { "OrderID": 102, "CustomerName": "John Doe", "OrderDate": "2024-02-02", "Status": "Shipped" };	Data In	IEnumerable

SetRowData

Inserts the specified row data into a data table. You must provide the index number of the row to the RowIndex parameter and data that needs to be added to the row to the Data parameter.

SetRowData parameters

Parameter Name	Description	Data Port type	Data type
RowIndex	Index number of the row that needs to be modified.	Data In	Integer
Data	Data in a row that is inserted into a data table. The **IEnumerable** input data type accepts the data as array, list, or array list. { "OrderID": 102,	Data In	IEnumerable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetRowData parameters (continued)

Parameter Name	Description	Data Port type	Data type
	"CustomerName": "John Doe", "OrderDate": "2024-02-02", "Status": "Shipped" };		

ToList

Converts the specified table to a list.

ToList parameters

Parameter Name	Description	Data Port type	Data type
Return	Returns an IEnumerable representing a DataTable object converted into a List. The **IEnumerable** data type accepts the data as array, list, or array list and returns the list.	Data Out	IEnumerable

VLookUp

Gets cell value(s) of a particular row if row contains specified text.

To input the values, do the following actions:

1. Click the method settings icon ( ).
2. Click .
3. Enter the values.
4. Click **OK**.

VLookUp parameters

Parameter Name	Description	Data Port type	Data type
Port name	Name of the port of the component.	Data In	String
SearchText	Text that the method will search in the rows and columns.	Data In	String
DataColumnIndex	Integer value that indicates the order of the column from the left. The default index	Data In	Integer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VLookUp parameters (continued)

Parameter Name	Description	Data Port type	Data type
	value is -1 for the first column. Providing a custom index value is optional. If the field receives no custom index value, the method automatically sets the order of the columns.		
SearchColumnIndex	Integer value that indicates the order of the column from the left. The default index value is -1 for the first column. Providing a custom index value is optional. If the field receives no custom index value, the method automatically sets the order of the columns.	Data In	Integer
StartRowIndex	Integer value that indicates the order of the column from the left. The default index value is -1 for the first row. Providing a custom index value is optional. If the field receives no custom index value, the method automatically sets the order of the columns.	Data In	Integer

VLookUpSet

Sets cell value(s) of a particular row if row contains specified text.

To input the values, do the following actions:

1. Click the method settings icon ( ).
2. Click .
3. Enter the values.
4. Click **OK**.

VLookUpSet parameters

Parameter Name	Description	Data Port type	Data type
Port name	Name of the port of the component.	Data In	String
SearchText	Text that the method will search in the rows and columns.	Data In	String
DataColumnIndex	Integer value that indicates the order of the column from the left. The default index value is -1 for the first column. Providing a custom index value is optional. If the field receives no custom index value, the method automatically sets the order of the columns.	Data In	Integer
SearchColumnIndex	Integer value that indicates the order of the column from the left. The default index value is -1 for the first column. Providing a custom index value is optional. If the field receives no custom index value, the method automatically sets the order of the columns.	Data In	Integer
StartRowIndex	Integer value that indicates the order of the column from the left. The default index value is -1 for the first row. Providing a custom index value is optional. If the field receives no custom index value, the method automatically sets the order of the columns.	Data In	Integer

Timer

The Timer connector sets a user-defined timer within a workflow and when the timer stops, it triggers an automation.

You must first use and then expose the methods in the Timer connector to use its methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To use the connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Timer connector methods

Learn about the Timer connector methods and event.

Start method

The Start method enables you to set a time in milliseconds.

Input

Interval

Start method parameters

Parameter name	Port type	Data type	Description	Mandatory?
Interval	Data In	Integer	Timer interval in milliseconds.	Yes

Stop method

Stops the timer.

OnTimeTick event

The event starts when the Start method starts.

OnTimeTick event parameters

Parameter name	Port type	Data type	Description	Mandatory?
SignalTime	Data Out	Integer	The system date and time when the trigger starts operating.	Yes
ElapsedTime	Data Out	Integer	Total time in the timer elapsed.	Yes

Terminal (Mainframe) connector

Automate various actions on the IBM Personal Communications and Rocket BlueZone emulators by using the Terminal connector that RPA Desktop Design Studio provides. For example, you can simulate a command on the emulator screen or get text from the screen.

Important:
The Terminal connector uses the IBM Personal Communications and the Rocket BlueZone APIs internally to interact and automate applications that are hosted on Mainframe or AS/400 applications. Any known issue or limitation of IBM Personal Communications and the Rocket BlueZone API is applicable.

You must first make the Terminal connector available for use on the Design surface of RPA Desktop Design Studio. To learn how to make the Terminal connector available for use, see Use a connector in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the Terminal connector by capturing the IBM Personal Communications and Rocket BlueZone emulator screens and their elements on which the connector performs actions. To learn how to configure the Terminal connector, see Configure the Terminal connector.

Automate actions on the IBM Personal Communications (PCOMM) and Rocket BlueZone emulator screens by using the methods that the Terminal connector provides. To learn how to use the methods, see Use a component in RPA Desktop Design Studio.

Configure the Terminal connector

Create automations on the IBM Personal Communications (PCOMM) and the Rocket BlueZone emulators by using the Terminal connector that RPA Desktop Design Studio provides. By capturing these emulator screens and their elements, you can automate actions on them.

Ensure you have installed the Terminal (Mainframe) plugin on the RPA Desktop Design Studio. To install, see Manage plugins in RPA Desktop Design Studio.

Ensure that you have added the Terminal connector object under the Global Objects in the Project Explorer pane.

Ensure that you have started an emulator session and connected it to a server.

Role required: none

Configure the IBM Personal Communications emulator

Configure the IBM Personal Communications (PCOMM) emulator on the RPA Desktop Design Studio by capturing the PCOMM emulator screens and their elements. After capturing the screens, you can use the screen and element methods to automate actions on the screens and elements.

Before you begin

Add the Terminal connector object to the Global Objects list in the Project Explorer pane so the Terminal connector is available to all the activities, components, and connectors in the automation project.

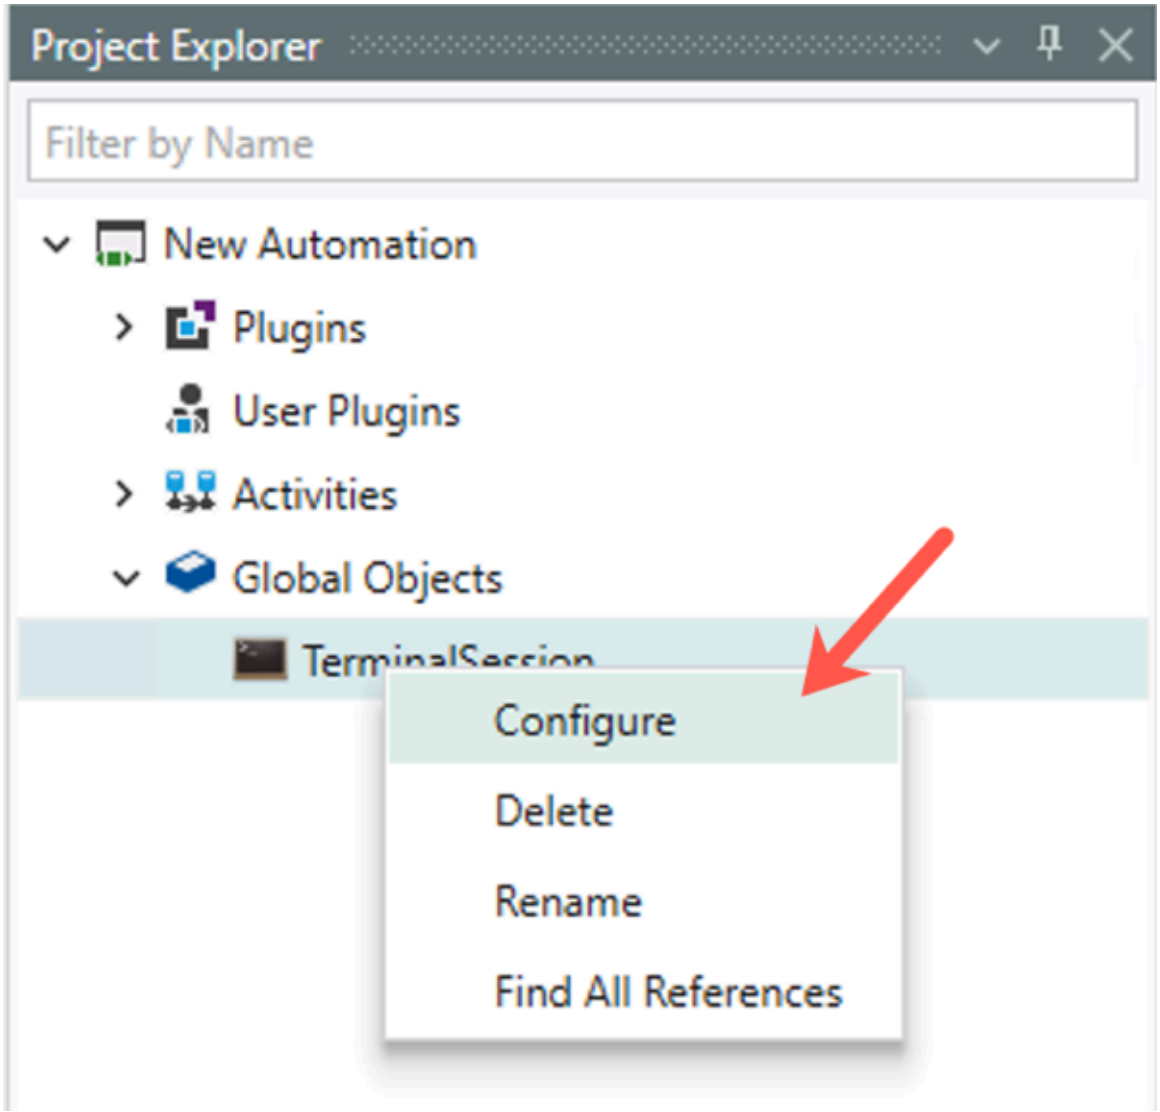
Start an emulator session and connect it to a server.

Role required: none

Procedure

1. Navigate to the Project Explorer pane **> Global Objects** and right-click the **TerminalSession** object.
2. Select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the Terminal Connector window, make sure that Pcomm is selected.

   By default, Pcomm is selected.

Tip:
To load a PCOMM emulator screen that doesn't appear in the list, select the refresh icon ( ).

4. Capture a PCOMM emulator screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Pcomm list, select a PCOMM Mainframe emulator screen.

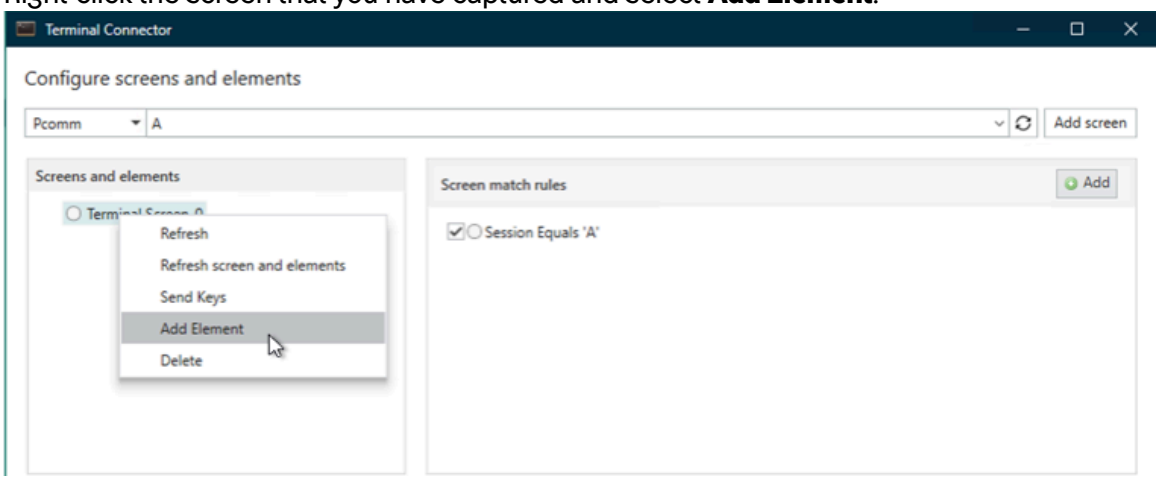
Note:
When the PCOMM emulator establishes a connection with the server, a session is created with the name of the session. For example, the name of the session in the example is A.

b. Select **Add Screen**.
The emulator screen is added and appears in the Screens and elements pane and under the TerminalSession object in the Project Explorer pane.

When you capture multiple screens and elements and want to automate tasks on one screen or element, the connector must first find the screen or element by using the match rules. To know about the match rules, see Use the screen or element match rules.

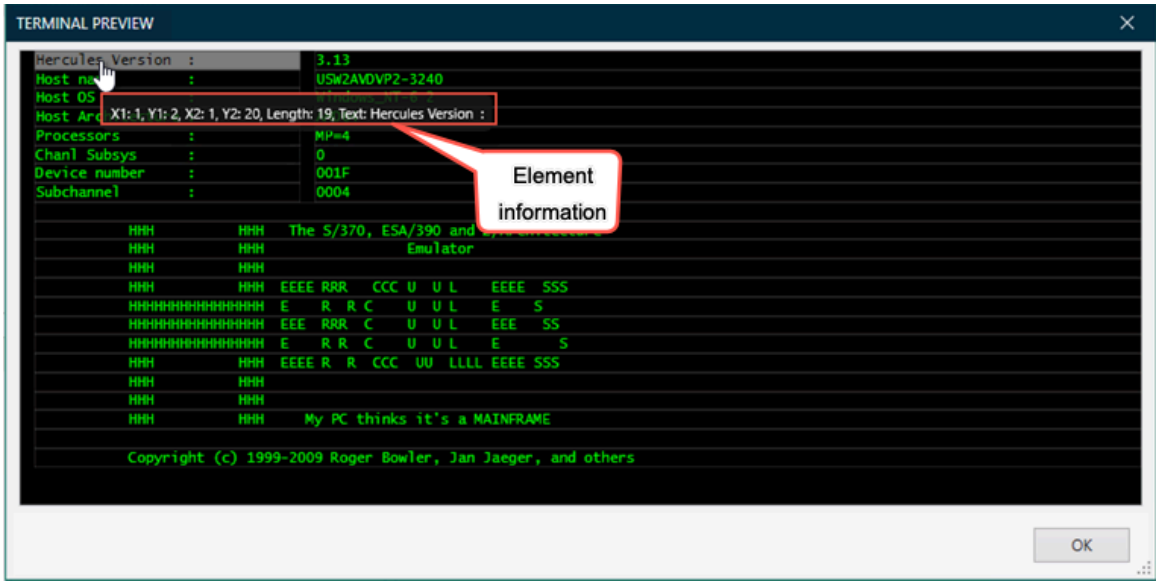
5. Capture an element from the Pcomm emulator screen.

a. Right-click the screen that you have captured and select **Add Element**.



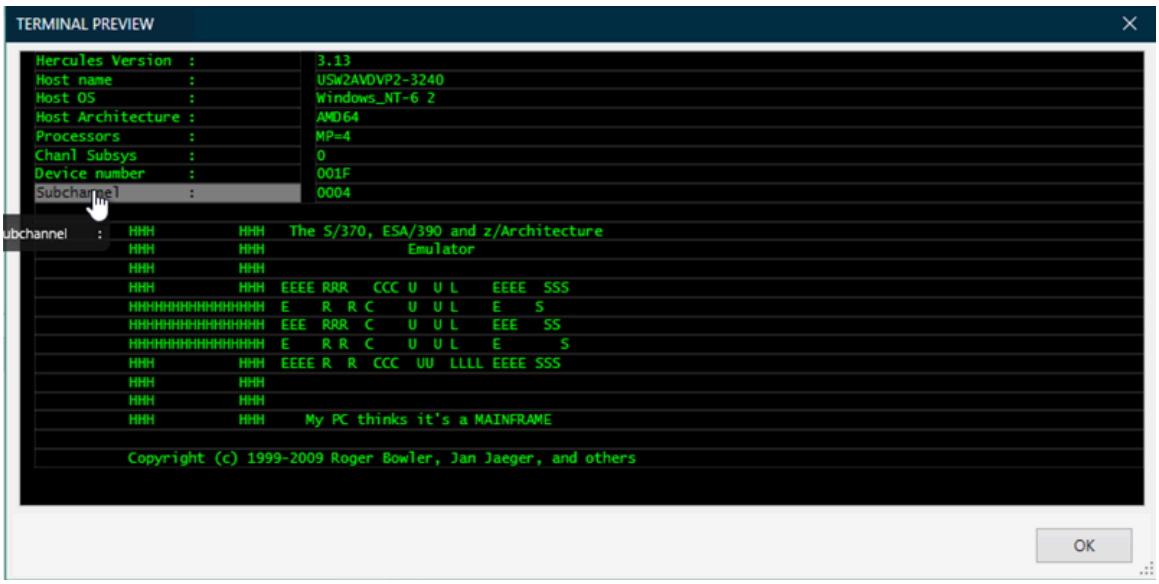
b. In the TERMINAL PREVIEW screen, move your mouse device to the element that you want to capture.
The element displays its information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Add the element as a field by right-clicking the element and selecting **Add as Field**.

The data in a Mainframe screen is displayed within fields. The emulator screen that you configure in the RPA Desktop Design Studio indicates a field with a rectangle. The following image shows a field within a rectangle.

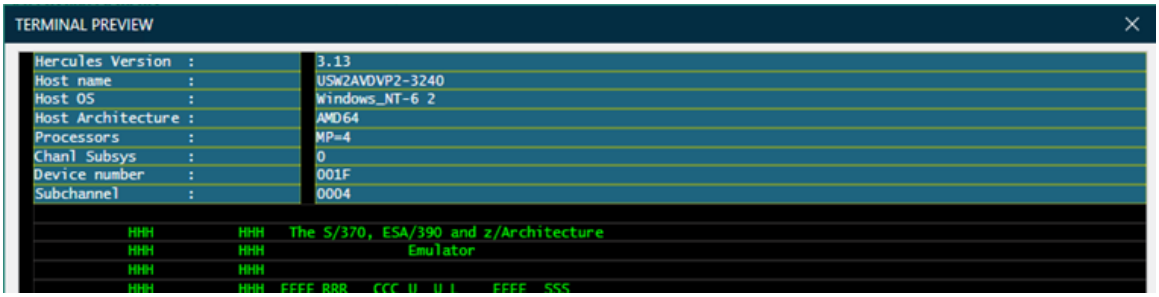


When you select **Add as Field**, the connector treats the element as a field that displays the data or enables data entry. With this option, you can get the text or data from a field and then enter the data in a form.

d. Add fields after selecting them in a tabular format.

To add fields after selecting them in a tabular format, select the contiguous fields that make up a table. The following example shows how you must select the fields to capture a table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Select the fields.

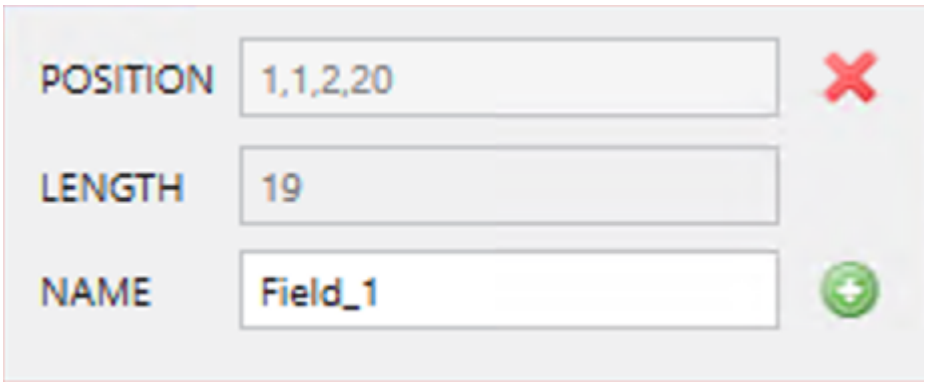
i. Select the first field in the table.

ii. On your keyboard, press **Shift**.

iii. Select the last field in the table.

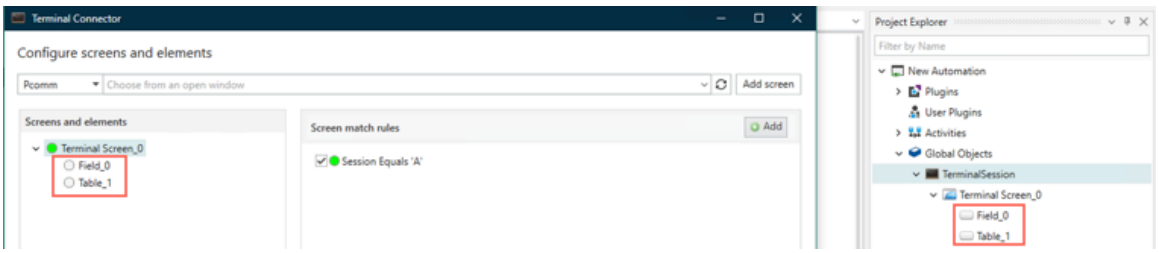
Right-click and select **Add as Table**.

e. In the context dialog box, enter the name of the field or table in the **NAME** field.



f. Select the Add Field icon .
To capture more elements, you can repeat steps 5a through 5f.

g. Close the **TERMINAL PREVIEW** screen by selecting **OK**.
The element is added and appears in the Screens and elements pane in the Terminal Connector screen under the TerminalScreen_0 object.



6. **Optional:** Use the screen match rules to enable the terminal connector to locate a screen or element.
When you capture multiple screens, fields, or tables and want to automate tasks on one screen or element, the connector must first find the screen or element. To enable the connector to find the screen or element, use the screen match rules at Use the screen or element match rules.

7. View the screen and element methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. View the screen-level methods under the TerminalSession object in the Project Explorer pane by double-clicking the screen that you captured.
The methods appear in the Object Explorer pane.

b. View the element-level methods in the Project Explorer pane by navigating to the element under the screen that you captured and double-clicking the element.
The methods appear in the Object Explorer pane.

Rocket BlueZone emulator methods

Use the screen or element match rules

Use the screen or element match rules to match a screen or element from among multiple screens and elements with its corresponding rules. Match rules enables the connector to identify the appropriate screen or element and perform tasks.

Before you begin

Capture at least one emulator screen and an element.

Role required: none

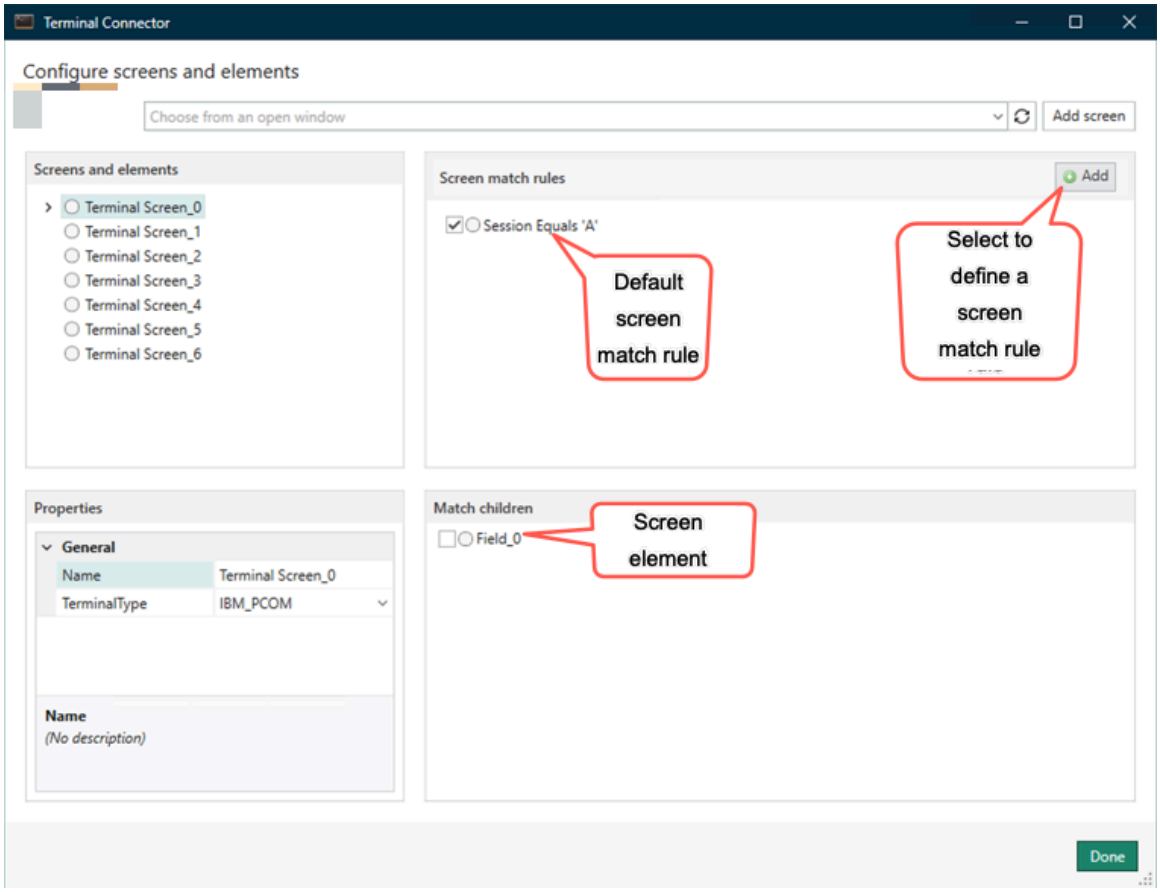
About this task

To perform tasks on a specific emulator screen or element from among multiple emulator screens and elements, the Terminal connector must first identify a screen. To identify a screen or element, the Terminal connector uses the screen match rules, attributes, and the element locators. The screen match rules, locators, and attributes provide unique identification criteria for each screen and element.

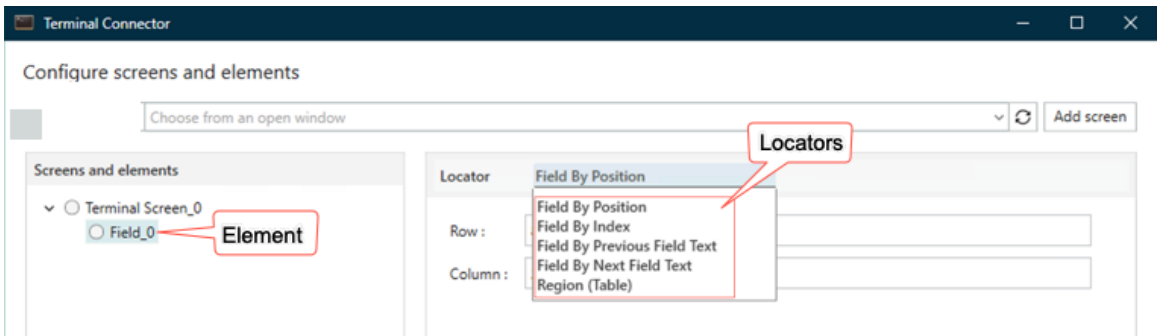
All captured screens have a default screen match rule. Additionally, you can define one or more screen match rules. You can modify or remove the default screen match rules or the screen match rules that you define.

Screen and elements have different match rules. For a screen, the terminal connector uses screen match rules and for an element, it uses locators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The image shows the locators for a screen element.



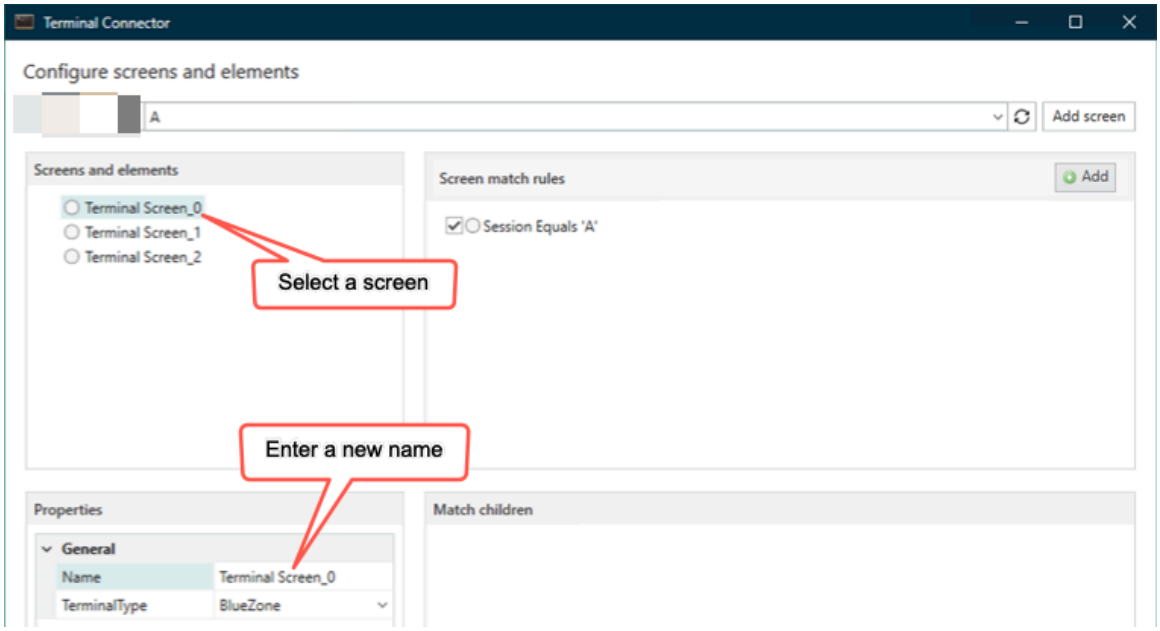
Procedure

1. **Optional:** Rename the screen with a unique name.

   a. Under the Screen and elements pane, select the screen.

   b. Under the **Properties** pane, rename the screen and press **Enter**.

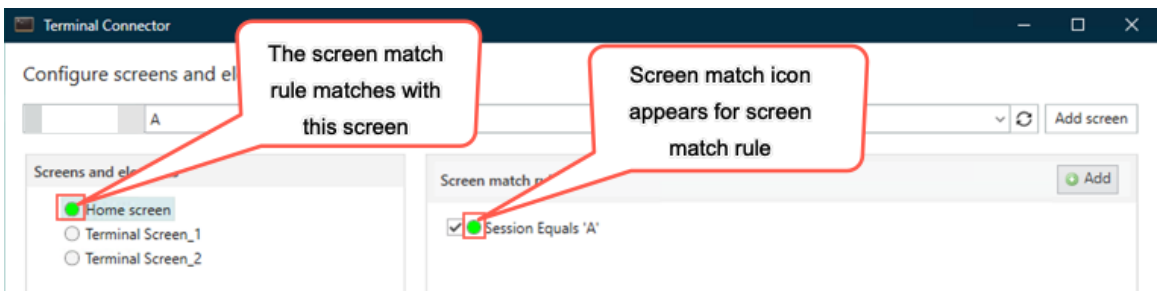
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The new screen name appears under the Screen and elements pane.

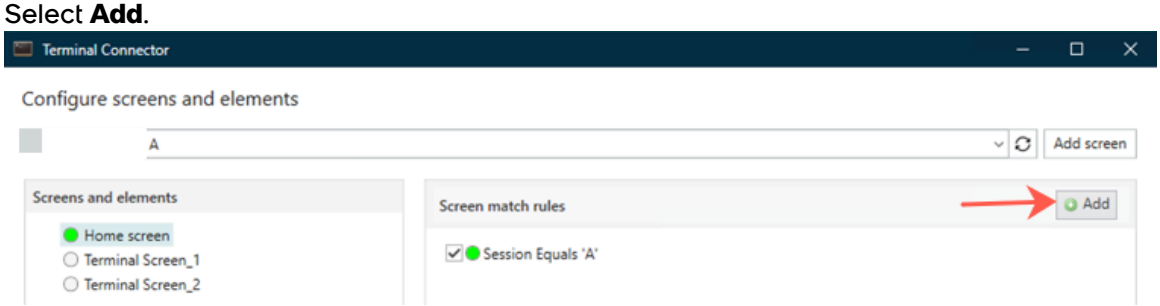
c. Under the Screen and elements pane, right-click the screen and select **Refresh**.

If the screen match rule matches a screen, the screen match icon ( ) appears for both the screen and the screen match rule. The icon indicates that the screen match rule matches with the screen.



2. Optional: Define a screen match rule.
You can add a field or text from the emulator screen that the Terminal connector uses as a screen match rule.

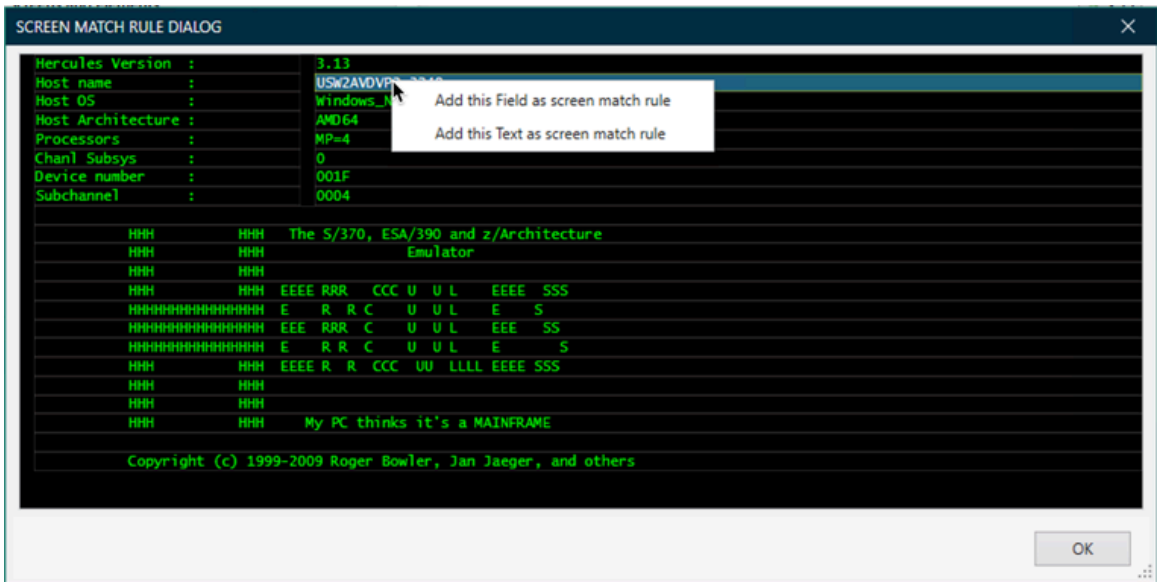
a. Select **Add**.



b. Right-click on the required field and select either of the options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Add this Field as screen match rule**: The connector uses the field details such as row, column, and text as a screen match rule.
- **Add this Text as screen match rule**: The connector uses the field text as a screen match rule.



The screen match rule appears under the **Screen match rules** pane.

c. Select **OK**.

3. **Optional:** Define an element and match rules.
The Terminal connector provides multiple rules or locators that provide information about elements. For example, the row and column numbers of the field on the screen is one of the match rules. The Terminal connector provides five locators and you can choose any locator to match the element.

a. Rename the field.

(Optional) When you capture multiple elements, the Terminal connector provides them default names such as Field_0, Field_1, Table_0, and Table_1. To easily identify an element, you can rename it.

Element locators

Rule	Description
Field By Position	Matches a field with its row and column number in the screen. The Row and Column fields show the row and column numbers of the starting point of the field that you captured from the screen.  (Optional)
Field By Index	Matches a field with its index number in the screen. (Optional) An index number is a unique identifier of a field in the Mainframe screen that enables the connector to identify a field. Each field on the emulator screen has a unique index number. The first field in the first row gets index 1, then the second field in the first row gets index 2, and so on. Index numbers are first assigned to the fields in the first row and then from the first field of the second row until all fields in the screen get index numbers. Field By Previous Field Text	Matches a captured field with the text in the field that is located immediately before the field that you captured. The **Previous Field Text** match rule shows the text in the previous field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

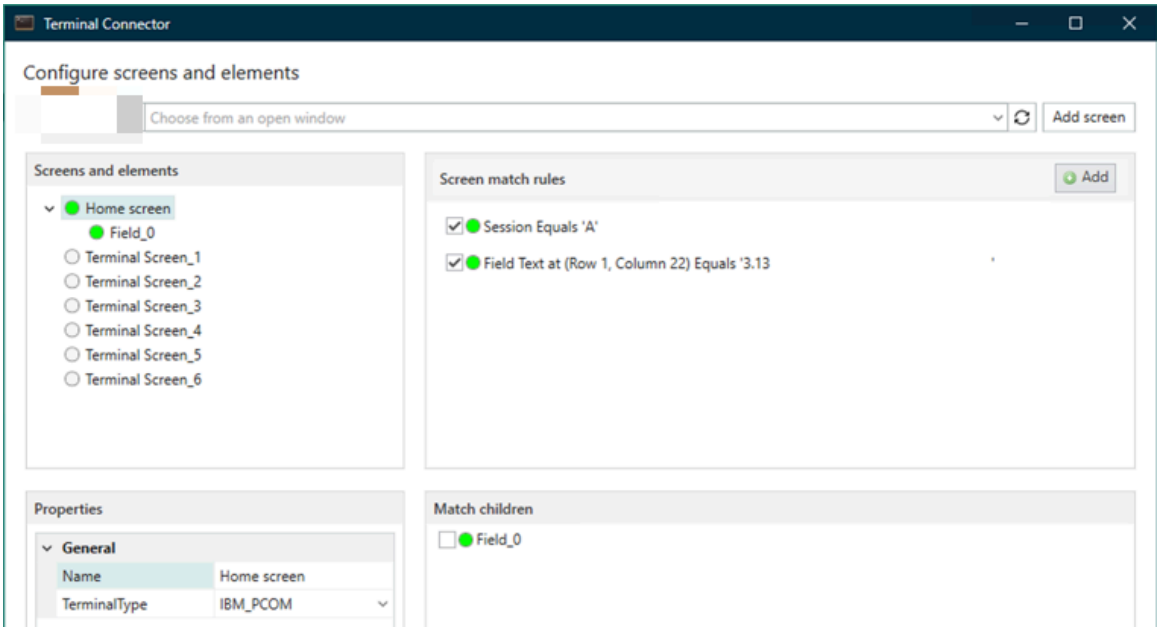
The element match icon ( ) appears for the screen and its elements and the corresponding rules, locators, or attributes.



Terminal connector methods

The Terminal connector methods enable you to perform various tasks on the emulator screens. For example, you can extract login data from a variable and use a method to enter the data and log in to a Mainframe application.

IBM Personal Communications emulator methods

Use the IBM Personal Communications emulator methods to perform various automation tasks on the IBM Personal Communications emulator.

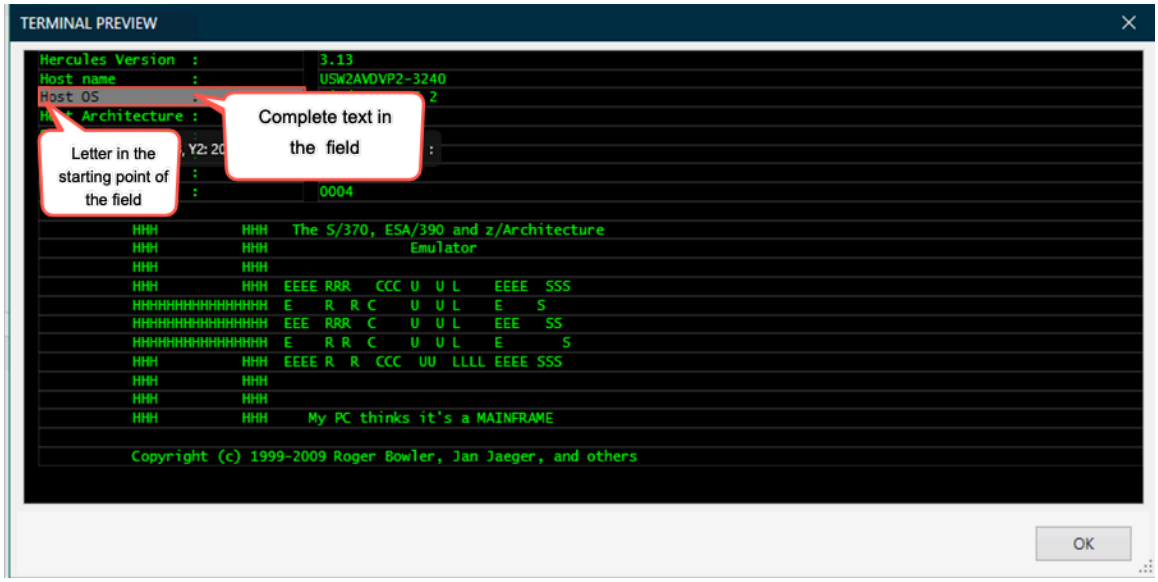
Screen-level methods

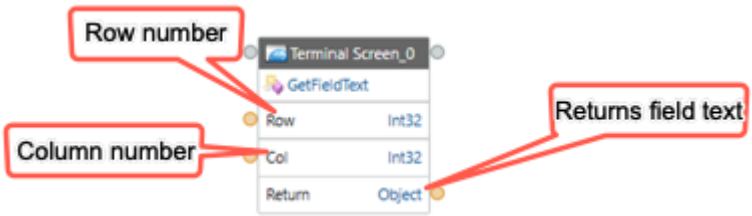
Use screen-level methods to perform the automation tasks on the emulator screen. For example, you can simulate a command on the screen or get text from the screen.

GetFieldText

Returns the text that a field contains after it identifies the field by the row and column number that you specify. The row and column that you specify are the starting point of the field. The method identifies the whole field and then returns the text in the field. In the following example, H is the first letter and the starting point in the field and `Host OS :` is the complete text in the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.





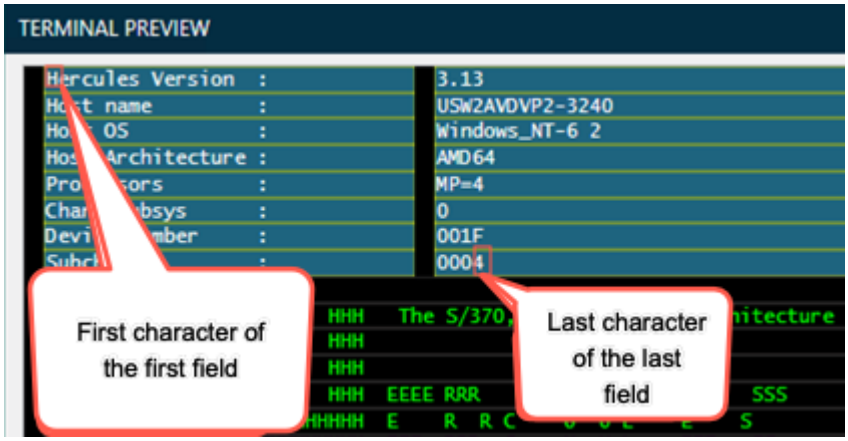
GetFieldText method parameters

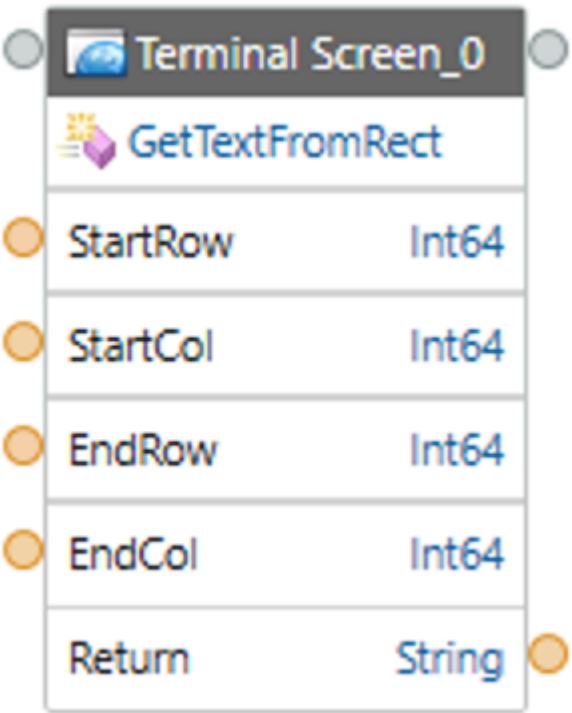
Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Row	Field row number that identifies the field.	Data In	Integer	NA	Yes	
Column	Field column number that identifies the field.	Data In	Integer	NA	Yes	
Return	Returns the text in the field.	Data Out	String	NA	NA	

GetTextFromRect

Returns the text in all the fields of a rectangular area that you define on the screen. You define an area by providing the starting and ending rows and column numbers. The method locates and identifies the first and the last fields and returns all the text in all the fields within that area. The following example shows the area that you defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.





GetTextFromRect method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
StartRow	Row number that indicates the first character of the first field in the rectangular area.	Data In	Integer	NA	Yes	
StartCol	Column number that contains the first	Data In	Integer	NA	Yes	

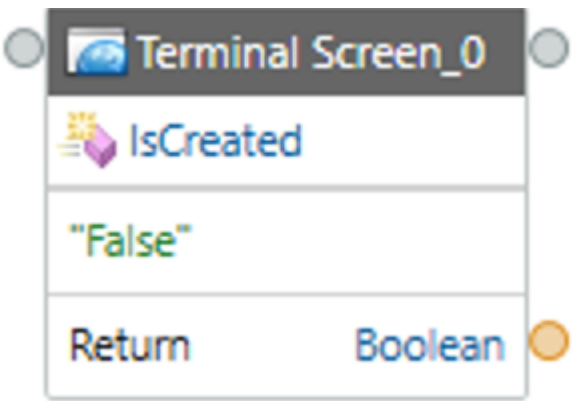
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GetTextFromRect method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
	character of the first field in the rectangular area.					
EndRow	Row number that contains the last character of the last field in the rectangular area.	Data In	Integer	NA	Yes	
EndCol	Column number that contains the last character of the last field in the rectangular area.	Data In	Integer	NA	Yes	
Return	Returns the text from all the fields within the rectangular area.	Data Out	String	NA	NA	

IsCreated

Verifies whether the emulator screen exists based on the screen match rule and can accept inputs from the user. After verification, the method returns the appropriate Boolean value.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IsCreated method parameters

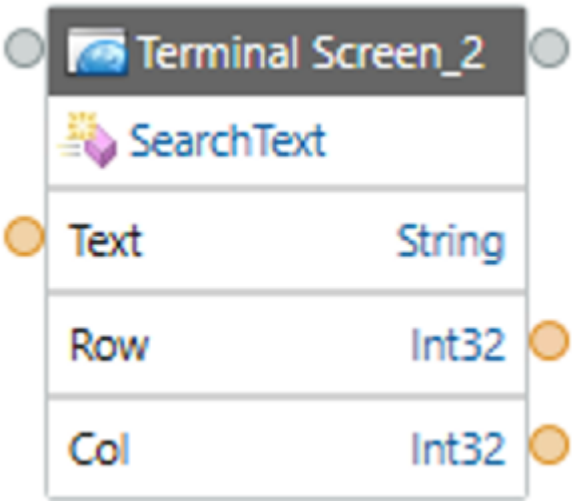
Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
MatchAllChildren	Option to find the emulator screen by matching the child elements that you have captured.	Data In	Boolean	False	Yes	**Warning:** Using this option may slow down the method.
Return	Returns the Boolean value depending on whether emulator screen exists based on the screen match rule and can accept inputs from the user.	Data Out	Boolean	NA	NA	

SearchText

Returns the numbers of the row and column that holds the first character of the text that you specify. For example, if you specify the string `emulator`, the method returns the row and column numbers of the starting point of the word `emulator` which is `e`.

Note:
If you provide the text that spans multiple fields, the Row and Col ports return 0 because the method supports the text only from a single field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



SearchText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Text	Text that the method searches.	Data In	String	NA	Yes	The text you specify may be case-sensitive depending on the emulator you use.
Row	Row number that has the first character of the text you specify.	Data Out	Integer	NA	NA	If the text that you specify occurs at multiple rows and columns, the method returns the first row and column that contains the text.
Col	Column number that has the first character of the text that you specify.	Data Out	Integer	NA	NA	If the text that you specify occurs at multiple rows and columns, the method returns the first row and column that contains the text.

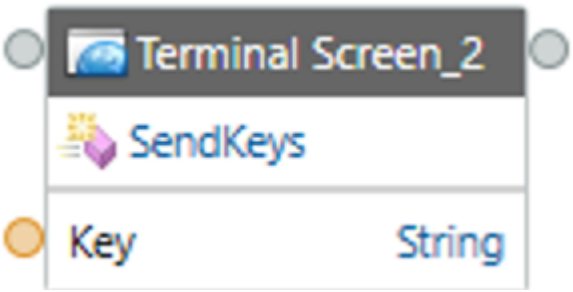
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SendKeys

Simulates the keystrokes that you enter from the keyboard at the mouse device position on the emulator screen. For example, you can simulate the **[enter]** keystroke on the screen.

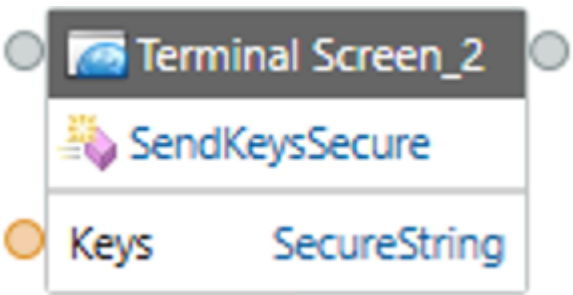


SendKeys method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Keys	Keystrokes that you enter from your keyboard.	Data In	String	None	Yes	**Tip:** To learn about the keystrokes, refer the respective terminal emulator documentation.

SendKeysSecure

Simulates the keystrokes that is a secured string at the mouse device position on the emulator screen.



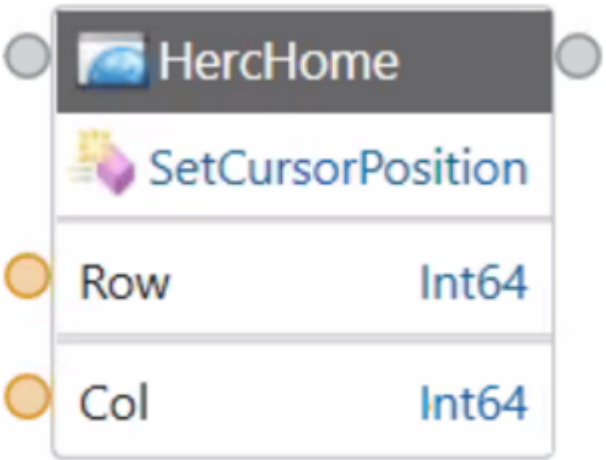
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SendKeysSecure method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Keys	Keystrokes that you enter as a secured string.	Data In	Secured String	None	Yes	**Tip:** To learn about the keystrokes, refer to the respective terminal emulator documentation.

SetCursorPosition

Attempts to set the mouse device at the row and column number that you specify.



SetCursorPosition method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Row	Option to provide the number of the row based on which the method attempts to set the mouse device on the screen.	Data In	Integer	NA	NA	The row number must be positive and within the size of the emulator screen. For example, if the screen size is 24X80, the maximum

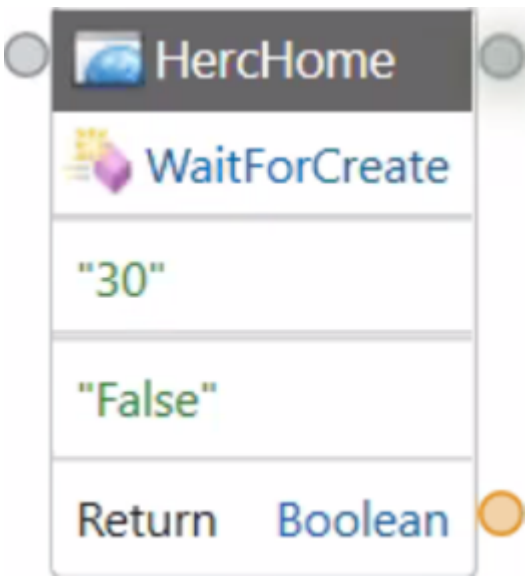
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetCursorPosition method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
						value that you can provide for a row is 24.
Col	Option to provide the number of the row based on which the method attempts to set the mouse device on the screen.	Data In	Integer	NA	NA	The column number must be positive and within the size of the emulator screen. For example, if the screen size is 24X80, the maximum value that you can provide for a column is 80.

WaitForCreate

Waits for the duration that you specify while the connector uses the screen match rule to find whether the screen exists.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WaitForCreate method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
timeoutinSeconds	Option to provide the number of seconds for which the method waits while the connector uses the screen match rule to find if the screen exists.	Data In	Integer	30	Yes	
MatchAllChildren	Option to match all screen elements that you had captured to find if the screen exists.	Data In	Boolean	False	Yes	**Warning:** Using this option may delay the execution of the method.
Return	Returns the Boolean value based on whether the emulator screen was found.	Data Out	Boolean	NA	NA	

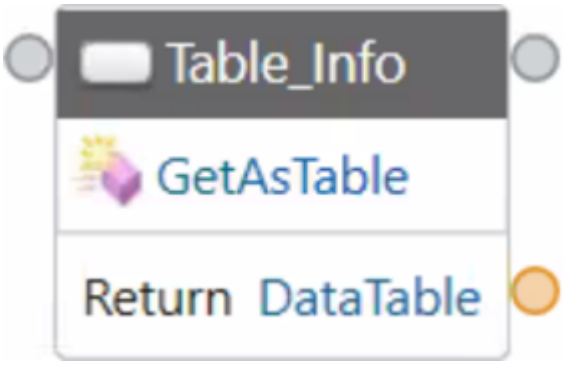
Element-level methods

Element-level methods perform automation tasks on the emulator screen elements that you add from the Terminal Connector screen. You can add a screen element as a field or a table.

GetAsTable

Returns the text that you captured as a data table object. Use this method when you capture the data from a screen as a table. However, you can also use the method for the data that you capture as a field. To learn how to capture the data as a table, see Configure the IBM Personal Communications emulator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

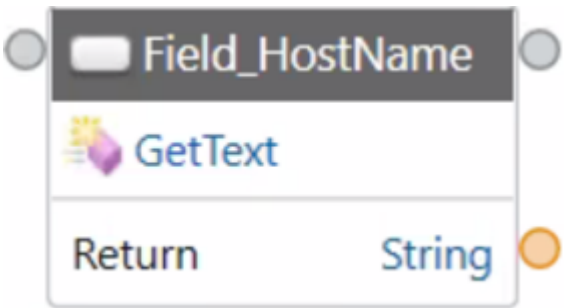


GetAsTable method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Return	Returns the captured text from the terminal screen as a data table object.	Data Out	Data Table	NA	NA	To view the table, right-click the parameter and select **Preview Data**.

GetText

Returns the text in the field that you captured from the emulator screen. If you use this method for a table that you captured, it returns the text in the first field of the rectangle.



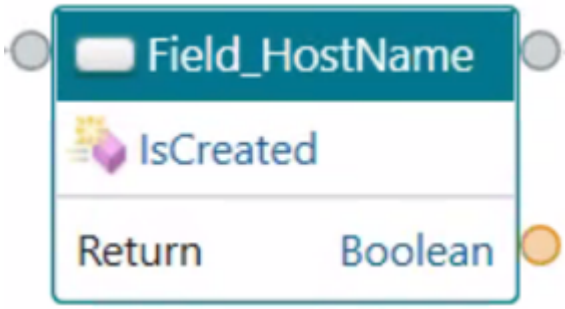
GetText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?	Notes
Return	Returns the text from the captured field.	Data Out	String	NA	NA	

IsCreated

Matches the rules and verifies whether the captured element exists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

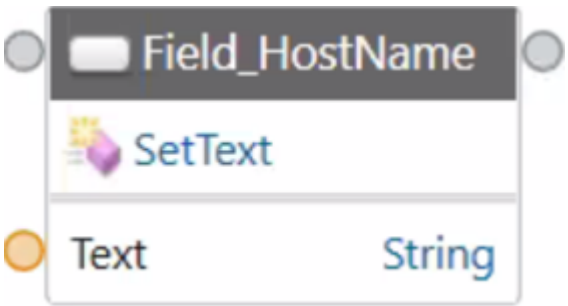


IsCreated method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Return	Returns the Boolean value based on whether the element is active.	Data Out	Boolean	NA	NA	

SetText

Attempts to set the text to the field.



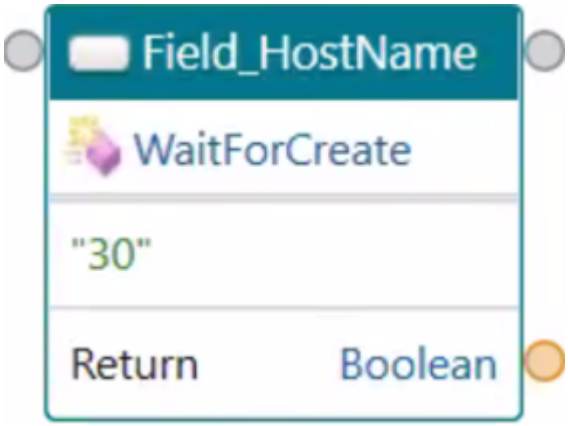
SetText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Text	Option to specify the text that the method attempts to set in the field.	Data In	String	NA	Yes	You can't use this method on protected emulator screens.

WaitForCreate

Waits for the duration that you specify while the connector uses the match rule to find whether the element exists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



WaitForCreate method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
timeoutinSeconds	Option to provide the number of seconds for which the method waits while the connector uses the match rule to find whether the element exists.	Data In	Integer	30	Yes	
Return	Returns the Boolean value depending on whether the element was found.	Data Out	Boolean	NA	NA	

Rocket BlueZone emulator methods

Use the Rocket BlueZone emulator methods to perform various automation tasks on the Rocket BlueZone emulator.

Screen-level methods

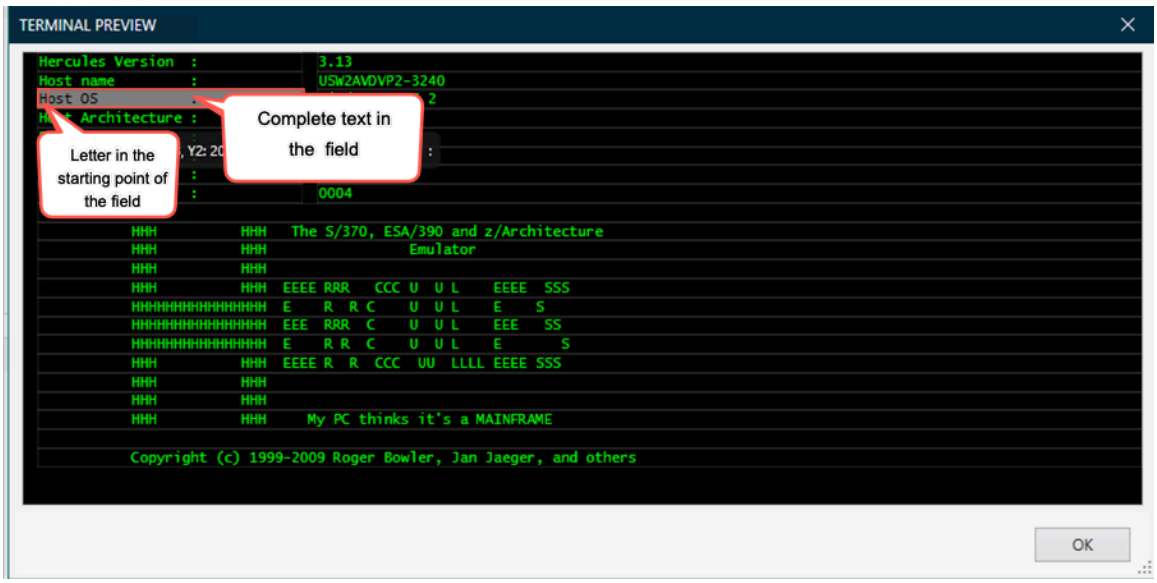
Use screen-level methods to perform the automation tasks on the emulator screen. For example, you can use simulate a command on the screen or get text from the screen.

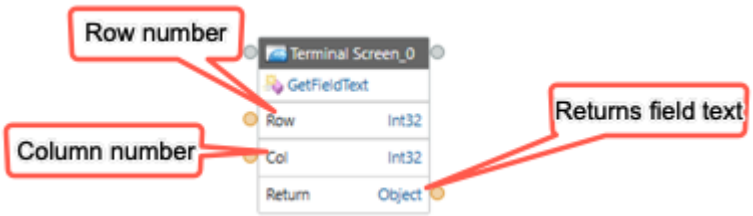
GetFieldText

Returns the text that a field contains after it identifies the field by the row and column number that you specify. The row and column that you specify are the starting point of the field. The method identifies the whole field and then returns the text in the field. In the following example,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

H is the first letter and the starting point in the field and `Host OS :` is the complete text in the field.





GetFieldText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Row	Field row number that identifies the field.	Data In	Integer	NA	Yes	
Column	Field column number that identifies the field.	Data In	Integer	NA	Yes	
Return	Returns the text in the field.	Data Out	String	NA	NA	

GetTextFromRect

Returns the text in all the fields of a rectangular area that you define on the screen. You define an area by providing the starting and ending rows and column numbers. The method locates and identifies the first and the last fields and returns all the text in all the fields within that area. The following example shows the area that you defined.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

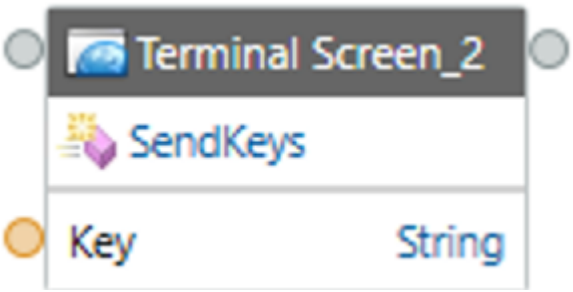
SendKeys

Simulates the keystrokes that you enter from the keyboard at the mouse device position on the emulator screen. For example, you can simulate the **<enter>** keystroke on the screen.

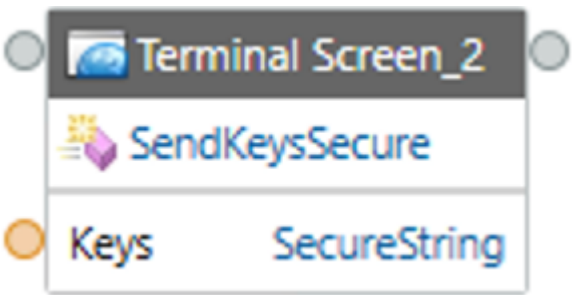


SendKeys method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Keys	Keystrokes that you enter from your keyboard.	Data In	String	None	Yes	**Tip:** To learn about the keystrokes, refer the respective terminal emulator documentation.

SendKeysSecure

Simulates the keystrokes that is a secured string at the mouse device position on the emulator screen.



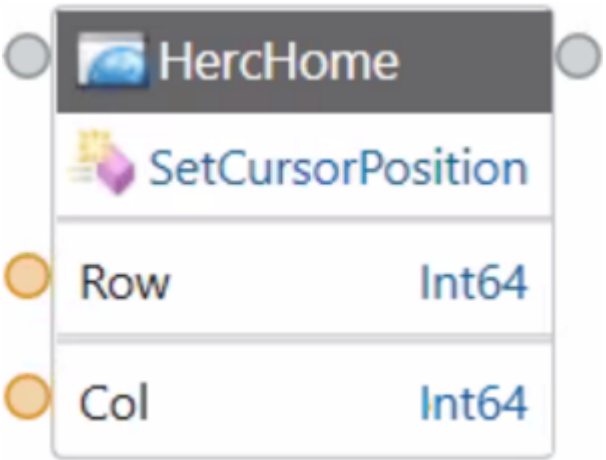
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SendKeysSecure method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Keys	Keystrokes that you enter as a secured string.	Data In	Secured String	None	Yes	**Tip:** To learn about the keystrokes, refer to the respective terminal emulator documentation.

SetCursorPosition

Attempts to set the mouse device at the row and column number that you specify.



SetCursorPosition method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Row	Option to provide the number of the row based on which the method attempts to set the mouse device on the screen.	Data In	Integer	NA	NA	The row number must be positive and within the size of the emulator screen. For example, if the screen size is 24X80, the maximum

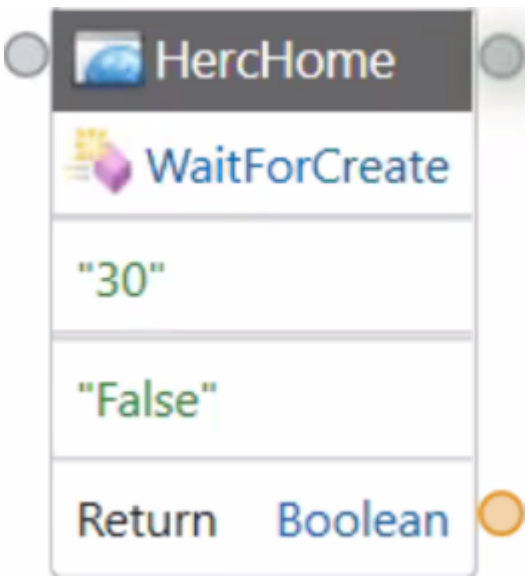
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetCursorPosition method parameters (continued)

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
						value that you can provide for a row is 24.
Col	Option to provide the number of the row based on which the method attempts to set the mouse device on the screen.	Data In	Integer	NA	NA	The column number must be positive and within the size of the emulator screen. For example, if the screen size is 24X80, the maximum value that you can provide for a column is 80.

WaitForCreate

Waits for the duration that you specify while the connector uses the screen match rule to find whether the screen exists.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WaitForCreate method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
timeoutinSeconds	Option to provide the number of seconds for which the method waits while the connector uses the screen match rule to find if the screen exists.	Data In	Integer	30	Yes	
MatchAllChildren	Option to match all screen elements that you had captured to find if the screen exists.	Data In	Boolean	False	Yes	**Warning:** Using this option may delay the execution of the method.
Return	Returns the Boolean value based on whether the emulator screen was found.	Data Out	Boolean	NA	NA	

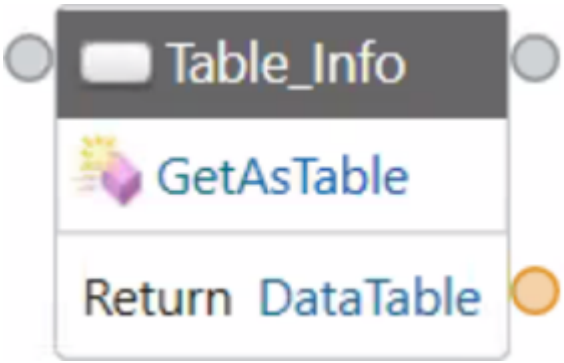
Element-level methods

Element-level methods perform automation tasks on the emulator screen elements that you add from the Terminal Connector screen. You can add a screen element as a field or a table.

GetAsTable

Returns the text that you captured as a data table object. Use this method when you capture the data from a screen as a table. However, you can also use the method for the data that you capture as a field. To learn how to capture the data as a table, see Configure the IBM Personal Communications emulator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

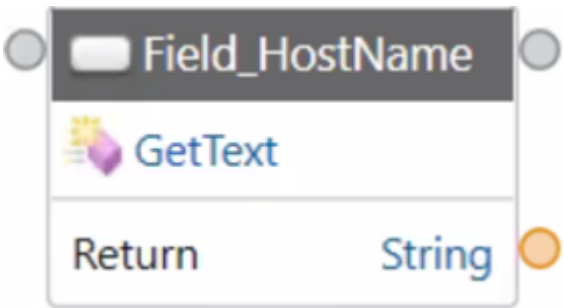


GetAsTable method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Return	Returns the captured text from the terminal screen as a data table object.	Data Out	Data Table	NA	NA	To view the table, right-click the parameter and select **Preview Data**.

GetText

Returns the text in the field that you captured from the emulator screen. If you use this method for a table that you captured, it returns the text in the first field of the rectangle.



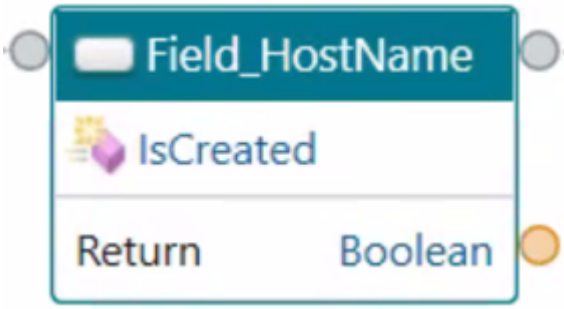
GetText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory?	Notes
Return	Returns the text from the captured field.	Data Out	String	NA	NA	

IsCreated

Matches the rules and verifies whether the captured element exists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

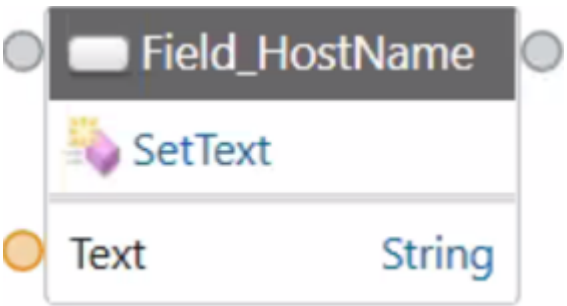


IsCreated method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Return	Returns the Boolean value based on whether the element is active.	Data Out	Boolean	NA	NA	

SetText

Attempts to set the text to the field.



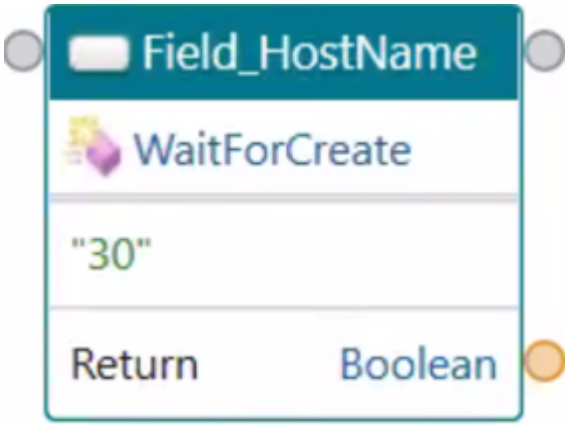
SetText method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
Text	Option to specify the text that the method attempts to set in the field.	Data In	String	NA	Yes	You can't use this method on protected emulator screens.

WaitForCreate

Waits for the duration that you specify while the connector uses the match rule to find whether the element exists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



WaitForCreate method parameters

Parameter	Description	Data port entry type	Data type	Default value	Mandatory	Notes
timeoutinSeconds	Option to provide the number of seconds for which the method waits while the connector uses the match rule to find whether the element exists.	Data In	Integer	30	Yes	
Return	Returns the Boolean value depending on whether the element was found.	Data Out	Boolean	NA	NA	

Universal app connector

Create automations for your Windows, Java, and web applications by using the Universal App Connector (UAC) of RPA Desktop Design Studio. Configure the application screens and their elements from a single, unified connector instead of using the individual connectors of these applications.

How UAC works

UAC is automatically added as a default connector to any attended, unattended, or skilled automation project of RPA Desktop Design Studio. UAC currently supports Windows, Java, and web applications (Google Chrome and Microsoft Edge browsers only).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
It is recommended that you create automations for Windows, Java, and web applications using UAC instead of using their individual connectors. However, RPA Desktop Design Studio still supports automation projects that are designed using the individual connectors.

Tip:
If you've installed a hot fix for UAC connector, to verify that the hot fix is accurately downloaded to your machine, perform the post requisite steps. For more information, see Post requisites after installing a hot fix.

UAC is added as an object to Global Objects in Project Explorer similar to how the other connectors are added. For more information on how to use a connector, see Use connector method.

Add the screens and elements of Windows, Java, and web applications that are open in your machine while you configure UAC. Modify the screens and elements match rules during the configuration. Add the methods related to the screens and elements from the Design surface, and then build your automation.

For more information on using a UAC, see Use the Universal App Connector.

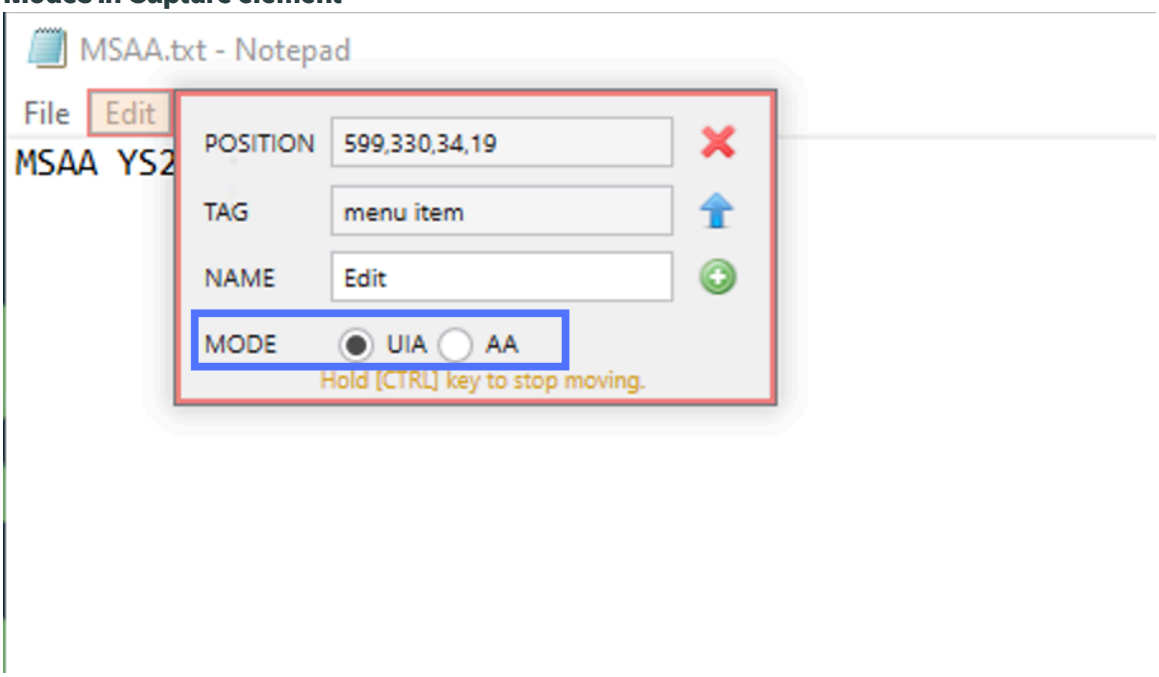
Modes in UAC for Windows applications

Starting from Yokohama release, Active Accessibility is supported when adding elements in the Universal App Connector, for Windows applications.

Select the mode, UI automation or active accessibility, while capturing the elements and showing the captured elements. The mode determines which internal library is used for automating Windows applications. UI automation mode refers to UI automation library and active accessibility refers to active accessibility library of Microsoft. Active accessibility mode is for legacy Windows applications.

To capture the elements from the screen, under the Screen and elements pane, right-click the added screen and select **Capture Element**. There are two modes **UIA** and **AA**. **UIA** is the default mode.

Modes in Capture element

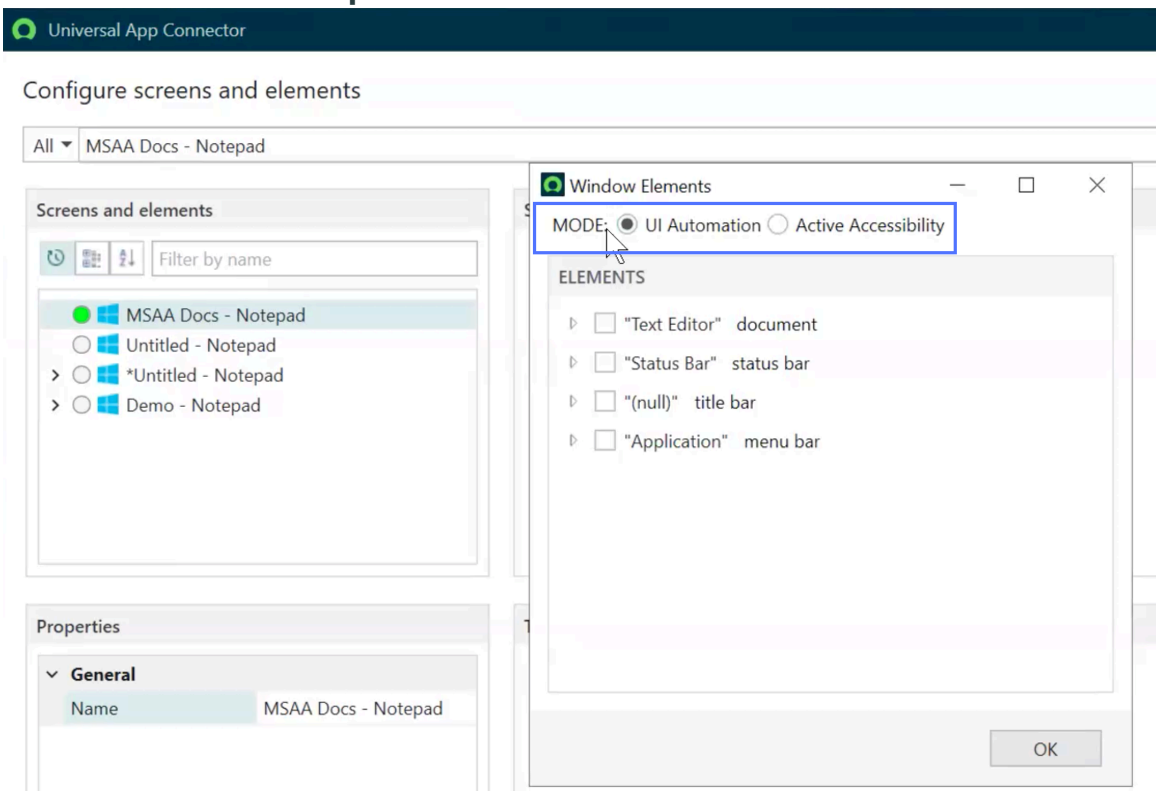


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about capturing an element in the Windows application, see Use the Universal App Connector.

From the Screen and elements pane, right-click the added screen and select **Show Elements** to display all the existing elements in the target application screen in a tree view. There are two modes **UI Automation** and **Active Accessibility**. **UI Automation** is the default mode.

Modes in Show Elements options



For more information about showing captured elements of the Windows application, see Additional options for application screens and elements in Universal App Connector.

For more information about the methods for UI Automation mode and Active Accessibility mode, see Methods of UI Automation mode and Active Accessibility mode.

Use the Universal App Connector

Create automations for your Windows, Java, Google Chrome, and Edge browser-based applications by using the Universal App Connector (UAC). Configure the applications from a single, unified connector and capture the screens and elements or screen controls such as check boxes, and buttons. Use the methods of these screens and elements to build your automation.

Before you begin

Add the Universal App Connector plugin from the Plugins Manager before using the connector. For more information about adding the SSH plugin, see Manage plugins in RPA Desktop Design Studio.

Verify that you have open or active Windows, Java, Google Chrome, or Edge applications.

Role required: None

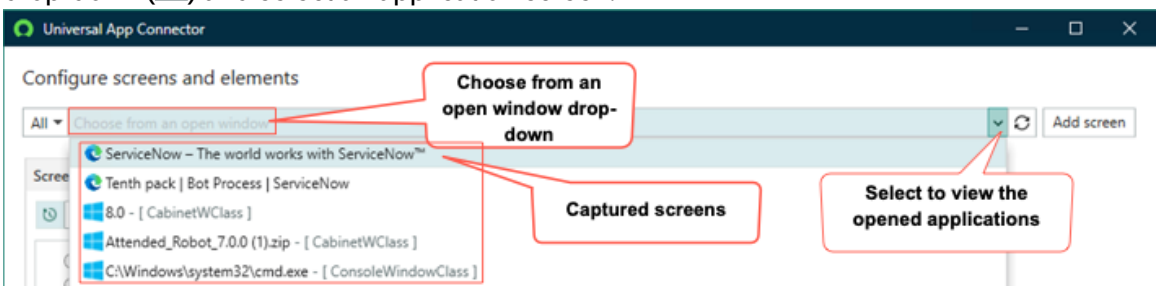
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Connectors**, and drag **Universal App Connector** to **Global Objects** in the Project Explorer pane.
   The connector is added as a **UniversalApplication** object under **Global Objects**.
2. To use the methods at the **Universal App Connector** connector level, double-click the **UniversalApplication** object.
   For example, the Start method is used if you want the browser or application to start before interacting with any application screens or elements.
   The methods appear in the Object Explorer pane.
3. To configure the screens and elements in the UAC, do the steps.

   a. Under Global Objects, right-click **UniversalApplication** and select **Configure**.

   b. On the Configure screens and elements window, select the **Choose from an open window** drop-down ( ) and select an application screen.



Note:

- If no supported applications are open, the `App window not found message` is displayed.
- To display newly opened application screens on the list, select the Click to refresh windows icon ( ).

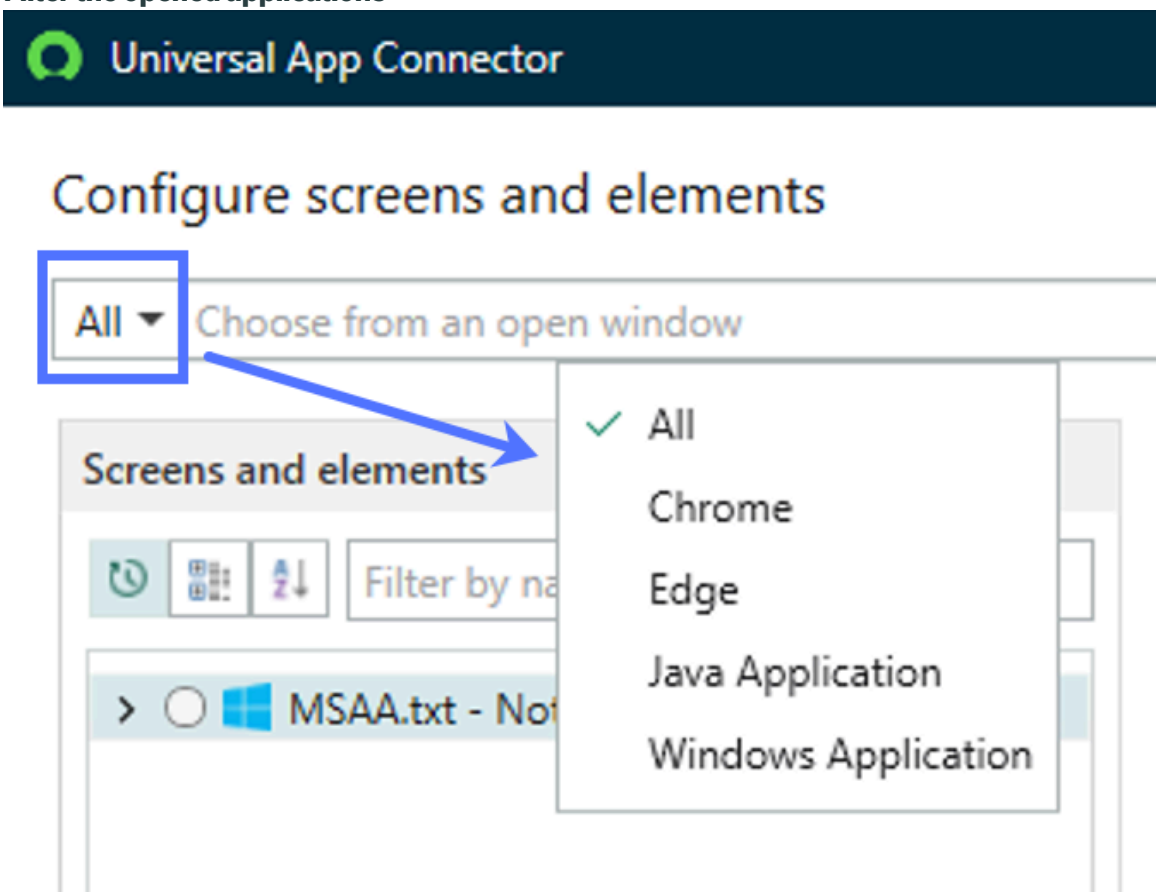
   c. **Optional:** To filter the opened applications by their type, select the **All** filter application type icon ( ) and select All or the application type.

   (Optional) For example, if you select **Chrome**, only Google Chrome web pages appear in the **Choose from an open window** list.

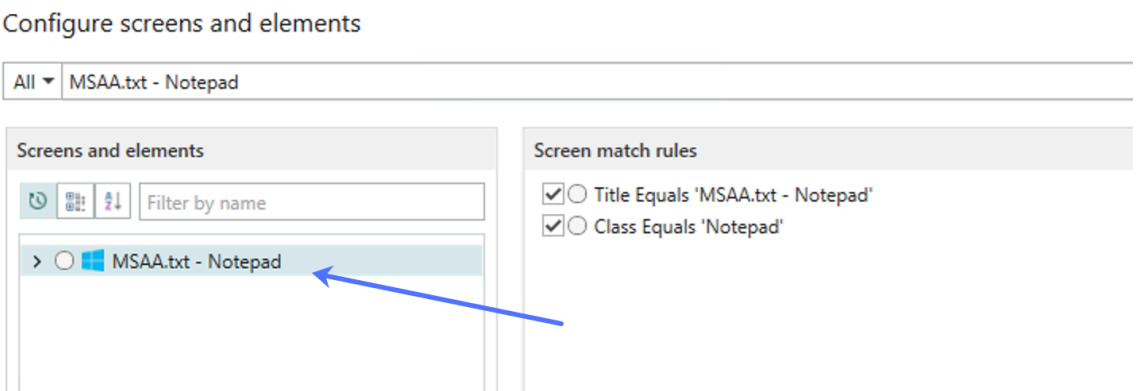
   For example, if you select *`Windows`* **Application**, only Windows screens appear in the **Choose from an open window** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter the opened applications

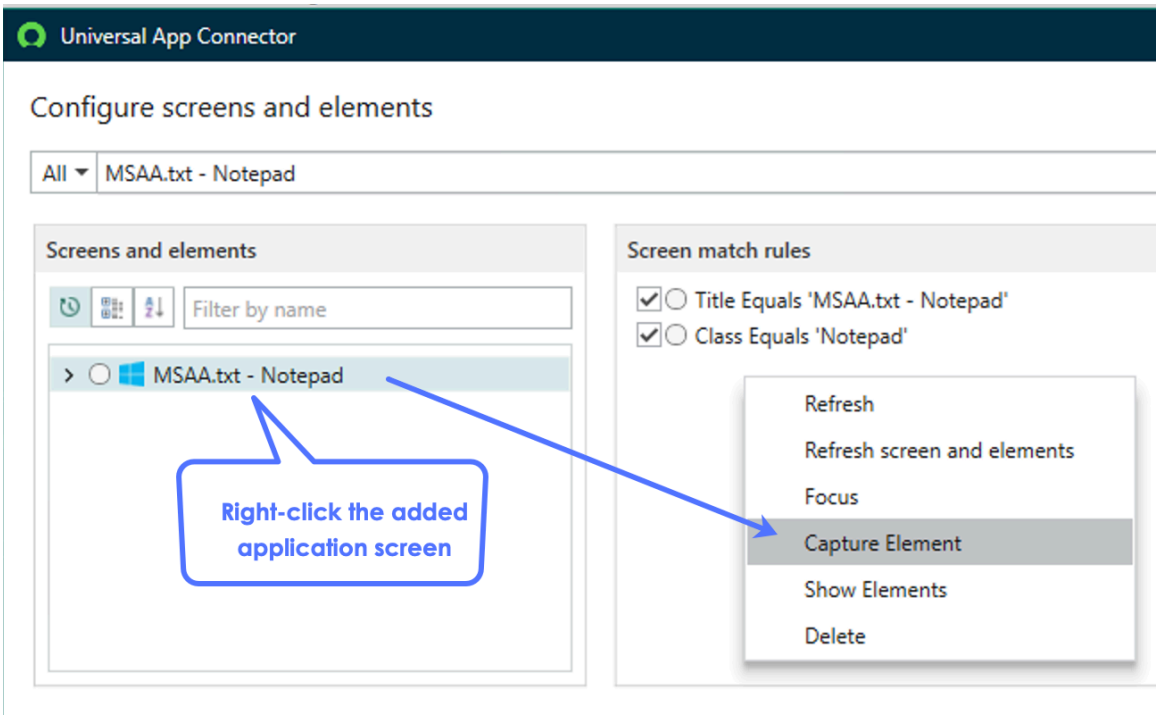


d. To add the selected application screen, select **Add screen**.
After you do this step, you can capture the screen elements to perform actions.
The application screen appears under the Screens and elements pane.



e. To capture the elements from the screen, under the Screen and elements pane, right-click the added screen and select **Capture Element**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The focus is set on the application screen that you had captured and the capture elements dialog appears.

For example, when you are capturing elements of a *Windows* application such as Notepad. If you select the **UIA** mode (UI Automation), the scroll bar of the Notepad is also captured.

Capture dialog for Windows application - Notepad - UIA mode

If you select the **AA** mode (Active Accessibility), the scroll bar of the Notepad is not captured.

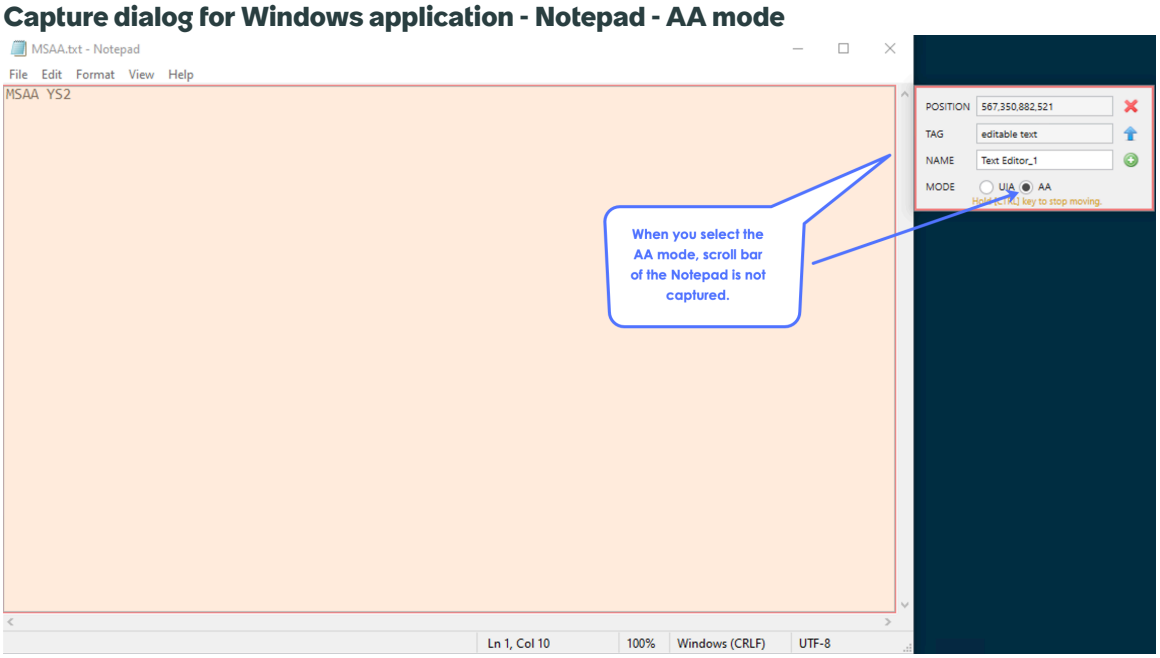
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. To use the methods at the **Universal App Connector** connector level for the two modes, UI Automation and Active Accessibility, double-click the **UniversalApplication** object.
For more information about the methods for UI Automation mode and Active Accessibility mode, see Methods of UI Automation mode and Active Accessibility mode.
The methods appear in the Object Explorer pane.

4. Do any of the following options for a desired action.

5. **Optional:** Right-click the application screen or element to perform any additional operations such as **Refresh**, **Refresh screen and elements**, **Focus**, **Add custom element**, **Show Elements**, **Delete**, and more.
For information on the various additional operations that are available for the application screens and elements, see Additional options for application screens and elements in Universal App Connector.

6. Select **Done** after you finish configuring your application screens or elements.
The application screens and their elements appear under the UAC object in **Global Objects**.

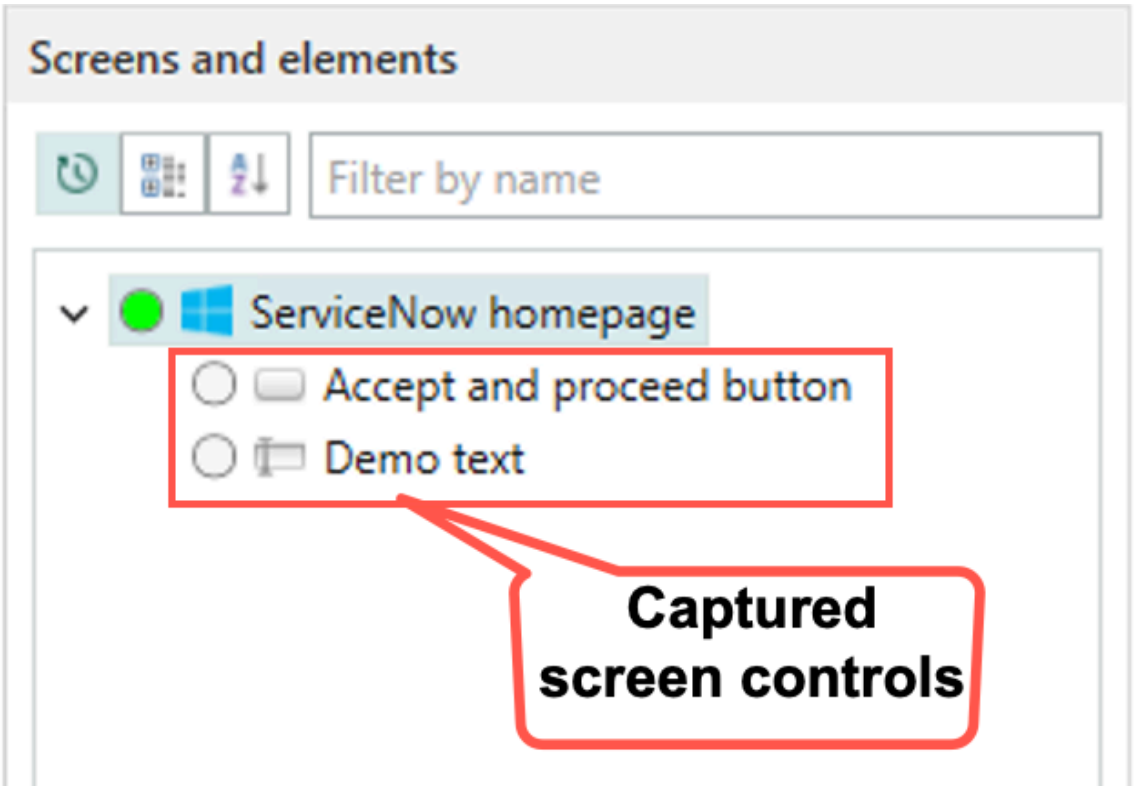
7. Double-click the required application screen or element and the Object Explorer pane is displayed listing the related methods.
For example, if you select a Java application screen or element, the Java connector methods are displayed in Object Explorer.
   - For more information on Java connector methods, see Java connector methods.
   - For more information on Google Chrome and Microsoft Edge connector methods, see Chromium connector methods.
   - For more information on Windows connector methods, see Windows Connector methods.
   - If you have captured a web application screen and you want to execute a custom JavaScript on it, you can use the ExecuteJavascript method.

8. Capture as many screen elements as you need by using the Capture element dialog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To learn to use the Capture element dialog, see Use the Capture element dialog.

The captured screen elements appear under the captured application screen as elements.



9. Drag the required method from the Object Explorer pane to the Design surface.

   The method is displayed with the application screen or element name in the Design surface.

What to do next

Design the automation by using the different methods for the application screens and elements, and save the automation.

Use the Click method for Universal App Connector

Use the Click method to perform a click action on an element.

Before you begin

Verify that you have open or active applications, for example, where you want to capture elements.

Role required: None

About this task

For information on the various additional operations that are available for the application screens and elements, see Additional options for application screens and elements in Universal App Connector.

Procedure

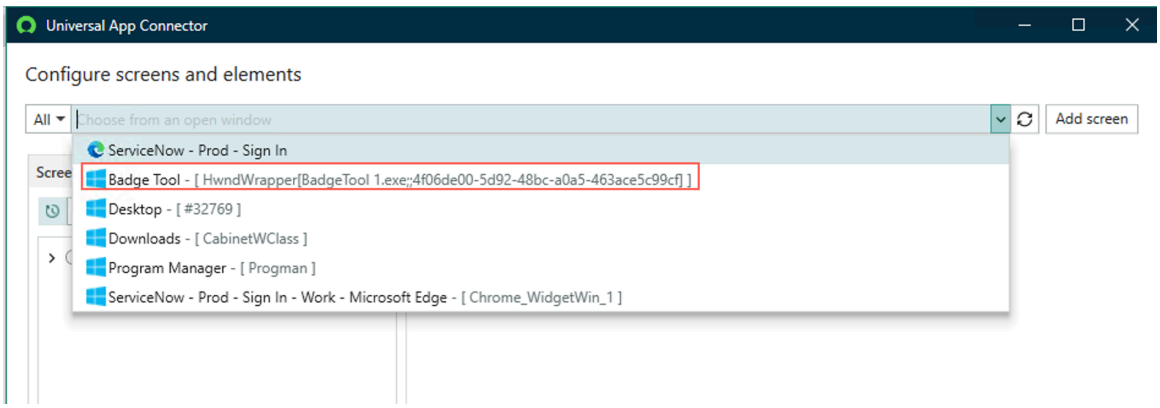
1. Configure Universal App Connector.
   To learn more about configuring the application screens and child elements, see Use the Universal App Connector.
2. Under Global Objects, double-click the **UniversalApplication** object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Click method appears in the Object Explorer pane.

3. Drag the Click method to the Design surface.
4. Double-click the Click method to configure the screens and elements in Universal App Connector.
5. On the Configure screens and elements window, select the Choose from an open window drop-down ( ) and select an application screen.

   For example, select the Badge Tool application.



Note:

- If no supported applications are open, the `App window not found message` is displayed.
- To display newly opened application screens on the list, select the Click to refresh windows icon ( ).

6. To add the selected application screen, for example, Badge Tool application, select **Add screen**.
   After you do this step, you can capture the screen elements to perform actions.
   The application screen appears under the Screens and elements pane.

7. To capture the elements from the screen, right-click the added screen and select **Capture Element**.
   The focus is set on the application screen that you had captured and the Capture Element dialog appears.
8. After selecting the required element, select the Add Element icon ( ) and select the mode as **UIA**, to capture the element

Note:
You must add at least one element to continue.

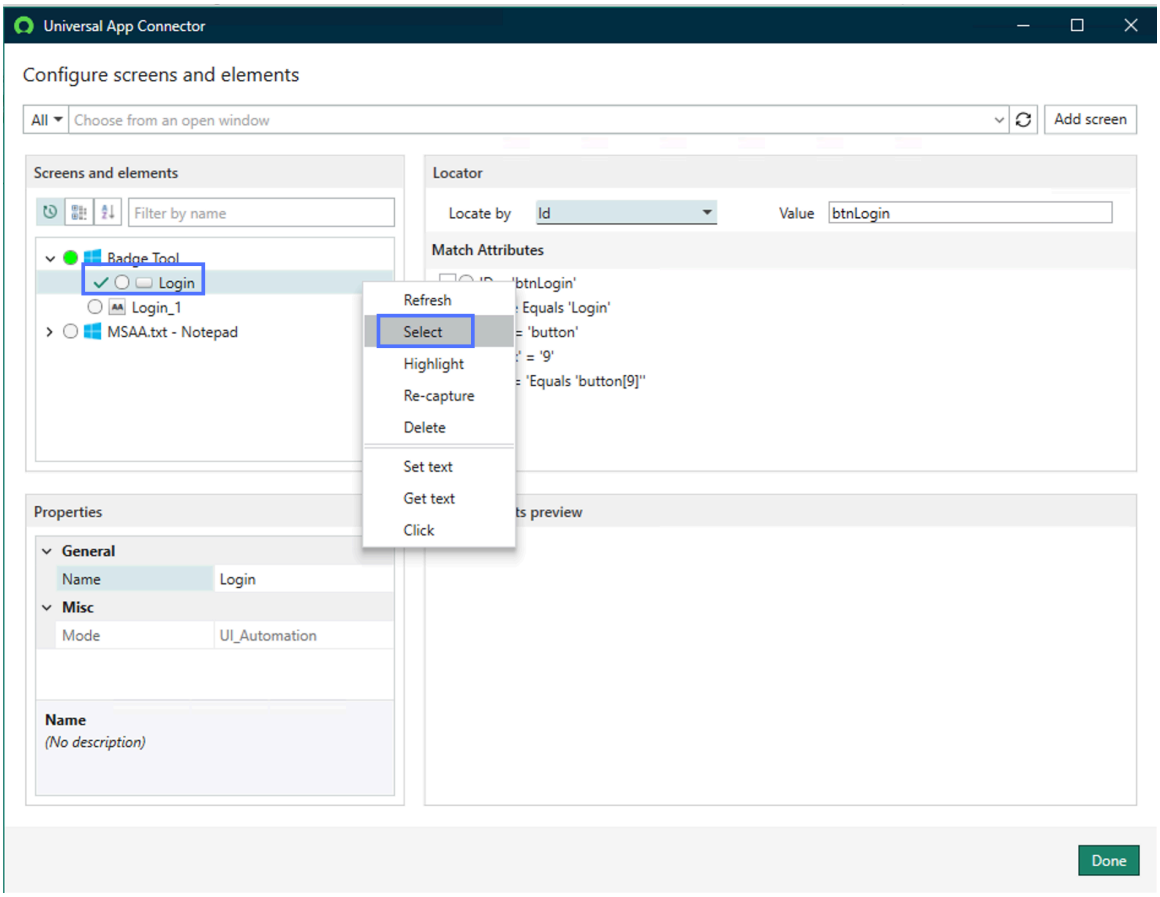
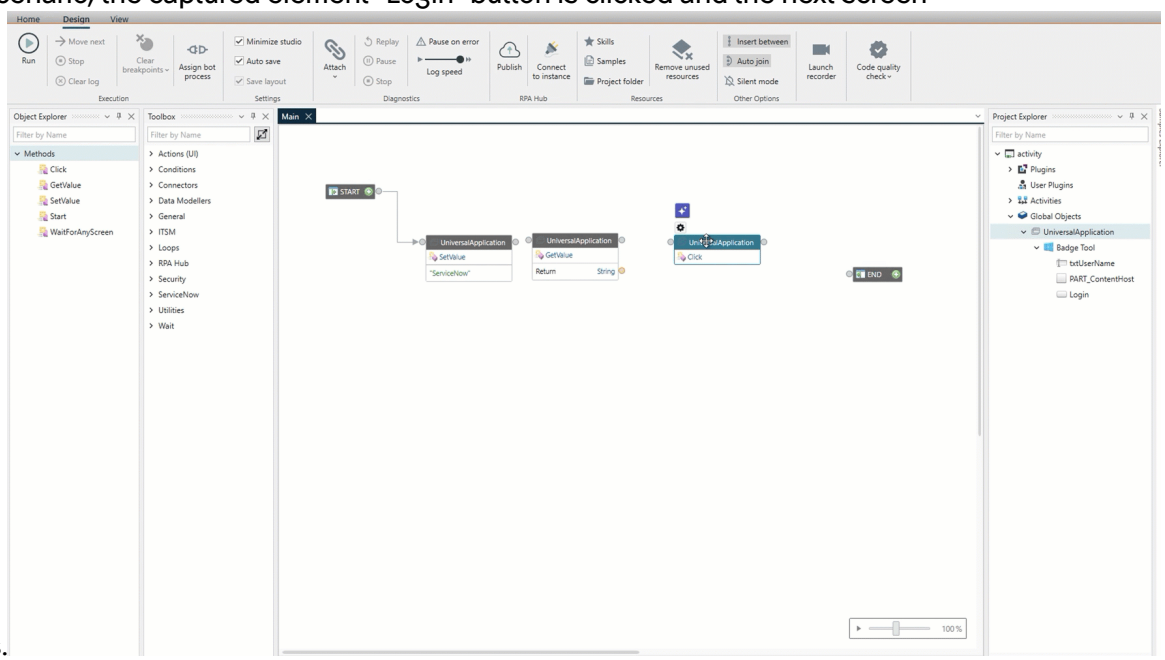
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. Right-click the Click method and select either **Run From Here** or **Run This**.
    In this scenario, the captured element "Login" button is clicked and the next screen appears.



11. Double-click the required application screen or element and the Object Explorer pane is displayed listing the related methods.
    For example, if you select a Java application screen or element, the Java connector methods are displayed in Object Explorer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For more information on Java connector methods, see Java connector methods.
- For more information on Google Chrome and Microsoft Edge connector methods, see Chromium connector methods.
- For more information on Windows connector methods, see Windows Connector methods.
- If you have captured a web application screen and you want to execute a custom JavaScript on it, you can use the ExecuteJavascript method.

Use the GetValue method for Universal App Connector

Use the GetValue method to retrieve a value from an element.

Before you begin

Verify that you have open or active applications, for example, where you want to capture elements.

Role required: None

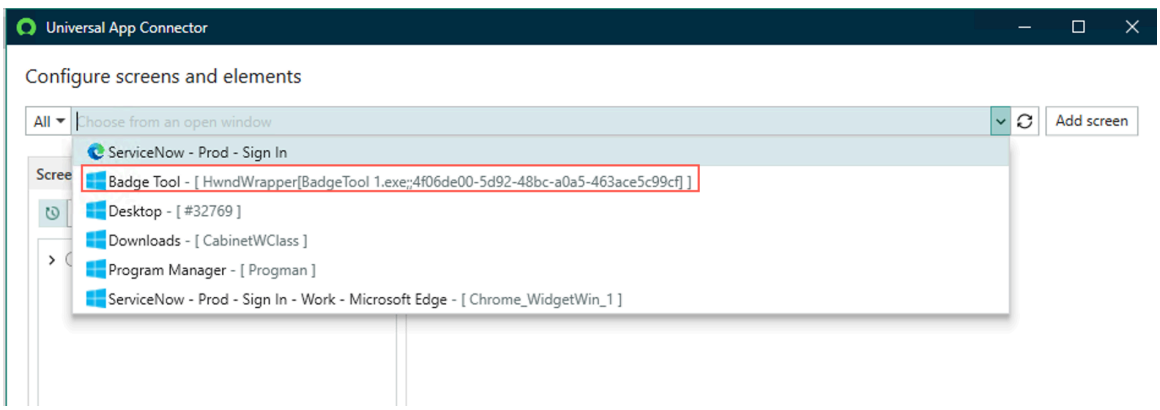
About this task

For information on the various additional operations that are available for the application screens and elements, see Additional options for application screens and elements in Universal App Connector.

Procedure

1. Configure Universal App Connector.
   To learn more about configuring the application screens and child elements, see Use the Universal App Connector.
2. Under Global Objects, double-click the **UniversalApplication** object.
   The GetValue method appears in the Object Explorer pane.
3. Drag the GetValue method to the Design surface.
4. Double-click the GetValue method to configure the screens and elements in Universal App Connector.
5. On the Configure screens and elements window, select the Choose from an open window drop-down ( ) and select an application screen.

   For example, select the Badge Tool application.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If no supported applications are open, the `App window not found message` is displayed.
- To display newly opened application screens on the list, select the Click to refresh windows icon ( ).

6. To add the selected application screen, for example, Badge Tool application, select **Add screen**.
   After you do this step, you can capture the screen elements to perform actions.
   The application screen appears under the Screens and elements pane.

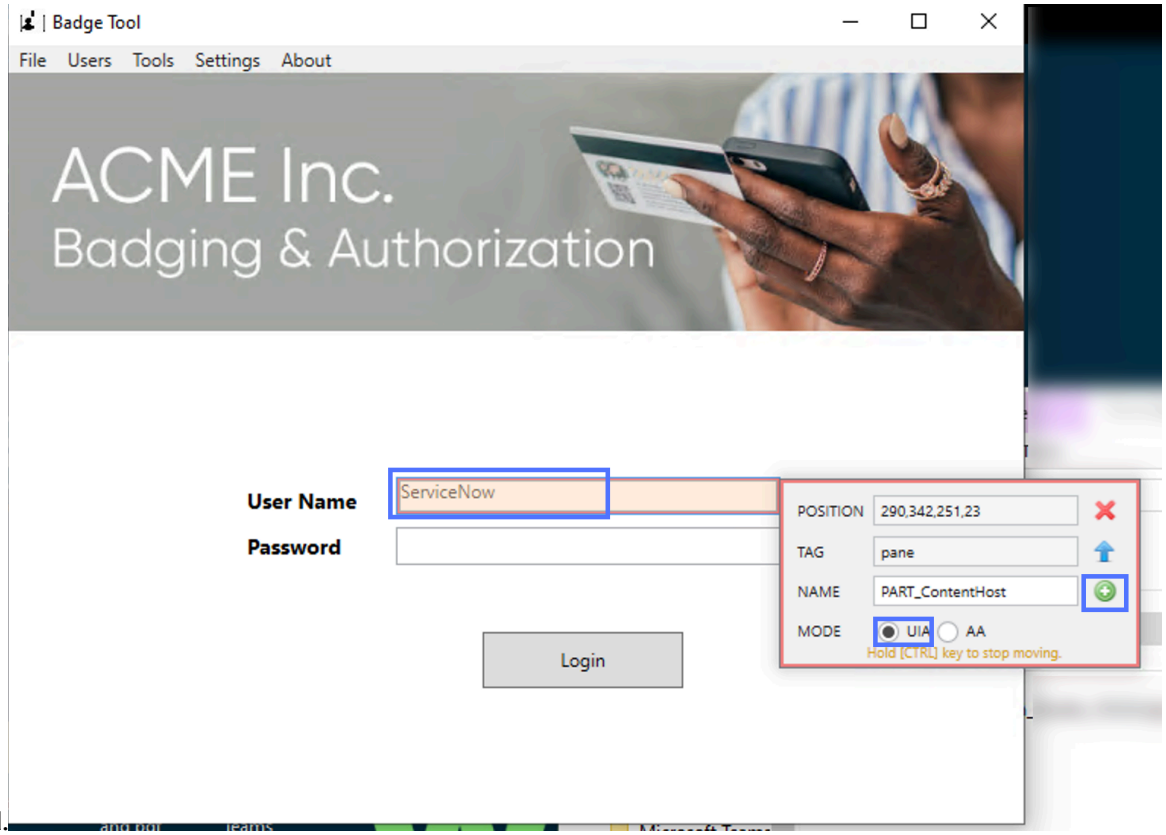
7. To capture the elements from the screen, right-click the added screen and select **Capture Element**.
   The focus is set on the application screen that you had captured and the capture elements dialog appears.

8. After selecting the required element, select the Add Element icon ( ) and select the mode as **UIA**, to capture the element.

Note:
You must add at least one element to continue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, select the textbox element tagged as edit by selecting the text box next to User Name

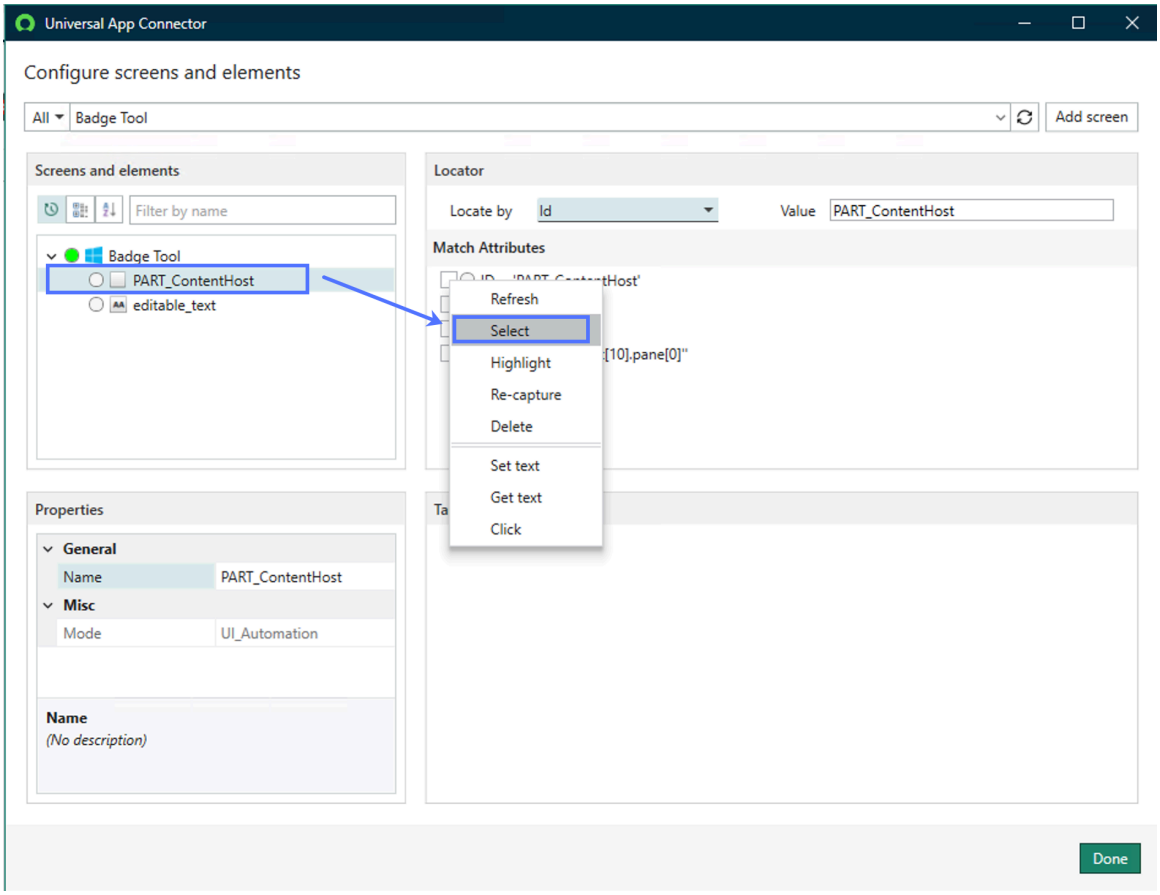


field.

9. In the Configure screens and elements window, right-click the captured element, choose **Select** and select **Done**.

> **Note:**
> Select at least one element to perform the action. If none are selected, the action won't be executed. To proceed without selecting, select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



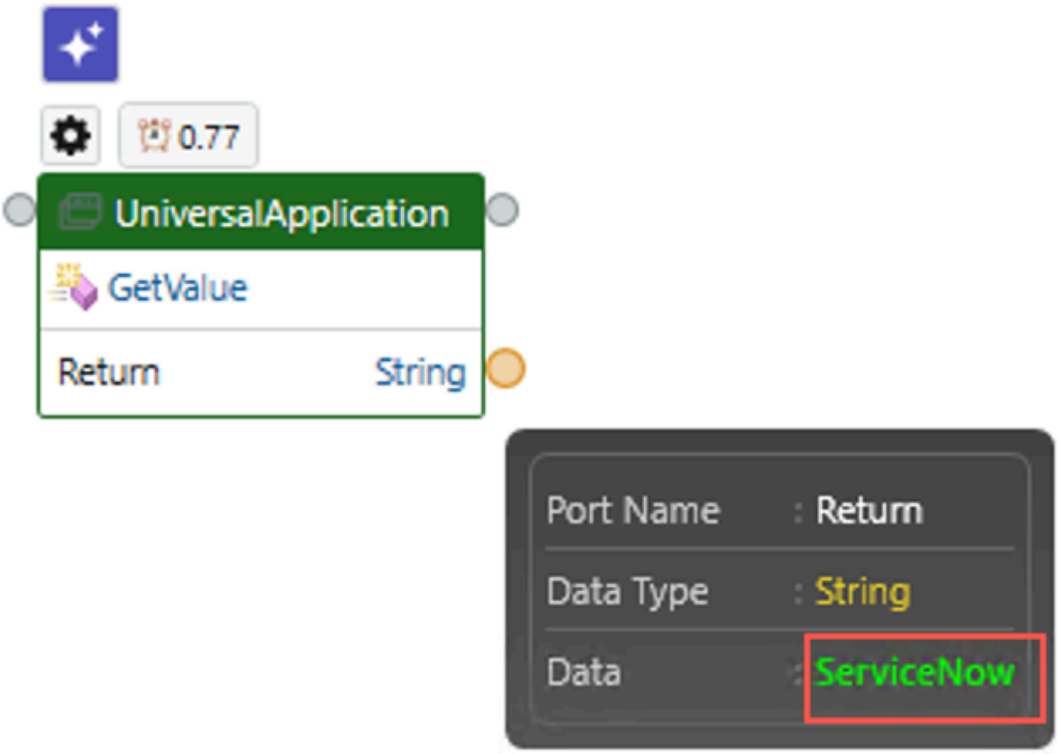
10. Right-click the GetValue method and select either **Run From Here** or **Run This**.

Parameters of the GetValue method

Parameter name	Parameter description	Port Type	Data Type
Return	Retrieves a value from the captured element.	Data Out	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The input value in the captured element is retrieved and displayed in the Data Out port of the GetValue method. In this scenario, ServiceNow is



retrieved.

11. Double-click the required application screen or element and the Object Explorer pane is displayed listing the related methods.
For example, if you select a Java application screen or element, the Java connector methods are displayed in Object Explorer.
    - For more information on Java connector methods, see Java connector methods.
    - For more information on Google Chrome and Microsoft Edge connector methods, see Chromium connector methods.
    - For more information on Windows connector methods, see Windows Connector methods.
    - If you have captured a web application screen and you want to execute a custom JavaScript on it, you can use the ExecuteJavascript method.

Use the SetValue method for Universal App Connector

Use the SetValue method to assign a specified value into an element.

Before you begin

Verify that you have open or active applications, for example, where you want to capture elements.

Role required: None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

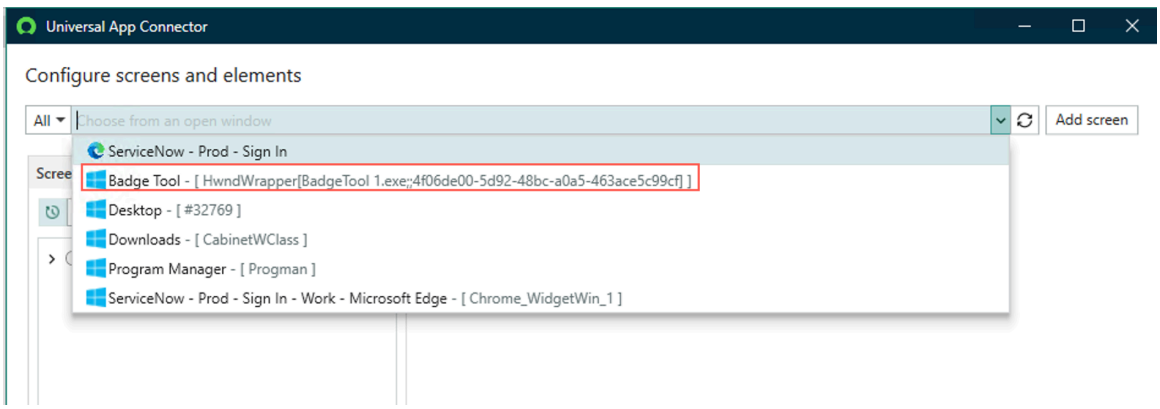
About this task

For information on the various additional operations that are available for the application screens and elements, see Additional options for application screens and elements in Universal App Connector.

Procedure

1. Configure Universal App Connector.
   To learn more about configuring the application screens and child elements, see Use the Universal App Connector.
2. Under Global Objects, double-click the **UniversalApplication** object.
   The SetValue method appears in the Object Explorer pane.
3. Drag the SetValue method to the Design surface.
4. Double-click the SetValue method to configure the screens and elements in Universal App Connector.
5. On the Configure screens and elements window, select the Choose from an open window drop-down ( ) and select an application screen.

   For example, select the Badge Tool application.



Note:

- If no supported applications are open, the `App window not found message` is displayed.
- To display newly opened application screens on the list, select the Click to refresh windows icon ( ).

6. To add the selected application screen, for example, Badge Tool application, select **Add screen**.
   After you do this step, you can capture the screen elements to perform actions.
   The application screen appears under the Screens and elements pane.

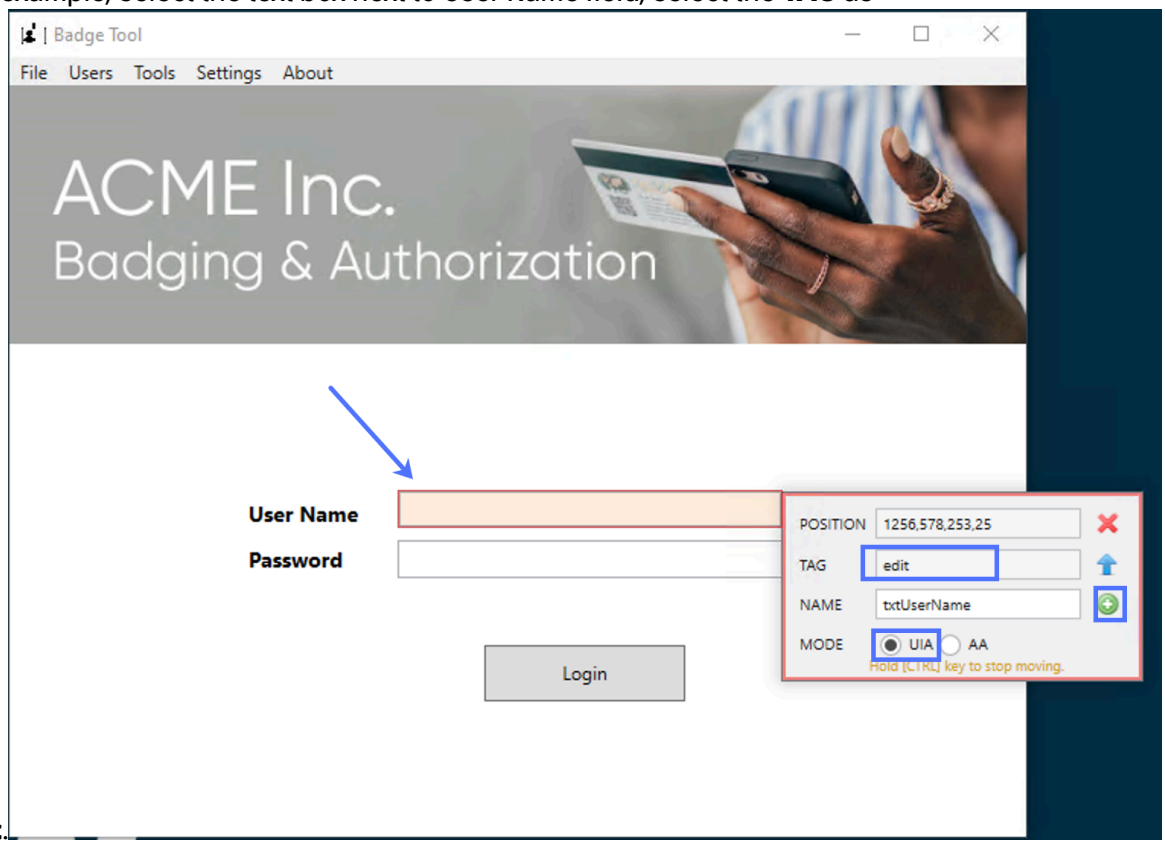
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. To capture the elements from the screen, right-click the added screen and select **Capture Element**.
   The focus is set on the application screen that you had captured and the capture elements dialog appears.

8. After selecting the required element, select the Add Element icon ( ) and select the mode as **UIA**, to capture the element.

   Note:
   You must add at least one element to continue.

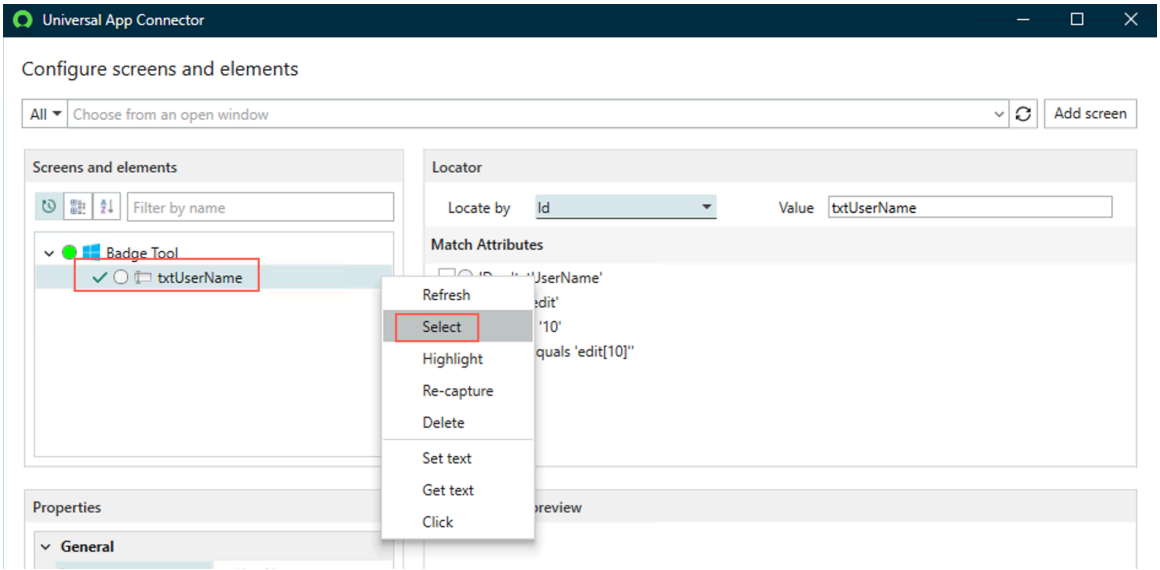
   For example, select the text box next to User Name field, select the **TAG** as **edit**.



9. In the Configure screens and elements window, right-click the captured element, choose **Select** and select **Done**.

   Note:
   Select at least one element to perform the action. If none are selected, the action won't be executed. To proceed without selecting, select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. Complete the following parameters in the SetValue method:

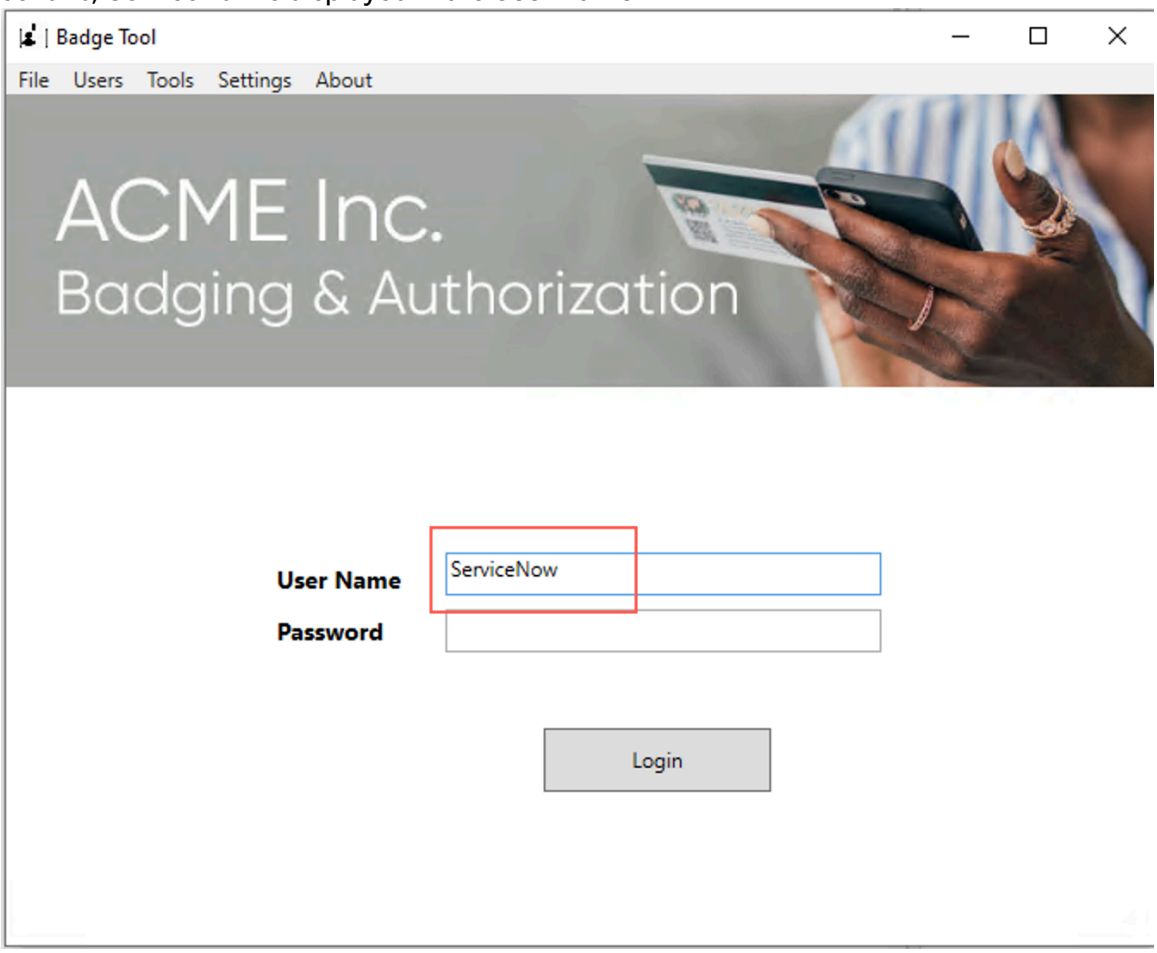
Parameters of the SetValue method

Parameter name	Parameter description	Port Type	Data Type
Value	Enter the value that you want to assign in the element. For example, `ServiceNow`.	Data In	String

11. Right-click the SetValue method and select either **Run From Here** or **Run This**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The input value is displayed in the captured element. In this scenario, ServiceNow is displayed in the **User Name** Field.



12. Double-click the required application screen or element and the Object Explorer pane is displayed listing the related methods.
For example, if you select a Java application screen or element, the Java connector methods are displayed in Object Explorer.
    - For more information on Java connector methods, see Java connector methods.
    - For more information on Google Chrome and Microsoft Edge connector methods, see Chromium connector methods.
    - For more information on Windows connector methods, see Windows Connector methods.
    - If you have captured a web application screen and you want to execute a custom JavaScript on it, you can use the ExecuteJavascript method.

Use the Start method for Universal App Connector

Use the Start method to launch a browser or an application for the Universal App Connector (UAC) object. You can use this method if you want a browser or application to start before interacting with any application screens or elements.

Before you begin
Role required: None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Note:
If the application type that you select for the Start method is Google Chrome or Microsoft Edge browser, then the same browser must be selected from the **Browser** list in the Configure screen and elements window of UAC.

Procedure

1. In the Toolbox pane, navigate to **Connectors** and drag **Universal App Connector** to **Global Objects** in Project Explorer.
   The connector is added as a **Universal Application** object in Global Objects. You can rename this UAC object from here.
2. Double-click the UAC object and drag the **Start** method from the Object Explorer to the Design surface.
3. Complete the following parameters in the Start component:

Parameters of the Start method

Parameter name	Parameter description	Required?
AppType	Opens the Port Properties dialog. The options available are **Chrome**, **Edge**, and **Application**. If you select **Chrome** or **Edge** from the **Static Value** list, the selected browser opens in a new tab. For more information on how to configure port properties, see Configure port properties. If you select **Application** from the **Static Value** list, you must provide the full path of the application in the **Path** parameter of the Start method.	Yes
Path	Full navigation path of the application that you want to open. The path is entered in string format. For example, `D:\TestApps\JavaTest.jar`	No
StartParams	Arguments for the launch application. For example, if you select Google Chrome as the application and provide `google.com` as the argument, the Google web page is opened when the browser is launched.	No

4. Double-click the required application screen or element and the Object Explorer pane is displayed listing the related methods.
   For example, if you select a Java application screen or element, the Java connector methods are displayed in Object Explorer.
   - For more information on Java connector methods, see Java connector methods.
   - For more information on Google Chrome and Microsoft Edge connector methods, see Chromium connector methods.
   - For more information on Windows connector methods, see Windows Connector methods.
   - If you have captured a web application screen and you want to execute a custom JavaScript on it, you can use the ExecuteJavascript method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the WaitForAnyScreen method for Universal App Connector

Find one or more application screens and optionally, their child elements within a time period that you specify and then perform actions that you specify.

Before you begin

Role required: None

About this task

When you use the WaitForAnyScreen method, it tries to find a screen by matching the screen match rules within a specified duration. If it fails to find the screen within that duration, you may optionally enable it to perform an action by passing the control to another component through the ELSE port. Else, the WaitForAnyScreen method completes its execution. For the WaitForAnyScreen method to find a screen, the screen must be in an opened state.

Procedure

1. Configure the UAC.
   To learn to configure the application screens and child elements, see Use the Universal App Connector.
2. Under Global Objects, double-click the **UniversalApplication** object.
   The WaitForAnyScreen method appears in the Object Explorer pane.
3. Drag the WaitForAnyScreen method to the Design surface.
4. Configure the WaitForAnyScreen method.

   a. Select the settings icon ( ).

   b. On the CHOOSE SCREENS window, select one or more application screens.

   c. Select **OK**.
   The application screen that you selected appears in the WaitForAnyScreen method.

   d. Configure the parameters on the WaitForAnyScreen method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WaitForAnyScreen method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?	Notes
MatchAllChildren	Set to `True`, the method also finds the child elements of the parent screen that you had captured by matching the attributes of the child elements.	Data In	Boolean	False	No	**⚠ Warning:** Setting this parameter to `True` may slow down the execution of the component.
Timeout	Duration in seconds within which the WaitForAnyScreen method tries to find the screen and, optionally, its child elements.	Data In	Integer	30 seconds	Yes	
Application screen	Title of the application screen that you've selected in the CHOOSE SCREENS window. The component allows multiple window entries depending on the number of screens you had selected	Data Out	Not applicable	Not applicable	Not applicable	If the WaitForAnyScreen method finds the first screen that is listed, the execution of the WaitForAnyScreen method completes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description	Data Port type	Data type	Default value	Mandatory?	Notes
	in the CHOOSE SCREENS window.					
ELSE	Executes another component or method if the WaitForAnyScreen method fails to find any screen within the duration specified in the Timeout port.	Data Out	Not applicable	Not applicable	No	

5. Double-click the required application screen or element and the Object Explorer pane is displayed listing the related methods.
   For example, if you select a Java application screen or element, the Java connector methods are displayed in Object Explorer.
   - For more information on Java connector methods, see Java connector methods.
   - For more information on Google Chrome and Microsoft Edge connector methods, see Chromium connector methods.
   - For more information on Windows connector methods, see Windows Connector methods.
   - If you have captured a web application screen and you want to execute a custom JavaScript on it, you can use the ExecuteJavascript method.

Find the elements on the application screen

Use the locators of the captured elements to find the elements on the application screen while using the Universal App Connector (UAC) in the RPA Desktop Design Studio.

Before you begin

Familiarize yourself with UAC concepts. For more information, see Universal app connector.

Configure the UAC. For more information, see Use the Universal App Connector.

Verify that you have open or active Windows, Java, Google Chrome, or Edge applications.

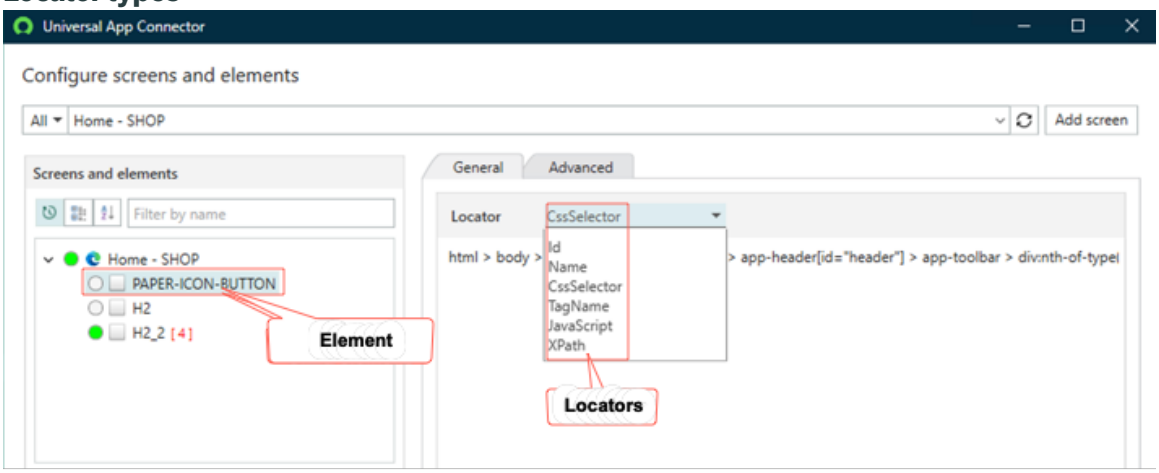
Role required: None

About this task

The UAC provides multiple locator types. For example, the XPath locator provides the XPath to the element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Locator types



Procedure

1. In the Toolbox pane, navigate to **Connectors**, and drag **Universal App Connector** to **Global Objects** in the Project Explorer pane.
   The connector is added as a **UniversalApplication** object under **Global Objects**.
2. Configure Universal App Connector and add a screen.
   For more information, see Use the Universal App Connector.
3. Under the Screens and elements pane, select an element under a screen.
4. From the **Locator** list, select one of the element locators.

Screen element locators

Locator type	Application type	Description
Id	Web, Java, and Windows	Unique identifier of the element if its defined in the target application.
Name	Web, Java, and Windows	Unique name of the element if its defined in the target application.
CssSelector	Web	The CSS selector that locates the captured web element. For example, `div#navbarNav > ul > li > a`. If a web application supports Shadow DOM, the CSS Selector shows the path with the shadow DOM elements. For example, `html > body > shop-app > /ShadowDom/ > app-header[id="header"] > app-toolbar > div:nth-of-type(3) > a > paper-icon-button > /ShadowDom/ > iron-icon[id="icon"]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Locator type	Application type	Description
TagName	Web	Unique tag name of the web element.
JavaScript	Web	Allows the user to define a custom JavaScript code to locate an element.
XPath	Web	XPath to locate the web element. If a web application supports Shadow DOM, this locator shows the full XPath with the Shadow DOM elements. For example, `html > body > shop-app > /ShadowDom/ > iron-pages > shop-home > /ShadowDom/ > div > h2`.
Type	Java and Windows	Enables you to locate a screen element by its type. For example, button or text box. When you select the `Type` locator, the UAC connector populates the **Value** field with the type of the element.
Path	Java and Windows	Enables you to locate a screen element by specifying its position in the hierarchy of screen elements. When you select the `Path` locator, the UAC connector populates the **Value** field with the path of the element.
CustomPath	Windows	Enables you to fine-tune or trim the path to an element.

Additional options for application screens and elements in Universal App Connector

Validate and perform additional operations for the added application screens and their captured elements. The additional options for the application screens are categorized based on the application type.

Type of application screens, their additional options, and descriptions

In the Screens and elements pane, right-click the application screen to perform the following additional operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type of application screens and their additional options

Type of application	Additional options
Java	• Refresh screen • Refresh screen and elements • Focus • Capture element • Delete
Windows	• Refresh screen • Refresh screen and elements • Focus • Capture element • Show elements • Delete
Google Chrome or Microsoft Edge	• Refresh screen • Refresh screen and elements • Focus • Capture element • Add custom element • Delete

Description of additional options for the application screens

Additional action	Description
Refresh screen	Rematches the selected screen based on the screen match rules or locators that you defined.
Refresh screen and elements	Rematches the selected screen and its child elements based on the screen match rules or locators that you defined.
Focus	Sets the targeted application screen into focus.
Capture element	Captures elements from the application screen. For more information, see Use the Universal App Connector.
Add custom element	Adds a custom element to the application screen. For example, you can interact with hidden elements that you cannot directly capture from the web page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Description of additional options for the application screens (continued)

Additional action	Description
Show elements	Displays the Windows Elements dialog that displays all the existing elements in the target application screen in a tree view. You can select the required element from here and add it to the application screen. For Windows application screens, the elements are displayed in two modes. They are **UI Automation** and **Active Accessibility**. **UI Automation** is the default mode. For example, when you capture a notepad windows screen and right-click and select **Show Elements**, the following modes are displayed. **Elements displayed in UI Automation mode for a Notepad**  **Elements displayed in Active Accessibility mode for a Notepad** Delete	Deletes the application screen.

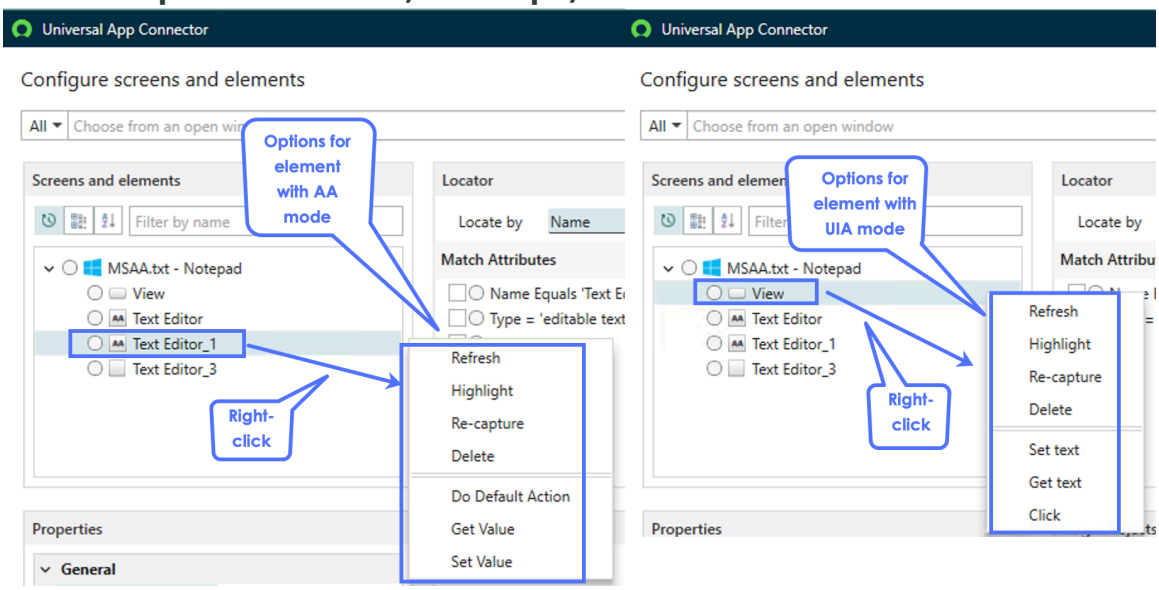
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional options for elements and their descriptions

In the Screens and elements pane, right-click the application element to perform the following additional operations. For example, for a Windows screen.

Additional options for elements, for example, for a Windows screen



Additional options for elements and their description

Additional option	Description
Refresh	Rematches the selected element based on the element match attributes or locators that you defined. When you capture an element in both UIA and AA modes of a Windows application screen, you view both elements in the Screens and elements pane. For example,  Text Editor_UIA and Text Editor_AA. When you capture a Text Editor element in Active Accessibility mode and perform the **Refresh** action on that element, the Target objects preview pane displays two text editors with different types, such as window and editable  text.
Highlight	Highlights the element on the target application screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional options for elements and their description (continued)

Additional option	Description
Re-capture	Recaptures an element from the application screen retaining the same name.
Delete	Deletes the element.
Do Default Action	Executes the default action of the target object. This the same action you perform by clicking, pressing Enter, or using another common method of activation. The default actions are listed for the following UI elements. • Button: Clicks the button • Check box: Toggles the check (select/clear) • Link: Opens the link (navigate) • Combo Box: Opens the drop-down • List Item: Selects the item • Tree View Node: Expands or collapses the node
Get Value	Retrieves the value of the target object, which typically represents the data the object holds or displays (not the label or name).
Set Value	Sets the value property of the target object.
Set text	Sets text to the element if applicable.
Get text	Retrieves text from the element if applicable.
Click	Clicks the elements if applicable.

Methods of UI Automation mode and Active Accessibility mode

The Universal app connector provides multiple methods that perform various actions when screens are captured in Windows applications, for UI Automation mode and Active Accessibility mode.

Methods of UI Automation mode

If the screens are captured in Windows applications, for UI Automation mode, double-click the **UniversalApplication** object under Global Objects. The following methods for different element types appear in the Object Explorer pane.

Methods of UI Automation mode

UI Automation Element Type	UI Automation Method Name
Common	Click
Common	Focus
Common	GetInstanceCount
Common	GetProperty
Common	IsCreated
Common	MouseAction

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Methods of UI Automation mode (continued)

UI Automation Element Type	UI Automation Method Name
Common	ScrollIntoView
Common	SendKeys
Common	SetElementIndex
Common	SetLocatorValue
Common	SetLocatorValueArgs
Common	SetMatchRuleValue
Common	WaitForCreate
Edit	GetText
Edit	SetText
ComboBox	SetComboBoxItem
ComboBox	GetComboBoxItem
ComboBox	GetComboBoxItems
ComboBox	SelectNextItem
ComboBox	SelectFirstItem
ComboBox	ExpandComboBox
ComboBox	CollapseComboBox
Label	GetText
CheckBox	IsChecked
CheckBox	Check
CheckBox	UnCheck
Image	GetImage
ListBox	GetTable
ListBox	SelectListItem
ListBox	SelectNextItem
ListBox	SelectFirstItem
ListBox	SelectListItemByIndex
ListBox	ClickCell
ListItem	SelectItem
ListItem	AddToSelection
ListItem	IsSelected
Password	SetText
Password	GetText
Password	GetProperty
Password	SetPassword

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Methods of UI Automation mode (continued)

UI Automation Element Type	UI Automation Method Name
RadioButton	IsChecked
RadioButton	Check
Table	GetTable
TreeView	ExpandAll
TreeView	CollapseAll
TreeView	SelectNextItem
TreeView	SelectFirstItem
TreeView	SelectItemByText

Methods of Active Accessibility mode

If the screens are captured in Windows applications, for Active Accessibility mode, double-click the **UniversalApplication** object under Global Objects. The following methods for Common element type appear in the Object Explorer pane.

Methods of Active Accessibility mode

Element type	Active Accessibility Method Name
Common	DoDefaultAction
Common	SetValue
Common	GetValue
Common	Select
Common	Focus
Common	GetInstanceCount
Common	GetProperty
Common	IsCreated
Common	MouseAction
Common	SendKeys
Common	SetElementIndex
Common	SetLocatorValue
Common	SetLocatorValueArgs
Common	SetMatchRuleValue
Common	WaitForCreate

VB.Net

The VB.Net connector enables you to write and execute VB.Net scripts as part of a Workflow in RPA Desktop Design Studio.

You must first use and then expose the methods in the VB.Net connector to use its methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To use the connector, see Use a connector in RPA Desktop Design Studio.
- To configure the VB.Net connector, see Configure the VB.Net connector.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Configure the VB.Net connector

Write and validate a custom VB.Net script before executing it as part of a Workflow in the RPA Desktop Design Studio.

Before you begin

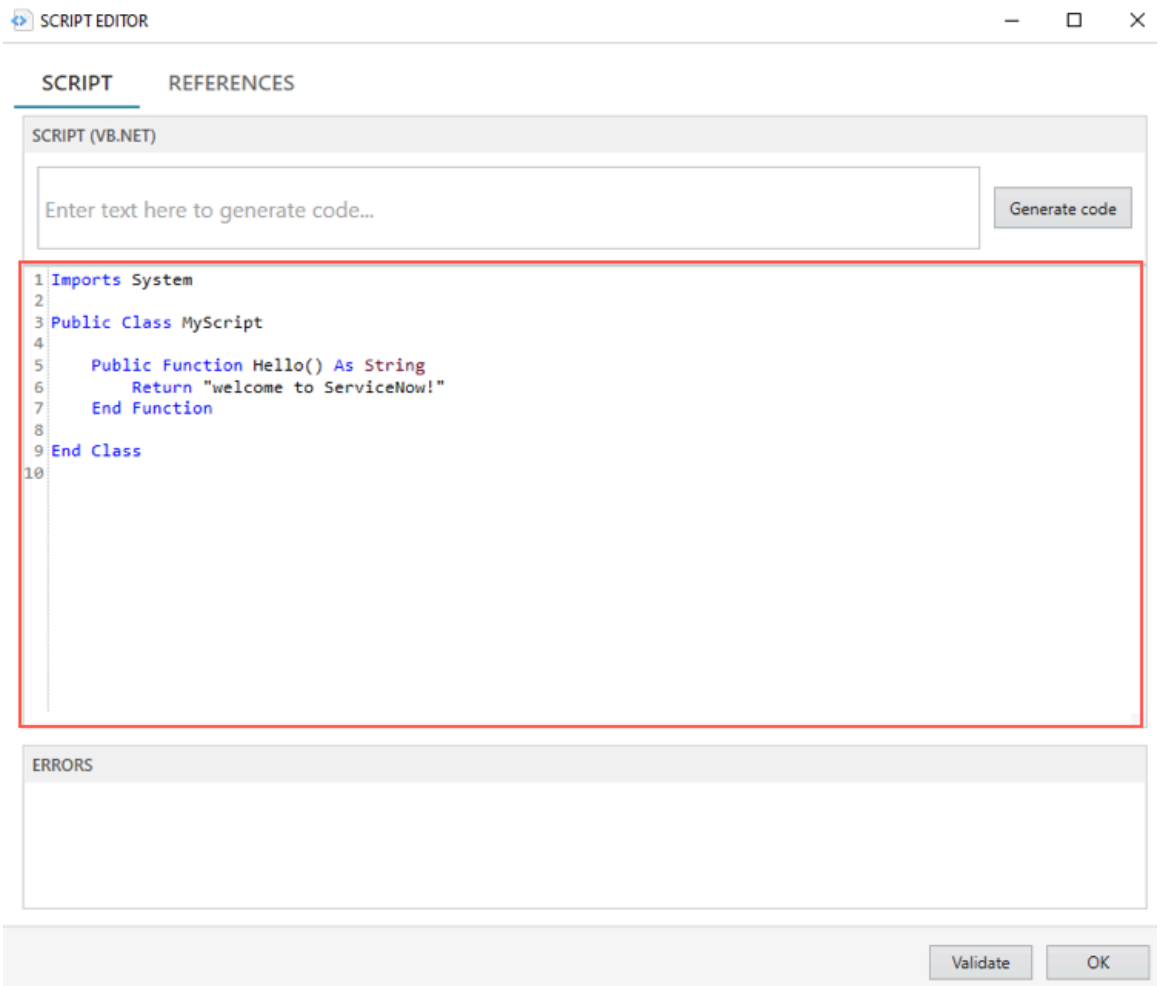
Ensure you have installed the Scripting plugin on the RPA Desktop Design Studio. To install, see Manage plugins in RPA Desktop Design Studio.

Role required: Developer

Procedure

1. In the Toolbox pane, navigate to **Connectors** > **VB.NET**.
2. Drag the VB.NET connector to **Global Objects** in the Project Explorer pane.
3. Right-click the **JavaScript**connector in Global Objects and select **Configure**.
   The Script Editor window is displayed.
4. Enter the custom VB.NET script in the Script pane.

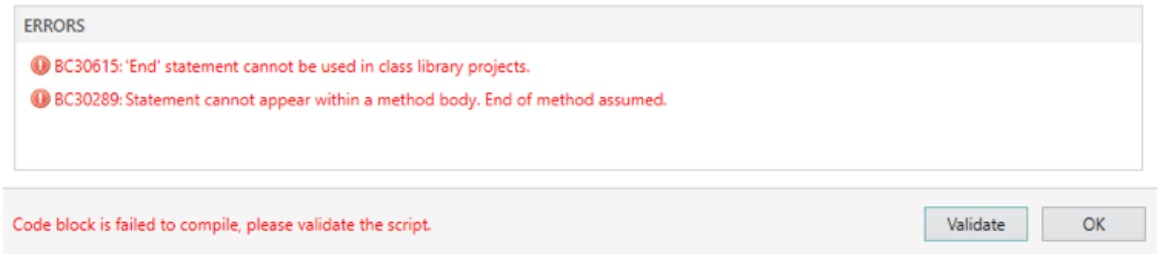
Script pane in Script Editor



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Select **Add Reference** from the **References** tab section if you want to add Dynamic-link library (DLL) references to your custom script.
   You can select the references from the Reference Manager window and also from your computer.
6. Select **Validate**.
   If your custom script has any errors, it is displayed in the Errors pane. Resolve the errors and select **Validate** to check for errors again.

Error pane for Script Editor



7. Click **OK**.
   If you want to save the changes, select **Yes**. An error validation is performed again and the changes are saved. If you want to discard the changes, select **No**.

What to do next

The custom script you created by using the VB.net connector is now ready to be used in your automation.

VB connector methods

The VB connector method executes the VB.Net script you had written as part of the VB.NET connector configuration.

Execute

Executes VB scripts configured during the configuration of the VB.NET connector.

You must configure the method before using it. To configure, do the following steps.

1. Click the method settings icon ( ).
2. Select the class created during the configuration of the VB.NET connector from the **CLASSES** list.
3. Select the method created during the configuration of the VB.NET connector from the **METHODS** list.
4. Click **OK**.

Output

Result (String)

Execute method output description

Parameter	Description	Mandatory?
Result (String)	Returns the output of the Execute method execution.	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows connector

The Windows connector enables you to perform various actions on the Windows applications, and their user interface elements. These actions are performed through the methods provided by the Windows connector. You must configure the connector to expose its methods.

You must first use, configure, and then expose the methods in the Windows connector to use its methods.

- To use the Windows connector, see Use a connector in RPA Desktop Design Studio.
- To configure the Windows connector, see Configure Windows connector.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Windows connector methods are available at the following levels:

- Connector
- Screen
- Element

Types of Windows connector methods

Method level	Description
Connector	These methods enable you to perform actions on the connector to set a working directory, get the Windows handle, and more.
Screen	These methods perform various actions on the screens you have configured. For example, click a button.
Element	These methods perform various tasks on the various elements on the screen.

Important:
Windows connector uses Microsoft UI Automation Framework internally to interact with applications built for Windows desktop such as Win32, WPF platforms. Any known issue or limitation published by Microsoft for this framework are applicable.

Configure Windows connector

Configure the Windows connector to access its methods and build automation on a Windows application. It provides methods at different levels and you must first configure it to expose methods at all levels.

Before you begin

Add the Windows plugin from the Plugins Manager before using the connector. For more information about adding the SSH plugin, see Manage plugins in RPA Desktop Design Studio.

Ensure at least one Windows application is open or active.

Role required: none

Procedure

1. In the Toolbox pane, navigate to **Connectors** > **Windows Connector**.
2. Drag the Windows connector under Global Objects in the Project Explorer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Under the Global Objects node, right-click the connector.
4. Click **Configure**.
5. In the **AVAILABLE WINDOWS** list, select the required application window.

> **Tip:**
> If the window doesn't appear in the list, click the refresh icon ( ).

6. Click **Add Window**.
7. Under the WINDOWS section, right-click the name of the window.
8. Click **Add Element**.
9. Use the context dialog to capture elements.
   To use the context dialog, see Use the Capture element dialog.

> **Important:**
> If the language of your Microsoft Windows machine is non-english, then an unhandled exception error message is displayed when you click the Target Objects Preview pane. Click **Ok** on the error message box to proceed configuring the connector.

Windows Connector methods

The Windows methods in RPA Desktop Design Studio interact with the Windows applications to perform various tasks. The connector provides methods at different levels of the Windows applications.

Windows connector method levels

Connector level methods

Window level methods

Element level methods

Connector level methods

CloseMainWindow

Closes the active window of the application.

GetMainWindowHandle

Retrieves the handle ID of the active window of the application.

GetMainWindowTitle

Retrieves the title of the active window of the application.

SetWorkingDirectory

Sets the working directory of the application for all file operations through the application to be performed in the specified directory.

Input

Path

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Start

Starts the application.

Input

Path Args

Terminate

Terminates the application.

Window level methods

Focus

Sets the focus on a window that is inactive, minimized, or in the background.

GetFields

Returns the data in the form fields of the screen. You must configure the method before using.

To configure, do the following steps.

1. Click the method settings icon ( ).
2. Select the form elements.
3. Update the form element data type.
4. Click **OK**.

Output

Form element data

GetScreenShot

Captures the screenshot of the screen.

Output

Return (Bitmap)

IsCreated

Returns the Boolean response depending on whether a specific window matches the rules set in the MATCH CHILDREN section of the configuration window.

Inputs

MatchAllChildren

Outputs

Return (Boolean)

Maximize

Maximizes the window.

Minimize

Minimizes the window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SendKeys

Simulates keystrokes on web pages and windows.

Inputs

Keys

ClearExistingValue (Boolean)

TypeDelay

SetFields

Sets data in form field types. To set the form fields, you must first configure the method. To configure, do the following steps.

1. Click the method settings icon ( ).
2. Select the form elements.
3. Update the form element data type.
4. Click **OK**.

Input

Form data field

WaitForCreate

Sets delay before a web page or a window loads.

Inputs

timeoutInSeconds

MatchAllChildren

Outputs

Return (Boolean)

Element level methods

These methods are exposed when you double-click an application element under the Global Objects in the Project Explorer.

Click

Performs a click operation.

IsCreated

Checks whether an element matches the rules set in the MATCH CHILDREN window.

Outputs

Return (Boolean)

SendKeys

Simulates keystrokes on web pages and windows.

Inputs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Keys (String)

ClearExistingValue

TypeDelay (Double)

SetPassword

Automate entering password securely in the password field of a Windows application.

To provide inputs to the fields see Configure port properties.

SetPassword method parameters

Parameter	Description	Data Port type	Data type	Default value	Mandatory?	Notes
Password	Accepts the password as a secured string.	Data In	Secured string	None	Yes	Since it accepts the password as a secured string, it only shows the length of the string when you right-click on the parameter and then click **Preview Data**.
UseSendKeys	SendKeys is a method used to send keyboard inputs such as characters, numbers, and symbols to text boxes inside an application.	Data In	Boolean	False	Yes	**Tip:** If the **SetPassword** method fails to input the password in the password field, set the value to **True** and execute the method again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters of the Windows connector methods

Learn about the parameters of the Windows connector methods in RPA Desktop Design Studio.

Parameters of the Windows connector methods

Parameter Name	Description	Mandatory?
Args	Arguments to pass as the initial values to start an application.	No
Form data field	Data to set in the form fields of the element.	Yes
Return (Bitmap)	Returns the screenshot image of the screen in the Bitmap format.	Not applicable
Path	Directory path where the initial files to start the application are stored.	Yes
Form element data	Returns the captured form element data.	Not applicable

Enter inputs for parameters

To enter inputs, see Configure port properties.

Application level method parameters

These parameters pass custom specifications to the various applications such as Java, Google Chrome , Windows , and Mainframe. Based on the specifications, the applications return an output. The process is a part of a Robotic Process Automation .

Application level method parameters

Parameter	Description	Mandatory?
Return (Boolean)	Returns the Boolean response to the request of setting an inactive window active. Successful operation returns True.	Not applicable
Form data	Returns the captured form element data.	Not applicable
MatchAllChildren	Option to indicate whether the method will match all elements of the application while the terminal session executes.	No
Action (MouseAction)	Action the mouse device will perform on the Java application.	No
Keys	Accepts keys, combination of keys, or special keys to trigger their specific actions. For example, **CTRL+A** selects all text.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application level method parameters (continued)

Parameter	Description	Mandatory?
Return (Integer)	Returns the integer value of the number of open Java application instances.	Not applicable
ClearExistingValue	Clears or retains existing value in a field after accepting a Boolean response of True or False.	No
Keys (String)	Shortcut keys that perform specific actions.	Yes
ClearExistingValues	Option to indicate whether the method will clear any existing value on the field in the Java application.	No
TypeDelay	Option to set any delay before the method operates.	No
xPos	Position of the Java application along the X-axis.	No
yPos	Position of the Java application along the Y-axis.	No
Width	Width of the Java application along the X-axis.	No
Height	Height of the Java application along the X-axis.	No
TypeDelay	Delays the execution of the SendKeys method in terms of seconds. Specify the seconds.	No
timeoutInSeconds	Time until which the method waits for the terminal session to execute. The method times out if the terminal session doesn't execute after the specified time.	No
Return (Boolean)	Returns the Boolean response to the WaitforCreate request. If the terminal session executes before the set timeout, the value is **True**.	Not applicable
Return (Boolean)	Boolean response to indicate whether a window or web page is ready to accept requests.	No
Timeout	Time after which the wait for elements to load will time out.	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application level method parameters (continued)

Parameter	Description	Mandatory?
Return (Boolean)	Boolean response to indicate whether the method waited for the elements to load.	Not applicable
Return (Boolean)	Returns the Boolean response on whether all children elements matched.	Not applicable
Return (Integer)	Returns the integer value of the Microsoft Windows handle.	Not applicable
MatchAllChildren	Option to indicate whether the request will match all parameters of the window while it waits for the window to load.	No
Parameter	Parameter value for the JavaScript.	Yes
Return (Bitmap)	Returns the captured screenshot of the active Java application window in Bitmap format.	Not applicable
Return (Boolean)	Returns the boolean response to whether a Java application is active or available.	Not applicable
Field (String)	Returns the data in the form or text field.	Not applicable
MatchAllChildren	Option to indicate whether the method will match all elements of the application while the terminal session executes.	No

Element level method parameters

These parameters pass custom specifications to the elements in various applications such as Java, Google Chrome , Windows , and Mainframe. Based on the specifications, the applications return an output. The process is a part of a Robotic Process Automation .

Element level method parameters

Parameter	Description	Mandatory?
Return (Boolean)	Returns the Boolean response to whether the rules in the MATCH RULES section matched. The responses are True or False.	Not applicable
ClearExistingValue	Clears or retains existing value in a field after accepting a	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element level method parameters (continued)

Parameter	Description	Mandatory?
	Boolean response of True or False.	
TypeDelay	Delays the execution of the SendKeys method in terms of seconds. Specify the seconds.	No
Value (String)	Accepts keys, combination of keys, or special keys to trigger their specific actions. For example, **CTRL+A** selects all text.	Yes
Return (String)	Returns a list of actions you can perform on an element.	Not applicable
Return	Returns the Boolean response on whether the action was successful.	Not applicable
Action (String)	Option to indicate the action to be performed on the method.	Yes
Keys (String)	Accepts keys, combination of keys, or special keys to trigger their specific actions. For example, **CTRL+A** selects all text.	No
Return (Boolean)	Boolean response to whether the Click method was successful.	Not applicable

Data Modellers

The Data Modeller creates templates by adding fields or data to PDF and XML documents. It also provides methods to classify the templates and use the fields or data created.

- To use the Data Modeller, see Use the XmlTemplate component.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Use the XmlTemplate component

Create templates from existing XML or PDF documents by adding custom data or fields to the documents.

Before you begin

Role required: none

About this task

The XmlTemplate component also provides methods to work with the templates. To expose the methods, see View the XmlTemplate methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Data Modellers** > **XMLTemplate**.
2. Drag the XmlTemplate component under Global Objects in the Project Explorer.
3. Click to expand the Global Objects node.
4. Right-click XmlTemplate.
5. Click **Configure**.
6. Under the **TEMPLATES** section, click the add templates icon ( ).
7. Click the template added.
   A new template is by default named in the `Template<number>` format. You can rename it from the Name field in the PROPERTIES section on the XML TEMPLATE DESIGNER window.
8. To select an existing PDF or XML document, in the **XML/PDF File** field, click the Load XML or PDF File icon ( ).
9. Select the XML or PDF file from the local drive.
   The preview displays the document data under corresponding XML tags.
10. To add a field to the file, right-click the required XML tag.
11. Click one of the following field options.
    - Text
    - Text Array
    - Table
    - XPath

    You've successfully updated the template by adding fields.
12. **Optional:** In the Name field of the PROPERTIES section, provide a custom name to the template you added.
13. **Optional:** Repeat the steps to add more fields.
14. Close the XML TEMPLATE DESIGNER window.

View the XmlTemplate methods

After configuring the XmlTemplate connector, you can expose its methods.

Before you begin

Role required: none

Procedure

1. Navigate to **Data Modellers > XMLTemplate**.
2. Drag the XmlTemplate connector under Global Objects in Project Explorer.
3. Expand the Global Objects node.
4. Double-click the XmlTemplate connector.
   The methods appear under the Object Explorer pane.

XmlTemplate connector methods

The XMLTemplate methods classify the templates and get the fields added to the templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Clasify

Classifies the template created. To see the steps to create templates, see Use the XmlTemplate component.

You must first configure the method before executing it. To configure, do the following steps.

1. Click the method settings icon ( ).
2. Select the required template.
3. Click **OK**.

Input

FilePath

Status

Template

GetFields

Returns the fields that were added to the template. You must configure the method before using it. To configure, do the following steps.

1. Click the method settings icon ( ).
2. Select the required template.
3. Select the corresponding field.

   A Data Out field is added with each field you select.
4. Click **OK**.

Parameters of the XmlTemplate connector methods

Learn about the various parameters of the XmlTemplate connector methods in RPA Desktop Design Studio.

Parameters of the XmlTemplate connector methods

Parameter name	Description	Mandatory?
FilePath	Path to the PDF or XML document that is used to create templates.	Yes
Status	Boolean response to whether the template was loaded correctly.	Not applicable
Template	Template name as configured in the XmlTemplate connector.	Yes

Properties of the XmlTemplate methods

Learn about the properties of the XmlTemplate methods in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the XmlTemplate methods

Property name	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

General

The RPA Desktop Design Studio General components automate diverse use cases. Examples range from execute a database query to passing a variable.

Use the Confirm component

Set a confirmation message that is shown in a dialog box requiring user inputs by using the Confirm component in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

The Confirm component is used as part of an Attended Robot automation. Use this component to request a confirmation from the user as a response to a user action. For example, request user inputs on whether the user wants to save a file.

To configure the properties, see Properties of Confirm components.

Procedure

1. In the Toolbox pane, navigate to **General** > **MessageBox**.
2. Drag the Confirm component to the Design surface.
3. To provide inputs to the parameters, see Configure port properties.
4. Connect the data and control ports of the Confirm component to the corresponding ports of the other components as described in the following table.

Confirm component port parameters

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data in	Message	String	Takes the confirmation message from another component.	No default value	Yes
Data out	Return	Boolean	Returns the Boolean value based	Not applicable	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
			on the user input. If True, the user has clicked **Ok**. Else, if False, the user has clicked **False**.		

5. **Optional:** To test the component, right-click the component bar and click **Run From Here**.

Use the Input component

Set up a user input dialog with by using the Input component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

The input component is used in the Attended Robot automation.

To configure the properties, see Properties of Confirm components.

Procedure

1. In the Toolbox pane, navigate to **General** > **MessageBox**.
2. Drag the Input component to the Design surface.
3. To provide inputs to the parameters, see Configure port properties.
4. **Optional:** Connect the data and control ports of the Input component to the corresponding ports of the other component as described in the following table.

Input component data port parameters

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data in	Message	String	Takes the heading of the user input dialog from another component.	No default value	No
Data out	Return	String	Returns the input entered in the form.	Not applicable	Not applicable

5. **Optional:** To test the component, right-click the component bar and click **Run From Here**.

Use the Input Password component

Set up a password input form by using the Input Password component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

About this task
The Input Password component is used in Attended Robot automations.

To configure the properties for the Input Password component, see Properties of Confirm components.

Procedure
1. In the Toolbox pane, navigate to **General** > **MessageBox**.
2. Drag the Input Password component to the Design surface.
3. To provide inputs to the parameters, see Configure port properties.
4. Connect the data and control ports of the Input Password component to the corresponding ports of the other components as described in the following table.

Input Password component data port parameters

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data in	Message	String	Takes the heading of the password from a previously executed component.	No default value	No
Data out	Return	Secured String	Returns the password entered in the form as a secured string.	Not applicable	Not applicable

5. **Optional:** To test the component, right-click the component bar and click **Run From Here**.

Use the Show component

Display custom messages as part of a Attended Robot automation by using the Show component in the RPA Desktop Design Studio

Before you begin
Role required: none

About this task
For example, in an assisted automation, a component could evaluate a user input and show a message `Incorrect Date of Birth` through the Show component.

You can configure the properties for the Show component. For more information about these properties, see Properties of the General components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **General** > **MessageBox**.
2. Drag the Show component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the Show component to the corresponding ports of the other components as described in the following table.

Confirm component port parameters

Port type	Port name	Data type	Purpose of connection	Mandatory?
Data in	Message	String	Takes the custom message that the component shows.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Variable component

Create a variable in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Variable component. For more information about these properties, see Properties of the General components.

Procedure

To use the Variable component, see Create and use a variable in RPA Desktop Design Studio.

Use the Try Catch component

Catch an error or exception that occurs in a component in an automation.

Before you begin
Role required: none

About this task
To configure the properties for the Try Catch component, see Properties of the Try Catch component.

For details on the issues related to the Try Catch component, see KB article KB1123551, KB article KB1123552, and KB article KB1123556.

You can use multiple instances of the Try Catch component in an automation to handle errors from other components along the same execution path. When the Try Catch component catches an error or exception in a component, the automation after the failed component doesn't execute. The Try Catch component returns the error message and can optionally execute an alternative flow which is connected to its On Error port. If an activity comprising a Try Catch component calls another activity with no Try Catch component along the same execution path

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and after its Try Catch component, the Try Catch component can catch errors, if any, in the called activity.

Procedure

1. In the Toolbox pane, navigate to **General** > **Try Catch**.
2. Drag the Try Catch component to the Design surface.
3. Connect the ports of the Try Catch component to the corresponding ports of the other components or activities as described in the following table.

Try Catch component port parameters

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Control Out	Control-Out	Not applicable	When there us no error, passes the control to another component or an Activity.	Not applicable	Yes
Control Out	On Error	Not applicable	Passes the control to another component or activity after the Try Catch component catches an error. Use this port after the Try Catch component catches an error or exception and you want to execute another component in the current or another activity.	Not applicable	No. Connecting the port is optional.
Data Out	Error Message	String	Returns the error message.	Not applicable	No. Connecting the port is optional.

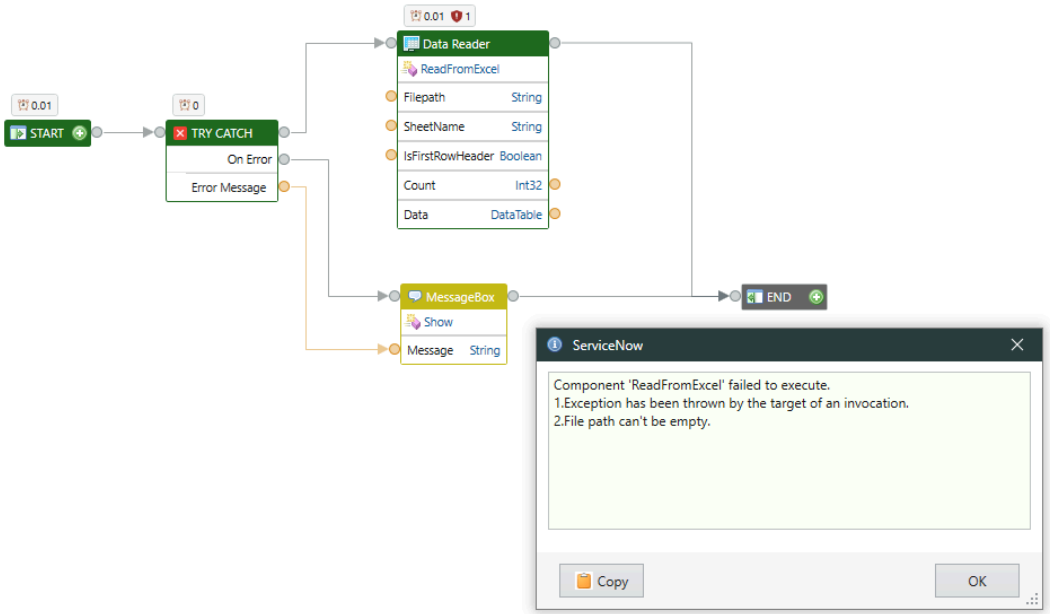
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** To test the component, right-click the component bar and then select **Run From Here**.

> **Note:**
> The Try Catch component may not work as expected with the Parallel component.

Example: The TRY CATCH component catches the error from the ReadFromExcel method

The Try Catch component catches the error from the ReadFromExcel method. The On Error port then passes the control to the Show component.



Use the Expression component

Perform mathematical and logical operations with various operands and operators using the Expression component in RPA Desktop Design Studio. The Expression component supports multiple operators and functions for you to use.

Before you begin

Role required: none

About this task

You can combine Expressions with operators with each operator having a priority. The priorities of the operators are given.

1. Primary
2. Unary
3. Power
4. Multiplicative
5. Additive
6. Relational
7. Logical

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Expression component supports multiple functions. See Supported functions for the Expression components.

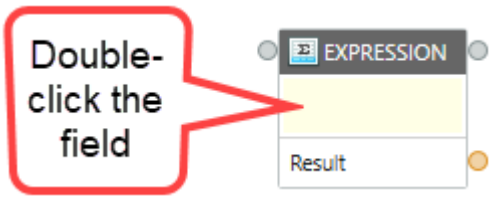
You can configure the properties for the Expression component.

Properties of the Expression component

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Procedure

1. In the Toolbox pane, navigate to **General** > **Expression**.
2. Drag the Expression component to the Design surface.
3. Double-click the light-yellow colored field and enter the expression.



A Data In port is dynamically added for each operand. For example, if you enter the expression X+Y, then two Data In ports are added for "X" and "Y". The Data In ports accept values for the operands.

4. To configure the input fields, see Configure port properties.
5. Connect the data and control ports of the Expression component to the corresponding ports of the other components as described in the following table.

Expression component port parameters

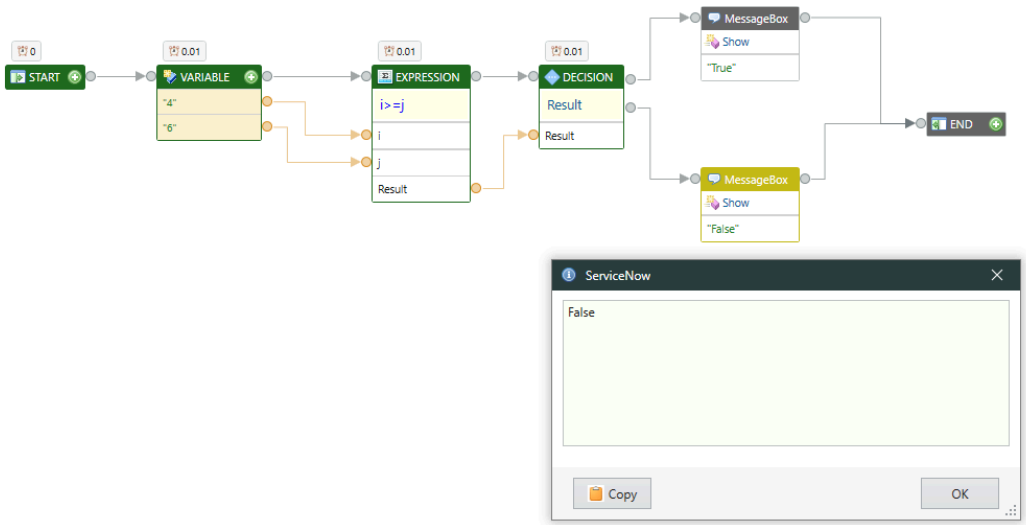
Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data in	The name of the port is the same as the name of the operand. For example, if X is the operand, then the port name is "X".	String	Takes the value of the operand.	No default value.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data out	Result	Object	Returns the result of the expression.	Not applicable	Not applicable

6. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Example: Expression component performs a mathematical operation between two operands



In the example, the Variable component passes the integer values for the two operands "i" and "j" set in the Expression component. The Expression component takes the values and finds whether the value of i>=j. The result is passed to the Decision component. The Decision component passes the result to the Show component. In the example, since the value of "i" is lesser than "j", the Show component shows "False" in a message box.

Use the Find Window component

Set the focus back on various windows that are inactive or running in the background as part of a Robotic Process Automation workflow in the RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
The Find Window component identifies one or more rules associated with a Window and later uses the rules to set the focus back on the window. The component also returns the window handle of the window.

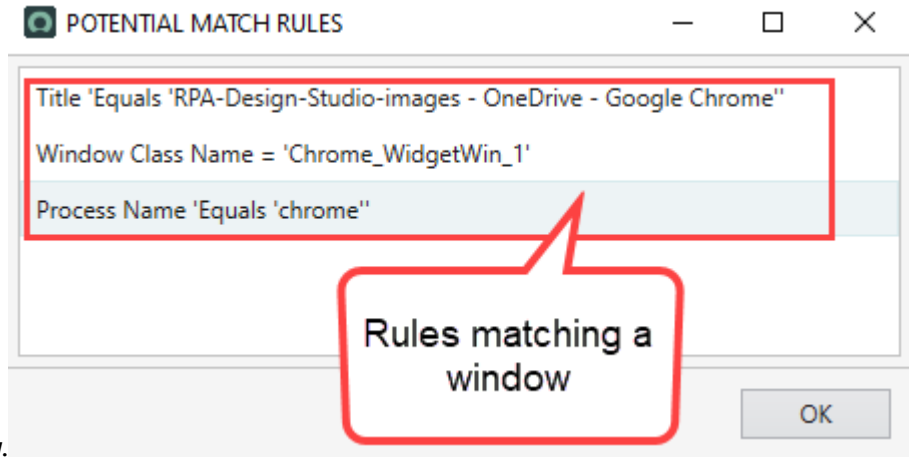
You can configure the properties for the Find Window component. For more information about these properties, see Properties of the General components.

Procedure

1. In the Toolbox pane, navigate to **General** > **Find Window**.
2. Drag the Find Window component to the Design surface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click the component settings icon ( ).
4. Click and drag the capture window icon ( ) and drop it on the window that you want to find.
   The POTENTIAL MATCH RULES window shows the rules matching the window.



5. Select a rule by clicking the rule.

   Tip:
   To select more than one rule, press Shift and click the rules.

6. In the POTENTIAL MATCH RULES window, click **OK**.
   The FIND WINDOW MATCH RULES window displays the rules matching the captured windows.
7. In the FIND WINDOW MATCH RULES window, click **OK**.
8. Connect the data and control ports of the Find Window component to the corresponding ports of the other components.

Find Window component port parameters

Port type	Port name	Data type	Purpose of connection	Mandatory?
Data in	Set Focus	Boolean	If True, the focus is set on the window else, the window continues to run in the background.	Yes
Control out	Fail	Not applicable	If the component fails to execute, passes the control to the next component.	No
Data out	Window Handle	Integer	Returns the window handle.	Not applicable.

9. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Parallel component

Execute multiple components in a sequence to perform multiple actions. The Parallel component exposes multiple threads that can execute multiple components as part of a Robotic Process Automation in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

For example, you can set two threads. In thread 1, the component launches the Google Chrome window with the START APP component and in thread 2, the component uses the Send Keys component to enter a URL.

You can configure the properties for the Parallel component. For more information about these properties, see Properties of the General components.

Procedure

1. In the Toolbox pane, navigate to **General** > **Parallel**.
2. Drag the Parallel component to the Design surface.
3. Click the add thread icon ( ).
   The Control Out port of the thread passes the control and executes the next component.
4. Repeat the step to add more threads.
5. Create multiple workflows by connecting one or more components with the threads.
6. Connect the data and control ports of the Parallel component to the corresponding ports of the other component as described in the following table.

Find Window component port parameters

Port type	Port name	Data type	Purpose of connection	Mandatory?
Control Out	Thread	Not applicable	Passes the control to the next component from the thread.	Yes

When you use the parallel component to run tasks across multiple threads, do not share the same global object instance across threads. This can cause the following issues such as:

- Race conditions: Concurrent access and modifications to the same object can lead to inconsistent or unpredictable results.
- Data corruption: Multiple threads changing shared data can overwrite or corrupt the object's state, resulting in incorrect behavior.
- Unexpected behavior: Without proper synchronization, actions by one thread may interfere with or conflict with those of another, causing errors or system instability.

To ensure thread safety, create a separate instance of the object for each thread. This prevents threads from modifying shared state and ensures that each thread operates on its own independent object.

7. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

> **Note:**
> The Send Keys and the Mouse components under the Utilities category don't work with the Parallel component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Script component

Write and execute custom Visual Basic (VB) scripts by using the Script component in RPA Desktop Design Studio.

Before you begin

Role required: none

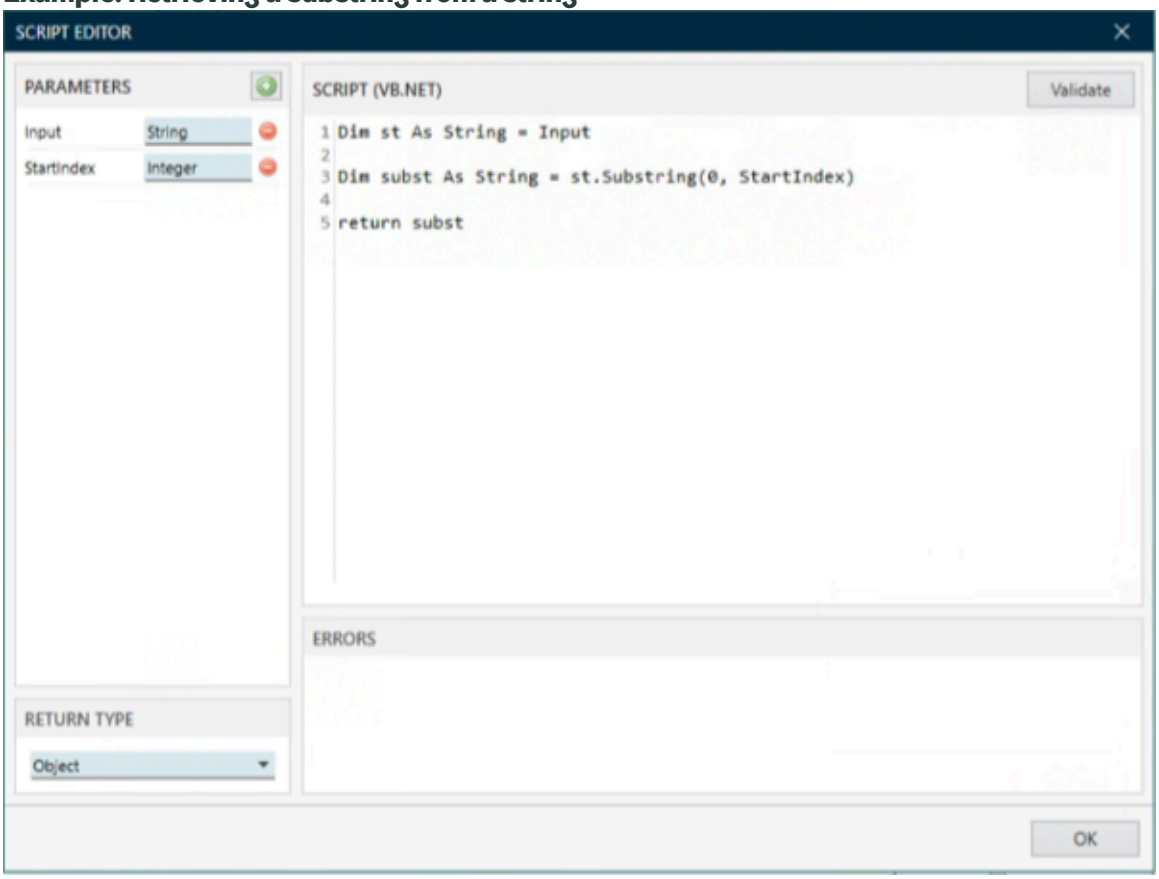
About this task

You can configure the properties for the Script component. For more information about these properties, see Properties of the General components.

You can use this component to perform actions that are not covered by existing RPA components or combine actions of multiple components.

For example, you can retrieve a substring from a string by using the VB script in the Script component. You can specify the string and the start character position.

Example: Retrieving a substring from a string



Procedure

1. In the Toolbox pane, navigate to **General** > **Script**.
2. Drag the Script component to the Design surface.
3. Click the component settings icon ( ).
4. Under the SCRIPT (VB.NET) heading, enter the custom VB script.
5. **Optional:** To add parameters to the script, do the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click the add parameter icon ( ).

b. Update the data type of the parameter.

c. Repeat the steps to add more parameters.
A Data In Port is added with each parameter you add.

6. **Optional:** To set the output data type, under the RETURN TYPE heading, select the data type.
7. To validate the script, click **Validate**.
Errors, if any, are shown in the ERRORS section. You must fix all errors before proceeding.
8. Click **OK** to close the SCRIPT EDITOR window.
9. Connect the data and control ports of the Script component to the corresponding ports of the other component as described in the following table.

Port name	Description	Port type	Mandatory?
Parameter	Enter a value for the parameter or use the value from a previously executed component.	Data In	No. Connecting this port is optional.
Return	Returns the output of the script and passes to the next component.	Data Out	Yes. To view the output, right-click the **Return** field and click **Preview Data**.

10. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SQL component

Write custom SQL queries to perform various operations by using the SQL component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the SQL component. For more information about these properties, see Properties of the General components.

Procedure

1. In the Toolbox pane, navigate to **General** > **SQL**.
2. Drag the SQL component to the Design surface.
3. Click the component settings icon ( ).
4. Under the SCRIPT (SQL) heading, write the custom SQL query.
5. **Optional:** To add a parameter to the query, do the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click the add parameter icon ( ).

b. Update the data type of the parameter.

c. Repeat the steps to add more parameters.
A Data In Port is added with each parameter you add.

6. Click **OK**.
7. To configure the input fields, see Configure port properties.
8. To close the PORT PROPERTIES dialog, click **OK**.
9. Connect the data and control ports of the SQL component to the corresponding ports of the other component as described in the following table.

Parameter	Description	Data Port type
Connection Provider	Takes the data table connection provider that enables an application to communicate with a database. **Example:** SqlClient, MySqlClient	Data In
Connection String	Connection string helps in connecting to the required data source using the details, such as server name, username, and password. In the following connection strings for each authentication type, replace the placeholder parameter values (for example, <myUser> and <myPassword>) with actual values: **Example:** For SQL authentication: `Server=<MY_SERVER>;Database=<MyDatabase>;User Id=<myUser>;Password=<myPassword>;` For Windows authentication:	Data In

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description	Data Port type

	`Server=MY_SERVER;Database=MyDatabase;Trusted_Connection=True;`
	
	For Oracle database:
	`Data Source=MyTnsName;User Id=myUsername;Password=myPassword;`
	
	For MySQL database:
	`Server=MY_SERVER;Database=MyDatabase;User Id=myUsername;Password=myPassword;`
	
	For ODBC database:
	`Driver={SQL Server};Server=MY_SERVER;Database=MyDatabase;Uid=myUsername;Pwd=myPassword;`
	
	For OLEDB database:
	`Provider=SQLOLEDB;Data Source=MY_SERVER;Initial`	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description	Data Port type
	`Catalog=MyDatabase;User Id=myUsername;Password=myPassword;`	
Parameter	Takes the value of the parameter from a previously executed component.	Data In
DataTable	Returns the data table and passes to the next component.	Data Out

10. To view the output, right-click the **Return** field and click **Preview Data**.
11. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Start App component

Start or launch an application or file by using the START APP component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Start App component.

Properties of the START APP component

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Height	Specifies the height of the application window that is launched.
Left	Specifies the location of the application that is launched along the left edge of the screen.
Top	Specifies the location of the application that is launched along the top edge of the screen.
Width	Specifies the width of the application window that is launched.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the START APP component (continued)

Property	Description
Max Wait Time in Seconds	Maximum time, in seconds, to wait for the image or application to appear on the screen. The default value is 30 seconds.
Wait For Start	Specifies the wait time (in seconds) before the action is executed.
State	Specifies the state in which the Windows based or web-based application is launched. The states are normal, maximized, minimized, hidden, or custom location.

Procedure

1. In the Toolbox pane, navigate to **General** > **START APP**.
2. Drag the START APP component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Start App component to the corresponding ports of the other component as described in the following table.

START APP component port parameters

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data In	File Path	String	Takes the path to the file or the application in the local disk.	No default value	Yes
Data In	Args	String	Takes the arguments for the path. For example, if you provide the local path to the Google Chrome browser, the argument can be https://servicenow.com	No default value	No. Connecting the port is optional.
Data Out	Window Handle	Integer	Returns the window handle of	Not applicable	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
			the file or application.		

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Format Text component

Format the text by using variable placeholders and line and tab variables with the Format Text component in RPA Desktop Design Studio. You can update the text and their positions easily by just updating the variable placeholders and the line and tab variables.

Before you begin

Role required: none

About this task

Essential tips to remember when using the Format Text Component to avoid the following exceptions.

Missing Arguments

This issue occurs when the format string contains more placeholders than the number of arguments provided.

For example,

- Format string: {0} {1}
- Arguments provided: "Hello"

The error message displayed for this issue is "An error occurred during execution. Component 'Format Text' failed to execute in the activity 'New Activity'."

Index (zero based) must be greater than or equal to zero and less than the size of the argument list.

The solution is to ensure the number of arguments matches the number of placeholders in the format string:

"Hello"

"World"

Correct Argument Placement

The index (zero-based) must be greater than or equal to zero and less than the size of the argument list.

Solution:

The solution is to ensure the number of arguments matches the number of placeholders in the format string. For example:

- Format String: `"Hello"`
- Argument: `"World"`

In this case, the format string does not contain any placeholders, so no arguments are needed. If you have a format string like `"Hello, {0}! Welcome to`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`{1}."`, you would need to provide two arguments, such as `"World"` and `"ServiceNow"`.

Using Literal Curly Braces in Format Strings

Issue: Curly braces {} have special meaning in string formatting and must be escaped when used as literal characters.

Example of Incorrect Usage:

Format String:

```
{
{0}
{1}
},
```

Error Message: An error occurred during execution. Component 'Format Text' failed to execute in the activity 'New Activity'.

Input string was not in a correct format

The solution is to use double braces to represent literal curly braces:

```
{{
{0}
{1}
}},
```

Rule to remember:

- { { represents a literal {
- } } represents a literal }

You can configure the properties for the Format Text component. For more information about these properties, see Properties of the General components.

Procedure

1. In the Toolbox pane, navigate to **General** > **Format Text**.
2. Drag the Format Text component to the Design surface.
3. To set the text placeholder variable, do the following steps.

   a. Click the add variable icon ( ).
   A Data In port is added for each variable you add.

   b. To configure the variable value, see Configure port properties.

   c. **Optional:** Repeat the steps to add more variables and values.

4. Click the component settings icon ( ).
5. Insert the text in the TEXT FORMAT EDITOR.
6. Insert the text.
7. **Optional:** Insert the line separator \n or tab separator \t variable at appropriate places within the text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Insert the text variable placeholders within the text body, wherever appropriate.

   Tip:
   To update the text, update the placeholder value.

9. Connect the data and control ports of the Format Text component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Variable)	Takes the variable value from a previously executed component.	Yes
Data Out (Formatted Output)	Returns the formatted text and passes to the next component.	Yes. To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from the previously executed component.	Yes
Control Out	Passes the control to the next component.	No. Connecting the port is optional.

10. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Terminate component

Abort an automation by using the Terminate component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Terminate component. For more information about these properties, see Properties of the General components.

Use the Terminate component in attended automations to complete the automation execution. For more information about the embedded task automation, Embedded Task Automation in RPA Hub.

Procedure

1. In the Toolbox pane, navigate to **General** > **Terminate**.
2. Drag the Terminate component to the Design surface.
3. To configure the input field, see Configure port properties.
4. **Optional:** Connect the data and control ports of the Terminate component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

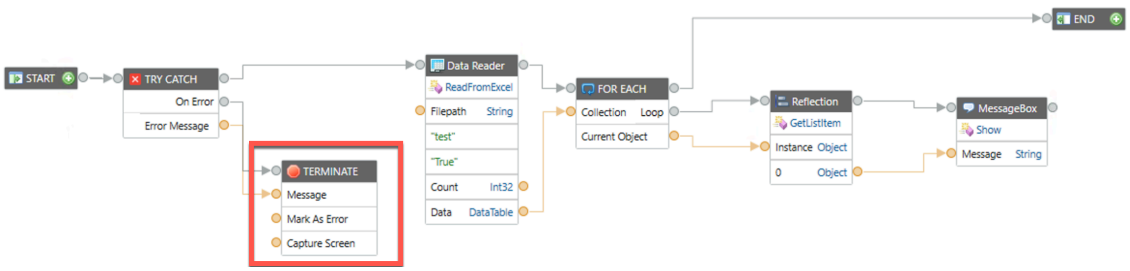
Port name	Purpose of connection	Port type	Data type	Mandatory?	Notes
Message	Takes the message when an automation is terminated. (Optional) This message is also shown in the process job.	Data In	String	No. Connecting the port is optional.	If the Boolean input in the Mark As Error port is True, then you must provide a message.
Mark As Error	Takes the Boolean value that indicates the status of the process job. If True, the state of the process job is Failed. If False, the status of the process job is a success.	Data In	Boolean	No. Connecting the port is optional.	You can view the status of the process job under the **Process Jobs** tab of the respective process in the instance.
Capture Screen	Takes the Boolean value that indicates whether the component captures the screenshot when an automation fails to execute. If True, the screen is captured at that point in time. If False, the screen is not captured.	Data In	Boolean	No. Connecting the port is optional.	To view the screenshot, do the following actions: **a.** On the **Design** tab, click **Attach > Remote log**. **b.** Select the required process job and click **Fetch Logs**. **c.** Click **Play log**. The Execution

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port name	Purpose of connection	Port type	Data type	Mandatory?	Notes
	Note: Ensure that the **Track Execution Logs** setting is enabled in your bot process record in RPA Hub. If Flat file is selected as an output type, then the screenshots are not captured.				log window shows the screenshot.

5. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Example:
For example, in the automation workflow that requires to read data from an Excel, For Each loop and GetListItem components are used to extract data from the DataTable and display in a message box. If any error occurs while reading the data from the Excel, you can use the Try Catch component to handle the exception and the Terminate component to end the automation. The error message is also shown in process job.



Use the Throw Error component

Raise an exception during the automation process to indicate something incorrect has occurred by using the Throw Error component in RPA Desktop Design Studio.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can configure the properties for the Throw Error component. For more information about these properties, see Properties of the General components.

Procedure

1. In the Toolbox pane, navigate to **General** > **Throw Error**.
2. Drag the Throw Error component to the Design surface.
3. In the Toolbox pane, navigate to **General** > **Try Catch**.
4. Drag the Try Catch component to the Design surface.
5. In the Toolbox pane, navigate to **General** > **MessageBox** > **Show**.
6. Drag the Show component to the Design surface.
7. **Optional:** Connect the data and control ports of the Throw Error component to the corresponding ports of the other components as described in the following table and image.

Port name	Purpose of connection	Port type	Data type
Exception Type	Specify the category of the occurred error. (Optional) For example, Application.	Data In	String
Message	Provide a detailed description of the error, explaining the issue and the suggestion solution. (Optional) For example, "There was an error loading the application. Please try again."	Data In	String

Throw Error component

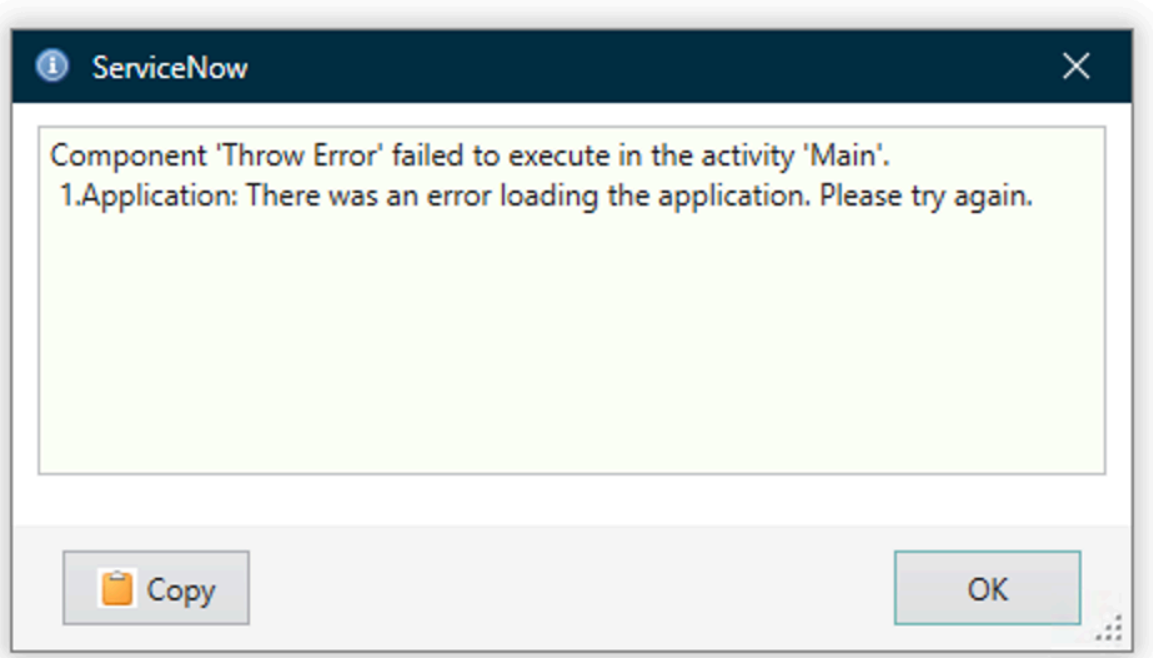
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. **Optional:** To test the component, click **Run** from the Design tab.

Throw Error component result



Use the Wait For Time component

Set a wait time by using the Wait For Time component in RPA Desktop Design Studio.

Watch this video to learn how to use the Wait For Time component.

https://player.vimeo.com/video/1081541198?h=84930f80a1&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Role required: none

About this task

You can use the Wait For Time component anywhere in an automation. Depending on the wait time that you have configured, the automation waits after the component previous to the Wait For Time component is executed.

To configure the properties for the Wait For Time component, see Properties of the Wait components.

Procedure

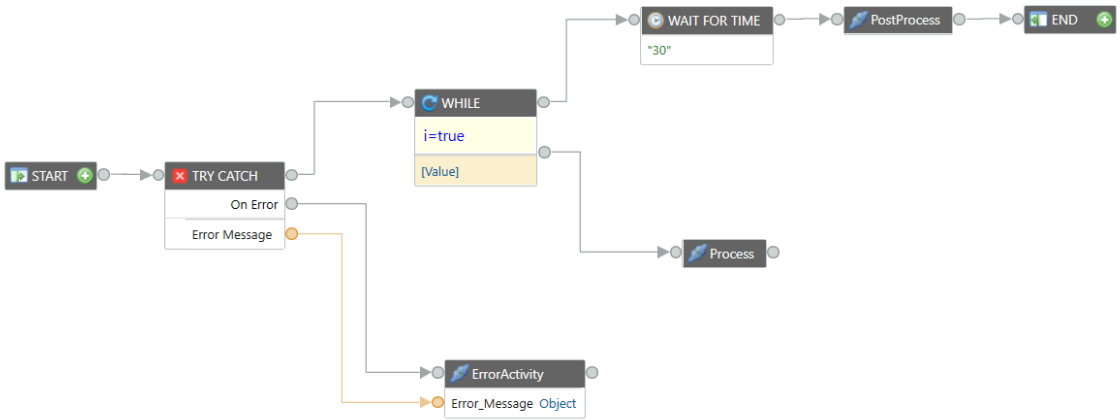
1. In the Toolbox pane, navigate to **General**.
2. Drag the Wait For Time component to the Design surface.
3. To set the wait time, see Configure port properties.
4. **Optional:** Connect the data and control ports of the Wait For Time component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port Type	Port name	Data type	Purpose	Mandatory?	Notes
Data In	Wait Time (Seconds)	Integer	Takes the wait time.	Yes	

5. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Example: Set a wait time in an automation



In the example, the WHILE component executes while the value of "i" is true. The Wait For Time component is placed between the While component and the Post Process component. The Wait For Time component puts a waiting time of 30 seconds before the Post Process component executes.

Supported functions for the Expression components

Learn about the various functions for the Expression components in RPA Desktop Design Studio.

Supported functions for the Expression components

Name	Description	Usage	Result
Abs	Returns the absolute value of a specified number.	Abs	1
Acos	Returns the angle whose cosine is the specified number.	Acos	(1)
Asin	Returns the angle whose sine is the specified number.	Asin(0)	0
Atan	Returns the angle whose tangent is the specified number.	Atan(0)	0
Ceiling	Returns the smallest integer that is greater than or equal to the specified number.	Ceiling(1.5)	2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported functions for the Expression components (continued)

Name	Description	Usage	Result
Cos	Returns the cosine of the specified angle.	Cos(0)	1
Exp	Returns raised to the specified power.	Exp(0)	1
Floor	Returns the largest integer less than or equal to the specified number.	Floor(1.5)	1
IEEERemainder	Returns the remainder resulting from the division of a specified number by another specified number.	IEEERemainder(3, 2)	-1
Log	Returns the logarithm of a specified number.	Log(1, 10)	0
Log10	Returns the base 10 logarithm of a specified number.	Log10(1)	0
Max	Returns the larger of two specified numbers.	Max(1, 2)	2
Min	Returns the smaller of two numbers.	Min(1, 2)	1
Pow	Returns a specified number raised to the specified power.	Pow(3, 2)	9
Round	Rounds a value to the nearest integer or specified number of decimal places. The mid number behavior can be changed by using EvaluateOption.RoundAwayFromZero during the construction of the Expression object.	Round(3.222, 2)	3.22
Sign	Returns a value indicating the sign of a number.	Sign(-10)	-1
Sin	Returns the sine of the specified angle.	Sin(0)	0
Sqrt	Returns the square root of a specified number.	Sqrt(4)	2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported functions for the Expression components (continued)

Name	Description	Usage	Result
Tan	Returns the tangent of the specified angle.	Tan(0)	0
Truncate	Calculates the integral part of a number.	Truncate(1.7)	1
NCalc	The NCalc is a mathematical expressions evaluator in .NET. With this function, you can parse any expression and evaluate its result. This includes static or dynamic parameters, or custom functions.	For more information, see https://github.com/ncalc/ncalc/wiki	

Properties of the General components

Learn about the properties of the General components in RPA Desktop Design Studio.

Properties of the Confirm components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Properties of the Try Catch component

Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

ITSM connector

The ITSM connector comprises two connectors: the Windows Management Instrumentation (WMI) and PowerShell. The WMI connector enables you to interact with the Windows Operating

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System to get important information and the PowerShell connector enables you to perform various actions on IT services.

- To use the ITSM connectors, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

PowerShell connector methods

The PowerShell connector methods act as interfaces with the Microsoft PowerShell to send requests and get responses in the RPA Desktop Design Studio.

CreateShell

Acts as an interface to pass your inputs in the form of commands and scripts. The CreateShell method is the first method you must use.

InvokeCommand

Runs commands and block of scripts on local or remote computers and gets the output including errors, if any.

Note:
You must execute the CreateShell method before executing this method.

Input

Command (String)

Output

Return

InvokeScript

Runs a script on local or remote computers and gets the output.

Note:
You must execute the CreateShell method before executing this method.

Input

Script

Output

Return

PSObjectToString

Accepts PowerShell objects from other methods or components and converts them to a string.

Inputs

PSObject

GetValuesByProperty

Accepts a PowerShell object and gets the values of the various properties.

Inputs

PSObject

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output

Return (String)

Disconnect

Disconnects the connection to the PowerShell.

Serialize

Accepts a PowerShell object and returns the object as a string.

Input

PSObject

Output

Return (String)

Parameters of the PowerShell connector methods

Learn about the various parameters of the Microsoft PowerShell connector methods in RPA Desktop Design Studio.

Parameters of the PowerShell connector methods

Parameter name	Description	Mandatory?
Command (String)	Command to run on local or remote computers.	Yes
Return	Output of the command as a collection.	Not Applicable
Script	Script to run on local or remote computers.	Yes
Return	Output of the script that is returned.	Not Applicable
PSObject	Takes the PowerShell object from a previously executed method.	Yes
Return (String)	Returns the values of the properties in the PowerShell Object.	Not applicable
PSObject	Data in the form of a PowerShell object.	Yes
Return (String)	Returns the PowerShell object as a string.	No

Input parameter values

To input the parameter values, see Configure port properties.

WMI connector methods

The Windows Management Instrumentation (WMI) connector methods act as interfaces with the WMI to send various requests and get responses in the RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect

Establishes a connection with the WMI. You must execute this method first before executing any other method.

Input

Hostname

Username

Password

GetDiskDetails

Returns the disk details such as the name, manufacturer, model, and media type of a local or remote computer.

Output

Hashtable

GetEnvironmentValue

Returns the environment variable values in the local or remote computers.

Input

Var

Output

Return

GetProcessesByCpuUsage

Returns the CPU usage by all processes in the remote or local computer.

Output

Return (Sorted Dictionary)

GetProcessesByMemUsage

Gets the memory usage by all processes in the remote or local computer.

Output

Return (Sorted Dictionary)

PageFaultsPerSecond

Gets the total page exceptions per second. It returns the page exceptions as objects.

Output

Return

PageFilePercentUsage

Gets the usage of page files by the local or remote computers as percentages. It returns the page percentages as objects.

Output

Return

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PercentMemoryUsage

Returns the percentage of the total memory that is used in the local or remote computers. It returns the percentages as objects.

Output

Return

PercentProcessorUsage

Gets the percentage of the total processes that are used in the local or remote computers. It returns the percentages as objects.

Output

Return

Query

Queries a local or remote computer by specifying the class and filter.

Input

Class

Filter

Output

Return

TotalPhysicalMemory

Provides the total available physical memory. It returns the output as an object.

AvailableMBytes

Provides the total available megabytes.

Output

Return

Parameters for WMI connector methods

The parameters for the Windows Management Instrumentation (WMI) connector methods enable you to send custom inputs to the WMI to perform different actions such as get disk details, environment value, CPU usage, and more as part of an automation Workflow in RPA Desktop Design Studio.

Parameters for WMI connector methods

Parameter name	Description	Mandatory?
Hostname	Hostname of the local or remote computer.	Yes
Username	Username of the host.	Yes
Password	Password to connect to the local or remote host.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters for WMI connector methods (continued)

Parameter name	Description	Mandatory?
Hashtable	Disk details in the local or remote computer in the form of a hash table.	Not applicable
Var	Environment variable name.	Yes
Return	Environment variable value.	Not applicable
Class	Class as input.	Yes
Filter	Filter as input.	Yes
Return (Sorted Dictionary)	Returns the memory usage values as key-value pairs in a sorted dictionary.	Not applicable
Return (Sorted Dictionary)	Returns the CPU usage values as key-value pairs in a sorted dictionary.	Not applicable
Return	Returns the usage values of system files in Windows as objects.	Not applicable
Return	Returns the page fault values per second as an object.	Not applicable
Return (Object)	Returns the usage of memory in percentage terms as an object.	Not applicable
Return	Returns the usage values of the processor in percentage terms as objects.	Not applicable
Return	Returns the available memory in bytes as integers.	Not applicable
Return	Query result as an object.	Not applicable

Input parameter values

To input the parameter values, see Configure port properties.

Loops

The Loops provide a set of components that implement the concepts of loops, for each, and while as part of an automation Workflow in the RPA Desktop Design Studio.

Use the Break component

Break a loop at any time with the Break component in the RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Break component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the Break component

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Message	Custom message for the user.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Procedure

1. In the Toolbox pane, navigate to **Loops** > **Break**.
2. Drag the Break component to the Design surface.
3. Connect the control port of the Break component to the corresponding port of the another component as described in the following table.

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Control In	Control In	Not applicable	Takes the input from another component when the defined condition is fulfilled.	Not applicable	Yes

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the For Each component

Traverse each item in a collection in the order of first to last using the For Each component in the RPA Desktop Design Studio. The collection can be an array, list, or a table.

Before you begin

Role required: none

About this task

You can configure the properties for the For Each component.

Properties of the For Each component

Property	Description
Delay After Execution	The number of seconds to pause after running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the For Each component (continued)

Property	Description
Delay Before Execution	The number of seconds to pause before running.
Delay for each execution (Seconds)	Specified delay before an item in the object, array, or a list is executed.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Procedure

1. In the Toolbox pane, navigate to **Loops** > **For Each**.
2. Drag the For Each component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the For Each component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data In	Collection	Object	Takes the collection as an input.	No default value	Yes
Data Out	Current Object	Object	Returns each item from the collection.	Not applicable	Not applicable

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the For Loop component

Execute a code recurrently to perform tasks of repetitive nature with the For Loop component in the RPA Desktop Design Studio. The For Loop is a control flow component for specifying iterations.

Before you begin

Role required: none

About this task

You can configure the properties for the For Loop component.

Properties of the For Loop component

Property	Description
Delay After Execution	The number of seconds to pause after running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the For Loop component (continued)

Property	Description
Delay Before Execution	The number of seconds to pause before running.
Delay for each execution (Seconds)	Specified delay before each execution.
Increment By	Specified number by which the component increments the values. For example, if the number is 2 and the loop is from 1 through 10, then the numbers are 1, 3, 5, and so on.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Procedure

1. In the Toolbox pane, navigate to **Loops** > **For Loop**.
2. Drag the For Loop component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the For Loop component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data In	From	Integer	Takes the starting value of the For Loop counter.	Not applicable	Yes
Data In	To	Integer	Takes the end value of the For Loop counter.	Not applicable	Yes
Data Out	Index	Integer	Passes the current value of the For Loop counter to the next component.	Not applicable	Yes
Control Out	Loop	Not applicable	Passes the iteration to the next component.	Not applicable	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the While component

Execute a code until a specified condition is true using the While component in RPA Desktop Design Studio.

Watch this video to learn how to use the While component.

https://player.vimeo.com/video/1074330129?h=89bb9706ed&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Role required: none

About this task

You can configure the properties for the While component.

Properties of the While component

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Delay for each execution (Seconds)	Specified delay before each execution of the code while the condition is true.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Procedure

1. In the Toolbox pane, navigate to **Loops** > **While**.
2. Drag the While component to the Design surface.
3. Double-click the light-yellow colored field ( ) under the WHILE component bar.
4. Enter the condition.
   A Data In port is dynamically added for the parameter that contains the While condition.
5. Connect the data and control ports of the While component to the corresponding ports of the other components as described in the following table.

Port name	Purpose of connection	Port type	Data type
The name of the port is the same as the name of the parameter that defines the condition.	Takes the value of the parameter. The component matches the value with the condition. For example, `i<=10`.	Data In	Object
ControlOut	Use the port at the end of the While Loop	Control Out	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port name	Purpose of connection	Port type	Data type
	to continue to the next action flows.		
LoopPort	Use the port to perform actions inside the While Loop (such as calculating expressions, logging values, and so on).	Control Out	

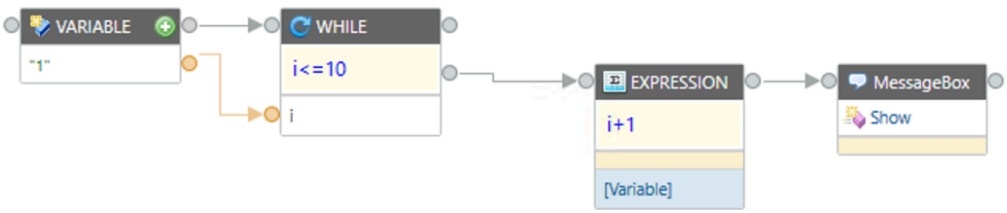
6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Example: While component

Drag Variable component before the While component. Add Expression component and MessageBox components after the While component. In the Variable component, enter `1`. In the Expression component, enter `i+1`. Set a Breakpoint at the Expression component. In the While component, enter `i<=10`.

When you run this automation, the value 1 is incremented to 2 and shows in the output, MessageBox, as 2. When you select **Move next** on the Design tab, the value is incremented until 11. Since the condition matches at this point, i<=10, the loop ends and automation is ended.

While component



Properties of the Loops components

Learn about the properties of the Loops components in RPA Desktop Design Studio.

Properties of the Loops components

Property	Description
Search	Option to enable a search for a property.
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Message	Custom message for the user.
Enable Timeout	Component times out after the specified time period.
Timeout	Custom time in seconds before the component times out. The default time is 60 seconds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the Loops components (continued)

Property	Description
Delay for each execution (Seconds)	Custom delay in seconds before execution of each item in the object.
Delay for each Execution	Waiting time, in seconds, for each step performed until the ForLoop ends.
Increment By	Number, which increments, in the From and To boxes in the component.

RPA Hub

The components under RPA Hub enable interactions with the RPA Hub and ServiceNow platforms. The robots designed in RPA Desktop Design Studio can interact with various ServiceNow platform-related features. You can find components to do the same under this category.

Common

The common components enable you to connect to a RPA Hub instance and impersonate a robot under a bot process.

Use the GetProcessJobSysID component

Retrieves the process job SysID of a process job record when an automation gets executed by a robot. By using the GetProcessJobSysID component in the RPA Desktop Design Studio application, you can identify when the robot is in a free state to execute a process or you can identify the state of the process job.

Before you begin

Role required: none

About this task

If a robot is working on an automation, a process job record for the execution is created in RPA Hub. The robot is then moved to the Busy state. For more information on the different states of a robot, see Robot states form. If you try to execute another automation in the Busy state against this robot, the automation doesn't execute and a process job record is created in the Skipped state. Use the process job SysID to identify when the robot is free and to assign the skipped process jobs to the robot for execution.

The process job SysID can be a passed as an input parameter to a subflow when the subflow is used to check the completion of a process job. When the process job is completed, you can start a new process on the same robot.

Important:

You can't retrieve the process job SysID by running the GetProcessJobSysID component from RPA Desktop Design Studio. The component can retrieve the process job SysID only during the execution of an automation by a robot. If you run the component from RPA Desktop Design Studio, an error is displayed.

Procedure

1. In the Toolbox pane, navigate to **RPA Hub** > **Common**.
2. Drag the **GetProcessJobSysID** component to the Design surface to add it as part of your automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Connect the data and control ports of the GetProcessJobSysID component to the other components as described in the following table.

Ports for GetProcessJobSysID component

Port name	Port type	Port description
SysID	Data out	Process job system ID of the execution when the automation gets executed by a robot in a Windows machine. Returns a string value.
Control In	Not applicable	Connects to the Control Out port of one or more components.
Control Out	Not applicable	Connects to the Control In port of another component or the default end component.

4. **Optional:** To test the component, right-click the component and select **Run From Here**. You can also run the automation by selecting **Run** from the **Design** tab.

Use the GracefulStop component

Verify that an automation from RPA Hub doesn't stop abruptly by using the GracefulStop component in RPA Desktop Design Studio. With this component, you can define a secure termination point within an automation process and automate housekeeping activities such as closing in-use applications or performing clean-up operations.

Before you begin

Make sure that you analyze the automation for scenarios where you can stop the automation gracefully and perform the clean-up tasks such as closing in-use applications.

Role required: None

About this task

Previously, when you selected the **Stop Process** button on a bot process in RPA Hub, the robots exited the automation abruptly. This process may have caused data inconsistencies. You can now exit the automation smoothly by using the GracefulStop component. For more information on how the GracefuStop component works for an automation in RPA Hub, see Using Graceful Stop functionality in RPA Hub.

Note:
The GracefulStop component is available only for unattended automations.

Procedure

1. In the Toolbox pane, navigate to **RPA hub** > **Common**.
2. Drag the GracefulStop component to the Design surface to add it as part of your automation.
3. Connect the component to the sequence that stops the automation gracefully by using the Control-In port.
4. Use the Return data port to connect to the steps that the user performs to initiate a graceful stop from RPA Hub.
   For example, let's consider a scenario where automation copies the employee details from a Microsoft Excel sheet to an Oracle application. By using the Return data port, the current transaction completes and successfully terminates the automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Make sure that the GracefulStop component meets the following conditions:

- The Control-In port must have a connection.
- The Return data port must have a connection or it must be mapped to a variable.

The Graceful stop option is available in RPA Hub to only those automations that satisfy these conditions.

When you use the GracefulStop component from RPA Desktop Design Studio, the component returns a false value. By selecting the GracefulStop toggle for the **Stop process** option in a bot process in RPA Hub, the component returns a true value. You can then stop the automation. If the automation path leads to a safe termination point, the automation is gracefully exited. For more information about stopping a bot process in RPA Hub, see Stop an unattended bot process in RPA Hub.

What to do next

Publish the automation project. For more information on how to publish an automation project, see Publish an automation project in RPA Desktop Design Studio.

Properties of the Common components

Learn about the properties of the Common components in RPA Desktop Design Studio.

Properties of the Common components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Credentials

The Credentials components retrieve or update the login credentials in the RPA Hub applications.

Use the GetApplicationCredential component

When login credentials for an RPA Hub application are already set in RPA Hub, retrieve the credentials by using the GetApplicationCredential component.

Before you begin

In RPA Desktop Design Studio, assign your automation to a bot process by selecting **Assign bot process** option from the **Design** tab. For more information, see Assign bot process to an automation project.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The GetApplicationCredential component can be used when the automation involves an application that requires user authentication. When a user name and password for the application are stored in RPA Hub, GetApplicationCredential retrieves them.

You can configure the properties for the GetApplicationCredential component. For more information about these properties, see Properties of the Credentials components.

Procedure

1. In the Toolbox pane, navigate to **RPA Hub** > **Credentials**.
2. Drag the GetApplicationCredential component to the Design surface.
3. Confirm the configuration of the component's input fields.
   For more information, see Configure port properties.
4. Connect the data and control ports of the GetApplicationCredential component to the corresponding ports of the other components as described in the following table.

Port	Description	Port type	Data type	Required
Name	Receives the name of the business application that is associated with the bot process	Data In	String	Yes
UserName	Returns the user name that is needed to log in to the business application	Data Out	String	Yes
Password	Returns the password needed to log in to the business application	Data Out	SecureString	Yes

5. To test the component, on the **Design** tab, select **Run**.

Use the SetApplicationCredential component

Set or update the login credentials in RPA Hub applications by using the SetApplicationCredential component.

Before you begin

In RPA Desktop Design Studio, assign your automation to a bot process by selecting **Assign bot process** option from the **Design** tab. For more information, see Assign bot process to an automation project.

Role required: none

About this task

The SetApplicationCredential component can be used when the automation involves an application that requires the login credentials to be periodically updated, or when the login

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

credentials must be changed for any other reason. This component updates the credentials in RPA Hub.

You can configure the properties for the SetApplicationCredential component. For more information about these properties, see Properties of the Credentials components.

If the application credential record has the **External Credential** check box enabled, then this SetApplicationCredential component does not set the credentials and displays an error. For more information about the application credential settings, see Create an application credential in RPA Hub.

Procedure

1. In the Toolbox pane, navigate to **RPA Hub** > **Credentials**.
2. Drag the SetApplicationCredential component to the Design surface.
3. Confirm the configuration of the component's input fields.
   For more information, see Configure port properties.
4. Connect the data and control ports of the SetApplicationCredential component to the corresponding ports of the other components as described in the following table.

Port	Description	Port type	Data type	Required
Name	Receives the name of the business application that is associated with the bot process	Data In	String	Yes
Password	Receives the password that is needed to log in to the business application	Data In	String	Yes
Return	Returns True if the credentials are set successfully or False if setting the credentials failed	Data Out	Boolean	Yes

5. To test the component, on the **Design** tab, select **Run**.

Properties of the Credentials components

To set the properties of a Credentials component, double-click a component and enter the values in the Properties pane.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the Credentials components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Process Parameters

The Process parameters components enable you to get or update the values of the process parameters you had set for bot processes in the RPA Hub.

Use the GetProcessParameter component

Get the value of a specific process parameter you had set for a bot process in RPA Hub with the GetProcessParameter component in the RPA Desktop Design Studio.

Before you begin

Set at least one process parameter as part of a bot process on the RPA Hub. See Create a process parameter within a bot process in RPA Hub.

Assign the automation to the bot process by using the **Assign bot process** option in the Toolbar of RPA Desktop Design Studio . You must set the same bot process and robot associated with the process parameter.

Role required: none

About this task

You can configure the properties for the GetProcessParameter component. For more information about these properties, see Properties of the Process Parameters components.

Procedure

1. In the Toolbox pane, navigate to **RPA Hub** > **Process Parameters**.
2. Drag the GetProcessParameter component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the GetProcessParameter component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Name)	Takes the name of the process parameter you had set as part of the bot process on RPA Hub from a previously executed component.	Yes
Data Out (Value)	Returns the value of the process parameter	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	and passes to the next component.	
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetProcessParameters component

Get the values of a process parameter you had set for a bot process in RPA Hub with the GetProcessParameters component in the RPA Desktop Design Studio. The component returns both the individual values of the parameters and all values as an object.

Before you begin

Set at least two process parameters as part of a bot process on the RPA Hub. See Create a process parameter within a bot process in RPA Hub.

Assign the automation to the bot process by using the **Assign bot process** option from the **Design** tab of RPA Desktop Design Studio. You must set the same bot process and robot associated with the process parameter. For more information, see Assign bot process to an automation project.

Role required: none

About this task

You can configure the properties for the GetProcessParameters component. For more information about these properties, see Properties of the Process Parameters components.

Procedure

1. In the Toolbox pane, navigate to **RPA Hub** > **Process Parameters**.
2. Drag the GetProcessParameters component to the Design surface.
3. Click the component settings icon ( ).
4. Click the add key icon ( ).
5. Enter the name of one of the process parameters.
   A Data In port is created.
6. **Optional:** Update the process parameter data type.
7. Repeat the steps to add more parameters.
8. Click **OK**.
9. Connect the data and control ports of the GetProcessParameters component to the corresponding ports of other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (Parameter)	Returns the value of an individual process parameter	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	and passes to the next component.	
Data Out (Object)	Returns the values of process parameters you had set in the component as an object and passes to the next component.	Yes
Control In	Connect to the Control Out port of one or more components.	Yes
Control Out	Connect to the Control In port of another component or the default end component.	Yes

10. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SetProcessParameter component

Update the value of an existing process parameter you had set for a bot process in the RPA Hub with the SetProcessParameter component in the RPA Desktop Design Studio.

Before you begin

Set at least one process parameter as part of a bot process on the RPA Hub. See Create a process parameter within a bot process in RPA Hub.

Assign the automation to the bot process by using the **Assign bot process** option from the **Design** tab of RPA Desktop Design Studio. You must set the same bot process and robot associated with the process parameter. For more information, see Assign bot process to an automation project.

Role required: none

About this task

You can configure the properties for the SetProcessParameter component. For more information about these properties, see Properties of the Process Parameters components.

Procedure

1. In the Toolbox, navigate to **RPA Hub** > **Process Parameters**.
2. Drag the SetProcessParameter component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the SetProcessParameter component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Name)	Takes the name of the process parameter you had set as part of the bot process on RPA Hub from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Value)	Takes the new value of the process parameter you had set as part of the bot process on RPA Hub from a previously executed component.	Yes
Data Out	Returns the Boolean response to whether the process parameter value was updated and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Process Parameters components

Learn about the properties of the Process Parameters components in RPA Desktop Design Studio.

Properties of the Process Parameters components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Queue

The Queue connector enables you to create and manage work items on a queue created in the RPA Hub.

The Queue connector provides multiple methods to create and manage work items on a queue created in the RPA Hub. These methods can create, update, pick, or get work items from the specified queue in the RPA Hub.

After you create a queue in the RPA Hub and assign a bot process to it, you must associate the Queue connector with the queue name. Then, assign the bot process to the automation project by using the **Assign bot process** option from the **Design** tab of RPA Desktop Design Studio to access the work items. For more information, see Assign bot process to an automation project.

To create a queue, see Create a queue in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To assign a bot process to a queue, see Assign a bot process to a queue from Queues menu.

You must first use, configure, and then expose the methods in the Queue connector to use its methods.

- To use the Queue connector, see Use a connector in RPA Desktop Design Studio.
- To expose the methods, see Use connector method.
- To use the methods, see Use a component in RPA Desktop Design Studio.

Queue connector methods

The Queue connector methods enable you to create and manage work items for queues in the RPA Hub.

Prerequisites

1. Assign the bot process to the automation project by using the **Assign bot process** option from the **Design** tab of RPA Desktop Design Studio to access the work items. For more information, see Assign bot process to an automation project.
2. Set the QueueName property by doing the following steps:
   a. In the RPA Desktop Design Studio, navigate to **Toolbox** > **RPA Hub** > **Queue**.
   b. Drag the Queue connector under Global Objects in the Project Explorer.
   c. Double-click the Queue connector.
   d. Under the Properties pane, in the QueueName property, enter the name of the Queue.

> **Note:**
> The name of the Queue must be the same as that defined in RPA Hub.

CreateJSONWorkItem

Creates a work item for the queue in the JSON format.

Input

Name

Priority

Output

WorkItemId

IsNameExists

To create the key-value pairs in a JSON object, do the following actions:

1. On the CreateJSONWorkItem method bar, click the method settings icon ( ).
2. Enter the criteria as given in the table.

CREATE ITEM CONFIGURATION

Field	Description
CONFIGURATION	
INPUT FIELDS	
Type	The type of the work item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, for an accounting system queue, savings and current are types of accounts. To configure the input field, see Configure port properties.
Stage	Updates the stage of the work item. Custom field to maintain different stages of the transaction.
SLA	Service Level Agreement (SLA) of the work item completion.
JSON PROPERTIES	
JSON PATH NOTATIONS	
Name	Key-value pair (JSON content) for the request content. To add a key, do the following: **a.** Click the add key icon ( ). **b.** Enter the key name in the field. **c.** To add more keys, repeat the previous steps. **d.** To pass the value to these fields, see Configure port properties.
Sensitive	Sensitive content that is passed when the work item is created. Select this option as sensitive, then the data is encrypted and stored in the **Sensitive Request Content** field in the new work item in RPA Hub. For more information about the work item form, see Work item form in RPA Hub. With this functionality, you can pass sensitive information through queues. For example, if you want customer data to be encrypted in the queue, you must use the **Sensitive** field to store customer details such as credit card number, address, and so on.

3. Click **OK**.

CreateStringWorkItem

Creates a work item in a queue in the RPA Hub by accepting a string.

Input

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RequestContent

Name

Output

WorkItemId

IsNameExists

To specify additional criteria for creating string work items, do the following steps.

1. On the CreateStringWorkItem method bar, click the method settings icon ( ).
2. Enter the criteria as given in the table.

CREATE ITEM CONFIGURATION

Field	Description
INPUT FIELDS	
SensitiveRequestContent	Stores sensitive content in encrypted format in the new work item. To configure the input field, see Configure port properties. With this functionality, you can pass sensitive information through queues. For example, if you want customer data to be encrypted in the queue, you must use the **SensitiveRequestContent** field to store customer details such as credit card number, address, and so on.
Stage	Updates the stage of the work item. Custom field to maintain different stages of the transaction.
Type	The type of the work item. For example, for an accounting system queue, savings and current are types of accounts. To configure the input field, see Configure port properties.
SLA	Service Level Agreement (SLA) of the work item completion.

3. Click **OK**.

GetWorkItems

Returns the count and the details of the work items created under the queue based on the criteria you specify. The method provides a default criterion already but you can specify additional criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input

Limit

Output

TotalCount

To specify additional criteria for identifying and getting work items, do the following steps.

1. Click the method settings icon ( ).
2. Configure the filters, as required. No filter is mandatory.

WORKITEM CONFIGURATION

Field	Description
INPUT FILTERS	
Name	Name of the work item. You can specify one of the following filters: ○ **Equals**: Name of the work item is exactly equal to the criteria you specify. ○ **Contains**: Name of the work item contains characters you specify. ○ **StartsWith**: The name of the work item starts with the characters you specify. ○ **EndsWith**: The name of the work item starts with the characters you specify.
Type	Type of the work item in string format. You can specify one of the following filters: ○ **Equals**: Type of the work item is exactly equal to the criteria you specify. ○ **Contains**: Type of the work item contains characters you specify. ○ **StartsWith**: The type of the work item starts with the characters you specify. ○ **EndsWith**: The type of the work item starts with the characters you specify.
Status	Status of the work item.
Stage	Updates the stage of the work item. Custom field to maintain different stages of the transaction.
Priority	Priority of execution: ○ **Critical** ○ **High** ○ **Medium** ○ **Low**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The assigned robot executes the bot process as per the defined priority in the work queue. The default priority is always **High**.
DateType	Date type of the work item. If you provide inputs to this field, you must also provide inputs to the **FromData** and **ToDate** fields also.
FromDate	If the method is picking work items within a date range, starting date in the range.
ToDate	If the method is picking work items within a date range, ending date in the range.
Offset	Number of work items that will be retrieved after the set limit. For example, if the limit is 20, the next picked work item starts from 21.
OUT FIELDS	
OutRecords	Returns the details of the work items in an object form.

3. Click **OK**.

Note:
A Data In port is created with each field you configure.

PickWorkItem

Enables a robot to pick a work item based on the given criteria. You can also configure additional criteria for the work item to be picked.

queryConditions included in the PickWorkItem component are considered for calculating the number of robots required to complete the work allocated, if the bot process is enabled with robot pool. For more information about calculating the number of robots, see Calculate the number of robots in RPA Hub. For more information about robot pool concepts, see Robot pool in RPA Hub.

Input

Priority

Output

WorkItemId

RequestContent

To specify additional criteria for picking work items, do the following steps.

1. Click the method settings icon ( ).
2. Enter the criteria as given in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PICK ITEM CONFIGURATION

Field	Description
CONFIGURATION	
INPUT FILTERS	
Name	Name of the work item based on the following filters. ○ **Equals**: Name of the work item is exactly equal to the criteria you specify. ○ **Contains**: Name of the work item contains characters you specify. ○ **StartsWith**: The name of the work item starts with the characters you specify. ○ **EndsWith**: The name of the work item starts with the characters you specify. Selection exposes a Data In port.
Type	Type of the work item based on the following filters. ○ **Equals**: Type of the work item is exactly equal to the criteria you specify. ○ **Contains**: Type of the work item contains characters you specify. ○ **StartsWith**: The type of the work item starts with the characters you specify. ○ **EndsWith**: The type of the work item starts with the characters you specify. Selection exposes a Data In port.
Stage	Stage of the work item work item based on the following filters. ○ **Equals**: Stage of the work item is exactly equal to the criteria you specify. ○ **Contains**: Stage of the work item contains characters you specify. ○ **StartsWith**: Stage of the work item starts with the characters you specify. ○ **EndsWith**: Stage of the work item starts with the characters you specify. Selection exposes a Data In port.
Status	Status of the work item for the robot to select.
OUT FIELDS	
Name	Data out port that returns the name of the work item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	Data out port that returns the type of the work item.
Remarks	Data out port that returns remarks on the work item.
Stage	Data out port that returns the stage of the work item.
RequestContent	String content for the work item. Picks the stored content when the work item is created.
SensitiveRequestContent	The sensitive content from this field is picked, decrypted and passed to the RPA Desktop Design Studio or robots.
JSON PROPERTIES	
JSON PATH NOTATIONS	Data out port that returns the JSON path notation of a work item. Click the add key icon ( ) to add a key name. JSON can be passed in both **RequestContent** and **SensitiveRequestContent** fields. While picking work item, the JSON data is picked from a work item. For example, if a key-value pair "City: Mumbai" (City is key and Mumbai is value) is in the **RequestContent** field and "City: Delhi" (City is key and Delhi is value) is created in **SensitiveRequestContent** field. When you try to pick the same work item, since the key is same for both fields, the **SensitiveRequestContent** field is given precedence and that output is retrieved from this field.

3. Click **OK**.

ReleaseWorkItem

Releases a work item that has been accepted and executed by a bot. You must execute PickWorkItem method before executing this method.

Input

WorkItemId

Output

Return

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UpdateWorkItem

Enables a robot to update a work item after picking it with the PickWorkItem method based on specified criteria. You can configure additional criteria for the work item to be updated. You must execute PickWorkItem method before executing this method.

Inputs

WorkItemId

RequestContent

ReleaseMode

Priority

Status

Exception Type

To specify additional criteria for updating work items, do the following steps.

1. Click the method settings icon ( ).
2. Enter the criteria as given in the table.

UPDATE ITEM CONFIGURATION

Field	Description
CONFIGURATION	
INPUT FIELDS	
Stage	Updates the stage of the work item. Custom field to maintain different stages of the transaction.
DeferredTill	Option to specify a time duration during which the same work item will not be picked. For example, 5 minutes.
Name	Name of the work item.
Type	The type of the work item. For example, for an accounting system queue, savings and current are types of accounts. To configure the input field, see Configure port properties.
Remarks	Supporting remarks on the work item.
SLA	Service Level Agreement (SLA) of the work item completion.
ResponseContent	String content for the work item. Updates the stored content of a work item.
SensitiveRequestContent	Updates the sensitive content of a work item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
JSON PROPERTIES	
JSON PATH NOTATIONS	
Name	Key-value pair (JSON content) for the request content. To add a key, do the following: **a.** Click the add key icon ( ). **b.** Enter the key name in the field. **c.** To add more keys, repeat the previous steps. **d.** To pass the value to these fields, see Configure port properties.
Sensitive	Sensitive content is updated for a work item. With this functionality, you can pass sensitive information through queues. For example, if you want customer data to be encrypted in the queue, you must use the **Sensitive** field to store customer details such as credit card number, address, and so on. When you add a key-value pair "City: Mumbai" in **SensitiveRequestContent** field and add another key-value pair "Country: India" in JSON Path Notation and the UpdateWorkItem is executed. Then, in the **SensitiveRequestContent** field, the output is combined to "City: Mumbai" and "Country: India".

Parameters for the Queue connector methods

Learn about the various parameters for the Queue connector methods in RPA Desktop Design Studio.

Parameters for the Queue connector methods

Parameter name	Description
Name	Name of the work item. The name is recorded under the Name column in the Work Items tab in the RPA Hub. By default, all queue item names are unique. However, you can create duplicates by clearing the **Is Work Item Name Unique** check box on the Queue form. For more information, see, Queue form in RPA Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters for the Queue connector methods (continued)

Parameter name	Description
	After creation, you can find the work item under the **Work Items** tab of the queue, in RPA Hub.
Type	The type of the work item. For example, for an accounting system queue, savings and current are types of accounts. To configure the input field, see Configure port properties.
Priority	Priority of execution: • **Critical** • **High** • **Medium** • **Low** The assigned robot executes the bot process as per the defined priority in the work queue. The default priority is always **High**.
Stage	Stage of the work item. Custom field to maintain different stages of the transaction.
SLA	Service Level Agreement (SLA) of the work item completion.
WorkItemId	Unique work item ID generated by the system.
IsNameExists	Boolean response to whether a duplicate work item exists.
RequestContent	String content for the work item.
Limit	The maximum number of items the method will get. By default, the method gets 20 work items which you can increase up to 100.
TotalCount	Total count of the work items retrieved from the queue.
Status	Status of the work item for the robot to select. By default, the status of the work item is always **Pending**.
ReleaseMode	Whether the work item is released or still locked for the robot after execution. Types of release modes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters for the Queue connector methods (continued)

Parameter name	Description
	• Release • Lock
Return	Boolean response on whether the work item is released.
Exception Type	Type of the exception: • **Application** - For example, if an issue persists with an associated application such as SAP. • **Business** - For example, if an issue requires a manual intervention to fix it. The auto retry functionality retries the work items based on the exception type. If the **Exception Type** field is **Application**, then the work item is auto retried.

Enter inputs for parameters

To enter inputs for the parameters, see Configure port properties.

Shared Parameters

You can set parameters and their values that are shared across bot processes in the RPA Hub. The Shared Parameters components enable you to get the values of one or more such parameters.

Use the GetSharedParameters component

Get the values of multiple shared parameters set up for multiple bot processes on the RPA Hub using the GetSharedParameters component.

Before you begin

Set multiple shared parameters and associate multiple bot processes on the RPA Hub. For more information, see Create a shared parameter in RPA Hub and Assign a bot process to a shared parameter.

Assign the automation to the bot process by using the **Assign bot process** option in the **Design** tab of RPA Desktop Design Studio. For more information, see Assign bot process to an automation project.

Role required: none

About this task

You can configure the properties for the GetSharedParameters component. For more information about these properties, see Properties of the shared parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **RPA Hub** > **Shared Parameters**.
2. Drag the GetSharedParameters component to the Design surface.
3. Click the component settings icon ( ).
4. Click the add key icon ( ).
5. Enter the shared parameter name.
6. **Optional:** Update the shared parameter data type.
7. Repeat the steps to set more shared parameters.
8. Click **OK**.
9. Connect the data and control ports of the GetSharedParameters component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (Shared Parameter)	Returns the value of the shared parameter and passes to the next component.	No. Connecting the port is optional. To view the output, right-click the **Return** field and click **Preview Data** .
Data In (Return)	Returns the values of multiple shared parameters as an object and passes to the next component.	Yes To view the output, right-click the **Return** field and click **Preview Data**
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	Yes

10. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SetSharedParameter component

Update the value of a specific shared parameter that you had set for multiple bot processes on the RPA Hub by using the SetSharedParameter component in the RPA Desktop Design Studio.

Before you begin

Set at least one shared parameter and associate multiple bot processes on the RPA Hub. For more information, see Create a shared parameter in RPA Hub and Assign a bot process to a shared parameter.

Assign the automation to the bot process by using the **Assign bot process** option in the **Design** tab of RPA Desktop Design Studio. For more information, see Assign bot process to an automation project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: none

About this task

You can configure the properties for the SetSharedParameter component. For more information about these properties, see Properties of the shared parameters.

Procedure

1. In the Toolbox pane, navigate to **RPA Hub** > **Shared Parameters**.
2. Drag the SetSharedParameter component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the SetSharedParameter component to the corresponding ports of the other components.

Port type	Purpose of connection	Mandatory?
Data In (Name)	Takes the name of the shared parameter that you had set for bot processes in the RPA Hub from a previously executed component.	Yes. To pass the variable name, double-click the **Name** field and enter the variable name.
Data In (Value)	Takes the new value of the shared parameter that you had set for bot processes in the RPA Hub from a previously executed component.	Yes. To pass the variable value, double-click the **Value** field and enter the value.
Data Out (Return)	Returns the Boolean response to whether the existing shared parameter value was replaced and passes to the next component.	Yes. To view the output, right-click the **Return** field and select **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the shared parameters

Learn about the properties of the shared parameters in RPA Desktop Design Studio.

Properties of shared parameters

Property	Description
Delay Before Execution	The number of seconds to pause before running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of shared parameters (continued)

Property	Description
Delay After Execution	The number of seconds to pause after running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Use the Log component

Capture custom messages as automation logs by using the Log component in an automation in RPA Desktop Design Studio. With this component, you can write custom messages as automation logs and view them from a unified space so that you can track the progress of an automation.

Before you begin

Make sure that you enable the **Track Execution Automation Logs** option from a bot process. For more information on how to enable Track Execution Logs, see Bot Process form in RPA Hub.

Role required: none

About this task

Previously, the messages from the Log component were updated to the product error log files in the machine where the automation was executed.

Starting from the Vancouver release, the log messages from the automations that execute on the RPA Desktop Design Studio, the attended robots, and the unattended robots are written to the **Message** field in the Automation logs table of a process job in RPA Hub.

You aren't required to upgrade the plugin version of the older automations. For more information about the list components that are upgraded with RPA Desktop Design Studio, Attended Robot, and Unattended Robot, see List of components compatible with latest version.

Procedure

1. In the Toolbox pane, navigate to **RPA Hub** > **Log**.
2. Drag the **Log** component to the Design surface.
3. Configure the **Message** (string) field by entering a message or capturing the output string from a previous component or method.
   For example, if the automation is successful, you can enter the string *Success* or capture the string result from a previously executed component or method.
4. **Optional:** If you want to classify the message, configure the **Log level** property from the Properties explorer.
   You can classify the message as one of the following types:
   - Info
   - Warning
   - Error

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Exception

> **Important:**
> In the previous version of RPA Desktop Design Studio, the **Error image** and **Verbose** options were available. If you open an older automation project in the Vancouver release of RPA Desktop Design Studio, these options are converted to the type **Error**.

For more information on how to configure the remaining properties of the Log component, see Properties of the General components.

5. **Optional:** To test the component, under the **DESIGN** tab, select **Run**.

> **Note:**
> When you run the Log component from RPA Desktop Design Studio, no message updates to RPA Hub because no process job is associated to it.

Security

The Security components in the RPA Desktop Design Studio perform data security operations such as Microsoft Data Protection API and data encryption.

DPAPI

The DPAPI components in the RPA Desktop Design Studio secure data by applying the Microsoft DPAPI.

Use the Protect component

Encrypt a string with the DPAPI algorithm from the Microsoft by using the Protect component in RPA Desktop Design Studio. The component returns the encrypted form of the data you provide.

Before you begin
Role required: none

About this task
You can configure the properties for the Protect component. For more information about these properties, see Properties of the DPAPI components

Procedure

1. In the Toolbox pane, navigate to **Security** > **DPAPI**.
2. Drag the Protect component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Protect component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (ClearText)	Passes the string that you want to encrypt from a previously executed component.	Yes
Data In (Optional Entropy)	The optional entropy provides additional security to the encrypted data from risks that make applications running under the same	No. Connecting the port is optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	user vulnerable. Passes the entropy from a previously executed component.	
Data In (Scope)	Passes the scope of protection from a previously executed component.	Yes
Data Out (String)	Returns the encrypted string.	No. Connecting the port is optional. To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from a from a previously executed component.	Yes
Control Out	Passes the control to the next component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ProtectData component

Encrypt and save string data to a file with the ProtectData component in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the ProtectData component. For more information about these properties, see Properties of the DPAPI components.

Procedure

1. In the Toolbox pane, navigate to **Security** > **DPAPI**.
2. Drag the ProtectData component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ProtectData component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Filename)	Passes the name of the file to which the encrypted string is saved from a previously executed component.	Yes
Data In (Data)	Passes the data to be encrypted from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Optional Entropy)	The optional entropy provides additional security to the encrypted data from risks that make applications running under the same user vulnerable. Passes the entropy from a previously executed component.	No. Connecting the port is optional.
Data In (Scope)	Passes the scope of protection from a previously executed component.	Yes
Data Out (String)	Returns the encrypted string.	No. Connecting the port is optional. To execute the component, right-click the ProtectData component bar and click **Run From Here**. To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from a from a previously executed component.	Yes
Control Out	Passes the control to the next component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Unprotect component

Decrypt an encrypted string using the Unprotect component in the RPA Desktop Design Studio. You can use the component on strings encrypted by the ProtectData or any other application as part of a Workflow. The Unprotect component returns the decrypted string or data.

Before you begin
Role required: none

About this task
You can configure the properties for the Unprotect component. For more information about these properties, see Properties of the DPAPI components.

Procedure

1. In the Toolbox pane, navigate to **Security** > **DPAPI**.
2. Drag the Unprotect component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Unprotect component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (EncryptedText)	Passes the encrypted string from a previously executed component.	Yes
Data In (Optional Entropy)	If the string is protected by entropy, you need to enter the entropy details to enable the component to access the data. Passes the entropy details from a previously executed component.	No. Connecting the port is optional.
Data In (Scope)	Passes the scope of protection from a previously executed component.	Yes
Data Out (String)	Returns the decrypted string.	Yes To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from a from a previously executed component.	Yes
Control Out	Passes the control to the next component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the UnProtectData component

Decrypt an encrypted string that is saved in a file with the UnProtectData component in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the UnProtectData component. For more information about these properties, see Properties of the DPAPI components.

Procedure

1. In the Toolbox pane, navigate to **Security** > **DPAPI**.
2. Drag the UnProtectData component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the UnprotectData component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Filename)	Passes the name of the file that saves the encrypted string from a previously executed component.	Yes
Data In (Optional Entropy)	If the string is protected by entropy, you need to enter the entropy details to enable the component to access the data. Passes the entropy details from a previously executed component.	No. Connecting the port is optional.
Data In (Scope)	Passes the scope of protection from a previously executed component.	Yes
Data Out (String)	Returns the decrypted string.	No. Connecting the port is optional. To execute the component, right-click the ProtectData component bar and click **Run From Here**. To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from a from a previously executed component.	Yes
Control Out	Passes the control to the next component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the DPAPI components

Learn about the properties of the DPAPI components in RPA Desktop Design Studio.

Properties of DPAPI components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of DPAPI components (continued)

Property	Description
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Encryption components

The RPA Desktop Design Studio secures data through encryption, file hashes, and encoding. This feature of RPA Desktop Design Studio can be the part of a workflow.

Use the DecryptString component

Decrypt an encrypted string by providing the encryption key using the Decrypt String component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Decrypt String component. For more information about these properties, see Properties of the Encryption components.

Procedure

1. In the Toolbox pane, navigate to **Security** > **Encryption**.
2. Drag the Decrypt String component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Decrypt String component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Passes the encrypted string that you want to decrypt from a previously executed component.	Yes
Data In (encryptionKey)	Passes the encryption key used to encrypt the string you want to decrypt from a previously executed component.	Yes
Data Out	Returns the decrypted string.	No. Connecting the port is optional. To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Passes the control to the next component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the EncryptString component

Encrypt a string by providing the encryption key with the EncryptString component in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Encrypt String component. For more information about these properties, see Properties of the Encryption components.

Procedure

1. In the Toolbox pane, navigate to **Security** > **Encryption**.
2. Drag the Encrypt String component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Encrypt String component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Passes the string that you want to encrypt from a previously executed component.	Yes
Data In (EncryptionKey)	Passes the encryption key from a previously executed component.	Yes
Data Out	Returns the encrypted string.	No. Connecting the port is optional. To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from a from a previously executed component.	Yes
Control Out	Passes the control to the next component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the GenerateFileHash component

Generate the file HashCode for any file using the GenerateFileHash component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Generate File Hash component. For more information about these properties, see Properties of the Encryption components.

Procedure

1. In the Toolbox pane, navigate to **Security** > **Encryption**.
2. Drag the Generate File Hash component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the Generate File Hash component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (FilePath)	Passes the path of the file for which the HashCode will be generated from a previously executed component.	Yes
Data Out	Returns the file HashCode and updated HashCodes for each update to the file.	No. Connecting this port is optional. To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from a previously executed component.	Yes
Control Out	Passes the control to the next component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SecureStringDecode component

Decode a secure string by using the SecureStringDecode component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Secure String Decode component. For more information about these properties, see Properties of the Encryption components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Security** > **Encryption**.
2. Drag the Secure String Decode component to the Design surface.
3. To configure the input field, see Configure port properties.
4. **Optional:** Connect the data and control ports of the SecureStringDecode component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (SecureString)	Passes the string that you want to decode from a previously executed component.	Yes
Data Out	Returns the decoded string.	Yes (Optional) To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from a previously executed component.	Yes
Control Out	Passes the control to the next component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SecureStringEncode component

Encode a string to secure it by using the Secure String Encode component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Secure String Encode component. For more information about these properties, see Properties of the Encryption components.

Procedure

1. In the Toolbox pane, navigate to **Security** > **Encryption**.
2. Drag the Secure String Encode component to the Design surface.
3. To configure the input field, see Configure port properties.
4. In the Secure String Encode component, enter the string that you want to encode in the **Text** field or pass the string through the Data In port.
5. Connect the data and control ports of the Secure String Encode component to the corresponding ports of the other components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Passes the string that you want to encode from a previously executed component.	Yes
Data Out	Returns the encoded, secure string.	Yes
Control In	Passes the control from a previously executed component.	Yes
Control Out	Passes the control to the next component.	No

6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Encryption components

Learn about the properties of the Encryption components in RPA Desktop Design Studio.

Properties of encryption components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

ServiceNow

The ServiceNow components enable you to interact with ServiceNow platform features such as the Flow Designer, manage attachments from table records, and trigger embedded task automations.

For more information about Embedded Task Automation, see Embedded Task Automation in RPA Hub.

Flow Designer components

The Flow Designer components let you invoke flows, subflows, and actions from Workflow Studio and use them as part of a workflow. You can also use these components to determine a flow's output or execution status.

Use the InvokeFlow component

Invoke or call a flow that is available in Workflow Studio by using the InvokeFlow component of RPA Desktop Design Studio. Generate the context ID of the flow and use the ID in other flow designer components to get the execution status and output.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

To understand more about flows in Workflow Studio, see Building flows.

Before you use any Flow Designer component, use the Connection Manager to make sure that you're connected to the instance. For more information about how to connect to an instance, Connect to an RPA Hub instance from RPA Desktop Design Studio.

Enable the client callable option on an RPA Hub flow or subflow. For more information, see Enable the client callable option on an RPA Hub flow or subflow.

Role required: fd_read role. For more information on this role, see User access to Workflow Studio flows.

About this task

The InvokeFlow component returns the context ID of a flow in Workflow Studio so you can use it in other components. For example, you can use the context ID to get the execution status or the output of a flow.

Add the InvokeFlow component to get the context ID of a flow so other Flow Designer components can check its status or obtain its output. To get the context ID of a subflow, use the InvokeSubFlow component.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Flow Designer**.
2. Drag the InvokeFlow component to the Design surface.
3. On the Design surface, select the Configure button of the InvokeFlow component to show the InvokeFlow dialog box.
4. In the **Flow name** field, enter a minimum of three characters to search and select Enter.

   A list of flows that start with the entered characters is shown from the connected ServiceNow instance.

   Important:
   You can view and select only those flows that have the application scope set to **All application scopes**. The application scope is set in the **Accessible From** field in your Workflow Studio instance. When the application scope of the flow is set as **This application scope only**, the flow isn't available in the drop-down list of the **Flow name** field.

5. Select the required flow from the search list.
6. Verify the input fields, and select **OK**.
7. **Optional:** Configure the properties of the InvokeFlow component.
   For more information, see Properties of the Flow Designer components.

   You can now connect the **Context ID** port to another Flow Designer component such as GetExecutionStatus or GetOutputs.
8. **Optional:** To test the component, in the **Design** tab, click **Run**.

Use the GetExecutionStatus component

Use the GetExecutionStatus component to determine the execution status of a flow or a subflow in Workflow Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

To understand more about flows in Workflow Studio, see Building flows.

Before you use any Flow Designer component, use the Connection Manager to make sure that you're connected to the instance. For more information about how to connect to an instance, see Connect to an RPA Hub instance from RPA Desktop Design Studio.

Role required: none

About this task

Before you use the GetOutputs component to get the output of a flow, you may want to check the flow's status. When a flow has executed successfully, the execution status is COMPLETE. When the execution status is other than COMPLETE, the GetOutputs component may not obtain a helpful result.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Flow Designer**.
2. Drag the GetExecutionStatus component to the Design surface.
3. **Optional:** Configure the component properties by using the Properties pane.
   For example, you can configure the component to include a timeout or a delay before the component executes. For more information about these properties, see Properties of the Flow Designer components.
4. Connect the data and control ports of the GetExecutionStatus component to the corresponding ports of other components as described in the following table.

Parameter	Description	Data port type	Data type	Required?
ContextID	Receives a context ID from the InvokeFlow, InvokeSubFlow, or InvokeAction component	Data In	String	Yes
Status	Returns the execution status and passes it to the next component	Data Out	String	Yes

   To view the execution status in RPA Desktop Design Studio, right-click the **Status** field and select **Preview Data**.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetOutputs component

Use the GetOutputs component to get the output of a flow or a subflow in Workflow Studio.

Before you begin

To understand more about flows in Workflow Studio, see Building flows.

Before you use any Flow Designer component, use the Connection Manager to make sure that you're connected to the instance. For more information about how to connect to an instance, see Connect to an RPA Hub instance from RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the GetExecutionStatus component to know the execution status of the flow or subflow. To use the component, see Use the GetExecutionStatus component.

Role required: none

About this task

There are many reasons why you might want to receive the output of a flow. For example, suppose you have an automation that includes an incident number, and you want to obtain the incident's description. You can use Workflow Studio to create a flow that takes the incident number as input and returns the description. Then, in RPA Desktop Design Studio, you can invoke the flow using the InvokeFlow component and send its context ID to the GetOutputs component to get the output, including the incident description.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Flow Designer**.
2. Drag the GetOutputs component to the Design surface.
3. **Optional:** Configure the component properties by using the Properties pane.
   For example, you can configure the component to include a timeout or a delay before the component executes. For more information about these properties, see Properties of the Flow Designer components.
4. Connect the data and control ports of the GetOutputs component to the corresponding ports of the other components as described in the following table.

GetOutputs - Ports

Port type	Purpose of connection	Mandatory?
Data In (Context ID)	Receives a context ID from the InvokeFlow, InvokeSubFlow, or InvokeAction component	Yes
Data Out (Return)	Returns the output of the flow, subflow, or action and passes it to the next component	Yes. To view the output, right-click the **Return** field and click **Preview Data**.
Control In	Passes the control from the previously executed component.	Yes
Control Out	Passes the control to the next component to be executed.	No. Connecting this port is optional.

   To view the output in RPA Desktop Design Studio, right-click the **Return** field and select **Preview Data**.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the InvokeSubFlow component

The InvokeSubFlow component returns the context ID of a subflow in Workflow Studio so you can use it in other components. For example, you can use the context ID to get the execution status or the output of a subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

To understand more about flows in Workflow Studio, see Building flows.

Before you use any Flow Designer component, use the Connection Manager to make sure that you're connected to the instance. For more information about how to connect to an instance, see Connect to an RPA Hub instance from RPA Desktop Design Studio.

Enable the client callable option on an RPA Hub flow or subflow. For more information, see Enable the client callable option on an RPA Hub flow or subflow.

Role required: fd_read role. For more information on this role, see User access to Workflow Studio flows.

About this task

Add the InvokeSubFlow component to get the context ID of a subflow so other Flow Designer components can check its status or obtain its output. To get the context ID of a flow, use the InvokeFlow component.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Flow Designer**.
2. Drag the InvokeSubFlow component to the Design surface.
3. On the Design surface, select the Configure button of the InvokeSubFlow component to show the InvokeSubFlow dialog box.
4. In the **Subflow name** field, enter a minimum of three characters to search and select Enter.

   A list of subflows that start with the entered characters is shown from the connected ServiceNow instance.

   Important:
   You can view and select only those subflows that have the application scope set to **All application scopes**. The application scope is set in the **Accessible From** field in your Workflow Studio instance. When the application scope of the subflow is set as **This application scope only**, the subflow isn't available in the drop-down list of the **Subflow name** field.

5. Select the required subflow from the search list.
6. Verify the input fields, and select **OK**.
7. **Optional:** Configure the properties of the InvokeSubFlow component.
   For more information, see Properties of the Flow Designer components.

   You can now connect the **Context ID** parameter with other Flow Designer components such as GetExecutionStatus or GetOutputs
8. **Optional:** To test the component, in the **Design** tab, select **Run**.

Use the InvokeAction component

The InvokeAction component returns the context ID of an action in Workflow Studio so you can use it in other components. For example, you can use the context ID to get the execution status or the output of an action.

Before you begin

To understand more about flows in Workflow Studio, see Building flows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you use any Flow Designer component, use the Connection Manager to make sure that you're connected to the instance. For more information about how to connect to an instance, see Connect to an RPA Hub instance from RPA Desktop Design Studio.

Enable the client callable option on an RPA Hub flow or subflow. For more information, see Enable the client callable option on an RPA Hub flow or subflow.

Role required: fd_read role. For more information on this role, see User access to Workflow Studio flows.

About this task

Add the InvokeAction component to get the context ID of an action so other Flow Designer components can check its status or obtain its output. To get the context ID of a flow or a subflow, use the InvokeFlow component or the InvokeSubFlow component.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Flow Designer**.
2. Drag the InvokeAction component to the Design surface.
3. On the Design surface, select the Configure button of the InvokeAction component to show the InvokeAction dialog box.
4. In the **Action name** field, enter a minimum of three characters to search and select Enter.

   A list of actions that start with the entered characters is shown from the connected ServiceNow instance.

   Important:
   You can view and select only those actions that have the application scope set to **All application scopes**. The application scope is set in the **Accessible From** field in your Workflow Studio instance. When the application scope of the action is set as **This application scope only**, the action isn't available in the drop-down list from the **Action name** field.

5. Select the required action from the search list.
6. Verify the input fields, and select **OK**.
7. **Optional:** Configure the properties of the InvokeSubFlow component.
   For more information, see Properties of the Flow Designer components.

   You can now connect the **Context ID** port to another Flow Designer component such as GetExecutionStatus or GetOutputs.
8. **Optional:** To test the component, in the **Design** tab, select **Run**.

Properties of the Flow Designer components

To set the properties of a Flow Designer component, double-click the component and enter the values in the Properties pane.

Properties of the Flow Designer components

Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the Flow Designer components (continued)

Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Attachments

The Attachment components enable you to upload or download attachments from table records in the RPA Hub and get the metadata of the attachments.

In the Attachment component, all file types supported by ServiceNow tables are included.

Use the DownloadAttachment component

Download the attachments from the ServiceNow table record to the local drive by using the DownloadAttachment component in the RPA Desktop Design Studio.

Before you begin

You must have access to the ServiceNow table record.

Role required: none

About this task

The maximum size of the attachments is 1024 MB.

You can configure the properties for the DownloadAttachment component. For more information about these properties, see Properties of the Attachment components.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Attachments**.
2. Drag the DownloadAttachment component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the DownloadAttachment component to the corresponding ports of the other components.

Port name	Purpose of connection	Data Port type	Data type
attachmentSysID	The sys ID of the record that has the attachment. You can pass this value from a previously executed component. You can get the sys ID of a record following these steps: **a.** Select the record in the connected ServiceNow instance and right-	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port name	Purpose of connection	Data Port type	Data type
	click the header bar. **b.** Select Copy URL. **c.** In the URL, you can find the sys ID after the parameter sys_id=. For example, 9d385017c611228701d22104cc95c371.		
folderPath	The path in the local drive where the attachment will be downloaded.	Data In	String
Overwrite	Returns a true or false value that indicates whether the file was successfully downloaded. If the download location already has a file with the same name, the operation fails.	Data In	Boolean
Return	Returns the details of the downloaded file as an object and passes it to another component.	Data Out	Boolean

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetAttachmentsMetadata component

Get the metadata of all attachments that are associated with a ServiceNow table record by using the GetAttachmentsMetadata component in the RPA Desktop Design Studio.

Before you begin

You must have access to the ServiceNow table that contains attachments.

Role required: none

About this task

The maximum size of the attachments is 1024 MB.

You can configure the properties for the GetAttachmentsMetadata component. For more information about these properties, see Properties of the Attachment components.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Attachments**.
2. Drag the GetAttachmentsMetadata component to the Design surface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetAttachmentsMetadata component to the corresponding ports of the other components.

Port name	Purpose of connection	Data Port type	Data type
SysID	The sys ID of the record that has the attachment. You can pass this value from a previously executed component. You can get the sys ID of a record following these steps: **a.** Select the record in the connected ServiceNow instance and right-click the header bar. **b.** Select Copy URL. **c.** In the URL, you can find the sys ID after the parameter sys_id=. For example, 9d385017c611228701d22104cc95c371.	Data In	String
tableName	The name of the table that has the record with the attachments. You can pass this value from a previously executed component.	Data In	String
Return	Returns the metadata of the attachments and passes to the next component.	Data Out	Object

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the UploadAttachment component

Attach documents to a table record in the RPA Hub by using the UploadAttachment component in the RPA Desktop Design Studio.

Before you begin

You must have access to the required ServiceNow table to upload attachments.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A table in the RPA Hub contains one or more records and each record provides certain information. Attachments can provide additional, useful information about the record. The maximum size of the attachments is 1024 MB.

You can configure the properties for the UploadAttachment component. For more information about these properties, see Properties of the Attachment components.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Attachments**.
2. Drag the UploadAttachment component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the UploadAttachment component to the corresponding ports of the other components.

Port name	Description	Data Port type	Data type
filePath	The path to the file that must be uploaded to the record from a previously executed component.	Data In	String
SysId	The sys ID of the record to upload the attachment to. You can also pass this value from a previously executed component. You can get the sys ID of a record following these steps: **a.** Select the record in the connected ServiceNow instance and right-click the header bar. **b.** Select Copy URL. **c.** In the URL, you can find the sys ID after the parameter sys_id=. For example, 9d385017c611228701d22104cc95c371.	Data In	String
tableName	Takes the table name that comprises the record from a previously executed component.	Data In	String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port name	Description	Data Port type	Data type
Return	Returns the Boolean response on whether the file was successfully uploaded and passes to the next component.	Data Out	Boolean

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Attachment components

Learn about the various properties of the Attachment components.

Properties of the Attachment components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Forms

The Forms components help you to trigger attended automations that are enabled with the Embedded Task Automation.

Ensure you are familiar with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Use the AttendedConfigurations component

When you use the AttendedConfigurations component, it shows a list of attended configurations associated to the selected same bot process. To select and give control out port for each configuration that routes the automation logic.

Before you begin

If you are running an automation from RPA Desktop Design Studio, then assign the automation to the bot process by using the **Assign bot process** option from the **Design** tab of RPA Desktop Design Studio. In the **Bot Process** field, ensure to select an attended bot process that is enabled with Embedded Task Automation. In the **Attended Config** field, ensure to select an associated attended configuration. In the **Record Context** field, ensure to enter the Sys ID or URL of the ServiceNow form record. For more information, see Assign bot process to an automation project.

Ensure you are familiar with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Role required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin, if you are running the automation from RPA Desktop Design Studio
- sn_rpa_fdn.rpa_assisted_user, if you are running the automation from the Attended Robot application.

About this task

The AttendedConfigurations component segregates the execution of the automations in a single automation project and calls the respective logic according to the action invoked.

If you are triggering the automation from the ServiceNow form's UI action (button) and it executes using the Attended Robot application, then the AttendedConfigurations component routes the automation flow from the associated attended configuration.

You can configure the properties for the AttendedConfigurations component. For more information about these properties, see Properties of the Forms components.

For example, if an automation requires two UI actions, create two attended configurations in RPA Hub, that are associated to the same bot process and table. Define the automation logics separately for these UI actions, under different activities.

Let's consider a currency price retrieval use case, where one automation is built with two automation logics for UI actions such as Get Prices and Update Price. These UI actions are associated to two attended configurations, Get Prices and Update Price. The attended configurations are associated to the same bot process and table. The following steps provide guidance of how to use the AttendedConfigurations component in this use case.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Forms**.
2. Drag the AttendedConfigurations component to the Design surface.
3. Click the component settings icon ( ).
4. Select one or more applicable attended configurations.

   In this example, select both the attended configurations (Get Prices and Update Price).

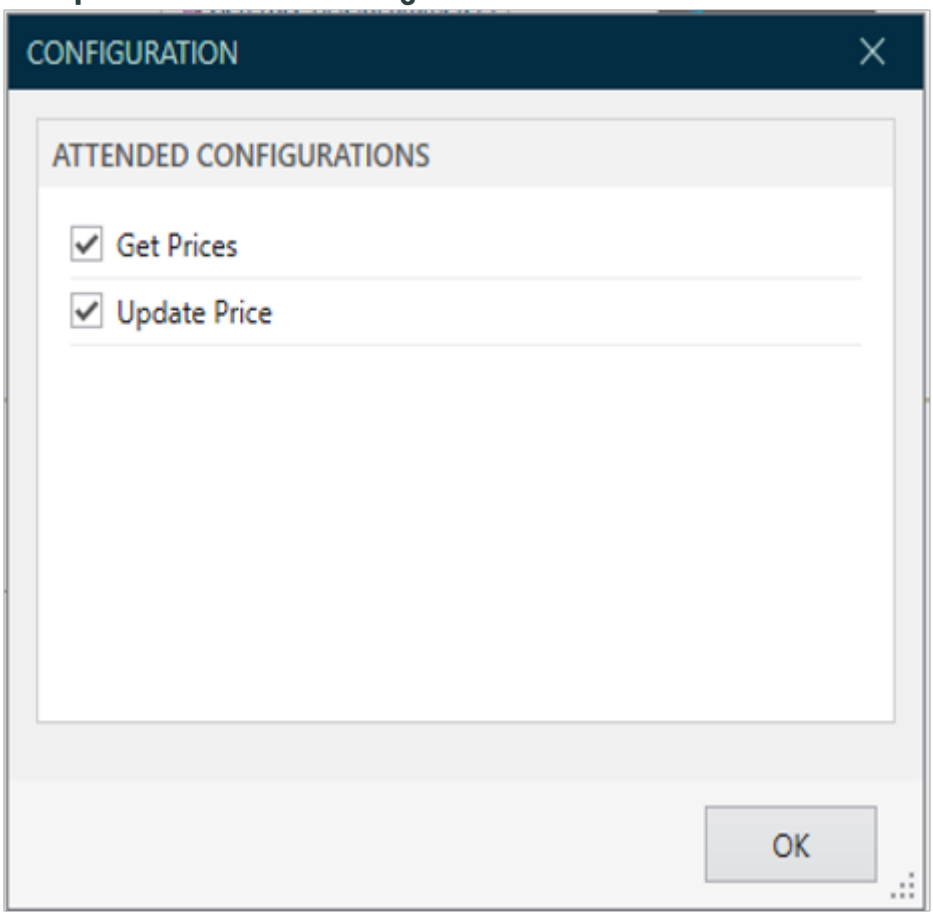
Example: Select attended configurations



5. Click **OK**.
   You will view more than one control out port.
6. Connect the data and control ports of the AttendedConfigurations component to the corresponding ports of other components as described in the following table.

   In this example, map the Get Prices Control Out port to the corresponding activity. Similarly, map the Update Price Control Out port to the corresponding activity. After you select the Get Prices UI action, the corresponding logic is executed. Similarly, after you select the Update Price UI action, the corresponding logic is executed.

Port type	Purpose of connection	Mandatory?
Control In	Connect to the Control Out port of one or more components.	Yes
Control Out	[Multiple] For each selected attended configuration, a control out is created. Connect to the Control In port of another component	No

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	or activity as per the required automation logic.	

7. **Optional:** To test the component, right-click the title bar of the component and select **Run From Here**.

Use the GetProcessFieldParameters component

Gets the values of the associated **Table** fields mapped to the process field parameter, that you had configured in an attended configuration record of a bot process. The component returns both the individual values of the parameters and all values as an object. This component reads the value of the associated **Table** field in the ServiceNow form record.

Before you begin

If you are running an automation from RPA Desktop Design Studio, then assign the automation to the bot process by using the **Assign bot process** option from the **Design** tab of RPA Desktop Design Studio. In the **Bot Process** field, ensure to select an attended bot process that is enabled with Embedded Task Automation. In the **Attended Config** field, ensure to select an associated attended configuration. In the **Record Context** field, ensure to enter the Sys ID or URL of the ServiceNow form record. For more information, see Assign bot process to an automation project.

Create a process field parameters as part of a bot process on the RPA Hub. See Create a process field parameter in RPA Hub.

Ensure you are familiar with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Role required:

- sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin, if you are running the automation from RPA Desktop Design Studio
- sn_rpa_fdn.rpa_assisted_user, if you are running the automation from the Attended Robot application.

About this task

You can configure the properties for the GetProcessFieldParameters component. For more information about these properties, see Properties of the Forms components.

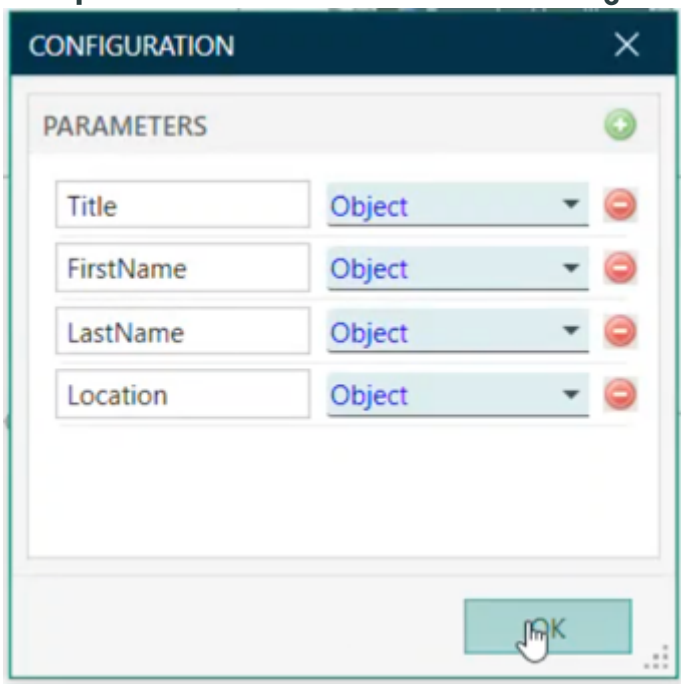
Let's consider an employee badge creation use case. The following steps provide guidance of how to use the GetProcessFieldParameters component in this use case. For more information about the use case, see Embedded Task Automation in RPA Hub.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Forms**.
2. Drag the GetProcessFieldParameters component to the Design surface.
3. Click the component settings icon ( ).
4. Click the add key icon ( ).
5. Enter the name of one of the process field parameters.
   For example, Title, FirstName, LastName, Location, as shown in the following image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of the Process Field Parameters Configuration



6. **Optional:** Update the process field parameter data type.
   You can define multiple parameters with primitive data type.
7. Repeat the steps to add more parameters.
8. Click **OK**.
9. Connect the data and control ports of the GetProcessFieldParameters component to the corresponding ports of other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (Parameter)	Returns the value of an individual process field parameter and can be used in the next components.	No
Data Out (Return, Object)	Returns the process field parameters in key value pair format that are configured in the attended configuration. This value can be used in the next components.	No
Control In	Connect to the Control Out port of one or more components.	Yes
Control Out	Connect to the Control In port of another component as per the required automation logic.	No

10. **Optional:** To test the component, right-click the title bar of the component and select **Run From Here**.

Use the GetRecordContextID component

Get the Sys ID of the ServiceNow form record that is associated to an attended configuration with the GetRecordContextID component in the RPA Desktop Design Studio. Sys ID is the output of the component. For example, Sys ID is used to fetch the attachments in a record.

Before you begin

If you are running an automation from RPA Desktop Design Studio, then assign the automation to the bot process by using the **Assign bot process** option from the **Design** tab of RPA Desktop Design Studio. In the **Bot Process** field, ensure to select an attended bot process that is enabled with Embedded Task Automation. In the **Attended Config** field, ensure to select an associated attended configuration. In the **Record Context** field, ensure to enter the Sys ID or URL of the ServiceNow form record. This is the output of your component. For more information, see Assign bot process to an automation project.

Ensure you are familiar with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Role required: none

About this task

Use the GetRecordContextID component to fetch the Sys ID of the ServiceNow form record, from where the automation is triggered. Use the GetAttachmentsMetadata component to get the metadata of the attachments of this record. After getting the attachment Sys ID, use the DownloadAttachment component to download the attachment. For more information about these components, see Use the DownloadAttachment component and Use the GetAttachmentsMetadata component.

If you are triggering the automation from the ServiceNow form's UI action (button) and it executes using the Attended Robot application, then the GetRecordContextID component returns the Sys ID of the ServiceNow form record.

You can configure the properties for the GetRecordContextID component. For more information about these properties, see Properties of the Forms components.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Forms**.
2. Drag the GetRecordContextID component to the Design surface.
3. Connect the data and control ports of the GetRecordContextID component to the corresponding ports of other components as described in the following table.

Port Name	Purpose of connection	Mandatory?
SysID [Data Out]	Returns the Sys ID of the ServiceNow form record.	No
Control In	Connect to the Control Out port of one or more components.	Yes
Control Out	Connect to the Control In port of another component	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port Name	Purpose of connection	Mandatory?
	or activity as per the required automation logic.	

4. **Optional:** To test the component, right-click the title bar of the component and select **Run From Here**.

Use the SetProcessFieldParameters component

Sets the values of the associated **Table** fields mapped to the process field parameter, that you had configured in an attended configuration record of a bot process. This component updates the values of the configured field parameters associated to the **Table** field in the ServiceNow form record.

Before you begin

If you are running an automation from RPA Desktop Design Studio, then assign the automation to the bot process by using the **Assign bot process** option from the **Design** tab of RPA Desktop Design Studio. In the **Bot Process** field, ensure to select an attended bot process that is enabled with Embedded Task Automation. In the **Attended Config** field, ensure to select an associated attended configuration. In the **Record Context** field, ensure to enter the Sys ID or URL of the ServiceNow form record. For more information, see Assign bot process to an automation project.

Create process field parameters as part of a bot process on the RPA Hub. See Create a process field parameter in RPA Hub.

Ensure you are familiar with Embedded Task Automation concepts. For more information, see Embedded Task Automation in RPA Hub.

Role required:

- sn_rpa_fdn.rpa_developer or sn_rpa_fdn.rpa_admin, if you are running the automation from RPA Desktop Design Studio
- sn_rpa_fdn.rpa_assisted_user, if you are running the automation from the Attended Robot application.

About this task

You can configure the properties for the SetProcessFieldParameters component. For more information about these properties, see Properties of the Forms components.
