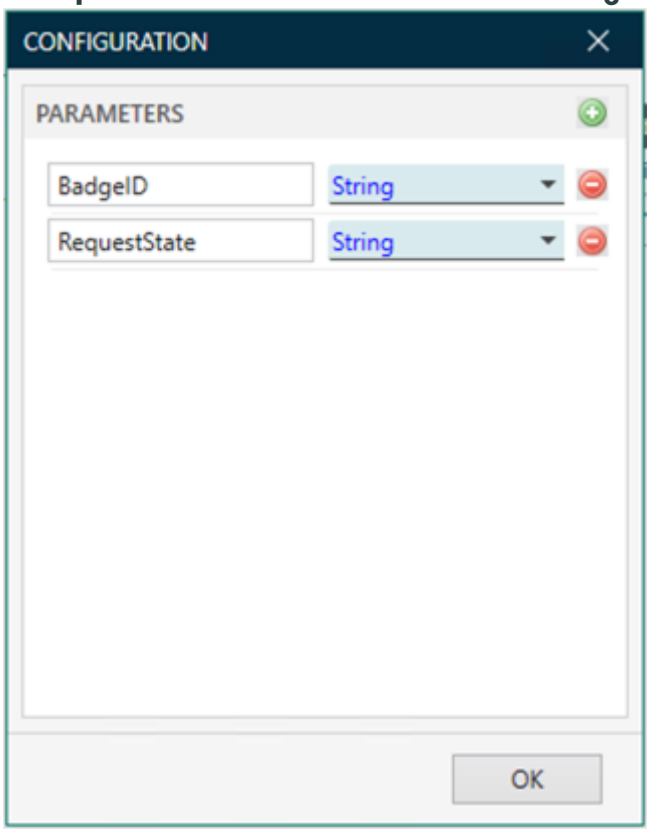
Let's consider an employee badge creation use case. The following steps provide guidance of how to use the SetProcessFieldParameters component in this use case. For more information about the use case, see Embedded Task Automation in RPA Hub.

Procedure

1. In the Toolbox pane, navigate to **ServiceNow** > **Forms**.
2. Drag the SetProcessFieldParameters component to the Design surface.
3. Click the component settings icon ( ).
4. Click the add key icon ( ).
5. Enter the name of one of the process field parameters.
   For example, BadgeID, RequestState.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of the Process Field Parameters Configuration



A Data In port is created.

6. **Optional:** Update the process field parameter data type.
   You can define multiple parameters with primitive data type.
7. Repeat the steps to add more parameters.
8. Click **OK**.
9. Connect the data and control ports of the SetProcessFieldParameters component to the corresponding ports of other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In	Pass the data of the field parameter.	Yes
Is Success [Data Out]	Boolean response to whether the update operation on the end form is successful or not.	Not Applicable
Control In	Connect to the Control Out port of one or more components.	Yes
Control Out	Connect to the Control In port of another component as per the required flow.	Not Applicable

10. **Optional:** To test the component, right-click the title bar of the component and select **Run From Here**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the Forms components

Learn about the properties of the Forms components in RPA Desktop Design Studio.

Properties of the Forms components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Utilities

The Utilities components in the RPA Desktop Design Studio enable diverse and wide-range useful operations. The utilities range from changing screen resolution to extracting zipped files.

Barcode

The Barcode components in RPA Desktop Design Studio accept an image file that contains one or more barcodes and return the barcode values.

Add the Barcode Reader plugin from the Plugins Manager before using the connector. For more information about adding the SSH plugin, see Manage plugins in RPA Desktop Design Studio.

Use the ReadBarcode component

Read a single barcode and return its contents by using the ReadBarcode component in RPA Desktop Design Studio.

Before you begin

Add the Barcode Reader plugin from the Plugins Manager before using the connector. For more information about adding the SSH plugin, see Manage plugins in RPA Desktop Design Studio.

Role required: none

About this task

The ReadBarcode component reads a single barcode from an image file that it receives from another component.

The ReadBarcode component can return both the value and the encoding type (format) of the barcode. The encoding value that the Type parameter returns may be one of the following supported formats:

- AZTEC
- CODABAR
- CODE_39
- CODE_93
- CODE_128
- DATA_MATRIX
- EAN_8

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- EAN_13
- ITF
- MAXICODE
- PDF_417
- QR_CODE
- RSS_14
- RSS_EXPANDED
- UPC_A
- UPC_E
- All_1D
- UPC_EAN_EXTENSION
- MSI
- PLESSEY
- IMB
- PHARMA_CODE

If the component can't read the barcode, it returns an error.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Barcode**.
2. Drag the ReadBarcode component to the Design surface.
3. Confirm the configuration of the component's input fields.
   For more information, see Configure port properties.
4. Connect the data and control ports of the ReadBarcode component to the corresponding ports of the other components as described in the following table.

Port	Description	Port type	Data type	Required
Image	Receives an image that contains a barcode	Data In	Bitmap	Yes
Type	Returns the barcode type	Data Out	String	Yes
Result	Returns the encoded value of the barcode	Data Out	String	Yes

To test the component, on the **Design** tab, select **Run**.

Use the ReadBarcodes component

Read multiple barcodes and return their contents by using the ReadBarcode component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Add the Barcode Reader plugin from the Plugins Manager before using the connector. For more information about adding the SSH plugin, see Manage plugins in RPA Desktop Design Studio.

Role required: none

About this task

The ReadBarcodes component reads multiple barcodes from an image file that it receives from another component.

The ReadBarcodes component returns a single output that contains concatenated text, with each item on a new line.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Barcode**.
2. Drag the ReadBarcodes component to the Design surface.
3. Confirm the configuration of the component's input fields.
   For more information, see Configure port properties.
4. Connect the data and control ports of the ReadBarcodes component to the corresponding ports of the other components as described in the following table.

Port	Description	Port type	Data type	Required
Image	Receives an image that contains barcodes	Data In	Bitmap	Yes
Return	Returns a value that includes concatenated information from each barcode	Data Out	String	Yes

To test the component, on the **Design** tab, select **Run**.

Properties of the Barcode components

Use the properties of the Barcode components to set a delay before or after a component executes, or to set a timeout that stops execution when the component doesn't finish within a period that you set.

Properties of the Barcode components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the Barcode components (continued)

Property	Description
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Screen

The screen components in the RPA Desktop Design Studio enable capturing program windows and changing screen resolution.

Use the Capture component

Capture a screen or a window in the desktop or an application as part of an automation Workflow using the Capture component in the RPA Desktop Design Studio .

Before you begin

Role required: none

About this task

You can configure the properties for the Capture component. For more information about these properties, see Properties of the Screen components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Screen**.
2. Drag the Capture component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Capture component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection	Mandatory?
Data in	Mode	Not applicable	Takes the input on whether the component captures a screen or a window.	Yes
Data out	Return	Bitmap	Returns the image of the screen or window.	Not applicable

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the CaptureWindow component

Capture the image of an application window as part of an automation Workflow by using the CaptureWindow component in RPA Desktop Design Studio.

Before you begin

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can configure the properties for the CaptureWindow component. For more information about these properties, see Properties of the Screen components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Screen**.
2. Drag the CaptureWindow component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the CaptureWindow component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection	Mandatory?
Data in	Handle	Integer	Takes the handle of the window that the component captures.	Yes
Data out	Return	Bitmap	Returns the image of the window the component has captured.	Not applicable

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ChangeResolution component

Change the resolution of a user's system screen as part of an automation Workflow by using the ChangeResolution component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the ChangeResolution component. For more information about these properties, see Properties of the Screen components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Screen**.
2. Drag the ChangeResolution component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the ChangeResolution component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port name	Data type	Purpose of connection	Mandatory?
Resolution	String	Takes the resolution of the user's system screen.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetResolution component

Get the resolution of the current screen by using the GetResolution component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

The properties of the GetResolution component are common with the properties of the other Screen components. To configure these properties, see Properties of the Screen components.

Procedure

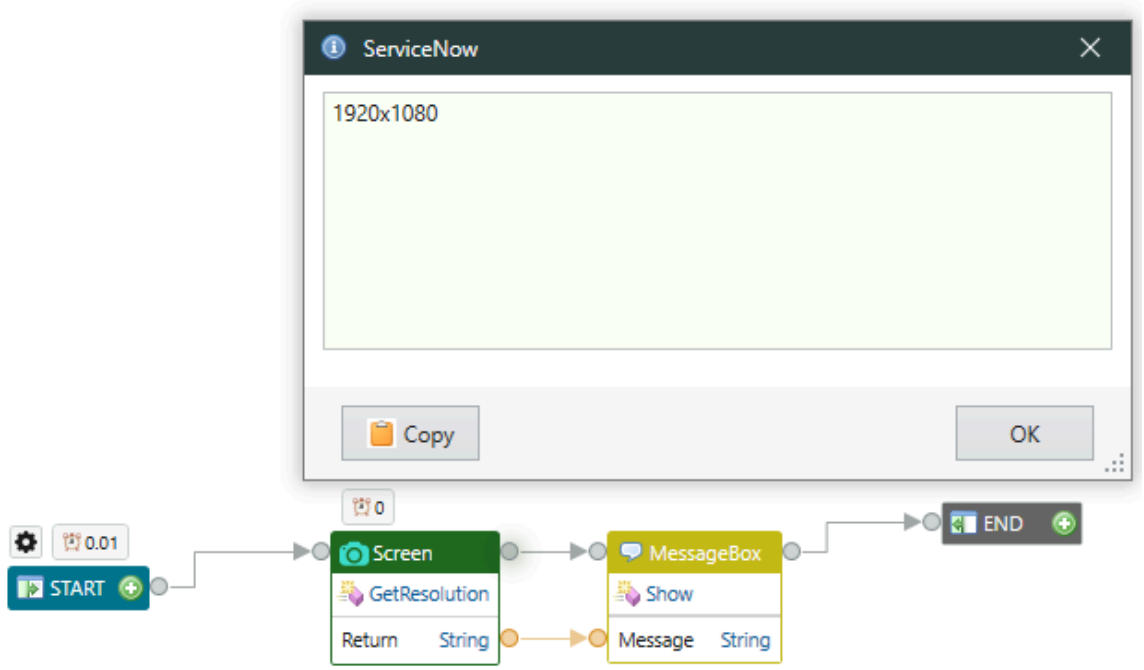
1. In the Toolbox pane, navigate to **Utilities** > **Screen**.
2. Drag the GetResolution component to the Design surface.
3. **Optional:** Connect the data and control ports of the GetResolution component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection	Mandatory?
Data In	Return	String	Returns the resolution of the current screen.	Not applicable

4. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Display the current screen resolution in a message box



The GetResolution component passes the current screen resolution through the Return Data Out port to the Show component. The Show component takes the resolution through its Message Data In port and is displayed in a message box.

Properties of the Screen components

Learn about the properties of the Screen components in RPA Desktop Design Studio.

Properties of the Screen components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Clipboard

The Clipboard components in the RPA Desktop Design Studio enables the clipboard, copy, and extraction operations on files.

Use the Clear component

Clear the contents of the clipboard as part of an automation Workflow using the Clear component in RPA Desktop Design Studio.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
The Clear component can work with other components or methods to execute an automation Workflow.

You can configure the properties for the Clear component. For more information about these properties, see Properties of the Clipboard components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Clipboard**.
2. Drag the Clear component to the Design surface.
3. Connect the control ports of the Clear component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Control In	Passes the control from another component.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetAsTable component

Get the content of the clipboard as a data table as part of an automation Workflow by using the GetAsTable component in the RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetAsTable component. For more information about these properties, see Properties of the Clipboard components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Clipboard**.
2. Drag the GetAsTable component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetAsTable component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (ColumnSeperator)	Passes the column separator for the table columns from the Data Out port of another component.	Yes
Data In (LineSeperator)	Passes the data separator for the table columns from the Data Out port of another component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data Out	Returns the clipboard content as a data table.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetFileDropList component

Get a list of file names as a string array from the Windows clipboard by using the GetFileDropList component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

A file drop list is a collection of strings that contain the path information for files on the Windows clipboard.

You can configure the properties for the GetFileDropList component. For more information about these properties, see Properties of the Clipboard components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Clipboard**.
2. Drag the GetFileDropList component to the Design surface.
3. Connect the control ports of the GetFileDropList component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out	Returns a file drop list from the Windows clipboard as a String array.	Yes. To preview the capture, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the GetImage component

Get an image from the clipboard by using the GetImage component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetImage component. For more information about these properties, see Properties of the Data Writer components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Clipboard**.
2. Drag the GetImage component to the Design surface.
3. Connect the data and control ports of the GetImage component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (Bitmap)	Returns the image from the clipboard.	Yes. To preview the image, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	No. Connecting the port is optional.
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetText component

Get text from the clipboard and return as a string by using the GetText component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetText component. For more information about these properties, see Properties of the Clipboard components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Clipboard**.
2. Drag the GetText component to the Design surface.
3. Connect the data and control ports of the GetText component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data Out	Returns the text from the clipboard as a string.	Yes. To preview the text, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SetFileDropList component

Clear the clipboard and then add a collection of file names by using the SetFileDropList component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

A file drop list is a collection of strings that contain the file paths and is stored on the Windows clipboard as a String array.

You can configure the properties for the SetFileDropList component. For more information about these properties, see Properties of the Clipboard components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Clipboard**.
2. Drag the SetFileDropList component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the control ports of the SetFileDropList component to the corresponding ports of the other components.

Port type	Purpose of connection	Mandatory?
Data In (Filenames)	Passes the file names as string array from the Data Out component of another component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the SetImage component

Copy an image to the clipboard by using the SetImage component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the SetImage component. For more information about these properties, see Properties of the Data Writer components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Clipboard**.
2. Drag the SetImage component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the SetImage component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (img)	Passes the image through the Data Out port of another component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SetText component

Copy a text string to the Windows clipboard as part of an automation Workflow by using the SetText component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the SetText component. For more information about these properties, see Properties of the Clipboard components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Clipboard**.
2. Drag the SetText component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the SetText component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (strText)	Passes the string through the Data Out port of another component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Clipboard components

Learn about the properties of the Clipboard components in RPA Desktop Design Studio Clipboard utility.

Properties of the Clipboard components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Data Reader

The Data Reader components in the RPA Desktop Design Studio enable reading of data from different programs such as MS Excel and CSV.

Note:
OLEDB 32 bit is not supported for the Data Reader components.

For details on the issues related to the Data Reader component, see KB article KB1123553 and KB article KB1123554.

Use the GetExcelSheetNames component

Get the names of the sheets in an Excel file as part of an automation Workflow by using the GetExcelSheetNames component in RPA Desktop Design Studio.

Before you begin

To use the ReadFromExcel component, install Microsoft Access Database Engine.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The GetExcelSheetNames component can work with other components or methods in an automation Workflow.

You can configure the properties for the GetExcelSheetNames component. For more information about these properties, see Properties of the Data Reader components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Data Reader**.
2. Drag the GetExcelSheetNames component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetExcelSheetNames component to the corresponding ports of the other components as described in the following table.

Parameter	Description	Data Port type	Data type
Filepath	The path to the Excel file to get the sheet names.	Data In	String
Return	Returns sheet names as array of strings.	Data Out	String[]

5. To preview the data, right-click the **Return** field and click **Preview Data**.
6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the QueryExcel component

Query data from a Microsoft Excel file with the QueryExcel component in RPA Desktop Design Studio.

Before you begin

To use the ReadFromExcel component, install Microsoft Access Database Engine.

Role required: none

About this task

You can configure the properties for the QueryExcel component. For more information about these properties, see Properties of the Data Reader components.

Real-world scenario: Extracting specific sales data

A company stores monthly sales data in an Excel file. Using the QueryExcel component, an RPA bot filters sales records for a specific product category and extracts only the relevant data for analysis and reporting.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Data Reader**.
2. Drag the QueryExcel component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the QueryExcel component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description	Data Port type	Data type
Filepath	The path to the Excel file from a previously executed component.	Data In	String
CommandText	The query from a previously executed component.	Data In	String
IsFirstRowHeader	True or false value that indicates whether the first row of the Excel sheet is a header from a previously executed component.	Data In	Boolean
Count	Returns the total number of rows containing data.	Data Out	Integer
DataTable	Returns the extracted data from the Excel file in a DataTable.	Data Out	DataTable

5. To preview the data, right-click the **Return** field and click **Preview Data**.
6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ReadFromCSV component

Read data from a CSV file by using the ReadFromCSV component in RPA Desktop Design Studio.

Watch this video to learn how to use the ReadFromCSV component.

https://player.vimeo.com/video/1069664680?h=60cb93843a&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Role required: none

About this task

You can configure the properties for the ReadFromCSV component. For more information about these properties, see Properties of the Data Reader components.

Real-world scenario: Extracting product inventory data

An e-commerce company maintains stock details in a CSV file. The RPA bot uses the ReadFromCSV component to read the file and update inventory levels in the company's database, ensuring real-time stock availability.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Data Reader**.
2. Drag the ReadFromCSV component to the Design surface.
3. To configure the input fields, see Use the ReadFromCSV component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Connect the data and control ports of the ReadFromCSV component to the corresponding ports of the other components as described in the following table.

Parameter	Description	Data Port type	Data type
FilePath	The file path of the CSV file.	Data In	String
StartRow	The number of the row that will be first queried in the CSV file.	Data In	Integer
Delimiter	A character that separates values in a row of the CSV file. For example, comma, tab, semicolon, pipe, or space.	Data In	String
IsFirstRowHeader	True or false value that indicates whether the first row of the CSV file is a header.	Data In	Boolean
Count	Returns the total number of rows containing data.	Data Out	Integer
DataTable	Returns the extracted data from the CSV file in a DataTable.	Data Out	DataTable

5. To preview the data, right-click the **Return** field and click **Preview Data**.
6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ReadFromExcel component

Extract data from a Microsoft Excel file as a DataTable by using the ReadFromExcel component in RPA Desktop Design Studio.

Before you begin

To use the ReadFromExcel component, install Microsoft Access Database Engine.

Role required: none

About this task

You can configure the properties for the ReadFromExcel component. For more information about these properties, see Properties of the Data Reader components.

Real-world scenario: Importing employee records

An HR department maintains employee details in an Excel file. The ReadFromExcel component extracts this data into a DataTable, which is then used to update an HR management system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Data Reader**.
2. Drag the ReadFromExcel component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ReadFromExcel component to the corresponding ports of the other components as described in the following table.

Parameter	Description	Data Port type	Data type
Filepath	Path to the Excel file that you can pass from the previously executed component.	Data In	String
Sheetname	Name of the sheet in the Excel file that you can pass from a previously executed component.	Data In	String
IsFirstRowHeader	Specifies true or false value that indicates the first row of the Excel sheet is a header or not.	Data In	Boolean
Count	Returns the total number of rows containing data.	Data Out	Integer
Data	Returns the extracted data from the Excel file in a DataTable.	Data Out	DataTable

5. To preview the data, right-click the **Return** field and click **Preview Data**.
6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ReadFromXPS component

Read the data from an XPS file by using the ReadFromXPS component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the ReadFromXPS component. For more information about these properties, see Properties of the Data Reader components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Data Reader**.
2. Drag the ReadFromXPS component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ReadFromXPS component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description	Data Port type	Data type
Filepath	The file path of the XPS file.	Data In	String
PageNumber	The page number from the XPS file to read the data from.	Data In	Integer
Data	Returns the extracted data from the XPS file.	Data Out	String

5. To preview the data, right-click the **Return** field and click **Preview Data**.
6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Data Reader components

Learn about the properties of the Data Reader components in RPA Desktop Design Studio.

Properties of the Data Reader components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Data Writer

The Data Writer components in the RPA Desktop Design Studio writes data to different programs such as MS Excel and CSV.

Note:
OLEDB 32 bit is not supported for the Data Writer components.

For details on the issues related to the Data Writer component, see KB article KB1123553 and KB article KB1123554.

Use the WriteToCSV component

Write the data to a CSV file by using the WriteToCSV component in RPA Desktop Design Studio as part of a Workflow.

Before you begin
Role required: none

About this task
You can configure the properties for the WriteToCSV component. For more information about these properties, see Properties of the Data Writer components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Data Writer**.
2. Drag the WriteToCSV component to the Design surface.
3. Connect the data and control ports of the WriteToCSV component to the corresponding ports of the other components as described in the following table.

Port Name	Port type	Purpose of connection	Data Type
FilePath	Data In	Passes the path to the CSV file.	String
Data Table	Data In	Passes the data to be written to the CSV file from a previously executed component. The port accepts data in the Data Table format.	Table
Delimiter	Data In	Passes the delimiter from a previously executed component. You can specify a custom delimiter, such as, comma.	String
Append	Data In	Indicate whether the data passed appends or replaces existing data in the CSV file (True or False). Double click to configure the port properties. For more information, see Configure port properties.	Boolean

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the WriteToExcel component

Write the data to a worksheet of a Microsoft Excel file as part of an automation Workflow by using the WriteToExcel component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the WriteToExcel component. For more information about these properties, see Properties of the Data Writer components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Data Writer**.
2. Drag the WriteToExcel component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the WriteToExcel component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Filepath)	Passes the path to the Excel file from a previously executed component.	Yes
Data In (SheetName)	Passes the name of the sheet in the Excel file to which data will be written from a previously executed component.	Yes
Data In (Data)	Passes the data that will be written from a previously executed component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the WriteText component

Write the data to a text document as part of an automation Workflow by using the WriteText component in RPA Desktop Design Studio. You can add the data in string format to existing string on the text file or replace the existing data with new data.

Before you begin

Role required: none

About this task

You can configure the properties for the WriteText component. For more information about these properties, see Properties of the Data Writer components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Data Writer**.
2. Drag the WriteText component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the WriteText component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Filepath)	Passes the path to the text file from a previously executed component.	Yes
Data In (Data)	Passes the string to be written to the text file from a previously executed component.	Yes
Data In (Append)	Passes the Boolean value to indicate whether the string passed appends or replaces existing data in the text file. The values are: ○ True: Appends to the existing string. ○ False: Replaces the existing string.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Data Writer components

Learn about the properties of the Data Writer components in RPA Desktop Design Studio.

Properties of the Data Writer components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

DateTime

The DateTime components in the RPA Desktop Design Studio enables different useful operations with date and time.

Use the Add component

Increase or decrease the time or date by the value you specify as part of a Workflow with the Add component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

About this task
You can configure the properties for the Add component. For more information about these properties, see Properties of the DateTime components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **DateTime**.
2. Drag the Add component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Add component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (SourceDate)	Passes the source date, which is the date or time that the Add component increases or decreases by the value you specify, from a previously executed component.	Yes
Data In (Type)	Passes the unit of time from a previously executed component. You can provide the following values: ○ Year ○ Month ○ Day ○ Hour ○ Minute ○ Second ○ Millisecond ○ Tick	Yes
Data In (Value)	Passes the numeric value by which you want to change the source date, from a previously executed component. For example, if you provide 5 and the source date 10/8/2019, then the new source date will be 10/13/2019.	Yes
Data Out	Returns the updated date and time.	Yes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
		To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Compare component

Compare two dates and time to find out whether the dates are the same by using the Compare component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Compare component. For more information about these properties, see Properties of the DateTime components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **DateTime**.
2. Drag the Compare component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Compare component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (date1)	Passes the first date of the two dates to be compared, from a previously executed component.	Yes
Data In (date2)	Passes the second date of the two dates to be compared, from a previously executed component.	Yes
Data Out	Returns one of the values based on the comparison result:	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	○ **-1** if the first date is earlier than the second. ○ **0** if the first and second dates are the same. ○ **1** if the first date is later the second date.	
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Format component

Change the format of a date by using the Format component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Format component. For more information about these properties, see Properties of the DateTime components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **DateTime**.
2. Drag the Format component to the Design surface.
3. Click the component settings icon ( ).
4. Do the following:
   a. In the From field, specify the date format you want to change.
   b. In the To field, specify the destination date format.
   c. Click **OK**.
5. To configure the input field, see Configure port properties.
6. Connect the data and control ports of the Format component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (DateObject)	Passes the date object through the Data Out port of another component. For example, 03-25-2009.	Yes
Data Out	Returns the date object in the destination date format.	Yes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
		To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

7. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetPart component

Get the value of a part of the date format by using the GetPart component in RPA Desktop Design Studio. For example, you might want to get the value of the month in the MM/DD/YYYY format.

Before you begin

Role required: none

About this task

You can configure the properties for the GetPart component. For more information about these properties, see Properties of the DateTime components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **DateTime**.
2. Drag the GetPart component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetPart component to the corresponding ports of the other components as described in the following table.

Port name	Purpose of connection	Port type	Data type
SourceDate	Passes the date and time for which you want to view the part, from a previously executed component. Drag the Now component from DateTime to get today's date as the source date. For example, if the source date is 01-Feb-2025.	Data In	DateTime
Format	Passes the part of the date and format that the value of which is returned, from a	Data In	String

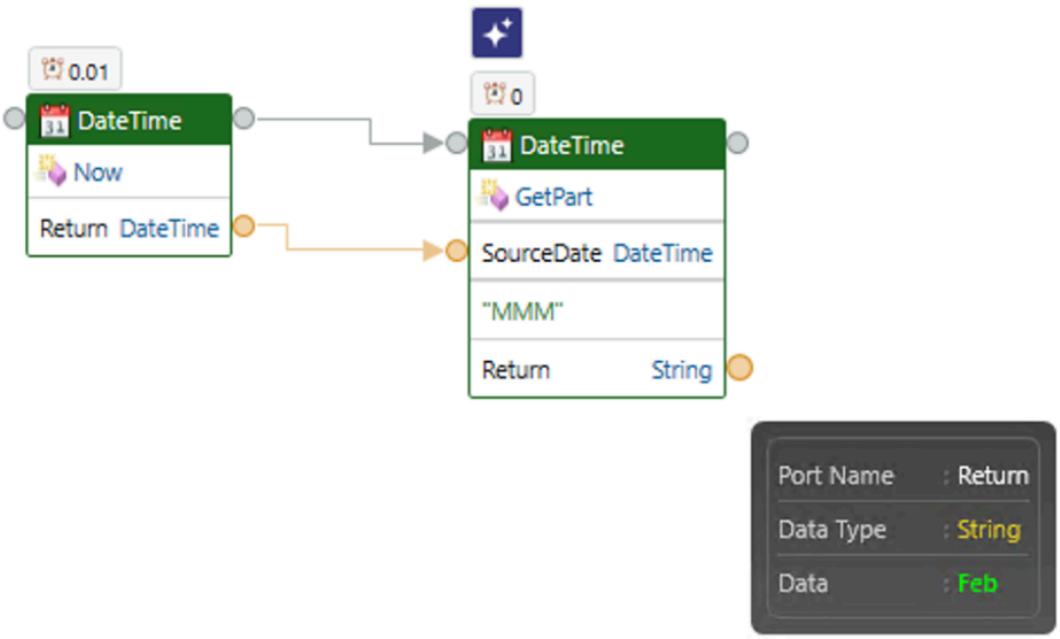
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port name	Purpose of connection	Port type	Data type
	previously executed component. For example, enter `MMM`.		
Return	Returns the value of the part of the date format. If the format is MMM, the output is Feb.	Data Out	String

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Example: GetPart component with Now component

GetPart component



Use the IsLeapYear component

Specify a year to find out whether it's a leap year by using the IsLeapYear component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the IsLeapYear component. For more information about these properties, see Properties of the DateTime components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

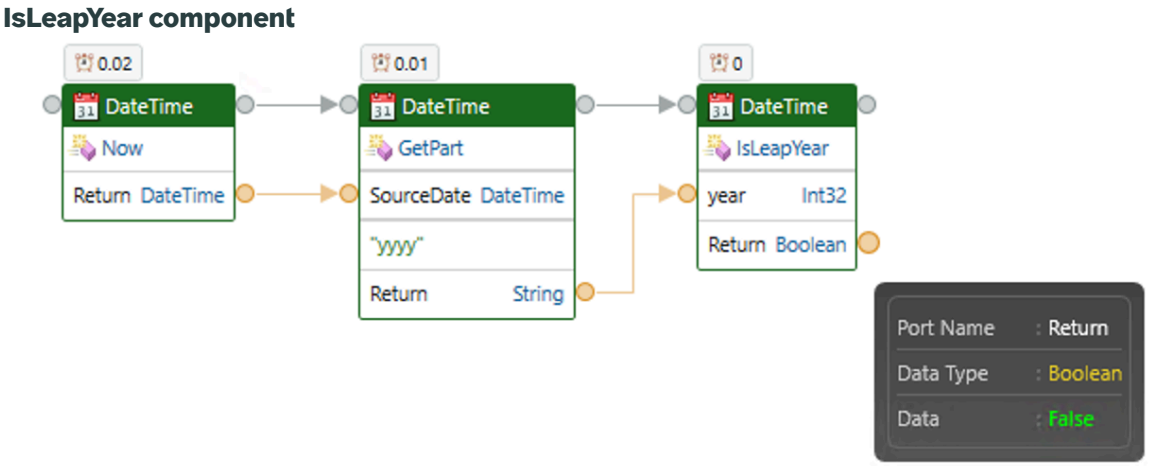
Procedure

1. In the Toolbox pane, navigate to **Utilities** > **DateTime**.
2. Drag the IsLeapYear component to the Design surface.
3. Drag the Now component to the Design surface.
4. Drag the GetPart component to the Design surface.
5. To configure the input field, see Configure port properties.
6. Connect the data and control ports of the IsLeapYear component to the corresponding ports of the other components as described in the following table and image.

Port Name	Port type	Data type	Purpose of connection
Year	Data In		Passes the year that you specify from a previously executed component.
Return	Data Out		Returns **True** if the specified year is a leap year. Otherwise, it returns **False**.

7. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.
   GetPart component extracts a date part from the Now component, and IsLeapYear determines if the year is a leap year.

Example: IsLeapYear component with GetPart and Now component



Use the Now component

Get the current date and time of the system as part of an automation Workflow by using the component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the component. For more information about these properties, see Properties of the DateTime components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **DateTime**.
2. Drag the Now component to the Design surface.
3. Connect the data and control ports of the component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (DateTime)	Passes the current date and time of the system to another component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Today component

Get the current date of the system by using the Today component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Today component. For more information about these properties, see Properties of the DateTime components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **DateTime**.
2. Drag the Today component to the Design surface.
3. Connect the data and control ports of the Today component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out	Passes the current date to another component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the UtcNow component

Get the current date and time of the system in the Coordinated Universal Time (UTC) format by using the UtcNow component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the UtcNow component. For more information about these properties, see Properties of the DateTime components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **DateTime**.
2. Drag the UtcNow component to the Design surface.
3. Connect the data and control ports of the UtcNow component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out	Passes the current date in the UTC format.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the DateTime components

Learn about the properties of the DateTime components in RPA Desktop Design Studio.

Properties of the DateTime components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the DateTime components (continued)

Property	Description
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Debug

The Debug components in the RPA Desktop Design Studio enable writing logs to the console log and verify whether a project is running from the RPA Desktop Design Studio or a robot.

Use the ConsoleLog component

Write a message to view the console log of RPA Desktop Design Studio by using the ConsoleLog component.

Before you begin

Role required: none

About this task

You can configure the properties for the ConsoleLog component. For more information about these properties, see Properties of the Debug components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Debug**.
2. Drag the ConsoleLog component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ConsoleLog component to the corresponding ports of the other components as described in the following table.

ConsoleLog component parameters

Port type	Description	Data port type	Data Type
Message	Provide a message that must to be written to the console log. For example, `started first activity` or `completed the first activity`.	Data In	String

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Result

Open the console log to check the messages.

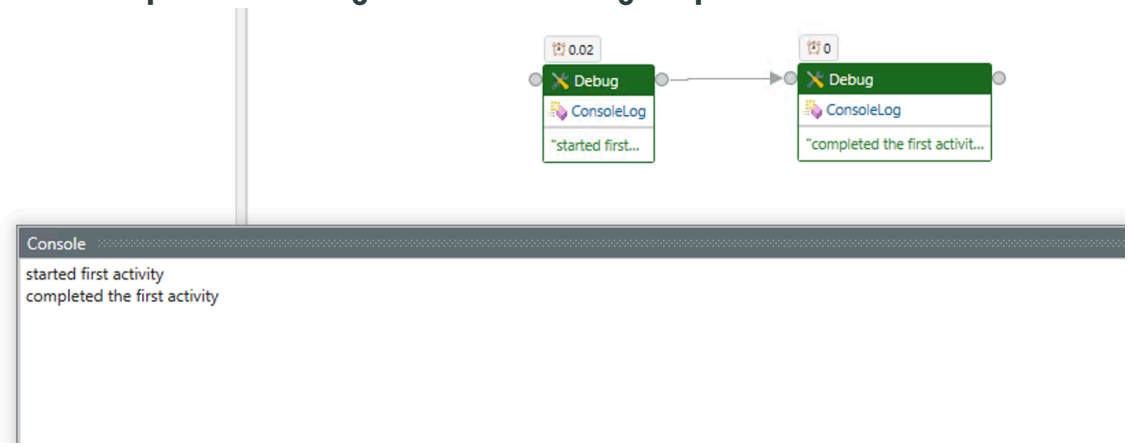
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Console with provided messages in the ConsoleLog component



Use the IsRunningFromStudio component

Determine whether a project is run by studio as part of an automation Workflow using the IsRunningFromStudio component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the IsRunningFromStudio component. For more information about these properties, see Properties of the Debug components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Debug**.
2. Drag the IsRunningFromStudio component to the Design surface.
3. Connect the data and control ports of the IsRunningFromStudio component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out	Returns **True** if a project is being run from the RPA Desktop Design Studio. Otherwise, it returns **False**.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the IsRunningInBotsession component

Determine if a project is running in a Bot session as part of an automation Workflow by using the IsRunningInBotsession component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

About this task
You can configure the properties for the IsRunningInBotsession component. For more information about these properties, see Properties of the Debug components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Debug**.
2. Drag the IsRunningInBotsession component to the Design surface.
3. Connect the data and control ports of the IsRunningInBotsession component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out	Returns **True** if a project is running in a Bot session. Otherwise, it returns **False**.	Yes To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	No. Connecting the port is optional.
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Debug components
Learn about the properties of the Debug components in RPA Desktop Design Studio.

Properties of the Debug components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Dialogs
The Dialogs group of components performs basic operations on file and folder dialogs as part of an attended automation.

The components can do the following operations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Open a file dialog to open a file based on the criteria you specify.
- Open a folder dialog and then open a folder.
- Save a file to a location.

Use the OpenFileDialog component

Open a file dialog from where you can open a file using the OpenFileDialog component in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

By default, the OpenFileDialog component opens the last file dialog you had opened. You can change the file dialog location and the type of file you want to open by specifying the location and the file type.

There are properties that you configure for the OpenFileDialog component. For more information, see Dialog component properties.

Procedure

1. In the Toolbox pane, navigate to **Utilities>Dialogs**.
2. Drag the OpenFileDialog component onto the Design surface.
3. To open the last file dialog you had opened, right-click the OpenFileDialog component bar.
4. Click **Run From Here**.
5. In the Save As file dialog, select the required file and click **Open**.
   The Result (Boolean) and FileName (String) returns the Boolean response to whether you had opened a file and the file name and path respectively.
6. **Optional:** To configure the input ports, see Configure port properties.
7. Connect the data and control ports of OpenFileDialog to the corresponding ports of other components.

OpenFileDialog - Ports

Port type	Purpose of connection	Mandatory?
Data In (Filter)	Takes the format of the file that you want to open from a previously executed component.	No. Connecting the port is optional.
Data In (InitialDirectory)	Takes the path to the directory that contains the file you want to open from a previously executed component.	No. Connecting the port is optional.
Data Out (Result)	Passes the Boolean response to whether you had opened a file to the next component.	Yes
Data Out (FileName)	Passes the name of the file you had opened and its path to the next component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Passes the control from the previously executed component.	Yes
Control Out	Passes the control from the Get Text component to the next component to be executed.	Yes

8. **Optional:** To test the component, click **Run** under the **DESIGN** tab.

Use the LockUIDialog component

Provide additional authentication to any step of your attended automation by using the LockUIDialog component in the RPA Desktop Design Studio application.

Before you begin

Ensure that you are in an attended automation project to use the LockUIDialog component.

Role required: RPA developer

About this task

Consider the scenario where you want to provide additional security to a step in your attended automation. For example, the automation is trying to access the employee database. This database has sensitive information. When you use the LockUIDialog component, the automation proceeds to the next step only if the user is authenticated by using the machine user name and password. You can also provide a message to be displayed during the authentication.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Dialogs** in an attended automation project.
2. Drag the LockUIDialog component to the Design surface.
3. Connect the data and control ports of the LockUIDialog component to the corresponding ports of the other components as described in the following table:

Ports of the LockUIDialog component

Port name	Port type	Port description	Required?
DisplayText	Data In	Text that you want to display during the authentication. The text can be used to convey why an authentication is required for the automation step. For example, you can use the following text if the automation step is trying to access the employee database: `Enter the user name and password to access the employee database.` The text is displayed in the authentication dialog box that is used to enter the machine user name and password.	No
Result	Data Out	True or false value of the authentication. If the authentication is successful, the result is true. If the authentication is unsuccessful, the result is false.	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port name	Port type	Port description	Required?
		The true or false value of the result can be further used to connect to any condition. For more information on how to use the condition components, see Conditions.	
Not applicable	Control In	Passes the control from the previously executed component.	No
Not applicable	Control Out	Passes the control from the LockUIDialog component to the next component to be executed.	No

4. **Optional:** To test the component, right-click the component and select **Run From Here**. You can also run the automation by selecting **Run** from the **Design** tab.

Use the OpenFolderDialog component

Open a folder dialog so you can open a folder from there with the OpenFolderDialog component. After opening the folder dialog, you can create a folder.

Before you begin

Role required: none

About this task

There are properties that you configure for the OpenFolderDialog component. For more information, see Dialog component properties.

Procedure

1. In the Toolbox pane, navigate to **Utilities>Dialogs**.
2. Drag the OpenFolderDialog component onto the Design surface.
3. To open the folder dialog, right-click the OpenFolderDialog component bar.
4. In the Browse For Folder dialog, select the required folder and click **Open**.
5. To configure the outputs from the data ports, see Configure output port properties. The Result (Boolean) and Path (String) returns the Boolean response to whether you had opened a folder and the folder name and path respectively.
6. Connect the data and control ports of OpenFolderDialog to the corresponding ports of other components.

OpenFolderDialog - Ports

Port type	Purpose of connection	Mandatory?
Data Out (Result)	Passes the boolean response to whether you had opened a folder to the next component.	Yes
Data Out (Path)	Passes the path to the folder you have opened from the folder dialog to the next component.	Yes
Control In	Passes the control from the previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Passes the control from the Get Text component to the next component to be executed.	Yes

7. **Optional:** To test the component, click **Run** under the **DESIGN** tab.

Use the SaveFileDialog component

Save a file to a folder using the SaveFileDialog component in the RPA Desktop Design Studio. By default, the component opens the last file dialog you had opened.

Before you begin

Role required: none

About this task

There are properties that you configure for the SaveFileDialog component. For more information, see Dialog component properties.

Procedure

1. In the Toolbox pane, navigate to **Utilities>Dialogs**.
2. Drag the SaveFileDialog component onto the Design surface.
3. To open the last file dialog you had opened, right-click the SaveFileDialog component bar.
4. Click **Run From Here**.
5. In the Save As dialog, enter the name of the file in the File name field.
6. Click **Save**.
   The Result (Boolean) and FileName (String) returns the Boolean response to whether you had opened a file and the file name and path respectively.
7. Connect the data and control ports of SaveFileDialog to the corresponding ports of other components.

SaveFileDialog - Ports

Port type	Purpose of connection	Mandatory?
Data Out (Result)	Passes the boolean response to whether the file was saved to the next component.	Yes
Data Out (Filename)	Passes the name of the file that you saved and the path to the file to the next component.	Yes
Control In	Passes the control from the previously executed component.	Yes
Control Out	Passes the control from the Get Text component to	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	the next component to be executed.	

8. **Optional:** To test the component, click **Run** under the **DESIGN** tab.

Dialog component properties

Refer to the descriptions of the properties of the Dialog components. You can update the properties, if required.

Dialog component properties

Property	Description
Delay Before Execution	The number of seconds to pause before running.
Delay After Execution	The number of seconds to pause after running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Environment

The Environment components in the RPA Desktop Design Studio retrieve information and perform specific operations on the Windows environment.

Use the CurrentDirectory component

Find out the current working directory and its path by using the CurrentDirectory component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the CurrentDirectory component. For more information about these properties, see Properties of the Environment components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the CurrentDirectory component to the Design surface.
3. Connect the data and control ports of the CurrentDirectory component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (Return)	Returns the path to the current working directory. Passes the path to the next component.	Yes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
		To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetEnvironmentVariable component

Retrieve the value of an environment variable by using the GetEnvironmentVariable component in RPA Desktop Design Studio. For example, you can get the value of the TEMP variable.

Before you begin

Role required: none

About this task

You can configure the properties for the GetEnvironmentVariable component. For more information about these properties, see Properties of the Environment components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the GetEnvironmentVariable component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the GetEnvironmentVariable component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (variable)	Takes the environment variable through the Data Out port of another component.	Yes
Data Out	Returns the value of the specified environment variable and passes to another component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Is64BitOperatingSystem component

Determine if an operating system is 64 bits as part of an automation Workflow by using the Is64BitOperatingSystem component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Is64BitOperatingSystem component. For more information about these properties, see Properties of the Environment components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the Is64BitOperatingSystem component to the Design surface.
3. Connect the data and control ports of the Is64BitOperatingSystem component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out	Returns **True** if the current operating system is a 64-bit operating system. Otherwise, it returns **False** and passes the output to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the MachineName component

Retrieve the name of your computer as part of an automation Workflow by using the MachineName component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the MachineName component. For more information about these properties, see Properties of the Environment components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the MachineName component to the Design surface.
3. Connect the data and control ports of the MachineName component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out	Returns the name of the computer and passes to the next component.	No. Connecting the port is optional. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	No. Connecting the port is optional.
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ResolvePath component

Find the path of your current automation project as part of an automation Workflow by using the ResolvePath component in RPA Desktop Design Studio. You must specify the parameter, for example, %projectpath% to get the path.

Before you begin
Role required: none

About this task
You can configure the properties for the ResolvePath component. For more information about these properties, see Properties of the Environment components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the ResolvePath component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the ResolvePath component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Path)	Takes the project path through the Data Out port of another component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data Out	Returns the automation project path and passes to another component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SetEnvironmentVariable component

Create an environment variable as part of an automation Workflow by using the SetEnvironmentVariable component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the SetEnvironmentVariable component. For more information about these properties, see Properties of the Environment components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the SetEnvironmentVariable component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the SetEnvironmentVariable component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (variable)	Takes the environment variable name from a previously executed component.	Yes
Data In (value)	Takes the environment variable value from a previously executed component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SpecialFolderPath component

Retrieve the path to a special folder In Windows based on the name you specify by using the SpecialFolderPath component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the SpecialFolderPath component. For more information about these properties, see Properties of the Environment components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the SpecialFolderPath component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the SpecialFolderPath component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (folder)	Takes the name of the special folder from a previously executed component.	Yes
Data Out (Return)	Returns the path to the specified system special folder and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SystemDirectory component

Retrieve the path to the system directory as part of an automation Workflow by using the SystemDirectory component in RPA Desktop Design Studio.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can configure the properties for the SystemDirectory component. For more information about these properties, see Properties of the Environment components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the SystemDirectory component to the Design surface.
3. Connect the data and control ports of the SystemDirectory component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (Return)	Returns the path to the system directory and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the UserDomain component

Retrieve the user domain name that is associated with a current user as part of an automation Workflow by using the UserDomain component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the UserDomain component. For more information about these properties, see Properties of the Environment components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the UserDomain component to the Design surface.
3. Connect the data and control ports of the UserDomain component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (Return)	Returns the domain name for the current user and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the UserName component

Retrieve the user name of the user who is currently logged on to the Windows machine as part of an automation Workflow by using the UserName component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the UserName component. For more information about these properties, see Properties of the Environment components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Environment**.
2. Drag the UserName component to the Design surface.
3. Connect the data and control ports of the UserName component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out	Returns the name of the user who is currently logged on to the Windows machine and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes.
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Environment components

Learn about the properties of the Environment components in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the Environment components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

File

The File components in the RPA Desktop Design Studio perform standard operations on the Windows files and directories. For example, copying files or retrieving temporary file names.

Use the AppendBytes component

Append bytes to a file as part of an automation Workflow by using the AppendBytes component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the AppendBytes component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the AppendBytes component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the AppendBytes to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (filePath)	Takes the path to the file to which the bytes are appended from a previously executed component.	Yes
Data In (bytes)	Takes the bytes you want to append to the file from a previously executed component.	Yes
Data Out	Returns the status of the Append Bytes operation. Returns **True** if successful or **False** if an error occurred.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the AppendText component

Add text to an existing text of a file as part of an automation Workflow by using the AppendText component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the AppendText component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the AppendText component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the AppendText component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (filePath)	Takes the path to the file to which the method appends text from a previously executed component.	Yes
Data In (text)	Takes the text that the method appends text from a previously executed component.	Yes
Data Out (text)	Returns **True** if the specified text is successfully added to the file. Otherwise, it returns **False**.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ChangeExtension component

Change the extension of a path string by using the ChangeExtension component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the ChangeExtension component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the ChangeExtension component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ChangeExtension component to the corresponding ports of the other components as described in the following table.

Port Name	Port type	Data Type	Description
Path	Data In	String	Takes the path to the file for which the method changes the extension from a previously executed component.
Extension	Data In	String	Takes the new extension (with or without a leading period) that the method changes from a previously executed component. Specify null to remove an existing extension from path.
Return	Data Out	String	Returns the changed extension value in string format.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Combine component

Combine two paths to create a single path with the Combine component in RPA Desktop Design Studio. For example, C:\Users could be the first path and \Data\TestFolder could be the second path and both could be combined to create the path C:\Users\Data\TestFolder.

Before you begin
Role required: none

About this task
You can configure the properties for the Combine component. For more information about these properties, see Properties of the File components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the Combine component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Combine component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Path 1)	Takes the first part of the combined path from a previously executed component.	Yes
Data In (Path 2)	Takes the last part of the combined path from a previously executed component.	Yes
Data Out (String)	Returns the combined path and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the CopyFile component

Copy an existing file to a new location by using the CopyFile component in RPA Desktop Design Studio.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can configure the properties for the CopyFile component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the CopyFile component to the Design surface.
3. To configure the input fields, see by doing the following steps.
   a. Right-click the field.
   b. Click **Override**.
   c. Enter details for the following fields, Configure port properties.
4. Connect the data and control ports of the CopyFile component to the corresponding ports of the other components as described in the following table.

CopyFile method parameters

Parameter	Description	Data port type	Data type
sourcefilePath	Provide a file path to be copied, along with the file name. For example, `C:\Users\ABC\Desktop\ Folders\Txt Files\Scripts.txt`	Data In	String
destFilePath	Provide a destination file path (along with the file name), where the file should be copied. For example, `C:\Users\ABC\Desktop\Scripts.txt`	Data In	String
overwrite	Provide a True or False value. Set to True to overwrite existing files.	Data In	Boolean

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the DeleteFile component

Delete a file from the location you specify as part of an automation Workflow by using the DeleteFile component in RPA Desktop Design Studio.

Before you begin

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can configure the properties for the DeleteFile component. For more information about these properties, see Properties of the File components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the DeleteFile component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the DeleteFile component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (filePath)	Takes the path to the file and the name of the file from a previously executed component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the FileExists component

Find out whether the file you specify exists as part of an automation Workflow by using the FileExists component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the FileExists component. For more information about these properties, see Properties of the File components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the FileExists component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the FileExists component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (filePath)	Takes the path to the file and the name of the file	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	from a previously executed component.	
Data Out (Return)	Returns **True** if the specified file exists. Otherwise, it returns **False** and passes the output to another component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetDirectoryName component

Get the directory name of the specified path as part of an automation Workflow by using the GetDirectoryName component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetDirectoryName component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the GetDirectoryName component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the GetDirectoryName component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Path)	Takes the path to the directory from a previously executed component.	Yes
Data Out (Return)	Returns the directory name of the path and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	No. Connecting the port is optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetExtension component

Get the extension of a file and know its type as part of an automation Workflow by using the GetExtension component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetExtension component. For more information about these properties, see Properties of the File components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the GetExtension component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetExtension component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Path)	Takes the path to the file and the name of the file from a previously executed component.	Yes
Data Out (Return)	Returns the file extension and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	No. Connecting the port is optional.
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetFileName component

Get the name of a file as part of an automation Workflow by using the GetFileName component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

About this task
You can configure the properties for the GetFileName component. For more information about these properties, see Properties of the File components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the GetFileName component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the GetFileName component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Filepath)	Takes the path to the file from a previously executed component.	Yes
Data Out	Returns the file name and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetFileNameWithoutExtension component

Get the name of a file without its extension as part of an automation Workflow by using the GetFileNameWithoutExtension component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetFileNameWithoutExtension component. For more information about these properties, see Properties of the File components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the GetFileNameWithoutExtension component to the Design surface.
3. To configure the input field, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Connect the data and control ports of the GetFileNameWithoutExtension component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Path)	Takes the path to the file from a previously executed component.	Yes
Data Out (Return)	Returns the file name and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetLastModifiedFile component

Get the name and path to the last modified file in a directory by using the GetLastModifiedFile component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetLastModifiedFile component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the GetLastModifiedFile component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetLastModifiedFile component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Folderpath)	Takes the path to the directory from a previously executed component.	Yes
Data In (searchSubDirectories)	Takes the Boolean response to indicate whether the method searches subdirectories inside the target directory from	No. Connecting the port is optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	a previously executed component.	
Data In (fileExtension)	If you want to find files by their extensions, then use this option. Takes the extension of a file type from a previously executed component.	No. Connecting the port is optional.
Data Out (Return)	Returns the path to the file and its name that were modified last.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetPathRoot component

Get the name of the root folder or directory of a path by using the GetPathRoot component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetPathRoot component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the GetPathRoot component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the GetPathRoot component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Path)	Takes the path from a previously executed component.	Yes
Data Out (Return)	Returns the name of the root folder in the path taken through the Data In port	Yes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	and passes to the next component.	To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetRandomFileName component

Get randomly generated file names and their extensions by using the GetRandomFileName component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the GetRandomFileName component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the GetRandomFileName component to the Design surface.
3. Connect the data and control ports of the GetRandomFileName component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (Return)	Returns the random file name and extension and passes to the next component	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Passes the file names from a previously executed component.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the GetTempFileName component

Get the names of temporary Windows files by using the GetTempFileName component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetTempFileName component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the GetTempFileName component to the Design surface.
3. Connect the data and control ports of the GetTempFileName component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (Return)	Returns the new temporary file name and path on the disk and passes to the next component to be executed.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the HasExtension component

Find out whether a file has an extension by using the HasExtension component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the HasExtension component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the HasExtension component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the HasExtension component to the corresponding ports of the other component as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Path)	Takes the path to the file and the name of the file from a previously executed component.	Yes
Data Out (Return)	Returns the Boolean value based on whether the file has an extension and passes the value to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the IsPathRooted component

Find out if the path you specify has a root folder by using the IsPathRooted component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the IsPathRooted component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the IsPathRooted component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the IsPathRooted component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Path)	Takes the path to the file from a previously executed component.	Yes
Data Out (Return)	Returns the Boolean value indicating whether the path has a root folder and passes the value to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the MoveFile component

Move a file from an existing location to a new location as part of an automation Workflow by using the MoveFile component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the MoveFile component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the MoveFile component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the MoveFilecomponent to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (sourcefilePath)	Takes the path to the source file from a previously executed component.	Yes
Data IN (destFilePath)	Takes the path to the destination directory from a previously executed component.	Yes
Data In (Overwrite)	Takes the Boolean value to indicate whether the method overwrites the same file in the destination directory from a previously executed component.	No
Control In	Connects to the Control Out port of one or more components.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ReadBytes component

Read the specified number of bytes as part of an automation Workflow by using the ReadBytes component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the ReadBytes component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the ReadBytes component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the ReadBytes component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (filePath)	Takes the path to a file from a previously executed component.	Yes
Data Out (Return)	Returns the bytes as a string array and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ReadText component

Return all text in a file as output by using the ReadText component in the RPA Desktop Design Studio.

Before you begin

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can configure the properties for the ReadText component. For more information about these properties, see Properties of the File components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the ReadText component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the ReadText component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (filePath)	Takes the path to the file from a previously executed component.	Yes
Data Out (Return)	Returns the read text from the file and passes the output to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the RenameFile component

Rename a file and change the file type by using the RenameFile component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the RenameFile component. For more information about these properties, see Properties of the File components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the RenameFile component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the RenameFile component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (filePath)	Takes the path to the file and its name from a previously executed component.	Yes
Data In (newName)	Takes the new name of the file from a previously executed component. **Note:** You must provide the extension of the file. By providing a new extension, you can change the file type.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the WriteBytes component

Write the specified byte array to a file as part of an automation Workflow by using the WriteBytes component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the WriteBytes component. For more information about these properties, see Properties of the File components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the WriteBytes component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the WriteBytes component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (filePath)	Takes the path to the file from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (bytes)	Takes the bytes as byte array from a previously executed component.	Yes
Data Out	Returns **True** if the operation is successful and **False** if the write operation failed and passes the Boolean value to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the WriteText component

Append or overwrite existing text to an existing file or create a file and write text to it with the WriteText component in the RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the WriteText component. For more information about these properties, see Properties of the File components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **File**.
2. Drag the WriteText component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the WriteText component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (filePath)	Takes the path to an existing or a new file and the file name from a previously executed component.	Yes
Data In (text)	Takes the text to be written to the exiting file or new file from a previously executed component.	Yes
Data Out	Returns **True** if the text is written to the file. Otherwise, it returns **False** and passes	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	the Boolean output to the next component.	
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the File components

Learn about the properties of the File components in RPA Desktop Design Studio.

Properties of the File components

Property	Description
Search	Option to enable a search for a property.
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.

Directory

The Directory components in the RPA Desktop Design Studio perform standard operations on Windows directories. For example, rename a directory or get the list of files in a directory.

Use the CopyDirectory component

Copy a directory to another location by using the CopyDirectory component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the CopyDirectory component. For more information about these properties, see Properties of the Directory components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the CopyDirectory component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the CopyDirectory component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (SourceDirPath)	Takes the path to the source directory from a previously executed component.	Yes
Data In (destDirPath)	Takes the path to the destination directory from a previously executed component.	Yes
Data In (overwrite)	Takes the Boolean value to indicate whether the method overwrites the directory in the destination folder from a previously executed component.	No
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the CreateDirectory component

Create a directory by using the CreateDirectory component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the CreateDirectory component. For more information about these properties, see Properties of the Directory components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the CreateDirectory component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the CreateDirectory component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (directoryPath)	Takes the path where the directory will be created and the directory name from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the CurrentDirectory component

Get the current working directory path and name by using the CurrentDirectory component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the CurrentDirectory component. For more information about these properties, see Properties of the Directory components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the CurrentDirectory component to the Design surface.
3. Connect the data and control ports of the CurrentDirectory component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data Out (directoryPath)	Returns the path to the current working directory and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the DeleteDirectory component

Delete a directory by using the DeleteDirectory component in RPA Desktop Design Studio.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can configure the properties for the DeleteDirectory component. For more information about these properties, see Properties of the Directory components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the DeleteDirectory component to the Design surface.
3. Connect the data and control ports of the DeleteDirectory component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (directoryPath)	Takes the path to the directory from a previously executed component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the DirectoryExists component

Find out if a directory exists by using the DirectoryExists component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the DirectoryExists component. For more information about these properties, see Properties of the Directory components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the DirectoryExists component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the DirectoryExists component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (directoryPath)	Takes the path to the directory and its name from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data Out (Return)	Returns **True** if the specified directory exists. Otherwise, it returns **False** and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetFiles component

Get the names of the files in the directory and subdirectories by using the GetFiles component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetFiles component. For more information about these properties, see Properties of the Directory components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the GetFiles component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the GetFiles component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (directoryPath)	Takes the path to the directory from a previously executed component.	Yes
Data In (searchSubDirectories)	Takes the Boolean value to indicate whether the method searches the subdirectories from a previously executed component.	No
Data In (fileExtension)	Takes the extension of a file from a previously executed component. You can use this field if you want to search for files with a particular extension.	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data Out (Return)	Returns the names of all the subdirectories and files in the specified directory and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetLastModifiedFolder component

Get the name of the last modified folder by using the GetLastModifiedFolder component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetLastModifiedFolder component. For more information about these properties, see Properties of the Directory components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the GetLastModifiedFolder component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetLastModifiedFolder component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (directoryPath)	Takes the path to the directory from a previously executed component.	Yes
Data In (searchSubDirectories)	Takes the Boolean value to indicate whether the method searches the subdirectories for changes from a previously executed component.	Yes
Data Out (Return)	Returns the name of the last modified folder and the file name and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetSubFolders component

Get the names of all subfolders under a directory by using the GetSubFolders component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetSubFolders component. For more information about these properties, see Properties of the Directory components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the GetSubFolders component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetSubFolders component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (directoryPath)	Takes the path to the folder from a previously executed component.	Yes
Data In (searchSubDirectories)	Takes the Boolean value to indicate whether the method gets the subfolder names from the subdirectories from a previously executed component.	No
Data Out (Return)	Returns the names of all the subdirectories and files in a specified directory as an ArrayList and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the MoveDirectory component

Move a directory and its contents to a new location by using the MoveDirectory component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the MoveDirectory component. For more information about these properties, see Properties of the Directory components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the MoveDirectory component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the MoveDirectory component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (sourceDirPath)	Takes the path to the source directory from a previously executed component.	Yes
Data IN (destDirPath)	Takes the path to the destination directory from a previously executed component.	Yes
Data In (overwrite)	Takes the Boolean response on whether the method should overwrite the same directory in the destination folder from a previously executed component.	No
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the RenameDirectory component

Change the name of a directory by using the RenameDirectory component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the RenameDirectory component. For more information about these properties, see Properties of the Directory components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Directory**.
2. Drag the RenameDirectory component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the RenameDirectory component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (directoryPath)	Takes the path to the directory from a previously executed component.	Yes
Data In (newname)	Takes the new directory name from a previously executed component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Directory components

Learn about the properties of the Directory components in RPA Desktop Design Studio.

Properties of Directory components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of Directory components (continued)

Property	Description
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

HTTP

The HTTP components enable you to interact with servers over the HTTP protocol. You can download files or post content to the server using the components.

Use the DownloadFile component

Download a file over the HTTP protocol using the DownloadFile component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the DownloadFile component. For more information about these properties, see Properties of the HTTP components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **HTTP**.
2. Drag the DownloadFile component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the DownloadFile component to the corresponding ports of the other components as described in the following table:

Port name	Port type	Data type	Purpose of connection	Mandatory?
URL	Data In	String	Takes the URL from a previously executed component.	Yes
FilePath	Data In	String	Takes the path to the file the method downloads from a previously executed component.	Yes
UserName	Data In	String	Takes the user name to log in to the server from a previously executed component.	Yes
Password	Data In	String	Takes the password to log	Yes

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port name	Port type	Data type	Purpose of connection	Mandatory?
			in to the server from a previously executed component.	
RequestTimeout	Data In	Integer	Time value in seconds to timeout the download request. If the download request does not happen after the timeout value that you set, the download request fails and a connection timeout exception is displayed. The default value of timeout is 100 seconds.	Optional
NA	Control In	NA	Passes the control through the Control In port of the next component.	Optional
NA	Control Out	NA	Passes the control through the Control In port of the next component.	Optional

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Post component

Perform a POST request to a server by providing the request using the Post component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Post component. For more information about these properties, see Properties of the HTTP components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **HTTP**.
2. Drag the Post component to the Design surface.

3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Post component to the corresponding ports of the other components as described in the following table:

Port Name	Port type	Data type	Purpose of connection	Mandatory
URL	Data In	String	Takes the URL where the content will be posted from a previously executed component.	Yes
Data	Data In	Object	Takes the data the component posts from a previously executed component.	Yes
ContentType	Data In	String	Takes the content type such as JSON or XML from a previously executed component.	Yes
RequestTimeout	Data In	Integer	Time value in seconds to timeout the request. If the post request does not work after the timeout value that you set, the request fails and a connection timeout exception is displayed. The default timeout value is 100 seconds.	Optional
Status	Data In	String	Takes status of the content from a previously executed component.	Yes
Response	Data Out	Object	Returns the status of the POST operation.	Yes. To preview the data, right-

Port Name	Port type	Data type	Purpose of connection	Mandatory
				click the **Status** and **Response** fields and click **Preview Data**.
NA	Control In		Connects to the Control Out port of one or more components.	Yes
NA	Control Out		Connects to the Control In port of another component or the default end component.	Optional

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the HTTP components

Learn about the properties of the HTTP components in RPA Desktop Design Studio.

Properties of the HTTP components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Image Utilities

The Image utility components in the RPA Desktop Design Studio perform various useful operations on images. For example, adjust brightness or contrast or resize images.

Use the AdjustBrightness component

Adjust the brightness of an image as part of an automation Workflow by using the AdjustBrightness component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the AdjustBrightness component. For more information about these properties, see Properties of the Image Utilities components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the AdjustBrightness component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the AdjustBrightness component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image from a previously executed component.	Yes
Data In (Value)	Takes the value to adjust the brightness from a previously executed component.	Yes
Data Out	Returns the image with the specified brightness.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the AdjustContrast component

Adjust the contrast of an image as part of an automation Workflow by using the AdjustContrast component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the AdjustContrast component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the AdjustContrast component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the AdjustContrast component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image from a previously executed component.	Yes
Data In (Value)	Takes the value to adjust the contrast from a previously executed component.	Yes
Data Out	Returns the image with the specified contrast.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Convert component

Convert the format of an image to a different format by using the Convert component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Convert component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the Convert component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Convert component to the corresponding ports of the other components as described in the following table.

Convert component parameters

Name	Purpose of connection	Port type	Data Type
Image	Takes the path to the current image from a previously executed component. For example, provide a file path of the	Data In	Bitmap

Name	Purpose of connection	Port type	Data Type
	Convert component using other components 		

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the DrawBorder component

Create a border around an image as part of an automation Workflow by using the DrawBorder component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the DrawBorder component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the DrawBorder component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the DrawBorder component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image from a previously executed component.	Yes
Data In (BorderSize)	Takes the value that determines the border size from a previously executed component.	Yes
Data Out (Return)	Returns the image with the specified border and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the DrawRectangle component

Draw a rectangle on an image and specify its dimensions as part of an automation Workflow by using the DrawRectangle component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the DrawRectangle component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the DrawRectangle component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the DrawRectangle component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image on which the method draws a rectangle from a previously executed component.	Yes
Data In (Top)	Takes the top measurement from a previously executed component.	No
Data In (Left)	Takes the left measurement from a previously executed component.	No
Data In (Height)	Takes the height of the rectangle from a previously executed component.	No
Data In (Width)	Takes the width of the rectangle from a previously executed component.	No
Data In (Color)	Takes the color of the rectangle in hex values from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Thickness)	Takes the border thickness of the rectangle from a previously executed component.	Yes
Data Out	Returns the image after drawing a rectangle with the specified dimensions.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the DrawString component

Draw a string on an image at a specific location and set the string's color, font style, and size as part of an automation Workflow by using the DrawString component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the DrawString component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the DrawString component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the DrawString component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image on which the method draws a string from a previously executed component.	Yes
Data In (Text)	Takes the text string from a previously executed component.	Yes
Data In (Top)	Takes the top measurement from a previously executed component.	No

Port type	Purpose of connection	Mandatory?
Data In (Left)	Takes the left measurement from a previously executed component.	No
Data In (Color)	Takes the color of the string in hex values from a previously executed component.	Yes
Data In (Font)	Takes the font of the string in from a previously executed component.	No
Data In (FontSize)	Takes the font size of the string from a previously executed component.	No
Data Out	Returns the image after drawing a rectangle with the specified dimensions.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetPart component

Crop and retrieve part of an image as part of an automation Workflow by using the GetPart component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the GetPart component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the GetPart component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetPart component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image from a previously executed component.	Yes

Port type	Purpose of connection	Mandatory?
Data In (Top)	Takes the top measurement from a previously executed component.	No
Data In (Left)	Takes the left measurement from a previously executed component.	No
Data In (Height)	Takes the height of the rectangle from a previously executed component.	No
Data Out	Returns the image with the specified dimensions.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Grayscale component

Convert a color image to grayscale as part of an automation Workflow by using the Grayscale component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure properties for the Grayscale component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the Grayscale component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Grayscale component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Required?
Data In	Takes the color image from a previously executed component.	Yes
Data Out	Returns the image after converting it to grayscale.	Yes.

Port type	Purpose of connection	Required?
		To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	No. Connecting the port is optional.
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ImageToString component

Extract text from an image and return the text as output by using the ImageToString component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the ImageToString component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the ImageToString component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ImageToString component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image from a previously executed component.	Yes
Data Out (Return)	Returns the input image as string.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Invert component

Invert the colors of an image as part of an automation Workflow by using the Invert component in RPA Desktop Design Studio. The component takes the original colors of the image you input and applies the exact opposite of the colors.

Before you begin
Role required: none

About this task
You can configure the properties for the Invert component. For more information about these properties, see Properties of the Image Utilities components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the Invert component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the Invert component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image the method inverts from a previously executed component.	Yes
Data Out (Return)	Returns the image with the inverted colors.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Median component

Apply the median filter to an image as part of an automation Workflow by using the Median component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure properties for the Median component. For more information about these properties, see Properties of the Image Utilities components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the Median component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Median component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image from a previously executed component.	Yes
Data In (SquareSize)	Takes the square size of each pixel from a previously executed component.	No
Data Out (Return)	Returns an image with the median filter applied.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ReadFromFile component

Read an image file from its path and name and return the image as an output by using the ReadFromFile component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the ReadFromFile component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the ReadFromFile component to the Design surface.
3. Configure the input field, see Configure port properties.
4. Connect the data and control ports of the ReadFromFile component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Filepath)	Takes the path to the image file and its name from a previously executed component.	No. Connecting the port is optional.
Data Out	Returns the image as a bitmap and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	No. Connecting the port is optional.
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Resize component

Resize an image by specifying the dimensions as part of an automation Workflow by using the Resize component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Resize component. For more information about these properties, see Properties of the Image Utilities components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the Resize component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Resize component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image the method resizes from a previously executed component.	Yes
Data In (Width)	Takes the new width from a previously executed component.	Yes
Data In (Height)	Takes the new height from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data Out	Returns the resized image.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Save component

Save an image to a specific location as part of an automation Workflow by using the Save component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Save component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the Save component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Save component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image from a previously executed component.	Yes
Data In (Filepath)	Takes the new path to the location where the method saves the image from a previously executed component.	Yes
Data In (Overwrite)	Takes the Boolean response to whether the method should overwrite the same file at the new location from a previously executed component.	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data Out (Return)	Returns the Boolean response to whether the operation was successful and passes to the next component.	Next. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ScaleImage component

Scale the size or dimensions of an image as part of an automation Workflow by using the ScaleImage component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the ScaleImage component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the ScaleImage component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ScaleImage component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image that the method scales from a previously executed component.	Yes
Data In (Scale)	Takes the value to scale the image accordingly from a previously executed component. Negative values are not allowed.	Yes
Data Out (Return)	Returns the scaled image and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Sharpen component

Sharpen an image to enhance its appearance as part of an automation Workflow by using the Sharpen component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Sharpen component. For more information about these properties, see Properties of the Image Utilities components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the Sharpen component to the Design surface.
3. Connect the data and control ports of the Sharpen component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image to sharpen from a previously executed component.	Yes
Data Out (Return)	Returns the sharpened image and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the StringToImage component

Create an image from an input string as part of an automation Workflow by using the StringToImage component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

About this task
You can configure the properties for the StringToImage component. For more information about these properties, see Properties of the Image Utilities components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the StringToImage component to the Design surface.
3. To configure the inputs, see Configure port properties.
4. Connect the data and control ports of the StringToImage component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (strimage)	Takes the image from a previously executed component.	Yes
Data Out (Return)	Returns the input string as image.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Threshold component

Apply the threshold filter to an image as part of an automation Workflow by using the Threshold component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Threshold component. For more information about these properties, see Properties of the Image Utilities components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the Threshold component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Threshold component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image from a previously executed component.	Yes
Data Out (Range)	Takes the threshold value for the image from a previously executed component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Trim component

Remove the transparent pixels from the borders of an image as part of an automation Workflow by using the Trim component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Trim component. For more information about these properties, see Properties of the Image Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Image Utilities**.
2. Drag the Trim component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the Trim component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Image)	Takes the image that the method trims from a previously executed component.	Yes
Data Out (Return)	Returns the trimmed image and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Image Utilities components

Learn about the properties of the Image Utilities components in RPA Desktop Design Studio.

Properties of Image Utilities components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

JSON

The JSON components in the RPA Desktop Design Studio perform different operations on JSON objects. For example, serialize a JSON object or get JSON object properties.

Use the DeserializeObject component

Convert a string containing JSON data to a JSON object by using the DeserializeObject component in RPA Desktop Design Studio. You can also extract specific properties from the JSON object.

Before you begin

Role required: none

About this task

To configure the properties for the DeserializeObject component, see Properties of the JSON utilities.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **JSON**.
2. Drag the DeserializeObject component to the Design surface.
3. **Optional:** To specify the required property name in the JSON object that you want to extract, do the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click the component settings icon ( ).

b. Click the add property icon ( ).

c. Enter a property name.

d. Repeat the steps to add multiple properties.
A Data Out port is added with each key that you provide.

e. Click **OK**.

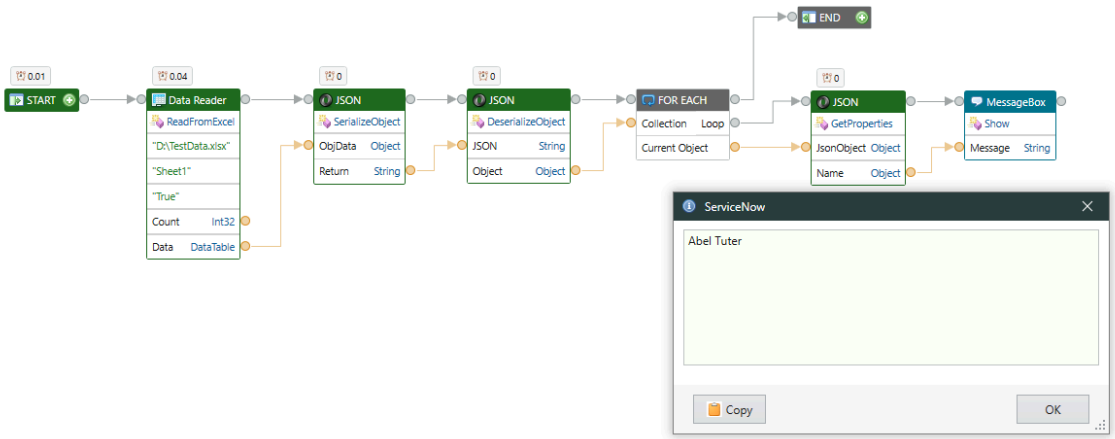
4. To configure the input field, see Configure port properties.
5. **Optional:** Connect the data and control ports of the DeserializeObject component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Description
Data In	JSON	String	The string containing JSON data to be converted to a JSON object.
Data Out	Object	Object	The output parameter to store the converted JSON object.
Data Out	Name of the port is the same as the name of the key that you add.	Object	Returns the value of the key from the string. (Optional) This appears when additional properties are added to the component settings.

6. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Convert a string to a JSON object



In this example, the ReadFromExcel component reads data from an Excel document and passes to the SerializeObject component. The SerializeObject component converts the data to string and passes to the DeserializeObject component. The DeserializeObject component converts the string to the JSON object. The items in the Excel document traverses from first to last in the For Each component and passes the item to the GetProperties component. The GetProperties component returns the name of the component and passes the name of the item to the Show component. The item is shown in a message box.

Use the GetProperties component

Get the values of multiple properties from a JSON object by using the GetProperties component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

To configure the properties of the GetProperties component, see Properties of the JSON utilities.

Procedure

1. In the Toolbox pane, navigate to **General** and drag the Variable component to the Design surface.
2. Double-click the variable and enter a code as a variable.

```
{
  "name": "Abel Tutor",
  "age": 30,
  "email": "abletutor@example.com",
}
```

3. In the Toolbox pane, navigate to **Utilities** > **JSON**.
4. Drag the GetProperties component to the Design surface.
5. Click the component settings icon ( ).
6. Click the Add property icon ( ).
7. Enter a property name.
8. **Optional:** Repeat the steps to add multiple property names.
   A Data In port is added with each property that you add.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Click **OK**.
10. To configure the input fields, see Configure port properties.
11. **Optional:** Connect the data and control ports of the GetProperties component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Description
Data In	JsonObject	Object	The JSON object from which to extract property values. (Optional) JSON object to be passed from the previous component. Serialize the JSON and pass it from the previous component to get properties. Example of JSON object: `{ "name": "Abel Tutor", "age": 30, "email": "abletutor@example.com", "address": { "street": "123 Main St", "city": "New York", "state": "NY", "zip": "10001" }, "phoneNumbers": [ { "type": "home", "number": "555-1234" }, {`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Port name	Data type	Description
			<pre>"type": "work", "number": "555-5678" }], "isActive": true }</pre>
Data Out	Name of the port is the same as the name of the properties that you added.	Object	Returns the values of the properties. (Optional) If no property value is found, the port return an error.

12. **Optional:** To test the component, right-click the component bar and click **Run From Here**.

Use the GetProperty component

Get the value of a property from a JSON object by using the GetProperty component in the RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
To configure the properties for the GetProperty component, see Properties of the JSON utilities.

Procedure
1. In the Toolbox pane, navigate to **General** and drag the Variable component to the Design surface.
2. Double-click the variable and enter a code as a variable.
   For example,

```
{
  "name": "Abel Tutor",
  "age": 30,
  "email": "abletutor@example.com",
}
```

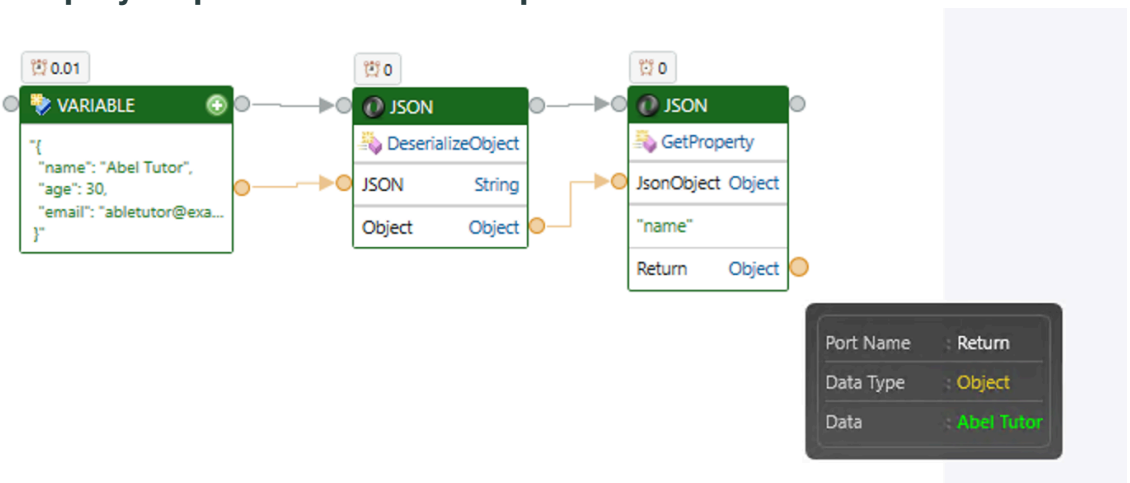
3. In the Toolbox pane, navigate to **Utilities** > **JSON**.
4. Drag the DeserializeObject component to the Design surface to convert a string containing JSON data to a JSON object.
5. In the Toolbox pane, navigate to **Utilities** > **JSON**.
6. Drag the GetProperty component to the Design surface.
7. To configure the input fields, see Configure port properties.
8. **Optional:** Connect the ports as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Port name	Data type	Description
Data In	JsonObject	Object	The JSON object from which to extract a property value.
Data In	PropertyName	String	The name of the property whose value is to be retrieved. (Optional) For example, `name`.
Data Out	Return	Object	Returns the value of the property. (Optional) If no property value is found, the port return an error.

9. **Optional:** To test the component, right-click the component bar and click **Run From Here**. The name is displayed as Abel Tutor when you right-click the GetProperty Data Out port.

GetProperty component Automation Example



Use the JsonArrayToArray component

Convert a JSON object to an array of objects using the JsonArrayToArray component in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

To configure the properties for the JsonArrayToArray component, see Properties of the JSON utilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **JSON**.
2. Drag the JsonArrayToArray component to the Design surface.
3. In the Toolbox pane, navigate to **General** > **Variable**.
4. Drag the Variable component to the Design surface.
5. Double-click the variable and enter a script.

   An example of a script.

```
[{
  "name": "Abel Tutor",
  "age": 30,
  "email": "abletutor@example.com",
},
{
  "name": "Alex Tutor",
  "age": 32,
  "email": "alextutor@example.com",
}]
```

6. To configure the input field, see Configure port properties.
7. **Optional:** Connect the data and control ports of the JsonArrayToArray component to the corresponding ports of the other components as described in the following table and image.

Port type	Port name	Data type	Description
Data In	JsonObject	Object	The JSON object to be converted to an array of objects.
Data Out	Return	Object[]	Used to return an array of JObjects. Each JObject has the same set of properties with different values for each property. (Optional) To modify the details of a JObject, iterate over the JObjects in the

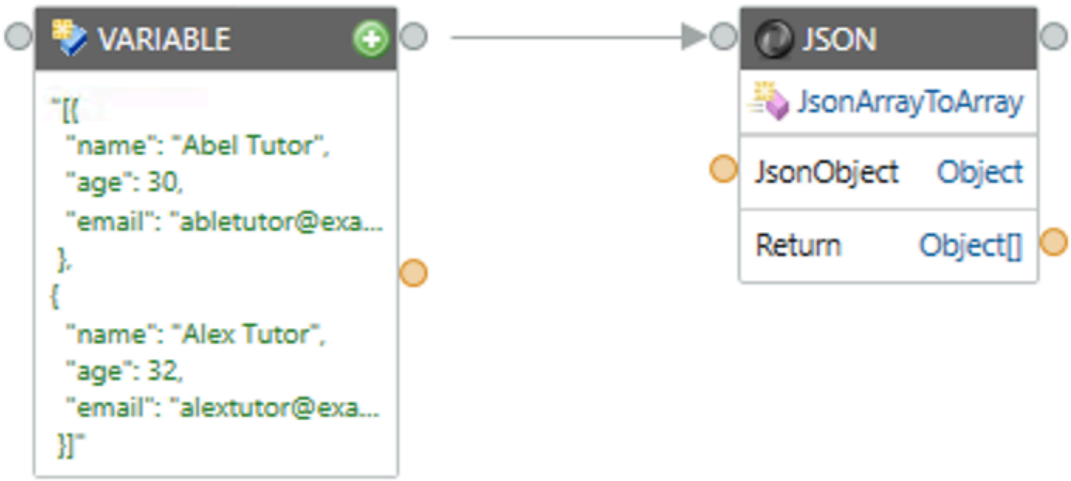
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

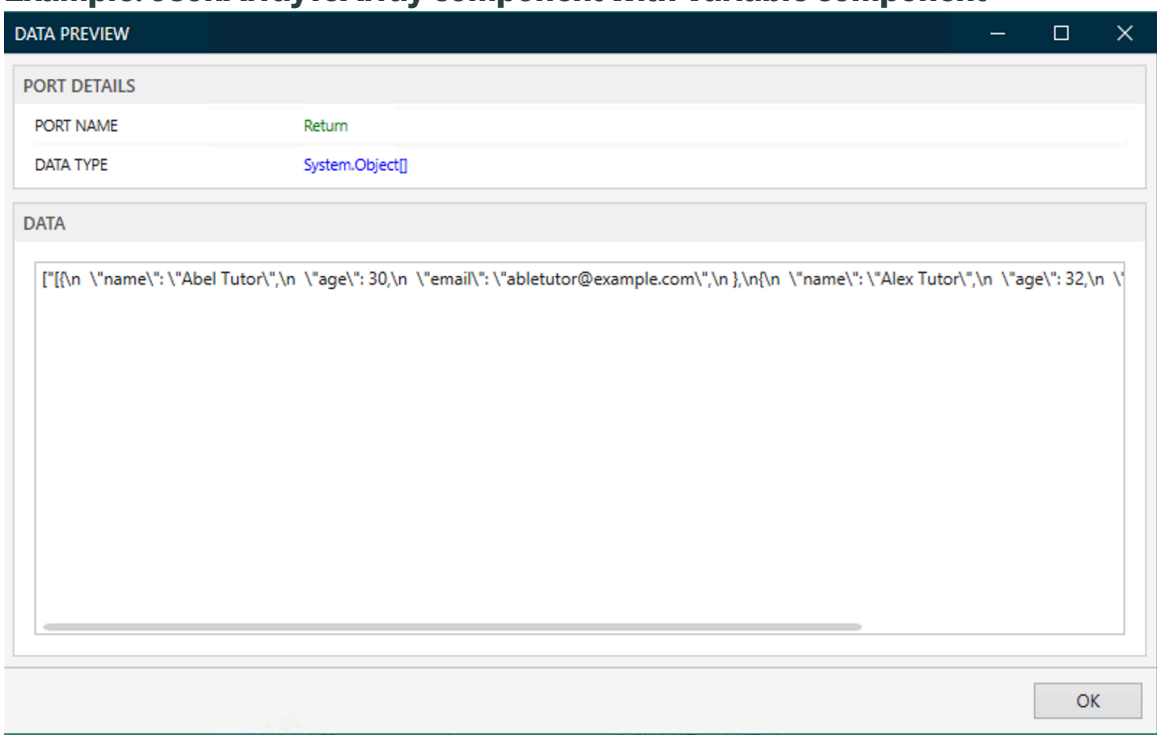
Port type	Port name	Data type	Description
			array returned until the criteria is met.

JsonArrayToArray component with Variable component



8. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.
9. To view the complete data output, right-click the Data port of JsonArrayToArray component and select **Preview Data**.

Example: JsonArrayToArray component with Variable component



Use the SerializeObject component

Convert a JSON object to a string by using the SerializeObject component in RPA Desktop Design Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

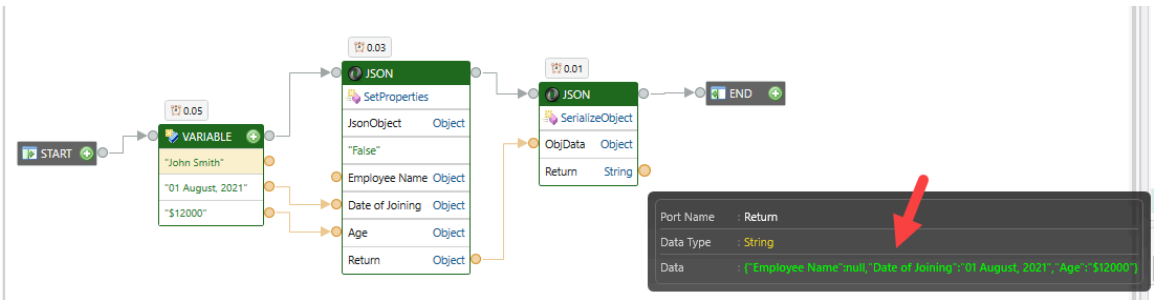
About this task
To configure the properties for the SerializeObject component, see Properties of the JSON utilities.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **JSON**.
2. Drag the SerializeObject component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. **Optional:** Connect the data and control ports of the SerializeObject component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Description
Data In	ObjData	Object	The JSON object to be converted to a string.
Data Out	Return	String	Returns a JSON string which is representation of given object.

5. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Example: Convert employee data from JSON object format to string



In this example, a JSON object contains the name, date of joining, and the salary of an employee. The JSON object is created by using the SetProperties component. To convert the JSON object to string, we use the SerializeObject component. After you run the automation, point the mouse device over the **Return** Data Out port of the SerializeObject component. The component displays the data as a string.

Use the SetProperties component

Set multiple properties within a JSON object by using the SetProperties component in the RPA Desktop Design Studio. You can also override a property within the JSON object.

Before you begin
Role required: none

About this task
To configure the properties of the SetProperties component, see Properties of the JSON utilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **JSON**.
2. Drag the SetProperties component to the Design surface.
3. Click the component settings icon ( ).
4. Click the add property icon ( ).
5. Enter the property name.
6. Repeat the steps to add more property names.
7. Click **OK**.
8. To provide the values for the property names, see Configure port properties.
9. **Optional:** Connect the data and control ports of the SetProperties component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Description
Data In	JsonObject	Object	The JSON object in which the properties are to be set. (Optional) The properties that you set in this component are added to the JSON object.
Data In	Override	Boolean	Indicates whether to override properties, if they already exist. (Optional) If True, the component overrides an existing property in the JSON object with the property that you specify. Else, if False, it doesn't override any property.
Data In	Name of the port is the same as the name of the property that you added in the component settings.	Object	Takes the value of the property name.
Data Out	Return	Object	Returns a JSON object with updated or new values for multiple properties.

10. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the SetProperty component

Set a property within a JSON object by using the SetProperty component in the RPA Desktop Design Studio. You can also override a property within the JSON object.

Before you begin

Role required: none

About this task

To configure the properties of the SetProperty component, see Properties of the JSON utilities.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **JSON**.
2. Drag the SetProperty component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. **Optional:** Connect the data and control ports of the SetProperty component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Description
Data In	JsonObject	Object	The JSON object in which the property is to be set. (Optional) The property that you set in this component is added to the JSON object.
Data In	PropertyName	String	The name of the property to set in the JSON object.
Data In	PropertyValue	String	The value to set for the specified property in the JSON object.
Data In	Override	Boolean	Indicates whether to override the property if it already exists. (Optional) If True, the component overrides an existing property in the JSON object with the property that you specify. Else, if False, it doesn't override any property.
Data Out	Return	Object	Returns the JSON object with the

Port type	Port name	Data type	Description
			updated or new property value.

5. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Properties of the JSON utilities

Learn about the properties of the JSON utilities in RPA Desktop Design Studio.

Properties for the JSON utilities

Property name	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Keyboard

The Keyboard component in the RPA Desktop Design Studio simulate keyboard strokes and shortcuts to perform various day-to-day actions on various applications and programs.

Use the SendKeys component

Simulate the actions of the standard Microsoft Windows supported keys on various applications and programs with the SendKeys component in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

The standard Microsoft Windows keyboard provides many keyboard functions to perform various day-to-day tasks quickly and efficiently. For example, **[Alt+A]** can select all content on a file.

Note:
You must specify the keyboard shortcuts within the square brackets []. For example, [Ctrl +A].

To see the various supported keys, see Supported keys and functions.

You can configure the properties for the SendKeys component. For more information about these properties, see Properties of keyboard components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Keyboard**.
2. Drag the SendKeys component to the Design surface.
3. To configure the input fields, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Connect the data and control ports of the SendKeys component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection	Mandatory?
Data In	keys	String	Takes keys that perform an action on the application.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of keyboard components

Learn about the properties of the keyboard components in RPA Desktop Design Studio.

Properties of the keyboard components

Property name	Description
Delay Before Execution	The number of seconds to pause before running.
Delay After Execution	The number of seconds to pause after running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Math

The Math components in the RPA Desktop Design Studio perform simple mathematical operations. For example, find the highest integer or round off a decimal.

Use the Max component

Take two integers and find which one is larger as part of an automation Workflow by using the Max component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Max component. For more information about these properties, see Properties of the Math components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Math**.
2. Drag the Max component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Max component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Value1)	Takes the first of the two integers that the method compares from a previously executed component.	Yes
Data In (Value2)	Takes the last of the two integers that the method compares from a previously executed component.	Yes
Data Out (Return)	Returns the larger of the two integers entered and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Min component

Take two integers and find which one is smaller as part of an automation Workflow by using the Min component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Min component. For more information about these properties, see Properties of the Math components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Math**.
2. Drag the Min component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Min component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Value1)	Takes the first of the two integers that the method compares from a previously executed component.	Yes
Data In (Value2)	Takes the last of the two integers that the method	Yes

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	compares from a previously executed component.	
Data Out	Returns the smaller of the two integers entered and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Round component

Round a decimal to the closest integer as part of an automation Workflow by using the Round component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Round component. For more information about these properties, see Properties of the Math components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Math**.
2. Drag the Round component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Round component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Value)	Takes the fraction number from a previously executed component.	Yes
Data In (Decimals)	Takes the integer value that defines the decimal places from a previously executed component.	Yes
Data Out	Returns the rounded off value to the closest integer and passes to the next component.	Yes. To preview the data, right-click the **Return** field and click **Preview Data**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Math components

Learn about the properties of the Math components in RPA Desktop Design Studio.

Properties of the Math components

Property	Description
Delay Before Execution	The number of seconds to pause before running.
Delay After Execution	The number of seconds to pause after running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Mouse

The Mouse components enable you to perform various mouse device actions as part of a Workflow on various programs and applications.

Use the Click component

Simulate the click actions of the mouse device on applications and programs with the Click component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Click component. For more information about these properties, see Properties of the Mouse components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Mouse**.
2. Drag the Click component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Click component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Left)	Takes the exact position from the left of the screen in integer from a previously executed component. The mouse device click will occur at this position.	Yes
Data In (Top)	Takes the exact position from the top of the screen in integer from a previously executed component. The mouse device click will occur at this position.	Yes
Data In (ClickType)	Takes the type of click action the mouse device will perform from a previously executed component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetPosition component

Get the current mouse position on the screen in integer terms by using the GetPosition component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetPosition component. For more information about these properties, see Properties of the Mouse components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Mouse**.
2. Drag the GetPosition component to the Design surface.
3. Connect the data and control ports of the GetPosition component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Date Out (Left)	Takes the current mouse device position relative to the left of the screen from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
		To preview the data, right-click the **Return** field and click **Preview Data**.
Data Out (Top)	Takes the current mouse device position relative to the top of the screen from a previously executed component.	Yes To preview the data, right-click the **Return** field and click **Preview Data**.
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Move component

Move the mouse device to a precise location on the screen by specifying the parameters using the Move component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Move component. For more information about these properties, see Properties of the Mouse components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Mouse**.
2. Drag the Move component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Move component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Left)	Takes the location relative to the left of the screen from a previously executed component.	Yes
Data In (Top)	Takes the location relative to the top of the screen from a previously executed component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of any other component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Scroll component

Simulate the scrolling by the mouse device on applications and programs using the Scroll component in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Scroll component. For more information about these properties, see Properties of the Mouse components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Mouse**.
2. Drag the Scroll component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Scroll component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Left)	Takes the position where the scrolling occurs relative to the left of the screen from a previously executed component.	Yes
Data In (Top)	Takes the position where the scrolling occurs relative to the top of the screen from a previously executed component.	Yes
Data In (ScrollType)	Takes the direction of scrolling from a previously executed component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Mouse components

Learn about the properties of the Mouse components in RPA Desktop Design Studio.

Properties of mouse components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Random

The Random components in the RPA Desktop Design Studio perform random operations on data types. For example, generate a random password or a number within a range of numbers.

Use the Number component

Generate any random number between two integers by using the Number component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Number component. For more information about these properties, see Properties of the Random components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Random**.
2. Drag the Number component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Number component to the corresponding ports of the other components.

Port type	Purpose of connection	Mandatory?
Data In (Min)	Takes the starting integer of the range from a previously executed component.	Yes
Data In (Max)	Takes the ending integer of the range from a previously executed component.	Yes
Data Out (Return)	Returns the random number and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	No. Connecting the port is optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of another component or the default end component.	No. Connecting the port is optional.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Password component

Generate any random password by using the Password component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can define the complexity of the password based on the following rules:

- Define the length of the password. 11 is the default length.
- Number of lowercase characters. The default number is 1.
- Number of uppercase characters. The default number is 1.
- Symbols. The default symbols are "~!@#$%^&*()_-+=;?\/"
- Number of symbols: The default count is 1.
- Numbers. The default number is 1.

To configure the properties for the Password component, see Properties of the Random components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Random**.
2. Drag the Password component to the Design surface.
3. To provide the inputs to the fields, see Configure port properties.
4. **Optional:** Connect the data and control ports of the Password component to the corresponding ports of the other components as described in the following table.

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data In	Length	Integer	Takes the length of the password.	11	Yes
Data In	Lowercase	Integer	Takes the number of lowercase characters to be included in the password.	1	Yes
Data In	Uppercase	Integer	Takes the number of	1	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
			uppercase characters to be included in the password.		
Data In	Symbols	String	Takes the symbols to be included in the password.	~!@#$ %^&*()_-+=;? \/	Yes
Data In	SymbolsCount	Integer	Takes the count of symbols to be included in the password.	1	Yes
Data In	Numbers	Integer	Takes the total count of numbers to be included in the password.	1	Yes
Data Out	Return	String	Returns the random password.	Not applicable	Not applicable

5. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Use the String component

Generate a random string by using the String component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the String component. For more information about these properties, see Properties of the Random components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Random**.
2. Drag the String component to the Design surface.
3. Connect the data and control ports of the String component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Size)	Takes the length of the string from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data Out	Returns the random string and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	Yes

4. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Random components

Learn about the properties of the Random components in RPA Desktop Design Studio.

Properties of the Random components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Reflection

The Reflection components in the RPA Desktop Design Studio perform standard Reflection operations on objects and classes. For example, retrieve object properties.

Use the GetListItem component

Return items from a list by using the GetListItem component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the GetListItem component. For more information about these properties, see Properties of the Reflection components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Reflection**.
2. Drag the GetListItem component to the Design surface.
3. To set the field that accepts an item from the list, do the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click the component settings icon ( ).

b. Click the add index icon ( ).

c. **Optional:** Update the data type of the index value.
A Data out port is dynamically created with each index that you add.

d. **Optional:** Repeat the steps to add more indexes.

e. Click **OK**.

4. To configure the input field, Configure port properties.
5. **Optional:** Connect the data and control ports of the GetListItem component to the corresponding ports of the other components.

Port type	Port name	Data type	Purpose of connection	Default value	Mandatory?
Data In	Instance	Object	Takes a list item.	No default value	Yes
Data Out	Name of the port is the same as the name of the index value that is created.	Object	Returns the list item.	Not applicable	Not applicable

6. **Optional:** To test the component, right-click the component bar and then click **Run From Here**.

Use the GetProperty component

Access single or multiple properties of a given object at a time by using the GetProperty component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetProperty component. For more information about these properties, see Properties of the Reflection components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Reflection**.
2. Drag the GetProperty component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Click the add icon ( ) on the GetProperty component title bar to add the additional parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Connect the data and control ports of the GetProperty component to the corresponding ports of the other components.

Port type	Purpose of connection	Mandatory?
Data In	Connects to the Data Out port of another component from where the data is to be collected. The For Loop component exposes the From and To Data In ports.	Yes
Dynamic Data Out	Connects to the Data In port of another component where the data is to be displayed. This port is displayed when you add items into the component.	No
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	Yes

6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SetListItem component

Return the specific defined st items by using the SetListItem component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the SetListItem component. For more information about these properties, see Properties of the Reflection components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Reflection**.
2. Drag the SetListItem component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the SetListItem component to the corresponding ports of the other components.

Port type	Purpose of connection	Mandatory?
Data In	Connects to the Data Out port of another component from where the data is to be collected. The For Loop	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	component exposes the From and To Data In ports.	
Dynamic Data Out	Connects to the Data In port of another component where the data is to be displayed. This port is displayed when you add items into the component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SetProperty component

Set the properties of an object instance by using the SetProperty component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the SetProperty component. For more information about these properties, see Properties of the Reflection components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Reflection**.
2. Drag the SetProperty component to the Design surface.
3. On the SetProperty component bar, click the component settings icon ( ).
4. To add a property, click the add property icon ( ).
5. In the **Property Name** box, enter the property name.
6. **Optional:** Update the property data type from the list.
7. To configure input fields, see Configure port properties.
8. Connect the data and control ports of the SetProperty component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Instance)	Passes the object from a previously executed component.	No. Connecting the port is optional.
Data Out (Object)	Passes the object properties from a previously executed component.	No. Connecting the port is optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	Yes

9. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Reflection components

Learn about the properties of the Reflection components in RPA Desktop Design Studio.

Properties of the Reflection components

Property	Description
Search	Option to enable a search for a property.
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.

String utilities

The String components in the RPA Desktop Design Studio perform different operations on strings. For example, replace or convert string to upper or lower case.

Use the Base64Decode component

Convert a base64 string to text by using the Base64Decode component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Base64Decode component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Base64Decode component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the Base64Decode component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Data port type	Data type
Base64String	Used to specify Base64 string that converts to a normal string.	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Data port type	Data type
	Takes the encoded Base64 string from a previously executed component, such as Base64Encode component. For example, if you input a value like `1234test` in the Base64Encode component and then connect it to the Base64Decode component, running the components will result in the Base64Encode component encoding the value `1234test` and passing it to the Base64Decode component. The Base64Decode component then decodes the encoded value, such as "MzIzNDIzdGVzdHR0" and retrieves the original output as "1234test". **Base64Encode and Base64Decode components** 		
Return	Returns a string representing plain text.	Data Out	String

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Base64Encode component

Encode a string with the base64 algorithm by using the Base64Encode component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Base64Encode component. For more information about these properties, see Properties of the String Utilities components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Base64Encode component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Base64Encode component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection
Data In (Text)	Passes the text the component encodes from a previously executed component. Used to specify the string that is converted to a Base64 string. Data type: String
Data Out (Return)	Returns the encoded string and passes to the next component.
Control In	Passes the control from the previously executed component.
Control Out	Passes the control to the next component to be executed.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Compare component

Compare two string objects that are based on their ASCII values by using the Compare component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
Compare method is used to compare given text with provided options. If option is matched, it opens the matching control out port.

You can configure the properties for the Compare component. For more information about these properties, see Properties of the String Utilities components.

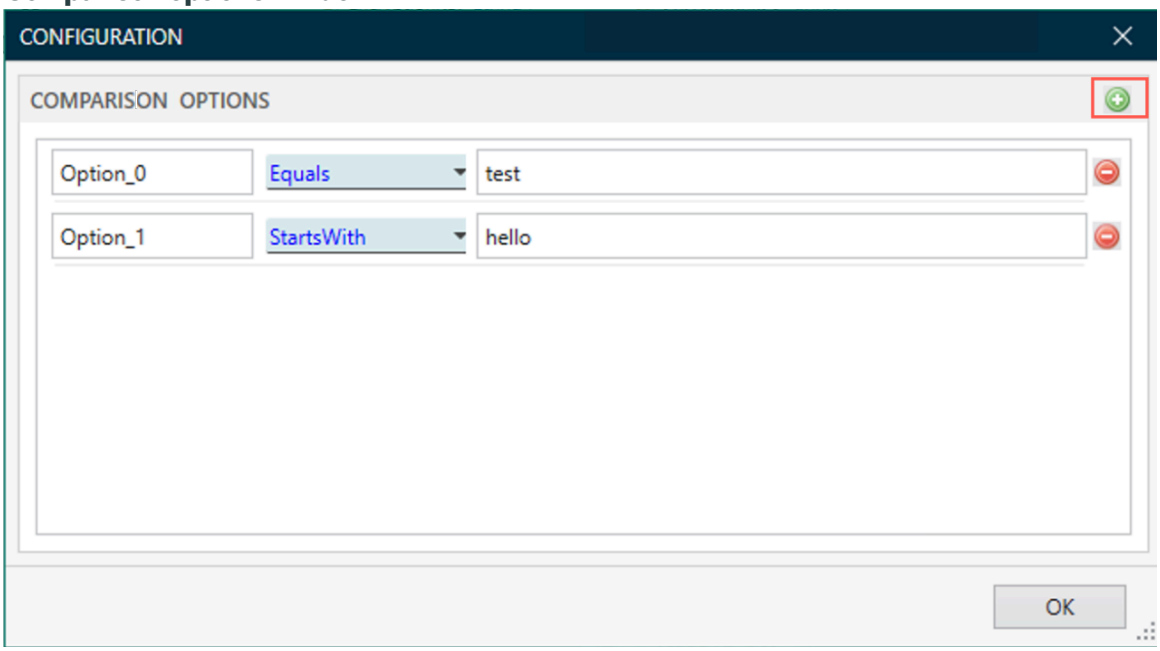
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Compare component to the Design surface.
3. In the Compare component, double click the title bar to launch the Configuration editor.
4. Select the Add icon ( ) to add the string options from the Comparison Options drop-down list.

   For example, select the following options.

Comparison options window



5. Connect the data and control ports of the Compare component to the corresponding ports of the other components as described in the following table.

Compare component parameters

Name	Purpose of connection	Port type	Data type
Text	Provide text that must be compared with multiple control out ports based on the comparison type. For example, if you provide `hello welcome` as the comparison text, the component compares option 0 and option 1. Since Option 1 starts with hello, it matches with the text provided. Connect this to	Data In	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Purpose of connection	Port type	Data type
	a MessageBox component to view the output. **Compare component** 		

6. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Contains component

Check whether a body of text contains a specified text by using the Contains component in the RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Contains component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Contains component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Contains component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection
Data In (Text)	Takes the text that the component searches from a previously executed component. Data type: String
Data In (textToSearch)	Takes the text that the component tries to find from a previously executed component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection
	Used to specify the string that must be checked, whether it is available or not. Data type: String
Data In (IgnoreCase)	Takes the Boolean value to indicate whether the component ignores the case while searching for the text. Used to specify the boolean value. If value is false, it checks the case sensitive, otherwise it ignores the case sensitive. Data type: Boolean
Data Out	Returns the Boolean response to whether the text searched was found and passes to another component. Data type: Boolean
Control In	Connects to the Control Out port of one or more components.
Control Out	Connects to the Control In port of another component or the default end component.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Format component

Provide a placeholder and a value in a body of text by using the Format component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Format component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Format component to the Design surface.
3. To configure the input fields, see Configure port properties.
   You must insert is {0} as the placeholder.
4. Connect the data and control ports of the Format component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection
Data In (_Format)	Passes the text body and the placeholder from a previously executed component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection
	Used to specify the format. Data type: String
Data In (Input)	Used to specify the input string that is replaced in given format. Data type: String
Data Out (Return)	Returns the text body with the placeholder value inserted in the placeholder. This method returns a string that represents formatted text. Data type: String
Control In	Connects to the Control Out port of one or more components.
Control Out	Connects to the Control In port of another component or the default end component.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetLength component

Count the number of characters including spaces and special characters in a string by using the GetLength component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the GetLength component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the GetLength component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetLength component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the characters that the component counts from a previously executed component. Used to specify the string from where the length is retrieved.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	Data type: String	
Data Out (Return)	Returns the number of characters including the spaces and special characters and passes to the next component. Returns an integer that represents the text length. Data type: integer	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetHashCode component

Generate a HashCode from a string by using the GetHashCode component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the GetHashCode component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the GetHashCode component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetHashCode component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection
Data In (Text)	Takes the string from a previously executed component. Used to specify the string from where the hashcode is computed. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection
Data Out (Return)	Returns the generated HashCode and passes to the next component. Data type: String
Control In	Connects to the Control Out port of one or more components.
Control Out	Connects to the Control In port of another component or the default end component.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetTextAfter component

Find the string characters that are placed after a string by using the GetTextAfter component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the GetTextAfter component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the GetTextAfter component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetTextAfter component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection
Data In (Text)	Takes the text that the component searches from a previously executed component. Used to specify the string from where a substring is extracted, beginning at a specific position identified by a string match, and continuing for a specified length. Data type: String
Data In (findStr)	Takes the string characters that the component finds in the text from a previously executed component. Used to specify the string that determines the starting position based on a string match. Data type: String
Data In (length)	Takes the number of characters that the component finds in the text from a previously executed component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection
	Used to specify the number of characters to be extracted from a given string. Data type: Integer
Data Out	Returns the string the component found and passes to the next component. This method returns a string that represents the text after the search text. Data type: String
Control In	Connects to the Control Out port of one or more components.
Control Out	Connects to the Control In port of another component or the default end component.

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetTextBefore component

Find the string characters that are placed before a string by using the GetTextAfter component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

This method is used to extract text that precedes a specified find string up to a specified length. If the length is 0, it extracts text from the beginning of the string.

You can configure the properties for the GetTextBefore component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the GetTextBefore component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetTextBefore component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection
Data In (Text)	Takes the text that the component searches from a previously executed component. Used to specify the string from where a sub string is extracted, starting at a position determined by a string match minus a specified length, and extending for a specified length. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection
Data In (findStr)	Takes the string characters that the component finds in the text from a previously executed component. Used to specify the string that determines the starting position based on a string match. Data type: String
Data In (length)	Takes the number of characters that the component finds in the text from a previously executed component. Used to specify the number of characters to be extracted from a given string. Data type: Integer
Date Out (Return)	Returns the specified sub string. This method returns a string that is the text found before search string. Data type: String
Control In	Connects to the Control Out port of one or more components.
Control Out	Connects to the Control In port of another component or the default end component

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetTextBetween component

Find the string characters that are placed between two strings by using the GetTextBetween component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the GetTextBetween component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the GetTextBetween component onto the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetTextBetween component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text that the component searches from	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	a previously executed component.	
Data In (findStr1)	Takes the first set of string characters that is placed on one side of the string the component searches from a previously executed component.	Yes
Data In (findStr2)	Takes the first set of string characters that is placed on the other side of the string the component searches from a previously executed component.	Yes
Data Out	Returns the string between strings and passes to the next component. **Note:** The returned value may include spaces. Spaces between characters are also counted as characters.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetValueByRegex component

Specify a regular expression and characters to find characters that match by using the GetValueByRegex component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetValueByRegex component. For more information about these properties, see Properties of the String Utilities components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the GetValueByRegex component to the Design surface.
3. To configure the input fields, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Connect the data and control ports of the GetValueByRegex component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text from a previously executed component.	Yes
Data In (RegExpression)	Takes the regular expression from a previously executed component.	Yes
Data Out (Boolean)	Returns the status of the regular expression matching in Boolean and passes to the next component.	Yes
Data Out (List 1)	Returns the matched value.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the IsEqual component

Check whether two string objects have the same value by using the IsEqual component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the IsEqual component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the IsEqual component to the Design surface.
3. To configure the input fields, see Configure port properties.

> **Note:**
> The component considers the case of the string values as it performs a case-sensitive comparison.

4. Connect the data and control ports of the IsEqual component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (Text1)	Takes the first of the two strings that the component compares from a previously executed component.	Yes
Data In (Text2)	Takes the last of the two strings that the component compares from a previously executed component.	yes
Data Out (Boolean)	Returns the Boolean value indicating whether the strings matched and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the IsNullOrEmpty component

Determine whether the text is null or an empty string by using the IsNullOrEmpty component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the IsNullOrEmpty component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the IsNullOrEmpty component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the IsNullOrEmpty component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text that the component evaluates from a previously executed component.	Yes
Data Out (Boolean)	Returns the Boolean response to whether the	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	text is null or empty and passes the value to the next component.	
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the IsNullOrWhiteSpace component

Determine whether the text is null or contains only white-space characters by using the IsNullOrWhiteSpace component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the IsNullOrWhiteSpace component. For more information about these components, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the IsNullOrWhiteSpace component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the IsNullOrWhiteSpace component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text that the component evaluates from a previously executed component.	Yes
Data Out (Boolean)	Returns the Boolean response to whether the text is null or contains whitespaces and passes the value to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Join component

Concatenate the elements of an array into a string by using the Join component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can concatenate the elements of an array into a string by applying a specified separator such as dot, comma, or pipe. For example, if the string is {“Apple”, “Banana”, “Orange”} and separator is dot (.), then the concatenated string would be "Apple.Banana.Orange".

You can configure the properties for the Join component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Join component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Join component to the corresponding ports of the other components as described in the following table.

Parameter name	Description	Data Port type	Data type
StringArray	Specify a string array that you want to concatenate or use the string array from the previously executed component.	Data In	String[]
Separator	The text separator that joins the arrays such as dot (.), comma (,), or pipe (|).	Data In	String
String	Returns concatenated string as an output that you can use in the next component.	Data Out	String

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Occurrence component

Count how many times a character or word appears in a text body by using the Occurrence component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Occurrence component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Occurrence component to the Design surface.
3. To configure the text fields, see Configure port properties.
4. Connect the data and control ports of the Occurrence component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text that the component searches from a previously executed component.	Yes
Data In (pattern)	Takes the word or character that the component searches for the number of occurrences from a previously executed component.	Yes
Data In (IgnoreCase)	Takes the Boolean value to indicate whether the component ignores the case while searching for occurrences from a previously executed component.	No
Data Out (Return)	Returns the number of occurrences of the character or word as an integer and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the RemoveWhiteSpace component

Remove any white spaces from a string by using the RemoveWhiteSpace component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the RemoveWhiteSpace component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the RemoveWhiteSpace component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the RemoveWhiteSpace component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text from which the component removes whitespace from a previously executed component.	Yes
Data Out	Returns the string after removing the whitespaces and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Replace component

Replace all occurrences of a word in a text with another word by using the Replace component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Replace component. For more information about these properties, see Properties of the String Utilities components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Replace component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Replace component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text where the component replaces a word or character from a previously executed component.	Yes
Data In (oldValue)	Takes the text or character that the component replaces from a previously executed component.	Yes
Data In (newValue)	Takes the text or character that the component replace the old text with from a previously executed component.	Yes
Data Out (String)	Returns the text after replacing the specified word and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the Split component

Divide a string into substrings by applying a specified separator. You can do this task by using the Split component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Split component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Split component to the Design surface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Split component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text that the component will be separating with the separator from a previously executed component.	Yes
Data In (separator)	Takes the separator that the component uses to separate the string from a previously executed component.	Yes
Data Out	Returns the substring of the string and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the SubString component

Retrieve a substring from a string by using the SubString component in RPA Desktop Design Studio. You can specify the start character position and length of the substring.

Before you begin

Role required: none

About this task

You can configure the properties for the SubString component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the SubString component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the SubString component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (String)	Takes the string from which the component creates a	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
	substring from a previously executed component.	
Data In (startindex)	Takes the index position value of the string characters from a previously executed component. For example, if RPA is the string and 2 is the index value, the substring starts from the character"A" and is A.	Yes
Data Out (String)	Returns the substring and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ToLowerCase component

Convert an uppercase text to lowercase letters by using the ToLowerCase component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the ToLowerCase component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the ToLowerCase component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ToLowerCase component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text that the component converts to lowercase from a previously executed component.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data Out (String)	Returns the lowercase text and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	In

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ToUpperCase component

Convert a lowercase text to uppercase by using the ToUpperCase component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the ToUpperCase component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the ToUpperCase component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ToUpperCase component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text that the component converts to uppercase from a previously executed component.	Yes
Data Out (String)	Returns the specified text in uppercase letters and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Trim component

Remove the white-space characters at the beginning and end of a string by using the Trim component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the Trim component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the Trim component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the Trim component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text from which the component trims the whitespace.	Yes
Data Out (String)	Returns the trimmed text and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the TrimEnd component

Remove the white-space characters that you specify at the end of the text by using the TrimEnd component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the TrimEnd component. For more information about these properties, see Properties of the String Utilities components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the TrimEnd component to the Design surface.
3. To configure the input fields, see Configure port properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Connect the data and control ports of the TrimEnd component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text that the component trims from a previously executed component.	Yes
Data Out (String)	Returns the text after removing the white-space characters and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the TrimStart component

Remove white-space characters at the beginning of the text that you specify by using the TrimStart component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the TrimStart component. For more information about these properties, see Properties of the String Utilities components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **String Utilities**.
2. Drag the TrimStart component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the TrimStart component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Text)	Takes the text that the component trims from a previously executed component.	Yes
Data Out (String)	Returns the text after removing the white-space characters and passes to the next component.	Yes

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the String Utilities components

Learn about the properties of the String Utilities components in RPA Desktop Design Studio.

Properties of the String Utilities components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

System process

The System components in the RPA Desktop Design Studio perform standard Windows systems operations. For example, get the process ID or terminate a process.

Use the CloseMainWindow component

Closes any Windows application by providing the Process ID as input.

Before you begin

Role required: none

About this task

You can configure the properties for the CloseMainWindow component. For more information about these properties, see Properties of the System Process components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **System Process**.
2. Drag the CloseMainWindow component to the Design surface.
3. To configure the input field, see Configure port properties.
4. Connect the data and control ports of the CloseMainWindow to the corresponding ports of the other component as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

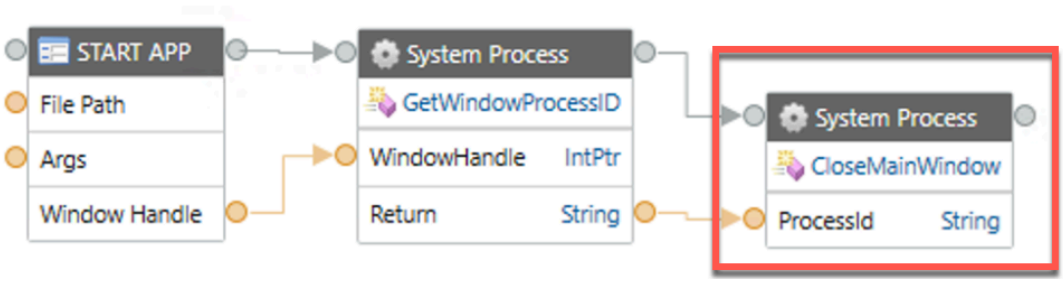
Parameter	Description	Port type	Mandatory?
ProcessId	The process ID of the application to close. You can pass this value from a previously executed component. You can get the ProcessId by opening the Task Manager on your Windows machine. **Example:** ProcessId of Services.exe: 660	Data In	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Example:
As part of your automation workflow, after you have opened an app, such as Windows Terminal and ran a command on it, you can close the app window by providing the process ID in the CloseMainWindow component.

Add the Start App component and GetWindowProcessID component before the CloseMainWindow component and connect the ports as shown in the image.

For more information about these components, see Use the Start App component and Use the GetWindowProcessID component.



Use the GetMainWindowHandle component

Retrieve the window handle of a main window of an active process by using the GetMainWindowHandle component in RPA Desktop Design Studio. This component accepts the Process ID as input and returns the Integer value of the specified process.

Before you begin
Role required: none

About this task
You can configure the properties for the GetMainWindowHandle component. For more information about these properties, see Properties of the System Process components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **System Process**.
2. Drag the GetMainWindowHandle component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetMainMainWindowHandle to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (ProcessId)	Takes the process ID of the window as a string from a previously executed component.	Yes
Data Out (Integer)	Returns the Windows handle of the specified process and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetMainWindowHandleAsInt component

Retrieve the window handle of a main window of an active process as an integer by using the GetMainWindowHandleAsInt component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetMainWindowHandleAsInt component. For more information about these properties, see Properties of the System Process components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **System Process**.
2. Drag the GetMainWindowHandleAsInt component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetMainWindowHandleAsInt to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (String)	Takes the Process ID of the Window from a previously executed component.	Yes
Data Out (Integer)	Returns the IntPtr value of the specified process as an integer and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the GetWindowProcessID component

Retrieve the window handle of a main window of an active process as an integer by using the GetWindowProcessID component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the GetWindowProcessID component. For more information about these properties, see Properties of the System Process components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **System Process**.
2. Drag the GetWindowProcessID component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the GetWindowProcessID component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (WindowHandle)	Takes the Windows handle number as an integer from a previously executed component.	Yes
Data Out ()	Returns the ProcessID value of the specified process as a String and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the StartNew component

Start a new process by using the StartNew component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the StartNew component. For more information about these properties, see Properties of the System Process components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **System Process**.
2. Drag the StartNew component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the StartNew component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (Filepath)	Takes the filePath and Params of the process that needs to be started from a previously executed component.	Yes
Data In (Params)	Takes the parameter of the process that needs to be started from a previously executed component.	Yes
Data Out (String)	Returns the Process ID and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Terminate component

End the specified Windows system process by using the Terminate component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the Terminate component. For more information about these properties, see Properties of the System Process components.

Procedure

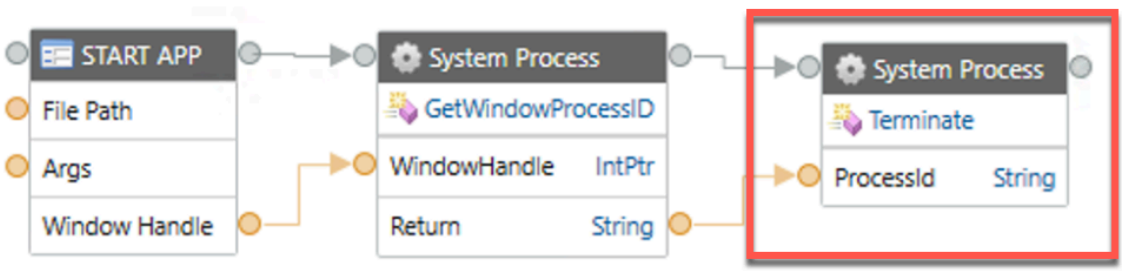
1. In the Toolbox pane, navigate to **Utilities** > **System Process**.
2. Drag the Terminate component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the Terminate component to the corresponding ports of the other component as described in the following table.

Parameter	Description	Port type	Mandatory?
ProcessId	The process ID of the process to terminate. You can pass this value from a previously executed component. You can get the processId by opening the Task Manager on your Windows machine. **Example:** ProcessId of Services.exe: 660	Data In	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Example:

As part of your automation workflow, after you have opened an app, such as Windows Terminal and ran a command on it, you can terminate the app by providing the process ID in the Terminate component.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the TerminateByName component

Use the TerminateByName component to end the specified process or application, for example Chrome browser, Excel, Notepad, by its respective name.

Before you begin
Role required: none

About this task
You can configure the properties for the TerminateByName component. For more information about these properties, see Properties of the System Process components.

During high density robots execution, the TerminateByName component checks and terminates the specified process or application only with in the current user session. When an automation runs on a virtual machine, it queries for the process and terminates it within the same user session of the robot. If the same process is running inside other user sessions on virtual machine, those process instances are not terminated.

Note:
Within the current user session, if the robot user does not have permissions to terminate a process, component throws an error.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **System Process**.
2. Drag the TerminateByName component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the TerminateByName component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In	Takes the process name of the process to terminate from a previously executed component. For example, Notepad.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of any other component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the WhoLockedFile component

Provide a file path to find out the user name of the person who locked a file by using the WhoLockedFile component in RPA Desktop Design Studio.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can configure the properties for the WhoLockedFile component. For more information about these properties, see Properties of the System Process components.

Procedure

1. In the Toolbox pane, navigate to **Utilities > System Process**.
2. Drag the WhoLockedFile component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the WhoLockedFile component to the corresponding ports of the other component as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (FilePath)	Takes the file name from a previously executed component.	Yes
Data Out (Return)	Returns the user name and passes to the next component.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the System Process components

Learn about the properties of the System Process components in RPA Desktop Design Studio.

Properties of the System Process components

Property	Description
Search	Option to enable a search for a property.
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.

Token

The Token utilities in the RPA Desktop Design Studio retrieve the OKTA token to get access to an application.

Use the GetTOTP component

Generate the Time-based One-time Password (TOTP) to access multi-factor authentication (MFA)-enabled applications in an automation by using the GetTOTP component in the RPA Desktop Design Studio application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Create an MFA authenticator record and map the TOTP authenticator to the robot credential. For more information on how to perform these tasks on RPA Hub, see Create an MFA authenticator in RPA Hub and Create a TOTP authenticator in RPA Hub. For more information on TOTP authentication in RPA Hub, see TOTP authentication in RPA Hub.
- Connect to the required instance in RPA Desktop Design Studio and assign the bot process with the TOTP record to the automation. For more information, see Assign bot process to an automation project.

Role required: sn_rpa_fdn.rpa_release_manager or sn_rpa_fdn.rpa_admin

About this task

The TOTP record is created in RPA Hub and the record is associated to the robot credential. The GetTOTP component in RPA Desktop Design Studio has an *AuthenticatorName* parameter. The authenticator name that you provide from the component must be present in the TOTP record. If the authenticator is present, the TOTP is generated.

Procedure

1. Navigate to **Utilities** > **Token** from the Toolbox pane in the **Design** tab.
2. Drag the **GetTOTP** component to the Design surface.
3. In the **AuthenticatorName** field of the component, enter the name of the authenticator. The name that you enter must match with the value in the **Authenticator** field of the TOTP record.
4. To test the component, right-click the component and select **Run From Here**. You can also run the automation by selecting **Run** from the **Design** tab.

   When the component is successfully run, the output ports are populated in the connector as per the following table.

Output ports of the GetTOTP component

Port name	Port type	Port description
TOTP	Data Out	One-time password that is generated at that point of execution.
ValidFor	Data Out	Time in seconds until the password is valid.

5. **Optional:** To test the component, right-click the component and select **Run From Here**. You can also run the automation by selecting **Run** from the **Design** tab.

Properties of the Token components

Learn about the properties of the Token components in RPA Desktop Design Studio.

Properties of the Token components

Property name	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties of the Token components (continued)

Property name	Description
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Zip

The Zip components in the RPA Desktop Design Studio perform standard Zip utility operations. For example, extract or remove files.

Use the AddDirectory component

Add the directory contents to an existing zip archive by using the AddDirectory component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the AddDirectory component. For more information about these properties, see Properties of the Zip components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Zip**.
2. Drag the AddDirectory component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the AddDirectory component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (zipFilePath)	Takes the zipFilePath.	Yes
Data In (directoryPath)	Takes the directory path.	Yes
Data Out	Returns **True** if the directory contents are successfully added to the specified zip archive. Otherwise, returns **False**.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the AddFile component

Add a file to an existing zip archive by using the AddFile component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the AddFile component. For more information about these properties, see Properties of the Zip components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Zip**.
2. Drag the AddFile component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the AddFile component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (zipFilePath)	Takes the zipFilePath from a previously executed component.	Yes
Data In (directoryPath)	Takes the directory path from a previously executed component.	Yes
Data Out	Returns **True** if the file is successfully added to the specified zip archive. Otherwise, returns **False**.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the AddFiles component

Add multiple files to an existing zip archive by using the AddFiles component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the AddFiles component. For more information about these properties, see Properties of the Zip components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Zip**.
2. Drag the AddFile component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the AddFiles component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (zipFilePath)	Takes the zipFilePath from a previously executed component.	Yes
Data In (directoryPath)	Takes the directory path from a previously executed component.	Yes
Data Out	Returns **True** if the files are successfully added to the specified zip archive. Otherwise, returns **False**.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the CreateFile component

Zip an existing folder or create a zip file by using the CreateFile component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the CreateFile component. For more information about these properties, see Properties of the Zip components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Zip**.
2. Drag the CreateFile component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the CreateFile component to the corresponding ports of the other components as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (zipFilePath)	Location of the zip file along with the zip file name that needs to be created. For example, `C:\Users\abel.tutor\Downloads\test.zip`	Yes
Data In (Path)	Location of the source file or folder. For example, for file- `C:\Users\abel.tutor\Downloads\test.txt` For example, for folder- `C:\Users\abel.tutor\Downloads`	Yes
Type	Open port properties and then select either **File** or **Folder** from the **Static Value** field.	Yes
Data Out (Boolean)	Returns **True** if the file is successfully created to the specified location. Otherwise, returns **False**.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ExtractAll component

Extract all the files from a zip archive to a specific location by using the ExtractAll component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the ExtractAll component. For more information about these properties, see Properties of the Zip components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Zip**.
2. Drag the ExtractAll component to the Design surface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the ExtractAll component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (zipFilePath)	Takes the zipFilePath from a previously executed component.	Yes
Data In (PathToExtract)	Takes the extraction path from a previously executed component.	Yes
Data Out	Returns **True** if the files are successfully extracted to the specified location. Otherwise, returns **False**.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the ExtractFile component

Extract a file from a zip archive to a specified location by using the ExtractFile component in RPA Desktop Design Studio.

Before you begin

Role required: none

About this task

You can configure the properties for the ExtractFile component. For more information about these properties, see Properties of the Zip components.

Procedure

1. In the Toolbox pane, navigate to **Utilities** > **Zip**.
2. Drag the ExtractFile component to the Design surface.
3. To configure the inputs, see Configure port properties.
4. Connect the data and control ports of the ExtractFile component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (zipFilePath)	Provides the zipFilePath and PathtoExtract Data In ports to extract files to a location.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Data In (file)	Takes the file name from a previously executed component.	Yes
Data In (filePath)	Takes the file path from a previously executed component.	Yes
Data Out	Returns **True** if the files are successfully extracted to the specified location. Otherwise, returns **False**.	Yes
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	No

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Use the RemoveFile component

Delete a specified file in a zip archive by using the RemoveFile component in RPA Desktop Design Studio.

Before you begin
Role required: none

About this task
You can configure the properties for the RemoveFile component. For more information about these properties, see Properties of the Zip components.

Procedure
1. In the Toolbox pane, navigate to **Utilities** > **Zip**.
2. Drag the RemoveFile component to the Design surface.
3. To configure the input fields, see Configure port properties.
4. Connect the data and control ports of the RemoveFile component to the corresponding ports of the other components as described in the following table.

Port type	Purpose of connection	Mandatory?
Data In (zipFilePath)	Provides the zipFilePath and PathtoExtract Data In ports to extract files to a location.	Yes
Data In (file)	Takes the file name from a previously executed component.	Yes
Data Out	Returns **True** if the files are successfully removed. Otherwise, returns **False**.	Yes

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Port type	Purpose of connection	Mandatory?
Control In	Connects to the Control Out port of one or more components.	Yes
Control Out	Connects to the Control In port of another component or the default end component.	Yes

5. **Optional:** To test the component, under the **DESIGN** tab, click **Run**.

Properties of the Zip components

Learn about the properties of the Zip components in RPA Desktop Design Studio.

Properties of the Zip components

Property	Description
Delay After Execution	The number of seconds to pause after running.
Delay Before Execution	The number of seconds to pause before running.
Enable Timeout	Option to set a timeout value.
Timeout	Number of seconds that the operation ends after if not completed. To apply this value, you must set the **Enable Timeout** property.

Wait

The Wait components in the RPA Desktop Design Studio enable you to detain or change the automation execution using the criteria provided in the component.

Use the Wait For Images component

Change the automation execution flow that is based on the image information on the screen by using the Wait For Images component in RPA Desktop Design Studio. You can also identify the state of a business application or an item that is based on an error or status icon.

Before you begin

Role required: none

About this task

You can configure the properties for the Wait For Images component. For more information about these properties, see Properties of the Wait components.

Procedure

1. In the Toolbox pane, navigate to **Wait**.
2. Drag the Wait For Images component to the Design surface.
3. To add images, click the add image icon on the Wait For Images component title bar.
4. To capture the image that you want the component to find first, click the .
5. To select a region, press the **CTRL+SHIFT** keys.
   You can add as many screenshots as you want by clicking the add image icon.

Methods

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

Click

Occurs when the element is clicked.

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the TextBlock element

The TextBlock element in RPA Desktop Design Studio enables you to add a label on the form so that your user can view that label as read-only information.

The methods and events of the TextBlock element are displayed in the Object Explorer pane.

Methods

ClearText

Clears the text from the current element.

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

GetText

Gets the text from the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetText

Sets the text data to the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the TextBox element

The TextBox element in RPA Desktop Design Studio enables you to add a text box to a form so that your user can provide information within that text box.

The methods and events of the TextBox element are displayed in the Object Explorer pane.

Methods

ClearText

Clears the text from the current element.

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

GetText

Gets the text from the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetText

Sets the text data to the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

TextChanged

Occurs when the text property value changes.

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the Date element

The Date element in RPA Desktop Design Studio enables you to provide a date picker on the form. It enables the user to select a specific date on the form.

The methods and events of the Date element are displayed in the Object Explorer pane.

Methods

ClearValue

Clears the value from the current element.

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

GetValue

Gets the value from the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetValue

Sets the value to the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

ValueChanged

Sets the value of the built-in property of the current element.

SetValue

Sets the value to the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

ValueChanged

Occurs when the property value changes.

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the CheckBox element

The CheckBox element in RPA Desktop Design Studio enables you to capture true or false, yes or no, or on or off inputs from users. It helps in decision-making, enabling or disabling features, and controlling workflow execution.

The methods and events of the CheckBox element are displayed in the Object Explorer pane. You can use this element to present yes or no or true or false selections.

Use cases

- User preferences selection - Allows users to enable/disable specific options, such as "Run in background" or "Send email notification".
- Conditional execution - Based on whether the checkbox is checked, the automation can execute or skip certain steps.
- Multi-selection options - You can also use the check box element in groups to display multiple choices in a form. When multiple checkboxes are available, users can select multiple options. For example, selecting multiple file formats for export.
- Validation and confirmation - Ensures that a user has acknowledged terms, agreements, or completed a required step before proceeding.

Methods

Checked

Sets a value of the current element.

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

IsChecked

Returns a Boolean value whether the current element is selected or cleared.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

OnStateChanged

Occurs when a state is changed.

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the RadioButton element

The RadioButton element in RPA Desktop Design Studio enables you to select a choice from a group of choices.

The methods and events of the RadioButton element are displayed in the Object Explorer pane.

Methods

Checked

Sets a value of the current element.

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

IsChecked

Returns a Boolean value whether the current element is selected or cleared.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the ComboBox element

The ComboBox element in RPA Desktop Design Studio enables you to display the data in a drop-down combination box.

The methods and events of the ComboBox element are displayed in the Object Explorer pane. By default, the ComboBox element appears in two parts: the top part is a text box that enables you to type a list item. The second part is a list box that displays a list of items from which you can select one.

Methods

ClearItems

Removes all the items from the current element.

ClearSelection

Clears the current selection from the current element.

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetItems

Gets an object that represents the collection of the items that are contained in the current element.

GetNativeProperty

Gets the value of the built-in property of the current element.

GetSelectedIndex

Gets the index value that specifies the currently selected item.

GetSelectedItem

Gets the selected item that specifies the currently selected item.

InvokeNativeMethod

Invokes the built-in method of the current element.

SelectItem

Selects the item in the current element.

SelectItemByIndex

Selects the item by using the index value.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetItems

Sets an object that represents the collection of the items that are contained in the current element.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetVisibility

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

MouseClick

Occurs when a cell within the table is clicked.

MouseDoubleClick

Occurs when a user double-clicks the selected item.

SelectionChanged

Occurs when a value is selected from the element.

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the ListBox element

The ListBox element in RPA Desktop Design Studio enables you to display a list of items from which you can select one or more Items.

The methods and events of the ListBox element are displayed in the Object Explorer pane.

Methods

ClearItems

Removes all the items from the current element.

ClearSelection

Clears the current selection from the current element.

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetItems

Gets an object that represents the collection of the items that are contained in the current element.

GetNativeProperty

Gets the value of the built-in property of the current element.

GetSelectedIndex

Gets the index value that specifies the currently selected item.

GetSelectedItem

Gets the selected item that specifies the currently selected item.

GetSelectedItems

Gets multiple selected items that specify the currently selected items.

InvokeNativeMethod

Invokes the built-in method of the current element.

SelectAll

Selects all the items in the current element.

SelectItem

Selects the item in the current element.

SelectItemByIndex

Selects the item by using the index value.

SelectItems

Selects multiple items in the current element.

SelectItemsByIndex

Selects multiple items by using the index value.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetItems

Sets an object that represents the collection of the items that are contained in the current element.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

UnselectAll

Clears all the selections in the current element.

Events

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the DataGrid element

The DataGrid element in RPA Desktop Design Studio enables you to display and manipulate tabular data.

The methods and events of the DataGrid element are displayed in the Object Explorer pane.

Methods

ClearData

Clears all the rows in the current element.

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetCellValue

Gets the value of a specified cell in the current element.

GetCount

Gets the count of rows and columns of the current element.

GetData

Gets the current element data.

GetNativeProperty

Gets the value of the built-in property of the current element.

GetRow

Gets the row data that is based on the index value.

GetSelectedRow

Gets the index value of the selected row.

InvokeNativeMethod

Invokes the built-in method of the current element.

SetCellColor

Sets the color in a cell that is based on the row value and column value.

SetCellValue

Sets the cell value for a particular row and column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetData

Sets the data into the current element.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetReadOnly

Sets a value that indicates whether the current element is in read-only mode.

SetRowColor

Sets the row color that is based on the row index.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

MouseClick

Occurs when a cell within the table is clicked.

MouseDoubleClick

Occurs when a user double-clicks the selected item.

SelectionChanged

Occurs when a value is selected from the element.

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the PasswordBox element

The PasswordBox element in RPA Desktop Design Studio is a text box that displays placeholder characters while you type a string.

The methods and events of the PasswordBox element are displayed in the Object Explorer pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Methods

Clear

Clears the password from the current element.

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

GetPassword

Retrieves the password text data from the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetPassword

Sets the password text data to the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the ImageControl element

The ImageControl element in RPA Desktop Design Studio enables you to display images in a form.

The methods and events of the ImageControl element are displayed in the Object Explorer pane.

Methods

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetImage

Retrieves the image from the current element.

GetNativeProperty

Gets the value of the built-in property of the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetImage

Sets the image to the current element.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

© 2026 ServiceNow, Inc. All rights reserved.

Occurs when the focus moves out of the current element.

Methods and events of the ImageViewer element

The ImageViewer element in RPA Desktop Design Studio enables you to open and view image files including JPEG, GIF, WMF, and other image formats in a form. You can also stretch and shrink images, rotate the images at different angles through all axis, and save them in different formats.

The methods and events of the ImageViewer element are displayed in the Object Explorer pane.

Methods

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

FitToContent

Fits the image into the current element.

GetImage

Retrieves the image from the current element.

GetNativeProperty

Gets the value of the built-in property of the current element.

Highlight

Highlights a specific area of an image in the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetImage

Sets the image to the current element.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

UnHighlight

De-emphasizes the highlighted area of an image in the current element.

ZoomIntoPoint

Zooms into a specific point by inputting the x and y values.

Events

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the TabControl element

The TabControl element in the RPA Desktop Design Studio enables you to add one or more tabs in your form.

The methods and events of the TabControl element are displayed in the Object Explorer pane.

Methods

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

SelectTabByIndex

Selects the tab with a specific index.

SelectTabByName

Selects the tab with a specific name.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetTabState

Enables or deactivates the tab.

SetTabVisibility

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Gets or sets a value that indicates whether the tab and all its child elements are displayed.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the Web Browser element

The Web Browser element in the RPA Desktop Design Studio enables you to host web pages and provides web browsing capabilities to your application.

The methods and events of the Web Browser element are displayed in the Object Explorer pane.

Methods

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

InvokeNativeMethod

Invokes the built-in method of the current element.

Navigate

Opens the browser with the provided URL.

Refresh

Refreshes the webpage.

SetContextMenu

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Methods and events of the Form Renderer element

The Form Renderer element in RPA Desktop Design Studio enables you to build forms quickly with controls such as TextBox, ComboBox, CheckBox, RadioButton, ToggleButton, Date, Time, and PasswordBox.

The methods and events of the Form Renderer element are displayed in the Object Explorer pane.

Methods

Enable

Gets or sets a value indicating whether the element can respond to user interaction.

- If true, the element is enabled
- If false, the element is not enabled.

GetNativeProperty

Gets the value of the built-in property of the current element.

GetData

Gets the current element data.

InvokeNativeMethod

Invokes the built-in method of the current element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reset

Resets the data for the fields defined in the current element.

SetChoices

Sets choices for list controls such as a radio button and ComboBox via a program.

SetContextMenu

Sets the context menu for the UI element. It accepts the input in either a string array or a comma-separated string.

SetData

Sets the data into the current element.

SetHelpContent

Sets the field help content so that you can provide the related data.

SetNativeProperty

Sets the value of the built-in property of the current element.

SetVisibility

Gets or sets a value that indicates whether the current element and all its child elements are displayed.

- If true, the current element and all its child elements are displayed.
- If false, the current element and all its child elements aren't displayed.

Events

OnContextMenuClick

Occurs when an option on the context menu is clicked.

MouseEnter

Occurs when the mouse device enters that element field.

MouseLeave

Occurs when the mouse device leaves that element field.

OnMouseClick

Occurs when the element is clicked.

GotFocus

Occurs when the focus is on the current element.

LostFocus

Occurs when the focus moves out of the current element.

Robotic Process Automation (RPA) Hub reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Robotic Process Automation (RPA) Hub.

Robotic Process Automation (RPA) Hub glossary

Learn about the terms and concepts that are unique to Robotic Process Automation (RPA) Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A

Glossary terms are grouped alphabetically.

activities

Reusable set of instructions that are designed for an automation on the Design surface of RPA Desktop Design Studio.

alert

Custom notifications that are sent to a user or a group. These notifications are generated for robots, schedules, process jobs, and other RPA Hub related tables.

AMB channel

The Asynchronous Message Bus (AMB) channel is utilized to notify unattended robots, when a change is made to bot processes in RPA Hub. Consequently, all the robots subscribed to the designated channel receive a notification. For example, when Start Process is initiated from RPA Hub, a message is sent to the selected robot via an AMB channel, then the robot receives the message to start the automation process.

Attachment Framework

A set of REST APIs that enable uploading or downloading attachments to or from a ServiceNow instance. This helps in publishing and downloading automation packages that are built in RPA Desktop Design Studio to the ServiceNow instance (RPA Hub) that run on attended or unattended robots.

Attended Robot

Software agent that is installed on a Windows machine and executes attended automations.

automation

Robotic Process Automation (RPA) is a software technology that makes it easy to build, deploy, and manage robots that emulate human actions interacting with digital systems and software.

B

Glossary terms are grouped alphabetically.

bot process

A predefined sequence of actions that a robot follows to accomplish a specific task or achieve a particular goal in RPA Hub. You can assign and schedule a package that will be executed by the software agent. You can add other details that pertain to the bot process, such as business applications, credential groups, process robot credentials, process parameters, attended users, or groups.

bot process configuration

A record that contains the bot process settings. The bot process configuration record is mapped to a bot process record in RPA Hub. It is a one to one mapping.

breakpoint

Option in RPA Desktop Design Studio that you set to stop or pause the automation execution for debugging purposes.

C

Glossary terms are grouped alphabetically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

component

Reusable blocks that are used for designing automations and to abstract functionality in RPA Desktop Design Studio.

connector

Connector that connects to various data sources and tools to create automation in RPA Desktop Design Studio.

D

Glossary terms are grouped alphabetically.

Desktop In Desktop

Option in Attended Robot where you can work simultaneously while the robot runs an automation in the background. You can create multiple sessions on your machine.

E

Glossary terms are grouped alphabetically.

execution logs

Logs that are captured when an automation is executed by either an attended or an unattended robot. These logs help in understanding the errors and the end-to-end logging of automation execution. For more information, see Bot Process form in RPA Hub.

G

Glossary terms are grouped alphabetically.

GraphQL services

A web query language optimized for client-side development to request the exact data they need. It provides a flexible and efficient way to interact with an API. Graph QL services refer to the APIs that utilize the GraphQL query language to retrieve and manipulate data for bot processes. RPA Desktop Design Studio, Unattended Robot, and Attended Robot applications use GraphQL services from RPA Hub.

H

Glossary terms are grouped alphabetically.

HashCode

Unique, auto-generated alphanumeric value of a published package version.

Heartbeat

Every 30 seconds, the ServiceNow unattended robot that runs on a robot machine posts a collection of heartbeat messages.

High density robot

High density robots leverage the Remote Desktop Services to execute multiple automations simultaneously in separate user sessions on the same Windows Server machine.

P

Glossary terms are grouped alphabetically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

package

A package refers to a set of workflows, scripts, configurations, and dependencies that are designed to automate specific tasks or processes. These packages can be published or imported onto the RPA platforms to quickly deploy automation solutions.

Packages are used to encapsulate functionalities, libraries, or applications, making it simpler for developers or RPA administrators to deploy software components.

package version

Package version that is a number that identifies the set of components uploaded in a package.

After a package is created, the RPA developer publishes an automation from RPA Desktop Design Studio. This process results in a new package version.

port

Part of the component, categorized into Data ports and Control ports in RPA Desktop Design Studio.

process job

Execution of a bot process by a robot in RPA Hub.

process parameter

Variable that is used within a bot process in RPA Hub.

Q

Glossary terms are grouped alphabetically.

queue

Repository that can hold a number of work items in RPA Hub. Work items can store multiple types of data, such as transaction information, customer details, or information from a document.

Queues are used in automations to distribute transactional data or the workload among different robots.

R

Glossary terms are grouped alphabetically.

robot

A software agent that runs a bot process (automation). Robots are designed to interact with software applications, data sources, and user interfaces like a human operator would, but in a more efficient, accurate, and consistent manner.

robot file

The automation file that is created when you use RPA Desktop Design Studio for designing an automation workflow. This robot file contains the automation logic for the robot to execute.

RPA bot generation skill

A Now Assist for RPA Hub skill that uses generative AI for creating automations, activities, and extending automation logic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RPA Desktop Design Studio

Windows native application that is used by RPA developers to design or configure automation workflows.

RPA plugin

Software component that adds a specific feature for an interaction with third-party applications such as Microsoft Office 365, Google Chrome, Windows, and so on.

RPA plugins app (RPA plugin bundle)

The Robotic Process Automation (RPA) Plugin Bundle is the application responsible for building automations. The RPA Plugin Bundle contains metadata of Windows library files that are consumed by RPA Desktop Design Studio, Unattended Robot, and Attended Robot applications. These plugins extend the capability of the RPA product. For instance, RPA Chrome Plugin enables the RPA application to automate tasks on the Google Chrome browser. Similarly, the RPA Excel plugin enables the RPA applications to interact with Excel files and many more. With Integration Hub, the RPA Plugins Bundle is part of Workflow Data Fabric for a complete integration and automation solution for ServiceNow.

S

Glossary terms are grouped alphabetically.

schedule

In RPA Hub, a schedule is associated to an unattended bot process to enable users to execute jobs in a planned manner at regular intervals. More than one schedule can be associated with one bot process.

shared parameter

A global variable or configurable item that is stored in one place. These variables are used across bot processes.

skill

A pre-built automation and plug-and-play integration for your complex business processes.

U

Glossary terms are grouped alphabetically.

Unattended Robot

A software agent that is installed on a Windows machine and executes unattended automations.

W

Glossary terms are grouped alphabetically.

work item

Store multiple types of data, such as transaction information, customer details, or information from a document.

Requirement Intake Diagram

Use Requirement Intake Diagram to design the automation requirements visually. The diagram provides a way to visualize the complete requirements, which depend on different departments and involve multiple activities. Once the diagram is created, it will be translated into a detailed

Exploring Requirement Intake Diagram

Learn about the Requirement Intake Diagram application key features, flow, and workspace.

Requirement Intake Diagram overview

Use Requirement Intake Diagram to design the automation requirements visually. The diagram provides a way to visualize the complete requirements, which depend on different departments and involve multiple activities. Once the diagram is created, it will be translated into a detailed Playbook process, which can then be configured and executed as actual running automation.

Requirement Intake Diagram users

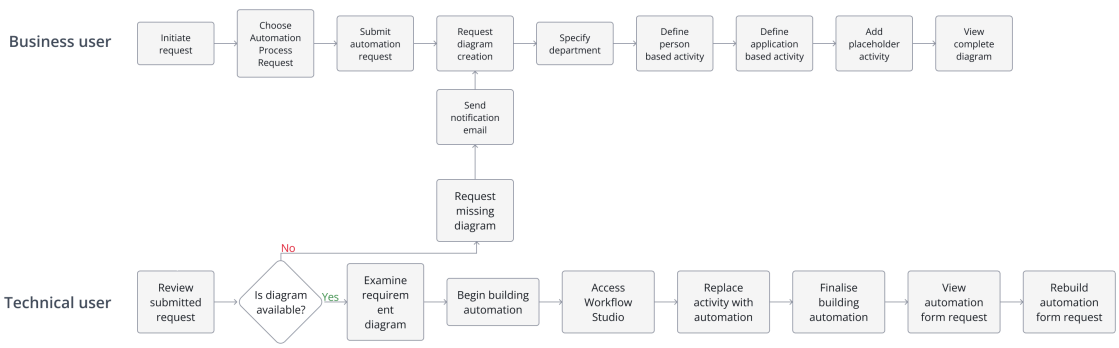
Users

Role title	Description	Contains roles
[sn_ac.automation_admin]	Sets up Automation Center application configurations. Performs all the actions in the Automation Center application. Possesses CRUD access for all tables.	• sn_ac.automation_business_user • sn_ac.automation_technical_user • sn_ac.automation_admin
• sn_ac.automation_technical_user • playbook.activity_def_read • playbook.write	Creates a requirement diagram, translates it into a Playbook process, and eventually creates the automation.	playbook.write contains pd_shared.user
• sn_ac.automation_business_user • playbook.activity_def_read • playbook.write	Requests for an automation by providing the requirement diagram.	playbook.write contains pd_shared.user

Requirement Intake Diagram flow

The following diagram shows the flow of the Requirement Intake Diagram. Users with sn_ac.automation_business_user, playbook.activity_def_read, and playbook.write roles request a requirement diagram. Users with sn_ac.automation_technical_user, playbook.activity_def_read, and playbook.write roles create a requirement diagram, translate it into a Playbook process, and eventually creates the automation.

Requirement Intake Diagram flow



1. The requester or business user creates an automation request from Automation Center.
2. After saving the request, the fulfiller or technical user gets a review request for the automation request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The fulfiller or technical user checks if the requirement diagram is available.

   If the diagram is not available, the fulfiller or technical user sends a request to the requester or business user to create a requirement diagram.

4. If the diagram is available, the fulfiller or technical user starts creating the automation in the Workflow Studio using Playbook.

Configuring Requirement Intake Diagram

Plan and configure Requirement Intake Design implementation in your organization.

Configuration overview

- Install Requirement Intake Diagram

  Install the Requirement Intake Diagram application (sn_aa). The application installs related ServiceNow® Store applications and plugins if they aren't already installed.

- Set up connections and credentials

  Define connections to access the instances when building automation using Requirement Intake Diagram.

Install Requirement Intake Diagram

Install the Requirement Intake Diagram application (sn_aa). The application installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Requirement Intake Diagram application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Requirement Intake Diagram:

- Plugins
- Store applications
- Roles
- Tables

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Requirement Intake Diagram application (sn_aa) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the list next to the **Install** button, the versions that are available to you're displayed.

3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Set up connections and credentials

Define connections to access the instances when building automation using Requirement Intake Diagram.

Before you begin

Role required:

- The admin role is required to create an alias.
- The credential_admin and connection_admin roles have read access to the alias record.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Select **Create PAD Process**.
3. Select **New** in the **Connections** and **Child Aliases** tab under **Related links**.
4. Select **Submit**.

Result

The connection is now available as an instance for creating an automation.

For more information about connections and credentials, see Create a Connection & Credential alias.

Using Requirement Intake Diagram

Use Requirement Intake Diagram to design the automation requirements visually from a diagram.

You must first create an automation request from Automation Center workspace. For information, see Create an automation request from Automation Center.

- Request diagram
- View diagram
- View automation
- Build automation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request diagram

After creating an automation request, if a diagram is not created, request for a diagram. A diagram is a visual representation of the automation that you want to create.

Before you begin

Role required: sn_ac.automation_technical_user, playbook.write, playbook.activity_def_read, connection_admin, or cmdb_read

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. On the **Lists** tab ( ), under **Build**, select **All Automation Requests**.
3. Select an automation request for which you want to request the diagram.
4. Select **Request diagram**.

   A diagram is requested to the business user.

   Important:
   This button is available only if the business user has not created a requirement diagram when creating an automation request.

   A notification is sent to the creator of the automation request to provide a requirement diagram.

View diagram

After creating a diagram, you can view it to edit or continue creating an automation from it. A diagram is a visual representation of the automation that you want to create.

Before you begin

Role required: sn_ac.automation_technical_user, playbook.write, playbook.activity_def_read, connection_admin, or cmdb_read

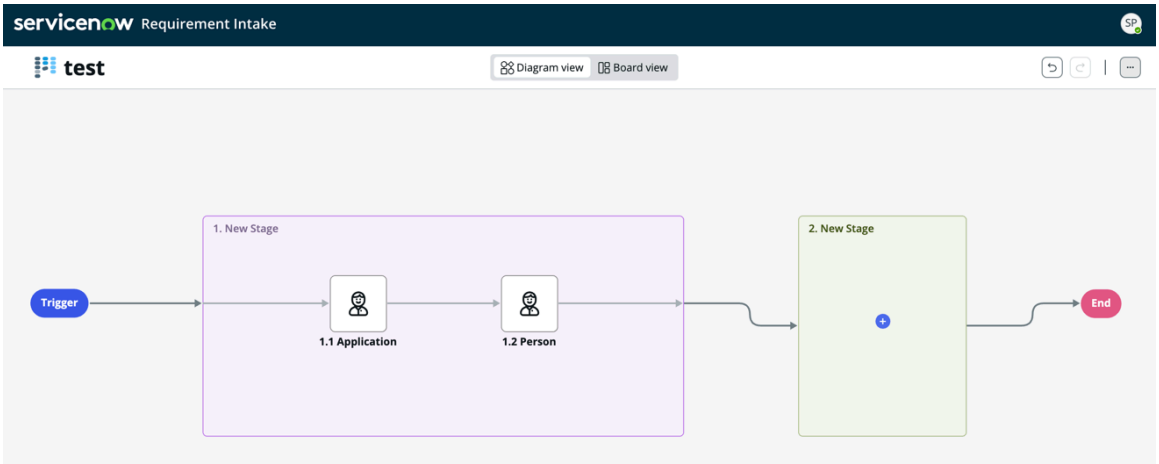
Note:
You should have a diagram ready to so that you can view it.

Procedure

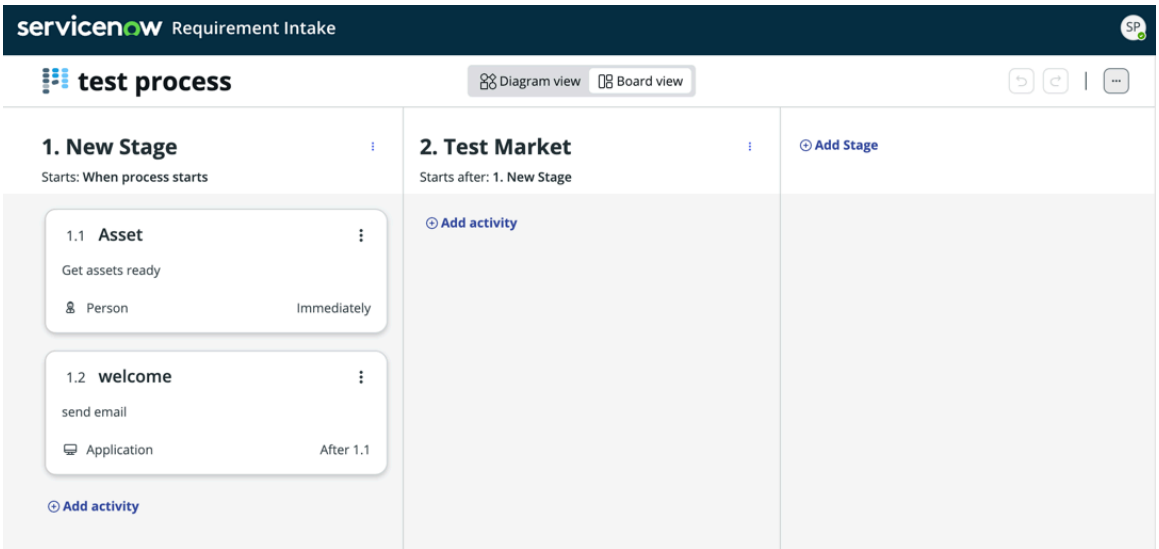
1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. On the **Lists** tab ( ), under **Build**, select **All Automation Requests**.
3. Select an automation request for which you want to view the diagram.
4. Select **View diagram**.
5. The Requirement Intake page is displayed.
   The page displays two views of the requirement diagram:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Diagram view



- Board view



6. You can edit the diagram if required.
   For more information about editing or creating diagrams, see Create a playbook.

   When viewing or editing a diagram, we need not set a trigger. A trigger will be set when the automation is created from the requirement diagram.

View automation

View the automation created using the requirement diagram.

Before you begin

Role required: sn_ac.automation_technical_user, playbook.write, playbook.activity_def_read, connection_admin, or cmdb_read

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. On the **Lists** tab ( ), under **Build**, select **All Automation Requests**.
3. Select an automation request for which you want to view the automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **View Automation**.
5. The Workflow Studio page is displayed.
   The page displays two views of the automation:
   - Diagram view
   - Board view
6. You can edit the diagram if required.
   For more information about editing or creating diagrams, see Create a playbook.

Build automation

Use the requirement diagram to build an automation.

Before you begin

Role required: sn_ac.automation_technical_user, playbook.write, playbook.activity_def_read, connection_admin, or cmdb_read

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. On the **Lists** tab (), under **Build**, select **All Automation Requests**.
3. Select an automation request for which you want to build an automation.
4. Select **Build Automation**.
   The **Select Instance** dialog box is displayed.

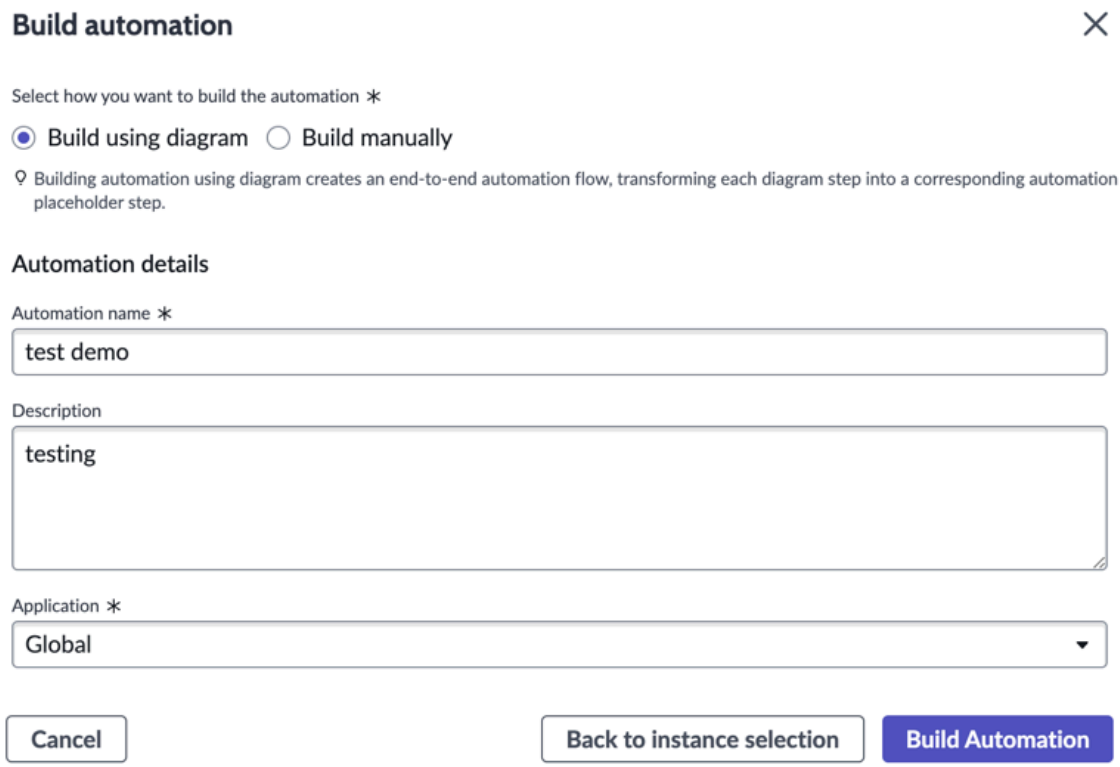
   Important:
   The **Build Automation** button is available only when the automation request is in the **In progress** state.

5. Select an instance where you want to create an automation.

   Note:
   The instances that are set up will be available in the list. For more information, see Set up connections and credentials.

6. Select **Continue**.
   The **Build automation** window is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. On the form, fill in the details.

Field	Description
Select how you want to build the automation	There are two options: ○ **Build using diagram**: Building automation using diagram creates an end-to-end automation flow, transforming each diagram step into a corresponding automation placeholder step. ○ **Build manually**: Building automation manually does not use the diagram. It lets you create a fresh automation.
Automation name	The name of the automation.
Description	The description of the automation.
Application	The application scope where this automation is created.

8. Select **Build Automation**.

   The requirement diagram is visible from the Workflow Studio.

   For more information about editing or creating diagrams, see Create a playbook.

   At this point you must create a trigger to activate the automation.

   Note:
   When the new automation request is created, an automation with the same name is created and mapped to the automation request.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirement Intake Diagram reference

Requirement Intake Diagram reference section provides additional information about the lists and forms that you use to configure and administer Requirement Intake Diagram.

Domain separation and Requirement Intake Diagram

Domain separation is supported for Requirement Intake Design. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview of Requirement Intake Design

The goal of Requirement Intake Design is to govern the end-to-end multi-vendor life cycle from one place. Domain separation is enabled in all the features.

You should have either a flat hierarchy or a single-tier hierarchy and at least one primary or top-level domain.

Imports

Import data from external systems and transform it into ServiceNow AI Platform record data.

Products

Import sets

Import sets enable administrators to import data from various data sources, and then map that data into ServiceNow tables.

Integration Hub - Import

Automate data import tasks through a consolidated interface that provides a guided, step-by-step experience. Define external data sources, specify target tables, map how source data becomes target data, and schedule regular imports.

Import Set API

The `Import Set` API provides endpoints that enable you to interact with import set tables. The API transforms incoming data based on associated transform maps. The `Import Set` API supports synchronous transforms and mirrors the existing SOAP interface.

Easy import

Easy import is a simplified import process that enables you to import only the columns you want.

Inbound email actions

Define an inbound email action to script how the system responds to an inbound email.

Import sets

Import sets enable administrators to import data from various data sources, and then map that data into ServiceNow tables.

Import sets key concepts

Learn about import sets before importing data to your instance.

The import sets table acts as a staging area for records imported from a data source.

Note:
Do not import data in extremely large chunks. Creating an extremely large import set can cause delays and system outages.

A transform map determines the relationships between fields displaying in an import set table and fields in an existing ServiceNow table, such as the Incidents or Users table.

Importing sets skip records when the data in the instance matches the data being imported.

Note:
Import sets run as user System and therefore cannot add data to encrypted fields.

Import sets terminology

Key terms

Term	Definition
Import Set table	A table that acts as a staging location for records imported from a data source before transforming those records. Fields on these tables are generated automatically based on imported data and should not be modified manually. **Note:** Columns in an import set table are generated automatically and shouldn't be added manually. Manually adding columns can negatively impact the table's scheduled cleanup and may lead to an incomplete cleanup and orphaned records. If you need to add columns to an import set table, first add the column to the input data, then select **Test Load 20 Records** or **Load All Records** to auto generate the columns in the import set table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key terms (continued)

Term	Definition
	Columns in an import set table might not have the same type as the input data. For example, a currency column may be represented as a string column in an import set table until it's assigned to a target table column that is of type currency.
Data source	A record that defines where to get the data to import. A data source may point to a file, a JDBC-compatible database, or an LDAP organizational unit.
Transformation	The conversion of data from an import set table to another table according to the rules defined in a transform map.
Transform map	A set of field maps that define the relationships between fields in an import set and fields on a table, such as Incident. During transformation, data is copied from the Import Set table to the destination table based on the transform map. A single import set field may be mapped to multiple fields on other tables.
Robust import set transformer	Extract, transform, and load data to one or more target tables. Separate the transform and processing functions, providing a more flexible alternative to transform maps.
Foreign record insert	A foreign record insert occurs when an import makes a change to a table that is not the target table for that import. This change happens when updating a reference field on a table. For example, when updating a value for the caller on an incident, the import is actually updating the sys_user table.
Coalesce	Lets you update existing target table records when transforming import data. You can specify whether a **Target field** should be used to coalesce on when import set records are transformed. If the field map **Coalesce** option is selected, when the import set row is transformed, the instance checks for an existing record in the target table that has the same value in the **Target field** as the import set row **Source field**. If an existing record with a matching value in the target table is found, that record is updated. If no matching record is found, then a new record is created in the target table.

Supported import formats

You can import data from several different file formats or external data sources.

File formats

Format	Limitations
CSV	CSV files must comply with the proposed CSV standard in RFC4180. In particular, this means that double quotes may not appear inside fields. The first row of data in an imported CSV file becomes the header row and defines the columns for that import set.
Excel	Excel files must have the XLS or XLSX extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File formats (continued)

Format	Limitations
XML	XML files must have a consistent XPath for each data row.
JSON	• For JSON arrays, the path for each row must specify the array root element twice, such as `/incidents/incidents`. • JSON files should follow RFC-4627. For example, a single comma should separate a value from the following name. Names within an object should be unique. • Predicates such as `@element`, `[index]`, or `text()`, as well as Axis such as children, siblings, or ancestors are not supported.
Custom (Parse by Script)	You can write custom JavaScript to parse input lines into the list of maps.

The ServiceNow® platform can import data from the following external data sources.

External data sources

Data Source	Limitations
JDBC	JDBC imports require a valid transform map. Some network configurations may require a ServiceNow® MID Server.
LDAP	LDAP imports require a valid transform map.
OIDC	OIDC imports require a valid transform map.
ServiceNow® REST (Integration Hub)	REST imports require a valid transform map.
Custom (Load by Script)	Custom imports require a valid transform map.

For more details about the different data sources, see Data sources.

Transform maps versus robust import set transformers

Both transform maps and robust import set transformers convert data. Transform maps convert data from the staging table to the destination file. Robust import set transformers convert data from a source table to a message listener. If a data source has both a transform map and a robust import set transformer, the system uses the robust import set transformer instead of the transform map.

Import set scheduled cleanup

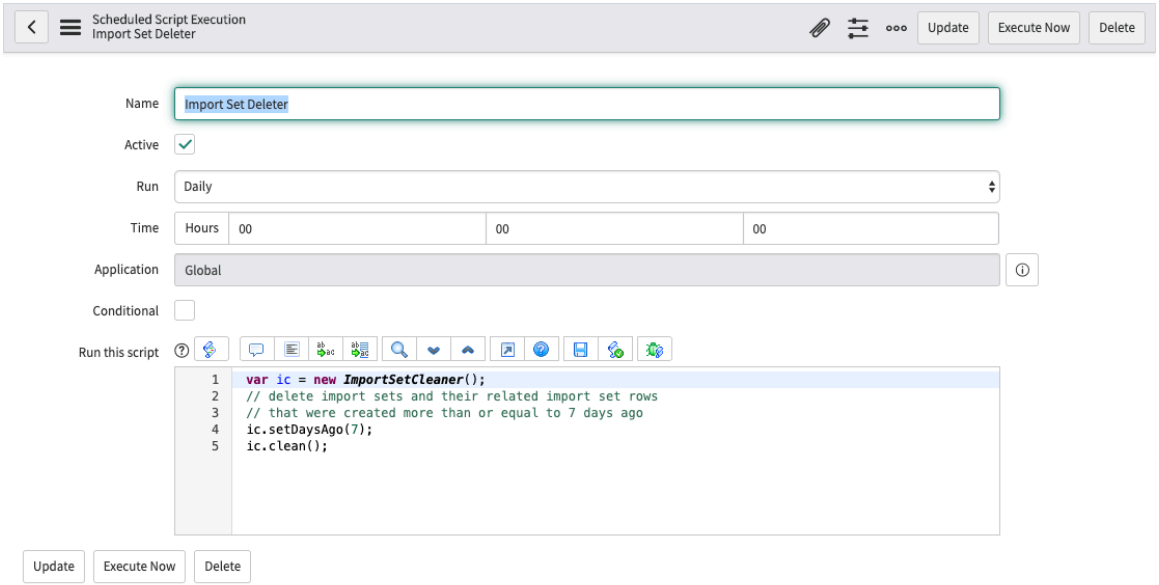
The *`Import Set Deleter`* scheduled job cleans up old import set data every day at midnight.

By default, the job deletes all import sets that are older than 7 days, as well as the associated import set table records. If this scheduled job is not active on your instance, activate it to mitigate the growing import set tables you may have, especially when using recurring imports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If scheduled cleanup is not currently active on your system, you must ensure that your import set tables are not too large (> 5 million records total across all tables) before enabling this cleanup. If the tables are too large, manually delete the records first before proceeding. Contact Customer Service and Support to coordinate the deletion of this data.

Scheduled Script Execution



For procedures, see Delete import sets.

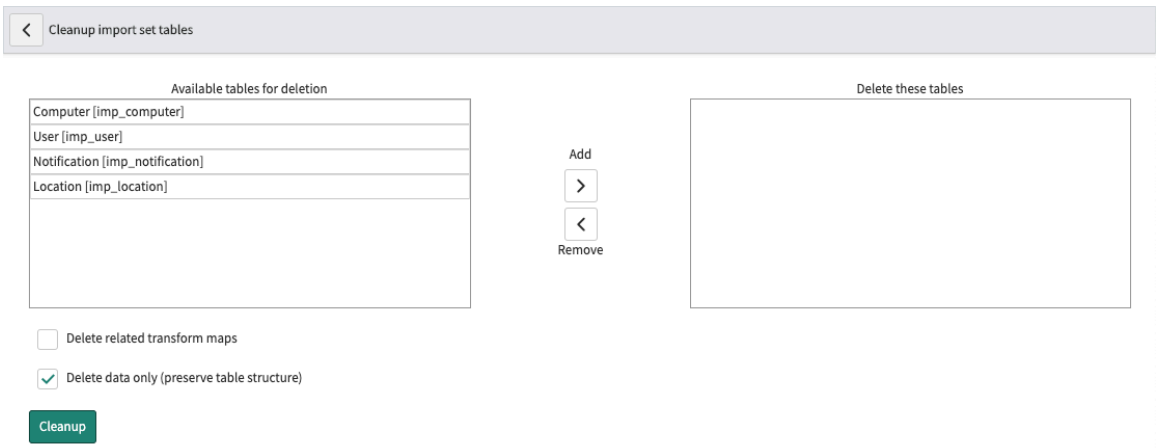
Import set table deleter

You can manually delete any or all of the following import set tables:

- Computer
- User
- Notification
- Location

You can also delete the related transform maps, or you can delete data only and preserve the table structure.

Tables available for deletion



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For procedures, see Delete import set tables.

Concurrent imports

Split incoming data into multiple import sets and transform the import sets concurrently to reduce processing time.

Running a concurrent import can be helpful when order does not matter and imports take a long time due to large data sets with time-consuming scripts. If order matters, you can split the import into multiple partitions to ensure that each partition is processed in order.

Note:
Concurrent imports add processing and monitoring overhead. Use them only with large data sets.

Enable concurrent imports only after fine-tuning all other parameters, such as database indexes and transformations.

Scheduling concurrent imports

You enable concurrent imports by selecting **Concurrent Import** on the Scheduled Data Import form. For instructions, see Schedule a data import.

When the schedule runs a concurrent import, the system pulls the data from databases, Excel spreadsheets, CSV files, or other sources to a temporary staging table, and then transforms the data from the staging table to the target table.

When you run a concurrent import, the system creates multiple import sets, up to the value of the *glide.scheduled_import.max.concurrent.import_sets* system property (default = 10). For example, a two-node cluster produces four import sets, and a ten-node cluster produces ten import sets.

Import Set Transformer job

Each active node runs two Import Set Transformer jobs every minute, and those jobs poll the Concurrent Import Sets Jobs queue, pick import sets from the queue, and transform those import sets. All jobs run concurrently, depending on the availability of worker threads.

Concurrent Import Set record

Each concurrent import creates a Concurrent Import Set record. The form view shows all related import sets, concurrent import set jobs, and transform histories.

You can resume or reprocess any import set. For more information, see Monitor concurrent import sets.

Concurrent Import Sets Jobs queue

After loading data, the system adds the import sets to the Concurrent Import Sets Jobs table. The Concurrent Import Sets Jobs table indicates the job type and status of each concurrent import set job.

For more information, see Monitor concurrent import set jobs.

Partitioning concurrent imports

You can partition import sets to maintain the processing order within each partition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the system allocates records to import sets in a round robin fashion. However, you can write a custom script to define a custom partition key that identifies the target import set. Every row with the same partition key adds to the same import set, and the data in that import set is processed in sequential order.

Hierarchical imports

You can create a scheduled import set hierarchy by scheduling an import to run after another import set completes. One parent scheduled import can have many child scheduled imports, and each child scheduled import executes in the order specified. For concurrent scheduled imports, child scheduled imports can be started only after all Import Set Transformer jobs complete.

The last Import Set Transformer job starts the next import in the hierarchy.

The system generates an execution plan at the beginning of parent import process. Each import process uses the execution plan to fetch the next process to invoke. For concurrent imports, the last Import Set Transformer job fetches the next import and executes it.

Synchronized inserts

Coalesce fields help define uniqueness among records. The transformation process checks for an existing record with the coalesce values and updates the existing record, if it exists, or inserts a new record if none exists. For more information, see Updating records using coalesce.

By default, concurrent imports allow each running import set to insert new records. When an import set inserts a record, it establishes a write lock on the target table to prevent other import sets from inserting the same record.

Tables for concurrent imports

Table	Description
Concurrent Import Set (sys_concurrent_import_set)	Stores details of each concurrent import set in import set records.
Concurrent Import Set Jobs (sys_concurrent_import_set_job)	Lists the import sets to be processed.
Execution Context for Scheduled import (sys_execution_context)	Specifies the execution context for each scheduled import. The execution context specifies the next scheduled import to use when processing a hierarchical scheduled import.
Hierarchical scheduled import execution plan (sys_execution_plan).	Stores the execution plan for hierarchical imports. The execution plan is a tree structure that identifies which scheduled import runs after the preceding scheduled input.

Domain Separation with concurrent imports

You can add the sys_domain field to a scheduled import table to enable domain separation for the import set. Both import set loading and transform jobs run in the domain specified in the scheduled import set job.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data sources

Data sources are used to create an import set so that data can be processed, if necessary, prior to being mapped onto a production table.

Data Source Types

Type	Description
File	Data is in a recognized file format, accessible locally or remotely through several file retrieval methods.
JDBC	Data is in a database, accessible using JDBC. Customer Service and Support supports Oracle, MySQL, Sybase, DB2 Universal, and MS SQL Server drivers.
LDAP	Data is in an LDAP server, accessible through the LDAP or LDAPS ports, 389 and 636 respectively.
OIDC	Data is accessible via OpenID Connect.
REST (Integration Hub)	Data is in a REST API, accessible through Integration Hub.
Data Stream Integration Hub	Data is loaded from a Data Stream Action, accessible through Integration Hub.
Custom (Load by Script)	Data is obtained using a custom script.

File type data sources

Import a file from a local source, a remote network server, or another instance by providing a path and authentication information.

For file type import sets, you can select from a list of file retrieval methods: SFTP, FTP, FTPS, HTTP, HTTPS, and SCP.

Note:
FTPS is not recommended because it is no longer supported by some firewall vendors. Consider using SFTP as an alternative.

File retrieval methods

The following file retrieval methods are available to copy the file from where it resides to ServiceNow to be loaded into an import set.

After defining the files that are compatible for importing, define how the files can be imported.

Note:
For the import to succeed, your FTP server and client must be set up for the same authentication mechanism that you select here.

Method	Description
Attachment	Add and manage attachments a file to the record and import that file in an import set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Method	Description
SFTP	Retrieve a file using SFTP. Fields are provided for the server name and login credentials.
FTP	Retrieve a file from an FTP server in your network. Fields are provided for the server name and login credentials. **Note:** FTP transfers are sent as clear text and cannot be encrypted. Use SCP or SFTP instead whenever possible.
FTPS (Auth SSL) [not recommended]	Not recommended because FTPS is no longer supported by some firewall vendors. Consider using SFTP as an alternative. An FTP Secure authentication command issued through the Secure Socket Layer (SSL) protocol. This method is also known as explicit FTP over SSL.
FTPS (Auth TLS) [not recommended]	Not recommended because FTPS is no longer supported by some firewall vendors. Consider using SFTP as an alternative. An FTP Secure authentication command issued through the Transport Layer Security (TLS) protocol. This method is also known as explicit FTP over TLS.
FTPS (Implicit SSL) [not recommended]	Not recommended because FTPS is no longer supported by some firewall vendors. Consider using SFTP as an alternative. In implicit security, the FTPS server defines a specific port for the client (990) to use for secure connections. Implicit security automatically begins with an SSL connection the moment an FTPS client connects to an FTPS server.
FTPS (Implicit TLS) [not recommended]	Not recommended because FTPS is no longer supported by some firewall vendors. Consider using SFTP as an alternative. In implicit security, the FTPS server defines a specific port for the client (990) to use for secure connections. Implicit security automatically begins with a TLS connection the moment an FTP client connects to an FTP server.
HTTP	Retrieve a file using HTTP. Fields are provided for the server name and login credentials. **Important:** For HTTP and HTTPS protocols, the file path is automatically URL encoded. Do not specify a URL-encoded file path when using either of these protocols.
HTTPS	Retrieve a file using HTTPS. Fields are provided for the server name and login credentials. Use this method to transfer data between ServiceNow instances.
SCP	The Secure Copy protocol (SCP) securely transfers files between a local and a remote host or between two remote hosts, using the Secure Shell (SSH) protocol.

File data source examples

These examples describe how to import various file types as data sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

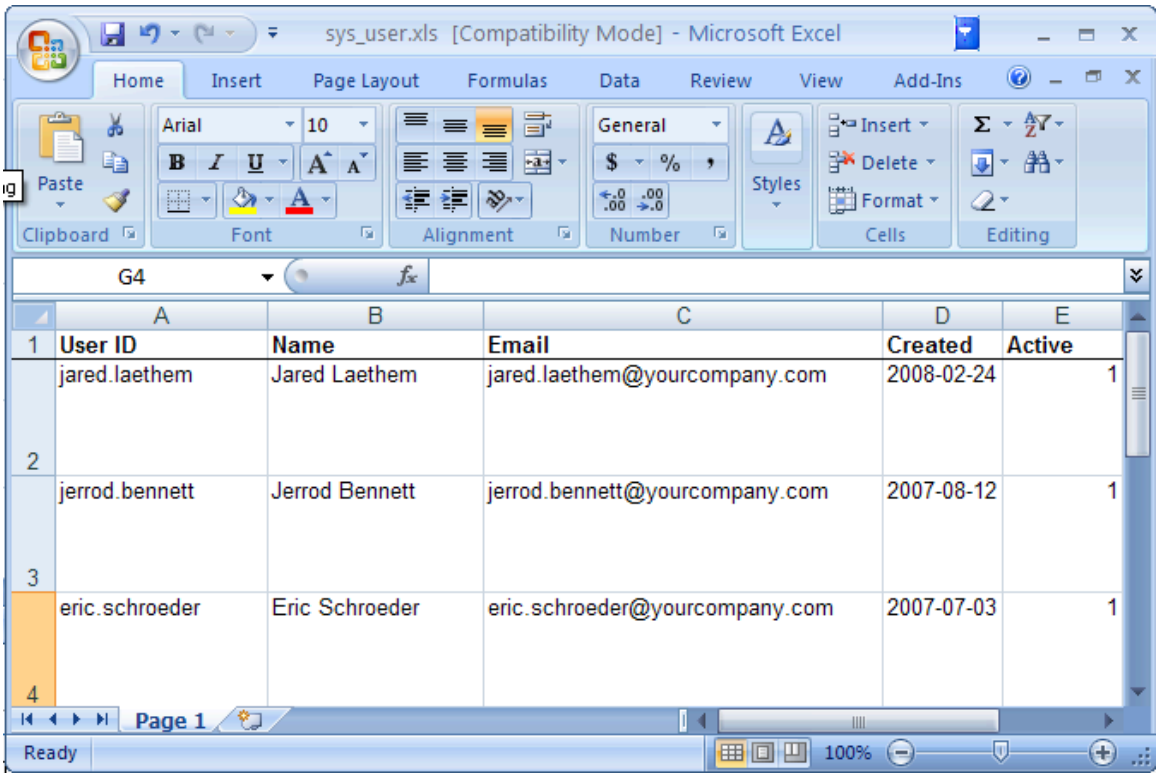
Excel data source file

You can import using both the XLSX format and the legacy XLS format. XLS is the default format for spreadsheets created in Excel for versions 2003 and older. XLSX is the default format for Excel 2007 or later. Use XLSX instead of legacy XLS whenever possible for optimal performance.

Note:

- All .xls files must use the 1900 date system as opposed to the 1904 date system. The 1904 date system causes your dates to be imported with a year that is four years earlier than what appears in your spreadsheet. Refer to MS Support for additional information about date systems.
- When importing a file from Excel that has upper case boolean values of (TRUE/FALSE), both values always transform to false. To prevent this behavior, set the *glide.transform.boolean.casesensitive* property to false.

Microsoft Excel Demo Data



XML data source file

XPath for each row

XML data source definitions have an extra field to specify the **XPath for each row**. This field is an XPath expression to select the elements whose children are converted to rows in the import set table. Each selected element causes a row to be created in the import set table. The children of the selected element are converted into columns in the row. For example, to import the asset information from the sample XML file below, the XPath expression should be specified as `/export/asset`. This expression matches the three `<asset>` elements in the file, so three rows are created. Although you could also specify `//asset`, this expression is much less efficient for large files. Use the absolute location path form for XPath expressions when using the XML loader. In other words, avoid expressions containing `//` unless strictly necessary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Be careful not to specify an insufficiently restrictive XPath expression with a large XML file. For example, the expression `/export` would be wrong for the following sample file, since it matches the document (root) element. In general, you should never specify an XPath expression which matches the root element unless you want everything in the document to be made into a single row. Specifying an insufficiently restrictive XPath expression when attempting to load large XML files could result in lengthy processing times and incorrect output. For this reason, it is best to test and debug XML data source specifications with small XML files containing only a few rows worth of data. Once the specification has been tested, you can run it again with the full file.

<userInfo> elements

Note that the `<userInfo>` elements contained within `<asset>` contain child elements. This type of nesting creates a column called **userInfo** that contains XML for the `<userInfo>` element. If **Expand child nodes** is checked, individual columns are also created for **userInfo/lastName** and **userInfo/firstName**. If **Expand child nodes** is not checked, only the **userInfo** XML column is created.

Loading data from an XML file

When loading data from an XML file, ServiceNow samples the first 10 records to determine what fields are required to hold the data. If none of the first 10 records specify a value for a field, ServiceNow does not add that field to the table that holds the imported data. Ensure that at least one of the first 10 records specifies a value for any fields being imported.

If the XML file used for an XML data source does not contain a field in the first 10 nodes, the field is ignored. To import the field and ensure it is not ignored, you can add the *glide.db.impex.XMLLoader.max.scan_nodes* system property with a value greater than or equal to the position of the node where the field is first encountered. This property applies to all XML data sources. *glide.db.impex.XMLLoader.max.scan_nodes* defaults to **10**, but you can enter a value from **1** to **2147483647** to specify how many nodes should be scanned to determine the values to be used for the import. You can specify **-1** to scan all nodes in the XML files.

Important:
If you specify **-1** or increase the value of *glide.db.impex.XMLLoader.max.scan_nodes* beyond the default of **10**, all XML import processing may incur a significant increase in overall load time.

```
<?xml version= "1.0" encoding=
 "utf-8" ?

CSV data source file

CSV files are used as a cross-compatible file format for transferring files across platforms. A CSV file is a text file that defines a grid, where commas define columns and line breaks define rows. To define precise spacing for importing strings, you can optionally wrap text in quotes.

```

```

When using CSV files, you can specify the encoding charset using the **Properties** field on the Data Source form. You may need to Configuring the form layout the Data Source form to see this field. For example, to use utf-8 encoding, enter **charset=utf-8**.

Data in single column

For the JSON and XML formats, this feature lets you store a full record in a single column.

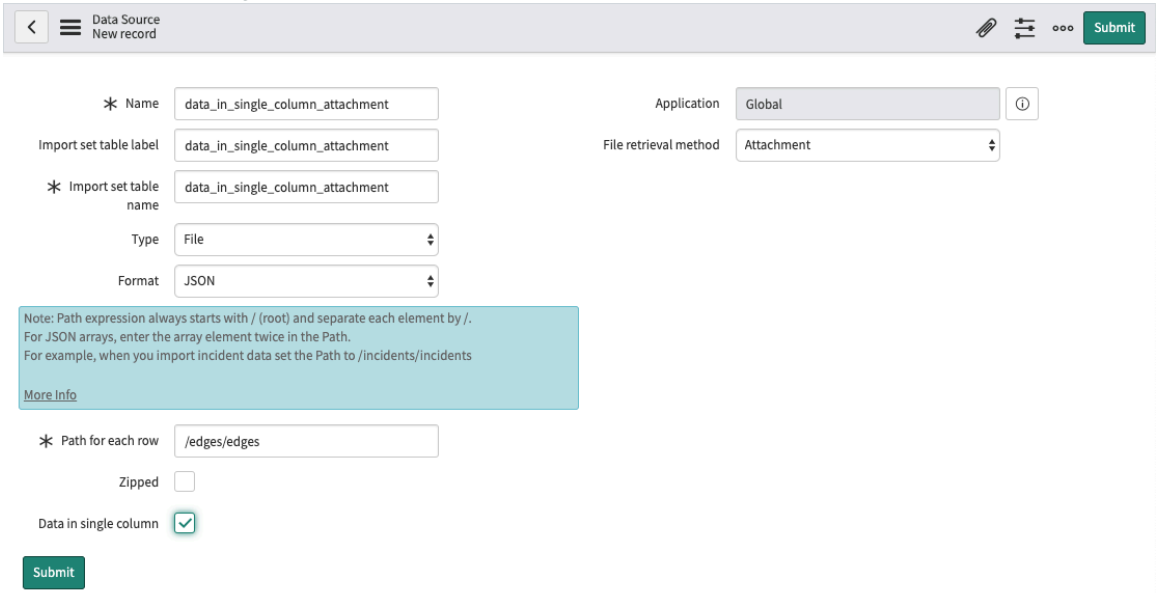
The column name used to store the full record is `data`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you create a JSON format data source to save data in a single column, selecting the **Data in single column** check box updates the following options:

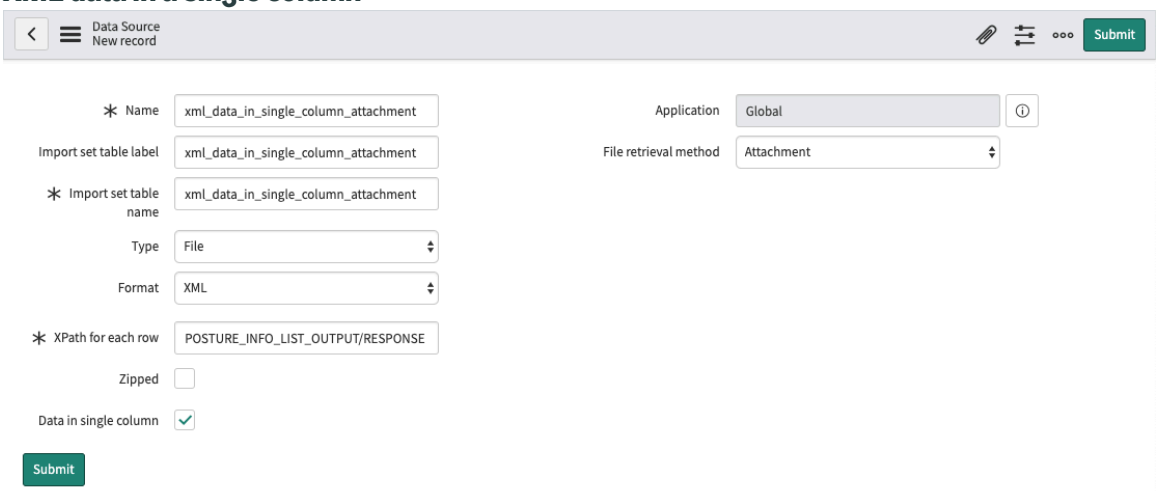
- **Discard Array** becomes unselected and is removed from the form.
- **Expand node children** becomes selected and is removed from the form.

JSON data in a single column



If you create an XML format data source to save data in a single column and you select the **Data in single column** check box, **Expand node children** becomes selected and is removed from the form.

XML data in a single column



Custom (Parse by Script) format

When you select a **Type** of **File** and a **Format** of **Custom (Parse by Script)**, a Javascript editor called **Parsing script** appears. You can use the parsing script to create customized Javascript to parse input lines into the list of maps.

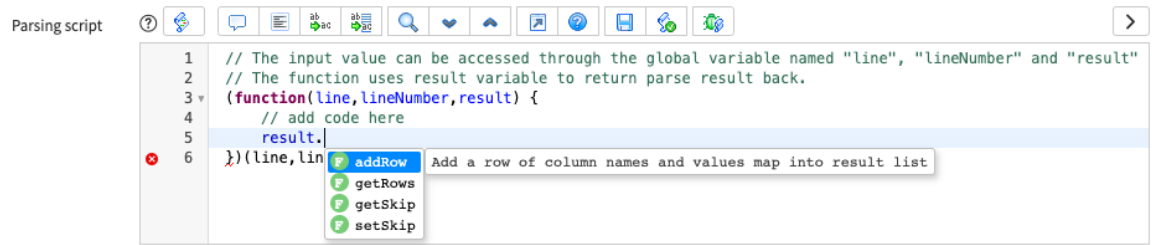
The Javascript has three predefined parameters:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The *line* parameter is a string which contains line data from the source file.
- The *lineNumber* is the line number from the source file for this line data.
- The *result* parameter is used to pass back the parsed result from Javascript.

The *result* parameter is an instance of Java object ScopedScriptParseResult. When you type `result.`, four available methods appear as script auto-complete in the Javascript editor:

Auto-complete menu



- `void setSkip(boolean skip);`
- `boolean getSkip();`
- `addRow(Map<String, String> map);`
- `List<Map<String,String>> getRows()`

The `setSkip()` and `getSkip()` set and retrieve the skip flag. When the skip flag is set to true, the entire parsing result from Javascript is ignored.

The `addRow()` adds one map of the parsing row result, which is inserted into the staging table.

The `getRows()` retrieves all rows of the current parsing result, which are inserted into the staging table.

One line of source data can contain one row or multiple rows. It is up to the script writer to decide how to process the line data. For example, for line data `name=john,computer=windows;name=joe,computer=linux;name=linda,computer=windo` if you use a semicolon (;) as a row break, then this line contains three rows of data. Each row is a map with two keys: `name` and `computer`. The `name` and `computer` become the column names for the staging table schema. You could use the following sample of Javascript to parse this line data:

```
(function(line, lineNumber, result) {
 var rowArr = line.split(";");
 var i;
 for(i in rowArr) {
 var map = {};
 var arr = rowArr[i].split(",");
 var x;
 for(x in arr) {
 var items = arr[x].split("=");
 map[items[0]]=items[1];
 }
 result.addRow(map);
 }
})(line, lineNumber, result);
```

The script writer must add the result so that the result is inserted in the staging table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Processing custom CSV files

You can process CSV files that are delimited by a character other than commas.

Before you begin

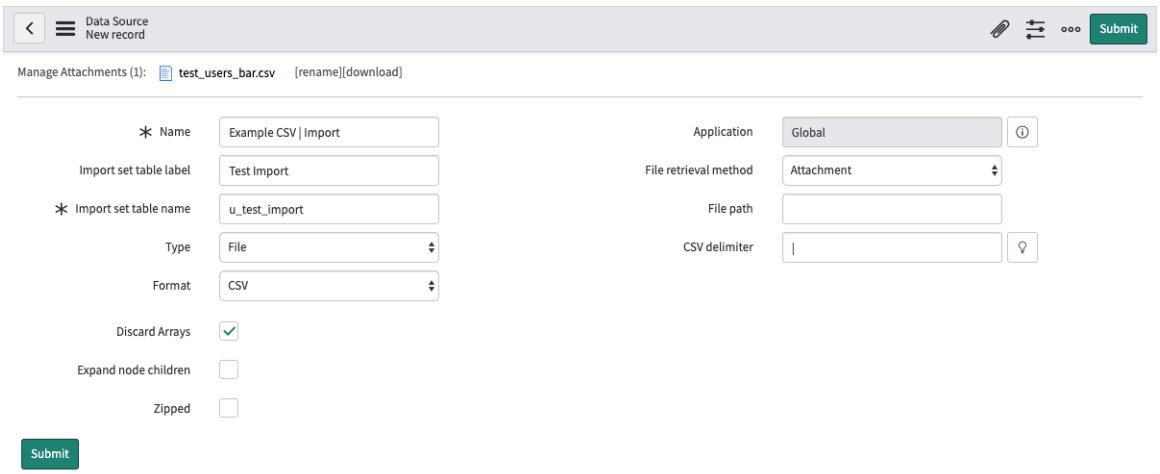
Role required: admin.

About this task

This is an advanced step to create a CSV import. Normally, you would upload the data and import it directly using System Import Sets, which will create this CSV data source for you automatically.

Procedure

1. Create the data source record.
2. Attach the CSV file to the data source.
3. Customize the Data Source form and add the **CSV Delimiter** field.
4. Enter the character you want to use as the CSV file delimiter, such as the pipe symbol (|).
5. Test load the data source.



JSON file import examples

These examples demonstrate how to import various types of JSON data and the necessary path for each row. JSON files that you import should follow these guidelines.

For step-by-step instructions on creating a File type data source see, Create a File type data source.

- For JSON arrays, the path for each row must specify the array root element twice, such as `/incidents/incidents`.
- JSON files should follow RFC-4627. For example, a single comma should separate a value from the following name. Names within an object should be unique.
- Predicates such as `@element`, `[index]`, or `text()`, as well as Axis such as children, siblings, or ancestors are not supported.

Simple array

- Path for each row: `/incidents/incidents`
- Result: 2 records

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, the path for each row includes the array root node `/incidents` twice. This is necessary when importing an array.

```
{
   "source":"HI",
   "incidents":[
      {
         "number":"INC0000001",
         "short_description":"Can't read email"
      },
      {
         "number":"INC0000002",
         "short_description":"Error loading XML file"
      }
   ]
}
```

Array in 2nd level

- Path for each row: `/problems/data/data`
- Result: 3 records

In this example, the path for each row includes the array root node `/data` twice.

```
{
   "problems":{
      "id":"0",
      "data":[
         {
            "number":"PRBTEST001",
            "short_description":"testsd1"
         },
         {
            "number":"PRBTEST002",
            "short_description":"testsd2"
         },
         {
            "number":"PRBTEST003",
            "short_description":"testsd3"
         }
      ]
   }
}
```

Nested array

- Path for each row: `/problems/problems/data/data`
- Result: 3 records

In this example, the path for each row includes the root nodes for both arrays twice, `/problems` and `/data`.

```
{
   "problems": [
         {
      "id":0,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "data":[
            {
               "number":"PRBTEST001",
               "short_description":"testsd1"
            },
            {
               "number":"PRBTEST002",
               "short_description":"testsd2"
            },
            {
               "number":"PRBTEST003",
               "short_description":"testsd3"
            }
         ]
       }
    ]
}
```

Supporting child (nested) arrays

By default, import does not support child (nested) arrays. You can enable support by unchecking the **Discard Arrays** check box in the Data Source view. The following table describes different behaviors when enabling and disabling child array support.

```
{
  "response":{
    "docs":[
      {
        "id":"id_val",
        "childrenArray":[1,2,3],
        "anotherArray":[{"key1":"value1"}, {"key1": "value2"}],
        "elementWithArray":{"childrenArray":[1,2,3]}
      }
    ]
  }
}
```

Child array behavior

Path	Discard Arrays Enabled	Discard Arrays Disabled
/response/docs/docs	Creates one record with the following columns and values: • Id : id_val • elementWithArray : {} Any arrays found in a record, such as childrenArray or anotherArray, are not created as columns in the import table.	Creates one record with the following columns and values: • Id : id_val • childrenArray : [1, 2, 3] • anotherArray : [{"key1" : "value1"}, {"key1" : "value2"}] • elementWithArray : {"childrenArray" : [1, 2, 3]}
/response/docs/docs/anotherArray/anotherArray	Creates two records, each with one column: key1.	Creates two records, each with one column: key1.
/response/docs/docs/childrenArray/childrenArray	Does not work and returns a **Path should always refer**	Does not work and returns a **Path should always refer**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Child array behavior (continued)

Path	Discard Arrays Enabled	Discard Arrays Disabled
	JSON Objects error because the values in the array are not in a key-value structure.	**JSON Objects** error because the values in the array are not in a key-value structure.

Orphan array

- Path for each row: `//`
- Result: 2 records

```
[
   {
      "number":"PRBTEST001",
      "short_description":"testsd1"
   },
   {
      "number":"PRBTEST002",
      "short_description":"testsd2"
   }
]
```

Multiple elements instead of an array

- Path for each row: `/problems/problem`
- Result: 3 records

Important:
This format is not recommended. JSON files should follow RFC-4627, which states that names within an object should be unique. Use JSON arrays instead.

```
{
   "problems":{
      "title":"2 problems",
      "problem":{
         "number":"PRBTEST001",
         "short_description":"testsd1"
      },
      "problem":{
         "number":"PRBTEST002",
         "short_description":"testsd2"
      }
   },
   "problems":{
      "title":"1 problem",
      "problem":{
         "number":"PRBTEST005",
         "short_description":"testsd5"
      }
   }
}
```

FTP data source extended properties

Certain properties are available for customizing your FTP data source.

To enter these properties, you must Configuring the form layout the Data Source form and add the **Properties** field. When specifying more than one property, use a comma to separate each property.

Available FTP Properties

Property	Description
connection.timeout	Defines the number of milliseconds to wait before timing out the FTP connection attempt. • Default value: 10000 • Example custom value: connection.timeout=12000 • Data source: FTP, FTPS
remove_file	Determines if the remote file is deleted after the import. • Default value: true • Example custom value: remove_file=false • Data source: FTP, FTPS, SFTP
rename_file	Determines if the remote file is renamed after the import. Renamed files use the format <original file name>.imported. • Default value: false • Example custom value: rename_file=true • Data source: FTP, FTPS, SFTP

JDBC type data source

A JDBC data source retrieves its data via a JDBC driver, usually type 4 network.

The JDBC connection is available either directly from the ServiceNow instance (a VPN setup required), or via a dedicated MID Server installed inside your firewall that can access the database port.

Note:
JDBC calls from the MID Server are never encrypted. Limit the rights available to the MID Server user whenever making JDBC calls from a MID server.

JDBC data source supported database formats

JDBC data sources support several database formats and ports.

Supported database formats

SQL Server Type	Port
MySQL	3306
Microsoft SQL Server	1433

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported database formats (continued)

SQL Server Type	Port
Oracle	1521

Note:
Oracle DATE fields are loaded as ServiceNow Date/Time fields.

JDBC data source SQL statement requirements

JDBC queries that run SQL statements must specify a column name.

For example, this query specifies the column name **ServerID**.

```
SELECT DISTINCT 'server_name:' + CONVERT ( VARCHAR ,
 lg .ResourceID ) AS 'ServerID'
,LastHWScan
,Account0
,Category0
Fromv_GS_WORKSTATION_STATUSsInner  JOIN
v_GS_LocalGroupMembersOlg
ON s .ResourceID  = lg .ResourceID
WhereType0  = 'Local' AND Category0  = 'SystemAccount'
```

SQL server integrated authentication for Windows

A JDBC data source can use the ID of for the Windows MID Server service user to authenticate with SQL Server.

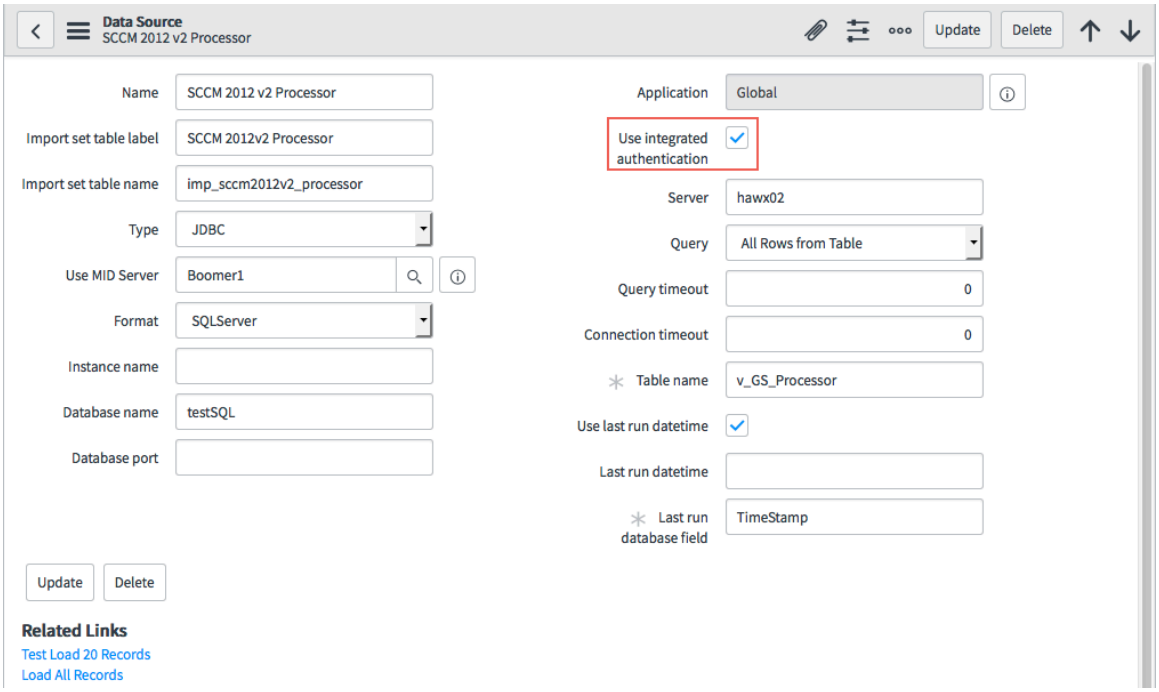
The **Use integrated authentication** check box on the Data Source form determines if the JDBC data source uses the MID Server service user credentials. For this field to appear on the Data Source form, the integration must meet these criteria:

- The MID Server must be running on a Windows computer with SQL Server.
- The MID Server service must use the same credentials that SQL Server requires.
- The data source **Type** is JDBC.
- The data source **Use MID Server** check box is selected.
- The data source **Format** is SQLServer.

Important:
If integrated authentication is chosen, and you are integrating with Microsoft System Center Configuration Manager, the account running the MID Server service must have read rights on the SCCM database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Source form



Note:
The **Last run database field** on the JDBC data source is case-sensitive for the SQL server.

Adding JDBC drivers for unsupported database formats

Use the following procedure to extend the data source to use a driver for a database that is not provided in the base system. JDBC connections are supported for the following default databases:

Add a new JDBC format choice

Extend the available JDBC driver options by creating a new choice list entry to specify the JDBC driver Java package name.

Before you begin

Role required: import_admin

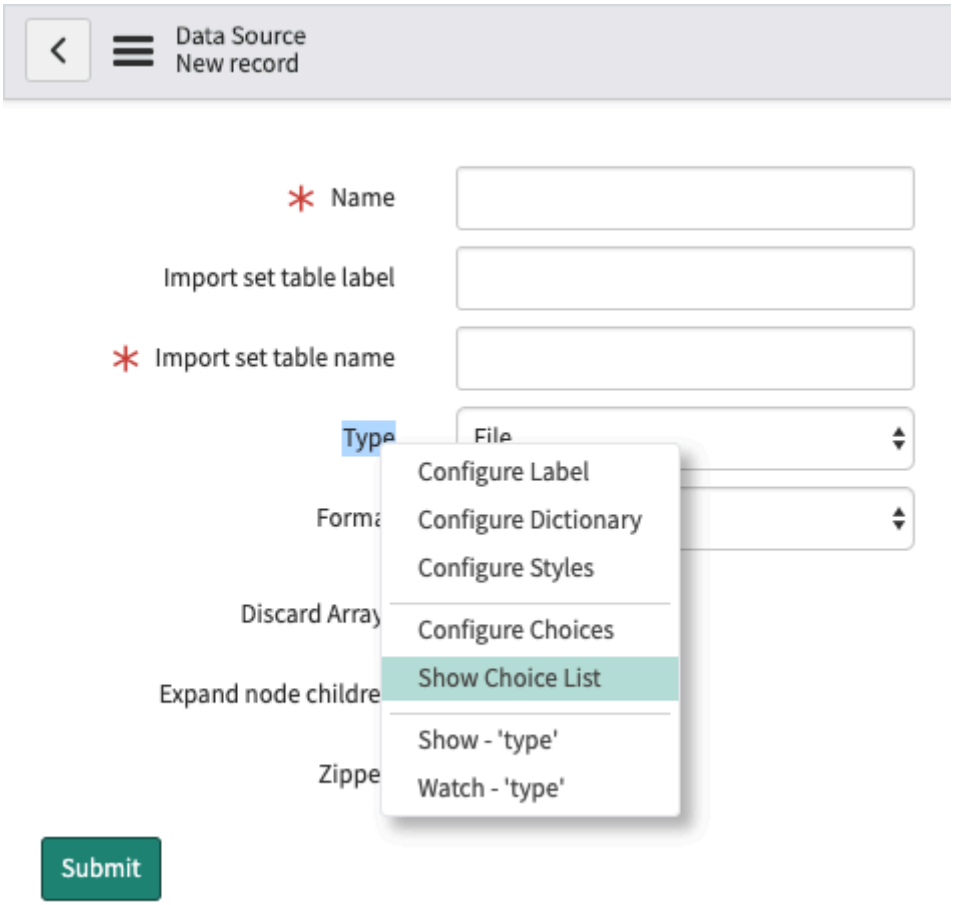
About this task

Add a new choice list entry for the new database to the **Format** field in the *sys_data_source* table.

Procedure

1. Navigate to **System Import Sets > Administration > Data Sources**.
2. Click **New**.
3. In the Data Sources form, right-click the **Format** field label, and select **Show Choice List** from the pop-up menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

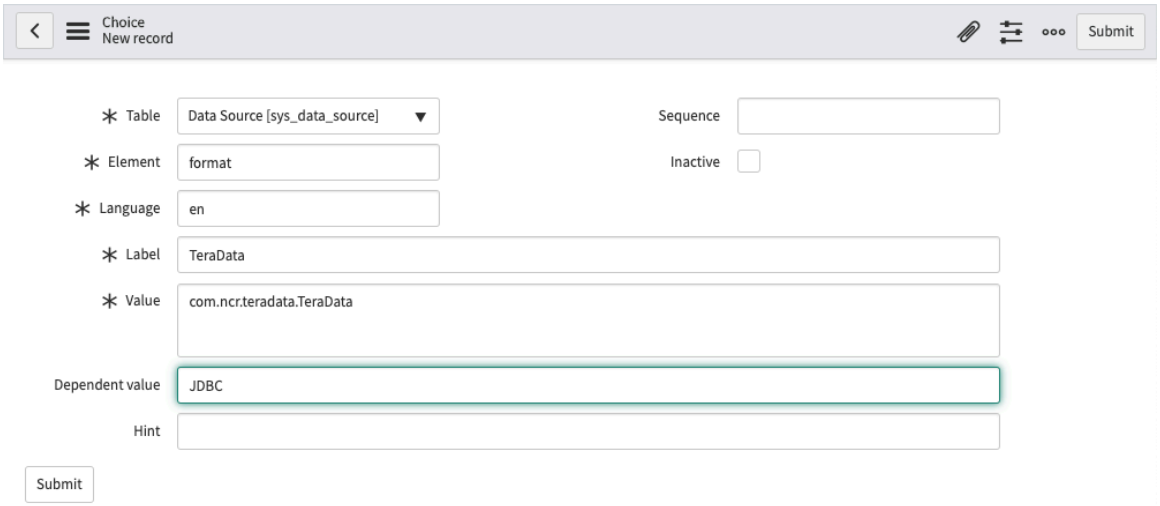


4. Click **New** in the list of choices.
5. Provide the following values to create the new database choice.
   Look at the existing drivers for examples.
   - Table: *sys_data_source*
   - Label: Database name that appears as an option in the **Format** choice list, for example: Teradata.
   - Value: Package name and class of the driver. For example, the value for TeraData is *com.ncr.teradata.TeraDriver*.

     Note:
     The driver package and class must be provided by the driver vendor. This information is often available in the vendor's documentation, such as for MariaDB or Teradata.

   - Dependent value: JDBC

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Submit**.

   The new data source now appears in the list of available JDBC formats.

Add Sybase or DB2 JDBC format choices

Extend the available JDBC driver options by activating the Sybase or DB2 choices.

Before you begin

Roles required: admin

Important:
To use Sybase or DB2 JDBC drivers, you must manually install the driver JAR file on a MID server. Refer to KB0551236 for more information.

About this task

Activate the Sybase or DB2 JDBC drivers to connect with those database formats through a MID server. This procedure assumes you are using the following Sybase or DB2 drivers:

Drivers

Format	Driver	Driver class
Sybase	jconnect-jdbc	com.sybase.jdbc3.jdbc.SybDriver
DB2	db2jcc	com.ibm.db2.jcc.DB2Driver

If you are using a different implementation of the Sybase or DB2 driver, you must modify the choice **Value** to use the driver class from your driver implementation.

Procedure

1. Navigate to **System Import Sets > Administration > Data Sources**.
2. Click **New**.
3. In the **Type** field, select **JDBC**.
4. Right-click the **Format** field label, and select **Configure Choices** from the pop-up menu.
5. Move the **Sybase** or **DB2 Universal** choices from the **Available** column to the **Selected** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **Save**.

   The new data source now appears in the list of available JDBC formats.

Install a driver on a MID Server

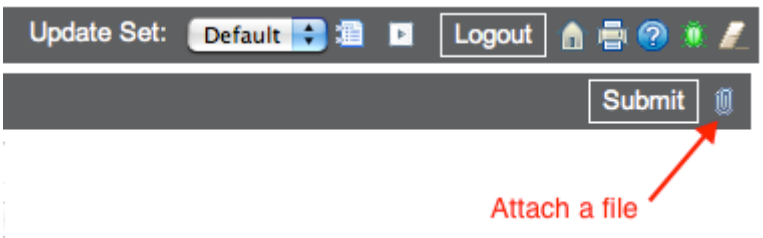
You can install a new JDBC driver JAR file to a MID server to access database formats that are not supported by default.

Before you begin

Role required: agent_admin

Procedure

1. Navigate to **MID Server > JAR Files**.
2. Click **New**.
3. Complete the following fields:
   - Name: A unique and descriptive name for identifying the file in the instance.
   - Version: A version number for the file, if one is available.
   - Source: Location of the JAR file for reference purposes. Source information is not used by the system.
   - Description: Short description of the JAR file and its purpose in the instance.
4. Click the paper clip icon in the banner and attach the JAR file to the record.



5. Click **Submit**.
6. Restart the MID Server service.

   The platform makes the JAR file available to any MID Server configured to communicate with the instance.

Create a new JDBC data source for an unsupported database format

Add a new JDBC data source by defining a data source record.

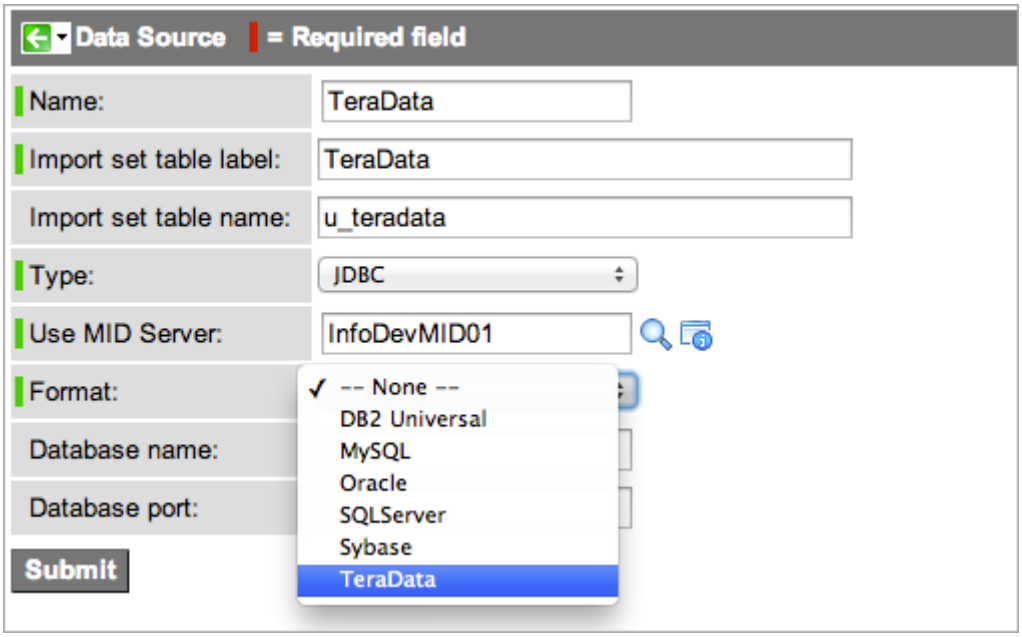
Before you begin

Role required: import_admin

Procedure

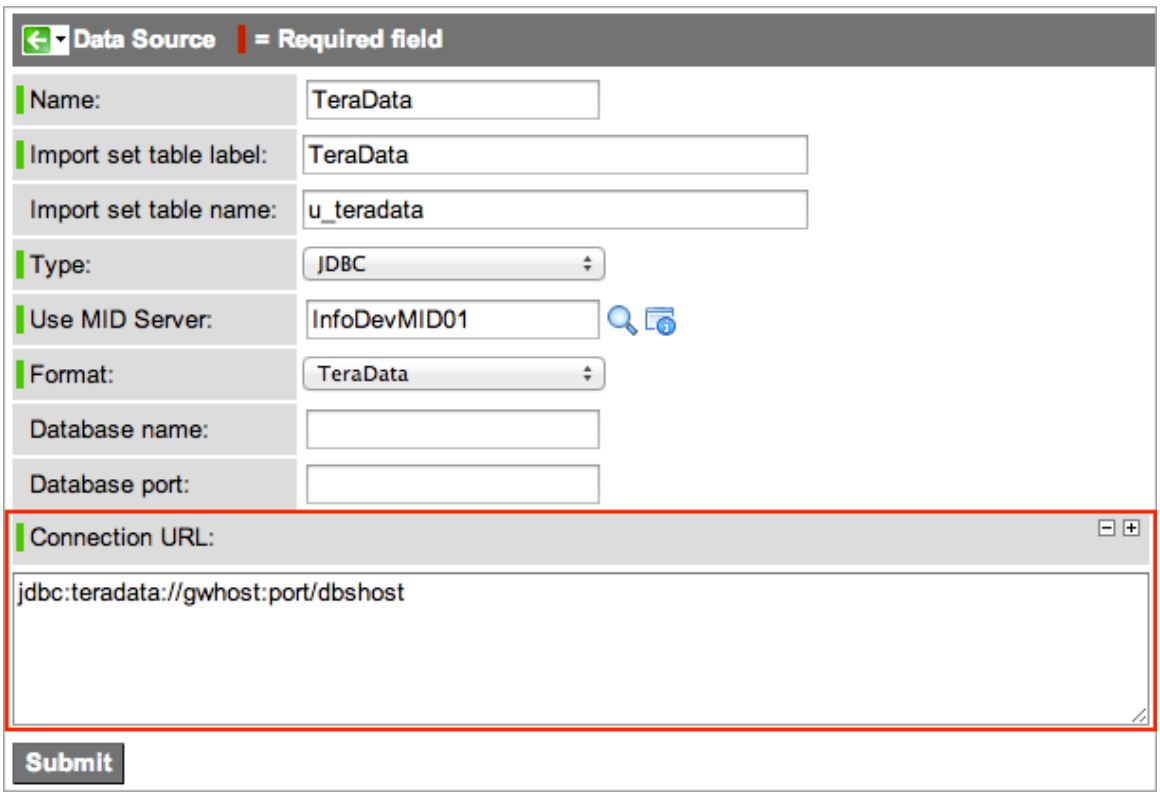
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources** and click **New**.
2. In the Data Source form, select **JDBC** from the list in the **Type** field.
3. Select the new data source from the choice list in the **Format** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Configuring the form layout and add the **Connection URL** field.
5. Provide the connection URL to the JDBC data source, and then click **Submit**.

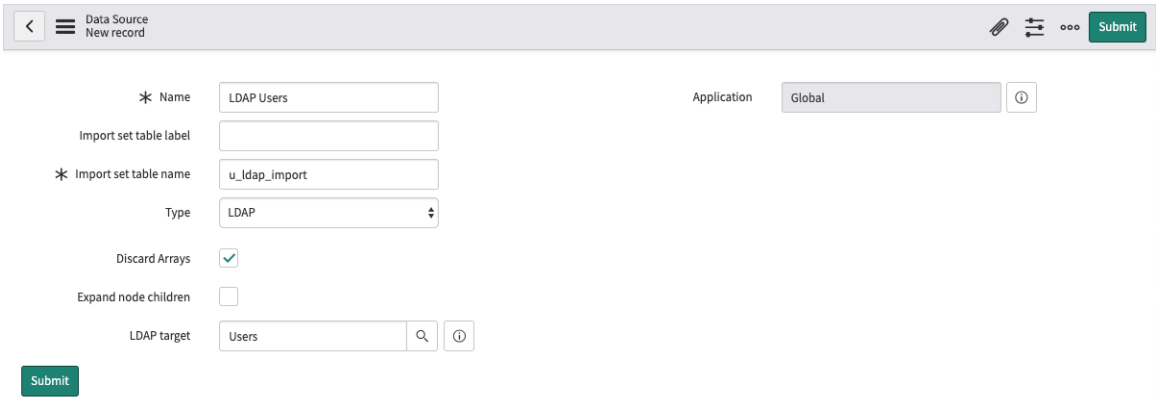
   No other connection information is required.



LDAP type data source

An LDAP data source is automatically created when you configure your instance to integrate with LDAP.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Processing a large LDAP request without paging

When an LDAP server does not support paging, a large request is automatically broken into multiple smaller requests.

This process is known as "nibbling" the LDAP request. The large request is broken into multiple smaller requests based on the value of the **Query field** in the LDAP OU definition. This field should specify a unique value such as email address or user ID.

For example, the following LDAP query might return more than 1000 records.

```
(&(objectclass=user)(sn=*))
```

In this example, the LDAP server **Query field** is **preferredIdentity**. The instance then splits the large request into multiple smaller requests, grouping records based on the **preferredIdentity** value.

```
(&((&((preferredIdentity>=0)(preferredIdentity<=1)))((&(objectc
lass=user)(sn=*))))
(&((&((preferredIdentity>=1)(preferredIdentity<=2)))((&(objectc
lass=user)(sn=*))))
(&((&((preferredIdentity>=2)(preferredIdentity<=3)))((&(objectc
lass=user)(sn=*))))
. . .
(&((&((preferredIdentity>=9)(preferredIdentity<=a)))((&(objectc
lass=user)(sn=*))))
(&((&((preferredIdentity>=a)(preferredIdentity<=b)))((&(objectc
lass=user)(sn=*))))
(&((&((preferredIdentity>=b)(preferredIdentity<=c)))((&(objectc
lass=user)(sn=*))))
```

Data Stream (Integration Hub) data source

Enable platform Data Sources to load data from Integration Hub Data Stream actions.

A Data Stream is a stream of response data larger than 10 MB or data that returns paginated results. Successful execution of the Data Stream action returns a complex data output stream that the Data Source consumes. For more information, see Data stream actions and pagination.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Complex data allows you to encode and store structured data in a machine-readable format. Based on Data Source configuration, complex objects can be either flattened into an import table or serialized completely as JSON data into a single column.

Complex data includes parent and child objects and nested objects, as shown in the following example:

For more information, see Complex data.

Custom (Load by Script) type data source

Use a custom script to store any type of incoming data in the import set table.

When you select a **Type** of **Custom (Load by Script)** for your data source, the **Data Loader** field appears. The **Data Loader** field is a JavaScript field where you can enter a script to fetch data and insert it into the import set table using the *import_set_table* input parameter. For example, you can enter a script to get data from a REST API or a file attachment.

The **Data Loader** script loads the data. You can also **Enable parallel loading** to use a script to partition the data into smaller sections, then load them in parallel. Parallel loading can enable your integrations to finish in less time and create less of an impact on other tasks.

Note:
With parallel loading, you must be running a concurrent import and the **Partition Method** for the import must be set to **Custom size**. For more information see, Schedule a data import.

Data Loader script

The data loader script has the following input parameters.

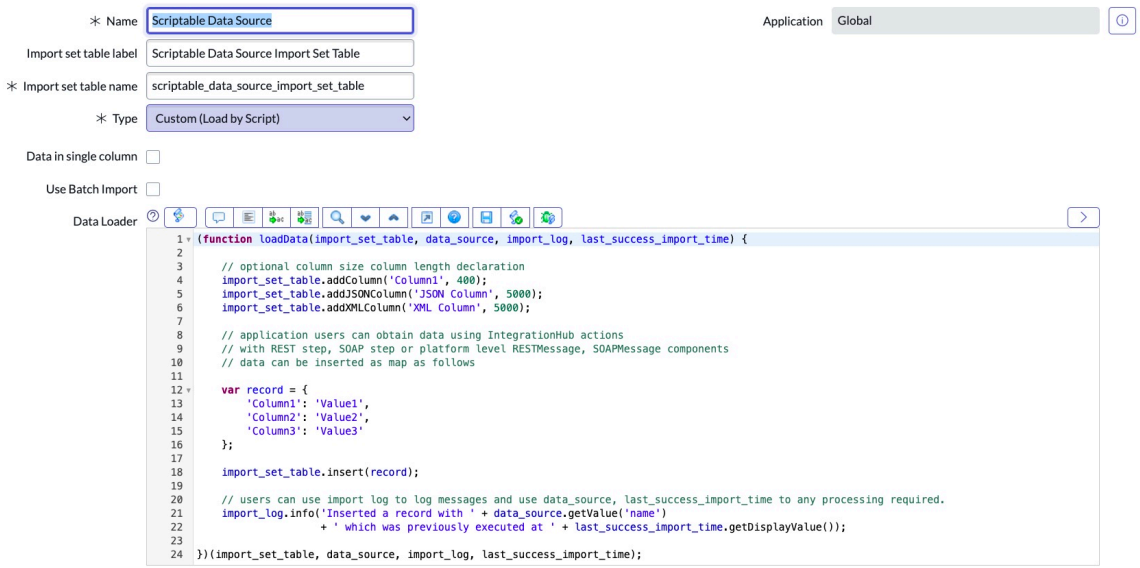
- `import_set_table`: The import set table referred to in the Data Source record. The data is inserted into this table.
- `data_source`: The data source referred to in the Data Source record.
- `import_log`: The log that records information about data import activity.
- `last_success_import_time`: The last time this data source was run successfully.
- `partition_info`: The partitioning information for the data. Used for parallel loading.

The import_set_table parameter has the following methods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `addColumn(label, maxLength)`: Adds a string-type column to the import set table.
- `addJSONColumn(label, maxLength)`: Adds a JSON-type column to the import set table.
- `addXMLColumn(label, maxLength)`: Adds an XML-type column to the import set table.
- `insert(rowData)`: Inserts a map (key = column name, value = column value) in the import set table.
- `getMaximumRows()`: Returns 20 when you select **Test load 20 records**. In every other case, returns `-1`.

Data Loader example



Parallel loading script

The parallel loading script has the following input parameters.

- `parallel_job_loader`: The Parallel Jobs [sys_parallel_job] table.
- `data_source`: The data source referred to in the Data Source record.
- `import_log`: The log that records information about data import activity.

The parallel_job_loader parameter has the `add(partitionInfo)` method, which adds the partition information to the Parallel Jobs [sys_parallel_job] table.

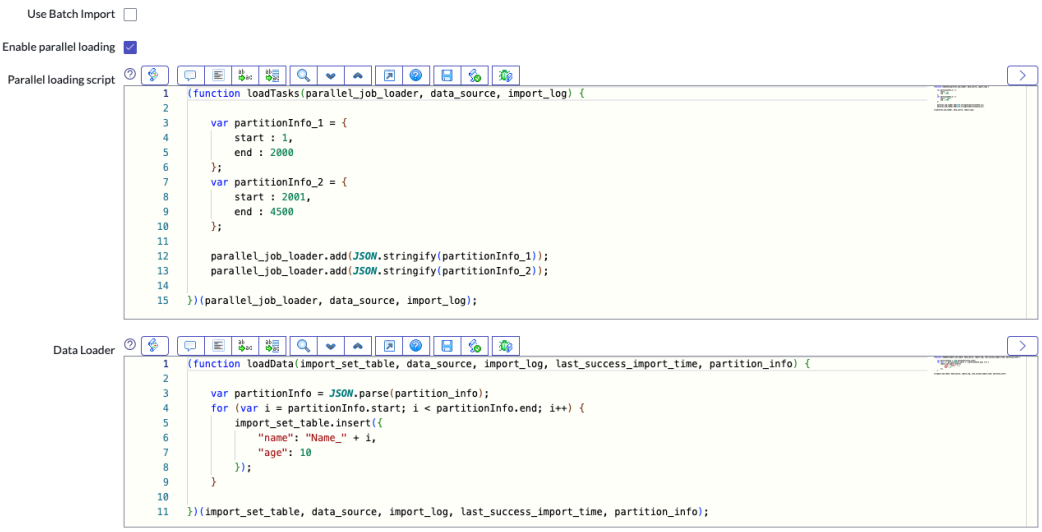
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parallel loading example



Parallel loading properties and status

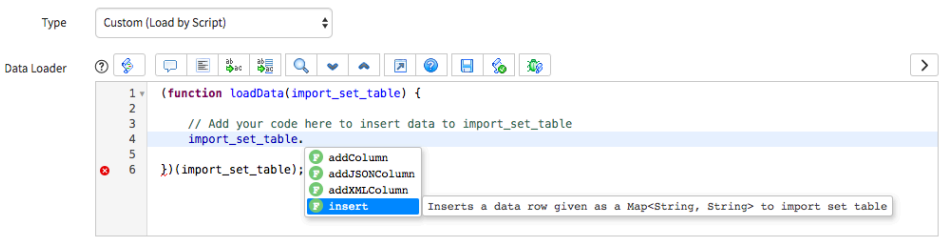
If a job gets stuck in a **Running** state for more than 600 minutes, it's automatically put back into a **Pending** state. You can modify the amount of time a parallel job is allowed to be stuck in a running state with the *com.glide.system_parallel_job_inactive_time_minutes* property.

If a parallel job can't complete after two tries, the job is set to **Error**. You can modify the number of tries before having an error state with the *com.glide.system_parallel_job_max_retry_count* property. The *com.glide.system_parallel_job_auto_retry* property can be set to false to disable auto retry.

You can check the status of your current parallel import tasks by navigating to **All** > **System Import Sets** > **Advanced** > **Concurrent Import Sets**, selecting your job, and viewing the Parallel Jobs tab.

Script auto-complete

As you type the script, the script auto-complete displays the available options, as shown in this example.



Create a data source

Create a data source record to define what data an import set should import.

Depending on the type of data source you want to create, see the following topics for procedures.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a File type data source

Create a **File** type data source record to define what data an import set should import.

Before you begin

Role required: import_admin

About this task

For additional information, see File type data sources.

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**File**.
Format	Only the default XML-based file format (.xlsx) is supported, unless saved as "Strict Open XML Document."
Zipped	Selected if the import file is compressed.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
File retrieval method	The retrieval method for this file.
File path	The path to the file to import. You can include a system property value in this field using the format `${system.property.name}`. When the connection is made, the variable is replaced with the value of the specified property. **Note:** For files retrieved using HTTP or HTTPS, the *`glide.ds.file.http.variable_replacement`* property must be true to use system property expansion. For example, you can specify the **File path** value `/countries.csv?key=${datasource.apikey}`. When the connection is made, the value of the *`datasource.apikey`* system property is passed as the value for the *`key`* parameter. **Note:** For HTTP and HTTPS protocols, the file path is automatically URL encoded. Do not specify a URL-encoded file path when using either of these protocols.
CSV delimiter	The delimiter character for the CSV file.
Parsing script	The script used to parse a single line of input. As you type the script, script auto-complete presents the choices available to you. For more information, see File type data sources.
Sheet number	The Excel sheet number to load data.
Header row	The Excel row number to load the column labels.
Path for each row	The path expression used to select JSON objects, which will become rows in the import set table. The path should be / / for JSON objects.
Discard Arrays	Selected to discard JSON arrays as a value. Unselected to serialize JSON arrays as a value.
Expand node children	Selected if child elements of the XML node or JSON object should be converted into additional columns. Unselected if the parent column value should be an XML or JSON fragment. For JSON, note that selecting this option expands objects only, not arrays. For nested array support, see JSON file import examples.
Data in single column	Selected to store data in a single column.
Xpath for each row	XPath expression that selects the nodes which become rows in the import table. The children of the selected nodes will become the columns in the rows.
SCP authentication method	Choice to authenticate with a username and password or with a public key. **Note:** You cannot authenticate to data sources with a public-private key pair. Use a username and password authentication instead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Server	Name of the server from which the tables will be imported.
Port	Port to use to connect to the specified server. This field appears if you select HTTP or HTTPS as the file retrieval method.
Username	User name for authentication on the JDBC server.
Password	Password for authentication on the JDBC server.
Private keyfile	Keyfile when using legacy SCP public-private keyfiles. **Note:** ○ You cannot authenticate to data sources with a public-private key pair. Use username and password authentication instead. ○ Do not use this legacy option. Although it is available for use, it is not supported.
System keystore	Selected to validate the certificate from the FTPS server against all saved certificates. This certificate may be any type supported by the instance. If not selected, the instance uses the Java default certificate to validate the FTPS server. This field is available only for data sources with a **File retrieval method** value of **FTPS**. All FTPS file retrieval methods are supported, including Auth TLS, Auth SSL, Implicit SSL, and Implicit TLS.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Create a JDBC type data source

Create a **JDBC** type data source record to define what data an import set should import.

Before you begin
Role required: import_admin

About this task
For additional information, see JDBC type data source.

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	**JDBC**.
Use MID Server	MID Server to use to connect to this data source.
Format	Select one of the following formats: MySQL, Oracle, or SQLServer.
Instance name	Used to support dynamic port connectivity with SQL Server. To ensure connectivity, provide the instance name for a SQL Server that receives a new port number dynamically after each reboot. This field only appears when **SQLServer** is selected as a data source format.
Database name	Name of the database instance.
Database port	Port number for the database. Leave this field empty when using dynamic port connectivity with SQL Server.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Use integrated authentication	Selected to allow the JDBC connection to use the ID of the user configured for the Windows MID Server service for SQL Server authentication. For additional details, see JDBC type data source.
Username	User name for authentication on the JDBC server.
Password	Password for authentication on the JDBC server.
Server	Name of the server from which the tables will be imported.
Query	Type of query to run: **All rows from Table** or **Specific SQL**. If you select to run a SQL statement, the SQL statement field appears.
Query timeout	Number of seconds the JDBC driver will wait for a query (SELECT) to complete. Zero (0) means no timeout. If timeout is exceeded, the integration considers the JDBC result inaccessible and places it in an error state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection timeout	Number of seconds before MID Server connection cache pool closes and removes it from the pool. Zero (0) means no timeout.
Table name	Name of the table from which the data is being exported.
SQL statement	SQL statement to extract the desired data from the database.
Use last run datetime	Controls the amount of data that is retrieved from a database during an import run. If unselected, then all rows in the table specified are imported, every time. You might want to use this setting if this is a one-time import, or if all the data in the target table is new. If selected, two additional fields appear, enabling you to select a datetime value to limit imported data to delta values only.
Last run datetime	The datetime value in this field is automatically populated from the database field you select below and represents the latest value from the previous run. This value acts as a dynamic filter to restrict the number of records retrieved to those records that have changed since the data source's last runtime.
Last run database field	Field name from the source table that will be used as the filter in the next run. This value may need to be case sensitive, depending on the target database type.
Additional Database Parameters	Optional parameters to add to the end of the URL generated for this data source. Semicolon-separated list of parameters. You may need to configure the form to view this field.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Create an LDAP type data source

Create an **LDAP** type data source record to define what data an import set should import.

Before you begin
Role required: import_admin

About this task
For additional information, see LDAP type data source.

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**LDAP**.
LDAP target	Target selected from the list of your LDAP OU definitions.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Create an OIDC type data source

Create an **OIDC** type data source record to define what data an import set should import.

Before you begin
Role required: import_admin

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**OIDC**.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Format	Defaults to **-- None --** and can't be changed.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Create a REST (Integration Hub) type data source

Create a **REST (IntegrationHub)** type data source record to define what data an import set should import from a REST API.

Before you begin
Roles required: import_admin and action_designer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**REST (IntegrationHub)**.
Format	One of the following formats: Custom (Parse by Script), JSON, or XML.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Request action	Data source request action that will be invoked to get data. You can choose only published request actions. Click the link in the dialog box below to create/configure a new Data Source request action in Integration Hub. After the request action is published in Integration Hub, you can choose it as a **Request action** in the Data Source record. For more information, see Define action properties.
Support pagination	Selected to enable pagination for the request action. Pagination helps you reduce processing overhead by processing a specified number of records at a time, instead of processing all records at once.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Limit	Maximum number of records per page. For example, to process 50 records at a time, enter a **Limit** of 50.
Offset	The initial offset used for pagination. The offset is the starting record number. For example, to process 50 records at a time, starting with the first record, enter a **Limit** of 50 and an **Offset** of 0.
Parsing script	Type the script used to parse a single line of input. Three parameters are available in this function: ○ **line**: the current line to be parsed by the script ○ **lineNumber**: the line number of the current line in the entire response payload ○ **result**: output result
Path for each row	The path expression used to select JSON objects, which will become rows in the import set table. The path should be / / for JSON objects.
Discard Arrays	Selected to discard JSON arrays as a value. Unselected to serialize JSON arrays as a value.
Expand node children	Selected if child elements of the XML node or JSON object should be converted into additional columns. Unselected if the parent column value should be an XML or JSON fragment. For JSON, note that selecting this option expands objects only, not arrays. For nested array support, see JSON file import examples.
Data in single column	Selected to store data in a single column.
Xpath for each row	XPath expression that selects the nodes which become rows in the import table. The children of the selected nodes will become the columns in the rows.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Define action properties

Create and configure a Data Source request action in Integration Hub. After the request action is published in Integration Hub, you can choose it as a **Request action** in the Data Source record.

Before you begin
Role required: import_admin

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Select **New**.
3. Select a **Type** of **REST (IntegrationHub)**.
4. Click the link under **Request action**.
5. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name of the request action.
Accessible From	Scope from which the request action is accessible.
Category	Category of the request action.
Protection	Specifies whether the request action is read-only.
Description	Description of the request action.
Application	Scope of the application.
In-Flow Annotation	Text you want to appear under the **Action** title on the Data Source Request Action page.

6. Click **Submit**.
7. The Data Source Request Action page appears with the following fields:

Field	Description
Limit	Limit set by the user in the REST (IntegrationHub) data source record. If the REST API supports pagination and **Support pagination** is selected in the Data Source record, you must supply this input to your REST step.
Offset	Offset set by user in the REST (IntegrationHub) data source record. If the REST API supports pagination and **Support pagination** is selected in the Data Source record, you must supply this input to your REST step.
Last Success Import Time	Last time data was successfully imported. A numeric value representing the number of milliseconds since January 1, 1970, 00:00:00 GMT. The data source populates this value. If the REST API supports queries based on time, you must supply this input to your REST step.
Import Start Time	Time the import is actually started. A numeric value representing the number of milliseconds since January 1, 1970, 00:00:00 GMT. The data source populates this value. If the REST API supports queries based on time, you must supply this input to your REST step.

8. If desired, you can add a Script step to validate or modify action inputs, set default values, or build request payloads before executing the REST step.
   a. Select **Data Source Request** from the Action Outline.
   b. Select **Enable Processing Script**.
   c. Select **Script step** from the Action Outline.
   d. Configure the Script step as described in Script step.
9. Select **REST step** from the Action Outline.
10. Configure the REST step as described in REST step.
11. Choose from the following:
    - Click **Properties** to return to the Action Properties window.
    - Click **Test** to test the request action before publishing it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Click **Executions** to view the history of executions of the request action.
- Click **Save** to save the request action.
- Click **Publish** to publish the request action and make it available for use.

Create a Data Stream (Integration Hub) type data source

Create a **Data Stream (IntegrationHub)** type data source record to define what complex data an import set should import from a Data Stream action.

Before you begin

Role required: import_admin and action_designer

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	Data Stream (Integration Hub) type data source.
Data Stream action	Selected to use an existing published Data Stream action from Integration Hub. Selected for one of the following reasons: ▪ If you select a published Data Stream action, click this button to open the Data Stream action in Integration Hub. ▪ If you don't select a Data Stream action, click this button to create and publish a new Data Stream action in Integration Hub. **Note:** Data Stream actions require a subscription for production use.
Connection	Specify the connection alias for the Data Stream action. You can use the default parent alias or select any of its children's aliases. Available child aliases are listed in the menu. This field is only available when the Data Stream action is configured to use a connection alias. For more information, see Create a Connection and Credential alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Data in single column	Selected to store data in a single column.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Data Stream action inputs	Additional fields may appear, based on the inputs defined in the **Data Stream action**.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Create a Custom (Load by Script) type data source

Create a **Custom (Load by Script)** type data source record to define what data an import set should import.

Before you begin
Role required: import_admin

About this task
For additional information, see Custom (Load by Script) type data source.

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**Custom (Load by Script)**.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Enable parallel loading	Option to use parallel data loading.
Parallel loading script	Script used for parallel data loading. Appears only when **Enable parallel loading** is selected. For more information, see Custom (Load by Script) type data source.
Data Loader	Script used to load data. For more information, see Custom (Load by Script) type data source.

4. Click **Submit**.

What to do next

Define a transform map for the new data source and run an import.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data source fields

In addition to common fields, other fields appear on the data source form, depending on the value of the **Type** field.

Common data source fields

These fields are common to all data sources.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	The type of data you are importing: • From a remote **File** • From a **JDBC** database • Using **LDAP** • Using **OIDC** • Using **REST** to import data through the Integration Hub • From a **Data Stream** action through the Integration Hub • Using a **Custom** script
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. • For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. • For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. • For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) • For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Application	Application scope for this record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File type data source fields

These additional fields appear on the data source form when the **Type** field value is **File**.

Field	Description
Format	Only the default XML-based file format (.xlsx) is supported, unless saved as "Strict Open XML Document."
Zipped	Selected if the import file is compressed.
File retrieval method	The retrieval method for this file.
File path	The path to the file to import. You can include a system property value in this field using the format `${system.property.name}`. When the connection is made, the variable is replaced with the value of the specified property. **Note:** For files retrieved using HTTP or HTTPS, the *`glide.ds.file.http.variable_replacement`* property must be true to use system property expansion. For example, you can specify the **File path** value `/countries.csv?key=${datasource.apikey}`. When the connection is made, the value of the *`datasource.apikey`* system property is passed as the value for the *`key`* parameter. **Note:** For HTTP and HTTPS protocols, the file path is automatically URL encoded. Do not specify a URL-encoded file path when using either of these protocols.
CSV delimiter	The delimiter character for the CSV file.
Parsing script	The script used to parse a single line of input. As you type the script, script auto-complete presents the choices available to you. For more information, see File type data sources.
Sheet number	The Excel sheet number to load data.
Header row	The Excel row number to load the column labels.
Path for each row	The path expression used to select JSON objects, which will become rows in the import set table. The path should be `//` for JSON objects.
Discard Arrays	Selected to discard JSON arrays as a value. Unselected to serialize JSON arrays as a value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Expand node children	Selected if child elements of the XML node or JSON object should be converted into additional columns. Unselected if the parent column value should be an XML or JSON fragment. For JSON, note that selecting this option expands objects only, not arrays. For nested array support, see JSON file import examples.
Data in single column	Selected to store data in a single column.
Xpath for each row	XPath expression that selects the nodes which become rows in the import table. The children of the selected nodes will become the columns in the rows.
SCP authentication method	Choice to authenticate with a username and password or with a public key. **Note:** You cannot authenticate to data sources with a public-private key pair. Use a username and password authentication instead.
Server	Name of the server from which the tables will be imported.
Port	Port to use to connect to the specified server. This field appears if you select HTTP or HTTPS as the file retrieval method.
Username	User name for authentication on the JDBC server.
Password	Password for authentication on the JDBC server.
Private keyfile	Keyfile when using legacy SCP public-private keyfiles. **Note:** • You cannot authenticate to data sources with a public-private key pair. Use username and password authentication instead. • Do not use this legacy option. Although it is available for use, it is not supported.
System keystore	Selected to validate the certificate from the FTPS server against all saved certificates. This certificate may be any type supported by the instance. If not selected, the instance uses the Java default certificate to validate the FTPS server. This field is available only for data sources with a **File retrieval method** value of **FTPS**. All FTPS file retrieval methods are supported, including Auth TLS, Auth SSL, Implicit SSL, and Implicit TLS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JDBC type data source fields

These additional fields appear on the data source form when the **Type** field value is **JDBC**.

Field	Description
Use MID Server	MID Server to use to connect to this data source.
Format	One of the following formats: MySQL, Oracle, or SQLServer.
Instance name	Used to support dynamic port connectivity with SQL Server. To ensure connectivity, provide the instance name for a SQL Server that receives a new port number dynamically after each reboot. This field only appears when **SQLServer** is selected as a data source format.
Database name	Name of the database instance.
Database port	Port number for the database. Leave this field empty when using dynamic port connectivity with SQL Server.
Use integrated authentication	Selected to allow the JDBC connection to use the ID of the user configured for the Windows MID Server service for SQL Server authentication. For additional details, see JDBC type data source.
Username	User name for authentication on the JDBC server.
Password	Password for authentication on the JDBC server.
Server	Name of the server from which the tables will be imported.
Query	Type of query to run: **All rows from Table** or **Specific SQL**. If you select to run a SQL statement, the SQL statement field appears.
Query timeout	Number of seconds the JDBC driver will wait for a query (SELECT) to complete. Zero (0) means no timeout. If timeout is exceeded, the integration considers the JDBC result inaccessible and places it in an error state.
Connection timeout	Number of seconds before MID Server connection cache pool closes and removes it from the pool. Zero (0) means no timeout.
Table name	Name of the table from which the data is being exported.
SQL statement	SQL statement to extract the desired data from the database.
Use last run datetime	Controls the amount of data that is retrieved from a database during an import run. If unselected, then all rows in the table specified are imported, every time. You might want to use this setting if this is a one-time import, or if all the data in the target table is new. If selected, two additional fields appear, enabling you to select a datetime value to limit imported data to delta values only.
Last run datetime	The datetime value in this field is automatically populated from the database field you select below and represents the latest value from the previous run. This value acts as a dynamic filter to restrict the number of records retrieved to those records that have changed since the data source's last runtime.
Last run database field	Field name from the source table that will be used as the filter in the next run. This value may need to be case sensitive, depending on the target database type.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Additional Database Parameters	Optional parameters to add to the end of the URL generated for this data source. Semicolon-separated list of parameters. You may need to configure the form to view this field.

LDAP type data source field

This additional field appears on the data source form when the **Type** field value is **LDAP**.

Field	Description
LDAP target	Target selected from the list of your LDAP OU definitions.

OIDC type data source field

This additional field appears on the data source form when the **Type** field value is **OIDC**.

Field	Description
Format	Defaults to **-- None --** and can't be changed.

REST (Integration Hub) type data source fields

These additional fields appear on the data source form when the **Type** field value is **REST (IntegrationHub)**.

Field	Description
Format	One of the following formats: Custom (Parse by Script), JSON, or XML.
Request action	Data source request action that will be invoked to get data. You can choose only published request actions. Click the link in the dialog box below to create/configure a new Data Source request action in Integration Hub. After the request action is published in Integration Hub, you can choose it as a **Request action** in the Data Source record. For more information, see Define action properties.
Support pagination	Selected to enable pagination for the request action. Pagination helps you reduce processing overhead by processing a specified number of records at a time, instead of processing all records at once.
Limit	Maximum number of records per page. For example, to process 50 records at a time, enter a **Limit** of 50.
Offset	The initial offset used for pagination. The offset is the starting record number. For example, to process 50 records at a time, starting with the first record, enter a **Limit** of 50 and an **Offset** of 0.
Parsing script	The script used to parse a single line of input. As you type the script, script auto-complete presents the choices available to you. For more information, see File type data sources.
Path for each row	The path expression used to select JSON objects, which will become rows in the import set table. The path should be / / for JSON objects.

Field	Description
Discard Arrays	Selected to discard JSON arrays as a value. Unselected to serialize JSON arrays as a value.
Expand node children	Selected if child elements of the XML node or JSON object should be converted into additional columns. Unselected if the parent column value should be an XML or JSON fragment. For JSON, note that selecting this option expands objects only, not arrays. For nested array support, see JSON file import examples.
Data in single column	Selected to store data in a single column.
Xpath for each row	XPath expression that selects the nodes which become rows in the import table. The children of the selected nodes will become the columns in the rows.

Data Stream (Integration Hub) type data source fields

These additional fields appear on the data source form when the **Type** field value is **Data Stream (IntegrationHub)**.

Field	Description
Type	Data Stream (Integration Hub) type data source.
Data Stream action	• Selected to use an existing published Data Stream action from Integration Hub. • Selected for one of the following reasons: ○ If you select a published Data Stream action, click this button to open the Data Stream action in Integration Hub. ○ If you don't select a Data Stream action, click this button to create and publish a new Data Stream action in Integration Hub. **Note:** Data Stream actions require a subscription for production use.
Connection	Specify the connection alias for the Data Stream action. You can use the default parent alias or select any of its children's aliases. Available child aliases are listed in the menu. This field is only available when the Data Stream action is configured to use a connection alias. For more information, see Create a Connection and Credential alias.
Data in single column	Selected to store data in a single column.
Data Stream action inputs	Additional fields may appear, based on the inputs defined in the **Data Stream action**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom (Load by Script) type data source field

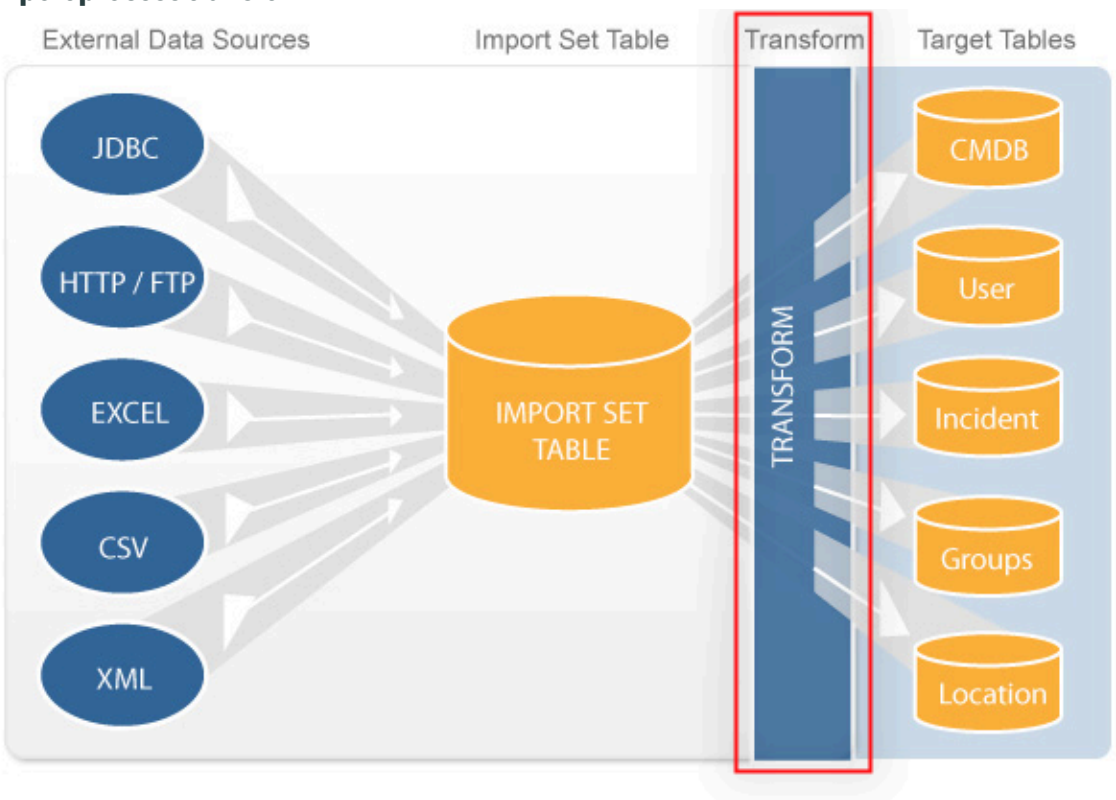
This additional field appears on the data source form when the **Type** field value is **Custom (Load by Script)**.

Field	Description
Data Loader	Script used to load data. For more information, see Custom (Load by Script) type data source

Transform maps

A transform map is a set of field maps that determine the relationships between fields in an import set and fields in an existing ServiceNow table, such as Incident [incident] or User [sys_user].

Import process transform



After creating a transform map, you can reuse it to map data from another import set to the same table.

The **Transform Maps** module enables an administrator to define destinations for imported data on any tables. Transform mapping can be as simple as a drag and drop operation to specify linking between source fields on an import set table and destination fields on any table. Use transform mapping to map source and destination fields dynamically.

For a video overview of transform maps, see the Transform Maps video on the ServiceNow Dev Program YouTube channel.

Transform considerations

Auto-mapping

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Double-check that fields the system maps automatically are actually required. For example, encrypted passwords probably should not be mapped.

Mapping reference fields

If you are mapping reference field data and the sys_id does not exist, the sys_id could potentially appear in the target record as the DisplayValue, and this may be undesirable.

Field mapping a large number of reference fields incurs additional performance overhead because the system checks that the referenced sys_id actually exists before performing choice actions at the field level.

Note:
You can bypass the performance overhead using transform scripts such as onBefore (on the assumption that there is no requirement to validate the import of reference fields). For example, `target.<field_name> = source.<field_name>`.

Using multiple transform maps

Multiple transform maps can be applied to a single data source.

One import set row is created per transform map, which can cause a large number of temporary records to be generated.

Note:
If you use multiple transform maps for the same import set, the transform creates multiple entries in the import set table.

Run multiple transforms off a single import set

Users can select multiple transform maps during data import.

The selected transform maps will be executed on the same import set in the order specified.

Multi-map transform

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform map scripts

Transform Map scripts allow you to customize import operations using a robust programming interface to introduce advanced logic.

A transform map script executes as events occur while an import set is being transformed onto a ServiceNow table. Transform Map scripting is fully integrated into the ServiceNow scripting environment. There are two types of Transform Map scripts:

- Explicit Transform Map scripts, which explicitly define mapping relationships
- Transformation Event scripts, which modify the processing of events at different stages of a transformation

Transformation script variables

Multiple variables can be used to define explicit mapping relationships in a transform map script.

Variable name: source

Type: GlideRecord object

Description: Contains the import source record currently being transformed. Specify a specific field from the source record as an object property.

Example:

```
var x = source.incident_state;
```

Variable name: target

Type: GlideRecord object

Description: Contains the import target record currently being inserted. Specify a specific field from the target record as an object property.

Example:

```
target.incident_state = "active";
```

Variable name: map

Type: GlideRecord object

Description: Contains the transformation map record currently being used for the transformation process. Specify a specific field from the transform map record with one of these properties.

- name
- sys_id
- source_table
- target_table
- order

Example:

```
var x = map.order;
```

Variable name: log

Type: Function

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Description: Log information about the current import process. Each log level has its own method.

Example:

```
log.info("This is an information message");
log.warn("This is a warning message");
log.error("This is an error message");
```

Variable name: action

Type: Function

Description: Specify the transformation action occurring on the target record. This value can be either "insert" or "update".

Example:

```
if(action =="insert"){
    ignore = true;
}
```

Variable name: ignore

Type: Boolean

Description: When set to true, skips or aborts the current import action. In onStart scripts, this variable aborts the entire transformation process. In onBefore scripts, this variable only skips the current row being transformed.

Example:

```
(function runTransformScript(source, map, log,
 target /*undefined onStart*/ ) {
    var transformCheck = new TransformCheck(source,
 map, log, target);
    var isMappingValid =
 transformCheck.validateMapping();
    if (!isMappingValid) {
        ignore = true;
    }
})(source, map, log, target);
```

Variable name: error

Type: Boolean

Description: When set to true, aborts the current import action and logs an error message in the Import Set Log.

Example:

```
if(source.name=="no_transform"){
  error = true;
}
```

Variable name: error_message

Type: String (output message)

Description: When an error occurs, adds the specified error message to SOAP response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:

```
if(source.name=="no_transform"){
  error = true;
  error_message = "Source is not intended for
 transformation";
}
```

Variable name: status_message

Type: String (output message)

Description: Adds the specified status message to SOAP response.

Example:

```
if(action =="insert"){
    status_message = "Inserting record";
}
```

Map with explicit transform map scripts

Explicitly define mapping relationships in the Transform Map record itself.

An explicit Transform Map script explicitly defines mapping relationships in the Transform Map record itself. It runs after the source field values have been copied over to the target record, and before they are written to the database.

CMDB software import facilitated by explicit mapping script

An example demonstrating how explicit map scripting can be used to facilitate an import of software instances to the CMDB where it is necessary to have the count in the software packages table reflect the number of instances.

In the CMDB there exist tables for software packages and software instances. A software package refers to a one individual software title, such as Mozilla Firefox. A software instance refers to an individual instance of a software title such as Mozilla Firefox on Jared_T60_Laptop.

In more technical terms a software instance is a many-to-many relationship with a software package and a configuration item. This script imports software instances. In doing so it checks to see if a software package for the instance exists. If the software package doesn't exist then it is created and the sys_id for the newly created package is associated with the instance via the instance record's **Software** field.

```
//First we will initialize some temporary variables,
//referencing values from the Import Set table source that will
 be used to
//reference software package records and create them if
 necessary.

var name= source.u_name;
var version = source.u_version;
var sid ="";

//Next we will perform a glide query on the software package
 table (Note: The target table
//for the import is software instances)
var sgr =new GlideRecord("cmdb_ci_spkg");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Here we are building our query to search for software packages
 where the name and
//version of the package matches the name and version of the
 instance being imported
sgr.addQuery("name",name);
sgr.addQuery("version", version);
sgr.query();

//Now if a software package with the correct name and version
 are found then we record
//the sys_id of the package record otherwise we create the
 package and then record the sys_id
if(sgr.next()){
   sid = sgr.sys_id;}else{// create it
   sgr.initialize();
   sgr.newRecord();
   sgr.name=name;
   sgr.version= version;
   sid = sgr.insert();

   //Here we make an entry in System Import Set Log saying that
 we had to create a software package
   log.info("Created new spkg: "+name+" - "+ version);
}
//Finally we set the reference field on our software instance
 record to the sys_id we have
//recorded for the software package. In doing so we are also
 relating the
//software package with the instance and so the count, which
 keeps track of
//the number of instances associated with a package, will
 automatically be incremented.
target.software= sid;
```

Populating child tables by setting class names in an import to the CMDB

An example demonstrating how to import servers into the configuration management database.

The destination table for the import is the cmdb_ci_servers table.

```
var operating_system = source.u_operating_system.toString();

//This if statement uses JavaScript regular expressions to
 search the operating system
if( operating_system.match(/linux/i)!=null){
   target.sys_class_name="cmdb_ci_linux_server";
};

if( operating_system.match(/win/i)!=null){
   target.sys_class_name="cmdb_ci_win_server";
};
```

User import data sanitation

An example script demonstrating how to sanitize user data before import.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Note: The field names referenced from an import set are
//prefixed with an "u_", also note that it is necessary  to use
 the java method
// toString() to so that we can use JavaScript functions to
//manipulate the data.
var name= source.u_name.toString();

//Use native JavaScript function split to create an array for
 each word in the name "splitting" it
//anywhere that there is a space
var split_names =name.split(" ");

//Find the number of of names (i.e., first and last name only,
 or first middle and last name, etc.)
var num_names = split_names.length;

// If there is only one name then map it to the last name field
 in the user table
if(num_names ==1){
   target.last_name= split_names[0];
}

//if there are two names then map the first one to first name
 and the last one to last name
if(num_names ==2){
   target.first_name= split_names[0];
   target.last_name= split_names[1];
}

//if there are more than 3 names then all middle names get
 combined into one middle name this is done
//by shifting off the first name (array element 0 ) and mapping
 to first name and popping off the last
// name and returning it to the last name field
if(num_names >=3){
   target.first_name= split_names.shift();
   target.last_name= split_names.pop();
   target.middle_name= split_names.join(" ");
}
```

Map with transformation event scripts

Transformation events occur during the process of transforming an import set table onto a table.

These events modify the transformation behavior from any type of mapping specification. Transformation Event scripts modify the processing of the events at various stages of the transformation.

For example, the processing of a mapping operation defined using the Mapping Assist Utility can be manipulated using the event scripts. There are a number of import set JavaScript objects that are accessible during these events. These objects represent tables or portions of tables. It is important to note that what these objects refer to varies depending on the context of the event in which they are referenced.

The following is a table of all of the transform events and their contextual variables.

Robust Import Set Transformers

Use robust import set transformers instead of transform maps if you want to extract, transform, and load data to one or more target tables.

Robust import set transformers versus transform maps

Transform maps define the mapping from imported data stored in a staging table to a single target table in the ServiceNow AI Platform. Transform maps also insert data into target tables, performing both transform and processing functions. You can define multiple table mappings with multiple transform maps.

The Robust Transform Engine (RTE) and the robust import set transformer separate the transform and processing functions, providing a more flexible alternative to transform maps. The robust import set transformer allows you to extract data from a source table into an intermediary data structure. You can transform the data as desired and then load that data to one or more target tables. Records are processed as batches to enhance performance.

With transform maps, if you want data from the source table to go to three different target tables, you must create three separate transform maps. Each transform map parses the data separately, which results in three separate read operations. By contrast, the robust import set transformer requires only a single read operation to prepare the data for three target tables. The robust import set transformer is more efficient, especially when dealing with multiple target tables.

Extract Transform Load (ETL)

When you use the robust import set transformer, Extract Transform Load (ETL) functionality transfers imported data to target tables. You define how the data is extracted, transformed, and loaded to one or more target tables. You can use ETL definitions to do the following:

- Define entities (an abstraction similar to tables).
- Define entity fields (an abstraction similar to table fields).
- Define mapping between entities, and optionally designate whether a specific mapping should be ignored during data integration.
- Define entity field mappings.
- Define entity operations.

For an overview of ETL definitions, see Extract Transform Load (ETL) definition overview. For a step-by-step guide on how to create ETL definitions, see Create Extract Transform Load (ETL) definitions.

As of the Paris release, ETL definitions also support nested data structures such as the following when the **Data source** has JSON/XML payloads in a single column.

```
{
   "records":[
      {
         "network":{
            "location":"San Diego",
            "computers":[
               {
                  "id":"C100",
                  "os":"Mac",
                  "disks":[
                     {
                        "size":"200GB",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                        "type":"SSD"
                    },
                    {
                        "size":"1TB",
                        "type":"Magnetic"
                    },
                    {
                        "size":"1TB",
                        "type":"Magnetic"
                    }
                ]
            },
            {
                "id":"C200",
                "os":"Windows",
                "disks":[
                    {
                        "size":"5TB",
                        "type":"Magnetic"
                    }
                ]
            }
        ]
    }
  ]
}
```

Related topics

Create a robust import set transformer

Create robust transform definitions

Create Extract Transform Load (ETL) definitions

Create a robust import set transformer

Define how information is sent from the source table to target tables via a Robust Transform Engine (RTE).

Before you begin

- Role required: import_transformer
- Create an ETL definition.
- Create a robust transform definition.

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Robust Import Set Transformers**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	The name of the robust import set transformer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source table	The source table for the robust import set transformer.
Robust transform engine	Enables you to select an ETL definition or CMDB definition. For procedures to define an RTE, see Create robust transform definitions.
Description	A description of the robust import set transformer.
Properties	Custom properties which can be used in processing the data.
Application	Application scope for this record.
Active	Selected if the robust import set transformer is currently active. Deselected if the robust import set transformer is not currently active.
Batch size	The number of import set rows the system processes at a time. For example, if an import set has 1000 rows and the batch size is 100, the system processes 10 batches of 100 rows each. The minimum batch size is 1. The maximum batch size depends on the row size and processing complexity. Consider starting with a batch size of 100 and adjusting from there.
Verbose	Enables some transform logs that show how transform operations are applied to records.

4. Click **Submit**.

Robust import set transformer properties

Properties that define the types of updates that are permitted.

Properties for CI reclassification

To configure properties, navigate to **System Import Sets** > **Administration** > **Robust Import Set Transformers**.

The properties defined in the Robust Import Set Transformers form are at the IRE payload level and apply to all rows for the given import. If you define properties at the individual item level using IntegrationHub ETL, they take priority over properties defined at the IRE payload level. For more details about CI reclassification, see, CI reclassification during IRE processing.

CI reclassification properties

Name	Value	Description
ire.input.items.settings.updateWithoutDowngrade	true/ false	Valid values: • true: Update the item but don't permit a downgrade. • false: Update the item and permit a downgrade. Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI reclassification properties (continued)

Name	Value	Description
ire.input.items.settings.updateWithoutUpgrade	true/ false	Valid values: • true: Update the item but don't permit an upgrade. • false: Update the item and permit an upgrade. Default: false
ire.input.items.settings.updateWithoutSwitch	true/ false	Valid values: • true: Update the item but don't permit class switching. • false: Update the item and permit class switching. Default: false
ire.input.items.classDowngrade	true/ false	Valid values: • true: Update the CI class to a class that is higher in the class hierarchy, and the newly assigned class is a parent of the current class. • false: Update the item but don't permit a class downgrade. Default: false
ire.input.items.classUpgrade	true/ false	Valid values: • true: Update the CI class to a class that is higher in the class hierarchy, and the newly assigned class is a parent of the current class. • false: Update the item but do permit a class downgrade. Default: false
ire.input.items.classSwitch	true/ false	Valid values: • true: Update the attribute. The newly assigned class is in a different branch in the class hierarchy and has a different set of attributes than the current class. • false: Update the attributes but don'tn't permit a class switch.

		Default: false

Create robust transform definitions

Specify your own Robust Transform Engine (RTE) to transfer data from a source table to a target table.

Before you begin

Role required: import_transformer

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Robust Import Set Transformers**.
2. Select an existing robust import set transformer, or click **New** to create a new robust import set transformer.
   For procedures, see Create a robust import set transformer.
3. At the **Transformer Definition** field, click the search icon.
4. On the Robust Transform Definitions window, click **New**.
5. On the Robust Transformer Definition pop-up, select **ETL Definition**.
6. Complete the form.

Field	Description
Active	Selected if the robust transform engine is active. Deselected if the robust transform engine is not active.
Description	A description of the robust transform engine.
Application	Application scope for this record.
Name	The name of the robust transform engine.

7. Click **Submit**.

Extract Transform Load (ETL) definition overview

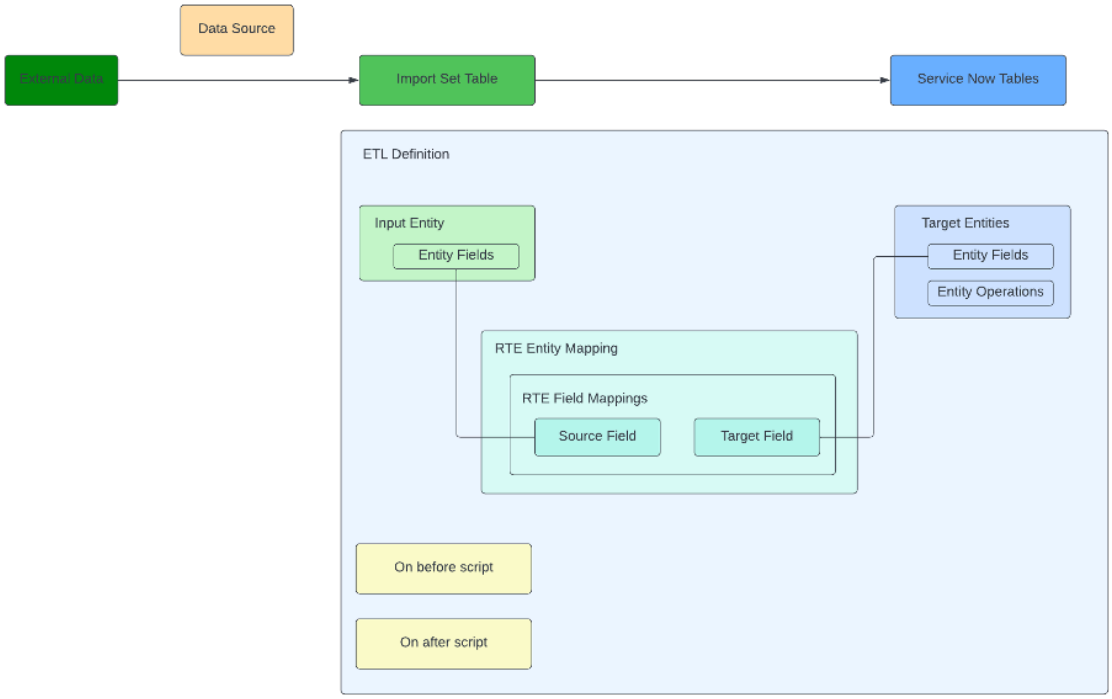
ETL definitions extract data from a source table, transform the data as desired, and load the data into one or more target tables. ETL definitions also support nested data structures.

ETL definitions specify how to map data

Importing data starts with a data source. A data source specifies the type of data that you want to extract and its location. After the data is extracted, it's loaded into a staging, or import set, table. Then an ETL definition specifies how to map the data into one or more target tables in ServiceNow. You can create ETL definitions that map data to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow tables while still maintaining the foreign key and unique key constraints.



ETL entities represent input data and target tables

ETL definitions are based on entities. Every ETL definition that you create must have entities associated with it. Entities represent input data and target tables.

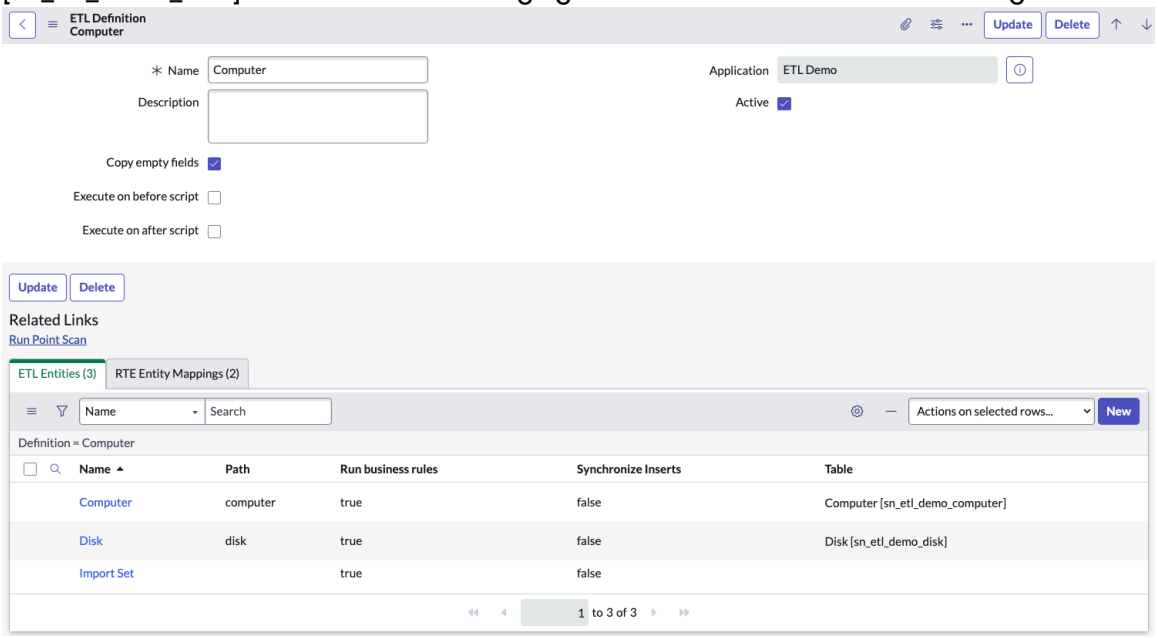
- Input data is the data that has been loaded into the staging table.
- Target tables are the ServiceNow tables where you want your data to end up.

Mappings and operations are also based on entities, so it's helpful to create entities early, when you create the definition.

The following image shows an example of an ETL definition for Computer. This definition has three entities associated with it. The Import Set entity represents the input data, the data loaded from an Excel file into a staging table. The table for the Import Set entity is set to **None**. Computer and Disk are the target entities. They represent two ServiceNow tables named Computers [sn_etl_demo_computer] and Disk

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

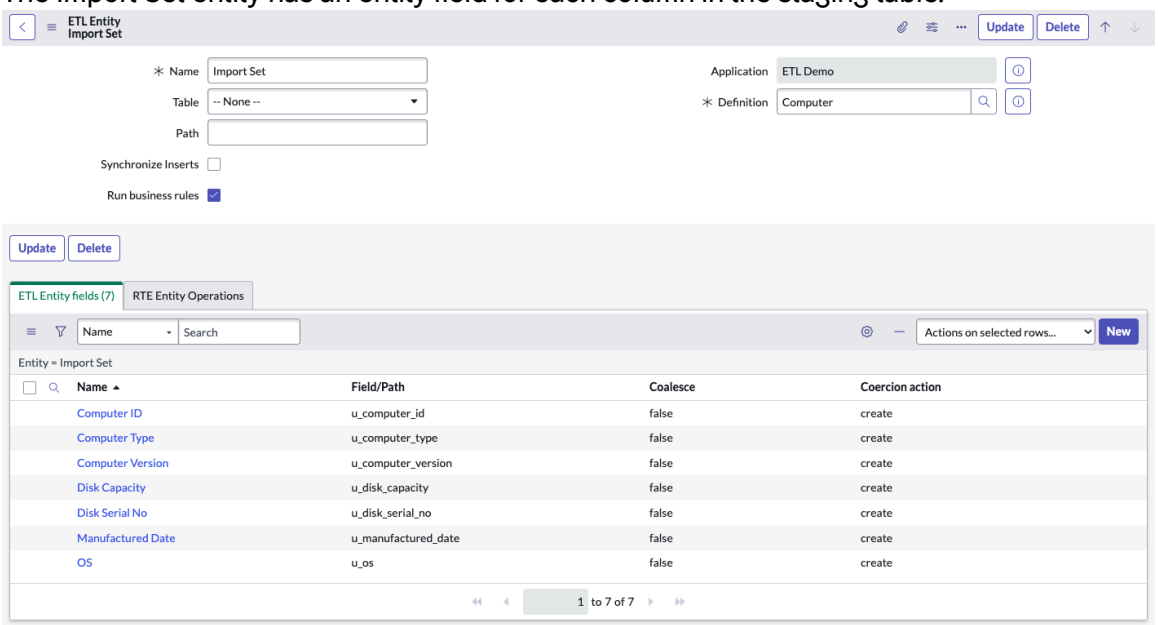
[sn_etl_demo_disk]. The data from the staging table will be loaded into the two target tables.



Input entities

Input entities represent the extracted data that was loaded into the staging table. Input entities have ETL entity fields to represent the import set table columns or, for a single column mode, JSON keys. You can create entity fields by selecting **New** on the ETL Entity fields tab.

The following image shows the Import Set entity from the Computer ETL definition. The Import Set entity represents the input data loaded from an Excel file into the Computers [sn_elt_demo_computers_stage] staging table. The Import Set entity has an entity field for each column in the staging table.



Target entities

Target Entities represent the target tables in ServiceNow. The following image shows the Disk target entity from the Computer ETL definition. Disk represents the sn_etl_demo_disk

© 2026 ServiceNow, Inc. All rights reserved.

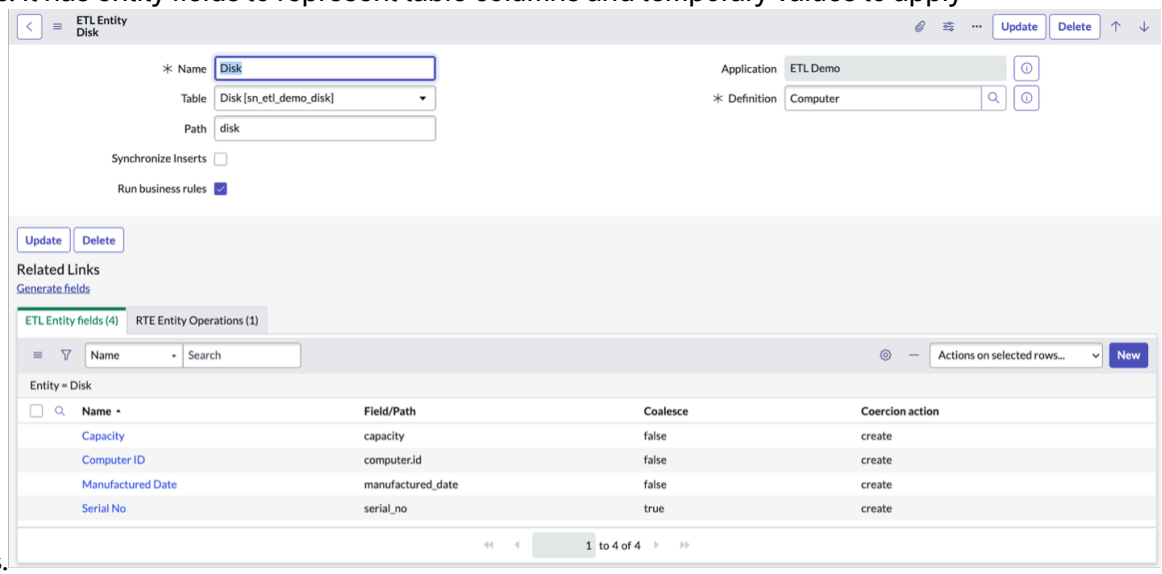
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

target table. It has entity fields to represent table columns and temporary values to apply operations.



Each entity field has a name, a reference or path field, a coalesce field, and a coercion action.

Reference field

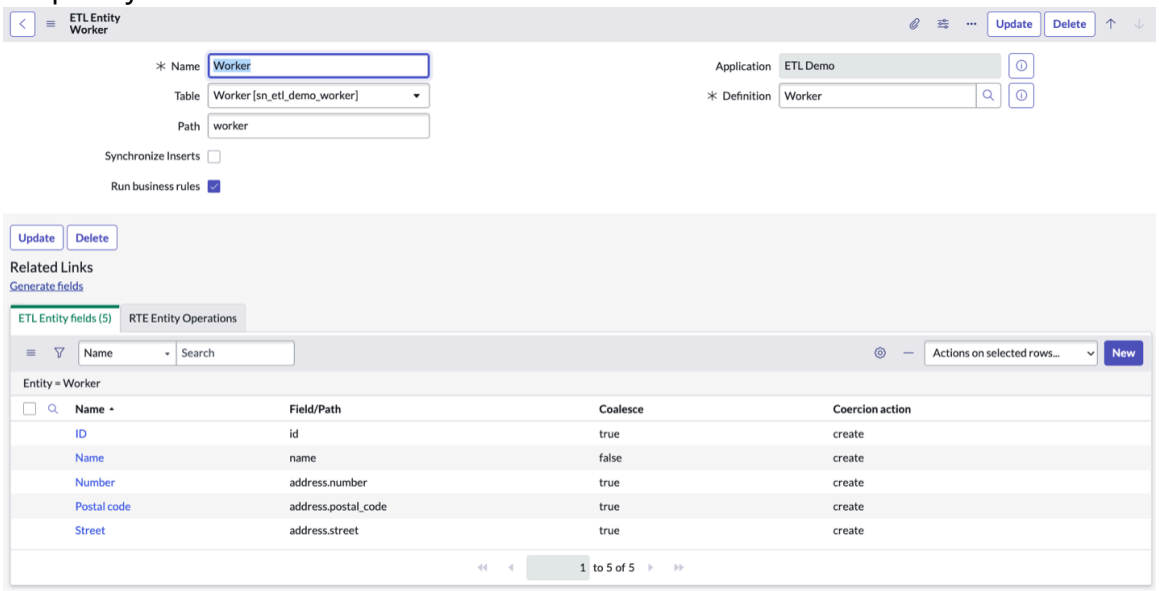
Special field where a row in one table refers to a row in a second table by storing the sys_id of the second table's row as a column value in the first table's row. Though the reference is stored as a sys_id, when the data is imported, it's imported as values. So for reference fields, you map the values of the unique fields of the referred table to the imported data. Ultimately, the system will use the values to find the associated record, retrieve the sys_id, and store it in the appropriate column.

For example, in the Disk entity mentioned previously, the sn_etl_demo_disk table has a reference to the computer using the reference field **computer**. However, the imported data only contains the computer ID, which can be used to uniquely identify the computer. So in the Disk entity, the referenced field path (computer.id) specifies the column of the Computer table as well.

If there's more than one field for a unique key, all the field values should be given by adding multiple fields. For example, in the following image, the sn_etl_demo_worker table has a reference to the sn_etl_demo_address table. The sn_etl_demo_address table has three columns (number, street, and postal code) as unique keys. Therefore, the Worker entity has three fields for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

unique key columns. Reference fields can be used as coalesce fields as well.



Coalesce field

Specifies the unique key for a target entity. The system uses the coalesce field to determine whether to update an existing record or insert a new one. If the Coalesce field is true, and the system finds an existing record with the same coalesce field value, it updates the existing record. For the sn_etl_demo_disk table shown previously, in the Disk entity, the Serial No column is unique for all the disk entries, so it is specified as a coalesce field.

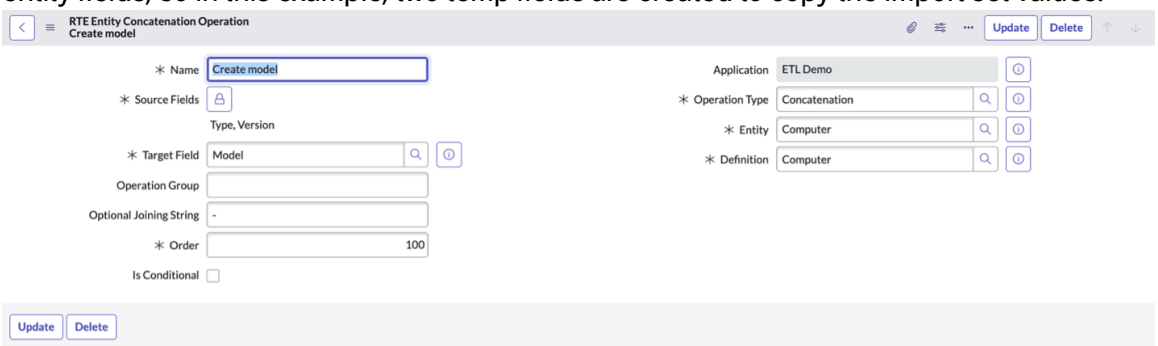
Coercion action

For reference fields, specifies what to do when a row with the unique key value doesn't exist in the referred table. The Coercion action has the following options.

- **Create** a new row in the referred table and assign it to the target row.
- **Ignore** the reference field value. The reference column is saved as empty.
- **Reject** the reference field value. It is not inserted into or updated in the target table.

Robust Transform Engine (RTE) entity operations modify data

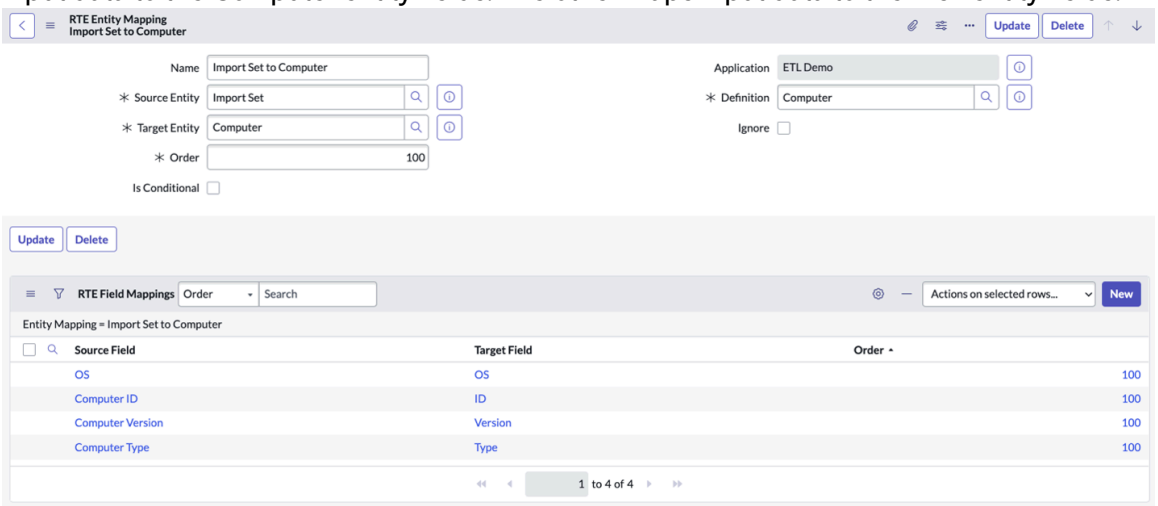
Entity operations modify input data before storing it in a target table. The following image shows an example of a concatenation operation. In the ETL definition for Computer, the imported data contains both a type and a version. However, the target table requires a value that is a combination of the type and version. So the Computer entity uses a concatenation operation to concatenate type and version. Entity operations can only be performed on entity fields, so in this example, two temp fields are created to copy the import set values.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RTE entity mappings specify field mappings

After creating the input and target entities with their entity fields and operations, create an RTE entity mapping for each target entity. RTE entity mappings specify how fields in the input entity are mapped to fields in the target entities. In the ETL definition for Computer, there are two RTE entity mappings. One, shown in the following image, maps input data to the Computer entity fields. The other maps input data to the Disk entity fields.



Nested data in ETL definitions

With JSON data imports, you might need to import records with JSON arrays, or records that import more than one row for the same table. ETL definitions support these payloads with a small change to the paths. The following JSON data has an array for email information. You can import this data by modifying the path or paths in the input or target entities as shown in the next two images.

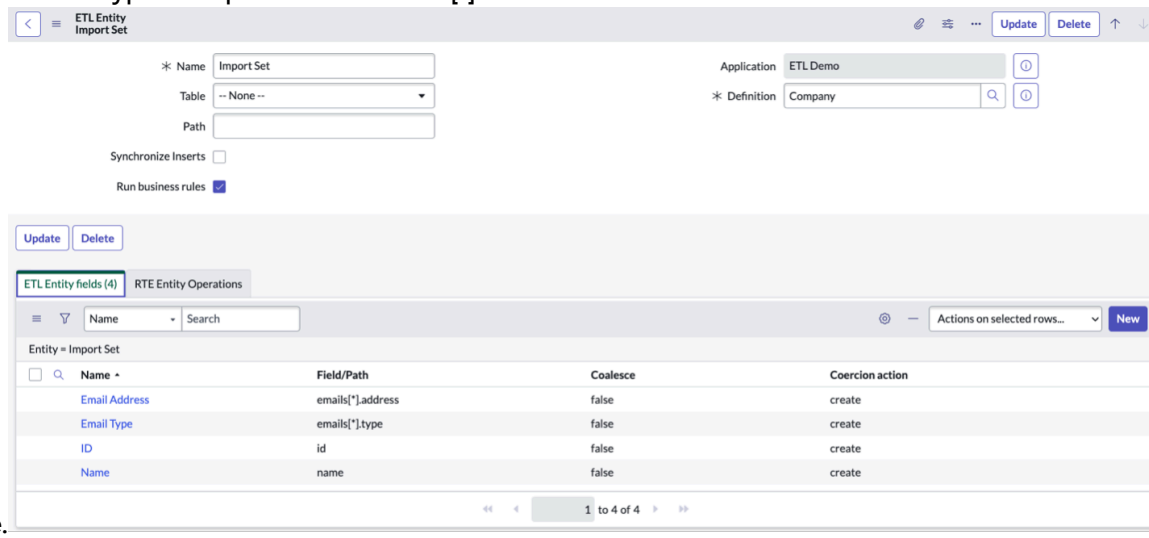
```
{
      "id": "123",
      "name": "Jhon",
      "emails": [
        {
          "address": "jhon@servicenow.com",
          "type": "work"
        },
        {
          "address": "jhon@gmail.com",
          "type": "personal"
        }
      ]
    }
```

Input entities with nested data

Input entities for nested data also represent the input JSON data. Like imports without nested data, they have entity fields to represent the values. The only difference is that paths with arrays are specified with an asterisk (*). The following image shows how the

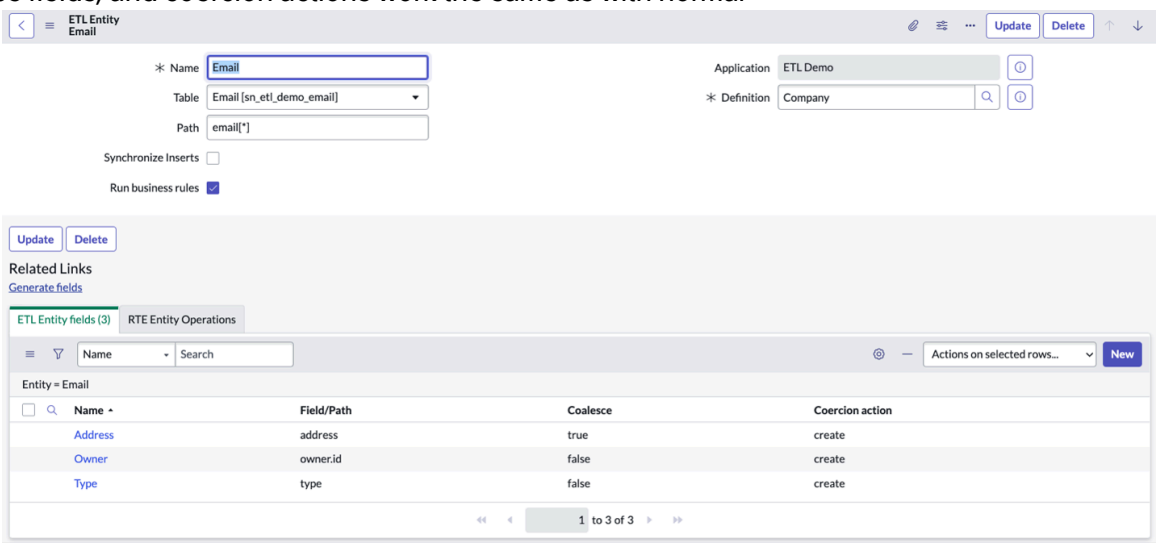
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

paths to address and type are specified as emails[*].address and emails[*].type.



Target entities with nested data

Target entities with nested data are also like the target entities in a normal import except that the path ends with an asterisk (*). The asterisk tells the system to process the entity as an array. In the Email entity, the target path is specified as email[*]. Coalesce fields, reference fields, and coercion actions work the same as with normal imports.



RTE entity mappings with nested data

RTE entity mappings for nested data are like normal mappings. Any field from the hierarchy can be assigned to the entity.

Temporary entity model

Use temporary ETL entities to avoid repetitive operations in target entities.

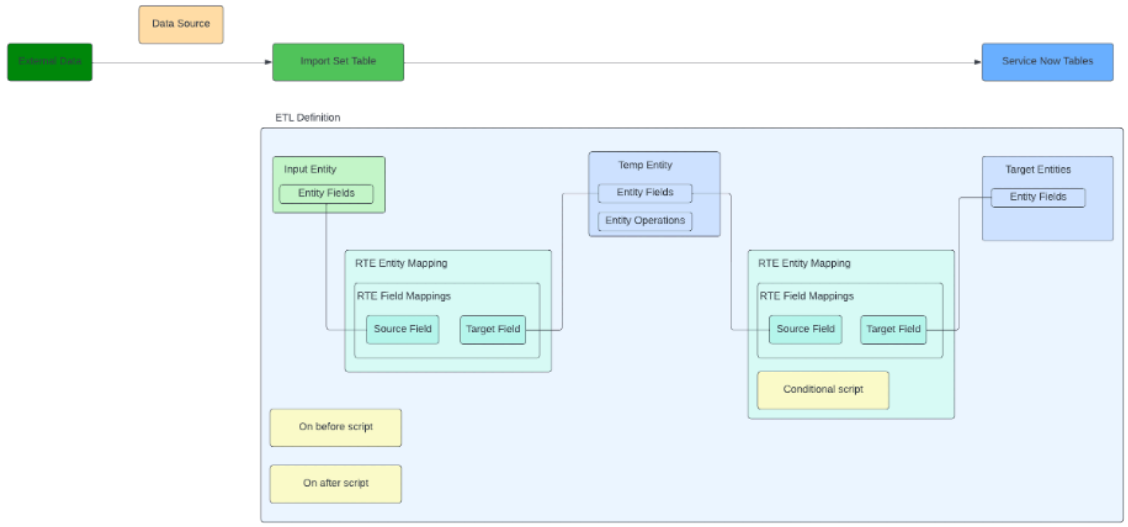
In the temporary (temp) entity model, temporary entities serve as an intermediate between the input and target entities. Data is mapped from the input entity to the temp entity, then from the temp entity to the target entities. To use the temp entity model:

- Create a temp entity, with entity fields similar to the ones in the input entity. For example, if the input entity has a field named Type, the temp entity might have a field named Temp Type.
- Add an RTE entity mapping to map data from the input entity to the temp entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the temp entity, add new entity fields and entity operations to support the values required to map the data to the target entities.
- Add target entities and RTE entity mappings to map data from the temp entity to the target entities.

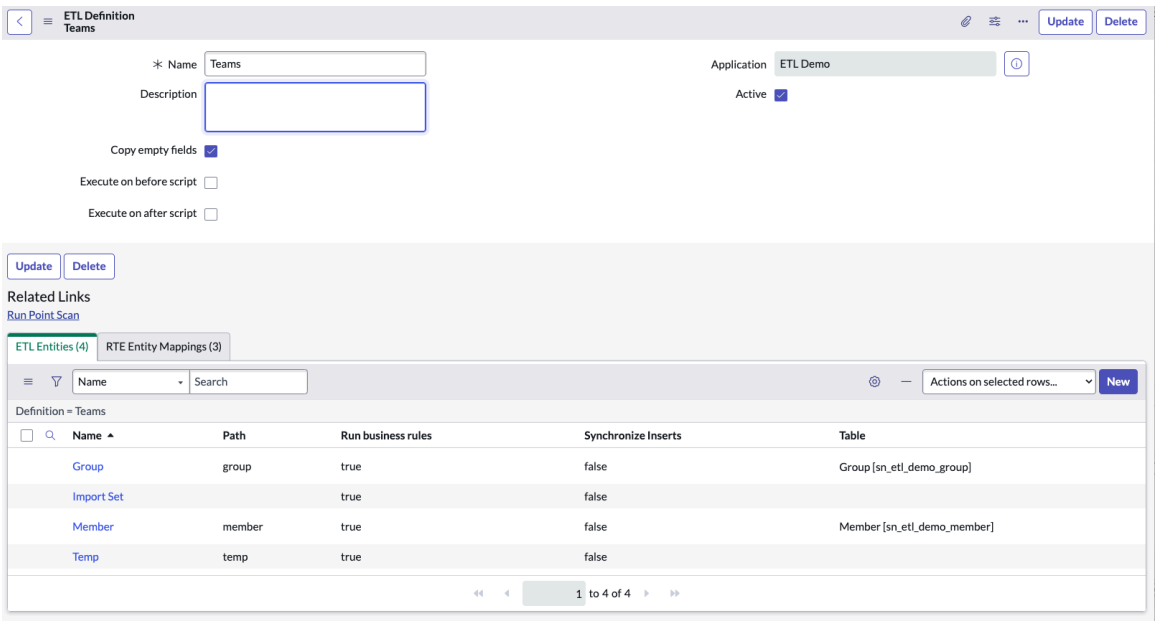
With this model, there's no need to define operations in the target entity. You create operations only in the temp entity, then map the final values to the target entities.



Example: Teams ETL definition

In this example, the Teams ETL definition maps data from the input entity to a temp entity, then from the temp entity to the target entities. The Teams definition has four ETL entities.

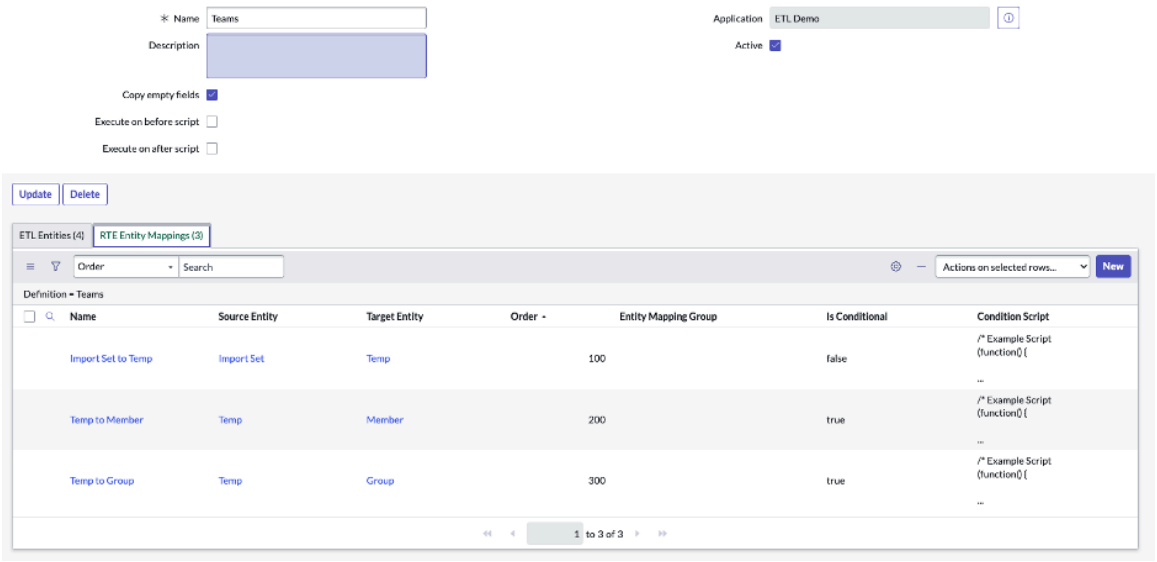
- Group: a target entity
- Import Set: an input entity
- Member: a target entity
- Temp: the temporary, intermediate entity



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

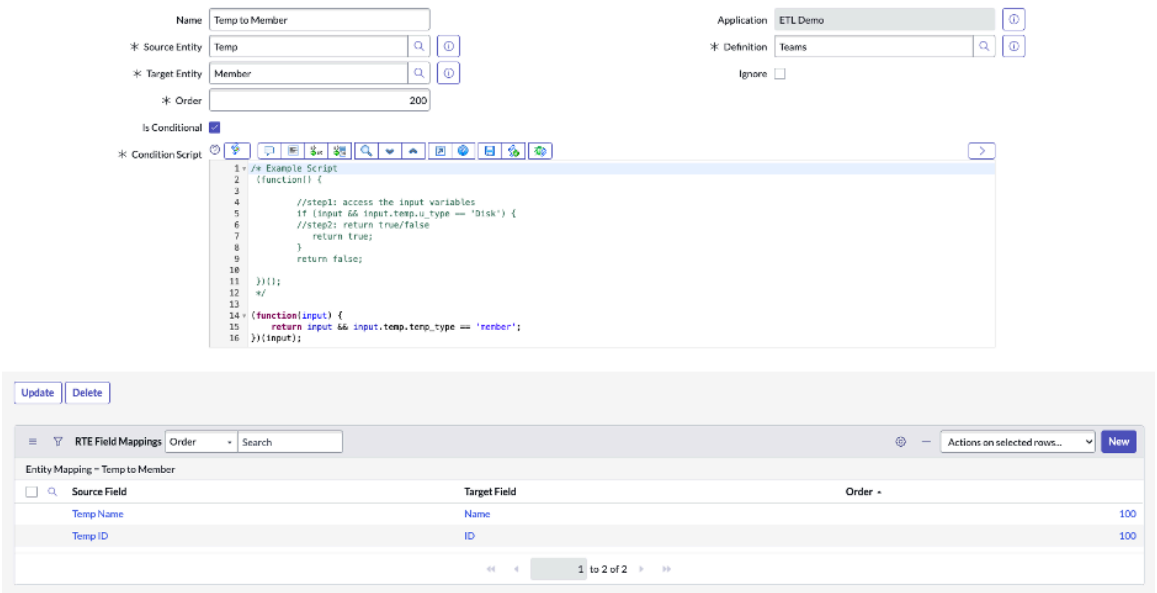
The Teams definition also has three RTE entity mappings.

- Import Set to Temp, which maps data from the input entity to the temp entity.
- Temp to Member, which maps data from the Temp entity to the Member target entity.
- Temp to Group, which maps data from the Temp entity to the Group target entity.



Conditional script

In some cases, you might not want to insert or update all the input data to a target table. You can use a conditional script to pick which import set rows to map to a target entity. In the following example, the Temp to Member RTE entity mapping uses a conditional script to specify which rows to map from the Temp entity to the Member entity. Only rows with a type of `member` are mapped to the Member entity.



ETL Definition quick start guide

Learn how to set up and use an ETL definition to import data into ServiceNow tables.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For this quick start guide, we're going to import data in the following JSON file to ServiceNow target tables. This JSON file contains hierarchical data for a school, classes, students and subjects. Save the following content to a JSON file.

```
[{
   "name": "schoolA",
   "classes": [
   {
    "name": "classA",
    "students": [
    {"name": "studentA", "subjects": [{"name": "subjectA",
 "marks": 80},
     {"name": "subjectB", "marks": 90},{"name": "subjectC",
 "marks": 100}]},
    {"name": "studentB", "subjects": [{"name": "subjectA",
 "marks": 75},
     {"name": "subjectB", "marks": 85}, {"name": "subjectC",
 "marks": 95}]}
   ]
  },{
   "name": "classB",
   "students": [
   {"name": "studentC", "subjects": [{"name": "subjectA",
 "marks": 60},
    {"name": "subjectB", "marks": 70}, {"name": "subjectC",
 "marks": 80}]},
   {"name": "studentD", "subjects": [{"name": "subjectA",
 "marks": 55},
    {"name": "subjectB", "marks": 65}, {"name": "subjectC",
 "marks": 75}]}
   ]
  }
 ]
}]
```

Procedure

1. Create a data source and load data.

a. Create a data source with a **Format** of **JSON**, and the **Path for each row** as `//`.

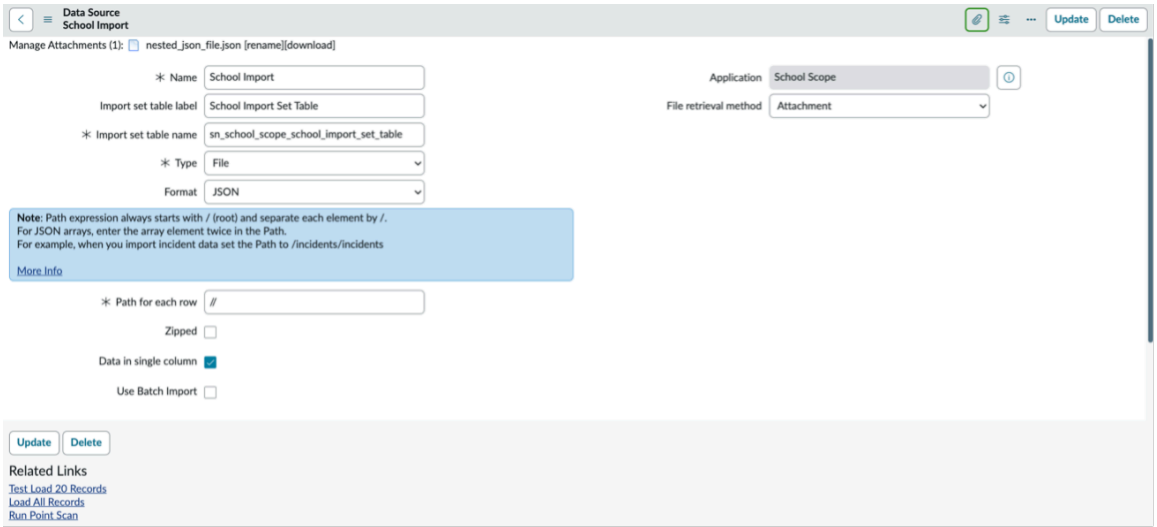
b. Check the **Data in single column** option.

c. Save the data source.

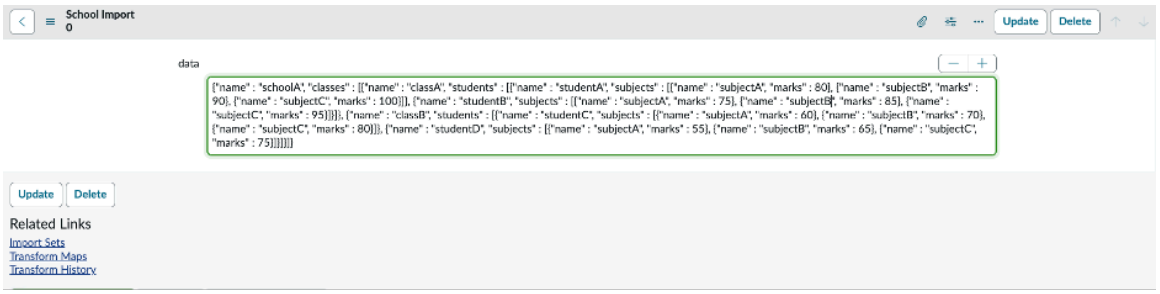
d. Attach the above JSON file to the data source.

e. Select **Load All Records** to load records to the import set table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Open the import set row created.
The record should be saved to a single JSON column.



2. Create the target table structure to import data.

a. In this example, we have a school with multiple classes, each class has multiple students, and each student has multiple subjects.

b. Create a table structure to reflect these relationships.

c. `School -> name : string`.

d. `Class -> name : string , school : reference to school`.

e. `Student -> name : string, class : reference to class`.

f. `Subject -> name : string, mark : integer, student : reference to student`.

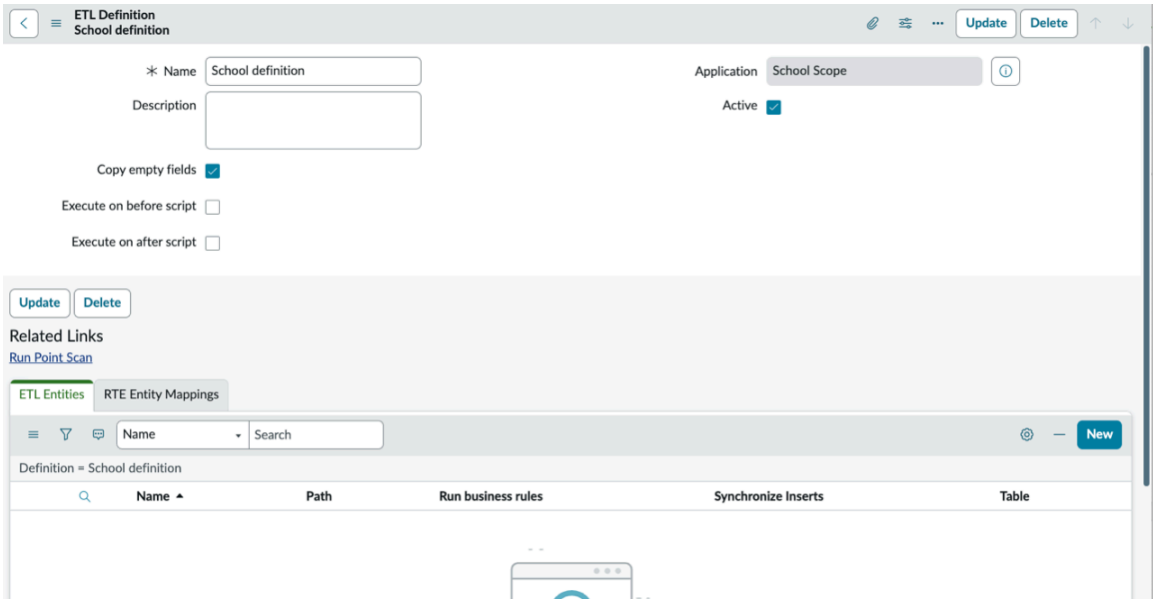
3. Create an ETL Definition to map the JSON record data to target tables.

a. Go to **System Import Sets** > **ETL Definition**.

b. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Enter a name and save the record.

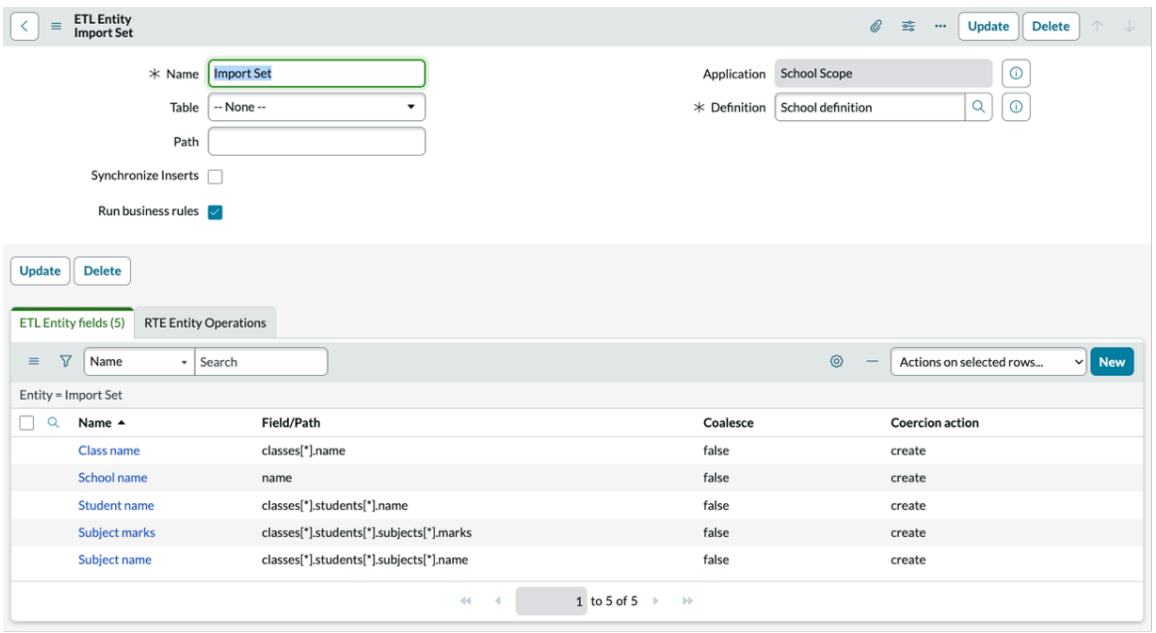


4. Create entities.

a. Under the ETL Entities tab, select **New**.

b. Set the **Name** as `Import Set` and save.

c. Add import set entity fields for all the leaf values of the JSON.
The field/path is the path from the root of the JSON and we mark arrays with [*].



d. Go to ETL Definition and under ETL Entities, select **New**.

e. Set the **Name** as `School`.

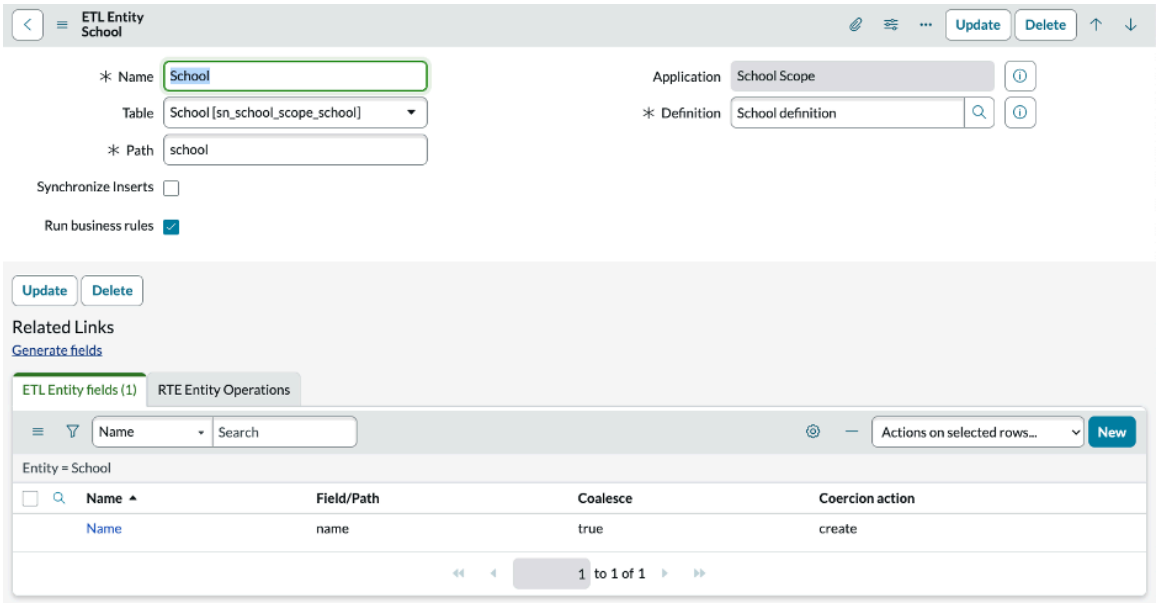
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Set the **Table** as the school table created in step 2.

g. Set the **Path** as `school`.

h. Save the Entity.

i. Select **Generate fields** under Related Links.
This should generate the **Name** field. Set the **Coalesce** to **true**.



j. Go to ETL Definition and under ETL Entities, select **New**.

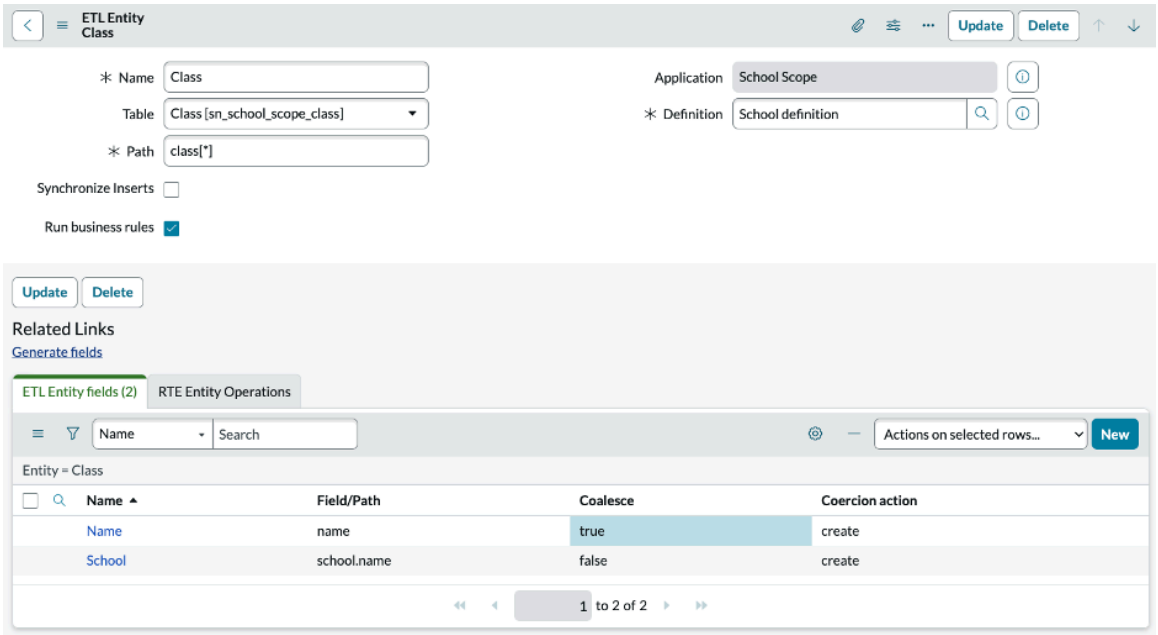
k. Set the **Table** as the class table created in step 2.

l. Set the **Path** as `class[*]`.
Using [*] makes it an entity with multiple rows.

m. Select **Generate fields** under Related Links.

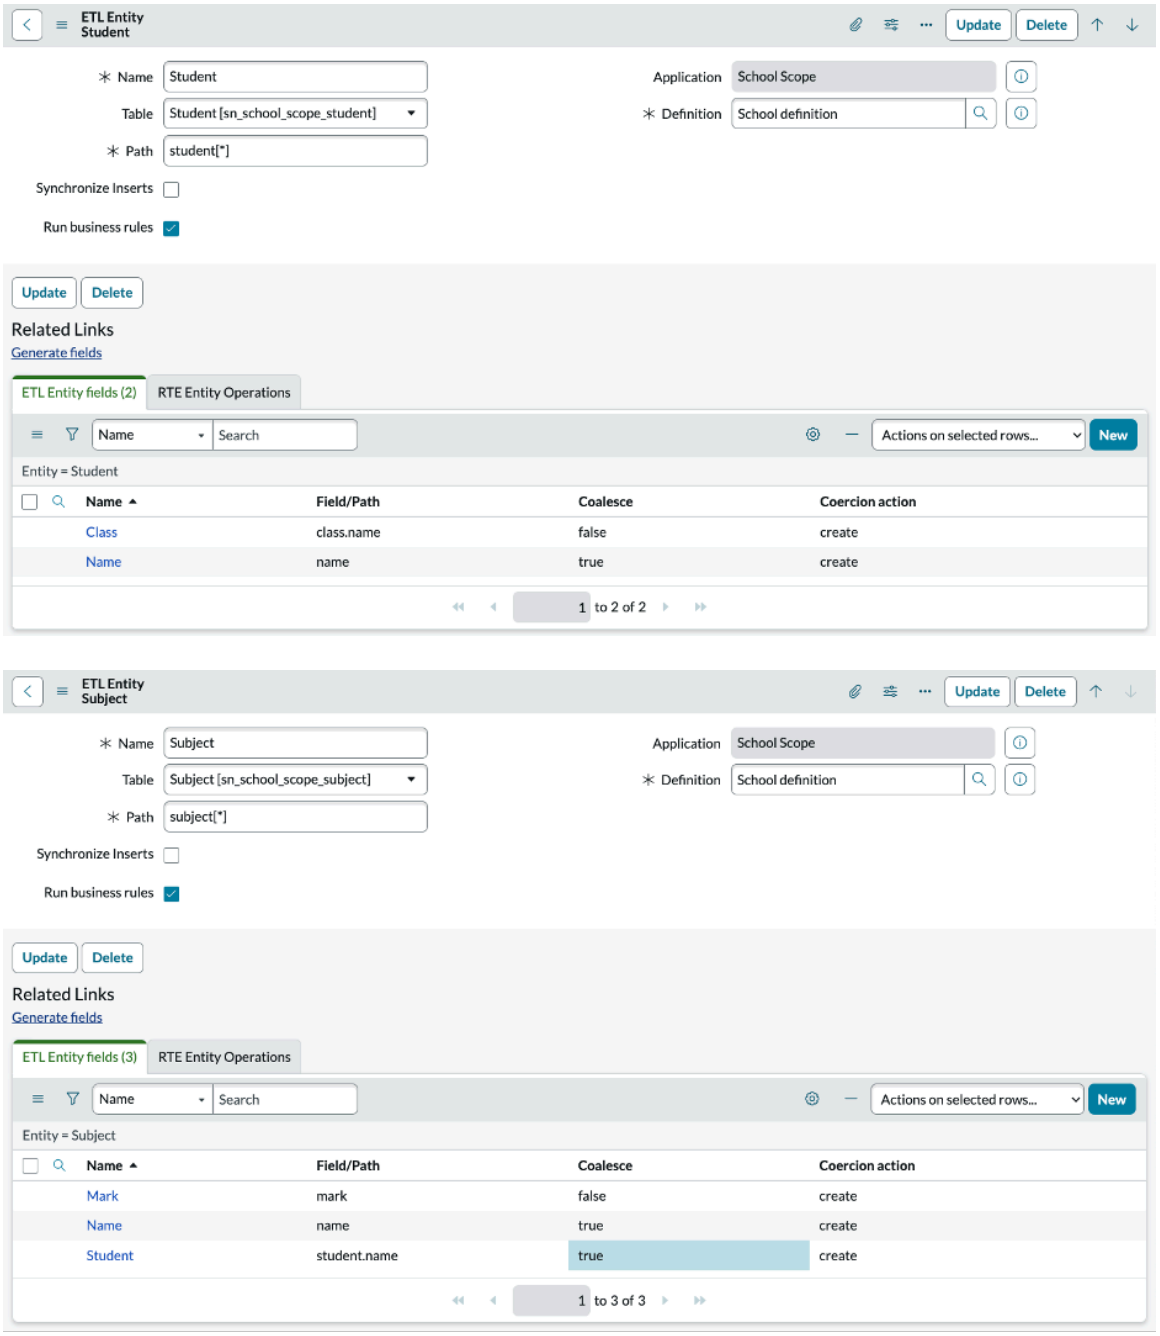
n. Since **School** in the ETL Entity fields is a reference field, modify the **Field/Path** to `school.name` and set **Coalesce** to **true** for the **Name** field because name is unique.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



o. Add Entities to Student and Subject as well.
For Subject, set **Coalesce** to **true** for both the **Name** and **Student** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Add RTE Entity Mappings.

   a. Go to RTE Entity Mappings and select **New**.

   b. Set the **Name** to `Import Set to school`.

   c. Set the **Source Entity** to **Import Set**.

   d. Set the **Target Entity** to **School**.

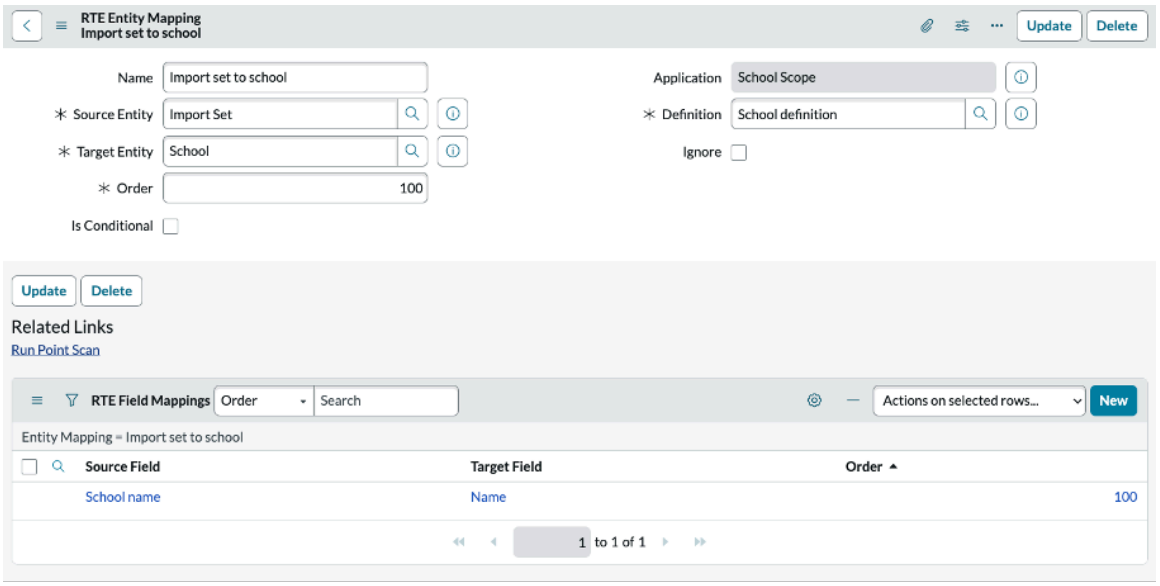
   e. Keep the **Order** as **100**.

   f. Under RTE Field Mappings, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. For the **Source Field**, select **School name**.
You can only select the Entity fields from the source entity.

h. For the **Target Field**, select **Name**.
You can only select the Entity fields from the target entity.



i. Go to ETL Definition and under RTE Entity Mappings select **New**.

j. Set the **Name** to `Import set to class`.

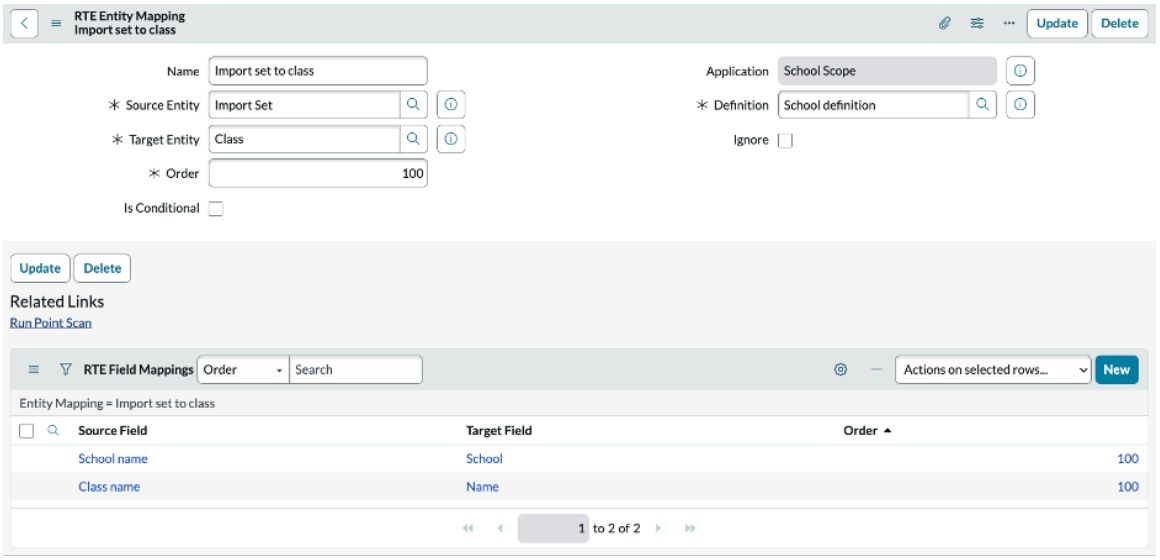
k. Select **Source Entity** to **Import Set**.

l. Select **Target Entity** to **Class**.

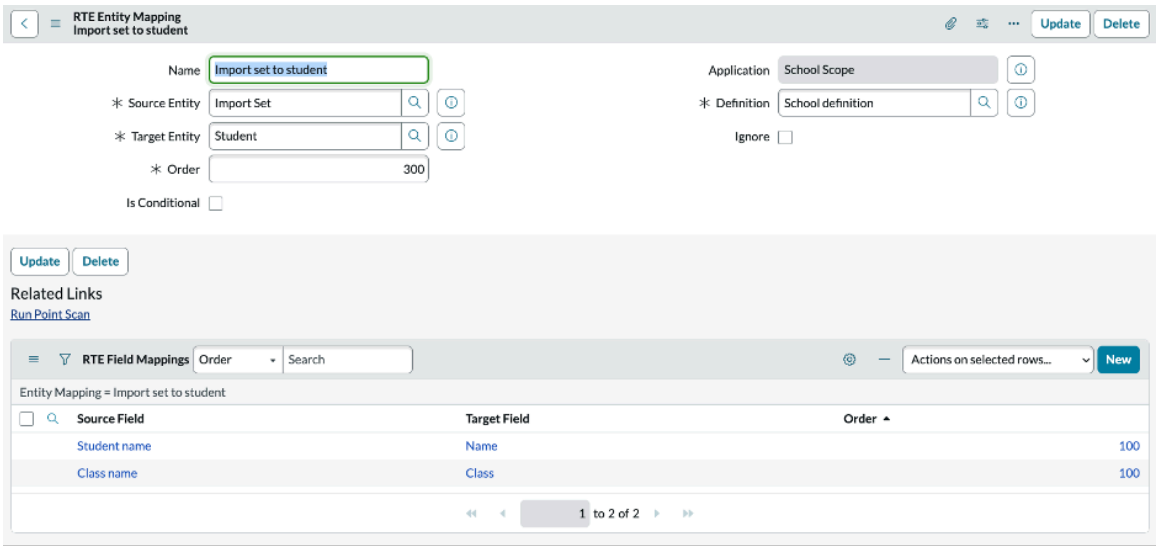
m. Set **Order** to **200**.

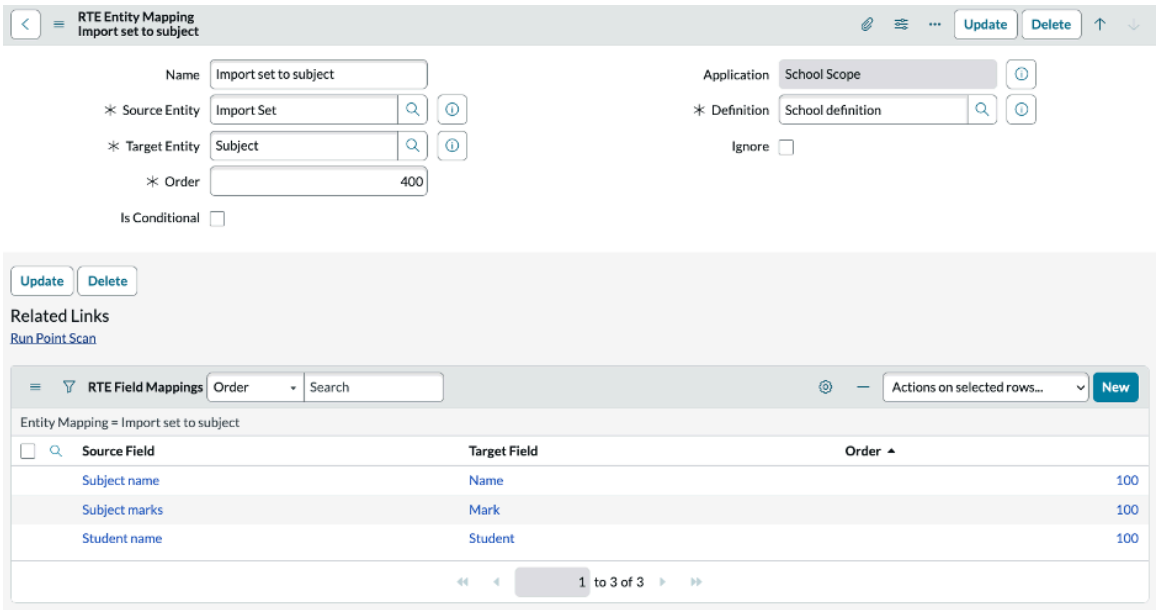
n. Add the RTE Field Mappings to map **Name** and **School name**.
The school **Target Field** should map to the **School name** of the import set. The system does the school look up using this value and sets the correct school reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



o. Add mappings for Student and Subject as well.





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Create a Robust Import Set Transformer record and run the import.

   a. Go to the Data source created in step 1.

   b. Select the Robust Transformer tab and select **New**.

   c. Set a **Name**.

   d. Set the **Transformer definition** to the ETL Definition we created earlier.

   e. Set **Verbose**.
   Selecting **Verbose** is not required, but enables you to debug the configuration. Switch this off before moving to production because it can negatively impact the performance.

   f. Select **Submit**.

   g. Select **Load All Records**.

   h. Select **Run Robust Transform**.

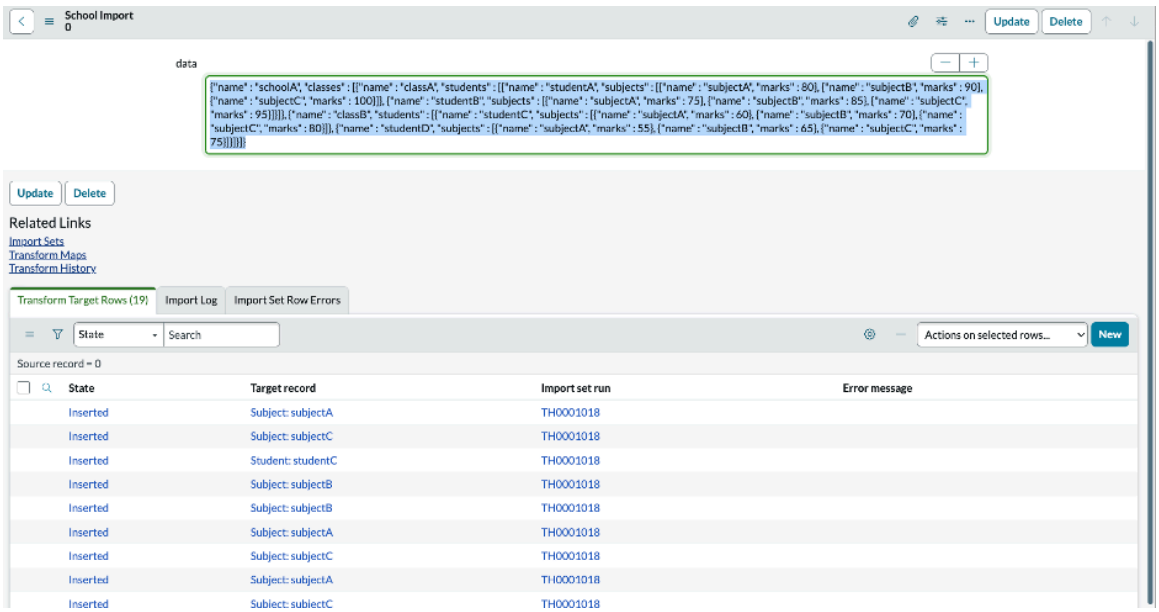
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Select **Transform**.

j. Go to the import set.

k. Select the Import Set Rows tab and open the import set row record.

l. If the configuration works correctly, it should show the import set row record with all the records inserted.



Create Extract Transform Load (ETL) definitions

Create ETL definitions to extract data from a source table, transform the data as desired, and load the data into multiple target tables. ETL definitions also support nested data structures.

Before you begin

Role required: import_transformer

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **ETL Definitions**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	Name of the ETL definition.
Description	Description of the ETL definition.
Copy empty fields	Option to copy empty field values. If the incoming data has a field with an empty value, you can either copy the empty value or ignore it and keep the existing value.
Execute onBefore script	Option to run a script before inserting or updating data. The onBefore script has three parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

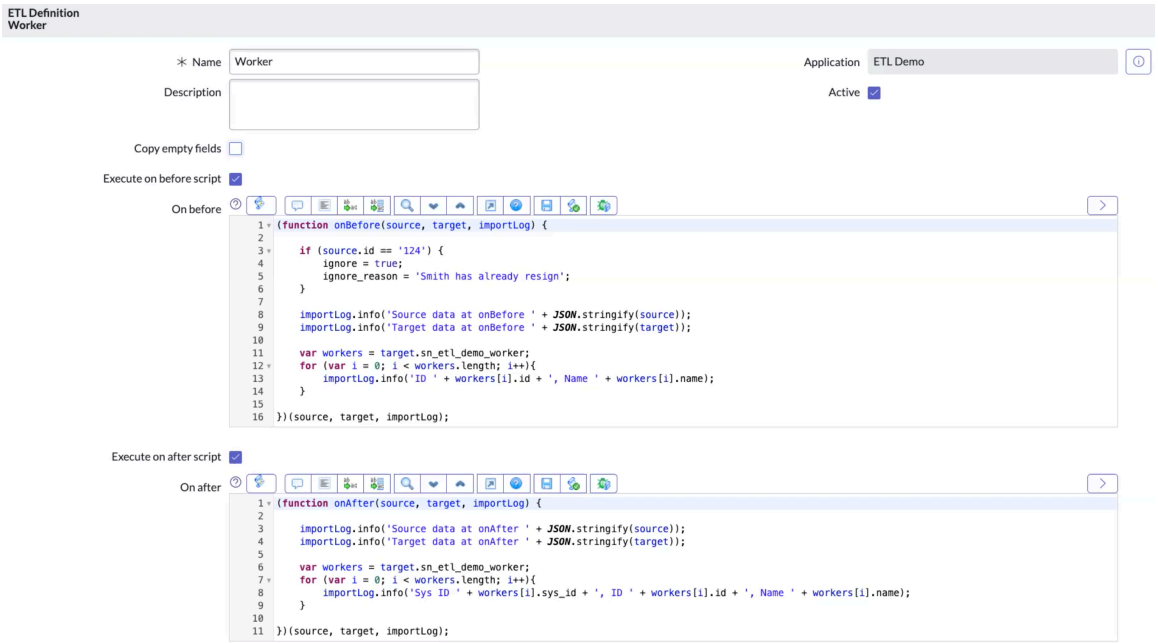
Field	Description
	○ *source*: The source data from the import record. ○ *target*: The transformed data from the import record. In the onBefore script, this parameter accesses transformed data before it's inserted into the target table. ○ *importLog*: The log that records information about data import activity. The onBefore script has two variables. ○ *ignore*. Type: Boolean. When **true**, the specified import set row is ignored. ○ *ignore_reason*. Type: String. Message describing why the import set row was ignored.
Execute onAfter script	Option to run a script after inserting or updating data. The onAfter script has three parameters. ○ *source*: The source data from the import record. ○ *target*: The transformed data from the import record. In the onAfter script, this parameter accesses transformed data after it's inserted into the target table. Once a record is inserted or updated, it has a sys_id. ○ *importLog*: The log that records information about data import activity.
Application	Application scope for this record.
Active	Selected if the ETL definition is active. Unselected if the ETL definition isn't active.

4. Click **Submit**.

Example:
In this example, the ETL Definition for Worker has both an onBefore and onAfter script. In the onBefore script, the source record with an id of 124 is ignored because that worker has already resigned. The source data and target data are both written to the import log. Finally, the script iterates through the transformed values of the sn_etl_demo_worker table to get each worker's ID and name and record them in the import log.

In the onAfter script, the source and target data are both written to the import log. The script again iterates through the transformed values of the sn_etl_demo_worker table. Now that the data has been inserted into the target table, each record has a sys_id. The script records each worker's Sys ID, ID, and name in the import log.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:

- For creating these definitions and mapping using a guided or step-by-step experience, refer to Integration Hub - Import.
- If your target table or application is related to CMDB, use the IntegrationHub ETL guided experience.

Related topics

Define ETL entities

Define ETL entity mappings

Create ETL entity field definitions

Define Robust Transform Engine operations

Define ETL entities

Define the Extract Transform Load (ETL) entities used by the Robust Transform Engine.

Before you begin

Role required: import_transformer

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **ETL Definitions**.
2. Select an ETL definition.
3. On the ETL Entities tab, click **New**.
4. Complete the form.

Field	Description
Name	Name of the ETL entity.
Table	Target table for the ETL entity.

© 2026 ServiceNow, Inc. All rights reserved.

Field	Description
Path	Unique path for this entity. Should not specify any path for the entity representing the import set table. When an entity represents a collection, the path must end with [*]. This requirement applies to intermediate entries and the target table entity.
Synchronize Inserts	Selected to guarantee only one record with unique coalesce field values by synchronizing record inserts. Unselected if you don't want to synchronize record inserts.
Run business rules	Selected to run business rules. Unselected if you don't want to run business rules.
Application	Application scope for this record.
Definition	Selected ETL entity.

5. Click **Submit**.

Define ETL entity mappings

Map the source entity to a target entity.

Before you begin

Role required: import_transformer

About this task

You can optionally set the **Ignore** check box to exclude the entity mapping when performing data integrations using Robust Import Set Transformation (RTE).

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **ETL Definitions**.
2. Select an ETL definition.
3. On the RTE Entity Mappings tab, click **New**.
4. Complete the form.

Field	Description
Name	Name of the mapping.
Source Entity	Source entity for the mapping.
Target Entity	Target entity for the mapping.
Order	Order in which the mapping should be processed.
Is Conditional	Check box that designates that the mapping is conditional. Select the check box if the mapping is conditional and clear it if it is not.
Condition Script	Script that defines the conditions that must be met for the mapping. For an example of a conditional script, see Temporary entity model.
Application	Application scope for this record.
Definition	Selected ETL entity that this mapping belongs to.

Field	Description
Ignore	Check box that designates if this ETL entity mapping should be ignored when performing data integrations using Robust Import Set Transformation (RTE). Select this check box if this ETL entity mapping should be ignored when running data integrations using RTE. Clear the check box if it should not (default). To learn more about data integrations, see: ○ Importing data using import sets ○ Robust Import Set Transformers

Create ETL entity field definitions

Define the entity fields mapped for Extract Transform Load (ETL) operations.

Before you begin

Role required: import_transformer

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **ETL Definitions**.
2. Select an ETL definition.
3. On the ETL Entities tab, select an ETL entity.
4. On the ETL Entity fields tab, click **New**.
5. Complete the form.

Field	Description
Name	Name of the ETL Entity field definition.
Field/Path	The column name in the staging or import set table. For reference fields in a target entity, you can specify the columns to map data to. For example, suppose you're mapping data to an address table with three columns: number, street, and postal code. You can specify the unique column to map to by entering `address.number`, `address.postal_code`, and `address.street`. When specifying unique columns in reference fields, all must have the same coercion action and coalesce value. For example, all three address fields listed previously must have the same coercion action and the same coalesce value. For an import entity, a field within an array can be referenced with the [*] notation. For example, for the following nested structure, you can specify the email address by entering `emails[*].address`. `{ "id": "123", "name": "Jhon", "emails": [ { "address": "jhon@servicenow.com", "type": "work"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	<pre>},] }</pre>
Coercion action	What the system should do if a reference or choice could not be found. Available options are create, ignore, and reject. ○ For the create option, the system creates a new reference/choice and assigns it to the current record. ○ The ignore option sets the current value as empty. ○ The reject option does not save the whole record to the database.
Coalesce	Use this field to query the existing records.
Application	Application scope for this record.
Entity	Name of the robust transform engine entity.
Definition	Selected ETL entity that this field definition belongs to.

6. Click **Submit**.

Define Robust Transform Engine operations

Define the operations the Robust Transform Engine (RTE) should perform.

Before you begin
Role required: import_transformer

About this task
You should always perform operations on only one entry. Select all source and target fields from the same entity.

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **ETL Definitions**.
2. Select an ETL definition.
3. On the ETL Entities tab, select an ETL entity.
4. On the RTE Entity Operations tab, click **New**.
5. Select the kind of operation you want to create.
6. Complete the form.

Field	Description
Name	Name of the operation.
Source Field	Input ETL field for the operation if the operation takes a single input.
Target Field	Output ETL field for the operation if the operation takes a single output.
Source Fields	Input ETL fields for the operation if the operation takes multiple inputs.
Target Fields	Output ETL fields for the operation if the operation takes multiple outputs.
Operation Group	Optional name to group related operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Overwrite Existing Value	If true, overwrites an existing non-empty value in the target fields.
Optional Joining String	Optional string to join values on.
Decimal Places	Optional number of decimal places to force output value to.
Remainder Target Field	Optional second target field to write the trimmed remainder of the source string after the first numeric value is removed.
Glide Matching Fields	Comma-delimited list of column names to use for lookup in the target table.
Target Table	Table to perform a lookup on.
Glide Target Fields	Comma-delimited list of columns to return from the target table.
Match Regular Expression	Matching regular expression for replace operations.
Replacement Regular Expression	Replacement string.
Use Unique Input Sets	If true, the operation processes only the unique set of inputs to the operation. Otherwise, the operation processes every record individually.
Literal Set Value	String value to set to target.
Splitting String	String to split the input value on.
Date Format	Date/time format expressed in simple Java format.
Order	Order in which the operation runs on the entity.
Script	Script that runs as part of the operation.
Is Conditional	Specifies whether to apply the operation if the specified conditions are met.
Conditional Fields	Fields to use in the condition.
Conditional Script	Condition specified as a string. For an example of a conditional script, see Temporary entity model.
Application	Application scope for this record.
Operation Type	Operation type for this operation.
Entity	Entity this operation applies to.
Definition	Selected ETL entity definition that this entity and operation belong to.

7. Click **Submit**.

Import run details

View detailed information about import set runs, individual rows in the import set, and import logs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are two ways to run or process an import set. The data displayed after the run varies slightly depending on which way you choose.

Robust import set transformers

Separate the transform and processing functions, providing a more flexible alternative to transform maps. Robust import set transformers enable you to extract data from a source table into an intermediary data structure. You can transform the data as desired and then load that data to one or more target tables. Records are processed as batches to enhance performance. For more information, see Robust Import Set Transformers.

Transform maps

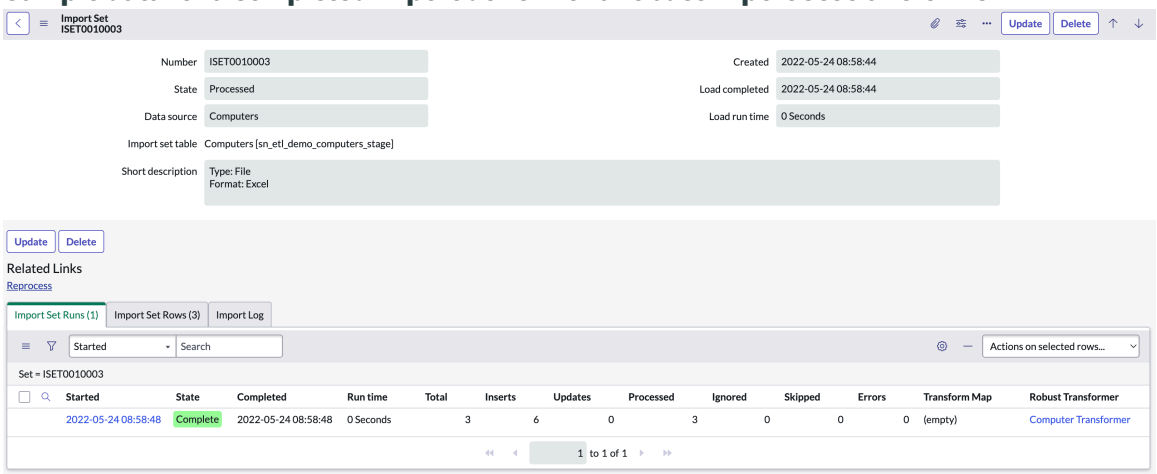
Legacy method to map data from an import set staging table to a single target table. Transform maps combine the transform and processing functions into a single process. Each time you run a transform map, the system must load data from the import set staging table, transform it, and then insert it into a single target table. You can define multiple table mappings with multiple transform maps. For more information, see Transform maps.

After running the import, you can view the import history by navigating to the Import Set record and checking the tabs below the Related Links section. They cover the import set runs, import set rows, and import log.

Import Set Runs

The **Import Set Runs** tab provides details about individual imports.

Sample data for a completed import done with a robust import set transformer



The following table provides more details about the fields in the image.

Field	Description
Started	Date and time the import started. Given in the time zone of the logged-in user.
State	State of the import. Options are: • Cancelled • Cancel requested • Complete • Complete with errors

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

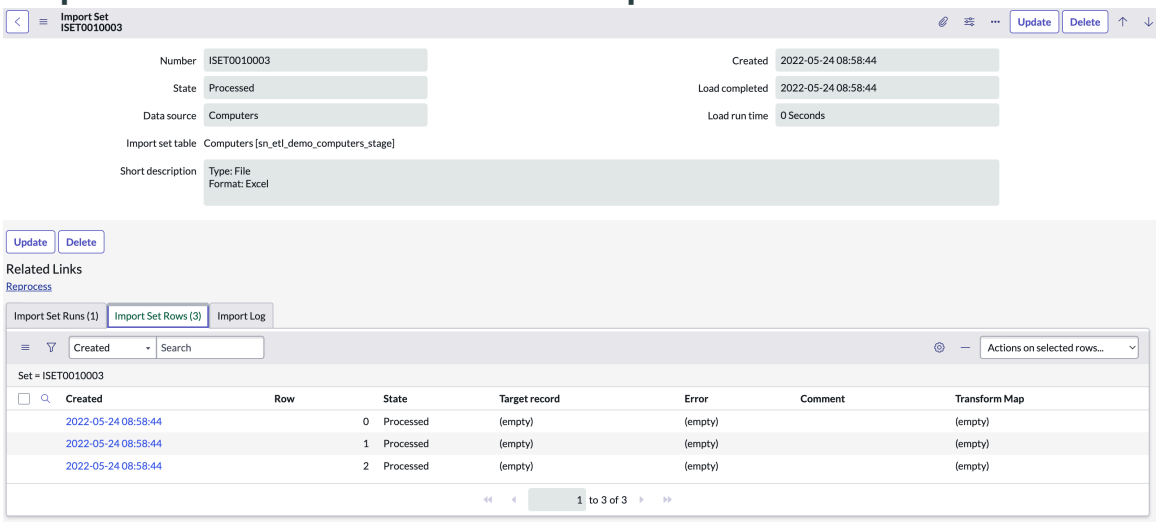
Field	Description
	• Did not complete • Running
Completed	Date and time the import finished. Given in the time zone of the logged-in user.
Run time	Total amount of time the import required to run.
Total	Total number of import set rows. For an import using a robust import set transformer, this field is the total number processed, ignored, skipped, and with errors. For an import using a transform map, this field is the total number inserted, updated, ignored, skipped, and with errors.
Inserts	Number of records inserted.
Updates	Number of records updated.
Processed	Number of records processed.
Ignored	Number of records ignored. An ignored record is one the user has specified should be ignored during an import. For example, you can identify records to ignore with the *ignore* variable in an onBefore script. For more information, see Create Extract Transform Load (ETL) definitions.
Skipped	Number of records skipped. A skipped record is one that has been skipped by the system, due to an internal issue.
Errors	Number of errors encountered during the import.
Transform Map	If data is imported using a transform map, the associated map is shown here.
Robust Transformer	If data is imported using a robust import set transformer, the associated transformer is shown here.

Import Set Rows

The **Import Set Rows** tab provides details about rows included in the import set run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample data for the three rows included in the import



The following table provides more details about the fields in the image.

Field	Description
Created	Date and time the import set row was created. Given in the time zone of the logged-in user.
Row	Number for the row. Numbering starts at zero.
State	State of the row import.
Target record	Record updated with the row. This field displays the target record only when the import is run with a transform map. For imports run with a robust import set transformer, you can view the target records by clicking the row record and checking the **Target record** field in the **Transform Target Rows** tab. For more information and an example, see the following section on Target records for robust import set transformers.
Error	Details for any errors encountered during the row import.
Comment	Comments from the transform script.
Transform Map	If data is imported using a transform map, the associated map is shown here.

Target records for robust import set transformers

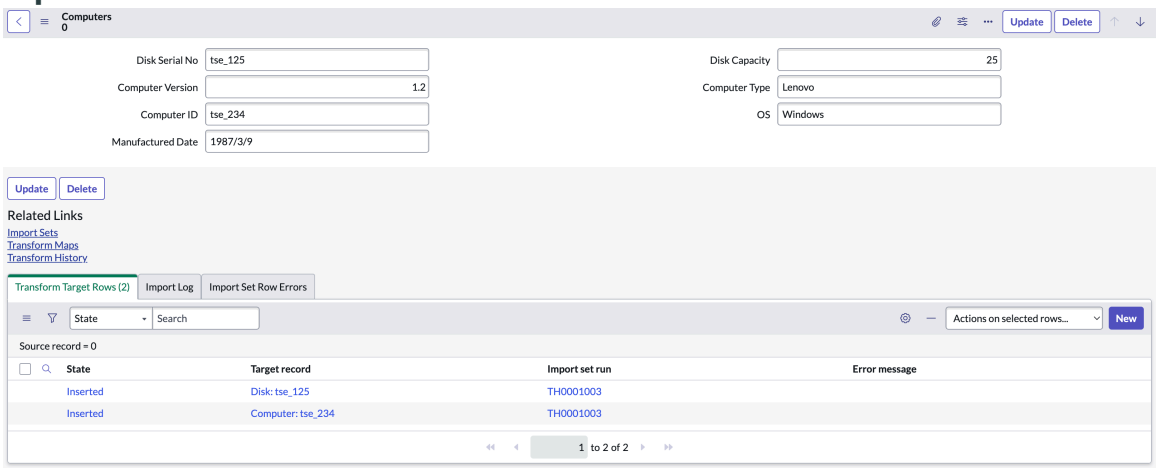
For imports using a robust import set transformer, you can view additional details by running the import in verbose mode. Verbose mode enables the following.

- Greater detail in the import log. With verbose mode, the import log includes transform logs that show how transform operations are applied to records.
- More information about each row's transform target rows. For each row in the **Import Set Rows** tab, clicking the row record opens the row in the import set table. In this view, you can see the transform target rows, import log, and import set row errors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Transform Target Rows** tab displays the state, target record, import set run, and any error messages for each row. The first three fields are all links to the associated records, making it easier to find and track information for improved debugging. For more information on enabling verbose mode, see Create a robust import set transformer.

Sample data showing the transform target row details for a row in the Computers import set table



The following table provides more details about the fields in the image.

Field	Description
State	State of the transform target row. Options are: • Inserted • Updated • Error
Target record	Record updated with the row.
Import set run	Import Set record associated with the transform target row.
Error message	Text describing any errors encountered by the transform target row.

Import Log

The Import Log tab displays the logs for the import set. It shows when each log was created, its level, the log message, and the source of the log. For details, see Import logs.

Updating records using coalesce

The coalesce option allows you to update existing target table records when transforming import data.

The coalesce option on a field map allows you to specify if the selected **Target field** should be used to coalesce on when import set records are transformed. If the field map **Coalesce** checkbox is selected, when the import set row is transformed the instance checks for an existing record in the target table that has the same value in the **Target field** as the import set row **Source field**. For step-by-step instructions, see Create a field map.

If an existing record with a matching value in the target table is found, that record is updated. If no matching record is found, then a new record is created in the target table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Choose fields in the target table to coalesce on only if those fields will have unique values. If more than one record in the target table matches the specified coalesce options, only the first matching record in the target table is updated.

Coalesce options

There are several possible configurations you can use to coalesce data in import sets.

No coalesce

If no coalesce is defined, all imported rows are treated as new records. No existing records are updated.

Single-field coalesce

You can coalesce on a single field to update an existing record.

If a target table record exists with the same value in the coalesce field as the staging table record, the target table record is updated using the import set record values.

Multiple-field coalesce

You can coalesce on multiple fields to update an existing record.

If a target table record exists with the same values in all coalesce fields as the staging table record, the target table record is updated using the staging table record values. All coalesce field values between the target and staging tables must match to coalesce with multiple fields.

Conditional coalesce

You can use a script to determine if a staging table row should coalesce to a target record.

Most conditional coalesce scripts are defined in the **Source script** field of a field map for the sys_id field. To update a target record using the staging table record values, the script must return the sys_id of the target table record.

Example conditional coalesce scripts

Review examples of conditional coalesce scripts.

Updates only

To only update records where a match is found, and skip records where a match is not found, specify a coalesce field and add the following script as an **onBefore** script to the transform map.

```
if (action == 'insert')
  ignore = true;
```

Conditional coalesce using dot-walking

You can use dot-walked fields in a conditional coalesce script, such as to match the email address of a user when importing incident data.

In this example, this script is defined in the **Source script** of a field map for the Incident target table sys_id field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gr = new GlideRecord('incident');
gr.addQuery('caller_id.email', source.u_email); //check if the
 incident caller's email matches the import row email value
gr.query();

if(gr.next())
{
    answer = gr.sys_id; //if a match exists, return the sys_id
 of the matching Incident record
}
else
{
    answer= -1;
}
```

Conditional coalesce with an OR condition

You can use a conditional coalesce script to match source and target records based on multiple field values. Unlike multiple-field coalesce where all coalesce fields must match, you can specify a script to only require one of the fields to match.

In this example, this script is defined in the **Source script** of a field map for the User target table sys_id field.

```
var gr = new GlideRecord('sys_user');
var qc = gr.addQuery('email', source.u_email); //first check if
 the user's email matches
qc.addOrCondition('user_name', source.u_name); //alternatively,
 check if the username matches
gr.query();

if(gr.next())
{
    answer = gr.sys_id; //if a match exists, return the sys_id
 of the matching User record
}
else
{
    answer = -1;
}
```

Case-sensitive coalesce field values

You can control if an import set will coalesce on matching values with different cases.

The field map **Coalesce case sensitive** field enables you to coalesce field values by case sensitivity.

By default, fields marked as **Coalesce** in the field map are used in a case insensitive lookup for existing records. If the **Coalesce case sensitive** check box is selected, the instance attempts to match coalesce field values by case. The target table record is updated only if the value in the target record and the import set staging record have the same value and case. Otherwise, a new record is created.

Coalesce on empty fields

You can control if an import set will coalesce on fields with no value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The field map **Coalesce empty fields** field allows you to coalesce on fields with no value.

By default, fields marked as **Coalesce** in the field map cause the import set to check for a target record with a field value that matches the value from the import set staging record. When **Coalesce empty fields** is selected for that field map, an empty value in the target record and import set staging record counts as a match for the purpose of coalescing.

For example, the User transform map coalesces on the email field. With the **Coalesce empty fields** option selected, a source record containing an empty email address coalesces to a target record containing an empty email address.

Standard import set tables

Several Import Set tables are available by default.

Notification

A standard object for describing an external interface for a notification in the system, such as alarms and alerts from monitoring systems. The default transform map for this object will create or update an incident record. The incoming notifications are coalesced into incidents based on the UUID field.

imp_notification

Field	Description	Data type
uuid	The universally unique identification number or string that uniquely identifies this notification. It is marked as the coalescing value in the default transform map for the corresponding Incident and is mapped to the correlation_id field of Incident.	Character (40)
corrective_message	A free form string value that indicates the corrective or followup steps to be taken to address the issue identified in this notification. This field is not mapped by default.	Character (40)
duration	A string value representing the time value duration affecting the issue reported in this notification. Out of box, the duration field is not mapped. The format of the time is up to the calling program and must be mapped accordingly in the default map to be used.	Character (40)
expires_on	A string value representing the datetime value that the issue reported in this notification will expire. Out of box, the expires_on field is not mapped. The format of the time is up to the calling program and must be mapped accordingly in the default map to be used.	Character (40)
message	A string value describing the nature of the issue related to this notification. It should be a concise description and is mapped to the short_description field of the Incident.	Character (80)
comments	A string value containing additional comments related to this notification. The value is mapped to the comments field of the Incident.	Character (4000)
category	A string value categorising the nature of this notification. The value is mapped to the category field of the Incident, and therefore should be one of its valid values. If an existing	Character (40)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

imp_notification (continued)

Field	Description	Data type
	value does not exist, the default behavior is to create a new category.	
assignment_group	A string value of the assignment group for this notification. The value is mapped to the assignment_group field of the Incident, and therefore should be one of its valid values. If an existing value does not exist, the default behavior is to create a new assignment group and set it for the resulting incident.	Character (40)
severity	A string representation of a numeric value that indicates the severity of the issue being reported in this notification. This field is mapped to the severity field on Incident. The out of box numeric values and their meanings are: • 1 - High • 2 - Medium • 3 - Low	Character (40)
state	A string that indicates the state of the issue being reported in this notification. This field is mapped to the incident_state field on Incident. The out of box values are: • New • Active • Resolved • Closed	Character (40)
source	A string value to indicate the source of the issue or the configuration item (by unique identifier eg IP address, host name etc) related to the issue in this notification. It s mapped to the cmdb_ci field of Incident.	Character (40)
timestamp	A string value representing the datetime value that marks the beginning of the issue reported in this notification. Out of box, the timestamp field is not mapped. The format of the time is up to the calling program and must be mapped accordingly in the default map to be used.	Character (40)
type	A string value categorizing the type of issue related to this notification. Out of box, this field is not mapped to any field on Incident. Integrations using this Notification message may use this field to identify its source and trigger additional scripts.	Character (40)

Computer

A standard object for describing an external interface for a computer in the system. The default transform map will create/update a Computer (cmdb_ci_computer) or Server (cmdb_ci_server, cmdb_ci_win_server, cmdb_aix_server etc ..) based on the operating_system field value. The incoming computers are coalesced based on the serial_number field. Additionally, the transform script of the map will map to various extensions of the Computer (cmdb_ci_computer) based on the operating_system value being entered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- UNIX Server (cmdb_ci_unix_server)
  - AIX
  - HP/UX
  - Solaris
  - AIX
- Windows Server (cmdb_ci_win_server)
  - Windows 2000 Server
  - Windows 2003 Server
  - Windows NT 4.0
- Server (cmdb_ci_server)

  Any operating system that contains the word "Linux".

imp_computer

Field	Description	Data type
serial_number	The unique identifier for this computer. It is marked as the coalescing value in the default transform map for the correcponding Computer and is mapped to the serial_number field of Computer (cmdb_ci_computer).	Character (40)
cpu_count	The number of CPUs that this computer has. It is mapped to the cpu_count field of the Computer (cmdb_ci_computer) table.	Character (40)
cpu_speed	The clock speed of the CPU in MHz. This field is mapped to the cpu_speed field of Computer (cmdb_ci_computer)	Character (40)
cpu_type	Free form text describing the type of CPU. Example values are "GenuineIntel", "IBM", or "Pentium 4". This field is mapped to the cpu_type field of Computer (cmdb_ci_computer)	Character (40)
disk_space	A numeric value describing the total disk space available to the computer in GB. This field is mapped to the disk_space field of Computer (cmdb_ci_computer)	Character (40)
manufacturer	A string name for the manufacturer of the computer. This field is mapped to the manufacturer field of Computer (cmdb_ci_computer) which is a reference to Company (core_company)	Character (40)
model_id	A string name for the model of the computer. This field is mapped to the model_id field of Computer (cmdb_ci_computer) which is a reference to Model Name (cmdb_model)	Character (40)
name	A string value representing the name of the Computer, usually a host name or IP/MAC address. It is mapped to the name field of Computer (cmdb_ci_computer)	Character (40)
operating_system	A string value for the main operating system running on the computer. It is mapped to the os field of Computer (cmdb_ci_computer). Out of box values are: • AIX • GNU/Linux	Character (40)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

imp_computer (continued)

Field	Description	Data type
	• HP/UX • Linux Fedora • Linux Red Hat • Linux SuSE • macOS OS 10 (OS/X) • macOS OS 8 • macOS OS 9 • macOS OS/X • OS/400 • Solaris • SunOS • Windows • Windows 2000 • Windows 2000 Advanced Server • Windows 2000 Datacenter Server • Windows 2000 Professional • Windows 2000 Server • Windows 2003 Datacenter • Windows 2003 Enterprise • Windows 2003 Standard • Windows 2003 Web • Windows 95 • Windows 98 • Windows ME • Windows NT 4.0 • Windows XP • Windows XP Home • Windows XP Professional • Windows 2000 Server • Windows 2003 Enterprise	
ram	A numeric value for the total number of memory installed on this computer in MB. This value is mapped to the ram field of Computer (cmdb_ci_computer)	Character (40)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User

A standard object for describing an external interface for a user in the system. The default transform map script sets the user_name field value to first_name.last_name if the web service's user_id field value is not supplied, otherwise, the user_id value is mapped directly to the user_name field in the User (sys_user) table.

imp_user

Field	Description	Data type
email	A string value containing the user's email address. This value is mapped to the email field in User (sys_user) and is set as the coalesce value for the transform.	Character (40)
department	The department the user is in. This field is mapped to the department field in User (sys_user) which is a reference to the Department (cmn_department) table.	Character (40)
first_name	The first name of the user, mapped to the first_name field of the User (sys_user) table.	Character (40)
last_name	The last name of the user, mapped to the last_name field of the User (sys_user) table.	Character (40)
location	The location the user is in, mapped to the location field of the User (sys_user) table which is a reference field to Location (cmn_location)	Character (40)
phone	The phone number of the user, mapped to the phone (Business Phone) field of the User (sys_user) table.	Character (40)
user_id	This is the user identification, usually a login name, that maps to the user_name (User ID) field of the User (sys_user) table.	Character (40)

Location

A standard object for describing an external interface for a location in the system. The web service will create or modify records in the Location (cmn_location) table.

imp_location

Field	Description	Data type
name	The name of the location, for example "Headquarters", "Sales office" etc. This field is mapped to the name field of Location (cmn_location) and is part of the coalesce to search for an existing location.	Character (40)
street	The street address of the location, for example "1234 ServiceNow way" etc. This field is mapped to the street field of Location (cmn_location) and is part of the coalesce to search for an existing location.	Character (40)
city	The city of the location, for example "San Diego", "Madrid" etc. This field is mapped to the city field of Location (cmn_location) and is part of the coalesce to search for an existing location.	Character (40)
state	The state of the location, for example "California", "Connecticut" etc. This field is mapped to the city field of Location (cmn_location) and is part of the coalesce to search for an existing location.	Character (40)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

imp_location (continued)

Field	Description	Data type
zip	The zip code for the location, for example "92130", "10001" etc. This field is mapped to the zip field of Location (cmn_location) and is part of the coalesce to search for an existing location.	Character (40)
country	The country for the location, for example "USA", "United Kingdom" etc. This field is mapped to the country field of Location (cmn_location).	Character (40)

Import sets maximum row size

Rows imported using import sets must not exceed the maximum row size.

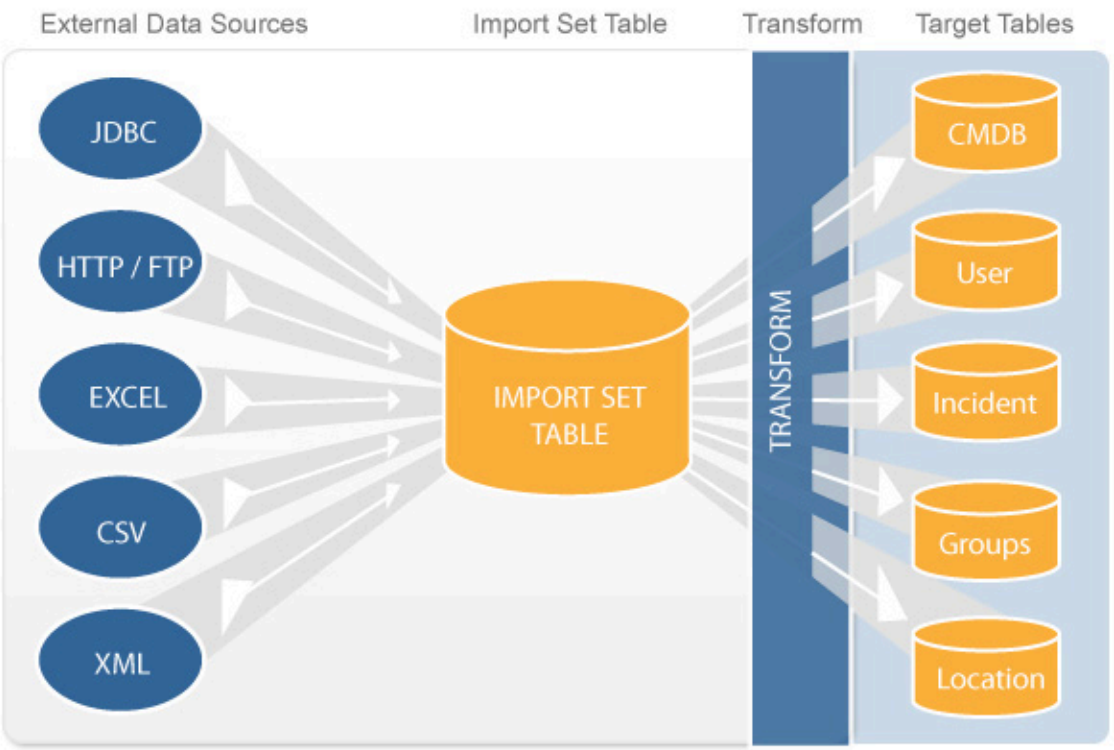
A single row in a database may not contain more than 8126 bytes of data. The size of each row is determined by the amount of content in all fields, as well as the character set for text fields. For example, a row with 10 text fields each containing 1000 characters using a French character set takes 15360 bytes.

Attempting to import more data to a single row than the maximum size causes the import to skip that row. Any rows that were skipped for this reason are listed in the import log.

Importing data using import sets

To import data define a data source and transform map, and run or schedule an import.

Importing data: data flow



Create a data source

Create a data source record to define what data an import set should import.

Depending on the type of data source you want to create, see the following topics for procedures.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a File type data source

Create a **File** type data source record to define what data an import set should import.

Before you begin

Role required: import_admin

About this task

For additional information, see File type data sources.

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**File**.
Format	Only the default XML-based file format (.xlsx) is supported, unless saved as "Strict Open XML Document."
Zipped	Selected if the import file is compressed.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
File retrieval method	The retrieval method for this file.
File path	The path to the file to import. You can include a system property value in this field using the format `${system.property.name}`. When the connection is made, the variable is replaced with the value of the specified property. **Note:** For files retrieved using HTTP or HTTPS, the *`glide.ds.file.http.variable_replacement`* property must be true to use system property expansion. For example, you can specify the **File path** value `/countries.csv?key=${datasource.apikey}`. When the connection is made, the value of the *`datasource.apikey`* system property is passed as the value for the *`key`* parameter. **Note:** For HTTP and HTTPS protocols, the file path is automatically URL encoded. Do not specify a URL-encoded file path when using either of these protocols.
CSV delimiter	The delimiter character for the CSV file.
Parsing script	The script used to parse a single line of input. As you type the script, script auto-complete presents the choices available to you. For more information, see File type data sources.
Sheet number	The Excel sheet number to load data.
Header row	The Excel row number to load the column labels.
Path for each row	The path expression used to select JSON objects, which will become rows in the import set table. The path should be / / for JSON objects.
Discard Arrays	Selected to discard JSON arrays as a value. Unselected to serialize JSON arrays as a value.
Expand node children	Selected if child elements of the XML node or JSON object should be converted into additional columns. Unselected if the parent column value should be an XML or JSON fragment. For JSON, note that selecting this option expands objects only, not arrays. For nested array support, see JSON file import examples.
Data in single column	Selected to store data in a single column.
Xpath for each row	XPath expression that selects the nodes which become rows in the import table. The children of the selected nodes will become the columns in the rows.
SCP authentication method	Choice to authenticate with a username and password or with a public key. **Note:** You cannot authenticate to data sources with a public-private key pair. Use a username and password authentication instead.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Server	Name of the server from which the tables will be imported.
Port	Port to use to connect to the specified server. This field appears if you select HTTP or HTTPS as the file retrieval method.
Username	User name for authentication on the JDBC server.
Password	Password for authentication on the JDBC server.
Private keyfile	Keyfile when using legacy SCP public-private keyfiles. **Note:** ○ You cannot authenticate to data sources with a public-private key pair. Use username and password authentication instead. ○ Do not use this legacy option. Although it is available for use, it is not supported.
System keystore	Selected to validate the certificate from the FTPS server against all saved certificates. This certificate may be any type supported by the instance. If not selected, the instance uses the Java default certificate to validate the FTPS server. This field is available only for data sources with a **File retrieval method** value of **FTPS**. All FTPS file retrieval methods are supported, including Auth TLS, Auth SSL, Implicit SSL, and Implicit TLS.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Create a JDBC type data source

Create a **JDBC** type data source record to define what data an import set should import.

Before you begin
Role required: import_admin

About this task
For additional information, see JDBC type data source.

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	**JDBC**.
Use MID Server	MID Server to use to connect to this data source.
Format	Select one of the following formats: MySQL, Oracle, or SQLServer.
Instance name	Used to support dynamic port connectivity with SQL Server. To ensure connectivity, provide the instance name for a SQL Server that receives a new port number dynamically after each reboot. This field only appears when **SQLServer** is selected as a data source format.
Database name	Name of the database instance.
Database port	Port number for the database. Leave this field empty when using dynamic port connectivity with SQL Server.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Use integrated authentication	Selected to allow the JDBC connection to use the ID of the user configured for the Windows MID Server service for SQL Server authentication. For additional details, see JDBC type data source.
Username	User name for authentication on the JDBC server.
Password	Password for authentication on the JDBC server.
Server	Name of the server from which the tables will be imported.
Query	Type of query to run: **All rows from Table** or **Specific SQL**. If you select to run a SQL statement, the SQL statement field appears.
Query timeout	Number of seconds the JDBC driver will wait for a query (SELECT) to complete. Zero (0) means no timeout. If timeout is exceeded, the integration considers the JDBC result inaccessible and places it in an error state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection timeout	Number of seconds before MID Server connection cache pool closes and removes it from the pool. Zero (0) means no timeout.
Table name	Name of the table from which the data is being exported.
SQL statement	SQL statement to extract the desired data from the database.
Use last run datetime	Controls the amount of data that is retrieved from a database during an import run. If unselected, then all rows in the table specified are imported, every time. You might want to use this setting if this is a one-time import, or if all the data in the target table is new. If selected, two additional fields appear, enabling you to select a datetime value to limit imported data to delta values only.
Last run datetime	The datetime value in this field is automatically populated from the database field you select below and represents the latest value from the previous run. This value acts as a dynamic filter to restrict the number of records retrieved to those records that have changed since the data source's last runtime.
Last run database field	Field name from the source table that will be used as the filter in the next run. This value may need to be case sensitive, depending on the target database type.
Additional Database Parameters	Optional parameters to add to the end of the URL generated for this data source. Semicolon-separated list of parameters. You may need to configure the form to view this field.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Create an LDAP type data source

Create an **LDAP** type data source record to define what data an import set should import.

Before you begin
Role required: import_admin

About this task
For additional information, see LDAP type data source.

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**LDAP**.
LDAP target	Target selected from the list of your LDAP OU definitions.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Create an OIDC type data source

Create an **OIDC** type data source record to define what data an import set should import.

Before you begin
Role required: import_admin

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**OIDC**.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Format	Defaults to **-- None --** and can't be changed.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Create a REST (Integration Hub) type data source

Create a **REST (IntegrationHub)** type data source record to define what data an import set should import from a REST API.

Before you begin
Roles required: import_admin and action_designer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**REST (IntegrationHub)**.
Format	One of the following formats: Custom (Parse by Script), JSON, or XML.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. ○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Request action	Data source request action that will be invoked to get data. You can choose only published request actions. Click the link in the dialog box below to create/configure a new Data Source request action in Integration Hub. After the request action is published in Integration Hub, you can choose it as a **Request action** in the Data Source record. For more information, see Define action properties.
Support pagination	Selected to enable pagination for the request action. Pagination helps you reduce processing overhead by processing a specified number of records at a time, instead of processing all records at once.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Limit	Maximum number of records per page. For example, to process 50 records at a time, enter a **Limit** of 50.
Offset	The initial offset used for pagination. The offset is the starting record number. For example, to process 50 records at a time, starting with the first record, enter a **Limit** of 50 and an **Offset** of 0.
Parsing script	Type the script used to parse a single line of input. Three parameters are available in this function: ○ **line**: the current line to be parsed by the script ○ **lineNumber**: the line number of the current line in the entire response payload ○ **result**: output result
Path for each row	The path expression used to select JSON objects, which will become rows in the import set table. The path should be / / for JSON objects.
Discard Arrays	Selected to discard JSON arrays as a value. Unselected to serialize JSON arrays as a value.
Expand node children	Selected if child elements of the XML node or JSON object should be converted into additional columns. Unselected if the parent column value should be an XML or JSON fragment. For JSON, note that selecting this option expands objects only, not arrays. For nested array support, see JSON file import examples.
Data in single column	Selected to store data in a single column.
Xpath for each row	XPath expression that selects the nodes which become rows in the import table. The children of the selected nodes will become the columns in the rows.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Define action properties

Create and configure a Data Source request action in Integration Hub. After the request action is published in Integration Hub, you can choose it as a **Request action** in the Data Source record.

Before you begin
Role required: import_admin

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Select **New**.
3. Select a **Type** of **REST (IntegrationHub)**.
4. Click the link under **Request action**.
5. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name of the request action.
Accessible From	Scope from which the request action is accessible.
Category	Category of the request action.
Protection	Specifies whether the request action is read-only.
Description	Description of the request action.
Application	Scope of the application.
In-Flow Annotation	Text you want to appear under the **Action** title on the Data Source Request Action page.

6. Click **Submit**.
7. The Data Source Request Action page appears with the following fields:

Field	Description
Limit	Limit set by the user in the REST (IntegrationHub) data source record. If the REST API supports pagination and **Support pagination** is selected in the Data Source record, you must supply this input to your REST step.
Offset	Offset set by user in the REST (IntegrationHub) data source record. If the REST API supports pagination and **Support pagination** is selected in the Data Source record, you must supply this input to your REST step.
Last Success Import Time	Last time data was successfully imported. A numeric value representing the number of milliseconds since January 1, 1970, 00:00:00 GMT. The data source populates this value. If the REST API supports queries based on time, you must supply this input to your REST step.
Import Start Time	Time the import is actually started. A numeric value representing the number of milliseconds since January 1, 1970, 00:00:00 GMT. The data source populates this value. If the REST API supports queries based on time, you must supply this input to your REST step.

8. If desired, you can add a Script step to validate or modify action inputs, set default values, or build request payloads before executing the REST step.
   a. Select **Data Source Request** from the Action Outline.
   b. Select **Enable Processing Script**.
   c. Select **Script step** from the Action Outline.
   d. Configure the Script step as described in Script step.
9. Select **REST step** from the Action Outline.
10. Configure the REST step as described in REST step.
11. Choose from the following:
    - Click **Properties** to return to the Action Properties window.
    - Click **Test** to test the request action before publishing it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Click **Executions** to view the history of executions of the request action.
- Click **Save** to save the request action.
- Click **Publish** to publish the request action and make it available for use.

Create a Custom (Load by Script) type data source

Create a **Custom (Load by Script)** type data source record to define what data an import set should import.

Before you begin
Role required: import_admin

About this task
For additional information, see Custom (Load by Script) type data source.

Procedure
1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	**Custom (Load by Script)**.
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. ○ For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. ○ For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) ○ For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Enable parallel loading	Option to use parallel data loading.
Parallel loading script	Script used for parallel data loading. Appears only when **Enable parallel loading** is selected. For more information, see Custom (Load by Script) type data source.
Data Loader	Script used to load data. For more information, see Custom (Load by Script) type data source.

4. Click **Submit**.

What to do next
Define a transform map for the new data source and run an import.

Data source fields

In addition to common fields, other fields appear on the data source form, depending on the value of the **Type** field.

Common data source fields

These fields are common to all data sources.

Field	Description
Name	A unique name for this data source.
Import set table label	A label for the import set staging table to use.
Import set table name	The ServiceNow AI Platform uses the label you entered to construct a unique table name. This prevents namespace collision with an already existing table.
Type	The type of data you are importing: • From a remote **File** • From a **JDBC** database • Using **LDAP** • Using **OIDC** • Using **REST** to import data through the Integration Hub • From a **Data Stream** action through the Integration Hub • Using a **Custom** script

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use Batch Import	If selected, specifies that loading data should be batched when you click **Load data** or **Test load 20 records**.
Batch Size	Specifies how big the batches should be. Appears only when the **Use Batch Import** field is selected. The *glide.import_set_load_usebatch* and *glide.import_set_load_batch_size* properties affects these fields. The priority order for the properties and fields are as follows: If the property is set, use the property value. If not, use the field value. If neither property is set, use the default batch size of 1000. • For example, if *glide.import_set_load_usebatch* = **true** and *glide.import_set_load_batch_size* = **200**, use 200 as the batch size, regardless of the field values. • For example, if *glide.import_set_load_usebatch* = **true** and the *glide.import_set_load_batch_size* property is not set, use the default batch size of 1000. • For example, if the *glide.import_set_load_usebatch* property is not set and the **Use Batch Import** field = **true**, use the **Batch Size** field value (or the default of 1000 if the **Batch Size** field value is not set) • For example, if the *glide.import_set_load_usebatch* property = false and the **Use Batch Import** field = true, do not use batch import, since the property is set to false.
Application	Application scope for this record.

File type data source fields

These additional fields appear on the data source form when the **Type** field value is **File**.

Field	Description
Format	Only the default XML-based file format (.xlsx) is supported, unless saved as "Strict Open XML Document."
Zipped	Selected if the import file is compressed.
File retrieval method	The retrieval method for this file.
File path	The path to the file to import. You can include a system property value in this field using the format `${system.property.name}`. When the connection is made, the variable is replaced with the value of the specified property. **Note:** For files retrieved using HTTP or HTTPS, the *glide.ds.file.http.variable_replacement* property must be true to use system property expansion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, you can specify the **File path** value `/countries.csv?key=${datasource.apikey}`. When the connection is made, the value of the *`datasource.apikey`* system property is passed as the value for the *`key`* parameter. **Note:** For HTTP and HTTPS protocols, the file path is automatically URL encoded. Do not specify a URL-encoded file path when using either of these protocols.
CSV delimiter	The delimiter character for the CSV file.
Parsing script	The script used to parse a single line of input. As you type the script, script auto-complete presents the choices available to you. For more information, see File type data sources.
Sheet number	The Excel sheet number to load data.
Header row	The Excel row number to load the column labels.
Path for each row	The path expression used to select JSON objects, which will become rows in the import set table. The path should be `//` for JSON objects.
Discard Arrays	Selected to discard JSON arrays as a value. Unselected to serialize JSON arrays as a value.
Expand node children	Selected if child elements of the XML node or JSON object should be converted into additional columns. Unselected if the parent column value should be an XML or JSON fragment. For JSON, note that selecting this option expands objects only, not arrays. For nested array support, see JSON file import examples.
Data in single column	Selected to store data in a single column.
Xpath for each row	XPath expression that selects the nodes which become rows in the import table. The children of the selected nodes will become the columns in the rows.
SCP authentication method	Choice to authenticate with a username and password or with a public key. **Note:** You cannot authenticate to data sources with a public-private key pair. Use a username and password authentication instead.
Server	Name of the server from which the tables will be imported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Port	Port to use to connect to the specified server. This field appears if you select HTTP or HTTPS as the file retrieval method.
Username	User name for authentication on the JDBC server.
Password	Password for authentication on the JDBC server.
Private keyfile	Keyfile when using legacy SCP public-private keyfiles. **Note:** • You cannot authenticate to data sources with a public-private key pair. Use username and password authentication instead. • Do not use this legacy option. Although it is available for use, it is not supported.
System keystore	Selected to validate the certificate from the FTPS server against all saved certificates. This certificate may be any type supported by the instance. If not selected, the instance uses the Java default certificate to validate the FTPS server. This field is available only for data sources with a **File retrieval method** value of **FTPS**. All FTPS file retrieval methods are supported, including Auth TLS, Auth SSL, Implicit SSL, and Implicit TLS.

JDBC type data source fields

These additional fields appear on the data source form when the **Type** field value is **JDBC**.

Field	Description
Use MID Server	MID Server to use to connect to this data source.
Format	One of the following formats: MySQL, Oracle, or SQLServer.
Instance name	Used to support dynamic port connectivity with SQL Server. To ensure connectivity, provide the instance name for a SQL Server that receives a new port number dynamically after each reboot. This field only appears when **SQLServer** is selected as a data source format.
Database name	Name of the database instance.
Database port	Port number for the database. Leave this field empty when using dynamic port connectivity with SQL Server.
Use integrated authentication	Selected to allow the JDBC connection to use the ID of the user configured for the Windows MID Server service for SQL Server authentication. For additional details, see JDBC type data source.
Username	User name for authentication on the JDBC server.
Password	Password for authentication on the JDBC server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Server	Name of the server from which the tables will be imported.
Query	Type of query to run: **All rows from Table** or **Specific SQL**. If you select to run a SQL statement, the SQL statement field appears.
Query timeout	Number of seconds the JDBC driver will wait for a query (SELECT) to complete. Zero (0) means no timeout. If timeout is exceeded, the integration considers the JDBC result inaccessible and places it in an error state.
Connection timeout	Number of seconds before MID Server connection cache pool closes and removes it from the pool. Zero (0) means no timeout.
Table name	Name of the table from which the data is being exported.
SQL statement	SQL statement to extract the desired data from the database.
Use last run datetime	Controls the amount of data that is retrieved from a database during an import run. If unselected, then all rows in the table specified are imported, every time. You might want to use this setting if this is a one-time import, or if all the data in the target table is new. If selected, two additional fields appear, enabling you to select a datetime value to limit imported data to delta values only.
Last run datetime	The datetime value in this field is automatically populated from the database field you select below and represents the latest value from the previous run. This value acts as a dynamic filter to restrict the number of records retrieved to those records that have changed since the data source's last runtime.
Last run database field	Field name from the source table that will be used as the filter in the next run. This value may need to be case sensitive, depending on the target database type.
Additional Database Parameters	Optional parameters to add to the end of the URL generated for this data source. Semicolon-separated list of parameters. You may need to configure the form to view this field.

LDAP type data source field

This additional field appears on the data source form when the **Type** field value is **LDAP**.

Field	Description
LDAP target	Target selected from the list of your LDAP OU definitions.

OIDC type data source field

This additional field appears on the data source form when the **Type** field value is **OIDC**.

Field	Description
Format	Defaults to **-- None --** and can't be changed.

REST (Integration Hub) type data source fields

These additional fields appear on the data source form when the **Type** field value is **REST (IntegrationHub)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Format	One of the following formats: Custom (Parse by Script), JSON, or XML.
Request action	Data source request action that will be invoked to get data. You can choose only published request actions. Click the link in the dialog box below to create/configure a new Data Source request action in Integration Hub. After the request action is published in Integration Hub, you can choose it as a **Request action** in the Data Source record. For more information, see Define action properties.
Support pagination	Selected to enable pagination for the request action. Pagination helps you reduce processing overhead by processing a specified number of records at a time, instead of processing all records at once.
Limit	Maximum number of records per page. For example, to process 50 records at a time, enter a **Limit** of 50.
Offset	The initial offset used for pagination. The offset is the starting record number. For example, to process 50 records at a time, starting with the first record, enter a **Limit** of 50 and an **Offset** of 0.
Parsing script	The script used to parse a single line of input. As you type the script, script auto-complete presents the choices available to you. For more information, see File type data sources.
Path for each row	The path expression used to select JSON objects, which will become rows in the import set table. The path should be / / for JSON objects.
Discard Arrays	Selected to discard JSON arrays as a value. Unselected to serialize JSON arrays as a value.
Expand node children	Selected if child elements of the XML node or JSON object should be converted into additional columns. Unselected if the parent column value should be an XML or JSON fragment. For JSON, note that selecting this option expands objects only, not arrays. For nested array support, see JSON file import examples.
Data in single column	Selected to store data in a single column.
Xpath for each row	XPath expression that selects the nodes which become rows in the import table. The children of the selected nodes will become the columns in the rows.

Data Stream (Integration Hub) type data source fields

These additional fields appear on the data source form when the **Type** field value is **Data Stream (IntegrationHub)**.

Field	Description
Type	Data Stream (Integration Hub) type data source.
Data Stream action	• Selected to use an existing published Data Stream action from Integration Hub. • Selected for one of the following reasons:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ If you select a published Data Stream action, click this button to open the Data Stream action in Integration Hub. ○ If you don't select a Data Stream action, click this button to create and publish a new Data Stream action in Integration Hub. **Note:** Data Stream actions require a subscription for production use.
Connection	Specify the connection alias for the Data Stream action. You can use the default parent alias or select any of its children's aliases. Available child aliases are listed in the menu. This field is only available when the Data Stream action is configured to use a connection alias. For more information, see Create a Connection and Credential alias.
Data in single column	Selected to store data in a single column.
Data Stream action inputs	Additional fields may appear, based on the inputs defined in the **Data Stream action**.

Custom (Load by Script) type data source field

This additional field appears on the data source form when the **Type** field value is **Custom (Load by Script)**.

Field	Description
Data Loader	Script used to load data. For more information, see Custom (Load by Script) type data source

Create a transform map

Every import operation to a production table requires at least one transform map associated with an import set.

Before you begin

Role required: import_transformer, import_admin, or admin

About this task

The transform map specifies the data relationships between the import set and the target table. For every transformation, you must either create a new transform map or select an existing one.

Procedure

1. Navigate to **All** > **System Import Sets** > **Create Transform Map**.
2. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table transform map fields

Field	Description
Name	User-friendly label to identify the transform map.
Source table	Import table containing the raw import set data. An import table is any table that extends the Import Set Row `[sys_import_set_row]` table. You can select only tables within the currently selected application scope.
Active	Check box to make the transform map available for use.
Run business rules	Check box to run business rules, workflows, approval engines, auditing, and field normalization while the transformation inserts or updates data into the target table. Clearing this check box runs GlideRecord.setWorkflow() with a value of **false**.
Enforce mandatory fields	Selects whether to enforce mandatory fields on the target table: ○ **No**: Do not enforce mandatory fields. ○ **Only Mapped Fields**: Enforce mandatory mapped fields only. ○ **All Fields**: Enforce all mandatory fields.
Copy empty fields	Check box to copy empty field values and override existing target field values.
Create new record on empty coalesce fields	Check box to create a new record when all coalesce fields are empty, instead of ignoring the record or overwriting an existing record. If **Coalesce empty fields** is selected for any field in the record, the record is coalesced.
Application	Application scope: global or per application.
Created	Transform map creation date (populated automatically).
Target table	The table in which you want the transformed data to be inserted. You can select only tables within the currently selected application scope or the global scope, or tables that grant write access to other applications.
Order	Order in which to apply transform maps if more than one map fits the conditions. The system runs transform maps from lowest to highest **Order**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use Secondary Storage for References	Option to use a secondary database to look up reference fields. Importing a high volume of data that includes many reference fields might cause performance issues. Using secondary storage enables some read queries to be redirected to a secondary database, reducing the load on the primary database. When using secondary storage, set the **Choice action** field in the field map to **ignore** or **reject**. Setting the **Choice action** to **create** may cause multiple copies of a record to be created because the reference resolution doesn't detect newly created records immediately. For more information, see Create a field map. A secondary database is always slightly out of date compared to the primary database. If your import requires completely up-to-date data, don't use secondary storage. This field appears only when the Secondary Database Pools [com.glide.secondary_db_pools] plugin has been activated, and the import_reference_resoultion secondary database category has been configured and enabled. For more information, see Large data imports with many reference fields.
Run script	Check box to define a script that transforms field values in the source table to the target table.
Script	Transform map script that transforms field values in the source table to the target table. The system runs the transform map script in addition to any field maps.

Important:
The string `NULL` is a reserved word. It should not be used as a field value in import set transform maps or anywhere in the **First name** or **Last name** fields. The reserved word is `NULL` in all capital letters. A field with the value `Null` or `null`, for example, is acceptable. `NULL` should be used only to clear out a particular field.

Mapping options

You can map fields in a number of ways depending on the circumstances of the import and whether data must be transformed prior to loading onto a production table.

It is also important to note that any given import operation may require taking advantage of multiple mapping methods, and these methods can be readily used in conjunction with one another.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

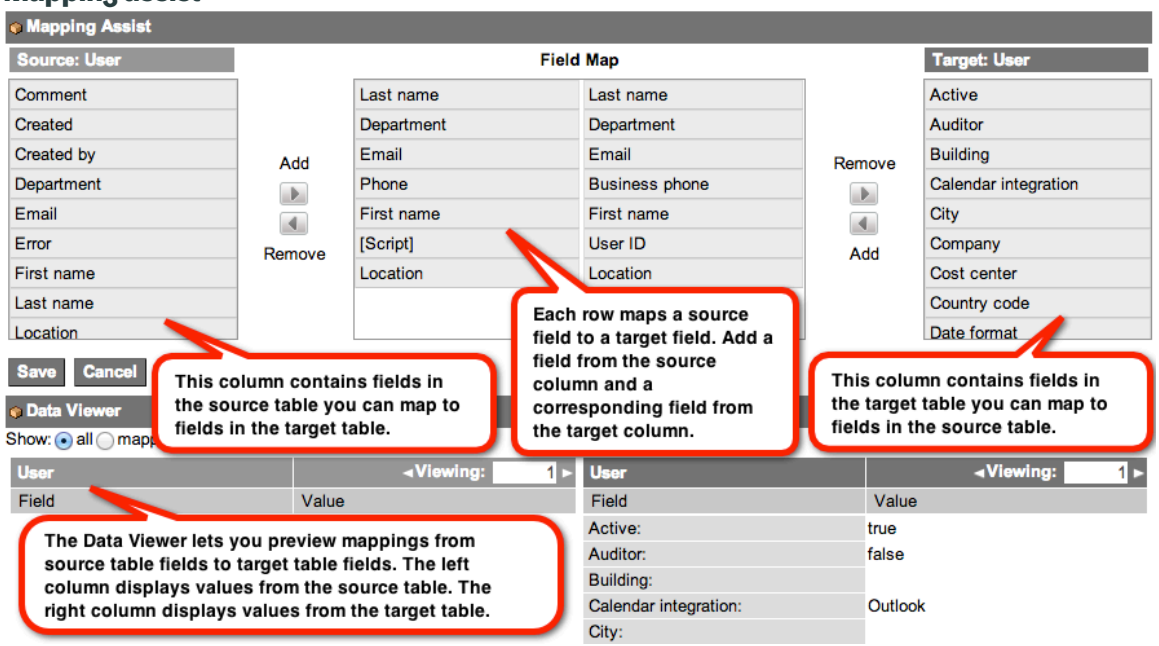
Automatic Mapping Utility

The simplest mapping method is where all of the field names of the import sets match the names of the fields on the production tables onto which the data will be transformed. In this case, simply click **Auto map matching fields** in the related list in the Table Transform Map form and confirm proper matching. If there are any discrepancies in terms of how fields were automatically matched, use the mapping assist utility to correct them. When all fields are matched properly, click the **Transform** related link to begin transforming data onto the destination table.

Mapping Assist Utility

The mapping assist utility provides a visually intuitive environment for specifying mapping between import set fields and production table fields. The mapping assist utility makes it possible to map a single source field (field on an import set table) to multiple destination fields (fields on a production table).

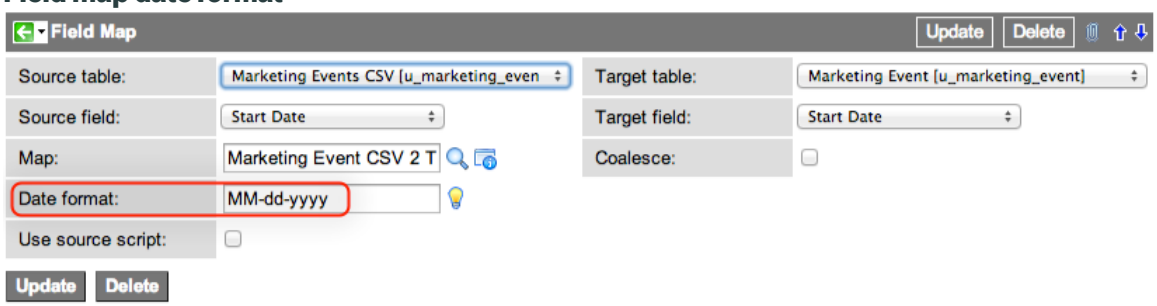
Mapping assist



Changing the Date Format

If the date format of the source field does not match the format of the target field, you can set a date format mapping to transform dates from one format to another. For example, this mapping specifies that the date format of the CSV source file uses the **MM-dd-yyyy** format.

Field map date format



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field map date format options

Label
dd-MM-yyyy
dd-MM-yyyy hh:mm:ss
dd-MM-yyyy hh:mm:ss z
MM-dd-yyyy
MM-dd-yyyy hh:mm:ss
MM-dd-yyyy hh:mm:ss z
yyyy-dd-MM
yyyy-MM-dd
yyyy-MM-dd hh:mm:ss

Date format options include:

Mapping Options

Date Format	Description
dd-MM-yyyy	Day-month-year
dd-MM-yyyy hh:mm:ss	Day-month-year hours-minutes-seconds
dd-MM-yyyy hh:mm:ss z	Day-month-year hours-minutes-seconds timezone
MM-dd-yyyy	Month-day-year
MM-dd-yyyy hh:mm:ss	Month-day-year hours-minutes-seconds
MM-dd-yyyy hh:mm:ss z	Month-day-year hours-minutes-seconds timezone
yyyy-dd-MM	Year-day-month
yyyy-MM-dd	Year-month-day
yyyy-MM-dd hh:mm:ss	Year-month-day hours-minutes-seconds

To denote 24 hour time format, specify a custom date format using **HH:mm:ss** instead of hh:mm:ss.

Note:

Converting from a 24-hour to 12-hour date format might cause times from 12:00 to 23:59 to be formatted as 00:00 to 11:59.

Mapping to a Duration Field

ServiceNow duration fields use a special data type that lists the number of milliseconds the duration value is. To map import data to a duration field use one of the following methods to transform source values into a duration.

- Calculate the duration from a start and end date
- Convert an existing duration value into a ServiceNow duration value

Calculating a Duration Value from a Start and End Date

If the import source has a start and end date, you can calculate a duration with JavaScript.

1. Navigate to **System Import Sets** > **Transform Maps**.
2. Select the transform map you want to calculate a duration value. For example, the Notification transform map that imports into the Incident table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Run script** check box.
4. Enter JavaScript to transform the start and end dates into a duration. See the sample script.
5. Click **Update**.

This sample script transforms the source.u_start and source.u_end fields to a duration value in the target.duration field. Change the field names to match your source and target fields as needed.

```
target.duration = gs.dateDiff(source.u_start.getDisplayValue(),
 source.u_end.getDisplayValue(), false);
```

Convert a Duration Value into a ServiceNow Duration Value

If the import source already contains a start date and a duration value, you can convert the existing duration into a ServiceNow duration. For example, you might have an Excel data source that lists a duration in seconds. ServiceNow expects durations to have millisecond values.

1. Navigate to **System Import Sets** > **Transform Maps**.
2. Select a transform map.

   For example, the Notification transform map that imports into the Incident table.
3. Select the **Run script** check box.
4. Enter JavaScript to convert existing duration values into a ServiceNow duration values. See the sample script.
5. Click **Update**.

This sample script converts a duration in seconds (from the *source.u_duration* field) to a duration in milliseconds (in the *target.duration* field). Change the field names to match your source and target fields, as needed.

```
//Transform the value in source.u_duration from seconds to
 milliseconds
target.duration.setDateNumericValue(source.u_duration * 1000);
```

This sample script converts a duration already in milliseconds (from the *source.u_duration* field) to a ServiceNow duration (in the *target.duration* field). Change the field names to match your source and target fields, as needed.

```
//Transform the value in source.u_duration to ServiceNow format
target.duration.setDateNumericValue(source.u_duration);
```

Using a Script to Calculate a Source Value

You may want to use a source script instead of the **Source field** when:

- The source value is not in the format for the mapped target value.
- You want to look up a value before mapping to the target field.
- The source value must be computed from multiple fields.
- You need to create a compounded or calculated coalesce value in the target field.

For example, this example source script computes the value of the user_name field when it is blank in the source.

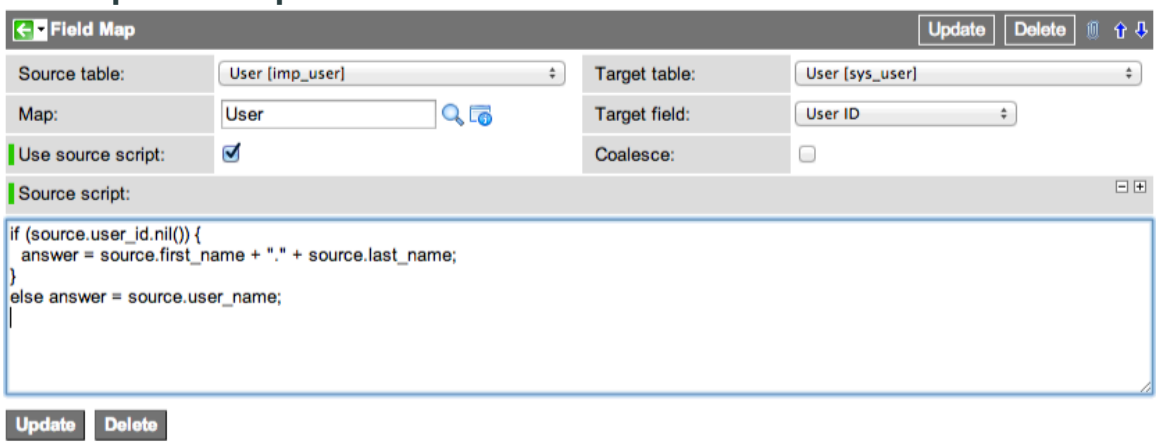
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field map source script



A source script expects the calculated value to be set in the global variable `answer`.

Mapping Binary or BLOB Fields

ServiceNow uses a special process to import binary and binary large object (BLOB) data from JDBC data sources. All binary data is automatically converted into a record in the Attachment [sys_attachment] table before the transformation occurs. The import set table only stores the attachment record's sys_id value in the import table field instead of the actual binary value. For example, suppose you use a JDBC data source to import data from a CA Service Desk system, which stores each record's key value as binary data. When you import the Service Desk key values into a ServiceNow table, the ServiceNow field only contains a sys_id reference to the corresponding binary data in the Attachment Record [sys_attachment] table rather than the actual binary data.

To have a transform map access the attachment, use the *`GlideRecord`* API in an `onAfter` script. The script needs to run in an `onAfter` event because the `target.sys_id` object is only available after the data is placed in the import set table. For example, to map the resulting attachment to the target transform record, you can use the following script.

```
var agr = new GlideRecord("sys_attachment");
  agr.addQuery("sys_id", source.u_blob_field);
  // the source field needs to be mapped to the source that is
 the BLOB
  agr.query();
   if(agr.next()) {
    agr.table_name = "cmdb_ci"; // the target table of the
 transform map
    agr.table_sys_id = target.sys_id; // the target record
    agr.content_type = source.u_contentype;
    // the content type string if available,
    // this becomes the mime encoding when clicking an
 attachment link
    agr.update(); // finally, move/re-attach the attachment to
 the target row }
```

If you are mapping directly to the `db_image` table, run the following `onAfter` script to display the image:

```
var strTemp = source.u_file_name;
var fType = strTemp.substr(- 3);
var iCont = "" ;

 if(fType == 'jpg') {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 iCont = 'jpeg' ; }
else {
 iCont = fType; }

var agr = new GlideRecord("sys_attachment");
agr.addQuery("sys_id", source.u_blob_field);
agr.query();

if(agr.next()) {
 agr.table_name = "ZZ_YYdb_image";
 agr.table_sys_id = target.sys_id;
 agr.content_type = 'image/' + iCont;
 agr.file_name = 'image';
 agr.update(); }
```

Create a field map

Field maps establish a relationship between a field in an import set table and a field in the target table.

Before you begin

Role required: import_transformer, import_admin, or admin

About this task

The field map determines what values from the source table the transformation adds to the target table.

Procedure

1. Navigate to **All** > **System Import Sets** > **Transform Maps**.
2. Open a transform map.
3. In the **Field Maps** related list, click **New**.
4. Complete the form.

Field map fields

Field	Description
Map	Transform map that uses this field mapping (populated automatically).
Source table	Table from which the raw import set data is loaded (the source for the transformation). Populated automatically from the transform map.
Source field	Field on the source table to be transformed. Can be blank if the **Source table** contains only raw data.
Choice action	Specifies the action to take if the import set contains a reference or choice value other than those available. Appears if the target field is a choice list or reference field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **create**: Create a new choice or record in the reference table. ○ **ignore**: Ignore the new value from the source table. ○ **reject**: Skip the entire row (record) containing the new value and continue to the next row.
Date format	Date format of the source field. Appears if the target field is a Date or Date/Time field. **Note:** To learn more about allowable date formats, see Global date and time field format.
Use source script	Check box to use a script instead of the **Source field**.
Application	Application scope: global or per application.
Target table	Table in which the transformed data is inserted. You can select only tables within the currently selected application scope or the global scope, or tables that grant write access to other applications.
Target field	Field in the target table where the value from the source field is stored.
Referenced field value name	When the target field is a reference field, the transform map needs a way to match incoming source values to existing records in the reference field's source table. Since most imports do not provide a 32-character sys_id value, you must specify a column from the reference field's source table that contains values that match the incoming source values. When there is a matching record, the transform map stores the sys_id of the matching record in the target field. If there is no matching record, the transform map creates a new record in the reference field's table and stores the sys_id of the new record in the target field. If you leave this field blank, the transform map looks for matching values from the display value column of the reference field table. For example, suppose you are importing incident records and the incoming data lists user IDs for the **Assigned to** field. If you leave

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Referenced value field name blank, the transform map searches for matching values in the User table's display value column: name. By setting the **Referenced value field name** to the user_name column, you can match the user ID values to the appropriate user records.
Coalesce	Configuring a target field to coalesce causes the import set to treat the field as a unique key. When selected, the import set application attempts to match source values to records with values from an existing record. If a match is found, the transform map updates the record instead of creating a new record. When false, the import set application always creates new records for each transformation. If multiple fields are set to coalesce, all coalesce values must match an existing record. If two fields are set for coalescing and a matching value is found for one of the coalescing fields but not on the other, a new record is inserted. You must create an index on the target table if none of the coalesce fields are indexed. Indexing can improve performance for read and write operations. If one or more coalesce fields already has an index, you do not need to create an additional index. After setting the **Coalesce** value for all fields on the target table, use the **Index Coalesce Fields** related link to create an index. Before creating the index, ensure that the **Coalesce** value is set correctly for all fields on the target table to avoid creating unnecessary indexes for the same target table. The index needs to be concatenated; meaning all fields specified to be coalesced, need to be in the same index. The correct setup is for one index to include all fields being coalesced.
Coalesce empty fields	Check box to match an empty source field value to an empty target field value. For example, the User transform map coalesces on the email field. With this option selected, a source record containing an empty email address coalesces to a target record containing an empty email address.
Coalesce case sensitive	Check box to make case-sensitive coalesce values result in the creation of new records. By default, values marked as **Coalesce** are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	used in a case-insensitive lookup for existing records. Case-insensitive records update existing records only and do not cause the creation of new records.

5. Click **Save**.
6. Repeat steps 3-5 for each field mapping.
7. Click **Update**.

Field map script variables

Several predefined variables are available in the **Source script** field.

Variable	Type	Description
source	GlideRecord	The record from the source table that is currently being processed.
target	GlideRecord	The record from the target table that is currently being processed.
answer	String	The field value to set in the target record.
map	GlideTransformMap	Read-only information about the current transform map record.
log	Function	The log object for the current import run. Use this object to log messages such as `log.info("<Message>")` or `log.warn("<Message>")`. This object logs to the import log for standard import sets, or other log locations as required, such as for web service imports.
action	String	Contains either the value **insert** or **update**, depending on whether the current target row will be created or updated. **Note:** The *action* variable is available only when the **Coalesce** field is **false**.

Run an import

You can manually run an import to immediately import data.

Before you begin

Role required: admin

Procedure

1. From a Transform Map, click **Transform**.

   When the import completes, you see a link to go to the target table containing your imported records. The amount of time that it takes to run an import varies depending on the number of records you import. It might take as long as several hours for very large import operations (tens of thousands of records).

2. **Optional:** Click **View the imported data** to see the loaded import set table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** Click **Create transform map** to create a new transform map to transform the data in the import set table to its target table.
4. **Optional:** Click **Run import** to execute an existing transform map for the loaded data.

Result

Three things to note at this point:

- The spreadsheet is imported, and a new table is created to hold the data.
- Within that table, the imported records are designated with their own Set value.
- A new module is created in the System Import Sets application for the new table.

Importing date/time values

Considerations when importing data containing date/time values.

- The field containing the date/time value should be a Date/Time type field in the target table.
- The user performing the import should have their timezone (in the **Time zone** [time_zone] field in the User [sys_user] record for that user) set to match the timezone of the date/time values in the import file.

  To set the user timezone, do the following.

  1. Click the user drop-down in the banner and select **Profile**.
  2. Change the **Time zone** field value to the timezone of the date/time values in the import file and click **Update**.

Review the import set

After an import set completes, you can review the completed import and clean up import set tables. Even if no errors are reported by the progress indicator, review how your data is imported into the new import set.

Before you begin

Role required: admin.

Procedure

1. Click **View imported data**.

   There are several fields that are visible in the table that were not part of the original data source, these are system rows that can be used to facilitate scripted import operations.

2. Review the data.
3. Return to the previous page.

What to do next

Create a transform map to associate with this import set.

Viewing the import log

The import log is where you can find information about the internal processing that occurs during an import operation.

The log includes information generated by the system during every step of the import operation from initialization of the import set table from a data source to transformation onto a target table. It is also possible to customize log output during the transformation by using log.info, log.warn, log.error statements.

Import run history

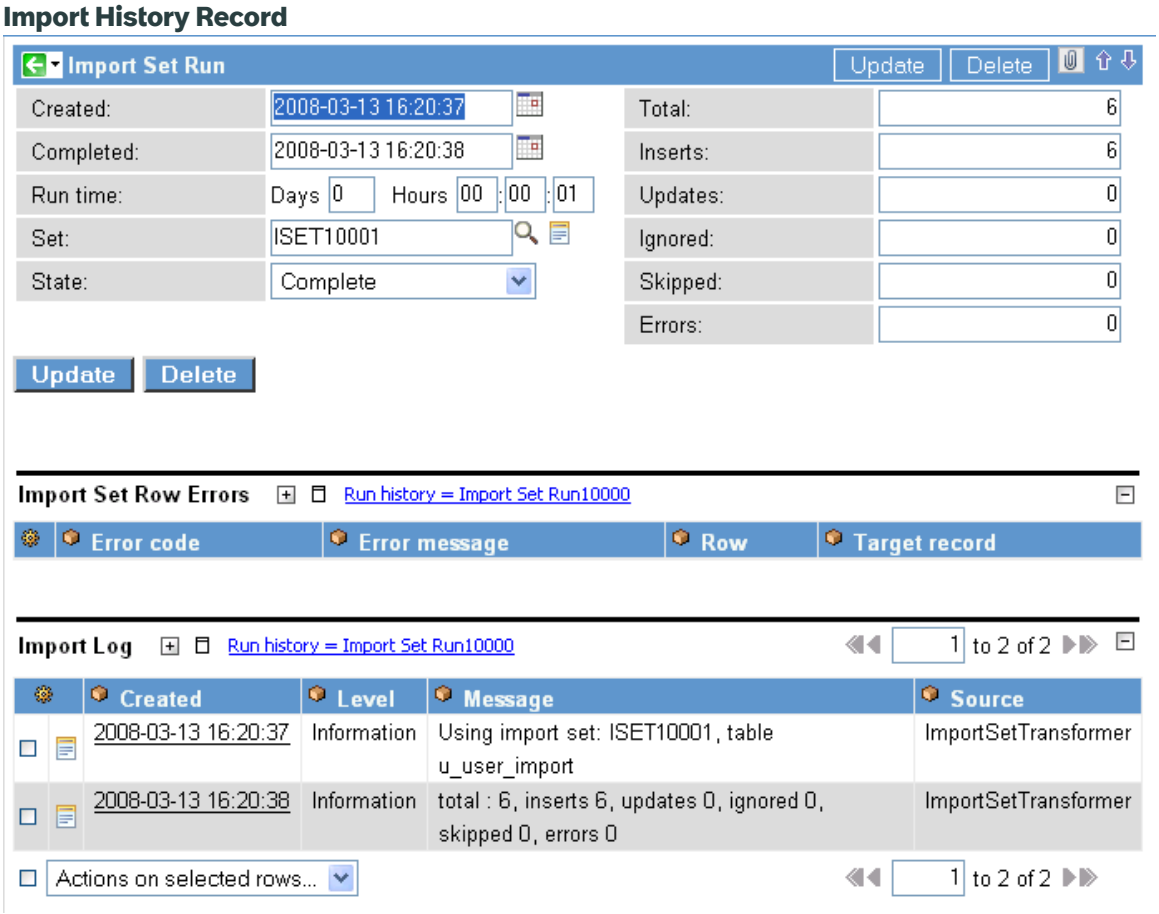
The import history gives status information about individual import operations.

Note:
Functionality described here requires the **Admin** role.

Run import utility

The Run Import utility is used to run an import operation using an existing Transform Map and Import Set table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Error Codes are related to a transformation. Not all errors produce error codes. If an error code does exist, it is in the [sys_import_set_row_error] table error code field.

Error Codes

- **100** Reference field value rejected.
- **200** Choice field value rejected.
- **300** List reference field rejected.
- **800** Invalid target record or field.
- **900** Transform script error.

Schedule a data import

Schedule imports to make it possible to specify that certain import operations occur at a regular interval.

Before you begin

Role required: import_scheduler, import_admin, or admin

Warning:

Giving the user the import_scheduler role is equivalent to giving the user the admin role, because the import_scheduler has the ability to execute scripts with administrator level privileges.

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Scheduled Imports**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Scheduled Data Import form

Field	Description
Name	Name for the scheduled data import.
Data source	Data source record that defines the data to import. If you select a remote data source, it refreshes using the remote connection before the import be The transform map or robust transformer used for the data import is connected to the selected d source. You can view the transform map or robust transformer by opening the data source record viewing the Transforms and Robust Transformer tabs.
Run as	Name of a user whose credentials the import job uses. If you do not specify a value, the import jo runs as the guest user.
Active	Option to activate the scheduled import.
Use connection	Option to specify the connection alias for the scheduled import. This option is available for Data Sources configured to use a connection alias.
Connection	Connection to use for the scheduled import. Select the default parent alias or any of its children's aliases. This field is available when **Use connection** is checked. The sys_id for the selected connection alias is stored in the Glide session. It can be accessed in the script for the custom data source or in any transform script using the code `gs.getSession().getClientData('connection_credential_alias_overri`
Run	Frequency at which you want to run the import.
Day	Day on which to run the import. Visible only if you select *Weekly* or **Monthly** from the Run list.
Time	Time that you want the import to begin. Do not schedule multiple imports at the same time. Runni multiple imports at the same time might negatively impact performance or cause an instance out
Repeat interval	Period that must elapse before the import repeats. Visible only if you set **Run** to *Periodically*.
Starting	Date on which the import should begin (selected using the select date and time icon ( ). Vis only if you set **Run** to *Periodically*.
Parent	The parent import set to which this import set belongs, and after which this import should run. Vis only if you set **Run** to *After Parent Runs*.
Conditional	Option to specify a script that defines the conditions that must evaluate to *true* before the import runs.
Condition	Script that evaluates whether an import should run. Visible only if you select **Conditional**.
Concurrent Import	Option to run a concurrent import. A concurrent import splits the data into multiple import sets ar runs the import sets concurrently to reduce processing time for large data sets. **Note:** A concurrent import does not transform data in a predictable order. If order matters, do not ru concurrent import. For more information, see Concurrent imports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Partition Method	Method used to allocate each data set record to an import set: ○ **Round Robin**: The system sets partitions automatically. Assume that there are 20 records and 4 import sets. The system allocates record 1 to import se 1, record 2 to import set 2, record 3 to import set 3, and record 4 to import set 4. The system the allocates record 5 to import set 1, record 6 to import set 2, record 7 to import set 3, and record 8 import set 4. This pattern continues until all records are assigned to import sets. When the allocation finishes, import set 1 contains records 1, 5, 9, 13, 17. Import set 2 contains records 2, 6, 10, 14, 18. Import set 3 contains records 3, 7, 11, 15, and 19. Import set 4 contains records 4, 8, 12, 16, and 20. ○ **Custom Script**: Sets the partitions with a **Partition Script** that you provide. ○ **Custom size**: Sets the partition size to the **Partition Size** specified. After the system processes the first partition, the data from that partition can be transformed, e though the other partitions have not finished processing.
Partition Script	Script used to return a partition key. The system ensures that data set rows with the same partitio key go to the same import set. Visible only if you set **Partition Method** to **Custom Script**.
Partition Size	The number of records in each partition. Visible only if you select a **Partition Method** of **Custom size**.
Execute pre-import script	Option to specify a script to run before the import happens.
Prescript	Script to run before the data imports. Visible only if you select **Execute pre-import script**.
Execute post-import script	Option to run a script after the import happens.
Post script	Script to run after the import happens. Visible only if you select **Execute post-import script**. **Note:** For concurrent imports, the script runs after the last *`Import Set Transformer`* job completes.

4. Click **Submit**.
5. To stop an import that is taking too much time, navigate to **System Import Sets** > **Advanced** > **Progress**.
   a. Open the Progress Worker that you must cancel.
   b. Click the **Cancel job** related link.
6. To display a list of executions records, click **Executions**.
7. From the Executions list, select the execution record that you want to display.

   The execution record shows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The execution number.
- The schedule import name.
- The import set name.
- The execution context number.

8. To display details about the executions, select the executions contexts record that you want to display.

Scheduled data import scripting options

Multiple JavaScript objects are available in the Scheduled Data Import **Pre script** and **Post script** fields.

Data import scripting options

Object	Description	Example
cancel	Set this object to *true* to stop the import action.	Use the **Pre script** field to evaluate the conditions of the import and determine whether to cancel the import process. To cancel the import process, use the following call: `cancel = true;`
import_set	Get the GlideRecord object for the new import set. This variable allows you to query the following columns from the sys_import_set table: • number • sys_id • state • table_name	If you want to use information from the import set, you can specify one of the properties of the import_set variable. `var x = import_set.number;`

data_source	GlideRecord of the data source to be used for the scheduled import.	Typically, you define the data source with the Scheduled Data Import record. If you want to access this data source or modify the data source in certain conditions, you can use the following.
		`data_source.import_set_table_name = 'new_set_from_scheduler';`
		`data_source.update();`

Monitor scheduled data import executions

Monitor scheduled data import executions to see the hierarchy and flow of the scheduled chained imports.

Before you begin

If after executing a scheduled concurrent data import there are indications of a problem, use the Execution Contexts to see the details necessary to diagnose the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: import_admin

About this task

The execution contexts feature enables you to identify the order of execution of concurrent import sets. You can also open the import set records to access the import log.

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Execution Contexts**.
2. In the list of execution contexts, select one record.

   The table lists:

   - The parent import scheduled data import record.
   - The execution record numbers for each scheduled import in a concurrent import.
   - All the import set records that are part of a scheduled import.
   - The scheduled import record names.
   - The date that the execution context was created. This date is when the import executed.
3. To add any of the following fields, click the personalized list icon ( ):
   - **Created by**
   - **Import Set Table**
   - **Updated**
   - **Tags**
   - **Updated by**
   - **Updates**
4. To open a record, click a record name or number.
5. To display the execution record, click the execution record number.

   The execution record shows:

   - Scheduled import name.
   - Import set table.
   - Import Set number.

   You can open the import set record from the execution record.

Monitor concurrent import sets

Monitor concurrent import sets to check the status of import sets and import set jobs, resume or reprocess import sets, and view transform history.

Before you begin

After executing a concurrent data import, use the Concurrent Import Set Jobs to verify the status.
Role required: import_admin.

About this task

When a scheduled concurrent import runs, each concurrent import creates a concurrent import set record. All related import sets, concurrent import set jobs, and transform histories are shown in the form view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Import Sets** > **Concurrent Import Set Jobs**.
2. Select the scheduled import for which you want to check the status.
3. Reprocess or continue import sets, check the status of import sets or concurrent import set jobs, view transform history, or display a list of executions records by clicking one of the following related links.

Option	Description
Reprocess	Start another scheduled import to reprocess the records.
Continue	Restart a scheduled import that is not complete.
Import Sets	State of import sets. **State** ○ **Pending** if the system has not started processing the im port set. ○ **Running** if the system is processing the import set. ○ **Processed** if the system has completed processing the im port set. ○ **Error** if the import set processing failed. Select an import set to see processing details for Import Set Runs and Import Set Rows for the import set.
Concurrent Import Set Jobs	Type and state of concurrent import set jobs: **Type** ○ **Regular** if you are running the scheduled im port for the first time. ○ **Reprocessing** if you are rerunning the sched uled import. ○ **Resuming** if you are resuming a scheduled im port that had an error. **State** ○ **Pending** if the system has not started process ing the import set. ○ **Running** if the system is processing the import set. ○ **Completed** if the system has completed pro cessing the import set. ○ **Error** if the import set processing failed. Select an import set job to see processing details for Import Set Runs and Import Set Rows for the import set job.
Transform Histories	Check statistics in the transform histories for the scheduled import.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Select a start time to see Import Set Row Errors (including er ror codes and messages) and the Import Log for the sched uled import.
Executions	Executions contexts ○ The parent import scheduled data import record. ○ The execution record numbers for each scheduled import in a concurrent import. ○ Import set records that are part of a scheduled import. ○ The scheduled import record names. ○ The date that the execution context was created.

Monitor concurrent import set jobs

Check the status of concurrent import set jobs.

Before you begin

Role required: import_admin

Procedure

1. Navigate to **All** > **System Import Sets** > **Concurrent Import Set Jobs**.
2. Review the **Type** and **State** of each parent import set job.

Option	Description
Type	Type of concurrent import set job: ○ **Regular** if you are running the scheduled import for the first time ○ **Reprocessing** if you are rerunning the scheduled import ○ **Resuming** if you are resuming a scheduled import that had an error
State	Status of the import set job: ○ **Pending** if import processing has not started ○ **Running** when import processing has started ○ **Completed** when import processing has finished ○ **Error** if import processing did not finish successfully

3. Select a parent import set job to review the **Type** and **State** of each of its child import set jobs.

Post CSV or Excel files directly to an import set

An administrator can post CSV or Excel files directly to instance.

Before you begin

Role required: import_set_loader

About this task

The `sys_import.do` target lets you dynamically upload a CSV or Excel file into the import set table specified by the *`sysparm_import_set_tablename`* parameter. You must specify a name that matches an existing import set table name. If the import set table does not exist, pre-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

create it by performing a manual import. The *sysparm_transform_after_load=true* parameter causes the CSV transform to be executed immediately, if a transform map exists.

You can upload a file using POST to the following URL (replace placeholders with desired values):

```
https://<instance>.service-now.com/sys_import.do?sysparm_import_
set_tablename=<table_name>&sysparm_transform_after_load=<true>
```

Important:
The body of the POST must contain the file as a multi-part attachment.

Posting a CSV file - Perl and Java examples

An example using Perl to post a CSV file with basic auth credentials and Java Apache HttpClient class to post a CSV file with basic auth credentials.

For more information, see Post CSV or Excel files directly to an import set.

Perl example

```
# file: uploadafile.pl
# call me like this:
# uploadafile.pl
 --url="https://
instance.service-now.com/sys_import.do?sysparm_import_set_tablen
ame=dloo_test&sysparm_transform_after_load=true"
# --uploadfile=/Users/davidloo/Desktop/test_files/test_users.csv
#
# the "sysparm_transform_after_load=true" parameter instructs
 the import set to transform immediately after loading
#
use strict;
use LWP::UserAgent;
use HTTP::Request::Common;
use Getopt::Long;
use File::Basename;

my ( $o_url, $o_fqn );
GetOptions(
    "url=s"        => \$o_url,
    "uploadfile=s" => \$o_fqn,
);

# mandatory arguments: url
&usage unless ( $o_url && $o_fqn );

my $url   = $o_url;
my $fname = $o_fqn;

# put timeouts, proxy etc into the useragent if needed
my $ua  = LWP::UserAgent->new();

# setup basic authentication credentials
$ua->credentials(
  'demo.service-now.com:443',
  'Service-now',
  'admin' => 'admin'
);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
my $req = POST $url, Content_Type => 'form-data',
        Content      => [
                submit => 1,
                upfile =>  [ $fname ]
        ];
my $response = $ua->request($req);

if ($response->is_success()) {
    print "OK: ", $response->content;
} else {
    print $response->as_string;
}

exit;

sub usage {
        printf "usage: %s --url=%s --uploadfile=%s\\n",
                basename($0),'https://....','c:/data/test.csv';
        exit
}
```

Java example

Note:
The Apache HttpClient may limit the amount of data you can import in a single transaction. This example is meant as a starting point and should not be used in production.

```
HttpClient httpclient = new HttpClient();
PostMethod post = new
 PostMethod("https://
instance-name.service-now.com/sys_import.do?sysparm_import_set_t
ablename=u_test_upload&sysparm_transform_after_load=true");

try {
  Credentials defaultcreds = new
 UsernamePasswordCredentials("admin", "admin");
  httpclient.getState().setCredentials(AuthScope.ANY,
 defaultcreds); // Prepare HTTP post
  httpclient.getParams().setAuthenticationPreemptive(true);

  File targetFile = new
 File("/Users/davidloo/Desktop/test_files/nodeinfo27368201988349
83863.csv");
  Part[] parts = { new FilePart(targetFile.getName(),
 targetFile) };

  post.setRequestEntity(new MultipartRequestEntity(parts,
 post.getParams()));

  int result = httpclient.executeMethod(post);

  // Display status code
  System.out.println("Response status code: " + result);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  // Display response
  System.out.println("Response body:
 "+post.getResponseBodyAsString());
} catch(Exception e) {
  System.err.println(e.getMessage());
} finally {
  // Release current connection to the connection pool
  // once you are done
  post.releaseConnection();
}
```

Delete import sets

Delete import sets to clean up your database on a scheduled basis, one time only, or on demand.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Import Sets** > **Import Set Tables** > **Scheduled Cleanup**.
2. Fill out the form.

Field	Description
Name	Defaults to **Import Set Deleter**. You can change the name if desired.
Active	Checked if the schedule is active. Unchecked if the schedule is not active.
Application	Defaults to **Global** and can't be changed.
Conditional	Checked if the Import Set Deleter must meet specified conditions. Unchecked if the Import Set Deleter doesn't have to meet any conditions.
Run	Specifies the frequency of the Import Set Deleter: **Daily**, **Weekly**, **Monthly**, **Periodically**, **Once**, or **On Demand**.
Time zone	For scheduled job types that require an entered time, you can enter an associated time zone. If no time zone is selected, the job runs at the specified time in the time zone of the user who entered the time. If **Use System Time Zone** is selected, the job runs at the specified time in the time zone of the instance running the job.
Time	The time of day to run the Import Set Deleter.
Run this script	The script that performs the deletion. Defaults to deleting import sets and their related import set rows that were created more than seven days ago.
Day	The day of the week for weekly runs, or the day of the month for monthly runs.
Repeat Interval	The number of days in the repeat interval and up to three times of day for the repeat interval.
Starting	The starting date and time for the periodical run or the one-time run.

3. Click **Update** to update the schedule, or click **Execute Now** to run the Import Set Deleter immediately.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete import set tables

Delete import set tables, related transform maps, or data only (preserving the table structure) to clean up your database.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Import Sets** > **Import Set Tables** > **Cleanup**.
2. Move the tables you want to delete from **Available tables for deletion** to **Delete these tables**.
   Deleting any table deletes all records and removes the table.
3. Include deleting related transform maps when you delete the import set tables by selecting the **Delete related transform maps** check box.
   All records and all associated transform maps are removed.
4. Delete only data from the selected import set tables and preserve the table structure by selecting the **Delete data only (preserve table structure)** check box.
   All records are removed, but the tables remain intact.
5. Click **Cleanup**.

Import sets properties

Multiple properties control import set behavior.

Import sets properties

glide.import_set.preserve.leading.spaces

Specifies whether the import process preserves leading spaces in Excel data cells. When false, the import process removes non-breaking leading spaces from Excel data cells. When true, the import process preserves non-breaking leading spaces.

Note:
The import process always removes trailing spaces from Excel data cells.

- Type: true | false
- Default value: false
- Location: Add a system property

glide.import_set_row.dynamically_add_fields

Specifies whether an import set can add new columns to the staging table (true) or not (false). Instances that contain large numbers of import sets can sometimes become unresponsive when an import adds a column because the instance must alter every row in the staging table. In some cases, the database alter table action causes an outage. Setting this property to false prevents an import set from adding columns to the staging table and produces a log message. As a workaround, administrators can manually add a column to the staging table by creating a new dictionary entry and then reimporting the import set.

- Type: true | false
- Default value: true
- Location: Add a system property

com.glide.loader.verify_target_field_size

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enables dynamic resizing of import set fields. With the default setting of **false**, up to 20 records of the source data are sampled to determine the import set field length. If the field is empty in all the sampled records, the default length of 40 is used. Any data loaded that exceeds the import set table field length is truncated. Set this property to **true** to allow any import set field to increase the column size by 100 to match the length of the data. For example, if the incoming source data has a length of 60, the system sets the length of the column to 160. This is relevant to data source only.

- Type: true | false
- Default value: false
- Location: Add a system property

glide.ds.file.http.variable_replacement

Enables system property expansion for File-type data sources that are retrieved using HTTP or HTTPS.

- Type: true | false
- Default value: true
- Location: Add a system property
- More information: Data source fields

glide.scheduled_import.stop_on_error

Set to *true* to stop the import process when the parent scheduled import generates an error. This behavior can be useful when one import set depends on the results of another import set.

- Type: true | false
- Default value: false
- Location: Add a system property

glide.impex.transformer.empty_value_nil

Controls how empty string values are handled during transformation from an import set staging table. Set this property to *true* to preserve empty strings. Set this property to *false* to convert empty strings to the string NULL.

Note:
An empty string is always stored as a null value in the database, regardless of this property value.

You can use this property when you run an onBefore script during transformation. Setting this property to *true* allows you to check for null values using `hasValue()` or `nil()` functions.

- Type: true | false
- Default value: false
- Location: Add a system property

com.glide.loader.max_scan_rows

Controls how many rows of source data are sampled to automatically generate staging table fields when you import data. This property applies to JDBC, XLS, CSV, and XML imports but not to JSON and XSLX imports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 20
- Location: Add a system property

Concurrent import sets properties

glide.scheduled_import.max.concurrent.import_sets

Maximum number of import sets for one concurrent import.

- Type: Integer
- Default value: 10
- Location: Add a system property

com.glide.concurrent_import_set_insert_mutex_spin_wait

Wait time mutex spends if the lock is acquired (in milliseconds).

- Type: Integer
- Default value: 1000
- Location: Add a system property

com.glide.concurrent_import_set_insert_mutex_expiration

Mutex expiration time (in milliseconds).

- Type: Integer
- Default value: 300000
- Location: Add a system property

com.glide.concurrent_import_set_mutex_fast_lock

Specifies whether to use fast lock (true) or SQL-based slow lock (false).

- Type: true | false
- Default value: false
- Location: Add a system property

Web service import sets properties

com.glide.ws_import_set.column_resize

When true, enables dynamic column resizing on import staging tables for web service import sets.

- Type: true | false
- Default value: false
- Location: Add a system property

com.glide.ws_import_set.column_resize.max_row_count

The maximum number of rows an import staging table can have for dynamic column resizing with web service import sets.

Import staging tables with more than this number of rows will not use dynamic resizing with web service import sets, even if *com.glide.ws_import_set.column_resize* is true.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This property has a maximum value of 500,000.

- Type: Integer
- Default value: 100,000
- Location: Add a system property

CSV properties

com.glide.csv.loader.ignore_non_parseable_lines

Allows an instance to ignore one or more lines (rows) that contain bad data in a CSV import, such as a row that is missing a column of data. By default, imports cannot ignore bad data in CSV files and fail on the first error.

- Type: true | false
- Default value: false
- Location: Add a system property

com.glide.csv.loader.max_errors_allowed

Specifies the maximum number of lines (rows) that an import can ignore before failing. If the import succeeds, the import lists the number of rows the import ignored due to errors.

- Type: integer
- Default value: 100
- Location: Add a system property

glide.import.csv.charset

The charset of the CSV file to import. Valid values are UTF-8 and WINDOWS-1252. You may need to use UTF-8 formatting when importing special characters.

- Type: String
- Default value: WINDOWS-1252
- Location: Add a system property

Excel import properties

glide.excel.multiplier

The maximum amount of instance memory to allocate to an Excel import. This property applies when importing .XLS files only.

The value of this property is multiplied by the file size of the Excel file to determine the total memory allocation. The memory used cannot exceed the limit specified by the *glide.excel.max_memory_percent* property.

For example, with the default value 8 and a 10MB Excel file, the instance will use up to 80MB of memory for the import.

- Type: integer
- Default value: 8
- Location: Add a system property

glide.xlsx.multiplier

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The maximum amount of instance memory to allocate to an Excel import. This property applies when importing .XLSX files only.

The value of this property is multiplied by the file size of the Excel file to determine the total memory allocation. The memory used cannot exceed the limit specified by the *glide.excel.max_memory_percent* property.

For example, with the default value 10 and a 10MB Excel file, the instance will use up to 100MB of memory for the import.

Note:
Do not modify the value of this property. The default value was selected for optimal performance.

- Type: integer
- Default value: 10
- Location: Add a system property

glide.excel.max_memory_percent

The maximum amount of memory allowed for Excel imports, as a percentage of the total instance memory.

- Type: integer
- Default value: 10
- Location: Add a system property

glide.excel.use_disk_backed_strings_table

Controls whether the instance uses disk storage to maintain large file data during XLSX import. Set this property to false to store XLSX file data only in memory. Setting this property to false increases the memory used during XLSX import.

- Type: true | false
- Default value: true
- Location: Add a system property

glide.excel.in_memory_strings_table_size_mb

The maximum amount of memory, in megabytes, available to store XLSX file data before writing to disk storage when glide.excel.use_disk_backed_strings_table is true. Setting a lower value for this property will use less memory during XLSX import but may result in slower imports.

- Type: integer
- Default value: 5
- Location: Add a system property

glide.xlsx.import.debug

Enables debug logging for XLSX imports.

- Type: true | false
- Default value: false
- Location: Add a system property

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.import.excel.enhanced_number_conversions

When true, numeric values greater than 10 million are preserved in import staging tables. When false, imported values greater than 10 million are converted to scientific notation that may not match the original imported value. This property should be set to true for importing most kinds of data.

- Type: true | false
- Default value: true
- Location: Add a system property

glide.transform.boolean.casesensitive

When true, upper case boolean values of (TRUE/FALSE) always transform to false. When false, upper case boolean values (TRUE/FALSE) are transformed correctly.

- Type: true | false
- Default value: true
- Location: Add a system property

JDBC connection properties

glide.jdbcprobeloader.retry

The number of times a JDBC probe loader attempts to process data returning from a JDBC data source. Sleeps on the value defined in *`glide.jdbcprobeloader.retry_millis`* between retries.

- Type: integer
- Default value: 60
- Location: Add a system property

glide.jdbcprobeloader.retry_millis

How many milliseconds a JDBC probe loader waits in between retry attempts to process data from a JDBC data source.

- Type: integer
- Default value: 5000
- Location: Add a system property

Logging and debug properties

com.glide.import_set.importlog_level

Specifies how much information import sets add to the log. Possible values are INFO, WARNING, and ERROR. You can set this to INFO in the dev environment and change it to WARNING or ERROR in production to reduce amount of logging noise traffic to the database.

> **Note:**
> This property does not impact logging related to the cleanup of staging tables.

- Type: string
- Default value: INFO
- Location: Add a system property

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.import.debug

Enables debug logging for all import processes.

- Type: true | false
- Default value: false
- Location: Add a system property Add to the System Property [sys_properties] table

glide.importlog.log_to_table

Specifies whether to write information-level log messages into the import_log table. When true, the information-level log messages are written.

> **Note:**
> The information-level logs for IntegrationHub ETL are written to the importlog.log table regardless of this property setting. To have additional exceptions added, contact Now Support.

- Type: true | false
- Default value: false
- Location: Add a system property

glide.import.sftp.debug

Enables additional debug logging for SFTP imports. Enabling this property will cause the instance to log all outgoing and incoming messages during the SSH session.

- Type: true | false
- Default value: false
- Location: Add a system property

glide.import.scp.debug

Enables additional debug logging for SCP imports. Enabling this property will cause the instance to log all outgoing and incoming messages during the SSH session.

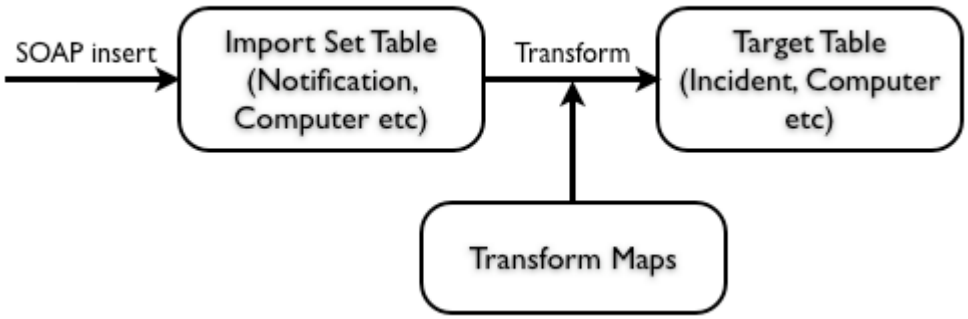
- Type: true | false
- Default value: false
- Location: Add a system property

Web service import sets

Web service import sets complement direct web services and scripted SOAP web services providing a web service interface to import set tables.

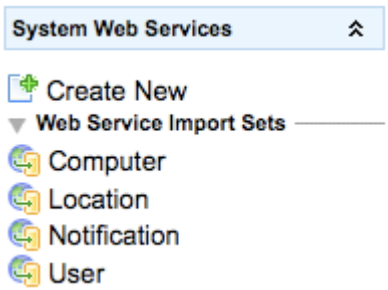
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Web service import set



By default, this type of web service transforms the incoming data synchronously based on the associated transform maps. If the associated import set mode is set to *Asynchronous*, the behavior is to save the data for transformation at a later time. Web service import sets tables publish all the default web service functions in the WSDL.

System web services



This plugin also provides the following standard import set tables:

- Computer
- Location
- Notification
- User

You can access a web service import set WSDL by specifying the import set table name + ".do?WSDL" on the URL.

For example:

`http://<instance name>.service-now.com/imp_notification.do?WSDL`.

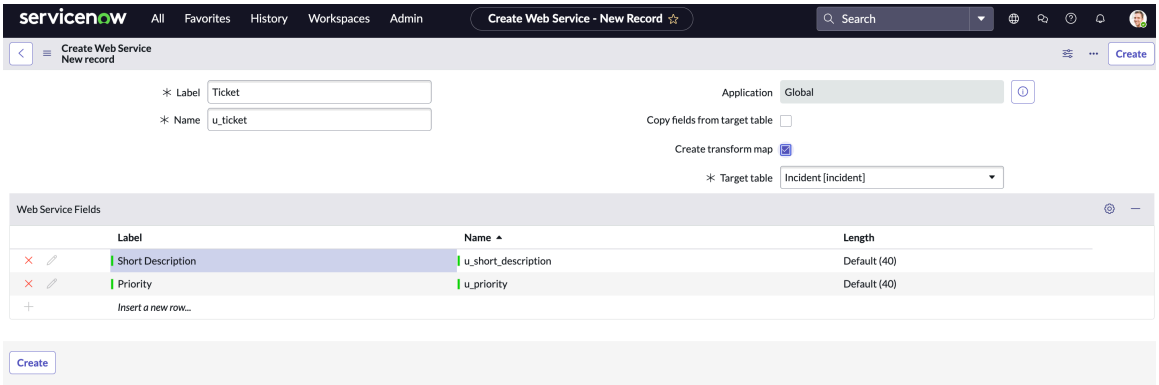
Creating an import set web service

Create a web service import set table to define how to stage and transform imported data.

Navigate to **All** > **System Web Services** > **Inbound** > **Create New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Web Service



The *Name* of the web service is the table name of the import set table whereas the *Label* field is the resulting table field.

If you want to create a transform map after creating the web service, check the **Create transform map** checkbox and choose the target table you want the data to transform into. After the **Create** button is selected, the web service is created and you will be immediately put into the *Table Transform Map* form. You may then continue to specify the transform map or script.

Web Service Fields

The fields available for this web service. All fields by default are published as the XSD type of `xsd:string`. The *Name* is the field that is exposed for the web service and therefore appears as the name of the field in the WSDL. The *Label* is the label of the field as it appears for the import sets table.

You can *Add*, mark for *Delete* or modify (double-click the field) an existing web service field in this list.

Note:
After adding web service fields, click **Create** to create the web service import set table.

To add other fields after the Web Service is created, find the target table, and add the fields to that table.

Mapping web service import sets

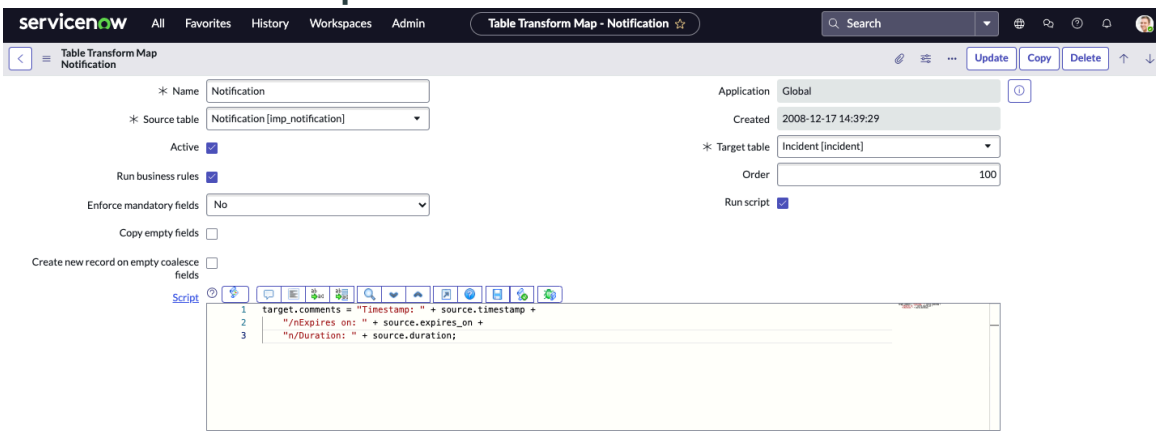
During the creation of the web service import set, you may optionally create the transform map for it.

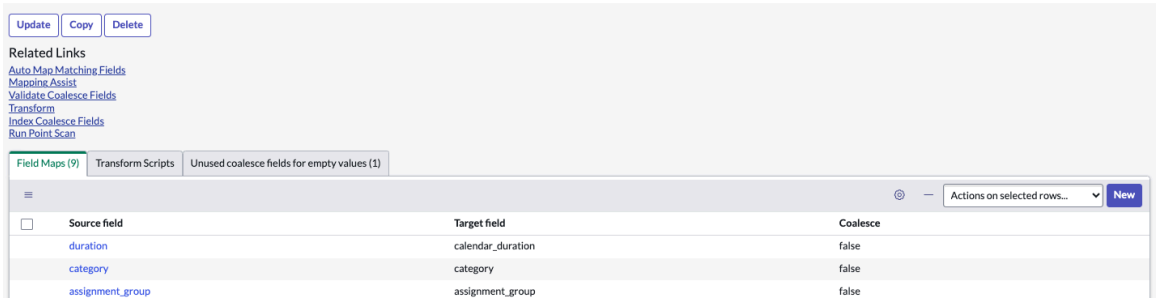
All transform maps are executed for the service when it is invoked and the import set mode is set as "Synchronous" (the default).

The following image is an example of the transform map associated with the Notification web service import set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notification Transform Map





Adding Web Service Response Values

In the transform map script associated with a web service import set, some variable values can change the response values of the web service. In addition to the normal variables that are available in a transform map script, the table documents the variables that are available and their effects.

Adding Web Service Response Values

Variable name	Type	Description
response	Output Object	Javascript object that holds dynamically created response elements used to customize the output response of a web service import set insert.

Example

```
// create new elements called "transaction_id"
// and "hello" in the web service response
response.transaction_id="abc123";
response.hello="world";

status_message="message 1";
// this is the normal status_message variable
```

The code snippet example results in the following response being generated back to the web service consumer

```
<soapenv:Envelopexmlns:imp="http://
www.service-now.com/imp_notification"
xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
<soapenv:Header/><soapenv:Body>
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
<insertResponse
 xmlns="http://www.service-now.com/imp_notification">
  <sys_id>969d157c0a0a0baf008ba5770ffa798c</sys_id>
  <table>incident</table>
  <display_name>number</display_name>
  <display_value>INC0010091</display_value>
  <status>inserted</status>
  <status_message>message 1</status_message>
  <transaction_id>abc123</transaction_id>
  <hello>world</hello>
</insertResponse>
</soapenv:Body></soapenv:Envelope>
```

Debugging web service import sets

To debug a SOAP Request coming into the system, create the system property *glide.processor.debug.SOAPProcessor*.

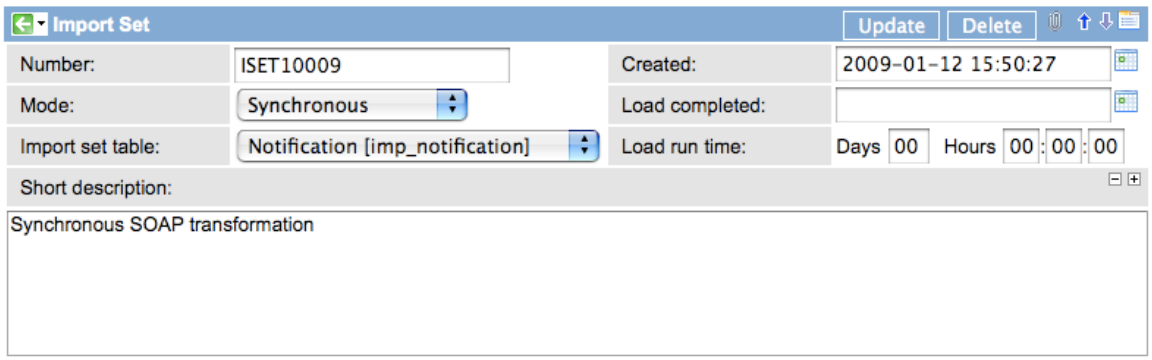
Once you have created it, set it to *true* to have all SOAP requests be logged in the System Log. Set it to *false* when you are done to keep the size of your System Log to a managed length.

Web service import set mode

When a SOAP message inserts a record into an import set table, and there is no import set for that table in the **Loading** state, a new import set will be created with the **Mode** set to **Synchronous**.

An import set with a *Mode* of *Synchronous* will transform the data as soon as it is inserted (provided that the transform map already exists). This import set will also have a default *State* of *Loading*. By default, all *Synchronous* import sets will automatically be modified to *Processed* at midnight. As a result, when a new insert happens to the same table, a new *Synchronous* import set will be created.

Synchronous import set



Changing this import set to a *mode* of *Asynchronous* and a *state* of *Loading* has the effect of not transforming the incoming data as it is inserted, but rather "loading" the import set and deferring the data transformation later, either manually, or with a scheduled script job.

Import Set Mode

Mode	State	Function
Asynchronous	Loading	Data transformation is not occurring automatically and immediately. Data added to import set row has a state of "Pending". Transform can be scheduled or executed manually when state is changed to *Loaded*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import Set Mode (continued)

Mode	State	Function
Asynchronous	Loaded	Marks the completion of data loading. Data transformation can now occur in a scheduled fashion or manually.
Synchronous	Loading	Data transformation is occurring automatically and immediately whenever data is inserted into the associated import set row.
Synchronous	Loaded	When new data is inserted into this associated import set, a new import set of mode *Synchronous* and state *Loading* will be created. Changing the state to *Loaded* is a way to indicate that a new *Synchronous* import set should be created for the next import set row insert (and transformed immediately)

Controlling Insert Behavior

In imports sets that specify one or more coalesce fields, records with a matching coalesce value are transformed from source to target table serially (one at a time) to prevent duplicates.

In import sets that do not specify any coalesce field, records are transformed concurrently. You can control this behavior using the *glide.import_set_insert_serialized_when_no_coalesce* property.

The *glide.import_set_insert_serialized.<table name>* system property controls how the instance inserts records from web service calls into a specific import set table. When true, this property prevents identical simultaneous inserts from creating duplicate records by serializing the database insert operations. If a target table does not have any coalesce fields defined in a transform map, set this property to *false* to improve web service import set performance.

Note:
Setting this property to **false** can result in the creation of duplicate records.

Note:
The *glide.soap.import_set_insert_serialized.<table name>* system property provides equivalent functionality to *glide.import_set_insert_serialized.<table name>*, but if both properties are defined, *glide.import_set_insert_serialized.<table name>* supersedes *glide.soap.import_set_insert_serialized.<table name>*.

Standard SOAP Response

The SOAP response from a web service import set insert call returns the following standard values.

```
<SOAP-ENV:Envelope
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xmlns:xsd="http://www.w3.org/2001/XMLSchema"
 xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
 xmlns:SOAP-ENC="http://schemas.xmlsoap.org/soap/encoding/"
 SOAP-ENV:encodingStyle="http://
schemas.xmlsoap.org/soap/encoding/"><SOAP-ENV:Body><insertRespon
se><sys_id>fa648f5f0a0a0b2b0048e7012448b8f1</sys_id><table>incid
ent</table><display_name>number</display_name><display_value>INC
10014</display_value><status>inserted</status></insertResponse
></SOAP-ENV:Body></SOAP-ENV:Envelope>
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard SOAP Response

Field	Description
sys_id	The Sys_id of the resulting record that was created or modified
table	The table name of the table that was affected. In the case of an *Asynchronous* call, the table name would be the import set table eg. imp_notification for the *Notifications* web service import set table
display_name	The name of the field that is set as the display field for the record that was created or modified
display_value	The value of the field designated as the display field. For example, the display field for the *Incident* table is the *Number* field and an example value would be INC10001
status	A string value that indicates the action that occurred as a result of the web service invocation, relating to the record defined by the `sys_id` and `table` field values • *inserted* - the record was inserted • *updated* - the record was updated • *ignored* - the input was ignored, the record was not updated and no new record was created • *skipped* - the input data was skipped (similar to ignored) due to missing coalesce values • *error* - there was an error processing the input
status_message	This value translates to the value found in the *Comment* field of the import set row and usually contains information related to the *status* value eg. "No field values changed" when the status is "ignored' . Setting this value to a customized string value will cause the SOAP response to contain an optional status_message field to be returned.
error_message	The message related to a status of *error*. When an error occurs, setting this value to a customized string value will cause the SOAP response to contain an optional error_message field to be returned

Tailoring the SOAP Response

It is possible to include information other than the information specified in the WSDL by overwriting the contents of *status_message* using the transform script.

Inserting multiple records using insertMultiple

You can insert multiple records in one SOAP request by using the insertMultiple operation.

By default, insertMultiple operations create new import sets in **Synchronous** mode. To process new import sets asynchronously, activate the business rule Insert multiple asynchronous mode.

The insertMultiple operation is available for the Direct Web Service API and Web Service Import Sets. To enable insertMultiple, activate the Insert Multiple Web Service plugin.

Note:
Activating this plugin adds a new operation to the SOAP WSDL. After this plugin is activated, consume a new WSDL to update your web services client.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Web service import sets security requirements

Web Service Import Sets use the same security mechanisms as SOAP Web Services.

- Basic authentication requires a Web Service user provide a valid user name and password.
- Contextual security requires a Web Service user meet the access control rule of the queried table.

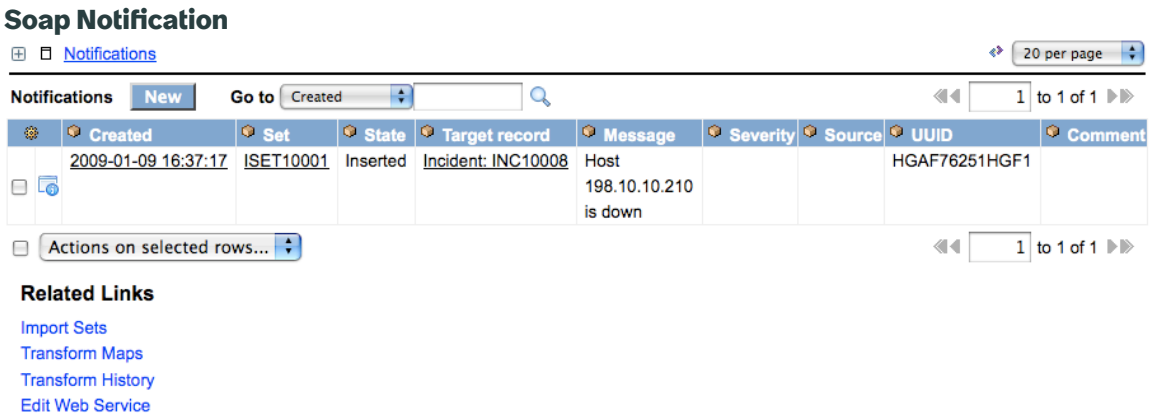
If your instance uses high security settings, the Web Service user may also need the *soap* role.

Web service import sets related links

When displaying a mapped web service table, you have the following related links.

- Import Sets — The import sets related to this web service import set.
- Transform Maps — A list of transform maps related to this web service.
- Transform History — The transformation history.
- Edit Web Service — Edit the web service.

The following image shows a record that was inserted into the web service import set Notification. The target record is the resulting creation or modification to the Incident table record as a result of the transform.



Web service import sets example

This example demonstrates the WSDL, SOAP envelope and response, Perl invocation, and result of a SOAP web service import.

Sample WSDL

```
<?xmlversion="1.0"encoding="UTF-8"?><wsdl:definitions

-ENV:Envelope>
```

Example Invocation using Perl

The following example script uses the *Notification* web service to create an Incident as the *itil* user. It uses the Perl language and the SOAP::Lite package.

```
#!/usr/bin/perl -w

#use SOAP::Lite ( +trace => all, maptype => {} );use SOAP::Lite;

sub
 SOAP::Transport::HTTP::Client::get_basic_credentials{return'iti
l'=>'itil';// set basic auth credentials for the itil user
}

my$soap=
 SOAP::Lite->proxy('http://
localhost:8080/glide/imp_notification.do?SOAP');

my$method= SOAP::Data->name('insert')->;attr({xmlns
 =>'http://www.service-now.com/'});

# insert into the web
 servicemy@params=( SOAP::Data->name(message =>'problem detected
 for database DB12DG'));push(@params, SOAP::Data->name(source
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 =>'DB12DG'));push(@params, SOAP::Data->name(uuid
 =>'HGAF76251HGF2'));

my$result=$soap->call($method=>@params);

print_fault($result);//print any SOAP faults
print_result($result);//print any results

sub print_result
 {my($result)=@_;if($result->body&&$result->body->{'insertRespon
se'}){my
%keyHash=%{$result->body->{'insertResponse'}};foreachmy$k(keys%k
eyHash){print"name=$k   value=$keyHash{$k}\n";}}}

sub print_fault
 {my($result)=@_;if($result->fault){print"faultcode=".$result->f
ault->{'faultcode'}."\n";print"faultstring=".$result->fault->{'f
aultstring'}."\n";print"detail=".$result->fault->{'detail'}."\n"
;}}
```

The following is the result printed by the Perl script on the console.

```
name=display_value   value=INC10011
name=status   value=inserted
name=table   value=incident
name=display_name   value=number
name=sys_id   value=cd45649c0a0a0b2b00e6f27649d6bd2c
```

The following image shows the resultant row created for the import set table *Notification* (imp_notification).

WS Iset Perl

	Created	Set	State	Target record	Message	Severity	Source	UUID	Comment
	2009-01-12 15:55:23	ISET10009	Inserted	Incident: INC10011	problem detected for database DB12DG		DB12DG	HGAF76251HGF2	

Troubleshoot import set performance

Review these performance issues to troubleshoot and improve the performance of your import set jobs.

Running business rules during transform

Running business rules during transform may cause the transform to take longer than expected, or cause the instance to slow down.

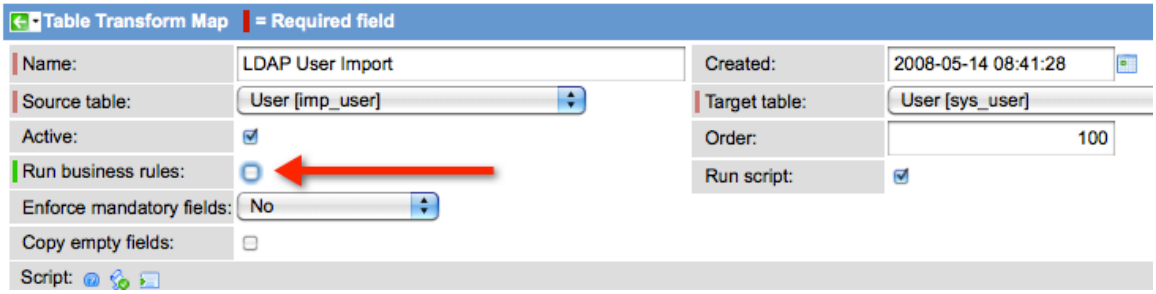
Becomes an issue: When importing a very large amount of data. For example, importing all data from an old system.

Symptoms:The transform takes much longer than expected. Also, the entire instance may be slow during that time.

How to avoid this: Do not run items like business rules, workflows, approval engines, and so on during a transform unless you want all insert and update business rules, notifications, and workflows to run. For example, when importing all data from an old system, you may not want notifications to run. To disable these items from running and to cease auditing and field normalization within the transform map for that import, deselect the **Run business rules** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform Map Checkbox



Note:
Consider using an onComplete transform script to run business logic such as calculations at the end of an import rather than on each record as business rules do.

Slow transform scripts

Using multiple GlideRecord queries or large loops may slow down transform scripts.

Becomes an issue: When the transform scripts are using multiple GlideRecord queries or looping through large collections of objects for each row. This issue may appear when the transform script is not efficient. In most cases, script goals can be accomplished using built-in functionality within the Import Set application. For example, you can script case-sensitive coalesce instead of writing scripts that use GlideRecord queries. GlideRecord queries typically slow down the import.

Symptoms: The transform takes much longer than would be expected. Depending on the script, the entire instance may be slow during that time.

How to avoid this: Use base system functionality whenever possible instead of writing custom scripts and if you do write scripts, avoid writing complicated scripts that use GlideRecord queries.

Importing data that has not changed

Repeatedly importing data that has not changed leads to many skipped rows.

Becomes an issue: When you are importing data from a table that is very large and most of the records are not getting updated on a regular basis.

Symptoms: The import set takes longer than expected. Under **System Import Sets** > **Progress**, expect to see an import with a *Total count* that is very high with a *Skipped count* that is also very high - this is found under the *Message* column. Indicating that most of the records imported had not actually changed. These records did not need to be imported.

How to avoid this: If you are running a JDBC import, use the last run datetime option in your import set Data Source. For a type of File import, be sure that whatever is generating your files is only adding data that is new, or has been changed.

Coalescing on non-indexed fields

Coalescing on non-indexed fields with a large amount of data may cause transforms to slow down.

Becomes an issue: When matching on fields that are not indexed, this causes the transform stage of an import to run slowly. However, it only becomes an issue if there is a large enough amount of data. In extreme cases, this causes performance issues with the database due to added load.

Symptoms: Time spent in the transform stage of the import is large relative to the time taken to load the data. Expect to see high transform times.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How to avoid this: If possible, you should coalesce on a field that unique and already indexed. To determine if a field is already indexed, navigate to **System Definition** > **Tables & Columns** and find the table. In the list of columns for that table, an indexed column has a blue icon with an i next to it if indexed. For assistance indexing a field contact ServiceNow Technical Support.

Running imports simultaneously

Running imports simultaneously may cause excessive load on the database.

Becomes an issue: When importing large amounts of data puts an additional load on the database. For example, importing 500,000 users and importing 200,000 configuration items at the same time. This can have a significant performance impact on all queries on the system due to the increased load on the database. This issue is especially severe when two imports are importing to the same table. In such a case, there is a possible contention issue for the table. Additionally, depending on which table is involved in processing, this can severely degrade performance of the import and the instance.

Symptoms: Multiple simultaneous imports running slowly combined with load on the database. You see large numbers of inserts and updates along; and if there is enough load or contention, high IO Wait times.

How to avoid this: Stagger your imports so they do not overlap.

Large import set tables

Failing to clean import set tables may lead to those tables becoming cluttered and slow.

Becomes an issue: When the Import Set Deleter job is not running.

Symptoms: This is a size issue. If the import sets are not cleaned on a regular basis (a cleanup is recommended after seven days worth of data) the table fills causing imports to stop.

How to avoid this: Verify the Import Set Deleter job is running. If it is not currently running, contact Customer Service and Support as they will truncate all import set tables before enabling this job.

Altering table schema during import

Changing the table schema, such as by importing a new column locks the import set table.

Becomes an issue: Any time a new column is imported, the entire import set table is locked during that schema change and depending on the size of the table, can take between five and ten minutes. During that time, no data can be selected or inserted. If that table is not used often, this may not cause any problems. However, if that table is frequently used, for example the LDAP import table, issues may arise.

Symptoms: The symptoms of this problem may vary. In our example of the LDAP import table, any transactions requiring a query of the LDAP import table will have to wait until the schema change has completed.

How to avoid this: Truncate the import table before importing with a new column.

Importing very large data sets

Importing a very large data set takes longer than importing multiple smaller data sets.

Becomes an issue: When very large data sets are imported in a single job.

Symptoms: The import job takes a long time to complete.

How to avoid this: Break a very large data set into multiple, smaller jobs for faster results. Consider import sets under 100,000 records as a guideline. For example, importing 10 sets of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

100,000 records completes faster than one import of 1 million records even though the total data imported is the same.

Large data imports with many reference fields

Importing a high volume of data with many references to resolve might take longer than expected or cause the database to slow down.

Becomes an issue: When using a transform map for high-volume data imports with many reference fields.

Symptoms: The transform takes much longer than expected. While importing, the entire database slows down.

How to avoid this: Use secondary storage to look up references. Secondary storage uses a secondary database for reference resolution. It enables some read queries to be redirected to the secondary database, reducing the load on the primary database.

To enable secondary storage:

- Activate the Secondary Database Pools [com.glide.secondary_db_pools] plugin. For more information, see Request a plugin.
- Confirm that the import_reference_resoultion category in the Secondary Database Categories [sys_db_category] table has been configured and enabled. When you request the plugin, ServiceNow support configures this category for you.

After the plugin is activated and your secondary storage category has been configured and enabled, there will be a **Use Secondary Storage for References** check box on the form to Create a transform map. Use this check box to enable or disable secondary storage.

When using secondary storage, set the **Choice action** field in the field map to **ignore** or **reject**. Setting the **Choice action** to **create** may cause multiple copies of a record to be created because the reference resolution doesn't detect newly created records immediately. For more information about choice actions, see Create a field map.

A secondary database is always slightly out of date compared to the primary database. If your import requires completely up-to-date data, don't use secondary storage.

Importing from another ServiceNow instance

There are several methods for moving data from one instance to another.

All of these methods assume you need to periodically move a collection of records from a table on one instance to a table on another instance. If you want an action on an individual record to trigger a corresponding action on another instance, consider using a REST web service instead.

Identifying Needed Related Records

All import processes work by fetching data from one table at a time. This process can produce unexpected results if the incoming data references new records in other tables such as users, locations, or companies. To prevent importing broken references to other tables you must identify the connections between your tables and import the common data prior to importing the application data.

For example, prior to importing incident data, you might want to first import related configuration items, users, and locations. Furthermore you might want to import incidents before importing problems or changes that refer to these incident records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available Import Processes

The system offers the following processes to move data from one instance to another.

- Export and import XML records directly from lists
- Create XML import sets and transform data as needed
- Export and import CSV files from lists

XML records from lists

You can directly export records as XML from any list or form.

This export process preserves all record field values including system generated field values such as:

- Sys ID
- Creation date
- Update date

The XML import process directly inserts records into the target table. During the import the system:

- Ignores any business rules that normally apply to the table.
- Does not provide any opportunity to transform incoming data.
- Automatically matches a reference field's display value to the local Sys ID for some tables.

This process is good for directly copying records from one system to another but does not remove the need to know the relationships between tables. If you need validate or transform data or reconcile the sys ID values of reference fields, use an XML import set instead.

Automatic matching of display values

During the import of XML records, the system attempts to match some reference field display values to a local sys_id value.

If the system finds an existing record with a matching display value on the local instance, the import uses the sys_id of the existing record rather than the sys_id of the imported record.

For example, suppose you export an incident record that is assigned to the user John Smith. In the exported XML file there is an entry such as:

```
<incident>
 ...
 <assigned_to display_value="John
 Smith">7712173d2ba80200c5244f74b4da159a</assigned_to>
 ...
</incident>
```

This user already exists on the target instance but has a different sys_id value such as:

```
<sys_user><name>John Smith</name>
 ...
 <sys_id>18cab8de2be80200c5244f74b4da15f7</sys_id>
 ...
</sys_user>
```

Since the display value matches an existing record, the system uses the local instance's existing sys_id value for the reference field such as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
<incident>
 ...
 <assigned_to display_value="John
 Smith">18cab8de2be80200c5244f74b4da15f7</assigned_to>
 ...
</incident>
```

The system can match display values for the following tables.

- User [sys_user]
- Group [sys_user_group]
- Role [sys_user_role]
- Group Roles [sys_group_has_role]

Using XML import sets

Use an XML import set to import data from another instance.

This method allows you to:

- Apply business rules
- Transform incoming data
- Reconcile sys_id values if necessary

Note:
Administrators cannot set the *update_synch* attribute in Dictionary records to move data as part of update sets. This attribute was being used incorrectly to migrate data in large tables and was causing significant performance problems.

Create an XML data source to another instance

Data sources are used to create an import set so that data can be processed, if necessary, prior to being mapped onto a production table.

Before you begin

Role required: admin.

About this task

Note:
To import using XML with High Security Settings enabled, you must possess elevated privileges.

Procedure

1. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
2. Click **New**.
3. Complete the form using the following values:

Import set table label	`<import_set_table_label>`
Type	File
Format	XML

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Xpath for each row	/xml/<source_table_name>
Expand node children	true
File retrieval method	HTTPS
File path	/<source_table_name>.do?XML
Server	<instance name>.service-now.com
Port	Port to use to connect to the specified server.
User name	A user account on the remote instance. The username used cannot be an email address.
Password	The password for the same remote account.

4. Click **Submit**.
5. Click **Test Load 20 Records** to create the import set table and to ensure that your data source is functional.

> **Note:**
> The 20 loaded records can't be transformed and are for testing purposes only.

Create a transform map

A transform map is a set of field maps that determine the relationships between fields in an import set and fields in an existing ServiceNow table, such as Incidents [incident] or Users [sys_user].

Before you begin
Role required: admin.

About this task
After creating a transform map, you can reuse it to map data from another import set to the same ServiceNow table.

Procedure
1. Open the data source record that you just created.
2. In the **Transforms** related list, click **New**.
3. Populate all the usual fields and be sure to choose the proper **Target table**.
4. Submit the record.

Result
You can view your transform map on the Table Transform Maps [sys_transform_map] table.

Add onBefore scripts to the transform map

Create one onBefore transform map script to copy the sys_id of new records from the source to the target instance. Create a second onBefore transform map script to identify records on the target instance that have the same unique values but different sys_id values.

Before you begin
Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the table transform map record you created.
2. In the **Transform Scripts** related list, click **New**.
3. In the **When** field, select **onBefore**.
4. Enter the following script:

```
if (action == "insert")
 {target.setNewGuidValue(source.u_sys_id); }
```

5. Click **Submit**.
6. In the **Transform Scripts** related list, click **New**.
7. In the **When** field, select **onBefore**.
8. Enter the following **Script**:

```
/**
* This script queries for a uniquely identifying value of the
 referenced record and then
* updates the target reference field with the sys_id of the
 matching target record.
* This sample assumes:
* 1) The target table contains an assigned_to field which is a
 reference field.
* 2) The reference field references the User [sys_user] table.
* 3) You can use the email field to uniquely identify users.
 Alternatively you
*    could use the user_name field.
*/
var ref = new GlideRecord("sys_user"); //Replace sys_user with
 any reference table
ref.addQuery("email", source.email); //Replace email with any
 unique field
ref.query();
if(ref.next()){
   target.assigned_to = ref.sys_id; //Replace assigned_to with
 any reference field
}
```

9. Click **Submit**.

Retrieving data from a CSV formatted file

In this method, you import data from another instance using an HTTPS data source to return a CSV formatted file containing the rows to be imported.

Before you begin

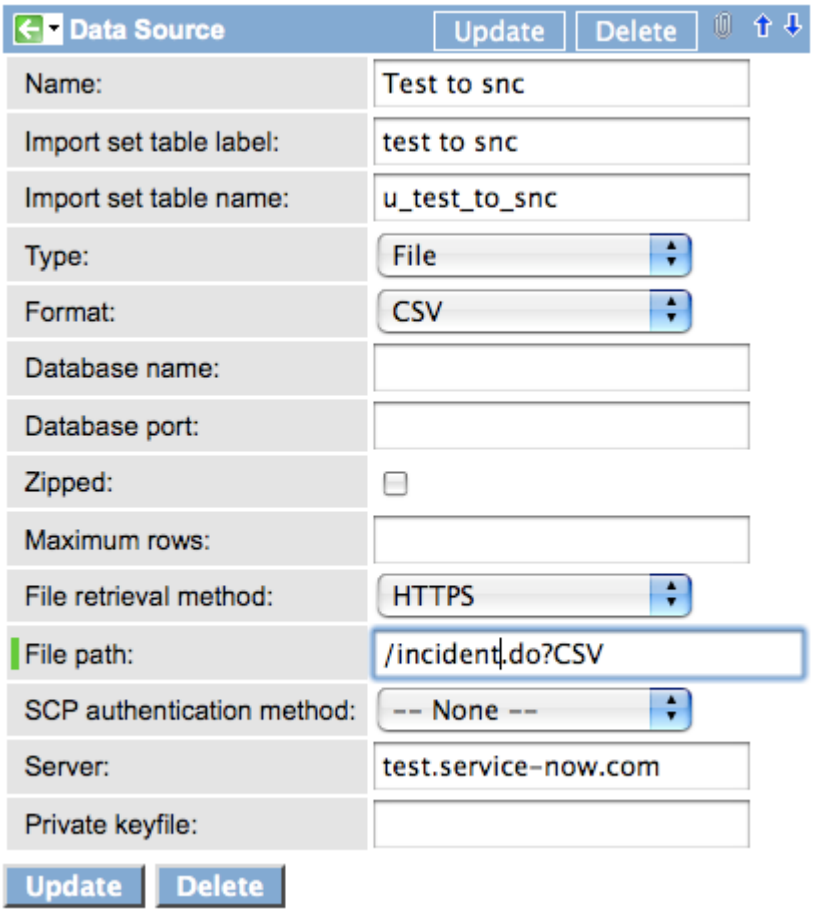
Role required: Admin.

About this task

This approach uses the Import Sets application to retrieve the data from the source and import it to the destination.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTPS Data Sources



Procedure

1. Create a new data source by navigating to **Import Sets** > **Data Sources** on the destination instance.
2. Provide the following field values:
   - **Import set table name**: Select a table.
   - **Type**:File
   - **Format**:CSV
   - **File retrieval method**:HTTPS

     Note:

     If the **Server**, **File path**, **Username**, and **Password** fields are not visible when you select **HTTPS**, change the file retrieval method temporarily to **SCP** and enter this information. Remember to reset the **File retrieval method** to **HTTPS** after you enter these fields.

   - **File path**:incident.do?CSV

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To import specific change records, you can add qualifiers to the path. For example, the following path would return all active change records: `incident.do ?CSV &amp ;sysparm_query =active = true "`

- **User name** and **Password:** Enter the user name and password for a valid user on the destination instance.

3. Click the **Test load 20 records** related link to verify that the import is configured correctly.
4. After setting up the data source, configure a standard transform map.

Easy import

Easy import is a simplified import process that enables you to import only the columns you want.

Only admins can use easy import. You can import data to tables within the current scope and tables that grant write access to other applications.

Easy import template validation

Each import template must pass two sets of validation.

Type of validation	Stored in	Results of failing validation
Client-side validation	Import template	The template highlights the invalid cell. Server-side validation	Instance	The import pauses and displays an error message. 
Download an import template

Select the list you want to import data to and create an import template from that list.

Before you begin
Role required: admin.

Procedure

1. Navigate to any list, such as **All** > **Self-Service** > **Incidents**.
2. Right-click the column heading.
3. Select **Import**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Make sure columns are updated before importing them.

4. Select if you want to **Insert** or **Update** records.

Import template

Template	Description
Insert	Use this template to add new records to a table.
Update	Use this template to change values within existing records in a table. This template contains one row for each record in the list. The current list filter determines what records the template contains.

5. **Optional:** Clear the **Include all fields in the template?** check box to include only columns that appear in the list in the template.

   (Optional) Certain fields in the table are updated by system processes, and you cannot import values into them. An example is the **Created by** field, which is populated during import with the logged-in user who performs the import.

   Leave this check box selected to include all columns from the table in the template, even those columns that are hidden in the list.

6. Select the **Export template format** you want, either **XLS** or **XLSX**.
   XLSX is the preferred format, XLS is available for legacy support. The **Export template format** field appears only if the property `glide.legacy.excel.export` is true.
7. Click **Create Excel template**.

What to do next
Open the spreadsheet using your preferred application.

Note:
Each template contains a *Directions* tab describing how to use the template.

Add a record in the template

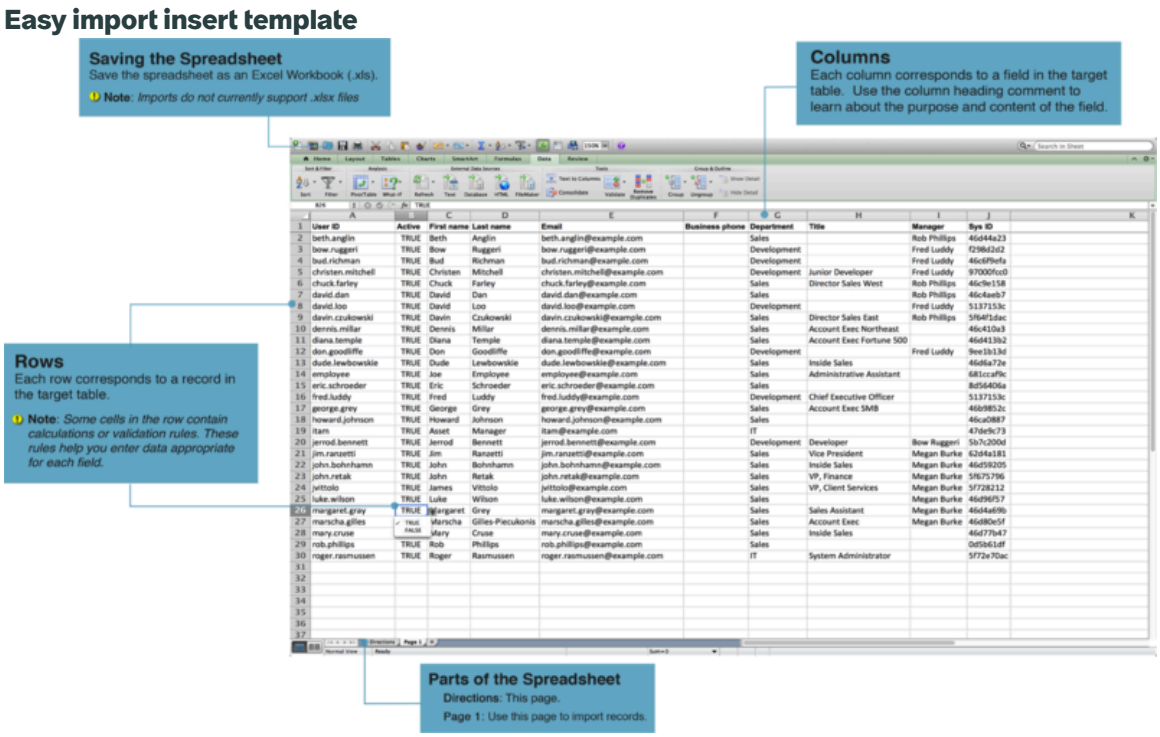
Add rows to the template to create new records.

Before you begin
Role required: admin.

Note:
The template only imports records on the first page of the template. The import process ignores all other pages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task



Procedure

1. Add a row for each record you want to add to the table.
   Each column corresponds to a field in the target table. Use the UI Field administration to learn about the purpose and content of the field.

   The template validates values as you enter them and highlights cells containing invalid data. While you do not have a provide a value for every column, certain fields may fail validation if you do not provide a value.
2. Review any highlighted cell and resolve the issue.
3. When you finish entering new rows, save the spreadsheet as an Excel Workbook.

   The insert templates uses special processing for certain fields:

   - *Created by Field*: The insert template always lists the system administrator user (admin role) in the *Created by* field regardless of whether the import includes a Created by column. Even if you provide a different user value in the template, the import process overwrites this value with the system administrator user.
   - *Blank Values*: Leaving a cell blank in the insert template results in a blank value in the imported record, provided the field supports a blank value. Fields that do not support a blank value will produce a validation error if you provide a blank value.

Update a record in the template

Modify rows in the template to update existing records.

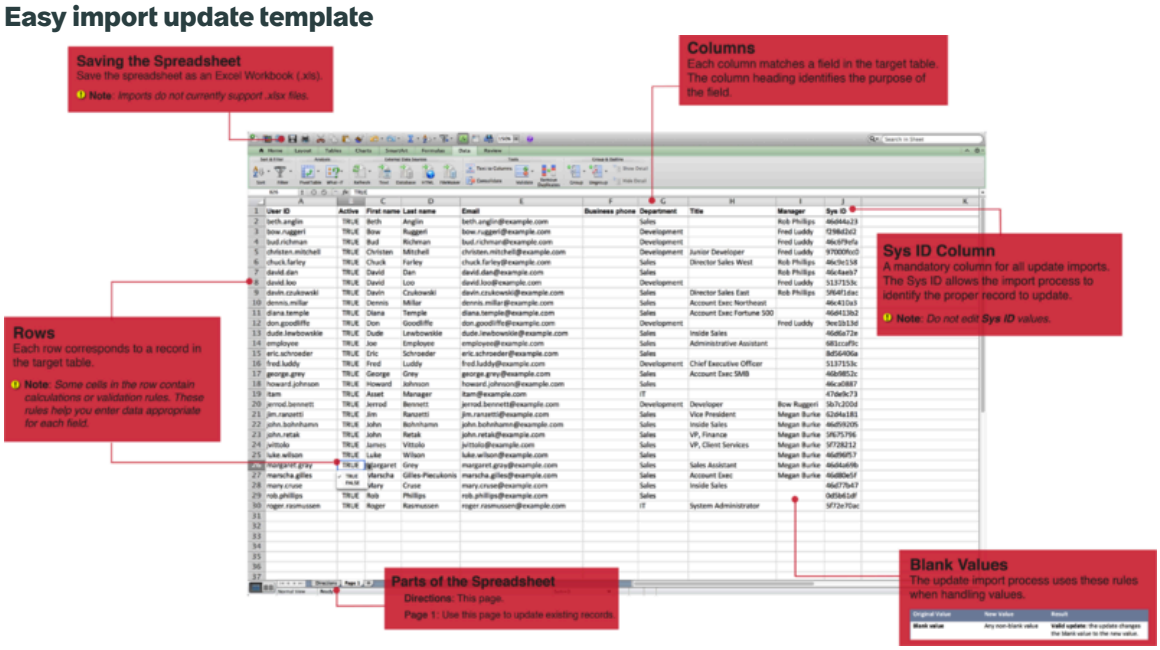
Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The template only imports records on the first page of the template. The import process ignores all other pages.

About this task



Procedure

1. Edit the row for each existing record to be updated and replace existing values with new values.
   Use the UI field hints to learn about the purpose and content of the field.

   The template validates values as you enter them and highlights cells containing invalid data. While you do not have a provide a value for every column, certain fields may fail validation if you do not provide a value.
2. Review any highlighted cell and resolve the issue.
3. When you finish updating existing rows, save the spreadsheet as an Excel Workbook (.xls).

   The insert templates uses special processing for certain fields:

   - *Updated by Field*: The update template always lists the system administrator user (admin role) in the *Updated by* field regardless of whether the import includes an Updated by column. Even if you provide a different user value in the template, the import process overwrites this value with the system administrator user.
   - Blank Values: The update template uses these rules when handling blank values in spreadsheet cells.

Blank values

Original Value	New Value	Result
Blank value	Any non-blank value	Valid update: the update changes the blank value to the new value.
Any non-blank value	Blank value	Invalid update: the update preserves the existing non-blank value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import a record from the template

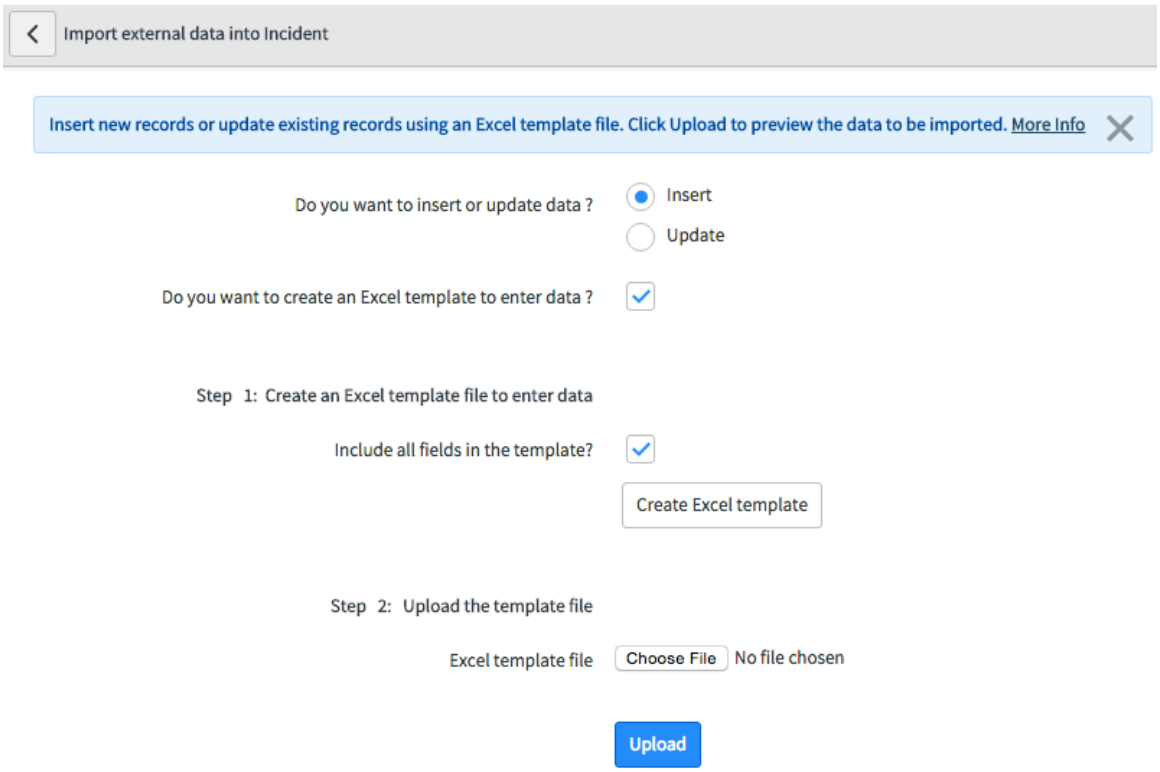
After updating the import template with new data, import the template to your instance.

Before you begin

Role required: admin.

Procedure

1. Navigate to the same list you used to download the import template.
2. Perform the appropriate action for the list version.



3. From *Insert or update*, select the import type.
4. From *File*, select the import template to import.
5. Click **Upload and Preview Import Data**.

   ServiceNow validates the template.

   If the template passes validation and the imported preview matches your expectations, click **Complete Import** to import records into the current table. If the template fails validation, review the errors. Click **Ignore Errors and Complete Import** to continue the import by skipping any bad data cells.

Show reference fields as lists in Excel templates

Display selected reference fields as lists in Excel templates to simplify data selection and updates.

Before you begin

When you do an Easy Import and export the data to an Excel spreadsheet, you may want to convert some cells to lists. For example, in the Incident [sys_incident] record, you may want

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

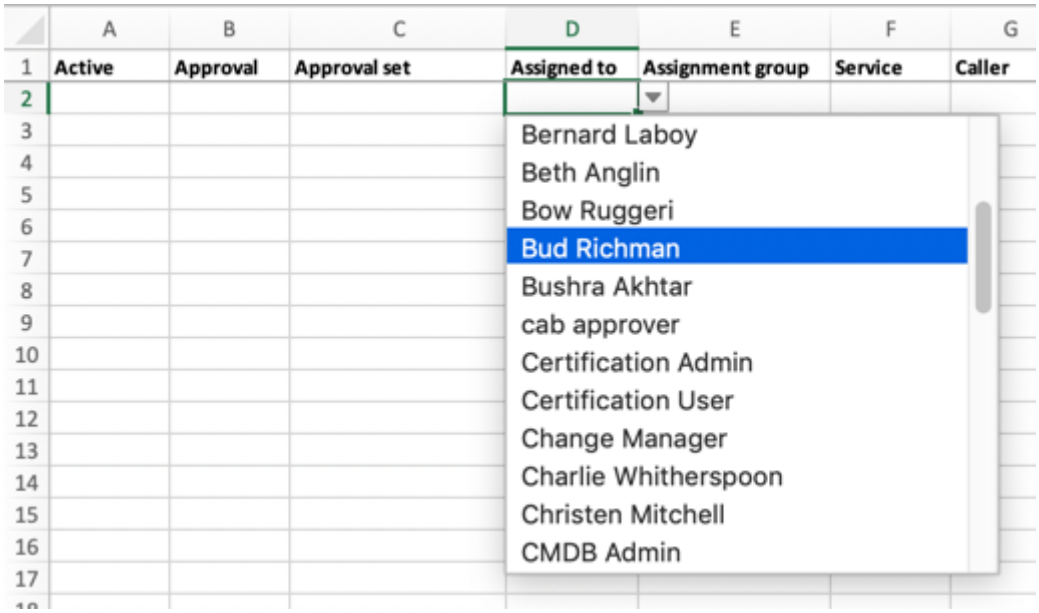
the **Assigned to** field options to appear as a list to enable you to select or update the person assigned to the incident.

Role required: admin

Procedure

1. Navigate to the record for which you want to create lists.
2. Go to the field you want to appear as a list.
3. Right-click the field name and select **Configure Dictionary**.
4. In the **Attributes** field of the Dictionary Entry page, enter the following attribute: `easy_import_ref_as_choice=true`.
5. Save your dictionary entry.
   You can also enter other **Attributes** for the dictionary entry. For example, there is a default limit of 250 entries in a list. If there are more than 250 entry options for a field, the entries do not appear in list format, but as a single entry. Assume that there are 500+ entry options. You can enter the following attribute in the dictionary entry for a field to set a higher limit of 600 entry options for that field: `easy_import_ref_query_limit=600`. The Excel spreadsheet now displays the field as a list of up to 600 options.

   You can set a system-wide limit for the number of entry options at a field by entering a value for the *`glide.easy_import.reference_query_limit`* system property. If the system property is not present or not set and the `easy_import_ref_query_limit` attribute is not set for the field, the default limit of 250 entry options applies. The attribute always takes priority over the property: If both the attribute and the property are set, the attribute value is used.
6. Repeat steps 2-4 for any other fields you want to appear as lists in the Excel output.
   The field appears as a list on the Excel spreadsheet:



Easy import template validation

Each import template must pass two sets of validation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

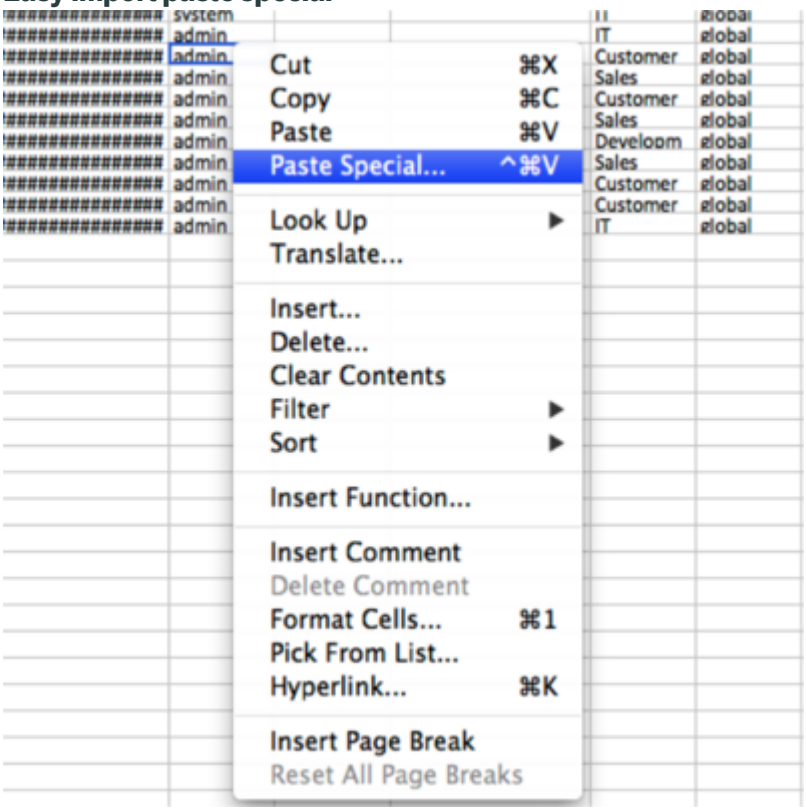
Template validation

Type of validation	Stored in	Results of failing validation
Client-side validation	Import template	The template highlights the invalid cell.
Server-side validation	Instance	The import pauses and displays an error message. 
Template data validation

Some cells in the template contain calculations or validation rules. These rules are intended to help you enter data that is appropriate for the field (column).

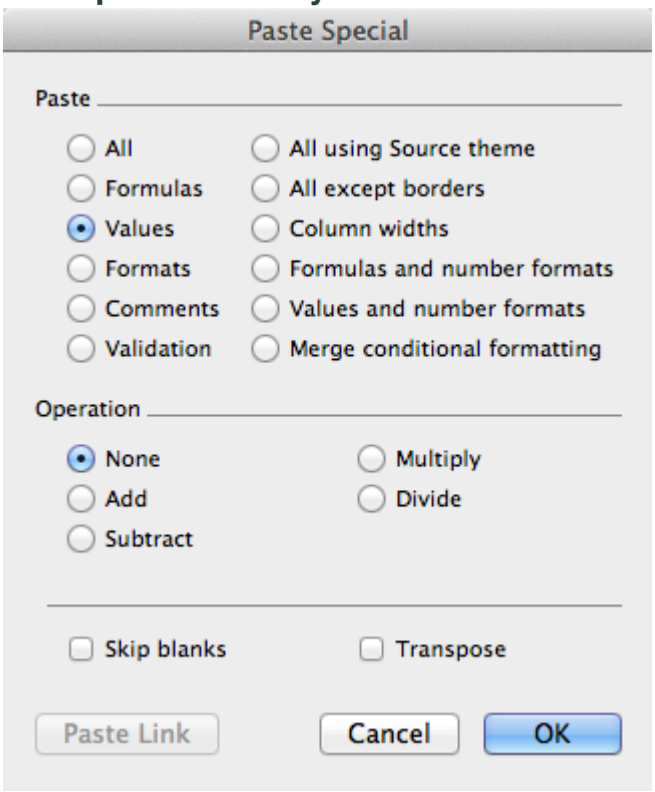
If you want to paste data from another spreadsheet, use the *Paste Special* command to paste only values or match the existing formatting.

Easy import paste special



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Paste special values only



Template type validations

Server-side validation verifies that the import template contains the necessary format.

Template type validation

Template type	Validation done
Insert template	• Template contains a header row with valid field names. • Template contains one or more data rows. • Template does not contain a sys_id column.
Update template	• Template contains a header row with valid field names. • Template contains one or more data rows. • Template contains a sys_id column to match a row to an existing record.

Data type validations

Both client-side and server-side validation verify that template cells contain data that matches the ServiceNow field type.

Data type validations

ServiceNow field type	Validation done
Choice list	Cell contains a value that matches a choice option from the choice list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type validations (continued)

ServiceNow field type	Validation done
Integer	Cell contains a number without any decimal points.
Reference	Cell contains a value that matches an existing related record. This validation applies only to fields in which the list of possible choices is relatively small and mostly static. It does not apply to fields such as 'Assigned To' in which the list of possible choices is dynamic and large. Validation takes place when the data is inserted into the database, but not in Excel. **Note:** When you enter reference field values in the Excel spreadsheet, enter the display value and not the sys_id of the referenced record. Enter this value the same as you would on a form. For example, for a reference to a user record, enter the username.
True | False	Cell contains a true or false value.

Easy import properties

Several properties control the behavior of easy import.

glide.import_template.row_limit

Controls the maximum number of rows included in an easy import template. By default, if a table contains more than 10,000 records, only the first 10,000 are exported.

- Type: Integer
- Default value: 10,000
- Location: Add a system property

glide.easy_import.run_business_rules

When true, business rules, workflows, approval engines, auditing, and field normalization apply when easy import inserts or updates data. This functionality is equivalent to setting GlideRecord.setWorkflow() to true or false.

- Type: true | false
- Default value: true
- Location: Add a system property

glide.import_template.field_types_to_ignore

A list of fields that will be ignored when a record is imported with easy import feature.

- Type: String
- Default value: table_name, order_index, collection, user_image, video, timer, translated_field, conditions, field_name, sys_class_name, journal, journal_input, due_date, user_input, image, workflow, template_value, domain_id, documentation_field, user_roles, glide_list
- Location: Add a system property

Exports

Exports enable you to push data from an instance to an external file. To dynamically export data from a script or web service, export data from the URL.

Get started

Explore Learn about export sets concepts and features.	**Configure** Create export sets, definitions, targets, and schedule an export.
Use Learn how to export directly from a URL.	**Reference** Get details about export set properties.

Products

Export sets

Export sets enable you to push data from an instance to an external file.

Export directly from a URL

To dynamically export data from a script or web service, export data from the URL.

Export sets

Export sets enable you to push data from an instance to an external file.

You can export data to a remote system using a MID Server.

Note:
You must use a MID Server from the Geneva release or later. Earlier MID Server releases do not support export sets. Export sets are not supported on MID Servers in a cluster.

Create an export set

Create an export set to export records from your instance to a file on a MID Server.

Before you begin

Role required: export_set_admin

About this task

Note:
Export sets do not export attachments to records. To download an attachment, either use the REST Attachment API (HTTP request originates from a third-party HTTP client), or use the outbound REST Message module to send the attachment from the instance (HTTP request originates from the instance).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Export Sets** > **Create Export Set**.
2. Enter a descriptive **Name** for the export set.
3. In the **What to export** section, define what data to export in one of these ways.

Option	Description
Select Yes and select an Export Definition record.	Use this configuration if you have already cre ated an export definition record specifying what data to export.
Select No and select a table to export data from.	Use this configuration if you have not created an export definition record. A new export de finition record is created automatically using the selected table that includes fields from the default list view for that table. You can modify the export definition record as needed after creating the export set.

4. In the **Where to export to** section, define where you want to export data to in one of these ways.

Option	Description
Select Yes and select an Export Target record.	Use this configuration if you have already cre ated an export target record specifying where to export data to.
Select No and select a MID Server, and spec ify a path on the MID Server to save the ex ported data to.	Use this configuration if you have not created an export target record. A new export target record is created automatically for the select ed MID Server and file path. You can modify the export target record as needed after creat ing the export set.

5. Click **Submit**.

What to do next

After creating the export set, the Export Set form appears. You can configure advanced options from the form such as specifying a data format or scheduling recurring exports.

Export Set form fields

Field	Description
Name	Enter a descriptive name for this export set.
File name	Enter a name for the target file.
Format	Select the format of the target file, such as CSV.
Append timestamp	Select this check box to append the current date and time to the name of the exported file.
Export definition	Select the export definition that specifies the data to export.

© 2026 ServiceNow, Inc. All rights reserved.

Export Set form fields (continued)

Field	Description
Export target	Select the export target that specifies the location you want to export to.

Create an export set from a list

You can quickly create an export set from a list.

Before you begin
Role required: export_set_admin

Procedure

1. Navigate to a list of records.
2. Perform the appropriate action for the list version.
   The Export Set form appears. An export definition is created automatically based on the list.
3. Configure the export set as needed.
4. Click **Submit**.

Create an export definition

Create an export definition to define what data to export in an export set.

Before you begin
Role required: export_set_admin

About this task
An export definition specifies the data to be exported in an export set. This data includes a table, one or more fields, and optionally a filter to limit the included records.

Procedure

1. Navigate to **All** > **System Export Sets** > **Export Definition**.
2. Click **New**.
3. Enter a descriptive **Name** for the export definition.
4. Select the **Table** to export data from.
5. Select one or more **Fields** from the selected table to export data from.
6. **Optional:** Specify a **Filter** to export only certain records from the selected table.
   Specifying a filter condition on the Created (sys_created_on) or Updated (sys_updated_on) fields may prevent scheduled data exports from using delta exports functionality. Do not specify filter conditions on these fields if you intend to use scheduled delta exports.

Create an export target

Define where to export data to by creating an export target.

Before you begin
Role required: export_set_admin

About this task
You must use a MID Server as the export destination. For more information on MID Server configuration, see MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

Navigate to **All** > **System Export Sets** > **Export Targets** and create a new record (see table for field descriptions).

Export target fields

Field	Description
Name	Enter a descriptive name for the export target.
MID Server	Select the MID Server to export to. The MID Server must have a **Validated** value of **Yes** and a **Status** value of **Up**. **Note:** You must use a MID Server from the Geneva release or later. Earlier MID Server releases do not support export sets. Export sets are not supported on MID Servers in a cluster.
File Path	Specify a path relative to the MID Server directory to save the exported data to. The user account used to run the MID Server must have permission to write to this location.

Related topics

Export set supported file types

Export sets support multiple file types for exporting and pushing data.

File types

You can export to these formats:

- CSV
- XML
- Excel
- JSON

Schedule an export

You can schedule an export to regularly push data from an export set to a remote destination. By setting up a recurring, scheduled export you are able to regularly push data to an external location, such as for reporting or for preserving a snapshot of the data.

Before you begin

Role required: export_set_scheduler or export_set_admin

About this task

You can configure scheduled export sets to export only new or changed records using delta exports.

Procedure

1. Navigate to **All** > **System Export Sets** > **Administration** > **Scheduled Exports**.
2. Click **New**.
3. Fill in the following fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Schedule Data Export fields

Field	Description
Name	Enter a descriptive name for this scheduled export.
Export set	Select the export set to schedule.
Run as	Select the user to run the scheduled export as. Ensure the user has any roles needed to view the data to export.
Run	Select the frequency for scheduled export.
Day	Select which day of the week or month to run this scheduled export on. This field appears when the **Run** field is set to **Weekly** or **Monthly**
Repeat interval	Enter the number of days and hours to wait before repeating this scheduled export. This field appears when the **Run** field is set to **Periodically**.
Time	Enter the time of day to run the scheduled export.
Delta Exports	
Enable delta exports	Select this check box to enable delta functionality for this scheduled export. When selected, only new or changed records are exported.
Delta on or after	Select **Updated** to export all records that changed since the last export, including new records. Select **Created** to export only new records created after the last export. **Note:** If the export definition already includes a filter condition on the sys_updated_on or sys_created_on fields, enabling delta exports will prevent you from saving the scheduled data export record. An error appears at the top of the form in this event.
Last export scheduled run	Leave this field blank to export all records from the export definition. When using delta exports, this field is set automatically each time the scheduled export runs. Records updated or created after this date and time are included in the export delta, depending on the **Delta on or after** value.
Scripts	
Conditional	Select this check box to run the schedule only when a condition is met.
Condition	Write the script to be used to evaluate whether the export should run. This field is visible if you select the **Conditional** check box.
Execute pre-export script	Select this check box to run a script before the export begins.
Pre script	Write the script you want to run before the data is exported. This field is visible if you selected the **Execute pre-export script** check box.
Execute post-export script	Select this check box to run a script after the export finishes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Post script	Write the script you want to run after the export finishes. This field is visible if you selected the **Execute post-export script** check box.

4. Click **Submit**.

What to do next

You can click the **Execute Now** button to run the export immediately and confirm the data is exported as expected.

Scheduled export set delta exports

Delta exports include only the records that changed since the last scheduled export.

You can use delta export for regular tables only, such as the task and problem tables.

Important:
You cannot use delta export for a database view table, which is a virtual table that joins physical tables.

A database view does not include system fields such as sys_created on, sys_created by and sys_updated on. Because the system date fields are not included in the database view, you cannot use delta exports with database views since there is no way to know when the table was last updated.

Scheduled export set scripting options

When scheduling an export set, you can access certain JavaScript objects.

Use these objects in scheduled export set scripts, such as the **Pre-script** and **Post-script** fields.

cancel

Set this object to *true* to stop the export action. Any child export sets are also cancelled if the parent is cancelled. This object is available only in the **Pre-script** field.

Example: Use the **Pre-script** field to evaluate the conditions of the export and determine whether to cancel the export process. To cancel the export process, use the following call:

```
cancel = true;
```

export_set

Get the GlideRecord object for the new export set. This variable allows you to query the following columns from the sys_export_set table:

- name
- sys_id
- state
- table_name

This object is available in both the **Pre-script** and **Post-script** fields.

Example: If you want to use information from the export set, you can specify one of the properties of the export_set variable.

```
var x = export_set.sys_id;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Export set history

An export set history record is automatically created whenever an export set runs, either scheduled or manually started by a user. Export set history records allow you to monitor and troubleshoot the progress of export sets.

Fields on the Export History form display the current status of the export set. The **Export Log** related list shows a detailed list of changes to the export set status.

Export History form fields

Field	Description
Export set	The export set that was run.
Started	The date and time the export started.
Completed	The date and time the export completed.
Export time	The amount of time it took to export the data, excluding the time it took to transfer the data to the target.
Run time	The amount of time it took to export the data, including the time it took to transfer the data to the target.
State	The current state of the export.
Delta export	The export used delta export functionality if this check box is selected.
ECC queue	The ECC Queue record associated with this export set run. This field is visible only to users with the admin role.
MID Server Attachment	A MID Server attachment record containing a copy of the exported file. The exported file is attached to this record in addition to being saved on the MID Server.

The **State** field may have the following values.

States

State	Description
Exporting	The export set is creating a file with the data to export.
MID Server Processing	The export set successfully created a file with the data to export. The file is being processed by the MID Server.
Completed	The export set successfully ran and sent the exported file to the target.
Completed wth errors	The export set ran, but encountered one or more errors.
Cancel requested	A user requested that the export set be cancelled.
Cancelled	The export set was cancelled.

Cancel an export set

You can cancel a running export set to stop the data from being sent to a MID server.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: export_set_admin

About this task
You can cancel only exports that have not yet been sent to a MID server. You cannot cancel an export after it reaches the **MID Server Processing** state.

Procedure
1. Navigate to **All** > **System Export Sets** > **Export Sets**.
2. Select an export set.
3. In the **Export Histories** related list, select a record with the **State** value of **Exporting**.
4. Click **Cancel Export Set**.

Export Set properties

Multiple properties control export set behavior.

Properties

Property	Description
glide.excel.local_based_currency	For Excel files, option to format currency values to match the localization of the instance. For example, say you've activated the I18N: French Canada Translations plugin on your instance, and you're exporting a currency value of 6300. If this property is set to true, the value will be correctly formatted as 6,300 €. If this property is set to false, the value will be formatted as € 6,300. For more information on localization, see Localization Framework. • Type: true | false • Default: false • Location: Add a system property
glide.export.excel.duration.readable_string	For Excel files, option to format duration fields i days, hours, minutes, and sometimes, seconds When false, duration fields are given in second For example, the **Actual elapsed time** field might have a value of 191,760 seconds. When true, duration fields are formatted in days hours, and minutes. For example, the **Actual elapsed time** field mentioned previously would have a value of 2 Days, 5 Hours, and 16 Minutes In some situations, duration fields include seconds, even when this property is true.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Property	Description
	This happens when the duration is less than one minute, or when the system property *glide.ui.duration.seconds.enable* is true. • Type: true | false • Default: false • Location: Add a system property
glide.export.xlsx.zip64_mode	For XLSX files, controls the compression mode. When true, XSLX files are generated using the Zip64 algorithm. • Type: true | false • Default: false • Location: Add a system property
glide.scheduled_export.stop_on_parent_error	When true, if a parent scheduled export set encounters an error, scheduled child export sets don't run. • Type: true | false • Default: false • Location: Add a system property

Export directly from a URL

Dynamically export data from a script or web service by building a URL query.

Before you begin

Role required: None

Note:
ServiceNow enforces basic authentication for direct URL access. The data extracted from the URL contains only the fields to which the currently authenticated user has read access.

About this task

You can use URL queries to generate filtered lists of records programmatically before exporting them. URL queries are useful for scripts that generate a list of records or when no user can manually add the filter from the UI.

You must be familiar with the ServiceNow table and column names to export data directly from the URL. See Navigate to a record or a module using a URL.

You can control whether to export the display value or raw value of fields and the field label or field name for headers using query parameters or system properties.

- For details on using query parameters, see Query parameters for display value and header.
- For details on using system properties, see System properties for display value and header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters, if present, override system properties.

Procedure

1. Specify the instance URL.
   For example:

```
https://<instance name>.service-now.com/
```

2. Specify the table form or list to export.
   For example:

```
incident_list.do
```

3. Specify the export format processor to use for the export.
   You can specify CSV, XLS, JSON, XLSX, or XML. For example:

```
?CSV
```

Note:
The XML processor in a URL export doesn't export attachments or journal fields. To export attachments and journal fields like the **Work Notes** or **Additional Comments** fields, export the records from a list by using the **Export** > **XML** option in the context menu.

4. **Optional:** Query for specific records by adding the *sysparm_query* parameter.
   The required syntax is `sysparm_query=[column name][operator][value]`. For example:

```
https://<instance
 name>.service-now.com/incident_list.do?XML&sysparm_query=prior
ity=1
```

Note:
All queries use a column name, an operator, and a value. See Condition Builder for a list of available operators.

5. **Optional:** Sort the records by column name using the *sysparm_orderby* parameter.
   The required syntax is `sysparm_orderby=[column name]`. For example:

```
https://<instance
 name>.service-now.com/incident_list.do?XML&sysparm_query=prior
ity=1&sysparm_orderby=assigned_to
```

Note:
You can sort by only one column using *sysparm_orderby*. To sort by multiple columns, use multiple orderby entries. For example:

```
sysparm_query=ORDERBYassigned_to^ORDERBYpriority
```

6. **Optional:** Export fields from a specific view using the *sysparm_view* parameter.
   The required syntax is `sysparm_view=[view name]`. For example:

```
https://<instance
 name>.service-now.com/incident.do?CSV&sysparm_view=ess
```

This URL exports incident fields visible from the Self Service (ess) view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- By default, exporting data from a list exports only the fields that are visible from the current view. If you want to export fields from another list view, you can switch views from the UI. See View management.
- If you're exporting CSV or Excel data and don't specify a view, the export uses the default list view.
- If you're exporting XML data, all fields are exported by default unless you specify a particular view.

7. **Optional:** Export specific fields from the table using the *sysparm_fields* parameter.
   The required syntax is `sysparm_fields=[field1],[field2]`. For example:

```
https://<instance
 name>.service-now.com/incident_list.do?CSV&sysparm_fields=sys_
id,number
```

8. **Optional:** Export all fields from the table, including the sys_id, using the *sysparm_default_export_fields* parameter.
   The required syntax is `sysparm_default_export_fields=all`. For example:

```
https://<instance
 name>.service-now.com/incident_list.do?CSV&sysparm_default_exp
ort_fields=all
```

   The *sysparm_default_export_fields* parameter has no effect on XML exports unless you include the *sysparm_view* parameter to specify a non-default view.

Example: Sample URLs

URL	Description
https://<instance name>.service-now.com/incident_list.do?CSV	Export all incidents to a comma-separated value text file.
https://<instance name>.service-now.com/incident_list.do?CSV&sysparm_query=sys_id%3E%3Db4aedb520a0a0b1001af10e278657d27	Export a particular incident to a comma-separated value text file.
https://<instance name>.service-now.com/incident_list.do?CSV&sysparm_orderby=sys_id	Export all incidents to a comma-separated value text file and sort the list by sys_id.
https://<instance name>.service-now.com/incident_list.do?XML&sysparm_query=priority=1&sysparm_orderby=assigned_to	Export a list of all priority 1 incidents to an XML file and sort the list by **Assigned to** field.

Call URL export programmatically

Dynamically export data from a script or web service by calling a URL export from any programming language.

Before you begin

Role required: none

About this task

The following procedure includes code samples that demonstrate calling a URL export in C# for a .Net framework call:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Add the following Imports:

```
using System.Net;
using System.IO;
```

2. Call the Download method:

```
static void Main(string[] args)

    {
        // Call to DownloadFile method supplying the URL and
 location to save CSV file locally
        int read =
 DownloadFile("https://
<instance>.service-now.com/incident_list.do?CSV&sysparm_query=p
riority=1&sysparm_orderby=assigned_to",
                    "c:\\test\\incident.csv");
    }
```

3. Create a Download method as follows:

```
public static int DownloadFile(String url,
                                    String localFilename)
    {
        // Function will return the number of bytes processed
        // to the caller. Initialize to 0 here.
        int bytesProcessed = 0;
        // Assign values to these objects here so that they can
        // be referenced in the finally block
        Stream remoteStream = null;
        Stream localStream = null;
        WebResponse response = null;
        // Use a try/catch/finally block as both the WebRequest
 and Stream
        // classes throw exceptions upon error
        try
        {
            // Create a request for the specified remote file
 name
            WebRequest request = WebRequest.Create(url);
            // Create the credentials required for Basic
 Authentication
            System.Net.ICredentials cred = new
 System.Net.NetworkCredential("user_name", "password");
            // Add the credentials to the request
            request.Credentials = cred;
            if (request != null)
            {
                // Send the request to the server and retrieve
 the
                // WebResponse object
                response = request.GetResponse();
                if (response != null)
                {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                    // Once the WebResponse object has been
retrieved,
                    // get the stream object associated with
the response's data
                    remoteStream =
response.GetResponseStream();
                    // Create the local file
                    localStream = File.Create(localFilename);
                    // Allocate a 1k buffer
                    byte[] buffer = new byte[1024];
                    int bytesRead;
                    // Simple do/while loop to read from stream
until
                    // no bytes are returned
                    do
                    {
                        // Read data (up to 1k) from the stream
                        bytesRead = remoteStream.Read(buffer,
0, buffer.Length);
                        // Write the data to the local file
                        localStream.Write(buffer, 0,
bytesRead);
                        // Increment total bytes processed
                        bytesProcessed += bytesRead;
                    } while (bytesRead > 0);
                }
            }
        }
        catch (Exception e)
        {
            Console.WriteLine(e.Message);
        }
        finally
        {
            // Close the response and streams objects here
            // to make sure they're closed even if an exception
            // is thrown at some point
            if (response != null) response.Close();
            if (remoteStream != null) remoteStream.Close();
            if (localStream != null) localStream.Close();
        }
        // Return total bytes processed to caller.
        return bytesProcessed;
    }
```

Break up a large export

If the number of records to be exported exceeds the actual export limit, you may want to break the export into smaller increments that do not place a significant performance load on the platform.

Before you begin

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a filtered list of records that you want to export by following the steps in Export directly from a URL.
2. Write down the number of records returned.
3. If the record number is higher than the defined threshold, issue a *sysparm* query for the first 10,000 records using the following syntax:

   ```
   https://<instance
    name>.service-now.com/syslog_list.do?XML&sysparm_orderby=sys_i
   d&sysparm_record_count=10000
   ```

   This exports the first 10,000 records in order, sorted by the *sys_id* number.

4. Find the next record in order, such as 10,001.
   You can find the next Sys ID value by creating a database view on the table and adding the sys_id column to the view. You don't need to specify a where clause. After you create the database view, view the records and their Sys ID values by selecting **Try it**. You can sort by the sys_id column and enter 10,001 to skip to that row.
5. Right-click the row and copy the sys_id of the next record you want to export.
6. Access the next series of records with a *greater than or equal to* query run against the *sys_id* of record 10,001.

   The following example shows a query that uses a sys_id of b4aedb520a0a0b1001af10e278657d27. Use the syntax shown in this query to export the next set of records.

   ```
   https://<instance
    name>.service-now.com/syslog_list.do?XML&sysparm_query=sys
   _id%3E
   %3Db4aedb520a0a0b1001af10e278657d27&sysparm_orderby=sys_id&sysp
   arm_record_count=10000
   ```

   Note:
   URL queries use typical percent encoding. In this example, the greater than sign (>) is encoded as %3E and the equal sign (=) is encoded as %3D.

7. **Optional:** Continue issuing this query, using the starting sys_id for the next set of records until you have exported all the necessary records.

Classic Orchestration

ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance.

Orchestration is available as a separate subscription from the rest of the ServiceNow platform. See Activate Orchestration for details.

Introduction to Orchestration

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. Subject matter experts can create activities that are reusable to numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well-designed orchestrations never fail and apply human tasks to address errors as they arise.

Orchestration tools

Orchestration can make calls outside of a ServiceNow instance, directly to web services or through a MID Server to systems within corporate firewall. Orchestration also enables the creation reusable activities that wrapper Java Script functions for manipulating things inside the platform. Orchestration extends the Workflow editor by providing these features:

- Activity packs containing ready-to-use activities.
- Activity Designer, which enables developers to create custom activities without an over dependence to create scripts to orchestrate to third-party systems.
- Ability to create activity packs using Scoped Applications.
- A Databus for following the flow of data across orchestration activities.

Orchestration Core provides entitlements to use specific applications:

Client Software Distribution

An application that automates software delivery from the Service Catalog. Provides OOB support for SCCM. Partner solutions support Macs using JAMF. Other third-party solutions provide support through the extension framework.

Configuring Password Reset

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An application for users to reset their password in Active Directory. It can expand to communicate with other third-party systems.

Orchestration ROI

Enables users to evaluate estimated costs and actual costs for tasks, automate these tasks, and track the ROI of these tasks.

Systems that Orchestration can automate

Orchestration can automate tasks such as employee onboarding, user access rights, server management, managed file transfers, and security operations orchestration activities. For example, you might use the Active Directory and Exchange activities provided in the base Orchestration system to set up network accounts and mailboxes for new employees.

If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the Orchestration Activity Designer. The external systems that Orchestration can automate for:

- Any system exposing web services (SOAP, REST)
- Any system accessible from the command line (such as a UNIX system accessible through SSH, a Windows system enabled for PowerShell remoting or WMI)
- Numerous proprietary services: Windows Active Directory, Microsoft Exchange mail servers, InfoBlox, and F5 Networks.

> **Note:**
> For a full list of Activity Pack service offerings, see Orchestration Core Activity Packs.

- Any filesystem accessible by SFTP
- Any database with a compliant JDBC driver
- Additional Activity Packs are also available with other ServiceNow products, such as Security Operations

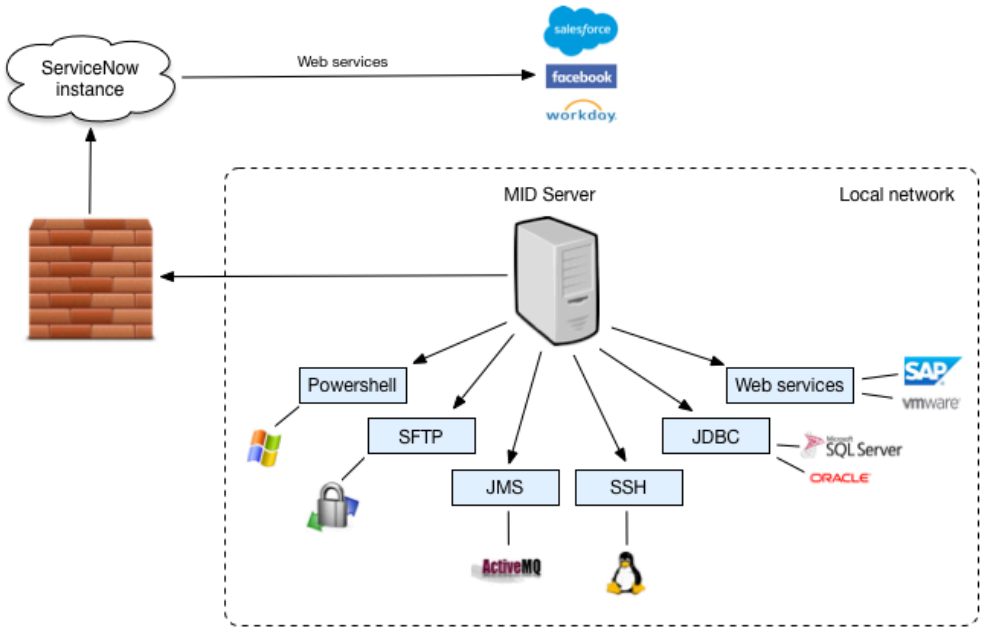
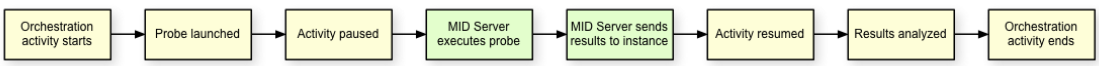
Orchestration capabilities



Orchestration workflow

When an Orchestration activity starts within a workflow, Orchestration launches a Discovery probes and sensors and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the request and executes the probe. When the probe reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

Orchestration workflow



Domain separation and Orchestration

Domain separation is supported in Orchestration. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard*

- Includes **Basic** level
- Business logic: Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another.

Domain separation for service providers

Activate Orchestration

The Orchestration (com.snc.runbook_automation) plugin is available within a separate subscription from the rest of the ServiceNow platform.

Before you begin

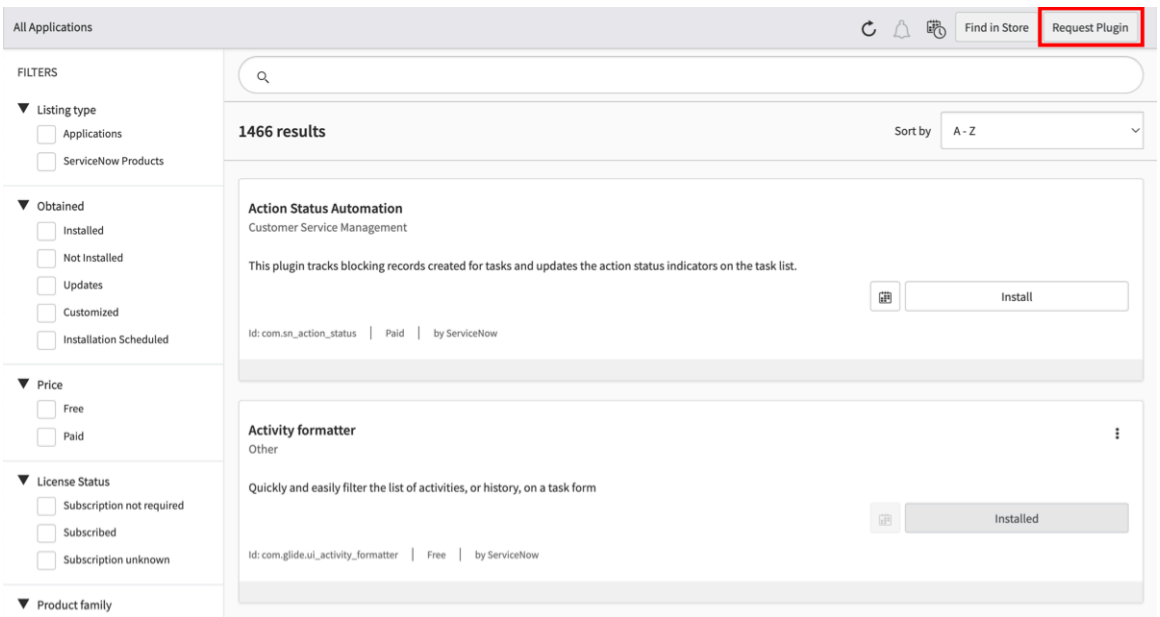
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Role required: none

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.

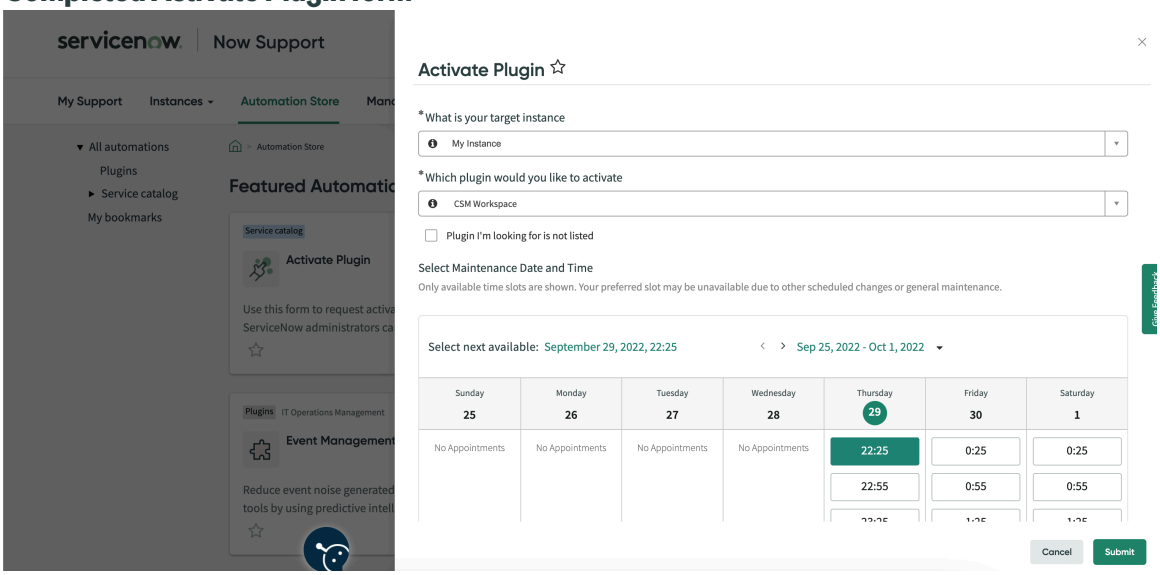
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

List of Orchestration plugins

This table lists all plugins available for Orchestration and their dependencies.

These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.

Name	Description	Dependencies
Orchestration [com.snc.runbook_automation]	Main plugin for the Orchestration feature. This plugin extends Workflow to automate operations with external systems. Use this plugin to orchestrate business services, applications, and infrastructure.This plugin automates operations such as deployments, configurations, and information gathering. Orchestration can automate Web Services and uses MID Servers to execute commands on devices inside an enterprise's network.	• Orchestration - ROI • Orchestration - Runtime
Orchestration - Active Directory [com.snc.orchestration.ad]	Installs the Active Directory activity pack. These activities create, delete, and manage objects in Windows Active Directory.	Orchestration
Orchestration - Asset Lease Management [com.snc.orchestration.asset_lease_management]	Provides the software lease functionality for Client Software Distribution. Allows users to select the start and end dates of software leases and to request an extension of a lease. **Note:** This plugin is not automatically enabled when Orchestration is active.	None
Orchestration - Azure Active Directory [com.snc.orchestration.azure.ad]	Installs the Azure AD activity pack. These activities automate employee onboarding and offboarding functions on Azure Active Directory and manage Office 365 licensing.	Orchestration
Orchestration - Client Software Distribution [com.snc.orchestration.client_software_distribution]	Allows the distribution of software from the service catalog using third party management systems, such as Microsoft System Center Configuration Manager (SCCM) **Note:** This plugin is not automatically enabled when Orchestration is active.	• Orchestration - System Center Configuration Manager • Orchestration - Asset Lease Management • Service Catalog Scoped API • Software Asset Management
Orchestration - Exchange [com.snc.orchestration.exchange]	Installs the Exchange activity pack. These activities manage Microsoft Exchange mail systems.	Orchestration

Name	Description	Dependencies
Orchestration - F5 network management [com.snc.orchestration.f5]	Installs the F5 Network Management activity pack. These activities configure elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.	Orchestration
Orchestration - Infoblox DDI Activity Pack [com.snc.orchestration.infoblox]	Installs the Infoblox DDI activity pack. These activities support Infoblox DDI management.	Orchestration
Orchestration - PowerShell [com.snc.orchestration.powershell]	Installs the PowerShell activity pack. These activities control and automate the administration of Windows machines and applications, using the Windows .NET Framework.	Orchestration
Orchestration - Probe [com.snc.orchestration.probe]	Installs the Probe activity pack. These activities run ServiceNow® probes on target hosts to return specific information.	Orchestration
Orchestration - ROI [com.snc.runbook_automation.roi]	Installs an Orchestration application that estimates savings resulting from automated tasks in an instance and computes actual savings. Orchestration - ROI is activated automatically with a base Orchestration subscription.	• Performance Analytics • Cost Management
Orchestration - ROI Premium [com.snc.runbook_automation.roi_premium]	Installs a premium dashboard that displays detailed reports on calculated savings for automated tasks over time. The Orchestration - ROI Premium plugin requires purchase and activation of the Performance Analytics - Premium plugin to display its reports. **Note:** This plugin is not automatically enabled when Orchestration is active.	• Orchestration - ROI • Performance Analytics - Premium
Orchestration - Runtime [com.snc.runbook_automation.runtime]	Enables other applications on the ServiceNow® platform to distribute and use orchestration content without requiring an Orchestration subscription. The Orchestration - Runtime plugin displays the Orchestration activities shipped with these applications in the Workflow Editor and allows customers to modify the activities without requiring an Orchestration license.	• Workflow Runtime Engine • Core Automation
Orchestration - SFTP [com.snc.orchestration.sftp]	Installs the SFTP File Transfer activity pack. These activities manage files and directories on an SFTP server and move files from one SFTP server to another.	Orchestration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Dependencies
Orchestration - SSH [com.snc.orchestration.ssh]	Installs the SSH activity pack. These activities read, write, and copy files, and reset user passwords on Linux computers.	Orchestration
Orchestration - System Center Configuration Manager [com.snc.orchestration.sccm_mgmt]	Installs the System Center Configuration Manager (SCCM) activity pack. These activities manage software deployments and collections on an SCCM server.	Orchestration

Orchestration Runtime plugin

The Orchestration – Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

The Orchestration – Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the **Packs** tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.

Included with the plugin

The Orchestration – Runtime plugin provides access to the **Packs** and **Data** tabs in the Workflow Editor. This plugin gives users access to custom activities for their applications and enables them to reuse data from the Databus. This plugin does not provide access to custom Orchestration activity packs or to the activity designer. The **Custom** tab in the Workflow Editor is not available without an Orchestration subscription.

Orchestration plugin relationships

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dependencies

The Orchestration – Runtime plugin activates these application plugins:

- Security Incident Response Orchestration
- Service Release Automation

.

Access to activities

Custom activities shipped with ServiceNow® applications are available in the **Packs** tab of the Workflow Editor for use in workflows. To edit these activities, navigate to **Orchestration** > **Activity Designer Activities** and select the activity you want to modify. For information about the provider templates used to create these activities, see Orchestration custom activity templates.

List of Orchestration activities

Use Orchestration activities in a Workflow to integrate with third-party systems.

Several Orchestration activities have been rewritten as Application scope activities using the activity designer and grouped into activity packs. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.

Global activities

These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the **Packs** and **Custom** tabs in the Workflow Editor.

Activity	Description
Test Server Alive	Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to validate whether the target system is alive.

Active Directory (AD) activities

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

Activity	Description
Create AD Object	Creates a user account in Windows Active Directory when a user account is created in a ServiceNow instance.
Disable AD User Account	Marks a Windows Active Directory user account disabled, making it inactive.
Enable AD User Account	Enables a Windows Active Directory user account, making it active.
Query AD	Retrieves entries from the Windows Active Directory based on a search filter.
Remove AD Object	Deletes a user account from Windows Active Directory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity	Description
Reset AD User Password	Resets the password of a user account in Windows Active Directory.
Change AD User Password	Changes the password of a user account in Windows Active Directory.
Update AD Object	Updates a user account in Windows Active Directory.
Is AD Account Locked	Determines if an Active Directory user account is locked.
Unlock AD Account	Unlocks a locked Active Directory user account.

Azure AD

All these activities are scoped and part of the Azure AD activity pack. They do not have legacy versions.

Activity	Description
Add User to Group	Adds a user to an existing security group in Azure Active Directory.
Assign User License	Assigns an extra Office 365 software license to the named user.
Create User	Creates a user for the Azure Active Directory tenant.
Delete User	Deletes the named user's account from the Azure Active Directory tenant.
Get User Info	Returns the named user's information from the Azure Active Directory.
Remove User from Group	Removes an existing user from a security group in Azure Active Directory.
Remove User License	Revokes the specified Office 365 software license for the named user.
Reset User Password	Changes the named user's Azure Active Directory password.

F5 Network Management activities

All these activities are scoped and part of the F5 Network Management activity pack. They do not have legacy versions.

Activity	Description
Add F5 Pool	Creates the load balancer pool.
Check F5 Pool	Checks the status of a pool to validate whether it is available to accept traffic.
Delete F5 Pool	Deletes an F5 pool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity	Description
Add F5 Pool Member	Adds a member to an F5 pool.
Get F5 Pool Member	Returns the pool members and verifies the pool status.
Delete F5 Pool Member	Deletes an F5 pool member.
Add F5 Virtual Server	Adds a virtual server.
Modify F5 Virtual Server	Configures a virtual server assigned to an F5 pool with irules and a vlan.
Delete F5 Virtual Server	Deletes a virtual server from an F5 pool.
Add F5 Profile to Virtual Server	Adds a profile to a virtual server assigned to an F5 pool.

Infoblox activities

All these activities are scoped and part of the Infoblox DDI activity pack. They do not have legacy versions.

Activity	Description
DHCP Reserve IP v4 Address Range	Reserves an IP address range for DHCP use.
DHCP Delete IP Reservation	Deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.
DHCP List IP Reservations	Generates a list of all the DHCP range reservations on a specific Infoblox server.
List DNS C-records	Retrieves all canonical (CNAME) records from a specified Infoblox server.
Register DNS A-record	Creates a DNS A record on a specified Infoblox server.
Register DNS C-Record	Creates a DNS canonical (CNAME) record on a specified Infoblox server.
List DNS Record	Generates a list of all the DNS entries on a specific Infoblox server.
DNS Delete	Deletes DNS records of any type from in Infoblox server, such as C and A records.
IPAM Register IP Address	Registers an IP address in a network using Infoblox IPAM.
IPAM Reserve IP Address	Reserves an IP address in a network using Infoblox IPAM.
IPAM List IP Reservations	Returns an array of all IP Address within the named Infoblox Server.
IPAM Delete	Deletes an IP Address within a named Infoblox server.
Create Network	Creates networks on a specified Infoblox server.
Get Network Details	Retrieves the information about a specific network on an Infoblox server.
Delete Network	Deletes a network from an Infoblox server.
List Registered Networks	Retrieves all the networks associated with an Infoblox server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Exchange activities

All Exchange Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Exchange activity pack. All previous version Exchange activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

Activity	Description
Create Address List	Creates an address list that acts as an alias for emailing all users in the group. This alias cannot be used to manage user permissions.
Delete Address List	Removes an existing address list from an Exchange server.
Get Address List	Retrieves all attributes from the specified Exchange address list.
Move Address List	Moves an Exchange address list to another location in the address hierarchy.
Set Address List	Modifies an Exchange address list.
Update Address List	Adds or removes users from the specified address list and immediately applies any cached address list changes to the server.
Create Mailbox	If a user does not exist, creates a new Active Directory user and associated Exchange mailbox.
Delete Mailbox	Deletes the Exchange mailbox of an Active Directory user.
Disable Mailbox	Disables the mailbox associated with a specified Active Directory account.
Enable Mailbox	Creates a mailbox for an existing Active Directory user.
Get Mailbox	Gets the mailbox for the specified user or all mailboxes on an Exchange server.
Set Mailbox	Modifies the settings of an existing Exchange mailbox.

PowerShell activities

These PowerShell activities were rewritten as scoped activities and are available in the PowerShell activity pack. All previous version PowerShell activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

Activity	Description
Install Windows App	Installs an application on a Windows target machine.
Join Domain	Joins a Windows machine to a domain.
Restart Windows Server	Restarts a Windows server using PowerShell.
Uninstall Windows App	Uninstalls an application from a Windows target machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity	Description
Change Service State	Starts or stops a Windows service on a remote system.

Probe activities

These probe activities were rewritten as scoped activities and are available in the Probe activity pack. All previous versions of these activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

Activity	Description
Resolve DNS Name	Resolves an IP address or a fully qualified domain name (FQDN) into one or more IP addresses.
SNMP Query	Queries an SNMP device.

SCCM activities

All these activities are scoped and part of the SCCM activity pack. They do not have legacy versions.

Activity	Description
Add to Device Collection	Adds a device to a Microsoft System Center Configuration Manager (SCCM) device collection.
Add to User Collection	Adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.
Get Applications	Returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.
Get Deployments	Returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.
Get Device Collections	Returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.
Get User Collections	Returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) host.
Remove from Device Collection	Removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.
Remove from User Collection	Removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH activities

These SSH activities were rewritten as scoped activities and are available in the SSH activity pack. The SSH activities not converted to scoped activities were moved to the Orchestration - Deprecated category, but are still available for all workflows.

Activity	Description
File Copy	Copies a file on a Linux or Unix computer, via SSH.
File Read	Reads a file on a Linux or Unix computer, via SSH.
File Write	Writes a file on a Linux or UNIX computer.
File Replace String	Finds and replaces a string in a file on a Linux or UNIX computer.
Files Compare	Compares two files on a Linux or Unix computer, via SSH.
Reset Linux User Password	Resets the password for a given user on a Linux computer.
Secure Copy	Copies a file from one host to another, without storing the copied file on the MID Server.

SFTP activities

All these activities are scoped and part of the SFTP File Transfer activity pack. They do not have legacy versions.

Activity	Description
Copy File	Copies a file from an SFTP server (source host) to another SFTP server (target host).
Create Directory	Creates a directory on an SFTP server.
Get File List	Returns a list of files from a given directory and its subdirectories on an SFTP server (source host).
Remove File or Directory	Removes a file or a directory on an SFTP server, including subdirectories, when configured.
Rename File or Directory	Renames a file or directory to a new name on an SFTP server.
Set File Attributes	Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deprecated activities

These activities have been removed from the Workflow Editor and are not available for new workflows, but continue to work normally in existing workflows. You can reactivate the deprecated activity or duplicate the functionality of a deprecated activity as a scoped activity by recreating it using the activity designer.

Activity	Description
Run Probe	Launches a MID Server probe on behalf of a document.
SOAP Request	Executes a SOAP request on a target server. The SOAP Message activity replaces this activity.
Run Command	Runs a command (including shell scripts) on a Linux or UNIX computer.
Run SCP	Uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides. The Secure Copy activity replaces the Run SCP activity.
Run Powershell	Executes Windows PowerShell commands on a MID Server.

Available activity packs

Activity packs are available with your subscription to Orchestration.

Before you begin

Role required: admin

About this task

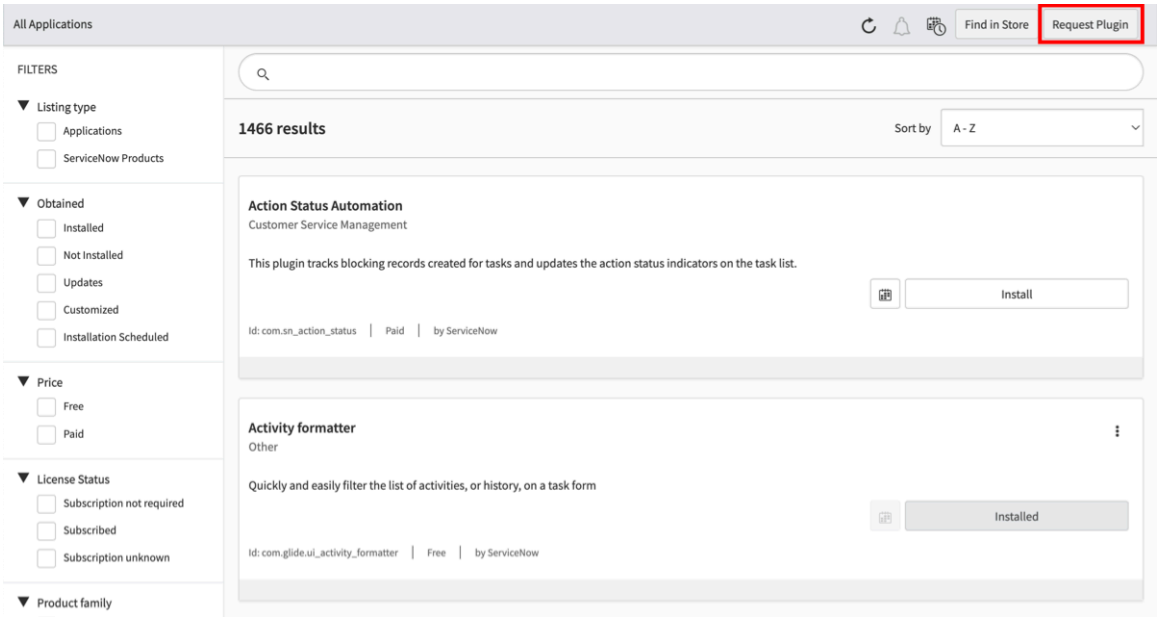
The following activity packs are available and active with your Orchestration subscription:

- Orchestration - Active Directory (com.snc.orchestration.ad)
- Orchestration - Azure Active Directory (com.snc.orchestration.azure.ad)
- Orchestration - Exchange (com.snc.orchestration.exchange)
- Orchestration - SFTP (com.snc.orchestration.sftp)
- Orchestration - Infoblox DDI Activity Pack (com.snc.orchestration.infoblox)
- F5 Network Management activity pack (com.snc.orchestration.f5)
- Orchestration - SSH (com.snc.orchestration.ssh)
- Orchestration - PowerShell (com.snc.orchestration.powershell)
- Orchestration - System Center Configuration Manager (com.snc.orchestration.sccm_mgnt)

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

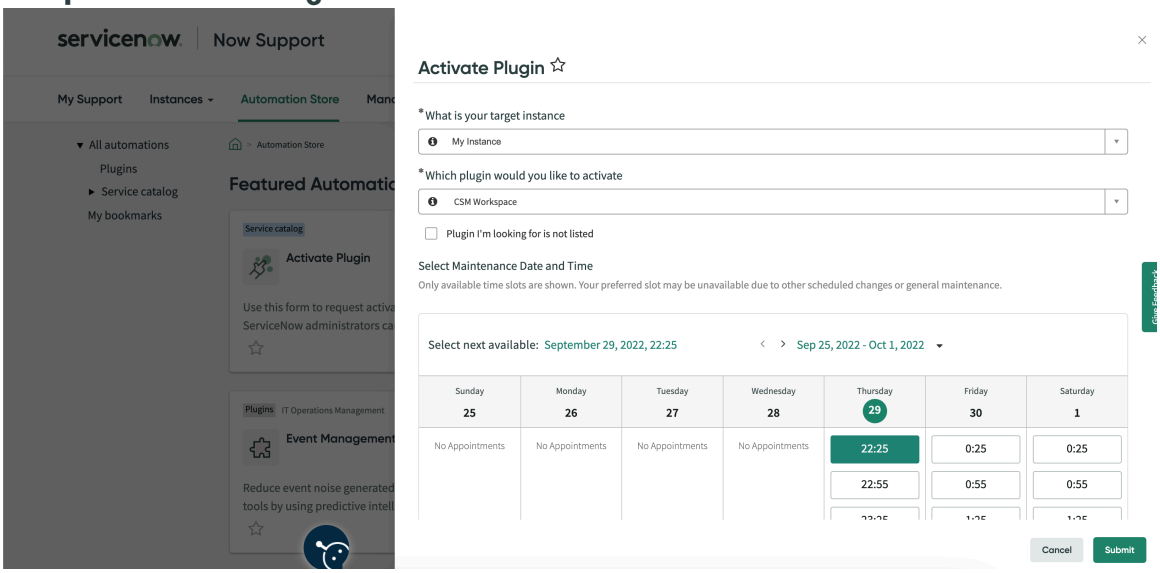
Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Deprecated Orchestration activities

These Orchestration activities have been deprecated.

Run Probe

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.

> **Important:**
> This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the Probe activity template to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.

Run Probe input variables

Field	Description
Probe	Select a MID Server probe from the list. This is the name of the probe as it appears in the *discovery_probes* table.
Source for probe	Enter the IP address of the host system against which the probe runs (the probe's target).
Sensor script	The script to run using the results of the probe. The output from the probe is contained in a variable called *output*. Any error from the probe is contained in a variable called *error*.

SOAP Request

The SOAP Request activity executes a SOAP request on a target server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
This activity is deprecated and is replaced by the SOAP Message workflow activity activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

SOAP Request input variables

Field	Description
SOAP URL	The SOAP endpoint.
Username	User name for basic authentication credentials.
Password	Password for basic authentication credentials.
Envelope Script	Script for setting up parameters for the web service.
Sensor Script	The script to execute after the request has been made and a response has been received.

Reactivate a deprecated activity

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

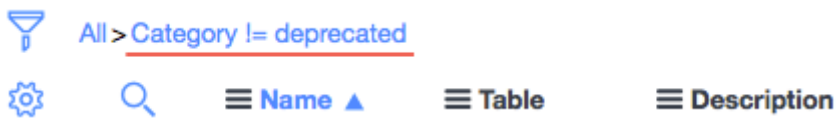
Before you begin

Role required: workflow_admin, admin

Note:
Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the databus and input variable testing.

Procedure

1. Navigate to **All** > **Workflow** > **Administration** > **Activity Definitions**.
2. In the list of activities, clear the condition **Category !=deprecated** from the filter.



3. Open the definition record for the activity you want to reactivate.
4. Select the **What to Display** tab.
5. In the **Category** field, replace the value **deprecated** with another category.
   This can be an arbitrary string.
6. Click **Update**.
   The system creates a new category using the value provided and reactivates the activity, which becomes available in the **Core** tab of the Workflow Editor.

SOAP Message workflow activity

The **SOAP Message** activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

SOAP Message activity input variables

Field	Parameter	Description
SOAP Message	soap_message	The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sys_soap_message] table. (**System Web Services** > **Outbound** > **SOAP Message**)
SOAP Message Function	soap_message_function	The function to call that is defined in the SOAP Message. Functions are listed in the **SOAP Message Functions** related list in each SOAP Message record.
SOAP Endpoint	soap_endpoint	Endpoint to use instead of the **SOAP endpoint** value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.
Variables	variables	Variables to substitute into the SOAP **Envelope** defined in the SOAP Message Function record. Use this format for the string: `name1=value1, name2=value2, . . .` If either the name or value contains a comma or equal sign, escape these characters with a backslash.
Use MID Server	use_midserver	Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the **MID Server** field, workflow automatically attempts to find a MID Server.
MID Server	midserver	Name of the MID Server to use. This field appears when you select the **Use MID Server** check box. The workflow ignores this parameter if the *`use_midserver`* parameter is disabled. **Note:** You can only select a specific MID Server in the legacy SOAP message activity and REST messages. These legacy activities do not use the MID Server selection available starting with the Istanbul release.
Sensor Script	sensor_script	The script to execute after the request has been made and a response has been received. You can access the full XML response body from the *`activity.output`* object.

Probes used by Orchestration

Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.

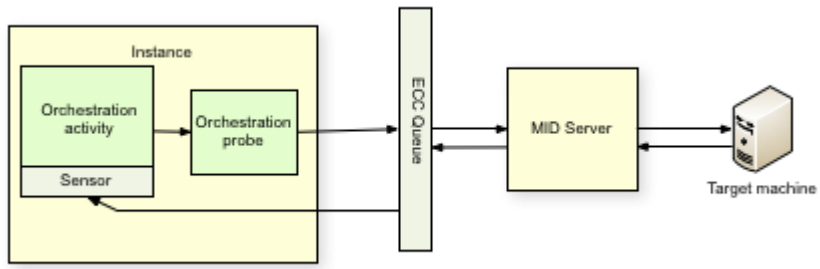
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How Orchestration probes work

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an *output* record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an *input* record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

Note:
The probe parameters are set by the activities that launch the probe.

How Orchestration uses probes



Probe List

The base system includes the following Orchestration probes (**Orchestration** > **Definition** > **Probes**).

Probe List

Probe Name	ECC Queue Topic	ECC Queue Name	Description
Command	Command		A probe that runs a local command on the MID server.
DNS Name Resolver	DNSNameResolver		A probe that resolves a fully qualified domain name (FQDN) into an IP address. The probe executes MID Server queries in parallel. It utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache. It also leverages the hosts file on the OS.
SCPCommand	SCPCommand		A probe that copies files securely from one machine to another. The copy function is performed using the MID Server as a tunnel.
Shazzam	Shazzam		A probe that identifies active devices.
SNMPProbe	SNMP	SNMP Query	This is a generic SNMP probe.
SOAPProbe	SOAPProbe		A probe that sends a SOAP request to target machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe List (continued)

Probe Name	ECC Queue Topic	ECC Queue Name	Description
SSHCommand	SSHCommand		A probe that executes shell scripts from a command line after logging in to a target machine via SSH.
SSHCommandLong	SSHCommandLong		A probe that executes long running shell scripts from a command line after logging in to a target machine via SSH.
VMWare	VMWareProbe		A generic VMware probe that executes the MID Server script include in the *ECC queue name* that is set by a VMware Orchestration activity. This probe can run any MID Server script include.
Windows - PowerShell	PowerShell	Windows - PowerShell	A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in `.ps1`. Two variables are available to the script: • `$computer`: The computer pointed to as the source for this probe • `$cred`: A PowerShell credential, using a user name and password from the Credentials table, that logs into `$computer` successfully.

PowerShell activities

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 3.0 to 5.1.

The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see PowerShell activity pack

Legacy Run PowerShell activity

The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

Important:
This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the Powershell activity template to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result Values

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

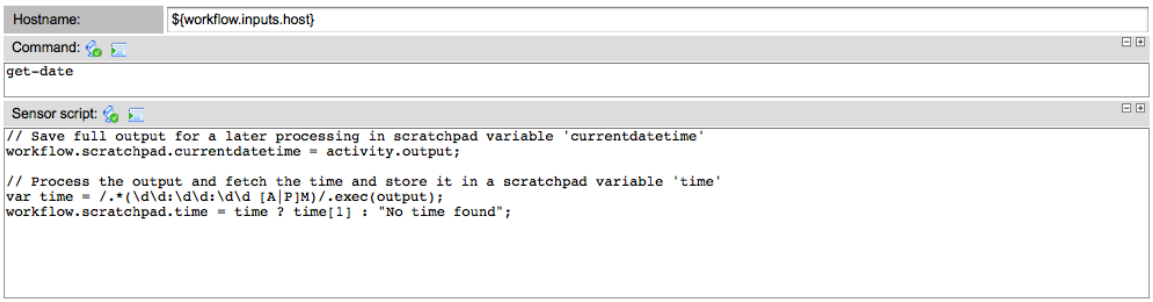
- Success
- Failure

Scratchpad Entries

Information written to *stdout* by the executing script is captured and returned to the activity in the *activity.output* variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity's sensor script.

An example would be to run the get-date command to get the MID Server's current time. This sensor script saves the full output received, but we can process it to return and save only the time.

PowerShell activity



Note:
This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to `stdout` is returned in `activity.output` and available to process.

Input Variables

Input Variables

Field	Description
Hostname	IP address of the target Windows machine. This value is mapped to the *$computer* variable for use in commands (see the example in the **Command** field). A PowerShell credential variable called *$cred* that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by **Hostname**.
Command	Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the *hostname* variable, the command is: `get-wmiobject <class> -computer $computer -credential $cred` If no credentials authenticate on the computer, the command runs in the context of the MID Server user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input Variables (continued)

Field	Description
	You cannot run both a command and a script file. Specifying a command hides the *Script file* variable.
Sensor script	The script to run using the results of the probe. The output from the probe is contained in a variable called *output*. Any error from the probe is contained in a variable called *error*.
Script file	The Enable script file synchronization for Windows enhanced security. You cannot run both a script file and a command. Selecting a script file hides the *Command* variable.
PowerShell script variables	Additional parameters, in JSON format, used by the specified script file.

States

The activity state tells the workflow engine what to do with the activity.

States

State	Description
Executing	The workflow engine knows to start the onExecute function of the activity.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activty, was cancelled.

Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the <class> was in a workflow input variable called *myclass*, the command would look like:

```
get-wmiobject $ {workflow. inputs. myclass } -computer $computer
 -credential $cred
Similarly  if the variable  is a scratchpad variable named
 myclass , the command would look like :
get -wmiobject $ {workflow. scratchpad. myclass } -computer
 $computer -credential $cred
```

HResult codes

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code -2146022651. To use this code, create an activity condition with the **Condition** value of *activity.hresult = -2146022651*. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH activities

SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

Run Command activity

The *Run Command* activity runs a command (including shell scripts) on a Linux or UNIX computer.

Important:
The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the SSH activity template in the ServiceNow® activity designer.

Input variables

Run command input variables

Field	Description
Long running	Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.
Hostname	Hostname or IP address of destination server for SSH activity.
Directory	Name of the working directory.
Command	The command to run from this activity.
Sudo	Select this check box to use sudo to run the command on the host machine.
Sensor script	The script to run using the results of the probe. The output from the probe is contained in a variable called `output`. Any error from the probe is contained in a variable called `error`.

Run SCP activity

The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

Note:
This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom Secure Copy activity replaces the Run SCP activity in the Geneva release.

Input variables

Run SCP input variables

Field	Description
From Host	Hostname or IP address of the source computer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Run SCP input variables (continued)

Field	Description
From File	Absolute path to the file to copy. This value can be a directory.
To Host	Hostname or IP address of the target computer.
To File	Path to the target file. This path can be absolute or relative to the logged in user's home directory. The specified directory must already exist on the target computer.
Copy Directory	Check box to copy a directory defined in the **From File** variable and all files contained in that directory.

Orchestration applications

Orchestration provides several applications with your subscription.

Orchestration ROI

The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.

After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a specific date/time range. The system also calculates the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.

Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The standard reports included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The ROI premium dashboard uses Performance Analytics to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

Note:
When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

Create Orchestration ROI labor rate cards

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

Before you begin
Role required: orchestration_manager

About this task
The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Orchestration** > **ROI** > **Labor Rate Cards**.
2. Complete the fields in the form using the descriptions in Manage a labor rate card.
3. Click **Submit**.
4. Create additional rate cards as needed.

Create an Orchestration ROI automation entry record

The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Before you begin

Role required: orchestration_manager
Before starting this procedure, verify that the appropriate labor rate cards were created.

About this task

Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.

- **Estimated savings**: Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.
- **Calculated savings**: Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

Procedure

1. Navigate to **All** > **Orchestration** > **ROI** > **Automation Entry Form**.
2. Fill in the fields on the form, as appropriate.

Automation Entry Form

Field	Description
Category	Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system: ○ **Access & Identity Management** ○ **Datacenter Automation** ○ **IT Service Management** ○ **Other** **Note:** To create a category, open the dictionary record for the Automation Entry Form [automation_entry_form] table and add an option to the choice list.
Item	Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as **Password Reset**.
Resource	Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Associated Workflows	Workflow automations created to automate this manual task. The system uses this field to identify the number of automations that have been run.
Estimated Duration (min) per Task	Estimated time to perform this task manually.
Estimated Volume per Month	Estimated number of times needed to perform this task manually per month.
Read-only fields	
Start time	Start time for the evaluation period. Configure this value in the Time Range for Calculated Averages module.
End time	End time of the evaluation period. Configure this value in the Time Range for Calculated Averages module.
Calculated average duration per task (min)	Actual time required to perform this task manually.
Calculated average volume per month	Actual average number of times this task is performed manually per month.

3. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

Create an Orchestration ROI correlated task rule

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.

Before you begin

Role required: orchestration_manager
Before starting this procedure, make sure you have created labor rate cards and the appropriate automation entry records for the automated tasks you want to evaluate.

About this task

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident [incident] table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

- **[Subcategory] [is] [Employee OnBoarding]**
- **[Sort description] [contains] [new employee]**

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.

Procedure

1. Navigate to **All** > **Orchestration** > **ROI Task Correlation** > **Correlated Tasks Rules**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Fill in the fields on the form, as appropriate.

Automation entry form

Field	Description
Automation entry	Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.
Table	Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.
Condition	Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.
Read-only fields	
Processed on	Date and time that the system performs the matching records lookup. The system automatically searches for new manual tasks matching these conditions.

4. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks [manual_mapping_records] table.
5. To view a rule, select the link in the **Table** column of the **Correlated Tasks Rules** related list for the automation entry you want to see.
6. To view the list of tasks that match all correlated rules in the system, navigate to **Orchestration** > **ROI Task Correlation** > **Correlated Tasks**.
7. To view the list of tasks that match this rule in the system, click **Correlated Tasks** under **Related Links** in this form

Configure the time range for Orchestration ROI calculations

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.

Before you begin

Role required: orchestration_manager

About this task

By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

Procedure

1. Navigate to **All** > **Orchestration** > **ROI Task Correlation** > **Time Range for Calculated Averages**.
2. Enter a new start or end date and time or click the icon to select a date using the calendar.
3. Click **Calculate** to recalculate the ROI based on the new time range and to save your settings.

© 2026 ServiceNow, Inc. All rights reserved.

Installed with Orchestration ROI

Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi).

Tables installed with Orchestration ROI

Tables are added with activation of Orchestration ROI.

Table	Description
Expense and Savings [run_rate_predicted_savings]	Contains the data for the reports in **Orchestration** > **ROI Reports** > **Predicted Savings**.
Savings Report [savings_report]	Contains the number of automations that have been run before the date specified in the **Processed On** column, based on: • Each automation entry's associated workflows • Estimated savings based on the estimated duration per task. • Calculated savings based on calculated duration.
Detailed Savings Report [detailed_savings_report]	Contains a detailed list for the Savings Report [savings_report] table. This list contains each automation's run date and savings for that automation.
Automation Entries [automation_entry_form]	Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed.
Roadmap Planning [roadmap_planning]	Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow.
Correlated Tasks [manual_mapping_records]	Contains all matching manual tasks for each automation entry. Each tasks's information is stored in this table for the system to use to calculate the actual duration and volume for each manual task.
Correlated Tasks Rules [manual_mapping_conditions]	Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry.

Plugins installed with Orchestration ROI

Plugins are installed with activation of Orchestration ROI, if they are not already active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	Description
Cost Management [com.snc.cost_management]	Provides the labor rate cards Orchestration ROI uses to determine the savings for each automated task. See Cost Management for more information.

Roles installed with Orchestration ROI

Roles are added with activation of Orchestration ROI.

Role title [name]	Description	Contains Roles
Orchestration manager [orchestration_manager]	Manages all activities in the Orchestration ROI module.	• pa_admin • report_admin

UI actions installed with Orchestration ROI

UI actions are added with activation of Orchestration ROI.

UI actions for Orchestration - ROI

UI action	Table	Description
Savings Report	Automation Entry Form [automation_entry_form]	Displays the savings report specific to this automation entry, if the associated workflows are not empty.
Estimated and Projected Savings	Automation Entry Form [automation_entry_form]	Displays the estimated savings, based on the estimated duration of the task, and calculated savings, based on the calculated duration of the task.
Show Workflow Context	Detailed Savings Report [detailed_savings_report]	Shows the related workflow context.
Submit AND process now	Automation Entry Form [automation_entry_form]	Processes this new entry
Correlated Tasks	Correlated Tasks Rules [manual_mapping_conditions]	Displays all matching tasks from the Correlated Tasks [manual_mapping_records] table.
Detailed Savings Report	Automation Entry Form [automation_entry_form]	Displays the list of automations that have been run, based on associated workflows.
Task	Correlated Tasks [manual_mapping_records]	Displays the task record.
Submit AND	Correlated Tasks Rules [manual_mapping_conditions]	Processes a correlated task rule. This action performs matching on the specified table and the filter conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

UI actions for Orchestration - ROI (continued)

UI action	Table	Description
process now		

Script includes installed with Orchestration ROI

Script includes are added with activation of Orchestration ROI.

Script include	Description
OrchestrationROIAjax	Script that calculates the actual duration and volume of a task.
OrchestrationROI	Script that calculates the number of workflow contexts, looks up all matching tasks, calculates savings, and other functions used in the UI actions.
ROIDemoDataUtil	Script that updates demo data timestamps.

Client scripts installed with Orchestration ROI

Client scripts are added with activation of Orchestration ROI.

Client script	Table	Description
Display info for processing rules	Correlated Tasks Rules [manual_mapping_conditions]	Displays annotation on the Correlated Task Rule form advising that new task rules are not evaluated until the time specified in the ROI schedule.

Business rules installed with Orchestration ROI

Business rules are added with activation of Orchestration ROI.

Business rule	Table	Description
Delete corresponding records	Automation Entry Form [automation_entry_form]	When a record is deleted from the Automation Entry Form [automation_entry_form] table, this business rule deletes all records in other ROI tables that reference this entry.
Insert into Run Rate & Savings	Automation Entry Form [automation_entry_form]	When a new automation entry is provided, this business rule calculates the estimated savings, based on the estimated duration of a task and its associated labor rate card.
Insert into Savings Reports	Automation Entry Form [automation_entry_form]	When a new automation entry is provided, this business rule inserts a new record into the Savings Report [savings_report] table with the**automations_run** field set to **0**.

Orchestration ROI reports

Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the Orchestration - ROI Premium plugin.

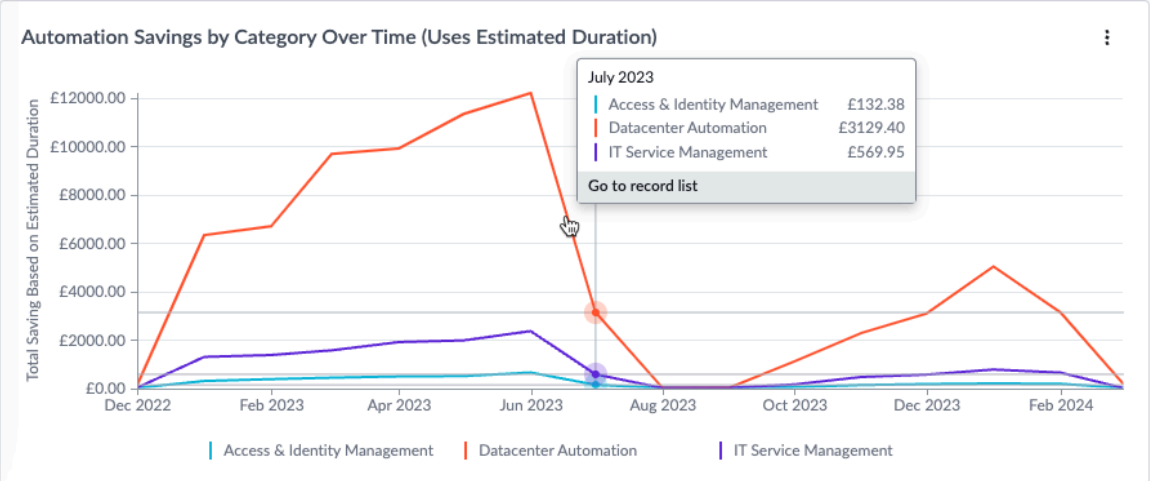
Orchestration ROI standard reports

The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes. To access the ROI standard dashboard, navigate to **Orchestration** > **ROI Reports** > **Dashboard**.

Summary tab

The Summary tab contains four reports on automation categories.

ROI summary report sample



Standard ROI summaries by category

Report	Description
Manual Tasks by Category Over Time	Trend of manual tasks by category over time. For example, if you use automations to perform a portion of the necessary tasks, the report shows the number of tasks still executed manually, decreasing over time. • **Type**: Line chart • **Table**: Detailed Savings Report [detailed_savings_report]
Automations by Category Over Time	Trend of automated tasks by category over time. For example, this chart can show the increase in the number of automated tasks as a workflow automation rolls out slowly over time. • **Type**: Line chart • **Table**: Detailed Savings Report [detailed_savings_report]
Automation Savings by Category Over Time (Uses Estimated Duration)	Amount of savings from automated tasks over time, based on the estimated duration of the task, the number of automations performed, and the cost from the labor rate card. • **Type**: Line chart • **Table**: Detailed Savings Report [detailed_savings_report]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

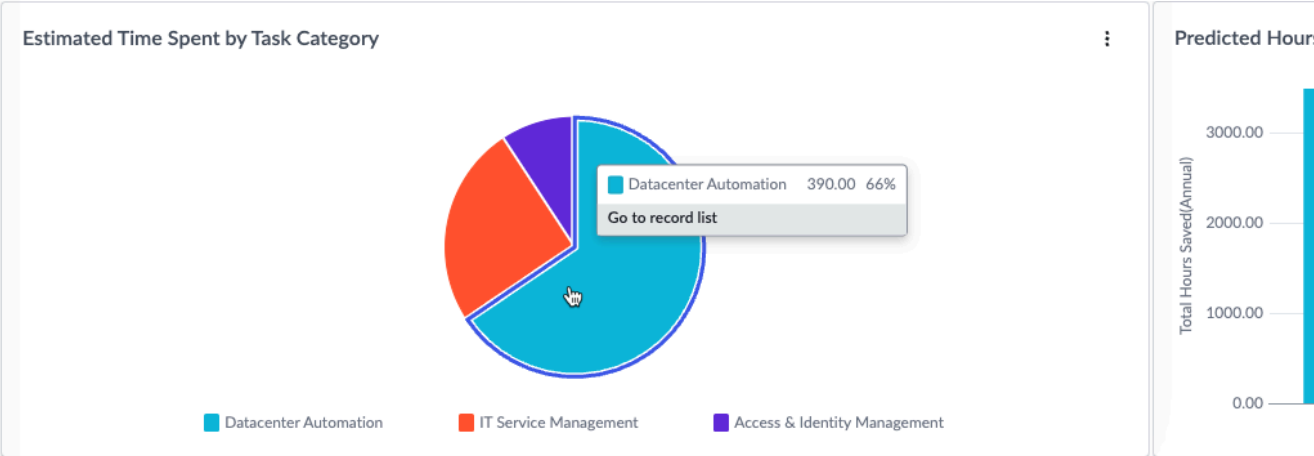
Standard ROI summaries by category (continued)

Report	Description
Automation Savings by Category Over Time (Uses Calculated Duration)	Amount of savings from automated tasks over time, based on the calculated duration of the task, the number of automations performed, and the cost from the labor rate card. • **Type**: Line chart • **Table**: Detailed Savings Report [detailed_savings_report]

Estimated Costs tab

The Estimated Costs tab contains eight reports on estimated time and expense for automations.

ROI estimated time and expense report samples



Standard ROI time and expense estimates

Report	Description
Estimated Time Spent by Task Category	Total estimated time spent, in minutes, on all tasks by task category. • **Type**: Pie chart • **Table**: Automation Entry Form [automation_entry_form]
Estimated Volume of Manual Tasks per Month by Category	Total estimated volume of all tasks per month by task category. • **Type**: Pie chart • **Table**: Automation Entry Form [automation_entry_form]
Predicted Hours Spent Monthly by Category (Uses Estimated Duration & Volume)	Total predicted hours spent monthly on all manual tasks by category, using the estimated duration of each task and the estimated volume of each task per month. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard ROI time and expense estimates (continued)

Report	Description
Predicted Monthly Expense by Category (Uses Estimated Duration & Volume)	Total predicted monthly expense for all manual tasks by category, using the estimated duration of each task, estimated volume of each task per month, and the cost from the labor rate card. **Note:** This report uses negative numbers to express an expense. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Predicted Hours Spent Quarterly by Category (Uses Estimated Duration & Volume)	Total predicted hours spent quarterly on all manual tasks by category, using the estimated duration of each task and the estimated volume of each task per month. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Predicted Quarterly Expense by Category (Uses Estimated Duration & Volume)	Total predicted quarterly expense for all manual tasks by category, using the estimated duration of each task, estimated volume of each task per month, and the cost from the labor rate card. **Note:** This report uses negative numbers to express an expense. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Predicted Hours Spent Annually by Category (Uses Estimated Duration & Volume)	Total predicted hours spent annually on all manual tasks by category, using the estimated duration of each task and the estimated volume of each task per month. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Predicted Annual Expense by Category (Uses Estimated Duration & Volume)	Total predicted annual expense for all manual tasks by category, using the estimated duration of each task, estimated volume of each task per month, and the cost from the labor rate card. **Note:** This report uses negative numbers to express an expense. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]

Costs from Correlated Tasks tab

The Costs from Correlated Tasks tab contains eight reports on time and expense for automations based on actual calculations.

Schedule Orchestration ROI calculations for standard reports

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

Before you begin

Role required: orchestration_manager, admin

About this task

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from **System Scheduler** > **Scheduled Jobs** > **Scheduled Jobs** and click **Configure Job Definition**. To execute the schedule directly from the job definition, click **Execute Now**

To control the running of the schedule job with the Orchestration properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Orchestration ROI** > **Properties**.
2. Configure the following properties:

ROI schedule properties

Property	Description
roi.processing.active	Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job. ○ **Type**: true | false ○ **Default**: true
roi.processing.interval	Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks. ○ **Type**: integer ○ **Default**: 24

3. Click **Save** to save your changes.

Orchestration ROI premium reports

The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using Performance Analytics. The Orchestration - ROI Premium plugin is dependent on the Performance Analytics - Premium plugin which requires a separate subscription.

Important:
You must activate the Performance Analytics scheduled collection job before Orchestration ROI premium can display data.

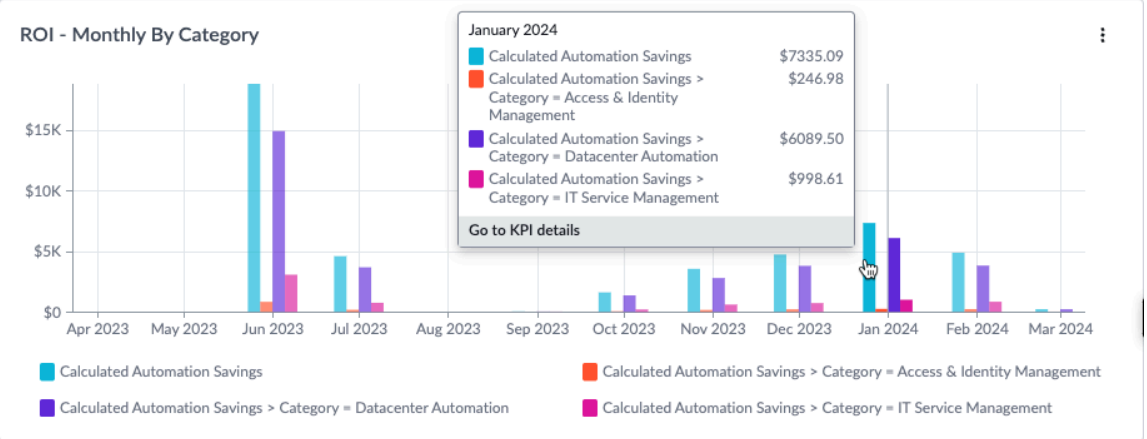
To access the ROI premium dashboard, navigate to **Orchestration** > **ROI Reports** > **Premium Dashboard**.

ROI By Category tab

The ROI By Category tab contains three reports showing the calculated savings over time by category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Calculated savings monthly by category



Premium reports for calculated savings over time by category

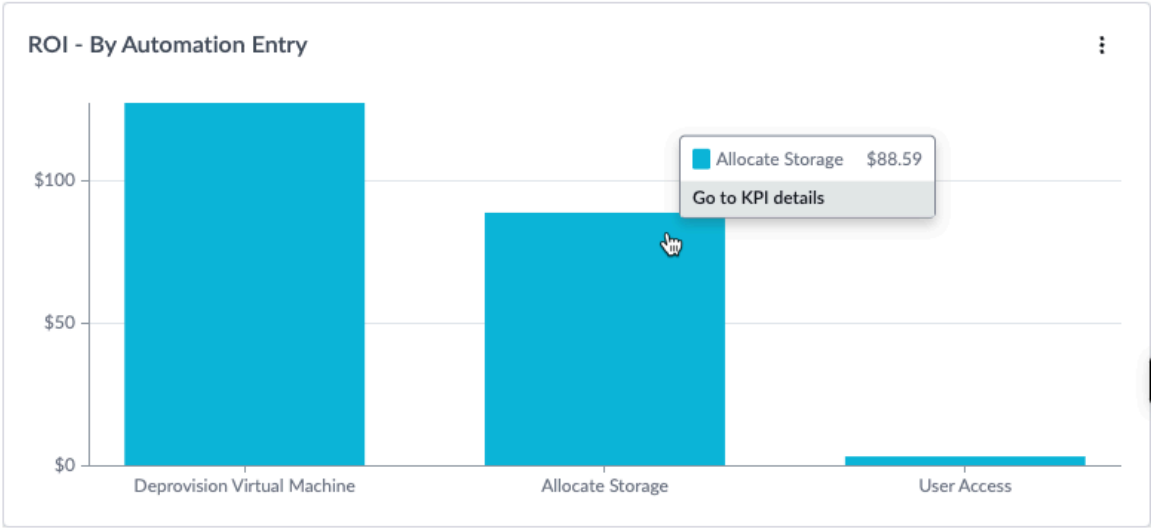
Report	Description
ROI - Monthly By Category	Shows the calculated savings each month by category. The chart displays the total calculated savings against the calculated savings for each category. • **Type**: Column chart • **Table**: Detailed Savings Report [detailed_savings_report]
ROI - By Category	Shows the trend of calculated savings by category. • **Type**: Spline chart • **Table**: Detailed Savings Report [detailed_savings_report]
ROI - Running Sum 12 month period	Shows the running sum of calculated savings for all categories in the last 12 months. • **Type**: Area chart • **Table**: Detailed Savings Report [detailed_savings_report]

ROI By Automation Entry

The ROI By Automation Entry tab contains two reports showing the calculated savings over time by automation entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Calculated savings for the current month by automation entry



Calculated savings over time by automation entry

Report	Description
ROI By Automation Entry	Shows the current month's calculated savings for each automation entry. • **Type**: Column • **Table**: Detailed Savings Report [detailed_savings_report]
ROI - By Automation Entry Top 10 List	Shows the top 10 automation entries that have the most calculated savings in the current month. • **Type**: Scorecard • **Table**: Detailed Savings Report [detailed_savings_report]

Request Orchestration ROI premium reports

To view the Orchestration ROI premium reports, you must request activation of the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin. The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.

Before you begin

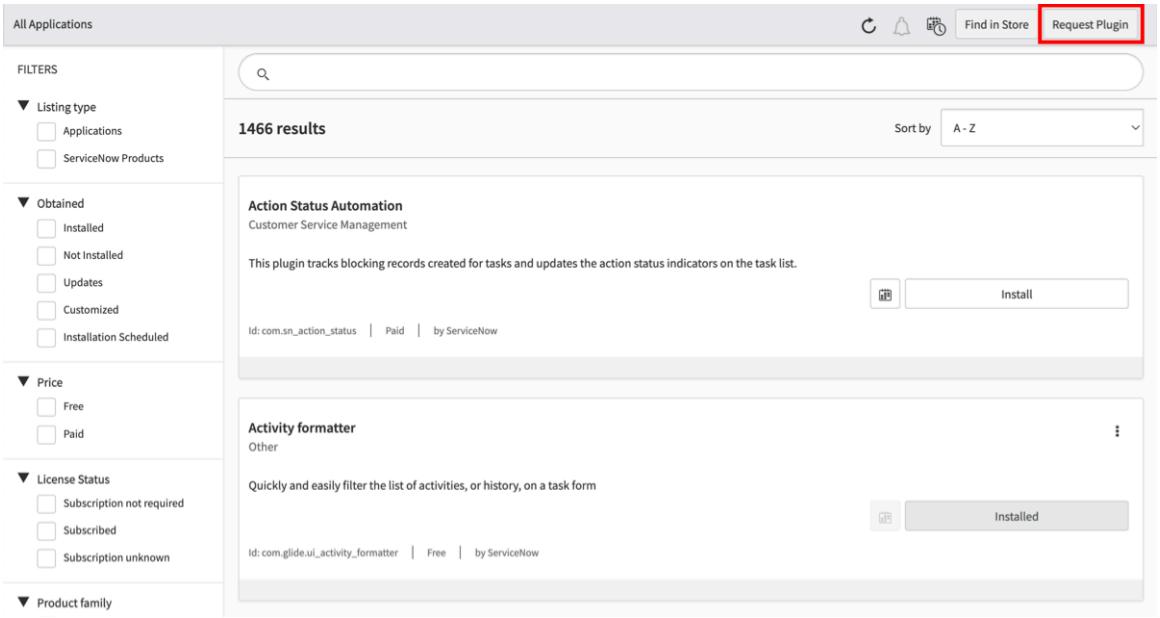
The Orchestration - ROI Premium plugin requires the Performance Analytics - Premium plugin, which must be purchased separately.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

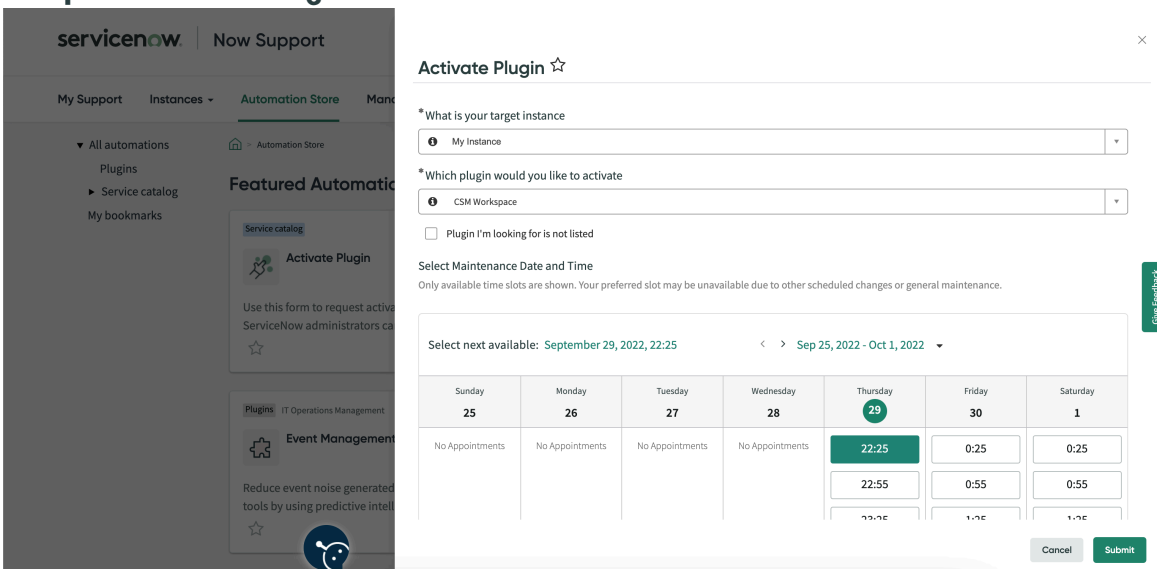
Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

Before you begin

Role required: orchestration_manager, admin

About this task

The scheduled job required to calculate premium ROI reports is called [PA ROI] Historic Data Collection and is installed with the Orchestration - ROI Premium [com.snc.runbook_automation.roi_premium] plugin. This job is not active by default.

Procedure

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Search for the [PA ROI] Historic Data Collection job.
3. Select the **Active** check box.
4. The scheduling options appear for the value selected in the **Run** field.
   For instructions on creating a schedule, see Create or schedule a data collection job.
5. To execute the schedule directly from the job definition, click **Execute Now**.
6. Click **Update**.

Client Software Distribution

The Client Software Distribution (CSD) application allows administrators to distribute software from the service catalog using third-party management systems.

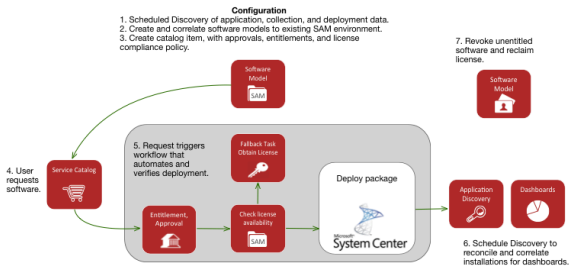
CSD allows an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the custom SCCM activity pack. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Orchestration activities and workflows.

CSD also integrates with Software Asset Management to manage license counts for deployed software.

CSD process flow using SCCM



Request client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Orchestration.

Before you begin

Role required: admin

About this task

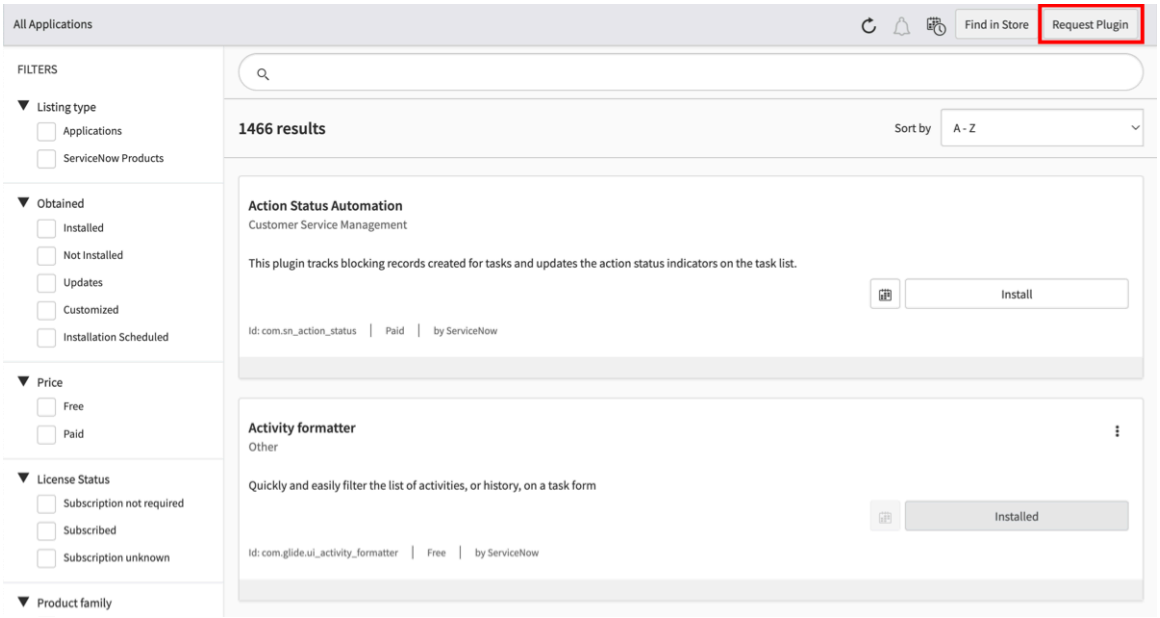
The Orchestration - Client Software Distribution plugin activates the Orchestration - System Center Configuration Manager plugin that contains the custom SCCM activities used to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution.

Note:
The Orchestration - Client Software Distribution plugin runs in its own application scope.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

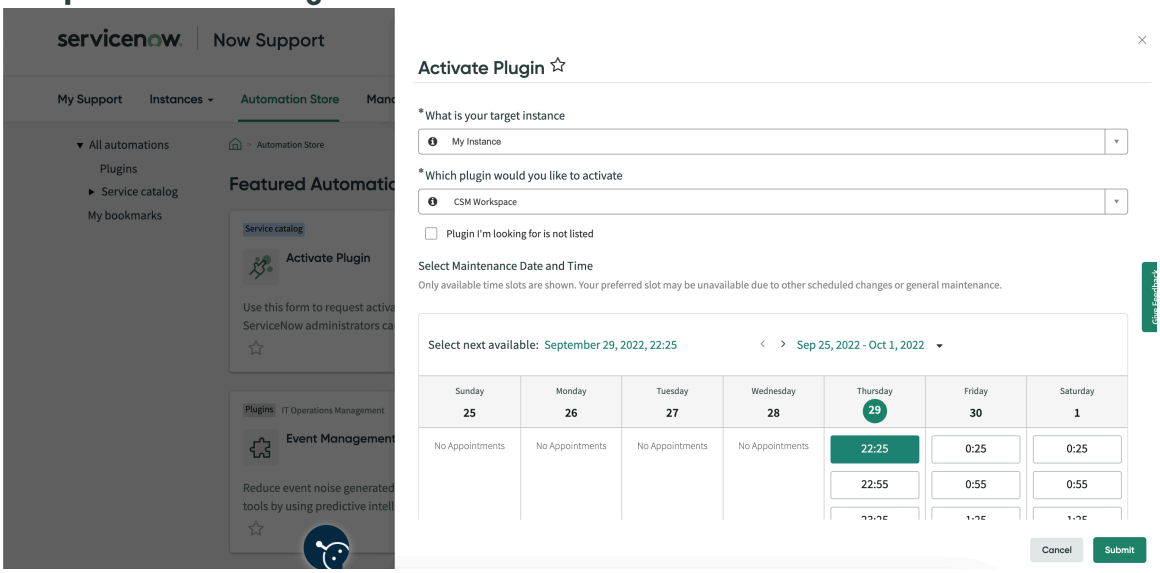
Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Installed with client software distribution

Several types of components are installed with client software distribution (CSD).

Tables installed with client software distribution

These tables are installed with the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

Client software distribution tables

Table	Description
Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item]	Contains all catalog items created for client software distribution. This table extends the Catalog Item [sc_cat_item] table.
Client Software Distribution Software Request [sn_client_sf_dist_req_software]	Contains all requested software, and their statuses.
Client Software Distribution Application [sn_client_sf_dist_application]	Contains all discovered CSD applications.
Client Software Distribution Provider [sn_client_sf_dist_provider]	Contains all software distribution providers.
Client Software Distribution Extension Key [sn_client_sf_dist_extension_key]	Contains the predefined CSD extension keys.
Client Software Distribution Extension Point [sn_client_sf_dist_extension_point]	Contains the customization script for the extension keys.
Client Software Distribution Software Configuration [sn_client_sf_dist_software_config]	Base table for all software provider configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution tables (continued)

Table	Description
SCCM Server Instance [sn_client_sf_dist_cmdb_ci_sccm_server]	Contains all SCCM server instances. This table extends the Configuration Item [cmdb_ci] table.
SCCM Application [sn_client_sf_dist_sccm_application]	Contains all discovered SCCM applications. This table extends the Client Software Distribution Application [sn_client_sf_dist_application] table.
SCCM Application Catalog Item [sn_client_sf_dist_sccm_app_cat_item]	Contains all catalog items created for SCCM applications. This table extends the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table.
SCCM Collection [sn_client_sf_dist_sccm_collection]	Contains all discovered SCCM collections. Contains all discovered SCCM collections.
SCCM Deployment [sn_client_sf_dist_sccm_deployment]	Contains all discovered SCCM deployments. Contains all discovered SCCM deployments.
SCCM Configuration [sn_client_sf_dist_sccm_sf_config]	Contains the SCCM application, install and uninstall collections, and Discovery model. This table extends the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config]

Plugins installed with client software distribution

These plugins are installed with the Orchestration - Client Software Distribution plugin, if they are not already active.

For instructions on requesting activation of Client Software Distribution (CSD) see Request client software distribution.

Plugins for Orchestration - Client Software Distribution

Plugin	Description
Orchestration - System Center Configuration Manager [com.snc.orchestration.sccm_mgnt]	Installs the custom SCCM Orchestration activities that do work on the SCCM target host.
Orchestration - Asset Lease Management [com.snc.orchestration.asset_lease_management]	Installs the lease functionality for software distributed through the Service Catalog. This includes starting, stopping, and extending leases.
Service Catalog Scoped API [com.glideapp.servicecatalog.scoped.api]	Installs the API to support application creation in the Service Catalog.
Software Asset Management [com.snc.software_asset_management]	Provides the ability to manage software assets, including the reconciliation of entitlements to licenses for named users, workstation, and enterprise software agreements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with client software distribution

These roles are installed with the Orchestration - Client Software Distribution plugin.

Roles for Orchestration - Client Software Distribution

Role title [name]	Description	Contains Roles
Client software distribution admin [sn_client_sf_dist.csd_admin]	Administrator role for managing client software distribution application.	• sam • agent_admin • report_admin • catalog_admin • itil • workflow_admin

Script includes installed with client software distribution

These script includes are installed with the Orchestration - Client Software Distribution plugin

Script includes for Orchestration - Client Software Distribution

Script include	Description
CSDExtensionPoint	Execute the CSD provider's specific code
CSDUtil	Utility functions for the CSD application.
RefQualsCSD	Reference qualifier filter. This script provides the filter functrions for the CSD providers, devices, SCCM application, install collections, and uninstall collections.
SCCMCatItemHandler	Sets the field values of specific SCCM catalog items. These values are the SCCM catalog item table name, catalog item name, SCCM provider, and SCCM software configuration.
SoftwareCatItemCreator	Creates software catalog items
CSDCatItemHandler	Base class for CSD catalog item creation. This script is used by the Create Catalog Item UI action to create and application catalog.
CSDDemoDataUtil	Populates demo data.
CSDDemoDataUtilAjax	Populates demo data.

Properties installed with client software distribution

Properties for client software distribution (CSD) manage the installation status of requested software deployments and configure scheduled Discoveries.

To access CSD properties, navigate to **Client Software Distribution** > **Properties**. The following properties are available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution properties

Property	Name	Description
Status check expiration interval (days)	sn_client_sf_dist.softwareInstallExpDays	Controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. Installation statuses are: • **Not installed**: User has not installed requested software prior to the expiration of the configured time limit. • **Installed**: Software was installed within the configured time limit. • **Status check expired**: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment. • **Revoked**: Software was revoked by the administrator. • **Type**: integer • **Default value**: 30
Reconcile software installation status interval (hours)	sn_client_sf_dist.softwareInstallIntervalHour	Determines when the scheduled job runs that determines the installation status. By default, the system checks the installation status every hour. • **Type**: integer • **Default value**: 24
Set scheduled application Discovery interval (days).	sn_client_sf_dist.discoveryExeDay	Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value. • **Type**: integer • **Default value**: 5
Set lease execution schedule job interval (minutes)	sn_client_sf_dist.lease_execution_interval	Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution properties (continued)

Property	Name	Description
		• **Type**: integer • **Default value**: 1
Set time prior to lease end to notify requester (days)	sn_client_sf_dist.lease_end_notification	Determines how many days prior to the end of a software lease to notify the requester. If lease extensions are allowed, ensure that this period provides enough time for the approval process to complete before the lease expires. • **Type**: integer • **Default value**: 5

Workflows installed with client software distribution

These workflows are installed with the Orchestration - Client Software Distribution plugin

Workflows installed with client software distribution

Workflow	Description
Discover SCCM	Retrieves lists of applications, collections, and deployments from SCCM servers using custom CSD orchestration activities. An administrator runs this workflow from a UI action in a SCCM Server Instance record.
Order Client Software	Runs automatically when a user orders software from the service catalog.
Deploy SCCM Application	Triggered by the Order Client Software workflow to deploy software through SCCM server. This workflow adds either the user or the device into the SCCM collection.
Revoke Client Software	Begins the software revocation process for software deployed by an external provider. Administrators run this workflow from a UI action on the Requested Software record and the Installed Software Not Entitled record. This workflow triggers the appropriate provider workflow that performs the actual recovation. For example, this workflow triggers the Revoke SCCM Application workflow for applications in SCCM uninstall collections.
Revoke SCCM Application	Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software workflow triggers this workflow to revoke software deployed by an SCCM server. This workflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.

Create licenses and counters for distributed software

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

Before you begin

Role required: sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license **Valuation** is greater than 0, and the license type is **Not allocated**, CSD assumes that the license is available for the software.

Procedure

1. Navigate to **All** > **Software Asset** > **Software Licenses**.
2. Add a new software license for the software model you used in CSD.
3. Navigate to **Software Asset** > **Reconciliation** > **Software Counters**.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

Client software distribution ordering process

Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.

Lease start and end dates

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Orchestration - Asset Lease Management plugin that is activated automatically with CSD. The system prepopulates the **Lease start** field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the **Lease end** field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The **Lease end** field is not mandatory and can be left blank to order software with no end date.

Note:
For systems deploying software from Microsoft System Center Configuration Management (SCCM), the **Lease end** field is only available if the SCCM configuration specifies an uninstall collection.

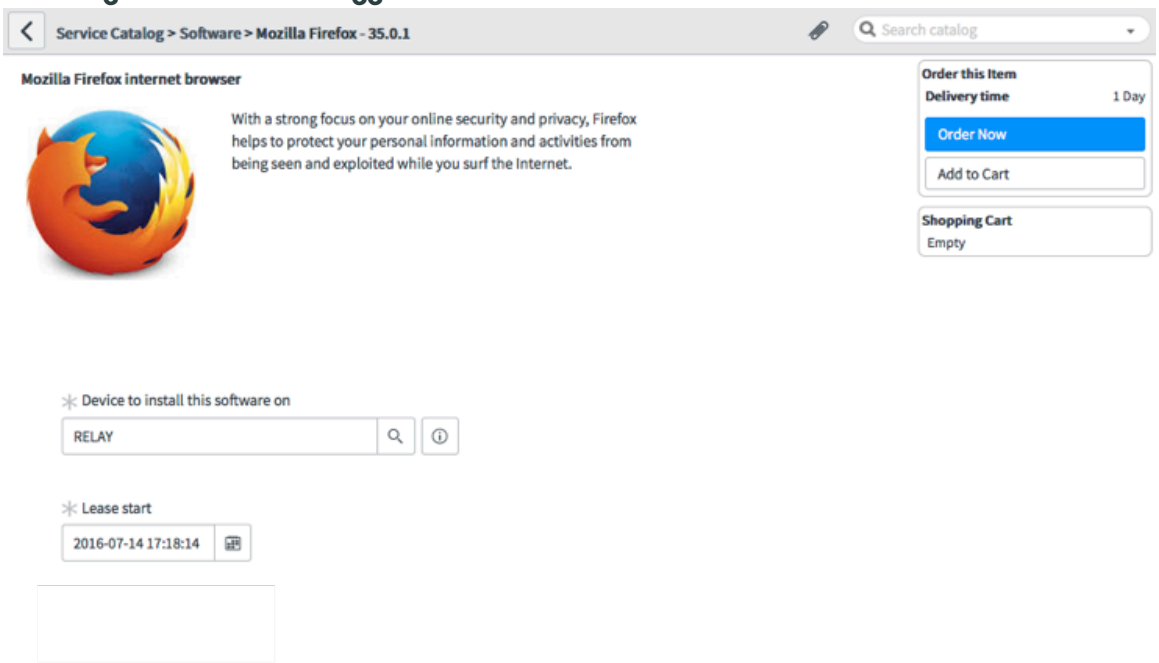
Software offered only to the logged in user

If the software catalog item is configured with the **Order on behalf of** check box cleared, the **User** field does not appear on the order form. The logged in user selects the device on which to deploy the software from the **Device to install this software on** field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to the user. User selects the machine from a list of owned devices and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the **Lease end** field is not available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ordering software as the logged in user



Software ordered on behalf of another user

If the software catalog item is configured with the **Order on behalf of** check box selected, the **User** field appears on the form. The logged in user can select any user from this field. The **Device to install this software on** field only lists the devices assigned to the user selected in the **User** field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the **User** field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.

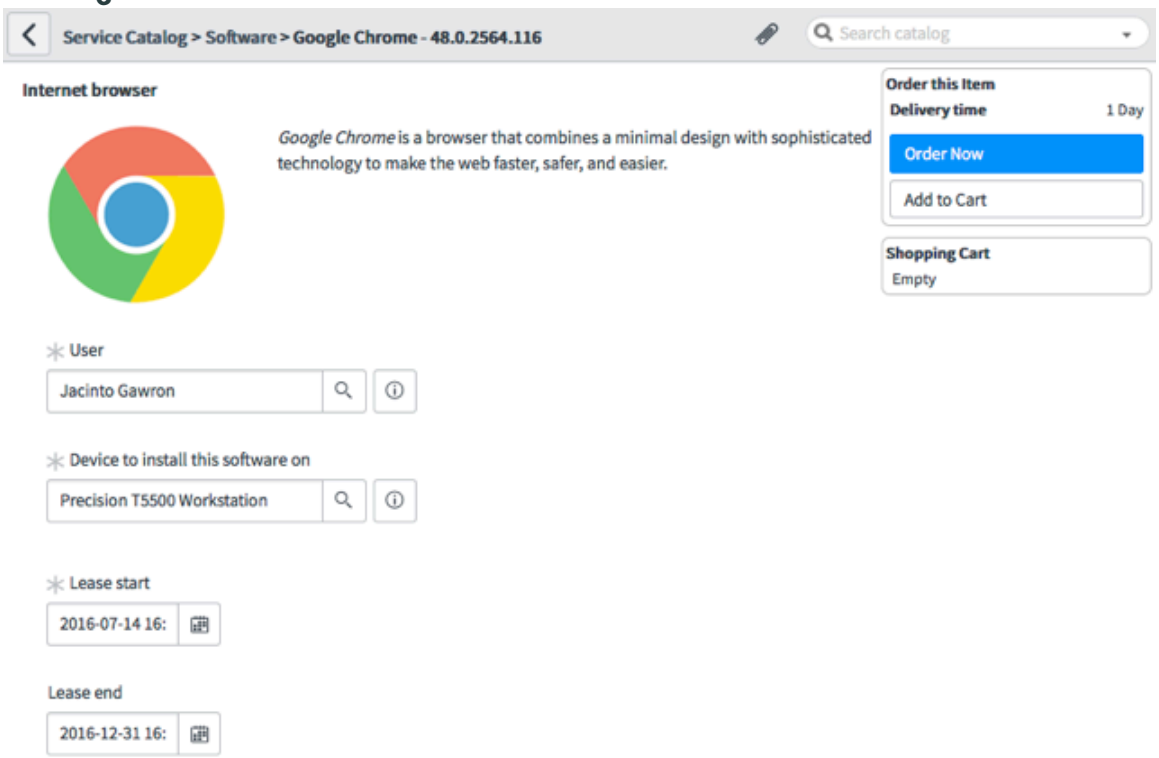
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Defining software lease window



Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Before you begin

Role required: Any system user

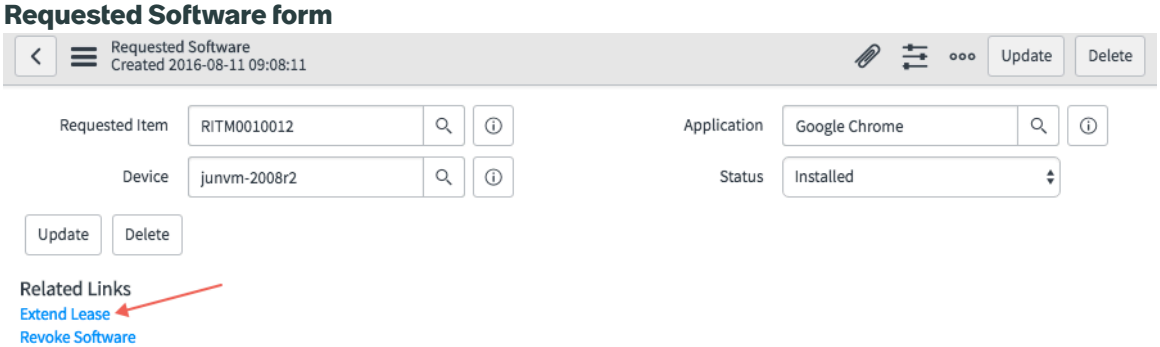
About this task

If your software has a lease end date defined, and the software status is **Installed**, you can request an extension of the lease, pending any approvals your organization requires.

Procedure

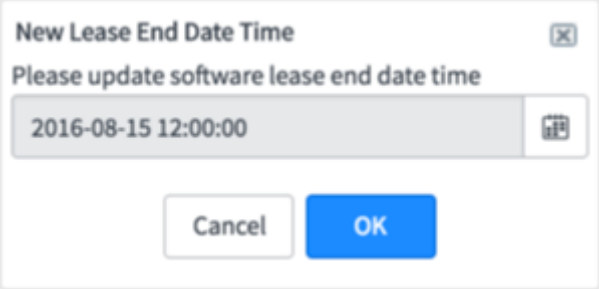
1. Navigate to **All** > **Service Catalog** > **My Requested Software**.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under **Related Links** click **Extend Lease**.

Requested Software form



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the dialog box that appears, select a new lease end date in the calendar and click **OK**. You must select a date later than the current date.



If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

Important:
If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.

Client software distribution from SCCM

You can use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The SCCM activity pack contains Orchestration activities that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

Configuring SCCM

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

Before you begin
SCCM role required: Application Administrator

About this task
These instructions are for Microsoft 2012 R2 Server.

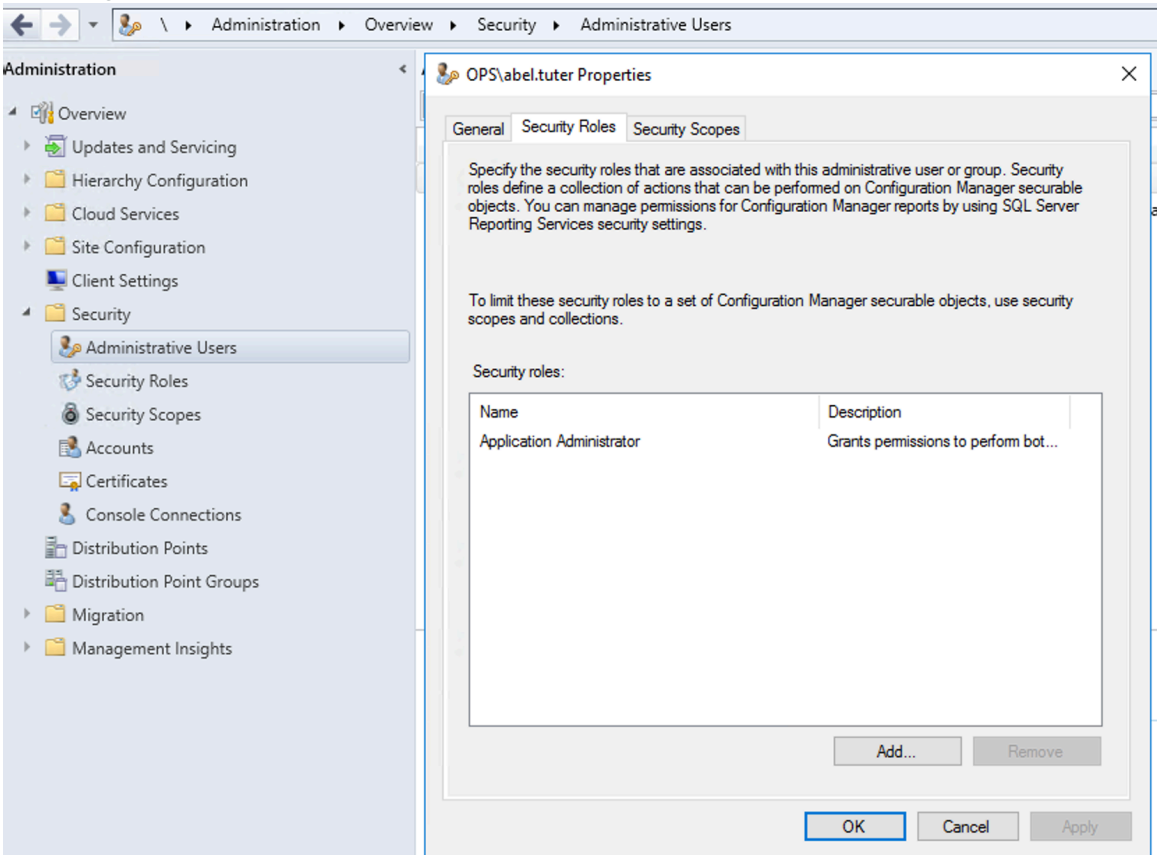
Procedure

1. In the System Center Configuration Manager console, navigate to **Administration** > **Security** > **Administrative Users**.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select **Properties** from the drop-down menu.
4. In the Properties dialog box, select the **Security Roles** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click **Add**, select this role from the list, and click **OK**.

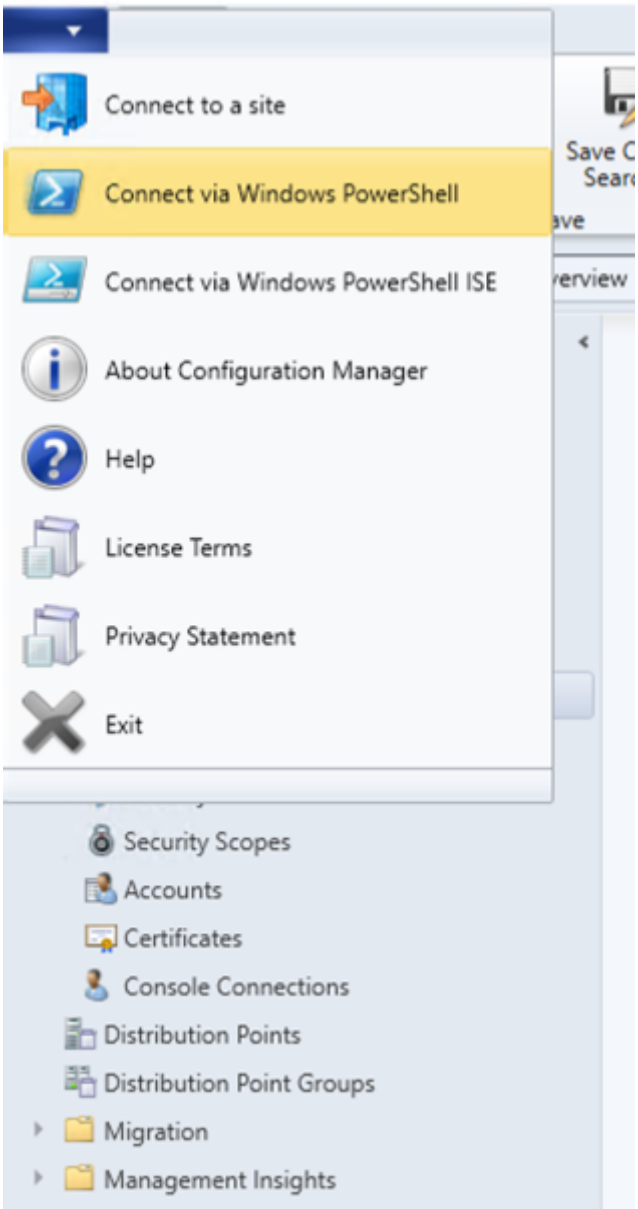
Granting the Application Administrator role on the SCCM server



7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect to PowerShell



9. Ensure that the user can access the CM console.
   This action establishes the environment path to PowerShell for the logged in Application Administrator user.

Update the SCCM cmdlet libraries

Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

Before you begin

Role required: Either current user or system administrator, depending on settings.

About this task

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
WARNING: An update to the System Center 2012 Configuration
 Manager Cmdlet
Library is available. Please go to
'http://go.microsoft.com/fwlink/?LinkId=528947' to download the
 latest version.
Running cmdlet version: 5.0.8231.1004 Latest cmdlet version:
 5.0.8328.1155
```

Download the latest version of the cmdlet library from Microsoft. For installation instructions, see https://learn.microsoft.com/en-us/fabric/enterprise/powerbi/service-admin-reference.

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to prodeed without issues.

Procedure

1. Log into the SCCM console as an adminstrator.
2. Open the menu from the upper left corner of the console.
3. Select **Connect via Windows PowerShell**.
4. Run one of these commands to disable the update check:
   - **Per-user**: *`Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`*
   - **Per-system**: *`Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`*

   Important:
   The per-system cmdlet must run in an elevated Windows PowerShell session.
5. Run the *`Get-CMCmdletUpdateCheck`* command to refresh the console and check the settings.
6. Ensure that the value of the *`IsEnabled`* configuration variable has changed to **False**. This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the *`-IsUpdateCheckEnabled 1`* command for either the current user or for the system.

Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter **cmdb_ci_dns_name.list**.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of the SCCM server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

Create Windows credentials for SCCM deployments

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

Before you begin
Role required: sn_client_sf_dist.csd_admin or admin

About this task
Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

Procedure

1. Navigate to **All** > **Orchestration** > **Credentials**.
2. Click **New**.
3. In the list of credential types, select **Windows Credentials**.
4. Provide a user name and password with administrative rights on the SCCM server.

> **Important:**
> Ensure the following:
>
> - This user must have the Application Administrator role on the SCCM server.
> - Use the credentials to log into the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

5. Fill in the other fields on the form, as appropriate.

   For details, see Windows credentials.
6. Click **Submit**.

Retrieve SCCM data for client software distribution

Retrieve the collections and the list of applications available for deployment from your SCCM servers.

Before you begin
Role required: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:

- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- Configure a user with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
- Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To populate the Client Software Distribution application with SCCM data:

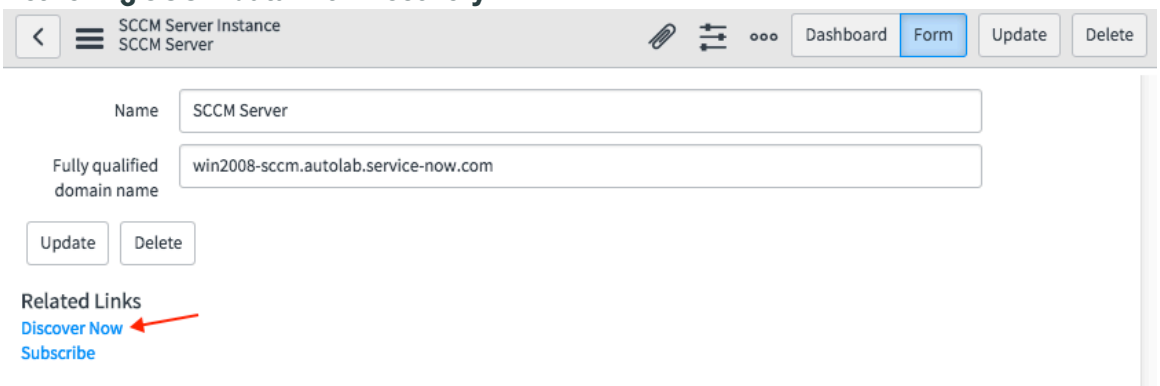
Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Server Instance**.
2. Click **New**.
3. In the SCCM Server Instance form, identify the server by name and provide the fully qualified domain name.
4. Click **Submit**.

   The new SCCM server appears in the list.
5. Open the new SCCM record and click **Discover now** under **Related links**.

   The system runs the Discover SCCM workflow that retrieves the application, collection, and deployment data from the SCCM server.

Retrieving SCCM data with Discovery



SCCM server Discovery for client software distribution

A Discovery workflow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the **Discover SCCM** workflow from an SCCM Server Instance record to populate the following ServiceNow tables:

SCCM data populated in ServiceNow tables

Table	Fields
SCCM Application [sn_client_sf_dist_sccm_application]	• name • publisher • version • model • sccm_server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SCCM data populated in ServiceNow tables (continued)

Table	Fields
SCCM Collection [sn_client_sf_dist_sccm_collection]	• name • type • sccm_server
SCCM Deployment [sn_client_sf_dist_sccm_deployment]	• application • collection • type

Note:
For details about the custom activities used in this workflow to extract data from an SCCM server, see Orchestration SCCM activity pack.

Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Before you begin

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution for details.

About this task

You can link an SCCM application to an existing software model or create a new model.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Applications**.
   A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the **Model** field and select a model from the list.

SCCM application record

4. To create a model, click **Create Software Model** under **Related Links**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Complete the software model fields.
See for details.

b. Click **Submit**.
The view returns to the SCCM Applications form.

Define an SCCM configuration

To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you begin

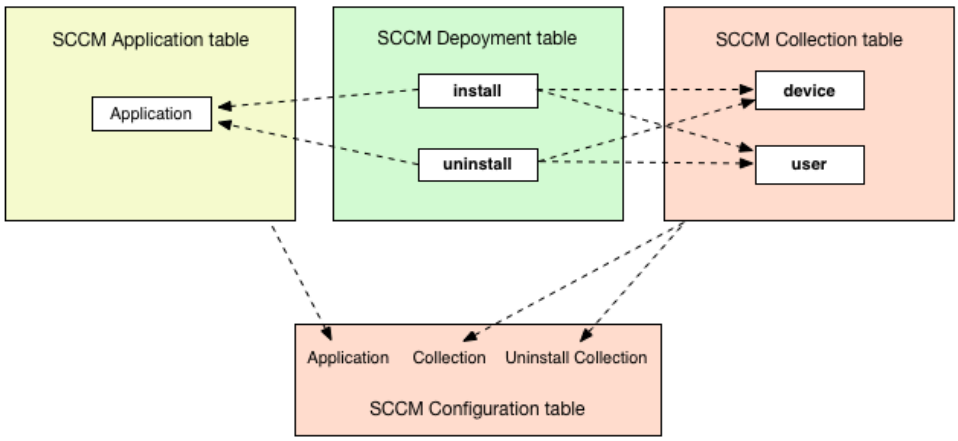
Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

About this task

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an **install** deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an **uninstall** collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.

SCCM table references

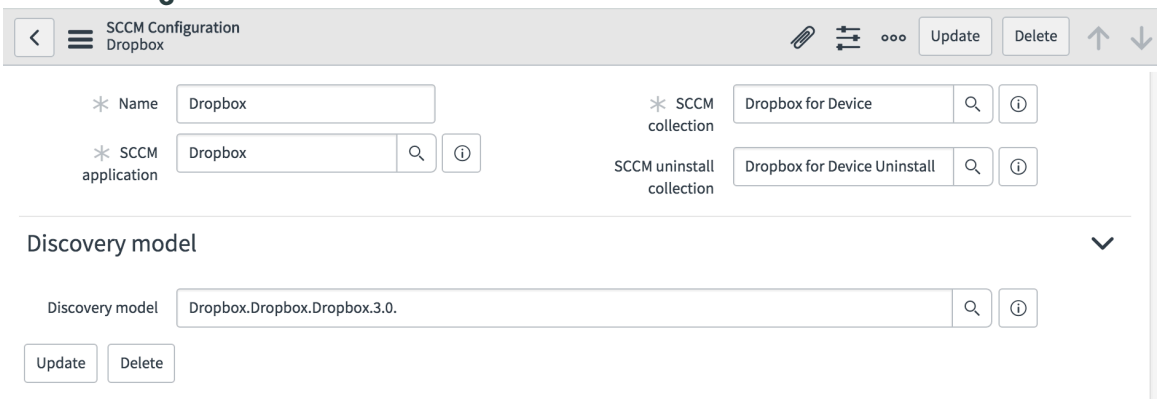


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Applications**.
2. Open an application that has a configured software model.
3. Under **Related Links**, click **Create Software Configuration**.
4. Complete the form, using the fields in the table.

SCCM configuration form



SCCM configuration fields

Field	Description
Name	Recognizable name for this SCCM software configuration.
SCCM application	Name of an application hosted on the SCCM server.
SCCM collection	Name of the collection associated with the **install** deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.
SCCM uninstall collection	Name of the collection associated with the **uninstall** deployment for the selected application on the SCCM server. You must specify an uninstall collection to: ○ Define a lease end date for deployed software. ○ Allow lease extensions. ○ Revoke software from a user's machine.
Discovery model	Discovery model that links the unentitled software installation with the SCCM configuration. From the SCCM configuration record, Client Software Distribution can determine which collection to use to revoke the software. Unentitled software is software found on the user's machine that the user is not entitled to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a catalog item for an SCCM application

Using the applications discovered on the SCCM server, create a catalog item for an application you want to offer for distribution from the service catalog.

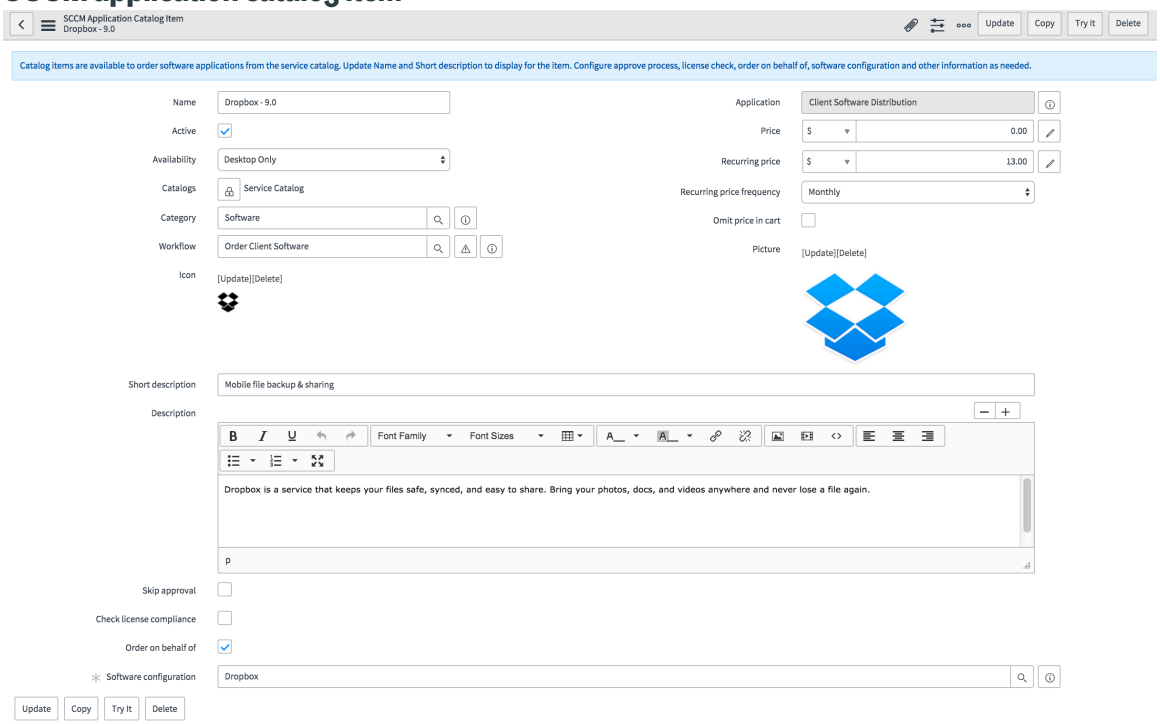
Before you begin

Role required: sn_client_sf_dist.csd_admin or admin
Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Applications**.
   A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
3. Under **Related Links**, click **Create Catalog Item**.
   A new SCCM Application Catalog Item record appears with preconfigured information. .

SCCM application catalog item



4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table by the Orchestration - Client Software Distribution plugin:

SCCM fields in the catalog item form

Field	Description
Skip approval (skip_approval)	Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the **Order on behalf of** field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the **Skip approval** check box to determine if the software item requires approval by the requester's manager.
Check license compliance (check_license_compliance)	Check box that forces the system to determine if deploying this item is allowed under the current license.
Order on behalf of	Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the **Skip approval** check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information: ○ **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list. ○ **Device to install this sofware on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list. ○ **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time.
SCCM configuration	Name of the SCCM configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server.

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the**Approved By Group** related list.
   By default, the Service Catalog Request workflow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this workflow skips approval altogether and ends. The system then runs the Order Client Software workflow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.
6. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The view returns to the SCCM Applications list.

7. To see all client software distribution (CSD) catalog items, navigate to **Client Software Distribution** > **Maintain Items** > **Software Items**.

SCCM deployment

Ordering an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software workflow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software workflow sends the catalog request to the requesting user's manager for approval.
2. If the **Check license compliance** check box is selected in the software catalog item, the workflow performs a software license check. If there is no license available, the workflow creates a catalog task to procure more licenses and assigns the task to the Client Software Distribution Administrators group.
3. The Order Client Software workflow triggers the Deploy SCCM Application workflow as a subflow. This workflow adds either the user or the device to the SCCM collection using the Add to User Collection or Add to Device Collection SCCM activity.
4. If the software configuration specifies SCCM uninstall collection in the software catalog item, the Deploy SCCM Application workflow checks if the user or device exists in the uninstall collection. The workflow uses the Is Device in Collection or Is User in Collection SCCM activity. If the user or device exists in the uninstall collection, the workflow removes the device or user. The workflow uses the Remove from Device Collection or Remove from User Collection SCCM activity before adding it to the SCCM install collection.

Client software distribution validation process

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.
- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses Properties installed settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the *sn_client_sf_dist.softwareInstallExpDays* property.
- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

SCCM software revocation

An administrator can revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Revoke software deployed through the service catalog

Software deployed by SCCM can be revoked, but only when the software's status is **Installed** and the application associated with the software configuration has an uninstall collection configured.

Before you begin

- Create an SCCM configuration record for the application that names an appropriate uninstall collection.
- Associate the CSD catalog item for the application with the SCCM configuration that specifies the uninstall collection.

Role required: sn_client_sf_dist.csd_admin or admin

A workflow called Revoke SCCM Application moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **Reports** > **Requested Software**.
2. Open the record for the SCCM software package you want to revoke.
   The package must have a **Status** of **Installed** to be revocable.
3. Under **Related Links**, click **Revoke software**.

   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoke unentitled software

An administrator can revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

Before you begin

To revoke software using SCCM, you must create an SCCM configuration record for the application, in which the appropriate software Discovery model is defined. See Software discovery models.

Role required: sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses Software Asset Management to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

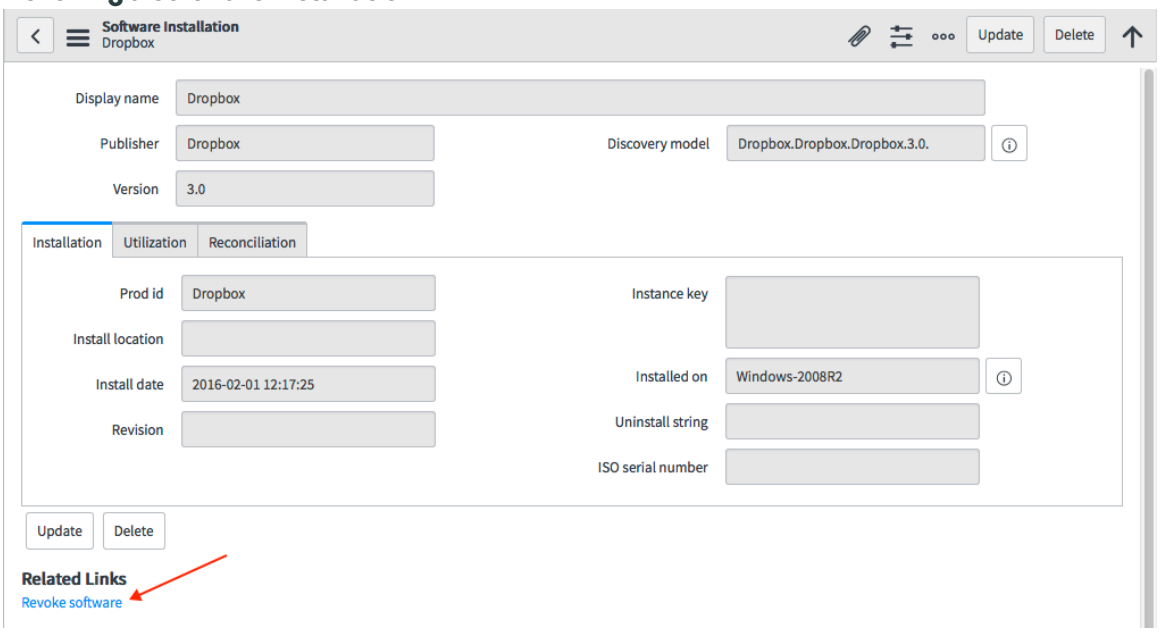
Procedure

1. Navigate to **All** > **Client Software Distribution** > **Reports** > **Installed Software Not Entitled**.
2. Select the record for the installation that has unentitled users.
3. Under **Related Links**, click **Revoke software**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoking a software installation



SCCM software revocation workflow

The Revoke SCCM Application workflow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation workflow to run, the software package must have a status of **Installed** and must be pre-configured for an appropriate uninstall collection. See Revoke software deployed through the service catalog for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application workflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The workflow employs two custom activities, Remove from User Collection and Remove from Device Collection, to remove either the user or the device from its original collection. The workflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the Add to User Collection or Add to Device Collection activity.

Note:
This workflow is triggered by the Revoke Client Software workflow as a subflow.

Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

CSD dashboard

To access the CSD dashboard, navigate to **Client Software Distribution** > **Requested Software** > **Dashboard**.

Client software distribution reports (continued)

Report	Description
	• **Type**: Line reports • **Table**: Requested Software [sn_client_sf_dist_req_software]
Software Requested Item Stage Report	Displays the sum of all requested items, grouped by the requested item's stage, for each month. • **Type**: Line reports • **Table**: Requested Software [sn_client_sf_dist_req_software]
License Counts Available	Displays the license counts for all available applications. • **Type**: Create a basic list report • **Table**: SCCM Application Catalog Item [sn_client_sf_dist_sccm_app_cat_item]

Usage Overview dashboard

Navigate to **Client Software Distribution** > **Usage Overview** to view the current transaction count for your instance.

Client software distribution extension framework

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.

Important:
The use of CSD extension points is an advanced procedure intended for use by experienced ServiceNow AI Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

Configure client software distribution providers

Identify the provider and specify the workflows and extension points for a customized software distribution process.

Before you begin

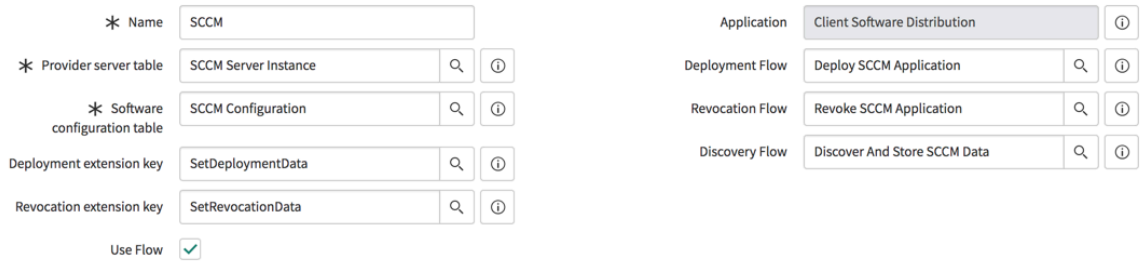
Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

Procedure

1. Navigate to **All** > **Client Software Distribution** > **Extensions** > **Providers**.
2. Click **New**.
3. Complete the form using the fields in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Client software distribution provider fields

Field	Description
Name	Descriptive name of the provider.
Provider server table	Table name of the provider server. You must create this table as an extension of the Configuration Item [cmdb_ci] table. For example, you might call your table Casper Server Instance [cmdb_ci_casper_server_instance].
Discovery flow	Flow that discovers the provider server and returns the data from that server back to the instance. This is the flow you create with custom activities that query the provider server.
Software configuration table	Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config] table. For example, you might create a table called Casper Software Configuration [sn_client_sf_dist_casper_sf_config].
Deployment extension key	The **SetDeploymentData** key provided with CSD. This key sets up the data for the software ordering and deployment workflow.
Deployment flow	Flow that deploys software from the provider server. This is the flow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.
Revocation extension key	The **SetRevocationData** key provided with CSD. This key sets up the data for installation revocation.
Revocation flow	Flow that revokes an installation from a provider server. This is the flow you created with custom activities that tells the provider which application to remove from a device.
Use Flow	Option to use Integration Hub flows for client software distribution. When this option isn't

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	selected, Orchestration workflows are used for client software distribution. **Note:**

Client software distribution extension keys

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for workflows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment workflow.
- **SetRevocationData**: Generates the input variables for the revocation workflow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

Client software distribution extension points

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation workflows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

SetDeploymentData

The script associated with this extension key must set the *csdExtensionResult* object with these attributes:

- *deploymentWorkflowInputs*: Object that specifies the deployment workflow input variables.
- *softwareModel*: Software model sys_id.
- *deploymentType*: An integer. Use **1** for deployment to a user and **2** for deployment to a device.
- *softwareApplication*: Software application sys_id.

CheckRevocable

The script associated with this extension key gets the input parameter *csdExtensionInputs.softwareConfiguration*, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the *csdExtensionResult* object to **true** or **false**, depending on whether the software configuration specifies uninstallation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetRevocationData

The script associated with this extension key gets the input parameter *csdExtensionInputs.softwareConfiguration*, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the *csdExtensionResult* object with these attributes:

- *revocationWorkflowInput*: Object that specifies the revocation workflow input variables.
- *softwareModel*: Software model sys_id.
- *deploymentType*: An integer. Use **1** for deployment to a user and **2** for deployment to a device.

Orchestration examples

These examples demonstrate how Orchestration can be used to automate common tasks.

Active Directory automation example

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.

The activities in the Active Directory activity pack are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

- Create AD User Account
- Update AD User Account
- Remove AD User Account
- Disable AD User Account
- Query AD
- Reset AD User Password.

These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.

Update Active Directory with Orchestration

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

About this task

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing

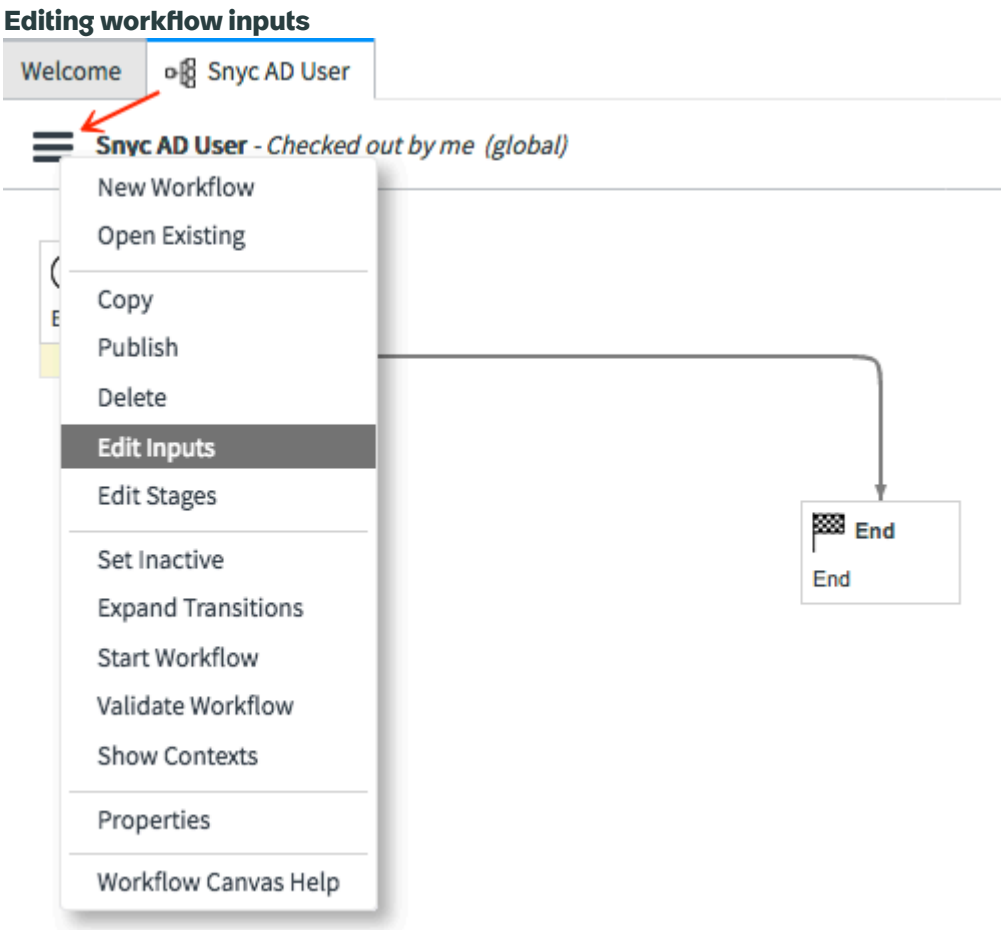
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User [sys_user] table.

Note:
This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller's IP address to the workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. In the **Workflow** tab, click the **+** icon to create a new workflow using these variables:
   - *Name*: Sync AD User
   - *Table*: Global [global]
3. Click **Submit**.
   A basic workflow with a Begin and End point appears on the canvas.
4. Click the menu icon in the upper left corner of the canvas and select **Edit Inputs** from the context menu.



5. In the Workflow Inputs form, click **New** in the **Variables** record list, and create a new variable, using the fields in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

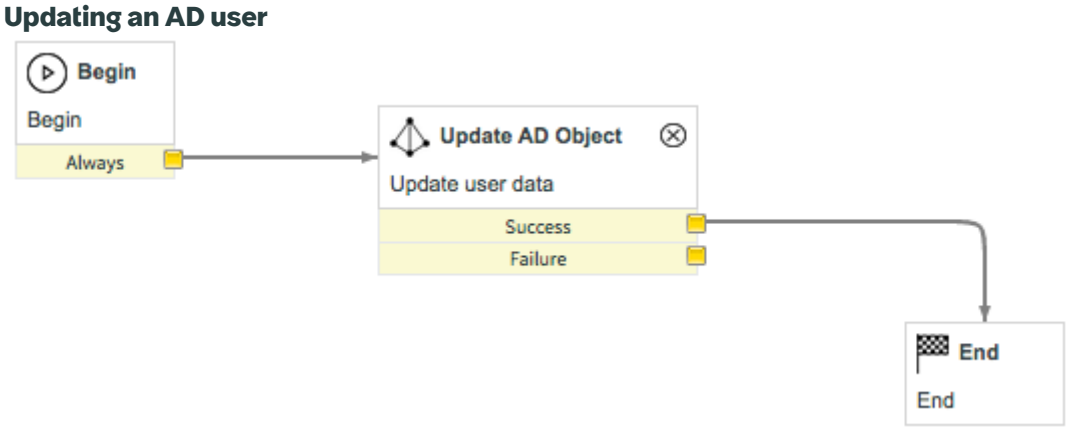
Field	Value
Type	Reference
Label	User
Column name	u_user
Reference Specification > Reference	User (sys_user)

6. Click **Submit**.
7. In the **Custom** tab, expand **Custom Activities** > **Active Directory**.
8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow.
   This action automatically links the activity with the end point and opens the Workflow Activity property form.
9. Complete the form using the fields in the table.

Field	Value
Name	Enter a logical name such as **Update user data**.
Domain controller	The ServiceNow LDAP integration adds a reference to the LDAP server to which the user's account is linked. To identify the LDAP server, enter the following statement: `${workflow.inputs.u_user.ldap_server.server_url}`
Type	Type of AD object. In this case, the type is **User**, which is the default.
Object name	This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following: `${workflow.inputs.u_user.user_name}`
Object data	Updates the user's account in Active Directory, if the user exists. In this example, the user's title is updated: `{"title" : "QA"}`

10. Click **Submit**.
    The workflow looks like this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. Attach both activity outcomes (Success and Failure) to the end point.
At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.

> **Note:**
> In a normal workflow, some type of alternate action is desirable upon failure. For example, you might send an Email and SMS notifications if the workflow failed to update the record.

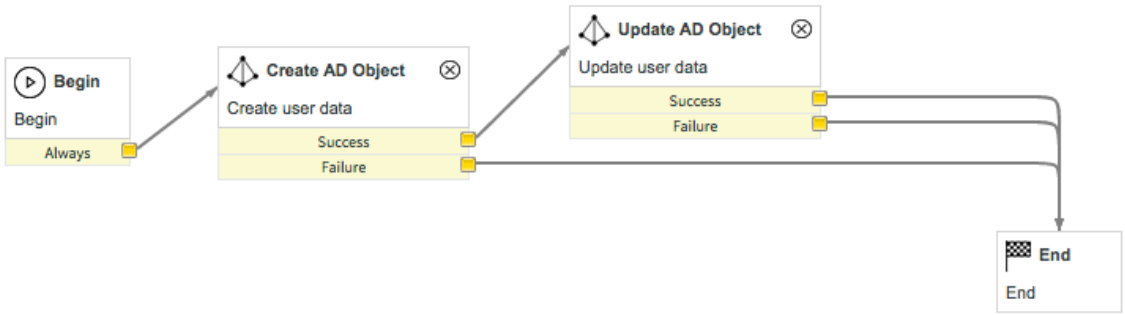
12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.
13. Complete the Workflow Activity property form using the fields in the table.

Field	Value
Name	Enter a logical name such as **Create user data**.
Domain controller	Same as for the update activity. `${workflow.inputs.u_user.ldap_server.server_url}`
Ou	The organizational unit to which this object belongs. For the purpose of this example, you can enter **OU=HQ,OU=Managed Objects**
Object name	Same as for the update activity. `${workflow.inputs.u_user.user_name}`
Object data	Creates an account with only the user name in it. For the purpose of this example, you can enter `{"givenName" : "${workflow.inputs.u_user.first_name}", "SN" : "${workflow.inputs.u_user.last_name}" }`

14. Click **Submit**.
15. Connect the Failure outcome of the Create AD Object activity to End.
For this example, we are ignoring errors. The workflow now looks like this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating an AD user



This procedure builds a simple workflow that creates a bare-bones Active Directory account consisting of a user name only. The workflow then updates that account with additional information provided by the ServiceNow User [sys_user] table. However, we do not want to execute the Create AD Object activity if the user account already exists. The workflow needs to query Active Directory for matching user records and then branch the workflow based on the results of the query. If an account already exists, then the workflow should update the account. If the account does not exist, then the workflow should create the account in Active Directory.

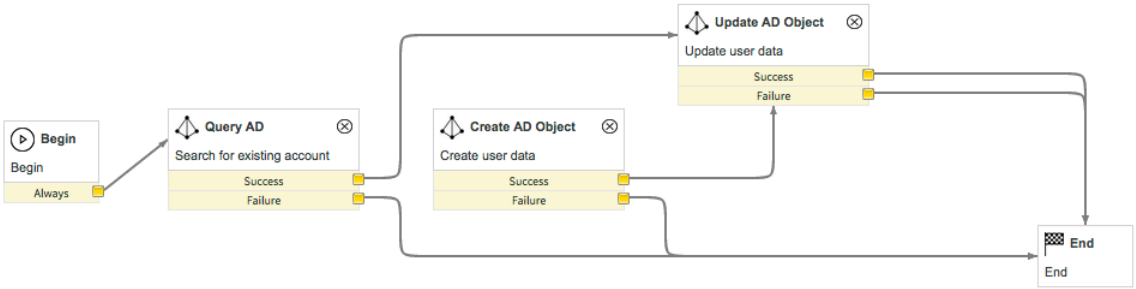
16. Drag and drop the Query AD activity onto the transition between Begin and Create AD Object.
17. Complete the Workflow Activity property form using the fields in the table.

Field	Definition
Name	Enter a logical name such as **Search for existing account**.
Domain controller	`${workflow.inputs.u_user.ldap_server.server_url}`
Properties	A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If the parameter field is blank, then all properties are returned. In this workflow, we leave the field blank.
Search filter	An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. To find user accounts matching the input record, we use: `(samaccountname=${workflow.inputs.u_user.user_name})`

18. Click **Submit**.
19. Connect the Failure outcome for the query activity to the End point.
Remember that we are ignoring errors in this workflow.
20. Connect the Success outcome of the query activity to the Update AD Object activity.
The workflow now looks like this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Querying AD for user accounts



The Query AD activity returns its results as a JSON string in the workflow data bus. This JSON string is always an array of objects. Each object corresponds to an Active Directory entry that matched the query. Our workflow should branch, whether that array is empty or not.

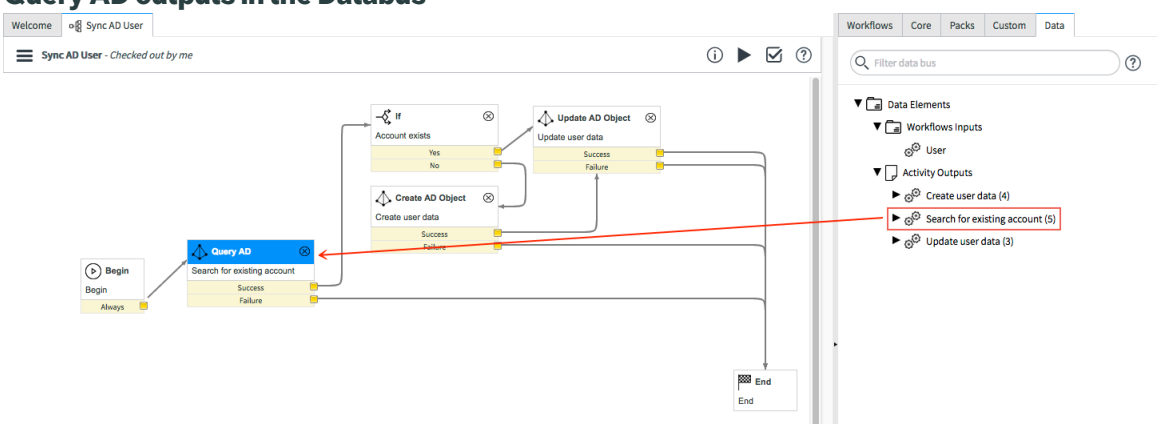
21. Drag a standard *If* activity from the *Conditions* folder in the **Core** tab and drop it onto the transition between Query AD and Update AD Object.
22. Complete the Workflow Activity properties form using the fields in the table.

Field	Value
Name	Enter a logical name such as **Account exists**.
Advanced	Select this check box to open the *Script* field.

Script	For the If activity to work correctly, we must return a **yes** or **no** in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called queryResults. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no.
	`var queryResults=new JSON().decode(data.get(5).output);`
	`answer = ( queryResults.length>0 ? 'yes' : 'no' );`

Note:
The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.

Query AD outputs in the Databus

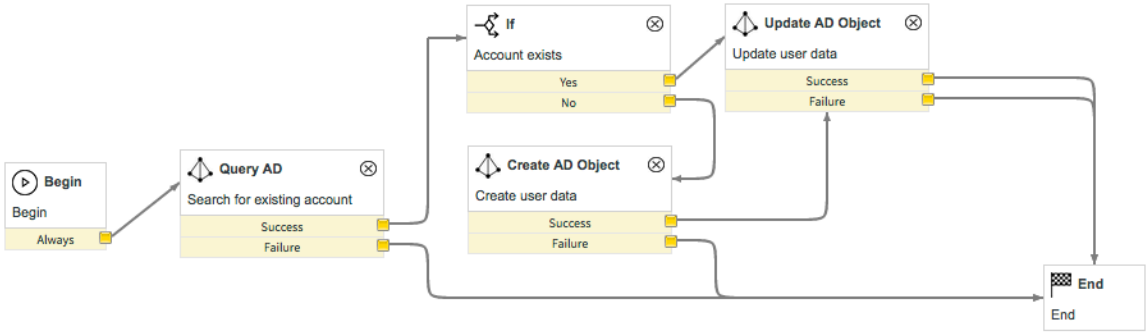


23. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.
25. Create a transition from the No outcome of the If activity to the Create AD Object activity. This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.

Creating the conditional paths



Orchestration activity packs

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.

Activity packs allow you to automate several common business processes, such as managing Active Directory accounts and Exchange server mailboxes. Activity packs can also automate IT functions such as starting and stopping Windows servers, joining domains, assigning IP addresses, and configuring load balancers.

Use an activity pack

The **Packs** tab of the Workflow Editor contains any activity packs downloaded from the ServiceNow Store and any activity packs that you create.

Before you begin

Roles required: admin, activity_admin, activity_creator

About this task

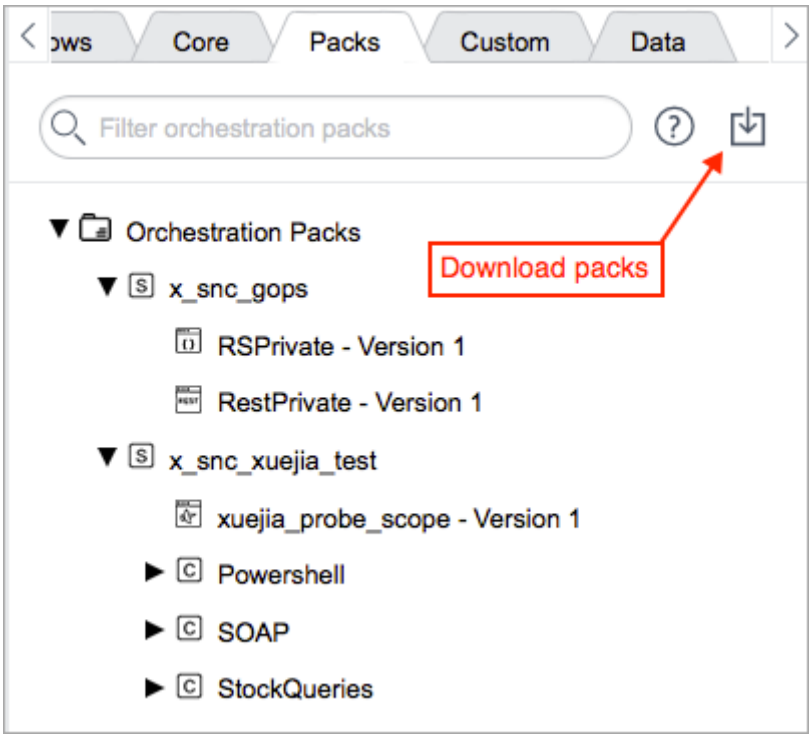
You can organize custom activities into packs and upload them to the ServiceNow Store. Your custom packs do not appear in the tree until at least one activity in the pack is published. Activities added to an existing pack are not displayed until they are published. Activity packs from any Application scope can appear in the **Packs** tab, regardless of the current scope setting for the instance.

Procedure

1. In the Workflow Editor palette, select the **Packs** tab.
2. Click the download icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The hierarchy in the tab organizes packs by vendor, scope, category, and activity.



Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow.

Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by a Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

Note:
All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the **Workflow Log** tab in a Workflow Context record.

Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration Create a PowerShell activity, starting with the Geneva release. These activities perform the same functions as AD activities by the same name from previous releases and replace those activities for all new workflows. Existing workflows from earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Istanbul. However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow administrators the ability to store input and output variables from the Query AD activity in the Databus.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To use the Active Directory custom activities, you must request activation of the Orchestration - Active Directory plugin.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record Windows credentials. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Connection port used by AD Orchestration activities

All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual Directory (OVD) as a proxy, set up pass-through on port 389 only.

Add User to Group AD activity

The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Input variables

Add User to Group input variables

Variable	Description
DomainController	IP address of the domain controller machine.
UserName	Name of the user to add to the group.
GroupName	Name of the group to which this user is added.

Output variables

Add User to Group output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Add User to Group conditions

Condition	Description
Success	User was successfully added to group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add User to Group conditions (continued)

Condition	Description
Failure	An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.

Change AD User Password activity

The Change AD User Password activity changes the password for an Active Directory user account.

This activity requires the user's current password to run, unlike the **Reset AD User Password** activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Change AD User Password input variables

Variable	Description
DomainController	IP address of the domain controller machine.
User	The sAMAccountName of the Active Directory user account.
New_password	The new password to assign this user.
Old_password	The user's current password.

Output variables

Change AD User Password output variables

Variable	Description
result	One of the following outcomes: • **failure** • **success** • **Policy Failure** • **Incorrect old password**
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change AD User Password output variables (continued)

Variable	Description
hresult	Powershell command result.

Conditions

The activity provides the following conditions:

Change AD User Password conditions

Condition	Description
Success	Password successfully reset.
Policy Failure	Password does not comply with the organization's Active Directory requirements.
Incorrect old password	Password being changed was not entered correctly.
Failure	An error occurred while attempting to change the password. Additional details may be available in the workflow log.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record Windows credentials. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Create AD Object activity

The Create AD Object activity creates an object in Windows Active Directory.

This activity fails if it finds an existing object with matching input variables.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Create AD Object input variables

Variable	Description
DomainController	IP address of the domain controller machine.
Type	The object type to create: user, group, or computer.
OU	The organizational unit to which this object belongs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create AD Object input variables (continued)

Variable	Description
ObjectName	The sAMAccountName of the Active Directory object. **Object name** is also used for the **name** attribute in Active Directory. This behavior is available in **ActiveDirectory.psm1**. Whatever is passed as the **Object name** becomes both the **samAccountName** and the **name** of the new user in Active Directory.
ObjectData	A JSON object containing Active Directory property names and their corresponding values. For example: `{ "givenName" : "John", "SN" : "Doe", "title" : "Sr. Account Specialist", "allowLogin" : true }` This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows expression evaluation via the ${} variable substitution syntax.

Output variables

Create AD Object output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Create AD Object conditions

Condition	Description
Success	A Windows Active Directory object was created successfully.
Failure	An error occurred while attempting to create the AD object. Additional details may be available in the workflow log.

Disable AD User Account activity

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Disable AD User Account input variables

Variable	Description
DomainController	IP address of the domain controller machine.
User	The sAMAccountName of the Active Directory user account.

Output variables

Disable AD User Account output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *`executionResult.errorMessages`* from the Activity designer parsing sources.

Conditions

Disable AD User Account conditions

Condition	Description
Success	AD user account was successfully disabled.
Failure	An error occurred while attempting to disable the account. Additional details may be available in the workflow log.

Enable AD User Account activity

The Enable AD User Account activity enables a Windows Active Directory user account, making it active.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Enable AD User Account input variables

Variable	Description
User	The sAMAccountName of the Active Directory user account.
DomainController	IP address of the domain controller machine.

Output variables

Enable AD User Account output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Enable AD User Account conditions

Condition	Description
Success	AD user account was successfully enabled.
Failure	An error occurred while attempting to enable the AD user account. Additional details may be available in the workflow log.

Is AD Account Locked activity

The Is AD Account Locked activity determines whether an Active Directory user account is locked.

An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the Unlock AD User Account activity.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Is AD Account Locked input variables

Variable	Description
DomainController	IP address of the domain controller machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Is AD Account Locked input variables (continued)

Variable	Description
User	The sAMAccountName of the Active Directory user account.

Output variables

Is AD Account Locked output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.
output	The query result.

Conditions

Is AD Account Locked conditions

Condition	Description
Locked	The AD account is locked.
Unlocked	The AD account is unlocked.
Failure	An error occurred while processing the query. Additional details may be available in the workflow log.

Query AD activity

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory** > **.**

Note:
This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul and will continue to save query results to the scratchpad. However, all new workflows must use the custom version of this activity. This activity was built with the Create a PowerShell activity, which stores input and output variables in the databus instead of the scratchpad.

Input variables

Query AD input variables

Variable	Description
DomainController	IP address of the domain controller machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query AD input variables (continued)

Variable	Description
Properties	A comma-separated list of Active Directory properties to return. For example, *`givenName,SN,title`*. If this field is blank, then all properties are returned.
SearchFilter	An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. For example, to find user accounts matching the ServiceNow input record, use: `(samaccountname=${workflow.inputs.u_user.user_name})`

Output variables

Query AD output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *`executionResult.errorMessages`* from the Activity designer parsing sources.
output	The query result.

Conditions

Query AD conditions

Condition	Description
Success	The query completed as expected.
Failure	An error occurred while processing the query. Additional details may be available in the workflow log.

Remove AD Object activity

The Remove AD Object activity deletes an object from Windows Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Remove AD Object input variables

Variable	Description
DomainController	IP address of the domain controller machine.
ObjectName	The sAMAccountName of the Active Directory object.
Type	The object type to remove: • **user** • **group** • **computer**

Output variables

Remove AD Object output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Remove AD Object conditions

Condition	Description
Success	AD object was successfully removed.
Failure	An error occurred while attempting to remove the AD object. Additional details may be available in the workflow log.

Remove User from Group AD activity

The Remove User from Group activity removes a user from a group in Windows Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Input variables

Remove User from Group input variables

Variable	Description
DomainController	IP address of the domain controller machine.
UserName	Name of the user to remove from the group.
GroupName	Name of the group from which this user is removed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Remove User from Group output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Remove User from Group conditions

Condition	Description
Success	User was successfully removed from the group.
Failure	An error occurred while attempting to remove the user from the group. Additional details may be available in the workflow log.

Reset AD User Password activity

The Reset AD User Password activity resets the password of a user account in Windows Active Directory.

If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Reset AD User Password input variables

Variable	Description
DomainController	IP address of the domain controller machine.
User	The sAMAccountName of the Active Directory user account.
Password	The new password for the user. This password must comply with the organization's Active Directory requirements.
ForceChange	Makes this password temporary by forcing the user to change it at the next login.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reset AD User Password input variables (continued)

Variable	Description
Unlock	Unlock the account if the account is locked.

Output variables

Reset AD User Password output variables

Variable	Description
result	One of the following outcomes: • **failure** • **success** • **Policy Failure**
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.
hresult	Powershell command result.

Conditions

Reset AD User Password conditions

Condition	Description
Success	Password was successfully reset.
Policy Failure	New password does not comply with the organization's Active Directory requirements.
Failure	An error occurred while attempting to reset the password. Additional details may be available in the workflow log.

Unlock AD Account activity

The Unlock AD Account activity unlocks a locked Active Directory user account.

You can use the Is AD Account Locked activity activity to determine if an account is locked.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Unlock AD Account input variables

Variable	Description
DomainController	IP address of the domain controller machine.
User	The sAMAccountName of the Active Directory user account.

Output variables

Unlock AD Account output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Unlock AD Account conditions

Condition	Description
Success	The account was successfully unlocked.
Failure	An error occurred while attempting to unlock the account. Additional details may be available in the workflow log.

Update AD Object activity

The Update AD Object activity updates an object in Windows Active Directory.

This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the Run PowerShell activity instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Update AD Object input variables

Variable	Description
DomainController	IP address of the domain controller machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update AD Object input variables (continued)

Variable	Description
ObjectName	The sAMAccountName of the Active Directory object.
ObjectData	A JSON object containing Active Directory properties and their values. For example, to set the first name, last name, and title of a user, clear the user's manager, and set the VIP flag to true, the Object Data specifies: `{ "givenName" : "John", "SN" : "Doe", "title" : "Sr. Account Specialist", "manager" : null, "msTSAllowLogon" : false }`
Type	The object type to update: user, group, or computer.

Output variables

Update AD Object output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Update AD Object conditions

Condition	Description
Success	AD object was successfully updated.
Failure	An error occurred while attempting to update an AD object. Additional details may be available in the workflow log.

Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration REST Web Service activity template.

Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Add User to Group input variables

Variable	Description
user_id	Object ID (GUID) of the member to be added.
group_id	Object ID (GUID) of the target group.

Output variables

Add User to Group output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

Conditions

Add User to Group conditions

Condition	Description
Success	Activity successfully added the object ID to the security group.
Failure	Activity failed to update the group's membership, or the activity failed to connect to Azure AD.

Assign User License Azure AD activity

The Assign User License activity assigns an additional Office 365 software license to the named user.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Assign User License input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com**.
sku_id	Subscription SKU ID associated with the tenant's enterprise agreement.

Output variables

Assign User License output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

Conditions

Assign User License conditions

Condition	Description
Success	Activity successfully assigned an Office 365 license to a user.
Failure	Activity failed to assigned an Office 365 license to a user, or the activity failed to connect to Azure AD.

Create User Azure AD activity

The Create User activity creates a user for the Azure Active Directory tenant.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Create User input variables

Variable	Description
display_name	Name of the Azure AD user in the accepted display format, such as **jacinto.gawron**.
user_principal_name	User principal name (UPN) in an email format. For example, you might enter **jacinto.gawron@khitomer.com**.
mail_nickname	User's email alias that redirects to the user's full address.
password	User's Azure AD password. This password must be passed as a workflow input with a type of **Password (2 Way Encrypted)** and must meet the password policy set in Azure AD.
change_password	Control that requires the user to change their password at the next login, if set to true.
account_enabled	Control that sets the user's account is enabled, if set to true.
given_name	First name of the user.
surname	Last name of the user.
other_mails	List of additional email addresses for the user. For example, you might enter `["jac@home.com", "jgawron@fabrikam.com"]`.
country	The country or region in which the user is located. For example, you might enter **US** or **UK**. The default value is set to**US**.
city	City in which the user is located.
department	Name of the department in which the user works.
mobile	User's primary cell phone number.
job_title	User's job title.
physical_delivery_office_name	Office location in the user place of business.
postal_code	Postal code of the user's address.
preferred_language	Language in which the user prefers to communicate. This value must follow the ISO 639-1 Code. For example, you might enter **en-US**. The default value is set to **en-US**.
state	State or province for the user's address.
street_address	Street address of the user's place of business.
telephone_number	Primary telephone number of the user's place of business.

Create User input variables (continued)

Variable	Description
usage_location	Two letter country code that is required for users who are assigned Office 365 licenses. The default value is **US**.

Output variables

Create User output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
status_code	Contains the status code returned from the Web service.
user_exists	Output variable mapped to the JSON message that contains the `User already exists` error.
user_info	The *`user_info`* array contains attributes that can be leveraged by other activities as inputs. For example, the user *`objectid`* output (GUID) can be passed to the Add User to Group activity as the *`user_id`* input. • *`objectid`*: User's Azure AD identifier. • *`accountEnabled`*: Boolean variable indicating whether the user's account is active or inactive. • *`displayName`*: Users display name, such as **jacinto.gawron**. • *`userPrincipalName`*: User's name in email format, such as **jacinto.gawron@wammo.com**. • *`mailNickname`*: User's email alias.

Conditions

Create User conditions

Conditions	Description
Created user	Activity successfully created the user.
User already exists	User already exists in the tenant domain.
Failure	Activity failed to connect to Azure AD, or an input value was invalid.

Delete User Azure AD activity

The Delete User activity deletes the named user's account from the Azure Active Directory tenant.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Delete User input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com**.

Output variables

Delete User output variables

Variables	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

Conditions

Delete User conditions

Condition	Description
Deleted user	Activity deleted the specified user.
User does not exist	Specified user does not have an account in the tenant domain.
Failure	Activity failed to connect to Azure AD.

Get User Info Azure AD activity

The Get User Info activity returns the named user's information from the Azure Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Check If User Exists input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com** **Note:** Version 2 of this activity enforces input validation. If empty, the following message appears: "Mandatory input 'user_id' is empty" .

Output variables

Check If User Exists output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.
user_info	The *user_info* array contains attributes that can be leveraged by other activities as inputs. For example, the user *objectid* output (GUID) can be passed to the Add User to Group activity as the *user_id* input. • *objectid*: User's Azure AD identifier. • *accountEnabled*: Boolean variable indicating whether the user's account is active or inactive. • *displayName*: Users display name, such as **jacinto.gawron**. • *userPrincipalName*: User's name in email format, such as **jacinto.gawron@wammo.com**. • *mailNickname*: User's email alias.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Check If User Exists conditions

Condition	Description
User exists	Activity found the named user.
User does not exist	Activity was unable to find the named user in the customer tenant domain.
Failure	Activity failed to connect to Azure AD.

Remove User from Group Azure AD activity

The Remove User from Group activity removes an existing user from a security group in Azure Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Remove User from Group input variables

Variable	Description
user_id	Object ID (GUID) of the user to be removed.
group_id	Object ID (GUID) of the target group.

Output variables

Remove User from Group output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Remove User from Group conditions

Variable	Description
Success	Activity removed the object ID from the security group.
Failure	Activity failed to update the group's membership, or the activity failed to connect to Azure AD.

Remove User License Azure AD activity

The Remove User License activity revokes the specified Office 365 software license for the named user.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Remove User License input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com**.
sku_id	Subscription SKU ID associated with the tenant's enterprise agreement.

Output variables

Remove User License output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Remove User License conditions

Condition	Description
Success	Activity removed an Office 365 license from the named user.
Failure	Activity failed to remove an Office 365 from a user, or the activity failed to connect to Azure AD.

Reset User Password Azure AD activity

The Reset User Password activity changes the named user's Azure Active Directory password.

The Azure password policy imposes constraints on the complexity, length, and re-use of a password.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Reset User Password input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com**.
password	User's Azure AD password. This password must be passed as a workflow input with a type of **Password (2 Way Encrypted)** and must meet the password policy set in Azure AD.
change_password	Control that requires the user to change their password at the next login, if set to true.

Output variables

Reset User Password output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reset User Password output variables (continued)

Variable	Description
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

Conditions

Reset User Password conditions

Condition	Description
Success	Activity reset the named user's password.
Failure	Activity failed to reset the named user's password, or the activity failed to connect to Azure AD.

Exchange activity pack

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems.

The use of Orchestration Exchange activities requires the following:

- Microsoft Exchange 2010, 2013, or 2016.
- A MID Server configured to run Powershell 2.0
- A target Exchange server in the same Active Directory domain as the instance.
- Powershell Remoting enabled on the target Exchange server.

Note:
These activities cannot be used to interact with Microsoft Exchange Online.

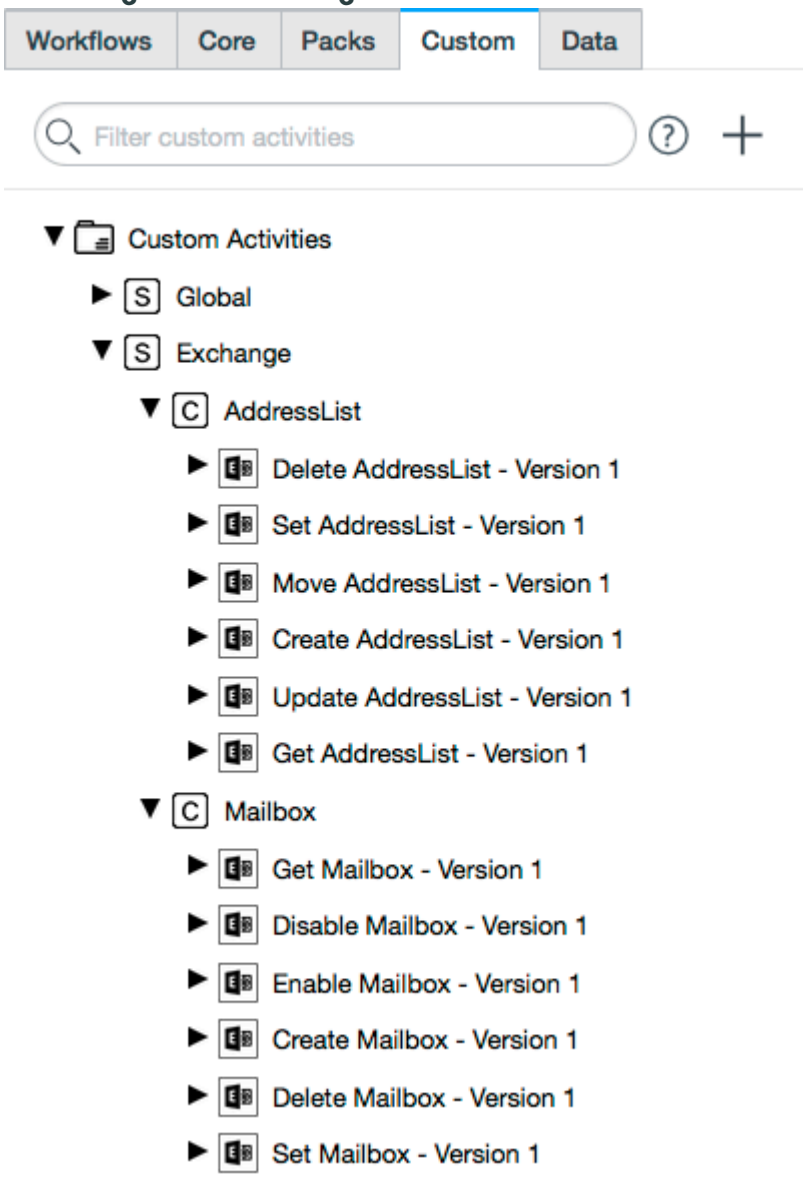
Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with a Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Note:
Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must request activation of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the **Custom** tab. Expand the **Custom Activities** tree and select the **Exchange** category for the activity you want to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing custom Exchange activities



Configure MID Server for Exchange

Configure a MID Server with defined IP ranges to use Exchange.

Before you begin

Role required: admin

About this task

If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

Procedure

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the **Name** field.
4. Right-click the form header and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of your Exchange server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

Pass multivalued properties with an Exchange activity

To set a multivalued property using an Exchange activity, you must use a specific parameter format.

About this task

The Optional parameters shared input variable allows you to set multivalued properties.

Procedure

- To set a multivalued property, replacing any existing values, use this format: "`PropertyName`":"(`value1`, `value2`, `value3`)"
- To add values, use this format: "PropertyName":"+(`value1`, `value2`, `value3`);"
- To remove values, use this format: "PropertyName":"-(`value1`, `value2`, `value3`);"
- To both add and remove values, use this format: "PropertyName":"-(`value1`, `value2`, `value3`);+(`value1`, `value2`, `value3`);"

Create Address List activity

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group.

This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange New-AddressList command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Create Address List input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
name	Name of the new address list to create.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Address List input variables (continued)

Variable	Description
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.

Output variables

Create Address List output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.
output	Raw XML payload from the Exchange server. This data includes all Exchange attributes.

Conditions

Create Address List conditions

Condition	Description
Success	The activity succeeded in creating a new address list.
Failure	The activity failed to create a new address list.

Delete Address List activity

The Delete Address List activity removes an existing address list from an Exchange server.

This activity implements the Microsoft Exchange Remove-AddressList command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Delete Address List input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
identity	Name of the address list to remove.
domainController	Fully-qualified domain name (FQDN) of the domain controller that writes to Active Directory.
recursive	Check box that indicates if the activity should delete Active Directory elements that are children of the specified address list.
whatif	Check box that indicates if the activity should stage the changes without applying them. Use this variable to test your activity settings before using the activity in a live workflow. When this variable is selected, the Exchange server does not make any changes but indicates if the command would succeed or fail. You can review any messages from the Exchange server using the ECC queue.

Output variables

Delete Address List output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Delete Address List conditions

Condition	Description
Success	The activity succeeded in removing the address list from the Exchange server.
Failure	The activity failed to remove the address list from the Exchange server.

Get Address List activity

The Get AddressList activity retrieves all attributes from the specified Exchange address list.

This activity implements the Microsoft Exchange Get-AddressList command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Get Address List input variables

Variables	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
domainController	Fully-qualified domain name (FQDN) of the domain controller that writes to Active Directory.
identity	Name of the address list to get attributes from. If you enter a value in this variable, leave the **container** and **searchText** variables blank.
organization	Organization to which the specified address list belongs.
searchText	Filter text that causes the activity to return only results that contain this text. This variable can only be used with Exchange 2013 servers. If you enter a value in this variable, leave the **container** and **identity** variables blank.
container	Parent address list of the address list from which you want to retrieve attributes. If you enter a value in this variable, leave the **identity** and **searchText** variables blank

Output variables

Get Address List output variables

Variables	Descriptions
result	Either **success** or **failure**.
error	Error message if the operation fails.
output	Raw XML payload from the Exchange server. This data includes all Exchange attributes.

Conditions

Get Address List conditions

Condition	Description
Success	The activity succeeded in retrieving the attributes from the address list.
Failure	The activity failed to retrieve the attributes from the address list.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Move Address List activity

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange Move-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Move Address List input variables

Variables	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
identity	Name of the address list to move.
target	Path to the address list's new location.
domainController	Fully-qualified domain name (FQDN) of the domain controller that writes to Active Directory.
whatif	Check box that indicates if the activity should stage the changes without applying them. Use this variable to test your activity settings before using the activity in a live workflow. When this variable is selected, the Exchange server does not make any changes but indicates if the command would succeed or fail. You can review any messages from the Exchange server using the ECC queue.

Output variables

Move Address List output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Move Address List conditions

Condition	Description
Success	The activity succeeded in moving the address list to another location.
Failure	The activity failed to move the address list to another location.

Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.

Use the Optional parameters variable to pass specific values to the Microsoft Exchange server. This activity implements the Microsoft Exchange Set-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Set Address List input variables

Variables	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
identity	Name of the address list to modify.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Set Address List output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Set Address List conditions

Variable	Description
Success	The activity succeeded in modifying the specified address list.
Failure	The activity failed to modify the specified address list.

Update Address List activity

The Update Address List activity adds or removes users from the specified address list and immediately applies any cached address list changes to the server.

Use the optional parameters variable to specify which users to add or remove. This activity implements the Microsoft Exchange Update-AddressList command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Update Address List input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
identity	Name of the address list to update.
domainController	Fully-qualified domain name (FQDN) of the domain controller that writes to Active Directory.
whatif	A check box that indicates if the activity should stage the changes without applying them. Use this variable to test your activity settings before using the activity in a live workflow. When this variable is selected, the Exchange server does not make any changes but indicates if the command would

Update Address List input variables (continued)

Variable	Description
	succeed or fail. You can review any messages from the Exchange server using the ECC queue.

Output variables

Update Address List output variables

Variable	Description
result	Either **Success** or **Failure**.
error	Error message if the operation fails.

Conditions

Update Address List conditions

Condition	Description
Success	The activity succeeded in adding or removing users from the specified address list.
Failure	The activity failed to add or remove users from the specified address list.

Create Mailbox activity

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange New-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Create Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Mailbox input variables (continued)

Variable	Description
	Important: The MID Server must be in the same domain as the Exchange server.
first_name	First name of the user.
middle_initial	Middle initial of the user.
last_name	Last name of the user.
alias	The display name for the mailbox address, the part of the email address to the left of the @ symbol. If no alias is specified, the activity uses First name.Last name as the alias. The alias is also used as the user's principal name (UPN) if none is specified in the optional parameters.
password	Password to use for the new mailbox. The password is encrypted when it is sent to the target host.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format *`"parameter":"true"`*.

Output variables

Create Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.
output	Raw XML payload from the Exchange server. This data includes all Exchange attributes.

Conditions

Create Mailbox conditions

Condition	Description
Success	The activity succeeded in creating a new mailbox for the specified user. If no Active Diectory account existed for that user, this activity succeeded in creating a new account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Mailbox conditions (continued)

Condition	Description
Failure	The activity failed to create a new mailbox or an Active Directory account for the specified user.

Delete Mailbox activity

The Delete Mailbox activity deletes the Microsoft Exchange mailbox of an Active Directory user.

Optional parameters determine how the Exchange server handles the mailbox after deleting the user. This activity implements the Microsoft Exchange Remove-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Delete Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
user	Active Directory user to delete. The activity passes this value to Exchange as the Identity Exchange variable.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.

Output variables

Delete Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Delete Mailbox conditions

Condition	Description
Success	The activity succeeded in deleting the specified user's mailbox.
Failure	The activity failed to delete the specified user's mailbox.

Disable Mailbox activity

The Disable Mailbox activity disables the mailbox associated with a specified Active Directory account.

This activity implements the Microsoft Exchange Disable-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Disable Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
user	Active Directory user who's mailbox should be disabled. The activity passes this value to Exchange as the Identity Exchange variable.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type.

Disable Mailbox input variables (continued)

Variable	Description
	Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format *`"parameter":"true"`*.

Output variables

Disable Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Disable Mailbox conditions

Condition	Description
Success	The activity succeeded in disabling the specified mailbox.
Failure	The activity failed to disable the specified mailbox.

Enable Mailbox activity

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user.

This activity implements the Microsoft Exchange Enable-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Enable Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.

Enable Mailbox input variables (continued)

Variable	Description
domain	The name of the Exchange server's assigned domain.
user	Active Directory user who's mailbox should be enabled. The activity passes this value to Exchange as the Identity Exchange variable.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.

Output variables

Enable Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Enable Mailbox conditions

Condition	Description
Success	The activity succeeded in creating a new mailbox for the specified user.
Failure	The activity failed to create a new mailbox for the specified user.

Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange Get-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Get Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
user	User whose mailbox this activity should retrieve. If no user is specified, the activity gets all mailboxes on the Exchange server. The activity passes this value to Exchange as the Identity Exchange variable.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.

Output variables

Get Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.
output	Raw XML payload from the Exchange server. This data includes all Exchange attributes.

Conditions

Get Mailbox conditions

Condition	Description
Success	The activity succeeded in retrieving the attributes of the specified mailbox.
Failure	The activity failed to retrieve the attributes of the specified mailbox.

Set Mailbox activity

The Set Mailbox activity modifies the settings of an existing Microsoft Exchange mailbox.

Use the optional parameters variable to pass specific values to the Exchange server. This activity implements the Microsoft Exchange Set-Mailbox command.

F5 Network Management activity pack

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application Application scope and are activated by the Orchestration - F5 network management plugin, which must be activated by request.

ServiceNow provides custom F5 activities, built from the REST web service activity template, that you can use to perform the following tasks:

- Add, delete, or verify pools.
- Add, delete, or identify pool members.
- Add or delete virtual servers.
- Add a profile to a virtual server.
- Configure the virtual server for vlans, irules, pool, and persistence.

Add F5 Pool Member activity

The Add F5 Pool Member activity adds a member to an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Membership Management
- **REST function**: post

Input variables

Add F5 Pool Member input variables

Variable	Description
PoolName	Name of this pool, such as `testPool`.
F5IPAddress	IP address of the F5 console.
MemberName	Pool member IP address and port, such as 192.168.2.19:80.

Output variables

Add F5 Pool Member output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.
output	The REST output.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Add F5 Pool Member conditions

Condition	Description
Success	Activity successfully added an F5 load balancer pool member.
Failure	Activity failed to add an F5 load balancer pool member.

Get F5 Pool Member activity

The Get F5 Pool Member activity returns the pool members and verifies the pool's status.

Use this activity to verify that a pool member was created properly.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Membership Management
- **REST function**: get

Input variables

Get F5 Pool Member input variables

Variable	Description
PoolName	Name of this pool, such as `testPool`.
F5IPAddress	IP address of the F5 console.

Output variables

Get F5 Pool Member output variables

Variable	Description
MembersArray	Array for the returned pool member IP address and port, such as 192.168.2.19:80.
status_code	The HTTP status code.
error	The REST error.
result	Success or failure.
output	The REST output.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Get F5 Pool Member conditions

Condition	Description
Success	Activity successfully returned the F5 load balancer pool members.
Failure	Activity failed to return the F5 load balancer pool members

Delete F5 Virtual Server activity

The Delete F5 Virtual Server activity deletes a virtual server from an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 VIP Management
- **REST function**: delete

Input variables

Delete F5 Virtual Server input variables

Variable	Description
F5IPAddress	IP address of the F5 console.
name	The virtual server's name, such as `testVIP`.

Output variables

Delete F5 Virtual Server output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.

Conditions

Delete F5 Virtual Server conditions

Condition	Description
Success	Activity successfully deleted the virtual server from the F5 load balancer pool.
Failure	Activity failed to delete the virtual server from the F5 load balancer pool.

Check F5 Pool activity

The Check F5 Pool activity checks the status of a pool to determine if it is available to accept traffic.

Use this activity to determine if a pool you just created is up and running with the proper configuration.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Management
- **REST function**: get

Input variables

Check F5 Pool input variables

Variable	Description
F5IPAddress	IP address of the F5 console.
PoolName	Name of this pool, such as `testPool`.

Output variables

Check F5 Pool output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.

Conditions

Check F5 Pool conditions

Condition	Description
Success	Activity successfully returned the status of the F5 load balancer pool.
Failure	Activity failed to return the status of the F5 load balancer pool.

Add F5 Profile to Virtual Server activity

The Add F5 Profile to Virtual Server activity adds a profile to a virtual server assigned to an F5 load balancer pool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 VIP Profile Management
- **REST function**: post

Input variables

Add F5 Profile to Virtual Server input variables

Variable	Description
name	The virtual server's name, such as `testVIP`
F5IPAddress	IP address of the F5 console.
VirtualServerName	Name of the virtual server, such as `testVIP`.

Output variables

Add F5 Profile to Virtual Server output variables

Variable	Description
result	Success or failure.
output	The REST output.
status_code	The HTTP status code.

Condtions

Add F5 Profile to Virtual Server conditions

Condition	Description
Success	Activity successfully added the F5 load balancer profile to the virtual server.
Failure	Activity failed to add the F5 load balancer profile to the virtual server.

Modify F5 Virtual Server activity

The Modify F5 Virtual Server activity configures a virtual server assigned to an F5 load balancer pool with irules and a vlan.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

REST settings

- **REST message**: F5 VIP Management
- **REST function**: put

Input variables

Modify F5 Virtual Server input variables

Variable	Description
name	The virtual server's name, such as `testVIP`.
F5IPAddress	IP address of the F5 console.
irules	The irules for the virtual server, such as `_sys_https_redirect`. • **pool**: Name of the pool for the virtual server, such as `testPool`. • **persistent**: Persistent profile for the virtual server, such as `cookie`.
vlans	Vlans for the virtual server, such as `internal`.

Output variables

Modify F5 Virtual Server output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
output	The REST output.

Conditions

Modify F5 Virtual Server conditions

Condition	Description
Success	Activity successfully configured a virtual server assigned to an F5 load balancer pool.
Failure	Activity failed to configure a virtual server assigned to an F5 load balancer pool.

Add F5 Virtual Server activity

The Add F5 Virtual Server activity adds a virtual server.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

© 2026 ServiceNow, Inc. All rights reserved.

REST settings

- **REST message**: F5 POOL Membership Management
- **REST function**: post

Input variables

Add F5 Virtual Server input variables

Variable	Description
name	The virtual server's name, such as `testVIP`.
description	Description of this virtual server.
ipProtocol	Protocol used for this virtual server, such as `tcp`.
destination	Virtual server IP address and port number, such as 192.168.4.20:80.
mask	Subnet mask for this virtual server, such as 255.255.255.255.
F5IPAddress	IP address of the F5 console.
sourceAddressTranslation	Source address translation mode.

Output variables

Add F5 Virtual Server output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.
output	The REST output.

Conditions

Add F5 Virtual Server conditions

Condition	Decription
Success	Acitivty successfully added a virtual server.
Failure	Activity failed to add a virtual server.

Delete F5 Pool Member activity

The Delete F5 Pool Member activity deletes an F5 load balancer pool member.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

REST settings

- **REST message**: F5 POOL Membership Management
- **REST function**: delete

Input variables

Delete F5 Pool Member input variables

Variable	Description
PoolName	Name of this pool, such as `testPool`.
F5IPAddress	IP address of the F5 console.
MemberName	Pool member IP address and port, such as 192.168.2.19:80.

Output variables

Delete F5 Pool Member output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.

Conditions

Delete F5 Pool Member output variables

Condition	Description
Success	Acivity succeeded in deleting an F5 load balancer pool member.
Failure	Acivity failed to delete an F5 load balancer pool member.

Delete F5 Pool activity

The Delete F5 Pool activity deletes an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Management
- **REST function**: delete

Variable	Description
F5IPAddress	IP address of the F5 console.
PoolName	Name of this pool, such as `testPool`.

Output variables

Delete F5 Pool output variables

Variable	Description
result	Success or failure.
error	The REST error.
status_code	The HTTP status code.

Conditions

Delete F5 Pool conditions

Condition	Description
Success	Activity successfully deleted the F5 load balancer pool.
Failure	Activity failed to delete the F5 load balancer pool.

Add F5 Pool activity

The Add F5 Pool activity creates the F5 load balancer pool.

Use this activity to verify that a pool member was created properly.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Management
- **REST function**: post

Input variables

Add F5 Pool input variables

Variable	Description
PoolName	Name of this pool, such as `testPool`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add F5 Pool input variables (continued)

Variable	Description
F5IPAddress	IP address of the F5 console.
MemberName	Pool member IP address and port, such as 192.168.2.19:80.

Output variables

Add F5 Pool output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.
output	The REST output.

Conditions

Add F5 Pool conditions

Condition	Description
Success	Activity succeeded in creating the F5 load balancer pool.
Failure	Activity failed to create the F5 load balancer pool.

Infoblox DDI activity pack

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox Web API (WAPI) REST web services to access the Infoblox GRID server.

Important:
Managing IP addresses through the Infoblox server requires a fully functional MID Server.

Starting with the Jakarta release, the Infoblox activity pack updates to version 2. This update supports Infoblox network views, which can restrict the visibility of network data. The view parameter can be passed as a query parameter or payload content, to do operations in a specific view. Version 2 also supports specifying the version of WAPI to use in integration endpoints.

Supported for Infoblox:

- WAPI version 2.0 for REST messages
- NIOS appliance version 7.0

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activty Pack plugin.

Create a REST credential for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server.

Before you begin

Before starting this procedure, make sure you have the following:

- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.

Role required: admin

About this task

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

Procedure

1. Navigate to **All** > **Orchestration** > **Credentials** and click **New**.
2. In the list of credential types, select **Basic Auth Credentials**.
3. Create the credential record with a logical name, such as **InfobloxCred**.
4. Right-click in the header bar of your new credential record and select **Copy sys_id** from the context menu.
   Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the **restCredentials** input field of each activity you use.

Infoblox workflows

The Infobox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to **Workflow** > **Workflow Editor** and select the **Workflows** tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.

Infoblox Reserve/Register IP in IPAM

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:

- IPAM Register IP Address
- IPAM Reserve IP Address
- Register DNS A-Record
- Get Network Details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Infoblox Reserve/Register IP input variables

Field	Description
Infoblox Server	IP address of the Infoblox DDI server.
Network	Network containing the target IP address.
Zone	The DNS zone for the IP address being registered.
Rest Credentials	The sys_id of the REST credentials from the ServiceNow instance.
DNS Host Name	Name of the DNS server machine on which the IP address is being registered.
IPv4 Address	IP address being reserved or registered.

Infoblox Release IPAM Reservations

Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

- IPAM List IP Reservations
- List DNS Record
- DNS Delete
- IPAM Delete

Infoblox Release IPAM Reservations input variables

Field	Description
Rest Credentials	The sys_id of the REST credentials from the ServiceNowinstance.
IP to Delete	IP address to release.
Infoblox Server	IP address of the Infoblox DDI server.

Infoblox roles and permissions

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.

Admin groups

There are three types of admin groups on an Infoblox server:

- Superuser
- Default
- Limited Access

To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the "About Admin Groups" section in the Infoblox NIOS Administrator Guide.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Permission hierarchy

1. **User**: A user can be part of multiple groups.
2. **Group**: A group can have many roles.
3. **Role**: Each role consistes of specific resource permissions.

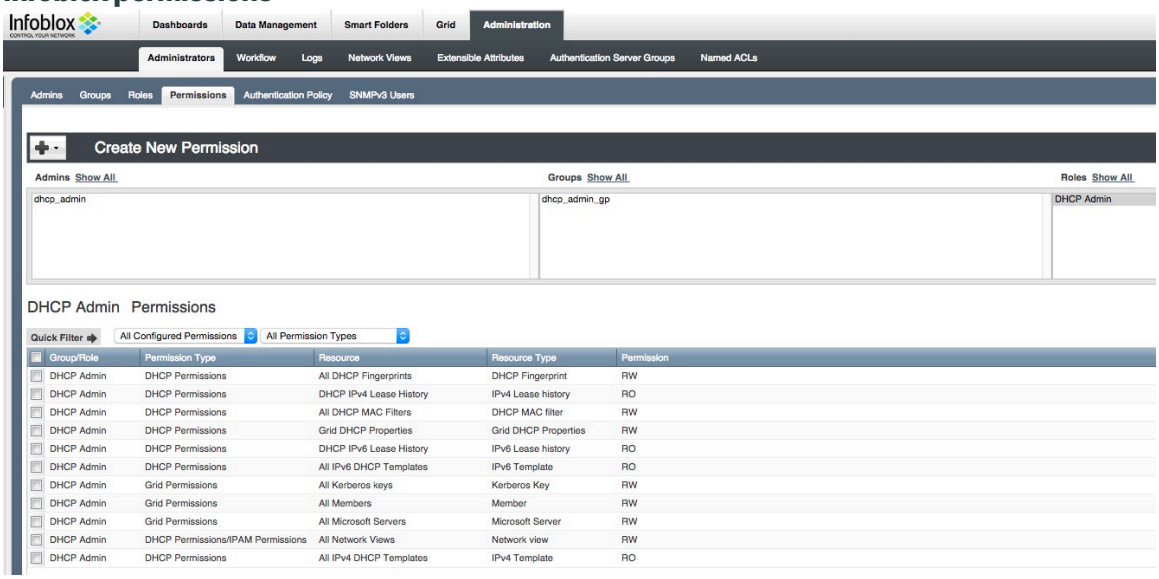
Required permissions

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

- Network
- DHCP
- DNS
- IPAM

This example shows a default DHCP admin role, its resources, and the related permissions for each.

Infoblox permissions



Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network.

Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

DHCP Reserve IP v4 Address Range activity

The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DHCP**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

DHCP Reserve IP v4 Address Range input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
startIpAddress	Beginning IPv4 address of the range to reserve.
endIpAddress	Ending IPv4 address of the range to reserve.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

Output variables

DHCP Reserve IP v4 Address Range output variables

Variable	Description
DHCPIpAddressRange	Range of reserved IPv4 addresses.
error	Displays the message for any REST error encountered.

Conditions

DHCP Reserve IP v4 Address Range conditions

Variable	Description
Success	Activity successfully reserved the specified IPv4 address range.
Failure	Activity failed to reserve the specified IPv4 address range.

DHCP Delete IP Reservation activity

The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:

- DHCP List IP Reservations
- DHCP Reserve IPv4 Address Range

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DHCP**.

Input variables

DHCP Delete IP Reservation input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
ipToDelete	IP address range to delete, in the form: `range/<encrypted code>:<start range>/<end range>/default`
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.

Output variables

DHCP Delete IP Reservation output variables

Variable	Description
DHCPDeletedIpRange	Range of deleted IP addresses.
error	Displays the message for any REST error encountered.

Conditions

DHCP Delete IP Reservation conditions

Variable	Description
Success	Activity successfully deleted the specified IP address range.
Failure	Activity failed to delete the specified IP address range.

DHCP List IP Reservations activity

The DHCP List IP Reservations activity generates a list of all the DHCP range reservations on a specific InfoBlox server.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DHCP**.

Input variables

DHCP List IP Reservations input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

DHCP List IP Reservations output variables

Variable	Description
reference	Reference value for an array of DHCP address ranges in this format: `range/<encrypted code>:<start range>/<end range>/default`
network	Address of the network containing the IP address range.
network_view	Routing doman associated with the network returned.

Conditions

DHCP List IP Reservations conditions

Variables	Description
Success	Activity successfully returned an array of DHCP IP address ranges.
Failure	Activity failed to return an array of DHCP IP address ranges.

Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an Infoblox DDI Grid Server.

Use these activities to register, list, or delete DNS records managed on an Infoblox server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List DNS C-records activity

The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Input variables

List DNS C-records input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

List DNS C-records output variables

Variable	Description
error	Displays the message for any REST error encountered.
reference	Reference value for a DNS CNAME record, such as: `record:cname/ZG5zLmJpbmRfY25hbWUkL19kZWZhdWx0LmNvbS50ZXN0LmNuYW1l:cname.test default`
cannonicalName	CNAME record.
name	Name of the network option returned, such as *`domain-name-server`*.
view	The assigned view of the DNS data. A given zone can have multiple views, which are accesse depending on the IP address of the source of the query. The **default** view of DNS data for this activity is the network view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

List DNS C-records conditions

Variable	Description
Success	Activity successfully listed the DNS C records.
Failure	Activity failed to list the DNS C records.

Register DNS A-record activity

The Register DNS A-record activity creates a DNS A record on a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Input variables

Register DNS A-record input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
network	Address of the network containing the IP address to register in the record.
hostName	Name of the actual server machine associate with the IP address in this record.
zone	The DNS zone associated with the record being created.
ipAddress	Specific IP address registered in this record.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Register DNS A-record output variables

Variable	Description
error	Displays the message for any REST error encountered.
DNSARecord	Name of the record registered, expressed in the format: *record:host/<encrypted code>:<network name>/default*.

Conditions

Register DNS A-record conditions

Variable	Description
Success	Activity successfully created the DNS A record.
Failure	Activity failed to create the DNS A record.

Register DNS C-Record activity

The Register DNS C-Record activity creates a DNS canonical (CNAME) record on a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Input variables

Register DNS C-Record input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
cname	The DNS cannonical record to create, as expressed by the *c_name* value.
recordName	Name of the record to create.
zone	The DNS zone containing the cannonical record to create.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register DNS C-Record input variables (continued)

Variable	Description
	Note: If the field is empty, the operation is treated as happening in the default view.

Output variables

Register DNS C-Record output variables

Variable	Desctiption
error	Displays the message for any REST error encountered.
DNSCRecord	Name of the CNAME record registered, expressed in the format: *record:cname/<encrypted code>:<network name>/default*.

Conditions

Register DNS C-Record conditions

Variable	Description
Success	Activity successfully created the cannonical DNS record.
Failure	Activity failed to create the cannonical DNS record.

List DNS Record activity

The List DNS Record activity generates a list of all the DNS entries on a specific InfoBlox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Input variables

List DNS Record input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List DNS Record input variables (continued)

Variable	Description
	Note: If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

List DNS Record output variables

Variable	Description
reference	Reference value for a DNS record, such as: `record:cname/ZG5zLmJpbmRfY25hbWUkL19kZWZhdWx0LmNvbS50ZXN0LmNuYW1l:cname.tes default`
configure_for_dhcp	Returns the status of a DHCP fixed address object.
host	Host machine with which the DNS record is associated.
ipv4addr	The reserved IPv4 address associated with a DNS record.
name	Name of the network option returned. For example, the name of the DNS record object from **reference** example is *cname.test.com*.
view	The assigned view of the DNS data. A given zone can have multiple views, which are acces depending on the IP address of the source of the query. The **default** view of DNS data for th activity is the network view.
error	Displays the message for any REST error encountered.

Conditions

List DNS Record conditions

Variable	Description
Success	Activity successfully listed all the available DNS record.
Failure	Activity failed to list the available DNS record.

DNS Delete activity

The DNS Delete activity deletes DNS records of any type from in Infoblox server, such as C and A records.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Note:
It is faster to create a new record than recover one that has been deleted.

© 2026 ServiceNow, Inc. All rights reserved.

Input variables

DNS Delete input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
RecordToDelete	Name of the DNS record to delete. The record is expressed in this format: *record:cname/ZG5zLmJpbmRfY25hbWUkL19kZWZhdWx0LmNvbS50ZXN0LmNuYW11:cname.test.com/default*
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.

Output variables

DNS Delete output variables

Variable	Description
DeletedRecord	Name of the deleted DNS record.
error	Displays the message for any REST error encountered.

Conditions

DNS Delete conditions

Variable	Description
Success	Activity successfully deleted the specified DNS record.
Failure	Activity failed to delete the specified DNS record.

Infoblox IPAM activities

The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server.

Use these activities to register, reserve, list, or delete IP addresses.

IPAM Register IP Address activity

The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **IPAM**.

Input variables

IPAM Register IP Address input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
macAddress	Mac address of the computer for which this IP address is registered.
ipAddress	Specific IP address to register.
network	Address of the network containing the registered IP address.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

Output variables

IPAM Register IP Address output variables

Variable	Description
error	Displays the message for any REST error encountered.
IPAddressRecord	IPAM record of the registered IP address.

Conditions

IPAM Register IP Address conditions

Variable	Description
Success	Activity successfully registered the specified IP address.
Failure	Activity failed to register the specified IP address.

IPAM Reserve IP Address activity

The IPAM Reserve IP Address activity reserves an IP address in a network using Infoblox IPAM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **IPAM**.

Input variables

IPAM Reserve IP Address input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
macAddress	Mac address of the computer for which this IP address is reserved.
network	Address of the network containing the reserved IP address. The Infoblox server reserves the next available IP address from this network.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

Output variables

IPAM Reserve IP Address output variables

Variable	Description
error	Displays the message for any REST error encountered.
IPAddressRecord	IPAM record of the reserved IP address.
IPAddress	Selected IP address to reserve.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

IPAM Reserve IP Address conditions

Variable	Description
Success	Activity successfully reserved the specified IP address.
Failure	Activity failed to reserve the specified IP address.

IPAM List IP Reservations activity

The IPAM List IP Reservations activity returns an array of all IP Address within the named InfoBlox Server.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **IPAM**.

Input variables

IPAM List IP Reservations input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

The output of this activity produces an array of reserved IP addresses in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.

IPAM List IP Reservations output variables

Variable	Description
reference	Reference value of a reserved IP address contained in an array of addresses, such as `fixedaddress/ZG5zLmZpeGVkX2FkZHJlc3MkMTAuMC4xMDMuMTEuMC4u:0.0.0.11/default" ipv4addr: "0.0.0.11"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IPAM List IP Reservations output variables (continued)

Variable	Description
ipv4addr	The reserved IPv4 address.
network_view	Routing domain associated with the network returned.
error	Displays the message for any REST error encountered.

Conditions

IPAM List IP Reservations conditions

Variable	Description
Success	Activity successfully retrieved the list of reserved IP addresses from the Infoblox server.
Failure	Activity failed to retrieve the list of reserved IP addresses from the Infoblox server.

IPAM Delete activity

The IPAM Delete activity deletes an IP Address within a named InfoBlox server.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **IPAM**.

Input variables

IPAM Delete input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
itemToDelete	The IP address to delete, in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

IPAM Delete output variables

Variable	Description
DeletedRecord	IPAM record of the deleted IP address.
error	Displays the message for any REST error encountered.

Conditions

IPAM Delete conditions

Variable	Description
Success	Activity successfully deleted the specified IP address.
Failure	Activity failed to delete the specified IP address.

Infoblox network activities

The Infoblox network activities manage networks using an Infoblox DDI Grid Server.

Use these activities to create, list, or delete networks on an Infoblox server.

Create Network activity

The Create Network activity creates new networks on a specified Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **Network**.

Input variables

Create Network input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
network	Address of the network to create.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Network input variables (continued)

Variable	Description
	Note: If the field is empty, the operation is treated as happening in the default view.

Output variables

Create Network output variables

Variable	Description
NetworkCreated	Address of the network created.
error	Displays the message for any REST error encountered.

Conditions

Create Network conditions

Variable	Description
Success	Activity successfully created the network.
Failure	Activity failed to create the network.

Get Network Details activity

The Get Network Details activity retrieves the information about a specific network on an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **Network**.

Input variables

Get Network Details input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
network	Address of the network whose details you want to see.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get Network Details input variables (continued)

Variable	Description
	Note: This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

Output variables

The output variables from this activity are objects on the Infoblox server used to identify network details. For more information, refer to the Infoblox documentation.

Get Network Details output variables

Variable	Description
error	Displays the message for any REST error encountered.
NetworkOptions	The *NetworkOptions* array contains these attributes: • *reference*: Reference value for the network requested. This value is in the form of `network/ZG5zLm5ldHdvcmskMTAuMS4wLjAvMTYvMA:10.1.0.0%2F1` • *options*: The *options* array contains these attributes: ◦ *name*: Name of the network option returned, such as *domain-name-server*. ◦ *num*: Index number of the option. For example, the index for *domain-name-server* is *6*. ◦ *use_option*: Indicates whether a DHCP option is used at that level in the network heirarchy. Set this value to **True** to override the Grid Level DHCP option with this option at the network level. ◦ *value*: Value to use for this option. For example, the value for the *domain-name-server* option is the IP address of the server machine. ◦ *vendor_class*: The class of the network object. The options are **DHCP**, **DNS**, or **IPAM**.

Conditions

Get Network Details conditions

Variable	Description
Success	Activity successfully retrieved network details from the Infoblox server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get Network Details conditions (continued)

Variable	Description
Failure	Activity failed to retrieve network details from the Infoblox server.

Delete Network activity

The Delete Network activity deletes a network from an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **Network**.

Input variables

Delete Network input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
networkToDelete	Reference number of the network to delete from the Infoblox server. You can obtain this value either by using the List Registered Networks activity or when creating a network with the Create Network activity. An example of the network reference value is: *`network/ZG5zLm51dHdvcmskMTUuMC40NS4wLzI0LzA:15.0.45.0/24/default`*.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.

Output variables

Delete Network output variables

Variable	Description
DeletedNetwork	Reference number of the deleted network from the Infoblox server.
error	Displays the message for any REST error encountered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Delete Network conditions

Variable	Description
Success	Activity successfully deleted the network.
Failure	Activity failed to delete the network.

List Registered Networks activity

The List Registered Networks activity retrieves all the networks associated with an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **Network**.

Input variables

Activity input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

Activity output variables

Variable	Description
reference	Reference value of a registered network.
network	Network address.
network_view	Routing doman associated with the network returned.
error	Displays the message for any REST error encountered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Activity conditions

Variable	Description
Success	Activity successfully retrieved the list of registered networks available on the Infoblox server.
Failure	Activity failed to retrieve the list of registered networks available on the Infoblox server.

PowerShell activity pack

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

Orchestration provides custom PowerShell activities that were created with the PowerShell activity designer template. These activities perform the same functions as PowerShell activities by the same name from previous releases and replace those activities for all new workflows. These custom activities give workflow administrators the ability to store input and output variables in the databus.

Note:
Existing workflows from earlier versions that were created with legacy PowerShell activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom PowerShell activities.

Starting with the Yokohama release, there are the following updates to the PowerShell activity pack:

- A new PowerShell probe (V2), which takes advantage of Integration Hub functionality
- The ability to insert debug statements in the PowerShell scripts and produce the resulting messages at runtime

To use the PowerShell custom activities, you must request activation of the Orchestration - PowerShell plugin. These activities are available in the Workflow Editor on the **Custom** tab. Expand the **Custom Activities** tree and select the PowerShell category for the activity you want to use.

ServiceNow supports PowerShell 3.0 to 5.1.

PowerShell activity designer

PowerShell activities are configured to return data to a workflow from a host using Microsoft PowerShell.

You must purchase Classic Orchestration to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer
- Create input variables
- Create a parsing rule

ServiceNow supports PowerShell 3.0 to 5.1.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell protocols and troubleshooting

PowerShell uses the Windows Management Instrumentation (WMI) and Windows Remote Management (WinRM) protocols to enable Orchestration activities to run commands on remote Windows hosts.

Windows Management Instrumentation (WMI)

WMI provides a uniform interface for any local or remote applications or scripts that obtain management data from a computer system, a network, or an enterprise. WMI contains these components:

- **Managed objects and WMI providers**: A WMI provider is a COM object that monitors one or more managed objects for WMI. A managed object is a logical or physical enterprise component, such as a hard disk drive, network adapter, database system, operating system, process, or service.
- **WMI infrastructure**: The WMI infrastructure is a Microsoft Windows operating system component know as the WMI service (winmgmt). The WMI infrastructure is composed of the WMI Core and the WMI repository. The WMI repository is organized by WMI namespaces. The WMI service creates namespaces, such as `root\default`, `root\cimv2`, and `root\subscription`, at system startup and preinstalls a default set of class definitions, including the Win32 Classes, the WMI System Classes, and others. The remaining namespaces found on your system are created by providers for other parts of the operating system or products.
- **WMI consumers**: A WMI consumer is a management application or script that interacts with the WMI infrastructure. A management application can query, enumerate data, run provider methods, or subscribe to events by calling either the COM API or the Scripting API for WMI.

WMI installation and configuration

For the MID Server to successfully make a remote connection to the target host, TCP port 135 must be open. The Windows firewall automatically creates an inbound rule for WMI connectivity called Windows Management Instrumentation (DCOM-In).

Windows Remote Management (WinRM)

WinRM is the Microsoft implementation of WS-Management Protocol, a standard Simple Object Access Protocol (SOAP) protocol that allows hardware and operating systems from different vendors to interoperate.

WinRM contains these components:

- **WinRM Scripting API**: This scripting API enables Orchestration to obtain data from remote computers, using scripts that perform WS-Management protocol operations.
- **WMI Service**: The WMI service continues to run side-by-side with WinRM and provides requested data or control through the WMI plug-in. You can continue to obtain data from standard WMI classes, such as as Win32_Process.

WinRM configuration

WinRM is automatically installed on Windows 2008 R2 and above operating systems, but must be configured before use.

1. In a command prompt, enter **winrm quickconfig**. This command is not case sensitive.
2. When the console displays **Make these changes [y/n]?**, enter **y**.

   The `winrm quickconfig` command performs the following operations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Starts the WinRM service, and sets the service startup type to **auto start**.
- Configures a listener for the ports that send and receive WS-Management protocol, using either HTTP or HTTPS on any IP address.
- Creates a firewall exception for the current user profile.

MID Server PowerShell files

PowerShell functions are stored in script files (*.ps1) that use a PowerShell Script module (*.psm1) file name extension.

The PowerShell functions are used by the PowerShell MID Server script files included in these activity packs:

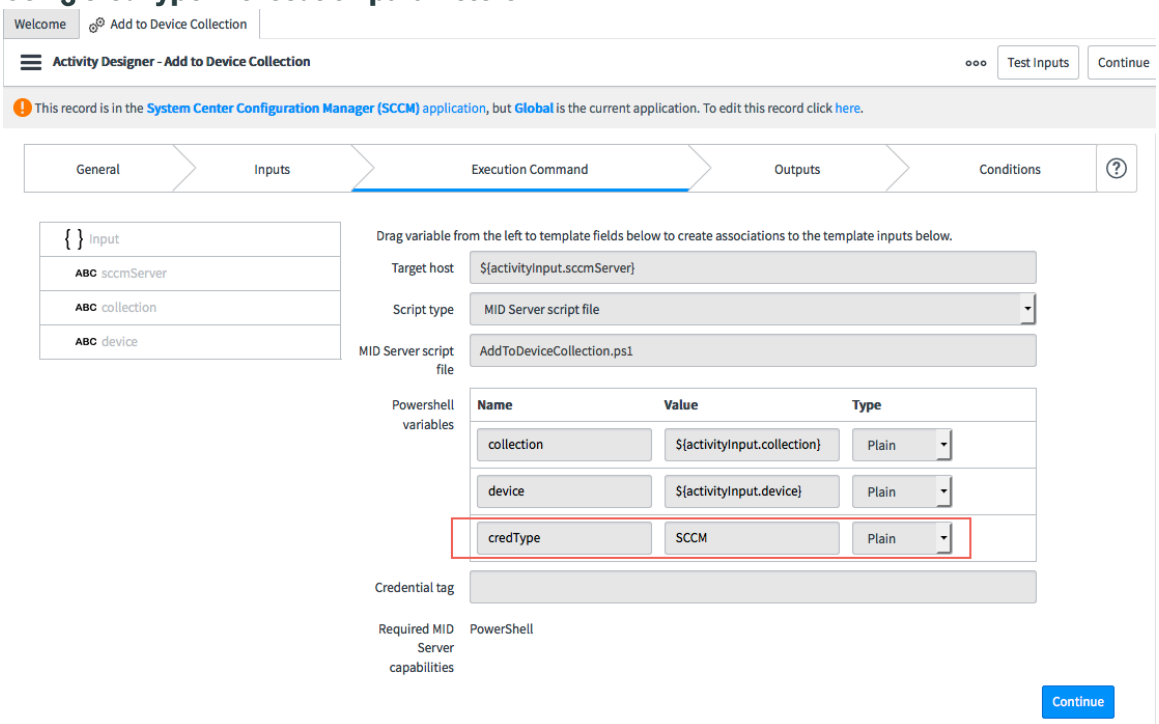
- Active Directory
- Exchange
- SCCM
- PowerShell

PSScript.ps1

This script performs a few tasks, such as credential testing, password encryption, and the execution of scripts configured in the Orchestration Activity Designer or in MID Script Files. However, this document focuses on how PSScript.ps1 uses the `credential.psm1` module for testing access to remote hosts.

The PowerShell variables are generally used directly in the PowerShell execution command or as arguments in the MID Server script file you specify. There are special variables that are passed to PSScript.ps1, such as *`credType`*.

Using credType in execution parameters



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell credTypes

The PowerShell credential types:

Type	Description
WMI	testCredentialWMI
Exchange	testCredentilExchange
AD	testCredentilAD
SCCM	testCredentilSCCM

If no credential type is passed to the PSScrip.ps1 script, the MID Server defaults to the WMI test function to test access to the target host. If there is a credential type used, the MID Server runs the corresponding test function for that credential type.

Exit codes

These exit codes are returned from the PSScript.ps1 script and logged in the MID Server log file.

PSScript.ps1 exit codes

Type	Test function
0	PowerShell command/script ran successfully.
1	Test finished successfully, but the command/script failed to execute.
2	Incorrect syntax passed to script.
3	All credentials including MID Server service account failed to execute the command/script.
4	Passed test and executed the activity, but an error was returned. Example user cannot be found.

DiagnosticsUtil.psm1

The MID Server uses this module file to perform PowerShell logging that assists debugging any Orchestration activity using PowerShell scripting. You can also add debugging statements directly to custom scripts.

PowerShell diagnostic utilities

Utility	Description
SNCLog-DebugInfo	Log a debug message for a PowerShell script or PowerShell Orchestration activity. Examples: • `SNCLog-DebugInfo -message "My debug message..."` • `SNCLog-DebugInfo "My debug message"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell diagnostic utilities (continued)

Utility	Description
SNCLog-ParameterInfo	Log a function parameter value. For `"function getHostName{ param( [String] $target )"`, the first value to the PowerShell hashtable is a string to indicate which function executes, and the values for each of the function parameters. Examples: • Function with single parameter: `SNCLog-ParameterInfo @("Running getHostName", $target)` **Note:** The debug message shows, 'Running getHostName $target: [actual value of $target]'. • Function with multiple parameters: `SNCLog-ParameterInfo @("Running functionName", $param1, $param2, $param3)`
SNCObfuscate-Value	Use this utility to encrypt values for security purposes. The function displays `"$variableName":***`, where *** is the obfuscated value. Example: `SNCObfuscate-Value $password` **Note:** The debug message reads: `"$password : ***"`.

Credentials.psm1

The MID Server uses this module file to test access to a target host. The MID Server loops through all Windows credentials stored in its credentials table using the following access type functions, unless the PowerShell activity has a credential type (**credType**) defined. All ServiceNow® authored PowerShell activities are hard-coded to use a specific credential type. As a result, the MID Server only tests credential access against the designated function.

PowerShell test functions

Function	Description
testCredentialWMI	Tests the given user and password on the target host using the *`Get-WMI`* object.
testCredentilAD	Tests the given user and password on the target host using the built-in *`DirectoryEntry`* object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell test functions (continued)

Function	Description
testCredentialExchange	Tests the given user and password to create a session on an Exchange host. This test uses the built-in PowerShell remoting feature on a remote host. WinRM is configured on Exchange servers by default.
testCredentialSCCM	Tests the given user and password to create a session on an SCCM server. This test uses the built-in PowerShell remoting feature on a remote host. This test requires WinRM to be configured.
testNoCredentialAccessWMI	Tests the given user and password on the target host, using the *Get-WMI* object. This test is used when no **credType** is used.

Note:
If the test passes using one of these functions, that credential is used to run the PowerShell script/command. If the tests fail to access the target host using these functions, the MID Server runs the PowerShell script/command under the account of the MID Server service.

This diagram illustrates the dependency of the credential selection behavior on the host being targeted by the PowerShell activity. If the target host is the IP address or host name of the MID Server, the MID Server bypasses all credentials in the Credentials table and uses the account of the MID Server service. If the target host is not the MID Server, then all Windows credentials are used first. If all credentials in the Credentials table are unsuccessful in running the PowerShell activity, then the MID Server uses the MID Server service account.

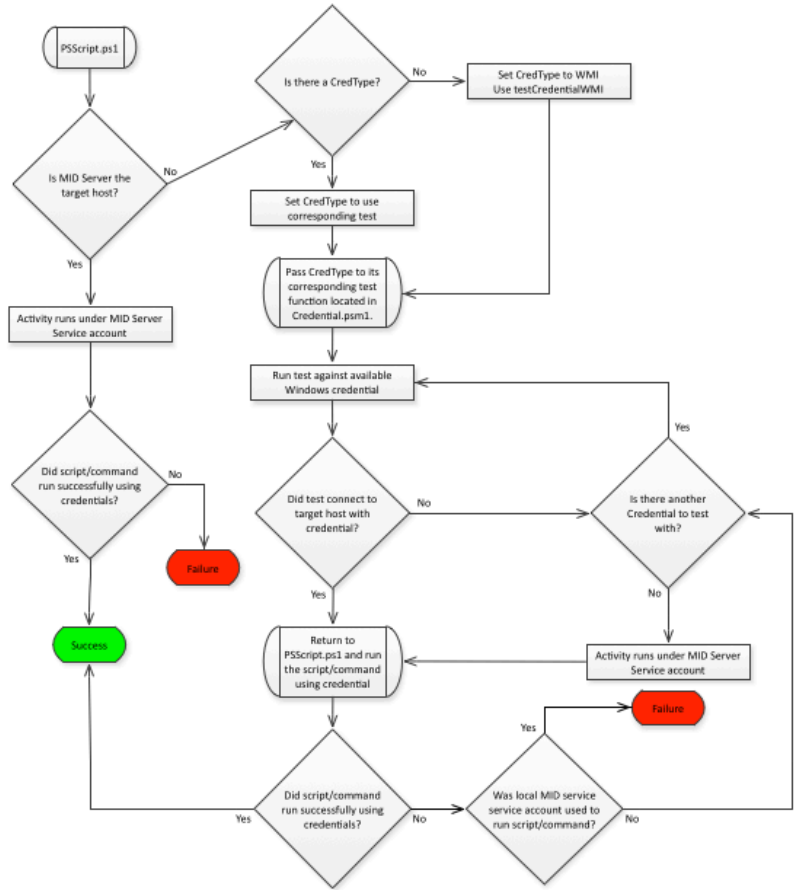
PowerShell credential selection criteria



ActiveDirectory.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Active Directory activity pack.

Exchange.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Exchange activity pack.

SCCM.psm1

This module file stores the functions used by the PowerShell scripts shipped with the SCCM activity pack.

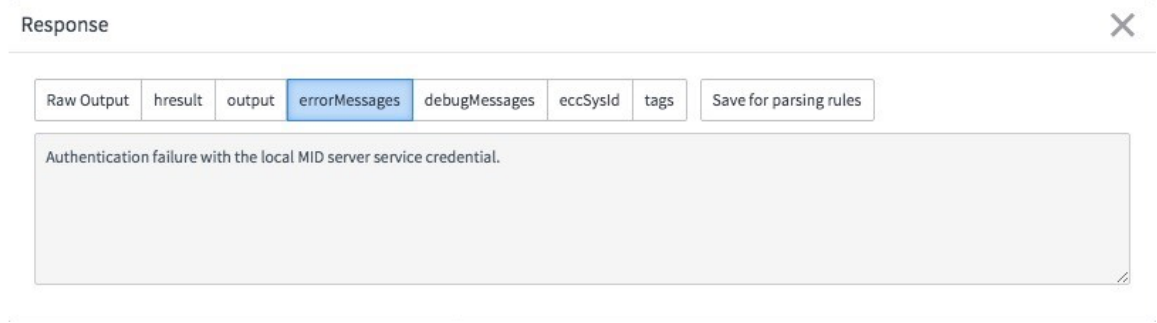
PowerShell troubleshooting

Authentication and access denied errors can prevent PowerShell activities from running a command on a target host.

Use these procedures for troubleshooting authentication failures with Orchestration PowerShell activities and when the Remote Procedure Call (RPC) server is unavailable or when access is denied. The authentication failure error displays when all credentials, including those of the local MID Server service account, do not have the correct permissions to run the Powershell script/command. The same error displays when the target host is unreachable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authentication error message



Authentication failure in an Active Directory activity

This example uses the Create AD Object activity to illustrate troubleshooting authentication failure in PowerShell.

Before you begin

Role required: Permissions to access and create accounts on Active Directory

About this task

Validate that the account you are using has the proper permissions to run the activity.

Procedure

1. Log on to the target machine using the account under which you want to run the activity. Active Directory tools must be installed on this machine.
2. Launch the Active Directory Users and Computers application.
3. Navigate to the OU under which you want to create the Active Directory object.
4. Attempt to create the object.

   If this procedure is successful under the specified user, the following might be the cause of the authentication failure:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- User name is invalid.
- Password entered incorrectly.
- Domain controller is unreachable.

Note:
The majority of the return codes listed in the MID Server log for this error are **1**s and **3**s. This is because the Active Directory activities use the ADSI provider and not WMI or WinRM. An error code of **1** means the account was able to connect with the test account, but running the script failed.

```
Attempting to use credential with username 'service-now\joel.zamallo
Running command:-> C:\Windows\System32\WindowsPowerShell\v1.0\powers
rShell\PSScript.ps1' -computer '10.11.144.230'   -script 'C:\Users\j
useCred $true -isDiscovery $false -debug $true; exit $LASTEXITCODE}"
Thread name is Powershell is executing...
The exit value from waitFor() is 1
The status code returned from running the command is 1
```

An error code of **3** means that the MID Server attempted to run the PowerShell activity under the MID Server service account but failed.

```
worker-Standard:PowershellProbe DEBUG: Thread name is Powershell is executing...
Gobbling stdout: Powershell is executing... Gobbled: <powershell>
Gobbling stdout: Powershell is executing... Gobbled: <output>
Gobbling stdout: Powershell is executing... Gobbled: </output>
Gobbling stdout: Powershell is executing... Gobbled: </powershell>
worker-Standard:PowershellProbe DEBUG: The exit value from waitFor() is 3
worker-Standard:PowershellProbe DEBUG: The status code returned from running the command is 3
worker-Standard:PowershellProbe DEBUG: Queuing Powershell Windows - Powershell (nodes: 3)
worker-Standard:PowershellProbe Sending to queue: Powershell,Windows - Powershell (nodes: 3),1
worker-Standard:PowershellProbe Document: <?xml version="1.0" encoding="UTF-8"?><results probe
<error>Authentication failure with the local MID server service credential.</error>
```

Authentication failure in an Exchange activity

This example uses the Create Mailbox activity to illustrate troubleshooting authentication failure in PowerShell.

Before you begin

Role required: Permissions to access and create mailboxes on the Exchange server

Procedure

1. Validate that the account you are using has the proper permissions to run the PowerShell activity.
2. Log on to a machine that has the Exchange Management Shell (EMS) installed.
3. Create a user using the `New-mailbox` Exchange commandlet.

Creating a new user in Exchange

```
[PS] C:\Windows\system32>
[PS] C:\Windows\system32>
[PS] C:\Windows\system32>
[PS] C:\Windows\system32>
[PS] C:\Windows\system32>New-Mailbox -Name 'Test P. Smith' -Alias 'test.smith' -OrganizationalUnit 'discolab2.service-no
w.com/Managed Objects/Users/San Diego' -UserPrincipalName 'test.smith@discolab2.service-now.com' -SamAccountName 'test.s
mith' -FirstName 'Test' -Initials 'P' -LastName 'Smith' -Password 'System.Security.SecureString' -ResetPasswordOnNextLog
on $false_
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If this procedure is successful under the specified credential, the following is the likely cause of the failure:

- User name is invalid.
- Password entered incorrectly.
- Exchange server is unreachable.

4. If the Exchange server is unreachable, examine the MID Server logs.
   Because the Exchange activities use WinRM to access the Exchange server, the logs can provide more troubleshooting information.

> **Note:**
> Ensure that the error is NOT **WinRM cannot process the request**.

Remote Procedure Call (RPC) server unavailable or access denied

Typically, this error is logged when running a PowerShell script/command that uses WinRM or WMI.

Possible causes of error

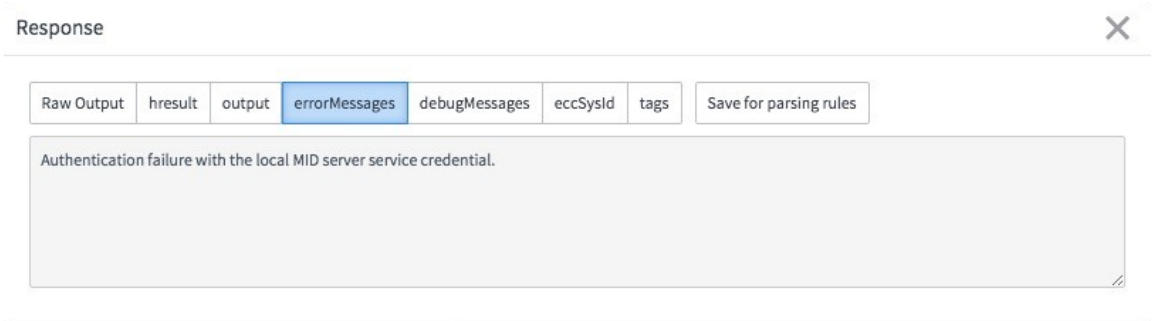
The target host might have one of these issues:

- WinRM isn't configured.
- Firewall is blocking access to the host over TCP port 135 (WMI) or HTTP/HTTPs and TCP port 5985 (WinRM).
- Kerberos issue, caused by hopping to multiple hosts using WMI.

Example WinRM error

The Create Mailbox activity from the Exchange activity pack has generated an error in the ECC queue involving authentication using the MID Server service credential. This occurred because the MID Server credential is the last to be used if the targeted host is not the MID Server.

Authentication failure error message



The MID Server log shows that the MID Server tried to run the activity under specific credentials, but wasn't successful and received an exit code of 1.

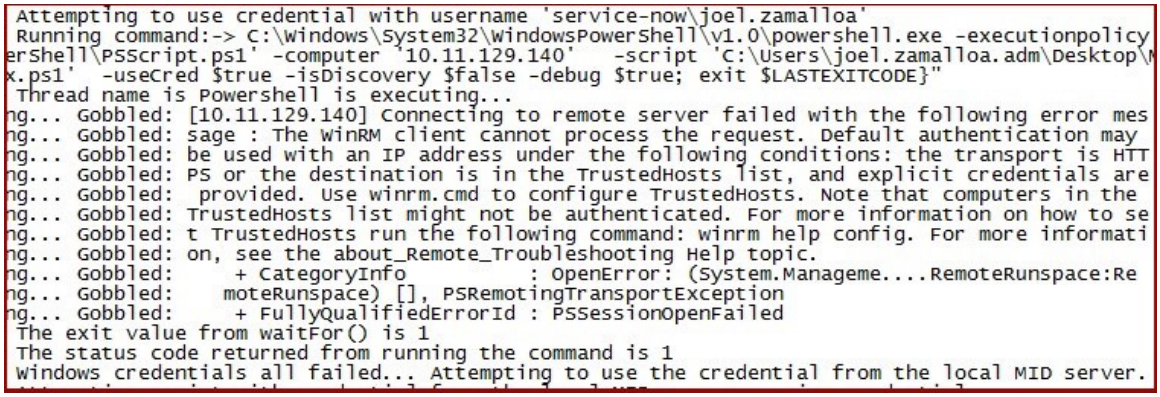
MID Server error code



Join Domain activity

The Join Domain activity joins a Windows computer to a domain.

If the computer is already a member of a domain, this activity completes without modifying the computer. Joining a domain requires a username and password. This user must have domain administration privileges or privileges to join a computer to the domain.

Note:
This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Join Domain input variables

Variables	Description
Hostname	Hostname or IP address of the Windows server that is joining the domain.
Domain	Name of the domain to join.
Domain_user	The name of a user who has domain administration privileges or privileges to join a computer to the domain.
Domain_user_password	The password for the user who has domain administration privileges or privileges to join a computer to the domain.

Output variables

Join Domain output variables

Variables	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Join Domain conditions

Condition	Description
Success	The activity succeeded in joining the computer to the domain.
Failure	The activity failed to join the computer to the domain.

Install Windows App activity

The Install Windows App activity installs an application from an MSI package on a Windows target machine.

Note:
This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Install Windows App input variables

Variable	Description
hostname	Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS MID Server capabilities to resolve hostnames into IP addresses.
installerpath	Path to the installer. The installer can be on any machine that is visible to both the MID Server and the target machine (local drive, UNC path, mapped drive, etc.).
installer	Name of the installer file, such as `winzip150.msi`. The installer must be an MSI package.
arguments	The parameter that contains the command line arguments to the MSI package. These are name=value pairs, separated by a space. For example, the argument might appear as: `INSTALLDIR=c:\myinstallfolder ADDDESKTOPICON=0`. These arguments are dependent on the what the actual MSI being installed defines. If there are no arguments, leave the field empty.

Output variables

Install Windows App output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *`executionResult.errorMessages`* from the Activity designer parsing sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

The activity state tells the workflow engine what to do with the activity.

Install Windows App conditions

Name	Description
Success	The Windows application was successfully installed on the target machine.
Failure	The Windows application failed to install on the target machine

Enable WMI Windows Installer provider

To install software on Windows machines using the Install Windows App activity, enable WMI Windows Installer provider on all target machines.

Before you begin

- It is recommended that the MID Server, the target machine, and the installer source machine be on the same Active Directory domain. However, if these computers are on separate domains, those domains must have a trust relationship established between them.
- If the installer path is a UNC file sharing machine, the Active Directory account of the target computer must be trusted for delegation. For instructions on this configuration, see the posting on the community for installing and uninstalling Windows applications.

About this task

Note:
See WMI Providers for a list of Windows operating systems that provide this tool by default.

Procedure

1. Open the Control Panel.
2. Go to **Add or Remove Programs**.
3. Select **Add/Remove Windows Components**.
4. Double-click **Management and Monitoring Tools**.

   This action opens a secondary window displaying additional selections.
5. Select **WMI Windows Installer Provider** check box.
6. Click **OK** to return to the Windows Components Wizard window.
7. Click **Next**.
   You might be asked for the Windows installation CD to complete this process.

Change Service State activity

The Change Service State activity starts or stops a Windows service on a remote system.

This activity replaces a Powershell activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input Variables

Change Service State input variables

Variable	Description
hostname	Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.
service	Name of the Windows service to start or stop. The *service* parameter is the service name, not the display name of the service affected.
state	There are two actions to select for a service state change: **StartService** or **StopService**.

Output variables

Change Service State output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If there is no error, this value is null.

Conditions

Change Service State conditions

Condition	Description
Success	The target service was successfully started or stopped.
Failure	The update to the target service was unsuccessful, or the service was not found on the target system.

Restart Windows Server activity

The Restart Windows Server activity stops and then restarts a Windows server using Powershell.

Note:
This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Restart Windows Server input variables

Variable	Description
Hostname	Hostname or IP address of the Windows server to restart.

Output variables

Restart Windows Server output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.

Conditions

Restart Windows Server conditions

Condition	Description
Success	The activity succeeded in restarting the Windows server.
Failure	The activity failed to restart the Windows server.

Uninstall Windows App activity

The Uninstall Windows App activity uninstalls an application from a Windows target machine.

The only applications that can be uninstalled using this activity are those that were installed by a Windows Installer.

Note:
This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Uninstall Windows App input variables

Variable	Description
hostname	Hostname or IP address of the Windows target machine on which to uninstall an application.
product	The name of the application to uninstall exactly as it appears in the Windows Add/Remove Programs list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Uninstall Windows App output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.

Conditions

Uninstall Windows App conditions

Condition	Description
Success	The activity succeeded in unistalling the application from the Windows server.
Failure	The activity failed to uninstall the application from the Windows server.

Probe activity pack

Orchestration provides an activity pack customized using the ServiceNow activity designer that runs probes on target hosts to return specific information.

These custom activities were built with the Create a probe activity, which gives workflow administrators the ability to store input and output variables in the databus.

To use the custom probe activities, you must request activation of the Orchestration - Probe plugin.

Resolve DNS Name activity

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses.

The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two variables: *resolved_ip* and *resolved_ips*. If multiple IP addresses are returned, the first IP address is stored in the *resolved_ip* variable, and all the addresses are stored in the *resolved_ips* variable. If an IP address is provided instead of an FQDN, this address is output directly to both variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Resolve DNS Name input variables

Variable	Description
FQDN	The fully qualified domain name to resolve or an IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Resolve DNS Name output variables

Variable	Desctiption
ip	The first IP address of the resolved DNS name.
ips	Comma separated list of resolved IP addresses.
result	One of the following: • **resolved**: Able to resolve the sprcified DNS name. • **unresolved**: Unable to resolve the specified DNS name.

Conditions

Resolve DNS Name conditions

Condition	Description
Success	Activity successfully resolved the DNS name.
Failure	Activity failed to resolve the DNS name.

SNMP Query activity

The SNMP Query activity queries an SNMP device.

Your ServiceNow instance must have access to a MID Server configured to use SNMP to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

SNMP Query input variables

Variable	Description
hostname	Hostname or IP address of the SNMP device being queried.
oids	A list of unique object identifiers used to identify SNMP devices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

SNMP Query output variables

Variable	Description
description	Description of the SNMP object.
timeout	Boolean value indicating whether or not the query timed out.
error	Indicates any error that occurred. If no error occurred, this value is null.
oid_data	An array of data objects for all unique object identifiers.

Conditions

SNMP Query conditions

Condition	Description
Success	Activity successfully ran the query on the target device.
Failure	Activity failed to run the query on the target device. Failure could be caused by invalid credentials or a device that is not accessible.

SCCM activity pack

The Microsoft System Center Configuration Management (SCCM) activity pack provides Orchestration activities you can use to manage software deployments and collections on an SCCM server.

You can use SCCM Orchestration activities to deploy and revoke software from an SCCM server or manage user and device collections. The system manages software on an SCCM server using Orchestration activities and workflows.

Client software distribution requires:

- SCCM 2012 R2 and later.
- Powershell 3.x.
- Powershell Remoting enabled.
- The Windows PowerShell x86 execution policy must be set to unrestricted mode.
- Latest version of the SCCM *cmdlet* library installed on the SCCM server.
- Use the credentials to log onto the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

Request SCCM activities

The Orchestration - System Center Configuration Manager plugin installs the SCCM activity pack that deploys software from an SCCM host and manages user and device collections.

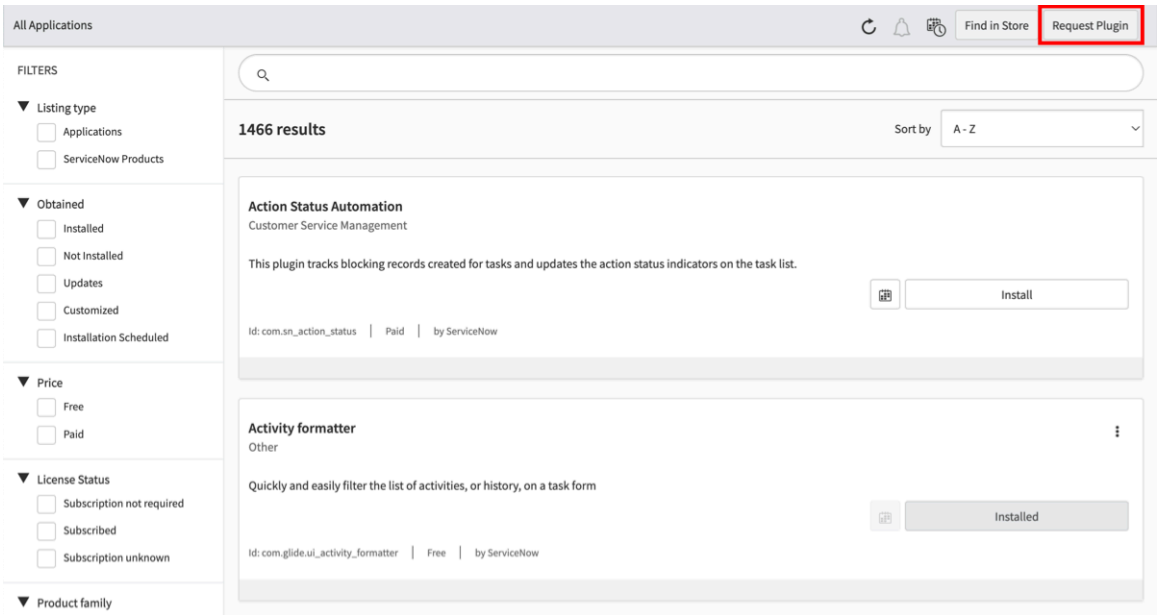
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
The SCCM plugin is activated automatically when the Orchestration - Client Software Distribution [com.snc.orchestration.sccm_mgnt] plugin is activated, but can be activated separately.

Note:
The activities in the SCCM plugin run in the System Center Configuration Manager scope.

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.

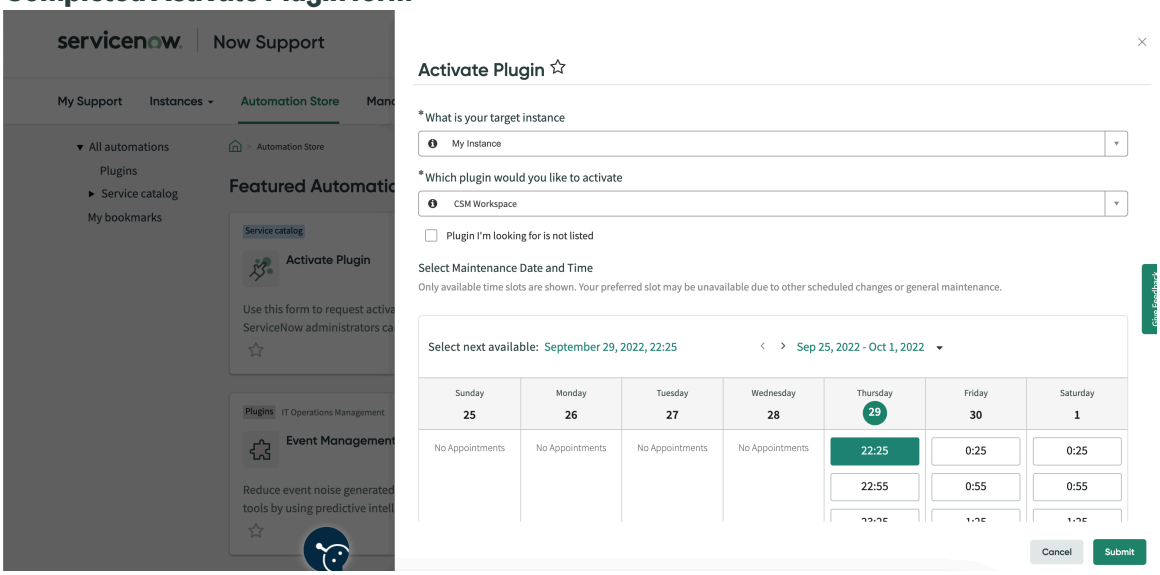
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter **cmdb_ci_dns_name.list**.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

Add to Device Collection activity

The Add to Device Collection activity adds the specified device into a Microsoft System Center Configuration Manager (SCCM) device collection.

The Add to Device Collection activity uses the Powershell activity template to add a specified device to an SCCM device collection. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `AddToDeviceCollection.ps1` to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Add to Device Collection activity does not use pre-processing or post-processing scripts.

Input variables

Add to Device Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the device collection.
device	Name of the device to add to the collection.

Output variables

Add to Device Collection output variables

Variable	Description
output	Variable that contains a value that is passed to other activities in the workflow.
error	Variable that contains the activity output error message.

Conditions

Add to Device Collection conditions

Condition	Description
Success	Activity successfully added the device to the SCCM device collection.
Failure	Activity failed to add the device to the SCCM device collection.

Add to User Collection activity

The Add to User Collection activity adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.

The Add to User Collection activity uses the Powershell activity template to access the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `AddToUserCollection.ps1` to edit the collection.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Add to User Collection activity does not use pre-processing or post processing scripts.

Input variables

Add to User Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the user collection.
user	Name of the user to add to the collection.

Output variable

Add to User Collection output variables

Variable	Description
output	Variable that contains a value that is passed to other activities in the workflow.
error	Variable that contains the activity output error message.

Conditions

Add to User Collection conditions

Success	Activity successfully added a user to the SCCM user collection.
Failure	Activity failed to add a user to the SCCM user collection.

Get Applications activity

The Get Applications activity returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.

The Get Applications activity uses the Powershell activity template to access the applications on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetApplications.ps1`. This script filters the results of the GET, so that only specific attributes are returned for the applications on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable application data. The list of available applications is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Get Applications activity does not use a pre-processing script.

Input variables

Get Applications input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.

Output variables

The output variables for the Get Applications activity contain an array of objects called *applications* and an error message. Each object in the array contains the attributes in this table.

Get Applications output variables

Variables	Description
applications	The *applications* array contains these attributes: • *id*: Primary key of the SCCM application. • *ciUniqueId*: Unique ID of the SCCM application. • *name*: Name of the application. • *manufacturer*: Manufacturer of the application. • *version*: Version of the application. • *isDeployable*: True/false value indicating if this application is deployable. • *isDeployed*: True/false value indicating if this application is already deployed. • *numberOfUsersWithApp*: Count of users with this application installed. • *numberOfDevicesWithApp*: Count of devices on which this application is installed. • *application*: Object containing the data set listed above for this application. Use the script to parse additional data from this set that you might need.
error	Variable that contains the activity output error message.

Conditions

Get Applications conditions

Variables	Description
Success	Activity successfully retrieved the list of applications available on the SCCM host.
Failure	Activity failed to retrieve the list of applications available on the SCCM host.

Get Deployments activity

The Get Deployments activity returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Get Deployments activity uses the Powershell activity template to access the deployments on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetDeployments.ps1` that returns the deployments on the host. This script filters the results of the GET, so that only specific attributes are returned for the deployments on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable deployment data. The list of available deployments is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Get Deployments activity does not use pre-processing scripts.

Input variables

Get Deployments input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.

Output variables

Get Deployments output variables

Variable	Description
deployments	The *deployments* array contains these attributes: • *id*: Primary key of the SCCM application. • *applicationId*: Primary key of the SCCM application. • *softwareName*: Name of the software that will be deployed. • *collectionId*: Primary key of the SCCM collection. • *collectionName*: Name of the SCCM collection. • *desiredConfigType*: Possible values are: *Install* (1) and *Uninstall* (2). • *deploymentIntent*: Intended purpose of the deployment. Possible values are: **Available** (1) and **Required** (2) . • *numberSuccess*: Number of clients that successfully installed the deployment. • *numberErrors*: Number of clients with an error when installing the deployment. • *deployment*: Object containing the data set of attributes listed here for this deployment. Use the post-processing script to parse additional data from this set that you might need..
error	Variable that contains the activity output error message.

Conditions

Get Deployments conditions

Condition	Description
Success	Activity successfully retrieved the list of deployments performed by Orchestration using an SCCM host.
Failure	Activity failed to retrieve the list of deployments performed by Orchestration using an SCCM host.

Get Device Collections activity

The Get Device Collections activity returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.

The Get Device Collections activity uses the Powershell activity template to access the collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetDeviceCollections.ps1` that returns the device collections on the server. This script filters the results of the GET, so that only specific attributes are returned for the device collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable device collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Get Device Collections activity does not use pre-processing scripts.

Input variables

Get Device Collections input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server..

Output variables

Get Device Collections output variables

Variable	Description
deviceCollections	The *deviceCollections* array contains these attributes: • *id*: Primary key of the SCCM device collection. • *name*: Name of the SCCM device collection. • *collectionType*: Type of SCCM collection. In this case, the value is **device**. • *localMemberCount*: Count of device collection members visible at the local SCCM site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get Device Collections output variables (continued)

Variable	Description
	• *memberCount*: Count of all device collection members. • *deviceCollection*: Object containing the data set of attributes listed here for this device collection. Use the post-processing script to parse additional data from this set to use.
error	Variable that contains the activity output error message.

Conditions

Get Device Collections conditions

Condition	Description
Success	Activity successfully retrieved a list of device collections available on the SCCM host.
Failure	Activity failed to retrieve a list of device collections available on the SCCM host.

Get User Collections activity

The Get User Collections activity returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) server.

The Get User Collections activity uses the Powershell activity template to access the user collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called *GetUserCollections.ps1* that returns the user collections on the host. This script filters the results of the GET, so that only specific attributes are returned for the user collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable user collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Get User Collections activity does not use pre-processing scripts.

Input variables

Get User Collections input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.

Output variables

Get User Collections output variables

Variable	Description
userCollections	The *userCollections* array contains these attributes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get User Collections output variables (continued)

Variable	Description
	• *id*: Primary key of the SCCM user collection. • *name*: Name of the SCCM user collection. • *collectionType*: Type of SCCM collection. In this case, the value is **user**. • *localMemberCount*: Count of user collection members visible at the local SCCM site. • *memberCount*: Count of all user collection members. • *userCollection*: Object containing the data set of attributes listed here for this user collection. Use the post-processing script to parse additional data from this set to use.
error	Variable that contains the activity output error message.

Conditions

Get User Collections conditions

Condition	Description
Success	Activity successfully retrieved the list of available user collections on an SCCM host.
Failure	Activity failed to retrieve the list of available user collections on an SCCM host.

Is Device in Collection activity

This activity verifies if a device exists in an SCCM device collection.

The Is Device in Collection activity uses the PowerShell activity template to verify if a specific device exists in an SCCM device collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called *IsDeviceInCollection.ps1* to perform the test.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Input variables

Is Device in Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the device collection.
device	Name of the device to verify is in the collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Is Device in Collection output variables

Variable	Description
output	Variable that contains the test result: True/False
errorMessage	Variable that contains the activity output error message.

Conditions

Is Device in Collection conditions

Condition	Description
Exist	The device exists in the collection.
Not exist	The device does not exist in the collection.
Failure	Activity failed.

Is User in Collection activity

This activity verifies if a user exists in an SCCM user collection.

The Is User in Collection activity uses the PowerShell activity template to verify if a specific user exists in an SCCM user collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called `IsUserInCollection.ps1` to perform the test.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Input variables

Is User in Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the user collection.
user	Name of the user to verify is in the collection.

Output variables

Is User in Collection output variables

Variable	Description
output	Variable that contains the test result: True/False
errorMessage	Variable that contains the activity output error message.

Conditions

Is User in Collection conditions

Condition	Description
Exist	The user exists in the collection.
Not exist	The user does not exist in the collection.
Failure	Activity failed.

Remove from Device Collection activity

The Remove from Device Collection activity removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.

The Remove from Device Collection activity uses the Powershell activity template to remove a device from a device collection on a Microsoft SCCM server. The activity is configured to use a MID Server with Powershell capabilites and to run a MID Server script called *`RemoveFromUserCollection.ps1`* to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Input variables

Remove from Device Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the device collection.
device	Name of the device to add to the collection.

Output variables

Remove from Device Collection output variables

Variable	Description
output	Variable that contains a value that is passed to other activities in the workflow
error	Variable that contains the activity output error message.

Conditions

Remove from Device Collection conditions

Condition	Description
Success	Activity successfully removed the device from the SCCM device collection.
Failure	Activity failed to remove the device from the SCCM device collection.

Remove from User Collection activity

The Remove from User Collection activity removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.

The Remove from User Collection activity uses the Powershell activity designer template to access a user collection on a Microsoft SCCM target host. The activity is configured to use a MID Server with Powershell capabilites and to run a MID Server script called `RemoveFromUserCollection.ps1` to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Input variables

Remove from User Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the user collection.
user	Name of the user to add to the collection.

Output variables

Remove from User Collection output variables

Variable	Description
output	Variable that contains a value that is passed to other activities in the workflow.
error	Variable that contains the activity output error message.

Conditions

Remove from User Collection conditions

Condition	Description
Success	Activity successfully removed the user from the SCCM user collection.
Failure	Activity failed to remove the user from the SCCM user collection.

SFTP File Transfer activity pack

Use the SFTP File Transfer activities to manage files and directories on an SFTP server and to move files from one SFTP server to another.

The SFTP activity pack includes scoped activities for common file transfer tasks and a ready-to-use workflow that includes these activities. Use the SFTP workflow to control which files are going to be moved, what conditions the files need to meet, the order in which the files are moved, and which overwrite options are executed.

Note:
To use the SFTP File Transfer activities and workflow, you must request activation of the Orchestration - SFTP plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP File Transfer workflow

The SFTP File Transfer activity pack includes a scoped workflow that uses multiple activities to manage files on SFTP servers.

The maximum activity count for the SFTP File Transfer workflow is set to 10,000. This allows the workflow to move up to 1000 files from one server to another.

Accessing the workflow

- Navigate to **Workflow** > **Workflow Editor** and select the **Workflows** tab.
- Click on the SFTP File Transfer workflow to open it.
- Click the information icon in the workflow header to display the properties dialog box.

Input variables

SFTP File Transfer workflow input variables

Variable	Description	Default value
Source host	Name or IP address of the server containing the files you want to move.	
Source port	Port number to use to communicate with the source server.	22
Source directory	Full path to the directory where the source files are located.	
Source files	Names of specific source files to move. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.	
Excluded files	Names of specific source files to exclude from the move. The system moves all other files found in the source directory or subfolders. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.	
Target host	Name or IP address of the server to which the files are being moved.	
Target port	Port number to use to communicate with the target host.	22
Datetime format	Timestamp format to apply when the `$[DateTime]` variable is used in the **Target directory** or **Target files** field. The system uses the current time from the instance to create timestamp values.	yyyy-MM-dd
Target directory	Path to the directory in the target host where the files are being moved. You can specify a target directory whose name includes the timestamp by adding the `$[DateTime]` variable to the directory name. For example, you might enter this path to a target directory: `/user/jacinto.gawron/documents/projects_$[DateTime]`. This produces the `projects_20150505` directory. When the timestamp variable is used, the system uses the format specified in the **Datetime format** field.

SFTP File Transfer workflow input variables (continued)

Variable	Description	Default value
Target file	Format to use for target file names when a timestamp is added. You can configure the system to add the timestamp as a prefix to the file name or insert the timestamp into the name, using these variables: • `$[DateTime]`: Current timestamp, using the format defined in the **Datetime format** field. • `$[SourceFile]`: Complete file name. • `$[SourceFile:Base]`: Base file name without the extension. • `$[SourceFile:Ext]`: File extension only. A target file name with the timestamp added as a prefix is expressed as: `$[DateTime]_$[SourceFile]`. This produces a file name that looks like this: `20150505_file1.txt` A target file name with the timestamp inserted into the name is expressed as: `$[SourceFile:Base]_$[DateTime]$[SourceFile:Ext]`. This produces a file name that looks like this: `file1_20150505.txt`	
Apply move conditions	Check box to apply conditions to the file transfer. If this check box is selected, additional fields appear for setting conditions.	false
Minimum file size, in bytes	Condition that defines a target file's minimum size requirement. This setting can help determine if the file is valid. This field appears when the **Apply move conditions** check box is selected.	0
Maximum file size, in bytes	Condition that defines a target file's maximum size requirement. This field appears when the **Apply move conditions** check box is selected.	-1
File is not older than	Condition that sets the earliest acceptable date for this file's age range. The range starts at 00:00 (midnight) on the date specified. This field appears when the **Apply move conditions** check box is selected.	
File is not newer than	Condition that sets the latest acceptable date for this file's age range. The range ends at 23:59 on the date specified. This field appears when the **Apply move conditions** check box is selected.	
Include subfolders	Check box to move the files from subfolders in the source directory. For information about how your selection affects other fields in the form, see the section below the table.	
Move order	Order in which the files are moved from the source to the target. The possible options are: • **None** (same order as files in the source directory) • **By timestamp** • **By file name** • **By file size**

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP File Transfer workflow input variables (continued)

Variable	Description	Default value
Sort order	Order in which the files are sorted in the target directory, using the option selected in the **Move order** field. Sorting options are **Ascending** and **Descending**.	desc
Maximum number of retries	Number of attempts the activity can make to connect to the target host or to move a file before timing out. When the retry limit to move a file or to connect to the host is exceeded, the system logs a failure. If the maximum number of failures is not exceeded, the system attempts to connect again or to move the next file named.	2
Time between retries, in seconds	Time, in seconds, between repeat attempts to connect to the target or to begin moving a file.	10
Maximum number of failures	Acceptable number of times the system can fail to connect to the target host or to move a file before it quits trying. A failure occurs when the number of configured retries is exceeded. Using the default settings, failure occurs when the system cannot connect to the target or move a file after two retries.	0
Duplicate file action	Action to take if a file being moved already exists in the target directory. The choices are: • **Overwrite if file exists** (default) • **Rename with index** • **Do not move**	overwrite
Preserve file attributes	Check box to use the time stamp and mode information from the source files for the copied files. If this check box is cleared, the copied files have a current time stamp and mode. **Note:** This timestamp is a file attribute and is not appended to the file name.	false
Upon success, remove files from source	Check box to delete original files from the source directory when they are copied to the new location. Clear this check box to keep the source files in their current location in the source host.	false
Upon failure, keep moved files on target	Check box to keep any files on the target that were moved successfully, even if the entire file transfer operation ended in failure. If this check box is cleared, the system removes all successfully transfered files from the target when general failure occurs.	true
Credential tag for source	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the source host.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP File Transfer workflow input variables (continued)

Variable	Description	Default value
Credential tag for target	Specific credential tag this activity must use to run SSH commands on the target host.	

File selection logic

When selecting the files to move from the source host, the system uses this logic:

- If the **Source files** and **Excluded files** fields are empty, the system moves all the files in the source directory.
- When the **Include subfolders** check box is selected, the following dependencies exist:
  - If no files are specified in the **Source files** and **Exclude files** fields, the system moves all files in the source directory and all files in all subfolders of the source directory.
  - If the **Source files** field contains file names, the system moves those files from their location on either the source directory or any of its subfolders.
  - If the **Exclude files** field contains file names, the system moves all the files from the source directory and its subfolders except those excluded files.
- When the **Include subfolders** check box is cleared, the system looks only in the source directory for files to move or exclude.

Copy File activity

The Copy File activity copies a file from an SFTP server (source host) to another SFTP server (target host).

Input variables

Copy File input variables

Variable	Description
sourceHost	Name or IP address of the server containing the files you want to transfer.
sourcePort	Port number to use to communicate with the source server. The default port number is **22**.
sourceFilePath	Full path to the file to copy from the source host.
targetHost	Name or IP address of the server to which you want to move the files.
targetPort	Port number to use to communicate with the target server. The default port number is **22**.
targetFilePath	Full path to the copied file on the target host.
tempFileSuffix	Temporary suffix to use when moving a file. If this field contains a value, the activity deletes the duplicate target file, if it exists, and then copies the source file to a temporary file using *`targetFilePath + tempFileSuffix`* as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Copy File input variables (continued)

Variable	Description
	activity copies the source file directly to the target file and overwrites it, if it already exists.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the source host.
targetCredentialTag	Specific credential tag this activity must use to run SSH commands on the target host.

Output variables

Copy File output variables

Variable	Description
errorMessages	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.
result	Text message advising that the command was executed successfully.

Conditions

Copy File conditions

Condition	Description
Success	The activity succeeded in copying the file.
Failure	The activity failed to copy the file.

Create Directory activity

The Create Directory activity creates a new directory on an SFTP server.

Input variables

Create Directory input variables

Variable	Description
sourceHost	Name or IP address of the server containing the files you want to move.
sourcePort	Port number to use to communicate with the source server. The default port number is **22**.
sourceDirectory	Path to the target directory to create.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Create Directory output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.
result	Text message advising that the command was executed successfully.

Conditions

Create Directory conditions

Variable	Description
Success	The activity succeeded in creating the directory.
Failure	The activity failed to create the directory.

Get File List activity

The Get File List activity returns a list of files from a given directory and its subdirectories on an SFTP server (source host).

Input variables

Get File List input variables

Variable	Description
sourceHost	Name or IP address of the server containing the files you want to list.
sourcePort	Port number to use to communicate with the target server. The default port number is **22**.
sourceDirectory	Path to the target directory containing the files to list.
sourceFiles	List of target files to return. This is a comma separated list that accepts wildcards, such as ***.txt**.
excludedFiles	List of target files to exclude. This is a comma separated list that accepts wildcards, such as ***.txt**.
includeSubfolders	True/false variable that determines if files from subfolders are included in the list. The default value for this variable is **false**.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

Output variables

Get File List output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed. An activity can examine the error message to customize a condition. For example, if the

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get File List output variables (continued)

Variable	Description
	error message contains *NO_SUCH_FILE*, the activity can be considered successful, depending on circumstances.
result	List of requested files, returned as a JSON string.

Conditions

Get File List conditions

Condition	Description
Success	The activity succeeded in listing the requested files.
Failure	The activity failed to list the requested files.

Remove File or Directory activity

The Remove File or Directory activity removes a file or a directory on an SFTP server, including subdirectories, when configured.

Input variables

Remove File or Directory input variables

Variable	Description
sourceHost	Name or IP address of the server containing the files you want to remove.
sourcePort	Port number to use to communicate with the target server. The default port number is **22**.
sourceFilePath	Full path to the file or directory to remove. To remove multiple files or directories using a single activity, enter a semicolon-separated list of paths in this field.
isDirectory	True/false variable that determines if the specified file path is a directory. The default value for this variable is **false**.
includeSubfolders	True/false variable that determines if the given directory and all of its subfolders should be removed. The default value for this variable is **false**. If the value for this field is **false**, then the activity can only remove an empty directory. This field appears when the **isDirectory** checkbox is selected.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

Output variables

Remove File or Directory output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remove File or Directory output variables (continued)

Variable	Description
result	Either **success** or **failure**.
deletionResults	The *deletionResults* array contains these attributes: • *fullPath*: Full path to the file or directory targeted. • *status*: Either **succeeded** or **failed**. • *reason*: Text message describing the cause of a failure.

Conditions

Remove File or Directory conditions

Condition	Description
Success	The activity succeeded in removing the file or directory specified.
Failure	The activity failed to remove the file or directory specified.

Rename File or Directory activity

The Rename File or Directory activity renames a file or directory to a new name on an SFTP server.

Input variables

Rename File or Directory input variables

Variable	Description
sourceHost	Name or IP address of the server containing the file or directory you want to rename.
sourcePort	Port number to use to communicate with the target server. The default port number is **22**.
sourceFilePath	Full path to the file or directory to rename.
targetFilePath	Full path to the renamed file or directory.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

Output variables

Rename File or Directory output variables

Variable	Description
errorMessages	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rename File or Directory output variables (continued)

Variable	Description
result	A message saying that the operation has been successful. For example, you might see: `Rename /tmp/sftp_test/subdir1 to /tmp/sftp_test/subdir2 complete`.

Conditions

Rename File or Directory conditions

Condition	Description
Success	The activity succeeded in renaming the file or directory.
Failure	The activity failed to rename the file or directory.

Set File Attributes activity

The Set File Attributes activity sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List activity to return a list of files and their attributes first. Then, when you moved a file from a source host to a target host, use the Set File Attributes activity to set the source file attributes on the target file. This is demonstrated in the SFTP File Transferworkflow.

Input variables

Set File Attributes input variables

Variable	Description
sourceHost	Name or IP address of the server containing the file or directory whose attributes you want to change.
sourcePort	Port number to use to communicate with the target server. The default port number is **22**.
sourceFilePath	Full path to the file or directory whose attributes you want to change.
userID	User ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.
groupID	Group ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.
permissions	File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as **16877**, which defines these permissions: *rwxr-xr-x*. **Note:** The permissions number is an internal value returned by the Get File List activity.
accessTimestamp	Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set File Attributes input variables (continued)

Variable	Description
modificationTimestamp	Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair.
sizeInBytes	Size of the file or directory, expressed in bytes.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

Output variables

Set File Attributes output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.
result	Text message advising that the command was executed successfully.

Conditions

Set File Attributes conditions

Condition	Description
Success	The activity succeeded in changing the attributes of the specified file or directory.
Failure	The activity failed to change the attributes of the specified file or directory.

SSH activity pack

Orchestration provides an activity pack of SSH activities that were customized using the ServiceNow activity designer.

These activities perform the same functions as SSH activities by the same name from previous releases and replace those activities for all new workflows. The custom SSH activities were built with the Create an SSH activity, which gives workflow administrators the ability to store input and output variables in the databus.

Note:
Existing workflows from earlier versions that were created with legacy SSH activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom SSH activities.

To use the SSH custom activities, you must request activation of the Orchestration - SSH plugin.

Secure Copy activity

The Secure Copy activity copies a file from one host to another, without storing the copied file on the MID Server.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Secure Copy input variables

Input variable	Description
from_host	Host name or IP address of the source machine.
from_scp_file	Name of the file to copy, including the absolute path.
to_host	Host name or IP address of the target machine.
to_scp_file	Path to the target file. This path can be absolute or relative to the logged in user's home directory.
debug_mid	Check box that enables debug logging when selected.
debug_ssh	Check box that enables J2SSH debug logging when selected.

Output variables

Secure Copy output variables

Output variable	Description
payload	The *executionResult.payload* from the Activity designer parsing sources.
output	The *executionResult.output* from the parsing sources.

Conditions

Secure Copy conditions

Condition	Description
Success	Activity successfully copied the file from one host to another.
Failure	Activity failed to copy the file from one host to another.

Files Compare activity

The Files Compare activity compares two files on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Global** > **Orchestration - SSH**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Files Compare input variables

Input variable	Description
Hostname	Hostname or IP address of the destination server for SSH activity.
Directory	Name of the working directory.
OldFile	Name of the first file to compare.
NewFile	Name of the second file to compare.

Output variables

Files Compare output variables

Output variable	Description
contents	File comparison result. This is the difference of the two compared files.
result	Either **success** or **failure**.
return-code	Either **0**, if the two files are the same, or **1**, if the two files are different.
errorMessage	The *`executionResult.errorMessages`* from the Activity designer parsing sources.

Conditions

Files Compare conditions

Condition	Description
Success	Activity successfully compared the specified files.
Failure	Activity could not complare the specified files.

File Read activity

The File Read activity reads a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Global** > **Orchestration - SSH**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

File read input variables

Input variable	Description
Hostname	Hostname or IP address of the destination server for SSH activity.
Directory	Name of the working directory.
File	The name of the file to read.

Output variables

File read output variables

Output variable	Description
contents	Content of the file to read.
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

File Read conditions

Condition	Description
Success	Activity successfully read the contents of the specified file.
Failure	Activity could not read the contents of the specified file.

File Write activity

The File Write activity writes a file on a Linux or UNIX computer.

The source file can be an absolute or relative path from the Directory. If an absolute path is used, then no value is required in the *Directory* field.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

File Write input variables

Field	Description
hostname	Hostname or IP address of destination server for SSH activity.
directory	Name of the working (target) directory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File Write input variables (continued)

Field	Description
file	Name of the file to be written.
behavior	Select one of the following: • **overwrite**: Creates the file if it does not exist and overwrites the file if it does exist. • **append**: Creates the file if it does not exist and appends the new content to an existing file. • **create only**: Creates the file if it does not exist and fails if the file does exist.
contents	What to write or append (depending on the behavior) to the file

Output variables

File Write output variables

Variable	Description
return_code	Indicates whether or not the file write operation was successful.
error_message	Message that indicates if an error has occurred. Any value other than **0** indicates a failure.

Conditions

File Write conditions

Condition	Description
Success	The activity wrote a file in the target directory.
Failure	The activity failed to write a file in the target directory.

File Copy activity

The custom File Copy activity copies a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Global** > **Orchestration - SSH**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

File Copy input variables

Input variable	Description
hostname	Hostname or IP address of destination server for SSH activity.
directory	Name of the working directory.
src_file	Name of the source file.
dst_file	The name of the destination file.

Output variables

File Copy output variables

Output variable	Description
result	Either **success** or **failure**.

Conditions

File Copy conditions

Condition	Description
Success	Activity successfully copied the file on the specified host.
Failure	Activity failed to copy the file on the specified host.

File Replace String activity

The File Replace String activity finds and replaces a string in a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

File Replace String input variables

Variable	Description
hostname	Hostname or IP address of destination server for SSH activity.
directory	Name of the working (target) directory.
file	Name of the file in which the string is to be replaced.
find_pattern	A regular expression of the text to replace.
replace_string	The replacement string for the text found by the expression in the *`find_pattern`* variable.
options	Replacement options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File Replace String input variables (continued)

Variable	Description
	• **first**: Replaces the first occurence of the pattern. • **all**: Replaces all occurrences of the pattern.

Output variables

File Replace String output variables

Variable	Description
return_code	Indicates whether or not the string was replaced successfully in the target file.
error_message	Message that indicates if an error has occurred. Any value other than **0** indicates a failure.

Conditions

File Replace String conditions

Condition	Description
Success	The activity has successfully replaced the string in the file.
Failure	The activity has failed to replaced the string in the file.

Reset Linux User Password activity

The *Reset Linux User Password* activity resets the password for a given user on a Linux computer.

This activity requires that the user executing the command be able to run the **chpasswd** command and, if expiring the password immediately, to run **chage** with MID Server privileged commands.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Reset Linux User Password input variables

Variable	Description
hostname	IP address of the target Linux machine.
user	Name of the user whose password is being reset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reset Linux User Password input variables (continued)

Variable	Description
password	New password set for this user. The password is a workflow variable that is encrypted either as a **password2** field or by calling the encryption method of a *`Packages.com.glide.util.Encrypter`* object.
force_change	Indicates if this password is temporary and to force the named user to change the password at login.

Output variables

Reset Linux User Password output variables

Variable	Description
return_code	Indicates whether or not the user password reset action was successful.
error_message	Describes any error that occurred during password reset. If no error occurred, this value is null.

Conditions

Reset Linux User Password conditions

Variable	Description
Success	Activity successfully changed specified user's password
Failure	Activity failed to change specified user's password.

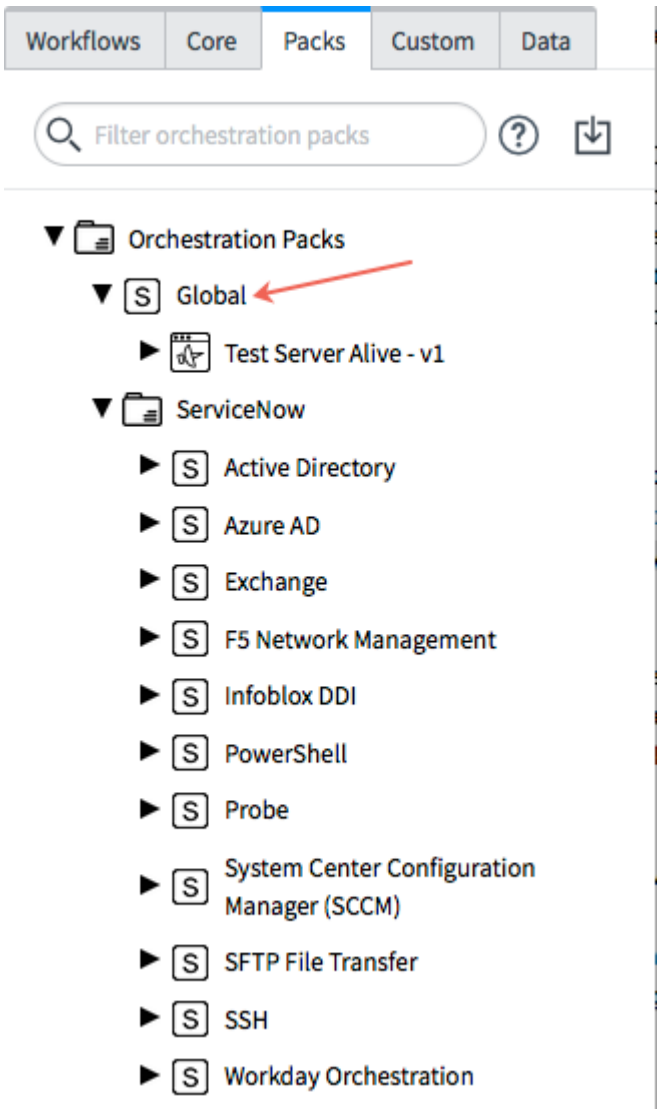
Global activities

Global activities are Orchestration activities created in the global scope.

Any activities you create in the global scope are listed in the Global category in the **Packs** and **Custom** tabs of the Workflow Editor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Global activities



Test Server Alive activity

The Test Server Alive activity determines if a target system is alive by its response to a particular protocol.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Test Server Alive input variables

Variable	Description
port_probes	A comma separated list of protocols to use to check for signs of activity on the target machine (example: *wmi,wins,https,ssh,http,https,snmp,dns*)
hostname	Hostname or IP address of the target system to check.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Test Server Alive output variables

Variable	Description
alive	Code that indicates whether or not the server is alive. If any value but **'1'** is returned, the server is not alive.

Conditions

Test Server Alive conditions

Condition	Description
Success	Activity determined that the device is running.
Failure	Activity failed to determine if the target device is running. Failure could be caused by a missing protocol or a device that is not accessible.

Orchestration activity designer

The Orchestration activity designer enables a user with either the workflow_admin or activity_creator and workflow_creator roles to construct reusable activities that suit an organization's business needs.

Activities created by the activity designer offer the following advantages over core activities offered in previous releases:

- Reuse custom activities in multiple workflows.
- Upload and download custom activities from the ServiceNow Store.
- Parse data from standard input formats.
- Test input variables against a target host or endpoint and inspect the payload.
- Automatically map values from a test payload to an activity's output variables.
- Share data between activities.
- View previous versions of an activity.

Access to the activity designer requires activation of ServiceNow Orchestration. For instructions about managing transitions and conditions for all activities, see Workflow activities.

Orchestration provides numerous pre-defined activities, which are reusable components that can be used in numerous workflows without having to understand the complexities of the underlying system. These activities are grouped into activity packs, which address specific business needs, such as: Active Directory, Azure AD, Exchange, Infoblox DDI, and PowerShell. There are other ServiceNow applications which provide and maintain their own separate activity packs, such as Security Incident Response, Cloud Management, or Release Automation.

Customers can also build their own activities and activity packs. You can construct custom activities with a specified template through the Orchestration Activity Designer. Custom-built activities built with the Activity Designer are referred to as activity elements. Activity elements provide optimal operations, enable code reuse, and minimize the need to write code. They also

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

enable you to follow the flow of data within a given workflow across orchestration activities. Incorporating activity elements limits the dependency on the scratchpad which reduces problems in complex workflows. Limit the use of core activities, like 'Run Script', unless you need direct access the scratchpad, for example, for a counter. Activity elements do not have direct access to the scratchpad. You can, however, pass scratchpad variables as inputs into your activities.

Orchestration activities created by the activity designer:

- Can be uploaded and shared in the ServiceNow App Store
- Use the databus, which allows the activity to have well-defined inputs and outputs
- Share data across activities within a workflow
- Use versioning
- Provide a consistent approach for activity development regardless protocol

Note:
Prior to the Fujirelease, activities were built with Activity Definitions. In Fuji, a new architecture was introduced using the Activity Designer. Orchestration Core activities, built originally as Activity Definitions, have been converted to use the new template format (Activity Elements) and the databus offered with the activity designer. Workflows in upgraded instances that use legacy activities continue to work normally.

For instructions on using activities to construct a workflow, see Add an activity to a workflow.

Introduction to credentials, connections, and aliases for Orchestration

All application integrations in Orchestration require connection information, credentials, and connection and credential aliases to their respective applications to access resources.

Before you can execute an application integration in Orchestration, you must create and configure the corresponding connection information and credentials. The Connections pertains to an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database. The associated Credentials are the authentication data required to make the connection.

Connection information and credentials can vary between QA/Development/Production environments for the same integration. The tight coupling between this data and application metadata, such as workflow or job scheduling, make application metadata obsolete when you change environments. To alleviate this problem, the concept of an alias is introduced, for connections and credentials, to decouple this data from application metadata. These aliases allow customers to design their application metadata to couple to an alias, which during runtime resolves to connection and credential data.

There are two types of aliases, a connection and credential alias and a credential alias. There are business rules that enforce certain constraints on these aliases. Names should contain alphabets, numbers, and underscores but cannot have special characters. The alias must be unique in a scope. If you choose to have multiple active connections, you can have more than one active connection in the same domain. If you do not choose this option, you can have only one active connection in per domain.

Note:
If you enable multiple active connections, when the connection records resolve, your application picks one connection based on an established order. The order of the connections depends on the API you use to retrieve connection data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add additional connection attributes to an alias, which are available in connection data during run time. Variables overridden by connection administration during run time should not affect the alias.

The credential alias resolves only credential data. Along with alias data model, you can use a scriptable API which can get connection and credential data during runtime.

Using Connection and Credential Alias with Orchestration

Define an alias to label a credential or connection record.

The Credential and Connection Alias defines an alias that labels a credential or connection record. It is extended from the sys_metadata table. It requires the admin role. The credential_admin and connection_admin have read access to sys_alias. A connection alias contains:

Name

Name of the alias.

ID

This field is based on the format "scope name.alias name" Unique index on ID to ensure unique record based on scope name + name. If the scope is global, the ID is the alias name.

Type

You can select either 'Credential' or 'Connection and Credential'. The default is Connection and Credential.

Connection type

This field is applicable when the alias type is set to Connection and Credential. There are three connection types: HTTP, JDBC, JMS. The default is HTTP.

If you create a workday alias in global scope, the ID is set to workday

If you create a workday alias in hr app scope, the ID is set to x_hr_app.workday

- Name can only contain alphabets, numbers and underscore.
- During the upgrade, the tag in credential record will be migrated to connection alias. If the tag in previous release's credential record contains special characters other than alphabets, numbers and underscore, the tag data will be preserved during the upgrade. The user still can use these connection alias, but the user cannot update these alias, unless he removes these special characters when do the update.

Using credentials with Orchestration

Orchestration requires credentials to access resources.

Credential table

The credential table (discovery_credential) defines credentials that can be used for integration. In the previous release, the Credential table contains a string-type tag field, which labels a credential and the tag is used in Orchestration activities. In the Madrid release, the credential alias is renamed from tag, and the type is changed from string to GlideList, which is a reference to the connection alias table.

Credential types

The following credential types are provided:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credential type	Description	Supports Test Credential option
Applicative credentials	The credentials to explore the applications on a device or computer. Discovery patterns used by ITOM Visibility often need applicative credentials.	No
Amazon Web Service credentials	The Amazon Web Services (AWS) main account, access key ID, and secret access key. **Note:** You cannot test AWS credentials through the Test	No
Azure Service Principal and Enterprise Agreement credentials	The Azure service principals required for an Azure subscription.	No
Basic authentication credentials	A user name and password.	No
CIM credentials	The user name and password required to access a CIMOM - Common Information Model Object Manager (CIM) server, which obtains information about VMware ESX servers.	No
Cloud credentials	Credentials that Orchestration uses to access cloud resources.	No
JDBC credentials	A user name and password to access a Java Database Connectivity (JDBC) connection.	Yes
JMS credentials	A user name and password to access to a Java Message Service (JMS).	Yes
OAuth 2.0 credentials	OAuth 2.0 credentials enable ServiceNow® to obtain access to user accounts on an HTTP service.	
SNMP community credentials	The community string to access devices via SNMP.	Yes
SNMPv3 credentials	The user name and keys required to access devices on your SNMP v3 network.	Yes
SSH credentials	The user name and password to access Linux and UNIX devices.	Yes
SSH credentials	The private key credentials to access Linux and UNIX devices. **Note:** For better security, SSH private key credentials are suggested over SSH password credentials.	Yes
VMware credentials	Credentials to access vCenter resources. These credentials are required for any work that is performed on vCenter, such as cloning a virtual machine.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credential type	Description	Supports Test Credential option
Windows credentials	The user name and password required to access Windows computers. Several Windows credentials must be met to use Windows credentials.	Yes

How MID Servers use credentials

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should Configure Windows MID Server service credentials so that they have domain or local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in **Discovery** > **Credentials**.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network as specified by the Workflow activities. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific workflow activities: Windows (for PowerShell) and VMware.

Encryption and decryption

The platform stores credentials in an encrypted field on the Credentials [discovery_credentials] table. Once they are entered, they cannot be viewed.

When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server's public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server's private key.

Note:
The platform does not have separate encryption keys for multi-tenant instances.

Credential order

Credentials can be assigned an order value in the Credentials form, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials [discovery_credential] table randomly, until it finds one that works, such as when Orchestration attempts to run a command on an SSH server (such as a Linux or UNIX machine), or when Discovery attempts to query an SNMP device (such as a printer, router, or UPS).

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity `[dscy_credentials_affinity]` table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log in to 90% of the devices, it is good practice to configure those five with low-order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.
- The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low-order value.

Credential alias

Credential alias enables flow and workflow creators to:

- Assign individual credentials to any activity in an Orchestration workflow.
- Assign individual credentials to any action in Workflow Studio.
- Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.
- Assign different credentials to each occurrence of the same action in designer flow.

Credential alias also works with credential affinities.

External credential stores

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. Only CyberArk is supported.

Connections with Orchestration

Use the connections table to setup a JMS, JDBC, or HTTP(s) connection to a target host.

Connection Table

The Connection table (sys_connection) is the base table for all connection tables. You can setup connections for the following protocols:

- JDBC
- JMS
- HTTP(s)

The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Base connection properties

Field	Description
Name	Name of the connection. This field must be unique on the table.
Credential	Specify the credential to use with this connection. This is optional.
Connection alias	The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.
Active	Check to make the current connection active.
Domain	Domain to which the connection belongs.

Credential is unique across active connections, if not empty.

Upgrading connection information

The JDBC connection (jdbc_connection) and JMS connection (orch_jms_ds) tables are existing Orchestration connection tables. In madrid, we re-parent them to extend from Connection (sys_connection) table. They move from Orchestration run time plugins to Credentials & Connections plugins. They are originally extended from sys_metadata. The sys_metadata related data will be removed. JDBC field name changes:

- JDBC server is renamed to host
- Database port is renamed to port

Create custom activities using custom activity designer templates

You can create and update different types of custom activities in the Workflow Editor using a custom template.

Before you begin

Roles required: workflow_admin or activity_creator

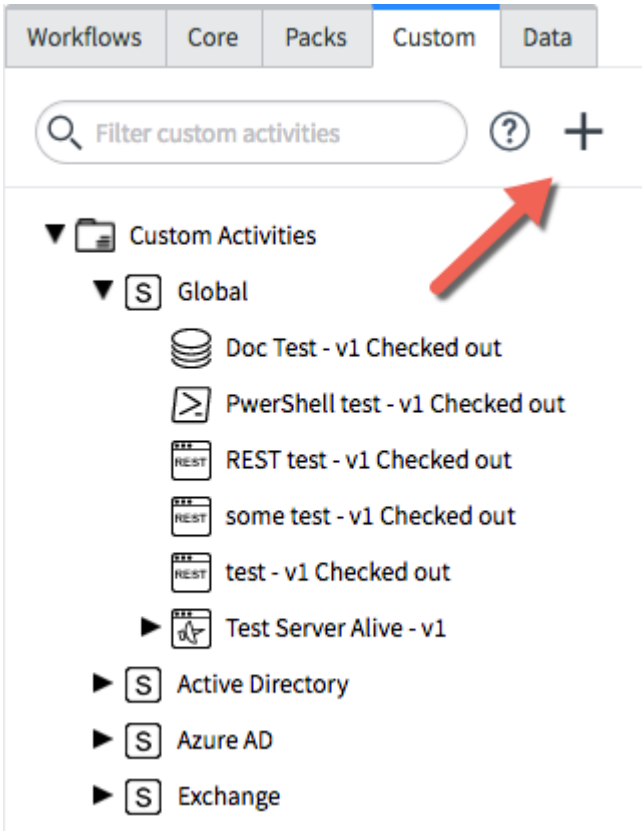
About this task

The Activity Designer contains common steps which are applicable to all the activities that you create. This procedure guides you through the common steps and the order they should be set up. You specify an activity template before you create a custom activity.

Procedure

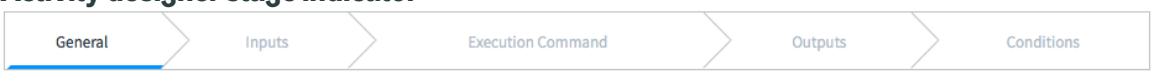
1. Navigate to **All** > **Orchestration** > **Workflow Editor**.
   The **Welcome** tab of the Workflow Editor opens.
2. On the **Custom** tab in the palette, click **+** to create a new activity select the appropriate template from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Activity Designer form appears, with a stage indicator at the top. All new activities start at the **General** stage. The current stage shows with a blue underscore.

Activity designer stage indicator



3. Add the general properties.
   This information is standard for each custom activity, include a name, description, and other related information.
4. Create the template Create input variables for the template.
   Create the variables to pass into the activity in the Inputs form of the activity designer.
5. **Optional:** Add a pre-processing script.
   For input validation or transforming input data, you might need a pre-processing script.

   Note:
   This step is not included in the Run Script activity.

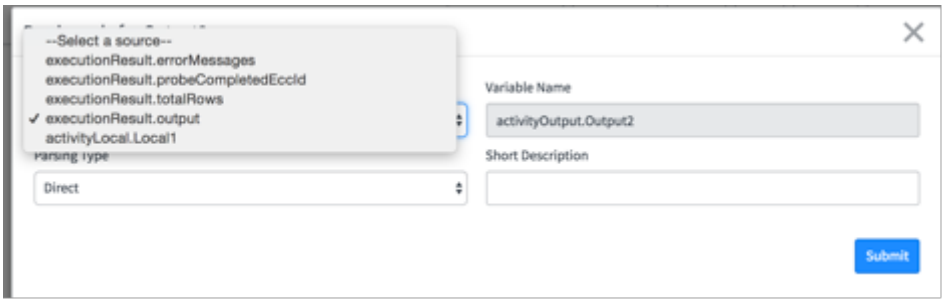
6. Click **Continue** to open the Execution Command form, then fill out the **Execution Command** step based on the corresponding execution templates:
   - Create a SOAP web service activity
   - Create a JDBC activity
   - Create a JavaScript Probe activity
   - Create a PowerShell activity
   - Create a REST web service activity
   - Create a Probe activity
   - Create an SFTP activity

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a Run Script activity
- Create an SSH activity
- Create a JMS activity

7. **Optional:** Test your inputs.
8. **Optional:** In the Outputs form, define local and/or output variables.
   Local variables can be used for temporary storage when cascading parsing rules. For example, you might extract an XML payload from within a JSON payload. A local variable can access the XML document and use that as a source for another parsing rule. The graphic shows a *Local1* variable source to parse data for *Output2*.

Define local variable



9. Use one of the options to assign values to Outputs.

Option	Description
Parsing rule	You can create a parsing rule and map them to the output fields by dragging and dropping the variables into the parsing rules structure. The REST, SOAP, and JDBC templates pro vide auto-mapping to create the parsing rules automatically. If available from the test inputs form, auto-mapping should be used when possible.
Post-processing	Post-processing scripts allow you to code your own output data validation, output pars ing code, and related tasks. Post-process ing executes after the execution command results have been returned and before the parsing rules and conditions are run. Click **Go to Post-Processing (Advanced)** to create a post-processing script. **Note:** If you create a script, this step reflects as a stage in the indicator.

10. Click **Continue** to open the Conditions form to create exit condition rules for your activity and then click **Save**.

General properties for activity designer templates

The following General Property fields are common to all activity designer templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General Property fields common to all activity designer templates

Fields	Description
Name	Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the **Data** tab of the Workflow Editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the **Data** tab.
Short description	Brief description of what the activity does.
Image	Icon that identifies an activity of this type in the workflow palette.
Execution template	Predefined template selected for this activity.
Application	Current Application scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the **Application** field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the Workflow Editor.
Accessible from	Accessibility setting for this activity, by scope. The following options are available: • **All application scopes**: This activity is available to all application scopes. • **This application scope only**: Use of this activity is restricted to the scope named in the **Application** field.
Category	Category for this activity in the **Custom** and **Packs** tabs. All categories are listed under their scope in the collapsible hierarchy.
Description	Detailed description of the activity.

Create input variables

Create the variables to pass into the activity in the **Inputs** form of the activity designer.

Before you begin

You must name your activity in the **General** form before you can advance to the **Inputs** stage.

Roles required: workflow_admin or activity_creator

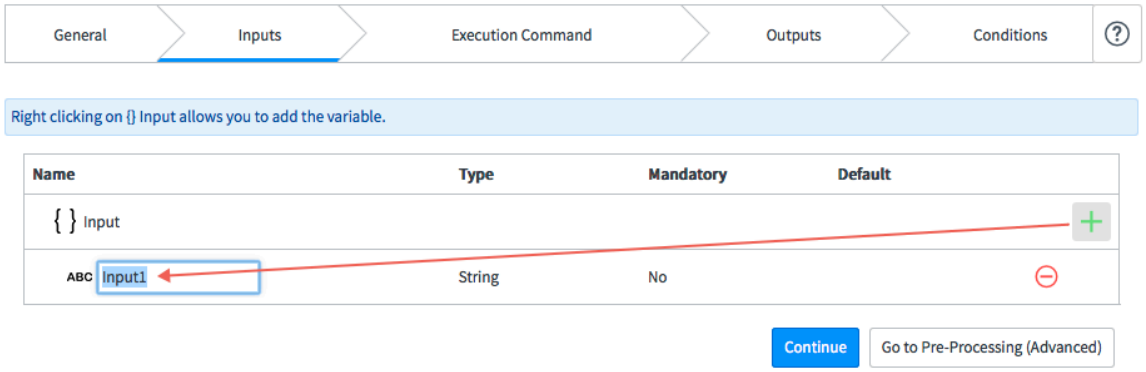
Note:
Variable strings in the **Inputs** form have a 255 character limit.

Procedure

1. Click the **+** icon to create a new input variable.

   The designer creates a default variable called **Input1**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Type your new variable name in the field.
3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
4. Configure your variable using these fields:

Variable configuration

Field	Description
Type	Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.
Mandatory	Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.
Default	Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.

5. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon ( ).
6. To delete a variable, click the delete icon ( ) in the row.
7. Click **Continue** to advance to the **Execution Command** stage or click **Go to Pre-Processing (Advanced)** to create a script that runs before the activity executes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map an input variable

After you create the input variables, map them to the fields in the Execution Command form.

Before you begin

Role required: activity_admin, activity_creator

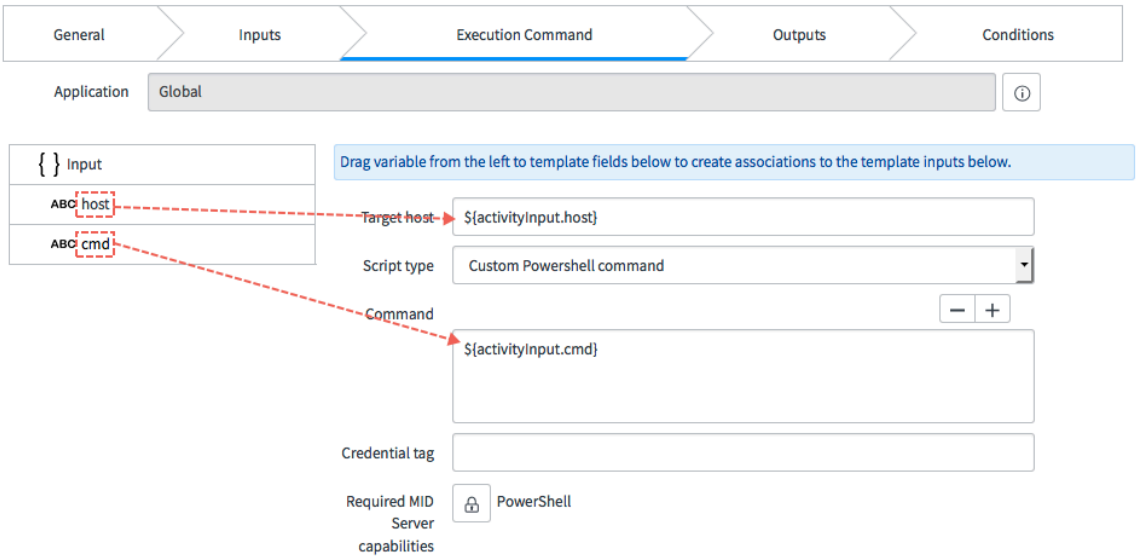
About this task

These fields contain values required by the target host or endpoint to authenticate and query for data. Included in this example are fields for a command to run on the target and the MID Server to use, if one is required.

Procedure

To map a variable, drag it into the appropriate field.

The designer automatically expresses the variable in the syntax the system requires.



Configure the PowerShell execution command

Use the input variables you created to configure the command that Orchestration executes on the Windows target machine.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

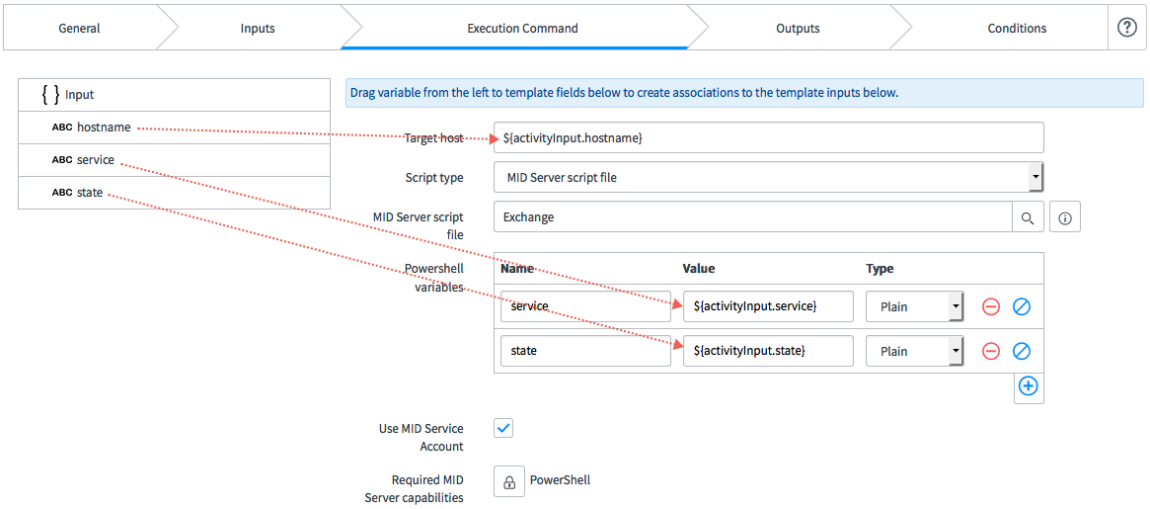
Note:
You can test the PowerShell connection between the MID Server and the target computer without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell execution command



2. Complete the fields shown in the table.

Powershell command fields

Field	Description
Input	Input variable builder. Create variables to map to available fields.
Target host	Host name or IP address of the target server for this PowerShell activity.
Script type	Type of script to run on the PowerShell host. Available options are: ○ Custom Powershell command ○ MID Server script file
MID Server script file	MID Server script file to run. This field is available when the **Script type** selected is *MID Server script file*.
Command	Command that this activity runs on the target host. This field is available when the **Script type** selected is *Custom Powershell command*. You can drag and drop input variables from the variable builder into this field to create your command.
Powershell variables	Name-value pairs to pass to the host with Powershell. You can create these variables manually, or drag input variables into the **Value** field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the **Encrypted** data type, your value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.
Use MID service account	Forces this activity to authenticate on the target host using the credentials of the MID Server service account only, without trying any other credentials. When this check box is selected, the **Credential tag** field is not available.
Credential tag	Specific Credential aliases for Orchestration activities this activity must use to run Powershell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential alias is defined, the MID Server tries the credentials for that alias only and does not try the MID Server service account. This field is not available when the **Use MID service account** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Required MID Server capabilities	MID Server to use for querying Powershell, by capabilities. By default, the system selects a Powershell MID Server.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Test activity template inputs

You can test the input parameters of a custom activity during its development without having to run the activity in a workflow context.

Before you begin

Create input variables and map them to fields in the **Execution Command** form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

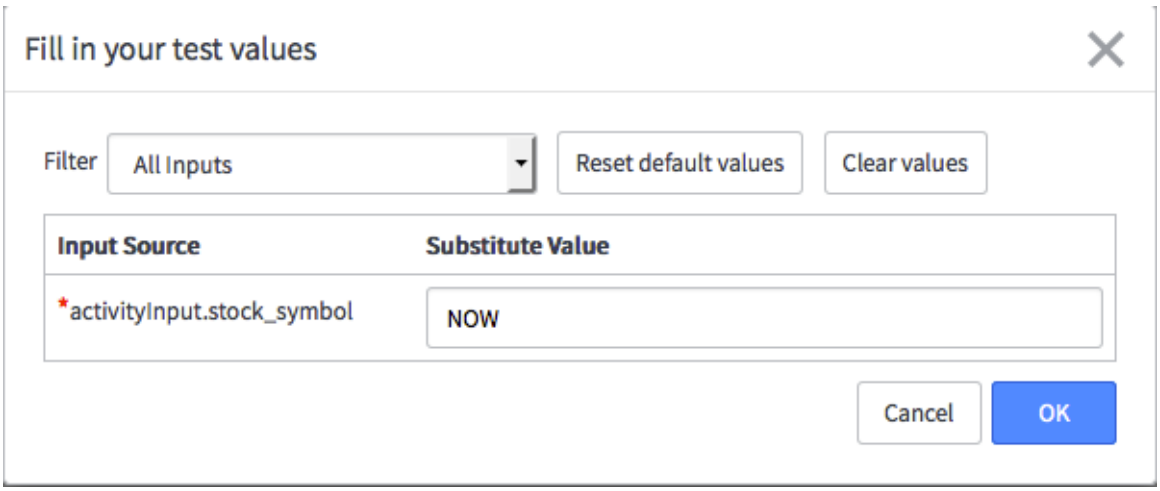
About this task

An input test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. You need to use a workflow to test a pre-processing or post-processing scritp. You do not need to check out the activity to test it, and you can test input variables from any stage in the activity designer, if your activity is properly configured. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

Note:
If you intend to use auto-mapping, you must test your input variables.

Procedure

1. Click **Test Inputs**.
   The list of input source variables appears. If you added default values for these variables, those values appear in the **Substitute Value** column. Mandatory variables are marked with a red star. In this example, a SOAP endpoint returns a value for a stock quote variable.



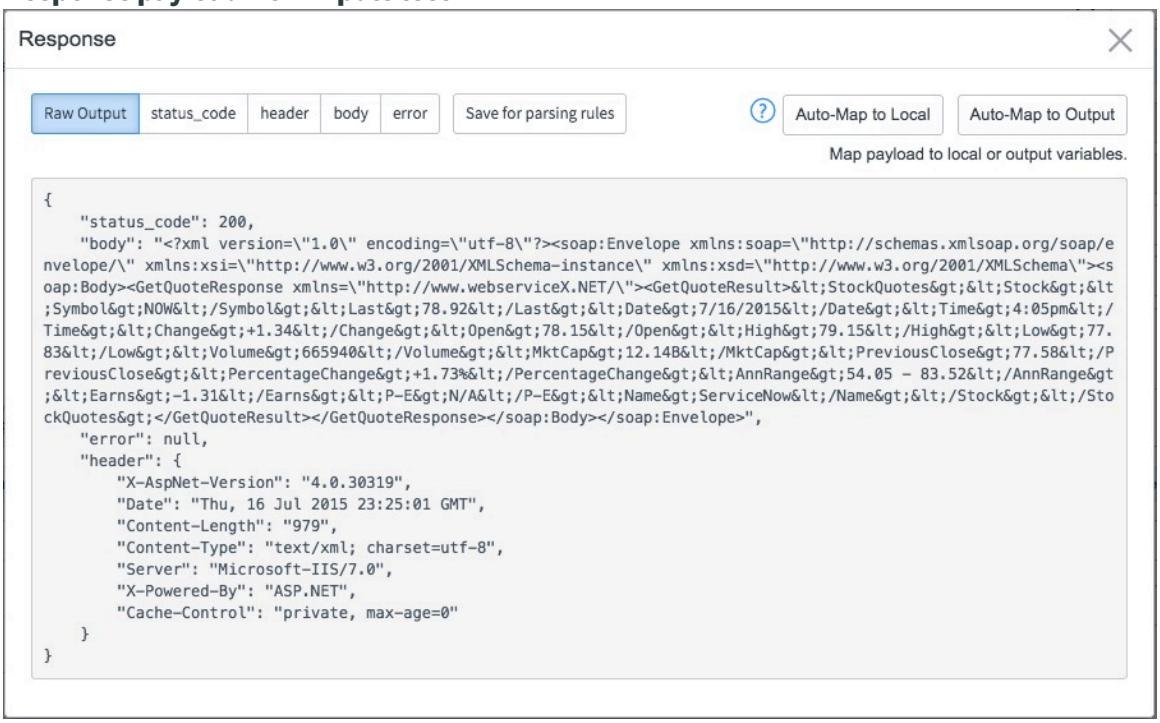
2. Filter the variable list with these controls:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **All Inputs**: Displays all input variables. This is the default view.
- **Mandatory Inputs**: Displays only mandatory input variables.
- **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   - **Reset default values**: Replaces any test values set in this form with the default values, if they are present.
   - **Clear values**: Clears all values in the input variable list, even if default values exist.
4. When your test values are configured correctly, click **OK**.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.

Response payload from inputs test



5. To map appropriate parameter values in the payload to variables in the **Outputs** stage automatically, select an auto-mapping option.
6. Alternately, you can click **Save for parsing rules** to copy the entire payload to the parsing rules. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.
7. Click the **X** in the upper right corner of the window to close it.

Data encryption for activity variables

You can protect sensitive data passed from Orchestration activities by encrypting input and output variables.

The system never stores encrypted variables as clear text. If the MID Server is used to fulfill the activity, the corresponding ECC Queue's input payload is encrypted if an encrypted output variable is defined in the template. Output variables passed to a downstream activity as input variables maintain their encryption throughout processing.

Inputs that require data encryption come from one of these sources:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Workflows: These inputs are provided through the Workflow Editor and must be in the password2 format for two-way encryption.
- Service catalog requests: These input values are provided to an activity as encrypted variables from a service catalog item.
- GlideRecord: These are variables attached to any ServiceNow table. The source column in the table must be a password2 type variable.
- Activity outputs: These are variables passed as outputs from one activity to a downstream activity as inputs, through the data bus.
- Empty string: The system allows you to define encrypted input variables but never pass a value into the variable.

Activity designer template pre-processing fields

Use the **Pre Processing** form of the activity designer to define a script to run before the activity executes.

Pre-processing fields

Field	Description
Input process script	Script to run before the activity executes.
Variables	Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the **Inputs** form. All activity variables added in the **Inputs** form are read-only and are expressed in the pre-processing script with this syntax: `activityInput.variable`. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the `executionParam.variable_name` execution parameter. Refer to the specific execution parameters for your template.

Logging

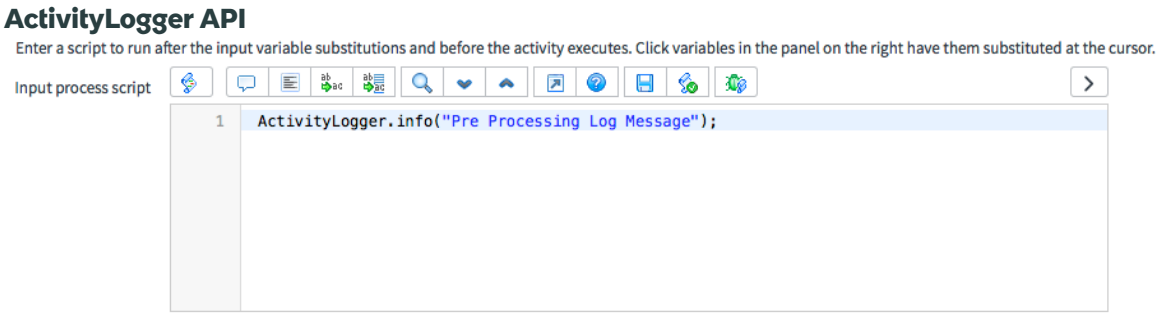
Activity designers can add logging to the pre-processing using the *`ActivityLogger`* API, which works for scoped or global applications. Logged data from the script appears in the **Workflow Log** related list in the context records for any workflow that uses the activity. The **Source** for these messages in the workflow log is **ACTIVITY**.

Important:
To display the debug messages in the workflow log, set the *`glide.workflow.log.debug`* property to **true**.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info ("Pre Processing Log Message");`
- `ActivityLogger.warn ("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Template post-processing fields

From the **Post Processing** form in the activity designer you can define a script to run after the activity executes.

Post-processing fields

To use the results returned by the activity, append the `executionResult.` prefix to these parameters.

Field	Description
Output process script	Script to run after the activity executes.
Variables	Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the **Inputs** form. All activity variables added in the **Inputs** form are read-only and are expressed in the post-processing script with this syntax: `activityInput.variable`. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.

Logging

Activity designers can add logging to the post-processing script using the *`ActivityLogger`* API, which works for scoped or global applications. Logged data from the script appears in the **Workflow Log** related list in the context records for any workflow that uses the activity. The **Source** for these messages in the workflow log is **ACTIVITY**.

Important:
To display the debug messages in the workflow log, set the *`glide.workflow.log.debug`* property to **true**.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info ("Post Processing Log Message");`
- `ActivityLogger.warn ("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`

Auto-map activity output variables

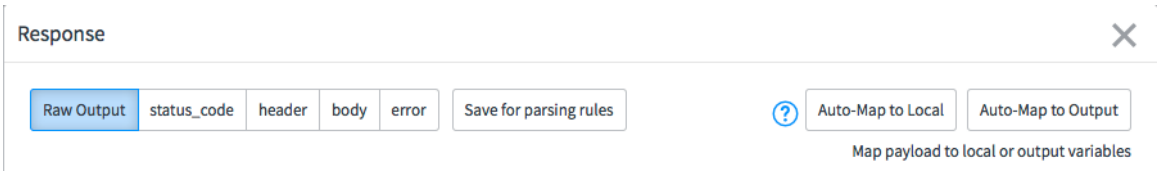
You can map parameter values in a test payload to variables in the **Outputs** tab automatically.

Before you begin

Role required: admin

Procedure

1. From the Execution Command in the template, select the **Inputs** tab.
2. Click **Test Inputs** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.



4. Select an auto-mapping option.

Option	Description
Auto-Map to Local	Translates the entire payload into a JSON object and places it in the data bus. This al lows for post-processing manipulation in JavaScript. This selection causes the entire data field on the right to disappear and the inputs structure to be auto-populated with these default variables: ○ output ○ totalRows ○ errorMessage ○ eccSysId

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Auto-Map to Output	Automatically populates the output variables in the activity with the same default variables used as inputs for the local variable.

Note:
No parsing rules are available with auto-mapping selections.

Create an output variable

The **Outputs** form in the designer contains a variable builder for creating data structures of objects and arrays.

Before you begin
Roles required: activity_admin, activity_creator

About this task
Elements in this structure are mapped with Create a parsing rule to specific data contained in payloads returned from an endpoint or host. These variables and their values are then made available locally or for reuse in other activities.

Procedure

1. Click the **+** icon in the **Outputs** column to create a local or output variable.

   Local variables are only available within an activity and are not visible in the data structures displayed in the **Custom** tab. Output variables are available for reuse in other activities, either individually or as an entire data structure. When you create a new variable of either type, the designer provides a default name of **Local1** or **Output1**.

2. Type your new variable name in the field and select a data type.

   Variable names must be unique within an array or an object. You can assign a data type of **Encrypted** to output variables that contain sensitive data. Data protected by encryption is passed to other activities or processes encrypted and is never displayed in plain text.

3. To change the name of a variable or any of its attributes, double-click the value, type a new value in the editing field, and then press **Enter**.

   The icon to the left of the name reflects the data type of the variable.

4. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon ( ).

5. Drag the row into another location.
6. Choose from the following options.
   - To reuse a variable from another activity, drag it from the **Custom** tab in the palette to the **Local** or **Output** heading at the top of the variable list.
   - To copy an entire data structure, drag the parent object or array into the variable list header.

   The designer duplicates the copied data structure in the outputs variable builder.

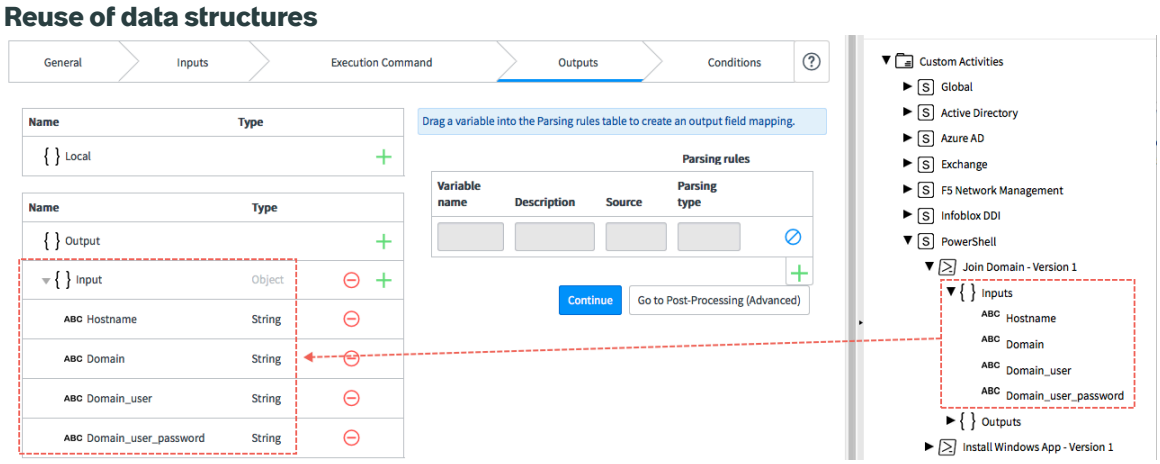
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. To delete a variable, click the delete icon ( ) in the row.

Activity designer template outputs

Output variables contain messages returned from a destination that are available to other activities in a workflow or internally to the activity.

Activity designer output fields

Field	Description
Variable name	Name of a variable, either **Local** or **Output**, that this activity passes.
Local	Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.
Output	Variable that contains a value that is passed to other activities in the workflow.

Map an output field

Mapping is configured with parsing rules that allow you to build expressions in the appropriate data format for the selected payload.

Before you begin

Role required: activity_admin, activity_creator

About this task

When you are finished creating the output data structure, map each variable to the specific data you want to extract from the target host.

Procedure

To map a variable, drag it from the **Outputs** variable builder and drop it into an empty **Variable name** field in the Parsing rules section.

See create a parsing rule for instructions on configuring parsing for output variables.

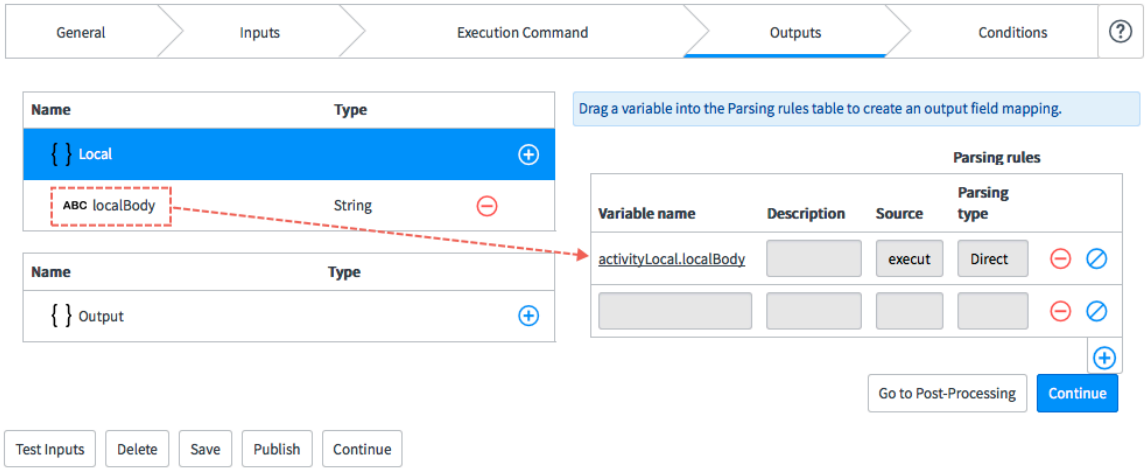
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create a parsing rule

Populate output variables defined in a custom activity with payload data returned from an inputs test on an external host or endpoint.

Before you begin

Roles required: activity_admin, activity_creator

About this task

Procedure

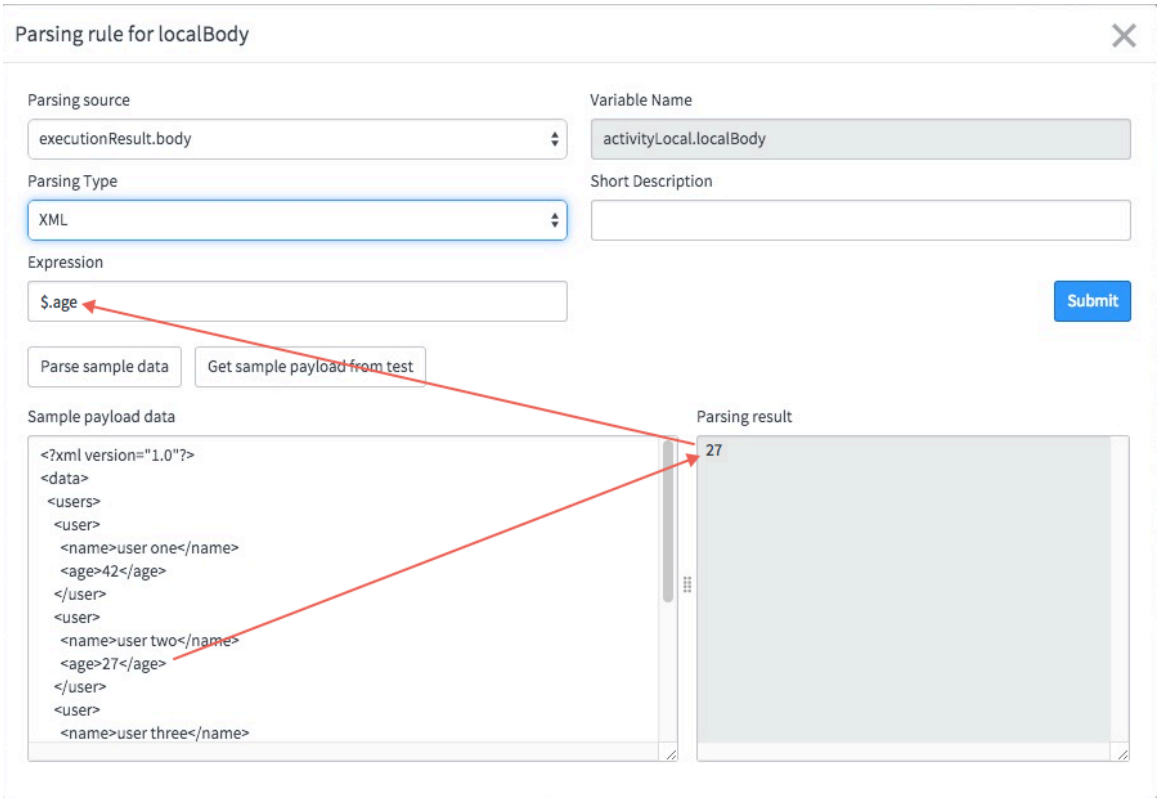
1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. From the **Custom** tab in the palette, open a custom activity.
3. In the Activity Designer form, advance to the **Output** stage.
4. Drag an output variable from the data structure builder into the **Variable name** field in the **Parsing rules** builder.

Mapping variables to parsing rules

   The parsing rules form appears for the selected variable. By default, the parsing type is set to **Direct**, which populates the variable with all the data from the selected payload, without parsing the contents. Each template has a specific default parsing source.

5. Complete the form using the fields in the table.
   In this example, the parsing type selected is **XML**, which allows you to select specific parameters from the payload to parse.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Parsing rules fields

Field	Description
Parsing source	Source of the data returned from the target host or endpoint. Each template opens to a specific, default payload. Available choices depend on the execution template selected for the activity. You can also use local variables as a parsing source if a parsing rule has previously been defined for them. For a list of the available payloads for each template, see Activity designer parsing sources.
Expression	Expression used to extract specific data from the selected parsing source. This expression is created from clickable data in the sample payload and appears in the format selected in the **Parsing type** field. When testing, the expression can return multiple results. Discern which choice gives reliable or predictable results before choosing your expression. **Note:** The system cannot generate clickable **RegEx** expressions from sample data. You must write all regular expressions manually.
Variable name	Revised variable name as it is used in the final output expression. The system adds the **activityOutput** or **activityLocal** prefix to the variable you specify.
Parsing type	The language to use for querying the target host's payload. The selections are: ○ **Direct**: Maps to the entire content of the payload selected in the **Parsing source** field, without any parsing. This is the default parsing type. ○ **XML**: XPath query used for selecting nodes from an XML payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **JSON**: JSONPath query for selecting parts of a JSON payload. ○ **RegEx**: Parsing method that uses a regular expression to extract data from a payload. The RegEx parsing type does not support multi-line parsing and is not case sensitive.
Short description	Brief description of this parsing rule.
Sample payload data	Sample data from the source containing the data requested. This field is not available for **Direct** parsing types. After you click **Parse sample data**, the data in this field cannot be edited, but becomes clickable for the purpose of creating expressions. Click **Edit sample data** to make the field editable again.
Parsing results	Displays the data returned from the source by the selected expression. This field is not available for **Direct** parsing types.

6. To retest the inputs, click **Get sample payload from test**.
   This action reopens the test form, allowing you to substitute different test values and create a different payload.
7. Click **Save** to have the parsing rules overwrite the previous payload with the one you just created.
8. To create an expression for the parsing rule, click the specific parameter you want to see in the sample payload.
   The value for that parameter appears in the **Parsing result** field, and the system creates the appropriate expression in the **Expression** field.
9. Click **Submit** to save the parsing rule for that variable.

Activity designer parsing sources

This table lists the parsing sources available with each execution template.

Parsing sources

Template	Source
SOAP Web Service	• executionResult.body (Default) • executionResult.status_code • executionResult.header • executionResult.error
JDBC	• executionResult.output (Default) • executionResult.errorMessages • executionResult.probeCompletedEccId • executionResult.totalRows
JavaScript Probe	• executionResult.payload (Default) • executionResult.output

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parsing sources (continued)

Template	Source
	• executionResult.eccSysId • executionResult.errorMessages
Powershell	• executionResult.output (Default) • executionResult.tags • executionResult.hresult • executionResult.eccSysId • executionResult.errorMessages
REST Web Service	• executionResult.body (Default) • executionResult.status_code • executionResult.header • executionResult.error
SFTP	• executionResult.output (Default) • executionResult.eccSysId • executionResult.errorMessages • executionResult.tags
Probe	• executionResult.output (Default) • executionResult.payload • executionResult.eccSysId
SSH	• executionResult.output (Default) • executionResult.eccSysId • executionResult.errorMessages • executionResult.tags
JMS	• executionResult.status • executionResult.standardHeaders • executionResult.customHeaders • executionResult.messagePayload • executionResult.eccSysId • executionResult.errorMessages

Activity designer parsing rule example

In this example, the parsing rule is configured to populate the *activityOutput.ipv4* variable with the value for the IP address from a domain server, using PowerShell.

Before you begin

Role required: activity_creator, activity_admin

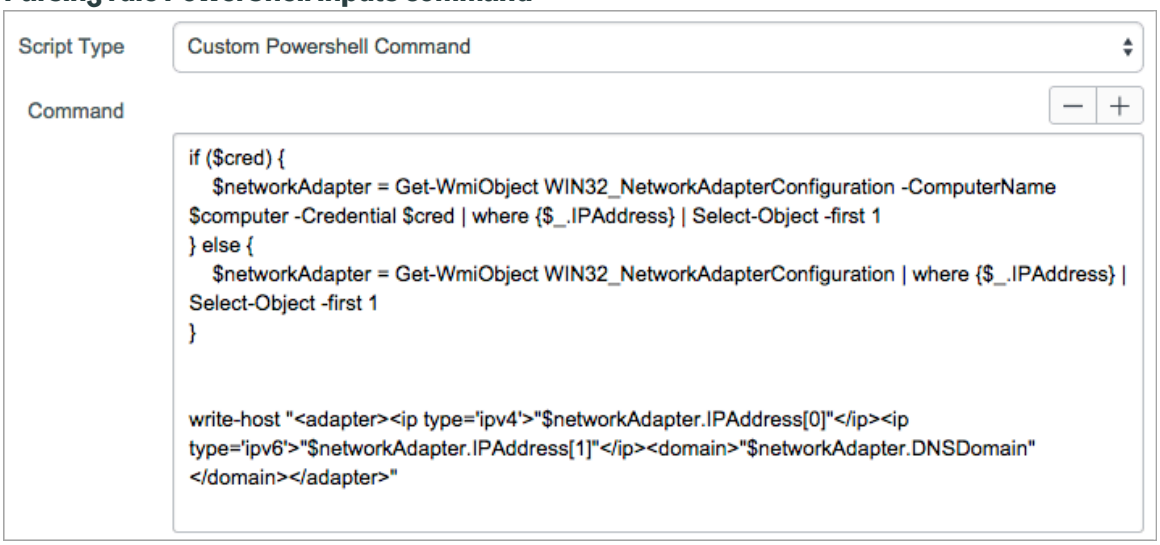
About this task

To generate the sample data, the administrator must actually run the command on the host and then paste the data returned into the **Sample payload data** field when creating the parsing rule. The administrator can then create an expression that returns IP addresses from that sample in two formats: `ipv4` and `ipv6`. In this example, the system produces two expressions to use for the parsing rule.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor** and open the activity that runs on the host.
2. Click the **Inputs** tab, and note the **Command**.

Parsing rule PowerShell inputs command



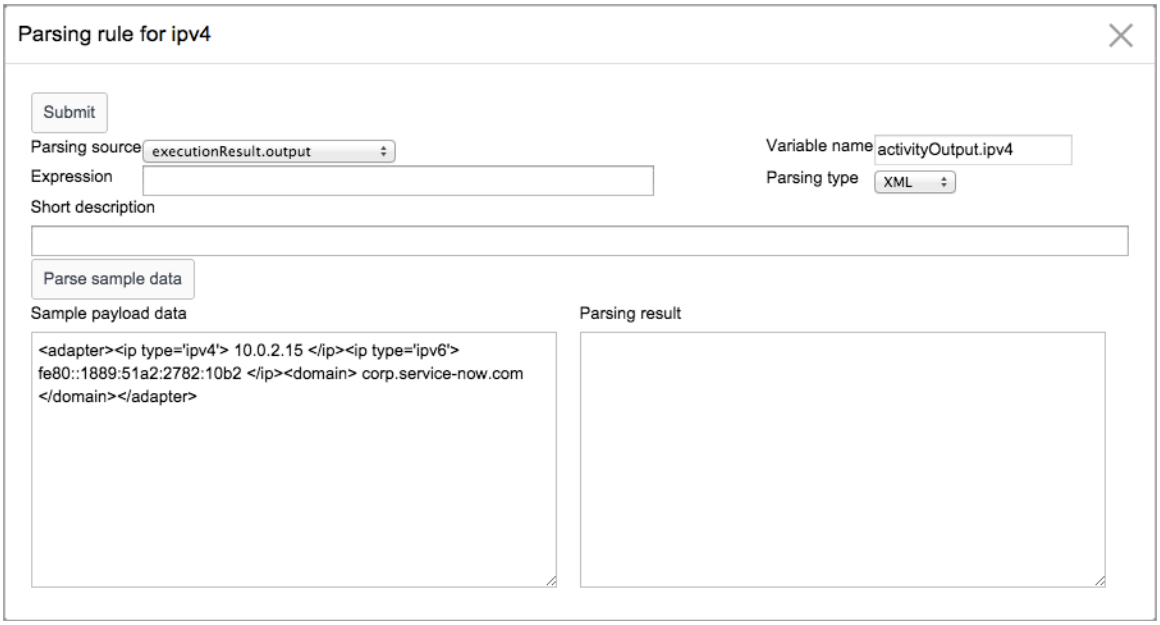
3. In a PowerShell console, run the **Command** on the host to extract the XML sample that contains the values you need.
4. Copy the data that is returned to the clipboard.
5. In the activity designer, click the **Outputs** tab and paste the returned data into the **Sample payload data** field.

   In this example, the data includes IP addresses in two different formats and the domain name.

6. Select the parsing type for the source.

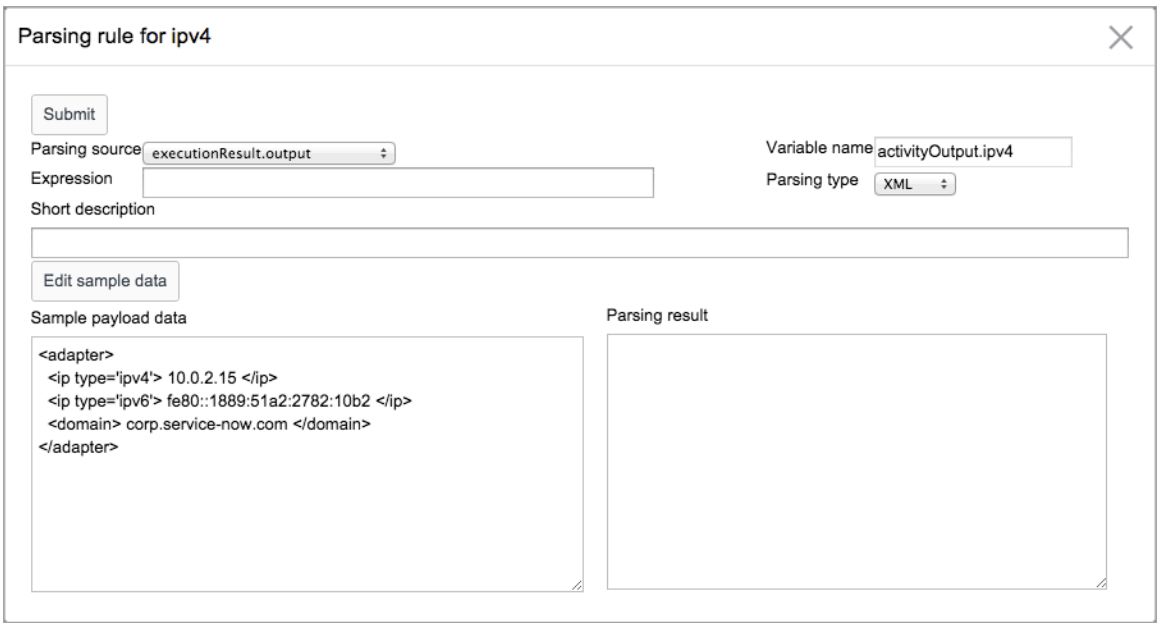
   Example
   In the following example, you would select **XML**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Click **Parse sample data**.

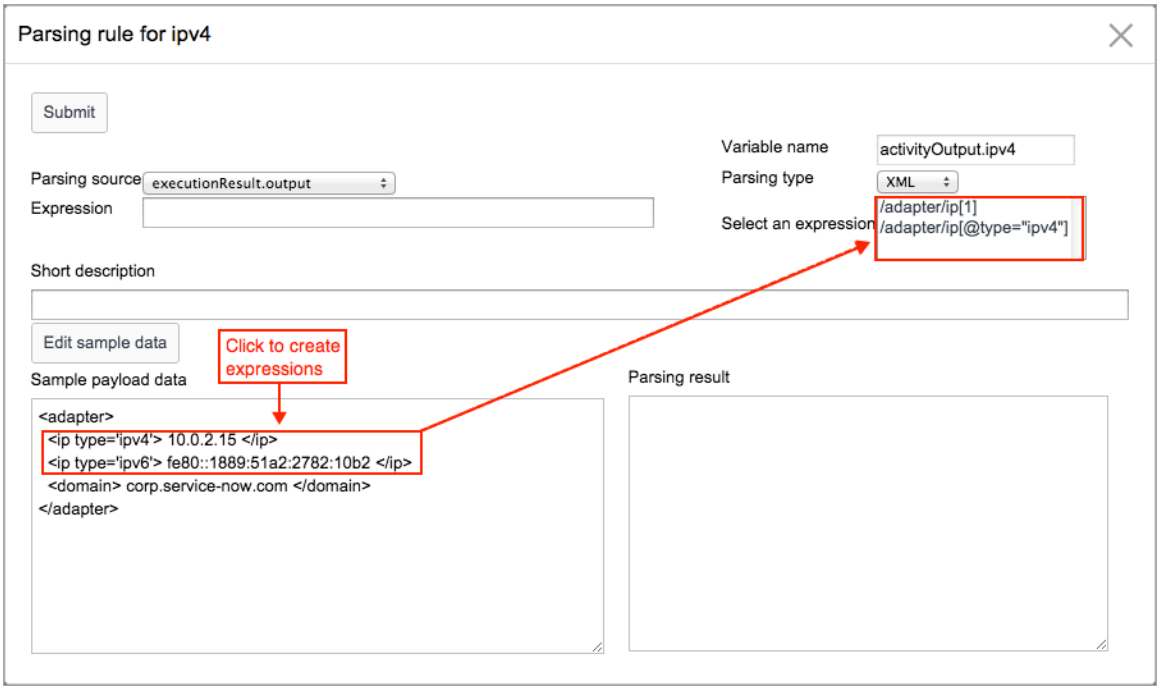
   The system displays the XML in the proper format, and it becomes clickable. In this view, the system can translate clicked data from the sample into an expression.



8. To create the expression, click the elements in the data sample you want to map to the variable.

   Based on the sample data you clicked, the system creates two expressions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



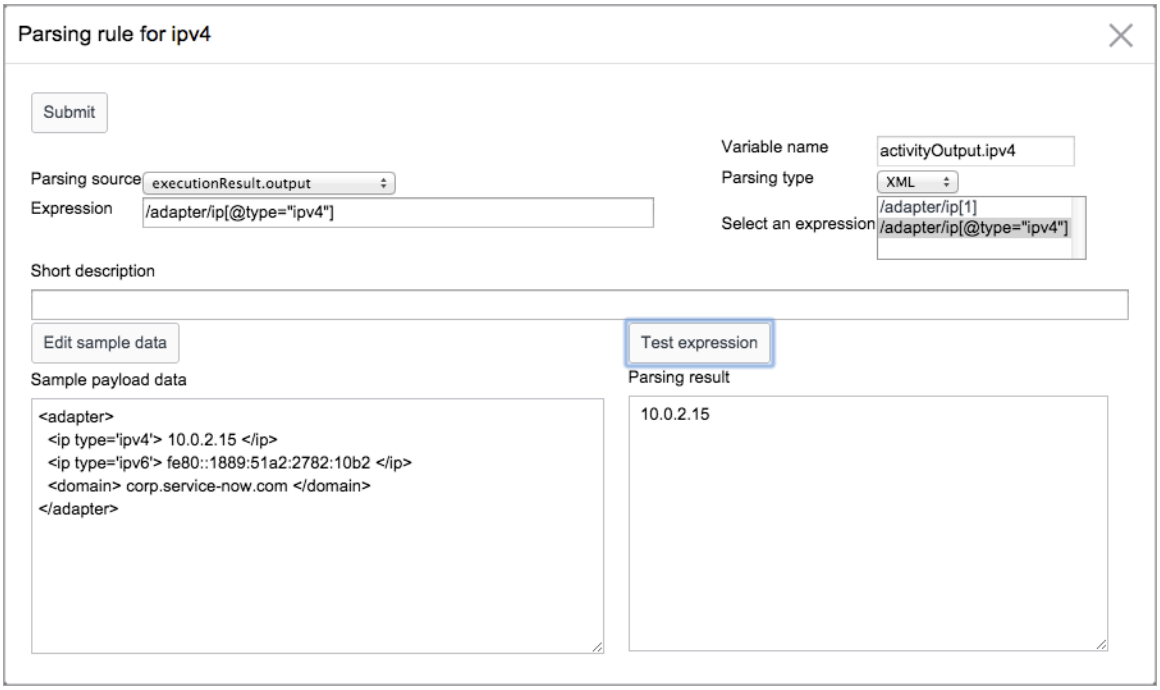
9. Select an expression from the list.

The desired result is the IP address that has a **type** attribute of **ipv4**. The system populates the **Expression** field with this choice.

10. Click **Test expression**.

The system parses the payload using the selected expression and returns the requested data in the **Parsing result** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. Click **Submit**.

The view returns to the **Outputs** tab of the activity designer. The new parsing rule is listed, and a blank row is available for another rule.

Activity conditions

Create the exit conditions for your activity in the **Condition** column and set the order for each..

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an **Else** value set to **true** until all conditions with an **Else** value set to **false** are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for **Else** is **true** and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

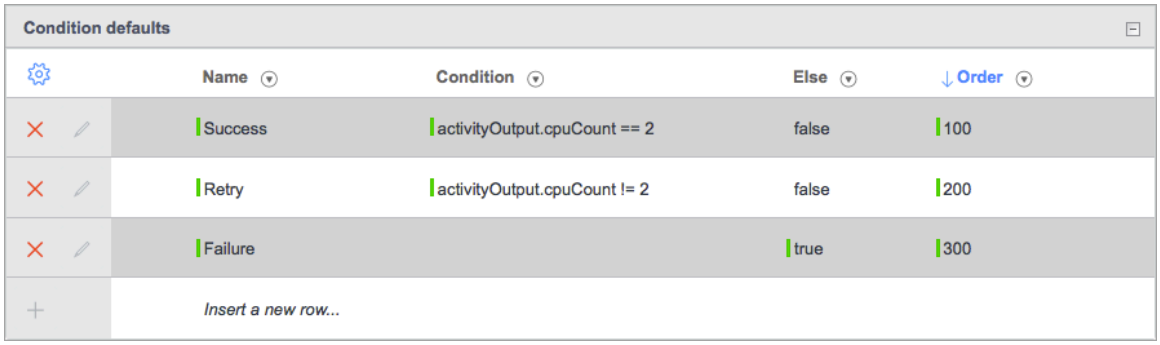
Sample activity conditions

Condition	Evaluation
Success	Tests for a success condition. **Else** is set to **false** and the **Order** is set to **100**. If this condition is true, the activity takes the **Success** exit. If this condition is false, the system evaluates the next condition in order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample activity conditions (continued)

Condition	Evaluation
Retry	Tests for a condition that runs the activity again. **Else** is set to **false**. If this condition is true, the activity runs again. If this condition is false, the system takes the default **Failure** exit.
Failure	Default condition that allows the workflow to continue if the other conditions in the activity are false. **Else** is set to **true**.



Orchestration custom activity templates

Orchestration provides customizable activity templates to create and manage custom activities in the Workflow Editor.

You create and update different types of Orchestration activities with the Activity Designer using activity templates for SSH, PowerShell, REST, SOAP, JMS, SFTP, JDBC, JavaScript Probes, and Probes.

Hundreds of workflows can share these activities simultaneously. Before you change an activity, you should check the workflows that they are part of by clicking the form menu icon (☰) and selecting **Used In**. Any central change to a versioned activity automatically updates across workflows unless you have pinned that activity.

All the Orchestration Core activities are built using the Activity Designer in scoped applications. Custom activities can be developed in the global scope or their own application scope even if that scope is different from the scope of the workflow. Use Activity scoping when build your own activity packs.

Create a JDBC activity

Create a custom JDBC activity to automate SQL commands and stored procedure calls to relational databases from workflow.

Before you begin

Role required: activity_admin, activity_creator

About this task

The JDBC activity template allows you to execute ANSI SQL statements or stored procedures on a target database. Support for stored procedures with IN, OUT, and INOUT parameters are available in Yokohama. To learn how to set up these parameters, see JDBC stored procedure parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you are transferring bulk data into a ServiceNow instance from an external data source, use Import sets key concepts. The JDBC activities allow you to transfer data between external data sources and ServiceNow within a workflow. It is not intended to replace the bulk import features of data sources.

Procedure

1. Create or verify your JDBC credential.
   Your JDBC credentials must have permission for the target database and proper configuration for the corresponding JDBC connection. Credentials must be set up before you can create a JDBC activity.
2. Create or verify your JDBC connection.
   Your JDBC connection must be configured with valid JDBC credentials set up before you can create a JDBC activity.
3. Create a custom activity.
   This action creates a custom activity using a template.
4. After setting up general properties and creating input variables, configure the JDBC Execution Command.

Option	Description
JDBC Connection	Configure or reference the appropriate JDBC Connection for the database. The connection selected provides the activity with the following information: ○ Target database information (server and database names) ○ Connection URL ○ Target database port (if different from standard port number) ○ Database instance name
Credential	JDBC credential to use for your JDBC connection.
SQL statement	Input the ANSI SQL to execute on the JDBC target database. **Note:** This field is hidden when the Stored Procedure check box is selected. You can map the input variables you created to configure the SQL statements. By default, you can run the following SQL statements. ○ select ○ insert ○ update ○ delete ○ show

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	○ create ○ describe For added security measure, a MID Server property controls the operations that this JDBCOrchestrationProbe executes, which restricts the SQL commands used. This property protects against potentially destructive commands, such as drop database. The mid.property.jdbc_operations contains the MID Server property controls. **Note:** You cannot run multiple statements of different types. For example, you cannot run a select statement and an update statement together, but you can run two insert statements. However, you cannot run multiple select statements in this activity.
Maximum rows	Maximum number of records to retrieve from database. The default is 1000.
Maximum payload size (KB)	You can set a limit on the maximum payload size of data retrieved from the database. The default is 64 kilobytes.
Connection timeout	How long the activity waits to make the connection. This field is populated automatically from the data source, but can be changed for this activity.
Query timeout	Elapsed time to wait after running the query until the data is returned. This field is populated automatically from the data source, but can be changed for this activity.
Required MID Server capabilities	MID Server to use for querying JDBC, by capabilities. By default, the system selects a MID Server that has JDBC capability.
Use stored procedure	If checked, you can run a stored procedure on MySQL, Oracle, or SQL Server databases by entering the procedure name and parameters. See JDBC stored procedure parameters.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Test JDBC activity inputs
- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Related topics

Create custom activities using custom activity designer templates

Create a JDBC connection for an Orchestration activity

The JDBC Connection [jdbc_connection] table provides the information custom JDBC Orchestration activities use to connect to various target databases.

Before you begin

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Note:
The ServiceNow instance supplies `mysql-connector-java-5.1.21.jar`, `sql-server-jdbc-4.0.jar`, and `ojdbc6.jar` files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: activity_admin, activity_creator

About this task

JDBC credentials JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

Procedure

1. Navigate to **All** > **Orchestration** > **Credentials & Connections** > **JDBC Connections** and click **New**.
2. Complete the form using the fields in the table.
   The database selection in the **Format** field determines which fields are available.

JDBC connection fields

Field	Database Format	Description
Name	All	Unique name of this JDBC connection. For example, you might enter **JDBC MySQLProd**.
Query timeout	All	Maximum elapsed time the JDBC query is allowed to run without a response.
Connection timeout	All	Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.
Application	All	Scope for this table. By default, the JDBC Connection [jdbc_connection] table runs in the **Global** scope.
Domain	All	Domain for this table. By default, the JDBC Connection [jdbc_connection] table runs in the **global** domain.
Format	All	Database type for this connection. The default choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Database Format	Description
		○ **MySQL** ○ **Oracle** ○ **SQLServer** ○ **None** You can add **Sybase** or **DB2 Universal** to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list.
Server	Oracle, MySQL, SQLServer	Host name or IP address of the database server.
Oracle sid	Oracle	The Oracle database site identifier. The default value is **orcl**.
Oracle port	Oracle	Port that the Oracle database is using. The default value is **1521**.
Database name	MySQL, SQLServer	Name of the database.
Database port	My SQL, SQLServer	Port that the selected database is using.
Instance name	SQLServer	Instance name for the selected SQLServer
Connection URL	All	URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. **Note:** If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.
JDBC driver	None, DB2 Universal, Sybase	The JDBC driver to use for this connection when it is not a default database. **Note:** If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.

© 2026 ServiceNow, Inc. All rights reserved.

JDBC credentials

Auto-map JDBC activity output variables

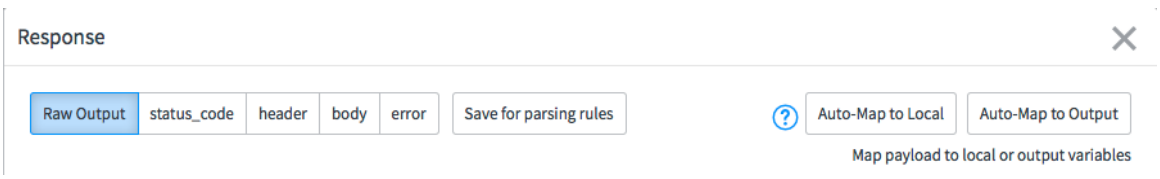
The ServiceNow activity designer allows you to map parameter values in a JDBC test payload to variables in the **Outputs** tab automatically.

Before you begin

Role required: admin

Procedure

1. In the JDBC provider template form, select the **Inputs** tab.
2. Click **Test Activity** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.



4. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JDBC stored procedure parameters

You can use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases.

There is support of multiple data types, with the following limitations:

- Only one result-set is returned.
- The order of input and output data types in the stored procedure parameters must match the activity definition.
- Binary, Blob, Varbinary, and LongBinary should be base64 encoded.
- Date, Time, and Timestamp have a specific format:

  Date format: yyyy-mm-dd

  yyyy-mm-dd is the supported format.

  Time format: hh:mm:ss[.sss]

  hh:mm:ss[.sss] is the supported format. Precision is in milliseconds only, microseconds or nanoseconds cannot be handled.

  Note:
  `10:30:59` and `10:30:59.999000` are correct, but `10:30:59.` is incorrect.

  Timestamp format: yyyy-mm-dd hh:mm:ss[.ffffff]

  yyyy-mm-dd hh:mm:ss[.ffffff] is the supported format. Precision is to microseconds.

- ResultSet is the first result set coming back from database server.
- MS-SQL does not support INOUT parameters. If you use INOUT parameters, the Activity Template transparently maps them to OUT parameters.

Note:
If you do not want to do a validation of data types in stored procedure parameters, like the legacy behavior, you set the glide.stored_proc.data_type.validation as false. See MID Server properties for more information.

Stored procedure parameters

Field	Description
Mode	Type of stored procedure parameter. Supported parameters: • IN • OUT • INOUT
Sql Type	A SQL data type. Supported data types: • ARRAY • BIGINT • BINARY • BIT

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stored procedure parameters (continued)

Field	Description
	• BLOB • CHAR • CLOB • DATE • DECIMAL • DISTINCT • DOUBLE • FLOAT • INT • INTEGER • JAVA_OBJECT • LONGVARBINARY • LONGVARCHAR • NULL • NUMERIC • OTHER • REAL • REF • REF_CURSOR • SMALLINT • STRUCT • TIME • TIMESTAMP • TINYINT • VARBINARY • VARCHAR
Name/Value	Name-value pairs to pass to the host. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.

Note:
Not all database providers support the entire realm of JDBC data types. Reference your database reference manual to understand the supported datatypes for your installation.

Test JDBC activity template inputs

You can test the input parameters of a custom JDBC activity during its development without having to run the activity in a workflow context.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields. Role required: web_service_admin, activity_admin, activity_creator

About this task

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

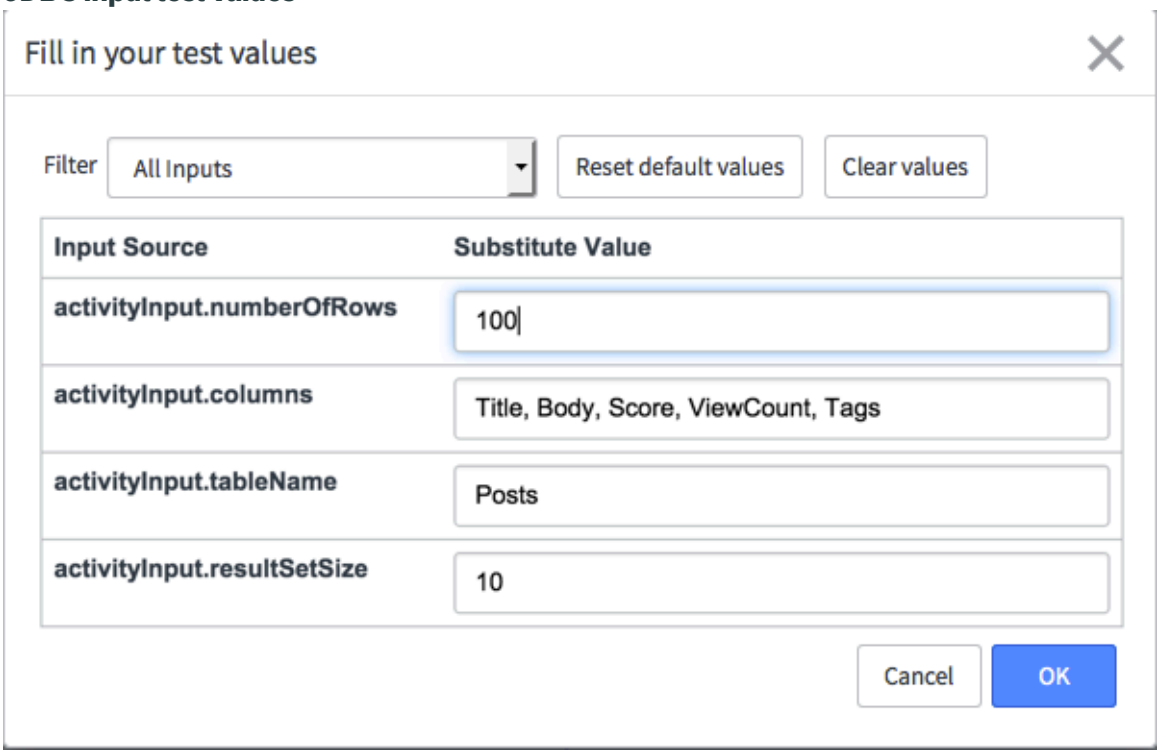
Note:
If you provide enough information for Orchestration to contact the endpoint or host and return data, you can test the input variables. You can test from any stage in the activity designer. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

Procedure

1. From the JDBC Execution Command, click **Test Inputs**.
   The list of input source variables appears. If you added default values for these variables, those values appear in the **Substitute Value** column. Mandatory variables are marked with a red star.

   Note:
   The test fails if the MID Server cannot be found or if it cannot connect to the target.

   JDBC input test values

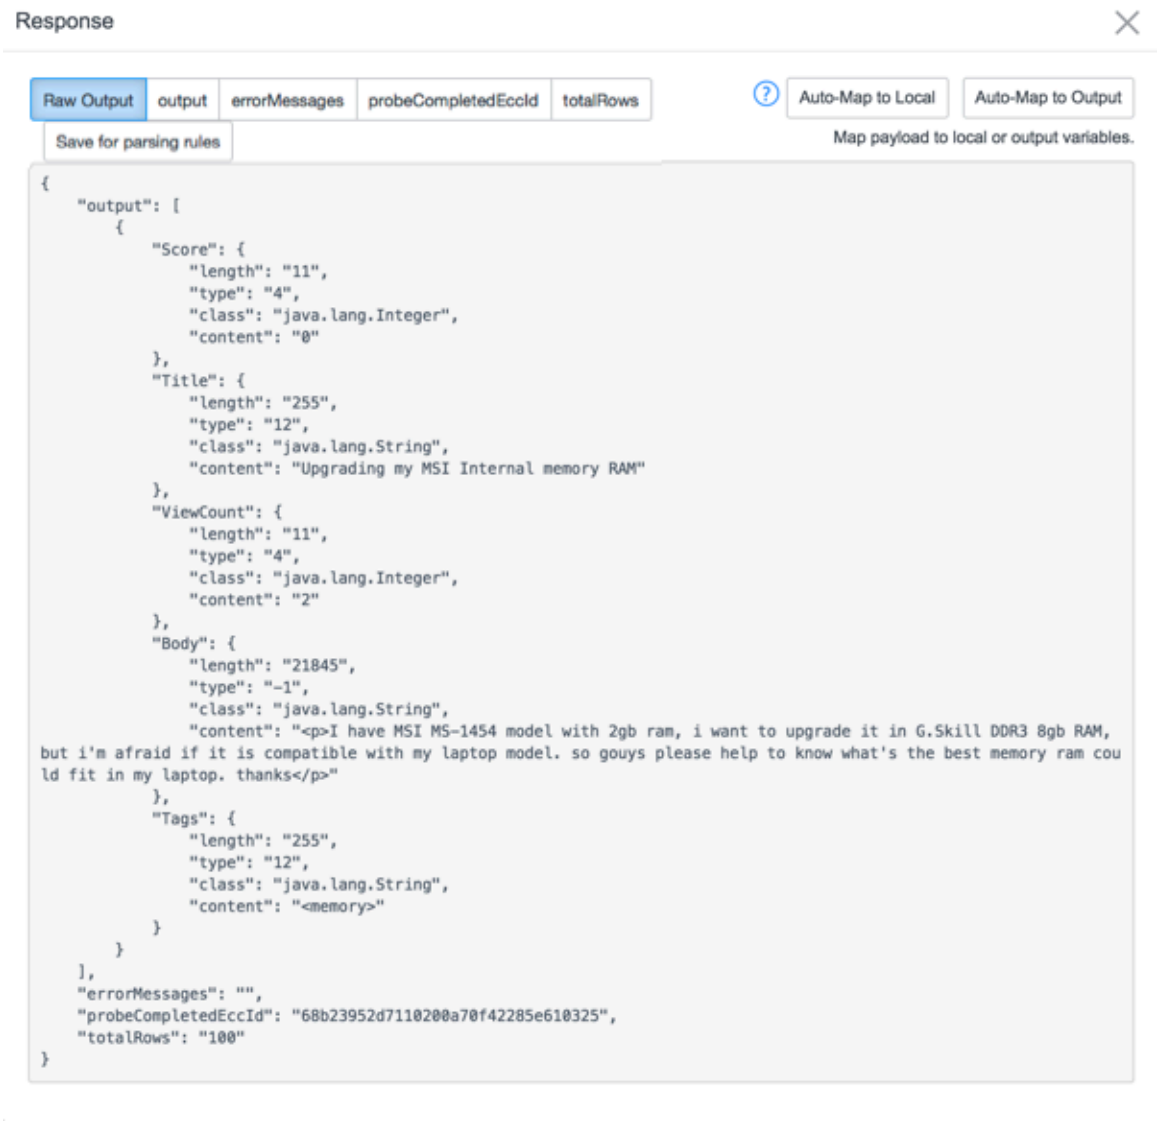
2. Filter the variable list with these controls:
   - **All Inputs**: Displays all input variables. This control is the default view.
   - **Mandatory Inputs**: Displays only mandatory variables.
   - **Inputs Without Defaults**: Shows input variables that do not have assigned default values.
3. Reset values as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Reset default values**: If values are present, this control replaces any test values set in this form with the default values.
- **Clear values**: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.

Response payload from inputs test



5. To map appropriate parameter values in the payload to variables in the **Outputs** stage automatically, select an auto-mapping option.
6. Click the **X** in the upper right corner of the window to close it.

Create a SOAP web service activity

Use this template to create a custom SOAP activity.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For instructions on using the activity template process flow, see create custom activities.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the SOAP web service Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes on the SOAP web service.
Web service message	Specify the SOAP web service message to use for this activity. If you need information on SOAP web services messages, see SOAP
Web service message function	Specify the SOAP message function available in conjunction with the SOAP web service.
Endpoint	If you enter an endpoint in this field, it over rides the endpoint URL configured in the SOAP message web service. Click the lock icon to open the input field and add the end point.
SOAP message parameters	Name-value pairs to pass to the SOAP end point. You can create these parameters man ually, or drag input variables into the parame ter fields and then assign a value. Parameters defined in the SOAP message that use ${ } can be assigned data from this activity tem plate. Use the **Additional attribute** column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The **Name** column is auto-populat ed if the users have provided variables using Variable substitution in outbound REST mes in the SOAP message.
Use MID Server	Check box that determines if a MID Server must be used to invoke the SOAP web ser vice. If the SOAP web service message func tion defines a MID Server, that MID Server is used instead of the one selected here.
Required MID Server capabilities	MID Server with the appropriate MID Server for connecting to the SOAP end point. By default, the system selects a MID Server with SOAP capabilities. This field is available when the **Use MID Server** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Timeout	Allowed duration of the SOAP web service request before it times out, in seconds. The default is **10**.
Authentication	Determines what type of authentication is required for the endpoint. The options are: ○ **Use existing credentials in SOAP message**: Uses credential definitions from the SOAP message definition. ○ **Override with Basic Authentication credentials:** Uses |Enable basic authentication credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection. ○ **Override with Certificate Authentication credentials**: Overrides the credentials in the SOAP message definition with certificate authentication credentials. ○ **Override with Both Basic and Certificate Authentication credentials**: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials. ○ **Override with WS-Security Username profile**: Overrides the credentials in the SOAP message definition with credentials defined in WS-Security.
Credentials	Required REST endpoint basic authentication credentials. This field is available when **Override with Basic Authentication credentials** is selected in the **Authentication** field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, *newsafe:orch-test-f5*. See Configure for details.
Protocol Profile	Outbound web services mutual authentication to use for authentication. This field is available when the authentication type is either **Override with Certificate Authentica**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	tion credentials or **Override with Both Basic and Certificate Authentication credentials**.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next

- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Auto-map SOAP activity output variables

The ServiceNow activity designer allows you to map parameter values in a SOAP test payload to variables in the **Outputs** stage automatically.

Before you begin

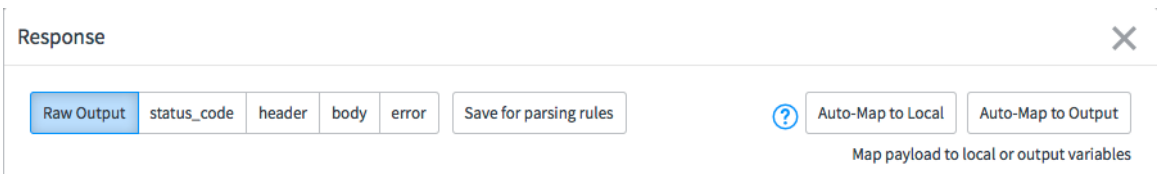
Role required: web_service_admin, activity_admin, activity_creator

About this task

Note:
You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

Procedure

1. In the activity designer, proceed to the **Execution Command** stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click **Test Activity** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.



5. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide credentials to access a SOAP message WSDL

If the SOAP WSDL you are requesting in a test payload requires authentication, you must provide basic auth credentials in either the SOAP message or the SOAP activity.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

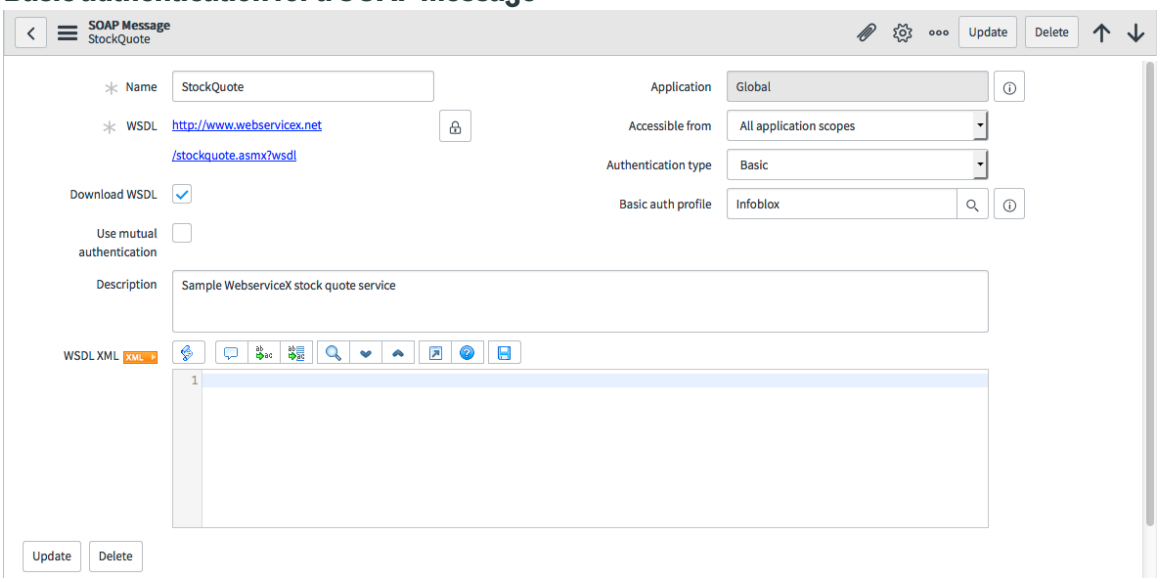
The ServiceNow instance only supports basic auth credentials for accessing a WSDL. If the SOAP function or the SOAP message does not provide these credentials, you must configure them in the SOAP activity template. Orchestration uses these priorities for deciding which basic authentication credentials to use:

- SOAP message: Credentials for a SOAP message are used if no other credentials are defined.
- SOAP function: Credentials for a SOAP function override the credentials configured for the SOAP message.
- SOAP activity template: Credentials for a SOAP activity template override both the SOAP function and SOAP message credentials.

Procedure

1. Navigate to **All** > **System Web Services** > **Outbound** > **SOAP Message**.
2. Select the SOAP message you want the activity to use.
3. In the SOAP Message record, select the **Download WSDL** check box.
4. In the **Authentication type** field, select **Basic**.
   The **Basic auth profile** field appears.
5. Select the basic auth profile to use with this SOAP message.

Basic authentication for a SOAP message



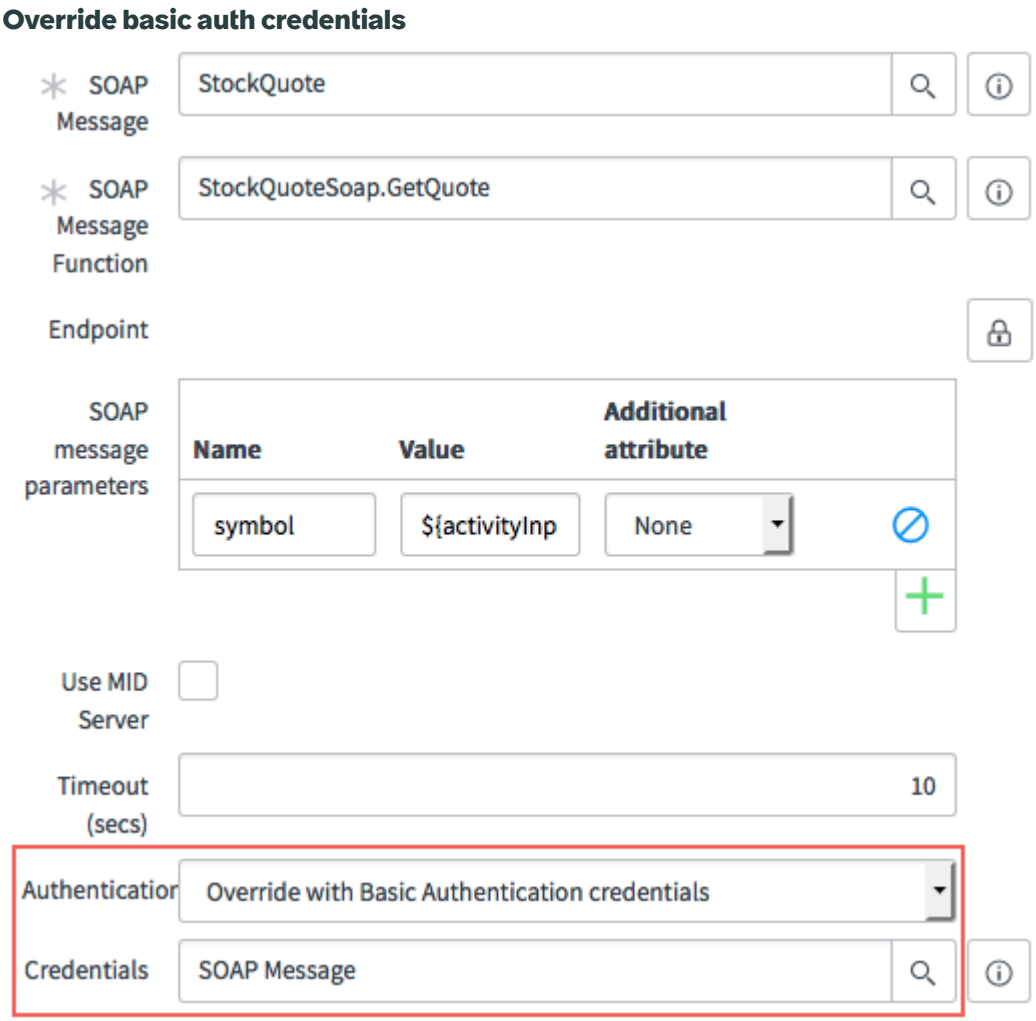
6. Alternately, you can configure basic authentication credentials in Configure the SOAP execution command.

   a. In the **Authentication** field, select **Override with Basic Authentication credentials**.
      The **Credentials** field appears.

   b. Select the basic auth credentials to use to access the WSDL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This setting overrides any credentials configured in the SOAP message.



Configure the SOAP execution command

Use the input variables you created to configure the command that Orchestration executes on the SOAP endpoint.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: web_service_admin, activity_admin, activity_creator

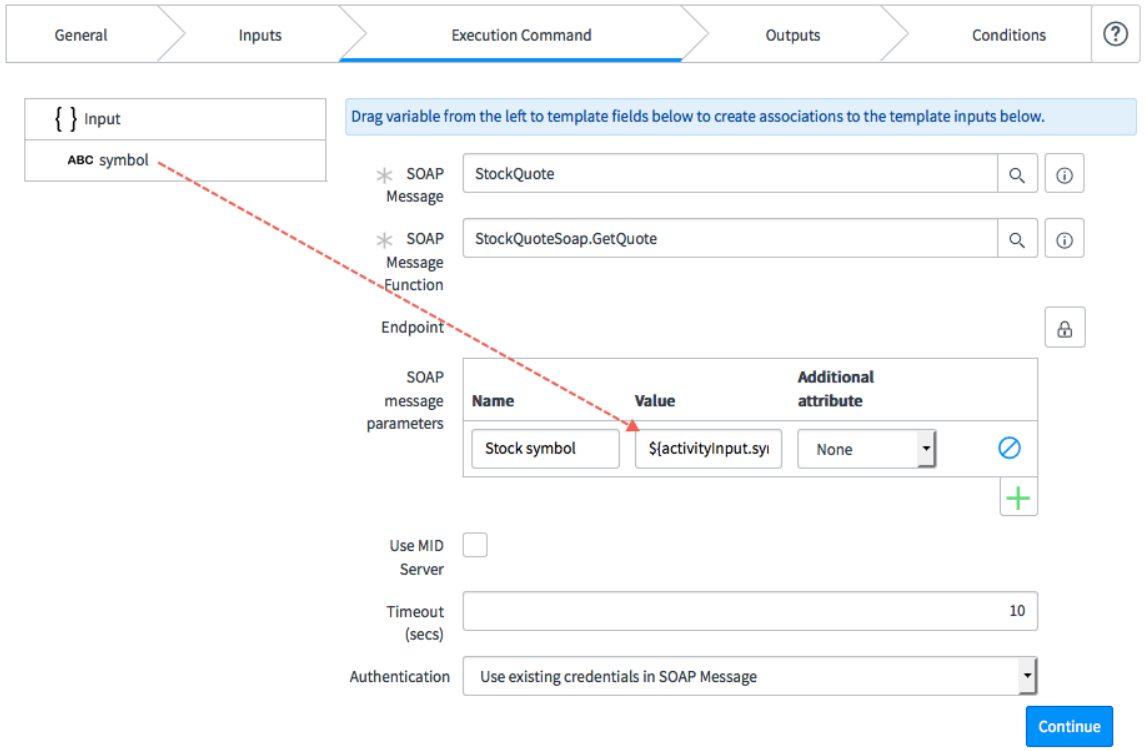
Note:
You can test the SOAP connection between the MID Server and the endpoint without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SOAP execution command



2. Complete the fields shown in the table.

SOAP template execution command fields

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
Web service message	SOAP message to use for this activity. Users must have the web_service_admin role to configure this field.
Web service message function	SOAP message SOAP message functions to use for this activity. Users must have the web_service_admin role to configure this field.
Endpoint	Endpoint URL for the SOAP web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the SOAP message. Click the lock icon to open the input field.
SOAP message parameters	Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use ${} can be assigned data from this activity template. Use the **Additional attribute** column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The **Name** column is auto-populated if the users have provided variables using Variable substitution in outbound REST messages in the SOAP message.
Use MID Server	Check box that determines if a MID Server must be used to invoke the SOAP web service. **Note:**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the **Use MID Server** check box is selected.
Timeout	Allowed duration of the SOAP web service request before it times out, in seconds. The default is **10**.
Authentication	Determines what type of authentication is required for the endpoint. The options are: ○ **Use existing credentials in SOAP message**: Uses credential definitions from the SOAP message definition. ○ **Override with Basic Authentication credentials:** Uses |Enable basic authentication for outbound SOAP credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection. ○ **Override with Certificate Authentication credentials**: Overrides the credentials in the SOAP message definition with certificate authentication credentials. ○ **Override with Both Basic and Certificate Authentication credentials**: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials. ○ **Override with WS-Security Username profile**: Overrides the credentials in the SOAP message definition with credentials defined in WS-Security.
Credentials	Required REST endpoint basic authentication credentials. This field is available when **Override with Basic Authentication credentials** is selected in the **Authentication** field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the Configure the MID Server for CyberArk defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, *`newsafe:orch-test-f5`*.
Protocol Profile	Outbound web services mutual authentication to use for authentication. This field is available when the authentication type is either **Override with Certificate Authentication credentials** or **Override with Both Basic and Certificate Authentication credentials**.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

SOAP template execution parameters

You use execution parameters to create the input process script in the **Pre processing** form of the activity designer.

For descriptions of the SOAP web service command fields, see the table in Configure the SOAP execution command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You must use the `executionParam.` prefix with all variables in this table.

SOAP execution parameters

Name	Variable	Type	Usage
Web service message	web_service_message	Reference	The sys_id of the corresponding SOAP message.
Web service message function	web-service_message_function	Reference	The sys_id of the SOAP message function.
Web service endpoint	web_service_endpoint	String	URL of the SOAP endpoint.
Parameters	parameters	Array of JavaScript objects	Array of JavaScript objects, expressed with the `executionParam.` prefix. For instructions on creating arrays using this parameter, see Create a JavaScript array in a SOAP template.
Use mid server	use_mid_server	Boolean	When true, indicates that a MID Server is used.
MidCapabilities	midCapabilities	String (comma separated)	List of references to required MID Server capabilities.
Time out	time_out	String	Allowed duration of the SOAP web service request before it times out, in seconds. The default is **10**.
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value: `var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`
Auth Type	auth_type	Boolean	Type of credentials to use. The choices are: • basic_auth_pick_credentials • use_existing_credentials
Credentials	credentials	Reference	Credentials to use for this SOAP message when the `auth_type` is `basic_auth_pick_credentials`.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a JavaScript array in a SOAP template

These are instructions for creating JavaScript arrays using SOAP execution parameters.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

About this task

To add more name-value pairs to the parameter's array, append the values to the existing array.

Procedure

1. Create a JavaScript object with the following syntax, and add it to the `executionParam.parameter` array:

```
var newParameter =
 {"name":"parameterName","value":"parameterValue","additional_a
ttribute":"none"};
executionParam.parameters.push(newParameter);
```

   By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the **Additional attribute** column in the **SOAP message parameters** input field to **Do not escape text**.

   In this case, the system does not escape the value specified for the **value** attribute. An example of this is:

```
var newParameter =
 {"name":"parameterName","value":"parameterValue","additional_a
ttribute":"do_not_escape_text"};
executionParam.parameters.push(newParameter);
```

   Note:
   If the value for the **additional_attribute** field is **None**, then the system escapes the value specified by the **value** attribute. In the first example, `parameterValue` is escaped.

SOAP template post-processing parameters

Use these parameters to create a post-processing script.

Activity designer post-processing parameters

Name	Variable	Type	Usage
Status code	status_code	Integer	Contains the status code returned from the web service.
Header	header	Hashmap of JavaScript object	Contains the key value paired hashmap associated with the header values passed into the web service. You can access each value with `executionResult.header[keyName]`.
Body	body	String	Contains a string value representing the output from the SOAP message
Error	error	String	Returns the error string from the SOAP web service, unless there are no errors, in which case it returns**null**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Create a JavaScript Probe activity

Create a JavaScript Probe activity to instruct a MID server to execute server-side javascript.

Before you begin

Role required: activity_creator or workflow_admin

About this task

The JavascriptProbe activity has the same functionality as making 'Packages' calls into standard Java libraries. It allows you to have more control over the Java libraries on the MID Server. You can load your own JAR files on the MID Server and have the JavascriptProbe make Package calls into those java files.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the JavaScript probe activity Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes on the MID server.
Script type	Select the type of script to include. Available options are: ○ Custom JavaScript ○ MID Server script include
Script	Custom JavaScript to run with this probe. **Note:** This field is available when the **Script type** selected is **Custom JavaScript**.
MID Server script include	Script for the MID Server to run with this probe. **Note:** This field is available when the **Script type** selected is **MID Server script include**.
Select MID Server by host	MID Server on which the probe runs.
Required MID Server capabilities	MID Server to use, by capabilities.
Parameters	Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the **Parameters** fields and assign a value.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Finish creating your JavaScript probe activity by creating output variables, creating a parsing rule, or Conditions. Refer to the create custom activities topic to know your template options.

JavaScript probe template execution parameters

You use execution parameters to create the input process script in the **Preprocessing** form of the activity designer.

For descriptions of the JavaScript Probe command fields, see the table in Configure the JavaScript Probe execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

JavaScript template execution parameters

Name	Variable	Type	Usage
Script Type	script_type	Enumerated	Type of script to run. The possible types are: • custom_javascript_typ • mid_script_include_type
Script	script	String	Script that runs custom JavaScript when the **script_type** is **custom_javascript_type**.
Mid script include	mid_script_include	Reference	The sys_id reference associated with the MID Server script include to call, when the **script_type** is **mid_script_include_type**.
Source	source	String	Target host on which to run the script.
MidCapabilities	midCapabilities	String (comma separated)	List of required MID Server capabilities.
Parameters	parameters	Array of JavaScript object	Array of JavaScript objects, expressed with the `executionParam.` prefix. To add more name-value pairs to the **parameters** array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the `executionParam.parameter` array. This assigns additional parameters to the message: `var newParameter = {"name":"parameterName","value":"parameterValue"}; executionParam.parameters.push(newParameter);`
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are

© 2026 ServiceNow, Inc. All rights reserved.

JavaScript template execution parameters (continued)

Name	Variable	Type	Usage
			additional capabilities that are assigned by value, use this example to customize the MID Server selection: `var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`

JavaScript probe template post-processing parameters

Use these parameters to create a post-processing script.

JavaScript probe post-processing parameters

Name	Variable	Type	Usage
Payload	payload	String	Contains raw payload returned from the JavaScript Probe.
Output	output	String	Contains output data returned from the JavaScript Probe.
EccSysId	eccSysId	String	Contains the reference ID associated with the ECC Queue input message.
Error Messages	errorMessages	String	Contains the error messages returned from the JavaScript probe. If no error messages are returned, this value is null.

Configure the JavaScript Probe execution command

Use the input variables you created to configure the command that Orchestration executes on the JavaScript Probe target host.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

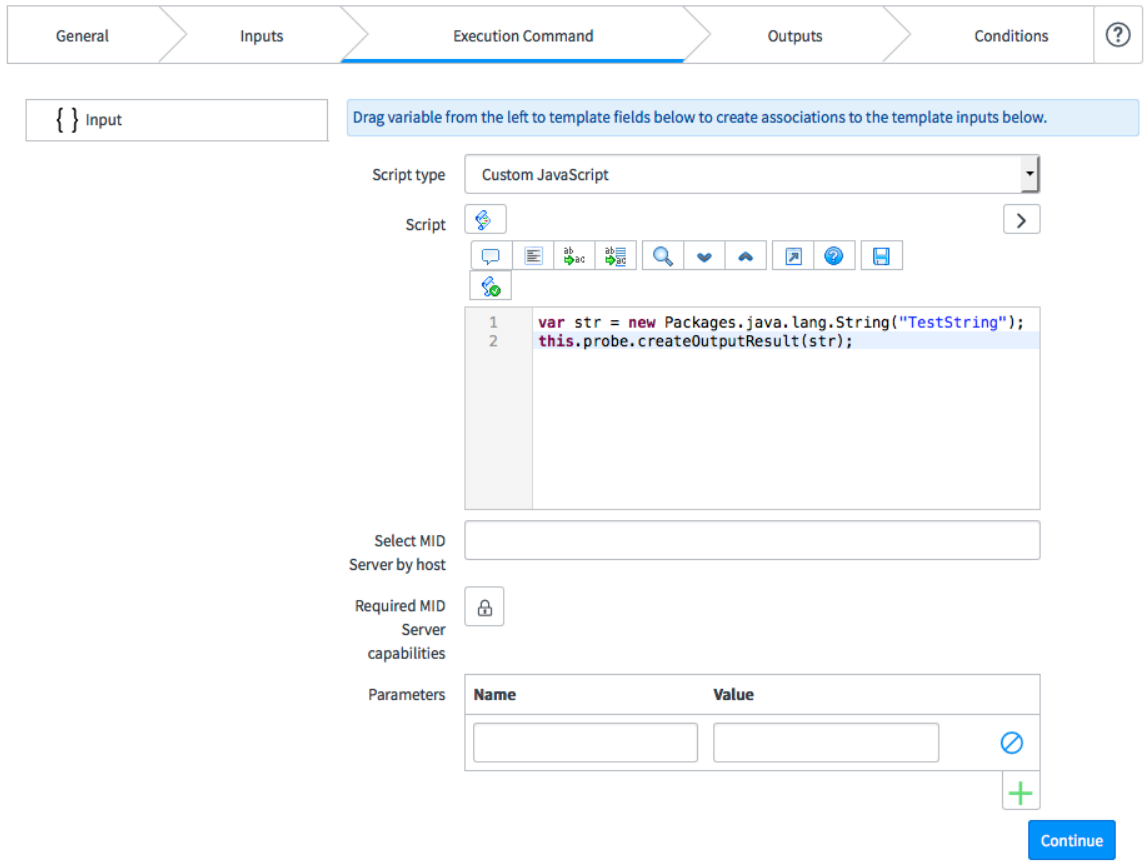
Note:
You can test the JavaScript Probe connection between the MID Server and the target without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JavaScript Probe execution command



2. Complete the fields shown in the table.

JavaScript Probe execution command fields

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
Script type	Select the type of script to include. Available options are: ○ Custom JavaScript ○ MID Server script include
Script	Custom JavaScript to run with this probe. This field is available when the **Script type** selected is **Custom JavaScript**.
MID Server script include	Script for the MID Server to run with this probe. This field is available when the **Script type** selected is **MID Server script include**.
Select MID Server by host	MID Server on which the probe runs.
Required MID Server capabilities	MID Server to use, by capabilities.
Parameters	Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the **Parameters** fields and assign a value.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create a PowerShell activity

Create a custom PowerShell activity return data to a workflow from a host using Microsoft PowerShell.

Before you begin

Role required: activity_creator or workflow_admin

About this task

ServiceNow supports PowerShell 3.0 to 5.1.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the PowerShell Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes on the MID Server.
Target host	Host name or IP address of the target server for this PowerShell activity.
Script type	Type of PowerShell script to run on the Power Shell host. Available options are: ○ Custom PowerShell command ○ MID Server script file
MID Server script file	The MID Server script file contains the Power Shell scripts. This field is available when the **Script type** selected is MID Server script file.
Command	PowerShell command the activity executes. This field is available when the **Script type** se lected is *Custom PowerShell command*. You can create your commands by dragging and dropping input variables from the variable builder into this field.
PowerShell variables	Name-value pairs to pass to the host with Pow erShell. You can create these variables man ually, or drag input variables into the **Value** field. Encrypted input variables retain their en cryption, regardless of the data type settings in this field. If you type in a value and select the **Encrypted** data type, your value appears in plain text. It is only encrypted when it pass es to the ECC Queue.
Use MID Service Account	If checked, this activity authenticates on the target host using the credentials of the MID

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Server service account only, without trying any other credentials. **Note:** The **Credential tag** field is not available.
Credential tag	Credential tag this activity must use to run PowerShell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential tag is defined, the MID Server tries the credentials with that tag specified on ly and does not try the MID Server service ac count. **Note:** This field is not available when the **Use MID service account** check box is se lected.
Required MID Server capabilities	MID Server to use for querying PowerShell, by capabilities. By default, the system selects a PowerShell MID Server.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next

Finish creating your PowerShell activity by creating output variables, creating a parsing rule, or Conditions. Refer to the create custom activities topic to know your template options.

PowerShell template execution parameters

You use execution parameters to create the input process script in the **Pre Processing** form of the activity designer.

For descriptions of the Powershell command fields, see the table in Configure the PowerShell execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

Powershell execution parameters

Name	Variable	Type	Usage
Source	source	String	Target host on which to execute the command.
Script type	script_type	Enumeration	Type of script to run. The possible types are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Powershell execution parameters (continued)

Name	Variable	Type	Usage
			• **command:** Custom PowerShell command. • **file:** Identifies the MID Server script file to run.
Command	command	String	Command sent to the MID Server for it to run on the target host.
MidScriptFile	midScriptFile	Reference	Reference sys_id of the MID Server script file to execute, when the **script_type** is **file**.
PowershellVariables	powershellVariables	Array of hashmap	Hashmap of JavaScript objects with **name**, **value**, and **type** for each object. The **type** of each object can be one of **plain**, **encrypted**, **boolean**, or **null**, corresponding to the PowerShell variable **type** selected in the inputs tab. For example, you might enter: `var newParameter = {"name":"parameterName","value":"parameterValue", "type": "plain" }; executionParam.powershellVariables.push(newParameter);`
Credential tag	credential_tag	String	Specific credential tag this activity must use to run PowerShell commands on the host.
MidCapabilities	midCapabilities	String (comma separated)	List of required MID Server capabilities.
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection: `var valueCapability = {'NEW_MID_CAPABIILTY': 'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Powershell post-processing parameters and payload parsing

Use these parameters to create a post-processing script, payload parsing, and tagging.

Powershell post-processing parameters

Name	Variable	Type	Usage

Tags	tags	Hashmap of tag values to return from the PowerShell command.	Contains the tags used to extract output using the PowerShell commands. The tag output is delimited by double percentage signs, as in **%%tagname%% ... %%**. Set up the command using the format in this example:
			`Write-Host %%tagname1%%`
			`output1 line 1`
			`output1 line 2`
			`…`
			`Write-Host%%`
			
			`Write-Host %%tagname2%%`
			`output2 line 1`
			`output2 line 2`
			`…`
			`Write-Host%%`
			
			The tags returned are JavaScript hashmap objects in which each key is prefixed with **tag** appended with the **tagname**.
			`{"__text__": "",`
			`"tagtagname1":"output1`
			`line1\noutput1 line2\n",`
			`"tagtagname2":"output2`
			`line1\noutput2 line2\n"}`

Hresult	hresult	String	Contains any **hresult** returned from the PowerShell command. If no **hresult** is returned, this parameter is **null**.
Output	output	String	Contains the raw output from the PowerShell command.
EccSysID	eccSysID	String	Contains the reference ID associated with the ECC Queue input message returned by the activity.
ErrorMessages	errorMessages	String	Contains any error messages retrieved from the PowerShell command. This value is **null** if there are no error messages.

Create a REST web service activity

Use this procedure to create a custom REST web service Orchestration activity.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

About this task

To create and use a REST web service workflow activity:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a Create a REST message if an appropriate one is not already configured.
- Assign the web_service_admin role to any user who must create or edit a custom REST activity.
- Determine an application, or Application scope, for this activity.
- Determine the Create a REST message to use for the activity. Use this value to override the endpoint configured in the REST message.
- Optionally, create basic authentication credentials. Use this value to override the credentials configured in the SOAP message.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the REST web service Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes.
REST message	Name of an existing REST message to use in this activity.
REST message function	REST message function to use for this activity.
Endpoint	Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the in put field.
Variable substitutions	Name-value pairs to pass to the REST end point. You can create these parameters manu ally, or drag input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use **${}** can be assigned data from this activity template. Use the **Additional attribute** column to config ure the system to not escape the text. By de fault the text sent to the REST message is es caped. If the users have provided variables using Variable substitution in outbound REST in the REST message, then the **Name** column is automatically populated.
Additional Headers	Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.
Additional Query Parameters	Additional query parameters for the REST message selected. You can also use these val ues to override parameters inherited from the REST message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Use MID Server	Check box that determines if a MID Server should be used to invoke the REST web service. **Note:** If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the **Use MID Server** check box is selected.
Timeout	Allowed duration of the REST web service request before it times out, in seconds. The default is **10**.
Authentication	Determines what type of authentication is required for the endpoint. The options are: ○ **Use existing credentials in REST message**: Uses credential definitions from the REST message definition. ○ **Override with Basic Authentication credentials**: Uses Enable basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection. ○ **Override with Certificate Authentication credentials**: Uses a certificate, such as a private key, to override the credentials in the REST message definition. ○ **Override with Both Basic and Certificate Authentication credentials**: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition. ○ **Override with OAuth Authentication credentials**: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its OAuth set to **OAuth 2.0** and its OAuth profiles and configured appropriately.
Credentials	Required REST endpoint basic authentication credentials. This field is available when

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Override with Basic Authentication credentials is selected in the **Authentication** field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file. See Configure for details. Add the name of a different safe as a prefix to the credential ID, separated by a colon. For example, *newsafe:orch-test-f5*.
Protocol Profile	Certificate authentication to use. This field is available when the selections in the **Authentication** are either **Override with Certificate Authentication credentials** or **Override with Both Basic and Certificate Authentication credentials**.
OAuth profile	Profile for the OAuth provider for this REST message. See for more information.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next
Finish creating your Rest web service activity by creating output variables, creating a parsing rule, or Conditions. Refer to the create custom activities topic to know your template options.

Auto-map REST activity output variables

The ServiceNow activity designer allows you to map parameter values in a REST test payload to variables in the **Outputs** stage automatically.

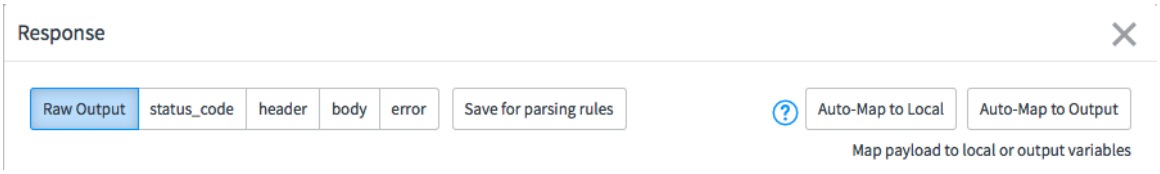
Before you begin
Role required: web_service_admin, activity_admin, activity_creator

About this task
Note:
You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

Procedure
1. In the activity designer, proceed to the **Execution Command** stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click **Test Activity** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.



5. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

REST template execution parameters

You use execution parameters to create the input process script in the **Pre Processing** form of the activity designer.

For descriptions of the REST web service command fields, see Configure the REST execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

REST template execution parameters

Name	Variable	Type	Usage
Web service message	web_service_message	Reference	The sys_id of the corresponding web service message.
Web service message function	web_service_message_function	Reference	The sys_id of the REST message function.
Web service endpoint	web_service_endpoint	String	URL of the REST endpoint.
Parameters	parameters	Array of JavaScript objects	Array of JavaScript objects, expressed with the `executionParam.` prefix. For instructions on creating arrays using this parameter see Create a JavaScript array in a REST template.
Use mid server	use_mid_server	Boolean	Selects whether or not to use the MID Server. A value of **true** uses the MID Server, and a value of **false** does not use the MID Server.
MidCapabilities	midCapabilities	String (comma separated)	List of references to required MID Server capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

REST template execution parameters (continued)

Name	Variable	Type	Usage
Time out	time-out	String	Allowable time out duration, expressed in seconds.
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value: `var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`
Auth Type	auth-type	Boolean	Type of credentials to use. The choices are: • basic_auth_pick_credentials • use_existing_credentials
Credentials	credentials	Reference	Contains the credentials to use for this REST message when the **auth_type** selected is **basic_auth_pick_credentials**.

Create a JavaScript array in a REST template

These are instructions for creating JavaScript arrays using REST execution parameters.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

About this task

To add more name-value pairs to the parameter's array, append the values to the existing array.

Procedure

1. Create a JavaScript object with the following syntax, and add it to the `executionParam.parameter` array:

```
var newParameter =
 {"name":"parameterName","value":"parameterValue","additional_attribute":"none"};
executionParam.parameters.push(newParameter);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the **Additional attribute** column in the **REST message parameters** input field to **Do not escape text**.

   In this case, the system does not escape the value specified for the **value** attribute. An example of this is:

```
var newParameter =
 {"name":"parameterName","value":"parameterValue","additional_a
ttribute":"do_not_escape_text"};
executionParam.parameters.push(newParameter);
```

Note:
If the value for the **additional_attribute** field is **None**, then the system escapes the value specified by the **value** attribute. In the first example, `parameterValue` is escaped.

REST template post-processing parameters

Use these parameters to create a post-processing script.

Activity designer post-processing parameters

Name	Variable	Type	Usage
Status code	status_code	Integer	Contains the status code returned from the REST web service.
Header	header	Hashmap of JavaScript object	Hashmap of key value pairs associated with the header values passed into the web service. You can access each value with `executionResult.header[keyName]`.
Body	body	String	Contains a string value representing the output from the REST message
Error	error	String	Returns the error string from the REST web service, unless there are no errors, in which case it returns**null**.

Configure the REST execution command

Use the input variables you created to configure the command that Orchestration executes on the REST endpoint.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: web_service_admin, activity_admin, activity_creator

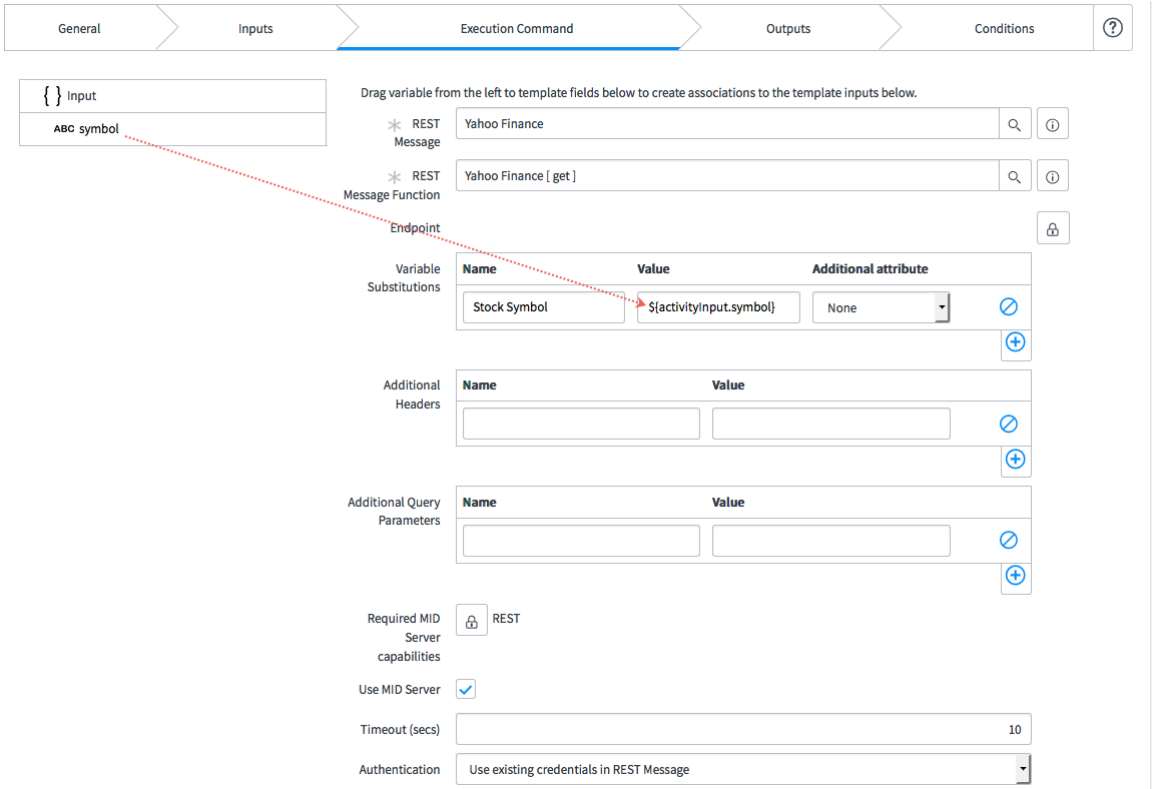
Note:
You can test the REST connection between the MID Server and the endpoint without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

REST execution command



2. Complete the fields shown in the table.

REST execution command fields

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
REST message	Name of an existing REST message to use in this activity. Users must have the web_service_admin role to configure this field.
REST message function	REST message function to use for this activity. Users must have the web_service_admin role to configure this field.
Endpoint	Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.
Variable substitutions	Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag and drop input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use **${}** can be assigned data from this activity template. Use the **Additional attribute** column to configure the system to not escape the text. By default the text sent to the REST message is escaped. The **Name** column is automatically populated if the users have provided variables using Variable substitution in outbound REST messages in the REST message.
Additional Headers	Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Additional Query Parameters	Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.
Use MID Server	Check box that determines if a MID Server should be used to invoke the REST web service. **Note:** If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the **Use MID Server** check box is selected.
Timeout	Allowed duration of the REST web service request before it times out, in seconds. The default is **10**.
Authentication	Determines what type of authentication is required for the endpoint. The options are: ○ **Use existing credentials in REST message**: Uses credential definitions from the REST message definition. ○ **Override with Basic Authentication credentials**: Uses Enable basic authentication for outbound SOAP credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection. ○ **Override with Certificate Authentication credentials**: Uses a certificate, such as a private key, to override the credentials in the REST message definition. ○ **Override with Both Basic and Certificate Authentication credentials**: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition. ○ **Override with OAuth Authentication credentials**: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its OAuth 2.0 tutorial - create a REST message set to **OAuth 2.0** and its OAuth profiles and scopes configured appropriately.
Credentials	Required REST endpoint basic authentication credentials. This field is available when **Override with Basic Authentication credentials** is selected in the **Authentication** field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the Configure the MID Server for CyberArk defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, *`newsafe:orch-test-f5`*.
Protocol Profile	Certificate authentication to use. This field is available when the selections in the **Authentication** field is either **Override with Certificate Authentication credentials** or **Override with Both Basic and Certificate Authentication credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth profile	Profile for the OAuth provider for this REST message. See Specify an OAuth profile for more information.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create an SFTP activity

Create an activity that executes basic SFTP commands on a remote server.

Before you begin

Roles required: activity_creator or workflow_admin

About this task

You can create a custom activity that manages files and directories on a target host or copies a file from one SFTP server to another. The file content is streamed through a MID Server, which avoids having to store the data on the hard drive of the MID Server host machine.

Note:
This activity requires the credentials of a user who can execute SFTP commands on the source host. The Copy File activity, provided in the activity pack, requires separate credentials to access the target host.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the SFTP Execution Command.

Option	Description
Command	Type of activity to create. The choices are: ○ Copy file ○ Create directory ○ Get file list ○ Remove file or directory ○ Rename file or directory ○ Set file attributes **Note:** The fields that display on the form de pend on the command you select.
Source host	Name or IP address of the server containing the files targeted by the activity.
Source port	Port number to use to communicate with the source server. The default port number is **22**.
Source file path	Full path to a file (`/temp/test_data_file.txt`) or directory (`/temp/test_dir`) on a source host depending on the se

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	lected command. Field available on following commands: ○ Copy file ○ Remove file or directory ○ Set file attributes
Source directory	Path to the directory where the source files are located. Field available on following com mands: ○ Create directory ○ Get file list
Source files	Names of specific source files to include in the file transfer. Separate the file names with semi-colons. This field supports a semi-colon separated list of wild-card patterns. For ex ample: `*.txt; a?cd.pdf`. If this field is blank, all files are included. Field available on following command: Get file list **Note:** For information about how the values in this field affect options in other fields, see the logic explanation which follows.
Is a directory	If checked, specifies the file path is a directo ry. Field available on following command: Re move file or directory
Credential tag for source	Specific credential tag this activity must use to run SFTP commands on the source host.
Credential tag for target	Specific credential tag this activity must use to run SFTP commands on the target host. Field available on following command: Copy file
Excluded files	Names of specific source files to exclude from the file transfer. The activity acts on all other files found in the source directory or subfold ers. Separate the file names with commas. This field supports comma-separated list of wild-card patterns. For example: `*.txt, a?cd.pdf`. Field available on following com mand: Get file list **Note:** For information about how the values in this field affect options in other fields, see the logic explanation which follows.
Include subfolders	If checked, includes the files from subfolders in the source directory. Field available on fol lowing command: Get file list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Note: For information about how your selec tion affects other fields in the form, see the logic explanation which follows.
Target host	Name or IP address of the server to which the files are being transferred. Field available on following command: Copy file
Target port	Port number to use to communicate with the target host. The default port number is **22**. Field available on following command: Copy file
Target file path	Full path to a file on a target host. Field avail able on following commands: ○ Copy file ○ Rename file or directory
Suffix for temporary file	If a file exists on a target host, this command enables a temporary suffix to use for a file name. If this field contains a value, the activity first copies the source file to a temporary file on the target host using *`targetFilePath + tempFileSuffix`* as the name. Up on completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file direct ly to the target file and overwrites it, if it exists. Field available on following command: Copy file
UID	User ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored. The UID and GID numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Trans fer workflow. Field available on following com mand: Set file attributes
GID	Group ID attribute to apply to a file or direc tory. The UID and GID values must be set to gether as a pair or they are ignored. The UID and GID numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Transfer workflow. Field available on following command: Set file attributes
Permissions	File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as **16877**, which defines these permissions: *rwxr-xr-x*. The permissions numbers are internal val ues returned by the Get File List activity. Typ ically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a tar get host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Transfer workflow. Field available on following command: Set file attributes
Access timestamp	Override the timestamp when the file or direc tory was last accessed. The access and mod ification timestamps must be set together as a pair. Field available on following command: Set file attributes
Modification timestamp	Override the timestamp when the file or direc tory was last modified. The access and modi fication timestamps must be set together as a pair. Field available on following command: Set file attributes
Size in bytes	Size of a file, expressed in bytes. Field avail able on following command: Set file attributes
Required MID Server capabilities	MID Server with the appropriate MID Server for connecting to the source and target servers.

The system uses this logic to determine which files to move from the source host:

- If the Source files field is empty, the system selects all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the Excluded files field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. If a file name matches one of the file name patterns in the Excluded files field, it does not get into the selection regardless of the include rule.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

SFTP template execution parameters

You use execution parameters to create the input process script in the **Preprocessing** form.

For descriptions of the command fields, see Configure the SFTP execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

SFTP execution parameters

Name	Variable	Type	Usage
Command	command	String	Identifies the function of this activity. The possible commands are: • Copy file • Create directory • Get file list • Remove file or directory • Rename file or directory • Set file attributes
Source	source	String	Identifies the source host.
Source port	source_port	Integer	Identifies the port used to communicate with the source host.
Source directory	source_directory	String	Path to the source directory of the files to be moved.
Source files	source_files	String	Names of the files on the source to be moved.
Excluded files	excluded_files	String	Lists the files excluded from the operation.
Source file path	source_file_path	String	Path to the source files to be moved.
Target host	target_host	String	Identifies the target host.
Target port	target_port	Integer	Identifies the port used to communicate with the target host.
Target directory	target_directory	String	Full path to the target directory on the target host.
Target file path	target_file_path	String	Full path to a file or directory on the source host or on the target host. For example, this value is used in the Rename File or Directory activity in the activity pack.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP execution parameters (continued)

Name	Variable	Type	Usage
Temp file postfix	temp_file_postfix	String	Temporary file name extension used by the Copy File activity when moving a file. If this field contains an extension, the source file is copied to a temporary file using *target file name + temp_file_postfix*, before being renamed to the actual target file. If this field is blank, the source file is copied directly to the target file.
Is directory	is_directory	Boolean	Indicates whether the given file path is a directory.
Include subfolders	include_subfolders	Boolean	Indicates whether the system looks into subfolders of the source directory for files to include and exclude.
File attribute uid	file_attribute_uid	Integer	User ID associated with a file or directory.
File attribute gid	file_attribute_gid	Integer	Group ID associated with a file or directory.
File attribute permissions	file_attribute_permissions	Integer	File or directory permissions for the user and group specified.
File attribute atime	file_attribute_atime	Integer	Access time stamp from the file attributes.
File attribute mtime	file_attribute_mtime	Integer	Modification time stamp from the file attributes.
File attribute size	file_attribute_size	Integer	Size of the file, in bytes.
Source credential tag	source_credential_tag	String	Credential aliases for Orchestration activities used to run the command on the source host.
Target credential tag	target_credential_tag	String	Credential tag used to run the command on the target host.
MidCapabilities	midCapabilities	String (comma separated)	List of required MID Server capabilities.

SFTP post-processing parameters and payload parsing

Use these parameters to create a post-processing script, payload parsing, and tagging.

SFTP post-processing parameters

Name	Variable	Type	Usage
Output	output	String	Contains output data returned by the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP post-processing parameters (continued)

Name	Variable	Type	Usage
EccSysId	eccSysId	String	Contains the Reference ID associated with the ECC Queue input message.
ErrorMessages	errorMessages	String	Contains the error messages returned from the query. If no error messages are returned, this value is null.

Tags	tags	Hashmap of tag values returned from the SSH command	Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in `%%tagname %% ... %%`. Set up the command using the following format:
			`%%tagname1%%`
			`output1 line 1`
			`output1 line 2`
			`...`
			`%%`
			
			`%%tagname2%%`
			`output2 line 1`
			`output2 line 2`
			`...`
			`%%`
			The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the tagname.
			`{"__text__": "",`
			`"tagtagname1":"output1 line1\noutput1 line2\n",`
			`"tagtagname2":"output2 line1\noutput2 line2\n"}`

Configure the SFTP execution command

Use the input variables you created to configure the command that Orchestration executes on the SFTP target.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

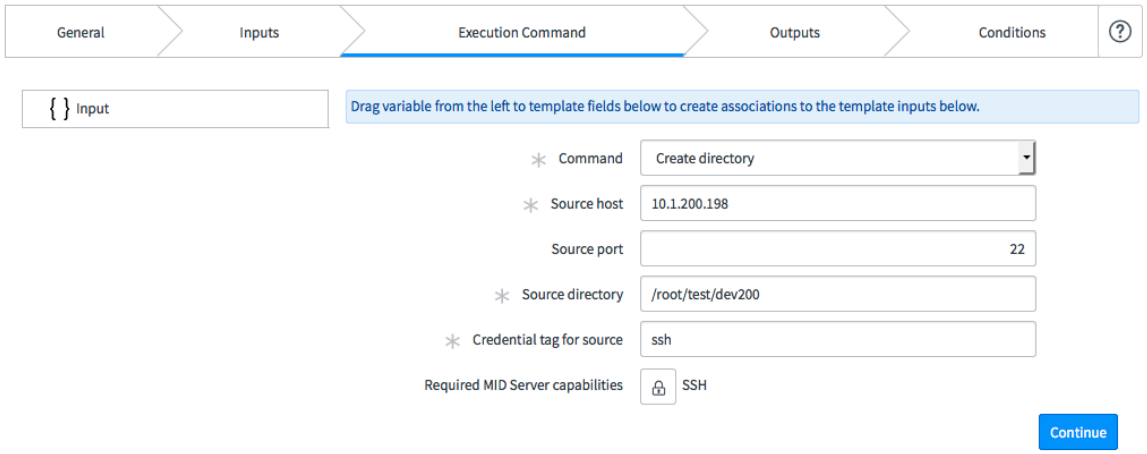
Note:
You can test the JDBC connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP execution command



2. Complete the fields shown in the table.

SFTP command fields

Field	Description	Command
Command	Type of activity to create. The choices are: ○ Copy file ○ Create directory ○ Get file list ○ Remove file or directory ○ Rename file or directory ○ Set file attributes **Note:** The fields displayed on the form depend on the command selected.	All
Source host	Name or IP address of the server containing the files targeted by the activity.	All
Source port	Port number to use to communicate with the source server. The default port number is **22**.	All
Source file path	Full path to a file on a source host.	○ Copy file ○ Remove file or directory ○ Set file attributes
Source directory	Path to the directory where the source files are located.	○ Create directory ○ Get file list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Command
Source files	Names of specific source files to include in the management action. Separate the file names in this list with semi-colons. This field supports the use of wild cards. If this field is blank, all files are included. For information about how the values in this field are affected by options in other fields, see the section below the table.	Get file list
Is a directory	Check box that determines if the specified file path is a directory.	Remove file or directory
Credential tag for source	Specific Credential aliases for Orchestration activities this activity must use to run SFTP commands on the source host.	All
Credential tag for target	Specific credential tag this activity must use to run SFTP commands on the target host.	Copy file
Excluded files	Names of specific source files to exclude from the management action. The activity acts on all other files found in the source directory or subfolders. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.	Get file list
Include subfolders	Check box to manage the files from subfolders in the source directory. For information about how your selection affects other fields in the form, see the section below the table.	Get file list
Target host	Name or IP address of the server to which the files are being transferred.	Copy file
Target port	Port number to use to communicate with the target host. The default port number is **22**.	Copy file
Target file path	Full path to a file on a target host.	○ Copy file ○ Rename file or directory
Suffix for temporary file	Temporary suffix to use for a file name if the file already exists on a target host. If this field contains a value, the activity deletes the duplicate target file if it exists, and then copies the source file to a temporary file using *`targetFilePath + tempFileSuffix`* as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file directly to the target file and overwrites it, if it already exists.	Copy file
UID	User ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.	Set file attributes
GID	Group ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.	Set file attributes
Permissions	File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as **16877**, which defines these permissions: *`rwxr-xr-x`*. The permissions number is an internal value returned by the Get	Set file attributes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Command
	File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow.	
Access timestamp	Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.	Set file attributes
Modification timestamp	Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair.	Set file attributes
Size in bytes	Size of a file, expressed in bytes.	Set file attributes
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the source and target servers. By default, the system selects an SSH MID Server.	All

The system uses this logic to determine which files to move from the source host:

- If the **Source files** field is empty, the system select all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the **Excluded files** field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. A file whose name matches one of the file name patterns in the **Excluded files** field does not get into the selection, even though it would be selected by the include rule.
- When the **Include subfolders** check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create a probe activity

Create an activity that runs a probe on the target host that is configured to return specific information..

Before you begin

Role required: activity_creator or workflow_admin

About this task

For instructions on using the activity template process flow, see create custom activities.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the Probe Execution Command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes.
Probe	Probe to run with this activity, from the list of probes in the system
Target host	Host name or IP address of the target server for this activity.
Parameters	MID Server to use, by capabilities.
Required MID Server capabilities	Name-value pairs to pass to the host with this probe. You can create these parameters man ually, or drag and drop input variables into the parameter fields and assign a value.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Probe template execution parameters

You use execution parameters to create the input process script in the **Pre Processing** form.

For descriptions of the command fields, see Configure the Probe execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

Probe activity execution parameters

Name	Variable	Type	Usage
Probe	probe	Reference	The sys_id of the MID Server probe.
Source	source	String	Intended target host
Parameters	parameters	Array of JS object	Array of JavaScript objects, expressed with the `executionParam.` prefix. To add more name-value pairs to the **parameters** array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the `executionParam.parameter` array. This assigns additional parameters to the message: `var newParameter = {"name":"parameterName","value":"parameterValue"};`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe activity execution parameters (continued)

Name	Variable	Type	Usage
			`executionParam.parameters.push(newParameter);`
MidCapabilities	midCapabilities	String (comma separated)	List of required MID server capabilities.

ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:
			`var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'};`
			`executionParam.valueCapabilities.push(valueCapability);`

Probe template post-processing parameters

Use these parameters to create a post-processing script.

Probe post-processing parameters

Name	Variable	Type	Usage
Payload	payload	String	Contains raw payload returned from the probe.
Output	output	String	Contains output data returned from the probe.
EccSysId	eccSysId	String	Contains the reference ID associated with the ECC Queue input message.

Configure the Probe execution command

Use the input variables you created to configure the command that Orchestration executes on the target.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

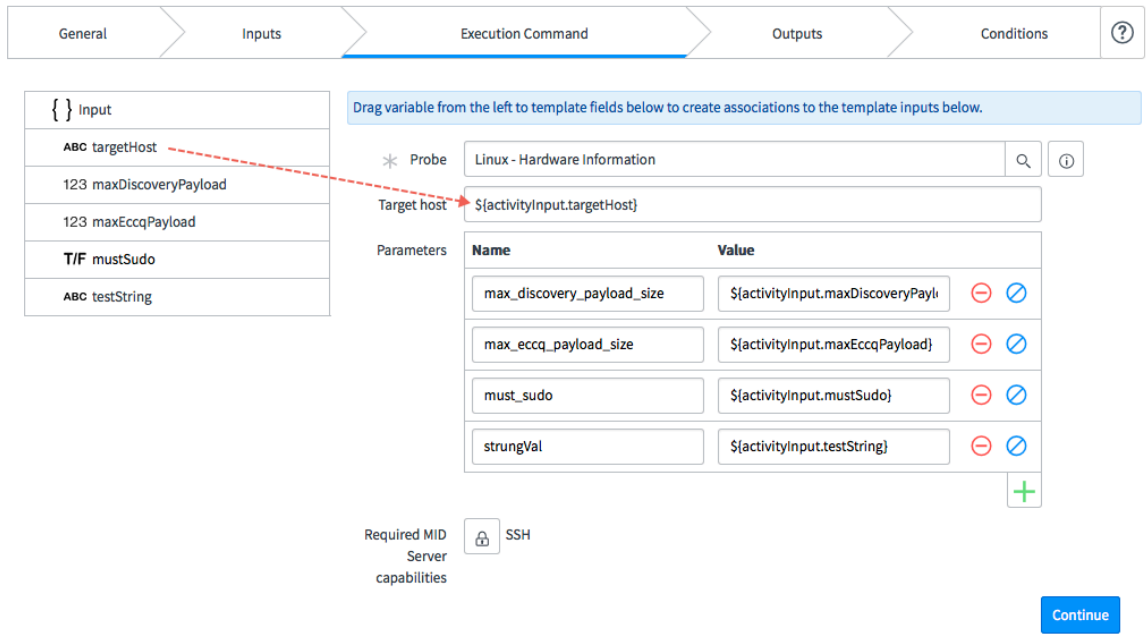
Note:
You can test the activity connection between the MID Server and the target without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe execution command



2. Complete the fields shown in the table.

Probe execution command fields

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
Probe	Probe to run with this activity, from the list of probes in the system.
Target host	Host name or IP address of the target server for this activity.
Required MID Server capabilities	MID Server to use, by capabilities.
Parameters	Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create an SSH activity

Create an activity that extracts data from a target host that uses the SSH network protocol.

Before you begin

Role required: activity_creator or workflow_admin

About this task

For instructions on using the activity template process flow, see create custom activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the SSH Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes.
Target host	Host name or IP address of the target server for this activity.
Command	Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that the SSH command line supports. For more informa tion, see **Advanced SSH script options** be low the table.
Directory	Directory on the target host where the com mand is run.
Credential tag	The Orchestration credential tag to use when running the command.
Required MID Server capabilities	MID Server with the appropriate capabilities for connecting to the host. By default, the sys tem selects a MID Server with SSH capabili ties.
Long running	If checked, disables the SSH connection time out for commands that might take longer to run than the default 60 seconds. Orchestra tion periodically checks the running process to determine its status until it is finished.
Must Sudo	If checked, enables the use of [redacted] to run commands.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

Example: Advanced SSH script options

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `${syncFile()}` parameter. The system uses this parameter to locate the named script in the MID Server Script File [ecc_agent_script_file] table and run it on the target host. For example, a bash script can be expressed as:

```
bash ${syncFile("<MID script name>")} argument1 argument2
 argument3
```

A base script (`main_script.bash`) can reference another script (`my_include.bash`) as well as a separate file (`.my_profile`) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `${syncFile()}` parameter, to execute properly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```
set $LIB_DIR=/usr/bin;.
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote
 package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well
 as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool
 myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

What to do next

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

SSH template execution parameters

Use execution parameters to create the input process script in the **Pre Processing** form of the activity designer.

For descriptions of the command fields, see Configure the SSH execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

SSH execution parameters

Name	Variable	Type	Usage
Source	source	String	Intended target or host.
Command	command	String	Comment to run on the host.
Directory	directory	String	Directory on the host in which to run the command.
Credential tag	credential_tag	String	Orchestration credential tag to use when running the command.
MidCapabilities	midCapabilities	String (comma separated)	List of required MID Server capabilities.
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH execution parameters (continued)

Name	Variable	Type	Usage
			this example to customize the MID Server selection: `var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`
Long running	long_running	Boolean	Indicates whether or not the command is long running. A value of true indicates that the command is long running.
Must sudo	must_sudo	Boolean	Indicates whether or not this activity must use sudo to run root commands. A value of true indicates that sudo SSH credentials must be used.

SSH post-processing parameters and payload parsing

Use these parameters to create a post-processing script, payload parsing, and tagging.

SSH post-processing parameters

Name	Variable	Type	Usage
Output	output	String	Contains the output returned from the SSH command.
EccSysID	eccSysID	String	Contains the reference ID associated with the ECC Queue input message returned by the activity.
ErrorMessages	errorMessages	String	Contains the error messages retrieved from the SSH command. This value is **null** if there are no error messages.

Tags	tags	Hashmap of tag values returned from the SSH command	Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in `%%tagname%% ... %%`. Set up the command using the following format:
			`%%tagname1%%`
			`output1 line 1`
			`output1 line 2`
			`...`
			`%%`
			
			`%%tagname2%%`
			`output2 line 1`
			`output2 line 2`
			`...`
			`%%`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH post-processing parameters (continued)

Name	Variable	Type	Usage
			The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the tagname. `{"__text__": "", "tagtagname1":"output1 line1\noutput1 line2\n", "tagtagname2":"output2 line1\noutput2 line2\n"}`

Configure the SSH execution command

Use the input variables you created to configure the command that Orchestration executes on the host target.

Before you begin

Create the input variables you need in the **Inputs** form before you advance to the **Execution Command** stage.

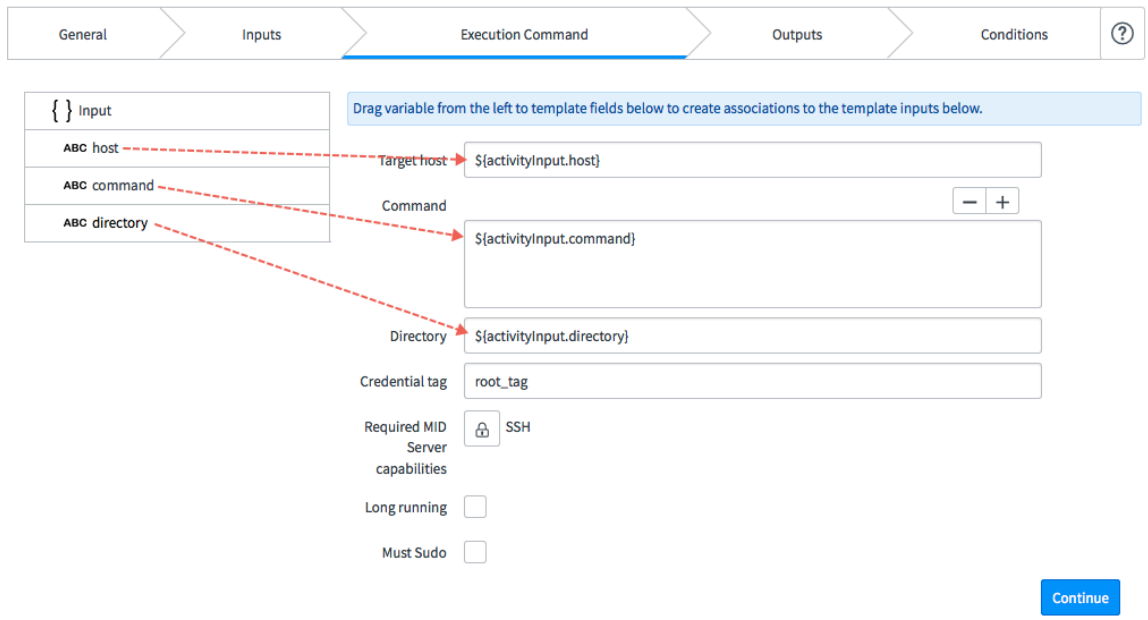
Role required: activity_creator, admin

Note:
You can test the SSH connection between the MID Server and the target without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

SSH execution command



2. Complete the fields shown in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH activity inputs

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
Target host	Host name or IP address of the target server for this activity.
Command	Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that is supported by the SSH command line. For more information, see **Advanced SSH script options** below the table.
Directory	Directory on the target host where the command is run.
Credential tag	The Credential aliases for Orchestration activities to use when running the command.
Select MID Server by capabilities	MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities
Long running	Check box to disable the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.
Must Sudo	Check box to allow the use of SSH credentials to run commands.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create a run script activity

Create an activity that runs any script.

Before you begin

Role required: activity_creator or workflow_admin

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the Run Script Execution Command:
   Create a script for this activity to execute.

> **Note:**
> You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Run Script template processing script

Use the Run Script custom template Script form to enter a script to call and use with other activities.

Run Script processing script

Field	Description
Processing script	Script that the activity runs.
Variables	Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays input variables you passed into the activity on the **Inputs** form. All activity variables added in the **Inputs** form are read-only and are expressed in the processing script with this syntax: `activityInput.variable`.

Create a JMS activity

Create a custom JMS activity to retrieve or send messages to external systems using the Java Messaging Service.

Before you begin

Role required: activity_creator or workflow_admin

About this task

The JMS activity supports third party JMS providers whose JMS client application is written with a typical Java EE pattern and can support these operations:

- Using JNDI to find a ConnectionFactory object.
- Using JNDI to find one or more destination objects.
- Using the ConnectionFactory to create a JMS connection object.
- Using the JMS connection to create one or more JMS session objects.
- Using a JMS session and the destinations to create the MessageProducer and MessageConsumer objects.
- Starting the JMS connection to enable delivery or consumption of messages.

Note:
The JMS activity designer has been tested with the JMS providers ActiveMQ and Tibco EMS. When connecting to a JMS provider, refer to your third party user documentation.

Procedure

1. Create or verify your JMS credential .
   Your JMS credentials must have permission for the target database and proper configuration for the corresponding JMS connection. Credentials must be set up before you can create a JMS activity.
2. Create or verify your JMS connection .
   Your JMS connection must be configured with valid JMS credentials set up before you can create a JMS activity.
3. Create a custom activity.
   This action creates a custom activity using a template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. After setting up general properties and creating input variables, configure the JMS Execution Command.

Option	Description
Configure your credential	Fill in the fields necessary for your database connection.
Connection Factory	Name of the JMS Connection Factory. You should create or verify your JMS connection. This configuration links the name of the Ini tial Context Factory with the URL of the JMS provider.
Destination Type	Type of destination used for this message: ○ **Queue**: Message is queued for point-to-point communications. **Note:** The **GET** operation is only supported for the Queue destination type. ○ **Topic**: Message is used for publish and sub scribe communication.
Destination Name	Name of the queue or topic destination that is configured on the JMS provider.
Message Type	The JMS message type value. Only the **Text Message** type is supported. The queue or top ic destination must be configured to receive or send only Text Message. Other message types are dropped, since the JMS Activity can not process them.
Operation	The programmatic operation to perform on the destination. The choices are **PUT** or **GET**.
Timeout (Secs)	Allowed time to wait for a message in the mes sage queue before it times out, in seconds. The default is **30**.
Custom message headers	The custom header values in a name/value pair format, that is available on the JMS desti nation. **Note:** This is only supported for a **PUT** opera tion.
Message payload	Actual message content or payload that is sent to the JMS destination. **Note:** This is only supported for a **PUT** opera tion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Credential tag	A tag for an individual credential for a JMS activity in an Orchestration workflow.
Required MID Server capabilities	MID Server to use, by capabilities.

What to do next

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Create a JMS connection for an Orchestration activity

Configure your system to use Java Messaging Service (JMS) with a custom Orchestration JMS activity.

Before you begin

Role required: admin

About this task

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the *mid.property.jms.command.allowed_factory_names* property, found in **MID Server** > **Properties**. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

Procedure

1. Navigate to **MID Server** > **JAR Files**.
2. Click **New** and add.

Option	Description
Name	A unique and descriptive name for identifying the file in the instance.
Version	A version number for the file, if one is available.
Source	Location of the JAR file for reference purposes. Source information is not used by the system.
Description	Short description of the JAR file and its purpose in the instance.

3. Click the paper clip icon in the banner and attach the JMS driver jar file.
   The JMS driver jar file should be available as part of JMS provider installation. Few JMS vendors make them available as a separate product. Refer to the JMS provider documentation to determine which JMS client driver jar files require the client applications to connect to the JMS provider. For example, if you are trying to connect to ActiveMQ V5.10 (JMS provider), you need the `activemq-all-5.10.1.jar` file.
4. Navigate to **Orchestration** > **Credentials & Connections** > **JMS Connection Factory**.
5. Click **New**, add the following, and click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Name	Unique name of this connection factory.
Initial Context Factory	Name of the JNDI class that is used to create the InitialContext. **Note:** For example, to connect to Active MQ V5.10 (JMS Provider), the value is `org.apache.activemq.jndi.ActiveMQInitialContextFactory`.
Provider URL	Location of the running JMS provider installation. **Note:** For example, to connect to ActiveMQ V5.1: `tcp://ipAddressOrHostName:61616`.

6. Navigate to **Orchestration** > **Credentials**.
7. Click **New**, select **JMS Credentials**, and provide the user name and password the MID should use to communicate with the JMS provider.
   For more information, see JMS credentials JMS credentials.
8. Click **Submit**.
   You are ready to create a custom JMS activity.

JMS template execution parameters

You use execution parameters to create the input process script in the **Preprocessing** form.

You must use the `executionParam.` prefix with all variables in this table.

JDBC execution parameters

Name	Variable	Type	Usage
Jms ds	jms_ds	Reference	Selected JMS data source.
Destination type	destination_type	Enumerated	
Destination name	destination_name	String	
Message type	message_type	Enumerated	
Operation	operation	Enumerated	
Time out	time_out	Integer	Length of time to wait for the query to return results.
Custom headers	custom_headers	Array of JavaScript objects	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JDBC execution parameters (continued)

Name	Variable	Type	Usage
Message payload	message_payload	String	
Credential tag	credential_tag	String	List of required MID Server capabilities.
MidCapabilities	midCapabilities	String (comma separated)	
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection: `var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`

JMS template post-processing parameters

Use these parameters to create a post-processing script.

JMS post-processing parameters

Name	Variable	Type	Usage
Status	status	String	Status of the operation (Put or Get) on the JMS destination.
StandardHeaders	standardHeaders	String	All the standard headers, as specified by JMS, that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.
CustomHeaders	customHeaders	String	All custom headers added by a producer or publisher application that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.
MessagePayload	messagePayload	String	Message payload that is obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.
EccSysID	eccSysID	String	Contains the reference ID associated with the ECC Queue input message returned by the activity.
ErrorMessages	errorMessages	String	Contains any error messages retrieved from the JMS command. This value is **null** if there are no error messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity scoping

Custom activities run in their own scope, even if it is different from that of the workflow.

Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

Note:
Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

Publish a custom activity

When a user creates a custom activity and saves or submits it, that activity appears in the **Custom** and **Packs** tabs of the designer palette, but is visible only to the user who created it.

Before you begin

Roles required: admin, activity_admin, activity_creator

Procedure

1. When you finish configuring the activity, click **Publish**.

   This makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

2. To edit a published activity, click **Checkout**.

   When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users.

3. When you are finished editing the checked out activity, publish it again.

   The system adds a new version of this activity to the **Custom** tab in the Workflow Editor palette.

   Note:
   Activities you create and publish are visible in the **Packs** tab only if they were created in the current application scope.

Return a locked activity to a published state

Problems can arise if an activity version is checked out by a user and not checked back in. An activity in this state cannot be checked out for update.

Before you begin

Role required: admin, activity_admin, activity_creator

About this task

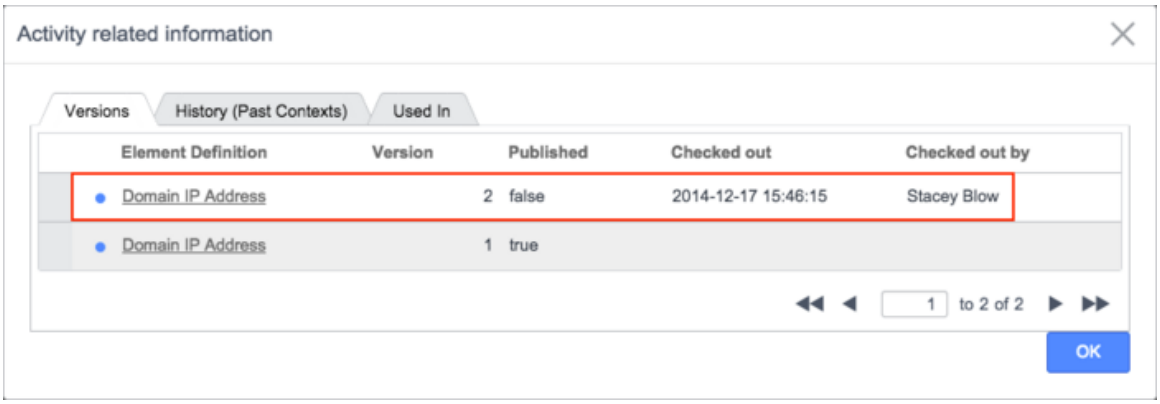
An administrator can return a locked activity to a published state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the Workflow Editor.
2. From the **Custom** tab, open the activity that is locked.
3. Click the menu icon in the title bar and select **Versions** from the context menu.

   A list of all the versions of that activity appears. The locked version displays the user who checked it out.



4. Select the checked out version.

   The system opens the record in the activity designer.

5. Click the menu icon again and select **Force Checkout** from the context menu.

   The activity fields become editable.

6. Click **Publish**.

   The activity becomes available to users with the appropriate roles.

Copy a custom activity

You can copy activities for reuse from the **Custom** tab in the global scope.

Before you begin

Role required: admin, activity_admin, activity_creator

About this task

Note:
You cannot copy an activity in a private scope.

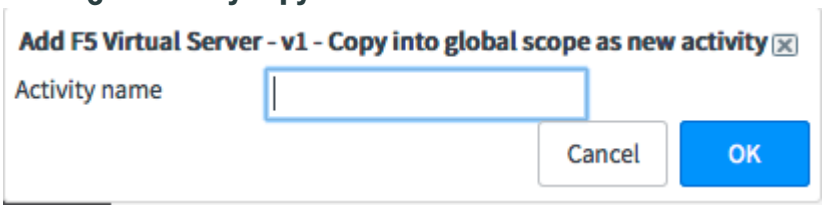
Procedure

1. To reuse an activity in the global scope, expand the parent category to display the activities.
2. Right-click the activity you want to copy and select one of these options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

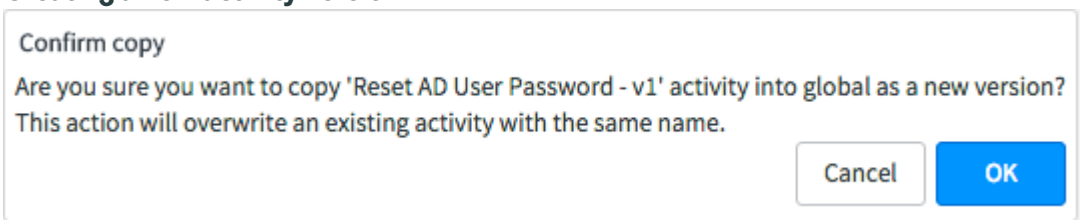
- *Copy into global scope as new activity*: Copies the activity with the new name you provide, uses the same version number as the original activity, and moves it to the global scope in the **Custom** tab.

Naming an activity copy



- *Copy into global scope as new version*: Copies the activity using the same name, increments the version number, and moves it to the global scope in the **Custom** tab. The system automatically adds the parent category to the **Custom** tab if it does not already exist. This action will overwrite another activity with the same name and version number.

Creating a new activity version



Note:
If the activity is in any other scope but global, the system displays this message: `Cannot copy privately scoped activity.`

Orchestration databus

The databus allows workflow designers to track the flow of data through an Orchestration workflow and provides access to output data that can be consumed by other custom activities.

Data is made available in a workflow when you use activities created with the Orchestration activity designer. The activity designer provides the ability to specify well defined inputs and outputs for your activities. When you use those activities on the workflow canvas, the outputs appear in the **Data** tab and are available for use as inputs in subsequent activities.

Note:
Orchestration does not filter the data you are given for reuse in the **Data** tab. You must make sure an activity in the workflow canvas has executed before you consume its output data.

When you drop a custom activity onto the workflow canvas, the system assigns it an index. If you delete an activity from the canvas and add a new one, the indexes are not reused. This ensures that you don't accidentally start subscribing to data you did not intend to use. If you update an activity in the activity designer, the system automatically updates the activity on the canvas to ensure the data you are subscribing to downstream is not affected.

Reuse data in the activity designer

The **Data** tab in the Workflow Editor lists all custom activities used in the current workflow that produce data and displays that data for reuse in other custom activities.

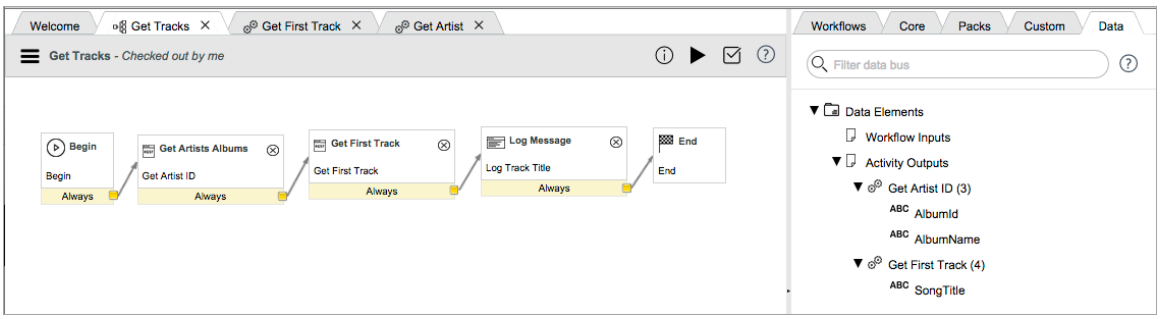
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Roles required: workflow_creator

About this task
Activities are categorized by application in this tab and are available for use as data sources for other activities. The **Data** tab is a graphical representation of the workflow Databus, which manages all the temporary data used by the current workflow.

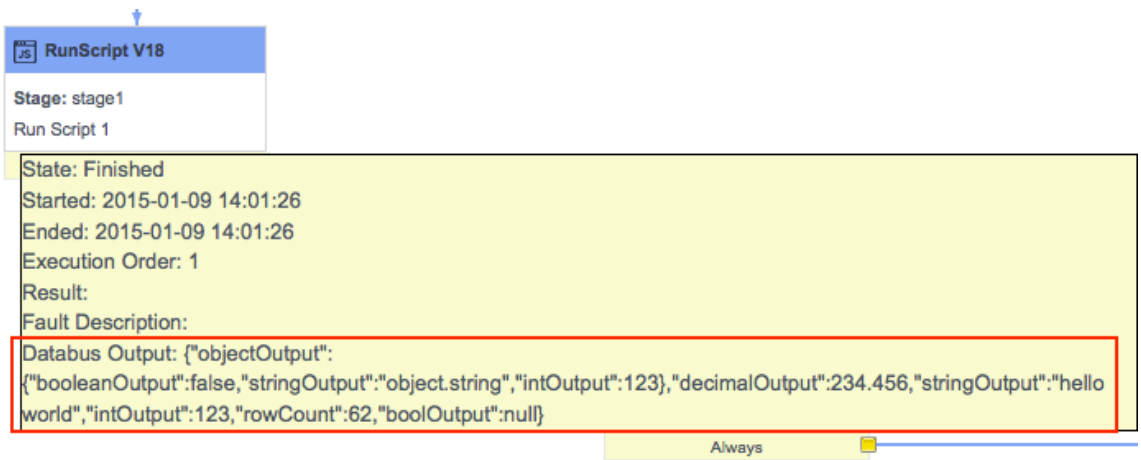
Procedure
1. Drag output variables from an activity in this tab into the inputs of another activity on the workflow canvas to link the activities together.

   You can use any of the outputs in the structure, regardless of the application to which they belong. An index number in parenthesis after the activity name provides a unique identifier for the parameters that you use as input data in other activities. If you do not name a custom activity, the only identifier for that activity in the **Data** tab is the index number. Index numbers indicate the sequence in which custom activities were added to the workflow and are not reused. When you drag a custom activity onto the workflow canvas, the system adds that activity and its output data to the structure. Conversely, if you remove a custom activity from the canvas, that activity and its outputs disappear from the data list.



2. Point to an activity to display information about it in a pop-up window.

   Any output data reused by the activity is listed in the **Databus Output** field of the pop-up window.



MID Servers for Orchestration

Orchestration automatically selects an appropriate MID Server based on the capabilities that you configure in activities, the IP addresses of target devices, and the application that the MID Server is allowed to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To allow a MID Server to work with Orchestration, it must have the **Orchestration** application or the **ALL** application assigned to it. See Configure a default MID Server for each application for instructions.

You can have MID Servers focus on different capabilities and separate sections of your network. See:

- MID Server capabilities
- Map an IP address to a DNS name

You can also specify a default MID Server to use if no MID Servers meet the capability and IP range criteria for an activity. See Select the default MID Server for Orchestration.

Related topics

MID Server capabilities

MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Nmap capability

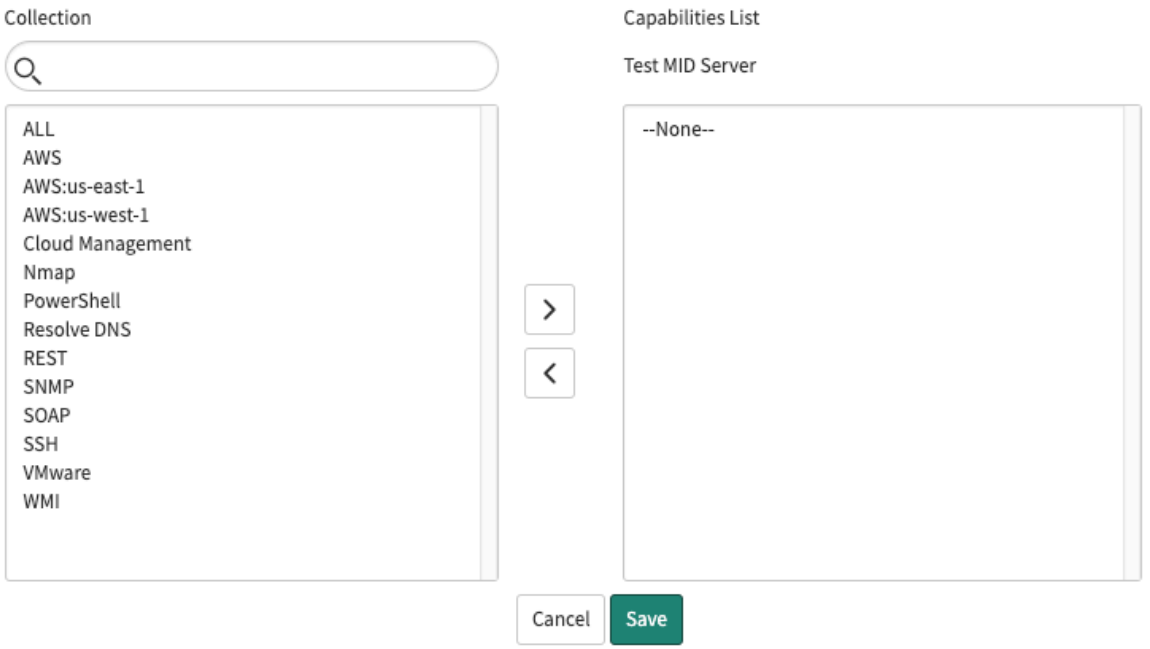
The **Nmap** capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server

MID Server capability values

Capabilities provided in the base system do not have a defined value string. The capability value can be blank, a single value, or a * (wildcard). A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match. The * (wildcard) will match a request capability specifying any non-blank value.

Starting with the Madrid release, the **[capability name]:[value]** combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the **Collection** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



MID Server selection

The MID Server is selected using an algorithm based on the capabilities available. The selector produces a list of suitable MIDs using filters in the following order: **server status** > **applications** > **IP range** > **capabilities**. The algorithm searches the capabilities in the following sequence and, if a step finds at least one MID server, the remaining steps are skipped:

1. **Exact value match:** Find each MID Server containing capabilities with name/value pairs with an exact match to all requested capability name/value pairs. Blank is a valid value. * (wildcard) values are ignored.
2. **Wildcard value match:** The same as an exact value match, but also allows a non-blank request value to match MID server capability records containing value *.
3. **Special capability name ALL:** Find each MID Server containing the special capability name ALL, ignoring capability's value field.

Note:
If the requested capability name does not exist in the ecc_agent_capability table, **BadArgumentException** is thrown rather than falling back to the ALL capability.

Scripted MID Server capability value matching

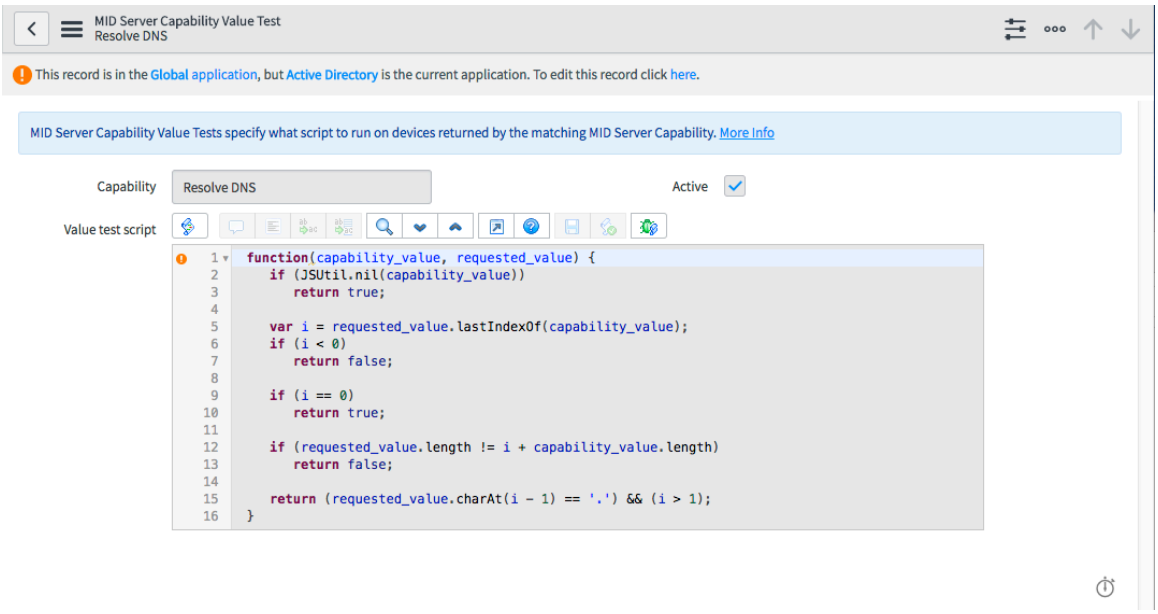
You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability **Value** entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by **Value**. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is `service-now.com`, the MID Server with this capability finds `lnxlab01.sandiego.service-now.com` and `dbsrv101.sanjose.service-now.com`. If the value is changed to `sandiego.service-now.com`, then the MID Server finds only `lnxlab01`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If **Value** in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to **MID Server** > **Capability Value Tests** and select **Resolve DNS** from the list.



Configure MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range, allowing an application to select the most appropriate MID Server. Configure capabilities on MID Servers for applications like Orchestration, , and .

Before you begin

Role required: admin or sm_admin

About this task

Several applications use capabilities, IP ranges, and to narrow the pool of MID Servers the applications need.

Note:
At least one capability is required for each MID Server used by Orchestration. See for more information.

The following capabilities are available by default with Discovery:

All	IBM	Resolve DNS
Ansible	JDBC	REST
AWS	NetApp	SNMP
Azure	Nmap	SOAP
Chef	OpenStack	SSH
Cloud Management	PowerShell	VMware
Google	RCA	WMI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **MID Server** > **Capabilities**.
2. Select an existing capability or select **ALL** to include all capabilities.

   Note:
   Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:

   a. Select **New**.

   b. Configure the value for a custom capability.

   Example
   An example is a capability for **DOMAIN**, with a value of **service-now**.

   c. Select **Submit**.

4. Select **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the **Available** list.
6. Select **Save**.

   The capability defined here also appears in the primary record for this MID Server.

Select the default MID Server for Orchestration

Orchestration uses the default MID Server if it cannot find a MID Server with the correct IP range and capability.

Specify the default MID Server in either of these locations:

- The **Default MID Server** field on the Orchestration application record. See Configure a default MID Server for each application for instructions.
- The **Default MID Server to use for Orchestration Activities** property. Navigate to **Orchestration** > **MID Server Properties** to set this value.

These two values are automatically kept in synch. You can change the default MID Server in either location.

PowerShell probe version 2 system property

View detailed PowerShell credential information and view extended logging information.

Starting with the madrid release, there is a new system property for the PowerShell probe which enables the version 2 of the probe. This new version enables you to view detailed credential information on why PowerShell credentials fail or succeed. You can also view logging information for an ECC Queue payload and Workflow Context log.

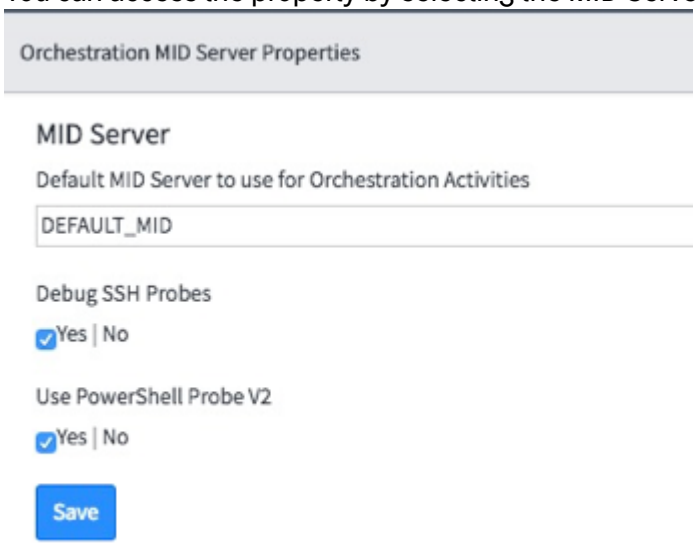
mid.server.rba_powershell_v2

Enables the PowerShell probe version 2 for use with all PowerShell activities. The default value is true. If you choose false, the legacy PowerShell probe is used. Unless there are issues, use version 2, as the legacy version is going to be deprecated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This property only applies to Orchestration activities. Discovery probes are not affected.

You can access the property by selecting the MID Server Properties link in the navigation pane:



PowerShell log property

Enable debug messages to display from PowerShell.

This property enables control of when and where to display debug messages generated by debug statements embedded in the PowerShell scripts.

mid.property.powershell.log_info

The new MID Server PowerShell log property:

- Displays logging information.

  Note:
  Once logging is enabled, OOB PowerShell scripts log information.

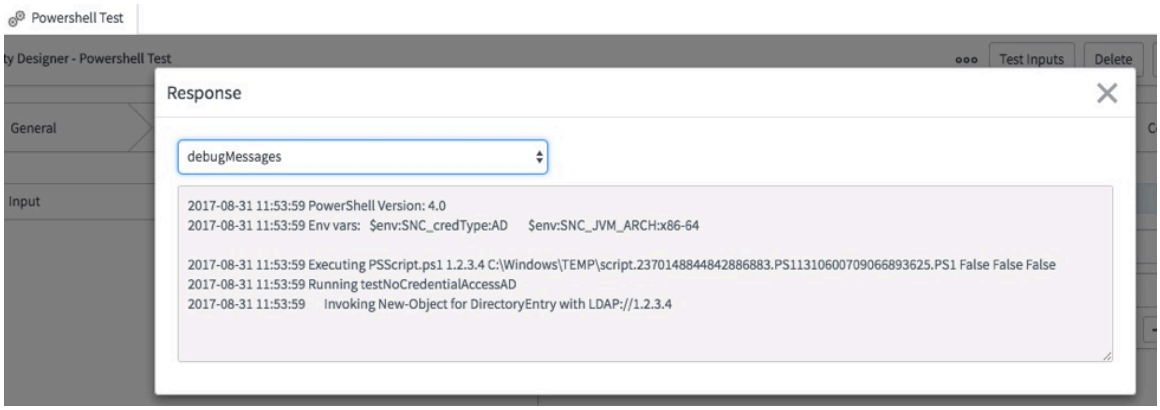
- Adds logging information to your developed PowerShell scripts and PowerShell activities.

  Note:
  Logging information is only available when property is enabled.

- Logging is not enabled by default.

If the property is set to true, debug messages display from the workflow context or from the Response popup after you test inputs. The ecc_queue entry payload for each of the PowerShell activities is going to show all the debug messages that were logged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Enable the PowerShell log property for each MID Server. If the MID Server field is empty, the property applies to all MID Servers. There are separate credential debug messages that always come back regardless of this setting. The credential debug messages show which credentials have been used and other related information.

Note:
All the debug messages that come back to the instance are also saved to the MID Server log file. The log file might have additional debug messages generated from Java code, which might help the debug process.

Use the Orchestration Usage dashboard

This dashboard shows an overview of Orchestration usage metrics to show customers how their organization uses Orchestration and to support license compliance.

Before you begin

Role required: orchestration_manager

Procedure

1. To view the dashboard, navigate to **Orchestration** > **Operations & Troubleshooting** > **Orchestration Usage Dashboard**.
   The Orchestration Usage dashboard is displayed. The tabs on the dashboard include Licensable Usage and Orchestration Usage. Reports on these tabs include:

Orchestration Usage Metrics

Metric	Description
Transaction Summary Last 12 months	A running transaction count of all Orchestration transactions over the last 12 months. Includes: ○ The count of orchestration transactions associated with the HR Application ○ The count of Orchestration transactions associated with the Security Operations Application
Transaction Summary YTD	Cumulative count of all transactions since the time the Orchestration plugin was activated or the customer upgraded to Geneva.
365 day Running Average of Server	The running average over the last 365 days for cmdb_ci_computer - cmdb_ci_server. This

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
	includes all physical and virtual client nodes and excludes server nodes from the count.
365 day Running Average of Client	The running average over the last 365 days for cmdb_ci_server. This includes all physical and virtual server nodes.
Orchestration Transactions by Month for Last 12 Months	
Average Client Nodes Orchestrated Last 365 Days	
Average Server Nodes Orchestrated Last 365 Days	
Number of Orchestration Activities Developed Last 365 Days	The aggregate number of activity definitions you have developed and OOB activity definitions you have modified. This number includes activity elements (Activities build with the Activity Designer) you have developed and OOB activity definitions you have modified. **Note:** his number excludes activity elements that are shipped with ServiceNow Applications that use the Orchestration Runtime e.g. ServiceNow Security Operations and Human Resources Apps.
Cumulative Client Nodes Orchestrated by Month	
Cumulative Server Nodes Orchestrated by Month	
Usage by Provider Last 12 Months	Breaks down emphasis by provider, such as PowerShell, JDBC, SSH, etc.
Top 10 Orchestration Activities	

2. **Optional:** You can add more widgets to the dashboard by clicking the **Add Content** icon ( ) in the upper right corner of the dashboard.

Note:
You should not modify the first tab in this Dashboard. If you want a different dashboard experience, add a tab and customize that with your usage reports.

Workflow Data Fabric Hub

Power your AI agents and enrich workflows on the ServiceNow AI Platform with real-time data from across the enterprise using ServiceNow® Workflow Data Fabric Hub.

https://player.vimeo.com/video/1103370420?h=0eb432e398&badge=0&autopause=0&player_id=0&app_id=58479

Exploring Workflow Data Fabric Hub

Discover how Workflow Data Fabric Hub unifies business and technology data from multiple sources, enabling centralized, real-time access to your enterprise data without copying it to your instance.

Workflow Data Fabric Hub overview

Workflow Data Fabric Hub provides a view where you can browse data source connectors, establish connections, and create data fabric tables that provide access to data from external sources.

- Access enterprise data from external data warehouses including Snowflake, Google BigQuery, and Amazon Redshift, data lakes such as Databricks, and databases including Oracle.
- Retrieve data from external sources in real time without copying any data to your instance using zero copy connections.
- Fuel AI agents and workflows on the ServiceNow AI Platform with external data using data fabric tables.
- Provide data to AI-powered features on the ServiceNow AI Platform, expand workflow automation, and enrich metrics and analytics with enterprise data.

© 2026 ServiceNow, Inc. All rights reserved.

Workflow Data Fabric users

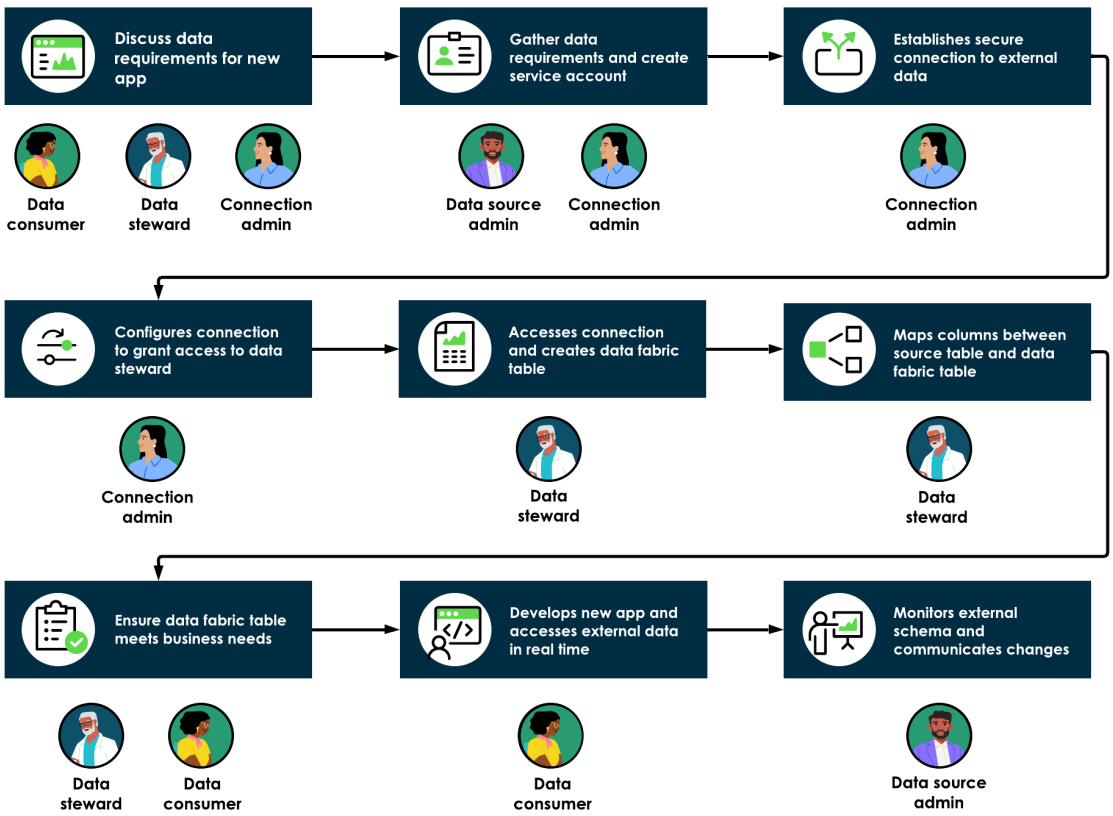
Users

User	Description
Connection admin	Establishes secure connections to external data sources by coordinating with data source administrators, managing connection credentials, and maintaining data access.
Data steward	Creates data fabric tables that provide access to external data, and maintains data quality to meet the business needs of data consumers.
Data consumer	Accesses data fabric tables to develop applications. Defines an application's data requirements and coordinates with the data steward to refine data.

End-to-end workflow

This infographic shows a sample end-to-end workflow of different users working together to gather requirements, establish a zero copy connection, and create a data fabric table in Workflow Data Fabric Hub.

Creating zero copy connections and data fabric tables



In this workflow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. A data consumer meets with a data steward and the connection admin to discuss data requirements for a new application on the ServiceNow AI Platform.
2. The connection admin gathers the data requirements and meets with the data source admin to create a service account that can access the schema and tables needed for the new application.
3. The connection admin establishes a secure connection to the external data lake in the Workflow Data Fabric Hub using the service account credentials provided by the data source admin.
4. The connection admin configures access controls in the connection details, ensuring the data steward can access the connection to view data assets in the external data lake and create a data fabric table.
5. The data steward selects the established connection in the Workflow Data Fabric Hub and creates a data fabric table.
6. The data steward explores the available schema, selects a source table with the required data, and maps columns between the source table and the data fabric table.
7. The data steward works with the data consumer to review the data fabric table and ensure that it meets the business needs of the application.
8. The data consumer begins developing the new application and accesses the data fabric table and its external data in real time just like any table on the ServiceNow AI Platform.
9. The data source admin monitors the external schema for consistency and communicates future schema changes to the connection admin and data steward.

Workflow Data Fabric Hub benefits

Workflow Data Fabric Hub benefits

Benefit	Feature	Users
Access real-time data from external sources directly, without copying any data to your instance.	Zero copy connections	Connection admin
Create a virtual representation of data from an outside source and make it accessible to data consumers on the instance as if it's stored locally.	Data fabric tables	Data steward, data consumer
Map internal or external data to a predefined data fabric table in an application using a zero copy connection.	Data fabric tables included with applications	Instance admin, connection admin, data steward

Differences between Workflow Data Fabric Hub and Integration Hub

Choose whether to use Workflow Data Fabric Hub or Integration Hub to integrate with external systems.

- When you want to retrieve real-time data from external sources without storing it on your instance, use Workflow Data Fabric Hub.
- When you want advanced import and transformation options or customizable integrations, use Integration Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to explore next

To learn more about configuring and using Workflow Data Fabric Hub, see:

- Configuring Workflow Data Fabric Hub
- Managing zero copy connections in Workflow Data Fabric Hub
- Managing data fabric tables in Workflow Data Fabric Hub
- Accessing real-time data in applications
- Workflow Data Fabric Hub reference

Available connectors

Discover available connectors to use in a zero copy connection.

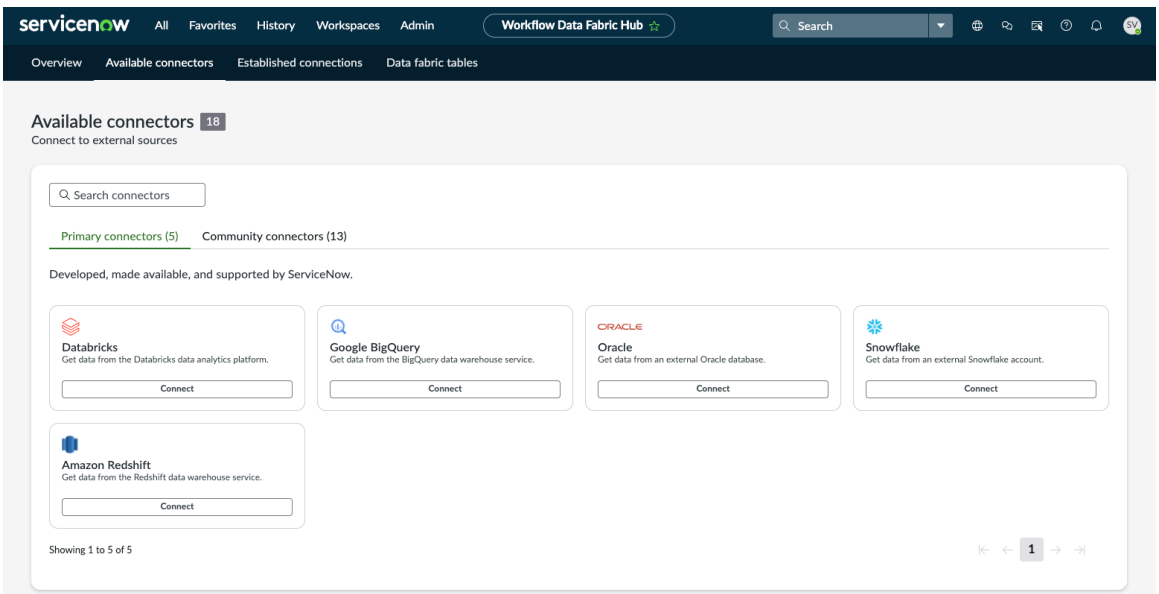
In Workflow Data Fabric Hub, you can access a variety of data sources that enable you to retrieve real-time data from across your organization using zero copy connections.

Key benefits

- Discover integration opportunities to external data warehouses including Snowflake, Google BigQuery, and Amazon Redshift, data lakes such as Databricks, and databases, including Oracle.
- Access external data using primary connectors developed by ServiceNow or community connectors developed by the open-source community.
- Create a zero copy connection to a data source, enabling data stewards to build data fabric tables.

In the Workflow Data Fabric Hub, a connection admin can navigate to the **Available connectors** tab to view primary and community connectors and create a zero copy connection. After the connection is established, the connection admin can grant access to a data steward. The data steward can then access the zero copy connection from the **Established connections** tab to create a data fabric table.

Available connectors in Workflow Data Fabric Hub



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform roles

The df_connection_admin role is required to view available connectors.

Accessing available connectors

View available primary and community connectors on the **Available connectors** tab by navigating to **Admin** > **Workflow Data Fabric Hub** > **Available connectors** or **All** > **Workflow Data Fabric Hub** > **Available connectors**.

Types of connectors

A connection admin with the df_connection_admin role can create connections to available data sources using primary and community connectors.

Primary connectors

Primary connectors are developed, made available, and supported by ServiceNow. Primary connectors have been enhanced to improve the performance of Glide queries and list view operations. These improvements allow the majority of queries to be executed at the data source.

Community connectors

Community connectors are developed by the open-source community and made available by ServiceNow. These connectors are certified for essential functionality but are not part of the ServiceNow support scope.

For details on creating connections using primary connectors, see Primary connectors.

For details on creating connections using community connectors, see Community connectors.

Established connections

Access data from external sources directly in the ServiceNow AI Platform, without copying any data to your instance using zero copy connections.

Key benefits

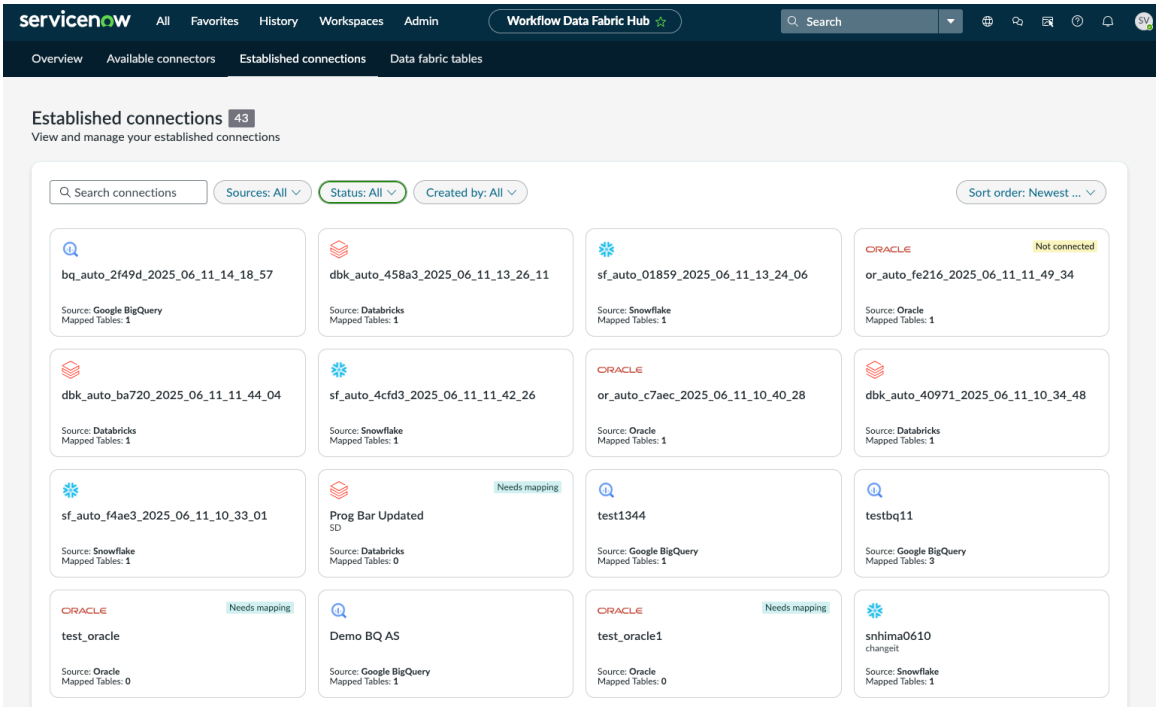
- Access external data without the complexity and maintenance involved with extract, transform, and load (ETL) processes.
- Minimize security risks associated with copying and storing data in multiple locations.
- Maintain data accuracy by avoiding errors associated with data replication.
- View external data assets and create data fabric tables with mapped data.

Zero copy connections enable access to external data locally, while reducing storage consumption and minimizing security risks typically associated with duplicating data across multiple systems.

In the Workflow Data Fabric Hub, a connection admin can navigate to the **Available connectors** tab to view primary and community connectors and create a zero copy connection. After the connection is established, the connection admin can grant access to a data steward. The data steward can then access the zero copy connection from the **Established connections** tab to create a data fabric table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Established connections in Workflow Data Fabric Hub



Required ServiceNow AI Platform roles

The df_connection_admin role is required to create and manage zero copy connections.

A role containing the df_data_steward role is required to access established connections and create data fabric tables.

Accessing established connections

View established connections by navigating to **Admin** > **Workflow Data Fabric Hub** > **Established connections** or **All** > **Workflow Data Fabric Hub** > **Established connections**.

Monitoring connection status

Determine whether a connection requires an update by checking the status on the **Established connections** tab.

Connected

The connection to the data source has been tested and established.

Deactivated

The connection to the data source has been deactivated by the connection admin.

Needs configuration

The connection attributes or authentication information are missing from the connection details.

Needs mapping

The connection has been tested and established, but the data isn't mapped to a data fabric table.

Not connected

The connection details have been added, but the connection to the data source isn't working.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data steward access

The connection admin determines which data stewards can access a specific connection by granting the df_data_steward role to one or more roles on the **Access Controls** tab in an established connection.

The data steward's primary goal is to provide quality data to consumers to meet their business needs. Additionally, data stewards have the following responsibilities:

- Understanding business applications and the data that users need.
- Communicating data access requirements to integration admins.
- Creating data fabric tables and mapping data from external sources.
- Maintaining the quality and integrity of data.

Use cases

- Access data from an external data source without importing and storing it on your instance. Customer order information is often stored in an external Customer Relationship Management (CRM) system, with the data ultimately residing in an external data lake such as Snowflake. When a customer calls to report a product issue, an agent working on the ServiceNow AI Platform opens a request and accesses the customer's full order history directly from Snowflake. The customer's order history stays in Snowflake, the system of record, but is available to the agent in real time on the ServiceNow AI Platform.
- Provide end-to-end details to agents with real-time data from an outside source. When a customer calls to make a warranty service claim against a vehicle, an agent working on the ServiceNow AI Platform can access extended warranty details from an external data lake in real time using a zero copy connection. The customer service agent can update the service request ticket with the latest warranty details directly from the data lake, ensuring the latest warranty information is used in the service ticket.

For more information, see Managing zero copy connections in Workflow Data Fabric Hub.

Data fabric tables

Fuel your AI agents and enrich workflows on the ServiceNow AI Platform with external data using data fabric tables.

Key benefits

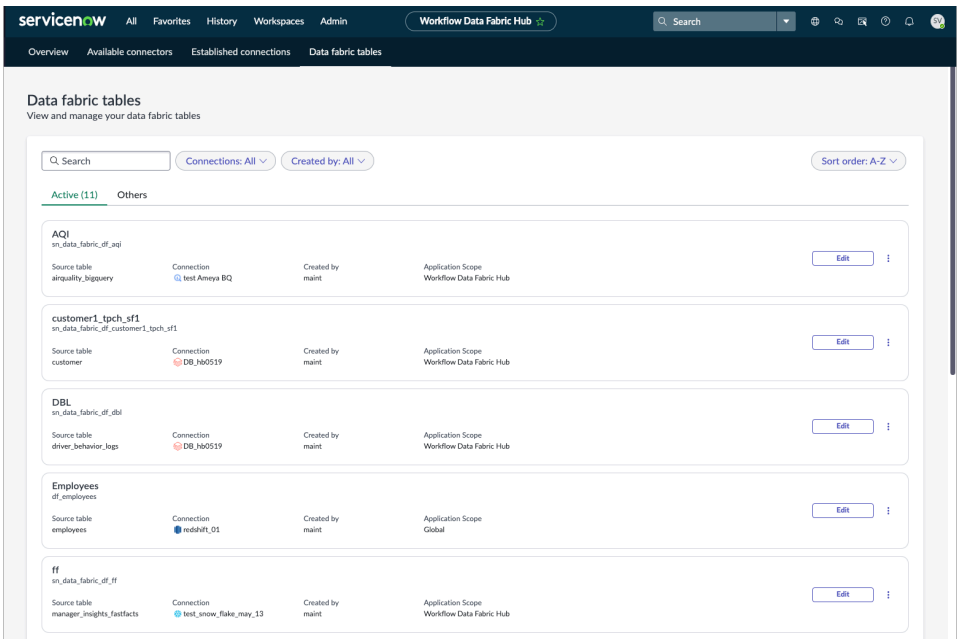
- Fetch external data in real time and view the data in lists and forms as if it's stored in your instance.
- Reduce storage consumption and performance load in your instance.
- Control access to external data so that only authorized users can view the data.

A data fabric table is a virtual representation of data stored in an external source, accessible directly from the ServiceNow AI Platform. The data fabric table definition is stored in the ServiceNow AI Platform, but its external records live in the memory in read-only mode. You can view external records from a data fabric table in lists and forms the same way you view records in a physical table.

Access to a data fabric table is controlled the same way access is controlled to a physical table. Data fabric tables belong to the application scope selected by the data steward during their creation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data fabric tables in Workflow Data Fabric Hub



Required ServiceNow AI Platform roles

A role containing the df_data_steward role or the connection_admin role is required to create and manage data fabric tables.

Accessing data fabric tables

View and manage data fabric tables on the **Data fabric tables** tab by navigating to **Admin** > **Workflow Data Fabric Hub** > **Data fabric tables** or **All** > **Workflow Data Fabric Hub** > **Data fabric tables**.

Viewing data fabric tables

View a list of all the data fabric tables that data stewards have created on the **Data fabric tables** tab.

- Search for a data fabric table by label or name.
- Filter the list of tables by data source and connection.
- Filter the list of tables by creator.
- View a list of data fabric tables from active connections in the **Active** tab.
- View a list of data fabric tables from connections that are deactivated or not configured in the **Others** tab.

Use cases

Unifying data from multiple sources

A manufacturer experiences an outage when a key piece of machinery fails, stopping production entirely. Unfortunately, the data needed to help prevent these failures is scattered across multiple systems.

- Asset inventory data in IT Asset Management (ITAM) and maintenance personnel data are stored locally in your instance.
- Historical asset maintenance records and real-time sensor are stored in an external data lake.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To help prevent potential failures and outages, you can provide service technicians with all the necessary data by connecting these systems using data fabric tables. For example:

1. Sensor data is fed to the data lake and analyzed by machine learning, generating a failure score.
2. When the failure score crosses a certain threshold, an alert is generated and sent to your instance.
3. The alert triggers a maintenance request flow, creating a case assigned to a service technician.
4. The technician reviews the case details and accesses inventory data from the instance, along with maintenance records and real-time sensor data from the external data lake, all in one place using data fabric tables.
5. The technician makes an informed decision and acts to address the issue before another outage occurs.

Retrieving real-time data in an application

An application can include both a physical table and a data fabric version of the same table. This gives the instance admin flexibility when installing the application. The admin can choose whether to populate the physical table through data import or allow users to access real-time data from an external data source via the data fabric table.

Analyzing data and generating AI-guided insights using AI Data Explorer

Create visualizations and analyses of fetched data through a conversational interface in AI Data Explorer. For more information, see Use AI to explore data with AI Data Explorer.

Note:
You must first add the relevant data fabric tables to the Semantic Table Configuration [sn_query_gen_table_config] table in Query Generation. See Add a table to the semantic data layer.

Enhancing the performance of AI experiences using the Knowledge Graph

Enhance the performance of Now Assist Virtual Agent, AI agents, and generative AI skills by leveraging data fabric tables in the Knowledge Graph application. For more information, see Knowledge Graph.

Differences between data fabric tables and remote tables

Data fabric tables are similar to remote tables on the ServiceNow AI Platform, but data fabric tables query external data sources and retrieve data using a zero copy connection instead of a script.

A data fabric table enables you to view external data, but you can't insert, update, or delete data in an external data source like you can from a remote table.

Configuring Workflow Data Fabric Hub

Set up and configure Workflow Data Fabric Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

The Workflow Data Fabric Hub application is free for all production instances and non-production instances.

You can install the Workflow Data Fabric Hub application in either of the following ways:

- Install the Workflow Data Fabric Hub application (sn_data_fabric) from the ServiceNow Store.
- Request the Zero Copy Connectors application (sn_data_fabric_zcc), which includes the Workflow Data Fabric Hub application.

With access to the Workflow Data Fabric Hub, you can map a data fabric table included with an application to a local table on your instance using the ServiceNow local instance connector.

To create data fabric tables that can retrieve external data using zero copy connections, request the Zero Copy Connectors app (sn_data_fabric_zcc). The Workflow Data Fabric Hub is automatically installed when the Zero Copy Connectors plugin (sn_data_fabric_zcc) is activated on your instance.

Activate Workflow Data Fabric Hub

Access Workflow Data Fabric Hub on your instance by activating the Workflow Data Fabric Hub plugin (sn_data_fabric).

Before you begin

Role required: admin

About this task

Follow the steps below to activate Workflow Data Fabric Hub on your instance. For the full experience, request the Zero Copy Connectors application (sn_data_fabric_zcc). Workflow Data Fabric Hub is automatically activated when the Zero Copy Connectors plugin (sn_data_fabric_zcc) is activated on your instance.

Roles are installed with Workflow Data Fabric Hub.

For more information, see Workflow Data Fabric Hub roles.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Workflow Data Fabric Hub plugin (sn_data_fabric) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Request Zero Copy Connectors

Create zero copy connections and data fabric tables in Workflow Data Fabric Hub after requesting the Zero Copy Connectors app through the Now Support Service Catalog. If it isn't already installed, the app installs Workflow Data Fabric Hub.

Before you begin

The Zero Copy Connectors app requires a separate subscription and must be activated by ServiceNow personnel.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

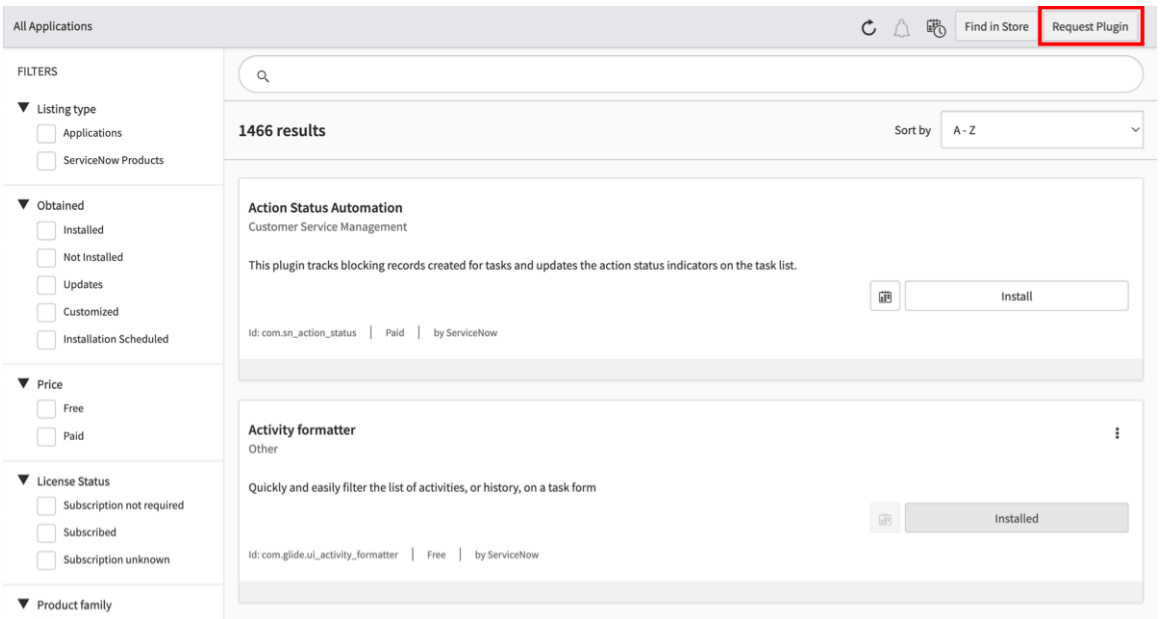
Important:
The Zero Copy Connectors app is only supported on production and non-production instances. The Zero Copy Connectors app is not supported on demo instances.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.



3. On the form, fill in the fields.

Activate Plugin request form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Plugin Name	Enter: `Zero Copy Connectors (sn_data_fabric_zcc)`
Select Maintenance Date and Time	Select the date and time to activate the plugin.

4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Create a connection administrator

Create a connection admin who can create zero copy connections in Workflow Data Fabric Hub.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Select an existing user.
3. Update the user's role assignment by selecting **Edit** in the Roles related list.
4. Add the df_connection_admin role.
5. Select **Update**.

Result

The user is now a connection admin in Workflow Data Fabric Hub. As a connection admin, the user can perform the following tasks:

- Browse available primary and community connectors on the **Available connectors** tab.
- Select a connector and create a zero copy connection to an external data source.
- Define who can access the connection and create data fabric tables by assigning the df_data_steward role to an existing role.

See Managing zero copy connections in Workflow Data Fabric Hub.

Enabling access to a data source

Work with your data source administrator to enable access to your external data source.

To connect to a data source behind a private network using a zero copy connection, there are two general approaches:

IP allowlist

Your data source admin must allow access to a source IP range based on where the zero copy queries are coming from. For help with identifying the correct IP range, contact your account manager or Customer Service and Support and reference KB1706533.

Private connectivity

For data sources hosted behind private Virtual Private Clouds (VPCs) or Virtual Networks (VNets) in the public cloud, connectivity options are available that enable

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

query traffic to transit over private IP address space, end to end. This private connectivity is enabled by technologies such as Private Link. It's important to note that each cloud provider implements this technology differently. To explore private connectivity options for your specific topology, contact your account manager or Customer Service and Support.

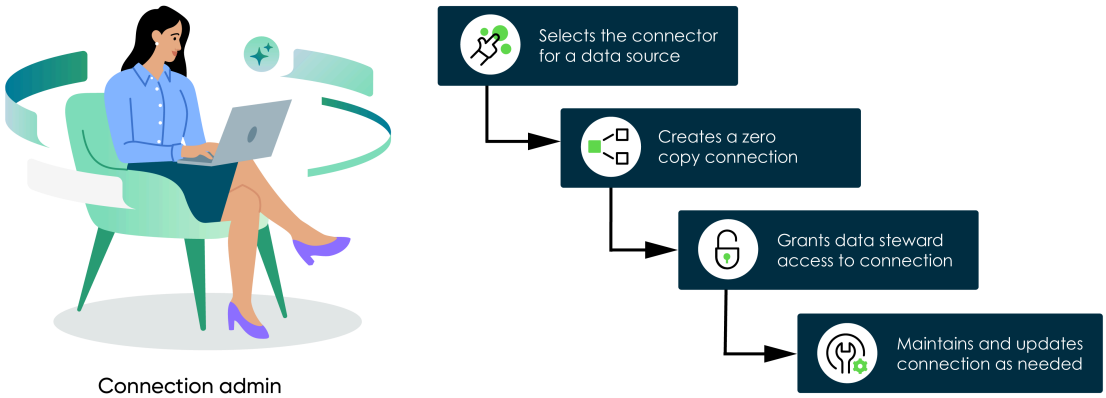
Managing zero copy connections in Workflow Data Fabric Hub

Securely connect to an external data source and access external data directly from your instance, without the need to copy or store any data locally.

Overview of managing zero copy connections

A zero copy connection provides secure, real-time access to data from outside sources without having to copy data to your local database. The connection admin is responsible for creating and managing zero copy connections as shown in this infographic.

Creating and managing zero copy connections



Types of connectors

A connection admin with the df_connection_admin role can create connections to available data sources using primary and community connectors.

Primary connectors

Primary connectors are developed, made available, and supported by ServiceNow. Primary connectors have been enhanced to improve the performance of Glide queries and list view operations. These improvements allow the majority of queries to be executed at the data source.

Community connectors

Community connectors are developed by the open-source community and made available by ServiceNow. These connectors are certified for essential functionality but are not part of the ServiceNow support scope.

Primary connectors

Connect to external data sources using primary connectors in Workflow Data Fabric Hub.

Primary connectors are developed, made available, and supported by ServiceNow.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Primary connectors and compatibility

Primary connector	Minimum compatibility
Databricks	Yokohama Patch 5
Google BigQuery	Yokohama Patch 5
Oracle	Yokohama Patch 5
Snowflake	Yokohama Patch 5
Amazon Redshift	Yokohama Patch 5
SAP ECC	Yokohama Patch 5
SAP S/4HANA	Yokohama Patch 5
Teradata	Yokohama Patch 5
Amazon S3 Tables	Yokohama Patch 5
Apache Iceberg	Yokohama Patch 5
Cloudera	Yokohama Patch 5
Microsoft OneLake	Yokohama Patch 5
Prometheus	Yokohama Patch 5
ServiceNow Remote Instance	Yokohama Patch 5

For additional information on data types and authentication methods that aren't supported with primary connectors, see KBB0010487.

Databricks

The Databricks connector provides read-only access to data and metadata from the Databricks data analytics platform.

A connection admin can set up a connection to Databricks in the Workflow Data Fabric Hub and grant data stewards access to this connection. Data stewards can then use the established connection to create a data fabric table and map data from Databricks. This allows users to access Databricks data through the table list view or by using GlideRecord scripts. For details on creating data fabric tables and mapping data, see Managing data fabric tables in Workflow Data Fabric Hub.

The connector has been enhanced to improve the performance of the following Glide queries and list view operations. These improvements allow the majority of queries to be executed at the data source.

Supported data types

The following table lists supported Databricks data types and the default matching data types in a data fabric table.

Important:
Databricks data types not included in the table aren't supported for data mapping in Workflow Data Fabric Hub.

Data type mapping

Databricks	Data fabric table
bigint	Long Integer String
int	Long Integer String
smallint	Long Integer String
tinyint	Long Integer String
timestamp_ntz	Basic Date/Time
char	Char
timestamp	Basic Date/Time
date	Date
decimal	Decimal
string	String
boolean	True/False
double	Floating Point Number
float	Floating Point Number

Create a Databricks connection

Create a Databricks connection

Establish a zero copy connection to the Databricks data analytics platform in Workflow Data Fabric Hub.

Before you begin

You can optimize queries to Databricks by enabling table statistics. Consult your data source admin to confirm whether table statistics are enabled in Databricks before enabling this option in Workflow Data Fabric Hub.

Role required: df_connection_admin

About this task

Work with your data source admin to create a connection to Databricks. For additional information about connecting to Databricks, refer to the Databricks documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the available primary connectors in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
2. Find the Databricks connector and select **Connect**.
3. On the form, fill in the fields.

New Databricks Connection form

Field	Description
Name and description	
Connection label	Unique name for this connection. This helps in identifying the connection within your system.
Connection name	System-generated name based on the Connection label. This field cannot be modified once the connection is established.
Short description	Description of the connection explaining what it is about.
Connection attributes	
Catalog name	Catalog name used for organizing and locating data assets in Databricks.
Connection URL	JDBC URL to establish the connection. For example: `jdbc:databricks://<host>:<port>`
Warehouse or compute path	Databricks warehouse or compute path. For example: `/sql/1.0/warehouses/`
Enable table statistics	Option to enable table statistics. Optimize SQL queries using table statistics by selecting this option. Enabling table statistics allows the system to use estimates of stored data such as row count, distinct values, and data size for enhanced query processing. **Note:** You must ensure that gathering table statistics is enabled in the data source before selecting this option.
Authentication method

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth client ID	Client ID issued by Databricks for authentication.
OAuth secret	Secret key associated with the client ID.

4. Select **Connect**.

Result
A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next
If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

If the connection fails, verify the connection details with your data source administrator and try again.

Google BigQuery

The Google BigQuery connector provides read-only access to data and metadata from the Google BigQuery data warehouse service.

A connection admin can set up a connection to Google BigQuery in the Workflow Data Fabric Hub and grant data stewards access to this connection. Data stewards can then use the established connection to create a data fabric table and map data from Google BigQuery. This allows users to access Google BigQuery data through the table list view or by using GlideRecord scripts. For details on creating data fabric tables and mapping data, see Managing data fabric tables in Workflow Data Fabric Hub.

The connector has been enhanced to improve the performance of the following Glide queries and list view operations. These improvements allow the majority of queries to be executed at the data source.

Field	Description
Short description	Description of the connection explaining what it is about.

4. Enter the full Google Cloud service account JSON key used for authentication.
   You can obtain the JSON key from the Google Cloud Console when you create a service account.

5. Select **Connect**.

Result
A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next
If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

If the connection fails, verify the connection details with your data source administrator and try again.

Oracle

The Oracle connector provides read-only access to data and metadata from an Oracle database.

A connection admin can set up a connection to Oracle in the Workflow Data Fabric Hub and grant data stewards access to this connection. Data stewards can then use the established connection to create a data fabric table and map data from Oracle. This allows users to access Oracle data through the table list view or by using GlideRecord scripts. For details on creating data fabric tables and mapping data, see Managing data fabric tables in Workflow Data Fabric Hub.

The connector has been enhanced to improve the performance of the following Glide queries and list view operations. These improvements allow the majority of queries to be executed at the data source.

About this task

Work with your data source admin to create a connection to Amazon Redshift. For additional information about connecting to Amazon Redshift, refer to the Amazon Redshift documentation.

Procedure

1. Navigate to the available primary connectors in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
2. Find the Amazon Redshift connector and select **Connect**.
3. On the form, fill in the fields.

New Amazon Redshift Connection form

Field	Description
Name and description	
Connection label	Unique name for this connection. This helps in identifying the connection within your system.
Connection name	System-generated name based on the Connection label. This field cannot be modified once the connection is established.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Short description	Description of the connection explaining what it is about.
Connection attributes	
Connection URL	JDBC URL to establish the connection. For example: `jdbc:redshift://<host>:<port>`
Database	Name of the database that you want to connect to.
Enable table statistics	Option to enable table statistics. Optimize SQL queries using table statistics by selecting this option. Enabling table statistics allows the system to use estimates of stored data such as row count, distinct values, and data size for enhanced query processing. **Note:** You must ensure that gathering table statistics is enabled in the data source before selecting this option.
Authentication method	
Access key ID	Access key ID associated with the source.
Secret access key	Secret access key associated with the access key ID.

4. Select **Connect**.

Result
A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next
If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

If the connection fails, verify the connection details with your data source administrator and try again.

SAP ECC

The SAP ECC connector provides read-only access to data and metadata from an SAP ECC system.

A connection admin can set up a connection to SAP ECC in the Workflow Data Fabric Hub and grant data stewards access to this connection. Data stewards can then use the established connection to create a data fabric table and map data from SAP ECC. This allows users to access SAP ECC data through the table list view or by using GlideRecord scripts.

For details on implementation, refer to .

Before you begin

Role required: df_connection_admin

Procedure

1. Navigate to the available primary connectors in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
2. Find the SAP ECC connector and select **Connect**.
3. On the form, fill in the fields.

New SAP ECC Connection form

Field	Description
Name and description	
Connection label	Unique name for this connection. This helps in identifying the connection within your system.
Connection name	System-generated name based on the Connection label. This field cannot be modified once the connection is established.
Short description	Description of the connection explaining what it is about.
Connection attributes	
Instance URL	URL of your local instance.
Authentication methods	
ServiceNow username	Username of the current user accessing your local instance.
ServiceNow user password	Password of the current user accessing your local instance.

4. Select **Connect**.

Result

A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next

If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the connection fails, verify the connection details with your data source administrator and try again.

SAP S/4HANA

The SAP S/4HANA connector provides read-only access to data and metadata from an SAP S/4HANA system.

A connection admin can create a connection to SAP S/4HANA and give data stewards access to that connection in Workflow Data Fabric Hub. A data steward can select the established connection to create a data fabric table and map data from SAP S/4HANA. This allows users to retrieve SAP S/4HANA data through the table list view or GlideRecord scripts.

For details on implementation, refer to .

Field	Description
ServiceNow username	Username of the current user accessing your local instance.
ServiceNow user password	Password of the current user accessing your local instance.

4. Select **Connect**.

Result
A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next
If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

If the connection fails, verify the connection details with your data source administrator and try again.

Teradata

The Teradata connector provides read-only access to data and metadata from a Teradata source.

A connection admin can set up a connection to Teradata in the Workflow Data Fabric Hub and grant data stewards access to this connection. Data stewards can then use the established connection to create a data fabric table and map data from Teradata. This allows users to access Teradata data through the table list view or by using GlideRecord scripts. For details on creating data fabric tables and mapping data, see Managing data fabric tables in Workflow Data Fabric Hub.

The connector has been enhanced to improve the performance of the following Glide queries and list view operations. These improvements allow the majority of queries to be executed at the data source.

- Sort
- Limit
- Filter
- GroupBy
- avg()
- count()
- max()
- min()
- sum()
- References

Supported data types

The following table lists supported Teradata data types and the default matching data types in a data fabric table.

Amazon S3 Tables

The Amazon S3 Tables connector provides read-only access to data and metadata in Amazon S3 Tables.

A connection admin can set up a connection to Amazon S3 Tables in the Workflow Data Fabric Hub and grant data stewards access to this connection. Data stewards can then use the established connection to create a data fabric table and map data from S3 Tables. This allows users to access data in S3 Tables through the table list view or by using GlideRecord scripts. For details on creating data fabric tables and mapping data, see Managing data fabric tables in Workflow Data Fabric Hub.

The connector has been enhanced to improve the performance of the following Glide queries and list view operations. These improvements allow the majority of queries to be executed at the data source.

About this task

Work with your data source admin to create a connection to Amazon S3 Tables. For additional information about connecting to Amazon S3 Tables, refer to the Amazon S3 Tables documentation.

Procedure

1. Navigate to the available primary connectors in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
2. Find the Amazon S3 Tables connector and select **Connect**.
3. On the form, fill in the fields.

New Amazon S3 Tables Connection form

Field	Description
Name and description	
Connection label	Unique name for this connection. This helps in identifying the connection within your system.
Connection name	System-generated name based on the Connection label. This field cannot be modified once the connection is established.
Short description	Description of the connection explaining what it is about.
Connection attributes	
Iceberg Rest Catalog URI	URI of Iceberg Rest Catalog to connect to the AWS S3 Tables Rest endpoint. For example: `https://s3tables.<region>.amazonaws.com/iceberg`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Authentication methods	
S3 Table bucket ARN	Amazon Resource Name (ARN) of your S3 Tables warehouse. For example: `arn:aws:s3tables:<region>:<account-id>:bucket/<bucket-name>`
S3 Region	Amazon S3 Tables region.
S3 Access Key	Amazon S3 Tables access key used to connect.
S3 Secret Access Key	Amazon S3 Tables Secret Access key used to connect.

4. Select **Connect**.

Result
A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next
If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

If the connection fails, verify the connection details with your data source administrator and try again.

Apache Iceberg

The Apache Iceberg connector provides read-only access to data and metadata in the Iceberg format.

A connection admin can set up a connection to Apache Iceberg in the Workflow Data Fabric Hub and grant data stewards access to this connection. Data stewards can then use the established connection to create a data fabric table and map data from Apache Iceberg. This allows users to access Apache Iceberg data through the table list view or by using GlideRecord scripts. For details on creating data fabric tables and mapping data, see Managing data fabric tables in Workflow Data Fabric Hub.

The connector has been enhanced to improve the performance of the following Glide queries and list view operations. These improvements allow the majority of queries to be executed at the data source.

1. Navigate to the available primary connectors in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Available connectors** > **Primary connectors**.
2. Find the ServiceNow Remote Instance connector and select **Connect**.
3. On the form, fill in the fields.

New ServiceNow Remote Instance Connection form

Field	Description
Name and description	
Connection label	Unique name for this connection. This helps in identifying the connection within your system.
Connection name	System-generated name based on the Connection label. This field cannot be modified once the connection is established.
Short description	Description of the connection explaining what it is about.
Connection attributes	
Connection URL	HTTPS URL of the remote ServiceNow instance to establish the connection. For example: `https://<host>.service-now.com`
Authentication method	
OAuth Client ID	Client ID generated by the remote ServiceNow instance for the OAuth application. For example: `TRINO_CONNECTOR_OAUTH_CLIENT`
OAuth Client Secret	Client secret associated with the Client ID for the remote ServiceNow instance OAuth application.
Username	Username of the service account for the remote ServiceNow instance. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`abel.tuter`
Password	Password of the service account for the remote ServiceNow instance.

4. Select **Connect**.

Result
A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next
If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

If the connection fails, verify the connection details with your data source administrator and try again.

Community connectors

Connect to external data sources using community connectors in Workflow Data Fabric Hub.

Community connectors are developed by the open-source community and made available through the ServiceNow AI Platform for general use.

- Community connectors are certified by ServiceNow for essential or baseline functionality. However, their functionality can vary and might not cover all use cases supported by primary connectors.
- Community connectors aren't maintained by ServiceNow, nor included in the ServiceNow support scope.
- Community connectors aren't eligible for support or case resolution.

Community connectors and compatibility

Community connector	Minimum compatibility
Apache Cassandra	Yokohama Patch 5
Apache Hive	Yokohama Patch 5
Apache Hudi	Yokohama Patch 5
Delta Lake	Yokohama Patch 5
Exasol	Yokohama Patch 5
MariaDB	Yokohama Patch 5
Microsoft SQL Server	Yokohama Patch 5
MongoDB	Yokohama Patch 5
MySQL	Yokohama Patch 5
OpenText Analytics Database (Vertica)	Yokohama Patch 5
PostgreSQL	Yokohama Patch 5, Zurich

Community connectors and compatibility (continued)

Community connector	Minimum compatibility
SingleStore	Yokohama Patch 5

Apache Cassandra

The Apache Cassandra connector provides read-only access to data and metadata in a Cassandra database.

A connection admin can create a connection to Apache Cassandra and give data stewards access to that connection in Workflow Data Fabric Hub. A data steward can select the established connection to create a data fabric table and map data from Apache Cassandra. This allows users to retrieve Apache Cassandra data through the table list view or GlideRecord scripts. For details on creating data fabric tables and mapping data, see Managing data fabric tables in Workflow Data Fabric Hub.

Related topics

Create an Apache Cassandra connection

Create an Apache Cassandra connection

Establish a zero copy connection to an Apache Cassandra database in Workflow Data Fabric Hub.

Before you begin

You can optimize queries to Apache Cassandra by enabling table statistics. Consult your data source admin to confirm whether table statistics are enabled in Apache Cassandra before enabling this option in Workflow Data Fabric Hub.

Role required: df_connection_admin

About this task

Note:
This connector was developed by the open-source community and made available through the ServiceNow AI Platform for general use. Functionality can vary and might not cover all use cases supported by primary connectors.

Procedure

1. Navigate to the available community connectors in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Available connectors** > **Community connectors**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Available connectors** > **Community connectors**.
2. Find the Apache Cassandra data source and select **Connect**.
3. On the form, fill in the fields.

New Apache Cassandra Connection form

Field	Description
Name and description	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection label	Unique name for this connection. This helps in identifying the connection within your system.
Connection name	System-generated name based on the Connection label. This field cannot be modified once the connection is established.
Short description	Description of the connection explaining what it is about.
Connection attributes	
Connection URL	URL to establish the connection.
Port	Port used in the connection.
Datacenter	Datacenter that you want to connect to.

4. Configure secure authentication by uploading a keystore file or by entering the keystore details manually.

5. Enter the keystore password.
6. Enter the data source username and password.
7. Select **Connect**.

Result
A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next
If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

If the connection fails, verify the connection details with your data source administrator and try again.

Apache Hive

The Apache Hive connector provides read-only access to data and metadata from a Hive data warehouse.

A connection admin can create a connection to Apache Hive and give data stewards access to that connection in Workflow Data Fabric Hub. A data steward can select the established connection to create a data fabric table and map data from Apache Hive. This allows users to retrieve Apache Hive data through the table list view or GlideRecord scripts. For details on creating data fabric tables and mapping data, see Managing data fabric tables in Workflow Data Fabric Hub.

About this task

Note:
This connector was developed by the open-source community and made available through the ServiceNow AI Platform for general use. Functionality can vary and might not cover all use cases supported by primary connectors.

Procedure

1. Navigate to the available community connectors in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Available connectors** > **Community connectors**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Available connectors** > **Community connectors**.
2. Find the PostgreSQL connector and select **Connect**.
3. On the form, fill in the fields.

New PostgreSQL Connection form

Field	Description
Name and description	
Connection label	Unique name for this connection. This helps in identifying the connection within your system.
Connection name	System-generated name based on the Connection label. This field cannot be modified once the connection is established.
Short description	Description of the connection explaining what it is about.
Connection attributes	
Connection URL	JDBC URL to establish the connection. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`jdbc://postgresql://<host>:<port>/database-name?ssl=true&sslmode=require`
Authentication method	
Username	Username associated with the source.
Password	Password associated with the username.

4. Select **Connect**.

Result
A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next
If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

If the connection fails, verify the connection details with your data source administrator and try again.

SingleStore

The SingleStore connector provides read-only access to data and metadata from a SingleStore database.

A connection admin can create a connection to SingleStore and give data stewards access to that connection in Workflow Data Fabric Hub. A data steward can select the established connection to create a data fabric table and map data from SingleStore. This allows users to retrieve SingleStore data through the table list view or GlideRecord scripts. For details on creating data fabric tables and mapping data, see Managing data fabric tables in Workflow Data Fabric Hub.

Related topics

Create a SingleStore connection

Create a SingleStore connection

Establish a zero copy connection to an external SingleStore database in Workflow Data Fabric Hub.

Before you begin
Role required: df_connection_admin

About this task
Note:
This connector was developed by the open-source community and made available through the ServiceNow AI Platform for general use. Functionality can vary and might not cover all use cases supported by primary connectors.

Procedure

1. Navigate to the available community connectors in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Available connectors** > **Community connectors**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Available connectors** > **Community connectors**.
2. Find the SingleStore connector and select **Connect**.
3. On the form, fill in the fields.

New SingleStore Connection form

Field	Description
Name and description	
Connection label	Unique name for this connection. This helps in identifying the connection within your system.
Connection name	System-generated name based on the Connection label. This field cannot be modified once the connection is established.
Short description	Description of the connection explaining what it is about.
Connection attributes	
Connection URL	JDBC URL to establish the connection. For example: `jdbc:singlestore://<host>:<port>/schema?useSsl=true`
Authentication method	
Username	Username associated with the source.
Password	Password associated with the username.

4. Select **Connect**.

Result

A test connection is made to the external data source, verifying that the connection details are correct and the data source is accessible.

What to do next

If the connection succeeds, configure data steward access on the **Access Control** tab. See Manage access to an established connection using roles.

If the connection fails, verify the connection details with your data source administrator and try again.

Manage access to an established connection using roles

Manage which data stewards can access an established connection and create data fabric tables.

Before you begin

Role required: df_connection_admin

About this task

Access to a zero copy connection in Workflow Data Fabric Hub is controlled by the connection admin. The connection admin grants access using custom roles that identify the data stewards responsible for managing the quality and integrity of the data provided by the connection.

For example, an instance admin can create a custom role for an application and assign it to each of the data stewards who manage the data for that application. Once the role and the data stewards are defined, a connection admin can add the custom role to an established connection. When a custom role is added to the connection, it inherits the df_data_steward role, which grants access to the data stewards who have the custom role.

Note:
Data stewards can access an established connection if they have a role that inherits the df_data_steward role. Users who are granted the df_data_steward role directly can view the Workflow Data Fabric Hub but can't access any established connections.

Procedure

1. Navigate to the **Established connections** tab in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Established connections**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Established connections**.
2. Select the connection that you want to configure.
3. Select the **Access Control** tab.
4. **Optional:** Grant data steward access by adding one or more roles.
   a. Select **Manage Access**.
   b. Browse or search for the role that you want to configure.
   c. Select the check box next to the role.
   d. **Optional:** Search and add additional roles as needed.
   e. Select **Save changes**.
5. **Optional:** Remove data steward access from one or more roles.
   a. Select **Manage Access**.
   b. Browse or search for the role that you want to update.
   c. Clear the check box next to the role that you want to remove.
   d. **Optional:** Search and remove additional roles as needed.
   e. Select **Save changes**.

Result

The df_data_steward role is granted to or removed from the selected roles. Each data steward with a role that contains the df_data_steward role can access the connection to create data fabric tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Assigning data steward access to separate connections

1. The connection admin creates separate connections for accessing external ITSM and finance data in Workflow Data Fabric Hub.
2. The instance admin creates the following custom roles in the ServiceNow AI Platform:
   - df_ITSM_data_steward
   - df_FINANCE_data_steward
3. The instance admin identifies the users who are responsible for creating and maintaining data fabric tables for the ITSM and finance applications.
4. The instance admin assigns the ITSM users to the df_ITSM_data_steward role and the finance users to the df_FINANCE_data_steward role.
5. The connection admin grants the df_data_steward role to ITSM data stewards by adding to the df_ITSM_data_steward role to the ITSM connection in Workflow Data Fabric Hub.
6. The connection admin grants the df_data_steward role to finance data stewards by adding the df_FINANCE_data_steward role to the finance connection in Workflow Data Fabric Hub.

After access is granted, ITSM data stewards can only access and manage external ITSM data, while finance data stewards can only access and manage external finance data.

View data assets from an established connection

View the external schema and tables that are accessible to the service account used in a zero copy connection.

Before you begin

Role required: df_connection_admin or a role containing the df_data_steward role

Procedure

1. Navigate to the **Established connections** tab in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Established connections**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Established connections**.
2. Select the connection with data assets that you want to view.
3. Select the **Data Assets** tab.
4. Browse or search for available data assets in the schema explorer.
5. **Optional:** View the data fabric tables that are currently mapped to a source table.
   a. Select a source table in the schema explorer.
   b. Select the **Data fabric tables** sub-tab.
6. **Optional:** View the available columns in a source table.
   a. Select a source table in the schema explorer.
   b. Select the **Columns** sub-tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Identify the tables and columns that you want to map to a data fabric table.
- Create a data fabric table and map source columns to the target table. See Managing data fabric tables in Workflow Data Fabric Hub.
- Consult with the data source administrator if the required schema and tables aren't available from this connection.

Monitoring established connections

Maintain the health of established connections by monitoring connection status in Workflow Data Fabric Hub.

Determine whether a connection requires an update by checking the status on the **Established connections** tab.

Connected

The connection to the data source has been tested and established.

Deactivated

The connection to the data source has been deactivated by the connection admin.

Needs configuration

The connection attributes or authentication information are missing from the connection details.

Needs mapping

The connection has been tested and established, but the data isn't mapped to a data fabric table.

Not connected

The connection details have been added, but the connection to the data source isn't working.

Update an established connection

Keep connection details current by updating service account information, authentication, or security settings.

Before you begin

Role required: df_connection_admin

Procedure

1. Navigate to the **Established connections** tab in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Established connections**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Established connections**.
2. Select the connection that you want to configure.
3. Update the connection details.

> **Important:**
> Changing connection details can affect data mapping in the data fabric tables created using this connection. If you need to preserve the current data mapping, consult the data source administrator before updating the connection to ensure the data mapping isn't affected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Edit**.

b. **Optional:** Update the connection identification.

(Optional) For example, update the connection description if data stewards can't find the connection or if the data source admin adds new data assets.

c. **Optional:** Update the connection attributes.
For example, you might update the connection attributes if the connection URL or service account information changes.

d. **Optional:** Update the authentication method or private key information.
For example, update the private key and pass phrase when the private key changes or is no longer valid.

e. In the confirmation dialog box, confirm that you want to make the changes by selecting **Edit**.

4. Select **Save and connect**.

Result
The system tests the connection. If connection succeeds, the changes are saved.

What to do next
If the connection fails, View the connection log. Review the connection details with the data source admin and try again.

If your changes impact data fabric tables, ensure the proper access is configured on the **Access Controls** tab.

View the connection log

Monitor and troubleshoot a connection by viewing the connection log.

Before you begin
Role required: df_connection_admin

Procedure
1. Navigate to the **Established connections** tab in the Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Established connections**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Established connections**.
2. Select the connection that you want to monitor.
3. Select the More Actions icon ( ), and select **View Connection Logs**.

Result
The Data Fabric Logs [df_log] table appears, displaying log entries for the current day related to this connection.

What to do next
Review the log entries and consult your data source administrator if necessary. Update the connection details if any connection attributes are incorrect. See Update an established connection.

Deactivate a connection

Temporarily disable the connection between data fabric tables and their data source by deactivating a connection.

Before you begin
Role required: df_connection_admin

About this task
A connection admin can stop queries to an external data source or prevent changes to data mapping by deactivating a connection. When a connection is deactivated, external data isn't available from any data fabric tables using the connection.

Procedure
1. Navigate to the **Established connections** tab in the Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Established connections**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Established connections**.
2. Select the connection that you want to deactivate.
3. Select the More Actions icon ( ), and select **Deactivate**.
4. Confirm that you want to deactivate the connection by selecting **Deactivate**.

Result
The connection is deactivated.

- External data is no longer pulled by any data fabric table using the connection.
- The **Data Assets** tab and **Access Control** tabs aren't accessible in the connection.

What to do next
To update the connection information or access the **Data Assets** or **Access Control** tabs again, you must reactivate the connection. See Reactivate a connection.

Reactivate a connection

Manage data assets and access control in a deactivated connection by reactivating it.

Before you begin
Role required: df_connection_admin

About this task
A connection admin can reactivate a connection that's been temporarily deactivated.

Procedure
1. Navigate to the **Established connections** tab in the Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Established connections**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Established connections**.
2. Select the connection that you want to reactivate.

Note:
View all deactivated connections by selecting **Deactivated** in the **Status** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Reactivate**.
4. **Optional:** Review and update connection details as needed.
5. Select **Save and connect**.

Result
The connection is activated.

- External data is pulled by any data fabric table using the connection.
- The **Data Assets** tab and **Access Control** tabs are accessible in the connection.

Delete a connection

Remove an established connection and its data fabric tables.

Before you begin
Role required: df_connection_admin

About this task
A connection admin can remove an established connection from the Workflow Data Fabric Hub by deleting the connection. To delete the connection, you must delete all the data fabric tables using the connection first.

Procedure
1. Navigate to the **Established connections** tab in the Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Established connections**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Established connections**.
2. Select the connection that you want to delete.
   The current connection information is displayed on the **Connection details** tab.
3. Delete the connection immediately if it doesn't have any associated tables or delete the associated tables and then delete the connection.

Option	Description
Delete a connection without any associated tables	**a.** Select the More Actions icon ( ), and select **Delete**. **b.** In the confirmation dialog box, select **Delete**.
Delete a connection with associated tables	**a.** Select the More Actions icon ( ), and select **Delete**. **b.** In the message that appears about deleting associated tables, select **View tables**. **c.** In the **Data fabric tables** tab, delete each associated table by selecting the More Actions icon ( ), and selecting **Delete**. **d.** Navigate back to **Established connections**. **e.** Select the connection that you want to delete again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	f. Select the More Actions icon ( ), and select **Delete**. g. In the confirmation dialog box, select **Delete**.

Result
The connection and any associated tables are deleted from the Workflow Data Fabric Hub.

Test an established connection

Test the connection to an external data source from an established connection.

Before you begin
Role required: df_connection_admin

Procedure

1. Navigate to the **Established connections** tab in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Established connections**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Established connections**.
2. Select the connection that you want to test.
3. Select **Test connection**.

Result
The test connection succeeds or fails. If the connection fails, consult your database administrator to verify the connection attributes and authentication details. Make any necessary changes, and then try again.

Managing data fabric tables in Workflow Data Fabric Hub

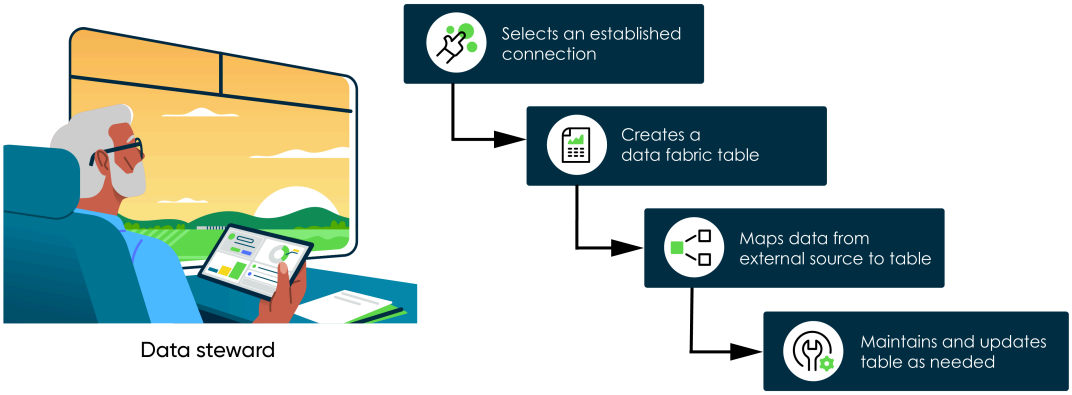
Access data virtually from an external source or a local table on your instance using data fabric tables in Workflow Data Fabric Hub.

Overview of managing data fabric tables

A data fabric table is a virtual representation of data stored in another source, accessible within the ServiceNow AI Platform. It enables users to interact with data from another source as if it's stored locally, without duplicating the data.#Data stewards are responsible for creating and managing data fabric tables using the process shown in this infographic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating and managing data fabric tables



Viewing data fabric tables

View a list of all the data fabric tables that data stewards have created on the **Data fabric tables** tab.

- Search for a data fabric table by label or name.
- Filter the list of tables by data source and connection.
- Filter the list of tables by creator.
- View a list of data fabric tables from active connections in the **Active** tab.
- View a list of data fabric tables from connections that are deactivated or not configured in the **Others** tab.

Defining primary keys

A primary key is used to indicate uniqueness and identify records in a data fabric table. Designating a column as a primary key enables you to create references to that column from other data fabric tables. When mapping data in a new data fabric table, primary keys from the source table are automatically defined in the target data fabric table. If the source table doesn't have a primary key, you can create one in the target table by choosing a column with unique values.

Note the following details when defining primary keys:

- Selecting a primary key doesn't enforce primary key constraints on the data fabric table or on the remote system. You must verify that records identified by the primary key are unique.
- Once you define a primary key, it can't be removed. If you determine that you need to change the primary key later, you must delete and recreate the data fabric table first.
- If you decide not to define a primary key when creating a data fabric table, you can do so by editing the table later. Note that without a primary key, you can't create references to this table and searches won't work until a primary key is defined.
- For every primary key column identified in the source table, a corresponding primary key is automatically created in the data fabric table. Once the data fabric table is created, you can't modify the primary keys that were derived from the source table.
- You can't use a reference column as a primary key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reference tables

When mapping external source columns to a data fabric table, you can add references to other tables. Establishing references between tables creates a relationship between the two tables and provides data integrity. A data fabric table can reference another data fabric table or a local table on your instance. A local table can also reference a data fabric table.

Note the following requirements when creating references between tables:

- To reference a local table on your instance from a data fabric table, an instance administrator must create an ACL rule with the data_fabric record operation on the local table. For example, to create a reference to the User [sys_user] table, the following ACL rule is required:
  - Type: record
  - Operation: data_fabric
  - Name: User [sys_user]

  For details on creating a record ACL rule, see Configure an ACL rule.
- To see values in a reference column when viewing records in the new data fabric table, you must set the Display attribute to true for the referenced column. You can manage this attribute in the referenced table's definition. See Select a field as the table display value.
- Ensure the referenced table has at least one primary key column.
- Ensure the primary key column in the referenced table contains unique values.
- Ensure the primary key column matches the data type of the source column.

Table queries

Records retrieved from a data stored and stored in a data fabric table have a finite duration, or life cycle, within the ServiceNow AI Platform.

After a data fabric table is connected to a data source, each time the data fabric table is viewed or accessed, a new query is made to the data source. The retrieved data lives in memory for as long as the list or form appears. After you close the list or form, that retrieved data is purged from memory. The next time that you use or view the retrieved data in the data fabric table, records are repopulated from the data source.

Data fabric table limitations

- When mapping data, ensure that the data source does not use case-sensitive table names. For example, if both MY_TABLE and my_table exist in the database, the schema will not load because the system cannot differentiate between the tables.
- When creating a reference to another table, you can only select one primary key column as the reference key. You can't select a composite key as the reference key.
- When creating a reference to another table, you can only reference a table that has one primary key defined.

For additional data fabric table limitations, see KB2017730.

Create a data fabric table

Retrieve data from an internal or external source by creating a data fabric table.

About this task

Unlike a remote table, a data fabric table uses a zero copy connection to its data source, eliminating the need for a script to populate the table. This connection allows you to access the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

data source directly, map the data you need, and create a data fabric table for data consumers on the ServiceNow AI Platform.

With a data fabric table, you can retrieve data from either an internal or external data source.

- Connect the data fabric table to your local database to reuse data from a physical table on your instance.
- Connect the data fabric table to an outside data source, such as a data lake or third-party database, to retrieve data that resides outside of your instance.

Before you begin

Role required: One of the following role combinations or admin.

- delegated_developer with sn_dd_<application_scope_name>_tablesforms OR sn_dd_<application_scope_name>_delegatedadmin, and a role containing the df_data_steward role
- delegated_developer with sn_dd_<application_scope_name>_tablesforms OR sn_dd_<application_scope_name>_delegatedadmin, and df_connection_admin

Read access to table records is automatically added to users with either of the delegated developer roles.

Note the following restrictions:

- Only a user with the admin role can create a data fabric table in the global scope.
- A data steward with the delegated_developer and the sn_dd_<application_scope_name>_tablesforms roles can create data fabric tables in the permitted application scope. These roles enable a data steward to create data fabric tables in an application scope if they have permissions for that application, but not in the global scope.

Procedure

1. Navigate to the established connections in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Overview**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Established connections**.
2. Select the established connection that you want to use.
3. On the connection page, select the **Data assets** tab.
4. In the list of data assets, select the source table that you want to pull data from.
5. Select **Create data fabric table**.
6. Enter a label for the data fabric table and select **Continue**.
7. Map one or more columns from the source table to the data fabric table.
   Each column that you select is automatically created in the data fabric table with the same name and data type.
8. **Optional:** Allow other tables to reference this table by defining a primary key using the Primary Key toggle switch.

   Note:
   Primary key columns detected in the source table are automatically selected as primary keys in the target table. If a primary key isn't detected in the source table automatically, you can select a column with unique values that you want to use as the primary key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Selecting a primary key doesn't enforce primary key constraints on the data fabric table or on the remote system. You must verify that records identified by the primary key are unique.
- Once you define a primary key, it can't be removed. If you determine that you need to change the primary key later, you must delete and recreate the data fabric table first.
- If you decide not to define a primary key when creating a data fabric table, you can do so by editing the table later. Note that without a primary key, you can't create references to this table and searches won't work until a primary key is defined.
- For every primary key column identified in the source table, a corresponding primary key is automatically created in the data fabric table. Once the data fabric table is created, you can't modify the primary keys that were derived from the source table.
- You can't use a reference column as a primary key.

9. **Optional:** Link data between tables by creating a reference to another table.
   - To reference a local table on your instance from a data fabric table, an instance administrator must create an ACL rule with the data_fabric record operation on the local table. For example, to create a reference to the User [sys_user] table, the following ACL rule is required:
     - Type: record
     - Operation: data_fabric
     - Name: User [sys_user]

     For details on creating a record ACL rule, see Configure an ACL rule.
   - To see values in a reference column when viewing records in the new data fabric table, you must set the Display attribute to true for the referenced column. You can manage this attribute in the referenced table's definition. See Select a field as the table display value.

   a. Identify the column that represents the same records in both tables.

   b. In the Type column, change the column type to **Reference**.

   c. Select **Set reference**.

   d. In the Set Reference Label dialog box, enter the name of the table that you want to reference in the Table field.

   > **Note:**
   > Only tables with a single primary key appear in the list.

   e. In the Set Reference Label dialog box, select the primary key column that you want to use in the Reference key field.

   f. Finish configuring the reference by selecting **Set reference**.

10. Select **Finish**.

Result
The data fabric table is created and connected to a data source. Data consumers can access the data fabric table and its data just like any physical table on the instance.

Update data mapping in a data fabric table

Update the data mapping between a source table and a data fabric table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: One of the following role combinations or admin.

- delegated_developer with sn_dd_<application_scope_name>_tablesforms OR sn_dd_<application_scope_name>_delegatedadmin, and a role containing the df_data_steward role
- delegated_developer with sn_dd_<application_scope_name>_tablesforms OR sn_dd_<application_scope_name>_delegatedadmin, and df_connection_admin

About this task

A data steward might need to update the field mapping for a data fabric table in the following scenarios:

- The data source administrator notifies the connection admin or data steward about a schema change in the external data source.
- A field in the data fabric table isn't named correctly.
- The data steward wants to create a relationship with another data fabric table by adding a reference column.
- A data steward wants to create a reference to the current data fabric table from another table but needs to designate a primary key in the current table first.

Procedure

1. Navigate to the **Data fabric tables** tab in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Data fabric tables**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Data fabric tables**.
2. Find the data fabric table that you want to update and select **Edit**.
3. Add or remove mapped columns from the external source.
   - In the list of source columns, select the check box for each column that you want to add to the data fabric table. Each column that you select is automatically created in the data fabric table with the same name and data type.
   - In the list of source columns, clear the check box for each column that you want to remove from the data fabric table.
4. **Optional:** Update a field's display name by changing the column label.
   You can only change the label and not the column name.
5. **Optional:** Add or remove references to other tables.
   - To reference a local table on your instance from a data fabric table, an instance administrator must create an ACL rule with the data_fabric record operation on the local table. For example, to create a reference to the User [sys_user] table, the following ACL rule is required:
     - Type: record
     - Operation: data_fabric
     - Name: User [sys_user]

     For details on creating a record ACL rule, see Configure an ACL rule.
   - To see values in a reference column when viewing records in the new data fabric table, you must set the Display attribute to true for the referenced column. You can manage this attribute in the referenced table's definition. See Select a field as the table display value.

Option	Description
Add a reference	**a.** In the Type column, change the column type to **Reference**. **b.** Select **Set reference**. **c.** In the Set Reference Label dialog box, en ter the name of the table that you want to reference. **d.** In the Set Reference Label dialog box, se lect a primary key in the Reference key field. **e.** Select **Set reference**.
Remove a reference	In the Type column, change the column type from **Reference** back to the data type that matches the source column.

6. **Optional:** Add or remove a primary key from the data fabric table using the Primary Key toggle switch.
   If the current table will be referenced by another data fabric table, you must select a primary key to use as the reference.
7. Select **Finish**.

Delete a data fabric table

Remove a data fabric table from your instance by deleting it.

Before you begin

Role required: One of the following role combinations or admin.

- delegated_developer with sn_dd_<application_scope_name>_tablesforms OR sn_dd_<application_scope_name>_delegatedadmin, and a role containing the df_data_steward role
- delegated_developer with sn_dd_<application_scope_name>_tablesforms OR sn_dd_<application_scope_name>_delegatedadmin, and df_connection_admin

Procedure

1. Navigate to the **Data fabric tables** tab in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Data fabric tables**
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Data fabric tables**.
2. Delete a data fabric table.
   a. Find the data fabric table that you want to delete.
   b. Select the More Actions icon ( ), and select **Delete**.
   c. Confirm that you want to remove the table by selecting **Delete**.

Result

The data fabric table is deleted and its data is no longer available on your instance.

View data fabric table records

View the records that are currently in a data fabric table.

Before you begin

Role required: none

Note that you must have read access to view records from a data fabric table in a list view.

Procedure

1. Navigate to the **Data fabric tables** tab in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Data fabric tables**
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Data fabric tables**.
2. Find the data fabric table that you want to view.
3. Select the More Actions icon ( ), and select **Open list**.

Result

The data source is queried and the data fabric table opens in a list view displaying records from the data source.

Change the connection in a data fabric table

Connect a data fabric table to a different data source.

Before you begin

Role required: a role containing the df_data_steward role in both the established connection and the new connection

Procedure

1. Navigate to the **Data fabric tables** tab in Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Data fabric tables**.
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Data fabric tables**.
2. Find the data fabric table that you want to update.
3. Select the More Actions icon ( ), and select **Change connection**.
   - A data fabric table with multiple primary keys can only use its current connection. To change the connection, you must delete and recreate the table with the data source that you want to use.
   - A data fabric table with a connection that still needs configuration or is deactivated can't use a different connection. You must finish configuring the connection or activate the current connection before you can change it.
4. Choose an established connection for the data source that you want to use and select **Continue**.
5. Select the source table with the data that you need.
6. Map source table columns to the existing columns in the data fabric table.
7. Select **Finish**.

Deploying a data fabric table from one instance to another

Copy a data fabric table from one instance to another through an update set.

You can capture a data fabric table configuration, including the table identification information and column mapping, and then copy it to another instance using an update set. A connection admin must reestablish the connection on the target instance after importing the update set.

For details on using update sets, see Get started with update sets.

Accessing real-time data in applications

Fetch real-time data using a data fabric table instead of using the physical table included with an application.

Overview of data fabric tables in applications

An application developer can package both a physical table and a predefined data fabric version of the same table within a single application. The data fabric table has the same definition and columns as the physical table, but can access external data using a zero copy connection. This gives the instance admin flexibility to choose how to populate the table. For example, the instance admin can use any of the following methods:

- Use the physical table and enter data manually.
- Use the physical table and import data using Integration Hub.
- Use the predefined data fabric table to connect to an outside source and fetch external data without storing it permanently.
- Use the predefined data fabric table to connect to a physical table on the instance and fetch data from that table without copying it permanently.

By default, a data fabric table included with an application retrieves data from a physical table in the same application using the ServiceNow local instance connector. This makes a snapshot of the latest physical table data accessible from the data fabric table in lists, forms, or scripts when needed.

The instance admin can choose to keep the predefined data fabric table connected to its physical table or change the connection to retrieve external data or data from a different physical table.

Connecting to an external data source using requires coordination between the instance admin, connection admin, and data steward. To configure this type of data fabric table, follow the process shown in this infographic.

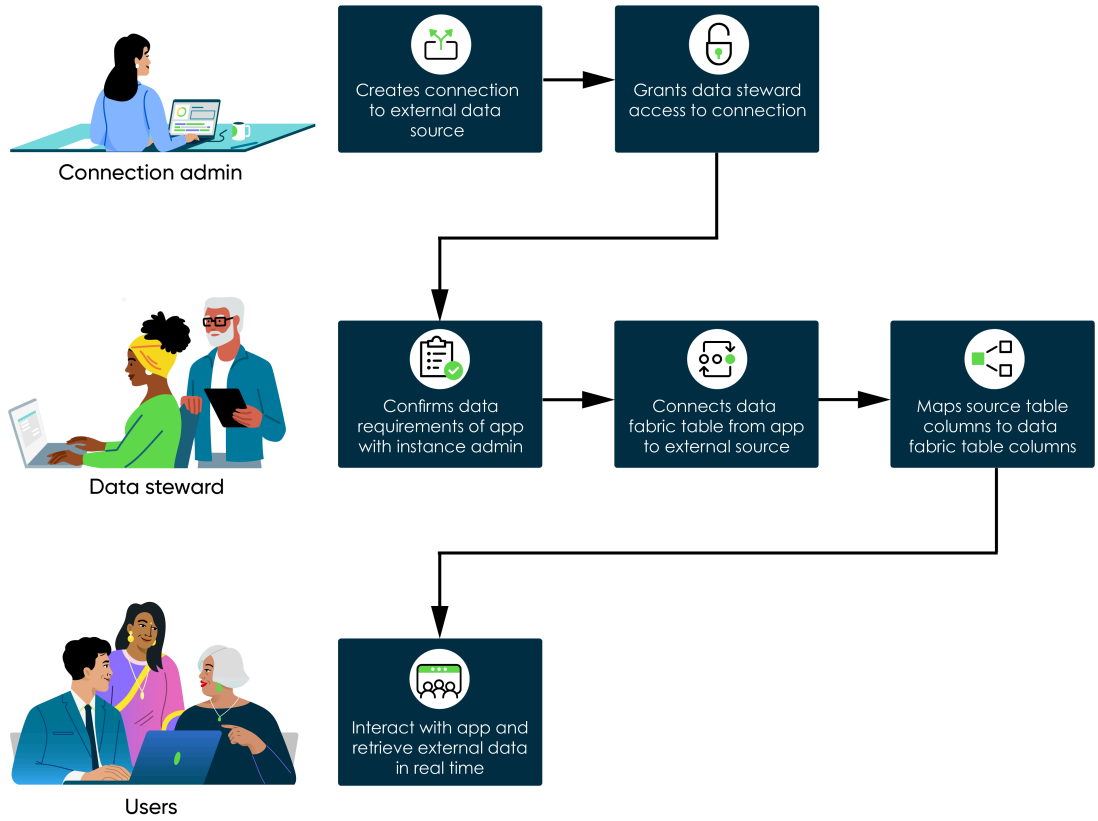
Connecting a predefined data fabric table to an external data source



In this workflow:

1. The connection admin creates a connection to an external source and enables the data steward to access the connection.
2. The data steward works with the instance admin to learn about the data requirements of the application.
3. The data steward connects the data fabric table from the application to an external source using the provided connection.
4. The data steward selects a source table and maps source columns to the existing columns in the data fabric table.
5. Users access the application, and interact with flows retrieving data from the external source in real-time.

Connect a predefined data fabric table to an external data source

Connect a data fabric table included with an application to an external data source.

Before you begin

- Work with the instance admin or application admin to identify the data fabric table that needs data from an external source.
- Work with the connection admin to create a connection to the external source or request access to an established connection.

Role required: a role containing the df_data_steward role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can fetch data from an external source using an application's data fabric table, instead of using the application's physical table. By using the data fabric table, users can access external data in real time, rather than accessing data that has been imported and stored in a physical table.

Procedure

1. Navigate to the **Data fabric tables** tab in the Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Data fabric tables**
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Data fabric tables**.
2. Find the data fabric table that you want to update.
3. Connect the table to an external data source.
   a. Select the More Actions icon ( ), and select **Change connection**.
   b. On the Select a connection page, select the established connection provided by the connection admin.
   c. Select **Continue**.
   A tree view of data assets appears, listing the available schema and tables in the external data source.
4. In the list of data assets, select the table that you want to fetch data from and select **Continue**.
5. Map source columns to each target column in the data fabric table.
   Because the data fabric table is predefined and belongs to an application, you can't add or remove columns when mapping data. The columns in the data fabric table are fixed.
   a. Review the label, name, and data type for each column in the target table.
   b. Select a source column with a matching data type for each target column.
6. Select **Finish**.

Result

The data fabric table is connected to the data source that you selected, with the field mapping you defined. Application users can access data from the data source in real time as if it's stored locally on the instance.

Connect a predefined data fabric table to a local table

Connect a data fabric table included with an application to a local table on your instance.

Before you begin

Identify the local table that you want to retrieve data from using the ServiceNow local instance connector.

Role required: a role containing the df_data_steward role

About this task

You can connect a data fabric table included with an application to a different physical table on your instance. After changing the connection, you can reuse the data from the physical table in your data fabric table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the **Data fabric tables** tab in the Workflow Data Fabric Hub in one of the following ways:
   - Navigate to **All** > **Workflow Data Fabric Hub** > **Data fabric tables**
   - Navigate to **Admin** > **Workflow Data Fabric Hub** > **Data fabric tables**.
2. Find the data fabric table that you want to update.
3. Connect the table to a different local table on the instance.
   a. Select the More Actions icon ( ), and select **Change connection**.
   b. On the Select a connection page, select the **ServiceNow local instance** connection.
   c. Select **Continue**.
   A tree view of data assets appears, listing the local applications and tables.
4. In the list of data assets, select the table that you want to fetch data from and select **Continue**.
5. Map source columns to each target column in the data fabric table.
   Because the data fabric table is predefined and belongs to an application, you can't add or remove columns when mapping data. The columns in the data fabric table are fixed.
   a. Review the label, name, and data type for each column in the target table.
   b. Select a source column with a matching data type for each target column.
6. Select **Finish**.

Result

The data fabric table is connected to the local table that you selected using the ServiceNow local instance connector. Application users can access real-time data from the local table using the data fabric table.

Workflow Data Fabric Hub reference

Reference topics provide information about roles and domain separation support.

Domain separation and Workflow Data Fabric Hub

Domain separation is unsupported for Workflow Data Fabric Hub. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Workflow Data Fabric Hub roles

Workflow Data Fabric Hub is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Connection administrator [df_connection_admin]

Role for creating and managing connections in Workflow Data Fabric Hub.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

A user with the df_connection_admin role can create and manage connections in Workflow Data Fabric Hub, and can also create and manage data fabric tables just like a user with the a role that contains the df_data_steward role.

Data steward [df_data_steward]

Role for creating and managing data fabric tables in Workflow Data Fabric Hub.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

When a user contains a role that inherits the df_data_steward role, the user is considered a data steward in Workflow Data Fabric Hub, and can create and manage data fabric tables. When the df_data_steward role is granted directly to a user, that user can access Workflow Data Fabric Hub, but can't create or manage any data fabric tables.
