IT Asset Management

Manage software licenses, hardware assets, and cloud assets with intuitive work flows and life cycle visibility.

IT Asset Management

Take command of your software, hardware, and cloud assets

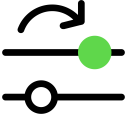

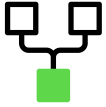

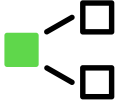

Gartner, Inc. states that organizations often face three or more software audits a year. The number of audits and lack of a consolidated asset management platform can create challenges for an organization to control and optimize software spend. Use the ServiceNow® Software Asset Management application to take command of your software assets.

Businesses need to know what assets they own, where those assets are located, who is using those assets, how often those assets are used, when those assets are being configured, how much those assets cost, and what value those assets deliver. Use the ServiceNow® Hardware Asset Management application to provide increased visibility into your asset estate and to automate the IT life cycle from procurement to disposal.

As businesses move to the cloud, they can encounter challenges when associating costs with delivered business value due to the lack of visibility into their cloud spend and usage. Use the ServiceNow® Cloud Cost Management application to gain complete visibility into the usage and costs that are associated with your cloud assets so that you can optimize operations and reduce your cloud spend.

View and download the full [Software Asset Management](#) or [Hardware Asset Management](#) infocard for a highlight of features.

	<p>Accelerate your cloud strategy and reduce costs</p> <p>Accelerate cloud implementation with a streamlined, responsive, and intuitive self-service cloud resource portal and non-intrusive policy guardrails. Reduce costs by rightsizing your cloud resources to match your organization's usage and by automatically turning off cloud resources during non-working hours.</p>

Normalize software assets

Software Asset Management normalization

After you enable a discovery source, the Software Asset Management application normalizes software installation data from your organization. Weekly content updates for publisher names, product names, software life cycle dates, and more are made available to normalize your discovered data so that you can keep it accurate and up to date. You can also improve your normalization rates by predicting the normalized values of your discovered data through machine learning. In addition, you can opt in to the Software Asset Management Content Service to securely and anonymously send your unnormalized content to ServiceNow for research, validation, and updates.

Manage software rights

Track and manage rights for your purchased software using software entitlements. Determine how many rights your organization has purchased, how much those rights cost, who those rights are allocated to, and more. You can create and update software entitlements individually or you can import bulk software entitlements in one go.

Leverage Publisher Packs

Software publishers use different licensing models to define how software licenses must be consumed, which can make license compliance difficult to track across all software publishers. In addition to the thousands of software publishers that are available through the Content Library, the Software Asset Management application offers publisher packs that extend functionality between the ServiceNow AI Platform and top third-party software publishers. With publisher packs, you can access additional capabilities to help you track and optimize licensing for the specified software publishers.

Track SaaS subscription usage

The Software Asset Management SaaS License Management application enables you to integrate your ServiceNow instance with third-party SaaS applications and SSO providers. With these integrations, you can pull subscription usage data from your SaaS and connected SSO applications to track usage, manage compliance, and optimize licensing for your subscriptions.

View and take action on your license position

License usage view in the Software Asset Workspace

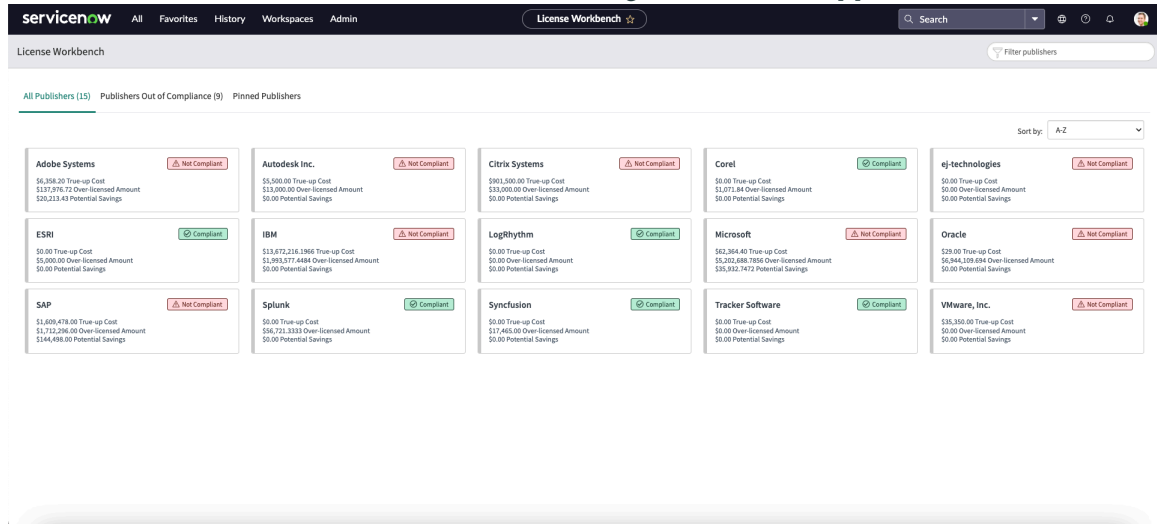

Pinned publishers

Publisher	Compliance	Compliant products	True-up cost	Over-licensed amount	Potential savings
Microsoft	31% compliant	4/13	\$62.36K	\$5.2M	\$35.93K
IBM	64% compliant	9/14	\$13.67M	\$1.99M	\$0.00
Oracle	67% compliant	2/3	\$29.00	\$6.94M	\$0.00
SAP	38% compliant	5/13	\$1.61M	\$1.71M	\$144.5K

Unpinned publishers

Publisher	Compliance	Compliant products	True-up cost	Over-licensed amount	Potential savings
Adobe Systems	63% compliant	5/8	\$6.36K	\$137.98K	\$20.21K
Autodesk Inc.	67% compliant	2/3	\$5.5K	\$13K	\$0.00
Citrix Systems	0% compliant	0/2	\$901.5K	\$33K	\$0.00
ej-technologies	0% compliant	0/1	\$0.00	\$0.00	\$0.00
VMware, Inc.	50% compliant	1/2	\$35.35K	\$0.00	\$0.00

License Workbench in the Software Asset Management classic application

The License usage view (Software Asset Workspace) and License Workbench (Software Asset Management classic application) offer you the ability to view the license compliance positions of all your software products from a centralized location. If any of your licenses are out of compliance, you can drill down into the specified product to review suggested remediation options. Select an option to efficiently bring your license back into compliance.

Track software spend

Use the Software Spend Detection application to track and optimize software spending based on imported financial transaction data. You can use this data to identify and take action on redundant software, reinforce or update company software purchasing policies, and begin managing unmanaged software products.

Analyze and improve your business processes using software asset analytics dashboards

The Software Asset Management application provides preconfigured dashboards with actionable data visualizations to help you track performance and improve your business processes. Use these dashboards to gain visibility into your license compliance, SaaS and SSO subscriptions, engineering applications, recommended licensing optimizations, potential cost savings, normalization trends, and more.

Normalize hardware assets

The Hardware Asset Management application normalizes the asset data in your hardware and consumable models. Weekly content updates for manufacturers, device types, and more are made available to normalize your data so that you can keep it accurate and up to date. You can also opt in to the Hardware Asset Management Content Service to securely and anonymously send your unnormalized content to ServiceNow for research, validation, and updates.

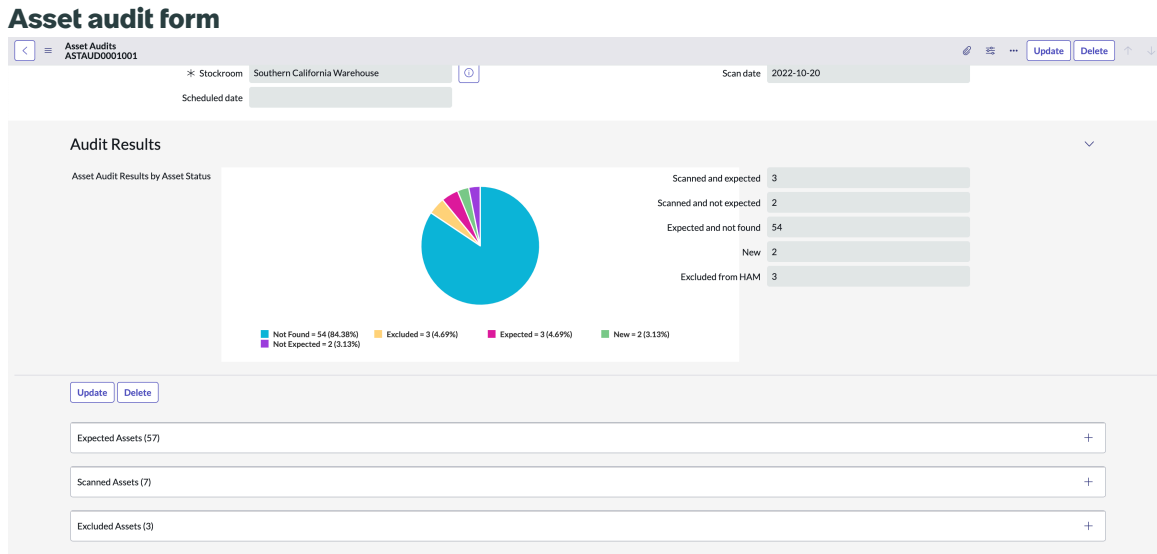

Automate your asset life cycle

Use the Hardware Asset Management application to control the entire life cycle of your hardware assets from procurement to disposal. The Hardware Asset Management application automates each stage of the asset life cycle by tracking the financial, contractual, and inventory details of your hardware assets. Asset tasks are provided to deploy, replace or swap, or retire your assets. Asset managers can assign asset tasks to Incident, Change, and Work orders, thereby reducing efforts on ticket resolution and delivering faster services. Asset tasks automatically update CIs and asset records to help eliminate the risk of data inaccuracy caused by manual entry.

Refresh aging hardware assets

As hardware assets near the end of their life cycles, associated maintenance costs and failure risks increase, while performance decreases. You can keep your hardware assets up to date by replacing aged hardware assets with new hardware assets of either the same or different hardware models.

Audit your asset inventory

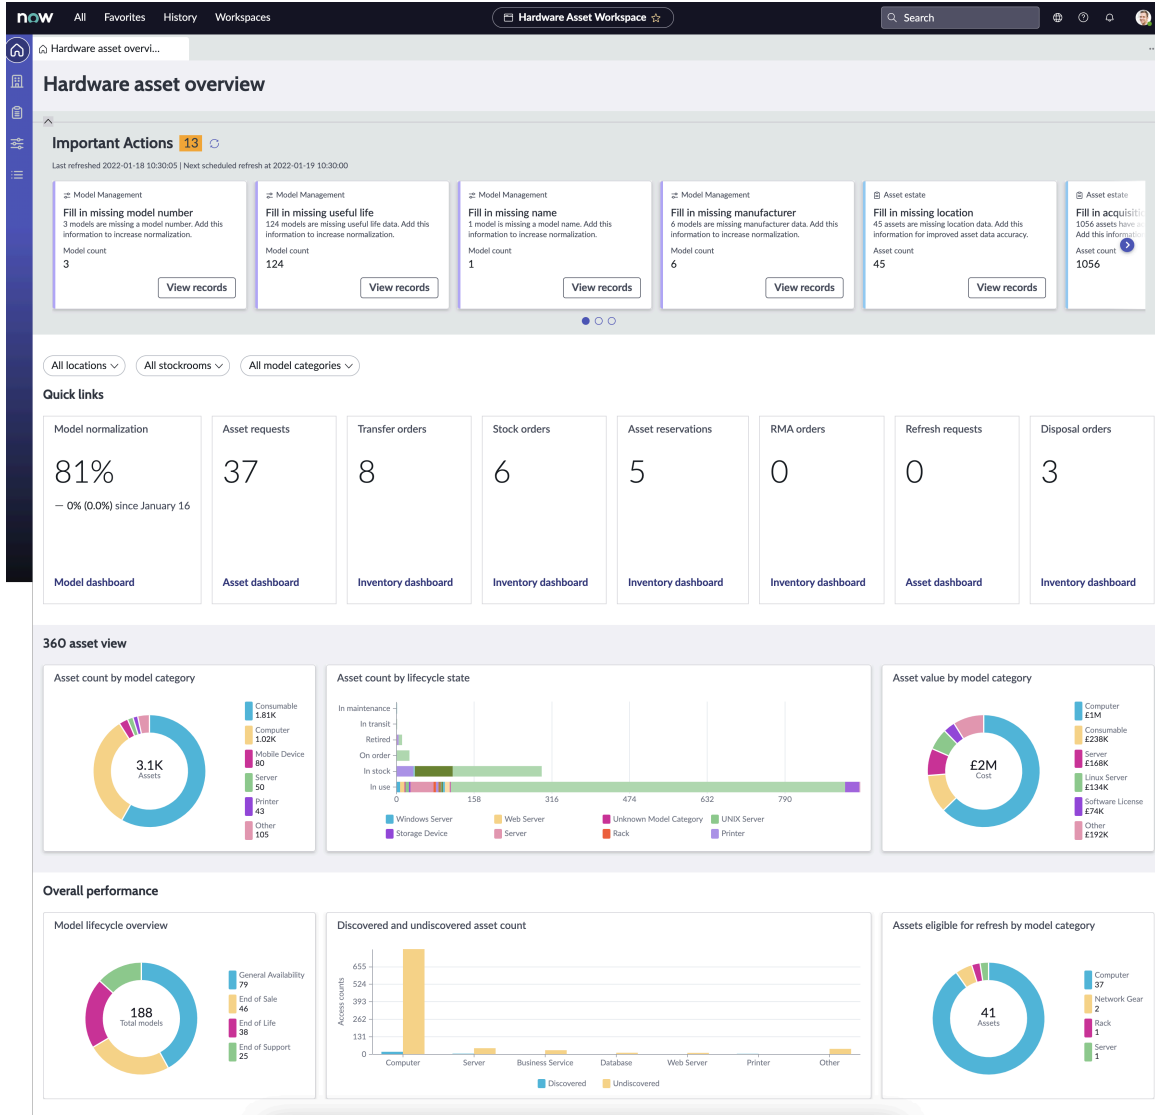

The Hardware Asset Management application enables you to capture asset inventory in specific stockrooms or locations using the ServiceNow Mobile Agent and mobile scanning capabilities. You can compare your scanned results with data that is stored on the ServiceNow AI Platform so that you can drive improved data quality and inventory process compliance.

Manage expiring maintenance and lease contracts

Avoid penalty charges on expiring maintenance and lease contracts by getting notified and taking action on those contracts before they expire. Use the Hardware Asset Dashboard to view the consolidated list of expiring contracts from a centralized location.

Drive asset manager productivity using a purpose-built workspace

Hardware asset overview in the Hardware Asset Workspace

Use the Hardware Asset Workspace for an intuitive and centralized view of your hardware asset estate. Gain visibility into the models and assets that are reaching the end of their life cycles, the health and status of your assets, the normalization status of your hardware and consumable models, purchase orders, stock orders, and more. The Hardware Asset Workspace also includes Important Actions to help you take the guess work out of your asset life cycle processes.

Accelerate your cloud strategy and reduce costs

The [Cloud Cost Management](#) application enables you to analyze the full range of costs that are associated with your cloud assets. You can identify and correct cost optimization targets, such as underused, over-provisioned, and stranded cloud assets, with the choice of automated or semi-automated operations.

Software Asset Management

The ServiceNow[®] Software Asset Management (SAM) application systematically tracks, evaluates, and manages software licenses, compliance, and optimization. You can reclaim unused software rights, purchase new software rights, and manage allocations for entitlements.

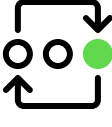

Watch this short video for an introduction to the Software Asset Management application.

https://player.vimeo.com/video/995307472?badge=0&autoplay=0&player_id=0&app_id=58479

Note:

Beginning with the ServiceNow AI Platform Yokohama release, limited support is provided for the Software Asset Management classic user interface. While it remains active in your instance, including when you upgrade to a new ServiceNow AI Platform release, you're encouraged to move to the new workspace experience.

[What is software asset management \(SAM\)?](#)

Exploring Software Asset Management

The Software Asset Management application's user interface is enhanced to make it more user friendly and intuitive, allowing you to better manage your software installations.

Beginning with the ServiceNow AI Platform Yokohama release, we will provide limited support for the Software Asset Management classic user interface. While it will remain active in your instance, including when you upgrade to a new ServiceNow AI Platform release, we encourage you to move to the new workspace experience.

The Software Asset Management application's core functionality remains the same in both the user interfaces.

Using the Software Asset Workspace

The Software Asset Management application is available with activation of the new Activate all Software Asset Management Professional plugins including Software Asset Workspace (com.sn_samp_master_ws). Activating this plugin automatically activates the Activate all Software Asset Management Professional plugin (com.sn_samp_master) and the Software Asset Workspace plugin (com.sn_sam_workspace). After the new plugin is activated, you can't access the classic user interface.

For releases prior to Yokohama, if you activated the older Software Asset Management Professional plugin (com.sn_samp_master), the Software Asset Workspace is available with activation of the Software Asset Workspace plugin (com.sn_sam_workspace). After the Workspace plugin is activated, you can't revert to the classic Software Asset Management application.

Note:

After the Software Asset Workspace is activated, the menus in the classic Software Asset Management application are hidden for the features that have been moved to the Software Asset Workspace.

For detailed information on configuring and using the Software Asset workspace, refer to [Configuring Software Asset Management](#) and [Software Asset Workspace](#).

Using the classic Software Asset Management application

To continue using the classic Software Asset Management application, you need to activate the Software Asset Management Professional (com.sn_samp_master) plugin.

If you later decide to use the Software Asset Workspace, you need to activate the Software Asset Workspace (com.sn_sam_workspace) plugin.

For detailed information on configuring and using the classic Software Asset Management application, refer to [Configuring Software Asset Management](#) and [Using Software Asset Management classic](#).

Menus that continue to reside in Software Asset Management classic

Even after you activate the Software Asset Workspace (com.sn_sam_workspace) plugin, the following menus continue to remain in the classic framework:

Software Asset Demand:

- Create New
- Demands
- Demand Requirement

Administration:

- Custom Products
- Custom part Numbers
- Custom License Metrics
- Software Asset Demand Actions
- Pattern Normalization Rules

- Reclamation Rules
- Job Results
- Content Service Setup
- Refresh Processor Definitions
- Migrate Software Results
- Properties
- Revert Customizations
- Software Model with De-activated Discovery Maps

SaaS License:

- Unrecognized Subscription Identifier
- SSO Integration Profiles
- Direct Integration Profiles

SAP Compliance and Optimization:

- SAP Connections
- Connection Setup
- Scheduled Import
- Transform History

Software Asset Management overview

An overview of the functionality of the Software Asset Management application.

Software Asset Management functionality consists of these main features.

Feature area	Description
Dashboards	<p>These dashboards show software installation results for your environment in the form of statistics and charts.</p> <ul style="list-style-type: none"> • Software Asset Analytics: Overview, License Summary, Compliance Summary, and Removal Summary • Normalization and Content Service: Normalization trend charts • Software Publisher Analytics: Citrix, IBM, Microsoft, Oracle, SAP, and VMware. <p>Note: The publisher pack add-on must be activated to see the Software Publisher Analytics dashboard.</p> <ul style="list-style-type: none"> • Office 365 and Adobe Cloud

Feature area	Description
	<p>Note: The publisher pack add-on must be activated to see the Office 365 and Adobe Cloud dashboard.</p> <ul style="list-style-type: none"> • Software Asset Management: Overview, Optimization, Compliance Analysis
Licensing	<p>Software models created for all installed software products are used to tie software installations (software being used) with entitlements (software owned). Entitlements define license details and are assigned to software models.</p> <p>Features include publisher part number lookup, common per core and per processor license metrics, entitlement discovery maps, exclusion listing, client access, license change projection, entitlement import, and entitlement import error results list.</p>
Discovery and normalization	<p>A discovery process, such as ServiceNow Discovery or Microsoft SCCM (2012 v2 or 2016), can be used to discover the software installed in your environment.</p> <p>The normalization process compares the discovered publisher, discovered product, and discovered version values against the ServiceNow repository of normalized equivalents</p> <p>An OOB Normalization library contains all content except publisher and product. Custom products can be created if a software product does not exist in the Software Library. Discovered software can also be manually normalized for reconciliation. A software discovery model is then matched to discovered software installations.</p> <p>Features include partial, full, and publisher normalization, License Workbench, License Position report, custom pattern normalization rules, normalization suggestions, on-premise customer support, and an optional Software Asset Management content service to update the Normalization Library with pattern normalization rules.</p> <p>The Integration – Microsoft SCCM 2016 plugin is compatible with SCCM version 1606, 1906, 1910, and 2002.</p> <p>Note: Legacy SCCM plugins, SCCM 2012 and SCCM 2016, will be deprecated in the upcoming releases. If you are creating the integration for the very first time, then begin with Microsoft SCCM Service Graph Connector SG Connector. If you are already using one of these plugins then use the application titled Migration Readiness Tool for Service Graph Connector for SCCM in the ServiceNow Store to prepare for migration to the Service Graph Connector.</p>

Feature area	Description
Reconciliation	<p>The reconciliation process calculates the compliance status of software products regarding discovery and entitlements.</p> <p>Removal candidates are generated for unused software that can be used to reclaim software rights.</p> <p>Features include reconciliation grouping, and remediation actions for resolving compliance issues.</p>
Optimization	<p>The reclamation process remediates non-compliance by uninstalling software from devices and reclaiming those software rights. The reclamation process can be automated using Client Software Distribution (CSD).</p> <p>Features include removal candidate and workflows, reclamation rule creation, software usage listing, and support for creating a purchase order directly using Procurement integration. For more information, see the Procurement overview.</p>
Downgrade Rights	<p>The concept of downgrading licenses is built into the Software Asset Management plugin feature. Downgrade rights is the process of having acquired the rights to the latest version of software but using the rights to license earlier versions of the same software. For more information, see Downgrade Rights.</p>

Software Asset Workspace

Use the Software Asset Workspace, the intuitive and streamlined user interface of the Software Asset Management application, to manage software licenses, compliance, and optimization.

Software Asset Workspace landscape

The Software Asset Workspace is a unified medium with multiple views. The views let you create entitlements, software models, run and review reconciliation results, remediate non compliance, give visibility into your software assets, and provides access to analytics via dashboards. Additionally, you can export asset information from the Software Asset Workspace using the **Export** button on all the related lists. To use the export functionality for versions earlier than Xanadu, see knowledge base article [KB1709844](#).

The Software Asset Workspace contains the following views:

- **Software asset overview:** The landing page of the Software Asset Workspace. You can create entitlements, run reconciliation, view key metrics and get time sensitive alerts and notifications regarding your software assets.
- **License usage:** You can view the compliance status of all your publishers, review reconciliation results, reclaim unused software, and view and run reports.
- **License operations:** Lists all the entitlements, software models, import entitlement errors, discovery models.
- **Software asset analytics:** View consolidated dashboards for SaaS, discovered inventory, optimization, lifecycle management, cloud cost simulator, Engineering License, and normalization and content.

- **Success portal view in Software Asset Workspace:** Assess the performance of the Software Asset Management application in your environment.
- **Renewals calendar:** View the entitlements nearing their expiry date and contracts nearing their expiry date or are already expired.
- **Overlapping usage:** View the feature level usage of your SaaS and SSO applications.
- **Content lookup:** View the data stored in the Software Asset Management Content Service.

Software asset overview

Enhance your software asset management experience by using the modernized and user-friendly software asset overview view. The software asset overview is a simplified and intuitive environment that helps you use the application more effectively by reducing complexity.

Use the software asset overview view to:

- Gain insights into key metrics such as compliance trends, true-up costs, potential savings, normalization rates.
- Execute routine tasks such as running reconciliation or creating entitlements.
- Get actionable insights into your software assets via alerts and notifications.
- Sort by product or publisher to narrow down your results.
- Filter by Published status to view reports and dashboards only related to the software products that you manage in a phase-wise implementation of Software Asset Management.

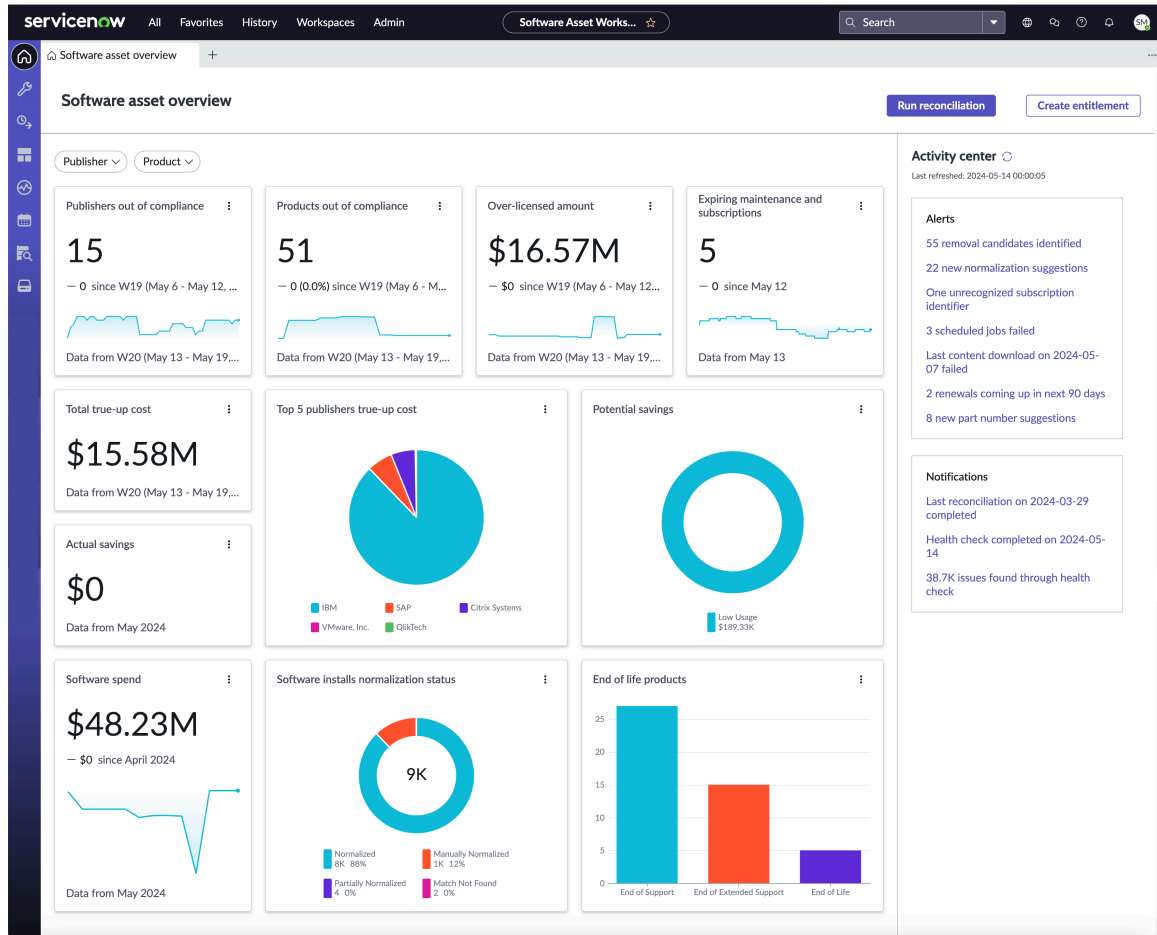

Note:

The Published status filter is shown only when the system property `com.snc.samp.manage.published.products` is enabled on your ServiceNow instance. By default, this filter is set to **Published** and the following reports show details of published products:

- Publishers out of compliance
- Products out of compliance
- Over-licensed amount
- Total true-up cost
- Top 5 publishers true-up cost
- Software spend

However, you can also view reports related to the products that aren't published by setting this filter to **Unpublished**. To view reports related to all the products, clear the Published status filter.

Software asset overview view

Select any widget to view detailed information. All the widgets are updated whenever a new reconciliation result is available.

To narrow down your results, you can filter the workspace by publisher or product.

Note:

If you select more than one publisher in the filter and then select the **Publishers out of compliance** widget, all non-compliant publishers are listed. The same is true for products.

Software asset overview dashboard

Report	Source	Description
Publishers out of compliance	Product Results [samp_product_result]	The number of publishers that have at least one software model out of compliance. Select the report to view the results in the License usage view.
Products out of compliance	Product Results [samp_product_result]	The number of products that have at least one software model out of compliance.

Software asset overview dashboard (continued)

Report	Source	Description
		Select the report to view the results in the License usage view.
Over-licensed amount	Product Results [samp_product_result]	Cost of licenses owned but not being used.
Expiring maintenance and subscription	Software Entitlement [alm_license]	<p>End date of the total sum of all entitlements that are going to expire within 6 months.</p> <p>The total sum of entitlements includes:</p> <ul style="list-style-type: none"> • Perpetual • Maintenance • Perpetual + Maintenance • Upgrade • SA • Perpetual +SA • Step-up <p>Select the report to view details about the specific entitlements that are going to expire.</p> <p>i Note: Maintenance and SA entitlements aren't displayed as the Perpetual entitlements associated with them are displayed.</p>
Total true-up Cost	Product Results [samp_product_result]	Cost to be compliant based on the average prices in entitlements for the rights by publisher.
Top 5 publishers true-up cost	Product Results [samp_product_result]	The top 5 publishers illustrated in a pie chart in order of true-up cost.
Potential Savings	Product Results [samp_product_result]	<p>Cost saved if removal candidates are reclaimed.</p> <p>Hover on the donut chart to view the number of removal candidates for a specific</p>

Software asset overview dashboard (continued)

Report	Source	Description
		justification along with the cost. Removal candidates are grouped by justification. Select on a justification on the donut chart to take you to the list of removal candidates with that specific justification.
Actual savings	Reclamation Candidate [samp_sw_reclamation_candidate]	Sum of potential savings in a given month of closed complete removal candidates.
Software Spend	License Metric Results [samp_license_metric_result]	Total software cost of all entitlements that aren't retired.
Software installs normalization status	Software Discovery Models [cmdb_sam_sw_discovery_model]	<p>Count of software installs based on the normalization status.</p> <p>Select a normalization status on the donut chart to view the list of discovery models along with the installation count for each discovery model. You can further select a discovery model to view the list of software installations.</p> <p>The report for this widget is populated only once the following daily scheduled jobs have run:</p> <ul style="list-style-type: none"> • SAM - Normalize discovery models using content library rules • SAM - Daily Job <p>Note: Only the Product filter can be applied to this widget.</p>
End of life products	Product Lifecycle [sam_sw_product_lifecycle]	Graph of software product lifecycles that are reaching their end of life cycle. Select to drill down to the software installations.

Activity center

Get alerts and notifications regarding your software assets. These alerts and notifications are asynchronous in nature. The Activity center displays a pre-defined set of alerts to notify you of actions that require your immediate attention. Notifications about events or activities that you should be aware of also appear in the Activity center. Select an alert or notification for more information.

Any user with the role of sam_user can access all alerts and notifications except for the following alerts that require the sam_admin role.

- Scheduled jobs failed.
- Last content download failed.

Alerts in the Activity center

Alerts	Source	Description
Removal candidates identified	Removal Candidate [samp_sw_reclamation_candidate]	New removal candidates whose active status is true and the state is ready. Select to view the entire list of removal candidates in the License usage view.
New normalization suggestions	Normalization Suggestions [samp_normalization_suggestions]	Normalization suggestion records created where the state is new. Select to view the new normalization suggestion records in detail.
Unrecognized subscription identifiers	Unrecognized Subscription Identifier [samp_sw_unrecognized_subscription_identifier]	The number of unrecognized subscriptions are identified where the identifier column is empty.
New software request	Request [sc_request]	Software requests where the request state is pending approval. Select to view the software request list in the classic Software Asset Management interface.
Last reconciliation failure	Reconciliation Result [samp_reconciliation_result]	The latest scheduled job for the reconciliation process failed. Select to view the results in the License usage view.

Alerts in the Activity center (continued)

Alerts	Source	Description
		<p>i Note: Last reconciliation failed (an alert) or Last reconciliation completed (a notification) is shown depending on the status of the reconciliation process. If the reconciliation process failed, an alert is shown. If the reconciliation process was successful, a notification is shown.</p>
Scheduled jobs failed	Software Asset Job Result [samp_job_log]	<p>Scheduled jobs that failed in their latest run within the last one week.</p> <p>Select to open the Software Asset job Logs in a new tab.</p> <p>i Note: Only a user with the sam_admin role can access the Software Asset Job result table.</p>
Entitlement import errors	Entitlement Import Error [samp_entitlement_import]	Entitlement import errors where the error status column has the value open.
New entitlement import error created via purchase receipts	Entitlement Import Errors [samp_entitlement_import]	<p>The number of entitlement import errors where the purchase orders have an associated procurement integration profile.</p> <p>i Note: This alert appears only when the Asset Management - Procurement Integration (app-itam-procurement-integration) store application is installed. For more information, see Install Asset Management - Procurement Integration.</p>
Last content download failed	Asset Job Log	The latest scheduled job for content download failed.

Alerts in the Activity center (continued)

Alerts	Source	Description
	[asset_job_log]	<p>Note: Only a user with the sam_admin role can access the Asset Job Log table.</p>
Failed - entitlement import of <<.xlsx>>	Entitlement Import [samp_bulk_import]	<p>Entitlement import status based on its success or failure. The failed status is displayed as an alert or one of the completed statuses is displayed as a notification:</p> <ul style="list-style-type: none"> Completed - entitlement import Completed with errors - entitlement import
New CPE normalization suggestion	CPE Normalization Suggestions [sn_samp_vr_cpe_mapping_suggestions]	<p>CPE normalization suggestion records created where the status is new.</p> <p>Select to view the new CPE normalization suggestion records in detail.</p>
Number of renewals coming up in 90 days	<ul style="list-style-type: none"> Contract [ast_contract] Software License [alm_license] 	<p>The number of software contract and entitlement renewals coming up in 90 days.</p> <p>Select the alert to view the upcoming renewals within 90 days from the current date.</p>

Notifications in the Activity center

Notifications	Source	Description
New SSO applications identified last week	SSO Application [samp_sso_application]	New single sign-on (SSO) applications that have the SSO status as disconnected and were created within the last one week from the current date.
Last reconciliation completed	Reconciliation Result [samp_reconciliation_result]	The latest scheduled job for the reconciliation process was successfully completed.

Notifications in the Activity center (continued)

Notifications	Source	Description
		Select to view the results in the License usage view.
Products nearing end of life	Software Lifecycle Report [sam_sw_product_lifecycle_report]	Products that are nearing the end of their lifecycle and the install count is greater than 0.
New PPNs added to the library	Software Product Definition [samp_sw_product_definition]	New PPNs added to the Content Service library with the latest content version as compared to the present date.
Software asset demands approved	Software Asset Demand [samp_demand]	Software Asset Demand list view filtered by those that are approved.
Completed - entitlement import or Completed with errors - entitlement import	Entitlement Import [samp_bulk_import]	Entitlement import is successfully completed or completed with some errors. Note: If the entitlement import fails, it's shown as an alert.
New entitlement created via purchase receipts	Software Entitlements [alm_license]	Number of entitlements created from purchase orders that have an associated procurement integration profile. Note: This notification appears only when the Asset Management - Procurement Integration (app-itam-procurement-integration) store application is installed. For more information, see Install Asset Management - Procurement Integration .

License usage view

Use the license usage view as a single plane to understand the license position of all software products, remediate non-compliance, view reconciliation results, view, or add removal candidates, and view Software Asset Management related reports.

The License usage view enables you to view the license usage trends for your organization and helps forecast the needs of your organization by trending the number of licenses required

against the number of licenses purchased. Manage your license positions by purchasing additional rights before software consumption surpasses the number of rights owned.

Access the License usage view by navigating to **Software Asset Workspace > License usage**.

Showing 1-18 of 18 Records per page 20

Use the License usage view to:

- pin publishers (user specific, saved).
- view key metrics for the publishers, such as over-licensed amount and true-up cost.
- filter by domain and compliance status.
- sort by true-up cost, over-licensed amount, and potential savings.
- run a reconciliation and view its results.
- be informed about the last reconciliation run.
- view and add new removal candidates.
- view and export reports.

- view publisher cards specific to the software products that you published as part of the phase-wise implementation of Software Asset Management. For more information, see [Publish a specific set of your software products](#).

Note:

The filter for published status is automatically applied.

Publishers tab

View the compliance status of all your publishers. Each publisher card displays its color-coded compliance status along with the percentage of compliance. As the products get compliant, the color changes to green.

- compliant: Indicated by the color green. All products under the publisher are compliant.
- non-compliant: Indicated by the color red. All products under the publisher aren't compliant.

A red icon  on a publisher card indicates that reconciliation failed for that publisher. Open the card to read the details. For details on which specific products failed, refer to the navigation tree on the Publisher details page.

Note:

Even though a publisher card may display a red icon, you may not notice any failed products on the navigation tree because the failure may have occurred before the product results were generated.

The pinned publishers are displayed followed by unpinned publishers. To view the compliance of selected publishers, you can pin publishers for easy access. Select the bookmark icon on a card to pin it. As soon as you pin a publisher card, it moves from the Unpinned publishers section to the Pinned publishers section.

Note:

The list of pinned publishers is saved on a per-user basis. The pinned publishers are stored in the Pinned User Publisher [samp_pinned_user_publisher] table.

View publisher cards related to the software products that you manage in a phase-wise implementation of Software Asset Management using the Published status filter. Filtering by Published status enables you to reduce clutter on the License usage view.

Note:

The Published status filter is shown when the system property `com.snc.samp.manage.published.products` is enabled on your ServiceNow instance. By default, this filter is set to **Published** and all the publisher cards show details of published products. However, you can also view license compliance reports related to the products that aren't published by setting this filter to **Unpublished**. To view reports related to all the products, clear the Published status filter.

To view compliance details about a publisher, select a publisher card. A summary of that publisher's compliance appears in the Publisher details page.

Publisher details page

The screenshot shows the Publisher details page in ServiceNow. The navigation tree on the left lists products under 'Adobe Systems' with their compliance status: Acrobat (Not compliant), Captivate (Compliant), Creative Cloud (Compliant), Dreamweaver (Compliant), Fireworks (Compliant), Illustrator (Compliant), InDesign (Not compliant), and Photoshop (Compliant). The main content area features a 'Summary' section with three cards: True-up cost (\$3.01K), Potential savings (\$0), and Actual savings (\$172.55K). To the right of these cards are 'Unlicensed entities' (Unlicensed installs: 0, Installs requiring action: 208, Unlicensed subscriptions: 0, Unlicensed client access: 0) and 'Progress indicators' (Ignored installs: 427, Number of reclamations: 111). Below the summary is a 'Product Results' table with 8 items, showing details for products like Dreamweaver, Illustrator, Photoshop, Captivate, Fireworks, and InDesign.

Number	Product	Status	True-up cost	Over-licensed amount	Potential savings
PR0003264	Dreamweaver	Compliant	£0.00	£23,432,5622	£0.00
PR0003265	Illustrator	Compliant	£0.00	£24,361,1131	£0.00
PR0003266	Photoshop	Compliant	£0.00	£8,833,4405	£0.00
PR0003268	Captivate	Compliant	£0.00	£29,909,1289	£0.00
PR0003311	Fireworks	Compliant	£0.00	£6,236,6877	£0.00
PR0003312	InDesign	Not Compliant	£3,011,4002	£0.00	£0.00

The navigation tree for the publisher appears on the Publisher details page with one of the following compliant statuses:

- **Compliant:** Reconciliation completed successfully and it was determined that installations and subscriptions are in compliance.
- **Not compliant:** Reconciliation completed successfully and it was determined that the installations and subscriptions aren't in compliance with purchased licenses.
- **Failed:** Reconciliation failure occurred and so can't correctly determine compliance. If a product fails, then everything underneath that product, such as software model results, also fails.

The navigation view shows license compliance details of products that were published. Scroll down to the reports mentioned in the Publisher metrics table to view details of published products. If you want to view details and compliance results of other unpublished products, you must set the Published status filter to **Unpublished**.

In the navigation view, a non-consumption icon is displayed next to a software model that has not utilized any licenses. Such software models are always positioned at the bottom of the tree and no software model results are shown for that software model.

A brief summary of metrics appears along with related lists pertaining to that publisher. For details on the metrics, refer to the Publisher metrics table. For details on the related lists, refer to [License usage publisher fields in workspace](#).

The navigation tree enables you to perform the following actions:

- drill down to a product, software model, or license metric to view the calculation and compliance information from the latest reconciliation results.
- filter products (active filtering, including collapsed items).
- expand and collapse tree links.

By default, the navigation tree is collapsed.

Publisher metrics

Report	Source	Description
True-up cost	Product Result [samp_product_result]	Estimated cost of remediating unlicensed installations based on the lowest number of rights needed (rights needed multiplied by average price per right from entitlements). The lowest cost from Purchase Rights remediation options.
Potential savings	Removal Candidate [samp_sw_reclamation_candidate]	Estimated cost of savings if software installations are reclaimed. The sum of all potential savings from all removal candidates. Select the report to see the list of removal candidates.
Actual savings	Removal Candidate [samp_sw_reclamation_candidate]	The total savings achieved if removal candidates are reclaimed. Select the report to see the list of removal candidates.
Unlicensed entities	Software Installation [cldb_sam_sw_install] Software Subscription [samp_sw_subscription] Oracle Options [samp_oracle_options]. SAP Users [samp_sap_system_user] SAP Engine Usage [samp_sap_sw_client_access] Entity unlicensed reason [samp_entity_unlicensed_reason]	Indicates the unlicensed entities for this publisher, product, and software model. The following are some of the indicators: <ul style="list-style-type: none"> • Unlicensed installs: refers to installations for which you have purchased some entitlements, but the rights owned are not sufficient to cover all the entities that require rights. • Installs requiring action: indicates an action that you need to perform to fix an issue for an installation, such as problems with CIs, entitlement, or software model setup.

Publisher metrics (continued)

Report	Source	Description
		<p>Note: An installation may have more than one issue. It is necessary to address each issue to fully resolve problems with an installation. Therefore, the number shown on the progress indicator and the details when you drill down may not align. Please ensure all issues are fixed for the installation.</p> <ul style="list-style-type: none"> • Unlicensed subscriptions: subscriptions that are unlicensed. • Unlicensed client access: refers to unlicensed CAL records on account of not having enough rights on entitlements to cover the CAL records. <p>Select the number adjacent to each category for a more detailed explanation of each installation, including the reason and causes of their unlicensed status.</p>
Progress indicators	<p>Software Installation [cldb_sam_sw_install]</p> <p>Requested Item [sc_req_item]</p> <p>Removal Candidate [smp_sw_reclamation_candidate]</p>	<p>Indicates the compliance progress already made for this publisher, product, and software model. The progress indicators differ for each publisher. The following are some of the indicators:</p> <ul style="list-style-type: none"> • Ignored installs: installations ignored from the reconciliation process. • Removal candidates: Number of removal candidates created. <p>Select the number adjacent to each category for a more</p>

Publisher metrics (continued)

Report	Source	Description
		detailed explanation of each installation.

Reconciliation tab

You can view all the historical reconciliation results in this tab along with the following status:

- **Completed:** If all the products and publishers completed reconciliation successfully.
- **Failed:** If all the products and publishers failed reconciliation.
- **Partially Completed:** If only some products or publishers completed reconciliation successfully.

Results of the latest reconciliation run are shown in the License usage view. For more details, see [Software reconciliation for compliance](#).

Removal candidates tab

View a list of all removal candidates in this tab. Removal candidates are used to reclaim software installations that aren't being used.

You can also create removal candidates. For more details, see [Create a software removal candidate in workspace](#).

Reports tab

You can create, view, and run reports from this tab. All the following base system reports are available in this tab:

- [Software product lifecycle report](#)
- [Software license compliance position](#)
- [Azure BYOL realized savings report](#)
- [Software models with deactivated discovery maps](#)
- [Oracle DB Server Deployments per Agreement report](#)
- [Oracle Infrastructure report](#)
- [Microsoft Windows and SQL Server infrastructure details reports](#)
- [SaaS detection report](#)

To create and manage reports, see [Create and manage reports in workspace](#).

License operations view

Use the License operations view in Software Asset Workspace to manage software asset operations such as licenses, contracts, discovery, client access, resource value, user subscriptions, content suggestions, software asset success, cloud cost simulation, SAM implementation, IBM ASP, and IBM ILMT V2 integrations.

You can access the License operations view by navigating to **Software Asset Workspace > License operations**.

The list view for the software assets on the License operations view shows the total number of records for your organization based on the value specified in the **SAM Workspace License operations list count limit** system property (*sn_sam_workspace.sam_license_operations_list_count*). The default value for the record count is set to **5000000**. However, the SAM administrator can set the value for the count in the system property as required. If there are less than five million records, then the exact count is shown. If there are more than five million records, then the count is shown as 5000000+.

The License operations view includes the following categories:

- **Licensing**

- **Software entitlements**

View the details of the software entitlements that record the terms of your software licenses. You can also create entitlements to enter your license details and allocate purchased rights to users or devices. For more information, see [Create entitlements in workspace](#).

- **Software models**

View the details of the software models created and also create a software model. For more information, see [Create software models in workspace](#).

- **Entitlement import**

View the details of the imported entitlements and also import entitlements at one go. For more information, see [Import bulk entitlements in workspace](#).

- **Entitlement import error**

View the details on entitlement import errors that gets generated while importing software entitlements. For more information, see [Entitlement import error fields](#).

- **Software lifecycle averages**

Create averages to calculate the End of Life (EOL) and End of Support (EOS) lifecycles of your software. For more information, see [Create averages for product life cycles in workspace](#).

- **Consumption rules**

Create consumption rules to restrict license consumption to certain entities within your organization. You must link this rule to one or many entitlements. For more information, see [Create consumption rules](#) and [Link consumption rules to entitlements](#).

- **Product install condition**

View the product install condition that accounts for all software model installations for a product during reconciliation. These installation conditions are applicable for the software product and all its components. For example, if you have purchased Microsoft Visual Studio, set up product installation conditions for using Visual Studio only to consume licenses in your non-production environment. These same conditions then apply across all software models under Visual Studio, including downgrades and editions. For more information, see [Create product install conditions](#).

- **Software installs**

View the details of software installation such as discovery model, publisher, and reconciliation details. The list view also shows the total number of software installation records for your organization. For more information, see [Software installation fields](#).

- **Contract - Software contracts**

Create a software contract to bind agreement between two parties. [Create a contract](#).

- **Discovery**

- **Discovered engineering license**

View a list of all the discovered and normalized software for your engineering applications.

- **Discovery models**

View and update software discovery models that are created when a version of software is discovered in a network environment. For more information, see [Discovery models and software installations](#).

- **Engineering license server**

View a list of all the license management servers that OpenLM or Open iT connect with to get data into your ServiceNow instance. Details on license management servers such as the type of the server, the name of the server, the status of the server, and the last connection time are also provided.

- **Software usage**

View software usage records to track the usage of software products for which you've created reclamation rules. You can also create software usage records manually from third party integrations or Microsoft System Center Configuration Manager (SCCM) integrations. For more information, see [View or create software usage](#).

- **All SAP engines**

View the monthly engine usage measurements for SAP clients based on the license metric for each engine.

- **All SAP users**

View all the discovered users pulled from the SAP systems and their details such as SAP user roles, SAP user active transactions, SAP user activities, and SAP web activities. For more information, see [View SAP users in workspace](#).

- **SAP named user types**

Create a custom-named user type that can be used with your SAP software entitlement. Creating a custom-named user type enables users to track licenses of their SAP systems. For more information, see [Create a custom named user type in workspace](#).

- **SAP price lists**

Create custom SAP price lists so that you can track and manage SAP licenses based on the contracts of your SAP system. For more information, see [Create custom SAP price lists in workspace](#).

- **SAP USMM rules**

View SAP User License Measurement (USMM) rules that map roles to the named user type for an SAP client. For more information, see [SAP USMM-based optimization](#).

- **SSO applications**

View details related to applications that you can connect through an SSO provider. For more information, see [View SSO applications in workspace](#).

- **SSO groups**

View details related to all SSO groups that have access to an SSO application. For more information, see [View SSO groups in workspace](#).

- **SSO users**

View details of all users that have direct access to an SSO application, but not through membership in a group. For more information, see [View SSO users in workspace](#).

- **Client access**

View the details of software client access records. You can also create a record to track and manage the users or devices that are accessing a version of your server software using a client access license (CAL). For more information, see [Create a software client access record in workspace](#).

- **Resource value**

View and create Resource value records for the software models. For more information, see [Create a resource value record](#).

- **User subscription**

- **User subscription**

View the details of the software subscriptions for SaaS and SSO applications. You can also create a software subscription. For more information, see [Create user subscriptions in the workspace](#).

- **Direct integration profiles**

View the details of the already created SaaS integration profiles. You can also create an integration profile by selecting the integration type to view software usage and optimize stale licenses. For the supported SaaS applications and procedures, see [Integrate with SaaS applications](#).

- **SSO integration profiles**

View the details of the already created SSO integration profiles. You can also create an SSO integration profile by selecting the integration type to view software usage and track user login data for all connected SSO applications, and reclaim unused licenses. For the supported SSO applications and procedures, see [Integrate with SSO providers](#).

- **Subscriptions without user**

View the list of subscriptions where the User field is empty on the Software Subscription [samp_sw_subscription] table.

- **User resolution rules**

Create a user resolution rule to map user subscriptions from SaaS applications to the User [sys_user] table in ServiceNow AI Platform. For more information, see [Associate a user with subscription records](#).

- **SaaS feature usage**

View the event details for each SaaS and SSO integration performed by the users, such as the event ID, event name, last activity, subscription, product, subscription profile, and publisher. For more information, see [Overlapping usage view](#).

- **Content suggestions**

- **Part number suggestions**

View Content Service suggestions for your custom publisher part numbers (PPN). For more information, see [Custom publisher part numbers \(PPN\)](#).

- **Normalization suggestions**

View Content Service normalization suggestion records that are created for discovery models. For more information, see [Normalization suggestions for discovery models](#).

- **Software asset success**

- **Software maturity**

View the list of Software Asset Management maturity item details. For more information, see [View all maturity items for Software Asset Management](#).

- **Success goals**

Create success goals to track the success of your Software Asset Management application and view the list of created success goals. For more information, see [Create success goals for Software Asset Management](#).

- **Success activities**

Create success activities to track the success of your goals and view the list of already created ones. For more information, see [Create success activities for Software Asset Management](#).

- **Success categories**

Create success categories to add categories to your success goal and view the list of already created ones. For more information, see [Create a success goal category for software assets](#).

- **All active value builder tasks**

Create Value builder tasks for publisher packs that aren't being fully used and view the list of already created ones. For more information, see [Create a Value builder task](#).

- **My value builder tasks**

Create Value builder tasks and view the list of tasks assigned to you. For more information, see [Value builder](#) and [Create a Value builder task](#).

- **Cloud cost simulator - Settings**

View the simulation settings, that is, the cost of moving your on-premise resources to the cloud environment. You can also create Cloud Cost Simulator settings. For more information, see [Cloud cost simulation](#).

- **IBM ASP integration**

- **Daily aggregated peak usage**

View the highest daily sub capacity and full capacity usage of your IBM software products based on the edition, license metric, domain, and region of each product. For more information, see [View the daily aggregated peak usage of your IBM software products](#).

- **Daily high water mark usage**

View the breakdown for the highest daily usage of your IBM software products by physical host based on both the edition and license metric of each product. For more information, see [View devices with the highest daily usage of your IBM software products](#).

- **Product classification**

View the product classifications for all IBM components that are installed in your environment. These product classifications enable you to track and manage licensing for your IBM components. For more information, see [View product classifications for your IBM components](#).

- **Devices to scan**

Specify the virtual machine (VM) managers, such as VMware vCenter Servers and IBM Hardware Management Consoles (HMCs), for which you want to track IBM licenses. You can track licenses for IBM software that is discovered within these specified VM managers only. For more information about updating the VM managers, see [Specify the virtual machine \(VM\) managers for which you are tracking IBM licenses](#).

- **Device settings**

To improve the accuracy of your IBM license calculations, verify the meta data for the physical hosts that your IBM software is installed on. Update any meta data that is incorrect or out of date. For information about updating meta data, see [Verify the meta data for your IBM hosts](#).

- **IBM ILMT V2 integration**

- **Peak consumption by product**

View the highest sub capacity and full capacity usage of your IBM software products based on the product name and the discovery model. For more information, see [View the peak usage of your IBM software products](#).

- **Peak consumption breakdown by device**

View the breakdown for the highest sub capacity and full capacity usage of your IBM software products by physical host based on the discovered device. For more information, see [View the peak usage of your IBM software products by device](#).

- **ILMT discovered computer**

View details for the discovered device including the server name, server id, server type, hardware model, hardware serial number, hardware vendor, total processor, and CMDB computer. For more information, see [View the devices that are running your IBM software products](#).

• **SAM implementation - Published products**

View the list of software products published in a phase-wise implementation of Software Asset Management. For more information, see [Manage phase-wise Software Asset Management implementation](#).

Software asset analytics view

The unified and streamlined dashboards in the Software asset analytics view in the Software Asset Workspace enable you to track your performance and view your analytics.

You can access the Software asset analytics view by navigating to **Software Asset Workspace > Software asset analytics**.

Software asset analytics view

The Software asset analytics view includes the following dashboards:

- **SaaS overview:** View all SaaS related analytics, create direct integration profiles, create entitlements, and view consumption analysis and details of various publishers.
- **Discovered inventory:** View your licensable discovered software and devices.
- **Normalization and content:** View normalization and Content Service trend charts.
- **Lifecycle management:** Review and track the end of life (EOL) software products in your asset estate.
- **Optimization and savings:** View metrics on how to maximize and save costs on your software assets. The dashboard also displays licensing optimizations for third-party publishers such as Microsoft, Red Hat, Adobe, and SAP.
- **Engineering License Overview:** View all your engineering applications license position and usage.
- **Cloud cost simulator:** Compare and evaluate the estimated costs of migrating your on-premises resources to the cloud for each cloud environment.

SaaS overview dashboard in workspace

View all SaaS related analytics for pure SaaS, Microsoft Office 365, and Adobe Cloud in the SaaS overview dashboard in the Software asset analytics view.

Optimize your organization's cost on SaaS by analyzing the subscription usage, cost, and compliance for your SaaS applications on the SaaS overview dashboard. You can also view compliance analysis results related to Microsoft Office 365 and Adobe Cloud.

Note:

The SaaS overview dashboard is only visible if you activate the Software Asset Management - SaaS License Management plugin from ServiceNow Store.

You can filter the dashboard by instance, publisher, software model, or domain. Select any report to see more information.

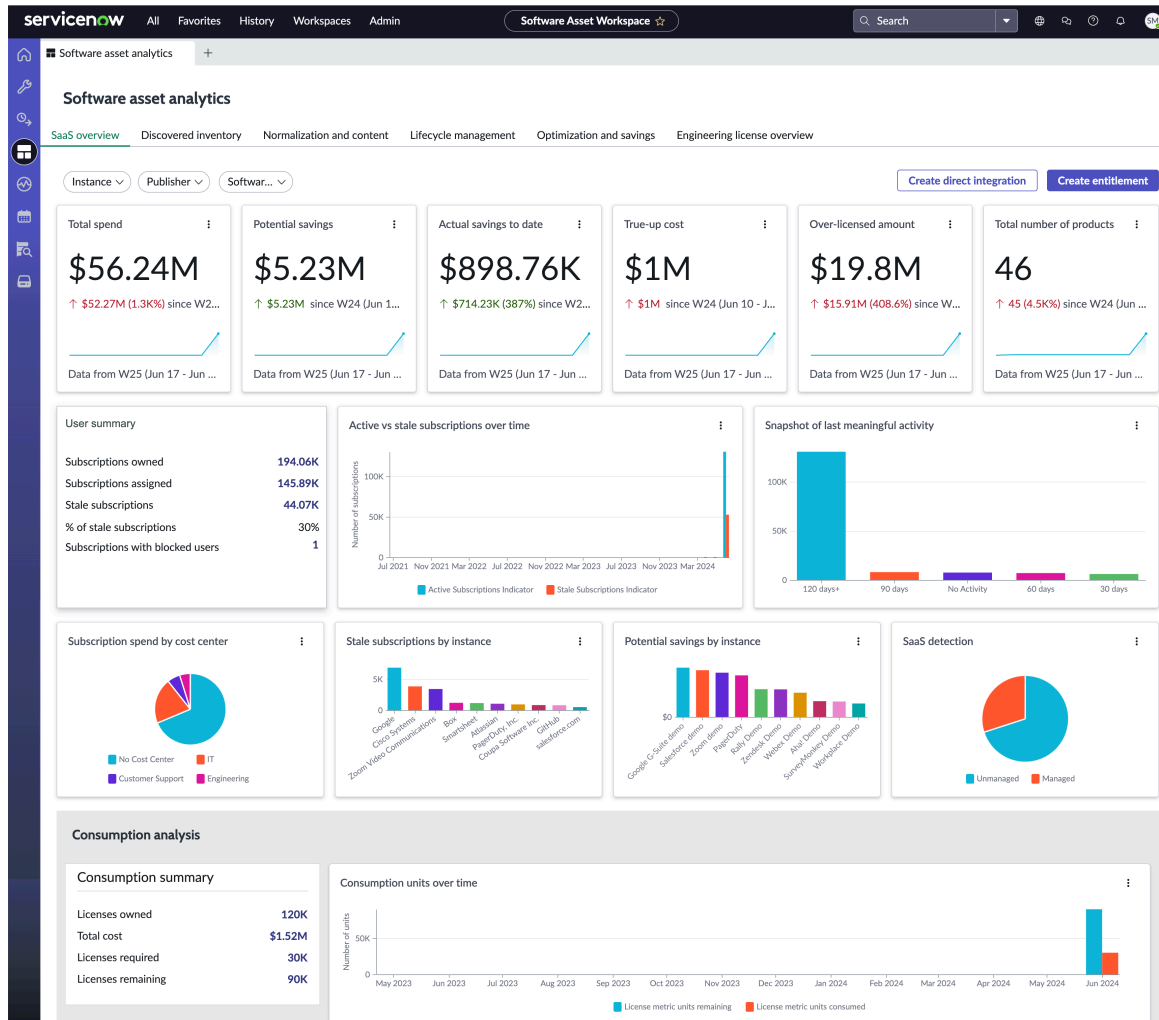

Note:

The Domain filter narrows your results based on the domain that you select. The default value for the domain filter is global. You can select a domain at any given time for widgets to reflect the selected domain. After you clear the selected domain, it defaults back to global. The Domain filter appears on the screen only if the following plugins are installed:

- Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer)
- Performance Analytics - Domain Support (com.snc.pa.domain_support)

You can access the SaaS overview dashboard by navigating to **Workspaces > Software Asset Workspace > Software asset analytics**.

SaaS overview dashboard

SaaS overview dashboard metrics

Report	Source	Description
Total spend	License Metric Results [samp_license_metric_result]	Total cost of all active subscription software entitlements.
Potential savings	Removal Candidate [samp_sw_reclamation_candidate]	Potential costs saved if you reclaim unused subscriptions.
Actual savings to date	Removal Candidate [samp_sw_reclamation_candidate]	Total yearly savings for all subscription software. This value is calculated as the total savings from closed complete reclamation candidates.
True-up cost	License Metric Results [samp_license_metric_result]	Cost to have the number of rights you own match the number of rights you've assigned to users. This metric helps to verify that your organization is paying for all the rights that your organization is using.
Over-licensed amount	License Metric Results [samp_license_metric_result]	Cost of licenses owned but not being used.
Total number of products	Software Subscription [samp_sw_subscription]	Total number of products, including products automatically detected from imported financial transactions and products manually added to transactions.
User summary Subscriptions Owned	Software Entitlement [alm_license]	All active entitlements with the license type as subscription.
User summary Subscriptions Assigned	Software Subscription [samp_sw_subscription]	Total number of assigned rights for SaaS software models.
User Summary Stale subscriptions	Software Subscription [samp_sw_subscription]	Number of subscriptions that don't meet the usage requirements defined by the reclamation rules.
User summary Percent of stale subscriptions	Software Subscription [samp_sw_subscription]	Percentage of subscriptions that don't meet the usage requirements defined by the reclamation rules. This percentage is calculated as the number of stale rights divided by the total number of assigned rights.

SaaS overview dashboard metrics (continued)

Report	Source	Description
User summary Subscriptions with blocked users	Software Subscription [samp_sw_subscription]	Number of subscriptions that are consumed by users that have their access blocked by the admin due to security issues. Note: Currently, the Blocked users report is supported only for Microsoft 365.
Active vs stale subscriptions over time	Software Subscription [samp_sw_subscription]	Graphical representation of actively used vs stale subscriptions over a given time period.
Snapshot of last meaningful activity	Software Subscription [samp_sw_subscription]	Distribution of users based on their subscription software usage behavior. Use this data to identify the users with the highest software usage and determine the most appropriate threshold for your software reclamation rules. This report displays the data if there's no activity, for 30 days, and for 120 or more days.
Subscription spend by cost center	Software Entitlement [alm_license]	Total cost of all active subscription software entitlements by cost center.
Stale subscriptions by instance	Removal Candidate [samp_sw_reclamation_candidate]	Total number of stale subscriptions for each subscription profile. If you have multiple profiles for the same subscription software, this report displays each profile separately.
Potential savings by instance	Removal Candidate [samp_sw_reclamation_candidate]	Potential costs saved for each subscription profile when you reclaim unused subscriptions.
SaaS detection	DEX Applications [samp_dex_application] Note: This table has been repurposed for use with the ACC-VC product 1.3.0.	Number of SaaS applications or percentage of the total applications that are managed and unmanaged. <ul style="list-style-type: none"> • Managed: A software model exists for a product. • Unmanaged: A software model doesn't exist for a product.

Report	Source	Description
		<p>i Important: To view this chart, you must do the following:</p> <ul style="list-style-type: none"> Request and install version 15.0.15 or later of the Software Asset Management -SaaS License Management application from the ServiceNow Store. For more information, see Request SaaS License Management. Install the Agent Client Collector for Visibility - Content (ACC-VC) product version 1.3.0 or later. For more information, see Agent Client Collector. <p>For more information, see the SaaS detection report.</p>
Consumption summary Total units	Subscription Consumption Summary [sam_saas_consumption_summary]	Total number of software units that you've purchased across all active entitlements for the software model.
Consumption summary Total cost	License Metric Results [samp_license_metric_result]	Total cost of the software units across all active entitlements for the software model.
Consumption summary units consumed	License Metric Results [samp_license_metric_result]	Number of software units that you've consumed. Unit of measure for the software units that can be consumed.
Consumption summary units remaining	License Metric Results [samp_license_metric_result]	Number of software units that haven't been consumed.
Consumption units over time	License Metric Results [samp_license_metric_result]	Graphical representation of the number of software units consumed vs the number of software units that aren't consumed over a period.

Discovered inventory dashboard

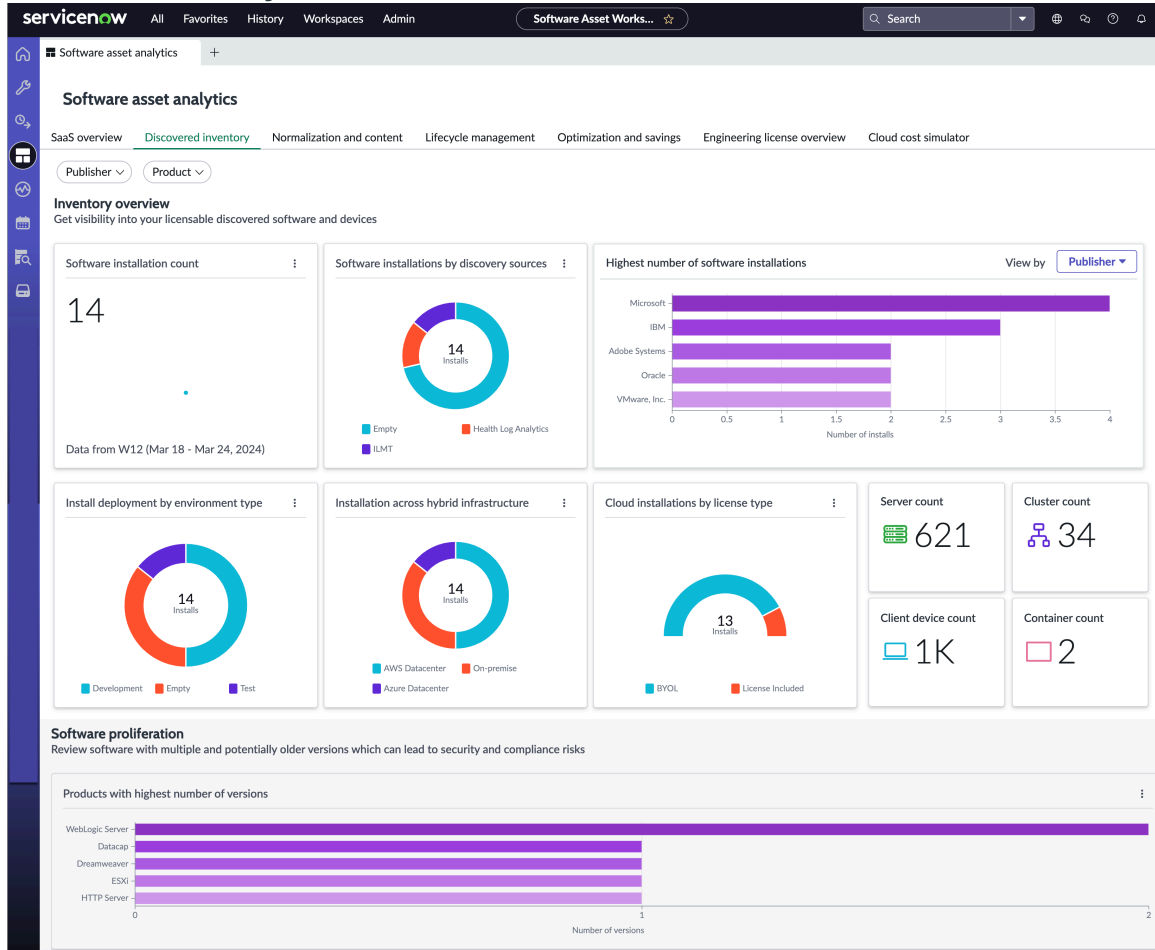

View your licensable discovered software and devices on the Discovered inventory dashboard in the Software asset analytics view of Software Asset Workspace.

Discovered inventory dashboard enables you to view all your licensable discovered software and devices. This dashboard also provides an insight into software products with multiple and potentially older versions that can result in security and compliance risk.

You can filter the count of installations based on a publisher or product. Select any report to see more information on software installations.

You can access the Discovered inventory dashboard by navigating to **Workspaces > Software Asset Workspace > Software asset analytics > Discovered inventory**.

Discovered inventory dashboard

Discovered inventory dashboard metrics

Report	Source	Description
Software installation count	Software Installation [cmdb_sam_sw_install]	Number of normalized and not normalized installs. For more information on normalized installations, see Normalization statuses .
Software installations by discovery sources	Software Installation [cmdb_sam_sw_install]	Total number of software installations grouped by discovery sources.
Highest number of software installations	Software Installation [cmdb_sam_sw_install]	The highest number of software installations for different products or

Central Data Service Download Status

The Central Data Service Download Status related list is updated daily when the *SAM - Central Data Service Download Status* job is run.

Central Data Service Download Status fields

Field	Description
Name	Table name from which the content is pulled.
Current count	Number of records in the table.
Expected count	Expected number of records in the table.
Last updated on	Last date and time the data was pulled.
Next action	Next scheduled date and time to pull data from the table.

Lifecycle management dashboard

Review and track the end of life (EOL) software products in your asset estate to reduce risks associated with software products that are reaching or have reached EOL.

The Lifecycle management dashboard displays reports on product life cycles, the current and past EOL product life cycles, and the upcoming EOL product life cycles for the next 18 months. You can also view EOL workflow status and workflow action.

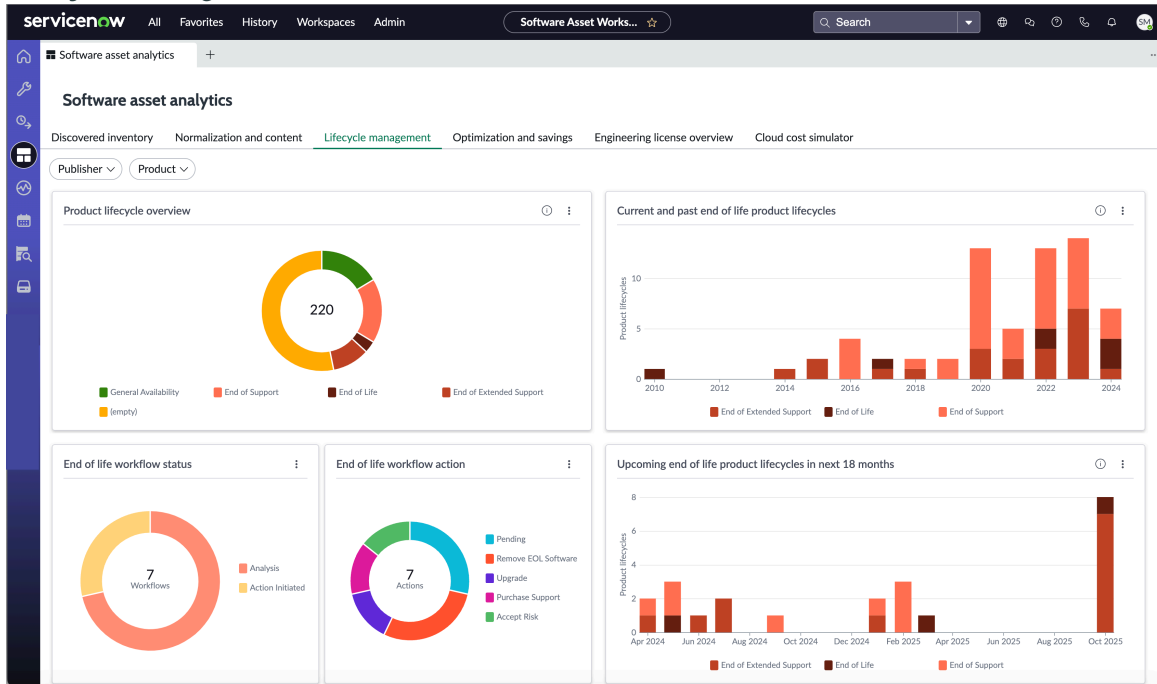

Note:

The Lifecycle management dashboard is only visible if you activate the Software Asset Management Professional plugin from ServiceNow Store.

Access the Lifecycle management dashboard by navigating to **Workspaces > Software Asset Workspace > Software asset analytics > Lifecycle management**.

You can filter the dashboard reports based on a publisher or product. Select any report to view more information on product life cycles.

Lifecycle management dashboard

Lifecycle management dashboard metrics

Report	Source	Description
Product lifecycle overview	Software Lifecycle Report [sam_sw_product_lifecycle_report]	Product life-cycle details for all the software products installed in your environment. Select a life-cycle phase to determine the current phase of the software products in your environment.
Current and past end of life product lifecycles	Software Lifecycle Report [sam_sw_product_lifecycle_report]	Software product life-cycles in your environment that are based on their EOL timelines. The chart displays data from the current year and the previous 15 years.
End of life workflow stages	Software EOL Request [samp_sw_eol_request]	EOL workflows grouped by the following stages: <ul style="list-style-type: none"> • Open • Analysis • Action initiated • Completed • Cancelled
End of life workflow actions	Software EOL Request	EOL workflows grouped by action initiated:

Lifecycle management dashboard metrics (continued)

Report	Source	Description
	[samp_sw_eol_request]	<ul style="list-style-type: none"> • Pending: Action is pending. • Remove EOL software: Remove the EOL software product from the asset inventory. • Upgrade: Upgrade to the latest or the supported software version. • Purchase support: Purchase additional support for maintenance. • Move to Azure: Migrate to Microsoft Azure. This action is available only for Microsoft products. • Accept risk: Accept the risks associated with the EOL software. <p>Note: This chart doesn't include EOL workflows that are in the Draft or Cancelled stage.</p>
Upcoming end of life product lifecycles in next 18 months	Software Lifecycle Report [sam_sw_product_lifecycle_report]	Software product life-cycles in your environment that are reaching EOL in the next 18 months.

Managing workflow to reduce risks associated with EOL software

Tracking product life cycles enables you to manage software products that are reaching or have already reached EOL, end of support (EOS), or end of extended support.

You can take required action for your EOL software products by using the Software Product Lifecycle report. The report opens when you select the **Upcoming end of life product lifecycles in next 18 months** or **Current and past end of life product lifecycles** report on the Lifecycle management dashboard. You can create an EOL request for the software products that have the Current phase as End of Support, End of Extended Support, or End of Life. For more details, see [Create an end of life workflow request for your software products](#).

Optimization and savings dashboard in workspace

Use the Optimization and savings dashboard to view actual and potential cost savings for your software assets. In addition, view the recommended licensing optimizations for third-party software publishers, including Microsoft, Red Hat, Adobe, and SAP. Use this information to downgrade or reclaim licenses so that you can optimize your licensing costs.

i Note:

You can use the Domain filter to narrow your results based on the domain that you select. The default value for the Domain filter is **global**. You can select a domain at any given time for widgets to reflect the selected domain. If you clear the selected domain, it defaults back to **global**.

The Domain filter appears on the screen only if the following plugins are installed:

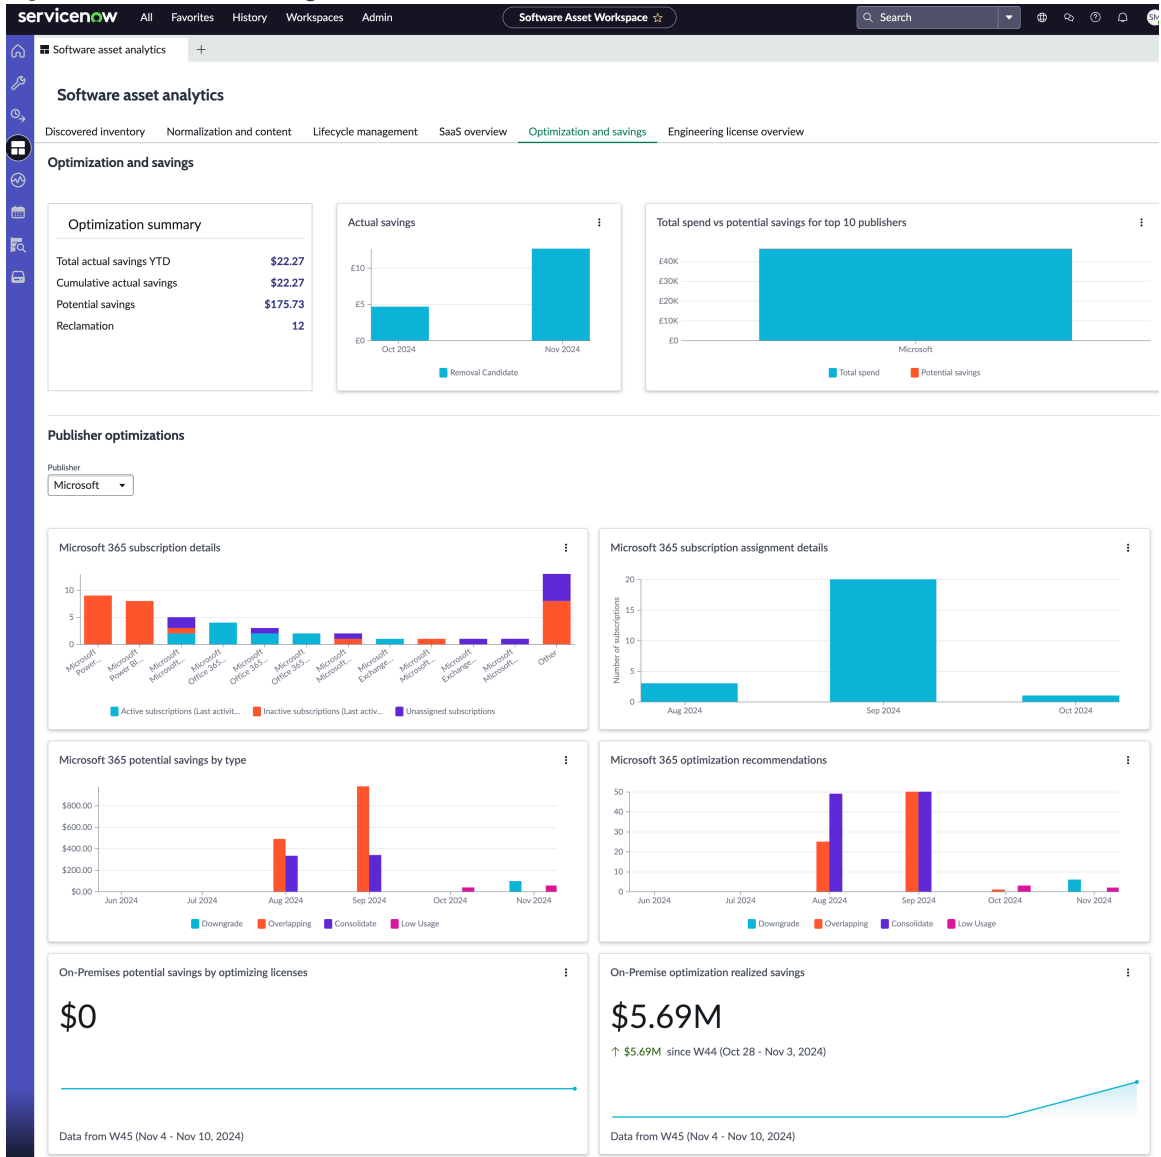

- Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer)
- Performance Analytics - Domain Support (com.snc.pa.domain_support)

You can access the Optimization and savings dashboard by navigating to **Software asset > Software Asset Workspace > Software asset analytics > Optimization and savings**.

View the licensing optimizations for a publisher by selecting the publisher from the **Publisher** drop-down list.

- [Publisher optimizations for SAP](#)
- [Publisher optimizations for Red Hat](#)
- [Publisher optimizations for Microsoft](#)
- [Publisher optimizations for Adobe](#)

Optimization and savings dashboard

Optimization and savings dashboard metrics

Report	Source	Description

Cumulative actual savings	Removal Candidate [samp_sw_reclamation_candidate]	State is Closed Complete and the sum of potential savings.
Potential savings	Removal Candidate [samp_sw_reclamation_candidate]	State is NOT closed complete OR closed canceled OR closed skipped and the sum of potential savings.
Reclamation	Removal Candidate [samp_sw_reclamation_candidate]	Active is true.

Optimization and savings dashboard metrics (continued)

Report	Source	Description
Actual Savings	Removal Candidate [samp_sw_reclamation_candidate]	Five months of history of closed complete reclamation candidates and their corresponding savings.
Total spend vs. potential savings top 10 publishers	Product Result [samp_product_result] and Removal Candidate [samp_sw_reclamation_candidate]	History of top 10 publishers sorted by highest spend and their corresponding potential savings.

Engineering License overview dashboard in workspace

Monitor and gain insights into your engineering applications license position and usage by viewing product usage reports in the Engineering license overview dashboard.

The Engineering license overview dashboard displays reports on normalized products and publishers that belong to engineering applications such as AutoCAD, GIS.

To narrow your results based on products or publishers across all tabs, use the filter in the left-hand corner of the dashboard. You can further narrow your results based on the date, user, or license server.

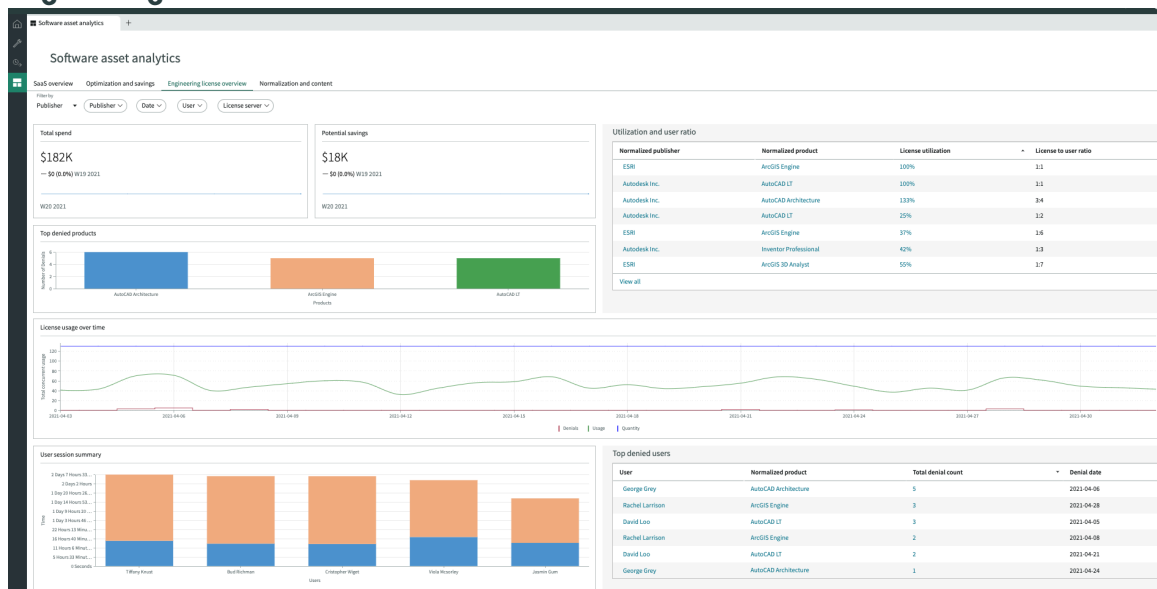

Note:

Only products and publishers that belong to engineering applications and are listed in the Engineering Application License [samp_eng_app_license] table appear in the filter. If no product or publisher is selected, the cumulative data for all products and publishers that belong to engineering applications appear.

All the reports are updated daily or whenever a new reconciliation result is available.

You can access the Engineering license overview dashboard by navigating to **Software asset > Software Asset Workspace > Software asset analytics > Engineering license overview**.

Engineering license overview dashboard

Engineering license overview dashboard metrics

Report	Source	Description
Total spend	Product Result [samp_product_result]	Total cost of all entitlements for all products.
Potential savings	Removal Candidate [samp_sw_reclamation_candidates]	Cost saved if removal candidates are reclaimed.
Top denied products	Engineering Application Denial [samp_eng_app_denial]	Top products that are denied to users as these products have reached their peak concurrent usage.
Utilization and user ratio	Engineering Application Utilization and User Ratio [samp_eng_utilization_user_ratio]	Ratio of license utilization, for normalized products and publishers, to the number of users using those licenses. <ul style="list-style-type: none"> • Normalized publisher • Normalized product • License utilization: Percentage of peak consumption of the product against number of rights. • License to user ratio: Ratio of rights using this license to users using this product over the period of 90 days rights.
License usage over time	Engineering Application License [samp_eng_app_license] Engineering Application Concurrent Usage [samp_eng_app_concurrent_usage] Engineering Application Denial [samp_eng_app_denial]	The total number or quantity of all available licenses; not just the active products but all the products. <ul style="list-style-type: none"> • The blue line represents the total number of licenses allocated to a product or a publisher • The green line indicates the concurrent usage of the licenses. • The red line indicates denials or if and when the concurrent usage peaks.
User session summary	Engineering Application Usage Summary [samp_eng_app_usage_summary]	Duration of time spent by users (idle vs active) on products. Only the top 5 users with more idle duration appear on the report.

Engineering license overview dashboard metrics (continued)

Report	Source	Description
		Note: Idle is the aggregate sum on Total idle duration column and Active is the aggregate sum on Total session duration column.
Top denied users	Engineering Application Denial [samp_eng_app_denial]	Top users that are denied licenses to products.

Cloud simulator dashboard

Compare and evaluate the estimated costs of migrating your on-premises resources to the cloud for each cloud environment.

Access the Cloud cost simulator dashboard by navigating to **Software Asset Workspace > Software asset analytics > Cloud cost simulator**.

(empty)	ccs1_host1	ccs1_cvm11	Microsoft Windows Server 2012 R2 Standard	Microsoft SQL Server 2008 R2 Enterprise	\$51,227.65	\$3,470.00	(empty)

Use filters on your on-premises resources to specify a criteria for receiving cost recommendations for cloud migration.

- Software
- Cluster
- Hardware EOL
- Software EOL
- Low utilization
- Show all matched VMs

Note:

You can also use the Optimization and savings dashboard to view recommendations without a filter.

The recommendations are listed based on the criteria you specified. Virtual machine records that meet the criteria you specified are listed. In addition to the on-premises cost listed for each virtual machine, the Software Asset Management application automatically lists the most optimal price match for the corresponding virtual machines on cloud: AWS and Microsoft Azure.

You can view the total cost of all the on-premises records as well as compare the individual cost for AWS and Microsoft Azure in the Compare cost estimates section.

Once you decide on the cloud environment that you want to migrate to, click **Change Request** to initiate your cloud migration request.

Compare cost estimates

Capex cost	Calculated hardware cost after including depreciation
Opex cost per month	Calculated from software entitlements: Windows Server, SQL Server, software assurance, and extended security updates costs. Also calculated from configuration item (CI) rate cards that are created by the user.
Without BYOL benefits per month	Cost of the instance (compute cost, OS cost, and software cost) plus storage cost.
With BYOL benefits per month	Cost of the instance cost (compute Cost) plus storage cost.
Potential savings	Total savings if all recommendations are applied.
Matched	Number of virtual machines on the cloud that match the on-premises virtual machines.
Unmatched	Number of virtual machines on the cloud that don't match the on-premises virtual machines.

Success portal view in Software Asset Workspace

Use the Success portal view in Software Asset Workspace to track the progress of your Software Asset Management (SAM) application with success goals, assign activities to track the success of your goals, run health checks on your software, maximize the usage of your SAM capabilities, and mature your SAM program with predefined maturity items.

Success portal helps you perform the following actions:

- **Track the progress of your SAM application through success goals**

Success goals help you analyze the value that you get out of your software licenses and calculate your projected savings. Create success goals for the licenses that you want to track. For more information about creating a success goal, see [Create success goals for Software Asset Management](#).

- **Track the progress of your success goals**

Track the success of your goals by creating success activities for the goals. For more information, see [Create success activities for Software Asset Management](#).

- **Perform a health check on your software**

Run health checks to review the health of licenses, permissions, and configurations to get the best out of each software suite. For more information, see [Health check](#).

- **Keep your software up to date using Value builder tasks**

Get an overview of which software upgrades, publisher packs, and integrations you must set up with Value builder tasks. These tasks are created automatically, but you can create your own as necessary. For more information, see [Value builder](#).

- **Mature your SAM program with predefined maturity items**

The program maturity is categorized into Crawl, Walk, and Run stages to help you improve the value return of your SAM program, including processes, features, functionalities, and capabilities within your organization. You can link these maturity items to Success goals and Value builder tasks to track and report on the improvements of your SAM application over time. For more information, see [View all maturity items for Software Asset Management](#).

Email notifications are sent when the following conditions are met:

- To a group, when a success goal is assigned to that group.
- To an owner, when a success goal is assigned to that owner.
- To an owner, when a success goal is marked as Pending Review.
- To an assigned user or an assignment group, when a success activity is assigned.

Access the Success portal view by navigating to **Software Asset Workspace > Success portal**.

The Success portal supports domain separation when the Performance Analytics - Domain Support plugin (com.snc.pa.domain_support) is activated. To filter the data by domain, select a domain at the top of the dashboard.

Success portal view

Success Portal
Use the Success Portal to evaluate the current health of your SAM program. Quickly track your progress with the provided maturity stages and create success goals and activities to calculate projected savings and show direct value of software updates and installations.

Health check

Use the Health check dashboard to view the results of the health scan that is performed on the configurations in your Software Asset Management application.

To access the Health check dashboard, navigate to **Software Asset Workspace > Success portal > Health check**.

i Important:

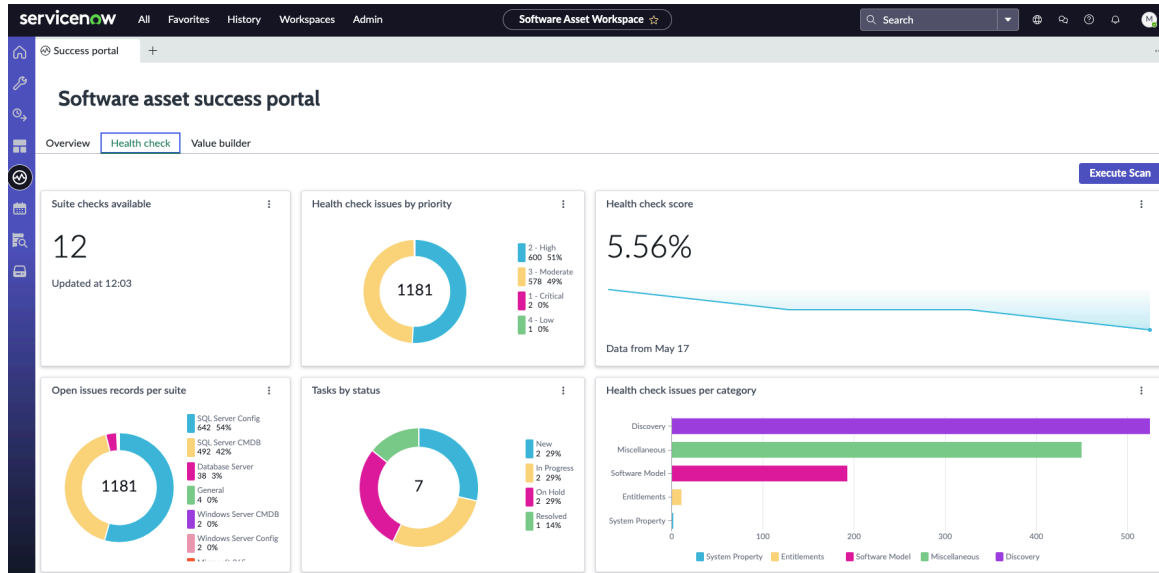

Ensure that you've activated the Software Asset Workspace (com.sn_sam_workspace) plugin and installed the ITAM Health Check application from [ServiceNow Store](#) to view the Health check dashboard. You must have the scan_user and sam_admin role to access this dashboard and view the health score data.

If you are on the Rome or the San Diego releases, you must execute the full scan to view the results in the base system scan dashboard. For details on executing a full scan, see [Execute full scan](#).

Select **Domain** and choose a domain to view the health check results.

You can also perform a scan for a suite by selecting **Execute Scan**. Verify the scan result to act accordingly. For more information, see .

Value builder

Maximize the usage of your Software Asset Management application capabilities by getting insights into integrations, playbooks, and other installations.

Overview of the Value builder

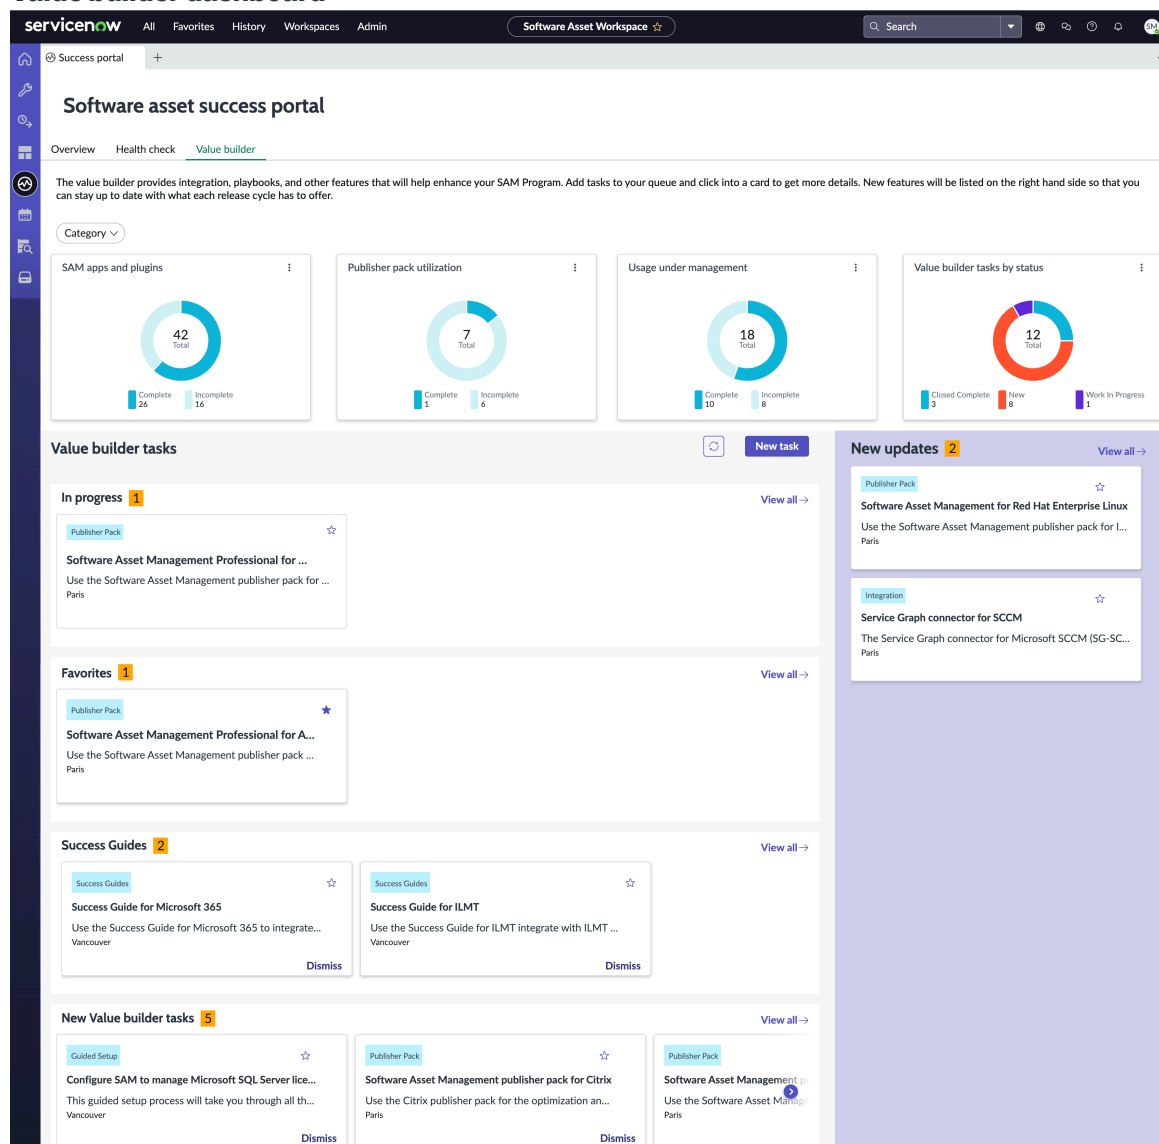

The sam_user role can identify and prioritize functionalities that haven't yet been implemented or aren't being used.

The Value builder functionality enables you to perform the following actions:

- Learn how close your instance is to maximizing the value of your Software Asset Management application.
- Track Value builder tasks that are automatically generated when publisher packs aren't fully used and are identified as incomplete. You can also manually create Value builder tasks. For details see [Create a Value builder task](#).
- Filter the data by domain or category or you can filter by both domain and category. The filter applies to the entire dashboard, and when selected, displays only the data that matches the specific filter.
- Prioritize or increase visibility of certain tasks by marking tasks as favorites.
- Stay up to date and get a glimpse of the new features available in the upcoming release.

You can view a maximum of 15 tasks in the Value builder section. To see additional tasks, click **View all**.

Value builder dashboard

Use case for Value builder

The Value builder displays four donut chart widgets to the sam_user role. Each widget shows you how far your instance is from fully using the Software Asset Management capabilities.

For example, the Publisher pack utilization widget shows five publisher packs but only four are being used in your instance. A Value builder task automatically gets created for the additional publisher pack that is not being used and appears in the New Value builder tasks section. You can prioritize this task and click the star icon to add this task to your Favorites list. If you decide not to work on this task, you can click **Dismiss** to remove it from the New Value builder tasks section.

Value builder widgets

Select a donut chart widget to take you to the list view of records. For example, if you want to view the incomplete publisher pack records, select the incomplete part in the donut chart widget.

All the widgets get refreshed and the value builder tasks are created after the following two scheduled jobs run:

- *SAM- Update value builder usage*
- *SAM- Value builder content handler*

Widget	Source	Description
SAM apps and plugins	sam apps and plugins [samp_sp_apps_and_plugins]	All Software Asset Management plugins and store applications that are available to use and how many haven't been installed on your instance. Complete indicates the store applications and plugins that are installed. Incomplete indicates the store applications and plugins that haven't yet been installed.
Publisher pack utilization	SAM Publisher Pack Utilization [samp_sp_publisher_pack_utilization]	All publisher packs that are available for use and how many are actually being used. Complete indicates the publisher packs that are fully used. Incomplete indicates the publisher packs that aren't fully used. Utilization of a publisher pack depends on a criteria. If the value is true for all three details in the Usage details section of a publisher pack record, namely Plugin enabled? , Usage found? , and Entitlements created? , then the publisher pack is considered to be fully used and is set to be complete. If

Widget	Source	Description
		<p>the value for even one of the three entities is false, then the publisher pack is considered to be not fully used and is set to be incomplete. Value builder tasks are automatically created for incomplete publisher packs.</p> <p>The criteria for Usage found? differs for each publisher pack. For details on the specific Usage found? criteria for each publisher pack, see Usage criteria for publisher packs.</p>
Usage under management	SAM usage under management [samp_usage_under_management]	<p>Usage of all licensable products.</p> <p>Usage of licensable products depends on a criteria. Success Guides

Use Success Guides, which are part of Value builder tasks, to easily find information about the tasks involved in various set ups and integrations.

The instructions in the Success Guides help you do the following:

- Track subscription licenses and proactively identify savings opportunities for Microsoft 365. For more information, see [Microsoft 365 SaaS License Management success guide](#).
- Track and license IBM usage by enabling you to configure the connection between the ServiceNow AI Platform and IBM License Metric Tool (ILMT) or BigFix Inventory. For more information, see [IBM ILMT setup success guide](#).

Microsoft 365 SaaS License Management success guide

Track Microsoft 365 SaaS subscription licenses in the ServiceNow Software Asset Management application and proactively identify saving opportunities for Microsoft 365.

Note:

Microsoft Dynamics 365 and Power Apps haven't been covered in this guide. For details, see [Integrating with Microsoft Dynamics 365 and Power Apps](#).

Microsoft 365 is a subscription-based product and offers various features and functionalities. For more information, see [Microsoft 365 FAQs](#).

Microsoft 365 licensing

Microsoft 365 is a hybrid Software as a Service (SaaS) application. Licensing of Microsoft 365 depends on subscription information from the cloud and from installations on endpoint devices, such as laptops, workstations, or virtual systems.

You must gather the following information and reconcile for licensing:

- Microsoft 365 subscription users from the Microsoft Cloud.
- Local installation information from relevant endpoint devices with enough detail for correctly aligning installations to user subscriptions in the Microsoft Cloud.

Microsoft 365 saving opportunities

You can collect and analyze data from multiple sources for identifying Microsoft 365 saving opportunities. The Software Asset Management application automates this process with the base system integrations to the cloud and on-premise inventory tools. This installation data is normalized with the subscription profiles, which helps in importing Microsoft 365 or Office 365 entitlements easily.

Reconciliation automatically produces license compliance positions based on attributes and calculations included in the Software Asset Management publisher pack for Microsoft. For more information, see [Identify savings opportunities](#).

Track subscription licenses and identify saving opportunities for Microsoft 365 by following these steps:

1. [Create a Microsoft 365 integration](#)
2. [Validate subscription, installation, and usage data](#)
3. [Import Microsoft 365 subscription entitlements](#)
4. [Identify savings opportunities](#)
5. [Microsoft 365 license optimization](#)

Create a Microsoft 365 integration

Compare Microsoft 365 user subscriptions with installation usage data for a complete license compliance position.

Before you begin

Role required: Navigate to the linked topics in each step for the required roles.

Enable the following plugins:

- [Software Asset Management Professional for Microsoft \(com.snc.samp.microsoft\)](#)
- [Software Asset Management - SaaS License Management \(sn_sam_saas_int\)](#)
-

Complete the steps in the [Request Software Asset Management](#) topic.

Procedure

1. Integrate with Microsoft 365 in the cloud for user subscription data.
For more information, see [Create a Microsoft 365 integration profile](#).
2. Configure Microsoft Power BI for gaining access to Power BI service content and APIs.
Power BI service content and APIs help optimize your Microsoft 365 subscriptions, such as by downgrading subscriptions from Office 365 E5 to Office 365 E3. For more information, see [Enable service principal authentication for Power BI read-only APIs](#).
3. Integrate with an inventory tool for installation usage data.
 - For integrating with Microsoft SCCM, complete the steps in the [Service Graph Connector for Microsoft SCCM](#)  topic and all subtopics.
 - For integrating with ServiceNow Agent Client Collector (ACC), complete the steps in the [Agent Client Collector installation](#)  topic and all subtopics.

Note:

ServiceNow Agent Client Collector (ACC) is a separately licensed IT Operations Management (ITOM) product. For details, contact your ServiceNow account executive.

- For integrating with Jamf for MAC OS devices, complete the steps in the [Service Graph Connector for Jamf](#)  topic and all subtopics.
- To integrate with a third-party inventory tool, complete the steps in the [Software asset connections](#) topic and all subtopics.

What to do next

[Validate subscription, installation, and usage data](#)

Validate subscription, installation, and usage data

Validate subscription, installation, and usage data before running a reconciliation for completeness and accuracy of your reports.

Before you begin

Role required: sam_admin, sam_user

Procedure

1. Validate user subscription data from the Microsoft cloud integration.

- a. Log in to your ServiceNow instance.

Interface	Action
Core UI	Navigate to All > Software Asset > Discovery > Software Subscriptions.
Software Asset Workspace	Navigate to Software Asset Workspace > License operations > User subscription > User subscription.

- b. Review the data in the User Subscription table by verifying the number of Microsoft 365 subscription records.

For more information about personalizing and filtering data, see [Configure user experiences](#).

- If the number of Microsoft 365 subscriptions records isn't accurate, verify that the *SAM - Import M365 User Subscriptions* scheduled job in the SAMP job log [samp_job_log] has completed successfully to pull the subscriptions.
 - Confirm that the existing integrations are working properly.
 - Determine if additional integrations are required for other Microsoft environments.
- If the Microsoft 365 records appear accurately, verify the values in the **Display name, User principal name, Software model, and Subscription identifier** fields.

Note:

Subscription identifiers uniquely identify SaaS applications. Each identifier is associated with a discovery map and a software model, which normalizes software installations to Microsoft 365 subscriptions from the cloud.

- Check if the software model is resolved correctly as per the subscription product definition.
- Check if the **User** field on the subscription records is resolved. If it is not resolved, check the email of the user, which must match with the user principal name. You can also match the user name from the user principal with the user_name on the sys_user record.
- If subscription identifiers are incorrect or empty, manage and resolve the subscription identifiers. For more information, see [Subscription identifiers for SaaS and SSO applications](#).

2. Validate installation and usage data from inventory tools.

Note:

Establish a validation scope, as a proxy for full inventory validation, with a sample set of devices known to have Microsoft 365 product installations. The sample size must be no larger than necessary to validate installation data from the integration. If there are multiple integrations, compile separate sample sets for each integration.

- a. Navigate to the Software Installations [cmdb_sam_sw_install] table, which lists the Microsoft 365 installations.

Interface	Action
Core UI	In the application filter navigator, search and select cmdb_sam_sw_install.list .
Software Asset Workspace	<ul style="list-style-type: none"> i. Navigate to Software Asset Workspace > License operations > Discovery > Discovery models. ii. Select a discovery model name. iii. Select the Software Installations tab.

- b. Locate the **Installed on** column field and filter to one or more devices that are part of the validation scope.
 - i. Filter the list further to see all the Microsoft 365 product installations for devices.
 - If the number of Microsoft 365 records is lower than expected, do the following:
 - Confirm that the existing discovery or inventory tools are working properly.
 - Determine if additional inventory tool integrations are required.
 - If the number of Microsoft 365 records is higher than expected, confirm that the existing discovery or inventory tools are working properly. If the inventory tool integrations are working properly, then the high number of records might indicate potential savings chances.
 - ii. Verify computer records for devices within the validation scope.
 1. Select the hyper-linked device name in the **Installed on** column field.
 2. Review the data values such as **Name, Assigned to, and Operating System**.
 - If the number of computer device records is lower than expected, do the following:
 - Confirm that the existing discovery or inventory tools are working properly.
 - Determine if additional inventory tool integrations are required for missing data.
 - If the number of computer device records is higher than expected, confirm that the existing discovery or inventory tools are working properly. If the inventory tool integrations are working properly, then the high number of records might indicate potential savings chances.

What to do next

[Import Microsoft 365 subscription entitlements](#)

Import Microsoft 365 subscription entitlements

Import Microsoft 365 subscription entitlements into the ServiceNow Software Asset Management application.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Gather as many Microsoft 365 subscription entitlements as possible.
2. Fill out the entitlement template and import into the ServiceNow Software Asset Management application.

- a. Open the **Import Software Entitlements** page.

Interface	Action
Core UI	<ol style="list-style-type: none"> i. Navigate to All > Software Asset > Licensing > Import Entitlements. ii. Select Download Template File (.xlsx).
Software Asset Workspace	<ol style="list-style-type: none"> i. Navigate to Software Asset Workspace > License operations. ii. Select Create entitlement. iii. In the Create new entitlement dialog box, select Import multiple entitlements from an Excel file. iv. Select Next. v. In the Create New Entitlement Import page, select Download template to download a spreadsheet template (.xlsx).

- b. Open the import template and review the **Directions** tab.

- c. Populate the import template with data from your gathered entitlements.
For more information about the additional details on the import template, see [ServiceNow SAM Entitlement Import User Guide](#).

- d. Use the following values on the template for Microsoft 365 entitlements:

- **Metric group:** Microsoft
- **License metric:** User Subscription

3. After the template is populated with entitlement data, import the template to the Software Asset Management application.

- a. Import the template to the Software Asset Management application.

Interface	Action
Core UI	Navigate to All > Software Asset > Licensing > Import Entitlements.
Software Asset Workspace	<ol style="list-style-type: none"> i. Navigate to Software Asset Workspace > License operations. ii. Select Create entitlement.

Interface	Action
	<p>iii. In the Create new entitlement dialog box, select Import multiple entitlements from an Excel file.</p> <p>iv. Select Next.</p>

- b. Import the completed template through **Browse files** or drag it.
 - c. Verify the imported software rights and resolve the import errors, if any.
4. Review the imported entitlements.
- a. Confirm that the software entitlements are linked to the correct software models.

Interface	Action
Core UI	Navigate to All > Software Asset > Licensing > Software Entitlements .
Software Asset Workspace	Navigate to Software Asset Workspace > License operations > Licensing > Software entitlements .

- b. Select the display name for a software entitlement record.
- c. On the Software Entitlements form, select the preview icon (🔍) next to the **Software model** field.
- d. Confirm that the discovery map and suite components match the values on the template for Microsoft 365 entitlements.

If the discovery map doesn't match, add or edit directly on the software model form and select **Update**.

Tip: After the entitlements are imported, you might need additional subscriptions purchases during the true-up process with Microsoft. For more information, see [Creating reserve entitlements for Microsoft online services](#).

What to do next

[Reconcile for compliance](#)

Reconcile for compliance

Run reconciliation to determine a license compliance position.

Before you begin

Role required: sam_admin

Procedure

1. Run reconciliation for Microsoft 365.

Interface	Action
Core UI	Navigate to All > Software Asset > Reconciliation.
Software Asset Workspace	Navigate to Software Asset Workspace > Software asset overview.

2. Select **Run Reconciliation.**
3. In the dialog box, select **Microsoft** in the **Publishers** field.
4. Select **Continue.**
5. Select **Run.**
You're automatically navigated to the Reconciliation Results page.
6. Monitor the status and progress values to confirm completion.
Refresh the Reconciliation Results page to view the updated values. If the **Assigned to** value is empty for computers with Microsoft 365 application installs, the reconciliation might not work. For information about validating installation and usage data, see [Validate subscription, installation, and usage data.](#)

What to do next

[Identify savings opportunities](#)

Identify savings opportunities

Identify savings opportunities and save money with the ServiceNow Software Asset Management application.

Before you begin

Role required: sam_admin

About this task

For enterprise subscriptions such as E1, E3, and E5, Microsoft may specify a commit level, which serves as a minimum or a floor to your license count, which means you can't reduce the enterprise subscription quantities below the commit level during the contract term. If your existing Microsoft contract has a commit level, you can realize potential savings opportunities at the end of the contract term.

Procedure

1. Realize your saving opportunities from over-licensed amounts.
 - a. Navigate to the Microsoft 365 data.

Interface	Action
Core UI	Navigate to All > Software Asset > Reconciliation > License Workbench.
Software Asset Workspace	Navigate to Software Asset Workspace > License usage.

b. Locate and select Microsoft 365.

The license compliance data is populated for the Microsoft 365 subscription.

- i.** Locate the Rights available value, which is calculated by `Rights used - Rights owned`.
- ii.** Locate the Over-licensed amount, which is calculated by `Rights available * Software entitlement unit cost`. This amount presents the following potential savings opportunities:
 - If new Microsoft 365 subscriptions aren't needed, you can remove the over-licensed amount during the next in-contract true-up without breaching the commit level.
 - If the commit level prevents in-contract true-up, you can use the over-licensed amount to inform new contract negotiations, which would be a proactive cost saving approach.

2. Realize your saving opportunities from software subscriptions last activity dates.

a. Navigate to the Software Subscriptions or User subscription page.

Interface	Action
Core UI	Navigate to All > Software Asset > Discovery > Software Subscriptions .
Software Asset Workspace	<ul style="list-style-type: none"> i. Navigate to License operations > User subscription > User subscription. ii. Select a user display name.

b. Add the **Last activity** field and filter the list to view desired subscriptions.

Note:

The Last activity date is pulled from the published Microsoft 365 integration profile and inventory tools. If a subscription is a suite product, the Last activity date is the latest activity information from any of its suite components. Validate Last activity dates with Microsoft cloud administrators as needed.

c. Right-click the **Display name** column header and select **Bar Chart**.

d. On the Create a report form, set **Group by** to **Last activity** and select **Run**.

For more information, see [Create a report](#).

The report visualization automatically updates to display filtered software subscriptions grouped by last activity in bar chart form.

e. Point to any bar in the chart to view additional details and select a bar to view the individual records that comprise it.

For more information about using reports, see [Using reporting](#).

3. Find Software Asset Management optimization recommendations for Microsoft 365 based on subscription details, usage, and potential savings based on recommendation type.

For more information, see [Publisher optimizations for Microsoft](#).

Result

Microsoft 365 subscriptions that haven't registered user activity in over a few months are the potential reclamation candidates.

What to do next

Here are a few follow-up actions:

- Review the **User principal name** for any former employees. If found, reclaim subscriptions.
- For subscriptions tied to active employees, navigate to the Software Installations (cmdb_sam_sw_install) table.
- Filter the Software Installations list for Microsoft 365 and add the **Last used** column. Create a report if wanted.
- Compare the Software installations report with the Software subscriptions report.

Microsoft 365 license optimization

Find Software Asset Management optimization recommendations for Microsoft 365 based on usage.

Microsoft 365 available subscription details

*Enhanced visibility of user activity within **Microsoft 365** subscriptions*

Report	Description
Microsoft 365 subscription details	<p>Number of active, inactive, and unassigned user subscription details for Microsoft 365, Office 365, and Power BI products, which are grouped by software models.</p> <p>Select a data point to view more details about the user subscriptions for a software model.</p> <ul style="list-style-type: none"> • Select the Active subscriptions bar to view the active user subscriptions, where the last activity date is equal to or less than 90 days. • Select the Inactive subscriptions bar to view the inactive subscriptions, where the last activity date is empty or was before 90 days. • Select the Unassigned subscriptions bar to view the number of available rights or user subscriptions that are unassigned.

Microsoft 365 optimization recommendations for subscriptions based on usage

Report	Description
Microsoft 365 optimization recommendations	<p>Number of licenses per month that can be downgraded or reclaimed based on recommended downgrade, double licensed, and consolidate candidates. This report displays data for the last 12 months.</p>

Microsoft 365 optimization recommendations for subscriptions based on usage (continued)

Report	Description
	<p>Select any bar to view more details and act on the recommended downgrade or dual license candidates for a given month.</p> <ul style="list-style-type: none"> • Select a bar that is marked as Downgrades from Office 365 E5 to E3 to view the list of candidates that can be downgraded from Office 365 E5 to Office 365 E3. Select a candidate from the list to downgrade the related license. • Select a bar that is marked as Downgrades from Office 365 E3 to E1 to view the list of candidates that can be downgraded from Office 365 E3 to Office 365 E1. Select a candidate from the list to downgrade the associated license. • Select a bar that is marked as Downgrades from Microsoft 365 E5 to E3 to view the list of candidates that can be downgraded from Microsoft 365 E5 to Microsoft 365 E3. • Select a bar that is marked as Downgrades from Microsoft 365 E3 to F3 to view the list of candidates that can be downgraded from Microsoft 365 E3 to Microsoft 365 F3. • Select a bar that is marked as Consolidate to view the list of consolidated Microsoft 365 optimization candidates.

Potential savings based on recommendation type

Report	Description
<p>Potential savings by optimizing licenses</p>	<p>Potential cost savings for licenses on your physical hosts and clusters that are based on recommended license optimizations.</p> <p>Note: This report is available only for Microsoft Windows Server licenses.</p> <p>Select the report to view details about the recommended license optimizations and associated cost savings for each host or cluster. License optimizations include the recommended license, recommended rights, and recommended spending.</p>
<p>Microsoft 365 potential savings by type</p>	<p>Potential monthly savings for Microsoft 365 and Office 365 licenses that are based on recommended downgrade, double license,</p>

Potential savings based on recommendation type (continued)

Report	Description
	<p>and consolidate candidates. This report displays potential savings for the last 12 months.</p> <p>Select any bar to view more details about the recommended downgrade or dual license candidates for a given month.</p> <ul style="list-style-type: none"> • Select a bar that is marked as Downgrades to view the list of candidates that can be downgraded to a previous version of Microsoft 365 and Office 365. • Select a bar that is marked as Double Licensed Users to view the list of candidates with both Microsoft 365 and its applications (Office 365, Enterprise Mobility +Security (EMS), Windows) subscriptions. • Select a bar that is marked as Consolidate to view the list of Microsoft 365 consolidate subscriptions reclamation candidates.
<p>Microsoft 365 portal available subscription details</p>	<p>Number of licenses that are available on the Microsoft portal per subscription.</p> <p>Select a bar to view details about the purchased subscription details, such as software model, product, purchased rights, assigned rights, available rights, and subscription profile.</p>

IBM ILMT setup success guide

This success guide provides information on the IBM License Metric Tool (ILMT) or IBM BigFix Inventory integration with the Software Asset Management application.

This integration supports license compliance for IBM products using the following IBM license metrics:

- Processor Value Unit (PVU)
- Resource Value Unit (RVU MAPC)

The integration imports only the IBM product usage data that is required for these license metrics.

***i* Note:**

This integration doesn't import any discovery or usage data for IBM products that are licensed via other metrics.

For IBM license compliance to work with this integration, you must complete the following prerequisites:

- Set up and run ILMT or BigFix Inventory on your instance.
- Configure IBM ILMT agents to scan your instance in compliance with the IBM usage measurement guidelines.
- Enable ILMT or BigFix Inventory to discover the configurations of both virtual machines (VMs) and physical hosts as well as the relationships between them.
- Classify IBM components into IBM products through ILMT or BigFix Inventory.
- Bundle IBM components into IBM products through ILMT or BigFix Inventory.
- Install ILMT version 9.2.7 or later.

Complete the following steps for the [IBM License Metric Tool \(ILMT\) and BigFix Inventory integrations](#) with the Software Asset Management application:

1. [Create a connection to ILMT or BigFix Inventory](#)
2. [Validate your ILMT connection health](#)

Alternative to ILMT or BigFix Inventory

You can track and manage IBM licenses in both VMware vSphere environments and IBM LPAR infrastructures by integrating the Software Asset Management publisher pack for IBM with Software Asset Management providers that are authorized to participate in the IBM Client Value Acceleration (CVA) Program. With these integrations, you can track and manage IBM licensing directly without having to integrate with the IBM License Metric Tool (ILMT) or BigFix Inventory. For more information, see [Authorized SAM Provider \(ASP\) integrations for IBM](#).

Additional resources

- IBM license management by the Software Asset Management application
 - [Software Asset Management publisher pack for IBM](#)
 - [Supported IBM license types](#)
- [Fix invalid computer serial numbers](#) 

Renewals calendar view

Use the Renewals calendar in the Software Asset Workspace to view the entitlements nearing their expiry date and contracts nearing their expiry date or are already expired.

The `sam_user` and `sam_admin` roles can gain an understanding of the upcoming contract and entitlement renewals and expired contracts by navigating to **Software Asset Workspace > Renewals calendar**.

Note:

Activate the Software Asset Workspace (`com.sn_sam_workspace`) plugin to view the Renewals calendar.

This view shows upcoming and expired renewals with the following conditions:

- The contract must be active.
- Contracts expiring in 90 days or fewer.
- The end date of the contract must not be empty.
- The state of the contract is active or expired.
- The substate of the contract is either `Awaiting review` or `Renewal rejected`.

- Contracts with contract model types such as Subscription, Software License, and Maintenance.
- Entitlements with only license types of Perpetual or Subscription.
- Entitlements without any associated contract.

The Renewals calendar lets you view:

- Calendar and list view of contracts and entitlements
- Details of contracts and entitlements in the calendar view

You can switch to the list view from the top-most right corner of the Renewals calendar page.

- Contracts
 - Contract name
 - Renewal start date for contracts nearing their end date
 - Renewal start date for expired contracts
 - Contract end date
 - Total cost
- Entitlements
 - Entitlement name
 - Start date
 - End date

Note: The end date for perpetual entitlements is the maintenance expiration date.

- Total cost

Note:

The calendar view shows the Renewal start date, which is calculated by

```
End date - Days past/until renewal
```

. Select the Days past/until renewal value such as 60, 90, 120, or 150 days. You must open the contract and entitlement record to view the actual start date.

- Number of upcoming contracts and entitlements renewals grouped based on the cost center in the left pane
- Contract information form on selecting the contract bar

Note:

You can renew, adjust, or cancel a contract from this record form.

- Entitlement information form on selecting the entitlement bar

Note:

You must create or associate a contract to proceed with the contract renewal workflow.

- A red line showing the current date. The contract or entitlement bar on the calendar view displays the start date as six months before the current date and the end date as six months after the current date.

You can filter and narrow down your results by:

- Upcoming renewals based on the time scale in the calendar view
- Days past or until renewal such as for 60, 90, 120, or 150 days
- Renewal types such as All contracts, All entitlements, and All contracts and all entitlements
- Publisher, Product, Contract model, and Cost Center subfilter based on the renewal type
- Domain

Note:

You must install the Domain Extension Installer [com.glide.domain.msp_extensions.installer] and Domain Support [com.snc.pa.domain_support] plugins to view the domain data on the Renewal calendar view.

Overlapping usage view

Use the Overlapping usage view in Software Asset Workspace to get insights into the feature level usage and rationalize your SaaS and Single sign-on (SSO) applications.

The Overlapping usage view displays reports showing the spend on your applications based on application category - SaaS or spend detection. You can also view the list of applications grouped by categories based on the main function of the software application, such as video conferencing, project management, and email marketing. This list of applications includes the following details:

- Spend
- Usage
- Total number of subscriptions
- Reclamation candidates

Access the Overlapping usage view by navigating to **Workspaces** > *Software Asset Workspace* > **Overlapping usage**.

Note: Request the Software Asset Management - SaaS License Management Integrations application from the [ServiceNow Store](#) to view the Overlapping usage view.

Note: The Overlapping usage dashboard supports domain separation when Domain Extension Installer (com.glide.domain.msp_extensions.installer) and Domain Support (com.snc.pa.domain_support) plugins are activated. To filter the data, select a domain from the Domain drop-down list.

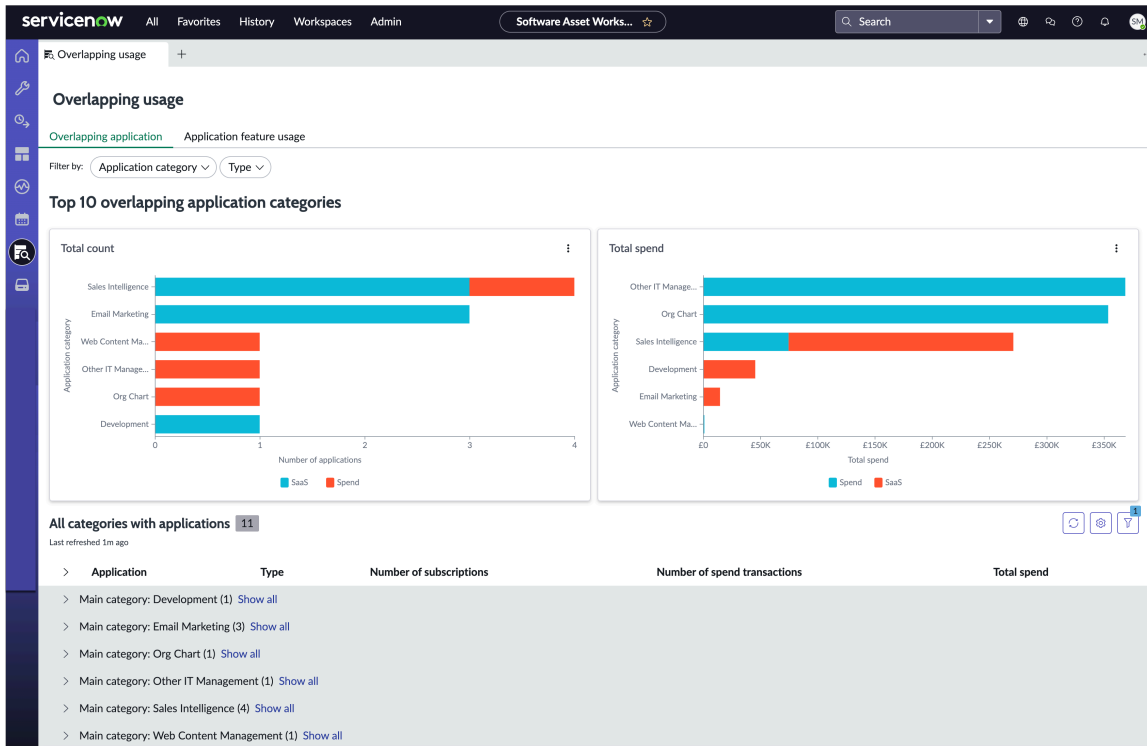

End users and roles

End user	Required role	Goal
SAM Admin/SAM User	sam_admin/sam_user	View the Overlapping usage dashboard. Note: A SAM Admin or a SAM user must have the it_demand_user role to create demand. You can create a demand from the Application feature usage page.

Overlapping applications

By selecting the **Overlapping applications** tab, you can view the following information:

- **Total count:** Total number of overlapping software applications grouped by application category, such as spend detection or SaaS. Selecting any application category bar navigates you to the list of applications of that type with details on their relevant number of subscriptions, total spend, and overall usage.
- **Total spend:** Total spend on overlapping software applications grouped by application category, such as spend detection or SaaS. Selecting any application category bar navigates you to the list of applications of that type with details on their relevant number of subscriptions, total spend, and overall usage.
- **All categories with applications:** The list of overlapping software applications grouped by category based on the main function of the software application. The number next to each category indicates the number of applications in that category, such as development and email marketing.

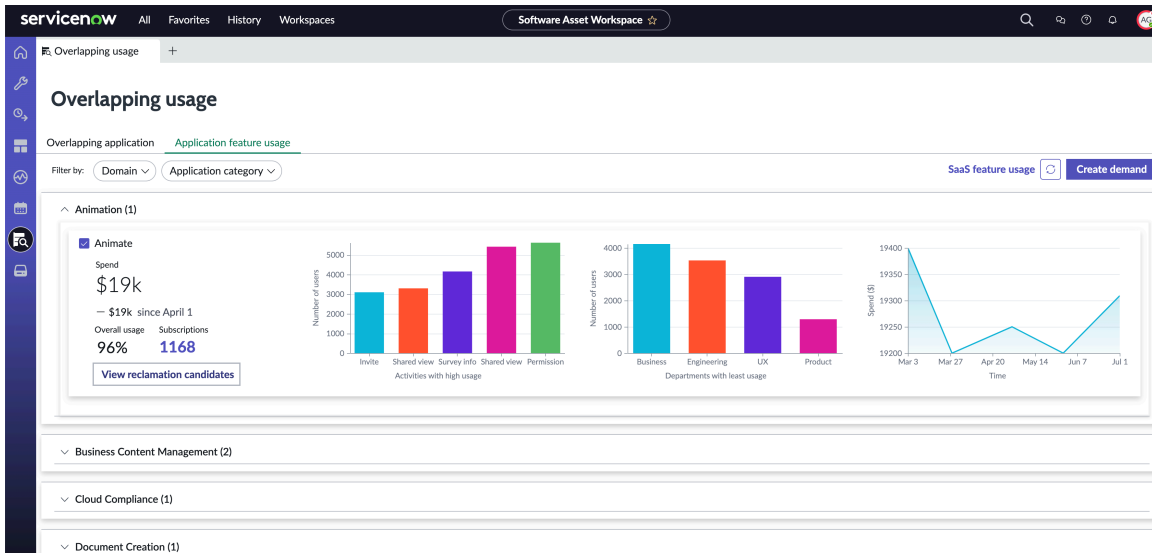

Application feature usage

By selecting the **Application feature usage** tab, you can view the following information:

- A list view of the application categories.
- Detailed and descriptive feature usage information of an application. By expanding an application category, you can view the following data for each application within that category.

Attribute/Chart	Description
Spend	Total spend for the application.
Overall usage	The percentage of users who have performed at least one event in the application.
Subscriptions	Total number of subscriptions for the application.
View reclamation candidates	List of reclamation candidates for the application that aren't closed.
Activities with high usage	Top five activities with the highest usage based on the number of users.

Attribute/Chart	Description
	<p>Note:</p> <ul style="list-style-type: none"> This chart gets replaced by Users with last login activity for SSO applications and the SaaS applications for which only the last login activity is pulled. This chart displays data for all events that have normalized mappings available in the SaaS Event Mapping (samp_saas_event_mapping) table.
<p>Departments with least usage</p>	<p>Five departments with least usage for the application in your organization. The usage is based on the number of users.</p> <p>This data helps IT administrators to determine if users within these departments need access and alternatively to help drive adoption for those users.</p> <p>Note: This chart displays data only for users who are assigned to a specific department.</p>
<p>Spend trend chart</p>	<p>Graphical representation of monthly spending trends on the application.</p>

SaaS feature usage

The SaaS feature usage page includes the event details for each integration, such as the event ID, event name, last activity, subscription, product, subscription profile, and publisher. Navigate to the SaaS feature usage page in the License operations view by selecting the **SaaS feature usage** link.

Note:

The SaaS feature usage page displays event details for up to one year from the current date.

The screenshot shows the ServiceNow interface for 'SaaS feature usage' with 4153 records. The table lists various events such as 'LOAD_SHEET', 'EXPORT_SHEET', 'LOAD_REPORT', 'UPDATE_SHEET', 'LOAD_SHEET', 'LOAD_DASHBOARD', 'LOAD_SHEET', 'LOAD_SHEET', and 'LOAD_REPORT', all occurring on 2023-07-18. The publisher for all events is 'Smartsheet'.

Event ID	Event name	Last activity	Subscription	Product	Subscription profile	Publisher
LOAD_SHEET	Loaded a sheet	2023-07-18		Smartsheet	smartsheet saas	Smartsheet
EXPORT_SHEET	Exported a sheet	2023-07-18		Smartsheet	smartsheet saas	Smartsheet
LOAD_REPORT	Loaded report	2023-07-18		Smartsheet	smartsheet saas	Smartsheet
UPDATE_SHEET	Updated a sheet	2023-07-18		Smartsheet	smartsheet saas	Smartsheet
LOAD_SHEET	Loaded a sheet	2023-07-18		Smartsheet	smartsheet saas	Smartsheet
LOAD_DASHBOARD	Loaded a dashboard	2023-07-18		Smartsheet	smartsheet saas	Smartsheet
LOAD_SHEET	Loaded a sheet	2023-07-18		Smartsheet	smartsheet saas	Smartsheet
LOAD_SHEET	Loaded a sheet	2023-07-18		Smartsheet	smartsheet saas	Smartsheet
LOAD_REPORT	Loaded report	2023-07-18		Smartsheet	smartsheet saas	Smartsheet

Creating demand to rationalize software applications

Creating demands enables you to take meaningful action against any redundant software you discover. You can discontinue software, reduce software usage, migrate users to approved software, or take other actions.

Note:

The PPM Standard plugin (com.snc.financial_planning_pmo) must be installed to create demands.

Select **Create demand** to rationalize software applications. For more information, see [Create demand to rationalize software applications](#).

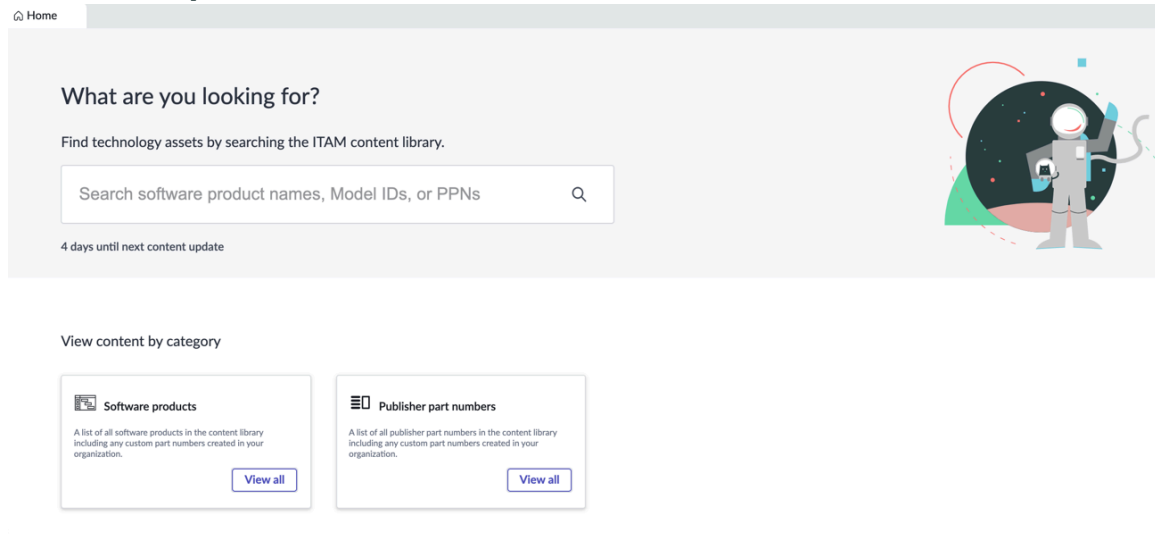

Content lookup

The Content library portal gives you visibility into the data stored in the Software Asset Management Content Service via an intuitive user interface.

The Software Asset Management Content Service is a repository of software product names and all additional information such as software product lifecycle dates, discovery maps, model numbers, publisher part numbers (PPNs). This information is stored in different tables in the Content Service. For more details on the Content Service, see [Software Asset Management Content Service](#).

To access the Content library portal, navigate to the Software Asset Workspace and click the Content lookup view icon on the left hand side of the page.

Content lookup

The Content library portal application is available in the ServiceNow Store. Once you install the application, ensure that the AI Search (com.glide.ais) plugin is activated. For details on installing the Content library portal application, see [Install Content library portal for Software Asset Management](#).

The Content library portal uses the AI search functionality and helps you to:

- Search for specific software product, PPNs, or model IDs.
- View the entire list of software products, PPNs, and model IDs in the Content Service.
- View additional details related to software products such as software version, software product life cycles.
- View the days remaining for the next content update.

Once you enter your search criteria in the search bar, the search results are listed with the most relevant matches at the top. Filters on the left-hand side of the page assist you in further narrowing down your results.

Based on your search criteria the information in the Content Service is pulled from multiple tables, such as:

- Software Product [samp_sw_product]
- Discovery Map [samp_sw_entitlement_definition]
- Publisher part numbers [samp_sw_product_definition]

Click the search result that matches your criteria to display the product details page along with the related lists. The product details page opens in a read-only mode. For example, if you click the Microsoft SQL Server 2008 Enterprise product result, the Microsoft SQL Server 2008 Enterprise page appears with the related lists such as software version, software life cycle data, and PPN.

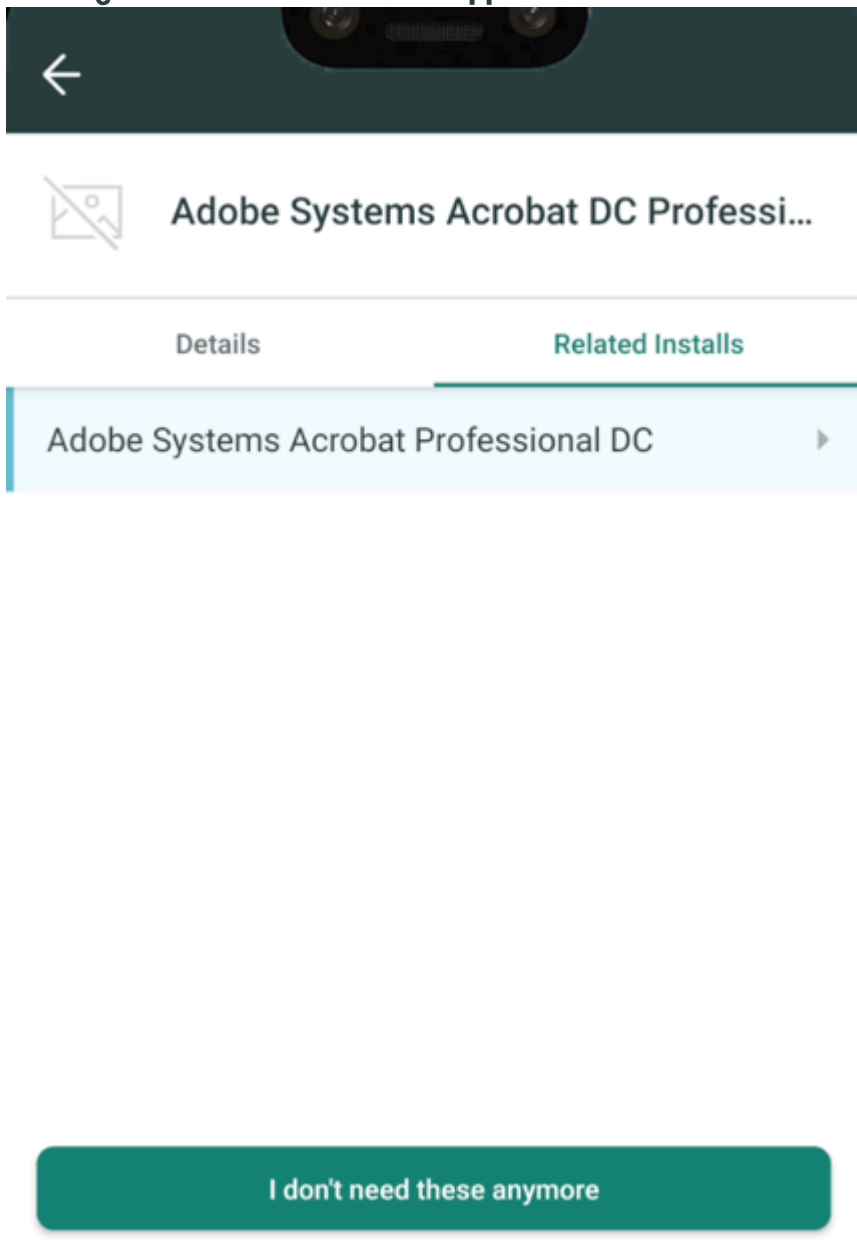

Now Mobile app for Software Asset Management

Use the Now Mobile app to view the hardware and software assets that are assigned to you.

In the Now Mobile app, you can view a list of both installed software and subscription software by navigating to **My Items > My Assets > Software**. You can find information on when you last used a piece of software. If some software is installed on more than one device, you can also view all

the devices. The Now Mobile app gets the list of assets from the Software Subscription, Rights used by, and Rights needed by tables.

Viewing assets on the Now Mobile app

Tap any of your assets to view its details such as its business cost, its last activity, and other information. If you want to surrender the asset, tap **I don't need this anymore**. A removal candidate is generated so that the software asset manager can review and approve the removal request.

Virtual Agent for software requests

You can implement ServiceNow[®] Virtual Agent to enable your employees to request software through a predefined conversational interface that is powered by artificial intelligence. Virtual Agent helps address software requests automatically so that your IT fulfillment professionals can focus on more complex requests and incidents.

For information on how to implement and use Virtual Agent, see [Virtual Agent](#).

Prerequisites

Before you can begin using Virtual Agent for your software requests, complete the following prerequisites:

- Activate the Software Asset Management Professional (com.snc.samp) plugin on your ServiceNow instance.

See [Request Software Asset Management](#) for more information on how to activate this plugin.
- Activate the Glide Virtual Agent (com.glide.cs.chatbot) plugin on your ServiceNow instance.

See [Activate Virtual Agent](#) for more information on how to activate this plugin.
- Request and install the ITSM Virtual Agent Conversations application from the [ServiceNow Store](#).
- Request and install the ITSM NLU Model for Virtual Agent Conversations application from the [ServiceNow Store](#).
- Enable automatic allocation of your software by setting the workflow of the corresponding software catalog items to **Procurement Process Flow - Auto allocation enabled**. See [Create or edit a catalog item](#) for more information on how to set the workflow for a software catalog item.

Software request flow on Virtual Agent

When a user requests software, Virtual Agent automatically recommends appropriate options based on the software that is available in your software catalog. Upon selecting an option, the user is prompted to specify the user or device that the software is being requested for. Virtual Agent then generates a request item and initiates one of the following workflows to allocate rights to the specified user or device:

- **User allocation workflow:** Allocates rights to the specified user. Virtual Agent initiates this workflow when the corresponding software entitlements support either user allocations only or both user and device allocations.
- **Device allocation workflow:** Allocates rights to the specified device. Virtual Agent initiates this workflow when the corresponding software entitlements support either device allocations only or both user and device allocations.

Note:

Rights are allocated to the specified user or device in ascending chronological order of software entitlements, starting with the oldest software entitlement.

Note:

If a software entitlement supports both user and device allocations or your software contains both user allocation- and device allocation-based software entitlements, Virtual Agent initiates the user allocation workflow first. Virtual Agent initiates the device allocation workflow only after all user allocations are consumed.

If the corresponding software entitlements contain enough active rights and allocations to fulfill the request, Virtual Agent automatically approves the request and allocates rights to the specified user or device. The user is then provided with instructions to download and install the software.

If the corresponding software entitlements do not contain enough active rights and allocations to fulfill the request, you must source the required rights manually. After you source those rights, Virtual Agent automatically allocates them to the specified user or device. The user is then provided with instructions to download and install the software.

i Important:

Software can be requested and allocated using this same flow in the ServiceNow® Service Catalog and Employee Center. See [Service Catalog](#) for more information on the Service Catalog. See [Employee Center](#) for more information on the Employee Center.

Software Asset Management Content Service

Opt in to the Software Asset Management Content Service to share unnormalized software installation data from your organization with ServiceNow® to improve the normalization process.

The Software Asset Management Content Service is an IT Asset Management (ITAM) shared service that provides users with continual software recognition improvements. By sharing unnormalized software installation data with ServiceNow, you receive automatic content updates based on your unique software installation footprint. For more information on content updates, see [Content updates for Software Asset Management](#).

The Software Asset Management Content Service transfers data between your organization and ServiceNow through a Content Data Service (CDS) instance. In commercial deployments, data is transferred through a CDS instance that is deployed in a commercial data center. In National Security Cloud (NSC) Department of Defense (DOD) Impact Level 5 (IL5) deployments, data is transferred through a CDS instance that is deployed in an NSC DOD IL5 data center.

i Note:

Data for your NSC DOD IL5 deployments can be transferred only from ServiceNow to your organization. It cannot be transferred from your organization to ServiceNow. Since you cannot share any unnormalized software installation data with ServiceNow, you must manually create a software content request for any software product that you want to add to the Software Asset Management Content Library. After the software product is added to the Content Library, the Software Asset Management application can begin normalizing the corresponding software installations that are discovered in your NSC DOD IL5 deployments. See [Create IT Asset Management content request](#) for instructions on how to create a software content request.

No personally identifiable information is shared with ServiceNow. However, please note the exception for custom software products, as described in the Software Asset Management Content Service asset data types table below.

Data that is shared using the Software Asset Management Content Service remains secure and is properly disposed of after review, following the same ServiceNow privacy policies, procedures, tools, and techniques that are used to secure ServiceNow instances. The selection of data types that are shared with ServiceNow is configurable by your organization. In addition, data is never packaged and shipped to other ServiceNow customers.

This new content improves your normalization hit ratios, which enable you to manage your software assets better. By default, you aren't opted in to the Content Service. For information on how to opt-in, see [Enable sharing information with Software Asset Management content service](#).

If you want to exclude any software discovery models, custom software products, or custom publisher part numbers from being shared with ServiceNow, select the **Exclude from content service** check box on the Software Discovery Model, Custom Software Product, or Custom Part Number form.

The normalization process acts only on active publishers, products, and rules. Obsolete rules aren't used. You can deactivate any Normalization Library content version at any time.

Data sharing for Software Discovery Models, Software Model Lifecycles, Part Numbers and Discovery Maps, Processor Names, and Product License Exception Rules is automatically

enabled after opting in. If you don't want to share a type of asset data, select the toggle button next to the type of data on the Content Service Setup page and then select **Save**.

Software Asset Management Content Service asset data types

Software asset data	Definition	Details transferred
Software Discovery Models	<p>Model created to classify and reduce duplication of software installs when new installs are identified.</p> <p>Only Software Discovery Models with the following statuses are transferred:</p> <ul style="list-style-type: none"> • Match not found • Publisher normalized • Partially normalized • Manually normalized • Normalized <p>i Note: Only the Discovery models whose status is Normalized and Version is empty are transferred.</p> <p>i Note: To improve the accuracy of machine learning predictions, software discovery models normalized by machine learning are transferred.</p>	<ul style="list-style-type: none"> • Discovered publisher • Discovered product • Discovered version • Normalized publisher • Normalized product • Normalized version • Edition • Language • Platform • Rule table • Rule ID • ML model version • ML normalization status • ML prediction values <p>i Note: You can override the ML model used for prediction by specifying alternate values in the property <code>com.snc.samp.ml.override_ml_</code>. The admin and <code>sam_admin</code> have read access to this property but only the admin has both read and write access.</p>

Extracted Entitlements from Software Contracts using Machine Learning	Software entitlement details are extracted from software contracts using machine learning. This helps in improving our machine learning model to predict product, publisher, and edition values. Additionally, it also enhances our mapping capabilities by adding more entries to the mapping table.	<ul style="list-style-type: none"> • Publisher part number • Product description • Publisher • Product • Version • Edition • Named user type • Database option • License type • License metric • Subscription period • Agreement type

Opting out

You can opt out at any time from the Content Service Setup page.

When you opt out, your company no longer contributes to the improvement of the normalization process. You still receive content updates, but the updates may be less applicable because they aren't informed by your company's unique software installation footprint that exists within your environment and CMDB.

Your company can rejoin the Software Asset Management Content Service at any time.

Related topics

[Normalization and Content Service dashboard](#)

[Enable sharing information with Software Asset Management content service](#)

Content updates for Software Asset Management

The Software Asset Management Content Service provides content updates to your instance weekly that you can use to normalize your data.

The following types of content can be updated as part of a content update:

- Categories
- Discovery maps

- Normalization suggestions
- Product classifications
- Product license exception rules
- Product names
- Product types
- Publishers
- Suite definitions
- Software model life cycles
- Software model suggestions
- Custom software product suggestions
- Common Platform Enumeration (CPE) normalization rule

Note:

Software models aren't updated when a publisher's name is updated as part of the content updates. The software model isn't updated because its display name is removed from the core company's reference. However, if a product moves to a different publisher, then the software model gets updated during content updates when the product goes from one core company to the other core company. The publisher name is updated for new software models but not for existing software models.

Product types can be updated on a product's edition level using the Custom Product License Exception Rules [samp_cust_prod_lic_excep_rules] table. For cases where certain editions are non-licensable, the product type gets updated automatically if the exception rule is defined in the Product License Exception Rules [samp_prod_lic_excep_rules] table or the Custom Product License Exception Rules [samp_cust_prod_lic_excep_rules] table. However, if a product is non-licensable, an exception rule can't be created for a licensable edition. For this case, you must raise a case with the Content Service team with supporting documentation and the team reviews whether the edition must be tagged as licensable.

The *SAM - Apply latest content changes* scheduled job runs and processes the content updates. After the content download is complete, the updated content is pulled from the staging columns to the corresponding target columns. Related downstream records are also updated.

A query runs and identifies what transactional data in your instance must be updated with the new content. After the changes are identified, the changes are then propagated to your instance.

Another scheduled job, *SAM - Create suites for a software model*, runs and propagates suite component and life cycle changes to your software models. If you don't want content changes applied to a software model, then you can clear the **Allow automated content updates** flag on the Software Model form. By default, the flag is selected to enable automated content updates to all software models.

Note:

If a content update adds life-cycle data, it can't be deleted from the software model, but you can deactivate it. Any life-cycle data that is added as part of a content update has the source set to **Servicenow**.

Use the Software Models with deactivated discovery maps report to show software models that are pointing to any deactivated discovery maps.

To see the changes that have been made to the software library, review the SAM Content Audit [sam_content_audit] table.

Note:

Content updates don't have an impact on any custom products or custom discovery maps.

For more information on how to send your content to ServiceNow and include it in the content updates, see [Enable sharing information with Software Asset Management content service](#). For more information on content updates, see [KB0824127](#).

Software models and Software entitlements

A software model is a profile of the software that you've purchased, including information about the publisher, version, and discovery map. Software entitlements are used to relate the software model to the rights that you've purchased.

Software models

Software models are used to record publisher information and create a profile. You can link multiple entitlements to one software model.

If you delete a software model, all records related to the software model, in the Downgrade Rights [smp_sw_downgrade_model and samp_downgrade_model] tables, are automatically deleted. For detailed information on downgrade rights, see [Downgrade Rights](#).

For details on manually creating software models, see [Create software models in workspace](#). For details on automatic creation of software models, see [Automatic creation of software models](#).

Software Product Lifecycle report

You can also track a software lifecycle phase for use with the [Technology Portfolio Management](#).

The Software Product Lifecycle [sam_sw_product_lifecycle] table holds the information of the software product, its lifecycle type (internal or external), full version, lifecycle phases, start date of the phase, and the risk.

The Content active column in the Software Product lifecycle [sam_sw_product_lifecycle] table is set to the value true by the Software Asset Management content service if the lifecycle records are valid. If you do not want a lifecycle phase to be rendered on the Technology Portfolio Management (TPM) timeline, then set the **Active** column to false. For example, you can have **General Availability**, **End of Extended Support**, and **End of Support** lifecycle phases as three records for Oracle DB Server software model in the Software Product Lifecycles list. However, if you do not want **General Availability** phase to be shown on the timeline, you can clear the **Active** check box in the Software Product Lifecycle form for that lifecycle phase record. As a result, the timeline starts with the **End of Support** phase. Although the lifecycle phase record exists for the software product lifecycle, the lifecycle data will not be rendered on the timeline. Because only active lifecycle records are considered and plotted in the TPM timeline.

View the Software Product Lifecycle report to be informed about the products nearing end-of-life, end-of-support, and end-of-extended support. View the report by navigating to **Reports > View/Run**. The report is based on the scheduled job, *SAM - Generate Data For Software Lifecycle Report*.

Software Lifecycle Report

The Software Lifecycle Report [sam_sw_product_lifecycle_report] table calculates the current and upcoming lifecycle phases from the lifecycle phases mentioned in the Software Product Lifecycle [sam_sw_product_lifecycle] table.

For records with the same publisher, product, version, full version, and edition, there's a single record for different lifecycle phases. This helps in avoiding duplicate software installation count for each lifecycle phase. You can export lifecycles from the Software Installation [cmdb-sam-sw-install] table. The software installation records are linked to lifecycles via the *Installs associated to lifecycle* column in the Software Installation [cmdb-sam-sw-install] table.

Five new columns have been added to Software Lifecycle Report [sam_sw_product_lifecycle_report] table:

New columns in the Software Lifecycle Report table

New column label and name	Description
Current phase [current_lifecycle_phase]	The lifecycle phase that is currently underway.
Current lifecycle phase start date [current_lifecycle_phase_start_date]	The start date of the current lifecycle phase.
Upcoming lifecycle phase [upcoming_lifecycle_phase]	The lifecycle phase that is soon coming up.
Upcoming lifecycle phase start date [upcoming_lifecycle_phase_start_date]	The start date of the upcoming lifecycle phase.
Owners [owners]	The person responsible for the software model.

Note:

The lifecycle phase column is removed from the Software Lifecycle Report [sam_sw_product_lifecycle_report] table.

Software entitlements

To track the software rights for your software, create a software entitlement that can be linked back to the publisher information.

A software entitlement records the terms of your software license. By using software entitlements, you can:

- Rapidly address if license allotment has been exceeded and return to compliant status by removing unauthorized software or ordering more licenses.
- If the license allotment is not being used completely, lower the number of future licenses purchased.

For example, a company purchases a software entitlement for 100 rights. From the software entitlement, 100 employee or machine allocations are created that are rightfully assigned a license. If Discovery finds the software installed on 200 machines, the software asset manager must identify the employees or machines that have the software installed without a license, and remediate the situation.

For details on creating software entitlements, see [Create entitlements in workspace](#).

Import software entitlements

You can import bulk software entitlements at one go.

If a Publisher Part Number (PPN) is specified for the entitlements that you import, the PPN is matched to PPN in the Content Service Library and the data is used to create a software model automatically.

Note:

If a Publisher Part Number not found error occurs during import of the software entitlement (product, publisher, version, edition, platform, and language) but a discovery map is found, then a **custom publisher part number** is automatically created. If a discovery map is not found, you can create a discovery map to be associated with the publisher part number.

If the import spreadsheet contains a conflicting (or missing) PPN, the PPN value is set to the value in the existing product definition, when available.

Note:

If you import a batch of Microsoft entitlements and the **License Duration** field is set to **Contractual**, you must specify both a start and end date.

The step-up license type is only available if the publisher is Microsoft. If you try to specify another publisher, an error message is displayed.

Automatic creation of software models

Software models are automatically created for software installations if one doesn't already exist.

All software installations need to be associated to software models. Being associated to a software model, helps in remediation and ensures that the software installations are included during cost estimation in order to be compliant.

If a software installation doesn't correspond to any software model, the system automatically creates a software model.

- To create a software model automatically for licensable products, enable the property *Automatically create software models for all 'licensable' products*.
- To create a software model for not licensable products, enable the property *Automatically create software models for all 'not licensable' products*.

Note:

You can update the above mentioned properties by navigating to **Software Asset > Administration > Properties**.

When reconciliation runs, the system searches if any software model exists for the software installation. The search for an existing software model is based on attributes such as version, edition, language, platform, and install condition. If all conditions for the attributes in an existing software model match, then a software model is not created hence avoiding the creation of duplicate software models.

A software model is only created if no match is found. The software model is created across versions and for the specific edition, if available. However a software model is never created against a specific version.

Discovery maps are associated to software models only if a discovery map exists for that software model. If a corresponding discovery map doesn't exist in the Content Service library, a software model still gets created without a discovery map.

You can identify if a software model is automatically created by the *Automatically create software models for all 'licensable' products* or *Automatically create software models for all 'not licensable' products* property. In

the Software Model list view, click the gear icon to display the *Created source* column. If the value in this property says *System property*, then it indicates that the software model was automatically created by one of the properties.

Custom publisher part numbers (PPN)

Propagate changes to entitlements and software models by replacing your custom PPNs and custom discovery maps (DMAPs) with the Software Asset Management Content Service PPNs and DMAPs.

Note:

Custom PPNs that use a part number that is not a valid SKU from the publisher can't be replaced.

Once the Content Service updates are downloaded to your instance, the scheduled job, *SAM - Find Product Definition Suggestions*, runs. The scheduled job checks all custom PPN and DMAP records to find corresponding PPN and DMAP matches on the Content Service. If a match for the custom PPN and DMAP is found, then a suggestion record is created in the Part number suggestions [samp_sw_part_number_suggestion] table. You can view the suggestions record by navigating to the **Part number suggestions** option.

Note:

If you have excluded custom PPNs from the Content Service by selecting the **Exclude from content service** option in the Custom Part Number form, then suggestions aren't shown for those custom PPNs.

Note:

For details on viewing the suggestion records, see [View publisher part number \(PPN\) suggestions in workspace](#) or [View publisher part number \(PPN\) suggestions in Software Asset Management classic](#).

You can accept or reject the suggestions. If you accept the suggestion, the custom PPN and DMAP are replaced with the Content Service PPN and DMAP. All changes to entitlements and software models are propagated automatically.

The propagation of the content service PPN results in the following changes:

- All impacted entitlements are updated with the new PPN.
- Downgrade rights associated with the content service DMAP gets copied to the entitlement.
- Downgrade rights that are copied overwrite any existing entries made by you.
- Values for license type and license metric get modified based on the PPN (where needed).
- Entitlement remains in the **In use** state.

The propagation of the Content Service DMAP results in the following changes:

- Associated software model is updated with the new DMAP.
- Fields get impacted on the software model:
 - Short description, Asset tracking strategy/unit, next version.
 - Suite components/parents get overwritten with the Content Service DMAP values.
 - Any custom components that were added are deleted, as stated in a warning.
 - Life cycles get overwritten (with a warning message).

Software Asset Management migration

Migrate from the Software Asset Management plugin (ITSM Software Asset Management feature of Asset Management) to the Software Asset Management application to take advantage of more powerful features. Manual actions by the customer are required after plugin activation.

After automatic changes are performed during plugin activation, successful migration from the Software Asset Management (com.snc.software_asset_management) plugin to the Software Asset Management Professional (com.snc.samp) plugin requires a [manual procedure](#) to be performed by the customer.

Customizations to forms and lists may need to be manually overwritten by the customer after plugin activation. In addition, certain fields in software models, software entitlements, user/device allocations forms require manual configuration by the customer after plugin activation.

Automatic changes

The Software Asset Management Professional (com.snc.samp) plugin performs these automatic changes:

- Tables
 - Table labels renamed

Table	Original Label	New Label
[alm_license]	Software License	Software Entitlement
[alm_entitlement_user]	User Entitlement	User Allocations
[alm_entitlement_asset]	Device Entitlement	Device Allocations

- Adds new tables and script includes.
- Adds any string value in the Software Entitlements **License key** field to the License Key [samp_sw_license_key] table

- Field names and values
 - **Inference mandatory** field

For software models that have suite components (to bundle software models), the **Inference mandatory** field value in the Software Suite [cmdb_m2m_suite_model] table is transferred to a new **Mandatory** field

- **Rights** field

The Software Entitlements (formerly Software Licenses) **Rights** field value in the License Entitlements [alm_entitlement] table is transferred to a new **Purchased rights** field, and name changed from **Rights** to **Active rights**

- The **Software model** field for a software entitlement allocation (Software Entitlement [alm_license] table) is automatically set to the software model on the entitlement (License Entitlements [alm_entitlement] table)
- The quantity for a software entitlement allocation (License Entitlements [alm_entitlement] table) is set to 1 unless there are multiple allocations

If there are multiple software entitlement allocations for the same user or device, the allocations are aggregated into one record, the quantity is set to the count of aggregated records, and duplicate allocations are not allowed.

- Forms and lists

Software Models, Entitlements (formerly Software License), Discovery Models, and Software Installations form and list layouts are modified to fit the new application

Note:

Any customizations to these forms and lists must be manually overwritten after plugin activation.

- Functionality

Functionality disabled

Functionality	Description
License and software counters	The scheduled job trigger for SAM License Counters is changed to None so that it is deactivated, and software counters are disabled.
Auto-match functionality	The auto-match functionality, which attempts to match a discovery model to a corresponding software model, is deactivated.
Navigation menu	The navigation menu for the Software Asset Management (com.snc.software_asset_management) plugin is deactivated and renamed.
Business rules	Legacy business rules applied to discovery models are disabled.

Software model relationship to software installation

Associating each software installation with a software model lets you perform audit reporting of licensable and non-licensable software.

Overview

Software models are automatically created for licensable and non-licensable products if the following system properties are enabled:

- *com.snc.samp.automaticsmrcreation*: for licensable products
- *com.snc.samp.automaticsmcreation*: for non-licensable products

If the system properties are enabled and a discovery model match exists, even if the match is generic, a software model will not be created. If the system properties are not enabled, the software model is just matched to a discovery model; no software models are created.

A match is made to the most specific software model. If no specific software model exists for the discovery model, then the match is made to the most generic software model.

During the matching process, if a matching software model is found, but it has an install condition on it then it's not considered to be a match. In such a scenario, a software model is automatically created without an install condition.

For each normalized publisher and normalized product pair in the Software Discovery Model (cmdb_sam_sw_discovery_model) table, the scheduled job, *SAM - Discovery Model to Software Model matching*, gets all software models with matching publisher and product. If the software model has no install condition, subscription condition, or DB option, the system gets matching discovery models with normalized publisher, normalized product, normalized edition, and normalized version values. Once a match is found, the software model reference is put on the software model column in the Software Discovery Model [cmdb_sam_sw_discovery_model] table.

Manually set software model

If you choose to match on a more generic software model than what the scheduled job *SAM - Discovery Model to Software Model matching* sets, you can manually set the desired software model in the form view on the Software Discovery Model (cmdb_sam_sw_discovery_model) table. The Automatically matched column becomes unchecked.

If a software model is set and the Automatically matched column's value is false, the scheduled job will not override the software model value on subsequent executions.

Sample matches

The following are some sample scenarios of software model and discovery model matches.

Discovery model	Software models	Matches with
SQL Server 2019 Enterprise	<ul style="list-style-type: none"> SQL Server 2019 Enterprise SQL Server 2019 	SQL Server 2019 Enterprise software model
SQL Server 2019 Enterprise	<ul style="list-style-type: none"> SQL Server 2019 Enterprise with install conditions SQL Server 2019 (Edition is anything) 	SQL Server 2019 software model
SQL Server 2019	SQL Server 2019 with install conditions (Edition is anything)	<p>No match found.</p> <p>If the system property is enabled, a new software model will be created: SQL Server Enterprise (Version is anything).</p>

Software license metrics

License metrics are set in software entitlements and used for reconciliation in various metric groups and software model combinations.

Each metric group has a set of license metrics that are specific to the publisher.

You can view the Metric Attributes related list in software models to set the attribute value. For more information, see [Software model fields](#).

You can also add custom license metrics. For more information, see [Add a custom license metric](#). You can use the Resource Value [samp_sw_resource_value] table to enhance the custom license metric capability by doing a 1:1 calculation between the Unit consumption column in the Resource Value [samp_sw_resource_value] table and the Licenses required column in the License Metric Results [samp_license_metric_result] table.

Adobe, Citrix, IBM (includes both IBM and Red Hat), Microsoft, Oracle, SAP, and VMware publisher packs are available as add-ons. They provide the capability to manage software licensed under the publisher licensing models.

Installing [SaaS License Management](#) adds the Subscription and Consumption metric groups.

You can view descriptions of your license metrics by selecting the reference (ⓘ) icon next to the **License metric** field in your software entitlements.

License metrics

Metric group	License metric
<p>Adobe</p> <p>Note: Adobe license metrics are visible only if the Adobe publisher pack is installed.</p>	<ul style="list-style-type: none"> • Per Device: Licenses a device for the number of installations of software. • Per User: Licenses a user for the number of installations of software. • User Subscription: Licenses a user for the number of activated software subscriptions. <p>When you run a reconciliation for software models with one or more entitlements, a right is consumed for each active unique software subscription record assigned to a user.</p> <ul style="list-style-type: none"> ○ A right is considered Allocated in use when a user has both a user allocation and a subscription record. ○ A right is considered Not Allocated in use when a user doesn't have a user allocation but has a subscription record. ○ A right is considered Allocated not in use when a user has a user allocation but doesn't have a subscription record. <p>If multiple rights are assigned to a user in a user allocation, then the user has the corresponding number of subscriptions for the software model. For example, a user has a user allocation with two rights but only one subscription record related to a software model. In this example, one right is considered Allocated in use and the second right is considered Allocated not in use.</p>

License metrics (continued)

Metric group	License metric
<p>Citrix</p> <p>Note: Citrix license metrics are visible only if the Citrix publisher pack is installed.</p> <p>A discovery process is required for Citrix data to be collected. Admin users must create a Discovery schedule to run on the Citrix Delivery Controller for communication with the Citrix License Server.</p> <p>See for information on the Citrix discovery pattern and tables.</p>	<ul style="list-style-type: none"> • Concurrent User: Licenses the number of simultaneous users accessing the program. • Per Device: Licenses a device for the number of installations of software. • Per Processor (CPU count): Licenses processors on either a physical server or virtual machine. • Per User: Licenses a user for the number of installations of software. <p>If you're reconciling Citrix server software through a client access record, this license metric licenses the users that are accessing the server.</p> <ul style="list-style-type: none"> • Per User/Device: License a unique user or a shared device. If the license is assigned to a user, they have unlimited connections to an unlimited number of devices. If the license is assigned to a device, an unlimited number of users can connect to a single device. <p>If you create an entitlement with the Citrix metric group and the Per User/Device license metric is specified, the license calculator checks the compliance of all related software models based on the number of distinct users and devices.</p> <p>If you're reconciling Citrix server software through a client access record, this license metric licenses the users and devices that are accessing the server.</p>
<p>Common</p>	<ul style="list-style-type: none"> • Per Core: Licenses cores on a physical server or virtual machine. <div style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;"> $\text{CPU core count} * \text{CPU count}$ </div> <ul style="list-style-type: none"> • Per Device: Licenses a device for the number of installations of software. • Per Named Device: Licenses a specific device for the number of installations of software. <p>Note: You must add allocations.</p> <ul style="list-style-type: none"> • Per Named User: Licenses a specific user for the number of installations of software.

License metrics (continued)

Metric group	License metric
	<p>Note: You must add allocations.</p> <ul style="list-style-type: none"> • Per Processor (CPU count): Licenses processors on either a physical server or virtual machine. • Per User: Licenses a user for the number of installations of software. • User CAL: Licenses each user that accesses your server, regardless of the number of devices that each user is using to access the server. • Device CAL: Licenses each device that accesses your server, regardless of the number of users that are using each device to access the server. • User/Device CAL: Licenses each user or device that accesses your server. • Resource Consumption. Consumption-based license metric that supports CAL reconciliation. A 1:1 ratio calculation between the Unit consumption column in the Resource Value [samp_sw_resource_value] table and the Licenses required column in the License Metric Results [samp_license_metric_result] table.
<p>Concurrent Licenses</p> <p>Note: Concurrent Licenses license metrics are visible only if the Software Asset Management Professional for Engineering Applications (sn_samp_eng_app) plugin is activated along with OpenLM and Open iT integration.</p>	<p>These licenses are based on the number of simultaneous users or devices accessing the software.</p> <ul style="list-style-type: none"> • Floating: Shares and manages a pool of software among users or devices on a network. Checks out a license when a user or device requests access to the software. If there's no license left at the peak of license consumption, the user or device is denied access to the software. The number of rights consumed is based on the peak number of licenses checked out during a specified time. • Token: Shares and manages a pool of tokens among users or devices. Checks out a token or a set of tokens when a user or device requests access to the software. If there are no tokens left at the peak of license consumption, the user or device is

See Software Asset Management properties.</p>
<p>Red Hat</p> <p>Note: Red Hat license metrics are visible only if the IBM publisher pack is installed.</p>	<ul style="list-style-type: none"> Per Socket-pair: Licenses the number of socket pairs on the physical host or the number of virtual machine (VM) pairs running a Red Hat Enterprise Linux server on a physical host. Per Core: Licenses the cores on both the virtual cores that support virtual machines and the physical server. It also presents a cost-efficient model based on the number of rights used.
<p>SAP</p> <p>Note: SAP license metrics are visible only if the SAP publisher pack is installed.</p>	<ul style="list-style-type: none"> Named User: Licenses the number of named users that can be assigned a Named User Type. The Named User Type is defined by the software model linked to the entitlement. Engine Measurement: Licenses the amount of engine usage. Digital Access: Licenses the indirect usage of SAP applications through a third-party

License metrics (continued)

Metric group	License metric
	<p>application or a non-SAP intermediary software by the count of documents created by the third-party application.</p> <ul style="list-style-type: none"> • Full Usage Equivalent (FUE): Licenses the number of users that are authorized to access specified solution capabilities of SAP S/4HANA Cloud Public Edition.
<p>Subscription</p> <p>Note: Subscription license metrics are visible only if the SaaS License Management is installed.</p>	<p>User Subscription: Licenses for the number of users.</p>
<p>VMware</p> <p>Note: This license metric isn't visible unless the VMware publisher pack is installed.</p>	<ul style="list-style-type: none"> • Per Application Instance: Licenses per application instance. Applies to VMware products: vCenter Server software. • Per Device: Licenses per specific device. A license can only be reused if it's removed from the device. The number of software users on the device isn't relevant as long as the license is used on the licensed device. Applies to the VMware suite of products: Horizon FLEX, ThinApp, ThinApp Virtualization Packager, and Mirage Windows Migration. • Per Named User: Licenses per named user. Applies to VMware named users: Horizon Advanced, Horizon Enterprise, Horizon Suite, Mirage, Horizon Socialcast on Premise, Workspace (Portal), Workspace Suite, Horizon Air, Horizon Air Desktop DR, ThinApp, ThinApp Virtualization Packager, vRealize Operations for Horizon, User Environment Manager, vRealize Business. • Per OSI: Licenses any server, virtual or physical, with an IP address that generates logs, including network devices and storage arrays. Applies to the VMware suite of products: vRealize Operations, vRealize Log Insight, vRealize Automation, vRealize Business for Cloud, and vRealize Code Stream.

License metrics (continued)

Metric group	License metric
	<ul style="list-style-type: none"> • Per Processor: Licenses a physical processor (CPU) in a server. A CPU requires one license per 32 cores. A Maximum cores per processor metric attribute with a default value of 32 is automatically created on software models for VMware per processor entitlements. This metric attribute is used during reconciliation to determine license compliance. <p>Applies to VMware suite products: vSphere, vSphere with Operations Management.</p>

Unlimited software licenses

Unlimited software licenses help you to create entitlements with unlimited allocations and unlimited rights, allowing you to license any number of software installations with no true-up cost.

A `sam_admin` or `sam_user` role can specify an entitlement as an unlimited license which allows for unlimited allocations (user or device allocations) and does not classify the license metric results as non-compliant.

While creating or importing an entitlement, you can select the **Unlimited license** check box on the Software Entitlement page or on the Import Entitlement page.

Considerations for unlimited licenses

- Reconciliation process takes unlimited licenses into account where the software installations match and are licensed. Unlimited license is given priority over fixed amount license
- License metric results are generated separately for unlimited licenses.
- An unlimited license perpetual entitlement can be associated to only one unlimited license maintenance entitlement.
- Unit cost is equal to the total cost.
- Downgrade rights are supported for unlimited licenses.
- **Purchased rights**, **Active rights**, and **Allocations available** fields are not displayed for an unlimited license on the Software Entitlement page.

Supported license metrics and license types

The following license metrics are supported across all metric groups for unlimited licenses:

- Per User
- Per Device
- Per Named User
- Per Named Device
- User Subscription

- Named User Plus
- Per Processor

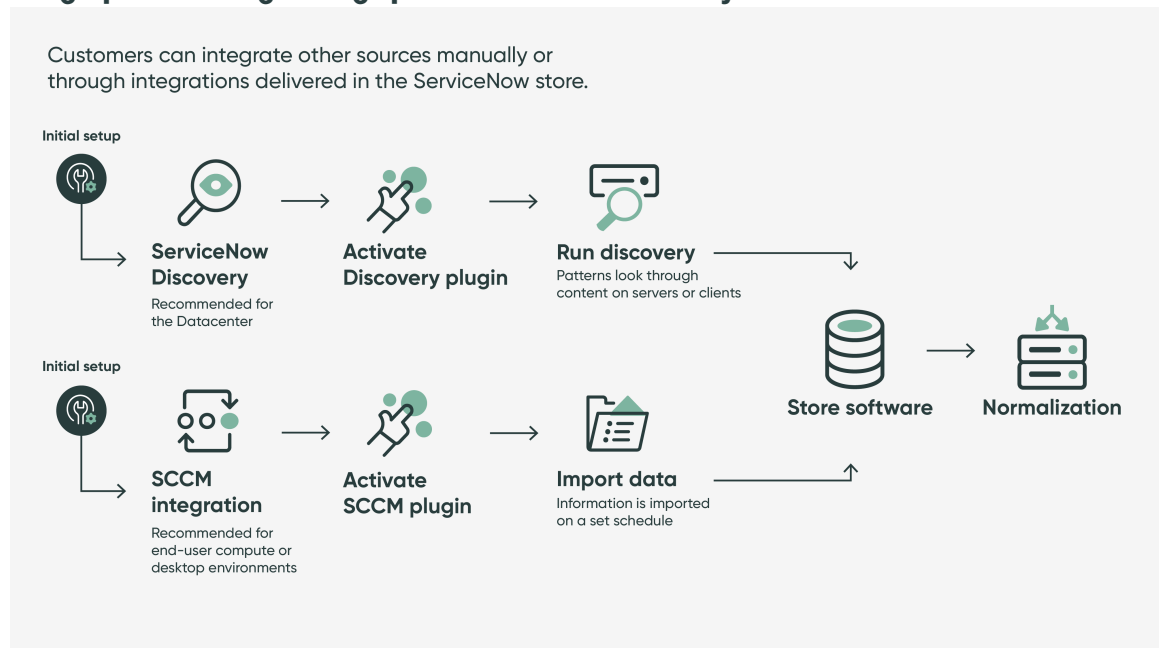

The following license types are supported for unlimited licenses:

- Perpetual
- Maintenance/Software Assurance
- Perpetual + Maintenance/Perpetual + Software Assurance
- Subscription

Software discovery and normalization

After you've imported your entitlements, use ServiceNow Discovery or Microsoft SCCM to discover software installations in your environment and transfer that data into the ServiceNow AI Platform.

Infographic showing setting up of ServiceNow Discovery or Microsoft SCCM

While you may use Discovery Home for datacenters and Microsoft SCCM for desktop environments, you can integrate other third-party discovery solutions with CMDB to support Software Asset Management. To integrate a different discovery solution, add it manually, or you can download an application, from the [ServiceNow Store](#). For more information about integrating a discovery source manually, see the [Customer Success Center](#).

To learn more about collecting data after you've integrated with both Discovery and SCCM, see [Collect software data with either SCCM or Discovery](#).

Discovery integration

ServiceNow Discovery is used to automatically populate the Software Installations table so the software can be normalized and reconciled.

Note:

To use Discovery, the [Discovery plugin](#) must be activated.

Discovery uses patterns in the discovery process that can be created or customized. The base system contains a wide range of patterns that cover most industry standard network devices and applications. The following are some of the base system patterns used by Software Asset Management.

- Citrix XenApp
- Citrix XenDesktop,
- VMware vCenter
- Microsoft SQL Server
- Microsoft Exchange Server
- Oracle Database Server

You can also customize other patterns for Software Asset Management. For more information, see [Create or modify patterns](#).

Discovered software is stored in the Software Installations [cmdb_sam_sw_install] table.

When software install records are written to the Software Installations table, a business rule verifies whether the unique combination of the discovered publisher, discovered product, and discovered version exist in the Discovery Model table.

- If so, the reference to the discovery model is set in the Software Installations table.
- If not, a new record is created in the Discovery Model table, and that discovery model reference is set in the Software Installations table.

After discovery, normalization is run.

For more information on Discovery, see [Discovery with Software Asset Management](#).

SCCM integration

You can use SCCM by itself or with Discovery Home to identify software on your devices.

Note:

While you may use Microsoft SCCM for discovering software installations in your desktop environments, you can integrate other third-party tools.

Both Microsoft SCCM 2012 v2 and 2016 plugins are certified with Software Asset Management. The corresponding Microsoft SCCM Integration plugin must be installed to integrate Microsoft SCCM with Software Asset Management.

Microsoft SCCM Integration plugins:

- Integration – Microsoft SCCM 2012 v2 (com.snc.integration.sccm2012v2) plugin
- Integration – Microsoft SCCM 2016 (com.snc.integration.sccm2016) plugin

Microsoft SCCM Software Usage plugins:

- Integration – Microsoft SCCM 2012 v2 Software Usage (com.snc.samp_usage_sccm) plugin
- Integration – Microsoft SCCM 2016 Software Usage (com.snc.samp.usage_sccm_2016) plugin

The Integration – Microsoft SCCM 2016 plugin is compatible with SCCM versions 1606, 1906, 1910, and 2002.

i Important:

These Microsoft SCCM plugins will be deprecated in the Tokyo release. If you are integrating with SCCM for the first time, request and install the Service Graph connector for Microsoft SCCM application from the [ServiceNow Store](#) instead. If you have already activated one of the Microsoft SCCM plugins on your ServiceNow instance, use the Migration Readiness Tool for Service Graph Connector for SCCM store application to prepare your instance for migration from the Microsoft SCCM plugin to the Service Graph connector. See [Service Graph connector for Microsoft SCCM](#) for more information on the Service Graph connector.

For more information on SCCM and how to import your data into your instance, see [Microsoft SCCM software usage](#).

Normalization

The normalization process compares the discovered publisher, discovered product, and discovered version and edition values against the ServiceNow repository of normalized equivalents. Matches are added to the corresponding normalized fields (publisher, product, version, and edition) of the Discovery Model table. The normalized fields are then used to reconcile entitlements purchased and to compute license positions.

For example, the discovered publisher Microsoft Corp could be normalized to Microsoft for the normalized publisher field.

The normalization process also looks for pattern matches between discovered fields and normalized values, and updates the normalized fields accordingly.

If certain software discovery models share similar discovered field values, the Software Asset Management application normalizes them using wide-net normalization principles, which reduces the need for the Content Service team to create separate normalization rules for each product.

i Note:

Only certain software products are eligible for wide-net normalization. These software products are determined by the Content Service team.

A scheduled job runs to pull in normalized content and pattern updates daily, but you can change the frequency that the schedule job is run. When there are changes to a normalization rule, applicable normalized and partially normalized Discovery models are renormalized with the updated values.

Evaluate suggestions to normalize discovery models that were manually normalized using the [Normalization Suggestions](#) feature. Suggestions are automatically identified if there is a difference between the updated normalization content and your content. Because the content from the updates contains the most up-to-date information, using the content provided helps to keep your software installs accurate.

You can opt in to the [Software Asset Management Content Service](#) that enables you to provide missed and not fully normalized software discovery models to ServiceNow for research. New content and rules created are provided back to customers to continually improve software normalization.

Benefits of normalization

- Normalization creates a definitive list of the discovered software in your organization. Organizations need a thorough inventory of its installed software whether for software audit readiness or IT operations. Without normalization, your organization will be challenged with

multiple names for the same publisher, which requires a substantial effort to rationalize and dilutes the accuracy and value of the reports you run.

- Normalization improves the accuracy and efficiency of reconciliation for your software entitlements. By using the normalized values in the discovery models to map against the software entitlements it has acquired, resulting in more accurate reconciliation results. This makes it easier to plan for and complete software audits knowing that the counts are accurate and that they match the entitlement records.
- The normalization process allows standardizing installation data from multiple discovery tools.

Normalization suggestions for discovery models

Normalization suggestions are created for all manually normalized discovery models. You can accept or reject these suggestions.

Overview of normalization suggestions

During the weekly normalization process, normalization suggestions are created in both the following scenarios:

- If even one discovery model field value differs from the suggested normalization values in the Content Service.
- If all the discovery model field values are the same as the suggested normalization values in the Content Service.

If the system property, *com.snc.samp.auto_accept_normalization_suggestion* is enabled, normalization suggestions are automatically accepted if there are no differences between the suggested normalization values and the manually normalized values. This property is enabled by default.

Note:

For domain separated environments, individual domains can override this system property for their own domain by creating a new `sys_application_property` value record.

If you accept a suggestion or if it was automatically accepted by the system property, then the status of the discovery model changes to **Normalized** and all suggested values are copied over to the discovery model's normalized fields. If you reject a suggestion, the manually normalized values do not get changed.

The records are contained in the Normalization Suggestion [`samp_normalization_suggestion`] table.

Accepting or rejection suggestions

If you **Accept** the suggestion:

- Publisher, Product, Version, Edition, Platform, and Language of the discovery model is updated with the values from the normalization rule.
- Normalization status changes from Manually Normalized to Normalized.
- Normalization Suggestion status changes to Accepted
- Normalization date on the discovery model is updated to when the suggestion was accepted.

If you **Reject** the suggestion:

- Discovery Model retains the manually normalized values and remains in Manually Normalized status.
- Normalization Suggestion status changes to Rejected.

Normalization Suggestions form

Field	Description
Discovery model	Software discovery model that represents the installed software.
Suggestion status	Suggested status of the normalization process.
Discovered publisher	Discovered publisher of the software.
Discovered product	Discovered name of the software.
Discovered version	Discovered version of the software.
Suggested Normalization	
Suggested publisher	Suggested publisher of the software.
Suggested product	Suggested name of the software.
Suggested version	Suggested version of the software.
Suggested edition	Suggested edition of the software.
Suggested platform	Suggested platform of the software.
Suggested language	Suggested language of the software.
Publisher	Normalized publisher of the software.
Product	Normalized product name of the software.
Version	Normalized version of the software product.
Edition	Normalized edition of the software product.
Platform	Normalized platform of the software product.
Language	Normalized language of the software product.

Normalization of discovery models using machine learning

Use machine learning to improve your normalization rates in real time by normalizing your unrecognized discovered software.

The Software Asset Management application uses machine learning to improve normalization of discovery models. The prediction values currently supported by machine learning are version, full version, and edition.

Opt in for machine learning normalization by activating the Software Asset Management – Machine Learning Normalization (com.sn_sam_ml_normalization) plugin.

Once the plugin is activated, ensure that the *Enable ML Normalization for discovered software* (com.snc.samp.enable.ml_normalization) property is selected. For more details on this property, see [Software Asset Management properties](#). You can opt out of machine learning normalization by disabling this property. If you opt out, normalization of discovery models only takes place against the content service rules.

The scheduled job, *SAM-Normalize discovery models using content library rules*, triggers on a daily basis and normalizes the discovery models based on the content rules. This scheduled job runs irrespective of whether the Software Asset Management – Machine Learning Normalization plugin is activated or not. If this plugin is activated, then the partially normalized discovery models are picked up by another scheduled job, *SAM-*

Normalize discovery models using machine learning. The scheduled job, *SAM-Normalize discovery models using content library rules* is enhanced to invoke the on-demand scheduled job, *SAM-Normalize discovery models using machine learning* and also validates machine learning predictions.

Once the scheduled job, *SAM-Normalize discovery models using machine Learning* is complete, you can view the updated values in the following machine learning based columns in the Software Discovery Model [cmdb_sam_sw_discovery_model] table:

- ML prediction values: Indicates the predicted values for the attributes.
- ML model version: Indicates the model version that was used for predicting the attributes.
- ML normalization status: Indicates the status of machine learning normalization. Values for this column include:
 - ML normalized: Discovery model is normalized by machine learning
 - Reverted: Discovery model is normalized by machine learning but the user reverted the normalized values
 - Content overridden: Machine learning predictions over-written by new content rules

i Note:

The status of the scheduled job, *SAM-Normalize discovery models using machine learning* is tracked in the Software Asset Job Result [samp_job_log] table.

As the content rules are always getting updated, the weekly scheduled job *SAM-Normalize discovery models using content library rules* picks up the discovery models normalized by machine learning and tries to normalize these models with the latest content rules. If the predicted values of machine learning differ from the predictive values of the content service, the machine learning predictions are overwritten with the content service values. The content service prediction values always get precedence over the machine learning prediction values.

i Note:

For details on the normalization rules for the predictive values, refer to tables titled **Normalization rules for licensed products** and **Normalization rules for non licensed products**.

You can manually normalize a discovery model by reverting the normalization values. When you revert normalizations in the Software Discovery Model form, all the normalized values, got from content and machine learning, are removed. The discovery model reverts to a status of Match not Found.

i Note:

When you revert a discovery model normalized by machine learning, the content rules are not deactivated. However, if a discovery model is normalized only by content rules, then the content rules are deactivated.

Normalization rules for licensed products

Fields	Normalization status
<p>All fields are normalized</p> <p>i Note: All the fields include publisher, product, version, edition, and full version.</p>	<p>Normalized</p>

Normalization rules for licensed products (continued)

Fields	Normalization status
Only the publisher is normalized	Publisher normalized
If none of the fields are normalized: publisher, product, version, edition, full version	Match not found
Only product and publisher are normalized.	Partially normalized

Normalization rules for non licensed products

Fields	Normalization status
If only publisher and product are normalized	Normalized
Only the publisher is normalized	Publisher normalized
If none of the fields are normalized: publisher, product, version, edition, full version	Match not found

Duplicate software installations in the Software Asset Management application

Duplicate software installation are created when you discover software installations with the same publisher, product, version, and edition through multiple discovery sources.

A software installation record is created for each software record in the Software Installation [cmdb_sam_sw_install] table.

By default, the Software Asset Management application prioritizes IBM software installations that are discovered through ServiceNow discovery. Duplicate entries are initially marked as false in the Active column in the Software Installation [cmdb_sam_sw_install] table.. When the *SAM - Deduplicate Install Table* scheduled job runs, records for all IBM software installations that are discovered through ServiceNow discovery are marked as active, while records for the same software installations that are discovered through an authorized Software Asset Management discovery provider are marked as inactive.

The *SAM - Deduplicate Install Table* scheduled job ensures that only one software installation record is marked as active and included in reconciliation.

Software Asset Management software suites

Software Suites is a way for a software publisher to group related applications as a set.

Overview of software suites

Create a suite and add components to the suite so that your organizations' rights are correctly counted during reconciliation.

An example for client software suites is the Microsoft Office suite, which comprises Word, Excel, PowerPoint, Outlook, and Access. Microsoft Office is considered the suite parent and the suite components are the suite children.

A more complex example is the "suite of suites" which is common in server software. Microsoft Core Infrastructure Server (CIS) Suite has two suite components: Windows Server and System Center (which is also a suite).

Suite components are licensed together using a suite license rather than each software component needing an individual license. Therefore, an entitlement for the suite parent licenses all suite components including suite children that are also suites themselves.

For software subscriptions, only one user subscription suite license is required for each user. For example, the Microsoft 365 suite includes the following components: Office 365, EMS (Enterprise Mobility plus Security), and Windows 10. One Microsoft 365 license entitles a user to use one or more of the components.

Software Suites [cmdb_m2m_suite_model] table captures the relationship between a suite parent and a suite child.

For any software model, you can specify whether the model is a suite (parent) or a component (child). A software model can be a component in multiple suites. For example, Microsoft Word is a component in two suites: Microsoft Office Standard and Microsoft Office Professional. Although you can set a single software model as both a suite and a component, software isn't typically sold as nested suites.

Suite information such as **Suite Components** and **Suite Parents** are found as tabs in the Software Model form. Whenever a software model is automatically created as part of a scheduled job, its child components are automatically created and appear in the [Suite Components](#) tab in the software model form.

Predefined suites

The Software Asset Management content library contains predefined suites to simplify your user experience. If suite content exists for a product, the suite information automatically populates the **Suite Components** tab in the Software Model form. Updates to the suite content are downloaded and existing suite definitions are updated via scheduled jobs.

Allocations

Allocations are used to apply a license to a device or user. In the context of suites, allocations enable the software asset manager to apply an individual component license to a user/device instead of the suite license.

Use case for allocations

An organization has both Microsoft 365 E5 (suite) entitlements as well as Windows 10 entitlements. User A has Windows 10, Word, Excel, and other components of Office 365 installed on their device. User A is allocated the Windows 10 entitlement. User A's Windows 10 installation is licensed with the Windows 10 entitlement rather than the Microsoft 365 suite entitlement while the remaining components is licensed as part of the Microsoft 365 suite.

Discovery maps

Discovery Maps (DMAPs) are variations of the software as predefined in the SAMP content library. Although a software model can be defined manually by setting the Publisher, Product, Version, Edition, the best approach is using DMAPs whenever possible. The DMAPs associate the relevant content with the Software Model automatically like the suite relationships, downgrade models, lifecycle, and next version.

Hybrid and subscription software suites

Software Asset Management supports hybrid and subscription-based software suites. In a hybrid software suite, either the suite parent or child component is subscription-based. In a subscription-based software suite, both the suite parent and child component are subscription-

based. The license that you use to determine compliance depends on whether the suite parent and child component are subscription-based:

- If only the suite parent is subscription-based, then all the child component installations are inferred as part of the suite parent. You can determine your license compliance using the suite parent license.
- If only the child component of a suite parent is subscription-based, then the instances of that child component aren't inferred as part of the suite parent. You can determine your license compliance using the child component license.
- If both the suite parent and child components are subscription-based, then the instances of the child components are inferred as part of the suite parent. You can determine your license compliance using the suite parent license. For example, Microsoft 365 E5 is a subscription-based software suite that includes the Office 365 E5, EMS E5, and Windows 10 subscription software. Since both the suite parent and child components are subscription-based, they're reconciled against the Microsoft 365 E5 parent license.

Software suites inference

Suite inference is used to determine whether the software is part of a suite and to infer the best or efficient suite to use when licensing.

[https://player.vimeo.com/video/1076402507?](https://player.vimeo.com/video/1076402507?h=831df261cd&badge=0&autopause=0&player_id=0&app_id=58479)

[h=831df261cd&badge=0&autopause=0&player_id=0&app_id=58479](https://player.vimeo.com/video/1076402507?h=831df261cd&badge=0&autopause=0&player_id=0&app_id=58479)

Suite inference flow

The process of suite inference is divided into two stages:

- Building the suite structure.
- Inferring the best suite for the software installation or subscription records.

After the suite structure is built based on the entitlements, software models, and suite relationships, the installs and subscription records are processed.

After the suite engine runs, the Inferred suite column of all install and subscription records that are part of a suite is stamped with a reference to the software model of the most optimal suite parent. For more information about the rules ranking, see the **Suite inference rules**. Entitlements for this software model license are each stamped record.

The suite engine prioritizes subscription suite models and inferences on software subscription records. Next, on-premises suite models and software installation records are inferred.

When a suite parent licensing is used, the individual child components licensing isn't used.

Note:

Users with the `model_manager` role can navigate to **Product Catalog > Product Model > Software Models**, but can't administer all aspects of software models.

The system property **Use component licenses to optimize compliance when suite licenses run out** is set by default to **false** for Microsoft license metrics, which enables you to use both suite component and suite parent licenses. This property only applies to Microsoft license metrics.

Inference options

Use the **Mandatory** and the **Inference option** fields when the suite parent isn't defined in the install table.

The **Mandatory** field enforces whether a component must be installed to infer that the suite is installed. Choices are **Optional**, **Always Mandatory**, and **Mandatory Group**.

The **Inference option** field contains the following options:

- **Number:** Specifies the number of components installed for the suite. The number can be any non-negative number.

Note:

For any new software models being created with suite components, the **Number** option is selected by default.

- **Percent:** Specifies what percentage of the components must be installed for the suite.

Note:

For existing software models with suite components that were using the inference percent, the **Percent** option is selected by default. However, you can choose to use the **Number** option.

If the system property *Use component licenses to optimize compliance when suite licenses run out* is set to true, the inference number and inference percent specifies a threshold to determine whether the suite or component licensing is optimal.

To illustrate the usage of the inference number, consider the scenario where Microsoft Office has an inference number of 2. If you have two Microsoft Office components such as Microsoft Word and Microsoft Excel, the inference number suggests utilizing the Microsoft Office license instead of individual components.

To illustrate the usage of the inference percent, consider a scenario where Core Infrastructure Suites(CIS) has two components such as Windows Server and System Center with an inference percent of 50%. This inference percent suggests using the CIS license when more than 50% of the individual components are installed. When less than 50% of the individual components are installed, using the component licenses is optimal.

Suite inference rules

The rules of suite inference ranking are as follows:

1. If one of the software installations belongs to the suite software model, the suite is inferred directly without the need to meet the Inference percentage.
2. If the first rule isn't met, then any suite that meets the Inference percentage on that device can be considered an Inferred suite candidate.
3. The candidate with the highest number of installed components is chosen.
4. If there's still a tie, the suite with the lower downgrade is chosen. For example, Office 2016 and Office 2013 are both candidates and have the same number of installed components. However, since Office 2013 is the downgrade of Office 2016, Office 2013 is chosen.
5. If there's still a tie, the one with the highest percentage of installed components is chosen.

Suite inference rules for Microsoft license metrics

Based on the system property **Use component licenses to optimize compliance when suite licenses run out**, the Software Asset Management application uses suite or component licenses. For example, if you have both Core Infrastructure Server (CIS) suites and Windows Server installations, both have their individual licenses. If Windows Server installations are discovered, then the Software Asset Management application will first license using the available Windows

Server licenses. Following the utilization of all the Windows Server licenses, the CIS licenses will be used.

When the system property **Use component licenses to optimize compliance when suite licenses run out** is set to true, the rules ranking for Microsoft license metrics are as follows:

1. If there are multiple suites that can be inferred for the component, then the suite which meets the inference percent is preferred.
2. The suite candidate with the highest number of installed components is preferred.
3. If there's still a tie, the suite with the lower downgrade rights is chosen. For example, CIS 2019 and CIS 2016 are both candidates and have the same number of installed components. However, since CIS 2016 is the downgrade of CIS 2019 and it has fewer downgrade rights, CIS 2016 is chosen.
4. The parent suite that meets the inference percent is preferred over the child suite. If the parent suite doesn't meet the inference percent, the child suite is preferred.
5. If there's still a tie, the one with the highest percentage of installed components is preferred.

Use case for suite inference

As an example, let's say you specify the **Inference percent** as 75% and set the **Mandatory** field to **Always Mandatory** on Microsoft Access. These settings specify that Microsoft Access must be installed, along with three out of four other products (Microsoft Word, Microsoft Excel, Microsoft PowerPoint, and Microsoft Outlook), to infer that Microsoft Office Professional is installed on a device.

Managing software suites

Simplify licensing and lower the cost of licenses from vendors. Get visibility into your complex suite licenses, manage compliance, and optimize your spending on these licenses.

Create a suite and add components to the suite so that your organizations' rights are accurately counted during reconciliation.

A software suite is a group of related software that is offered as one unit. An example is the Microsoft Office Professional suite that includes PowerPoint, Word, Excel, Outlook, and Access.

Another example of a server-side suite is the Microsoft Core Infrastructure Server (CIS) Suite. The CIS Suite can include the Windows Server software as well as the System Center suite, which includes Configuration Manager, Operations Manager, and other titles. CIS Suite, which is licensed with Microsoft server metrics (Per Core, Per Core (with CAL), Per Instance, Per Processor, Per Server), are considered during reconciliation.

For any software model, you can specify whether the model is a suite (parent) or a component (child). A software model can be a component in multiple suites. For example, Microsoft Word is a component in two suites: Microsoft Office Standard and Microsoft Office Professional. Although you can set a single software model as both a suite and a component, software isn't typically sold as nested suites.

Whenever a software model is automatically created as part of a scheduled job, its child components are automatically created and appear in the [Suite Components](#) section.

Use the **Inference percent** or **Inference number** and **Mandatory** fields when the suite parent isn't defined in the install table.

- **Inference percent:** Specifies the percentage of the components that must be installed for the suite.
- **Inference Number:** Specifies the number of components installed for the suite.

- **Mandatory:** Enforces whether a specific component must be installed to infer that the suite is installed. Choices are Optional, Always Mandatory, Mandatory Group.

Note:

If two or more software components are part of a Mandatory Group, then at least one of them must be present so that all the software components are considered a suite. This assumes that the inference percent, inference number, and other requirements are also fulfilled.

For example, let's say you specify the **Inference percent** as 75% and set the **Mandatory** field to **Always Mandatory** on Microsoft Access. These settings specify that Microsoft Access must be installed, along with three out of four other products (Microsoft Word, Microsoft Excel, Microsoft PowerPoint, and Microsoft Outlook), to infer that Microsoft Office Professional is installed on a device.

When a suite parent is detected during reconciliation, the child components don't count for the individual license.

Note:

Users with the model_manager role can navigate to **Product Catalog > Product Model > Software Models**, but can't administer all aspects of software models.

The rules of inference suite ranking are as follows:

- If one of the software installations belongs to the suite software model, the suite is inferred directly without the need to meet the Inference percentage or the Inference number.
- If the preceding rule isn't met, then any suite that meets the Inference percentage or the Inference number on that device can be considered an Inferred suite candidate.
- The candidate with highest number of installed components is chosen.
- If there's still a tie, the suite with the lower downgrade is chosen. For example, Office 2016 and Office 2013 are both candidates and have the same number of installed components. However, because Office 2013 is the downgraded version of Office 2016, Office 2013 is chosen.
- If there's still a tie, the one with the highest percentage of installed components is chosen.

Software Asset Management supports hybrid and subscription-based software suites. In a hybrid software suite, either the suite parent or child component is subscription-based. In a subscription-based software suite, both the suite parent and child component are subscription-based. The license that you use to determine compliance is dependent on whether the suite parent and child component are subscription-based:

- If only the suite parent is subscription-based, then all the child component installations are inferred as part of the suite parent. You can determine your license compliance using the suite parent license.
- If only the child component of a suite parent is subscription-based, then the instances of that child component aren't inferred as part of the suite parent. You can determine your license compliance using the child component license.
- If both the suite parent and child components are subscription-based, then the instances of the child components are inferred as part of the suite parent. You can determine your license compliance using the suite parent license. For example, Microsoft 365 E5 is a subscription-based software suite that consists of the Office 365 E5, EMS E5, and Windows 10 subscription software. Because both the suite parent and child components are subscription-based, they're reconciled against the Microsoft 365 E5 parent license.

Discovery models and software installations

Software discovery models are automatically created during discovery to identify and normalize the software installed in your environment.

Software discovery models are stored in the Software Discovery Model [cmdb_sam_sw_discovery_model] table. The normalization process is automatically run when a new discovery model is created. Discovery models are not created for software installations that have a name containing `Security Update`.

There is a difference between [software models](#) and software discovery models.

- A software model is a specific version or configuration of software that is purchased and/or available to users.
- A software discovery model is a model created when a version of software is discovered in a network environment.

Multiple software discovery models can be associated to one software model. For example, a software model can be defined as follows:

- Publisher = X
- Product = Y
- Version = Starts with 10

If there are two separate installs of this product (version 10.1 and version 10.2), two discovery models are created. One of the discovery models has the discovered version set to 10.1, and the other discovery model has the discovered version set to 10.2. The reconciliation process associates both of these discovery models to the same software model since they both meet the version criterion of `Starts with 10`.

Discovery Models

Software discovery models cannot be created manually. The following field combination, called the primary key, is used to match new software installations to a new or existing software discovery model.

Primary key: **Publisher, Display Name, and Version**

Note:

When analyzing version numbers, an exact match is always searched for first, but rounds down to a major version number when an exact match is not found.

For example, if no match is found for version number 8.0.4, but version 8.0 is found, then version 8.0 is used in the **Software model** field.

Note:

If normalized field values differ from the values in the package or pattern, a caution icon is indicated next to the Normalization status field indicating that a normalization suggestion record has been created. Clicking the caution icon opens the [Normalization Suggestion](#) record for that discovery model.

The differing values can be set by the user, or by accepting the normalization suggestion changes. Once a new value is set, the normalization status changes from Normalized to Manually Normalized.

Under specific conditions, certain fields that are typically read-only can be edited. If edited, the status changes to Manually Normalized.

Revert normalization

You can revert a normalization if needed.

When you revert a normalization, discovery models that have a status of **Normalized**, **Partially Normalized**, or **Publisher Normalized** revert to the status of **Match Not Found**. All normalized fields are also reset to their original unnormalized values. You can then normalize your discovery models manually or wait for the next normalization to run automatically. If you are normalizing your discovery models manually, the Software Asset Management application creates normalization suggestions based on the latest normalization rules from the Content Service team. You can choose to accept or reject these suggestions. If you wait for normalization to run automatically, discovery models are normalized using the latest normalization rules from the Content Service team. The discovery models are then set to a status of **Normalized**, **Partially Normalized**, or **Publisher Normalized**, and the normalized field values are set.

Software Installations

The Software Installations list contains the software installed in your organization and is populated by discovery.

Installed software is placed in the Software Installation [cmdb_sam_sw_install] table by Discovery, and a primary key is built (using **Publisher**, **Display Name**, and **Version** fields).

Discovery automatically matches the discovered software installation with a new or existing software discovery model using the primary key.

File Signature Normalization

File-based discovery finds files on UNIX or Windows servers and processes them with an established set of rules that enhance the identification of installed software. Use the results to monitor specific file types on network servers for security purposes or to manage your software licenses with the File Signature Normalization plugin for Software Asset Management - Professional (SAMP).

For more information on the file-based discovery, see the [File-based Discovery](#) .

Note:

The information provided in this page only covers the features available with the File Signature Normalization (com.snc.file_signature_normalization) plugin.

Required plugins

The File Signature Normalization plugin is required to allow file information to be mapped to installed software. To enable this plugin, [Request Software Asset Management](#).

You can also enable file-based discovery with the File-Based Discovery (com.snc.discovery.file_based_discovery) plugin to filter file signatures. This plugin is included with a Discovery subscription, but you must request plugin activation. Normalization of products and publishers is available for file-based discovery with or without Software Asset Management.

How File Signature Normalization works

File Signature Normalization uses discovered files and their attributes, such as file name, file sizes, and version, to find a signature match in the Content Data Service (CDS). Then, File Signature Normalization creates a normalized software installation record.

During regularly scheduled Discovery jobs, the file information is discovered at all the specified end points in a user environment and sent to the MID Server. The information from the MID

Server is then sent back to the ServiceNow instance. Information is matched against the content library and the software installation records are created.

If a discovered file name does not match a predefined file signature rule in the CDS, an unidentified file set record is created in the unidentified file set [cmdb_unidentified_file_set] table. Users with the sam_admin role can create a custom file signature rule for the unidentified file set to normalize data manually.

If you opt in to the content service, these custom file signatures are sent back to the CDS for further analysis and inclusion in the content service for future discovery. You can also restrict some custom file signatures from being sent to the CDS by changing the value in the Exclude From CDS column to True.

Note:

Software discovery models are stored in the Software Discovery Model [cmdb_sam_sw_discovery_model] table. Unlike pattern discovery normalization, discovery models created by File Signature Normalization do not go through the normalization process automatically and are ignored during scheduled normalization jobs.

File Signature Normalization also identifies duplicates. Software installations that are discovered on the same configuration item, but from different discovery sources, are considered duplicates. All installations that are identified are marked as inactive by default. Once the duplication has been deleted, the remaining installation is marked as active and the discovery model picks up all associated installs.

Note:

By default, scheduled jobs are performed during specific times so they do not run heavy loads that could cause performance or stability issues. If these scheduled job times are changed, performance issues could occur.

Any software installs discovered during File-based discovery are updated to reflect any CDS changes in the software install attributes such as product or publisher name change. Stage product and Stage publisher are new columns in the File Set [samp_file_set] table.

File Signature Normalization roles

File Signature Normalization adds the following role.

Roles	Description
file_normalization_admin	Users with this role can access file attribute and unidentified file information. Required to ensure that file signature normalization supports third-party software installation discovery sources.

Tables

File Signature Normalization adds the following tables.

Table	Description
samp_file_set	File set that maps to a software product. Multiple samp_file_map records can point to one samp_file_set record.
samp_file_map	File map record for each file hash discovered by the end-user device. The file hash is created based on the discovered file and its attributes.

Table	Description
samp_file_name	File names that are used to search on end-user devices.
samp_custom_file_name	File names that entered by the user that can be discovered on end-user devices.
cmdb_unidentified_file_set	Custom rules that are created if a software match is not found for the discovered file in the CDS.

Product life cycles

In the absence of vendor-provided life cycles, there are various capabilities that the Software Asset Management application provides to improve life cycle coverage.

Overview of product life cycles

For better visibility of all the life-cycle phases, the following columns have been added to the Software Lifecycle Reports [sam_sw_product_lifecycle_report] table:

- General Availability start date
- General Availability
- End of Support start date
- End of Support lifecycle
- End of Extended Support start date
- End of Extended Support lifecycle
- End of Life start date
- End of Life lifecycle
- Software model
- Owners

The Content Library provides approximated life cycle dates and life cycle codes which you can use to drive your life cycle reporting.

You can also use calculated life cycles to create end-of-support (EOS), end- of-extended-support (EOES), and end-of-life (EOL) life cycles for your software products. Additionally, you can create custom life cycles to supplement missing life cycles or overwrite any existing ones from the Content Library.

Approximated life cycles and life-cycle codes

Approximated life cycles are provided by the Content Library when life cycle dates are not explicitly published by the publisher. The life cycle record may contain an actual date (through various methods of approximation) or an explanation as to why the date could not be provided. This explanation is captured in the Lifecycle codes.

The Software Lifecycle Code [software_lifecycle_code] table, contains all the approximation codes along with a description of each code. For a detailed explanation of life-cycle codes, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB1642485.

A new column, Lifecycle code, is added to the Software Product Lifecycle [sam_sw_product_lifecycle] table. This column refers to the Software Lifecycle Code [software_lifecycle_code] table. If the column is populated, it indicates the record is an approximated lifecycle. If the column is empty, it indicates that the life cycle record has confirmed or explicit dates as published by the publisher.

Approximated life cycles are enabled by default as part of generating the Software Lifecycle Report. This is managed in the system property `com.sn.samp.use_lifecycle_approximation`. For details on this property, see [Software Asset Management properties](#).

Life cycle code columns can also be added to the Software Lifecycle Report for each life cycle phase (GA, EOS, EOES, and EOL). This may require dot-walking the columns from the Software Lifecycle Code table. You should be able to identify which life cycle phase is approximated based on the existence of the codes.

Calculated life cycles

To further improve life cycle coverages, even after approximated life cycles have been considered, EOS, EOES, and EOL life-cycle dates can be calculated based on software life cycle averages, measured in months, from the GA dates.

Software life cycle averages can be defined at the product level, publisher level, or industry level. For details on specifying software life cycle averages in the Software Asset Workspace, see [Create averages for product life cycles in workspace](#) and for specifying software life cycle averages in the Software Asset Management classic application, see [Create averages for product life cycles in Software Asset Management classic](#)

You can override the GA date provided by ServiceNow by creating a custom GA date. The custom GA date always takes priority over the GA date provided by ServiceNow. The life cycles are calculated based on the product or publisher values that you specified. Life cycle dates are defined only at the generic version and not the full version. For details on specifying custom values in the Software Asset Workspace, see [Create averages for product life cycles in workspace](#), and for specifying values in the Software Asset Management classic application, see [Create averages for product life cycles in Software Asset Management classic](#).

Software life cycle averages are stored in the Software Lifecycle Averages [samp_sw_lifecycle_averages] table. Lifecycle records created using these averages have their source column defined as calculated.

Note:

Life cycle averages can be created by the sam_user or the sam_admin role.

Calculated life cycles come with the following prerequisites:

- The Software Asset Management Professional (com.sn_samp_master) plugin must be activated.
- GA dates available for the product either provided by the Content Service or custom GA dates that you created.
- EOS, EOES, and EOL life cycles are not provided by the Content Service.
- Product is shipped by the Content Service.
- Life cycle dates are defined only at the generic version and not the full version.

Custom life cycles

Besides approximated life cycles and calculated life cycles, to further improve your life cycle coverage you can also create custom life cycles. Custom life cycles are records that you define at each life cycle phase for the product and version that you selected. You can type in the dates directly in the date fields, and these dates will take priority in the Software Lifecycle Report generation. You can also use this capability to overwrite an existing life cycle record that was provided by the Content Library.

Custom life cycles can be created from either of the two locations on selecting **New**:

- Software Product Lifecycles [sam_sw_product_lifecycle table.
- Custom Software Product Lifecycle [sam_custom_sw_product_lifecycle] table.

Software life-cycle process

The scheduled job *SAM - Generate Software Lifecycle Report* aggregates life cycle data for all normalized software products which have non- zero installation counts. Each record on the Software Lifecycle Report table displays all life cycle phase columns along with their corresponding phase start dates, if the date is available. Life cycle codes can also be displayed to indicate whether the record is an approximated life cycle or not.

The Software Lifecycle Report table also displays the Current Phase and Upcoming Phase columns along with their corresponding dates. For further details about these columns, see [Software models and Software entitlements](#).

Another scheduled job, *SAM - Create Calculated Software Lifecycles*, checks for all records on the Software Lifecycle Report table which have GA dates but are missing EOS, EOES, or EOL dates and creates calculated life cycles for them based on the definitions that you have created on Software Lifecycle Averages table.

Keep the following in mind for the scheduled job *SAM - Create Calculated Software Lifecycles* to generate life cycles:

- If domain separation is disabled, enable the `com.snc.samp.generate.calculated.lifecycles` system property in the System Property [sys_properties] table.
- If domain separation is enabled, use the Application Properties [sys_application_properties] table to enable the `com.snc.samp.generate.calculated.lifecycles` property. In the Application Properties [sys_application_properties] table, select the `com.snc.samp.generate.calculated.lifecycles` property to open the Application Properties page. Scroll down to **Application Property Values** and select **New** to create a record. The **Application Property** and **Domain** fields are pre-filled with values. In the **Value** field, enter **true** and select **Submit**. You also need to enable reconciliation by specifying the value of the column `Run asset process [run_asset_process]` to be true in the Domain Asset Process Setting [alm_domain_asset_process_setting] table.

Note:

Reconciliation can be enabled either for the parent domain or for the child domain; it cannot be enabled for both the parent and the child domains.

The calculated life cycles and the life cycles created by you are stored in the Custom Software Product Lifecycle [sam_custom_sw_product_lifecycle] table. Life cycles created by the Content Service are stored in the Software Product Lifecycle [sam_sw_product_lifecycle] table.

If you create custom life cycles, calculated life cycles created by the scheduled job gets deleted in the next Content Service update, as priority is given to the custom life cycles that you created.

Once created, the EOS, EOES, and EOL life cycles are visible in the software model page.

Note:

If a sam_user or sam_admin deletes an EOS, EOES, or EOL life cycle on a software model, the life cycles aren't reinstated back to the software model.

Downgrade Rights

The concept of downgrading licenses is built into the Software Asset Management plugin feature. Downgrading rights is the process of having acquired the rights to the latest version of software but using the rights to license earlier versions of the same software.

Downgrade rights are added at the software model level.

The Software Asset Management Content Service generates downgrade rights. The downgrade rights correspond to a discovery map. The *Download software content: Downgrade Rights* scheduled job that runs weekly, gets the downgrade rights from the Software Asset Management Content Service and pushes the data to the Downgrade Rights [samp_dmap_downgrade_model] table.

Another scheduled job, *SAM- Create downgrades/upgrades for a software entitlement*, picks up the information from the [samp_dmap_downgrade_model] table. The table propagates the next version and the downgrade rights on the existing software models and their corresponding entitlements.

If there's no software model corresponding to a discovery map, when populating the Downgrade Rights [samp_sw_downgrade_model] table, a new software model is automatically created.

If the discovery map corresponding to the software model has downgrade rights, the Downgrade Rights related list is automatically populated with a hierarchical list of downgraded versions of the software.

Once downgrade rights are created and saved in the Downgrade Rights tables, [samp_sw_downgrade_model] and [samp_downgrade_model], the downgrade rights can't be deleted. However, you can deactivate the downgrade rights.

If you delete a software model, all records corresponding to the software model in the Downgrade Rights [samp_sw_downgrade_model] table are automatically deleted.

Downgrade rights are supported across products for the same publisher, which helps in effectively managing product name changes. When a product is renamed, it's treated as two products. For example, if the product Captivate is renamed to Illustrator, both Captivate and Illustrator are considered distinct products. You can manually add software model downgrade rights from Illustrator to Captivate either in the software model form or in the software entitlement form.

The system doesn't permit creating duplicate downgrade rights; either through the scheduled job or manually in the Software Model and Entitlement form layout. If you try to create duplicate downgrade rights on software models or on entitlements, an error message appears informing you that the downgrade model exists. If they have the same values in all the following fields, downgrade rights are considered to be duplicates.

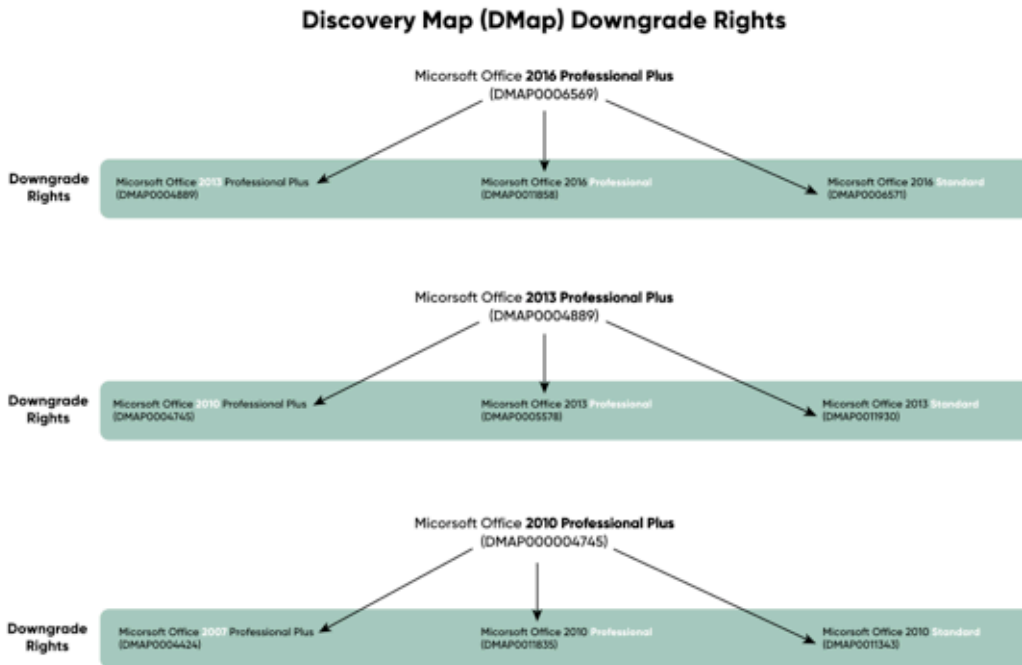

- **Publisher**
- **Product**
- **Version condition**
- **Version**
- **Edition condition**
- **Edition**
- **Platform**
- **Language**

- **Software install condition**
- **Named User Type**- is displayed only for SAP products.

If you already have duplicate downgrade rights from previous Software Asset Management Professional releases, then those duplicate downgrade rights aren't modified or deleted.

If you try to create a duplicate downgrade right for an inactive downgrade right, an error message appears. The error message informs you that an inactive downgrade right exists and you can reactivate it.

Downgrade support is available for all license metrics.

Downgrade rights aren't available for the following license metrics mentioned in the metric groups:

- Note:** Downgrade rights aren't supported for the User Subscription license metric regardless of the metric group.

License metrics not supported for downgrade rights

Metric group	License metric
SAP	<ul style="list-style-type: none"> • Engine Measurement • Named User
Consumption	SaaS Consumption

License metrics not supported for downgrade rights (continued)

Metric group	License metric
Concurrent Licenses	<ul style="list-style-type: none"> • Floating • Token • Network

Software license maintenance

Get visibility into your software maintenance entitlements to effectively manage these licenses throughout their life cycle.

Manage and optimize your software maintenance spend by:

- Importing, updating, and creating maintenance entitlements that specify a start and end date.
- Getting accurate true-up costs.
- Maximizing your resources by getting to know your potential savings.
- Being aware of expiring, unused, and under-used maintenance entitlements.

Determining expiring maintenance entitlements

ServiceNow Software Asset Management Professional helps you keep a track of all expiring maintenance entitlements using the Software Asset Workspace. You can track your entitlements by navigating to **All > Software Asset > Software Asset Workspace > Expiring maintenance and subscriptions**. This tracking ability enables SAM managers to get an overall view of all their expiring maintenance entitlements and take required action.

Maintenance for Microsoft

Microsoft Software Assurance (SA) is the maintenance program that Microsoft uses to provide active maintenance to its users.

Microsoft provides several benefits such as access to the latest software version and releases, cloud special rights, license mobility and many more. For more information on these benefits, see Microsoft [documentation](#).

ServiceNow Software Asset Management Professional leverages these benefits while licensing Microsoft products in the following ways:

- **New version rights:** With access to the latest version of a Microsoft product, SA users can upgrade their product licenses at zero additional cost. Also, there's no need for tracking or reassigning covered licenses based only on the software version. Software Asset Management Professional adds version support using the following mechanisms:
 - **Automatic application of new version:** If a software entitlement with active SA is associated with a newer version software model, Software Asset Management Professional automatically upgrades the entitlement and associates it with the latest version software model. Also, these changes are saved on the Upgrade History related list. For more information on software models and versions, see [Software model fields](#).
 - **Management of software entitlement:** Microsoft supplies publisher part number (PPN) with SA coverage without any version assigned for the product. Thus, there's a risk of incorrect assignment of SA benefits to all versions of Microsoft products. ServiceNow Software Asset Management Professional determines the latest software version released by Microsoft on

or before the expiry date of the SA coverage, selects the software model with the correct version, and associates the entitlement to the same. Also, these changes are saved on the Upgrade History Entitlement section.

- License mobility benefits: License Mobility provides the flexibility to manage licensing on premise (in high-density virtualized environments), or on cloud environments (AWS or Azure) using Azure Hybrid Benefits (AHB). For more information on license mobility, see [Microsoft documentation](#).

Software Asset Management Professional automatically applies the license mobility benefits while licensing deployments of your datacenter products such as Windows Server and SQL Server. The following are some of the benefits that are applied automatically:

- Provides options to license by virtual machine (VM) layer: With subscription licenses or licenses with SA, SQL Server 2022 can be licensed by the VM and licenses can move with the VM at any time to another server in the same server farm.
- Supports unlimited virtualization: Enables you to run any number of instances of SQL Server Enterprise Edition software in an unlimited number of VMs if the hosts are completely licensed. This feature is applicable only for the core licensing model.
- Provides AHB and Bring Your Own License (BYOL) support: AHB for SQL Server is a benefit for Azure that enables you to use SQL Server licenses with SA or subscription licenses to pay a reduced rate for only cloud-based computing. For more information on BYOL support, see [BYOL support](#).

If you're covered under Microsoft SA, you can also upgrade, or step-up, a standard version of your software to an enterprise edition. Use the **Upgraded Entitlements** tab of the Software Entitlement form to link related versions of your software under active maintenance and your upgrades.

You can upgrade a Step-up license type entitlement to a Subscription, Perpetual, Perpetual + Software Assurance, or a Step-up license type entitlement. You can upgrade a Subscription Step-up license type entitlement to only an entitlement with a Subscription license type.

Note:

Step-up at any time if you have the Microsoft Open Value agreement with Software Assurance.

Step-up license types with no upgraded entitlements could result in inaccurate reconciliation results due to double counting of active rights.

If you have the Microsoft SQL Server Enterprise edition with SA for the Per Core license metric, you can run unlimited virtual machines on the host machine. It doesn't matter how many physical core licenses that you have. For example, let's say that you have a license for running only four physical cores on a host machine. You can then run unlimited virtual machines on the host machine.

If you create a software entitlement at the time of receiving a purchase order and SA is activated on that entitlement, the new entitlement is created with one of the following license types:

- Perpetual + SA: If all previous entitlements have the license type specified as Perpetual + SA.
- Perpetual: If the previous entitlements have a combination of license types set to Perpetual + SA and Perpetual.

You can't use SA entitlements to license your software. SA entitlements aren't counted during reconciliation. Only perpetual license entitlements are considered.

SA entitlements need a base entitlement, or a perpetual entitlement, to determine license compliance. Thus, when you import entitlements from a Microsoft License Statement (MLS),

without a base entitlement, you see an error. For importing entitlements from an MLS, see [Importing entitlements from an MLS](#).

Note:

For creating entitlements for Microsoft SA in the Software Asset Workspace, see [Create Microsoft Software Assurance entitlements in workspace](#). For creating entitlements in for Microsoft SA in Software Asset Management classic or for adding SA coverage to an existing entitlement, see [Create entitlements for Microsoft Software Assurance in Software Asset Management classic](#).

Maintenance for publishers other than Microsoft

For all publishers other than Microsoft, you can create maintenance entitlements to support their software license maintenance needs.

You can associate maintenance entitlements with Perpetual, Perpetual + Maintenance, and Upgrade entitlements. Open the maintenance entitlement form layout, select the **Upgraded Entitlements** tab, and select the perpetual entitlement that you want to associate with.

Note:

If a maintenance entitlement is associated with a perpetual entitlement, the maintenance entitlement cost is part of the total cost when reconciliation runs.

If you create a software entitlement while you're receiving a purchase order and maintenance is activated on that entitlement, the new entitlement is created with one of the following license types:

- Perpetual + Maintenance: If all previous entitlements have the license type specified as Perpetual + Maintenance.
- Perpetual: If the previous entitlements have a combination of license types that are set to Perpetual + Maintenance and Perpetual.

Note:

For creating maintenance entitlements in the Software Asset Workspace, see [Create maintenance entitlements in workspace](#). For creating maintenance entitlements in Software Asset Management classic, see [Create maintenance entitlements in Software Asset Management classic](#).

Microsoft Per Core licensing rules

The Per Core licensing model is used by many Microsoft server products, such as SQL Server and BizTalk Server. It's useful when counting users or devices connecting to the software is difficult, often for internet-facing software.

Therefore, the Per Core licensing model is commonly used for enterprise software like Microsoft SQL Server.

The licensing rules for on-premise installations of these products and the cloud installations are separate. The cloud licensing rules follow Bring Your Own License (BYOL). For more information, see [Licensing rules for BYOL and BYOS](#).

To license the on-premise installation of these products using the Per Core licensing model, consider the following two options.

- Licensing by physical cores, also known as licensing by physical hosts
- Licensing by individual virtual machines

Note:

You can either allocate to individual hosts or individual virtual machines, not to cluster.

You can either allocate manually, or the Software Asset Management application can automatically select the most cost-effective licensing option based on optimization criteria. The number of core licenses required depends on whether you're licensing the physical server based on its physical cores or licensing individual virtual machines.

For more information about how to perform allocation, see [Allocation management](#) and how the Software Asset Management application performs automated optimization, see [View realized and potential cost-based licensing optimizations for Microsoft](#).

Note:

Both options, whether licensing by physical cores or licensing by individual virtual machines, come with their own set of Microsoft rules that must be followed. For more information, see [SQL Server](#).

Other licensing models, such as the Server CAL licensing model, are also available for these products.

Licensing by physical cores

The Software Asset Management application supports licensing by physical core rules, introduced by Microsoft in 2016.

Licensing by physical core rules

Rule	SQL Server Standard	SQL Server Enterprise
Applicability	<p>Not allowed</p> <p>Note: Only allowed to be licensed through individual virtual machines.</p>	<p>The number of licenses required equals the number of physical cores on the licensed server.</p> <p>The physical cores on servers are equal to <code>CPU count * Core count</code>.</p>
Min licenses required	<p>Not allowed</p> <p>Note: Only allowed to be licensed through individual virtual machines.</p>	<p>4 licenses per physical processor</p>

Licensing by physical core rules (continued)

Rule	SQL Server Standard	SQL Server Enterprise
Virtualization rights	<p>Not allowed</p> <p>Note: Only allowed to be licensed through individual virtual machines.</p>	<ul style="list-style-type: none"> Without software assurance or subscription licenses, run virtual machines equal to the number of core licenses assigned to the physical server. <p>Note: Each additional virtual machine would require an additional core license.</p> <ul style="list-style-type: none"> With active software assurance or subscription license, run an unlimited number of virtual machines if all physical cores on the server are fully licensed.
Failover rights	<p>Not allowed</p> <p>Note: Only allowed to be licensed through individual virtual machines.</p>	<p>For each server operating system environment (OSE) licensed with SQL Server subscription licenses covered by active Software Assurance, you can use the following passive replicas ahead of a failover event:</p> <ul style="list-style-type: none"> One passive failover replica for High Availability in a separate OSE One passive failover replica for Disaster Recovery in a separate OSE One passive failover replica for Disaster Recovery in a single virtual machine or instance on Azure
Components services licensing	<p>Not allowed</p> <p>Note: Only allowed to be licensed through individual virtual machines.</p>	<p>The software components of a single SQL Server license can't be separated. An OSE running any of the licensed components of SQL Server requires its own license. For more information about SQL Server components, see Editions and supported features of SQL Server 2022 </p>

When deploying Microsoft products like Windows Server or System Center (using the Per Core license model) on cluster virtualization technologies such as VMware vSphere, Microsoft Hyper-V, or Nutanix Acropolis HyperVisor (AHV), the number of licenses required for the physical host depends on the virtual machines that could potentially migrate to it within the cluster.

Technologies like VMware vMotion, which enables live migration of virtual machines across all hosts, and host affinity, which helps lock virtual machines to hosts within a cluster, manage the movement of virtual machines across hosts. To understand more about cluster virtualization technology and its support on the Software Asset Management application, see [Understanding your cluster infrastructure](#).

According to Microsoft licensing rules, if a virtual machine with a Microsoft product like Windows Server installed is hosted on one server but can potentially migrate to another, the destination server must be licensed as if the virtual machine is already running on it.

Tip:

As only the Enterprise edition license can be used for this option and you must license the physical host based on the number of virtual machines that can run on it, this licensing option can be more costly.

Licensing by virtual machines

The Software Asset Management application supports licensing by individual virtual machines rules, introduced by Microsoft in 2022.

Note:

This licensing option is the only option available for SQL Server Standard Edition when using the Per Core licensing model.

Licensing by individual virtual machines rules

Rule	SQL Server Standard and SQL Server Enterprise
Required number of licenses	<p>Equals the number of virtual cores on the virtual machine</p> <p>The virtual cores on servers are equal to CPU count * Core count * CPU thread count.</p>
Min licenses required	4 licenses per virtual machine
Software assurance or subscription license	Required
<p>Note:</p> <p>The option to license by virtual machine is only available with software assurance or a subscription license.</p>	
License mobility within Server farms (Software assurance benefit)	Supported

Licensing by individual virtual machines rules (continued)

Rule	SQL Server Standard and SQL Server Enterprise
<p>Note: Licenses can be reassigned within the same server farm as often as needed. The 90-day rule applies only when moving to another server farm or cloud provider.</p>	
<p>Component services licensing</p>	<p>The software components of a single SQL Server license can't be separated. An OSE running any of the licensed components of SQL Server requires its own license. For more information about SQL Server components, see Editions and supported features of SQL Server 2022.</p>
<p>Failover rights</p>	<p>For each server OSE licensed with SQL Server subscription licenses or licenses covered by active software assurance, use the following passive replicas ahead of a failover event:</p> <ul style="list-style-type: none"> • One passive failover replica for High Availability in a separate OSE • One passive failover replica for Disaster Recovery in a separate OSE • One passive failover replica for Disaster Recovery in a single virtual machine or instance on Azure

Microsoft Per Core (with CAL) licensing rules

The Per Core (with CAL) metric licensing model is followed by various Microsoft Server products such as Windows Server, System Center, and Core Infrastructure Server Suite. The number of licenses depends on the number of installations and operating system environments (OSE).

The licensing rules for on-premise installations of these products and the cloud installations are separate. The cloud licensing rules follow Bring Your Own License (BYOL). For more information, see [Licensing rules for BYOL and BYOS](#).

To license the on-premise installation of these products using the Per Core (with CAL) licensing model, consider the following two options.

- Licensing by physical cores, also known as licensing by physical hosts
- Licensing by individual virtual machines

Note:
You can either allocate to individual hosts or individual virtual machines, not to cluster.

You can either allocate manually, or the Software Asset Management application can automatically select the most cost-effective licensing option based on optimization criteria. For more information about how to perform allocation, see [Allocation management](#) and how the

Software Asset Management application performs automated optimization, see [View realized and potential cost-based licensing optimizations for Microsoft](#).

Note:

Both options, whether licensing by physical cores or licensing by individual virtual machines, come with their own set of Microsoft rules that must be followed. For more information, see [Windows Server Standard, Datacenter, and Essentials](#).

Licensing by physical cores

The Software Asset Management application supports licensing by physical core rules, introduced by Microsoft in 2016.

Licensing by physical core rules

Rule	Windows Server Standard	Windows Server Data Center
Required number of licenses	Equals the number of physical cores on the licensed server The physical cores on servers are equal to CPU count * Core count.	
Min licenses required	<ul style="list-style-type: none"> • 8 per physical processor • 16 licenses per server 	
CAL requirement	Device or user CALs are required for users or devices accessing the server	
Virtualization rights	Rights to use 2 virtual machines if all cores of the host are licensed with the option for license stacking Note: You must license the host again to get rights to use 2 additional virtual machines.	Rights to run unlimited virtual machines when all cores of the host are licensed
License mobility within Server Farms (Software assurance benefit) Note: License mobility isn't available for Windows Server. Licenses can be reassigned to servers as often as every 90 days.	Not supported	

When deploying Microsoft products like Windows Server or System Center (using the core with CAL license model) on cluster virtualization technologies such as VMware vSphere, Microsoft Hyper-V, or Nutanix AHV, the number of licenses required for the physical host depends on the virtual machines that could potentially migrate to it within the cluster.

Technologies like VMware vMotion, which enables live migration of virtual machines across all hosts, and host affinity, which helps lock virtual machines to hosts within a cluster, manage the movement of virtual machines across hosts. To understand more about cluster virtualization technology and its support on the Software Asset Management application, see [Understanding your cluster infrastructure](#).

According to Microsoft licensing rules, if a virtual machine with a Microsoft product like Windows Server installed is hosted on one server but can potentially migrate to another, the destination server must be licensed as if the virtual machine is already running on it.

Licensing by virtual machines

The Software Asset Management application supports licensing by individual virtual machines rules, introduced by Microsoft in 2022.

Licensing by individual virtual machines rules

Rule	Windows Server Standard and Windows Server Data Center
Required number of licenses	<p>Equals the number of virtual cores on the virtual machine</p> <p>The virtual cores on servers are equal to $\text{CPU count} * \text{Core count} * \text{CPU thread count}$.</p>
Min licenses required	8 licenses per virtual machine
Software assurance or subscription license	Required
<p>Note: The option to license by virtual machine is only available with software assurance or a subscription license.</p>	
License mobility within Server farms (Software assurance benefit)	Supported
<p>Note: Licenses can be reassigned within the same server farm as often as needed. The 90-day rule applies only when moving to another server farm or cloud provider.</p>	

Software Asset Management health check

The Health Check ServiceNow Store application gives a correct and reliable overview of your Software Asset Management configurations and recommends you to correct any errors that may exist.

The Health Check application can be used by multiple personas such as implementation partners, SAM managers, and support analysts to determine the health check of their configurations.

Use the Health Check ServiceNow Store application at any point during the deployment of the Software Asset Management application to identify errors. For example, configuration errors such as incorrect setup of entitlements or software models, or missing data attributes found from Discovery. For details on running a health check scan, see [Run a health check scan for Software Asset Management](#).

The current set of checks include checks for the following configurations:

- SQL Server Config
- SQL Server CMDB
- Windows Server CMDB
- Windows Server Config
- Database Server - Oracle
- Java - Oracle
- Microsoft 365
- General

The scheduled job, *SAM - Trigger Full Scan*, runs weekly on the KPI categories, shipped as part of the content service, on your ServiceNow instance. The KPI categories can be related to entitlement misconfiguration, downgrade, allocation, or any other configuration issue. You can configure these KPIs or even add more KPI categories. The scheduled job performs an overall health scan to check for any errors that may exist in your Software Asset Management configuration.

Notifications regarding the health checks can be viewed in the Software Asset overview view.

After the health scan is performed, view the results on the Health Check dashboard. View the results in the form of reports that you can download and those reports give recommendations on resolving the issues. For more information, see [Health check](#).

Reconciliation of licenses across global entities

Share entitlements across different entities within your organization by creating consumption rules for entitlements.

Limit consumption of entitlements to specific set of entities during the reconciliation process. This allows a cost center to purchase licenses and provide it as a service to other cost centers to license software running on their devices without requiring allocations.

Overview of consumption rules

Create consumption rules for entitlements to restrict all entities from using that entitlement. If a consumption rule isn't defined for an entitlement and when the reconciliation process runs, any entity can use that entitlement regardless of who owns that entitlement.

Consumption rules can be created for the following reconciliation groups:

- Company
- Department
- Region
- Cost center
- Country

A single consumption rule can be used across multiple entitlements that helps in reuse of consumption rules.

After you create consumption rules in the License operations view, you must link a consumption rule to one or more entitlements in the **Entitlement Consumption Rules** related list in the entitlement page. After you link a consumption rule to an entitlement, consumption is limited to the users or devices belonging to at least one of the specified entities specified in the consumption rule.

If no active consumption rules exist in the **Entitlement Consumption Rules** related list, anyone in your organization can use the entitlement.

i Note:

Consumption rules aren't supported for the following license metrics: IBM RVUs, IBM UVUs, and Workday.

Irrespective of grouping, consumption rules apply and licensing is restricted. After you link consumption rules with an entitlement and run the reconciliation process, the following actions take place:

- with grouping: The reconciliation result appears in the form of product results, software model results, and licenses metric results; all generated individually for each group.
- without grouping: The reconciliation result appears in the form of product results, software model results, and license metric results, all under a single heading.

The License Consumption Breakdown [samp_lmr_consumption_result] table reports the allocated and unallocated rights used per license metric results per consumption rule.

Further reporting can be done through the consumption rule column in the Licenses Required By [samp_licenses_required_by] table. The consumption rule column stamps the consumption rule satisfied by that entity.

Use case for consumption rules

Let's say that you've created three separate consumption rules for three departments, namely Sales, HR, and Marketing.

You now link all these three consumption rules to an entitlement, titled ENT A. After you run reconciliation, ENT A can be used by the Sales, HR, and Marketing departments. No allocations need to be created for ENT A.

Parent and child hierarchy

Consumption rules also support parent or child hierarchy for groups. If you have a consumption rule for parent company A, you can choose to include child company B and child company C without creating separate rules.

The *Create New Consumption Rule* page in the Enterprise Asset Workspace lets you include the children of the company, department, and cost center in the consumption rule. This

reduces the effort required to create individual consumption rules for each entity and to update consumption rules when new entities are added, update, or deleted.

License pools

Consumption rules allow you to define license pools for entities. A license pool is a reservation of rights for a group entity defined on a consumption rule. License pools are specific to an entity per entitlement. If no license pool is defined, the entity can consume rights, but none will be set aside as a guarantee.

For example, an entitlement with 100 available rights can have an HR consumption rule with a license pool of 50. This sets aside 50 rights for HR consumers, and the remaining 50 rights can be used by HR or other entities defined in the consumption rules.

You can view the consumption rules and associated license pools in the **Entitlement Consumption Rules** related list in the entitlement page.

If you don't want license consumption to be limited to entities in the consumption rules, you can use the **Unrestricted consumption** check box on the entitlement page. Once this check box is selected, any entity can consume rights, but the entities in the consumption rules have a reservation of rights set aside.

Note:

While both allocations and the **Unrestricted consumption** check box allow other groups to access the entitlement; only allocations provide priority.

Allocations

Allocations take precedence over consumption rules. You don't need to create consumption rules for allocations to work. For example, let's say you have a consumption rule that states that only HR devices can use this entitlement. This entitlement can still include allocations outside of HR such as Sales or Marketing.

Allocations are automatically counted towards license pools when the first applicable consumption rule is satisfied. This is the default setting, but allocations will still be honored even if there is no defined consumption rule or license pool.

Any new allocations that exceed the license pool count will be honored. Any allocations that do not satisfy a consumption rule will also be honored.

Upgrading from Pre Utah releases

If you're upgrading from a Pre Yokohama release and based on what you have selected in the *com. snc. samp. recon. group* and *com. snc. samp. recon. subgroup* properties (in the Software Asset Management Properties page), the following upgrade actions take place:

- Grouping: **Company**, **Cost Center**, **Region**, **Department**, or **Country** is selected. A consumption rule is automatically created for the grouping entity selected if the entitlement is in use. For example, if **Department** is selected, and **Company** is selected as the subgroup, then one combined consumption rule is created for both the group, Department and the subgroup, Company. When reconciliation is run, the entitlement usage is restricted to only the Department group and the Company subgroup.

Note:

An entitlement is considered to be in use, if in the Entitlement table, the Install status column has the value 1.

- Non-grouping: **None** is selected. No consumption rule is created as reconciliation runs without grouping. The entitlements can be used by any group.

Software reconciliation for compliance

Automated license reconciliation keeps license positions accurate and up-to-date without manual calculations. Reconciliation runs weekly or on demand.

Overview of reconciliation

Reconciliation is a scheduled job that is run at a specified frequency (default is weekly). It can also be run on demand for specific or all publishers, groups, and subgroups.

Group and subgroup values include country, department, company, region, or cost center. Default group and subgroup [properties](#) that apply to the weekly reconciliation run can be set in **Software Asset > Administration > Properties**.

When reconciliation runs, a list of reconciliation results is created that shows the compliance status of software products concerning discovery and entitlements. Users with the `sam_user` role can view reconciliation results.

In addition to creating a purchase order for new software licenses, additional remediation options are available in software model results. Use the results to automatically create and remove allocations, remove unallocated installs, and remove unlicensed installs.

Review reconciliation results in a simplified License Workbench view, and use the License Position report to see compliance details for each software model in a single list.

Upgrade considerations for customized reconciliation script includes

Starting from the Yokohama release, all the reconciliation script includes are being moved from the family release to the Software Asset Management store application (`com.sn_itam_samp`).

Note:

When you activate the Software Asset Management Professional (`com.sn_samp_master`) plugin or the Software Asset Management Foundation (`com.snc.sams`) plugin, the Software Asset Management store application (`com.sn_itam_samp`) is automatically activated.

When upgrading to Yokohama, if you have made customizations to reconciliation script includes, you need to move your customizations to the new script includes. The old script includes will be deprecated.

Software reconciliation results

Software reconciliation results show the compliance status of software products concerning discovery and entitlements. Users with the `sam_user` role can view the reconciliation results.

When software reconciliation runs, it calculates compliance based on how many rights are in use compared to the number of active rights that have been purchased. Reconciliation runs weekly or on demand for a specific publisher or all publishers. This process generates a list of reconciliation results that display the compliance status of the software in relation to discovery and entitlements. For more details on running software reconciliation, see [Run software reconciliation in Software Asset Management classic](#).

There are three tiers of reconciliation results:

- Product Results
- Software Model Results
- License Metric Results

You can view reconciliation results using both Core UI and Software Asset Workspace.

Interface	Action
Core UI	<ol style="list-style-type: none"> 1. Navigate to All > Software Asset > Reconciliation > Historical Results. 2. Select a reconciliation result. 3. On the Reconciliation Result form, select a Product Results record to view the product result details.
Software Asset Workspace	<ol style="list-style-type: none"> 1. Navigate to Software Asset Workspace > License usage. 2. Select a publisher card and then select a Product Results record to view the product result details.

Reconciliation results

Product Results

The screenshot displays the 'Product Results' section in ServiceNow. On the left, a list of products is shown with their compliance status: 'Not compliant' (red dot) or 'Compliant' (green dot). Products include various versions of SQL Server and System Center components. On the right, the 'Details' view for a specific product result (PR0001744) is shown. It includes fields for Number, Publisher (Microsoft), Product (SQL Server), Group (None), and Subgroup (None). Key financial metrics are displayed: Reconciliation result (RR0001012), Status (Not Compliant), True-up cost (USD \$ 53,484.82), Over-licensed amount (USD \$ 11,640,874.22), and Potential savings (USD \$ 0.00).

These results are for all models and installations associated with a software product and are specific to a publisher. Product results for licensable products are generated after reconciliation even if the products don't have defined software models for them. These results determine the license compliance status of the product. Additionally, product results provide details on true-up cost, overlicensed amount, and potential savings. The following related lists appear when you select a Product Results record:

- Software Model Results
- Licensed Installs
- Unlicensed Installs (SAP: Unlicensed Users or Unlicensed Engines)

- Unlicensed Subscriptions (Subscription-based software)
- Removal Candidates

Software Model Results

Software Model	Compliance Status
SQL Server	Not compliant
2017 Enterprise	Not compliant
2017 Standard	Compliant
2019 Enterprise	Compliant
2019 Standard	Not compliant
2022 Enterprise	Compliant
2022 Standard	Not compliant
SQL Server Analysis Services	Not compliant
SQL Server Database Engine Servi...	Not compliant
System Center Configuration Man...	Not compliant
System Center Data Protection M...	Not compliant
System Center Endpoint Protection	Not compliant
System Center Operations Manager	Not compliant
System Center Orchestrator	Not compliant
System Center Service Manager	Not compliant
System Center Virtual Machine M...	Not compliant
Visio	Not compliant
Visual C++ Redistributable	Not compliant
Visual Studio	Compliant
Windows Server	Not compliant

Software Model Result	Value
Number of reclamations	0
Status	Compliant
Product result	PRO001744
Group	None
Subgroup	None
Unlicensed installs	0
True-up cost	USD (\$) 0.00
Over-licensed amount	USD (\$) 328,500.00
Potential savings	USD (\$) 0.00

These results are for each individual software model related to the product. The Software Model Results appear as a related list on the product results records after reconciliation is run. A software model results record is created only when a software model or entitlement exists for the software product. The following related lists appear when you select the software model details:

- License Metric Results
- Remediation Options
- Licensed Installs
- Unlicensed Installs (SAP: Unlicensed Users)
- Unlicensed Subscriptions (Subscription-based software)
- Unlicensed Consumptions (Consumption-based software models)
- Unlicensed Options (Oracle only)
- Removal Candidates
- Purchase Orders (only when the Procurement (com.snc.procurement) plugin is active)

For more details on software model results related lists and descriptions, see [View software model results](#).

License Metric Results

These results are for each license metric associated with the software model. The License Metric Results appear as a related list on the software model results. License metric result details include rights owned and rights used, and the license allocation breakdown so that you can determine your options to stay compliant. There can be multiple license metric results for a software model because multiple licenses can be purchased for the same software.

From the Software Model Results form, you can drill down on a specific metric result. The following related lists appear when you select license metrics results details:

- Rights Used By (This tab isn't visible for the Resource Value Unit (RVU) IBM license metric.)
- Licensed Installs
- Installs Used (SAP: System Users)
- Downgrades/Upgrades
- Licensed Subscriptions
- Cloud Special Rights (This tab is visible only if you have cloud installations on cloud platforms such as AWS or Azure.)

For more details on license metric results related lists and descriptions, see [Software model results license metric results fields](#).

Accurately reporting your software true-up cost

Accurately report your software true-up costs to avoid compliance issues.

Specify the license cost or the license plus maintenance cost in the software model to accurately report the true-up costs during reconciliation. If you don't specify a license cost or a license plus maintenance cost, the average software entitlement cost is used for true-up cost calculations.

Note:

For the Employee license metric in the Oracle publisher pack, the true-up cost is shown for a subscription period of one year.

If you use a license metric to create a software entitlement for a software model, an override license cost record is created if one already doesn't exist for the same license metric. The license cost record is added in the Override License Cost related list. The license cost and license plus maintenance cost is set to zero. If a maintenance license exists, you can override the license cost or the license plus maintenance cost. For details, see [Create or update an override license cost record](#).

Software license compliance position

The Software Asset Management License Position report shows compliance details for each software model in a single list.

You can view and export the software model compliance list for your environment to understand your license position.

Two license metric results are generated if a software model has two entitlements, one with a perpetual SA license type and the other with a subscription license type. One license metric result where active maintenance is true and the other where the active maintenance is false. In such a scenario, two license position reports are generated, one with active maintenance true and the other one with active maintenance false.

A single license position report is generated if there are any unlicensed installations. A single license position report is also generated if there are any unlicensed subscriptions. If both are present, two license position reports are generated.

License compliance position report

Software publisher	Software product	Edition	Version	Software model status	License metric	Total spend	Licenses owned	Licenses required	Unlicensed
Adobe Systems	InDesign	(empty)	CC 2017	Compliant	Per Named Device	\$50,376.00	200	185	
Adobe Systems	Photoshop	(empty)	CC 2017	Compliant	Per Named Device	\$12,594.00	50	6	
Adobe Systems	Acrobat	Professional	DC	Not compliant	Per Core	\$8,141.67	122	5	
Adobe Systems	Photoshop	(empty)	CC 2017	Compliant	Per Named User	\$5,037.60	20	20	
Adobe Systems	InDesign	(empty)	CC 2017	Compliant	Per Named User	\$12,477.40	40	40	
Adobe Systems	Creative Cloud	Single App		Compliant	User Subscription	\$300.00	3	3	
Adobe Systems	Acrobat	Professional	DC	Not compliant	User Subscription	\$2,160.00	12	15	
Adobe Systems	Illustrator	(empty)	CC 2017	Compliant	Per Device	\$46,782.00	150	50	
Adobe Systems	Dreamweaver	(empty)	CC 2017	Compliant	Per Device	\$19,599.50	50	0	
Adobe Systems	Captivate	(empty)	8	Compliant	Per User	\$40,788.00	100	0	

License Position Report list

Field	Description
Software publisher	Software publisher of the software model.
Software product	Software product of the software model.
Edition	Edition of the software product.
Version	Version of the software product.
Software model status	Compliance status of the software model. <ul style="list-style-type: none"> Compliant (indicated with a green dot) Not Compliant (indicated with a red dot)
License metric	License metric of the software model.
Total spend	Total cost of rights owned.
Rights owned	Sum of all active rights.
Rights used	Sum of rights allocated in use and not allocated in use.

License Position Report list (continued)

Field	Description
Rights needed	Rights needed to cover the number of unlicensed installs.
Rights available	Rights owned less rights used.
Unlicensed installs	Number of unlicensed software installations that are not covered by any entitlements.
True-up cost	Estimated cost of remediating non-compliance based on the least number of rights needed.
Potential savings	Estimated savings from reclaiming unused installs.
Over-licensed amount	Total cost of unused rights.
Software model	Software model name.

The License Position Report form also contains **Group** and **Subgroup** fields that specify the group and subgroup on which reconciliation was run.

Determining license compliance through Virtualization Adapter

Software Asset Management Virtualization Adapter determines the license compliance of several software products deployed on virtualization technologies by applying license compliance rules. This feature is activated and installed with the base system in Software Asset Management.

The following are the software products for which Software Asset Management Virtualization Adapter determines the license compliance:

- Microsoft SQL Server
- Windows Server
- Red Hat Enterprise Linux Server (RHEL)
- Oracle Database Server, Options, and WebLogic Server

Virtualization is a process of simulating hardware functionality and creating a virtual environment in which you can run more than one virtual machine on a single server in a clustered environment. For more information on Oracle Database and WebLogic Server licensing support on VMware vSphere and Nutanix virtualization technology, see [Oracle Database and WebLogic Server licensing in soft-partitioned environments](#).

The virtualization technologies supported by Software Asset Management are:

- VMware
- Microsoft Hyper-V
- Red Hat Virtualization
- Nutanix

ITOM Discovery discovers virtualization technologies based on their relationship architecture. Software Asset Management depends on the discovered relationships to determine the license compliance of the software installations.

Software Asset Management Virtualization Adapter standardizes the relationship architecture through database views and metadata views, which are used by Software Asset Management to determine license compliance.

Software Asset Management considers the architecture of the virtualization technology while applying the licensing rules. For example, Microsoft Hyper-V architecture permits Windows Server Standard edition to use one running instance of the server software in the physical OSE on the licensed server in addition to two virtual OSEs if the physical OSE is used only to host and manage the virtual OSEs. Software Asset Management Virtualization Adapter automatically applies this rule set.

Explanation of license rights post reconciliation

Get visibility into how your rights are calculated and consumed post the reconciliation process.

Overview of explanation of rights

Understand how the Software Asset Management application calculates the number of licenses for your software assets.

A detailed explanation of license rights is provided for the following metric groups:

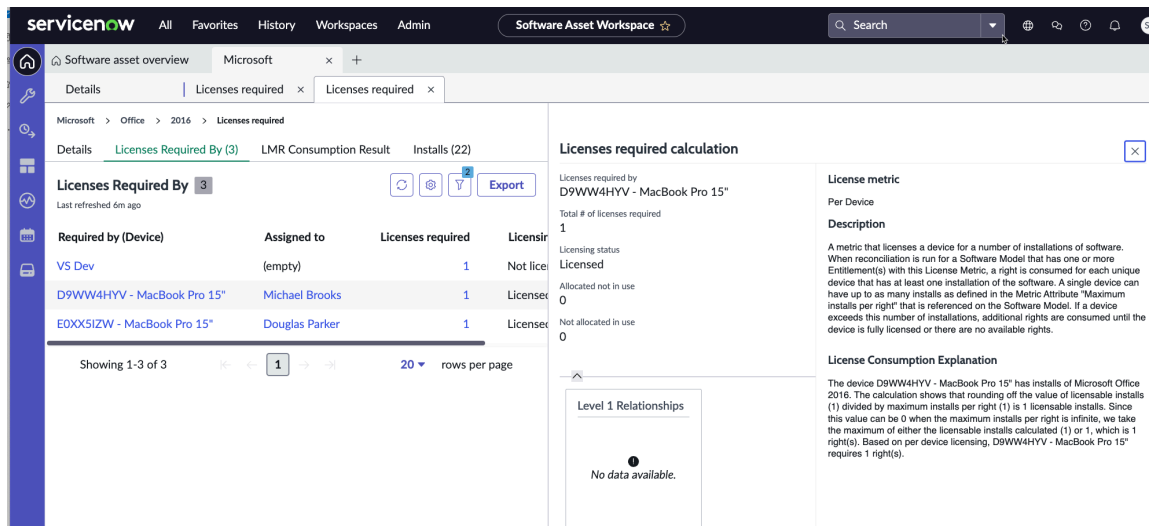

- Microsoft
- IBM
- Red Hat
- VMware
- Oracle
- SAP
- Citrix
- Common

For details on viewing the explanation of license rights, see [View calculations for your licenses in workspace](#)

Use case for Per Device license metric

The following is an example of how an explanation of license rights for a Per Device license metric appears on the Licenses Required by page:

- The MacBook Air 15" device has installations of Microsoft Office 2016.
- License consumption explanation: The device D9WW4HYV - MacBook Pro 15" has installs of Microsoft Office 2016. The calculation shows that rounding off the value of licensable installs (1) divided by maximum installs per right (1) is one licensable install. Since this value can be 0 when the maximum installs per right is infinite, we take the maximum of either the licensable installs calculated (1) or 1, which is 1 right. Based on per device licensing, D9WW4HYV - MacBook Pro 15" requires 1 right.

Software reclamation rules

Reclamation rules aggregate usage over time and specify a minimum number of hours or the latest date that a software unit must be used before the software is flagged for reclamation.

Overview of software reclamation rules

You can avoid purchasing more software rights for products by knowing which rights have already been allocated but are being used infrequently, haven't been used recently enough, or aren't being used at all. Reclamation rules reclaim those software rights so that these rights can be freed up and allocated elsewhere. Reclamation rules are configured to specify a period of time, amount of time, or most recent date that a software unit must be used before the software is flagged for reclamation.

When a reclamation rule is created for a suite parent, the usage for the suite parent as well as that of the suite components are automatically pulled into the rule.

When you create a reclamation rule, you can add software products associated to the reclamation rule. When you add a product, which is a suite parent, all the suite components automatically get added and appear in the Software Products related list in the Reclamation rule form. Similarly, the product processes for all the added software suite products and component products also get added and appear in the Product Processes related list.

i Note:

The products in the Software Products related list are updated based on the content updates in the Software Asset Management Content Service. For example, if a suite component has been added or removed from a suite parent, the change is reflected in the Software Products related list.

After a suite parent is added to a reclamation rule, you can't edit or delete any suite components, but you can edit or delete the suite parent. If you delete the suite parent, the suite components are also automatically deleted along with the product processes. If you edit a suite parent, then the changes of the edit are reflected for the suite components and the associated product processes. For example, if you change the suite parent from Microsoft Office 365 to Microsoft Word, all the suite components and product processes for Microsoft Office 365 get deleted. Microsoft Word becomes the new parent and all suite components and product processes for Microsoft Word are automatically added.

Filter conditions

You can add a filter condition on a suite parent record. The filter condition that you specify for a suite parent is automatically applied to all the suite components of the parent and the filter condition field on the suite component record is no longer editable. You can, however, edit the filter condition on the suite parent record. You can open a suite parent record from the Software Products related list and specify your filter condition in the record.

You can also specify a filter condition at the reclamation rule level. The filter condition that you specify applies to all the products that belong to the reclamation rule. The filter condition can only be applied when the **Applies to** field in the Reclamation rule form has the value **Installed Software** or **Subscription Software**. For details, see [Add a software reclamation rule](#).

Reclamation rules for SaaS and SSO applications

When you create a direct integration profile for a SaaS application or connect an SSO application, a reclamation rule is automatically created for the software product. It's important that you review the reclamation rule to verify that it meets your specifications. For more information, see [Review a software reclamation rule](#).

For more information about the reclamation rules for each application, see [Reclamation rules](#).

Upgrading to Yokohama

If you're upgrading to Yokohama from any past release, your existing reclamation rules do not automatically take bulk reclamation into account. You must manually set up your existing reclamation rules for bulk reclamation to take effect. For example, in an existing reclamation rule, you have Microsoft Office 365 listed in the Software Installations related list. When you upgrade to Yokohama, you must delete Microsoft Office 365 from the Software Product related list and re-add it to the same reclamation rule to trigger the automatic addition of suite components and their product processes.

Microsoft SCCM software usage

Activate the Microsoft SCCM software usage plugin to integrate your software usage data with the ServiceNow AI Platform.

One of the following Microsoft SCCM Software Usage plugins must be installed to import software usage data from Microsoft SCCM to Software Asset Management.

- Integration – Microsoft SCCM 2012 v2 Software Usage (com.snc.samp_usage_sccm) plugin
- Integration – Microsoft SCCM 2016 Software Usage (com.snc.samp.usage_sccm_2016) plugin

The Integration – Microsoft SCCM 2016 plugin is compatible with SCCM version 1606, 1906, 1910, and 2002.

i Important:

Both Microsoft SCCM plugins will be deprecated in the Tokyo release. If you are integrating with SCCM for the first time, request and install the Service Graph connector for Microsoft SCCM application from the [ServiceNow Store](#)  instead. If you have already activated one of the Microsoft SCCM plugins on your ServiceNow instance, use the Migration Readiness Tool for Service Graph Connector for SCCM store application to prepare your instance for migration from the Microsoft SCCM plugin to the Service Graph connector. See [Service Graph connector for Microsoft SCCM](#)  for more information on the Service Graph connector.

The SCCM integration plugin installs [several components](#).

After the SCCM usage plugin is [activated and configured](#), a scheduled import runs monthly to [bring SCCM software usage data into your instance](#) . The usage data is then mapped to Software Usage table. During the scheduled job, a SQL query is executed.

The scheduled import runs once a month, but you can run the import on demand by clearing the **Conditional** option on the Scheduled Data Import form. However, the data is always pulled from the previous month, so there won't be a change in the data until the following scheduled import.

Note:

The SCCM software usage data source can't be executed directly because the SQL statement doesn't actually pull in the data, so the records aren't retrieved. A valid SQL statement on the data source is updated dynamically through a scheduled import. So, if you need to pull the data into your ServiceNow instance, use the scheduled import.

There are two types of data (total usage and last used) that you can extract from SCCM and import into your instance. Last used data will only show the last time the software was used during the previous month.

Total usage data will show down to the second when the software was used in the previous month, which can be a large amount of data imported into your instance. A usage record tracks the sum of usage on a monthly basis so that you can assess the software usage in your environment.

Depending on what you've specified in the reclamation rule for the product, one of the following scheduled imports will run to pull in the data.

- SAMP Usage Import
- SAMP Usage 2016 Import
- SCCM 2012 v2 Software Last Used
- SCCM 2016 Software Last Used

Note:

Only usage data for products associated with a reclamation rule is imported. The **Reclamation type** field on the Reclamation Rule form must match the scheduled import that you are running, otherwise the data is not pulled into your instance. For more information, see [Create a reclamation rule to import Microsoft SCCM usage data](#).

You can also pull in user data from SCCM. User data is compared to the user_name field of the sys_user record. If the names don't match, the user data isn't imported.

Note:

Configuration item (CI), user, product, and publisher values are used to identify a matching software installation.

Duplicate usage information cannot be created for the same CI, user, product, or publisher values in the same month and year.

You can also import usage information using ServiceNow [import sets](#)  feature.

Allocation management on Software Asset Management

Software Asset Management (SAM) offers optimal license assignment confirming that licensing entities are allocated according to the available entitlements.

For example, Software Asset Management determines the most cost-effective license assignment for a specific host or virtual machine based on the available Microsoft SQL Server Standard or Enterprise entitlements. Software Asset Management streamlines the

licensing process and helps you optimize costs by selecting the most efficient licensing options. Allocation management saves your time, reduces the risk of compliance issues, and unnecessary expenses.

License allocations enable you to prioritize license assignments for specific hosts, virtual machines, users, devices, and more, according to the licensing strategy of your organization. You can override the default license assignment so that your unique needs are met.

There are several ways to manage allocations and here are a few scenarios to help you use allocation management effectively.

- Using allocation to license entities with other licenses

License a device or user with a different license than the one assigned by Software Asset Management for a flexible license management process.

- Locking license assignment by creating allocations

Lock a license assignment for the same license consumption to occur every time the reconciliation runs to maintain consistency and avoid unexpected changes.

- Removing unnecessary allocations

Remove unnecessary allocations when they're no longer needed for an efficient license management process.

- Copying allocations

SAM Managers can copy allocations from one entitlement to another which helps to apply the same allocation strategy across multiple entitlements, saving time and maintaining consistency.

- Overriding license assignment

Override Software Asset Management license assignment and allocate the license to the Host or the Virtual Machine (VM) in a Hypervisor Cluster.

Example: Licensing entities with other licenses

Software Asset Management automatically licenses entities such as a virtual machine with Microsoft SQL Server Microsoft Standard license based on cost effectiveness. But the SAM Manager wants to change the license assignment to SQL Server Enterprise according to the licensing strategy of the organization.

SAM Manager analyzes the license consumption of a particular entity, Cluster A- VM 13, and verifies that it has been consumed by SQL Server Standard and the software installed on this virtual machine is also SQL server Standard.

Microsoft SQL Server Standard 2017

But according to the licensing strategy of the organization, SAM Manager wants to assign the SQL Server Enterprise license to this entity. In this scenario, the SAM Manager or SAM Admin can add an allocation to the SQL Server Enterprise entitlement, which would allocate SQL Server Enterprise licenses to the entity.

Note:

You don't have to remember the quantity of licenses to allocate. Software Asset Management automatically determines the licenses required for the entity, so the SAM Manager or SAM Admin can allocate a license.

After reconciliation, Cluster A- VM 13 has consumed licenses from SQL Server Enterprise. Four rights have been consumed wherein only 1 was allocated. You can also verify that the **Allocated in use** field to confirm that the added allocations are

ESX-4-SQL-Cluster-C	Cluster C	(empty)	4	Licensed	false	0
Cluster-A-VM-13	Cluster A	(empty)	4	Licensed	true	1

consumed.

For more information about the allocation fields, see [Software model results license metric results fields](#).

In the Cluster A- VM 13 Software installation list, the installed software is SQL Server Standard. However, the Software model result indicates

that the entity is being consumed by the SQL Server Enterprise software

model

The use case of prioritizing certain entities to consume a specific license over others can be extended to many other scenarios. For example, software suites can be prioritized to consume licenses first, or licensing a particular device with a different license metric over others.

Example: Locking license assignments

Lets say, the SAM Manager is happy with the assignment of license consumption performed by the Software Asset Management application. You can view License Metric Results and Remediation Options for a software model result from a Product Result record. On the License Metric Results page, the **Not allocated in use** column shows the number of rights that are used to license installations, but not allocated. When this value is greater than zero, remediation options **Create Allocations** and **Remove Unallocated** are displayed on the Remediation Options page. For more information, see [View software model results](#).

The **Create Allocations** remediation option enables the SAM Manager to lock assignments for all entities (device/user) or individual entity, so that during future reconciliation runs, the license consumption occurs exactly as previously performed.

The allocation will be added to the entitlement immediately after performing the remediation action. For more information about remediation options, see [View software model results](#).

Example: Overriding license assignment to a host or VM

Lets say, there’s a SQL Server Enterprise license, and Software Asset Management has optimized licensing by assigning it to the virtual layer. If your license strategy involves assigning licenses to the host layer, you can adjust this approach.

To override the license assignment:

1. In the Software Asset Workspace, navigate to **License Operations > Licensing**.
2. Select **Software entitlements**.
3. Select the software entitlements for SQL Server. For example, select the Microsoft SQL Server 2017 Enterprise software

4. Select the **Device Allocations** tab and then select **New**.
5. Add the Device Allocations details. When allocating license to the Host or VM, based on the value provided in the **Quantity** field, the Software Asset Management application determines the core count based on the following criteria:
 - If an exact number of cores isn’t provided, the Software Asset Management application automatically uses the actual core count of a machine for licensing purposes.
 - If fewer cores than the actual machine is provided, the Software Asset Management application counts the exact number of cores present on the machine for licensing purposes.
 - If more cores than the actual machine is provided, the Software Asset Management application uses the number you entered. However, the surplus is marked as Allocated not in use for licensing.

Lets allocate one license to the Microsoft SQL Server 2017 Enterprise Software entitlement, and save the entitlement, then run software reconciliation. For more information, see [Run software reconciliation in the](#)

[workspace](#).

Cluster 103 has 3 hosts each with 16 cores. In the previous example, the license allocation was adjusted to 1 for one entitlement. The Software Asset Management

application assigns the host the correct licenses based on the number of

Microsoft SQL Server 2017 Enterprise Save

When allocating software licenses, follow the licensing rules supported by the publisher.

i Important:

- Allocation isn't required for the subscription products.
- According to Microsoft licensing rules, host layer licensing isn't supported for SQL Server Standard. When you allocate the license at host level, the allocated license number is shown in the **Allocated not in use** column.
- Avoid allocating licenses to a cluster directly. Instead, allocate them to the hosts or VMs within the cluster. When you allocate a license to a cluster, the allocated license number is shown in the **Allocated not in use** column.
- When the **Allocated not in use** column value is greater than zero, the **Remove Allocations** remediation option is automatically created for each unique license metric in the software model.

Software installation optimization and removal

You can optimize your environment by reclaiming unused software as well as removing unauthorized software.

If a user is not using software installed, or infrequently, that software can be a candidate for removal. Removal means uninstalling and reallocating the software to an individual who will use it more often. Removal candidates are used to reclaim software installations.

Overview of software reclamation

Software reclamation is integrated with Workflow and [Client Software Distribution](#)  (CSD) to automate the process of uninstalling software from devices and reclaiming those software rights. During the workflow, the state of the removal candidate changes based on the progression within the workflow.

i Note:

If you change a software asset's state to **Retired** or **Missing**, the installation associated to the software asset gets removed and a removal candidate won't be created.

Reclamation can be performed for suite based products and for individual products that are not part of a suite.

For suite based products, bulk reclamation is performed at the user level. One removal candidate is created for reclaiming the suite. You can add the suite components to the same removal candidate via the Software Installation related list on the removal candidate form. The potential savings displayed is for the entire suite. Suite components cannot be reclaimed individually. In the Software Asset Workspace, you can add the suite components to the removal candidate one at a time. In the Software Asset Management classic framework, you can add the suite components all at one go.

For individual products, you can specify the software installation that you wish to reclaim.

There are multiple ways that removal candidates get created. A monthly scheduled job, *SAM - Identify new reclamation candidates*, uses the reclamation rules and software usage to create removal candidates. Additionally, removal candidates are also created as part of using remediation options for unlicensed and unallocated software installations, and for restricted software. When a software model is marked as restricted, removal candidates are created for any software associated to that software model. The reclamation flow and process is the same in all these use cases.

The *SAM - Identify new reclamation candidates* scheduled job creates removal candidates and these removal candidates automatically have the bulk reclamation flag checked. The removal candidates created are based on the results from the reconciliation process. Verify

that at least one reconciliation process has run with successful results before running the *SAM - Identify new reclamation candidates* scheduled job. This ensures that the *SAM - Identify new reclamation candidates* scheduled job accurately creates removal candidates to identify the right potential savings.

In each list of Removal Candidates, you can select individual records for reclamation (**Reclaim**) or **Reclaim All** to reclaim all qualifying removal candidates. Qualifying candidates are those candidates in the Ready state. Once you select **Reclaim** or **Reclaim All**, the workflow to remove the software is initiated.

Upgrading to Yokohama

When you upgrade to Yokohama and if you have an existing removal candidate in the **Awaiting revocation** state, nothing will be done with that removal candidate. If that removal candidate was part of a suite, then removal candidates are created for each of the other software installations in that suite. However, if the state of the existing removal candidates is anything other than **Awaiting revocation** then those removal candidates are canceled and a single removal candidate gets created for all the software installations that are part of that suite. In the **Activity** section on the removal candidate form, a reason is mentioned for the closure of each removal candidate.

Removal candidate grouping

Removal candidates are grouped according to justification.

- Low Usage
- Restricted Software
- All other justifications (such as Unlicensed, Unallocated)

Removal candidate states

State	Description
Attention Required	A removal candidate requires attention if the User field is empty on an automatic removal candidate that has the Notify User check box selected. Once the User field is populated, the state automatically changes to Ready.
Ready	When a removal candidate is in the Ready state, you can select Reclaim to advance the workflow.
Awaiting User	If the Notify User check box was selected, the user was sent a notification of the removal candidate to approve or deny.
Awaiting Approval	If the Notify User check box was selected, the user can approve or deny the removal candidate. If the user still wants to keep the software installation, it becomes the responsibility of a member of the assignment group to approve or decline the removal.

Removal candidate states (continued)

State	Description
Awaiting Revocation	<p>The final step in the workflow. You can select Close Complete to reclaim software rights in the removal candidate manually.</p> <p>Otherwise, a weekly scheduled job (named SAM – Updating Existing Reclamation Candidates) automatically updates removal candidates in the Awaiting Revocation state and with the software install field empty to Closed Complete state.</p> <p>If the removal candidate is in any other state and the software install is empty, the Reclamation workflow is canceled and updated to Closed Skipped state.</p> <p>The state for a removal candidate that has restricted software is automatically set to Awaiting Revocation and the justification is set to Restricted Software.</p>
Closed Complete	Software rights have been reclaimed.
Closed Skipped	Software rights not reclaimed by the removal candidate.
Closed Canceled	Software rights not reclaimed by the removal candidate as user activity is detected.

Restricted software justification and unlicensed justification

Workflows for removal candidates with a restricted software justification or an unlicensed justification get executed automatically. The user is notified of unauthorized software use and is not prompted for approval.

- Restricted Software:

Unauthorized Software Use

[Publisher] [Product] installed on the device, [device name], is not authorized to be used on company property. Do not install this software again.

- Unlicensed:

Unauthorized Software Use

You are not licensed to use [Publisher] [Product] installed on the device, [device name]. Use the appropriate process to request a license for the software.

The workflow state for a Restricted software justification and an unlicensed justification is then set to Awaiting Revocation and, once discovery identifies that the installation no longer exists, the state is changed to Closed Complete.

Unallocated justification and Low Usage justification

Workflows for removal candidates with an unallocated justification or a low usage justification prompt the user for approval.

- Unallocated:

[Publisher] [Product] installed on the device, [device name], has been flagged for removal because an allocation to use the software does not exist. Do you still require access to this software?

- Low Usage:

[Publisher] [Product] has been flagged for reclamation. Do you still need this software installed on [device name]?

Justification descriptions

Removal candidate descriptions get updated based on the justification.

- Unallocated:

[Publisher] [Product] installed on the device, [device name], has been flagged for removal because an allocation to use the software does not exist. If you do not require this software, Reject this task. If you still require access to this software, Approve this task and your request for continued use of the software will be routed for software manager approval.

- Unlicensed:

[Publisher] [Product] installed on the device, [device name], has been flagged for removal because the licenses to use it are not owned. Please request access to this software through the appropriate process.

- Restricted Software:

[Publisher] [Product] installed on the device, [device name], is not authorized for use on company owned property.

- Low Usage:

[Publisher] [Product] installed on the device, [device name], has been flagged for reclamation due to low usage. If you do not require this software, Reject this task. If you still require access to this software, Approve this task and your request for continued use of the software will be routed for manager approval.

When the **Reclaim** action is clicked, if the **Notify User** field is selected and the days before reclamation is greater than 0, then the state is set to Awaiting User. Otherwise the state is set to Awaiting Reclamation.

When the state changes to Awaiting User, a notification is sent to the user.

Related topics[View or create software usage](#)[Reclaim software](#)**License usage analysis**

Gain visibility into the end-to-end journey from installing software to consuming licenses.

Overview of license usage analysis

Enable SAM managers to map the entire process from software installation to license utilization. This process includes identifying licenses used for each installation and differentiating between installations that have been used and those installations that haven't.

To gain further insights into your installations, use node maps for a detailed numerical breakdown. For each product, explore the installation layer to see the product versions and editions, examine the consumption status layer to determine if the installations are licensed, unlicensed, ignored, or require action. Finally, review the licensing layer that displays the software model results.

The nodes of a node map are stored in the Install Consumption Nodes [samp_install_consumption_nodes] table and the nodes are generated during reconciliation. You can view the node map in the License operations view in the Products with installs list. For details on node maps, see [View license usage for your installations](#).

Benefits to the SAM manager

- Verify that the total number of installations for a product aligns with the sum of used and not used installations.
- Determine the licensing status of the installations: licensed, unlicensed, requiring action, and ignored.
- Determine all issues related to installations in one view.
- Determine all key licensing concepts applied such as downgrades and inference.
- Track usage statistics by viewing the consumption percentage and installation status count.

Considerations for node maps

Here are some special considerations to keep in mind for node maps:

- Grouping: Reconciliation can be run with a group and a subgroup. The node map displays each group and subgroup as nodes.
- Domain separation: Reconciliation can be executed for a specific domain level, displaying domain-separated information based on the user's domain. If a product spans multiple domains, a separate node map gets generated for each domain. Consequently, you can view each node map within its respective domain, resulting in a single product having multiple node maps in the same reconciliation run.

Related topics[View license usage for your installations](#)**Employee off-boarding process for asset reclamation**

Coordinate an employee's off-boarding process via a workflow that lets you request, assess, and remove assets.

The Software Asset Management off-boarding process entails the return of all software licenses assigned to the employee. Additionally, all software installations are removed from the devices, all user allocations are removed, and access to SSO, SAP, and Citrix products is revoked.

When an employee leaves an organization or moves to a different role, retrieving the assets assigned to the employee necessitates extensive coordination between the Human Resources department and the asset manager. You can create an off-boarding catalog request, which initiates a prescriptive workflow to efficiently retrieve assets and restock them in the inventory, reassign them, send them for repair, or dispose as required.

Note:

For information on the Hardware Asset Management asset reclamation process, see [Asset reclamation](#).

You can create an asset reclamation request via the Service Catalog. Once the request is created, reclamation line items are created that comprise of a series of tasks. These tasks can only be accessed and performed only by the `sam_user` role. Once all the tasks are closed, the reclamation line item is complete. After all the reclamation line items are complete, the catalog request is also completed. For information on creating an off-boarding catalog request, see [Create a catalog request to reclaim assets](#).

Note:

Software reclamation line items of the type Device Reclamation are created for each device that is returned, provided the device has software installations on it and that device was selected in the Reclaim Asset form. An additional software reclamation line item of the type User Reclamation is created if the **Employee Separation** check box was selected in the Reclaim Asset form.

Windows Server cluster license optimization

Optimize rights used for Windows Server clustering based on costs and compliance criteria.

Windows Server installations are categorized into two editions - Standard and Datacenter. Windows Server Standard and Datacenter editions are licensed by physical cores. The licenses are available in packs of 2 and packs of 16. The minimum license requirements for Windows Server clustering is:

- All physical cores must be licensed
- 8 core licenses per processor
- 16 core licenses per server

A cluster is licensed by calculating the maximum number of virtual machines (VMs) that can run on one physical host.

The Windows Server Standard edition is licensed for 2 operating system environments (OSEs) or Hyper-V containers. Additional OSEs require additional licenses (physical server is licensed for every 2 OSEs, minimum of 16 rights). Windows Server Datacenter edition is licensed for unlimited OSEs.

The cluster or host density is determined by dividing the active operating systems by 2. The system property `com.snc.samp.windowserver.license.threshold` with a default value of 4.59 is used for marking the host or cluster density. This property is a ratio of the cost of Datacenter and non Datacenter licenses and identifies the optimal cluster size for Datacenter licenses. You can modify the value of this property based on the purchase costs for these licenses. Low density clusters are licensed by non Datacenter licenses starting from low to high density. High density clusters are licensed by Datacenter licenses starting from high to low density. Optimal license and potential savings are generated for host or cluster using non optimal licenses.

The Windows Standard rights are used first for the Standard list by using them from the smallest to the largest within this list. After using Standard rights for low density host or cluster, the remaining low density host or cluster are licensed by the remaining Datacenter rights from high to low density. After using Datacenter rights for high density host or cluster, the remaining high density host or cluster are licensed by the remaining Standard rights from low to high density. Clusters that do not have enough Datacenter or Standard rights to consume are marked as unlicensed.

A new table, Potential savings by optimizing licenses, [samp_license_optimization_summary] is created to store information about licensing Windows Server software installed on each device.

Bring your own license or subscription to the public cloud

Bring your own license (BYOL) support enables you to determine the license compliance of your Microsoft and Oracle software products across hybrid infrastructures. Bring your own subscription (BYOS) support enables you to determine the license compliance of your Red Hat Enterprise Linux (RHEL) software products across hybrid infrastructures.

When organizations move to the public cloud, existing on-premise perpetual licenses are carried over to the cloud using BYOL. Existing on-premise subscription licenses are also carried over to the cloud using BYOS. BYOL and BYOS help improve license optimization, as organizations must pay only for infrastructure costs.

The Software Asset Management application supports BYOL for Microsoft and Oracle software products and BYOS for RHEL software products as follows:

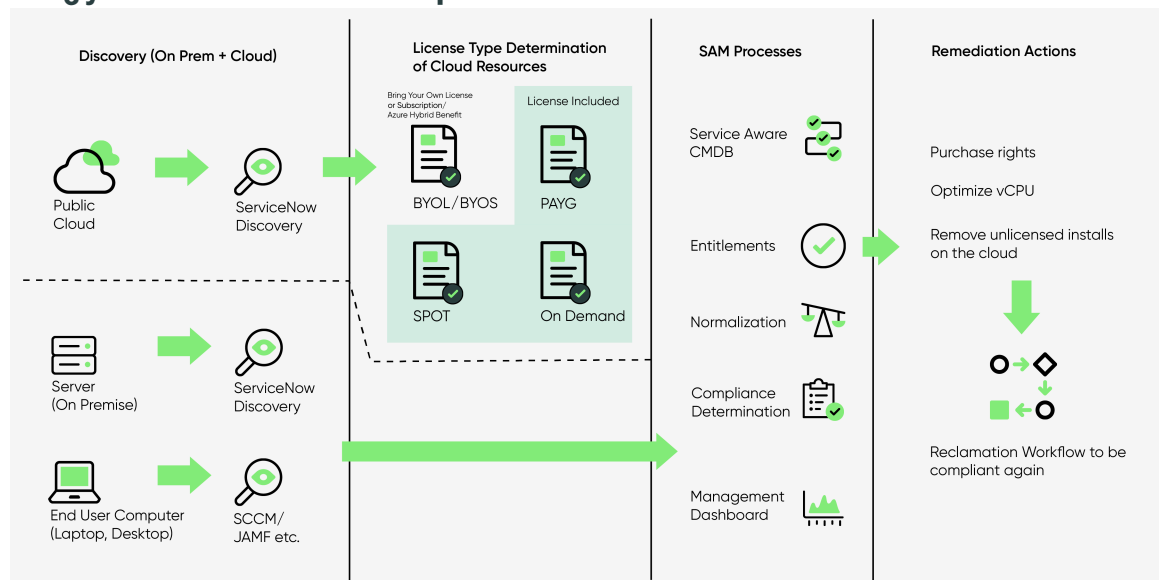

Product	Product edition	BYOL or BYOS	Supported cloud providers	Supported service model	Supported infrastructure type
					Note: This column applies to Infrastructure as a Service (IaaS) models only.
Microsoft SQL Server	All editions	BYOL	<ul style="list-style-type: none"> • AWS • Microsoft Azure • Google Cloud Platform (GCP) 	Infrastructure as a Service (IaaS)	Shared and dedicated
Microsoft Windows Server	All editions	BYOL	<ul style="list-style-type: none"> • AWS • Microsoft Azure • Google Cloud Platform (GCP) 	Infrastructure as a Service (IaaS)	Shared and dedicated

Product	Product edition	BYOL or BYOS	Supported cloud providers	Supported service model	Supported infrastructure type

BYOL and BYOS support on the Software Asset Management application help you:

- Discover perpetual and subscription-based software licenses automatically across on-premise and cloud environments, such as AWS, Microsoft Azure, and GCP.
- Determine the license compliance of the following software products across your hybrid infrastructure:
 - Microsoft SQL Server
 - Microsoft Windows Server
 - Oracle Database
 - Oracle WebLogic Server
 - Red Hat Enterprise Linux Server
- Provide advanced support for optimization through Cloud Special Rights, such as dual use rights, edition flexibility, and unlimited virtualization.
- Perform remediation when your software is out of compliance.

Bring your own license or subscription flow

Prerequisites

Before you can begin determining the license compliance of software across your hybrid infrastructures, you must complete the following prerequisites:

- Activate the Discovery (com.snc.discovery) plugin on your ServiceNow instance.

See [Request Discovery](#) for detailed instructions.

- Request and install the Discovery and Service Mapping Patterns application from the [ServiceNow Store](#).

See [Discovery patterns used by ITOM Visibility](#) for more information on Discovery and Service Mapping patterns.

- Migrate cloud discoveries from Cloud API (CAPI) probes to pattern-based discovery.

See [CAPI to Pattern Migration: Procedure for switching from CAPI-based Cloud Discovery to pattern-based Cloud Discovery \[KB0827153\]](#) for detailed instructions.

- Request and install the CMDB CI Class Models application from the [ServiceNow Store](#).

See [CMDB CI Class Models store app](#) for more information on the CMDB CI Class Models application.

- Request and install the Cloud Cost Management application from the [ServiceNow Store](#).

The Cloud Cost Management application is required for discovering the license types of software in your Microsoft SQL Server deployments on AWS. See [Cloud Insights application](#) for more information on the Cloud Cost Management application.

BYOL and BYOS discovery

With BYOL and BYOS, the ServiceNow® Discovery application locates and identifies licensable software in both your on-premise and cloud environments using Discovery and Service Mapping patterns. The Discovery application uses Amazon AWS Cloud, Microsoft Azure Cloud, and Google Cloud discovery patterns to discover the following resources for software in cloud environments:

- Cloud provider
- Virtual machine details
- Service model type, such as IaaS or PaaS
- Host infrastructure type for IaaS, such as shared or dedicated
- License type, such as BYOL, BYOS, or License Included
- Software that is installed on the virtual machine

Note:

The Amazon AWS Cloud, Microsoft Azure Cloud, and Google Cloud discovery patterns are included in the Discovery and Service Mapping Patterns store application. For more information on Amazon AWS Cloud discovery patterns, see [Amazon AWS Cloud components discovery using patterns](#). For more information on Microsoft Azure Cloud discovery patterns, see [Microsoft Azure Cloud components discovery using patterns](#). For more information on Google Cloud discovery patterns, see [Google Cloud Platform \(GCP\) resource inventory discovery](#) and [Google Cloud Platform \(GCP\) Organization discovery with Patterns](#).

Resources for your discovered software are populated and stored in corresponding Configuration Management Database (CMDB) tables, including the Host [cmdb_ci_cloud_host] and Serverless Hardware [cmdb_ci_serverless_hardware] tables, on your ServiceNow instance.

The Software Asset Management application then determines the license types of your discovered software either independently or with the Discovery or Cloud Cost Management application.

- For Microsoft Windows Server and Oracle Database on AWS, Microsoft Azure, and Google Cloud Platform (GCP), the Software Asset Management application determines license types independently.
- For Microsoft SQL Server on AWS, the Software Asset Management application determines license types using billing records from the Cloud Cost Management application.
- For
 - Microsoft SQL Server on Microsoft Azure and Google Cloud Platform (GCP)
 - and Red Hat Enterprise Linux Server on AWS, Microsoft Azure, and Google Cloud Platform (GCP),

the Software Asset Management application determines license types using resources that are discovered through the Discovery application.

- For Oracle WebLogic Server on AWS and Microsoft Azure, you must specify license types manually.

For all software products except Oracle WebLogic Server, license types are applied to associated configuration items (CIs) using automatically generated key-value pairs. The key-value pairs are stored in the Key Values [cmdb_key_value] table. Each key-value pair consists of a **Key** in the `<software-product>_License_Type_automatic` format and a **Value** of either **License Included**, **BYOL**, or **BYOS**.

For Oracle WebLogic Server, you must specify license types manually by creating key-value pairs. The key-value pairs must have a **Key** of `Oracle_WebLogic_Server_License_Type` and a **Value** of either `License Included` or `BYOL`. After you create these key-value pairs, the specified license types can be applied to the associated CIs.

Note:

If the license type is not manually specified for a software product, the Software Asset Management application won't license the installation due to insufficient information.

You can use these key-value pairs to determine whether the associated software licenses are using the BYOL, BYOS, or License Included licensing model. The BYOL and BYOS licensing models include license purchasing options such as Azure Hybrid Benefit. The License Included licensing model includes license purchasing options such as Pay As You Go (PAYG), SPOT, and On Demand. With the License Included licensing model, the cloud provider is responsible for managing licenses.

Note:

For Oracle Database, support for the BYOL and License Included licensing models is based on the cloud provider and Oracle Database version that you're using.

- AWS RDS (PaaS): The BYOL licensing model is supported on Oracle Database Standard Edition, Standard Edition One, Standard Edition 2, and Enterprise Edition. The License Included licensing model is supported on only Oracle Database Standard Edition 2.
- AWS EC2 (IaaS): Only the BYOL licensing model is supported.
- Microsoft Azure (IaaS): Only the BYOL licensing model is supported.

Software reconciliation for BYOL and BYOS license compliance

After your discovered software is marked as BYOL, BYOS, or License Included, reconciliation runs on the software that is marked as BYOL or BYOS. You can then use the resulting information to determine the software compliance across your hybrid infrastructure.

BYOL and BYOS licensing rules can differ for the same software products across different cloud providers. For example, Windows Server has different licensing rules on AWS and on Microsoft Azure. These rules must be combined with existing on-premise rules so that you can determine the complete license compliance position of each software product across your hybrid infrastructures. Microsoft offers special rights for products that are deployed on AWS vs Microsoft Azure, such as dual use rights, edition flexibility, and unlimited virtualization. For more information on licensing rules, see [Licensing rules for BYOL and BYOS](#).

The Software Asset Management application automatically reconciles these rules and provides an accurate license position report that can be viewed in the License usage view of the Software Asset Workspace.

- You can view BYOL license rights for your Microsoft software products in the Microsoft publisher overview of the Software Asset Workspace. For more information on the Microsoft publisher overview, see [Publisher overview for Microsoft in the Software Asset Workspace](#).
- You can view BYOL license rights for your Oracle software products in the Oracle publisher overview of the Software Asset Workspace. You can also view information about your Oracle Database server deployments across hybrid infrastructures, based on the agreement type, in the Oracle DB Server Deployments per Agreement report. For more information on the Oracle publisher overview, see [Publisher overview for Oracle in the Software Asset Workspace](#). For more information on the Oracle DB Server Deployments per Agreement report, see the [Oracle DB Server Deployments per Agreement report](#).
- You can view BYOS license rights for your RHEL software products in the Red Hat publisher overview of the Software Asset Workspace. For more information on the Red Hat publisher overview, see [Publisher overview for Red Hat in the Software Asset Workspace](#).

Cloud-based remediation options

To remediate non-compliance for cloud installations, the Software Asset Management application provides the following remediation options:

Remove Unlicensed Installs - Cloud

The **Remove Unlicensed Installs - Cloud** remediation option removes all cloud installations that are unlicensed for the associated software product.

When you select the **Remove Unlicensed Installs - Cloud** remediation option, removal candidates that follow the regular remediation workflow are created. After the removal candidates reach the **Awaiting Revocation** state, you can uninstall the cloud installations from your cloud provider and then mark the removal candidates as complete.

Optimize vCPU

The **Optimize vCPU** remediation option provides vCPU sizing optimizations based on the core count and core thread count. This remediation option is applicable only to Oracle Database Per Processor licenses on AWS RDS (PaaS). That Per Processor licensing is based on the number of vCPUs on which you install or run an Oracle database.

For more information on AWS core counts and core thread counts, see [Configuring the processor for a DB instance class](#) [↗](#).

Microsoft Windows and SQL Server infrastructure details reports

You can use the Microsoft Windows and SQL Server infrastructure details reports to gain visibility into the SQL Server and Windows Server deployments and infrastructure for different cloud providers including Microsoft Azure, AWS, and GCP.

License types on cloud

Azure BYOL Realized Savings report

You can use the Azure BYOL Realized Savings report to gain visibility into the potential and actual cost savings for your Microsoft SQL Server and Microsoft Windows Server deployments on Microsoft Azure when using Azure Hybrid Benefit, which is the bring your own license (BYOL) licensing model for Microsoft Azure.

The Azure BYOL Realized Savings report is generated only if you have requested and installed the ServiceNow[®] Cloud Cost Management application from the ServiceNow Store. See [Cloud Cost Management application](#) for more information on Cloud Cost Management.

i Note:

This report is available only in the Software Asset Workspace. This report isn't available in the Software Asset Management classic application.

To view this report, launch the Software Asset Workspace by navigating to **Software Asset > Software Asset Workspace** on your ServiceNow instance. From the Software Asset Workspace, navigate to **License usage > Reports > Azure BYOL Realized Savings Report**.

Azure BYOL Realized Savings report

Field	Description
Virtual Machine	Azure virtual machine (VM) that Microsoft SQL Server or Microsoft Windows Server is running on.
Host Type	Type of Azure host that the Azure VM is running on. The options are Shared and Dedicated .

Azure BYOL Realized Savings report (continued)

Field	Description
Location	Geographic location that the Azure host resides in.
vCPU	Number of virtual CPUs (vCPUs) that are assigned to the Azure VM.
Hardware Type	Hardware type of the Azure host.
Operating System	Operating system (OS) version and edition that is running on Azure.
SQL Server	Microsoft SQL Server version and edition that is running on the Azure VM.
AHB on Windows Server	Field indicating if Azure Hybrid Benefit is enabled for Microsoft Windows Server.
AHB on SQL Server	Field indicating if Azure Hybrid Benefit is enabled for Microsoft SQL Server.
Standard price per month without AHB	Potential VM cost per month when Azure Hybrid Benefit isn't enabled. This value is based on the assumption that the VM is running for the entire month (720 hours).
Standard price per month with AHB	Potential VM cost per month when Azure Hybrid Benefit is enabled. This value is based on the assumption that the VM is running for the entire month (720 hours).
Standard Savings Realized	Potential VM cost saved per month by using Azure Hybrid Benefit. This value is based on the assumption that the VM is running for the entire month (720 hours).
Actual price per month without AHB	Actual VM cost per month when Azure Hybrid Benefit isn't enabled. This value is based on the actual number of hours that the VM was running for within a month.
Actual price per month with AHB	Actual VM cost per month when Azure Hybrid Benefit is enabled. This value is based on the actual number of hours that the VM was running for within a month.
Actual Savings Realized	Actual VM cost saved per month by using Azure Hybrid Benefit. This value is based on the actual number of hours that the VM was running for within a month.

Core infrastructure suite (CIS) support for BYOL

Use your on-premise CIS entitlements to license Windows Server installations on cloud platforms such as AWS and Microsoft Azure.

The CIS entitlements would license the Windows Server installations in accordance with the Microsoft licensing rules on cloud: If you licensed Windows Server through CIS, you can use the Azure Hybrid Use Benefit. The System Center component in CIS, however, is not covered.

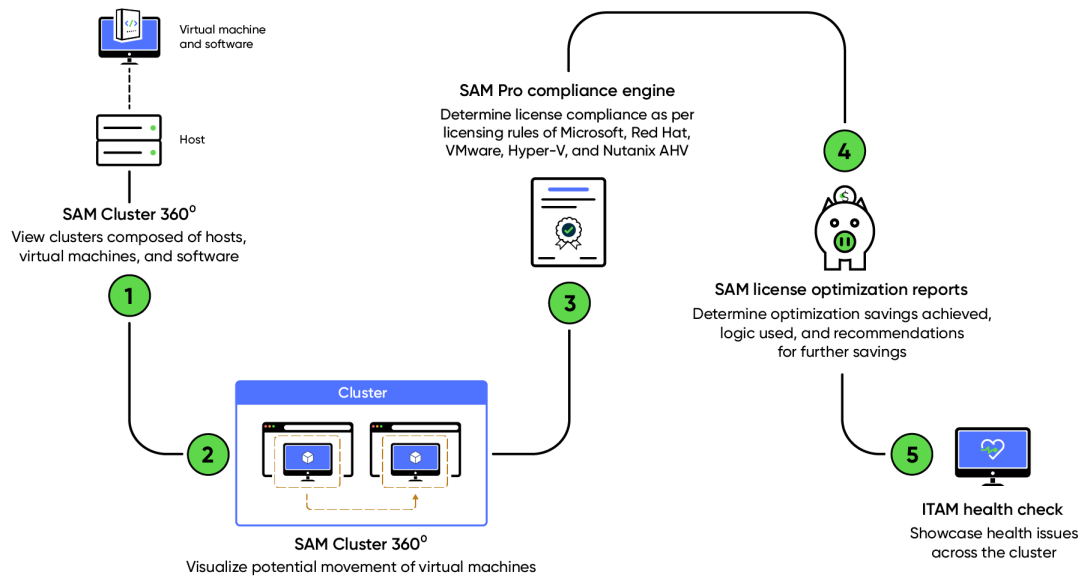

Understanding your cluster infrastructure

Get a holistic and strategic analysis of all the entities in your clusters in one view on the Software Asset Management application.

The SAM Cluster 360° feature simplifies the process of analyzing a cluster, which is typically a time-consuming task. This feature helps SAM managers to make strategic decisions by providing them with a visually comprehensive view of their cluster setup, licensing, and cluster health

issues. Drill down to each node on a cluster for a deeper understanding. For detailed information on your cluster, see [View your cluster setup in 360 degrees](#).

Cluster overview

A cluster is a type of virtualization where hosts are grouped and share resources. This technology provides high availability, resource pooling, and load balancing for virtual machines that run on it. This technology provides the foundation for building highly resilient, scalable, and efficient virtualized environments.

Each host has the capacity to run multiple virtual machines (VMs) and can be configured to support features such as high availability, DRS (Dynamic Resource Scheduling), and host affinity.

The VMs can move across the hosts depending on certain settings such as High availability or Distributed Resource Scheduler (DRS). Settings such as Host affinity can lock VMs to certain hosts.

Factors such as the number of VMs, movement of VMs, hosts, and VM cores in a cluster can affect your license compliance.

Cluster setup

Benefits of SAM Cluster 360°

SAM Cluster 360° provides a holistic and strategic analysis of clusters to support infrastructure understanding, license compliance, and health checks across the cluster.

The SAM Cluster 360° feature helps you to view and analyze the following concepts:

- Core infrastructure of a cluster: hosts, VMs, software, cores, and processors.
- All hosts and the VMs that can potentially move on them.
- All software, licensable and non-licensable, running on a cluster.
- All software consuming licenses.

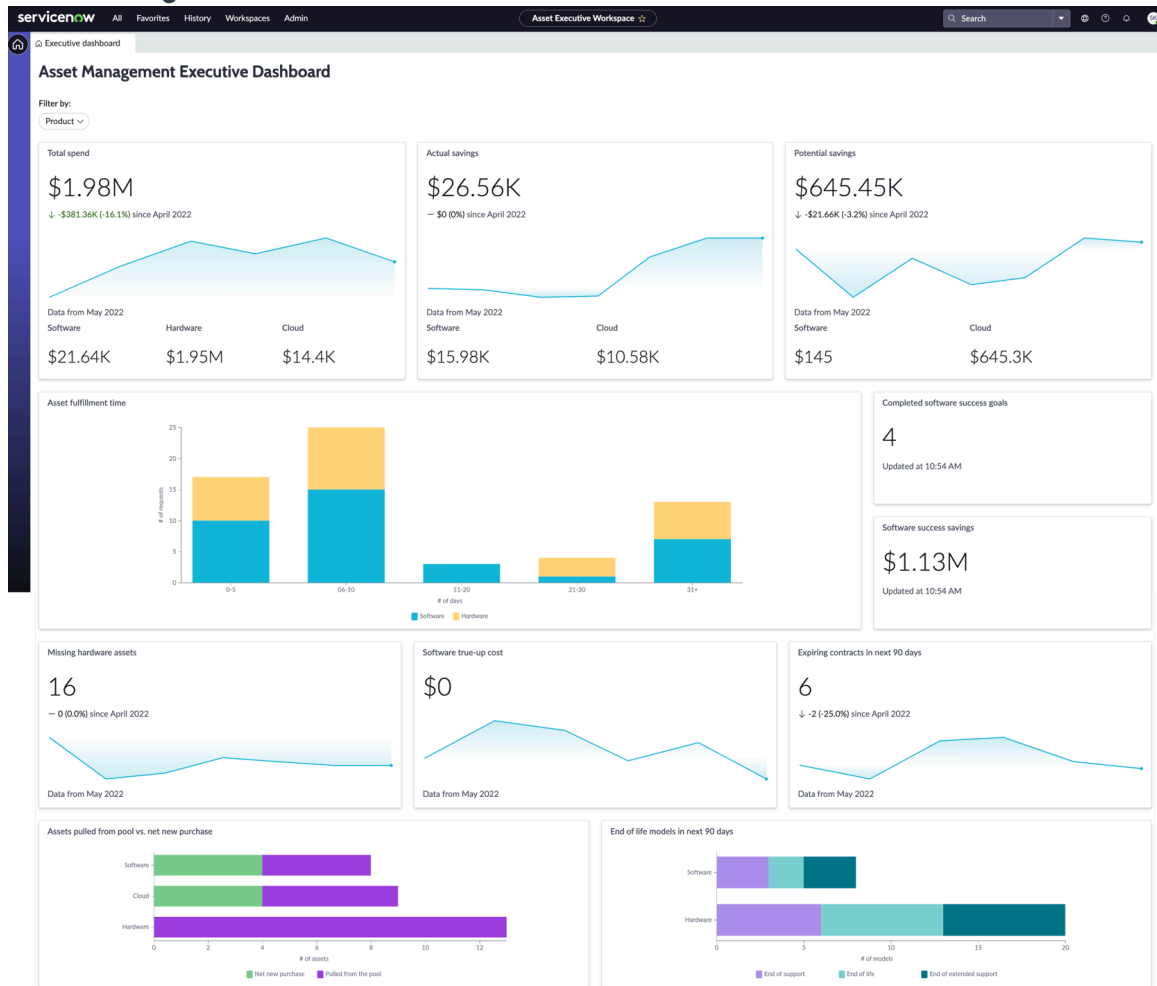

Executive insights into KPIs using the Asset Management Executive dashboard

Use the Asset Management Executive dashboard to gain visibility into critical KPIs for the Software Asset Management application, Hardware Asset Management application, and the Cloud Cost Management application via a single dashboard.

To access the Asset Management Executive dashboard, you must either have the Software Asset Management application or the Hardware Asset Management application in your ServiceNow instance.

To view the Asset Management Executive dashboard, navigate to **Asset Executive Workspace > Asset Management Executive Dashboard**. A user with the role of `sn_itam_common.asset_exec` can access the dashboard.

Asset Management Executive Dashboard

You can filter the results in the dashboard by product, domain, or by both product and domain. If you filter by domain, the filter gets applied to all the widgets. If you filter by product, since some widgets are specific to certain products, the filter is not applied to all the widgets.

After you select a filter, a blue box appears on the right side of each widget, displaying one of the following numbers:

- 0: Indicates that no filter is applied to a widget.
- 1: Indicates that only one filter is applied to a widget.
- 2: Indicates that both the filters are applied to a widget.

Note:

To use the domain filter, you must activate the plugins: `com.glide.domain.msp_extensions.installer` and `com.snc.pa.domain_support`.

The scheduled job, *Asset Management - Populate KPI aggregate table*, runs daily to update the data on the dashboard. To view the latest data for a widget, click the widget to display the list view page.

The dashboard widgets vary depending on the application plugins that you've activated in your instance. The widgets available with each application are listed in the following table:

Asset Management Executive Dashboard widgets

Widget	Software Asset Management	Hardware Asset Management	Cloud Cost Management
Total spend	<p>Total cost of all entitlements for all products.</p> <p>Source table: License Metric Results [samp_license_metric_result].</p>	<p>Total cost of all hardware assets whose status is either In stock, In use, In maintenance, or In transit.</p> <p>Source table: Hardware [alm_hardware].</p>	<p>Total active cost of all cloud resources.</p> <p>Source table: Spend Report Daily Aggregated Cost [sn_cld_spend_core_daily_aggregated_cost].</p>
Actual savings	<p>Total yearly savings for all products. This value is calculated as the total savings from closed complete reclamation candidates.</p> <p>Source table: Removal Candidate [samp_sw_reclamation_candidate].</p>	Not applicable.	<p>This value is calculated as the monthly savings on cloud resources.</p> <p>Note: This widget appears only if you have the Software Asset Management application installed on your instance.</p> <p>Source table: Cloud Insights Rightsizing Recommendation Automatics (sn_clin_core_rs_recommendation_automatic) where State = Completed.</p>
Potential savings	<p>Cost saved if removal candidates are reclaimed.</p> <p>Source table: Removal Candidate [samp_sw_reclamation_candidate].</p>	Not applicable.	<p>Total of potential savings on a monthly basis on cloud rightsizing, cloud unused machines, cloud reservations, and cloud business hours.</p> <p>Note: This widget appears only if you have the Software Asset Management application installed on your instance.</p> <p>Source tables:</p>

Asset Management Executive Dashboard widgets (continued)

Widget	Software Asset Management	Hardware Asset Management	Cloud Cost Management
			<ul style="list-style-type: none"> • Cloud Insights Rightsizing Recommendation Automatics [sn_clin_core_rs_recommendation_automatic]. • Cloud Insights Unused Recommendation [sn_clin_core_rs_unused_recommendation]. • Reserved Instance Recommendation [sn_clin_core_ri_recommendation].

Cloud cost simulation

Simulate the cost of moving your on-premise resources to the cloud environment before performing the migration.

Plugins required

The following plugins are required for supporting cloud cost stimulator recommendations:

- Cloud Insights application plugin (sn_clin_billing): for cloud infrastructure details and cost.
- Hardware Asset Management (sn_hamp): for end of life cycle for hardware.
- Cloud Migration Assessment application (com.sn_cloud_migration): for resource utilization.

Overview

The sam_manager role specifies the criteria for migrating the resources to the cloud. For example, you may need all virtual machines installed with SQL Server or all virtual machines having end of life software. In addition the Software Asset Management application automatically provides recommendations based on End of Life software and hardware and resource utilization.

Based on the criteria or recommendation, the Software Asset Management application automatically selects the virtual machines that match your criteria. Once all the on-premise virtual machine have been identified, the Software Asset Management application matches those virtual machines with the virtual machines on the cloud: AWS or Azure.

The most optimal matching of resources is conducted and the total cost involved is given to you. Cost for the various cloud providers: AWS and Azure is mentioned along with or without the cost of Bring Your Own License (BYOL). Once the decision is made to move to a particular cloud provider, a change request can be created to move forward with the implementation.

For information on comparing and evaluating the estimate cost of migrating your resources to the cloud, see [Cloud simulator dashboard](#).

Use cases

A `sam_manager` role can receive recommendations for migrating on-premise resources to the cloud while taking into account the following considerations:

- End of life for software: On some virtual machines, you may have software that is nearing the end of its life cycle. Calculate the cost of migrating these virtual machines to the cloud, taking into account all of the benefits. For example, Microsoft Azure offers free extended security updates for certain Microsoft products that have reached the end of their life cycle.

Note:

Recommendations are only shown for Microsoft Azure and AWS shared VMware virtual machines and not for dedicated host machines.

- End of life for hardware: You may have virtual machines running on hardware that is nearing its end of life phase. Simulate the cost of moving these virtual machines to the cloud.

Note:

Ensure that you have activated of the Hardware Asset Management (`sn_hamp`) plugin to get data on end of life cycle for hardware and hardware cost.

- Resource utilization: Some on-premise virtual machines may have low CPU and RAM utilization. Simulate the cost of moving these virtual machines to the cloud by recommending the appropriate sized virtual machines. For example, if a 32 vCPU virtual machine on-premises,

is utilizing only 4 vCPU, the recommendation would be a 4-vCPU virtual machine on the cloud, resulting in cost savings.

Note:

Ensure that you have activated the Cloud Migration Assessment application (com.sn_cloud_migration) plugin to get data on resource utilization.

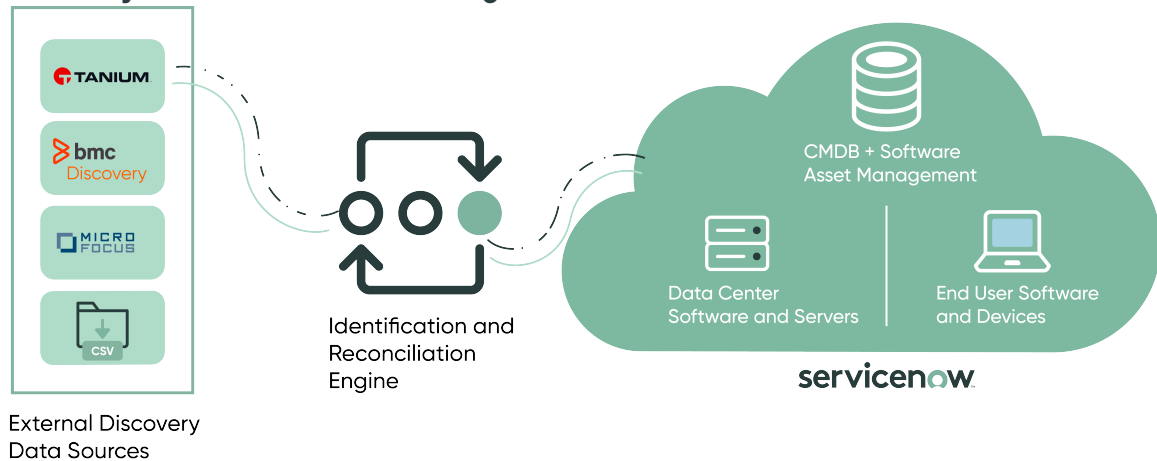

Software asset connections

Use third-party discovery sources to discover the installed software data that you can integrate with the Software Asset Management application.

The discovery process is an integral part of the Software Asset Management application. The discovery process consists of discovering where the installed software in your organization is installed, who the owner of the device is, and where it's located. The discovered information is then merged into a common configuration management database such as the CMDB application.

The CMDB application enables other business applications to use the discovered information to support various business needs.

Discovery with Software Asset Management

ServiceNow platform's identification and reconciliation engine (IRE) framework enables all third-party data integrations with the CMDB application.

IRE provides a centralized framework where you can perform reconciliations and de-duplication of the data when multiple sources are ingesting data at the same time. IRE uses identification rules, reconciliation rules, and IRE data source rules to process the incoming data and then inserts the data into the corresponding CMDB tables. You can extend these rules to insert the data into tables that extend the CMDB core tables such as the Software Asset Management tables. There are two types of identification rules for IRE:

- Independent: If the **Independent** check box is selected on a CI identifier, it means that the CI is not dependent on any other CI.
- Dependent: If the **Independent** check box is not selected on a CI identifier, it implies that this CI is dependent on other CIs.

For more information on IRE, see [Identification and Reconciliation Engine](#).

You should have already configured loading the CIs in the ServiceNow instance. For each CI in your environment, the Hardware [cmdb_ci_hardware] table has a corresponding CI identifier rule. When the third-party discovery application runs, the software is identified on CIs. The third-party

application constructs a payload and sends the payload via the IRE REST API endpoint to the ServiceNow instance to insert or update data into the Software Asset Management tables.

A [generic payload](#) is used for creating installed software records. For Oracle, VMware, and Citrix, specific payloads feed additional publisher-specific data apart from software installations.

If multiple discovery sources are enabled and if the key details of the software, such as the display name and the version for all discovery sources, match, the Installation record is overwritten. If multiple discovery sources identify the same software with different field values, an entry is created in the Software Installation [cmdb_sam_sw_install] table. When the schedule job *SAM- Deduplication install table* runs and if all the normalized values of these installations match, only one record is set to active. The rest of the records are marked as inactive.

Domain separation is supported for third-party discovery with SAM with the following considerations:

- The IRE REST API stamps the domain that you are logged in to when the REST call is made.
- Log in to the domain where the CI resides and from where you run the payload.
- Don't log in to the parent domain. Being logged in the parent domain updates the existing CI and also creates a new CI in the parent domain.
- Send the payload from the same domain where the CIs reside. For example, if you send a payload from Domain A and if the payload has CIs that belong to Domain B, a new CI gets created in Domain A.

Use Software Asset Management with Governance, Risk, and Compliance

Use the Software Asset Management application in conjunction with the Governance, Risk, and Compliance suite of applications to holistically work on compliance, risk, and regulatory aspects.

IT asset management directly feeds critical information required by GRC programs to monitor cyber security measures such as CIS controls from The Center for Internet Security™ to enhance the overall security preparedness and cyber defense posture. For example, CIS controls 2.2, 2.4 require that organizations keep an inventory of all software assets and ensure that they are supported by the vendor. This information is automatically collected and surfaced on the CIS control indicate template from GRC.

For detailed information on Cybersecurity Control Accelerators and regulations such as CIS controls, ISO 27001, 27002, see [Cybersecurity Controls Accelerators](#) .

Using Software Asset Management with Agent Client Collector

Use the Agent Client Collector application to collect software inventory and usage data for the Software Asset Management application.

An agent is useful in discovering software deployed on end user machines such as laptops as well as machines deployed on isolated networks that only allow outgoing data transmission. You do not need to keep track of login credentials or IP ranges, nor do you need to create a discovery schedule. The agent, along with other software, can be deployed via a deployment image and then it continuously performs discovery and sends data back to your ServiceNow instance. For more details on the Agent Client Collector application, see [Agent Client Collector for Visibility - Content](#) .

You can download the Agent Client Collector application from the ServiceNow Store.

Use Software Asset Management and Application Portfolio Management to manage technology onboarding

Use the Software Asset Management application along with Technology Reference Model (TRM) of Application Portfolio Management to manage onboarding of technologies.

TRM is a list of software products with information on their approval of use. Each product is associated with a set of lifecycle phases with a start and end date. The TRM library is maintained by the enterprise architect and used by application owners. For detailed information on TRM, see [Technology Reference Model](#).

The Software Asset Management application gives visibility into the TRM lifecycle phases for all products associated with software models. When a software model is created and associated with a product that is approved for use in TRM, the **Certified** check box in the software model form is selected by default. All software models associated with that product are then available for use.

The screenshot shows the 'General' tab of a software model form. The fields include:

- Short description: A text input field with a hyphen.
- Platform: A dropdown menu with '-- Anything --' selected.
- Language: A dropdown menu with '-- Anything --' selected.
- Asset tracking strategy: A dropdown menu with 'Leave to category' selected.
- Next version: A text input field with a hyphen.
- Asset tracking unit: A dropdown menu with 'Individual Unit' selected.
- Cost: A text input field with 'USD (\$)0.00'.

There are three checkboxes on the right side of the form:

- Certified
- Restricted software
- License all installs accessed by clients

If the same product in TRM is later marked as unapproved, the existing software models associated with that product don't reflect that change. However, when you open the existing software models, a banner appears stating **This software is not approved for use in the Technology Reference Model (TRM).** To be in sync with the TRM, set the **Certified** flag to **FALSE**.

If a new software model is created with this product, that software model is marked as unapproved, and a banner isn't displayed as this software model is in sync with TRM.

If a product is marked as unapproved in TRM, reclamation candidates are automatically created for all software installations that are associated with that product. After the product is approved for use in TRM, the existing reclamation candidates are either marked **Closed complete** or **Closed canceled**.

Software Asset Management and TRM use case

This section describes a use case that demonstrates how the Software Asset Management application and TRM interact.

For example, you create a software model SW1, on September 15, 2022, and associate it with PostgreSQL, which is an unapproved product in TRM. By default, the **Certified** check box in the SW1 form is set to false and the **Restricted software** check box is set to true. Also removal candidates are created for any installations discovered.

On September 18, 2022, release 14.5 of PostgreSQL gets approved for use in TRM. If you now open SW1 a banner appears stating the following **This software is approved for use in the Technology Reference Model (TRM). To be in sync with the TRM, set the Certified flag as true.** However software models with older versions would continue to be restricted.

If you create another software model SW2, on September 19, 2022, and associate it with PostgreSQL, the **Certified** check box is set to true and the **Restricted software** check box is set to false in the SW2 form.

Software Asset Management Guided Experiences

The Software Asset Management Guided Experiences application provides step-by-step guidance for completing tasks in your daily software management activities.

Playbook overview

A playbook takes a workflow and breaks it into multiple lanes. Each lane includes:

- A list of tasks that you must perform.
- Status indicators that display the current state of each task.
- Check boxes that indicate where you are in the workflow.

As you mark a task complete in a lane, you move to the next task. You can save a task at any time and return to the playbook later. After you complete all the tasks in a lane, you can move to the next lane. As you keep completing tasks and lanes, the status keeps getting reflected in the side panel. An activity log on the playbook shows all the data that you've entered for each task. After you complete all the tasks, you're asked to review the details you entered in all the lanes. You can choose to edit any field or select **Finish** to complete the process of creating the entitlement.

A playbook is divided into three parts:

- lanes on the left-hand side.
- work area in the center.
- activity log on the right-hand side.

Using playbook to set up entitlements

You can use the guided walk-through playbook for setting up entitlements. The guided walk-through playbook takes you step by step through each stage of the entitlement creation process, from initiation to completion.

To access the Software Asset Management playbook, you must install it from the ServiceNow Store and then access the playbook from the landing page on the Software Asset Workspace.

Using Guided Setups

Guided Setups provide a sequence of tasks that help you configure the following products or applications on your ServiceNow instance:

Software Asset Management Guided Setup

1. Navigate to **Workspaces > Software Asset Workspace > Success portal**.
2. Select the **Product Setups** tab.
3. Select **Set up product**.
4. In the Set up product dialog box, select **SaaS** or **On-premise** from the **Setup type** drop-down list.
 - For SaaS, select the SaaS application that you want to set up in the **Integration profile** field.
 - For On-premise, select the Publisher and Product.
5. Select **Next**.

Microsoft SQL Server Guided Setup

Note:

Only one instance of Microsoft SQL Server setup can run at a time.

1. Navigate to **Workspaces > Software Asset Workspace > Success portal**.
2. Select the **Product Setups** tab.
3. On the Product Setups page, launch the Guided Setup by selecting **Get Started** on the Microsoft SQL Server tile.

Microsoft Windows Server Guided Setup

Note:

Only one instance of Microsoft Windows Server setup can run at a time.

1. Navigate to **Workspaces > Software Asset Workspace > Success portal**.
2. Select the **Product Setups** tab.
3. On the Product Setups page, launch the Guided Setup by selecting **Get Started** on the Microsoft Windows Server tile.

Microsoft 365 Guided Setup

Navigate to the [Microsoft 365 Guided Setup](#) by either of the following ways:

- Option 1
 1. Navigate to **Workspaces > Software Asset Workspace > Success portal > Product Setups**.
 2. Select the **Product Setups** tab.
 3. On the Product Setups page, launch the Guided Setup by selecting **Get Started** on the Microsoft 365 tile.
- Option 2
 1. Navigate to **Workspaces > Software Asset Workspace > Success portal**.
 2. Select the **Product Setups** tab.
 3. Select **Set up product**.
 4. In the Set up product dialog box, select **SaaS** from the **Setup type** drop-down list.
 5. Select **Microsoft 365** in the **Integration profile** field.
 6. Select **Next**.

Configuring Software Asset Management

Configure the various aspects of the Software Asset Management application based on the needs of your organization.

Configuration overview

Configuring the Software Asset Management application by the system administrators involves performing the following tasks. Depending on your organization's needs and requirements, some configuration tasks are optional.

Task		Resource
Request the Software Asset Management application	Required	Request Software Asset Management
Overwrite customizations for Software Asset Management migration	Optional	Overwrite customizations for Software Asset Management migration
Configure SCCM for Software Asset Management.	Optional	Configure SCCM for Software Asset Management

Request Software Asset Management

The ServiceNow[®] Software Asset Management Professional (com.snc.samp) plugin requires a separate subscription. This plugin includes demo data. Depending on your environment, you may choose to request one or more related plugins.

Before you begin

To purchase a subscription or load demo data after activation, contact your ServiceNow account manager. Within a few days, the account manager can activate the plugin and load any demo data on the production and non-production instances of your organization.

If you do not have an account manager, decide to delay activation until after your purchase, or want to evaluate the product on a non-production instance at no extra charge, you can use this procedure to submit a plugin activation request through the ServiceNow® Now Support Service Portal.

Warning:

If you upgrade to the Software Asset Management Professional (com.snc.samp) plugin from the Software Asset Management plugin (com.snc.software_asset_management), then you cannot revert to the Software Asset Management plugin (com.snc.software_asset_management).

Role required: admin

About this task

Depending on your environment, you can request related plugins with the Software Asset Management Professional (com.snc.samp) plugin. You can request the optional plugins through either the Now Support Service Portal or through the ServiceNow Store.

For the list of Software Asset Management Professional plugins, see [Components installed with Software Asset Management Professional](#).

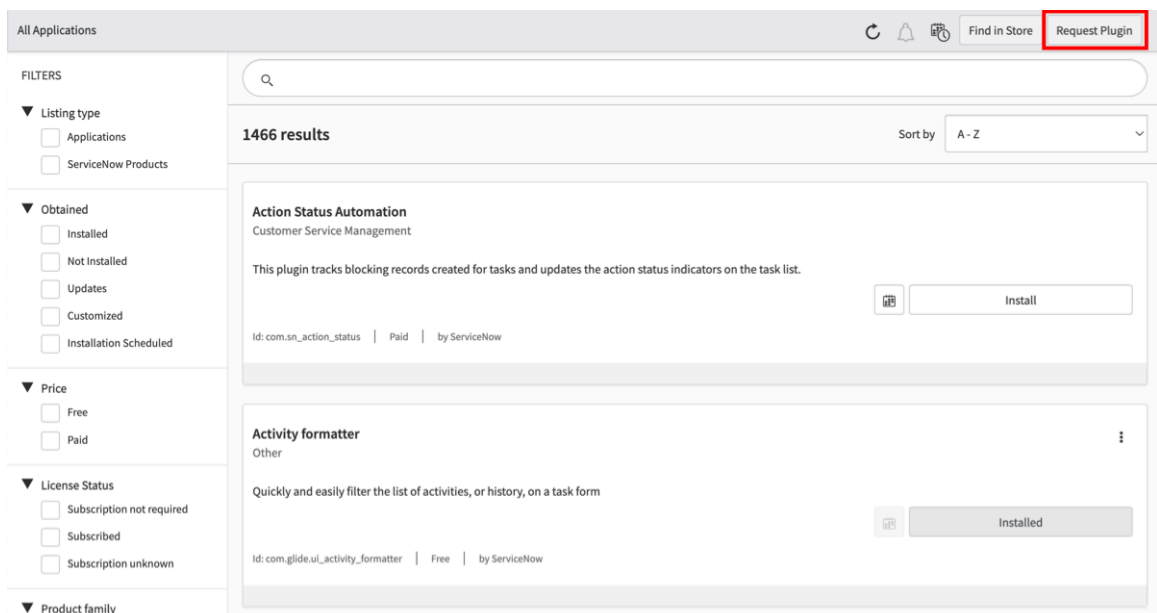

Only ServiceNow personnel can activate the Software Asset Management Professional (com.snc.samp) plugin and other related plugins. The plugins are not visible in the plugin list, even after activation.

Warning:

After installing the Software Asset Management application for the first time, or upgrading from the Software Asset Management Foundation plugin, you need to revert customizations for all features work. The Revert Customizations module in the Software Asset Management application can revert customized files related to Software Asset Management back to the base configurations that were skipped during the installation or upgrade process. See [Revert Software Asset Management customizations](#)

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.

3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.

4. Select your instance.

5. Select **Actions > Activate Plugin**.

6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	<p>Name of the plugin to activate.</p> <p>Note: Select Software Asset Management Professional Master Workspace (com.sn_samp_master_ws) plugin. If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the Plugin I'm looking for is not listed check box and then enter the name of the plugin.</p>
Select Maintenance Date and Time	<p>The date and time to activate the plugin.</p> <p>Note: Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.</p>

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form

7. Select **Submit**.

For additional details about requesting a plugin, see [Requesting a Plugin from the Service Catalog \[KB0751715\] article in the Now Support Knowledge Base.](#)

Overwrite customizations for Software Asset Management migration

When migrating from the Software Asset Management plugin (ITSM Software Asset Management feature of Asset Management) to the Software Asset Management application, further actions are required by the customer after plugin activation to ensure successful migration of customized forms and lists.

Before you begin

Role required: admin

About this task

If these lists and forms have been customized before the migration, they may have been skipped during plugin activation and, in that case, require further action.

- Software Entitlements (formerly Software Licenses)
- Software Allocations (formerly Software Entitlements)
- Software Models
- Discovery Models
- Software Installations

You can review plugin activation changes in the [Upgrade History module](#) to determine what changes have automatically been skipped so you can [Resolve a skipped update and set a resolution status](#), if needed.

Certain fields added by the migration also must be configured to take advantage of the new features offered.

Procedure

1. Navigate to **All > System Diagnostics > Upgrade History**.
2. Identify the records that correspond to the upgrade history for the activation of the Software Asset Management Professional (com.snc.samp) plugin.
The records in System Upgrades list that represent plugin activation contain the value **n/a** in the **From** field, and plugin name in the **To** field (such as com.snc.samp, com.snc.samp.core, com.snc.sam.core, com.glide.data_services_canonicalization.client, com.snc.asset_management, com.snc.model, com.snc.procurement). You can determine the list of related plugins based on the time stamp of when the Software Asset Management plugin was activated by sorting on the **Upgrade started** column.
3. Open a Software Asset Management upgrade record that has changes skipped.
4. In the **Upgrade Details** related list, open an Upgraded Details record, and then click **Resolve Conflicts** to view a side-by-side comparison of the base system file with the customized file.
5. Click **Revert to Base System** to overwrite the skipped change if it applies to form or list customization, and note down the changes.
Repeat these steps for all upgrade entries with skipped changes relating to customizations.
6. In the Software Asset Management application, manually reconfigure your original form and list customizations.
7. In the Software Asset Management application, set new field values (added as part of the automatic changes performed by plugin activation) to take advantage of the new features offered.
 - a. Navigate to **Software Asset > Licensing > Software Models**.
 - Select the software product in the **Product** reference field.
 - Select a discovery map, or clear the **Discovery Map** field and set the discovery conditions to find all discovery models that correspond to the software model.
 - b. Navigate to **Software Asset > Licensing > Software Entitlements** (formerly Software Licenses).
 - Navigate to **Software Asset > Licensing > Software Entitlements** (formerly Software Licenses).
 - Select the **License Metric** that the software license is counted against when reconciliation is run.
 - Define the upgrade and downgrade scenarios covered by certain rights.
 - c. In the **User Allocations** and **Device Allocations** related lists (formerly User/Device Entitlements), verify that the number of allocated rights are not more than rights owned.
If so, delete allocations so that the number of allocations does not exceed the number of rights owned.
8. If you have entitlements that require management of license keys, you can create multiple license keys associated to the same entitlement, as well as allocate these license keys to a user or device.

[plugin](#) 

Configure SCCM for Software Asset Management

Set up Microsoft SCCM for Software Asset Management to populate the Software Installation [cmdb_sam_sw_install] table with client software found in your environment. You can also set up SCCM for Client Software Distribution to reclaim unused and underused software.

Before you begin

Role required: sn_client_sf_dist.csd_admin or admin

Tip:

Sign up for the [Software Asset Management: Integration with SCCM for Reclamation and Distribution](#) course to learn about SCCM setup, reclamation, and more.

Procedure

1. **Activate the SCCM integration plugin** for your version of SCCM.

- Integration – Microsoft SCCM 2012 v2 (com.snc.integration.sccm2012v2)
- Integration – Microsoft SCCM 2016 (com.snc.integration.sccm2016)

If you want to pull software usage data from SCCM, activate the software usage plugin for your version of SCCM.

- Integration – Microsoft SCCM 2012 v2 Software Usage (com.snc.samp_usage_sccm) plugin
- Integration – Microsoft SCCM 2016 Software Usage (com.snc.samp.usage_sccm_2016) plugin

i Important:

These Microsoft SCCM plugins will be deprecated in the Tokyo release. If you are integrating with SCCM for the first time, request and install the Service Graph connector for Microsoft SCCM application from the [ServiceNow Store](#) instead. If you have already activated one of the Microsoft SCCM plugins on your ServiceNow instance, use the Migration Readiness Tool for Service Graph Connector for SCCM store application to prepare your instance for migration from the Microsoft SCCM plugin to the Service Graph connector. See [Service Graph connector for Microsoft SCCM](#) for more information on the Service Graph connector.

2. **Optional:** If you want to reclaim unused and underused software, set up SCCM for Client Software Distribution (CSD).

a. Request the [Client Software Distribution](#) (com.snc.orchestration.client_sf_distribution) plugin.

Client Software Distribution requires a subscription to [Orchestration](#).

b. In SCCM, create an application, install collection, and uninstall collection for any software that you have not already created these items for.

(Optional) After you create these items, you can then deploy the application for both the install and uninstall collection. For detailed instructions, see [Create and deploy an application with SCCM](#) and [Create collections in SCCM](#) from the Microsoft SCCM product documentation.

To reclaim software, an application, install collection, and uninstall collection must exist for the software. If you installed software manually or using an SCCM legacy package, you must still create these items so that you can reclaim the software.

Note:

If you installed software using an SCCM legacy package, you can use [Microsoft Package Conversion Manager](#)  to create the application.

3. [Setup the MID Server](#) .
4. [Configure SCCM and the ServiceNow AI Platform](#) .
5. To offer an application from the Service Catalog, [create a catalog item](#) .

What to do next

Once you've configured SCCM and discovered your software applications, you can [create reclamation rules](#) to identify unused or underused software, [view software usage](#), and [reclaim software](#).

Using Software Asset Workspace

Use the Software Asset Workspace, the intuitive and streamlined user interface of the Software Asset Management application, to manage software licenses, compliance, and optimization.

Create entitlements in workspace

Create entitlements in the Software Asset Workspace to enter your license details and allocate purchased software rights to users or devices.

Before you begin

These instructions are for using the standard form for creating software entitlements one at a time. You can also use the step by step approach of a [guided walk-through](#) for creating entitlements. If you already have software entitlement details entered in a spreadsheet, you can also [import](#) them using the bulk import functionality.

When you start creating the entitlement it is in the **build** status. Once you publish the entitlement, the status changes to **in use** and makes the entitlement eligible to be included in the reconciliation process.

If you installed SaaS License Management, a software model is generated automatically after you create an integration profile. Create an entitlement for the software model to track software used against software owned.

if you installed the SAP publisher pack, see [Create entitlements for SAP](#).

You can also create entitlements for RHEL and Citrix publisher packs. For details on the entitlement form fields for RHEL, see [Software Entitlement form](#).

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace**.
2. Select **Create entitlement** to open the Create new entitlement dialog box.
You can also navigate to the Create new entitlement dialog box from **Software asset > Software Asset Workspace > License operations**

Create new entitlement ×

Guided step-by-step walkthrough

Import multiple entitlements from an Excel file

Fill out the details in a standard form

3. Select **Fill out the details in a standard form** and then select **Next**.

4. In the Create New Software Entitlement page, fill in the fields.
For a detailed description of the fields, see [Software entitlement fields](#).

5. Select **Save**.

After you save the entitlement, the **Allocations**, **General**, **Financial**, and **Contracts** tabs appear on the page. You can now add details in these related tabs.

6. Once you have entered the required details, select **Publish**.

The entitlement is created and state of the entitlement is changed to **in use** from **build**. The entitlement is ready to be picked up for the reconciliation process.

You can perform additional configuration on the new entitlement by entering details in the other tabs such as Contracts, Downgrade Rights, Expense Lines, Entitlement History. For a detailed description of the fields in these tabs, see [Software entitlement fields](#).

Create maintenance entitlements in workspace

Define license details, for all publishers other than Microsoft in the Software Asset Workspace. Create maintenance entitlements to manage all your software license maintenance needs such as start and end dates of your contracts and software upgrades.

Before you begin

Role required: sam_user or sam_admin

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace**.

2. Click **Create entitlement** to open the Create new entitlement dialog box.

You can also navigate to the Create new entitlement dialog box from **Software asset > Software Asset Workspace > License operations**.

3. Select **Standard form** and then click **Next**.

The Create New Software Entitlement page opens and the entitlement is in build status.

4. On the Create New Software Entitlement page, fill in the mandatory fields and select **Maintenance** in the **License type** field.

For a detailed description of all the fields, refer to [Software entitlement fields](#).

If the **Next Version** field is populated in the software model that the maintenance entitlement is associated with and the metric group selected in the maintenance entitlement is **Common**, then the maintenance entitlement is updated with the next version of the software model. Next version is applicable only for the **Common** metric group.

5. Once you have entered the required details, click **Publish**.

The maintenance entitlement is created and state of the entitlement is changed to **in use** from **build**. The maintenance entitlement is ready to be picked up for the reconciliation process.

i Note:

If you purchase a perpetual entitlement and associate only some of the rights of that entitlement with a maintenance entitlement, your perpetual entitlement is automatically split into two entitlements. For example, you purchased a perpetual entitlement with 50 active rights (E1). You associate 20 of these rights with 20 rights of a maintenance entitlement. Your E1 perpetual entitlement is now automatically split into two entitlements: one perpetual entitlement (E1) with 20 active rights (and 50 purchase rights) associated with 20 rights of the maintenance entitlement (M1) and another perpetual entitlement (E2) with 30 active rights without any maintenance association and no purchased rights.

6. You can perform additional configuration on your new maintenance entitlement record.

For a detailed description, see [Software entitlement fields](#).

You can't add user or device allocations for maintenance entitlements.

- a.** Enter information pertaining to finance such as the vendor from which the asset was purchased, the invoice number, in the **Financial** tab.
- b.** Enter information relating to contracts such as the lease contracts, the expiration date of the warranty in the **Contracts** tab.
- c.** Link related perpetual entitlements to your maintenance entitlement from the **Related Entitlements** related list.
 - i.** Select the **Related Entitlements** related list and then click **New**.
The Create New Related Entitlement form opens in a new tab.
 - ii.** On the form, fill in the fields.

Create New Related Entitlement form

Field	Description
Active rights	Number of rights that you want to grant to the related perpetual entitlement.
Software Entitlement	Software entitlement that you are linking the related perpetual entitlement to. This field populates automatically.
Related Entitlement	Related perpetual entitlement that you want to link.

Field	Description
Domain	Domain that the related perpetual entitlement applies to. The default value is global .

iii. Click **Save**.

To remove the relationship between the perpetual and maintenance entitlement, remove the entitlement from the **Related Entitlements** related list in the maintenance entitlement.

If the entitlement has split and you've deleted the maintenance entitlement, the perpetual entitlement is not removed.

- d. View the downgrade rights for the software model associated with the maintenance entitlement in the **Downgrade Rights** related list.
- e. To manage license keys, and specify which licenses keys are allocated to entitlements, click the **License Keys** related list
- f. To track the cost of your software over its lifecycle, click the **Expense Lines** related list.
- g. To view the history of all maintenance entitlements that you have purchased, click the **Entitlement History** related list.
For example, if you purchased two maintenance entitlements, M1 (which is now retired) and M2 (currently in use), the Entitlement History related link displays both M1 and M2.
- h. To view the history of the newly upgraded software model related to your entitlement and the previous software model, click the **Upgrade History** related list.

7. Once you have completed filling in the additional configuration details, click **Save**.

Create Microsoft Software Assurance entitlements in workspace

Define license details for Microsoft Software Assurance (SA) in the Software Asset Workspace to manage your contracts start and end dates, software upgrades, and related software entitlements.

Before you begin

Role required: sam_user or sam_admin

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace**.
2. Click **Create entitlement** to open the Create new entitlement dialog box.
You can also navigate to the Create new entitlement dialog box from **Software asset > Software Asset Workspace > License operations**.
3. Select **Standard form** and then click **Next**.
The Create New Software Entitlement page opens and the entitlement is in build status.
4. On the Create New Software Entitlement form, fill in the mandatory fields and select **SA** in the **License type** field.

You must enter the number of rights to be granted for the SA entitlement in the **Active rights** field.

For a detailed description of the fields related to all entitlements, see [Create entitlements in Software Asset Management classic](#).

Note:

You can't add user or device allocations for SA entitlements.

5. Click Publish.

An entitlement appears in the Software Entitlement list.

Note:

If you purchase a perpetual entitlement and associate only some of the rights of that entitlement with a SA entitlement, your perpetual entitlement is automatically split into two entitlements. For example, you purchased a perpetual entitlement with 50 active rights (E1). You associate 20 of these rights with 20 rights of a SA entitlement. Your E1 perpetual entitlement is now automatically split into two entitlements: one perpetual entitlement (E1) with 20 active rights (and 50 purchase rights) associated with 20 rights of the SA entitlement (M1) and another perpetual entitlement (E2) with 30 active rights without any SA association and no purchased rights.

6. To perform additional configuration, select your new software entitlement record from the Software Entitlements list.

a. To link related perpetual and SA entitlements, use the following steps:

i. Select the Related Entitlements related list and then click **New.**

The Create New Related Entitlement form opens in a new tab.

ii. On the form, fill in the fields.

Create New Related Entitlement form

Field	Description
Active rights	Number of rights that you want to grant to the related perpetual or SA entitlement.
Software Entitlement	Software entitlement that you are linking the related perpetual or SA entitlement to. This field populates automatically.
Related Entitlement	Related perpetual or SA entitlement that you want to link.
Domain	Domain that the related perpetual or SA entitlement applies to. The default value is global .

iii. Click Save.

To remove the relationship between the perpetual and SA entitlement, remove the entitlement from the Related Entitlements related list in the SA entitlement.

If you delete either the perpetual or SA entitlement that is linked, the other entitlement isn't deleted.

If the entitlement has split and you've deleted the SA entitlement, the perpetual entitlement is not removed.

- b. To link your software to a newer version as part of your maintenance contract, click the Upgraded Entitlements related list.

Note:

This related list is only available if you selected **Step-up** as the entitlement license type.

If the **Next Version** field is populated on the software model, entitlements with active SA are updated to the new version of the software model.

After you've linked your related entitlements, if there aren't enough SA rights to cover the perpetual entitlement rights, an error message displays.

- c. To view all previously related entitlements that are linked, click the Entitlement History related list.

Note:

Validation is run against the active rights of all related entitlements automatically. If there's an error with the calculation, a message with additional information on how to resolve the problem is displayed.

7. Click **Update**.

Import bulk entitlements in workspace

You can import multiple entitlements at one go in the Software Asset Workspace.

Before you begin

Role required: sam_user or sam_admin

About this task

The entitlement import records are stored in the Entitlement import [samp_bulk_import] table. The **Publisher part number**, **Product**, and **Publisher** columns in the Entitlement import [samp_bulk_import] table offer drop-down lists for value selection.

You can leverage the Activity center in the Software asset overview landing page to view import errors and the import status.

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace**.
2. Select **Create entitlement**.

Create new entitlement ×

Guided step-by-step walkthrough

Import multiple entitlements from an Excel file

Fill out the details in a standard form

Cancel Next

3. In the Create new entitlement dialog box, select **Import multiple entitlements from an Excel file** and select **Next**.
4. In the Create New Entitlement Import page, select **Download template** to download a spreadsheet template (.xlsx).

You can add software entitlement fields to the template to include additional fields in your import. Add each field as a new column in the template. The column name must match the field label exactly. Besides the Publisher, Product, Version, Edition, Platform and Language, the Install condition name column is also taken into account to find the correct software model while importing entitlements.

You can include base system software entitlement fields as well as your custom software entitlement fields. Custom choice columns (where the type is Choice) created in the Asset [alm_asset] or Software Entitlement [alm_license] table are also supported.

Note:

By default, the **Unit cost** column in the spreadsheet takes into account the currency that your system is set to. However you can manually change the currency and the Software Asset Management application will honor the currency that you specify. To specify a currency, enter the currency code followed by a semicolon and the cost. For example, EUR ; 200. Valid currency codes are the ones listed in the Currency [fix_currency] table and have the **Active** column set to true.

5. Enter the entitlement details in the template and select **Attach File** to upload the spreadsheet. Once the file is uploaded, the name of the file appears and the **Description** field is automatically populated. You can change the description to make it more specific.
6. Select **Import**.

An import record is created that retains the history of the upload for you to view later.

A confirmation message appears informing you that the import of entitlements is in progress. Once the import record is processed, the **Status** field displays one of the following values: **Completed**, **Completed with errors**, or **Failed**.

7. Select the link in the confirmation message to check the status of the record.

The License operations view appears displaying the entitlement record in the Entitlement Import page

8. Open the entitlement record to view its details.
9. Click the **Entitlements** tab to view the list of entitlements that got successfully created.

Note:

The **Entitlements** tab only appears if the **Status** field displays the values, **Completed**, or **Completed with errors**.

10. If any errors occur and the status says **Completed with errors**, click **Review import errors**.

The Review entitlement import errors page opens containing two tabs:

- **Import errors:** displays records whose error status is **Needs review**.
- **Relate entitlements:** lists entitlements, such as maintenance entitlements, that are in the build state and can be linked to the base entitlements.

11. Select the import error record to view the errors.

For a detailed description of the entitlement import error fields, see [Entitlement import error fields](#)

12. Correct the errors and select **Import**.

The entitlement is successfully created. Further processing of the entitlement continues such as validation of downgrade models for the entitlement. For more information on resolving errors, see [Entitlement import error actions](#).

Install Software Asset Management Guided Experiences

Install the Software Asset Management Guided Experiences (com.sn_sam_playbook) application for step-by-step guidance for completing tasks in your daily software management activities. The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).

Role required: sam_admin or sam_user

About this task

The following items are installed with the Software Asset Management Guided Experiences application:

- Plugins
 - Software Asset Management Professional (com.snc.samp)
 - Software Asset Workspace (com.sn_sam_workspace)
 - com.glide.playbook_experience.config
- Store applications: Playbook Experience (sn_playbook_exp) and Playbook Experience Components (now_playbook_exp)
- Tables

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Software Asset Management Guided Experiences (com.sn_sam_playbook) using the filter criteria and search bar.

You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

3. In the Application installation dialog box, review the application dependencies.

Dependent plugins and applications are listed if they'll be installed, are currently installed, or must be installed. If any plugins or applications must be installed, you must install them before you can install the Software Asset Management Guided Experiences application.

4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.

5. Select **Install**.

Create entitlements using the guided walk-through

Use the guided walk-through playbook for a step-by-step process of creating entitlements.

Before you begin

You can create perpetual entitlements with or without a publisher part number. You can also create SaaS entitlements to manage software subscriptions of your pure SaaS and hybrid applications.

The guided walk-through takes you through the entire process of creating an entitlement. Initially the entitlement is in the **build** status when you start creating it. Once you publish the entitlement, the status changes to **in use** and makes the entitlement eligible to be included in the reconciliation process.

The process of creating an entitlement is organized into lanes. The lanes appear in the left pane of the page. Each lane has a few tasks that you are asked to complete. After you complete a task, click **Mark Complete** to move to the next task. You can click **Save** at any time in the process to save your changes and return to the playbook later. You can also click **Cancel** to abort the entitlement setup at any point of time. While you are performing a particular task, a status of in progress appears for that task. As you mark a task complete, the status of that task changes to complete. Once you complete all the tasks in a lane, you move to the next lane.

Role required: sam_user or sam_admin

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace**.
The Software asset overview page appears.
2. Select **Create entitlement**.

Create new entitlement ×

- Guided step-by-step walkthrough
- Import multiple entitlements from an Excel file
- Fill out the details in a standard form

3. Select **Guided step by step walk-through** and select **Next**.

The Create New Software Entitlement page opens and the status of the entitlement is in **build**.

Create New Software Entitlement

4. Select whether you are creating an entitlement for an on-premises product or for a SaaS product.

- If you select **on-premise**, enter the fields listed in the on-premise entitlement table below.
- If you select **SaaS**, enter the fields listed in the SaaS entitlement table below.

Note:

You are asked to select on-premise or SaaS only if the Software Asset Management - SaaS License Management Integrations (sn_sam_saas_int)SaaS plugin is activated. If this plugin is not activated, then the product type is automatically selected as on-premise.

On-premise entitlement

on-premise entitlement fields	Description
Do you have a PPN	Select if you have a publisher part number (PPN) for setting up the entitlement.
Publisher Part number	Enter the PPN if you have one; else create a custom PPN by clicking the link in the informational message to take you to the Custom Part Numbers page.

SaaS entitlement

SaaS entitlement fields	Description
Has an integration profile being set-up	<p>If you have an integration profile already set-up, select it; else, click the appropriate link to create a direct or a SSO integration profile.</p> <p>Note: Integration profile is needed to view software usage information and optimize stale licenses.</p>
Are you using a direct or SSO integration profile for this SaaS product	Select the type of profile, direct or SSO, that you are using for this SaaS product.
Select an integration profile	Based on the type of profile you specified, select an integration profile.

5. Select a software model for the entitlement.

Once you complete all the tasks in the Product Details lane, you can move to the Entitlement Details lane.

6. Select Entitlement Details.

If you entered a PPN, then the metric group, agreement type, and license type are automatically populated. You can change the values if required.

7. Enter a value in Asset tag to track the asset through its life cycle.

8. Select a value in License metric for the license group that the software license is counted against when reconciliation is run.

If you select Per Core or Per Core (with CAL), you need to enter values in the following fields:

a. In Rights per license pack, enter rights associated with each pack that is purchased for Microsoft Per Core or Microsoft Per Core with CAL licenses.

b. In Number of packs, enter the number of packs for Microsoft Per Core or Microsoft Per Core with CAL licenses.

9. Enter the number of rights purchased in Purchased rights.

If you've specified a Microsoft Per Core or Microsoft Per Core with CAL license type, this field is automatically populated. This value is based on the values entered in the Rights per license pack field multiplied by the value in the Number of packs field.

- 10.** Enter the cost of the software in **Unit cost**.
Once you complete all the tasks in the Entitlement Details lane, you can move to the Additional Details lane.
- 11.** Select **Additional Details**.
- 12.** Enter the name of the company that this asset belongs to in **Company**.
- 13.** Enter the location where the license is used.
For example, you can specify a specific site, country, or region.
- 14.** Enter the department of the person assigned to this software license in **Department**.
- 15.** Enter the user or department with financial ownership of the asset in **Owned by**.
The asset owner can be different than the manager.
- 16.** Enter the financial details for the vendor in **Vendor, Invoice Number, Request Line, Purchased, Opened, GL account** and **Cost Center** fields.
- 17.** Enter contract details in **Lease Contract, Warranty expiration, Support Group** and **Supported by** fields.
Once you complete all the tasks in the Additional Details lane, you can move to the Review lane.
- 18.** Select **Review** to show all the details that you have entered in all the lanes.
- 19.** You can choose to edit any field, else select **Finish**.
- 20.** Select **Publish** to publish this entitlement for use.
The entitlement is created and state of the entitlement is changed to **in use** from **build**. The entitlement is ready to be used for the reconciliation process.

Create software models in workspace

Create a software model in the Software Asset Workspace to add product details that are used to connect software rights you purchased with software installations discovered on your system.

Before you begin

Role required: sam_user, sam_admin, or model_manager

About this task

You can manually create a software model. However, you can leverage the Software Asset Management Content Service Library to automate the creation of software models through their relationship to software entitlements. While creating or importing a software entitlement, specifying a publisher part number automatically creates a software model (if needed) or links to an existing software model. You need to manually create a software model if a publisher part number is not available, a publisher part number does not exist in the Content Service Library, or if you are creating a software model for a custom product.

Procedure

- 1.** Navigate to **All > Software asset > Software Asset Workspace**.
- 2.** Select **License operations** view on the left hand bar.
- 3.** Under **Licensing**, select **software models**.
- 4.** Select **New**.

Create New Software Model Save

Details

Software Model Status

Display name

Status

Edition condition

Discovery map

Product classification

Software Licensing

Product type

License under management

Owner

5. On the Create New Software Model page, fill in the details in the fields.
See [Software model fields](#).

6. Select **Save**.

After you save the software model, the **General**, **Suite Components**, **Suite Parents**, and the **Product Catalog** tabs appear on the page. You can now add details in these related tabs.

7. Specify whether your software publisher is part of a suite.

- To designate your software model as a suite parent, click [Suite Parents](#) and add all software included with the suite.
- To designate your software model as a suite component, click [Suite Components](#) and add the parent suite.

Note:

If you've added a discovery map to your product details, predefined suites are used and suite components are created automatically for known suite parent.

8. To view all the product lifecycles associated with your software model, select [Software Product Lifecycle](#).

Select **New** to create a custom product life-cycle.

9. To view the override license cost for your entitlements, select [Override License Cost](#).

10. To set the attribute value, select the [Metric Attributes](#) and complete the form.

When you add an attribute value, entitlements with this publisher information associated with them automatically have the **Metric Group** field populated. Based on the metric group, only license metrics related to the publisher are available.

11. To associate your software model with a vendor, select [Vendor Catalog Items](#) and complete the form.

12. To specify the number of devices or users that are accessing the software, select [Client Access](#) and complete the form.

13. To create a new record for the software downgrade rights, click [Downgrade Rights](#) and complete the form.

i Note:

If your software model has a discovery map associated with it and the discovery map has downgrade rights, the downgrade rights are populated automatically. Downgraded versions of the software appear in a hierarchical list. For more information, see [Downgrade Rights](#).

14. To enable self-service capabilities for the software that is associated with your software model, publish the software model to your service catalog.

a. Select **Publish to Software Catalog**.

The Publish <*software - model*> to Software Catalog dialog box opens.

b. On the dialog box, set the **Category** field to **Software**.**c.** Select **OK**.

Run software reconciliation in the workspace

Reconciliation is run as a scheduled job (default is weekly), but you can also run reconciliation manually to reconcile software products in the Software Asset Workspace environment on-demand.

Before you begin

Reconciliation is run for products that have software entitlements or software installs. Grouping and subgrouping are supported so you can narrow the compliance results.

When running reconciliation manually, allow enough time for the process to complete. For faster results, narrow the scope by selecting specific publishers.

Role required: sam_user or sam_admin

Procedure

1. Navigate to the Run Reconciliation dialog box from either of the two ways:

- **Software Asset Workspace > Software asset overview > Run Reconciliation**
- **Software Asset Workspace > License usage > Run Reconciliation**

Run Reconciliation ✕

Domains

All enabled domains

Publishers

All publishers

Group

None

Sub-group

None

Cancel
Run reconciliation

Note:

If domain separation is enabled on your instance, then the Domain filter drop-down appears in the Run Reconciliation dialog box.

2. Select a particular publisher for which compliance should be calculated.
You can also select all publishers.
3. To narrow results further, select a group or subgroup.
Available group and subgroup values include None, Country, Department, Company, Region, and Cost Center.
4. Select **Run Reconciliation**.
The reconciliation process may take some amount of time to complete. Once reconciliation is complete, the reconciliation results are shown in the **Reconciliation** tab.

Reconciliation results

Field	Description
Number	Unique identifying number that is generated during the reconciliation process.
Last reconciled	Date of last reconciliation run.
Status	Status of the reconciliation. <ul style="list-style-type: none"> ○ Completed ○ In Progress ○ Failed

Field	Description
Ran for	All publishers, or specific publishers.
Publishers	Only shown if publishers were specified on which to run reconciliation.
Group	Group specified on which to run reconciliation. Values include None, Country, Department, Company, Region, and Cost Center.
Subgroup	Subgroup specified on which to run reconciliation. Values include None, Country, Department, Company, Region, and Cost Center.
Progress	Percent complete and progress bar for the reconciliation run.
Progress summary	<p>Specific step within the reconciliation process.</p> <p>Note: This list column is not shown by default. You can personalize your list column settings to add it, if desired.</p>
Updated	The date and time when the particular reconciliation process was completed.

Create a software removal candidate in workspace

Removal candidates reclaim software resources in your environment. They are created automatically from reclamation rules or can be created manually.

Before you begin

Role required: sam_admin or sam_user

About this task

Software reclamation is integrated with Workflow and Client Software Distribution to automate the process of uninstalling software from devices and reclaiming software rights. However, you can also create a removal candidate manually. The following steps are for manually creating a removal candidate.

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace.**
2. Select **License usage.**
3. Select the **Removal candidates** tab.
4. Select **New** to open the Create New Removal Candidate page.
5. On the form, fill in the fields.

Removal candidate form

Field	Description
Number	Unique removal candidate number that is automatically generated.
Assignment group	Automatically set to the software managers group authorized to respond to removal candidates.
Assigned to	Person primarily responsible for working on this task.

Field	Description
Name	<p>Removal candidate name that is automatically generated. Contains the software installation display name.</p> <p>Note: If you are using the bulk reclamation functionality, for the name to be generated, at least one software installation must be selected in the removal candidate form. If no software installation is selected, a name isn't generated and the Name field is empty. If you add software installations and later decide to remove all of them, the Name field returns to being empty.</p>
Description	Description of why the task exists and what the user must do if they receive an approval.
State	<p>Current state of the removal candidate.</p> <ul style="list-style-type: none"> ○ Attention Required ○ Ready ○ Awaiting User ○ Awaiting Approval ○ Awaiting Revocation ○ Closed Complete ○ Closed Skipped ○ Closed Canceled
Opened	Date the task was opened.
Closed	Date the task was closed.
Justification	<p>Justification for becoming a removal candidate.</p> <ul style="list-style-type: none"> ○ Low Usage (default) ○ Unallocated ○ Unlicensed ○ Restricted Software
Applies to	<p>Item type to which the reclamation rule applies.</p> <ul style="list-style-type: none"> ○ Installed Software ○ Subscription Software ○ Engineering App License
Software installation	The software installation being reclaimed.
Engineering App License	The Engineering application license that you want to reclaim.

Field	Description
<p>Note: Only appears if Engineering App License is selected in the Applies to list.</p>	
User	<p>Name of the user assigned to the software installation.</p> <p>This value can be changed so that another user receives the notification of software being uninstalled.</p> <p>If the Bulk Reclamation check box is selected, this becomes a mandatory field.</p>
User subscription	The user to whom this subscription is allocated.
Inactive days	<p>The number of days for which a user's subscription has been inactive.</p> <p>This field is visible only when the value in the Justification field is Low Usage and the User subscription field is not empty.</p>
Bulk Reclamation	<p>Select this check box to reclaim multiple software installations.</p> <p>Once you select this check box, the Software installation field is no longer visible. To add software installations, refer to the sub steps mentioned in Step 6.</p>
Configuration item	The device on which the software is installed.
Reclamation rule	The reclamation rule that created the removal candidate.
Rights to reclaim	The number of rights that you want to reclaim. For example, you have 100 rights installed on a license server but you want to reclaim only 40 rights.
<p>Note: Only shown if Engineering App License is selected in the Applies to list.</p>	
Potential savings	Estimated cost of savings if all removal candidates are in the Closed Complete state, meaning the software was uninstalled and the rights were harvested (unused rights * average price per right from entitlements).
Notify user	Check box for notifying the user assigned to the hardware on which the software is installed, requesting permission via email to remove the software.
Configuration item	The device on which the software is installed.

Field	Description
Activity	
Work notes	Used to track the actions that have been performed on this task.

6. Select Save.

The removal candidate record is created. If you selected the **Bulk Reclamation** check box, the state of the removal candidate changes to **Attention Required**. Perform the following sub steps to add software installations before proceeding to the next step. If you didn't select the **Bulk Reclamation** check box, proceed to the next step.

a. Select **New** in the Software Installation related list.

b. Select a software installation and select **Save**.

The software installation you added appears in the Software Installations related list. The state of the removal candidate moves from **Attention Required** to **Ready** and a name is generated in the **Name** field. Continue to select **New** to add more software installations. If you decide to remove all software installations, then the state reverts back to **Attention Required** and the name no longer appears in the **Name** field. For the name to be generated and for the removal candidate to be in **Ready** state, at least one software installation must be selected in the removal candidate form.

7. Select Reclaim.

Once your software installation is reclaimed and removed from your system, the Software Installation column becomes empty. You can refer to the following fields on the Software installation related list to give you insights into the history of the reclaimed software installation.

- Display name
- Product
- Publisher
- Software model

You may select any action button on the form to further configure the removal candidate. Action buttons are dependent on the removal candidate's justification and state.

Action buttons

Action	Description
Update	Update the removal candidate.
Close Complete	Reclaim rights and close the removal candidate.
Close Skipped	Close the removal candidate without reclaiming rights.
Delete	Delete removal candidate.

Create device allocation

Create a device allocation for a software entitlement to specify devices that have been granted rights.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **Software Asset Workspace > License operations.**
2. Select **Software entitlements.**
3. Select a software entitlements record.
4. Select the **Device Allocations** tab.
5. Select **New.**
6. On the form, fill in the fields.

Create New Device Allocations form

Display name	Display name for device allocation. This field value is automatically set based on the selected Allocated to and Entitlement field value. This field value appears only when the allocation record is saved.
Allocated to	The device to which the license is allocated.
Entitlement	Automatically set to the selected software entitlement.
Quantity	Quantity of licenses allocated to this device. Default is 1.
License key	License key of the software.

7. Click **Save.**

Result

- Device allocation record is created for the device and listed in the **Device Allocations** tab.
- The device allocation record is saved in the Device Allocations [alm_entitlement_asset] table.

Related topics

- [Create entitlements in workspace](#)
- [Copy user or device allocations](#)
- [Allocation management on Software Asset Management](#)

Copy user or device allocations

Copy user or device allocations from one entitlement to the other.

Before you begin

Copy allocations from a source entitlement to a target entitlement to renew expired entitlements or add a new maintenance. Additionally you can also copy allocations while creating entitlements that require the same allocations as in another entitlement.

The entitlement from which you want to copy the allocations is referred to as the source entitlement. The entitlement to which you want to copy the allocations is referred to as the target entitlement.

User allocations can be copied to only entitlements that support user allocations. Similarly, device allocations can be copied to entitlements that support device allocations. For details on license metrics, see [Software license metrics](#).

If the selected user or device is already allocated in the target entitlement, the quantity of that allocation is incremented.

Prior to copying allocations, ensure that the following prerequisites are met:

- The target entitlement has enough allocations available. The **Copy allocations** button only appears when the allocations available on the entitlement is greater than zero. An error occurs if the number of allocations being copied exceeds the number of available allocations in the target entitlement
- The target entitlement is in **Build**, **In use**, or **On order** state.
- The target entitlement has enough available rights.

Role required: sam_admin or sam_user.

Procedure

1. Navigate to **Software Asset Workspace > License operations > Software entitlements**.
2. Open the target entitlement in which you want to copy the user or device allocations.
3. Select the appropriate allocations related list (User Allocations or Device Allocations).
4. Select **Copy allocations**.
The details of the target entitlement such as allocations available, license type, active rights appear at the top of the page.
5. Select the entitlement from which you want to copy the allocations from in the **Source entitlement** list.
All the details of the source entitlement such as license metric, metric group appear on the Details page.
6. Select the Source allocations related list and select the allocations.
7. Select **Submit**.

If the copy allocation process is successful, then **Submit** gets disabled. A message informs you that the copy of allocations is being processed. You can check the status by clicking the link in the message.

The link takes you to the Software Asset Job Results [samp_job_log] table. Use the Name column to search for the job log record, titled *Copy Allocations to < >*, where the angle brackets refer to the display name of the target entitlement.

Create consumption rules

Create consumption rules to restrict license consumption to certain entities within your organization.

Before you begin

Role required: sam_user

Procedure

1. Navigate to **Software Asset Workspace > License operations > Consumption rules**.
2. Select **New**.
The Create New Consumption Rule page opens.

3. On the form, fill in the fields.

4. Select **Save**.

The new consumption rule appears in the Consumption rules list view. You must [link this rule](#) to one or many entitlements.

Link consumption rules to entitlements

After you've created a consumption rule, you must link the rule to one or more entitlements.

Before you begin

Consumption rules aren't supported for the following license metrics:

- IBM RVUs
- IBM UVUs
- Workday
- Employee

The Entitlement Consumption Rules related list on the entitlement form doesn't appear for these license metrics.

Role required: sam_user

Procedure

1. Navigate to **Software Asset Workspace > License operations**.
2. Open the entitlement to which you want to link the consumption rule.
3. Select the Entitlement Consumption Rules related list.
4. Select **New**.
The Create New Entitlement Consumption Rule page opens.
5. On the form, fill in the fields.
6. Select **Save**,
The consumption rule appears in the Entitlement Consumption Rules related list.

View discovered engineering licenses in workspace

View a list of all the discovered and normalized software for your engineering applications in the Software Asset Workspace.

Before you begin

Role required: sam_admin or sam_user

You can view a list of all the normalized publishers and products for your engineering applications. Additional information such as the version, quantity of licenses, and the type of license is also displayed.

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations**.
2. Select **Discovered engineering license** from the Discovery list view.

3. You can click a record to view additional details.
This takes you to the Company page in the classic view.

View engineering license servers in workspace

View the list of license management servers that OpenLM or Open iT connect with to get data into your ServiceNow instance in the Software Asset Workspace.

Before you begin

Information such as the name and type of the server, its current status, whether it's currently active, and the last connection time is displayed.

Note:

Engineering license servers only appear if the Software Asset Management Professional for Engineering Applications (com.sn_samp_eng_app) [plugin](#) is activated.

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations > Engineering license server**.
2. Select a license server record to view its details.

Add custom software products in workspace

Add a custom software product for any publicly available software product that does not exist in the Software Asset Management Content Library. Custom software products enable you to normalize and account for software products that aren't part of the Software Asset Management Content Library yet.

Before you begin

If you want to enable the Software Asset Management application to submit content requests for your custom software products, opt in to the Software Asset Management Content Service and then enable the Custom Software Products KPI. See [Enable sharing information with Software Asset Management content service](#) for detailed instructions.

Role required: sam_admin

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. From the Software Asset Workspace, open the License operations view.
3. From the navigation menu of the License operations view, navigate to **Content > Custom software products**.
4. Select **New**.
5. On the form, fill in the fields.

Create New Custom Software Product form

Field	Description
Publisher	Publisher of the custom software product.
Product	Name of the custom software product.

Field	Description
Subscription software	Option to indicate if the custom software product has a subscription.
Product type	Type of software product. Select one of the following options: <ul style="list-style-type: none"> ○ Child: A component of a main software product. This software product type isn't licensable. ○ Driver: A software product that controls a device. ○ Licensable: A software product that is licensable. ○ Not Licensable: A software product that is not licensable. ○ Patch: A software product that updates, fixes, or improves an existing computer program. ○ Unknown: A software product that is unknown.
Product classification	United Nations Standard Products and Services Code [®] (UNSPSC [®]) classification for the custom software product.
Active	Option to indicate if the custom software product is active.
Exclude from content service	Option to prevent the custom software product from being shared with the Software Asset Management Content Service.

6. Select Submit.

Result

The custom software product is immediately available to use in your downstream processes, such as normalization and reconciliation. Depending on whether you enabled or turned off the **Exclude from content service** option, the Software Asset Management application can either continue using the custom software product or begin using the corresponding software product in the Software Asset Management Content Library.

- If you enabled the **Exclude from content service** option, the Software Asset Management application continues to use the custom software product in your downstream processes.
- If you turned off the **Exclude from content service** option, the Software Asset Management application proceeds as follows:
 1. The Software Asset Management application automatically creates and sends a corresponding content request to the Content Service team.
 2. After the Content Service team reviews and approves the request, the software product is added to the Software Asset Management Content Library.
 3. During the next scheduled content update, the new software product in the Content Library is pushed to your ServiceNow instance and then mapped to the custom software product.
 4. The Software Asset Management application automatically generates a product suggestion that enables you to consolidate the custom software product with the software product in the Content Library. This consolidation updates all references to the custom software product with references to the software product in the Content Library. You can choose to accept or reject the suggestion.
 - If you accept the suggestion, the Software Asset Management application begins using the software product in the Content Library for your downstream processes.
 - If you reject the suggestion, the Software Asset Management application continues to use the custom software product in your downstream processes.

For more information on product suggestions, see [View custom software product suggestions in workspace.](#)

View custom software product suggestions in workspace

View the product suggestions that enable you to consolidate your custom software products with corresponding software products in the Software Asset Management Content Library. By consolidating these software products, you can update all references to your custom software products with references to the software products in the Content Library. You can choose to accept or reject these suggestions.

Before you begin

Role required:

- sam_admin: Accept or reject product suggestions.
- sam_user: View product suggestions.

About this task

You can add custom software products for any publicly available software products that don't exist in the Software Asset Management Content Library. For more information on custom software products, see [Add custom software products in workspace](#).

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. From the Software Asset Workspace, open the License operations view.
3. From the navigation menu of the License operations view, navigate to **Content > Custom software product suggestions**.
4. View the list of all product suggestions for your custom software products.
Select a product suggestion record to view more details about the suggestion. You can also choose to accept or reject the suggestion.
 - If you accept the suggestion, all references to the custom software product are updated with references to the corresponding software product in the Software Asset Management Content Library.
 - If you reject the suggestion, all references to the custom software product remain the same.

View license usage for your installations

Track your installation to license journey by connecting software installations to the licenses consumed and identifying statuses such as licensed, unlicensed, ignored, or requiring action.

Before you begin

Role required: sam_manager

Procedure

1. Navigate to **Software Asset Workspace > License operations > Products with installs.**

Display name	Install count	Install consumption percentage	Licensed install count	Unlicensed install count	Requiring action install count
SQL Server Analysis Services	1	100%	1	0	0
System Center Endpoint Protection	2	50%	1	0	1
Acrobat	734	77%	563	0	171
System Center Orchestrator	2	50%	1	0	1
JProfiler	45	0%	0	0	45
Splunk	6	100%	6	0	0
WebLogic Server	31	100%	31	0	0
vSphere	9	0%	0	0	9
Database	107	71%	63	22	9
BigFix Inventory	6	67%	4	0	2
Endpoint Configuration Manager Client	1	0%	0	0	1
Entourage	2	0%	0	0	2

The preceding page showcases all your products with installations and offers a high-level overview of how these installations are being used and licensed.

2. Select a product to open the Details page.

Category	Value
Publisher	Microsoft
Product	SQL Server
Install count	307
Install consumption percentage	82%
Licensed install count	193
Unlicensed install count	13
Requiring action install count	41
Ignored install count	60

3. Select **License usage**.

The License use analysis page for the product opens displaying a four-level node map that illustrates how the licenses are being used.

4. View the four-level node map to understand the license usage for the product.
 - The highest level in the node map represents the product.
 - The second-level features nodes for different product versions and editions, with each version-edition combo having its own node.
 - The third level nodes indicate the licensing status of installations, such as licensed, unlicensed, requiring action, and ignored.
 - The fourth level nodes display the licensing results for installation groups, showing which licenses are in use.

You can select a node to delve deeper into the software installation lists and examine individual installation records.

The top-right corner of the node map shows the reconciliation number that generated the current node map, along with the timestamp of the last reconciliation run. If reconciliation is executed with domain separation settings enabled, multiple node maps are displayed.

5. **Optional:** Select the Export map icon on the right side of the page to download this node map as an image.

Create averages for product life cycles in workspace

Create averages to calculate software End of Life (EOL) and End of Support (EOS) life cycles in the Software Asset Workspace.

Before you begin

Role required: model_manager

About this task

You can create averages that can be used globally for all products and publishers or you can create averages specific to a product or a publisher. These averages are used to create calculated life cycles for products.

Ensure that *com.snc.samp.generate.calculated.lifecycles* system property is enabled. For additional details, see [Product life cycles](#).

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations > Software lifecycle averages**.
2. Select **New** to open the Create New Software lifecycle averages page.
3. On the form, fill in the fields.

Field	Description
Type	The type of option you select for creating life cycles. Choose from the following options:

Field	Description
	<ul style="list-style-type: none"> ○ Custom industry average: Refers to the industry averages based on the General Availability (GA) dates. ○ Product: Refers to a specific product. This includes custom products too. ○ Publisher: Refers to a specific publisher. This includes custom publishers too.
Display name	A unique name for this life cycle average record.
Product	This field appears only if you select the value Product in the Type field.
Publisher	This field is automatically populated once you select a product. If you selected the value Publisher in the Type field, then you select a publisher.
Domain	Indicates the domain in which your instance is located.
Average end of life period (months)	Specify the number of months for the EOL life cycle.
Average end of support period (months)	Specify the number of months for the EOS life cycle.
Active	Indicates that the life cycle average record will be used for creating software life cycles.

4. Select Save.

The record is created and appears in the Software lifecycle averages list view.

View normalization suggestions in workspace

View normalization suggestion records in the Software Asset Workspace that are created for discovery models. You can accept or reject these suggestions.

Before you begin

Role required:

- sam_admin: accepts or rejects the normalization suggestions.
- sam_user: views normalization suggestions.

The normalization suggestion records are stored in the Normalization Suggestions [samp_normalization_suggestions] table.

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations.**
2. Select Normalization Suggestions in the Discovery list view
3. Select a normalization suggestion record to view its details.
For a detailed description of the normalization suggestion fields, see [Normalization suggestions for discovery models.](#)

4. Select **Accept** to update the discovery model with the correct values or click **Reject** to retain the manually normalized values.

Note:

Only the sam_admin role can accept or reject the normalization suggestions. For details on accepting or rejecting suggestions, see [Normalization suggestions for discovery models](#).

Revert normalization in the workspace

You can revert the normalization of discovery models in the Software Asset Workspace.

Before you begin

Discovery models with a status of **Normalized**, **Partially Normalized**, or **Publisher Normalized** revert to the status of **Match Not Found**. Discovery models with a status of **Manually Normalized** and discovery models that have been normalized using pattern rules cannot be reverted.

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations > Discovery models**.
2. Select a discovery model record.
3. Select **Revert Normalization**.
Once the revert normalization process is complete, fields are reset to their original values and any rules associated with the software discovery model are deactivated.

Manually override edition value in workspace

If the edition of a software installation is not automatically discovered, you can specify the edition on the Software Installation form (if known) so the software can be successfully reconciled.

Before you begin

Role required: sam_admin

About this task

For reconciliation to run successfully, the publisher, product, version, and edition fields of the software must be set. When the edition is not discovered automatically (edition value is not included as part of the **Display name** field) but you know the edition, you can manually set it to the correct value (for example **Enterprise**).

Once the edition value is set, the discovery model for the software install is automatically reset. If the appropriate discovery model does not exist, a new one is created.

Note:

Not all software products consist of an edition. Of the software products consisting of an edition, not all edition values are automatically discoverable.

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations**.
2. Select **Discovery models**.
3. In the Discovery models page, open a discovery model.

4. Select the Software Installations tab and open the software installation record for which you want to set the edition value.

Note:

The **Edition override** field is a free-form field (no lookup list) and since this field is used as a key, the value entered must be exact.

5. Select **Save**.

The software installation is associated to a different discovery model containing the edition value as part of the primary key. If the appropriate discovery model does not exist, a new one is created.

Manually normalize a software model in workspace

You can manually normalize a software discovery model that has not been fully normalized (partially normalized, publisher normalized, or match not found) in order to reconcile it.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations > Discovery models**.
2. Select a discovery model record that has a normalization status of **Partially Normalized**, **Publisher Normalized**, or **Match Not Found**.
3. Select the ellipsis icon on the right hand side of the page.
4. Select **Normalize**.
The normalization status changes to **Manually Normalized**.

Create parent-child relationships between software products

Create and define the parent-child relationships between your software products so that your child products can inherit life-cycle dates from their parent products.

Before you begin

Role required: sam_admin

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. From the Software Asset Workspace, open the License operations view.
3. From the navigation menu of the License operations view, navigate to **Content > Parent-Child Relationship**.
4. Select **New**.
5. On the form, fill in the fields.

Create New Software Product Parent-Child Relationship form

Field	Description
Parent product	Parent product that the specified child product inherits life-cycle dates from.

Field	Description
Child product	Child product that inherits life-cycle dates from the specified parent product. If you leave this field empty, a blanket parent-child relationship is created, in which all products under the same publisher as the specified parent product are considered its children and inherit its life-cycle dates.
Active	Option that indicates if the parent-child relationship is active.
Exclusion	Option to exclude the specified child product from any existing blanket parent-child relationships that are defined using the specified parent product.

6. Select Save.

Result

The Software Asset Management application automatically updates the life-cycle dates of the specified child product with the life-cycle dates of the specified parent product, given that the child product does not already have its own specific life-cycle dates.

What to do next

View life-cycle dates and other life-cycle information for both your parent and child software products in the Lifecycle management dashboard. You can access this dashboard by navigating to **Workspaces > Software Asset Workspace > Software asset analytics > Lifecycle management**. See [Lifecycle management dashboard](#) for more information on this dashboard.

View the Export Classification Control Number (ECCN) mappings for your software products

View the list of ECCNs that are mapped to your software products. Use this information to identify the products that are subject to U.S. export control regulations.

Before you begin

Role required: sam_user

About this task

An ECCN is a five character alphanumeric key that helps you identify products that are subject to export control regulations under the U.S. Department of Commerce. Each ECCN defines the export licensing requirements for a product based on the product type and the corresponding technical parameters. You can view the complete list of available ECCNs in the Commerce Control List (CCL), which is available on the Government Printing Office website as Supplement No. 1 to Part 774 of the Export Administration Regulations (EAR).

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. From the Software Asset Workspace, open the License operations view.
3. From the navigation menu of the License operations view, navigate to **Content > Software ECCN Mapping**.

4. View the complete list of ECCNs that are mapped to your software products.

Note:

ECCN mappings are curated and stored in the Software Asset Management Content Library. However, the Content Service team does not dictate any mappings between the ECCNs and software products. Each ECCN is mapped to an appropriate software product based only on either the official ECCN information that has been published by the given software publisher or the official classifications that have been provided by the Bureau of Industry and Security (BIS).

View or create software usage

View software usage records to track the usage of software products that you have created reclamation rules for. You can also create software usage records manually from third party integrations or Microsoft SCCM integrations.

About this task

If you're using Software Asset Workspace, the option to view or create software usage in Core UI is inactive.

The Software Usage [samp_sw_usage] table tracks down usage to the product level and not to the version or edition level.

Before you begin

Role required: sam_admin or sam_user

About this task

Use the following steps to create software usage records manually.

Procedure

1. Navigate to the Create New Software Usage form.
2. Select **New**.
3. On the form, fill in the fields.

Create New Software Usage form

Field	Description
Software usage	
Publisher	Publisher of the software product.
Product	Name of the software product.
Reclamation type	Type of reclamation used on the software installation. The options are Total Usage Time and Last Used Date . <p>Note: If you select Total Usage Time, the Usage Metering Data form section appears. If you select Last Used Date, the Last Used Data form section appears.</p>

Field	Description
Configuration Item	Configuration item (CI) that the software product is associated with. Note: If the CI Status or Hardware Status field changes to Retired or Stolen, installations that are related to the CI are deleted.
User	Name of the user who is using the software product.
Usage Metering Data Note: This form section appears only if the Reclamation type is set to Total Usage Time .	
Month	Month that the software product was used.
Year	Year that the software product was used.
Usage count	Number of times that the software product was accessed.
Total seconds used	Amount of time (in seconds) that the software product was used.
Last Used Data Note: This form section appears only if the Reclamation type is set to Last Used Date .	
Last used time	Date and time that the software product was last used.

4. Select Save.

Result

After the software usage is created, you can view it by navigating to **License operations > Discovery > Software usage**.

View SAP engines in workspace

View the monthly engine usage measurements for SAP clients based on the license metric for each engine.

Before you begin

You can also view all the discovered users pulled from the SAP systems.

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License Operations**.
2. Select **All SAP engines**.
3. Select on a SAP engine record to view more details on SAP system users and SAP Engine usage.

View SAP users in workspace

View all the discovered users pulled from the SAP systems in the Software Asset Workspace.

Before you begin

The Discovered Users [samp_discovered_user] table maps the discovered SAP users to system user records in the Users [sys_user] table.

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations**.
2. Select **All SAP users**.
3. Select a record to view details such as SAP user roles, SAP user active transactions, SAP user activities, and SAP web activities.
 - SAP User Roles [samp_sap_user_has_role]: SAP users and their assigned roles.
 - SAP User Active transactions [samp_named_user_type_has_transactions]: Data related to a named user's transaction activity on a SAP client. User transaction activity is based on SAP transaction codes, which are shortcuts for performing transactions or tasks on an SAP client. For example, the ME21N transaction code enables you to create a purchase order in SAP.
 - SAP User Activity [samp_sap_user_activity]: Data related to a user's activity on a SAP client, such as the amount of time spent on a SAP system or the number of database records created or updated.
 - SAP Web Activity [samp_sap_web_activity]: Data related to web activity or RFC connections performed on the SAP client, such as the number of calls or amount of data received or sent by each connection.

Create a custom named user type in workspace

Create a custom named user type that can be used with your SAP software entitlement in the Software Asset Workspace. Creating a custom named user type allows users to track licenses that are specific to their SAP systems.

Before you begin

Role required: sam_admin or sam_user

Note:

The custom SAP named user types that you create directly on your ServiceNow instance are not reflected in your SAP system. You must make the same changes in your SAP system.

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations**.
2. Select **SAP named user types**.
3. Select **New** and fill in the details.

Field	Description
Name	Name of custom named user.
Price list	Default price list.
Is developer	Indicates the user has a developer role.
Grant access to	Grant access to a named user type.
Value	Value associated with the named user type. This value can be either numbers or letters.
Rank	Priority of the named user type during reconciliation. Lower rank values take precedence.
Is licensable	Indicates the named user type license status.
Active	Indicates if the named user type is active.

4. Select Save.

The named user type is added to the Named User Types list.

Create custom SAP price lists in workspace

Create custom SAP price lists so that you can track and manage SAP licenses based on the contracts that are specific to your SAP system.

Before you begin

Role required: sam_admin

Note:

The custom SAP prices lists that you create directly on your ServiceNow instance are not reflected in your SAP system. You must make the same changes in your SAP system.

Procedure

1. From the Software Asset Workspace, open the License operations view.
2. From the left navigation menu of the License operations view, select **Discovery > SAP price lists**.
3. Select **New**.
4. On the Create New Custom Price List form, fill in the fields.

Create New Custom Price List

Field	Description
Name	Name of the price list.
Id	Unique identifier for the price list.
Default named user type	Default named user type for the price list.
Active	Option that indicates if the price list is active.

5. Select Save.

You are automatically redirected to the SAP price list record.

6. Optional: Associate SAP named user types with the custom SAP price list.

- a. On the **Named User Types** tab of the SAP price list record, select **New**.
- b. On the Create New Custom Named User Type form, fill in the fields.

Create New Custom Named User Type form

Field	Description
Name	Name of the named user type.
Price List	Price list that you want to associate the named user type with. This field populates automatically.
Is developer	Option that indicates if users with this named user type have a developer role.
Grants access to	Applications that the named user type has access to.
Value	Alphanumerical value that identifies the named user type.
Rank	Priority of the named user type during reconciliation. Lower rank values correlate with a higher priority during reconciliation.
Is licensable	Option that indicates if the named user type can be licensed.
Active	Option that indicates if the named user type is active.

- c. Select **Save**.
- d. Repeat steps a to c for each custom named user type that you want to add.

View SSO applications in workspace

View details related to applications that you can connect through a SSO provider in the Software Asset Workspace.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations**.
2. Select **SSO applications**.
List of all connected and disconnected SSO applications is shown.
3. Select a application record to view additional details such as SSO application groups, users, SSO subscriptions, and reclamation candidates for an application.

SSO Applications

List	Description
SSO Application Users	All users that have direct access to the application, but not through membership in a group.

List	Description
SSO Application Groups	All groups that have access to the application.
SSO Subscriptions	<p>Total number of subscriptions for the application. A user may have both direct access to an app and have access through a group. But the user's access counts as only one subscription so as only one record in the SSO Subscriptions list.</p> <p>Note:</p> <ul style="list-style-type: none"> ○ Add the SSO application role column to see how the user is granted access to the application. If the value is a group, then the user has access through membership in that group. If the value is the user's name, then the user has direct access to the application. User subscriptions can't be reclaimed in Software Asset Management if the user has access to the application through a group membership. To reclaim the subscription, remove the user from the group in the Azure AD portal and set the reclamation candidate state to Closed Complete. ○ When SSO subscriptions are created through SSO application groups, the Subscription assigned value is empty. When the subscriptions are created through SSO Application Users, the Subscription assigned value shows the date of when the subscription is assigned to the user. After you upgrade to the Software Asset Management - SaaS License Management 13.1.0 version or later, the existing Subscription assigned values for the subscriptions that were created through SSO application groups turns empty.
Reclamation Candidates	Subscriptions that don't meet the usage requirements that are defined by the reclamation rule for the application.

View SSO groups in workspace

View details related to all SSO groups that have access to a SSO application in the Software Asset Workspace.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations.**
2. Select **SSO groups.**
3. Select a group record to view additional details such as the users and child groups within that group.

View SSO users in workspace

View details of all users that have direct access to a SSO application in the Software Asset Workspace, but not through membership in a group.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License operations.**
2. Select **SSO users.**
3. Select a user record to view additional details related to the user.

Create a software client access record in workspace

Add a client access record to track and manage the users or devices that are accessing a particular version of your server software using a client access license (CAL).

Before you begin

Role required: sam_admin

Note:

You can also use the sam_user role to view and read client access records. However, you cannot use this role to create client access records.

About this task

Software Asset Management uses client access records to reconcile server software based on the following license metrics:

Metric group	License metric
Citrix	<ul style="list-style-type: none"> • Per User • Per User/Device
Common	<ul style="list-style-type: none"> • User CAL • Device CAL • User/Device CAL
IBM	<ul style="list-style-type: none"> • Authorized User • Authorized User Value Unit

Metric group	License metric
	<ul style="list-style-type: none"> Employee User Value Unit External User Value Unit
Microsoft	<ul style="list-style-type: none"> User CAL Device CAL Per Core (with CAL)
Oracle	Named User Plus
CrowdStrike	<ul style="list-style-type: none"> Reserved Hourly Average Sensor Sensor Subscription <p>Note: These license metrics are available with Yokohama Patch 1, Software Asset Management - SaaS License Management (sn_sam_saas_int) 15.0.8, and Software Asset Management (sn_itam_samp) 2.1.0 version onwards. If you are on any version for Yokohama below Patch 1, refer KB1801232.</p>

License metrics are set on the [software entitlement](#) form and can be accessed from the **Metric Attributes** related list on the [software model](#) form.

i Important:

You can enable the Software Asset Management application to automatically create client access records for Oracle Database Server using the **Auto-generate client access for allocations** option on the corresponding software model. To use this option, you must request the Data Collection for Oracle Global Licensing and Advisory Services application from the ServiceNow Store. See [Software model fields](#) for more details on the **Auto-generate client access for allocations** option. See [Request Data Collection for Oracle Global Licensing and Advisory Services \(GLAS\)](#) for more details on the Data Collection for Oracle Global Licensing and Advisory Services application.

Procedure

1. From your ServiceNow instance, navigate to **Software asset > Software Asset Workspace**. The Software Asset Workspace launches in a new tab.
2. On the left navigation menu of the Software Asset Workspace, select **License operations**. The License operations view opens.
3. On the **Lists** tab of the License operations view, navigate to **Client access > Client access**.
4. Select **New**.
5. On the Create New Client Access form, fill in the fields.

Create New Client Access form

Field	Description
Name	Name of the client access record.
Software model	Software model of the server that you are granting users or devices access to.
Type	<p>Type of CAL that is associated with the client access record. Select one of the following options:</p> <ul style="list-style-type: none"> ○ User CAL: Licenses each user that accesses the associated server, regardless of the number of devices that each user is using to access the server. <p>For example, if two users are accessing Microsoft Windows Server, the corresponding software entitlement must include two User CALs.</p> <p>If you select this option, you can assign the associated User CALs to specific users. See step 7 for more details.</p> ○ Device CAL: Licenses each device that accesses the specified server, regardless of the number of users that are using each device to access the server. <p>For example, if two devices are accessing Microsoft Windows Server, the corresponding software entitlement must include two Device CALs.</p> <p>If you select this option, you can assign the associated Device CALs to specific devices. See step 7 for more details.</p> ○ User/Device CAL: Licenses each user or device that accesses the associated server. <p>i Note: If you are using a Citrix software model, the User/Device CAL type is based on the user/device licenses that are assigned to your users or shared devices.</p> <p>For example, if two users and two devices are accessing Microsoft Windows Server, the corresponding software entitlement</p>

Field	Description
	<p>must include two User CALs and two Device CALs.</p> <p>If you select this option, you can assign the associated User and Device CALs to specific users and devices. See step 7 for more details.</p> <ul style="list-style-type: none"> ○ Authorized User: Licenses each user who accesses an IBM software product. <ul style="list-style-type: none"> Note: This CAL type is applicable to IBM software only. ○ Authorized User Value Unit: Licenses the number of select users who access an IBM software product. <ul style="list-style-type: none"> Note: This CAL type is applicable to IBM software only. ○ Employee User Value Unit: Licenses the total number of users within your organization who access an IBM software product. <ul style="list-style-type: none"> Note: This CAL type is applicable to IBM software only. ○ External User Value Unit: Licenses the total number of users outside your organization who access an IBM software product. <ul style="list-style-type: none"> Note: This CAL type is applicable to IBM software only. ○ Reserved Hourly Average Sensor: This metric counts the number of unique active endpoints per clock-hour and averages them over a rolling 28-day period. The count of Reserved Hourly Average Sensor Licenses resets at the start of each clock-hour. ○ Sensor Subscription: This metric calculates license usage by averaging endpoint counts over four consecutive weeks. Weekly endpoint counts are based on the total number of endpoints consumed in the previous seven days.

Field	Description
	<p>Note: The Reserved Hourly Average Sensor and Sensor Subscription license metrics are applicable only for CrowdStrike and are available with Software Asset Management Yokohama Patch 1 and Software Asset Management 2.1.0 version onwards.</p>
<p>WebLogic application</p> <p>Note: This field appears only if you select an Oracle WebLogic Server software model.</p>	<p>Oracle WebLogic Server application to which your users or devices are granted access.</p>
<p>Database instance</p> <p>Note: This field appears only if you select an Oracle Database Server software model.</p>	<p>Oracle database instance that accesses and manages the data in your Oracle database.</p>
<p>Source</p> <p>Note: This field appears only if you select an Oracle Database Server software model.</p>	<p>Source of your Oracle data. This field is automatically set to one of the following options:</p> <ul style="list-style-type: none"> ○ ServiceNow: Indicates that the client access record data was generated automatically through the SAM - Sync Auto-generated Client Access with DB Server Users scheduled job, which runs daily or on-demand. ○ Internal: Indicates that the client access record data was added manually.
<p>Count</p>	<p>Number of unique users or devices that are granted access to the associated server.</p> <p>Note: On automatically generated client access records for Oracle Database Server, this field populates automatically based on the number of users or devices that are currently added to the record. See step 7 for more information on how to add users or devices to the client access record.</p>

Field	Description
	<p>Note: If you are using a Citrix software model and User/Device CAL type, the Count field is based on the number of user/device licenses that are assigned to your users or shared devices.</p>
PaaS <p>Note: This field appears only if you select an Oracle Database Server software model.</p>	Option to indicate whether your Oracle database instance is managed by the Amazon Relational Database Service (RDS) on Amazon Web Services (AWS).
Cost Center	Cost center of the users or devices that are granted access to the associated server.
Department	Business department of the users or devices that are granted access to the associated server.
Location	Geographic location of the users or devices that are granted access to the associated server.
Company	Company of the users or devices that are granted access to the associated server.

6. Select Save.

The form reloads with the **Users** and **Devices** tabs.

7. To assign the associated CALs to specific users or devices, add those users or devices to your client access record based on the CAL type that you selected in the **Type field.**

By assigning CALs to specific users or devices, you can prevent those users or devices from being counted multiple times across different client access records during reconciliation.

- If you set the **Type** field to **User CAL**, **User/Device CAL**, **Authorized User**, **Authorized User Value Unit**, **Employee User Value Unit**, or **External User Value Unit**, add the users that you want to assign your user-based CAL to.

Note:

If you are using a Citrix software model and User/Device CAL type, add the users that you want to assign a user/device license to.

a. Select the **Users tab and then click **New**.**

The Create New Client Access User Breakdown form opens in a new tab.

b. In the **User field, search for and select a user that you want to assign a user-based CAL to.**

The **Device**, **Active**, **User Type**, and **Source** fields populate automatically for the specified user. However, you can modify the **Device**, **Active**, and **User type** fields as needed.

c. Select **Save.**

d. Close the form to return to your client access record.

e. Repeat steps a-d for each user that you want to assign a user-based CAL to.

- If you set the **Type** field to **Device CAL** or **User/Device CAL**, add the devices that you want to assign your device CALs to.

Note:

If you are using a Citrix software model and User/Device CAL type, add the devices that you want to assign a user/device license to.

- a. Select the **Devices** tab and then select **New**.

The Create New Client Access Device Breakdown form opens in a new tab.

- b. In the **Device** field, search for and select a device that you want to assign a device CAL to.

The **Active** and **Source** fields populate automatically for the specified device. However, you can modify the **Active** field as needed.

- c. Select **Save**.

- d. Close the form to return to your client access record.

- e. Repeat steps a-d for each device that you want to assign a device CAL to.

8. To track and license the configuration items (CIs) that the associated server is installed on, add them to the client access record.

Important:

This step is not applicable if you have enabled the **License all installs accessed by clients** option on the associated software model. If this option is enabled, CIs are licensed based on conditions that you specify on the software model, such as software install conditions. See [Software model fields](#) for more details on this option.

For Windows Server, each server installation requires Per Core (with CAL) rights that are licensed separately from the User and Device CAL rights in associated client access records. Other products like Oracle Java do not require rights to be licensed separately for server installations. For example, if you use CALs to license the users and devices that are accessing Oracle Java, you can enable Software Asset Management to automatically mark the corresponding Oracle Java installations as licensed. In this scenario, Software Asset Management licenses the Oracle Java installations as part of CAL licensing.

To enable this capability, you must add all CIs that a given server is installed on to the associated client access record. By specifying these CIs, you can enable Software Asset Management to determine which server installations your users and devices are connected to. After all users and devices on the client access record are licensed, all server installations on the specified CIs are also marked as licensed. No additional licenses are consumed for these installations.

- a. Select the **Devices with Installations** tab and then click **New**.

- b. In the **Device** field of the Create New Client Access Installed Device form, search for and select a CI that the associated server is installed on.

The **Active** field populates automatically for the specified CI. However, you can modify this field as needed.

- c. Select **Save**.

- d. Close the form to return to your client access record.
- e. Repeat steps a-d for each CI that the associated server is installed on.

What to do next

After you create a client access record, reconciliation runs on the associated server software as a scheduled job or on-demand. You can view your reconciliation results in the [License usage view](#). Use these results to determine your license compliance position and to remediate any non-compliance.

You can remediate non-compliance for your server software using the following remediation options:

- **Purchase Rights:** Generates a purchase order when the number of rights needed is greater than the number of rights owned across all client access records for the specified server software.
- **Create Allocations:** Allocates rights to unlicensed users or devices that have been added to the client access records for the specified server software.
- **Remove Allocations:** Removes rights from licensed users or devices when sufficient rights are unavailable.

Create a resource value record

Create a resource value record for each software model for which you want to calculate licensing requirements.

Before you begin

Role required: admin

Procedure

1. Navigate to **Workspaces > Software Asset Workspace > License operations > Resource Value**.
2. Select **New**.
3. On the form, fill in the fields.

Resource Value form

Field	Description
Name	Name of the resource value.
Software model	Software model of the software product that the resource value is associated with.
Company	Company of the associated resource value record.
Location	Physical location of the associated resource value record.
Units consumed	Total number of resource value units of the associated software product that you're currently consuming. For example, if you're protecting 50 terabytes of data using a data protection software product, set the Units consumed field to 50.

Field	Description
	For the Java SE software model with the Employee license metric, the Units consumed field must be set to the number of employees consuming the licenses.
Department	Department that the resource value record is assigned to.
Cost Center	Cost center that is financially responsible for the resource value.

4. Select Save.

Note:

You can create multiple resource value records for the same software model and give them unique names. All the resource value records with the same software model are taken into consideration before reconciliation is run.

Result

The resource value record that you created appears in the Resource Value list view.

Create user subscriptions in the workspace

Create software subscriptions for SaaS and SSO applications for users in the Software Asset Workspace.

Before you begin

The User subscription option is available only if the Software Asset Management - SaaS License Management (sn_sam_saas_int) plugin is activated.

Role required: sam_admin or sam_user

About this task

If you're using Software Asset Workspace, the option to create user subscriptions in Core UI is inactive.

Procedure

1. Navigate to the Create New Software Subscription form.
2. Select **New**.
3. On the Create New Software Subscription form, fill in the fields.

For more information on the Software subscription form fields and their descriptions, see [Software subscription fields](#).

4. Select Save.

- [Software models and Software entitlements](#)
- [Create software models in workspace](#)
- [Create entitlements in workspace](#)

View publisher part number (PPN) suggestions in workspace

View Content Service suggestions for your custom PPNs and DMAPS in the Software Asset Workspace.

Before you begin

PPN suggestions are available only if a corresponding match is found for your custom PPN in the Content Service. The PPN suggestion records are stored in the Part number suggestions [samp_sw_part_number_suggestion] table.

Role required: sam_admin.

Procedure

1. Navigate to All > Software asset > Software Asset Workspace > License operations.

You can also view the part number suggestions from the **License Usage** view by navigating to the Publisher details page and the **Progress indicators** section.

2. Select Part number suggestions from the Content suggestions list view.

3. Open a suggestion record to view the Part number suggestion page.

You can view the custom PPN details in the top part of the Part number suggestion page. The second half of the page contains the suggested part number details. All the entitlements where the custom PPN is used appear in the **Impacted entitlements** tab. All the software models where the custom DMAP is used appear in the **Impacted software models** tab. If no impacted software models exist, then this tab doesn't appear.

4. Select Accept or Reject.

- **Accept:** The Content Service PPN and DMAP replace the custom PPN and DMAP. In the impacted entitlement, the Content Service PPN is replaced. Similarly, the Content Service DMAP is replaced on the software model.
- **Reject:** The status of this record changes to rejected and you continue to use the custom PPN.

Manage phase-wise Software Asset Management implementation

Carry out phase-wise Software Asset Management implementation by publishing only on a few software products that you want to manage initially. You can also remove the software products from the published list when you no longer want to manage those products.

Set the domain-specific property to publish your software products

Use the domain separation application property of Software Asset Management to set the publish software products property for specific domains.

Before you begin

To set up domain separation application properties for Software Asset Management, you must activate the Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin on your ServiceNow instance.

Role required: sam_admin or admin

About this task

The *com.snc.samp.manage.published.product* application property enables you to specify the domains for which you want to enable publishing the software products in a phase-wise implementation of Software Asset Management.

Procedure

1. Navigate to **All > Software Asset Management > Administration > Application Properties.**
2. From the list of available application properties, select **com.snc.samp.manage.published.products.**
3. Create or update an application property value.
 - To create an application property value, select **New.**
 - To update an existing application property value, select that application property value from the list of available values.
4. On the form, fill in the fields.

Application Property Values form

Field	Description
Value	Value of the application property. You can specify one of the following: <ul style="list-style-type: none"> ○ true to enable the property. ○ false to disable the property.
Domain	Domain that you want the application property value to apply to.

5. Save the application property values.
 - To update an existing application property value, select **Update.**
 - To save a new application property value, select **Submit.**

What to do next

Publish the software products that you want to manage as part of phase-wise implementation of Software Asset Management. For more information, see [Publish a specific set of your software products.](#)

Publish a specific set of your software products

Report only on the licensable software products that are part of the current implementation phase of Software Asset Management by publishing those software products. By publishing only a few software products initially, you can assess the initial progress and gradually increase the scope of the implementation.

Before you begin

To be able to publish your software products, enable either the *com.snc.samp.manage.published.products* system property or the *com.snc.samp.manage.published.products* application property on your ServiceNow instance.

i Note:

The application property is domain-specific and available only on a ServiceNow instance that has domain separation activated for Software Asset Management. For more information, see [Domain separation and Software Asset Management](#) and [Set the domain-specific property to publish your software products.](#)

Role required: sam_admin

About this task

Note:

To view accurate data on the reports, you must [run software reconciliation](#) whenever the following occur:

- The system property *com.snc.samp.manage.published.products* is updated.
- The software products are published or removed from the list of published software.

Procedure

1. Navigate to **All > Software Asset Management Workspace > License operations**.
2. From the **SAM Implementation** list, select **Published products**.
3. Select **Add**.

Note:

If the **Add** option isn't available, make sure the *com.snc.samp.manage.published.products* property is enabled.

4. In the **Add to published products** dialog box, select the licensable software products that you want to publish and select **Add**.

Note:

When you publish a software product that is part of a suite, messages with links that contain the details of the parent software suite and its child software components are shown. You can view the details and publish these software products if necessary.

Result

- The software products are added to the Published products list that is grouped by the publisher.
- After you publish the products and run software reconciliation, you can view reports specific to only those published products in the License usage view and Software asset overview.

Remove published software products

Remove published software products that you no longer manage or report on as part of your Software Asset Management implementation.

Before you begin

To be able to remove software products from the list of published software products, make sure that either the *com.snc.samp.manage.published.products* system property or the *com.snc.samp.manage.published.products* application property is enabled on your ServiceNow instance.

Note:

The application property is domain-specific and available only on a ServiceNow instance that has domain separation activated for Software Asset Management. For more information, see [Domain separation and Software Asset Management](#) and [Set the domain-specific property to publish your software products](#).

Role required: sam_admin

Procedure

1. Navigate to **All > Software Asset Workspace > License operations**.
2. From the **SAM Implementation** list, select **Published products**.
3. Select the published software products that you want to remove from the list.
4. Select **Remove**.

Result

The software products that you removed are no longer shown in the Published products list.

Create product install conditions

Create product install conditions in the Software Asset Workspace that apply across all software models of a product during reconciliation.

Before you begin

Installs that do not meet the required product install conditions will be included in the reconciliation process; however, they are likely to be flagged as unlicensed.

To create product install conditions, you must request and activate the Software Asset Workspace (com.sn_sam_workspace) plugin. For details on requesting and activating the Software Asset Workspace (com.sn_sam_workspace) plugin, see [Request Software Asset Management](#).

Role required: sam_admin

About this task

Install conditions define where a software product can be installed. Product install conditions account for all the software model installations of a product during reconciliation.

Note:

If you want to set up install conditions for specific software models and not the entire software product suite, you can choose to add software install conditions. For details on adding software install conditions, see [Create software models in workspace](#).

Procedure

1. Navigate to **Software Asset > Software Asset Workspace > License operations > Licensing**.
2. Select **Product install condition**.
3. Select **New**.
4. From the list of available products, select a product.
5. Select **Set conditions**.
6. Add filter conditions that contain a field, operator, and value.
You can add multiple install conditions to a software product using the following options:
 - **or:** Enables you to specify any of the conditions that a software installation can meet to be included in reconciliation.
 - **and:** Enables you to specify all the conditions that a software installation must meet to be included in reconciliation.
 - **+ New condition set:** Enables you to specify additional sets of conditions that a software installation can meet to be included in reconciliation.
7. Select **Set**.

8. After setting up the install conditions successfully, select **Save**.

The install conditions are added for the complete suite of the software product. You can view the install conditions you have created on the Product install condition landing page.

Create or update an override license cost record

Create or update an override license cost record for your software entitlements based on your requirements.

Before you begin

Role required: sam_user, sam_admin

About this task

You can manually add or update the override license cost information for your software models and entitlements. When you create an entitlement for the Employee license metric, override license cost records are populated for Oracle Java, based on the data present in the Price tier [samp_price_tier] table. You can update the existing override license cost records according to the licensing agreement. For details on the tier-based pricing model, see [Pricing model for Oracle Java SE Universal](#).

Procedure

1. Navigate to **Software Asset Workspace > License operations**.
2. Select the target software model that you want to create or update the override license cost for.
3. Select the **Override License Costs** tab.
4. Select **New/Edit ranges**.
 - If you select **New**, the lower limit is calculated based on the employee count range in the Price tier [samp_price_tier] table, incrementing the previous upper limit by 1. For example, if the previous employee range is 40000-49999, then the lower limit is automatically populated as 50,000 for a new record.
 - If you select **Edit ranges**, all the existing records are set to inactive. You can select **Activate** after completing your updates to override license cost ranges.
5. On the form, fill in the fields.
For details on the override license cost fields and descriptions, see [Override License Costs](#).

Note:

You can revert your changes to the default values by selecting **Restore to default**.

6. Select **Save**.

Result

The override license cost record you created or modified appears in the **Override License Cost** list view. The following details are displayed for each record:

- Metric group
- License metric
- License cost
- License and maintenance cost

Reclaim software

Optimize your environment by reclaiming or removing installed software that is not being used or used infrequently.

Before you begin

Role required: sam_admin

About this task

Reclaiming software involves a workflow to remove software for a user. You can reclaim software for multiple reasons such as low usage, optimization generated due to consolidation, or overlapping subscriptions. The reclamation process can be managed manually through the creation of tasks or automatically using the Client Software Distribution (CSD 2.0) capabilities.

You can select **Show Workflow** at any point of time in the reclamation workflow to see the current stage the workflow is in. For information on CSD 2.0, see [Client Software Distribution 2.0 application](#) 

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace**.
2. Select **License usage**.
3. Select the **Removal candidates** tab.
4. Select to open a removal candidate record.
Ensure that the **Assigned to** field has a value. If not, select a value. Typically, the sam admin role takes ownership of the workflow and ensures that a group is mentioned in the **Assignment group** field. Having a group specified in the **Assignment group** field ensures that the approval goes to the correct group. The assignment group consists of users who can approve or reject a request to keep the software.
5. Select **Reclaim**

The state of the removal candidate record changes from **Ready** to **Awaiting User**. An email notification is sent to the user to whom the software license is assigned. The user details are mentioned under the removal candidate section.

An email notification is sent if the **Notify user** check box is selected in the reclamation rule record. If you don't select the **Notify user** check box, the task and email isn't sent to the user.

If the user is an ITIL user, then both email and the approval task will be created for the user. However, if the user is not an ITIL user then only an email is sent to the user.

The email mentions that the software is going to be reclaimed since it's not being used and provides the user with following two options:

- **Yes:** indicates keeping the software.
- **No:** indicates removing the software.

6. Select **Yes** or **No**.

If the user selects **Yes**, the following steps take place:

- a. A task gets created for the removal candidate record.
- b. The state of the removal candidate record changes to **Awaiting Approval** as a member of the assignment group needs to approve the request for keeping the software.
- c. A member of the assignment group approves or rejects the request.
 - If approved, the request in the email, the removal candidate record automatically moves to the **Close Skipped** state.
 - If the request is rejected, then the state of the removal candidate record changes to **Awaiting Revocation** which is handled by the sam admin role.

Note:

In case CSD 2.0 is not installed then the sam admin can assign the request to an individual who can manually uninstall the software. If CSD 2.0 is installed then the software is automatically removed. For more details, refer to the CSD 2.0 documentation.

If you have optimizations generated for Microsoft 365 products for low usage, consolidate, or overlapping subscription then you can automatically remove the subscriptions from the Microsoft 365 portal.

If you have integrations or API support reclamations, users will be removed automatically from the portal.

- If the installations or subscriptions are manually removed, then the sam admin role must manually mark the workflow as **Close Complete**. However if the process happens automatically then the system automatically updates the workflow record as **Close Complete**.

If the user selects **No**, the following steps take place:

- a. The state of the removal candidate record changes to **Awaiting Revocation**.
- b. Based on the scenarios mentioned in the above note, software removal takes place.

Note:

For removal candidates that are grouped into low usage or overlapping justifications, you do not need to manually remove subscriptions as auto reclamation is performed for these two justifications. For more information on justifications, see [Software installation optimization and removal](#).

Create a catalog request to reclaim assets

Create a catalog request to efficiently reclaim software assets when an employee leaves an organization or moves to a different role.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **Service Catalog**.
2. In the Service Catalog page, enter `Reclaim asset` in the **Search catalog** field on the right-hand side of the page.
3. Select **Reclaim Asset**.
4. On the form, fill in the fields.

Reclaim Asset form

Fields	Description
Requested by	The role of the person, such as HR, manager, or employee, who creates this catalog request.
Requested for	Name of the person for who you are submitting the catalog request.

Fields	Description
Employee separation	Whether the person for who you are submitting the asset reclamation is leaving the organization or moving to a different role.
Asset	Assets assigned to the person for who you are submitting the asset reclamation.
Reclaim date	The date by which you want the asset reclaimed by. You can enter today's date or a date in the future.
Reclaim method	The method you intend to use to collect the assets from the departing employee. You can pick up the assets, the employee can drop them off, or ship them to the organization.
Legal hold method	If the assets need to be kept on hold because of any legal reasons.
Notes/Special instructions	Any instructions that you may want to mention.

5. Select **Submit.**

The asset reclamation request is created. Once the request is created, the sam_user needs to close all the tasks mentioned in the request. For more details, see [Close an asset reclamation request](#).

Close an asset reclamation request

Close an asset reclamation request to efficiently reclaim software assets when an employee leaves an organization or moves to a different role.

Before you begin

Role required: sam_user or asset.

Procedure

1. Navigate to **Inventory > Asset Reclamation > Asset Reclamation Requests.**

2. Open the request that you want to fulfill.

In the Software Asset Reclamation Lines related list, a device reclamation line item is created for each device that is returned, has a corresponding CI record, has software installations on it, and that device was selected in the Reclaim Asset form. For example, if five computers were assigned to an employee, then for each computer a separate device reclamation line item is created.

An extra user reclamation line item is created if the **Employee Separation** check box was selected in the Reclaim Asset form.

3. Click the device reclamation line item.

The Software Asset Reclamation Line page opens, where a software asset reclamation task titled **Receive, evaluate and update asset** is created.

4. Click the **Receive, evaluate, and update task.**

The Software Asset Reclamation Task page opens. You now need to manually receive the asset, evaluate if the asset can be redeployed or reused, and then update the asset.

5. Select values for the **Assignment group and **Assigned to** fields.**

6. Click **Close Task** once you have completed all the tasks.

The line item state now changes to **Closed Complete**

For each software asset reclamation line item where the type is device reclamation, perform steps 3 to 6.

Note:

Once you receive the asset from the employee, navigate to the Asset page and change the values for the **State** and **Assigned to** fields. Since the asset is no longer assigned to a user, ensure that the **Assigned to** field is empty and the **State** field is not in the **In use** status.

If the asset that was updated has device allocations, then a software asset reclamation line task titled **Remove device license allocations** is created. All the device allocations records on that Asset (CI) are removed, and the task is marked as **Closed complete**.

If the asset that was updated has software install records, then a software asset reclamation line task titled **Remove software installs** is created. All the software install records on that Asset (CI) are removed, and the task is marked as **Closed complete**.

Once all the device reclamation tasks are complete and if a user reclamation line item is not created, then the status of the catalog request changes to **Complete**. However, if a user reclamation task is created, then you need to take care of the following steps to complete and close the user reclamation line item.

Note:

A user reclamation task is created if the **Employee Separation** check box was selected in the Reclaim Asset form.

A user reclamation workflow is initiated once the reclaimed date mentioned in the Asset Reclamation Request form has lapsed. A user license allocation task titled **Revoke user license allocations** is automatically created to remove all user license allocations. A few manual tasks are also created that need to be completed.

7. Complete the following manual user reclamation tasks:

- Revoke SSO access (if the employee had any SSO provider plugin enabled)
- Revoke Citrix access (if the employee had the Citrix plugin enabled)
- Revoke SAP access (if SAP publisher pack plugin was enabled)
- Revoke user subscriptions. Open the task and ensure that removal candidate records are created for each user subscription record.

8. Once all the user reclamation tasks are closed, the status of the catalog request changes to **complete**.

Create and manage reports in workspace

Create and manage your report tiles in the Software Asset Workspace.

Before you begin

Role required: sam_admin or admin

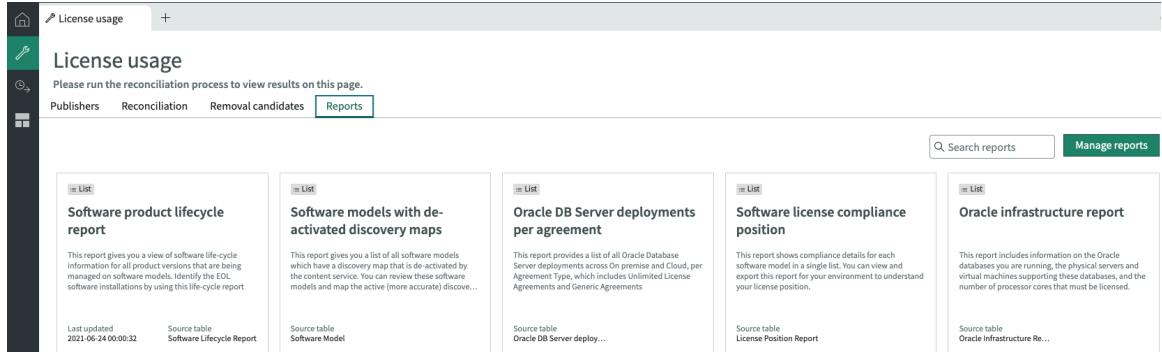

About this task

All the base system Software Asset Management reports and the custom created reports are stored in the SAM Workbench Report [sam_workbench_report] table. List reports are supported by default. For creating other types of reports, you need to create a UIB page in the Software Asset Workspace with the necessary data visualization. A parameter called *reportSysId*

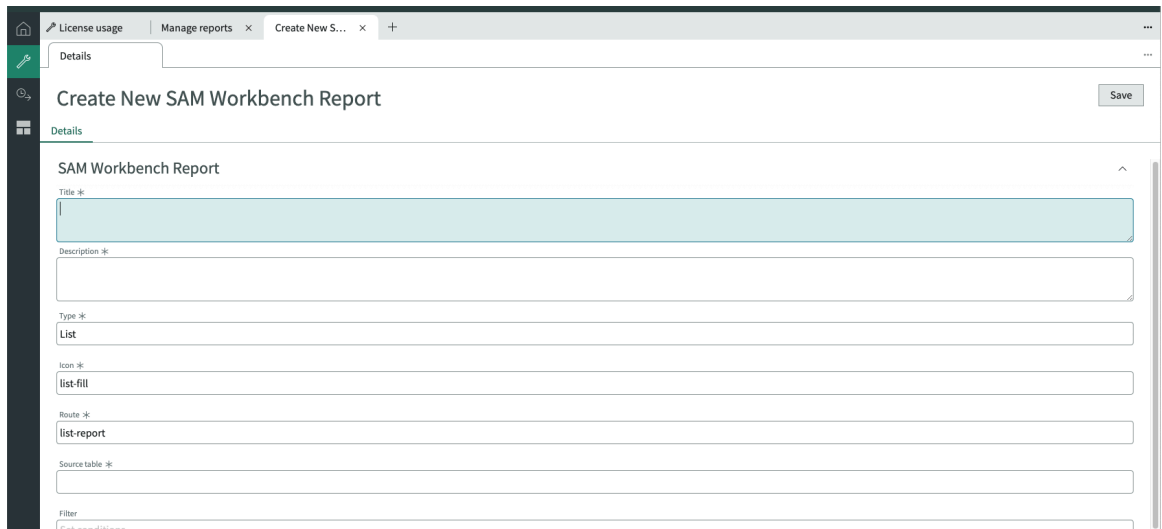

needs to be passed to the UIB page. You can utilize the UIB page's route in the report tile creation form after it has been built.

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License usage**.
2. In the License usage view, select the **Reports** tab.

3. Select **Manage Reports**.
4. In the Reports list view page, select **New**.
The Create New SAM Workbench Report page appears.

5. Fill in the details in the page.

Field	Description
Title	The title of the report tile.
Description	A brief description of the report tile.
Type	The type of the report. For example, list, bar, pie chart. The default value is List.
Icon	The unique icon identifier from the Now Design System icon library. Examples include chart-bar-group-fill, chart-pie-fill. The default value is list-fill.

Field	Description
Route	This the path taken by a report when it is clicked. This takes you to the list view of the source table with the specified filter conditions. This can be routed to any other page within the Software Asset Management application provided that the page accepts the <i>reportSysId</i> parameter. The default value is list-report.
Source table	The table on which the report is based.
Filter (Set conditions)	The filter to be used on the list report.

6. Select Save.

The new report tile appears on the Reports tab. You may need to reload the Reports tab to see the new report tile.

View your cluster setup in 360 degrees

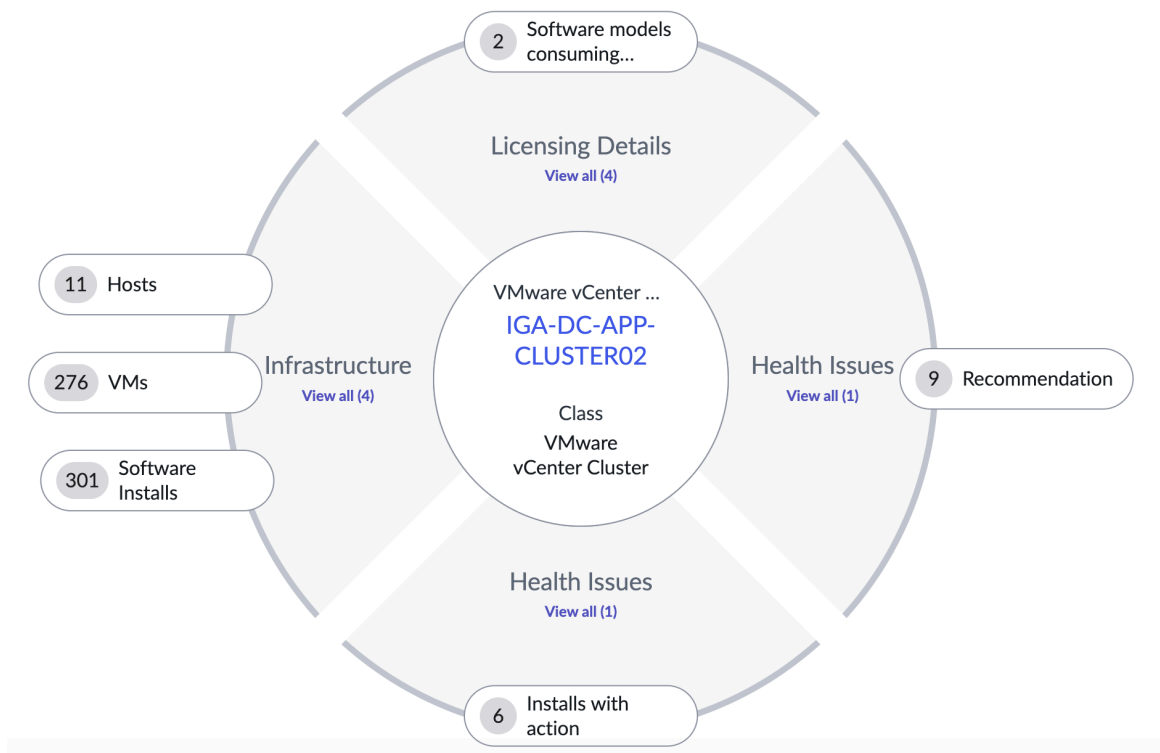

Get a 360-degree perspective of your cluster setup to manage license consumption across the cluster.

Before you begin

Role required: sam_admin

Procedure

1. Navigate to **Software Asset Workspace > License usage**.
2. Select a publisher card to open the publisher details page.
3. From the Publisher details page, select a software model from the navigation tree on the left hand side.
4. From the **License Metrics Results** tab, select the value on the **Licenses required** column.
5. In the Licenses Required By page, select a cluster from the **Cluster** column.
The cluster record page opens.
6. Select **SAM Cluster 360°**.
The cluster setup appears.

7. View the following details on the cluster.

- **Infrastructure:** View entities such as hosts, virtual machines (VMs), host affinity rules, and software installations in the cluster. Select an entity to view the complete list. For example, select **Software Installs** to view all software installations. You can group the software installations by normalized publisher, normalized product, or by software model results. You can also select any software installation from the list such as SQL Server to view all SQL Server software installations in that cluster.
- **Licensing details:** View the software models consuming licenses, allocations, device license consumption analysis, and ignored installations on the cluster. Select an entity to view the complete list.
- **Health issues:** View all health issues across products in the cluster. Additionally, view installations that require your attention to be considered for reconciliation.

The 360-degree view lets you drill down from the top view of an entity to the lowest level to better understand license composition and remediation actions across the cluster. As an example, you can select a software model to drill down to view its metric attributes, override license costs, downgrade rights, software entitlements, and software model results. You can further select any of these entities, such as software model results, to get to its lowest denominator.

8. Select **Open Dependency View to view the relationship between the nodes of the cluster.** For details on Dependency Views, see [Dependency Views map menus and controls](#) .

View calculations for your licenses in workspace

Evaluate the license compliance of software applications by viewing the details for all required licenses through the Software Asset Workspace License usage view.

Before you begin

Role required: sam_admin and sam_user

Procedure

1. Navigate to **All > Software asset > Software Asset Workspace > License usage**.
2. View the summary of a software model by selecting a publisher from the left pane.
3. View the number of licenses purchased and required by selecting the **License Metric Results** tab.

For more information about the fields in the License Metric Results tab, see the License metric results table in [License usage publisher fields in workspace](#).

4. View the details about the required licenses by selecting a value for a configuration item under the **License required** column.

Required by (Device)	Cluster	Assigned to	Licenses required	Licensing status	Is Virtual
Cluster: Cluster C (10) Show all					
Cluster: Cluster X (3) Show all					
Cluster: Cluster Y (3) Show all					
Cluster: Cluster1 (21) Show all					
Cluster: Cluster102 (1) Show all					
Cluster: Cluster103 (3) Show all					
Cluster103_ESX0	Cluster103	Abel Tuter (Architect)	16	Licensed	false
Cluster103_ESX1	Cluster103	Abel Tuter (Architect)	16	Licensed	false
Cluster103_ESX2	Cluster103	Abel Tuter (Architect)	16	Licensed	false

Licenses Required by

Field	Description
Required by (Device)	Name of the configuration item such as server, cluster, which consumes the licenses. The Required by (Device) field is replaced by the Required by (SAP Cloud use type) field when the publisher selected is SAP and the product is SAP S/4HANA.
Cluster	<ul style="list-style-type: none"> ○ If the configuration item is part of any cluster, the cluster name displays. ○ If the configuration item is not part of any cluster, the value is empty.
Assigned to	Name of the user assigned to that particular configuration item.
Licenses required	Sum of rights that the configuration item (allocated, not allocated, and installed) uses.
Licensing status	Indicates whether the configuration item is licensed or not licensed.
Is Virtual	Indicates whether the configuration item is a virtual or physical host.

5. View all the downgrades being used by the license.

This related list only appears if the specified license is used by a downgrade version of the software. If a downgrade is not using any rights, that downgrade doesn't appear in this related list.

Downgrades

Field	Description
Software model	Name of the software model.
Rights used	Number of rights used by the license.
Install count	The number of installations being used for the software model for the specified license.

6. In the Licenses Required By related list, view the details of required licenses by selecting the value for a device under the **License required** column.

The screenshot shows the 'Licenses Required By' related list in the ServiceNow interface. The main table lists users and their license requirements:

Required by (User)	Licenses required	Licensing status	Email
David Loo	1	Licensed	david.loo@example.com
Beth Anglin	1	Licensed	beth.anglin@example.com
Bow Ruggeri	1	Licensed	bow.ruggeri@example.com
Bud Richman	1	Licensed	bud.richman@example.com
Chuck Farley	1	Licensed	chuck.farley@example.com
Asset Manager	1	Licensed	itam@example.com
Annie Approver	1	Licensed	annie.approver@example.com
Carol Coughlin	1	Licensed	carol.coughlin@example.com

Below the table, there are two detailed views:

- Licenses required calculation:** Shows details for 'David Loo', including 'Total # of licenses required' (1), 'Licensing status' (Licensed), and 'Allocated not in use' (0). It also includes a 'License metric' section with a description and a 'License Consumption Explanation'.
- License consumption breakdown:** Shows a breakdown for 'David Loo' with 'Licensable installs' (1) and 'Licenses required' (1).

Licenses required calculation

Field	Description
Licenses required by	The cluster for which the calculations are shown.
Total # of licenses required	The total number of licenses consumed or required.
Licensing status	Shows the status of licenses. Licensed implies that all rights were used. Not Licensed implies that rights are required.
Allocated not in use	Rights allocated on the cluster but are unused to license any installations. The value 0 implies that there are no allocations on the cluster.

Field	Description
	<p>Note: Allocated not in use are the rights that are wasted because the user or device for which these rights have been allocated does not have the software installed.</p>
Not allocated in use	Number of rights for license installations, but not allocated.
Level 1 Relationships	<p>Relationship of hosts to the current configuration item.</p> <p>Note: Appears only for server-based calculators.</p>
Dependency View	Graphically displays an infrastructure view for a configuration item.
License Metric	Detailed explanation of the license metric.
License Consumption Explanation	A detailed license consumption summary post reconciliation. The summary gives you a thorough understanding of how your license rights are used, the methodology behind license calculations and the reasoning for the consumption process.

7. View the infrastructure of a configuration item and the metric attributes applied by selecting the **License consumption breakdown** tab.

License consumption details Software installs licensing details Host affinity rules

License consumption breakdown ¹ Refresh Filter Export

Last refreshed 6m ago.

Required by	Processors	Cores	Licensable cores	Licenses required
ESX1 - SQL Cluster A	1	2	4	4

Showing 1-1 of 1 ◀ 1 ▶ 20 rows per page

Metric attributes applied

Attribute	Attribute value	Description
Minimum cores per processor	4	The amount of core rights that must be applied to a physical processor or set of vCores.

License consumption breakdown

Fields	Description
Required by	Name of the configuration item that consumes the rights.
Processors	Number of processors on this configuration item.
Cores	Numbers of cores in this processor.
Licensable cores	Number of core licenses required to license this configuration item.
Licenses required	Number of licenses required to license this configuration item.
Metric attributes applied	Software products from publishers such as Microsoft require a minimum number of licenses to be assigned. For example, Microsoft SQL Server requires a minimum of 4 core licenses for each processor on a server. Metric attributes auto-assign these licenses.

8. View the details of the installations covered by licensing related to the configuration item by selecting **Software installs licensing details**.

Software installs licensing details ⁶ Refresh Filter Edit Export

Last refreshed just now.

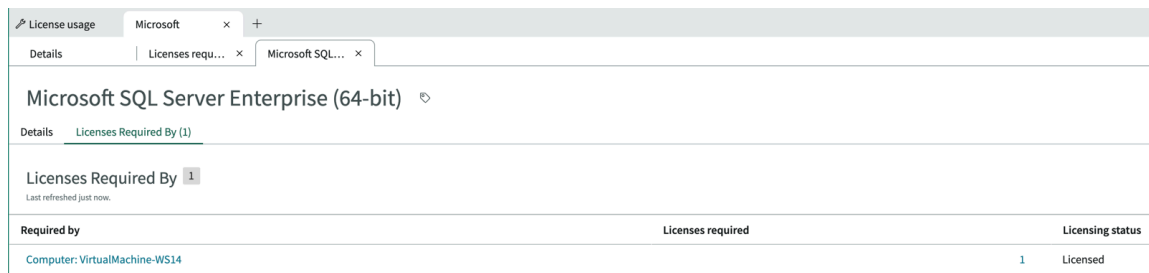

<input type="checkbox"/>	Normalized display name	Discovery model	Installed on	Assigned to	Unlicensed install
	Microsoft SQL Server Enterprise 2019	Microsoft SQL Server (64bit) Enterprise 2019	ESX3-CVM1-SQL Cluster A	(empty)	true
	Microsoft SQL Server Enterprise 2019	Microsoft SQL Server (64bit) Enterprise 2019	ESX2-CVM1-SQL Cluster A	(empty)	true
	Microsoft SQL Server Enterprise 2019	Microsoft SQL Server (64bit) Enterprise 2019	ESX2-CVM2-SQL Cluster A	(empty)	true
	Microsoft SQL Server Enterprise 2019	Microsoft SQL Server (64bit) Enterprise 2019	ESX1-CVM1-SQL Cluster A	(empty)	true
	Microsoft SQL Server Enterprise 2019	Microsoft SQL Server (64bit) Enterprise 2019	ESX1-CVM2-SQL Cluster A	(empty)	true
	Microsoft SQL Server Enterprise 2019	Microsoft SQL Server (64bit) Enterprise 2019	ESX3-CVM2-SQL Cluster A	(empty)	true

Software installs licensing details

Field	Description
Normalized display name	The normalized display name of a software product.
Discovery model	Normalizes the software you own by analyzing and classifying models to reduce duplication.
Installed on	Configuration item on which the software is installed.
Assigned to	Name of the user assigned to this configuration item.

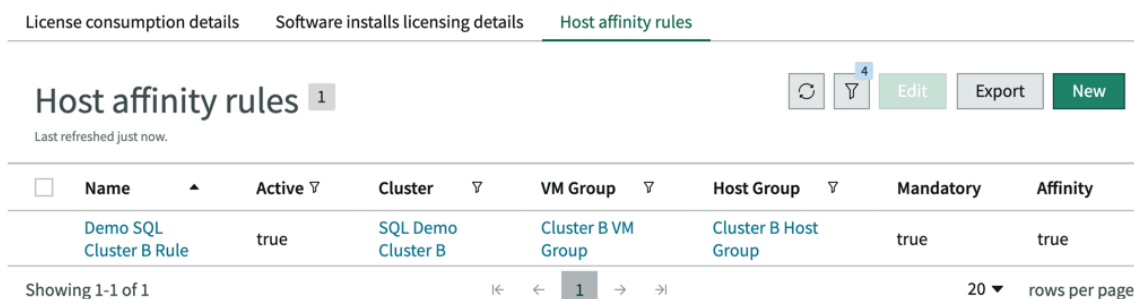

Field	Description
Unlicensed install	Indicates whether the install is licensed or unlicensed.

- a. View the licensing status of an install on various hosts within a cluster by selecting a normalized display name for Per Core and Per Core (with CAL) license metrics.

- 9. Check the accuracy of the license consumption and view the host affinity rules configured for a cluster by selecting the **Host affinity rules** tab.

Host affinity rules can be configured for SQL Server and Windows Server Standard while determining license consumption. This helps to optimize the number of licenses required and significantly minimizes the number of licenses required resulting in cost savings.

Host affinity rules

Field	Description
Name	Name of the rule configured for the cluster.
Active	Indicates whether the configured rule is active or inactive.
Cluster	Name of the cluster where the host affinity rule is configured.
VM Group	Name of the group of virtual machines.
Host Group	Name of the group of hosts.
Mandatory	Indicates whether the configured rule is required.
Affinity	Indicates whether the virtual machines live on a host group.

- 10. View the suite components for the software model.
This tab appears only if the software model is a suite.

Suite components

Field	Description
Suite parent	The parent suites to which the software is assigned. For example, the parent suite for several common Microsoft products is a version of Microsoft Office.
Suite child	The child product or products of the suite. For example, Microsoft Word and Microsoft Excel are child products of Microsoft Office.
Mandatory	Requirement of a suite component. A suite component can be Optional, Always Mandatory, or Mandatory Group.

License usage publisher fields in workspace

Field descriptions for the related lists for publishers in the Publishers page in the License usage view.

Product Results

Field	Description
Number	Unique product result number that is generated during the reconciliation process.
Publisher	Publisher of the software.
Product	Name of software product.
Group	Group to which the product result belongs.
Subgroup	Subgroup to which the product result belongs.
Latest	Indicates whether this product result is from the most recent reconciliation run.
Reconciliation result	Unique reconciliation result number that is generated during the reconciliation process.
Status	Status of the product. <ul style="list-style-type: none"> • Compliant • Not Compliant
True-up cost	Estimated cost of remediating non-compliance based on the lowest number of rights needed.
Over-licensed amount	Estimated cost of rights not being used. The sum of all Over Licensed amount values from every software model result.
Potential savings	Estimated cost of savings if software installations are reclaimed. The sum of all potential savings from all removal candidates.

Field	Description
Licensed installs	Total number of installations that are licensed for the product.
Unlicensed installs	Total number of installations that are unlicensed for the product.

Software Model Results

Field	Description
Software model result	Name of the software model.
Status	Status of the software model.
Unlicensed installs	Total number of installations that are unlicensed for the associated software product.
True-up cost	Estimated cost of remediating non-compliance based on the lowest number of rights needed.
Over-licensed amount	Estimated cost of rights not being used.
Potential savings	Estimated cost saved if reclamation candidates are reclaimed.

License metric Results

Field	Description
Software model	Name of the software model
License metric	Name of the license metric that the software license is counted against when reconciliation runs.
Licenses owned	Sum of all active rights from entitlements that share a license metric.
Licenses required	Sum of rights that are used during reconciliation (allocated plus not allocated and installed).
Licenses available	Sum of rights that are not used during reconciliation (rights owned minus rights used).
True-up cost	Estimated cost of remediating unlicensed installations that are based on the lowest number of rights needed.

Entitlements

Field	Description
Display name	Name of the publisher.

Field	Description
Metric group	The metric group specific to the publisher.
License metric	The license metric for the metric group that the software license is counted against when reconciliation is run.
License type	The type determines whether the rights grant full access to the software or if they are being upgraded from a previous version of the software.
Active rights	<p>Number of rights to be granted for this entitlement.</p> <p>Note: If an enterprise contract is attached to the license, the Active rights field is not shown</p>
Purchased rights	Number of rights you purchased.
Total cost	

Removal candidates

Field	Description
Number	Removal candidate number.
Name	Name of the removal candidate.
Publisher	Name of the publisher.
Product	Name of the product.
Potential savings	Savings to be gained from reclaiming unused software installations.
State	<p>State of the removal candidate.</p> <ul style="list-style-type: none"> • Attention Required • Ready • Awaiting User • Awaiting Approval • Approval • Awaiting Revocation • Closed Complete • Closed Skipped
Justification	<p>Reason for becoming a removal candidate.</p> <ul style="list-style-type: none"> • Low Usage (default) • Unallocated

Field	Description
	<ul style="list-style-type: none"> • Unlicensed • Restricted Software

Remediation options

Field	Description
Remediation action	<p>Action to take for compliance.</p> <ul style="list-style-type: none"> • Purchase Rights • Remove Allocations • Create Allocations • Remove Unallocated Installs (Not available for Oracle database options) • Remove Unlicensed Installs (Not available for Oracle database options) • Remove Unlicensed Installs - Cloud (available only if you have cloud installations)
Status	<p>Status of the remediation option.</p> <ul style="list-style-type: none"> • New (blue) • Complete (green) • Void (red) • In Progress (yellow) <p>In Progress state indicates that removal candidates were created for the installs.</p>
Affects compliance	Specifies whether the remediation options affect compliance.
Display Name	Specific license metric of the software model result.
Actionable rights	Total rights affected by the action.
True-up cost	Estimated cost of remediating unlicensed installations based on the lowest number of rights needed.

Create an end of life workflow request for your software products

Manage risks associated with your software product installations that have reached the end of life (EOL) or are reaching EOL in the next 18 months. You can create an EOL request and take the required action for the EOL software.

Before you begin

Role required:

- Create or modify an EOL request: sam_admin, itil users
- Read an EOL request: sam_user, users with an itil role to whom a task is assigned
- Complete an EOL task: sam_user, users with an itil role to whom a task is assigned

About this task

When software products reach EOL, end of support, or end of extended support, their risk of failure increases. You can choose to remove such software products that are reaching or have reached EOL, upgrade them to the latest software version, or purchase additional support for their maintenance. The EOL workflow takes you through the process of completing your change request based on the action you choose for your EOL software products. If you want to purchase additional support for your EOL software, you can create a purchase order.

Note:

You must have the Procurement plugin (com.snc.procurement) activated to complete a purchase order.

The EOL workflow can also be completed using the Software End of Life Flow in the Flow Designer application. You can customize the Software End of Life Flow according to your requirement by creating a copy of the flow and customizing the copy that you have created.

Procedure

1. Navigate to **Software Asset Workspace > Software asset analytics > Lifecycle management**.
2. On the [Lifecycle management dashboard](#), select the **Upcoming end of life product lifecycles in next 18 months** report or the **Current and past end of life product lifecycles** report.

The End of life products page displays the current and upcoming life-cycle phases calculated using the Software Product Lifecycle [sam_sw_product_lifecycle] table. For more details, see [Software models and Software entitlements](#).

3. Select a record that has the **Current phase** as either End of Support, End of Extended Support, or End of Life.
The Software Product Lifecycle report opens for the selected record.

Note:

You can also access the Software Product Lifecycle report by navigating to **Software Asset Workspace > License usage > Reports**.

4. Create an EOL request by selecting **Manage EOL risk**.

The product details in the Software EOL request form are populated from the Software Product Lifecycle Report [sam_sw_product_lifecycle_report] table.

5. On the Software EOL request form, fill in the fields.
For details on the fields and descriptions, see [Software EOL request fields](#).
6. Start the EOL workflow to take required action for your EOL software.
 - a. Select **Start EOL Workflow**.
 - b. Select the **Software EOL Tasks** tab.
 - c. On the Software EOL task form, fill in the fields.
For details on the form fields and descriptions, see [Software EOL tasks tab](#).

d. Complete the subtasks for the parent task by selecting the **Software EOL Subtasks** tab.

Note:

If a parent task has subtasks, you must close all the subtasks.

e. Repeat steps b through d for all the tasks listed on the **Software EOL Tasks** tab.

- If you select one of the following values in the **Action** field on the **Software EOL Tasks** tab, a change request is generated:
 - Remove EOL software
 - Upgrade
 - Move to Azure

For details on removing an EOL software product, see [Complete the end of life workflow request for your software product](#). For details on completing a change request and the role required for it, see [Process a change request](#) .

- If you select **Purchase support** in the **Action** field and select the **Auto create PO** option in the EOL task, a purchase order is created. For details on completing a purchase order and the role required for it, see [Create a purchase order line item](#).

After you complete the parent task, the **Stage** field is updated to reflect the stage of the task. Additionally, the **Action initiated** field is updated to reflect the action you have selected for the EOL request.

Note:

You can cancel the EOL workflow anytime by selecting the **More Actions** ellipsis icon and then selecting **Cancel EOL request**.

Result

After the change request or the purchase order is complete, the workflow request is complete.

Complete the end of life workflow request for your software product

Perform all the tasks that are required to remove the end of life (EOL) software products from your asset inventory. If you set the **Action** field to **Remove EOL Software** in the Decide on IT strategy task, you must perform these software EOL tasks.

Before you begin

Before you proceed with removing the EOL software, you must start an EOL workflow request. For details, see [Create an end of life workflow request for your software products](#).

Role required: sam_user, users with an itil role to whom a task is assigned

About this task

To close an EOL request, you have to close and complete all the tasks required to complete the workflow. The following procedure explains how to close the EOL request, when you set the **Action** field to **Remove EOL Software** in the Decide on IT strategy task. You can apply the same approach to close the EOL request for the following possible values in the **Action** field in the Decide on IT strategy task:

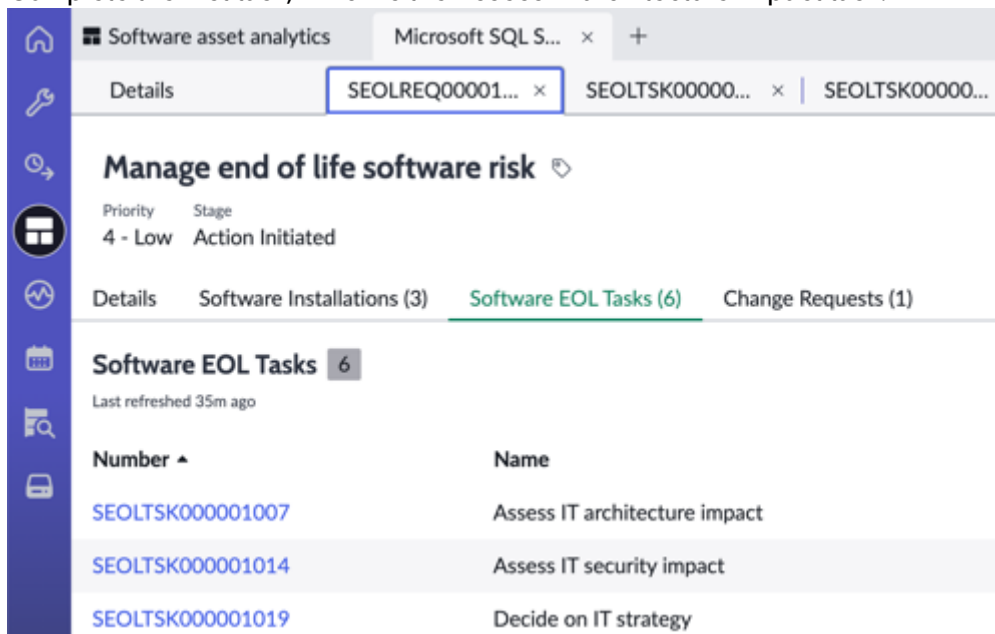

- Upgrade
- Purchase support

- Move to Azure
- Accept risk

Additionally, the EOL workflow can be completed using the Software End of Life Flow in the Flow Designer application. You can customize the Software End of Life Flow according to your requirement by creating a copy of the flow and customizing the copy that you have created.

Procedure

1. Navigate to **Software Asset Workspace > Software Asset Analytics > Lifecycle management**.
2. On the Lifecycle management dashboard, open the End of life (EOL) products page by selecting the **Upcoming end of life product lifecycles in next 18 months** report or the **Current and past end of life product lifecycles** report.
3. From the list of available EOL products, select the product for which you want to complete the EOL workflow.
4. On the product record, select the **Software EOL Requests** tab.
5. From the list of available software EOL requests, select the request number for which you want to complete the tasks.
6. Complete the first task, which is the Assess IT architecture impact task.

- a. On the **Software EOL tasks** tab, select the task number for the Assess IT architecture impact task.
- b. On the **Details** tab of the Assess IT architecture impact task, fill in the fields. For details on the form fields and their description, see [Software EOL tasks tab](#).
- c. Complete the subtasks for the Assess IT architecture impact task by selecting the **Software EOL Subtasks** tab.

Note:

If a parent task includes subtasks, you must close all the subtasks. After you close all the subtasks, the parent task is automatically updated with a state of Closed Complete. Additionally, a new task appears on the **Software EOL tasks** tab only after you have closed and completed the preceding task.

7. Complete the Assess IT security impact task.
 - a. On the **Software EOL tasks** tab, select the task number for the Assess IT security impact task.
 - b. On the **Details** tab of the Assess IT security impact task, fill in the fields.
For details on the form fields and their description, see [Software EOL tasks tab](#).
 - c. Complete the subtasks for the Assess IT security impact task by selecting the **Software EOL Subtasks** tab.
8. Complete the Decide on IT strategy task.
 - a. On the **Software EOL tasks** tab, select the task number for the Decide on IT strategy task.
 - b. On the **Details** tab, select **Remove EOL software** in the **Action** field.
For details on the form fields and their description, see [Software EOL tasks tab](#).
 - c. Select **Close Task**.
The Decide on IT strategy task is automatically updated with a state of Closed Complete. The corresponding Assess software licensing impact task appears in the list view on the **Software EOL Tasks** tab.
9. Complete the Assess software licensing impact task.
 - a. On the **Software EOL tasks** tab, select the task number for the Assess software licensing impact task.
 - b. On the **Details** tab of the Assess software licensing impact task, fill in the fields.
For details on the form fields and their description, see [Software EOL tasks tab](#).
 - c. Select **Close Task**.
The Assess software licensing impact task is automatically updated with a state of Closed Complete. The corresponding Complete secure backup task appears in the list view on the **Software EOL Tasks** tab.
10. Complete the Complete secure backup task.
 - a. On the **Software EOL tasks** tab, select the task number for the Complete secure backup task.
 - b. On the **Details** tab of the Complete secure backup task, fill in the fields.
For details on the form fields and their description, see [Software EOL tasks tab](#).
 - c. Select **Close Task**.
The Complete secure backup task is automatically updated with a state of Closed Complete. The corresponding Create IT change plans task appears in the list view on the **Software EOL Tasks** tab.
11. Complete the Create IT change plans task.

- a. On the **Software EOL tasks** tab, select the task number for the Create IT change plans task.
 - b. On the **Details** tab of the Create IT change plans task, fill in the fields.
For details on the form fields and their description, see [Software EOL tasks tab](#).
 - c. Select **Close Task**.
The Create IT change plans task is automatically updated with a state of Closed Complete. A change request appears on the **Change Requests** tab.
- 12.** Select the change request and review the values that are automatically populated in the Change Request form.
For details on completing a change request, see [Process a change request](#) .

Result

After the change request is complete, the workflow request is also complete.

Run a health check scan for Software Asset Management

Run a health check scan on your Software Asset Management configurations and get recommendations on fixing any errors that might exist.

Before you begin

Role required:

- sam_user
- implementation partners
- support analyst

About this task

You can run a health check scan to find the health score for the complete configuration of the Software Asset Management application or for a specific part of the configuration.

Procedure

- 1.** Navigate to **Software asset > Software Asset Workspace > Success portal > Health check**.
- 2.** Select the **Health check** tab.
- 3.** Select **Execute Scan**.
- 4.** Select the suite on which you want to run the health check scan.
- 5.** Select **Execute** to begin the scan.
All the checks in the selected suite get executed across your environment.
- 6.** After the scan is complete, select **View result** to view the scan result.
All issue records for the health checks are displayed under **Scan Findings** on the Scan Result page.
- 7.** Select on an issue record to get more details on an error such as detailed description of the error, resolution details.
You can create tasks and assign the tasks to individuals to act on the recommendations.
- 8.** Create tasks and assign the tasks to individuals to act on the recommendations.
Once the errors are fixed, you can run the scan again to see improved health scores.

Create a Value builder task

Manually create a Value builder task for publisher packs not being fully utilized in your instance.

Before you begin

Role required: sam_admin

About this task

Value builder tasks are automatically created for all publisher packs indicated as incomplete in the Publisher pack utilization widget. However you can also manually create Value builder tasks.

Procedure

1. Navigate to **Software Asset Workspace > Software asset success portal > Value builder**.
2. Click **New task**.
The Create New SAM Value Builder Task page appears.
3. On the form, fill in the fields.
4. Click **Save**.
The Value builder task is created and the state defaults to **New**.
5. Click **Start**.
The state of the task changes to **Work In Progress**.

View all maturity items for Software Asset Management

View the maturity of your Software Asset Management (SAM) program to analyze the status of each maturity stage, where each stage shows the number of maturity items completed.

Before you begin

Role required: sam_admin, sam_user

Note:

The sam_user can only view the maturity items. The sam_admin can view and change the state and success goal of the maturity item.

About this task

The maturity of your SAM program is divided into three stages:

- Crawl
- Walk
- Run

For more information, see [Maturity stages of your Software Asset Management program](#).

Note:

The maturity level can't be modified for a required maturity item.

Procedure

1. Navigate to **Workspaces > Software Asset Workspace > Success portal**.
2. On the Overview page, select **View all maturity items**.
The All maturity items page opens, which lists all the maturity items included in the stage your SAM program is in.
3. Select a maturity item to view its details.
For a description of the field values, see [Maturity item details](#).
4. If you want to create a Value builder task for the maturity item, select the **Value builder tasks** tab.
For more information about creating a Value builder task, see [Create a Value builder task](#).
5. Select **Save**.

Create success goals for Software Asset Management

Create success goals to track the success of the Software Asset Management application in your instance.

Before you begin

Role required: sam_admin

Procedure

1. Navigate to **Workspaces > Software Asset Workspace > Success Portal**.
2. Select **Create success goal**.
3. On the form, fill in the details.
For a description of the field values, see [SAM Success Goal Details](#).
4. Select **Save**.
The success goal appears in the [License operations view](#) under the Success goals list. You can cancel or delete a success goal from the License operations view.

Related topics

[Create success activities for Software Asset Management](#)

[Create a success goal category for software assets](#)

[Success portal view in Software Asset Workspace](#)

Create success activities for Software Asset Management

Create success activities to track the success of your goals.

Before you begin

Role required: sam_admin and sam_user

Procedure

1. Navigate to **Software Asset Workspace > Success Portal**.
2. Select **Create success activity**.
3. On the form, fill in the fields.
For a description of the field values, see [SAM Success Activity](#).
4. Select **Save**.

Result

The success activity appears in the License operation view under the Success activities list.

Related topics

[Create success goals for Software Asset Management](#)

[License operations view](#)

Create a success goal category for software assets

Create a success goal category for adding the category to the Software Asset Management success goal.

Before you begin

Role required: sam_admin

Procedure

1. Navigate to **Software Asset Workspace > License operations > Success goals > Categories**.
2. Select **New**.
3. On the Success Goal Category form, fill in the category that you want to add and select the **Software asset category** check box.

Result

The category that you add gets listed as an option in the **Category** field while creating a success goal for Software Asset Management. For more information, see [Create success goals for Software Asset Management](#).

Create demand to rationalize software applications

Create demands to rationalize SaaS and SSO applications by discontinuing software subscriptions, reducing software usage, and migrating users to approved software.

Before you begin

Role required: sam_admin or sam_user

Note:

The sam_admin and sam_user roles must have the it_demand_user role to create demand.

The PPM Standard (com.snc.financial_planning_pmo) plugin must be installed to create demands.

The Software Asset Management application includes the following demand actions that are ready for you to use:

- Discontinue after expiration
- Migrate to approved product
- Discontinue immediately
- Reclaim licenses
- No action

About this task

Use the Overlapping usage view to drive SaaS and SSO application rationalization by viewing the feature level usage of each application. For more information, see [Overlapping usage view](#).

Procedure

1. Navigate to **Software Asset Workspace > Overlapping usage**.
2. Select the **Application feature usage** tab.
3. Select the application in a category for which you want to create a demand.
4. Select **Create demand**.
The **Create demand** option is available only when you select an application that you want to create a demand for.
5. On the form, fill in the fields.

Software Asset Demand

Field	Description
Name	Name of the demand.
Number	Unique auto-generated identification number for the demand.
Submission status	Stage of the demand record. <ul style="list-style-type: none"> ○ Draft ○ Submitted ○ Screening ○ Qualified ○ Approved
Start date	Start date for the demand. The field name is replaced by Planned start date when the demand type is converted to a Project. Note: When you change the planned start date of a demand or project, the associated cost and resource plans also change.
Due date	Requested completion date for the demand. The field name is replaced by Planned end date when the demand type is converted to a Project.
Category	Software category of the demand. <ul style="list-style-type: none"> ○ Strategic ○ Operational
Type	Type of demand. <ul style="list-style-type: none"> ○ Enhancement ○ Project

Field	Description
	<ul style="list-style-type: none"> ○ Change ○ Defect <p>The Category field selection determines the selections available in this field.</p>
Assessment required	<p>Option for enabling the assessments for the demand.</p> <p>By default, the field is selected. When clear, the assessment questionnaire isn't triggered for the demand.</p> <p>When this field is clear, and you reset the demand to Draft, the value for the Assessment Required field is retained as clear.</p>

6. Optional: Select the **Demand Requirements** tab to view the details of the already-created requirements.

You can also create a demand requirement. For more information, see [Create a demand requirement](#).

7. Select **Save**.

Result

The demand is created with the **Submission status** field set to **Submitted**.

What to do next

Use the ServiceNow® Demand Management application to approve and complete the demand. For more information, see [Demand Management](#).

You can create a project for the demand by selecting the **Create Project** related link. A project enables you to track the status, percent complete, and duration of the work required to accomplish the demand. You can also create project tasks to define the work items that are required to complete the project. For more information, see [Project Management](#).

To view all Software Asset Management demands, navigate to **Software Asset > Software Asset Demand > Demands**.

To view all Software Asset Management demand requirements, navigate to **Software Asset > Software Asset Demand > Demand Requirements**.

Create a demand requirement

Create a demand requirement for rationalizing your SaaS and SSO applications.

Before you begin

Role required: sam_admin or sam_user

Note:

The sam_admin and sam_user roles must have the it_demand_user role to create demand.

The PPM Standard (com.snc.financial_planning_pmo) plugin must be installed to create demands.

Procedure

1. Navigate to **Software Asset Workspace > Overlapping usage**.
2. Select the **Application feature usage** tab.
3. Select the application in a category for which you want to create a demand.
4. Select **Create demand**.
The **Create demand** option is available only when you select an application that you want to create a demand for.
5. Select the **Demand Requirements** tab.
6. Select **New**.
All the fields are auto-populated.
7. On the form, fill in the fields.

Create New Demand Requirement

Field	Description
Demand Requirement	
Number	Unique auto-generated identification number for the demand requirement.
Software asset demand	Software asset demand for which you're creating the requirement.
Product	Product or application for which the demand requirement is created.
Main category	Category of the application. For example, if you select Zoom in the Product field, the Main category field would be set to Video Conferencing .
Action	Action items identified for the demand. <ul style="list-style-type: none"> ○ Discontinue after expiration ○ Migrate to approved product ○ Discontinue immediately ○ Reclaim licenses ○ No action
Description	Description of the demand requirement.
Notes	Additional notes for the demand requirement.
Spend Information	
Spend amount	Total spend on the application based on entitlements.

8. Select **Save**.

Result

The demand requirement for the demand is created. You can view the created demand on the Software Asset Demand [samp_demand] table.

What to do next

To view all Software Asset Management demand requirements, navigate to **Software Asset > Software Asset Demand > Demand Requirements**.

Install Content library portal for Software Asset Management

Install the Content library portal store application to view the data stored in the Software Asset Management Content Service.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#) .
- The Content library portal application requires the following plugins. Ensure that these plugins are activated before you install the Content library portal application.

Required ServiceNow plugins**Activate all Software Asset Management Professional (com.sn_samp_master) plugin**

Loads the following Software Asset Management Professional plugins in one step: Software Asset Management Professional (com.sn.samp) plugin, All publisher pack add-on plugins, and Software Asset Management UI Components (com.sn_samp_workbench). To enable SaaS License Management, you must request the Software Asset Management – SaaS License Management Integrations (sn_sam_saas_int) plugin separately from the ServiceNow Store.

Software Asset Workspace (com.sn_sam_workspace) plugin

Required to use the Software Asset Workspace, the new user interface of the Software Asset Management application.

AI Search plugin (com.glide.ais)

Activates AI search functionality.

 Note:

If you have installed Software Asset Management Professional (com.sn_samp_master) plugin, you can view data stored in the Software Asset Management Content service. If you have installed both Software Asset Management Professional (com.sn_samp_master) and Hardware Asset Management Professional (com.sn_hamp) plugins, you can view both Software Asset Management and Hardware Asset Management data stored in the Content service. For more information about installing Content lookup portal for Hardware Asset Management, see [Install Content lookup to view Hardware Asset Management data](#).

Role required: sam_admin

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Content library portal application using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

3. In the Application installation dialog box, review the application dependencies.

Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install the Content library portal application.

4. Select **Install**.

Using Software Asset Management classic

Use the classic Software Asset Management framework to manage your licenses, compliance, and optimization.

Create entitlements in Software Asset Management classic

Create entitlements in the Software Asset Management application classic to record your license details and allocate purchased software rights to users or devices.

Before you begin

Role required: sam_user

About this task

These instructions are for manually creating software entitlements or maintenance entitlements one at a time. If you already have software entitlements recorded in a spreadsheet, you can [import](#) them.

To automate the process of creating a software entitlement, specify a publisher part number in the software entitlement form. Based on the publisher part number, the software model, metric group, agreement type, and software lifecycle data (if it exists) automatically appears in the form.

To better manage your existing entitlements, you can edit certain fields in entitlements. You can edit fields such as **Purchased rights**, **Software model**, **License type**, **Number of packs**, and **Publisher part number**. Entitlements that have related entitlements, upgrade history, entitlement history, or upgraded entitlement are not editable.

Note:

Microsoft reserve entitlements and source entitlements are not editable.

If you installed SaaS License Management, a software model is generated automatically after you create an integration profile. Create an entitlement for the software model to track software used against software owned. For more information about tracking SaaS licenses and usage, see [Viewing your SaaS and SSO subscriptions](#).

If you installed the SAP publisher pack, see [Record software rights for SAP](#).

If you installed the Citrix publisher pack, see [Record software rights for Citrix](#)

Procedure

1. Navigate to **All > Software Asset > Licensing > Software Entitlements**.
2. Select **New**.
3. On the form, fill in the fields to record your license information.
For detailed descriptions of the fields, see [Software entitlement fields](#).

4. Right-click the form header and select **Save.**

Saving the form instead of submitting keeps you on the entitlement record so you can perform additional configuration.

5. To specify users and devices that have software rights allocated to them, select the **User Allocations or **Device Allocations** section.**

The **Device Allocations** section is not visible for the IBM Resource Value Unit (RVU) license metric. The Resource Value Unit (RVU) license metric is licensed at the product level and so rights are not used by individual devices. When you upgrade from a prior release, that had device allocations, to the Yokohama release, the existing device relocations are removed.

6. To track your software downgrade rights, select the [Downgrade Rights related list](#) and specify the version.

Creating a new record allows you to set an entitlement to previous versions of software. For example, the purchase of Microsoft Office Professional Plus 2016 rights entitles you to Microsoft Office Professional Plus 2013 too).

For more information, see [Downgrade Rights](#).

7. To track the cost of your software over its lifecycle, configure [expense lines](#) .**8. To manage license keys, select the [License Keys related list](#) and specify which licenses keys are allocated to entitlements.****9. To view the history of all maintenance entitlements that you have purchased, select the Entitlement History related list.**

For example, if you purchased two maintenance entitlements, M1 (which is now retired) and M2 (currently in use), the Entitlement History related link displays both M1 and M2.

10. To view the history of the newly upgraded software model related to your entitlement and the previous software model, select the Upgrade History related list.**11. Select **Update**.**

The entitlement is created and added to the entitlement list view.

[Software entitlement fields](#)

[Software models and Software entitlements](#)

[Software license metrics](#)

Create maintenance entitlements in Software Asset Management classic

Define license details, for all publishers other than Microsoft, to manage all your software license maintenance needs such as start and end dates of your contracts and software upgrades.

Before you begin

Role required: admin

Procedure**1. Navigate to **All > Software Asset > Licensing > Software Entitlements**.****2. Click **New**.****3. On the Software Entitlement form, fill in the mandatory fields and select **Maintenance** in the **License type** field.**

For a detailed description of all the fields, refer to [Software entitlement fields](#).

If the **Next Version** field is populated in the software model that the maintenance entitlement is associated with and the metric group selected in the maintenance entitlement is **Common**,

then the maintenance entitlement is updated with the next version of the software model. Next version is applicable only for the **Common** metric group.

4. Right-click the form header and select **Save**.

Note:

If you purchase a perpetual entitlement and associate only some of the rights of that entitlement with a maintenance entitlement, your perpetual entitlement is automatically split into two entitlements. For example, you purchased a perpetual entitlement with 50 active rights (E1). You associate 20 of these rights with 20 rights of a maintenance entitlement. Your E1 perpetual entitlement is now automatically split into two entitlements: one perpetual entitlement (E1) with 20 active rights (and 50 purchase rights) associated with 20 rights of the maintenance entitlement (M1) and another perpetual entitlement (E2) with 30 active rights without any maintenance association and no purchased rights.

5. Perform additional configurations on your new maintenance entitlement record.

For a detailed description, see [Software entitlement fields](#).

You can't add user or device allocations for maintenance entitlements.

- a. Enter information pertaining to finance such as the vendor from which the asset was purchased, the invoice number, in the **Financial** tab.
- b. Enter information relating to contracts such as the lease contracts, the expiration date of the warranty in the **Contracts** tab.
- c. Link related perpetual entitlements to your maintenance entitlement from the **Related Entitlements** tab.
 - i. Select the **Related Entitlements** tab.
 - ii. In the **Related Entitlement** field of the Related Entitlements list, double-click **Insert a new row...**
 - iii. When prompted, search for and select the related perpetual entitlement that you want to link and then click the Save (✔) icon.
 - iv. Double-click the corresponding **Active rights** field.
 - v. When prompted, enter the number of rights that you want to grant to the related perpetual entitlement and then click the Save (✔) icon.
 - vi. Click **Save** on the Software Entitlement form header.

To remove the relationship between the perpetual and maintenance entitlement, remove the entitlement from the Related Entitlements list.

If the entitlement has split and you've deleted the maintenance entitlement, the perpetual entitlement is not removed.
- d. View the downgrade rights for the software model associated with the maintenance entitlement in the **Downgrade Rights** related list.
- e. To manage license keys, and specify which licenses keys are allocated to entitlements, click the **License Keys** related list
- f. To track the cost of your software over its lifecycle, click the **Expense Lines** related list.

- g. To view the history of all maintenance entitlements that you have purchased, click the **Entitlement History** related list.
For example, if you purchased two maintenance entitlements, M1 (which is now retired) and M2 (currently in use), the Entitlement History related link displays both M1 and M2.
- h. To view the history of the newly upgraded software model related to your entitlement and the previous software model, click the **Upgrade History** related list.

6. Click **Update**.

Create entitlements for Microsoft Software Assurance in Software Asset Management classic

Define license details for Microsoft Software Assurance (SA) to manage your contracts start and end dates, software upgrades, and related software entitlements.

Before you begin

Role required: sam_user or sam_admin

Procedure

1. Navigate to **All > Software Asset > Licensing > Software Entitlements**.
2. Click **New**.
3. On the Software Entitlement form, fill in the details about the software publisher rights that you've purchased and select **Maintenance** in the **License type** field.

i Note:

Make sure that you enter the number of rights to be granted for the SA entitlement in the **Active rights** field. You can't add user or device allocations for SA entitlements.

For a detailed description of the fields related to all entitlements, see [Create entitlements in Software Asset Management classic](#).

4. Right-click the form header and select **Save**.
An entitlement appears in the Software Entitlement list.

i Note:

If you purchase a perpetual entitlement and associate only some of the rights of that entitlement with a SA entitlement, your perpetual entitlement is automatically split into two entitlements. For example, you purchased a perpetual entitlement with 50 active rights (E1). You associate 20 of these rights with 20 rights of a SA entitlement. Your E1 perpetual entitlement is now automatically split into two entitlements: one perpetual entitlement (E1) with 20 active rights (and 50 purchase rights) associated with 20 rights of the SA entitlement (M1) and another perpetual entitlement (E2) with 30 active rights without any SA association and no purchased rights.

5. To perform additional configuration, select your new software entitlement record from the Software Entitlements list.
 - a. To link related perpetual and SA entitlements, use the following steps:
 - i. On the Software Entitlement form, select the **Related Entitlements** tab.
 - ii. In the **Related Entitlement** field of the Related Entitlements list, double-click **Insert a new row...**

- iii. When prompted, search for and select the related perpetual or SA entitlement that you want to link and then click the Save (✔) icon.
- iv. Double-click the corresponding **Active rights** field.
- v. When prompted, enter the number of rights that you want to grant to the related perpetual or SA entitlement and then click the Save (✔) icon.
- vi. Click **Save** on the Software Entitlement form header.

To remove the relationship between the perpetual and SA entitlement, remove the entitlement from the Related Entitlements list.

If you delete either the perpetual or SA entitlement that is linked, the other entitlement isn't deleted.

If the entitlement has split and you've deleted the SA entitlement, the perpetual entitlement is not removed.

- b. To link your software to a newer version as part of your maintenance contract, click the Upgraded Entitlements related list.

Note:

This related list is only available if you selected **Step-up** as the entitlement license type.

If the **Next Version** field is populated on the software model, entitlements with active SA are updated to the new version of the software model.

After you've linked your related entitlements, if there aren't enough SA rights to cover the perpetual entitlement rights, an error message displays.

- c. To view all previously related entitlements that are linked, click the Entitlement History related list.

Note:

Validation is run against the active rights of all related entitlements automatically. If there's an error with the calculation, a message with additional information on how to resolve the problem is displayed.

6. Click Update.

Result

After you've created an entitlement, you can begin [viewing license usage](#).

Example: Record software rights for Microsoft Software Assurance

You have purchased 100 rights of Microsoft SQL Server 2016.

To accurately track your licenses, associate your perpetual and SA entitlements.

The screenshot shows the 'Software Entitlement' form for 'Microsoft SQL Server 2016 Standard Core'. The form is divided into several sections:

- General Information:**
 - Display name: Microsoft SQL Server 2016 Standard Core
 - Asset tag: (empty)
 - Publisher part number: (empty)
 - Software model: Microsoft SQL Server 2016 Standard Core
 - Agreement type: Generic
 - License type: Software Assurance
 - Start date: 2019-06-02
 - End date: 2021-06-02
- Financial/Operational Details:**
 - Metric group: Microsoft
 - License metric: Per Core
 - Purchased rights: 100
 - Active rights: 100
 - Allocations available: 100
 - Unit cost: \$ 9.30
 - Total cost: \$930.00
- Asset Management:**
 - Serial number: (empty)
 - Owned by: (empty)
 - State: In use
 - Substate: -- None --
 - Maintenance:
 - Company: (empty)
 - Location: (empty)
 - Department: (empty)

Buttons for 'Update' and 'Delete' are visible at the bottom left. Below the form, there are tabs for 'Expense Lines (1)', 'Entitlement Histories', and 'Linerada Histories'.

While you are under active maintenance, Microsoft releases SQL Server 2016 datacenter. Step up from your current version to the new release by creating an entitlement for your upgraded software and link the related entitlements.

The screenshot shows the 'Software Entitlement' form for 'Microsoft SQL Server 2016 Datacenter'. The form is divided into several sections:

- General Information:**
 - Display name: Microsoft SQL Server 2016 Datacenter
 - Asset tag: (empty)
 - Publisher part number: (empty)
 - Software model: Microsoft SQL Server 2016 Datacenter
 - Agreement type: Generic
 - License type: Step-up
 - Start date: 2019-06-30
 - End date: 2021-06-30
- Financial/Operational Details:**
 - Metric group: Microsoft
 - License metric: Per Core
 - Purchased rights: 100
 - Active rights: 100
 - Allocations available: 100
 - Unit cost: \$ 1,000.00
 - Total cost: \$100,000.00
- Asset Management:**
 - Company: (empty)
 - Location: (empty)
 - Department: (empty)

The 'Upgraded Entitlements' tab is active, showing a table with columns for 'Upgrade from' and 'Number of rights'. A '+ Insert a new row...' button is visible below the table. Buttons for 'Update' and 'Delete' are visible at the bottom left.

Import bulk entitlements in Software Asset Management classic

You can import multiple entitlements together using a Microsoft Excel spreadsheet in Software Asset Management classic.

Before you begin

Role required: sam_user or sam_admin

About this task

The entitlement import records are stored in the Entitlement import [samp_bulk_import] table.

Procedure

1. Navigate to **All > Software Asset > Entitlement Import**.
2. In the Entitlement imports page, select **New**.
A new entitlement import record opens.
3. In the Entitlement import page, click **Download template** to download a spreadsheet template(.xlsx).

You can add software entitlement fields to the template to include additional fields in your import. Add each field as a new column in the template. The column name must match the field label exactly. You can include base system software entitlement fields as well as your custom software entitlement fields. To learn how to create a custom field, see [Add and customize a field in a table](#) .

By default, the **Unit cost** column in the spreadsheet takes into account the currency that your system is set to. However you can manually change the currency and the Software Asset Management application will honor the currency that you specify. To specify a currency, enter the currency code followed by a semicolon and the cost. For example, EUR ; 200. Valid currency codes are the ones listed in the Currency [fx_currency] table and have the **Active** column set to true.

4. Enter the entitlement details in the template and select **Click to add** to select and upload the spreadsheet.
Once the file is uploaded, the name of the file appears and the **Description** field is automatically populated.
5. Select **Import**.
A confirmation message appears informing you that the import of entitlements is in progress. Once the process is completed, the fields on the page show the number of rows that were processed, successful, and with errors. Once you attach and import a spreadsheet, an import record is created that retains the history of the upload for you to view later.
6. Select the link on the confirmation message to view the status of the import record.
The Entitlement Imports page appears listing all the entitlement import records.
7. Select the entitlement import record to display the Entitlement Import page.
The Entitlement Import page contains two tabs:
 - **Entitlements**: lists all the entitlements that got successfully created.
 - **Relate entitlements**: lists entitlements, such as maintenance entitlements, that are in the build state and can be linked to the base entitlements.
8. If any errors occur, select **Review import errors** to open the Entitlement Import Errors page.
Only records whose error status is **Needs review** are listed by default. You may need to reload the page to view **Review import errors**.
9. Select an import error record to view its errors.
The Entitlement Import Errors page appears. For a detailed description of the entitlement import error fields, see [Entitlement import error fields](#).
10. Correct the errors and then select **Import**.
The entitlement is successfully created. For more information on resolving errors, see [Entitlement import error actions](#).

Create software models in Software Asset Management classic

Create a software model to add product details that are used to connect software rights you purchased with software installations discovered on your system.

Before you begin

Role required: sam_user or model_manager

About this task

You can manually create a software model. However, you can leverage the Software Asset Management Content Service Library to automate the creation of software models through their relationship to software entitlements. While creating or importing a software entitlement, specifying a publisher part number automatically creates a software model (if needed) or links to an existing software model. You need to manually create a software model if a publisher part number is not available, a publisher part number does not exist in the Content Service Library, or if you are creating a software model for a custom product.

Note:

If you have the model_manager role, you can navigate to **Product Catalog > Product Models > Software Models** but cannot administer all aspects of software models.

View and track life cycle information of your product versions (licensable, minor or build) via product life cycles. Product life cycles are associated to software models. Product life cycles are based on attributes such as publisher, product, edition, edition condition, version, and version condition. The life cycle information is maintained in the Product Lifecycle [sam_sw_product_lifecycle] and Custom Product Lifecycle [sam_custom_sw_product_lifecycle] tables.

You can view a detailed product life cycle report in the Software Asset Analytics dashboard and drill-down to the software installations. You can also manually create product life cycles and view product life cycles associated to a software model in the [Software Product Lifecycle related list](#) in the Software Model form layout.

Note:

Duplicate product life cycles can be created but in different domains.

You can view the life cycles for all the versions of the product on the software model form layout by clicking the **Show Product Lifecycles for all Versions** related link.

If you've installed the SAP publisher pack, see [Record publisher details for SAP](#).

Procedure

1. Navigate to **Software Asset > Licensing > Software Models**.
2. Select **New**.
3. On the Software Model form, [fill in the details](#) about the software publisher.
4. Right-click the form header and select **Save**.
5. Specify whether your software publisher is part of a suite.
 - To designate your software model as a suite parent, select the [Suite Parents related list](#) and add all software included with the suite.
 - To designate your software model as a suite component, select the [Suite Components related list](#) and add the parent suite.

Note:

If you've added a discovery map to your product details, predefined suites are used and suite components are created automatically for known suite parent.

6. To enable self-service capabilities for the software that is associated with your software model, publish the software model to your service catalog.

- a. Select the **Publish to Software Catalog** related link.
The Publish <*software - model*> to Software Catalog dialog box opens.
 - b. On the dialog box, set the **Category** field to **Software**.
 - c. Select **OK**.
7. To see discovery maps that have the match the software publisher and product fields of the software model, select the **Show Matching Discovery Models** related link.
 8. To view all the product lifecycles associated with your software model, select the [Software Product Lifecycles](#).
Select **New** to create a custom product life-cycle.
 9. To set the attribute value, select the [Metric Attributes related list](#) and complete the form.
When you add an attribute value, entitlements with this publisher information associated with them automatically have the **Metric Group** field populated. Based on the metric group, only license metrics related to the publisher are available.
 10. To associate your software model with a vendor, select the [Vendor Catalog Item related list](#) and complete the form.
 11. To specify the number of devices or users that are accessing the software, select the [Client Access related list](#) and complete the form.
 12. To create a new record for the software downgrade rights, select the [Downgrade Rights related list](#) and complete the form.

Note:

If your software model has a discovery map associated with it and the discovery map has downgrade rights, the downgrade rights are populated automatically. Downgraded versions of the software appear in a hierarchical list. For more information, see [Downgrade Rights](#).

13. Select **Update**.

View normalization suggestions in Software Asset Management classic

View normalization suggestion records that are created for discovery models. You can accept or reject these suggestions.

Before you begin

Role required:

- **sam_admin**: accepts or rejects the normalization suggestions.
- **sam_user**: views normalization suggestions.

The records are contained in the Normalization Suggestions [`samp_normalization_suggestions`] table.

Procedure

1. Navigate to **All > Software Asset > Discovery > Normalization Suggestions** For details on the normalization suggestion fields, see [Normalization suggestions for discovery models](#).

Note:

Suggested field values that differ from actual field values are indicated by a blue dot.

2. Select **Accept** to make the suggested changes to the discovery model, or click **Reject** to keep the existing settings.

Note:

Only the sam_admin role can accept or reject the normalization suggestions. For more details on accepting or rejecting suggestions, see [Normalization suggestions for discovery models](#).

View a software job result

You can view the results of Software Asset Management jobs that have run to verify completion.

Before you begin

Role required: sam_admin

About this task

Job results include:

- Discovery Model Normalization
- Identify Restricted Installs
- Identify New Reclamation Candidates
- Software Usage Import
- Update Existing Reclamation Candidates
- Software Asset Management Content Service Upload/Download

All Software Asset Management scheduled jobs are listed in the **System Definition > Scheduled Jobs** navigation area. Software Asset Management scheduled job names begin with the product name (SAM).

Note:

The default date, time, and order of Software Asset Management scheduled jobs are configured for optimal performance. Changing a scheduled job from the default run setting may not be optimal for performance or data availability.

Procedure

1. Navigate to **Software Asset > Administration > Job Results**.

2. Open a record to view the job results.

Software Asset Job Result form

Field	Description
Number	Number of the job result that is generated when the job is run.
Name	Name of the job.
Status	Status of the job.

Field	Description
Created	Date and time job was created.
Updated	Date and time job was updated.

Manually normalize a software discovery model in Software Asset Management classic

You can edit a software discovery model to manually normalize discovered software that has not been fully normalized (partially normalized, publisher normalized, or match not found) on the Software Discovery Models form so that it can be reconciled.

Before you begin

Role required: sam_user

About this task

If the information automatically added to the software discovery model is incomplete, you can add the missing fields to manually normalize the software discovery model.

Procedure

1. Navigate to **All > Software Asset > Discovery > Discovery models** and open a discovery model record that has a normalization status of Partially Normalized, Publisher Normalized, or Match Not Found.
2. Fill in the **Publisher**, **Product**, and **Version** fields, as appropriate.
You can create a [custom product](#) from the Product lookup list, if desired.
3. Select **Save**.
The normalization status is set to Manually Normalized.
4. **Optional:** To revert normalization, select **Revert Normalization**.

Note:

Discovery models with a status of Normalized, Partially Normalized, or Publisher Normalized revert to the status of Match Not Found. Discovery models with a status of Manually Normalized and discovery models that have been normalized using pattern rules cannot be reverted.

(Optional) Fields are reset to their original values, and any rules associated with the software discovery model are deactivated.

Manually override edition value in Software Asset Management classic

When the edition of a software install is not automatically discovered, you can specify the edition on the Software Installation form with the correct value (if known) so the software can be successfully reconciled.

Before you begin

Role required: sam_admin

About this task

For reconciliation to run successfully, the publisher, product, version, and edition fields of the software must be set. When the edition is not discovered automatically (edition value is not included as part of the **Display name** field) but you know the edition, you can manually set it to the correct value (Enterprise, for example).

Once the edition value is set, the discovery model for the software install is automatically reset. If the appropriate discovery model does not exist, a new one is created.

i Note:

Not all software products consist of an edition. Of the software products consisting of an edition, not all edition values are automatically discoverable.

Procedure

1. Navigate to **All > Software Asset > Discovery > Software Installations** and open the software installation record for which to set the edition value.
2. Fill in the **Edition override** field, as appropriate.

i Note:

The **Edition override** field is a free-form field (no lookup list) therefore, since this field is used as a key, the value entered must be exact.

3. Select **Update**.

The software installation is associated to different discovery model containing the edition value as part of the primary key. If the appropriate discovery model does not exist, a new one is created.

Discovered engineering licenses in Software Asset Management classic

View a list of all the discovered and normalized software for your engineering applications.

Navigate to **Software Asset > Discovery > Discovered Engineering Licenses**

You can view a list of all the normalized publishers and products for your engineering applications. Additional information such as the version, quantity of licenses, and the type of license is also displayed.

Software license usage

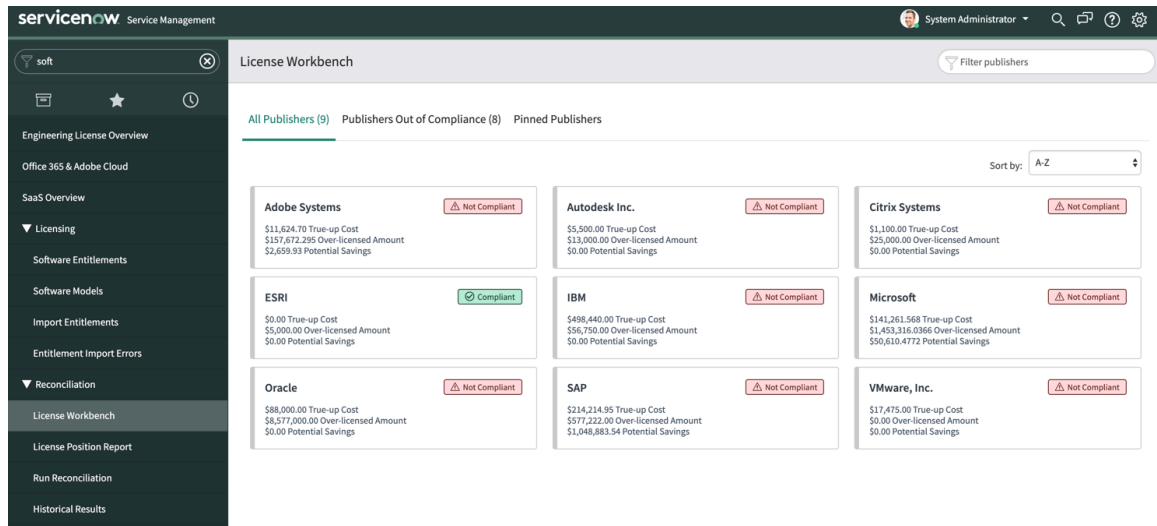

Review reconciliation results in a simplified workbench view.

The License Workbench lets you forecast the needs of your organization by trending the number of rights consumed against the number of active rights purchased. You can stay in compliance by purchasing additional rights before software consumption surpasses the number of rights owned.

Workbench features include:

- Color-coded compliance banner
- Financial calculations on card
- Publisher pinning functionality (user specific, saved)
- Sort card functionality
- Active filtering
- Card drill down to Product Results list
- Keyboard control
- Group and subgroup reconciliation information, if applicable

License workbench

Pinned publishers are listed in the **Pinned Publishers** tab. The list of pinned publishers is saved

on a per-user basis.

License Workbench tabs

Tab	Description
All Publishers	List of all publishers.
Publishers Out of Compliance	List of all publishers where status is not compliant.
Pinned Publishers	User-specific saved list of publishers that have been grouped.

Publisher workbench navigation tree

Drill down on a specific publisher, product, software model, or license metric in the workbench navigation tree to view the calculation and compliance information from the latest reconciliation results.

The navigation tree features are:

- Filter products (active filtering, including collapsed items)
- Compliance toggle switch
- Expand and collapse tree links
- Software model compliance icons

The screenshot shows the Microsoft License Workbench interface. On the left is a navigation tree with categories like 'Age of Empires', 'Exchange Server', 'Office', 'Office 365', 'Project', 'SQL Server', 'Visio', and 'Windows Server'. The main area displays a summary for Microsoft, including 'Total Spend' (\$5,237,544.49), 'True-up Cost' (\$56,451.592), 'Over-licensed Amount' (\$782,302.7607), and 'Potential Savings' (\$30,432.7472). Below this is a 'Product Results (8)' table with columns for Product ID, Product Name, Status, True-up cost, Over-licensed amount, and Potential savings.

Product ID	Product	Status	True-up cost	Over-licensed amount	Potential savings
PR0001020	Exchange Server	Compliant	\$0.00	\$207,796.44	\$0.00
PR0001021	Office	Compliant	\$0.00	\$115,375.10	\$0.00
PR0001022	Office 365	Not Compliant	\$15,960.00	\$10,320.00	\$0.00
PR0001023	Project	Not Compliant	\$40,391.592	\$17,731.69	\$23,328.9072
PR0001024	SQL Server	Compliant	\$0.00	\$157,230.2678	\$0.00
PR0001025	Visio	Not Compliant	\$100.00	\$80,806.18	\$7,103.84
PR0001026	Windows Server	Compliant	\$0.00	\$193,043.0829	\$0.00
PR0001027	Age of Empires	Not Compliant	\$0.00	\$0.00	\$0.00

By default, the navigation tree on the publisher license overview page is collapsed. When expanded, it's grouped by publisher.

Publisher: Product Results related lists:

- [Software Model Results](#)
- Licensed Installs
- Unlicensed Installs (SAP: Unlicensed Users or Unlicensed Engines)
- Unlicensed Subscriptions (Subscription-based software)
- Removal Candidates

Software Model Results related lists:

- License Metric Results
- Remediation Options: The **Rights Needed By** tab is not visible for the Resource Value Unit (RVU) IBM license metric. Rights are not used by individual devices, as the Resource Value Unit (RVU) license metric is licensed at the product level.

Note:

For more details on the remediation options, see [View software model results](#).

- Licensed Installs
- Unlicensed Installs (SAP: Unlicensed Users)
- Unlicensed Subscriptions (Subscription-based software)
- Unlicensed Consumptions (Consumption-based software models)
- Unlicensed Options (Oracle only)
- Removal Candidates
- Purchase Orders (only when the Procurement (com.snc.procurement) plugin is active)

License Metric Results related list:

- Rights Used By: Not visible for the Resource Value Unit (RVU) IBM license metric. The Resource Value Unit (RVU) license metric is licensed at the product level; it is calculated based on the total consumption of the product in your enterprise.

Note:

Four additional fields are visible in the Rights Used By related list if you have cloud installations.

- Licensed Installs
- Installs Used (SAP: System Users)
- Downgrades/Upgrades
- Licensed Subscriptions
- Cloud Special Rights: This tab is available only if you have cloud installations on cloud platforms such as AWS or Azure. This tab is a subset of the Rights Used By tab and displays fields pertaining to cloud installations. For detailed descriptions on the Cloud Special Rights fields, refer to the Rights Used By tab.

Report calculations

Report	Description
Publisher, product, software model	
Total Spend	Total cost of rights owned.
True-up Cost	Estimated cost of remediating unlicensed installations based on the lowest number of rights needed (rights needed multiplied by average price per right from entitlements). The lowest cost from Purchase Rights remediation options.
Over-licensed Amount	Estimated cost of rights not being used. The sum of the Over Licensed amount from the True-up value costs.
Potential Savings	Cost saved if removal candidates are reclaimed.
Agreement Type	Software license type.
License Metric results	
Display name	Name of the license metric that the software license is counted against when reconciliation runs.
Rights owned	Sum of all active rights from entitlements that share a license metric.
Rights used	Sum of rights that are used during reconciliation (allocated plus not allocated and installed).
Rights available	Sum of rights that are not used during reconciliation (rights owned minus rights used).

Report calculations (continued)

Report	Description
<p>Legacy license</p> <p>Note: This field appears only if your environment has dedicated hosts on AWS or on Azure.</p>	<p>Indicates licenses purchased before 1 Oct 2019.</p> <p>Note: Microsoft has updated licensing rules for dedicated hosts based on the purchase date.</p>

Rights Used By

Field	Description
Used by	User or device using the rights.
Rights used	Sum of rights used during reconciliation (allocated + not allocated and installed).
Cloud Provider	Name of the cloud provider.

Field	Description
	<p>i Note: This field appears only if you have cloud installations on AWS or Azure.</p>
Dual Use Rights Applied	<p>Indicates if the concurrent rights provided by Microsoft Azure that allows simultaneous usage of rights on-premise and on cloud is applied or not.</p> <p>i Note: This field appears only if you have cloud installations on AWS or Azure.</p>
Host Type	<p>Type of host on the cloud: shared or dedicated.</p> <p>i Note: This field appears only if you have cloud installations on AWS or Azure.</p>
Edition Flexibility Applied	<p>Indicates if the edition flexibility benefits provided by Microsoft Azure for Windows Server and SQL Server is applied or not.</p> <p>i Note: For details on the edition flexibility benefits, refer to Licensing rules for BYOL and BYOS.</p> <p>This field appears only if you have cloud installations on AWS or Azure.</p>
Allocated in use	<p>Rights that are allocated and are used to license installations.</p>
Not allocated in use	<p>Number of rights that are used to license installations, but not allocated.</p> <p>When this value is greater than 0, two remediation options (Create Allocations and Remove Unallocated Installs) are automatically created for each unique license metric in the software model that meets this requirement, except User CAL and Device CAL.</p>
Allocated not in use	<p>Rights that are allocated but are not being used to license any installations.</p> <p>i Note: Allocated not in use reflects rights that are wasted because the user or device for which these rights have been allocated do not have the software installed.</p> <p>When this value is greater than 0, a Remove Allocations remediation option is automatically created for each unique license metric in the software model that meets this requirement.</p>
Allocations needed	<p>Number of allocations needed for compliance. Only used for Per Named User and Per Named Device license metrics.</p>

Run software reconciliation in Software Asset Management classic

Reconciliation is run as a scheduled job (default is weekly), but you can also run reconciliation manually to reconcile software products in your environment on demand.

Before you begin

Role required: sam_admin

About this task

Reconciliation is run for products that have software entitlements or software installs. Grouping and subgrouping are supported so you can narrow the compliance results.

When running reconciliation manually, allow enough time for the process to complete. For faster results, narrow the scope by selecting specific publishers.

Procedure

1. Navigate to **All > Software Asset > Reconciliation > Run Reconciliation** and select the publishers for which compliance should be calculated, or select all publishers.
2. To narrow results further, select **Group** and **Subgroup**, if desired.
Available group and subgroup values include None, Country, Department, Company, Region, and Cost Center.
3. Select **Continue**.
The reconciliation process may take an extended amount of time to complete. Once reconciliation is complete, the reconciliation results are shown.

View software model results

View compliance information for software model results from the Product Results list after reconciliation is run.

Before you begin

Role required: sam_user

About this task

You can view License Metric Results, Remediation Options, Licensed Installs, Unlicensed Installs, and Removal Candidates related lists for a software model result from a Product Result record. When the [Procurement](#)  application (com.snc.procurement) is active, you can also create and view purchase orders directly from the Remediation Options form. More remediation options include automatically create and remove allocations, remove unallocated installs, and remove unlicensed installs.

For example, if the status of a product result shows that it isn't compliant, you can drill down on the product result to view software model details. These details can include the number of unlicensed installs and the true-up cost to become compliant. Further, you can drill down on the software model result to view the license metric result, which is based on the entitlements for the product.

License metric result information includes rights owned and rights used as well as the license allocation breakdown so you can determine your options to become compliant. The Remediation Options related list shows the number of rights needed and calculates the cost of those rights for you, based on the license metric.

You can use the dashboard field action () icon on the Software Model Results form to view the Rights Owned vs Rights Used chart to forecast when additional licenses are needed.

Procedure

1. Navigate to **All > Software Asset > Reconciliation > Historical Results** and select a reconciliation result.
2. On the Reconciliation Result form, select a Product Results record to view the product result details.

3. In the Software Model Results related list, open a record to view the software model result details.

Software Model Results form

Field	Description
Software model	<p>Software model associated with the product. Drill down on the software model to see the software model result.</p> <p>The dashboard field action () icon shows the Rights Owned vs Rights Used chart for the software model.</p>
Product result	Unique product result number generated during the reconciliation process.
Group	Group specified on which to run reconciliation. Values include None, Country, Department, Company, Region, and Cost Center.
Subgroup	Subgroup specified on which to run reconciliation. Values include None, Country, Department, Company, Region, and Cost Center.
Latest	Indicates whether this software model result is from the most recent reconciliation run.
Status	<p>Status of the software model.</p> <ul style="list-style-type: none"> ○ Compliant ○ Not Compliant
Agreement type	<p>Agreement type is set on the software entitlement.</p> <ul style="list-style-type: none"> ○ Common: Generic, Enterprise License Agreement (ELA) ○ IBM: Generic, Enterprise License Agreement (ELA), International Program License Agreement (IPLA), IBM Customer Agreement (ICA), Unlimited Level Agreement (ULA) ○ Microsoft: Generic, Enterprise License Agreement (ELA) ○ Oracle: Generic, Unlimited Level Agreement (ULA) ○ VMware: Generic, Enterprise License Agreement (ELA), Enterprise Purchasing Program (EPP), Volume Purchasing Program (VPP)

Field	Description
	<p>Note: If the agreement type is Enterprise Level Agreement or Unlimited Level Agreement, the Status is Compliant even if there are unlicensed installations or unlicensed subscriptions.</p>
Unlicensed installs	Number of unlicensed software installations that aren't covered by any entitlements.
True-up cost	Estimated cost of remediating unlicensed installations based on the lowest number of rights needed (rights needed * average price per right from entitlements). The lowest cost from Purchase Rights remediation options.
Over-licensed amount	Estimated cost of rights not being used. The sum of the Over Licensed amount from the True-up value costs.
Potential savings	The cost that can be saved by acting on underutilized or incorrect consumption of licenses in related removal candidates.
License Metric Results	
Display name	<p>Name of the license metric that the software license is counted against when reconciliation runs.</p> <p>Select the Display name to open the corresponding License Metric Results record, where you can view more in-depth information about the license metric result. See Software model results license metric results fields for more details.</p>
Rights owned	Sum of all active rights from entitlements that share a license metric.
Rights used	Sum of rights used during reconciliation (allocated plus not allocated and installed).
Rights available	Sum of rights not used during reconciliation (rights owned minus rights used).
Over-licensed amount	Estimated cost of unused rights.
Legacy license	Indicates licenses purchased before 1 Oct 2019. This field appears only when the environment has dedicated hosts on AWS or on Azure.

Field	Description
	<p>Note: Microsoft has updated licensing rules for dedicated hosts based on the purchase date.</p>
Allocated in use	Rights that are allocated and are used to license installations.
Not allocated in use	<p>Number of rights that are used to license installations, but not allocated.</p> <p>When this value is greater than 0, two remediation options (Create Allocations and Remove Unallocated Installs) are automatically created for each unique license metric in the software model that meets this requirement, except User CAL and Device CAL.</p>
Allocated not in use	<p>Rights that are allocated but aren't being used to license any installations.</p> <p>Note: Allocated not in use reflects rights that are wasted because the user or device for which these rights have been allocated don't have the software installed.</p> <p>When this value is greater than 0, a Remove Allocations remediation option is automatically created for each unique license metric in the software model that meets this requirement.</p>
Nontransferable rights	Remaining rights from a core pack that can't be used to license any additional devices. Nontransferable rights are available only for Microsoft Per Core and Microsoft Per Core with (CAL).
Not allocated	Number of rights that haven't been allocated (rights owned minus allocated regardless of whether installed or not).
Allocations needed	Number of allocations needed for compliance. Only used for Per Named User and Per Named Device license metrics.
Rights needed	Number of rights that are required to cover unlicensed installations.

Field	Description
<p>Note: This field is hidden by default. Select the personalize list icon  to modify the fields that appear in the License Metric Results.</p>	
<p>Unlicensed installs</p> <p>Note: This field is hidden by default. Select the personalize list icon  to modify the fields that appear in the License Metric Results.</p>	<p>Number of unlicensed software installations that aren't covered by any entitlements.</p>
<p>Unlicensed SAP users (SAP only)</p> <p>Note: This field is hidden by default. Select the personalize list icon  to modify the fields that appear in the License Metric Results.</p>	<p>Number of unlicensed SAP users that aren't covered by any entitlements.</p>
<p>Unlicensed options (Oracle only)</p> <p>Note: This field is hidden by default. Select the personalize list icon  to modify the fields that appear in the License Metric Results.</p>	<p>Number of unlicensed Oracle database options that aren't covered by any entitlements.</p>
<p>Unlicensed subscriptions</p> <p>Note: This field is hidden by default. Select the personalize list icon  to modify the fields that appear in the License Metric Results.</p>	<p>Number of unlicensed software subscriptions that aren't covered by any entitlements.</p>
<p>True-up cost</p> <p>Note: This field is hidden by default. Select the personalize list icon  to modify the fields that appear in the License Metric Results.</p>	<p>Estimated cost of remediating unlicensed installations that are based on the lowest number of rights needed.</p>
<p>Potential savings</p> <p>Note: This field is hidden by default. Select the personalize list icon  to modify the fields that appear in the License Metric Results.</p>	<p>Estimated cost saved by reclaiming removal candidates.</p>

Field	Description
<p>Downgrade rights</p> <p>Note: This field is hidden by default. Select the personalize list icon () to modify the fields that appear in the License Metric Results.</p>	<p>Previous software versions that you can license using software entitlements for the latest software version.</p>
Remediation Options	
Remediation action	<p>Action to take to for compliance.</p> <ul style="list-style-type: none"> ○ Purchase Rights ○ Remove Allocations ○ Create Allocations ○ Remove Unallocated Installs (Not available for Oracle database options) ○ Remove Unlicensed Installs (Not available for Oracle database options) ○ Remove Unlicensed Installs - Cloud (available only if you have cloud installations). ○ If the actionable rights value is 0, the Remediation action button will not appear.
Affects compliance	Specifies whether the remediation options affect compliance.
License metric	Specific license metric of the software model result.
Software model result	Specific software model result pertaining to the remediation option.
Status	<p>Status of the remediation option.</p> <ul style="list-style-type: none"> ○ New (blue) ○ Complete (green) ○ Completed with Errors (yellow) ○ Void (red) ○ In Progress (yellow) <p>In Progress state indicates that the remediation action is in progress. If removal candidates are being created, the status changes to completed once the removal candidates are created.</p>
<p>Rights not in use</p> <p>Rights not allocated</p> <p>Rights needed</p>	<ul style="list-style-type: none"> ○ Remove Allocations action shows Rights not in use field. ○ Create Allocations action shows Rights not allocated field.

Field	Description
Reclaimable rights Unlicensed rights (Field shown is based on Remediation action type)	<ul style="list-style-type: none"> ○ Purchase Rights shows Rights needed field. ○ Remove Unallocated Installs action shows Reclaimable rights field. ○ Remove Unlicensed Installs action shows Unlicensed rights field.
Actionable rights	Total rights affected by the action.
Purchase order	Purchase order number associated with the remediation option, if a purchase order was created.
True-up cost	Estimated cost of remediating unlicensed installations based on the lowest number of rights needed.
Unlicensed Subscriptions  Note: This related list is shown only for subscription-based software products.	
Display name	Name of the unlicensed software subscription that is not covered by any entitlements.
User principal name	Name of the user that is associated with the unlicensed software subscription.
Software model	Software model that the unlicensed software subscription is associated with.
Subscription profile	Integration profile that the unlicensed software subscription is associated with.
Subscription type	Type of subscription.
Unlicensed Consumptions  Note: This related list is shown only for consumption-based software models.	
Software model	Software model that has unlicensed software consumptions.
Subscription profile	Integration profile that has unlicensed software consumptions.
Units consumed	Number of software units that your users have consumed.
Contract start	Start date of your licensing contract.
Contract end	End date of your licensing contract.
Actual monthly consumption	Actual number of software units that your users consume per month.

Field	Description
Expected monthly consumption	Number of software units that you expect your users to consume per month.
Cost Center	Business unit that has unlicensed software consumptions.
Department	Department that has unlicensed software consumptions.
Location	Geographic location in which there are unlicensed software consumptions.
Company	Name of the company that has unlicensed software consumptions.

The Licensed Installs related list contains the [software installations](#) that are licensed. To view more information about a licensed software installation, open the corresponding Software Installation record by selecting the **Display name**. Refer to [Software installation fields](#) for detailed descriptions of each field in the Software Installation record.

The Unlicensed Installs related list contains the [software installations](#) that are unlicensed. To view more information about an unlicensed software installation, open the corresponding Software Installation record by selecting the **Display name**. Refer to [Software installation fields](#) for detailed descriptions of each field in the Software Installation record.

The Unlicensed Users related list contains the [SAP system users](#) that are unlicensed.

Note:

This related list is shown only for the SAP publisher.

The Removal Candidates related list contains removal candidates related to software installations. For more information, see [Removal candidates](#).

- Execute remediation options for specific remediation actions by selecting an option from the Remediation Options related list and then selecting the applicable action.

Remediation option action buttons

Remediation option action	Action button	Result
Remove Unlicensed Installs	Create All Removal Candidates	When removal candidates are created for unlicensed installs, the status is set to Awaiting Revocation.
Remove Unallocated Installs	Create All Removal Candidates	When removal candidates are created for unallocated installs, the status is set to Ready.
Remove Allocations	Remove All Allocations	When allocations are removed, the number of allocations is adjusted. When you select this button, a message is displayed on the screen indicating that the action is in progress.

Remediation option action	Action button	Result
Create Allocations	Create All Allocations	<p>When allocations are created, the status of Remove Unallocated Installs remediation options (for the same license metric of the same software model result) are then set to Void.</p> <p>When you select this button, a message is displayed on the screen indicating that the action is in progress.</p>
Purchase Rights	<p>Create Purchase Order</p> <p>i Note: The Create Purchase Order button creates a purchase order but is only shown when rights needed is greater than 0, and Procurement is active.</p> <p>The Create Purchase Order button remains active until the purchase order has finished processing. Therefore, to avoid the creating a duplicate purchase order for the same item, wait to run reconciliation again until after the purchase order has finished processing.</p>	<p>When a purchase order is created, the status of any Purchase Rights remediation options for the same software model result are then set to Void.</p> <p>Purchase order fields Part number, Metric group, License metric, and Ordered quantity are automatically populated with the content from the remediation option.</p> <p>Metric group and License metric fields are added to the purchase order form so the entitlement can be automatically created when the order is complete.</p> <p>A notification is shown if at least one active purchase order line item exists for the software model.</p> <p>Once a purchase order is created, the Purchase order field, containing the purchase order reference, is added to the remediation option.</p>

A confirmation message is shown and all applicable [removal candidates](#) are added to the Removal Candidates related list.

Add a software removal candidate in Software Asset Management classic

Removal candidates reclaim software resources in your environment. They are created from reclamation rules, or can be created manually.

Before you begin

Role required: sam_user

About this task

Software reclamation is integrated with Workflow and Client Software Distribution to automate the process of uninstalling software from devices and reclaiming software rights. However, you can also create a removal candidate manually.

Procedure

1. Navigate to **All > Software Asset > Removal Candidates**
2. Select **New**.
3. On the form, fill in the fields.

Removal Candidate form

Field	Description
Number	Unique removal candidate number that is automatically generated.
Assignment group	Automatically set to the software managers group authorized to respond to removal candidates.
Assigned to	Person primarily responsible for working this task.
Name	Removal candidate name that is automatically generated. Contains the software installation display name.
Description	Description of why the task exists, and what the user must do, if they receive an approval.
State	<p>Current state of the removal candidate.</p> <ul style="list-style-type: none"> ○ Attention Required ○ Ready ○ Awaiting User ○ Awaiting Approval ○ Awaiting Revocation ○ Closed Complete ○ Closed Skipped ○ Closed Canceled
Opened	Date the task was opened.
Closed	Date the task was closed.
Justification	<p>Justification for becoming a removal candidate.</p> <ul style="list-style-type: none"> ○ Low Usage (default) ○ Unallocated ○ Unlicensed ○ Restricted Software
Removal Candidate	

Field	Description
Applies to	Item type to which the reclamation rule applies. <ul style="list-style-type: none"> ○ Installed Software ○ Subscription Software ○ Engineering App License
Software installation	The software installation being reclaimed.
Engineering App License	The Engineering application license that you want to reclaim.
<p>Note: Only appears if Engineering App License is selected in the Applies to list.</p>	
User	Name of the user assigned to the software installation. This value can be changed so that another user receives the notification of software being uninstalled. If the Bulk Reclamation check box is selected, this becomes a mandatory field.
Bulk Reclamation	Select this check box to reclaim multiple software installations. Once you select this check box, the Software installation field is no longer visible. To add software installations, refer to sub steps mentioned in step 4.
Reclamation rule	The reclamation rule that created the removal candidate.
Rights to reclaim	The number of rights that you want to reclaim. For example, you have 100 rights installed on a license server but you want to reclaim only 40 rights.
<p>Note: Only shown if Engineering App License is selected in the Applies to list.</p>	
Potential savings	Estimated cost of savings if all removal candidates are in Closed Complete state, meaning the software was uninstalled and the rights were harvested (unused rights * average price per right from entitlements).
Notify user	Check box for notifying the user assigned to the hardware on which the software is installed requesting permission via email to remove the software.
Configuration item	The device on which the software is installed.

Field	Description
Activity	
Work notes	Used to track the actions that have been performed on this task.

4. Select Save.

The removal candidate record is created. If you selected the **Bulk Reclamation** check box, perform the following sub steps to add software installations, before proceeding to the next step. If you didn't select the **Bulk Reclamation** check box, proceed to the next step.

a. Select **Edit** in the Software Installation related list.

b. In the Edit Members page, move the software installations from the Collection box to the Software Installation List box.

Only the software installations that are assigned to the specified user appear in the Collection box.

c. Select **Save**.

The software installation you added appears in the Software Installations related list. The state of the removal candidate moves from **Attention Required** to **Ready** and a name is generated in the **Name** field. Continue to select **Edit** to add more software installations. If you decide to remove all software installations, then the state reverts back to **Attention Required** and the name no longer appears in the **Name** field. For the name to be generated and for the removal candidate to be in **Ready** state, at least one software installation must be selected in the removal candidate form.

5. Select Reclaim.

Once your software installation is reclaimed and removed from your system, the Software Installation column becomes empty. You can refer to the following fields on the Software installation related list to give you insights into the history of the reclaimed software installation.

- Display name
- Product
- Publisher
- Software model

You may select any action button on the form to further configure the removal candidate. Action buttons are dependent on the removal candidate's justification and state.

Action buttons

Action	Description
Update	Update the removal candidate.
Close Complete	Reclaim rights and close the removal candidate.
Close Skipped	Close the removal candidate without reclaiming rights.
Delete	Delete removal candidate.

Reconciliation and product results

Field descriptions for the reconciliation results, product results, and software product results.

Reconciliation results

Reconciliation results are listed in the navigation path **Software Asset > Reconciliation > Historical Results**

Reconciliation Results form

Field	Description
Number	Unique identifying number that is generated during the reconciliation process.
Last reconciled	Date of last reconciliation run.
Ran for	All publishers, or specific publishers.
Publishers	Only shown if publishers were specified on which to run reconciliation.
Group	Group specified on which to run reconciliation. Values include None, Country, Department, Company, Region, and Cost Center.
Subgroup	Subgroup specified on which to run reconciliation. Values include None, Country, Department, Company, Region, and Cost Center.
Status	Status of the reconciliation. <ul style="list-style-type: none"> • Completed • In Progress • Failed
Progress	Percent complete and progress bar for the reconciliation run.
Progress summary	Specific step within the reconciliation process. <p>i Note: This list column is not shown by default. You can personalize your list column settings to add it, if desired.</p>

Software product results

You can access Software Models, Unlicensed Installs, and Removal candidates related lists from a product result record.

A product result for a licensable product is generated after reconciliation even if there are no software models defined for the product.

i Note:

A Software Model Results record is only created when a software model or entitlement exists for the product.

For licensable products, a software model is automatically created for any unlicensed installs, subscriptions, or options in the Product Results list that do not have an entitlement by default. See [properties](#) to change the `com.snc.samp.automaticsmrcreation` property setting. You can also set the `com.snc.samp.automaticsmcreation` property to have a software model created automatically for not-licensable products, if desired.

To view more information about a specific software product result, select an entry from the Product Results list. Refer to the following table for field descriptions.

Product Results form

Field	Description
Number	Unique product result number that is generated during the reconciliation process.
Publisher	Publisher of the software.
Product	Name of software product.
Group	Group to which the product result belongs.
Subgroup	Subgroup to which the product result belongs.
Latest	Indicates whether this product result is from the most recent reconciliation run.
Reconciliation result	Unique reconciliation result number that is generated during the reconciliation process.
Status	Status of the product. <ul style="list-style-type: none"> • Compliant • Not Compliant
True-up cost	Estimated cost of remediating non-compliance based on the lowest number of rights needed.
Over-licensed amount	Estimated cost of rights not being used. The sum of all Over Licensed amount values from every software model result.
Potential savings	Estimated cost of savings if software installations are reclaimed. The sum of all potential savings from all removal candidates.
Licensed installs	Total number of installations that are licensed for the product.
Unlicensed installs	Total number of installations that are unlicensed for the product.
Software Model Results	
Status	Status of the software model.
Software model	Name of the software model.
Unlicensed installs	Total number of installations that are unlicensed for the associated software product.
True-up cost	Estimated cost of remediating non-compliance based on the lowest number of rights needed.
Over-licensed amount	Estimated cost of rights not being used.
Potential savings	Estimated cost saved if reclamation candidates are reclaimed.

Product Results form (continued)

Field	Description
Licensed Installs	
Display name	Name of the licensed software installation.
Publisher	Publisher of the software product.
Version	Version of the software product.
Discovery model	Software discovery model that represents the installed software product.
Installed on	Device on which the product is installed.
Assigned to	User to which the product is assigned.
Unlicensed Installs	
Display name	Name of the unlicensed software installation.
Publisher	Publisher of the software product.
Version	Version of the software product.
Installed on	Device on which the product is installed.
Assigned to	User to which the product is assigned.
Unlicensed Subscriptions	
<p>Note: This related list is only shown if the software product is a subscription.</p>	
Publisher	Publisher of the software product associated with the unlicensed subscription.
Product	Name of the software product associated with the unlicensed software subscription.
User	Name of the user associated with the unlicensed software subscription.
User principal name	Email address of the associated user.
Software model	Software model associated with the unlicensed software subscription.
Subscription profile	Integration profile associated with the unlicensed software subscription.
Unlicensed Users	
<p>Note: This related list contains SAP system users and is only shown for SAP publisher.</p>	
Display name	Unique display name.
User	User in the SAP system.
SAP user id	SAP ID of the user with access to an SAP system.

Product Results form (continued)

Field	Description
Email	SAP user email.
Names	First and last names of the SAP user.
User type	The type of user in the SAP system. <ul style="list-style-type: none"> • Dialog • System
License type	The named user type value assigned to the user in the specified SAP system.
Named user type	Normalized named user type assigned to the user in the specified SAP system.
SAP client	SAP client from which the user information was pulled.
Removal Candidates	
Number	Removal candidate number.
Name	Name of the removal candidate.
Justification	Justification for becoming a removal candidate. <ul style="list-style-type: none"> • Low Usage (default) • Unallocated • Unlicensed • Restricted Software
Product	Name of the product.
Publisher	Name of the publisher.
State	State of the removal candidate. <ul style="list-style-type: none"> • Attention Required • Ready • Awaiting User • Awaiting Approval • Approval • Awaiting Revocation • Closed Complete • Closed Skipped
Potential savings	Savings to be gained from reclaiming unused software installations.

Create averages for product life cycles in Software Asset Management classic

Create averages to calculate software End of Life (EOL) and End of Support (EOS) life cycles in the Software Asset Management classic application.

Before you begin

Role required: model_manager

About this task

You can create averages that can be used globally for all products and publishers or you can create averages specific to a product or a publisher. These averages are used to create calculated life cycles for products. For details on calculated life cycles, see [Product life cycles](#).

Procedure

1. Navigate to **Software asset > Software lifecycle averages**.
2. Select **New** to open the Software lifecycle averages page.
3. On the form, fill in the fields.

Field	Description
Type	The type of option you select for creating life cycles. Choose from the following options: <ul style="list-style-type: none"> ○ Custom industry average: Refers to the industry averages based on the GA dates. ○ Product: Refers to a specific product. This includes custom products too. ○ Publisher: Refers to a specific publisher. This includes custom publishers too.
Display name	A unique name for this life cycle average record.
Product	This field appears only if you select the value Product in the Type field
Publisher	This field is automatically populated once you select a product. If you selected the value Publisher in the Type field, then you select a publisher.
Domain	Indicates the domain in which your instance is located.
Average end of life period (months)	Specify the number of months for the EOL life cycle.
Average end of support period (months)	Specify the number of months for the EOS life cycle.
Active	Indicates that the life cycle average record will be used for creating software life cycles.

4. Select **Submit**.

The record is created and appears in the Software lifecycle averages list view.

Add a software client access record in Software Asset Management classic

Add a client access record to track and manage the users or devices that are accessing a particular version of your server software using a client access license (CAL).

Before you begin

Role required: sam_admin

Note:

You can also use the sam_user role to view and read client access records. However, you cannot use this role to create client access records.

About this task

Software Asset Management uses client access records to reconcile server software based on the following license metrics:

Metric group	License metric
Citrix	<ul style="list-style-type: none"> • Per User • Per User/Device
Common	<ul style="list-style-type: none"> • User CAL • Device CAL • User/Device CAL
IBM	<ul style="list-style-type: none"> • Authorized User • Authorized User Value Unit • Employee User Value Unit • External User Value Unit
Microsoft	<ul style="list-style-type: none"> • User CAL • Device CAL • Per Core (with CAL)
Oracle	Named User Plus
CrowdStrike	<ul style="list-style-type: none"> • Reserved Hourly Average Sensor • Sensor Subscription

Metric group	License metric
	<p>Note: These license metrics are available with Yokohama Patch 1, Software Asset Management - SaaS License Management (sn_sam_saas_int) 15.0.8, and Software Asset Management (sn_itam_samp) 2.1.0 version onwards. If you are on any version for Yokohama below Patch 1, refer KB1801232.</p>

License metrics are set on the [software entitlement](#) form and can be accessed from the **Metric Attributes** related list on the [software model](#) form.

Important:

You can enable the Software Asset Management application to automatically create client access records for Oracle Database Server using the **Auto-generate client access for allocations** option on the corresponding software model. To use this option, you must request the Data Collection for Oracle Global Licensing and Advisory Services application from the ServiceNow Store. See [Software model fields](#) for more details on the **Auto-generate client access for allocations** option. See [Request Data Collection for Oracle Global Licensing and Advisory Services \(GLAS\)](#) for more details on the Data Collection for Oracle Global Licensing and Advisory Services application.

Procedure

1. Navigate to **All > Software Asset > Administration > Client Access** and then select **New**.
2. On the Client Access form, fill in the fields.

Client Access form

Field	Description
Name	Name of the client access record.
Software model	Software model of the server that you are granting users or devices access to.
Type	<p>Type of CAL that is associated with the client access record. Select one of the following options:</p> <ul style="list-style-type: none"> ○ User CAL: Licenses each user that accesses the associated server, regardless of the number of devices that each user is using to access the server. <p>For example, if two users are accessing Microsoft Windows Server, the corresponding software entitlement must include two User CALs.</p> <p>If you select this option, you can assign the associated User CALs to specific users. See step 3 for more details.</p>

Field	Description
	<ul style="list-style-type: none"> <li data-bbox="818 197 1374 611"> <p>○ Device CAL: Licenses each device that accesses the specified server, regardless of the number of users that are using each device to access the server.</p> <p>For example, if two devices are accessing Microsoft Windows Server, the corresponding software entitlement must include two Device CALs.</p> <p>If you select this option, you can assign the associated Device CALs to specific devices. See step 3 for more details.</p> <li data-bbox="818 667 1374 1346"> <p>○ User/Device CAL: Licenses each user or device that accesses the associated server.</p> <p>i Note: If you are using a Citrix software model, the User/Device CAL type is based on the user/device licenses that are assigned to your users or shared devices.</p> <p>For example, if two users and two devices are accessing Microsoft Windows Server, the corresponding software entitlement must include two User CALs and two Device CALs.</p> <p>If you select this option, you can assign the associated User and Device CALs to specific users and devices. See step 3 for more details.</p> <li data-bbox="818 1381 1374 1577"> <p>○ Authorized User: Licenses each user who accesses an IBM software product.</p> <p>i Note: This CAL type is applicable to IBM software only.</p> <li data-bbox="818 1619 1374 1850"> <p>○ Authorized User Value Unit: Licenses the number of select users who access an IBM software product.</p> <p>i Note: This CAL type is applicable to IBM software only.</p> <li data-bbox="818 1892 1374 1955"> <p>○ Employee User Value Unit: Licenses the total number of users within your</p>

Field	Description
	<p>organization who access an IBM software product.</p> <p>Note: This CAL type is applicable to IBM software only.</p> <ul style="list-style-type: none"> External User Value Unit: Licenses the total number of users outside your organization who access an IBM software product. <p>Note: This CAL type is applicable to IBM software only.</p>
<p>WebLogic application</p> <p>Note: This field appears only if you select an Oracle WebLogic Server software model.</p>	<p>Oracle WebLogic Server application to which your users or devices are granted access.</p>
<p>Database instance</p> <p>Note: This field appears only if you select an Oracle Database Server software model.</p>	<p>Oracle database instance that accesses and manages the data in your Oracle database.</p>
<p>Source</p> <p>Note: This field appears only if you select an Oracle Database Server software model.</p>	<p>Source of your Oracle data. This field is automatically set to one of the following options:</p> <ul style="list-style-type: none"> ServiceNow: Indicates that the client access record data was generated automatically through the SAM - Sync Auto-generated Client Access with DB Server Users scheduled job, which runs daily or on-demand. Internal: Indicates that the client access record data was added manually.
<p>Count</p>	<p>Number of unique users or devices that are granted access to the associated server.</p> <p>On automatically generated client access records for Oracle Database Server or Oracle WebLogic Server, this field populates automatically based on the number of users or devices that are currently added to the record. See step 3 for more information on how to add users or devices to the client access record.</p>

Field	Description
	<p>Note: If you are using a Citrix software model and User/Device CAL type, the Count field is based on the number of user/device licenses that are assigned to your users or shared devices.</p>
PaaS <p>Note: This field appears only if you select an Oracle Database Server software model.</p>	Option to indicate whether your Oracle database instance is managed by the Amazon Relational Database Service (RDS) on Amazon Web Services (AWS).
Cost Center	Cost center of the users or devices that are granted access to the associated server.
Department	Business department of the users or devices that are granted access to the associated server.
Location	Geographic location of the users or devices that are granted access to the associated server.
Company	Company of the users or devices that are granted access to the associated server.

3. To assign the associated CALs to specific users or devices, add those users or devices to your client access record based on the CAL type that you selected in the **Type** field.

By assigning CALs to specific users or devices, you can prevent those users or devices from being counted multiple times across different client access records during reconciliation.

- If you set the **Type** field to **User CAL**, **User/Device CAL**, **Authorized User**, **Authorized User Value Unit**, **Employee User Value Unit**, or **External User Value Unit**, add the users that you want to assign your user-based CALs to.

Note:

If you are using a Citrix software model and User/Device CAL type, add the users that you want to assign a user/device license to.

a. Select the **Users** tab.

b. In the **User** field of the Client Access User Breakdowns list, double-click **Insert a new row...**

Note:

If you are using an Oracle Database Server software model, double-click **Insert a new row...** in the **Database user** field of the Client Access User Breakdowns list instead.

c. When prompted, search for and select a user that you want to assign a user-based CAL to.

d. Select the Save icon (✔).

The **Device**, **Active**, **User Type**, and **Source** fields populate automatically for the specified user. However, you can modify the **Device**, **Active**, and **User type** fields as needed.

- e. Repeat steps b-d for each user that you want to assign a user-based CAL to.
- o If you set the **Type** field to **Device CAL** or **User/Device CAL**, add the devices that you want to assign your device CALs to.

Note:

If you are using a Citrix software model and User/Device CAL type, add the devices that you want to assign a user/device license to.

- a. Select the **Devices** tab.
- b. In the **Device** field of the Client Access Device Breakdowns list, double-click **Insert a new row...**
- c. When prompted, search for and select a device that you want to assign a device CAL to.
- d. Select the Save icon (✓).

The **Active** and **Source** fields populate automatically for the specified device. However, you can modify the **Active** field as needed.

- e. Repeat steps b-d for each device that you want to assign a device CAL to.

- 4. To track and license the configuration items (CIs) that the associated server is installed on, add them to the client access record.

Important:

This step is not applicable if your client access record is associated with an Oracle WebLogic Server software model or you have enabled the **License all installs accessed by clients** option on the associated software model. If this option is enabled, CIs are licensed based on conditions that you specify on the software model, such as software install conditions. See [Software model fields](#) for more details on this option.

For Windows Server, each server installation requires Per Core (with CAL) rights that are licensed separately from the User and Device CAL rights in associated client access records. Other products like Oracle Java do not require rights to be licensed separately for server installations. For example, if you use CALs to license the users and devices that are accessing Oracle Java, you can enable Software Asset Management to automatically mark the corresponding Oracle Java installations as licensed. In this scenario, Software Asset Management licenses the Oracle Java installations as part of CAL licensing.

To enable this capability, you must add all CIs that a given server is installed on to the associated client access record. By specifying these CIs, you can enable Software Asset Management to determine which server installations your users and devices are connected to. After all users and devices on the client access record are licensed, all server installations on the specified CIs are marked as licensed. No additional licenses are consumed for these installations.

- a. Select the **Devices with Installations** tab.
- b. In the **Device** field of the Client Access Installed Devices list, double-click **Insert a new row...**
- c. When prompted, search for and select a CI that the associated server is installed on.

d. Select the Save icon (✔).

The **Active** field populates automatically for the specified CI. However, you can modify this field as needed.

e. Repeat steps b-d for each CI that the associated server is installed on.

5. Select Update.

What to do next

After you create a client access record, reconciliation runs on the associated server software as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#). Use these results to determine your license compliance position and to remediate any non-compliance.

You can remediate non-compliance for your server software using the following remediation options:

- **Purchase Rights:** Generates a purchase order when the number of rights needed is greater than the number of rights owned across all client access records for the specified server software.
- **Create Allocations:** Allocates rights to unlicensed users or devices that have been added to the client access records for the specified server software.
- **Remove Allocations:** Removes rights from licensed users or devices when sufficient rights are unavailable.

Add a custom software product in Software Asset Management classic

If a software product does not exist in the Software Library, you can add a custom product. Custom products enable you to normalize and account for homegrown software, or software that is not yet part of the Software Library.

Before you begin

Role required: sam_admin

About this task

The product and publisher combination is used during discovery model normalization. If the custom product exists, a message is shown.

Procedure

Navigate to **All > Software Asset > Administration > Custom Products** and create a new record (see table for field descriptions).

Custom Software Product form

Field	Description
Publisher	Publisher of the custom software product. If it does not exist, a new one can be created on the Publisher field Companies lookup list.
Product	Name of the custom software product.
Subscription software	Option that indicates that the software has a subscription.

Field	Description
Product type	<p>Product type of the custom software product.</p> <ul style="list-style-type: none"> • Child: A subcomponent of main software (not licensable). • Driver: A software product that controls a device. • Licensable: A software product that is licensable. • Not Licensable: A software product that is not licensable. • Patch: A software product designed to update, fix, or improve an existing computer program. • Unknown: A software product that is unknown.
Product classification	Official UNSPSC classification.
Exclude from content service	Option that excludes the custom product details from being shared with Software Asset Management Content Service if opted in.
Active	Option that indicates the rule is active.

View publisher part number (PPN) suggestions in Software Asset Management classic

View content service suggestions for your custom PPNs and DMAPS in the Software Asset Management classic application.

Before you begin

PPN suggestions are available only if a corresponding match is found for your custom PPN in the Content Service. The PPN suggestion records are stored in the Part number suggestions [samp_sw_part_number_suggestion] table.

Role required: sam_admin

Procedure

1. Navigate to **All > Software Asset > Administration > Part number suggestions**.
2. Open a suggestion record to view the Part number suggestion page.
 You can view the custom PPN details in the top part of the Part number suggestion page. The second half of the page contains the suggested part number details. All the entitlements where the custom PPN is used appear in the **Impacted entitlements** tab. All the software models where the custom DMAP is used appear in the **Impacted software models** tab. If no impacted software models exist, then this tab doesn't appear.
3. Select **Accept** or **Reject**.
 - **Accept:** The Content Service PPN and DMAP replace the custom PPN and DMAP. In the impacted entitlement, the content service PPN is replaced. Similarly, the content service DMAP is replaced on the software model.
 - **Reject:** The status of this record changes to rejected and you continue to use the custom PPN.

Subscriptions for Software Asset Management

The ServiceNow platform uses a licensing method where your organization is charged for using the IT Asset Management applications- ServiceNow Software Asset Management.

Software Asset Management licensing enables you to pay for resource categories that you use. To calculate the cost, Software Asset Management uses Subscription Units. A Subscription Unit is a unit of measure used to Managed IT Resources using defined ratios. The customer value of managing different types of IT resources varies. Subscription Units allows for a single unit price to be applied via ratios to those different IT resource type to reflect that varying customer value. To know more about managed IT resources and Subscription Unit ratios, see the Subscription Unit Overview on the <https://www.servicenow.com/products/entitlements-packages.html> .

Managed IT Resource types

There are five IT Resource categories in ServiceNow Software Asset Management - Server, End User Computing Device, SaaS Subscription User, PaaS Resources, and IaaS Storage.

- Server is any physical or virtual server that is represented as a configuration item (CI) in the CMDB tables listed in the following license resource categories and managed by the Software Asset Management application.
- End User Computing Device is any physical or virtual non-server CI in the CMDB tables listed in the following license resource categories and managed by the Software Asset Management application.
- SaaS Subscription User is any unique User Principal name in the SaaS Subscription User table listed in the following license resource categories and managed by the Software Asset Management application.
- PaaS Resources are cloud-based platform services that are represented as a CI in the CMDB tables listed in the following license resource categories and managed by the Software Asset Management application.
- IaaS Storage is any cloud-based infrastructure service represented as a CI in a CMDB table listed in the following license resource categories and managed by the Software Asset Management application.

Servers and End User Computing Devices are managed by the Software Asset Management application when the installed software on the Managed IT Resources is represented in the Software Installation [cmdb_sam_sw_install] table.

Software Asset Management License Resource Categories

Resource category	Subscription unit ratio	Model category
Server	1:1	<ul style="list-style-type: none"> • cmdb_ci_server • cmdb_ci_win_server • cmdb_ci_linux_server • cmdb_ci_aix_server • cmdb_ci_esx_server • cmdb_ci_solaris_server • cmdb_ci_hyper_v_server • cmdb_ci_hpux_server

Software Asset Management License Resource Categories (continued)

Resource category	Subscription unit ratio	Model category
		Any CMDB classes derived from the above listed classes or cmdb_ci_hardware and not defined as another Managed IT Resource type.
End user computing device	1:4	<ul style="list-style-type: none"> • cmdb_ci_computer • cmdb_ci_handheld_computing • cmdb_ci_pc_hardware Any CMDB classes derived from cmdb_ci_pc_hardware.
SaaS subscription user	1:15	samp_sw_subscription
PaaS resources	1:3	<ul style="list-style-type: none"> • cmdb_ci_database • cmdb_ci_cloud_database Any child classes of the above listed classes.
IaaS storage	1:3	cmdb_ci_storage_volume Any child classes of the above listed classes.

View license report for the IT Asset Management application

Resources that the IT Asset Management applications discover, monitor, and provision are configuration items (CIs) stored in the CMDB. The ITAM licensing module combines this information on CIs with the information on subscriptions your organization purchased to produce statistics on subscription use by IT Asset Management applications.

Before you begin

The process of collecting and aggregating information for licensing purposes consists of the following interactions. As a result, you can view the statistics on how your organization uses purchased subscription units.

1. The IT Asset Management applications count CIs and assign them to CI categories daily.
2. The IT Asset Management applications daily report CI count by CI category to the IT Asset Management licensing module. If features of the same application report the same CIs as their resources, the CI count is manipulated to remove the duplication.
3. The licensing module correlates the daily average CI counts for IT Asset Management applications with the licensing information from the customer contract to produce license statistics.

Role required:

- admin
- usage_admin

Procedure

1. Navigate to **All > ITAM Licensing > ITAM License Report**.
2. Select an application to view the subscription for a particular CI category.

Application	Resource Category	Resource Total Count	Subscription Unit Ratio	Total Subscription Units Consumed
Application: Hardware Asset Management (3)				
Hardware Asset Management	Servers	4	1:1	
Hardware Asset Management	End User Computers	27	4:1	
Hardware Asset Management	Network Gear	5	5:1	
				Sum
Application: Software Asset Management (3)				
Software Asset Management	Subscription Users	30	15:1	
Software Asset Management	Servers	1	1:1	
Software Asset Management	End User Computers	18	4:1	
				Sum
				Sum

You can view the following information on CI count and subscriptions purchased for each IT Operations Management application separately (a la carte):

- **Resource Category:** CI categories for IT Asset Management applications.
- **Resource Total Count:** CI count for CIs organized by CI categories, for each IT Asset Management application.
- **Subscription Unit Ratio:** Ratios define how many CIs of a certain CI category require a subscription. The Software Asset Management application has pre-defined values for End User Computers (4:1), for Servers (1:1), for Storage Volumes (3:1), for Databases (3:1), and for Subscription Users (15:1).
- **Total Subscription Units Consumed:** The number of subscriptions per CI category for each IT Asset Management application that your organization consumed. The licensing module calculates this number by applying the subscriptions ratio to the CI count number for each application's CI category.

For licensing purposes, the Software Asset Management application only considers CIs with software installs discovered within the last 90 days or those where the last discovered as empty. Additionally, all CIs are excluded that have a column added to the `cmdb_ci_hardware` table and that column name is referenced in the property labeled *Enter the name of the true/false field added to cmdb_ci_hardware table to exclude software installed on selected devices from Software Asset Management*. For more information on excluding CIs, see [Exclude software assets on CIs](#).

Supported software publisher licenses

With Software Asset Management, there are several publisher packs that can be used to extend functionality between the ServiceNow AI Platform and your third-party software applications.

The following Software Asset Management publisher pack plugins can be requested from ServiceNow personnel for activation. See [Request Software Asset Management](#) for more information on how to request these plugins.

- Adobe
- Citrix
- IBM (includes both IBM and Red Hat Enterprise Linux)
- Microsoft
- Oracle
- SAP
- VMware

Each publisher has a set of [license metrics](#) specific to that metric group. License metrics are set in software entitlements and used for reconciliation (metric group, license metric, and software model combination).

Publisher pack plugins

Plugin	Description
Software Asset Management Professional for Adobe (com.sn_samp_adobe)	Provides additional capabilities to reconcile Adobe subscription software.
Software Asset Management Professional for Citrix (com.sn_samp_citrix)	Provides additional capabilities to reconcile Citrix software, such as Virtual Applications and Virtual Desktop.
Software Asset Management Professional for IBM (com.sn_samp_ibm)	Provides additional capabilities to reconcile IBM products using PVU and RVU license metrics. This plugin also provides additional capabilities to reconcile Red Hat Enterprise Linux software, such as Red Hat Enterprise Linux Server and Red Hat Enterprise Linux for Virtual Datacenters.
Software Asset Management Professional for Microsoft (com.snc.samp.microsoft)	Provides additional capabilities to reconcile Microsoft software, such as Microsoft SQL Server.
Software Asset Management Professional for Oracle (com.snc.samp.oracle)	Provides additional capabilities to reconcile Oracle software, such as Oracle DB Server.
Software Asset Management Professional for SAP (com.sn_samp_sap)	Provides additional capabilities to reconcile SAP named user compliance and optimization.
Software Asset Management Professional for VMware (com.sn_samp_vmware)	Provides additional capabilities to reconcile VMware software, such as vCenter and vSphere.

Publisher pack dashboards

View compliance analysis results for the following publishers on the Software Publisher Analytics dashboards.

- [Adobe](#)
- [Citrix](#)
- [IBM](#)

- Microsoft
- Oracle
- SAP
- VMware

Note:

You must have one of the publisher pack add-ons (other than Adobe) activated to see the Software Publisher Overviews dashboard navigation module. In addition, the corresponding publisher pack must be activated to see the compliance analysis results tab for that publisher.

View compliance analysis results for Microsoft Office 365 and Adobe Cloud on the [Office 365 and Adobe dashboard](#).

Note:

The Software Asset Management Professional for Adobe publisher pack add-on must be activated to see the Office 365 and Adobe Cloud dashboard.

Software Asset Management publisher pack for Adobe

Use the Software Asset Management publisher pack for Adobe to track compliance using Adobe - specific licensing metrics and integrate with Adobe Cloud.

Adobe licensing options

The Adobe publisher pack (com.sn_samp_adobe) adds Adobe - specific licensing options for software entitlements.

Field	Options
Agreement type	<ul style="list-style-type: none"> • Generic • Enterprise Term License Agreement (ETLA) • Cumulative Licensing Program (CLP) • Transactional Licensing Program (TLP) • Value Incentive Plan (VIP)
License Metric	<ul style="list-style-type: none"> • Per Device • Per User • User Subscription

To use the Adobe - specific licensing options, select the Adobe metric group for the software entitlement.

Adobe Cloud integration

Create an Adobe Cloud integration profile to compare subscriptions with software installations for compliance reporting.

Note:

Installation discovery sources include ServiceNow Discovery, Microsoft SCCM, and other third-party discovery sources that can integrate as a data source in the ServiceNow CMDB.

For instructions on how to create an Adobe Cloud integration profile, see [Integrating with Adobe Cloud](#).

Adobe Cloud reporting

Adobe Cloud reports can be accessed by navigating to **Reports > View/Run** and searching all reports for Adobe.

- Adobe Cloud Users without Installations
- Underused Adobe Cloud Installations

You can view Adobe subscriptions, compliance, and cost using the [Office 365 & Adobe Cloud dashboard in Software Asset Management classic](#) or [Publisher overview for Adobe Systems in the Software Asset Workspace](#).

Integrating with Adobe Cloud

Integrate your Software Asset Management application with Adobe Cloud services to track your software subscriptions and to determine your license compliance.

The Adobe Cloud integration supports the following Adobe Cloud services:

- Adobe Creative Cloud
- Adobe Experience Cloud
- Adobe Document Cloud

Note:

You can create an Adobe Cloud integration only if you're using the Adobe Creative Cloud for Enterprise subscription plan. If you're using any other subscription plan, such as Adobe Creative Cloud for Teams, Education, or Individuals, you can't create an integration.

Integrate your Adobe subscriptions with Software Asset Management for compliance reporting using Adobe authentication. For more information about Adobe authentication integrations and certificates, see the [Adobe Authentication Guide](#).

You can integrate your ServiceNow[®] instance with Adobe Cloud services using either of the following authentication methods:

- [Service Account \(JWT\) credential](#)
- [OAuth Server to Server credential](#)

Note:

All new Adobe Cloud integrations must be created using the OAuth authentication type. Adobe is migrating from Service Account (JWT) credential to OAuth Server-to-Server credential. For more details, see [Adobe Migration Guide](#).

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Adobe Cloud application	Authentication scopes
Download subscriptions	System administrator	None

Integrate Adobe Cloud using Service Account (JWT) credentials

Integrate your ServiceNow® instance with Adobe Cloud services by using Service Account (JWT) credentials.

Create a project and add APIs using Service Account (JWT)

Create a project in the Adobe Developer Console for accessing Adobe APIs and add APIs to your project using a Adobe Service Account (JWT).

Before you begin

Role required: Adobe Cloud admin

Procedure

1. Create a project in the Adobe Developer Console to access the Adobe APIs by selecting **Create new project**.

For more information, see [Projects Overview](#).

2. Add an API to your project using a Adobe Service Account (JWT).
For more information, see [Add API to project using Service Account \(JWT\)](#).

Keep the following points in mind when adding an API to your project:

- For the Adobe service that you want to integrate with, select **User Management API**. This service enables you to access the Adobe user management API.
- When you're creating a Service Account (JWT) credential, which enables you to access the API within the selected Adobe service, select the option to generate a key pair. With this option, the Adobe Developer Console generates both a public key pair and a private key pair that can be used to authenticate your Service Account (JWT). The private key is automatically downloaded to your device.

After you successfully add the API to your project, you're redirected to the API overview page.

3. Copy the values in the **CLIENT ID**, **TECHNICAL ACCOUNT ID**, and **ORGANIZATION ID** fields in the Service Account (JWT) section of the Overview page.
4. Select **Retrieve client secret** to view and copy the value in the **CLIENT SECRET** field. Save this information in a safe location for later use.
5. Use the following openssl command to convert the key from the KEY format to the PKS format:
`openssl pkcs12 -export -out test1-certificate.pfx -inkey private.key -nocerts`

The key was automatically downloaded to your device in the previous step. The key must be in the PKS format for you to create a corresponding ServiceNow X.509 certificate for the Adobe Cloud integration.

You must create a password to convert a key. Use this password in the Key store password and Certificate password fields when creating the ServiceNow integration profile and X.509 certificate in the proceeding steps.

Note:

This password must be at least six characters in length.

Create an Adobe Cloud integration profile using JWT

Create an Adobe Cloud integration profile on your ServiceNow instance by using Service Account (JWT) credentials to track your software subscriptions and to determine your license compliance.

Before you begin

Role required: One of the following roles in combination can create Adobe Cloud integration profile using JWT credentials:

- admin and sam_admin
- admin and sam_integrator

Activate the following plugins:

- Software Asset Management Professional for Adobe (com.sn_samp_adobe)
- Software Asset Management - SaaS License Management (sn_sam_saas_int) from [ServiceNow Store](#)

About this task

If you're using Software Asset Workspace, the option to create the Adobe Cloud integration profile in Core UI is inactive.

Note:

All new Adobe integrations must be created using the OAuth authentication type. For more information, see [Integrate Adobe Cloud using OAuth Server-to-Server credentials](#). Adobe is migrating from Service Account (JWT) credential to OAuth Server-to-Server credential. For more information about the migration, see [Adobe Migration Guide](#).

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	Name of the Adobe integration profile.
Authentication type	Type of authentication to access Adobe Cloud APIs. <ul style="list-style-type: none"> ○ OAuth 2.0 ○ JWT

Field	Description
	<p>Note:</p> <ul style="list-style-type: none"> For the existing Adobe Cloud integration profiles before upgrade to Software Asset Management - SaaS License Management 13.1.0 version or later, this field is automatically set to JWT. For all the new Adobe Cloud integration profiles, this field is automatically set to OAuth 2.0. For more information, see Integrate Adobe Cloud using OAuth Server-to-Server credentials.
Client Id	Client ID that is assigned to your Adobe Service Account (JWT) while creating a project and adding APIs .
Organization Id	Adobe Organization ID that is assigned to your Adobe Service Account (JWT) while creating a project and adding APIs .
Technical account Id	Adobe Technical Account ID that is assigned to your Adobe Service Account (JWT) while creating a project and adding APIs .
Profile type	Type of integration profile. This field is automatically set to Adobe subscription .
Client secret	Client secret that is assigned to your Adobe Service Account (JWT) while creating a project and adding APIs .
Certificate	ServiceNow X.509 certificate for the Adobe Cloud integration.
Certificate password	Certificate password that you create when converting your key from the KEY format to the PKS format.

3. Add an X.509 certificate to your integration profile.

This certificate is based on the key from your Adobe Service Account (JWT) credential.

a. Navigate to the X.509 Certificate form.

- For Core UI:
 - i.** On the Integration Profile form, select the search icon (🔍) next to the **Certificate** field.
 - ii.** In the X.509 Certificates dialog box, select **New**.
- For Software Asset Workspace:
 - i.** Navigate to **System Definitions > Certificates**.
 - ii.** Select **New**.

b. On the form, fill in the fields.

X.509 Certificate form

Field	Description
Name	Certificate name.
Expiration notification	Option to send a notification when the certificate is about to expire.
Notify on expiration	Users that you want to notify when the certificate expires. This field is available only when Expiration notification is selected.
Warn in days to expire	Number of days prior to certificate expiration that you want to send a notification. This field is available only when Expiration notification is selected.
Active	Option to indicate if the certificate is active.
Short description	A brief description of the certificate.
PEM Certificate	Base-64 encoded PEM-formatted text containing the DER certificate. The instance decodes the certificate to populate the Valid from, Expires, Expires in days, Issuer, and Subject fields.
Format	Format of the certificate.
Type	Certificate type. Set this field to PKCS12 Key Store .
Expires in days	Number of days remaining until the certificate expires. This field populates automatically.
Key store password	Certificate password that you created when converting your key from the KEY format to the PKS format in Step 3.

- c. Upload your key (PKS file) by selecting the manage attachments icon (📎) on the X.509 Certificate form header.
 - d. In the Attachments dialog box, select **Choose file** to locate and select your key.

The dialog box closes, and you return to the X.509 Certificate form.
 - e. Validate the certificate by selecting the **Validate Stores/Certificates** related link.
 - f. After the certificate is validated, select **Submit**.
4. In the Process configuration section, view the required user roles or API permissions to minimize security risks and optimize SaaS licenses.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

For more information about the required roles and scopes, see [Minimal user permissions](#) table.

5. Select Submit.

6. After the form reloads, select the **Validate Adobe Credential** related link to complete the connection.

7. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Result

Adobe subscription data is pulled into the Software Asset Management application when the *SAM - Import Adobe User Subscriptions* scheduled job runs. When the subscription data is pulled, the *SAM - Optimize Adobe Subscriptions* scheduled job runs monthly to optimize the Adobe Creative Cloud subscriptions.

The completion of these two jobs results in the following scenarios:

- An optimization candidate that consolidates three (configurable) or more Single App or individual product subscriptions and recommends Adobe Creative Cloud All Apps when it isn't installed.
- A reclamation candidate that reclaims Single App or individual product subscriptions with dual licenses when Adobe Creative Cloud All Apps is installed.

Let's say, a user is subscribed to Adobe Creative Cloud All Apps and also consumes licenses for Single App or individual products such as Adobe Acrobat and Adobe Photoshop. In this dual license scenario, the Software Asset Management application recommends reclaiming the licenses for Single App or individual product subscriptions.

- A reclamation candidate that reclaims three (configurable) or more Single App or individual product subscriptions that are actively used and an optimization candidate that recommends assigning Adobe Creative Cloud All Apps.

Let's say, a user is subscribed to Adobe Acrobat, Adobe Illustrator, and Adobe Photoshop and uses all these products actively. In this scenario, Software Asset Management recommends reclaiming the licenses for these individual product subscriptions and recommends using Adobe Creative Cloud All Apps.

- A reclamation candidate that reclaims Adobe Creative Cloud All Apps when less than three (configurable) individual products are actively used and an optimization candidate that recommends assigning Single App or individual product subscriptions that are actively used.

Let's say, a user is subscribed to Adobe Creative Cloud All Apps but is using less than three individual Creative Cloud products actively. In this scenario, Software Asset Management reclaims the Adobe Creative Cloud All Apps license and recommends assigning these individual product subscriptions that are actively used.

What to do next

View the subscription data by navigating to **All > SaaS License > All User Subscriptions**. You can check the status of the *SAM - Import Adobe User Subscriptions* job by navigating to **All > Software Asset > Administration > Job Results**.

You can also view information about your Adobe subscriptions, compliance, and costs on the [Office 365 & Adobe Cloud dashboard in Software Asset Management classic](#).

After creating an integration profile, you can view information about software models, unrecognized subscription identifiers, scheduled jobs, scheduled job results, and software subscriptions in the Software Asset Workspace. Navigate to **License operations > User subscription > Direct integration profiles**.

Integrate Adobe Cloud using OAuth Server-to-Server credentials

Integrate your ServiceNow[®] instance with Adobe Cloud services by using OAuth Server-to-Server credentials.

Create a project and add APIs using OAuth

Create a project in the Adobe Developer Console for accessing Adobe APIs and add APIs to your project using OAuth.

Before you begin

Role required: Adobe Cloud admin

Procedure

1. Create a project in the Adobe Developer Console to access the Adobe APIs by selecting **Create new project**.
For more information, see [Projects Overview](#) .
2. Add an API to your project by selecting **Add API**.
For more information, see [Add API to project using OAuth](#) .
3. Select **User Management API** for the Adobe service that you want to integrate with.
This service enables you to access the Adobe user management API. After you successfully add the API to your project, you're redirected to the API overview page.
4. Select **Next**.
5. On the Configure API form, expand **Credentials**.
6. Select the **OAuth Server-to-Server** authentication.
7. Provide a name in the **Credential name** field to find the correct API credential easily on the **Admin Console > Users > API Credentials**.
You can also modify the name later in your project on the OAuth Server-to-Server credential overview page.
8. Select **Save configured API**.
The following values are displayed on the credential overview page:
 - CLIENT ID
 - CLIENT SECRET
 - SCOPES
 - CREDENTIAL NAME
 - TECHNICAL ACCOUNT ID
 - TECHNICAL ACCOUNT EMAIL
 - ORGANIZATION ID

Note:

Copy the CLIENT ID and ORGANIZATION ID and also retrieve the CLIENT SECRET to use them later.

9. Get the Connection URL (Instance) URL from the Adobe Developer Console to create and get an OAuth token for Adobe Cloud.

a. In the Generate access token section, select **View cURL command**.

b. Copy the Connection URL.

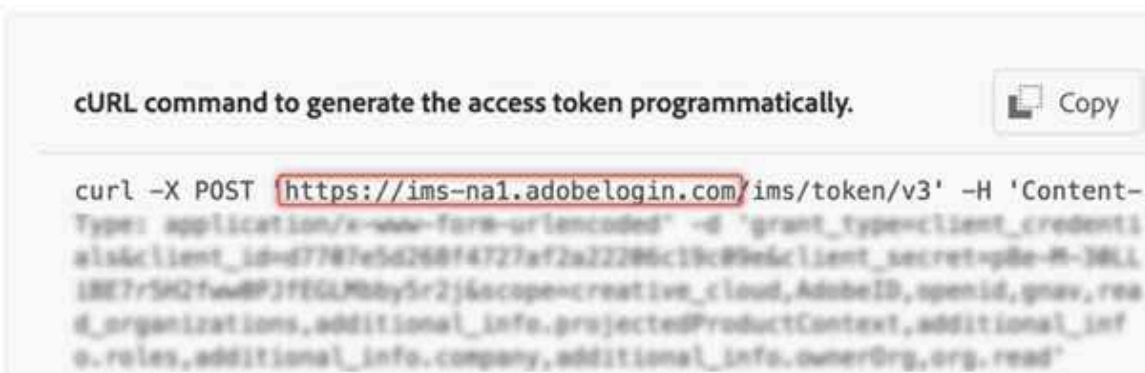

Note:

Copy only the required URL from the entire command.

For example, here the Connection URL is the highlighted part.

Generate access token

Generate an access token for quick experimentation, or view the cURL command to learn how to generate access tokens programmatically. [Learn more](#)

Create an Adobe Cloud integration profile using OAuth

Create an Adobe Cloud integration profile on your ServiceNow instance by using OAuth credentials to track your software subscriptions and to determine your license compliance.

Before you begin

Role required: sam_admin, sam_integrator

Activate the following plugins:

- Software Asset Management Professional for Adobe (com.sn_samp_adobe)
- Software Asset Management - SaaS License Management (sn_sam_saas_int) from [ServiceNow Store](#)

About this task

If you're using Software Asset Workspace, the option to create the Adobe Cloud integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	Name of the Adobe Cloud integration profile.
Authentication type	<p>Type of authentication to access Adobe Cloud APIs.</p> <ul style="list-style-type: none"> ○ OAuth 2.0 ○ JWT <p>Note:</p> <ul style="list-style-type: none"> ○ For the existing Adobe Cloud integration profiles before upgrade to Software Asset Management - SaaS License Management 13.1.0 version or later, this field is automatically set to JWT. For more information, see Integrate Adobe Cloud using Service Account (JWT) credentials. ○ For all the new Adobe Cloud integration profiles, this field is automatically set to OAuth 2.0.
Profile type	Type of integration profile. This field is automatically set to Adobe subscription.

3. In the Process configuration section, view the required user roles or API permissions to minimize security risks and optimize SaaS licenses.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

For more information about the required roles and scopes, see [Minimal user permissions](#) table.

4. Select **Submit**.

The **Connection & Credential** field appears on the form and is automatically set to **sn_sam_saas_int.Adobe_OAuth**.

5. Select the preview icon (i) beside the **Connection & Credential** field to open the Connection & Credential Aliases record.

6. Select the **Create New Connection & Credential** related link.

7. On the form, fill in the fields.

Create a Connection and Credential form

Field	Description
Connection Name	Name of the Adobe Cloud connection.
Connection URL (Instance URL)	URL for the connection. This field is automatically set to <code>https://<Instance Name>.adobelogin.com</code> . For more information about the steps to get the URL, see Step 9 in Create a project and add APIs using OAuth .
OAuth Client ID	Client ID that you generated while creating an Adobe Cloud OAuth credential .
OAuth Client Secret	Client Secret that you retrieved while creating an Adobe Cloud OAuth credential .
OAuth Redirect URL	<code>https://<instance_name>/oauth_redirect.do</code> , where the instance name is the name of your ServiceNow instance.
Organization ID	Adobe Cloud Organization ID that you find while creating an Adobe Cloud OAuth credential .

8. Select **Create and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

9. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Result

Adobe subscription data is pulled into Software Asset Management when the *SAM - Import Adobe User Subscriptions* scheduled job runs. When the subscription data is pulled, the *SAM - Optimize Adobe Subscriptions* scheduled job runs monthly to optimize the Adobe Creative Cloud subscriptions.

This job completion results in the following:

- An optimization candidate that consolidates three (configurable) or more Single App or individual product subscriptions and recommends Adobe Creative Cloud All Apps when it isn't installed.
- A reclamation candidate that reclaims Single App or individual product subscriptions with dual licenses when Adobe Creative Cloud All Apps is installed.

Let's say, a user is subscribed to Adobe Creative Cloud All Apps and also consumes licenses for Single App or individual products such as Adobe Acrobat and Adobe Photoshop. In this dual license scenario, the Software Asset Management application recommends reclaiming the licenses for Single App or individual product subscriptions.

- A reclamation candidate that reclaims three (configurable) or more Single App or individual product subscriptions that are actively used and an optimization candidate that recommends assigning Adobe Creative Cloud All Apps.

Let's say, a user is subscribed to Adobe Acrobat, Adobe Illustrator, and Adobe Photoshop and uses all these products actively. In this scenario, the Software Asset Management application recommends reclaiming the licenses for these individual product subscriptions and recommends using Adobe Creative Cloud All Apps.

- A reclamation candidate that reclaims Adobe Creative Cloud All Apps when less than three (configurable) individual products are actively used and an optimization candidate that recommends assigning Single App or individual product subscriptions that are actively used.

Let's say, a user is subscribed to Adobe Creative Cloud All Apps but is using less than three individual Creative Cloud products actively. In this scenario, the Software Asset Management application reclaims the Adobe Creative Cloud All Apps license and recommends assigning these individual product subscriptions that are actively used.

What to do next

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

View the subscription data by navigating to **All > SaaS License > All User Subscriptions**. You can check the status of the *SAM - Import Adobe User Subscriptions* job by navigating to **All > Software Asset > Administration > Job Results**.

You can also view information about your Adobe subscriptions, compliance, and costs on the [Office 365 & Adobe Cloud dashboard in Software Asset Management classic](#).

After creating an integration profile, you can view information about software models, unrecognized subscription identifiers, scheduled jobs, scheduled job results, and software subscriptions in the Software Asset Workspace. Navigate to **License operations > User subscription > Direct integration profiles**.

Office 365 & Adobe Cloud dashboard in Software Asset Management classic

View compliance analysis results related to Microsoft Office 365 and Adobe Cloud License Management in Software Asset Management classic.

Note:

The Office 365 & Adobe Cloud dashboard is no longer available for new Yokohama users who have activated the Software Asset Management Professional (com.snc.samp) plugin or upgraded to Yokohama without activating the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama. If you activated the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama but didn't activate the Workspace plugin (com.sn_sam_workspace), you have access to this dashboard. If you activated the workspace plugin (before or after upgrading to Yokohama, you won't be able to access this dashboard from the **Software Asset** navigation menu in your instance. You can however access this dashboard from the **Dashboards** navigation menu.

Access the dashboard by navigating to **All > Software Asset > Office 365 & Adobe Cloud**.

You can filter by **Subscription Software Models** or **Subscription Publisher** using filter lists.

i Note:

The Subscription Publisher filter list always includes Microsoft and Adobe even when only one subscription publisher pack is active.

The dashboard is updated whenever a new reconciliation result is available. You can save charts in PNG or JPG format.

Adobe

You can manage Adobe subscription information with Adobe I/O authentication integration.

i Note:

The add-on Adobe publisher pack (com.sn_samp_adobe) [plugin](#) must be installed to view Adobe subscription reporting.

Only Adobe software products that are recognized as subscription software are shown. [Adobe integration](#) must be set up to view compliance information.

- List of Active Subscriptions with no Active Adobe Software installs

If a user has an active subscription but does not have any respective Adobe suite of products deployed.

User Name | Email ID | Subscription Name | List of devices assigned to users.

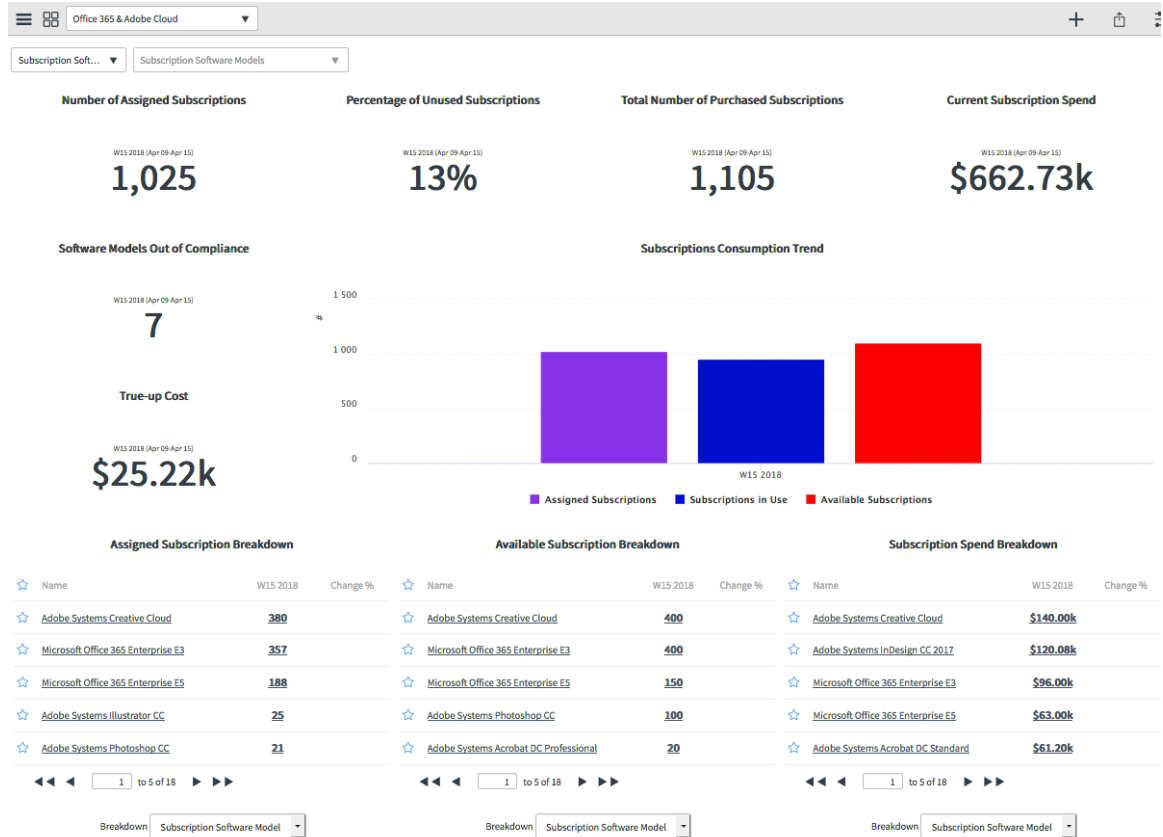

- Optimization of Adobe install using SCCM metering data

If user is underutilizing Adobe subscriptions

User Name | Email ID | Subscription Name | Subscription Cost | List of devices assigned to users | List of Adobe suite of products | Last Access Time

Publisher overview for Adobe Systems in the Software Asset Workspace

View license usage information related to Adobe in the publisher overview for Adobe Systems in the Software Asset Workspace.

From the Software Asset Workspace, access the Adobe Systems publisher overview by navigating to **License usage > Publishers** and then selecting **Adobe Systems** from the list of available software publishers.

Results are updated whenever a new reconciliation result is available.

You can view a summary of your license usage information in the Summary section of the Adobe Systems publisher overview.

Adobe Systems Summary

Report	Description
True-up cost	Cost to be compliant based on the average price of rights in your Adobe software entitlements.
Potential savings	Potential cost savings for your Adobe licenses.
Actual savings	Actual cost savings for your Adobe licenses.
Unlicensed entities	<p>Summary of your unlicensed entities.</p> <p>This summary includes the following information:</p> <ul style="list-style-type: none"> • Unlicensed installs: Total number of unlicensed Adobe software installations. Select the number to view the complete list of unlicensed Adobe software installations. • Installs requiring action: Total number of Adobe software installations that you must take action on. Select the number to view the complete list of these Adobe software installations. • Unlicensed subscriptions: Total number of unlicensed Adobe subscriptions. Select the number to view the complete list of unlicensed Adobe subscriptions. • Unlicensed client access: Total number of unlicensed Adobe client access records. Select the number to view the complete list of unlicensed Adobe client access records.
Progress indicators	<p>Summary of your license compliance progress.</p> <p>This summary includes the following indicators:</p> <ul style="list-style-type: none"> • Ignored installs: Total number of Adobe software installations that were ignored during reclamation. Select the number to view the complete list of ignored Adobe software installations. • Removal candidates: Total number of Adobe removal candidates. Select the number to view the list of all software removal candidates.

For more details on the license usage information that is provided in the publisher overview, see [License usage publisher fields in workspace](#).

Software Asset Management publisher pack for Citrix

Use the Citrix publisher pack for the optimization and reconciliation of your Citrix products. You can track licensing positions for your Citrix users and devices so that you can determine your license compliance.

To use the Citrix publisher pack, activate the Software Asset Management Professional for Citrix plugin (com.sn_samp_citrix). For details, see [Request Software Asset Management](#).

The Citrix publisher pack supports Virtual Applications products (formerly XenApp) and Virtual Desktop products (formerly XenDesktop). Using this publisher pack, you can manage licenses and determine the license compliance for your Citrix products. You can gain visibility into the third-party applications that are delivered through your virtual applications and desktops. You can also gain visibility into the users that may potentially access those applications.

Use the ServiceNow® Discovery application to collect data from Citrix. The license consumption data for your Citrix products is collected from the Citrix License Server.

Discovery uses OData APIs to identify the third-party applications that are delivered through your Citrix farm from the Citrix Delivery Controller. Use this information to create software installation records and track license usage for these applications. To identify these applications, admins must create a [Discovery schedule](#) to run on the Citrix discovery pattern. See [Citrix License Server and Delivery Controller discovery](#) for more details on the Citrix discovery pattern and tables.

Citrix licensing models

The Citrix publisher pack supports the following Citrix licensing models:

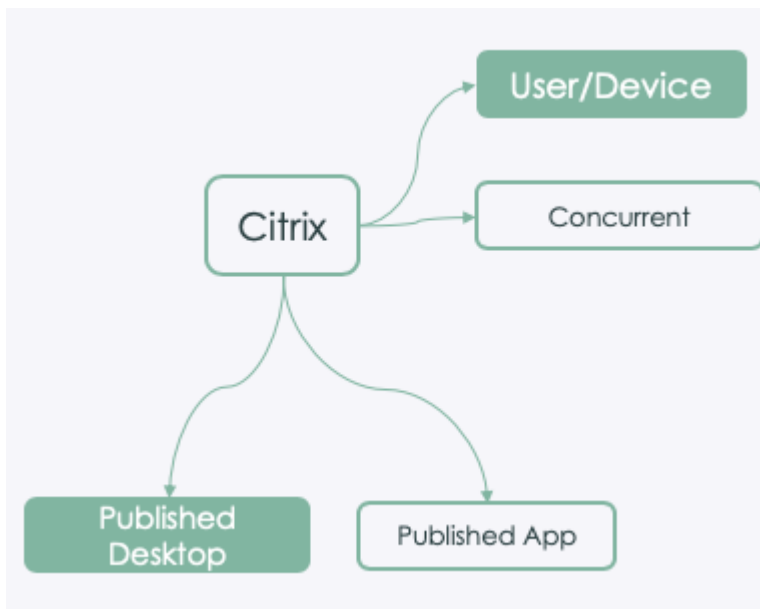

Concurrent licensing model

Concurrent licenses are used only during active sessions. When a user begins a session, the application or desktop checks out a license for the device that is running the session. When the session disconnects or ends, the application or desktop checks the license back in to make the license available to other users and devices. Concurrent licenses enable either one connection to a virtual desktop or unlimited applications for any user or device. License consumption is based on the number of licenses being used.

User/Device licensing model

User/Device licensing model: User/Device licenses are assigned to either a user or shared device. If the Citrix License Server assigns a license to a user, that user can make unlimited connections from unlimited devices. If the Citrix License Server assigns a license to a device, unlimited users can make unlimited connections from that device. License consumption is based on the user or device using the license.

The architecture for Citrix licenses is shown in the following figure:

Licensing for third-party applications that are delivered through Citrix virtualization technologies is based on potential access. Any user or device can consume a license as long as they have the potential to access an application or desktop deployed in a virtual Citrix environment. You can control access to these applications and desktops by using Delivery Groups and Application Groups:

Delivery Groups

Delivery Groups are collections of devices on which you can use Citrix applications or desktops. Each Delivery Group specifies the users that have access to those

devices. In addition, Delivery Groups specify the applications or desktops that are available to those users.

Application Groups

Application Groups are collections of applications that are shared across Delivery Groups or subsets of Delivery Group users. Each Application Group specifies the users or Active Directory (AD) groups that have access to those applications.

Refer to the [Citrix product documentation](#) for more information on Citrix deployment guidelines and recommendations. Use this information to determine whether you should map your users at the Delivery Group level or at the Application Group level. If you map users at both levels, Software Asset Management considers mappings at only the Application Group level.

You can view your Citrix license usage data from the [Software Publisher Analytics dashboard for Citrix](#). Use this data to optimize your license position by reclaiming any unused or unauthorized licenses.

Create entitlements for Citrix

Software entitlements enable you to define license details that are matched to software models. You can add an entitlement individually or import a list from a spreadsheet.

Before you begin

Role required: sam_user or sam_admin. The sam_admin role is required to import entitlements.

i Important: You can create and import entitlements in both the Software Asset Management classic application and the Software Asset Workspace. The following steps provide details on how to create entitlements in the Software Asset Management classic application. For details on how to create entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#). For details on how to import entitlements in the Software Asset Workspace, see [Import bulk entitlements in workspace](#).

Before you can create a software entitlement, [create a software model](#).

About this task

Manage available software and tie software installations (software being used) with entitlements (software owned) using software models. Create software models for all software to be monitored.

i Note: Users with the model_manager role can navigate to **Product Catalog > Product Model > Software Models** but can't administer all aspects of software models.

Procedure

1. Navigate to **All > Asset > Portfolios > Software Entitlement** and select **New**.

For a detailed description of the fields related to all entitlements, see [Create entitlements in Software Asset Management classic](#).

Software Entitlement form

Field	Description
License Metric	License metric for the license group that the software license is counted against when reconciliation is run. For detailed of the license metrics, see Software license metrics .

2. To set upgrade or downgrade entitlements, select the new software entitlement record from the Software Entitlements list.

For a detailed description on how to complete additional configurations for software entitlements, see [Create entitlements in Software Asset Management classic](#).

3. Select **Submit**.

Your entitlement is added to the software entitlements list.

What to do next

Run [software reconciliation](#) on your licenses.

Software Publisher Analytics dashboard for Citrix in Software Asset Management classic

View compliance analysis results for Citrix on the Software Publisher Analytics dashboard in the Software Asset Management classic application.

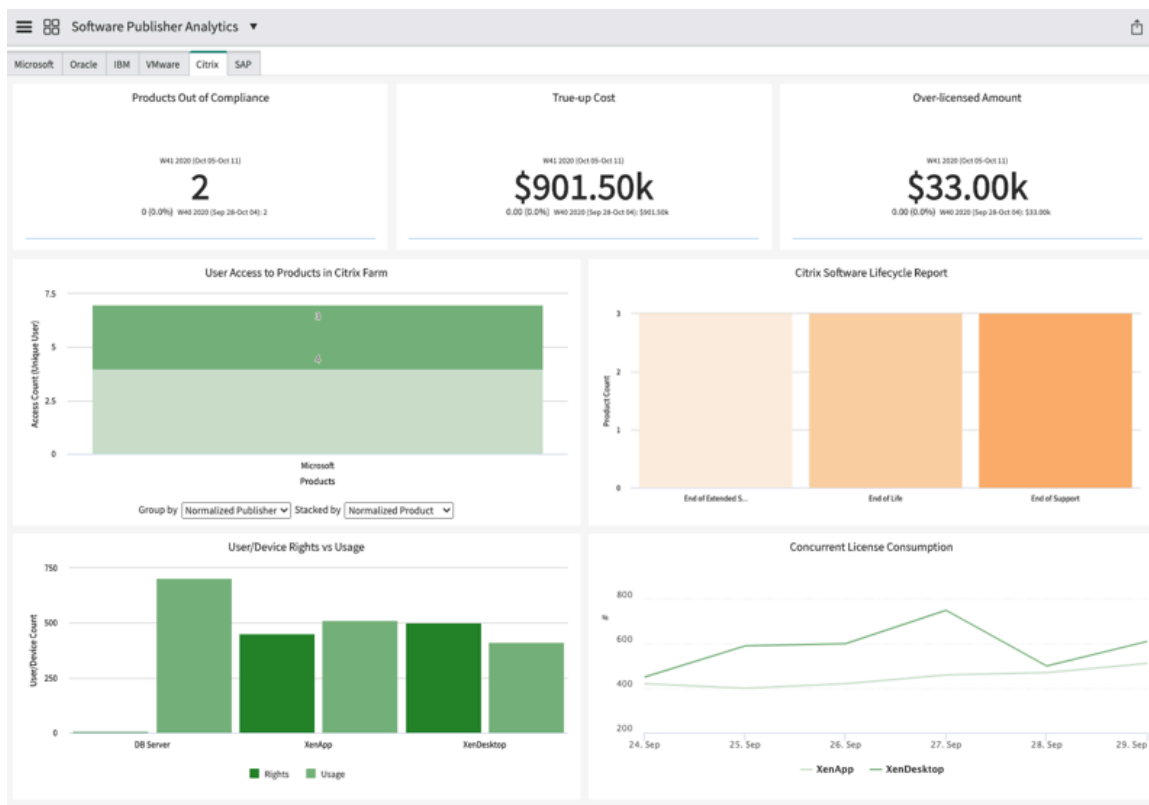

Access the Software Publisher Analytics dashboard by navigating to **All > Software Asset > Publisher Overview**.

Note:

The add-on Citrix publisher pack (com.sn_samp_citrix) [plugin](#) must be installed to view the Citrix dashboard tab.

A discovery process is required for Citrix data to be collected. For ServiceNow Discovery, a user with the admin role must create a [Discovery schedule](#) to run on the Citrix Delivery Controller for communication with the Citrix License Server.

The dashboard is updated whenever a new reconciliation result is available. You can save charts in PNG or JPG format.

Citrix tab

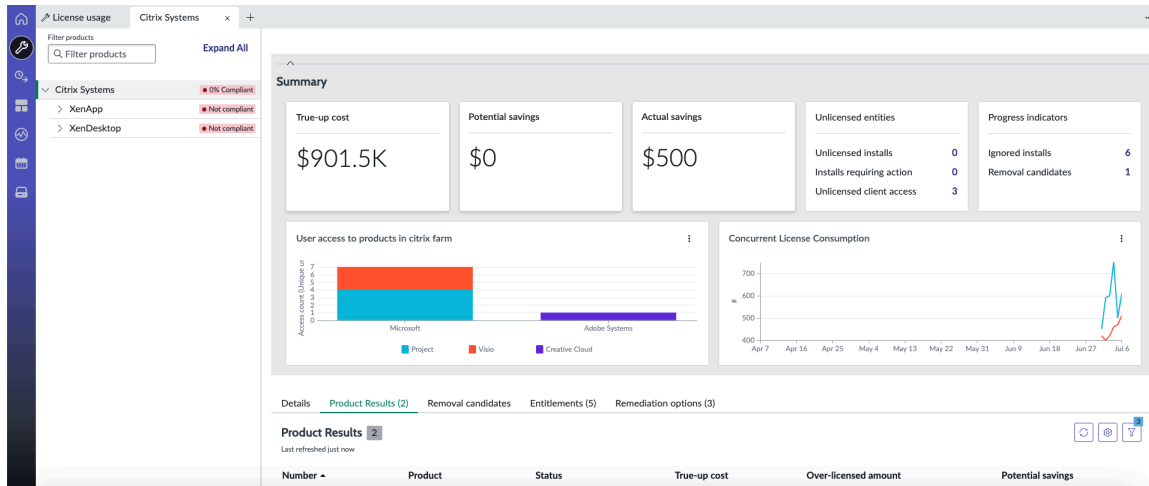

Report	Source list	Description
True-up Cost	Product Results	Cost to be compliant based on the average prices for entitlements for the rights.
Products out of Compliance	Product Results	Number of products that have at least one software model out of compliance. Select the report to view the results in the License Workbench .
Over-Licensed Amount	Product Results	Cost of licenses owned but not being used.
User Access to Products in Citrix Farm	Software Installations	Number of users with access to the Citrix farms.
Citrix Software Lifecycle Report	Software Lifecycle Report	Number of products in each software lifecycle phase, including End of Extended Support, End of Life, and End of Support.
User/Device Rights vs Usage Software Installs in Citrix Farm	Software Installations	Number of User/Device rights owned versus the number of rights being consumed.
Concurrent License Consumption Trend	License Consumption History	License consumption trends for your Citrix software products. Each data point represents the maximum in-use license count per day. Select a data point to view additional license consumption data for a specific Citrix software product.

Publisher overview for Citrix Systems in the Software Asset Workspace

View license usage information related to Citrix in the publisher overview for Citrix Systems in the Software Asset Workspace.

From the Software Asset Workspace, access the Citrix Systems publisher overview by navigating to **License usage > Publishers** and then selecting **Citrix Systems** from the list of available software publishers.

Results are updated whenever a new reconciliation result is available.

You can view a summary of your license usage information in the Summary section of the Citrix Systems publisher overview.

Citrix Systems Summary

Report	Description

Software Asset Management publisher pack for IBM

Use the Software Asset Management publisher pack for IBM to track and optimize licensing for your IBM software products. You can also use the publisher pack to track and optimize licensing for the Red Hat Enterprise Linux Server and Red Hat Enterprise Linux for Virtual Datacenters products.

To use the IBM publisher pack, activate the Software Asset Management Professional for IBM (com.sn_samp_ibm) [plugin](#).

The IBM publisher pack supports the following license metrics:

- Authorized User
- Authorized User Value Unit
- Employee User Value Unit
- External User Value Unit
- Per Device
- Per Named User
- Per Processor
- Per User
- Processor Value Unit (PVU)
- Resource Value Unit (RVU)
- Virtual Processor Core (VPC)

***i* Important:**

The PVU, RVU, and VPC license metrics are supported only if you integrate the IBM publisher pack with the IBM License Metric Tool (ILMT), BigFix Inventory, or a Software Asset Management provider that is authorized to participate in the IBM Client Value Acceleration (CVA) Program. For more information on ILMT and BigFix Inventory integrations, see [IBM License Metric Tool \(ILMT\) and BigFix Inventory integrations](#). For more information on Authorized SAM Provider (ASP) integrations, see [Authorized SAM Provider \(ASP\) integrations for IBM](#).

For more information on the supported IBM license metrics, see [Software license metrics](#).

i Important:

The IBM publisher pack is available as part of the Software Asset Management Professional (com.snc.samp) plugin. The publisher pack includes all capabilities that are required for tracking and managing both full capacity and sub-capacity PVU and RVU licenses for your IBM products. It does not require the legacy IBM PVU Process Pack to track and manage IBM PVU licenses. See [IBM PVU Process Pack](#) for more information on the legacy process pack.

When you run a discovery using a discovery tool such as the ServiceNow Discovery application, the discovery tool locates the IBM software installations in your environment and then imports the associated data into your ServiceNow instance. The Software Asset Management application compares this data against your IBM software entitlements to automatically reconcile your IBM software products, including products in complex server licensing scenarios.

i Important:

You must use different discovery tools based on the license metric that you are using for reconciliation, and if applicable, the type of IBM integration that you are using with the publisher pack:

PVU and RVU license metrics

To reconcile your IBM software products using the PVU or RVU license metrics, you must use one of the following discovery tools:

- If you are integrating with the ILMT or BigFix Inventory, you must connect to these discovery tools using either version 1 or version 2 of the integration APIs.
- If you are integrating with a Software Asset Management provider that is authorized to participate in the IBM CVA Program, you must use the ServiceNow Discovery application in conjunction with the IBM License Compliance for Software Asset Management application.

VPC license metric

To reconcile your IBM software products using the VPC license metric, you must use one of the following discovery tools:

- If you are integrating with the ILMT or BigFix Inventory, you must connect to these discovery tools using version 2 of the integration APIs.
- If you are integrating with a Software Asset Management provider that is authorized to participate in the IBM CVA Program, you must use the ServiceNow Discovery application in conjunction with the IBM License Compliance for Software Asset Management application.

All other supported license metrics

To reconcile your IBM software products using any other supported license metric, including user-based license metrics like Authorized User and External User Value Unit, you can use any other discovery tool.

Supported IBM license types

The Software Asset Management publisher pack for IBM adds license metrics for various IBM license types.

IBM processor value unit (PVU) and resource value unit (RVU) licenses

If you integrate the Software Asset Management publisher pack for IBM with Software Asset Management providers that are authorized to participate in the IBM Client Value Acceleration (CVA) Program, you can track and manage IBM PVU and RVU licenses. Alternatively, you can

track and manage these licenses when you integrate with the IBM License Metric Tool (ILMT) or BigFix Inventory using version 1 or 2 of the integration APIs.

With these integrations, the publisher pack adds the Processor Value Unit (PVU) and Resource Value Unit (RVU) license metrics for IBM so that you can calculate licensing for these license types. For more details on Authorized SAM Provider (ASP) integrations, see [Authorized SAM Provider \(ASP\) integrations for IBM](#). For more details on ILMT and BigFix Inventory integrations, see [IBM License Metric Tool \(ILMT\) and BigFix Inventory integrations](#).

Note:

IBM PVU and RVU licensing is supported in both physical and virtualized environments.

Processor value unit (PVU) licensing

A processor value unit (PVU) is a unit of measure that enables you to determine the licensing requirements for an IBM software product based on the processor technology that is used in your physical hardware environment. Each processor technology is assigned a PVUs per Core value based on the processor vendor, processor name, and model number. You can determine the number of rights that are required for a PVU license by multiplying the appropriate PVUs per Core value by the number of activated processor cores in the physical hardware environment that is available to or managed by your IBM software product.

The IBM publisher pack supports both full capacity and sub-capacity PVU licensing. If you are using a full capacity PVU license, you must account for all activated processor cores in the physical hardware environment that is available to or managed by the IBM software product. If you are using a sub-capacity PVU license, you must account for only the specific activated processor cores that are available to or managed by the IBM software product, as defined in [Virtualization Capacity License Counting Rules](#).

You can gain visibility into how your PVU licenses are applied to your devices by using the **Usage Type** field in the [license workbench](#). Use this information to determine whether your PVU licenses are applied to the full capacity or sub-capacity of each device. Depending on the type of IBM integration that you are using, specify how a PVU license is applied to a device using one of the following options:

- If you are integrating the IBM publisher pack with the IBM License Metric Tool (ILMT) or BigFix Inventory, navigate to **Integration - ILMT/BigFix Inventory > Import Set Data > IBM License Metric Peak Usage** to modify the value of the corresponding **Usage Type** field in the IBM Peak Consumption [samp_ilm_t_sw_install] table. By default, the **Usage Type** field for devices on the IBM Peak Consumption [samp_ilm_t_sw_install] table is automatically set to **Sub-capacity**. However, the **Usage Type** field for devices with allocations in your full capacity PVU entitlements is automatically set to **Full capacity** instead.

For more details on ILMT and BigFix Inventory, see [IBM License Metric Tool \(ILMT\) and BigFix Inventory integrations](#).

- If you are integrating the IBM publisher pack with an Authorized SAM Provider (ASP), navigate to **Workspaces > Software Asset Workspace**. When the Software Asset Workspace launches, open the License operations view. From the left navigation menu of the License operations view, navigate to **IBM ASP Integration > Device Settings** to modify the value of the corresponding **Usage Type** field. By default, the **Usage Type** field is automatically set to **Sub-capacity**. However, the **Usage Type** field for devices with allocations in your full capacity PVU entitlements is automatically set to **Full capacity** instead.

For more details on the available device settings, see [Verify the meta data for your IBM hosts](#).

For more details on ASPs, see [Authorized SAM Provider \(ASP\) integrations for IBM](#).

Refer to [Processor Value Units \(PVU\)](#) for more information on IBM PVU licensing, including the complete list of supported processor technologies and corresponding PVUs per Core values.

Resource value unit (RVU) licensing

A resource value unit (RVU) is a unit of measure that enables you to determine the licensing requirements for an IBM software product based on the number of activated processor cores that are available to or managed by that product. The number of activated processor cores corresponds directly with an RVU tier number and factor value.

RVU tiers and factors

Number of Activated Processor Cores	Tier	Factor
0 to 2,500	1	1.00
2,501 to 10,000	2	0.80
10,001 to 50,000	3	0.60
50,001 to 150,000	4	0.40
150,001 and above	5	0.20

You can determine the number of rights that are required for an RVU license by using a step function based on these RVU tiers. First, you must divide the total number of activated processor cores into tiers based on the [RVU tiers and factors table](#). Since RVU licensing is calculated at the product level and not the individual device level, you must account for all devices that the product is installed on when determining the total number of activated processor cores that must be licensed. Then, you must multiply the number of activated processor cores within each tier by the corresponding factor values. Finally, you must add the resulting numbers together to determine the total number of rights that are required for the RVU license.

i Important:

If you do not have enough rights to license all activated processor cores across all devices, none of the devices are licensed and the product is marked as Not Compliant.

For example, a product has access to a total of 150,000 activated processor cores across 100 devices. The total number of rights that are required for the RVU license is 72,500, based on the following calculations:

Tier	Number of Activated Processor Cores within the Tier	Factor	Number of Rights Required
1 (0 to 2,500 activated processor cores)	2,500	1.00	2,500 x 1.00 = 2,500
2 (2,501 to 10,000 activated processor cores)	7,500	0.80	7,500 x 0.80 = 6,000
3	40,000	0.60	40,000 x 0.60 = 24,000

Tier	Number of Activated Processor Cores within the Tier	Factor	Number of Rights Required
(10,001 to 50,000 activated processor cores)			
4 (50,001 to 150,000 activated processor cores)	100,000	0.40	100,000 x 0.40 = 40,000
n/a	150,000 total	n/a	2,500 + 6,000 + 24,000 + 40,000 = 72,500 total

Note:

The number of rights that are consumed for RVU licenses is reported differently from the number of rights that are consumed for PVU licenses. For PVU licenses, this number is reported at the individual device level. For RVU licenses, this number is reported at the product level.

Refer to [Resource value unit \(RVU MAPC\)](#) for more information on IBM RVU tiers.

The IBM publisher pack supports both full capacity and sub-capacity RVU licensing. If you are using a full capacity RVU license, you must account for all activated processor cores in the physical hardware environment that is available to or managed by the IBM software product. If you are using a sub-capacity RVU license, which is available only in virtualized environments, you must account for only the activated processor cores that are used by the virtual machines (VMs) on which the IBM software product is installed.

You can gain visibility into how your RVU licenses are applied to your devices by using the **Usage Type** field in the [license workbench](#). Use this information to determine whether your RVU licenses are applied to the full capacity or sub-capacity of each device. Depending on the type of IBM integration that you are using, specify how an RVU license is applied to a device using one of the following options:

- If you are integrating the IBM publisher pack with the IBM License Metric Tool (ILMT) or BigFix Inventory, navigate to **Integration - ILMT/BigFix Inventory > Import Set Data > IBM License Metric Peak Usage** to modify the value of the corresponding **Usage Type** field in the IBM Peak Consumption [samp_ilmt_sw_install] table. By default, the **Usage Type** field for devices on the IBM Peak Consumption [samp_ilmt_sw_install] table is automatically set to **Sub-capacity**.

For more details on ILMT and BigFix Inventory, see [IBM License Metric Tool \(ILMT\) and BigFix Inventory integrations](#).

- If you are integrating the IBM publisher pack with an Authorized SAM Provider (ASP), such as Anglepoint, navigate to **Workspaces > Software Asset Workspace**. When the Software Asset Workspace launches, open the License operations view. From the left navigation menu of the License operations view, navigate to **IBM ASP Integration > Device settings** to modify the value of the corresponding **Usage Type** field. By default, the **Usage Type** field is automatically set to **Sub-capacity**.

For more details on the available device settings, see [Verify the meta data for your IBM hosts](#).

For more details on ASPs, see [Authorized SAM Provider \(ASP\) integrations for IBM](#).

IBM user-based licenses

You can use the Software Asset Management publisher pack for IBM to track and manage your IBM user-based licenses, including authorized user licenses and user value unit (UVU)-based licenses.

Supported UVU-based licenses include authorized UVU, employee UVU, and external UVU. The publisher pack adds license metrics that are specific to IBM so that you can calculate licensing for these license types.

IBM user-based licensing enables you to license the users who require access to your IBM software products. You can track and optimize the compliance of your IBM user-based licenses by reconciling the associated IBM software products through client access records. With a client access record, you can specify the total number of users who are granted access to a particular version of an IBM software product. For more granular control, you can also identify the specific users who are granted access to that product. The Software Asset Management application can then compare this information against the software rights and allocations that are defined in the corresponding software entitlements to determine if the associated user-based licenses are compliant.

For more information on client access records in the Software Asset Workspace, see [Create a software client access record in workspace](#). For more information on client access records in the Software Asset Management classic application, see [Add a software client access record in Software Asset Management classic](#).

Authorized user licensing

Authorized user licensing enables you to license each unique user who requires access to an IBM software product.

With this licensing type, you can install a given IBM software product on an unlimited number of configuration items (CIs), such as servers and computers. Each user can then access an unlimited number of installations for that software product on any of the CIs that the software product is installed on.

Authorized user value unit (AUVU) licensing

Authorized user value unit (AUVU) licensing enables you to license the total number of unique users who require access to an IBM software product.

With this licensing type, you can install a given IBM software product on an unlimited number of configuration items (CIs), such as servers and computers. Each user can then access an unlimited number of installations for that software product on any of the CIs that the software product is installed on.

With AUVU licensing, the number of users who require access to an IBM software product corresponds directly with an AUVU tier number and factor value.

AUVU tiers and factors

Number of Users	Tier	Factor
1 to 20	1	1.00
21 to 50	2	0.83
51 or more	3	0.80

You can determine the number of rights that are required for an AUVU license by using a step function based on these AUVU tiers. First, divide the total number of users into tiers based on the [AUVU tiers and factors table](#). Then, multiply the number of users within each tier by the corresponding factor values. Finally, add the resulting numbers together to determine the total number of rights that are required for the AUVU license.

i Important:

If you do not have enough rights to license all users, none of the users are licensed and the product is marked as Not Compliant.

For example, a company wants to grant 150 employees and contractors access to an IBM software product so that they can collaborate on an upcoming project. The total number of rights that are required for the corresponding AUVU license is 125, based on the following calculations:

Tier	Number of Users within the Tier	Factor	Number of Rights Required
1 (1 to 20 users)	20	1.00	20 x 1.00 = 20
2 (21 to 50 users)	30	0.83	30 x 0.83 = 24.9
3 (51 or more users)	100	0.80	100 x 0.8 = 80
—	150 total	—	20 + 24.9 + 80 = 124.9 total (rounded up to 125 total)

Employee user value unit (EUVU) licensing

Employee user value unit (EUVU) licensing enables you to license the total number of users within your organization who require access to an IBM software product. These users can include both employees and contractors.

With EUVU licensing, the number of users who require access to an IBM software product corresponds directly with an EUVU tier number and factor value.

EUVU tiers and factors

Number of Users	Tier	Factor
1000 to 2,500	1	1.000
2,501 to 5,000	2	0.800
5,001 to 10,000	3	0.700
10,001 to 30,000	4	0.650
30,001 to 50,000	5	0.550
50,001 to 100,000	6	0.500

EUVU tiers and factors (continued)

Number of Users	Tier	Factor
100,001 to 300,000	7	0.465
300,001 to 500,000	8	0.400
500,001 to 1,000,000	9	0.360
1,000,001 to 100,000,000	10	0.320

You can determine the number of rights that are required for an EUVU license by using a step function based on these EUVU tiers. First, divide the total number of users into tiers based on the [EUVU tiers and factors table](#). Then, multiply the number of users within each tier by the corresponding factor values. Finally, add the resulting numbers together to determine the total number of rights that are required for the EUVU license.

i Important:

If you do not have enough rights to license all users, none of the users are licensed and the product is marked as Not Compliant.

For example, a company wants to grant 11,000 employees access to an IBM software product. The total number of rights that are required for the corresponding EUVU license is 8,650, based on the following calculations:

Tier	Number of Users within the Tier	Factor	Number of Rights Required
1 (1,000 to 2,500 users)	2,500	1.000	2,500 x 1.000 = 2,500
2 (2,501 to 5,000 users)	2,500	0.800	2,500 x 0.800 = 2,000
3 (5,001 to 10,000 users)	5,000	0.700	5,000 x 0.700 = 3,500
4 (10,001 to 30,000 users)	1,000	0.650	1,000 x 0.650 = 650
—	11,000 total	—	2,500 + 2,000 + 3,500 + 650 = 8,650 total

External user value unit (XUVU) licensing

External user value unit (XUVU) licensing enables you to license the total number of users outside your organization who require access to an IBM software product. These users can include third-party partners, suppliers, and contractors.

With XUVU licensing, the number of users who require access to an IBM software product corresponds directly with an XUVU tier number and factor value.

XUVU tiers and factors

Number of Users	Tier	Factor
1000 to 10,000	1	1.00000
10,001 to 50,000	2	0.87500
50,001 to 100,000	3	0.60000
100,001 to 500,000	4	0.43750
500,001 to 1,000,000	5	0.30000
1,000,001 to 25,000,000	6	0.24375
25,000,001 to 50,000,000	7	0.15000
50,000,001 to 250,000,000	8	0.13750
250,000,001 to 500,000,000	9	0.05000
500,000,001 to 100,000,000,000	10	0.05000

You can determine the number of rights that are required for an XUVU license by using a step function based on these XUVU tiers. First, divide the total number of users into tiers based on the [XUVU tiers and factors table](#). Then, multiply the number of users within each tier by the corresponding factor values. Finally, add the resulting numbers together to determine the total number of rights that are required for the XUVU license.

Important:

If you do not have enough rights to license all users, none of the users are licensed and the product is marked as Not Compliant.

For example, a company wants to grant 15,000 third-party partners access to an IBM software product. The total number of rights that are required for the corresponding XUVU license is 14,375, based on the following calculations:

Tier	Number of Users within the Tier	Factor	Number of Rights Required
1 (1,000 to 10,000 users)	10,000	1.00000	10,000 x 1.00000 = 10,000
2 (10,001 to 50,000 users)	5,000	0.87500	5,000 x 0.87500 = 4,375
—	15,000 total	—	10,000 + 4,375 = 14,375 total

IBM virtual processor core (VPC) licenses

If you integrate the Software Asset Management publisher pack for IBM with Software Asset Management providers that are authorized to participate in the IBM Client Value Acceleration (CVA) Program, you can track and manage IBM VPC licenses. Alternatively, you can track and

manage these licenses when you integrate with the IBM License Metric Tool (ILMT) or BigFix Inventory using version 2 of the integration APIs.

With these integrations, the publisher pack adds the Virtual Processor Core (VPC) license metric for IBM so that you can calculate licensing for this license type. For more details on Authorized SAM Provider (ASP) integrations, see [Authorized SAM Provider \(ASP\) integrations for IBM](#). For more details on ILMT and BigFix Inventory integrations, see [IBM License Metric Tool \(ILMT\) and BigFix Inventory integrations](#).

A virtual processor core (VPC) is a unit of measure that enables you to determine the licensing requirements for an IBM software product based on the number of cores that are available to or managed by that product. If you are licensing a virtual machine (VM), VPC is based on the number of virtual cores that are assigned to the VM. If you are licensing a physical host that is not partitioned for VMs, VPC is based on the number of processor cores on the host. Each VPC license requires one right for every core that is available to or managed by the associated IBM software product.

If you are integrating the IBM publisher pack with an ASP, the publisher pack supports both full capacity and sub-capacity VPC licensing. If you are integrating with ILMT or BigFix Inventory, the publisher pack supports only sub-capacity VPC licensing. With a full capacity VPC license, you must account for all processor cores on the physical host that is available to or managed by the IBM software product. With a sub-capacity VPC license, which is available only in virtual environments, you must account for only the virtual cores that are assigned to the VMs on which the IBM software product is installed and running.

You can gain visibility into how your VPC licenses are applied to your devices by using the **Usage Type** field in the [license workbench](#). Use this information to determine whether your VPC licenses are applied to the full capacity or sub-capacity of each device. If you are integrating with an ASP, you can specify how a VPC license is applied to a device by navigating to **Workspaces > Software Asset Workspace**. When the Software Asset Workspace launches, open the License operations view. From the left navigation menu of the License operations view, navigate to **IBM ASP Integration > Device Settings** to modify the value of the corresponding **Usage Type** field. By default, the **Usage Type** field is automatically set to **Sub-capacity**.

For more details on the available device settings, see [Verify the meta data for your IBM hosts](#).

IBM License Metric Tool (ILMT) and BigFix Inventory integrations

You can use an IBM License Metric Tool (ILMT) or BigFix Inventory integration to create a connection between your IBM servers and the ServiceNow AI Platform. Use this connection to import data into your ServiceNow instance so that you can track and optimize licensing for your IBM software products.

You can integrate with ILMT or BigFix Inventory using either version 1 or version 2 of the ILMT and BigFix Inventory integration APIs. The Software Asset Management application uses these APIs to retrieve data, such as software installation data and peak usage data, from the ILMT or BigFix Inventory. For more information on integrating with ILMT or BigFix Inventory using version 1 of the APIs, see [Integrating with the IBM License Metric Tool \(ILMT\) or BigFix Inventory using v1 APIs](#). For more information on integrating with ILMT or BigFix Inventory using version 2 of the APIs, see [Integrating with the IBM License Metric Tool \(ILMT\) or BigFix Inventory using v2 APIs](#).

i Important:

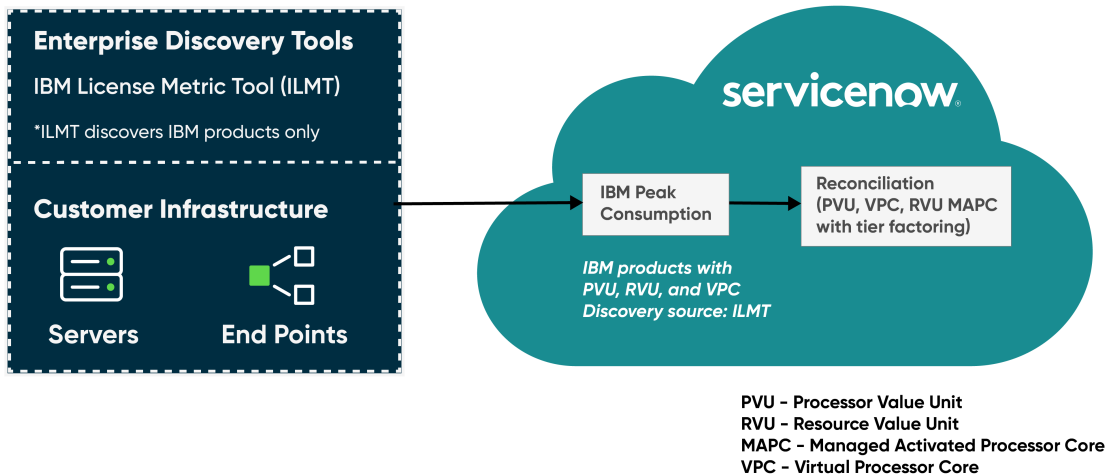

Version 1 of the ILMT and BigFix Inventory integration APIs have been deprecated by IBM. However, the Software Asset Management application continues to support integrations that are using this version of the APIs. If you are setting up an ILMT or BigFix Inventory integration for the first time, use version 2 of the APIs instead. For more information on the deprecation of these APIs, see [Deprecated REST APIs](#) .

Integrating with the IBM License Metric Tool (ILMT) or BigFix Inventory using v2 APIs

You can use version 2 of the IBM License Metric Tool (ILMT) and BigFix Inventory integration APIs to create a connection between your IBM servers and the ServiceNow AI Platform.

This connection enables you to import usage data into your ServiceNow instance so that you can track and optimize full capacity and sub-capacity processor value unit (PVU) and resource value unit (RVU) licensing as well as sub-capacity virtual processor core (VPC) licensing for your IBM software products.

See [REST API resources and HTTP methods](#) for more information on the ILMT and BigFix Inventory integration APIs.

The ILMT and BigFix Inventory integration enables you to create connections between one or more IBM servers and the ServiceNow AI Platform using HTTP or HTTPS. When you initiate the integration, you receive an IBM Server connection alias that you can use to set up your IBM server connections. If a connection is successful, the Software Asset Management application retrieves peak usage data within the aggregated period that you defined in ILMT or BigFix Inventory.

Prerequisites

To track your IBM full capacity and sub-capacity PVU, RVU, and VPC licenses using this integration, you must complete the following prerequisites:

- Install, set up, and run ILMT or BigFix Inventory on a physical host or virtual machine (VM).

i Important:

When you are setting up ILMT, ensure that all required configuration item (CI) data, including serial numbers, names, and IP addresses, is configured correctly so that your ServiceNow instance can accurately create corresponding CI records in the Configuration Management Database (CMDB). Refer to [KB0691430](#) for more details.

- Install ILMT version 9.2.24 or later.

i Note:

If you are using ILMT version 9.2.23 or earlier, you can import usage data only against your discovered IBM software products and not against the hosts that are running those products.

- Configure your IBM ILMT agents to scan your physical hosts or VMs in compliance with IBM usage measurement guidelines.

Note:

Refer to [Measuring License Use](#) for more information on IBM usage measurement guidelines.

- Enable ILMT or BigFix Inventory to discover the configurations of both physical hosts and VMs as well as the relationships between them.
- Classify and bundle IBM components into IBM products through ILMT or BigFix Inventory.
- Request and install the IBM License Compliance for Software Asset Management application from the ServiceNow® Store. See [Request the IBM License Compliance for Software Asset Management application for IBM License Metric Tool \(ILMT\) and BigFix Inventory integrations](#) for detailed instructions.
- Set the **Connect to ILMT using** (*sn_samp_ibm_lic_ilmt_api_version*) Software Asset Management property to **v2 API's**. For more details on this property, see [Software Asset Management properties](#).

Request the IBM License Compliance for Software Asset Management application for IBM License Metric Tool (ILMT) and BigFix Inventory integrations

If you are using version 2 of the IBM License Metric Tool (ILMT) and BigFix Inventory integration APIs to integrate with ILMT or BigFix Inventory, request the IBM License Compliance for Software Asset Management application from the ServiceNow® Store. Use the integration to track and manage your IBM licenses.

Before you begin

Role required: admin

Procedure

1. From a web browser, go to the [ServiceNow Store](#).
2. Log in using your HI credentials.
3. In the search bar, enter **IBM License Compliance for Software Asset Management** and then select **Search**.
4. Select the result called **IBM License Compliance for Software Asset Management**.
5. On the IBM License Compliance for Software Asset Management page, select **Request Install**. The ServiceNow Request for App Installation - IBM License Compliance for Software Asset Management dialog box opens.
6. In the dialog box, fill in the fields.

ServiceNow Request for App Installation - IBM License Compliance for Software Asset Management dialog box

Field	Description
Instance Name	Name of the instance on which you want to install the application. After you enter the instance name, select Validate Instance to verify that the instance exists.
Reason for request	Reason for requesting the application.

7. Select **Request**.

8. Select **Close**.

Result

If your request is approved, you will receive an email with detailed instructions on how to install the application.

What to do next

Install the application according to the instructions in the email.

IBM License Metric Tool (ILMT) and BigFix Inventory transform map for v2 APIs

When you import data from the IBM License Metric Tool (ILMT) or BigFix Inventory using version 2 of the ILMT and BigFix Inventory integration APIs, your ServiceNow instance uses a default transform map to process this data into ServiceNow tables.

Default ILMT and BigFix Inventory transform map

By default, the ServiceNow AI Platform provides the ILMT Software License Usage transform map to process the IBM license usage data that you import using version 2 of the ILMT and BigFix Inventory integration APIs. When you import this data into your ServiceNow instance, it is added to the source ILMT Product Usage Staging [ilmt_v2_product_usage_staging] and ILMT Device Usage Staging [ilmt_v2_device_usage_staging] tables. The ILMT Software License Usage transform map then uses the following table mappings to map the data from these source tables to the corresponding target tables:

ILMT Software License Usage transform map table mappings

Source Table	Target Table
ILMT Product Usage Staging [ilmt_v2_product_usage_staging] Note: Data that is imported into this table is reported against your discovered IBM software products.	ILMT Product Usage [ilmt_v2_product_usage]
ILMT Device Usage Staging [ilmt_v2_device_usage_staging] Note: Data that is imported into this table is reported against the hosts that are running your IBM software products. Note: You can import data into this table only if you are using ILMT version 9.2.24 or later. You cannot import data into this table if you are using ILMT version 9.2.23 or earlier or if you are using BigFix Inventory.	ILMT Product Usage Per Server [ilmt_v2_usage_per_server] ILMT Discovered Computer [ilmt_discovered_computer]

After the data is successfully mapped, it is updated in the corresponding target table records. You can then use the updated target table data to reconcile your IBM software products and verify compliance.

ILMT and BigFix Inventory data processing

The ILMT Software License Usage transform map processes data by using the onStart transform map script. The onStart transform map script is an event script that processes at the beginning of

an import. For more information on this transform map script, see [Map with transformation event scripts](#).

View the peak usage of your IBM software products

If you are integrating with the IBM License Metric Tool (ILMT) or BigFix Inventory using version 2 of the ILMT and BigFix Inventory integration APIs, view the highest full capacity and sub-capacity Processor Value Unit (PVU), Resource Value Unit (RVU), and Virtual Processor Core (VPC) usage for your IBM software products within an aggregated time period of up to 90 days.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. Open the License operations view.
3. From the left navigation menu of the License operations view, navigate to **IBM ILMT V2 Integration > Peak Consumption By Product**.
4. View the highest full capacity and sub-capacity PVU, RVU, and VPC usage for your IBM software products.
The Software Asset Management application displays the highest usage within an aggregated time period of up to 90 days. You can define this aggregated time period in ILMT or BigFix Inventory.

View the peak usage of your IBM software products by device

If you are integrating with the IBM License Metric Tool (ILMT) or BigFix Inventory using version 2 of the ILMT and BigFix Inventory integration APIs, view the highest full capacity and sub-capacity Processor Value Unit (PVU), Resource Value Unit (RVU), and Virtual Processor Core (VPC) usage for your IBM software products by physical host or virtual machine (VM).

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. Open the License operations view.
3. From the left navigation menu of the License operations view, navigate to **IBM ILMT V2 Integration > Peak Consumption Breakdown By Device**.
4. View the highest full capacity and sub-capacity PVU, RVU, and VPC usage for your IBM software products by physical host or VM.
The Software Asset Management application displays the highest usage within an aggregated time period of up to 90 days. You can define this aggregated time period in ILMT or BigFix Inventory.

View the devices that are running your IBM software products

If you are integrating with the IBM License Metric Tool (ILMT) or BigFix Inventory using version 2 of the ILMT and BigFix Inventory integration APIs, view the complete list of physical hosts and virtual machines (VMs) that are running your IBM software products.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. Open the License operations view.
3. From the left navigation menu of the License operations view, navigate to **IBM ILMT V2 Integration > ILMT Discovered Computer**.
4. View the list of physical hosts and VMs that are running your IBM software products.
You can also view detailed information about each host or VM, including the hardware model, the hardware serial number, and the corresponding configuration item (CI) in the Configuration Management Database (CMDB).

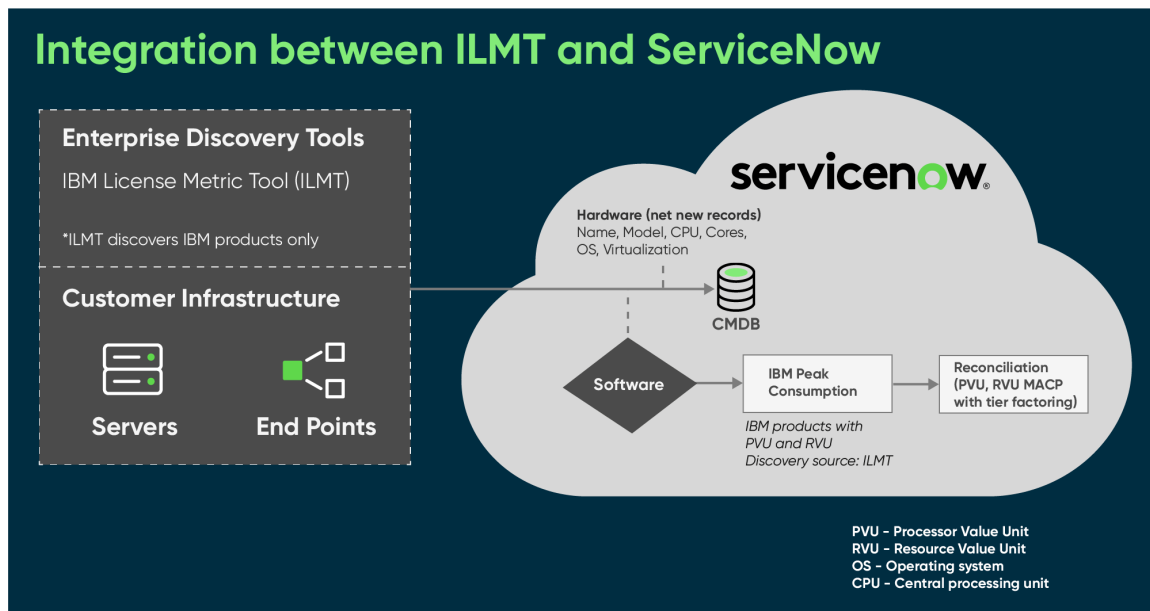

Integrating with the IBM License Metric Tool (ILMT) or BigFix Inventory using v1 APIs

You can use version 1 of the IBM License Metric Tool (ILMT) and BigFix Inventory integration APIs to create a connection between your IBM servers and the ServiceNow AI Platform.

This connection enables you to import software installation data into your ServiceNow instance so that you can track and optimize full capacity and sub-capacity processor value unit (PVU) and resource value unit (RVU) licensing for your IBM software products.

i Important:

Version 1 of the ILMT and BigFix Inventory integration APIs have been deprecated by IBM. However, the Software Asset Management application continues to support integrations that are using this version of the APIs. If you are setting up an ILMT or BigFix Inventory integration for the first time, use version 2 of the APIs instead. For more information on setting up the integration using version 2 of the APIs, see [Integrating with the IBM License Metric Tool \(ILMT\) or BigFix Inventory using v2 APIs](#). For more information on the deprecation of these APIs, see [Deprecated REST APIs](#).

The ILMT and BigFix Inventory integration enables you to create connections between one or more IBM servers and the ServiceNow AI Platform using HTTP or HTTPS. Upon activating the Software Asset Management Professional for IBM (com.sn_samp_ibm) plugin, you receive an IBM Server connection alias that you can then use to set up your IBM server connections. If a connection is successful, the Software Asset Management application retrieves historical software installation data within the aggregated period that you defined in ILMT or BigFix Inventory. This data includes products, components, editions, hosts, virtual machines, and license usage.

Note:

License usage is based on product use and not component use.

Prerequisites

To track your IBM full capacity and sub-capacity PVU and RVU licenses using this integration, you must complete the following prerequisites:

- Install, set up, and run ILMT or BigFix Inventory on a physical host or virtual machine (VM).

Important:

When you are setting up ILMT, ensure that all required configuration item (CI) data, including serial numbers, names, and IP addresses, is configured correctly so that your ServiceNow instance can accurately create corresponding CI records in the Configuration Management Database (CMDB). Refer to [KB0691430](#) for more details.

- Install ILMT version 9.2.7 or later.
- Configure your IBM ILMT agents to scan your physical hosts or VMs in compliance with IBM usage measurement guidelines.

Note:

Refer to [Measuring License Use](#) for more information on IBM usage measurement guidelines.

- Enable ILMT or BigFix Inventory to discover the configurations of both physical hosts and VMs as well as the relationships between them.
- Classify and bundle IBM components into IBM products through ILMT or BigFix Inventory.
- Set the **Connect to ILMT using** (*sn_samp_ibm_lic.ilm_t_api_version*) Software Asset Management property to **v1 API's**. For more details on this property, see [Software Asset Management properties](#).

IBM License Metric Tool (ILMT) and BigFix Inventory transform maps for v1 APIs

When you import data from the IBM License Metric Tool (ILMT) or BigFix Inventory using version 1 of the ILMT and BigFix Inventory integration APIs, your ServiceNow instance uses transform maps to process this data into ServiceNow tables.

Default ILMT and BigFix Inventory transform maps

By default, ServiceNow provides the following transform maps for ILMT and BigFix Inventory data when you are using version 1 of the ILMT and BigFix Inventory APIs:

Default ILMT and BigFix Inventory transform maps

Transform Map	Source Table	Target Table	Description
ILMT Computer Identity V1	Computer [imp_samp_ilm_t_computer_system]	Computer [cmdb_ci_computer]	Processes identification data for your virtual machines (VMs) and hosts. The ILMT Computer Identity V1 transform map uses the CMDB

Default ILMT and BigFix Inventory transform maps (continued)

Transform Map	Source Table	Target Table	Description
			<p>IRE API to create a configuration item (CI) record for each VM or host in the Computer [cmdb_ci_computer] table. If a VM uses the same hardware serial number as its host, the transform map creates a CI record for only the host. For more information on the CMDB IRE API, see Identification and Reconciliation engine (IRE).</p> <p>Note: ServiceNow does not support hardware serial numbers containing periods (.).</p>
ILMT Software Instance	ILMT Software Instance [imp_samp_ilm_t_sw_instance]	Global [global]	<p>Processes installation data for each IBM software component and product on your VMs and hosts.</p> <p>Software components are the independent units of software that you install or run on a VM. You can identify but not license software components individually. Software products are the units of software packaging on a host that can comprise of a collection of software components. You can license the software product as a whole. For more information on software components and products, refer to</p>

Default ILMT and BigFix Inventory transform maps (continued)

Transform Map	Source Table	Target Table	Description
			<p>the IBM Knowledge Center.</p> <p>The ILMT Software Instance transform map creates a record for each IBM software component and product installation in the IBM Peak Consumption [samp_ilmt_sw_install] table.</p> <p>Note: Although software products are not actual software installations, the transform map treats them as installations so that you can update and track license usage against each software product for reconciliation and compliance purposes.</p>
ILMT Software License Usage	License Consumption [imp_samp_ilmt_license_usage]	Global [global]	<p>Processes license usage data for your IBM software products. You can use this data to reconcile your IBM software products and verify compliance.</p> <p>Note: License usage data is reported against physical hosts only, as IBM software products are licensed based on physical host usage and not virtual machine (VM) usage.</p> <p>The ILMT Software License Usage</p>

Default ILMT and BigFix Inventory transform maps (continued)

Transform Map	Source Table	Target Table	Description
			transform map updates license usage data on corresponding records in the IBM Peak Consumption [samp_ilm_t_sw_install] table. If a corresponding record does not exist, the transform map creates a record for your license usage data with the version set to Not reported.

ILMT and BigFix Inventory data processing

Each ILMT and BigFix Inventory transform map processes data using field maps or transform map scripts.

ILMT Computer Identity V1 transform map

The ILMT Computer Identity V1 transform map processes data from the source Computer [imp_samp_ilm_t_computer_system] table to the target Computer [cmdb_ci_computer] table using both field maps and a transform map script.

By default, the ILMT Computer Identity V1 transform map includes the following field maps:

Default field maps

Source Field	Target Field	Description
u_ip_address	ip_address	IP address of the host or virtual machine.
u_dns_name	dns_domain	Domain name of the host or virtual machine.
u_server_processors	cpu_count	Number of CPUs or virtual CPUs (vCPUs) on the host or virtual machine.
u_host_name	name	Name of the host or virtual machine.
u_processor_brand_string	cpu_name	Brand name of the CPU or vCPU on the host or virtual machine (for example, IBM).
u_server_cores	cpu_core_count	Number of CPU or vCPU cores on the host or virtual machine.
[Script]	discovery_source	Discovery source that pulls in IBM software installation data.

Default field maps (continued)

Source Field	Target Field	Description
		Possible values are ILMT or BigFix Inventory.
[Script]	virtual	Option indicating whether a machine is virtual.
u_processor_brand	cpu_type	Type of CPU or vCPU on the host or virtual machine (for example, dual core CPU).
u_hardware_serial_number	serial_number	Serial number that identifies the host.

In addition to using field maps, the transform map processes data using the onAfter transform map script, which is an event script that processes at the end of each row transformation. For more information on this transform map script, see [Map with transformation event scripts](#).

ILMT Software Instance transform map

The ILMT Software Instance transform map processes data from the source ILMT Software Instance [imp_samp_ilm_t_sw_instance] table to the target IBM Peak Consumption [samp_ilm_t_sw_install] table using the onComplete transform map script. The onComplete transform map script is an event script that processes at the end of an import. For more information on this transform map script, see [Map with transformation event scripts](#).

ILMT Software License Usage transform map

The ILMT Software License Usage transform map processes data from the source License Consumption [imp_samp_ilm_t_license_usage] table to the target IBM Peak Consumption [samp_ilm_t_sw_install] table using the onStart transform map script. The onStart transform map script is an event script that processes at the beginning of an import. For more information on this transform map script, see [Map with transformation event scripts](#).

Setting up an IBM License Metric Tool (ILMT) or BigFix Inventory integration for HTTPS

You can set up an IBM License Metric Tool (ILMT) or BigFix Inventory integration for IBM compliance reporting.

If you're using an HTTPS connection, you can use any of the following connection types:

- HTTPS with the MID Server
- HTTPS without the MID Server

HTTPS with the MID Server

Set up IBM License Metric Tool (ILMT) and BigFix Inventory integration for IBM compliance reporting using an HTTPS connection with the MID Server.

Before you begin

Role required: sys_admin

Procedure

1. Download the certificate by logging in to the ILMT or BigFix Inventory server and navigating to **Management > Server Settings**.
2. [Import a certificate for the MID Server](#) .

What to do next

After you've finished uploading your certificates, [create a connection to ILMT/BigFix Inventory](#).

HTTPS without the MID Server

Set up IBM License Metric Tool (ILMT) and BigFix Inventory integration for IBM compliance reporting using an HTTPS connection without the MID Server.

Before you begin

Role required: sys_admin

About this task

Note:

The firewall port must be opened for connectivity to your ServiceNow instance IP address.

Procedure

1. Download the certificate by logging in to the ILMT or BigFix Inventory server and navigating to **Management > Server Settings**.
2. From your ServiceNow instance, navigate to **System Definition > Certificates** and create a [certificate](#)  (Trust Store Cert, PEM format).
3. Paste the full downloaded ILMT or BigFix Inventory server certificate content into the **PEM Certificate** field (including banners).
4. Select the **Validate Stores/Certificates** related link.
5. To create the Java Key Store file using the IBM certificate file, open the command prompt on your computer and navigate to the folder that contains the JRE keytool.
6. Execute the following commands:

```
keytool -import -trustcacerts -alias <Certificate alias>
-file <Certificate file path> -keystore IBM_Server.keystore
-storetype jks
keytool -list -v -keystore IBM_Server.keystore
```

These commands generate the `IBM_Server.keystore` file.

7. Return to the ServiceNow AI Platform, navigate to **System Definition > Certificates** and create a certificate (Java Key Store).
8. Upload the `IBM_Server.keystore` file that you generated as an attachment to the certificate record.
9. Select the **Validate Stores/Certificates** related link.
10. Navigate to **System Security > Protocol Profiles** and create a new protocol profile using the Java Key Store certificate that you created.

Note:

You need to select the protocol profile that you create when you create a connection to ILMT/BigFix Inventory.

What to do next

After you've finished uploading your certificates, [create a connection to ILMT/BigFix Inventory](#).

Create a connection to ILMT or BigFix Inventory

If you're using an HTTP connection or you've finished the initial configuration for HTTPS, establish a connection between your IBM server and the ServiceNow AI Platform.

Before you begin

Role required: sam_admin

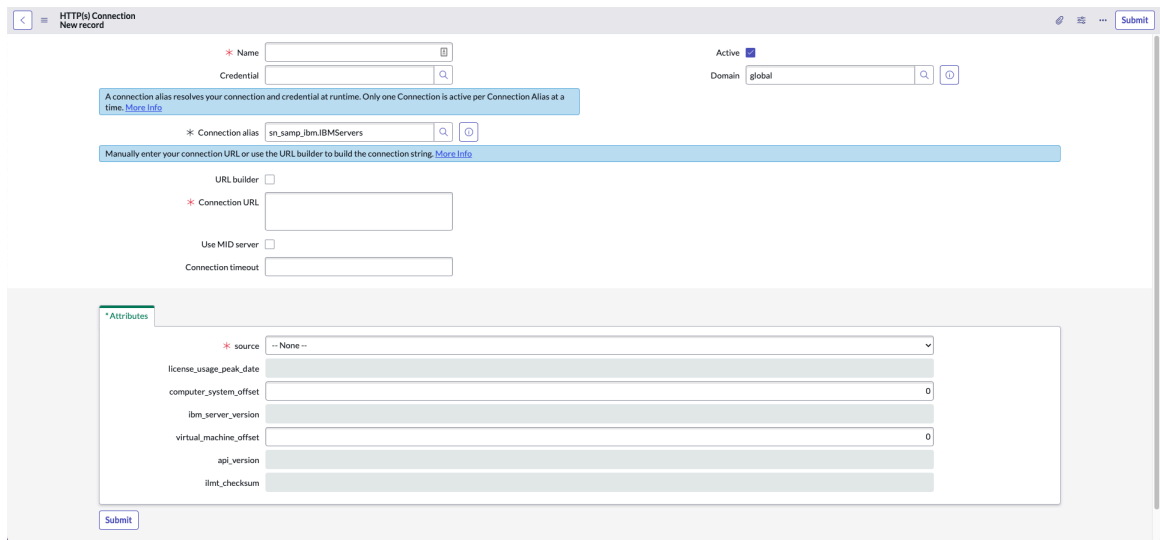

About this task

Note:

If you're using an HTTP or HTTPS connection without the MID Server, the firewall port must be opened for connectivity to your ServiceNow instance IP address.

Procedure

1. Navigate to **All > Integration – ILMT / BigFix Inventory > Setup**.
2. On the **Connections** related tab of the Connection & Credential Aliases form, select **New**. The HTTP(s) Connection form opens.

3. On the form, fill in the fields.

HTTP(s) Connection form

Field	Description
Name	Unique name of the connection.
Credential	Credentials that are used to establish the connection. You can use either basic authentication credentials, such as a username and password, or API key credentials. <p>Note: Select the same credentials that you use to access the ILMT server.</p>

Field	Description
Connection alias	<p>Connection alias with which the connection can be referred. This connection alias resolves your connection and credentials at runtime.</p> <p>This field is automatically set to the sn_samp_ibm.IBMServers alias.</p>
Active	Option indicating that the connection is active.
Domain	Domain to which the connection belongs.

4. Specify the URL for the connection.

Depending on whether you are using an HTTP or HTTPS connection, use one of the following options to specify the connection URL:

- **HTTP connection:** Specify the HTTP connection URL using the **Connection URL** field.

In the **Connection URL** field, enter a URL in the `http://<host-ip-address|dns-hostname>:<port>` format.

URL builder

* Connection URL

Use MID server

Connection timeout

Note:

You cannot modify the **Connection URL** field if you select the **URL builder** check box.

- **HTTPS connection:** Specify the HTTPS connection URL using either the URL builder or an SSL certificate.

HTTPS Connection URL Option	Procedure
URL builder	<p>a. To enable your ServiceNow instance to build a connection URL using the URL builder, select the URL builder check box.</p> <p>The Mutual authentication, Protocol, Host, Override default port, and Base path fields appear on the form.</p>

HTTPS Connection URL Option Procedure

b. In the **Protocol** field, specify the underlying protocol that is used by the connection.

This field is automatically set to **https**.

c. In the **Host** field, enter the URL of the target host that is used by the connection.

You must enter a URL in the `https://<host-ip-address/>dns-hostname>:<port>` format.

d. (Optional) In the **Override default port** field, enter the port number of the target port that is used by the connection.

You must enter the same port number that you used for your ILMT or BigFix Inventory setup.

e. (Optional) In the **Base path** field, enter the base path for the connection.

SSL certificate

a. Retrieve an SSL certificate from your IBM server.

b. Depending on whether you are using an HTTPS connection with or without the MID Server, use one of the following options to apply the certificate to your ServiceNow instance:

- Without the MID Server:

- i.** In a new tab or window, upload the certificate to your ServiceNow instance.

Refer to [HTTPS without the MID Server](#) for detailed instructions.

- ii.** Return to the HTTP(s) Connection form.

- iii.** Enable your ServiceNow instance to build a connection URL by selecting the **URL builder** check box.

The **Mutual authentication, Protocol, Host, Override default port, and Base path** fields appear on the form.

HTTPS Connection URL Option Procedure

iv. Enable mutual authentication for the connection by selecting the **Mutual authentication** check box.

The **Protocol** field is replaced by the **Protocol profile** field.

v. In the **Protocol profile** field, select the search icon (🔍) to locate and select the HTTPS protocol profile that specifies the certificate used for mutual authentication.

You must select the same protocol profile that you created in [HTTPS without the MID Server](#).

▪ With the MID Server:

i. In a new tab or window, upload the certificate to your ServiceNow instance.

Refer to [HTTPS with the MID Server](#) for detailed instructions.

ii. Return to the HTTP(s) Connection form and then select the **Use MID server** check box.

The **Advanced MID Server Configuration** tab appears.

iii. In the **MID Selection** field of the **Advanced MID Server Configuration** tab, specify how you want to select a MID Server for the connection.

Select one of the following options:

HTTPS Connection URL Option	Procedure
	<ul style="list-style-type: none"> <p>▪ Auto-select MID Server: Automatically selects a MID Server from the list of MID Servers that are configured for the connection. This option is selected by default.</p> <p>If you select this option, the Advanced MID Server Configuration tab displays the Capabilities and MID Application fields. You can use these fields to filter the list of available MID Servers based on supported MID Server capabilities and applications.</p> <ul style="list-style-type: none"> ▪ To filter this list based on MID Server capabilities, select the Unlock Capabilities icon (🔓) in the Capabilities field. After you unlock the field, select the Lookup using list icon (🔍) to search for and select the desired capabilities. ▪ To filter this list based on MID Server applications, select the Lookup using list icon (🔍) in the MID Application field to search for and select the desired applications. <p>See MID Server selection for more information on MID Server capabilities and applications.</p> <p>▪ Specific MID Server: Enables you to select a specific MID Server for the connection.</p> <p>If you select this option, the Advanced MID Server Configuration tab displays the MID Server field. Select the Lookup using list icon (🔍) in the MID Server field to search for and select the MID Server that you want to use for the connection.</p> <div style="background-color: #e0f2f1; padding: 10px; border: 1px solid #ccc;"> <p>Important: To select a specific MID Server for the connection, you must deselect the Included in application ALL check box for any applications that are configured to use the specified MID Server. For more information on this check box, refer to the Select applications to include in the definition of ALL for a MID Server section of Configure a default MID Server for each application.</p> </div> <p>▪ Specific MID Cluster: Enables you to select a specific MID Server cluster for the connection.</p> <p>If you select this option, the Advanced MID Server Configuration tab displays the MID Cluster field. Select the Lookup using list icon (🔍) in the MID Cluster field to search for and select the MID Server cluster that you want to use for the connection.</p>

5. Set up the connection timeout.

Use one of the following options to set up the connection timeout:

- **glide.http.outbound.max_timeout.enabled system property:** The ServiceNow AI Platform `glide.http.outbound.max_timeout.enabled` system property enables you to specify the number of seconds that RESTMessageV2 and SOAPMessageV2 APIs

wait for a response from a synchronous call. You can configure this system property by opening a new tab or window and then navigating to **System Properties > All Properties > glide.http.outbound.max_timeout.enabled**. If this system property is set to **true** or is not available on your ServiceNow instance, your instance uses a default timeout value of 30 seconds. If this system property is set to **false**, your ServiceNow instance uses a default timeout value 600 seconds. See [Available system properties](#) for more information on this system property.

- **Connection timeout field:** The **Connection timeout** field on the HTTP(s) Connection form enables you to specify the number of seconds that your ServiceNow instance waits to establish the given connection.

i Important:
 This option is applicable only in the San Diego and later releases. In the Rome and earlier releases, you must set up the connection timeout using only the `glide.http.outbound.max_timeout.enabled` system property.

Application of the **Connection timeout** field is dependent on your `glide.http.outbound.max_timeout.enabled` system property configuration. If the system property is set to **false**, your ServiceNow instance honors the value that is specified in the **Connection timeout** field.

i Note:
 If the **Connection timeout** field is empty, your ServiceNow instance uses a default connection timeout value of 300 seconds.

If the system property is set to **true** or is not available on your ServiceNow instance, your instance ignores the value that is specified in the **Connection timeout** field. Instead, your instance uses a default connection timeout value of 30 seconds.

6. Configure additional attributes for the connection.

Select the **Attributes** tab and then fill in the fields.

Attributes tab

Field	Description
source	Source of your IBM software installation data. The options are ILMT and BigFix Inventory .
computer_system_offset	Offset value that prevents your ServiceNow instance from re-importing computer records from ILMT or BigFix Inventory. Each time you run an import, the offset value updates automatically based on the computer records that are included in the import.

Field	Description
	<p>Every subsequent import then retrieves only new computer records starting from the specified offset value.</p> <p>If you are establishing a new connection, verify that the offset value is set to 0. If you want to re-import all computer records for an existing connection, reset the offset value to 0.</p>
virtual_machine_offset	<p>Offset value that prevents your ServiceNow instance from re-importing virtual machine (VM) records from ILMT or BigFix Inventory. Each time you run an import, the offset value updates automatically based on the VM records that are included in the import. Every subsequent import then retrieves only new VM records starting from the specified offset value.</p> <p>If you are establishing a new connection, verify that the offset value is set to 0. If you want to re-import all VM records for an existing connection, reset the offset value to 0.</p>

7. Select **Submit.**

The active connection information displays.

8. Optional: If you are using version 1 of the ILMT and BigFix Inventory APIs, import ILMT or BigFix Inventory scheduled data manually.

a. Navigate to **Integration - ILMT / BigFix Inventory > Scheduled Import** and then select **Execute Now**.

b. Verify that the import has completed successfully.

- To verify that both the import and transformation have completed successfully, navigate to **Integration - ILMT / BigFix Inventory > Transform History**.

Note:

Every record in the Transform Histories table displays an **Inserts** value of 0.

- To view all data that was imported into the License Consumption [samp_ilmt_sw_install] table, navigate to **Integration - ILMT / BigFix Inventory > Import Set Data > License Consumption**.
- To view all data that was imported into the Computer [cmdb_ci_computer] table, navigate to **Integration - ILMT / BigFix Inventory > Import Set Data > Computers**.

Validate your ILMT connection health

Validate the health of your ILMT connections to help improve the success of each connection. Use the results to evaluate how you can resolve unsuccessful connections, such as adjusting the connection response time or fixing errors related to invalid hardware serial numbers.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Software Asset > Integration - ILMT/BigFix Inventory > Connection Health**.

2. Select **Validate**.

The Connection Healths list reloads with the latest status of each ILMT connection.

3. Verify the status of each connection using the **Status field.**

If the **Status** field is set to **Failed**, refer to the corresponding **Information** field for more details about why that connection has failed and what actions you can take to help it establish successfully.

For example, if a connection has failed due to a timeout issue, the **Information** field indicates that the connection has timed out. The **Information** field also suggests a recommended timeout value to help prevent the connection from failing again.

Authorized SAM Provider (ASP) integrations for IBM

You can track and manage IBM licenses in both VMware vSphere environments and IBM LPAR infrastructures by integrating the Software Asset Management publisher pack for IBM with Software Asset Management providers that are authorized to participate in the IBM Client Value Acceleration (CVA) Program. With these integrations, you can track and manage IBM licensing directly without having to integrate with the IBM License Metric Tool (ILMT) or BigFix Inventory.

The CVA Program is an invitation-only license verification program that allows clients who contract with Authorized SAM Providers (ASPs) to report on their IBM license usage independently. For more information on the CVA Program, see [CVA Program Verification](#).

Important:

As of January 1, 2025, IBM has withdrawn its IBM Authorized SAM Provider (IASP) Program and replaced it with the CVA Program. If you are an existing IASP Program user, contact your IBM representative to upgrade to the new CVA agreement and migrate to the CVA Program.

The IBM publisher pack supports integrations with the following ASPs:

- Anglepoint (through the Anglepoint Elevate platform)
- Deloitte
- EY
- KPMG

To integrate with an ASP, you must request and install the IBM License Compliance for Software Asset Management application from the ServiceNow® Store. This application provides the core functionality and license metrics that are required for tracking and managing IBM licensing directly. If you are integrating with Anglepoint, you must also request and install Anglepoint's IBM Licensing for Software Asset Management application from the ServiceNow® Store. This application enables you to store IBM software information from Anglepoint.

After you install the necessary applications, you must retrieve the IBM software discovery catalog from the ASP that you are integrating with. This catalog, which is maintained separately by each ASP, is a centralized repository of IBM software information that discovery tools, such as the ServiceNow® Discovery application, can use to identify the IBM software that is discovered in your environment. After you retrieve the catalog, you must upload it to your ServiceNow instance.

On successful upload, you can use the ServiceNow Discovery application to run a discovery for your IBM software. The Discovery application uses the uploaded catalog to identify any IBM software that is discovered in your environment. It then sends this data to the ASP for comprehensive software classification and bundling.

After your discovered IBM software is properly classified and bundled, the ASP sends this data back to your ServiceNow® instance. The Software Asset Management application can then use the processor value unit (PVU), resource value unit (RVU), and virtual processor core (VPC) license metrics to reconcile this data so that you can track your IBM software usage and optimize your licensing costs. For more information on the PVU and RVU license metrics, see [IBM](#)

processor value unit (PVU) and resource value unit (RVU) licenses. For more information on the VPC license metric, see [IBM virtual processor core \(VPC\) licenses](#).

Prerequisites

Before you can integrate the IBM publisher pack with an ASP, you must complete the following prerequisites:

- Complete all prerequisites for participating in the CVA Program. For more information on these prerequisites, refer to the How it works section of [CVA Program Verification](#) .
- Request and install the IBM License Compliance for Software Asset Management application from the ServiceNow® Store. See [Request the IBM License Compliance for Software Asset Management application for authorized Software Asset Management provider integrations](#) for detailed instructions.
- Enable the **Use ServiceNow Software Asset Management and Discovery for IBM license compliance** (*com.snc.samp.ibm.use_samp_ibm_licensing*) Software Asset Management property. See [Software Asset Management properties](#) for more information on this property.
- Activate the Discovery (com.snc.discovery) plugin on your ServiceNow instance. See [Request Discovery](#)  for detailed instructions.
- Activate the File-based Discovery (com.snc.discovery.file_based_discovery) plugin on your ServiceNow instance. See [File-based Discovery](#)  for more information on file-based Discovery.
- Request and install the Discovery and Service Mapping Patterns application from the [ServiceNow Store](#) . See [Discovery patterns used by ITOM Visibility](#)  for more information on Discovery and Service Mapping patterns.
- If you want to use domain separation for the integration, activate the Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin on your ServiceNow instance. See [Domain separation plugin](#)  for detailed instructions.
- Download the IBM software discovery catalog from the ASP.
- If you want to track and manage IBM licensing in public cloud environments, configure one or more for the following services to automatically scan for and update the CMDB with cloud infrastructure changes every 30 minutes:
 - For public clouds hosted by AWS, configure the AWS Config service. See [Configure the AWS Config service to send event notifications to the ServiceNow instance](#)  for detailed instructions.
 - For public clouds hosted by Microsoft Azure, configure the Microsoft Azure Alert service. See [Configure the Microsoft Azure Alert service to auto-update the CMDB](#)  for detailed instructions.
 - For public clouds hosted by Google Cloud Platform (GCP), configure the Google Cloud Logging service. See [Configure the Google Cloud Logging service to auto-update the CMDB](#)  for detailed instructions.

If you are integrating the IBM publisher pack with Anglepoint, you must also complete these additional prerequisites:

- Request and install Anglepoint's IBM Licensing for Software Asset Management application from the ServiceNow® Store. See [Request Anglepoint's IBM Licensing for Software Asset Management application](#) for detailed instructions.
- Set up the Anglepoint Elevate platform.

Virtualization technologies and public cloud platforms supported by IBM Authorized SAM Provider (IASP) integrations

IBM Authorized SAM Provider (IASP) integrations support IBM licensing in VMware vSphere environments and IBM LPAR infrastructures. These integrations also support IBM licensing in public cloud environments that are owned and managed by AWS, Microsoft Azure, and Google Cloud Platform (GCP).

IBM licensing in VMware vSphere environments

When you integrate the Software Asset Management publisher pack for IBM with Software Asset Management providers that are authorized to participate in the IBM Authorized SAM Provider (IASP) Program, the Software Asset Management application supports IBM licensing rules for VMware vSphere.

VMware vSphere is a virtualization platform through which you can install and run IBM software products on virtual machines (VMs). The Software Asset Management application supports both full capacity and sub-capacity processor value unit (PVU), resource value unit (RVU), and virtual processor core (VPC) licensing for IBM software products in VMware vSphere environments.

IBM licensing models on VMware vSphere

Licensing capacity	Licensing model
Full capacity	<p>When you install and run an IBM software product on a VM, you must license each processor core on the underlying physical ESXi host that is running the VM. If the physical ESXi host is running multiple VMs simultaneously, you must still license each processor core on the host regardless of how many VMs you install and run the IBM software product on.</p> <p>Use the total number of processor cores on the underlying physical ESXi host to determine the number of rights that are required for your license, based on the license type. To determine the number of rights that are required for a PVU or RVU license, see IBM processor value unit (PVU) and resource value unit (RVU) licenses. To determine the number of rights that are required for a VPC license, see IBM virtual processor core (VPC) licenses.</p>
<p>Sub-capacity</p> <p>i Note: You can use sub-capacity licensing only if you configure and specify a VM manager for your VMs. For more information on VM managers, see Specify the virtual machine (VM) managers for which you are tracking IBM licenses.</p>	<p>You must license only the virtual cores that are assigned to the VMs on which you install and run an IBM software product.</p> <p>Use the sum of virtual cores that must be licensed across your VMs to determine the number of rights that are required for your license, based on the license type. To determine the number of rights that are required for a PVU or RVU license, see IBM processor value unit (PVU) and resource value unit (RVU) licenses. To determine the number of rights that are required for a VPC license, see IBM virtual processor core (VPC) licenses.</p>

IBM licensing models on VMware vSphere (continued)

Licensing capacity	Licensing model
	<p>Note: By default, the number of required rights is calculated using the sum of virtual cores. If the sum of virtual cores exceeds the total number of processor cores on the underlying physical ESXi hosts that are running the VMs, the number of required rights is calculated using the total number of processor cores on the hosts instead.</p> <p>Note: If you install and run an IBM software product on both a VM and the underlying physical ESXi host that is running the VM, you must also license the installation on the host.</p>

IBM licensing in IBM LPAR infrastructures

When you integrate the Software Asset Management publisher pack for IBM with Software Asset Management providers that are authorized to participate in the IBM Authorized SAM Provider (IASP) Program, the Software Asset Management application supports IBM licensing rules for IBM logical partitions.

A logical partition (LPAR) is a defined subset of processor hardware that supports the operating system. An LPAR contains resources, such as processors, memory, and input or output devices, that operate as an independent system. You can have multiple LPARs within each mainframe hardware system.

Discovering the LPARs and LPAR resources within your IBM LPAR infrastructure requires ServiceNow Discovery patterns for the IBM Hardware Management Console (HMC), which is the hardware appliance that enables you to manage and configure your LPARs. To access these discovery patterns, you must request and install the Discovery and Service Mapping Patterns application from the ServiceNow Store. For more information on how to configure a discovery on your LPARs, see [IBM Virtualization and Hardware Management Console discovery](#).

Note:

The `lparstat` command pulls a report of LPAR-related information and usage. For more information, see the [IBM Knowledge Center](#).

When you run a discovery, your discovered LPAR data is populated and stored in the following Configuration Management Database (CMDB) tables on your ServiceNow instance:

- `cmdb_ci_ibm_frame`
- `cmdb_ci_aix_server`
- `cmdb_ci_lpar_instance`
- `cmdb_ci_lpar_resource`
- `cmdb_rel_ci`
- `cmdb_sam_sw_install`

To populate and store this data, you must request and install the CMDB CI Class Models application from the ServiceNow Store. This application adds or updates CMDB classes for the IBM HMC. For more information on IBM HMC CMDB classes, see [IBM Hardware Management Console \(HMC\) extension classes](#).

The Software Asset Management application supports both full capacity and sub-capacity processor value unit (PVU), resource value unit (RVU), and virtual processor core (VPC) licensing for IBM software products in IBM LPAR infrastructures.

IBM licensing rules in IBM LPAR infrastructures

Full capacity licensing

When you use full capacity licensing, you must license each processor core on the underlying hardware system that is running the LPARs on which you have installed and run an IBM software product.

Using the total number of processor cores on the underlying hardware system, you can determine the number of rights that are required for your license based on the license type. To determine the number of rights that are required for a PVU or RVU license, see [IBM processor value unit \(PVU\) and resource value unit \(RVU\) licenses](#). To determine the number of rights that are required for a VPC license, see [IBM virtual processor core \(VPC\) licenses](#).

Sub-capacity licensing

When you use sub-capacity licensing, you must license only the processor cores that are assigned to the LPARs on which you install and run an IBM software product.

You can determine the number of rights that are required for a sub-capacity license based on the type of processor pool and license that you are using for your IBM software product.

IBM LPARs support both dedicated and shared processor pools. If you are using a dedicated processor pool, in which processor cores are assigned to only one dedicated LPAR, you must license each dedicated processor core that is assigned to the LPAR on which you install or run an IBM software product. If you are using a shared processor pool, in which processor cores are shared across micro-partitions, you must license the processor cores that are shared across the micro-partitions on which you install or run an IBM software product. You can determine the number of processor cores that must be licensed across your micro-partitions based on the LPAR type:

- **Capped LPAR:** A capped LPAR is a logical partition that is assigned a maximum entitled capacity, which is the number of CPU resources that the LPAR is entitled to receive. Capped LPARs cannot use more processor power than the assigned entitled capacity.
- **Uncapped LPAR:** An uncapped LPAR is a logical partition that can use more processor power than the assigned entitled capacity. Processor power usage is limited by the number of virtual processor cores that are assigned to the LPAR or by the maximum number of processor cores that are available to the shared processor pool.

For more details, see [Sub-capacity \(Virtualization\) License Counting Rules](#).

Using the sum of processor cores that must be licensed across your processor pools, you can determine the number of rights that are required for your license based on the license type. To determine the number of rights that are required for a PVU or RVU license, see [IBM processor value unit \(PVU\) and resource value unit \(RVU\) licenses](#). To determine the number of rights that are required for a VPC license, see [IBM virtual processor core \(VPC\) licenses](#).

IBM licensing in public cloud environments

When you integrate the Software Asset Management publisher pack for IBM with Software Asset Management providers that are authorized to participate in the IBM Authorized SAM Provider (IASP) Program, the Software Asset Management application supports IBM licensing rules in public cloud environments.

A public cloud is a cloud computing model through which computing resources are owned and managed by a third-party cloud provider but shared by multiple clients via the Internet. Clients can access these shared computing resources through the virtual machines (VMs) that are running on virtual servers within each public cloud.

The Software Asset Management application supports sub-capacity processor value unit (PVU) and virtual processor core (VPC) licensing for IBM software products in public cloud environments. Supported public cloud providers include Amazon Web Services (AWS), Microsoft Azure, and Google Cloud Platform (GCP).

With sub-capacity licensing in public cloud environments, you must license the virtual cores that are assigned to the cloud-based VMs on which you install and run an IBM software product. You can determine the total number of rights that are required for a license based on the sum of virtual cores that must be licensed across your cloud-based VMs. To determine the number of rights that are required for a PVU license, see [IBM processor value unit \(PVU\) and resource value unit \(RVU\) licenses](#). To determine the number of rights that are required for a VPC license, see [IBM virtual processor core \(VPC\) licenses](#).

i Important:

When determining the number of rights that are required for a PVU license used for VMs deployed in a public cloud environment, you must always use a standard PVUs per Core value of 70, regardless of which public cloud environment you choose.

Licensing for IBM Cloud Paks

When you integrate the Software Asset Management publisher pack for IBM with Software Asset Management providers that are authorized to participate in the IBM Authorized SAM Provider (IASP) Program, the Software Asset Management application supports licensing rules for IBM Cloud Paks.

An IBM Cloud Pak is a prepackaged set of IBM software products that can help you achieve a specific business goal. For example, the IBM Cloud Pak for Business Automation contains various IBM software products that automate business operations to help improve performance.

Each IBM Cloud Pak is licensed as a bundle using a supported IBM license metric, such as the Virtual Processor Core (VPC) license metric. However, you can determine the total number of rights that are required for a Cloud Pak based on the number of rights that are required for each software product within the Cloud Pak. These software products are also referred to as Bundled Programs. You can calculate the number of rights that are required for a Bundled Program by using a supported IBM license metric, such as the VPC and Resource Value Unit (RVU) license metrics. You must then use a corresponding conversion ratio to convert this number to the number of rights that are required for deploying the Bundled Program as part of the Cloud Pak. After you convert this number for each Bundled Program that you want to deploy, you can use the sum of the converted numbers to determine the total number of rights that are required for the Cloud Pak.

In the following example, a user wants to deploy various Bundled Programs as part of the IBM Cloud Pak for Integration:

Bundled Program within the IBM Cloud Pak for Integration	Bundled Program to Cloud Pak ratio	Number of rights required for the Bundled Program	Number of rights required for deploying the Bundled Program as part of the Cloud Pak
MQ Advanced	2 VPCs: 1 VPC	40	20
App Connect Enterprise	1 VPC: 3 VPCs	20	60
API Connect	1 VPC: 1 VPC	10	10
Datapower	1 VPC: 1 VPC	10	10

Based on the conversion ratios and the number of rights that are required for each Bundled Program, you must license the Cloud Pak using a total of 100 rights.

See [IBM virtual processor core \(VPC\) licenses](#) for more information on VPC licensing.

IBM reconciliation for IBM Authorized SAM Provider (IASP) integrations

IBM reconciliation keeps your IBM license positions accurate and up-to-date without requiring manual calculations. Reconciliation runs weekly or on-demand.

When the Software Asset Management application calculates the number of rights that are required for a processor value unit (PVU), resource value unit (RVU), or virtual processor core (VPC) license, it calculates two different numbers based on whether you are using the license to its full capacity or sub-capacity. The Software Asset Management application uses this information alongside the [daily aggregated peak usage of your IBM software product](#) and the usage type of your [PVU](#), [RVU](#), or [VPC](#) license to determine the high-water mark, or peak usage, of your IBM software product over a 90 day period.

Note:

You can determine the high-water mark of your IBM software product per region, including the Americas, EMEA, and APAC.

The Software Asset Management application then uses the high-water mark value to reconcile your IBM software product so that you can determine if your license is in compliance.

Note:

When you reconcile an IBM Cloud Pak, it is reconciled as a whole. The software products, also known as Bundled Programs, within the Cloud Pak are not reconciled individually.

Setting up an IBM Authorized SAM Provider (IASP) integration

Before you can integrate the Software Asset Management publisher pack for IBM with an authorized Software Asset Management provider, complete the setup process.

To integrate with an authorized Software Asset Management provider, you must request and install the IBM License Compliance for Software Asset Management application from the ServiceNow® Store. If you are integrating with Anglepoint, you must also request and install Anglepoint's IBM Licensing for Software Asset Management application from the ServiceNow® Store. You must also upload the IBM software discovery catalog from the authorized Software Asset Management provider to your ServiceNow instance.

Request the IBM License Compliance for Software Asset Management application for authorized Software Asset Management provider integrations

Request the IBM License Compliance for Software Asset Management application from the ServiceNow® Store so that you can integrate the Software Asset Management publisher pack for IBM with an authorized Software Asset Management provider. Use the integration to track and manage your IBM licenses.

Before you begin

Role required: admin

Procedure

1. From a web browser, go to the [ServiceNow Store](#) .
2. Log in using your HI credentials.
3. In the search bar, enter IBM License Compliance for Software Asset Management and then select **Search**.
4. Select the result called **IBM License Compliance for Software Asset Management**.
5. On the IBM License Compliance for Software Asset Management page, select **Request Install**. The ServiceNow Request for App Installation - IBM License Compliance for Software Asset Management dialog box opens.
6. In the dialog box, fill in the fields.

ServiceNow Request for App Installation - IBM License Compliance for Software Asset Management dialog box

Field	Description
Instance Name	Name of the instance on which you want to install the application. After you enter the instance name, select Validate Instance to verify that the instance exists.
Reason for request	Reason for requesting the application.

7. Select **Request**.
8. Select **Close**.

Result

If your request is approved, you will receive an email with detailed instructions on how to install the application.

What to do next

Install the application according to the instructions in the email.

License metrics added by the IBM License Compliance for Software Asset Management application

The IBM License Compliance for Software Asset Management application adds license metrics that enable you to classify your IBM software products.

These additional license metrics are available only if you have activated the Software Asset Management publisher pack for IBM and installed the IBM License Compliance for Software Asset Management application. They are not available if you have only activated the Software Asset Management publisher pack for IBM.

You can also use license metrics to reconcile the software products that are discovered in your environment. The Software Asset Management application automatically adds [default license metrics](#) for supported software publishers by using publisher-specific metric groups, such as the Adobe and Microsoft metric groups. These license metrics are then set in your corresponding software entitlements and used for reconciliation. Any additional license metric that is not included in an existing metric group must be added as a custom license metric in order to be used for reconciliation. Custom license metrics modify the reconciliation process by adding software license calculations that are not already included in the default list of supported license metrics.

By default, the IBM metric group includes the following license metrics for IBM reconciliation:

- Authorized User
- Authorized User Value Unit
- Employee User Value Unit
- External User Value Unit
- Per Device
- Per Named User
- Per Processor (CPU count)
- Per user
- Processor Value Unit (PVU)
- Resource Value Unit (RVU)
- Virtual Processor Core (VPC)

All other license metrics that are added by the IBM License Compliance for Software Asset Management application are not included in the IBM metric group. If you want to reconcile your IBM software products using any of these license metrics, you must create a corresponding custom license metric on your ServiceNow instance. See [Add a custom license metric](#) for more information on how to create a custom license metric.

Request Anglepoint's IBM Licensing for Software Asset Management application

If you are integrating the Software Asset Management publisher pack for IBM with Anglepoint, request Anglepoint's IBM Licensing for Software Asset Management application from the ServiceNow® Store. This application extends the base Software Asset Management File Names [samp_file_name], File Maps [samp_file_map], and File Sets [samp_file_set] tables so that you can store IBM software information from Anglepoint.

Before you begin

Role required: admin

About this task

The IBM Licensing for Software Asset Management application contains table dictionaries that extend the base File Names [samp_file_name], File Maps [samp_file_map], and File Sets [samp_file_set] tables as follows:

Base table	Extended table
File Names [samp_file_name]	Anglepoint File Names [samp_anglepoint_file_name]
File Maps [samp_file_map]	Anglepoint File Maps [samp_anglepoint_file_map]
File Sets [samp_file_set]	Anglepoint File Sets [samp_anglepoint_file_set]

The extended tables store software information from the IBM software discovery catalog that is maintained by Anglepoint. You can add this software information to these tables by downloading the IBM software discovery catalog from the Anglepoint Elevate platform and then uploading it to your ServiceNow instance. Discovery tools, such as the ServiceNow® Discovery application, can then use this software information to identify the IBM software that is discovered in your environment. See [Upload the IBM software discovery catalog to your ServiceNow instance](#) for more information on the IBM software discovery catalog.

Procedure

1. From a web browser, go to the [ServiceNow Store](#).
2. Log in using your HI credentials.
3. In the search bar, enter `IBM Licensing for Software Asset Management` and then select **Search**.
4. Select the result called **IBM Licensing for Software Asset Management**.
5. On the IBM Licensing for Software Asset Management page, select **Request Install**.
The ServiceNow Request for App Installation - IBM Licensing for Software Asset Management dialog box opens.
6. In the dialog box, fill in the fields.

ServiceNow Request for App Installation - IBM Licensing for Software Asset Management dialog box

Field	Description
Instance Name	Name of the instance on which you want to install the application. After you enter the instance name, select Validate Instance to verify that the instance exists.
Reason for request	Reason for requesting the application.

7. Select **Request**.
8. Select **Close**.

Result

If your request is approved, you will receive an email with detailed instructions on how to install the application.

What to do next

Install the application according to the instructions in the email.

Upload the IBM software discovery catalog to your ServiceNow instance

Upload the IBM software discovery catalog to your ServiceNow instance so that discovery tools, such as the ServiceNow® Discovery application, can identify the IBM software that is discovered in your environment.

Before you begin

Role required: `sam_admin`

About this task

The IBM software discovery catalog is a centralized repository of IBM software information that discovery tools can use to identify discovered IBM software. This catalog is maintained separately by each authorized Software Asset Management provider.

Procedure

1. Download the IBM software discovery catalog from the authorized Software Asset Management provider that you are integrating with.
2. Upload the catalog to your ServiceNow instance.
 - a. From your ServiceNow instance, navigate to **All > Software Asset > Administration > Import IBM Content**.
 - b. On the Manage Software Library form, select **Attach Content File**. The Attachments dialog box opens.
 - c. In the dialog box, select **Choose file** to search for and select the IBM software discovery catalog that you downloaded from the Anglepoint Elevate platform.
 - d. Close the dialog box to return to the Manage Software Library form.
 - e. Select **Run Import**.

Result

If you are integrating with Anglepoint, all IBM software information that is included in the catalog is stored in the following Software Asset Management tables:

- Anglepoint File Names [samp_anglepoint_file_name]
- Anglepoint File Maps [samp_anglepoint_file_map]
- Anglepoint File Sets [samp_anglepoint_file_set]

Note:

These tables are extensions of the base File Names [samp_file_name], File Maps [samp_file_map], and File Sets [samp_file_set] tables. To extend the base tables, you must request and install Anglepoint's IBM Licensing for Software Asset Management application. See [Request Anglepoint's IBM Licensing for Software Asset Management application](#) for detailed instructions.

Creating a connection for the Anglepoint integration

If you are integrating the Software Asset Management publisher pack for IBM with Anglepoint, you can create a connection between your ServiceNow instance and the Anglepoint Elevate platform to transfer licensing data for your IBM software products.

Create an API user for the Anglepoint integration

Create a user who is permitted to access the APIs used by the Anglepoint integration. These APIs provide the given user access to the Anglepoint integration resources that are available on your ServiceNow instance.

Before you begin

Role required: admin

About this task

The Anglepoint integration uses the following APIs:

Anglepoint integration APIs

API	API path	Description
Transform (POST)	/api/sn_samp_ibm_lic/ibm_data/transform	Processes information for your installed IBM software.
Get Computer	/api/sn_samp_ibm_lic/ibm_data/computer	Retrieves information about the virtual machines (VMs) and hosts that your IBM software is installed on.
Get Entitlements	/api/sn_samp_ibm_lic/ibm_data/entitlement	Retrieves entitlement information for your installed IBM software.
Get Classification	/api/sn_samp_ibm_lic/ibm_data/classification	Retrieves classification information for your installed IBM software.
Post Classification	/api/sn_samp_ibm_lic/ibm_data/classification	Sends classification information for your installed IBM software.

Procedure

1. Navigate to **All > Organization > Users** and then select **New**.
2. On the form, fill in the fields.

User form

Field	Description
User ID	Unique identifier for the user.
First name	First name of the user.
Last name	Last name of the user.
Title	Job title or job description of the user.
Department	Department that the user belongs to.
Password needs reset	Option to require the user to change the assigned password during the first login. Note: This option must be disabled.
Locked out	Option to lock the user out of the ServiceNow instance and terminate all active sessions.
Active	Option that indicates the user is active. Note: This option must be enabled.
Web service access only	Option to designate the user as a non-interactive user. Non-interactive users can use only assigned credentials to authorize API connections, including JSON, SOAP, and WSDL. See Non-interactive sessions for more information on non-interactive users. Note: This option must be enabled.

Field	Description
Internal Integration User	Option to designate the user as an internal integration user. See Mark service accounts as internal integration users  for more information on internal integration users.
Email	Email address of the user.
Language	Language preference of the user.
Calendar integration	Calendar through which the user receives meeting invitations and notifications.
Time zone	Time zone that the user is located in.
Date format	Preferred date format for the user.
Business phone	Business phone number that is assigned to the user.
Mobile phone	Mobile phone number that is assigned to the user.
Photo	Photo of the user.

3. Right-click the form header and then select **Save**.
The form automatically reloads with additional form actions, related links, and related tabs.

4. Generate a password for the user.

a. Select **Set Password**.

The Set Password dialog box opens.

b. In the dialog box, select **Generate**.

Your ServiceNow instance automatically generates a password for the user.

c. Copy the value in the **Password** field.

Save it in a secure location for later use.

d. Select **Save Password**.

The dialog box closes and you automatically return to the User form.

5. Assign roles to the user.

a. On the **Roles** related tab, select **Edit...**

b. From the Collection list on the Edit Members form, search for and select the following roles:

- snc_platform_rest_api_access
- oauth_user
- sn_samp_ibm_lic.sam_ibm_data_integrator

c. Select the Add button () to move the selected roles from the Collection list to the Roles List.

d. Select **Save**.

The Edit Members form closes and you automatically return to the User form.

- e. Verify that all selected roles appear on the **Roles** related tab.

Configuring the API authentication method for the Anglepoint integration

You can configure the API authentication method that grants users access to the Anglepoint integration resources on your ServiceNow instance.

The APIs that are used by the Anglepoint integration support both basic authentication and OAuth 2.0 authentication. Basic authentication uses standard usernames and passwords to grant users access to the resources on your ServiceNow instance. OAuth 2.0 authentication uses OAuth tokens to grant users access to those resources. To configure basic authentication, refer to either [Configure a REST message with basic auth](#)  or [Enable basic authentication for outbound SOAP](#) . To configure OAuth 2.0 authentication, refer to [Configure OAuth 2.0 authentication for the Anglepoint integration](#).

Configure OAuth 2.0 authentication for the Anglepoint integration

Configure OAuth 2.0 authentication to enable users to access Anglepoint integration resources through APIs using OAuth tokens.

Before you begin

Role required: admin

Procedure

1. From your ServiceNow instance, create an OAuth API endpoint.

The Anglepoint Elevate platform uses the OAuth API endpoint to request the OAuth tokens that authorize access to the Anglepoint integration resources on your ServiceNow instance.

Refer to [Create an endpoint for clients to access the instance](#)  for instructions on how to create an OAuth API endpoint.

Important:

After you successfully create an OAuth API endpoint, copy the values in the **Client ID** and **Client Secret** fields. Save them in a secure location for later use.

2. From the Anglepoint Elevate platform, create an API connection to your ServiceNow instance.

The API connection enables you to securely transfer data between the Anglepoint Elevate platform and your ServiceNow instance.

Result

The Anglepoint Elevate platform sends the credential information that you specified for your API connection to `https://<servicenow-instance-url>.service-now.com/oauth_token.do` using an HTTP Post request. Your ServiceNow instance responds to the request by generating OAuth tokens and then sending them to the Anglepoint Elevate platform. The Anglepoint Elevate platform can then use these tokens to make API requests for accessing the Anglepoint integration resources on your ServiceNow instance.

View the daily aggregated peak usage of your IBM software products

View the highest daily sub-capacity and full capacity Processor Value Unit (PVU), Resource Value Unit (RVU), and Virtual Processor Core (VPC) usage for your IBM software products based on the edition, license metric, and region of each product.

Before you begin

Role required: sam_admin or sam_user

About this task**Note:**

The highest daily usage of an IBM Cloud Pak is based on the Cloud Pak as a whole and not the individual software products, also known as Bundled Programs, within the Cloud Pak.

Procedure

1. From your ServiceNow instance, navigate to **Workspaces > Software Asset Workspace**. The Software Asset Workspace launches in a new tab.
2. Open the License operations view.
3. From the left navigation menu of the License operations view, navigate to **IBM ASP Integration > Daily aggregated peak usage**.
4. View additional usage details for a given IBM software product by selecting the value in the corresponding **Date** field.

View devices with the highest daily usage of your IBM software products

View the breakdown for the highest daily usage of your IBM software products by physical host based on both the edition and license metric of each product.

Before you begin

Role required: sam_admin or sam_user

About this task**Note:**

The highest daily usage of an IBM Cloud Pak is based on the Cloud Pak as a whole and not the individual software products, also known as Bundled Programs, within the Cloud Pak.

Procedure

1. From your ServiceNow instance, navigate to **Workspaces > Software Asset Workspace**. The Software Asset Workspace launches in a new tab.
2. Open the License operations view.
3. From the left navigation menu of the License operations view, navigate to **IBM ASP Integration > Daily high water mark usage**.
4. View the list of physical hosts with the highest daily usage of your IBM software products.

View product classifications for your IBM components

View the product classifications for all IBM components that are installed in your environment. These product classifications enable you to track and manage licensing for your IBM components.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. From your ServiceNow instance, navigate to **Workspaces > Software Asset Workspace**. The Software Asset Workspace launches in a new tab.
2. Open the License operations view.

3. From the left navigation menu of the License operations view, navigate to **IBM ASP Integration > Product classification**.
4. View the product classifications for all IBM components that are installed in your environment. Each product classification includes the classified product, product edition, product version, and assigned license metric.

Specify the virtual machine (VM) managers for which you are tracking IBM licenses

Specify the virtual machine (VM) managers, such as VMware vCenter Servers and IBM Hardware Management Consoles (HMCs), for which you want to track IBM licenses. You can track licenses for IBM software that is discovered within these specified VM managers only.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. From your ServiceNow instance, navigate to **Workspaces > Software Asset Workspace**. The Software Asset Workspace launches in a new tab.
2. Open the License operations view.
3. From the left navigation menu of the License operations view, navigate to **IBM ASP Integration > Devices to scan**.
4. Select **New**.
5. On the IBM Licensing VM Manager form, fill in the fields.

IBM Licensing VM Manager form

Field	Description
VM Manager	VM manager for which you want to track IBM licenses.
Type	Type of VM manager. Select one of the following options: <ul style="list-style-type: none"> <input type="radio"/> vCenter <input type="radio"/> ESX Server <input type="radio"/> HMC <input type="radio"/> All AIX Servers

6. Select **Submit**.

Deduplicating IBM software installations

To track and manage your IBM licenses, you can integrate the IBM publisher pack with an authorized Software Asset Management provider, IBM License Metric Tool (ILMT), or BigFix Inventory. If you are switching between an authorized Software Asset Management provider integration and either an ILMT or BigFix Inventory integration, you can deduplicate software installations that have the same edition, version, and language but are discovered through different sources.

If you discover the same IBM software installation through multiple sources, such as Anglepoint and ILMT, the Software Asset Management application creates a separate software installation record for each discovery of that software installation. You can resolve these duplicate software installation records by running the *SAM - Deduplicate Install Table* scheduled job, which ensures that only one duplicate software installation record is marked as active

and included in reconciliation. See [Duplicate software installations in the Software Asset Management application](#) for more information on deduplication.

By default, the Software Asset Management application prioritizes IBM software installations that are discovered through ILMT or BigFix Inventory. When you run the *SAM - Deduplicate Install Table* scheduled job, records for all IBM software installations that are discovered through ILMT or BigFix Inventory are marked as active, while records for the same software installations that are discovered through an authorized Software Asset Management provider are marked as inactive. If an IBM software installation is discovered through an authorized Software Asset Management provider only, the corresponding record is marked as active.

To prioritize IBM software installations that are discovered through authorized Software Asset Management providers instead, you can update the value of the **Use Servicenow Software Asset Management and Discovery for IBM license compliance** property (*com.snc.samp.ibm.use_samp_ibm_licensing*) by navigating to **All > System Properties > All Properties**. From the list of available system properties, search for and select the *com.snc.samp.ibm.use_samp_ibm_licensing* property. When the system property record opens, set the **Value** field to `true` and then select **Update**. Each time you subsequently run the *SAM - Deduplicate Install Table* scheduled job, records for all IBM software installations that are discovered through an authorized Software Asset Management provider are marked as active, while records for the same software installations that are discovered through ILMT or BigFix Inventory are marked as inactive. If an IBM software installation is discovered through ILMT or BigFix Inventory only, the corresponding record is marked as active.

Note:

The **Use Servicenow Software Asset Management and Discovery for IBM license compliance** property supports domain separation.

Enable IBM reconciliation for specific domains

If you are using domain separation for the integration between the Software Asset Management publisher pack for IBM and an authorized Software Asset Management provider, enable IBM reconciliation only for specific domains.

Before you begin

Role required: `asset` or `domain_admin`

Procedure

1. Open the Domain Asset Process Settings [`alm_domain_asset_process_setting`] table by navigating to **All > alm_domain_asset_process_setting_list.do**.
2. Double-click the **Run asset process** field for the domain that you want to enable reconciliation for.
3. When prompted, set the value to **true** and then select the Save icon (.
4. Repeat steps 2 and 3 for each domain that you want to enable reconciliation for.

Important:

If you have both parent and child domains, you can enable reconciliation for either the parent domain or child domain. You cannot enable reconciliation for both parent and child domains.

Verify the meta data for your IBM hosts

To improve the accuracy of your IBM license calculations, verify the meta data for the physical hosts that your IBM software is installed on. Update any meta data that is incorrect or out of date.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. From your ServiceNow instance, navigate to **Workspaces > Software Asset Workspace**. The Software Asset Workspace launches in a new tab.
2. Open the License operations view.
3. From the left navigation menu of the License operations view, navigate to **IBM ASP Integration > Device settings**.
4. Verify the meta data for all available hosts.
5. If any of the following meta data is incorrect, update it.
 - IBM PVUs per core
 - Region

Note:

If the Region meta data is empty for any of your physical hosts, the **Default Region for IBM Devices** (*sn_samp_ibm_lic.default_region*) Software Asset Management property automatically associates those hosts with a default region. By default, this system property is set to **North America and South America**. However, you can also set this system property to **Europe and Africa** or **Asia and Australia**. License usage can be calculated only for physical hosts that are associated with a region. See [Software Asset Management properties](#) for more information on this property.

- Usage type

Note:

You cannot update the Device, PVU Comment, and IBM PVU mapping meta data.

- a. Double-click the value in the incorrect meta data field.
- b. When prompted, enter or select the correct value and then select the Save icon (✓). The meta data field updates with the correct value.

Software Publisher Analytics dashboard for IBM in Software Asset Management classic

View compliance analysis results related to IBM on the Software Publisher Analytics dashboard in the Software Asset Management classic application.

Access the Software Publisher Analytics dashboard by navigating to **All > Software Asset > Publisher Overview**.

Note:

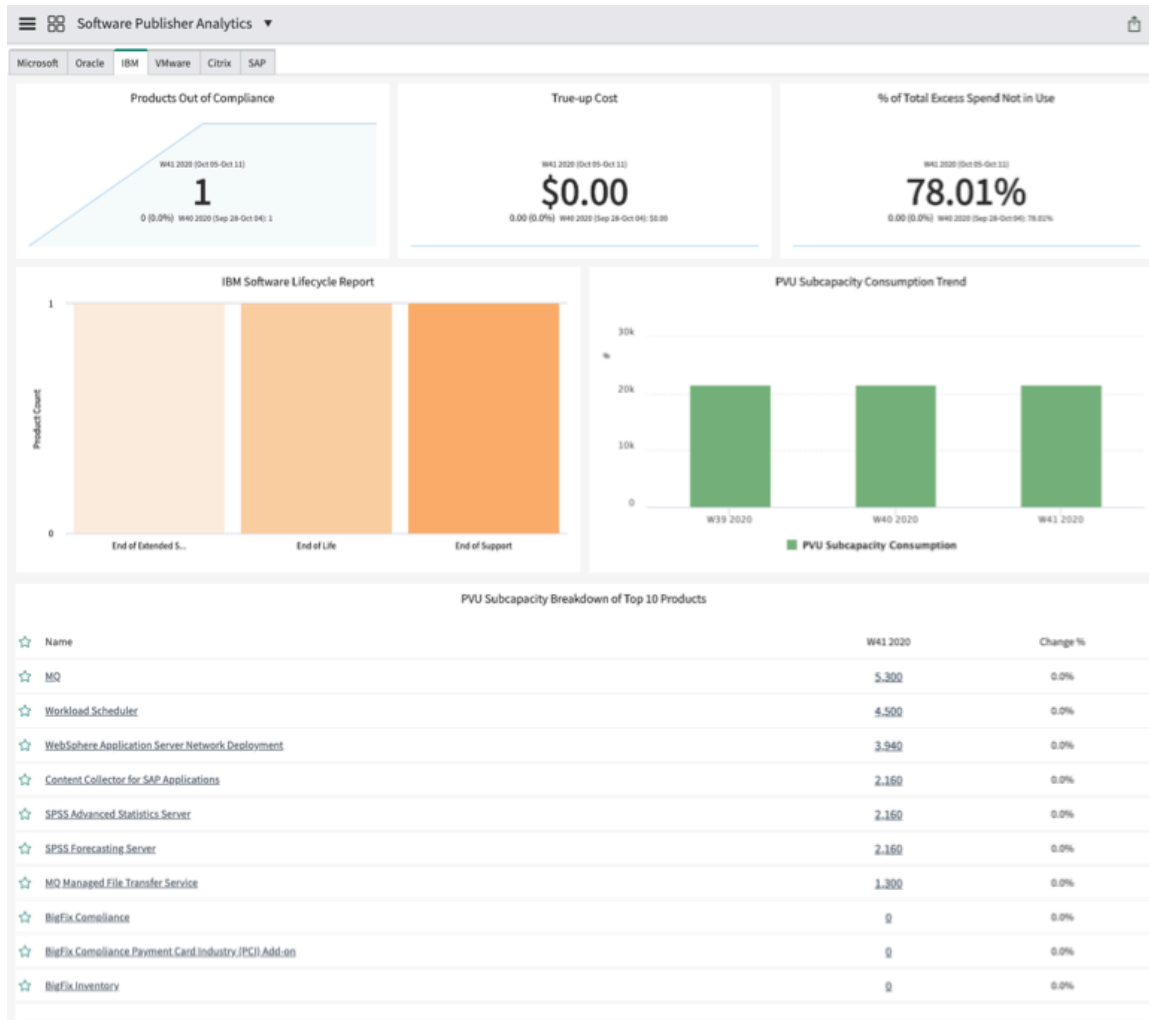

The add-on IBM publisher pack (com.sn_samp_ibm) plugin must be installed to view the IBM dashboard tab.

[IBM License Metric Tool \(ILMT\) integration](#) must be set up to view compliance information.

Results are updated whenever a new reconciliation result is available. You can save charts in PNG or JPG format.

IBM dashboard

You can manage IBM software using the IBM publisher pack.

IBM tab

Report	Source list	Description
Products out of Compliance	Product Results [samp_product_result]	Number of products that have at least one software model out of compliance. Select the report to view the results in the License Workbench .
True-up Cost	Product Results [samp_product_result]	Cost to be compliant based on the average prices for entitlements for the rights.
% of Total Excess Spend Not In Use	Software Entitlements [alm_license]	Sum of the over-licensed amount over the total of licensed amount.
PVU Subcapacity Consumption Trend	IBM Peak Consumption [samp_ilmt_sw_install]	Comparison of the aggregate peak consumption for all products over time.
IBM Software Lifecycle Report	Software Lifecycle Report	Number of products in each software lifecycle phase,

IBM tab (continued)

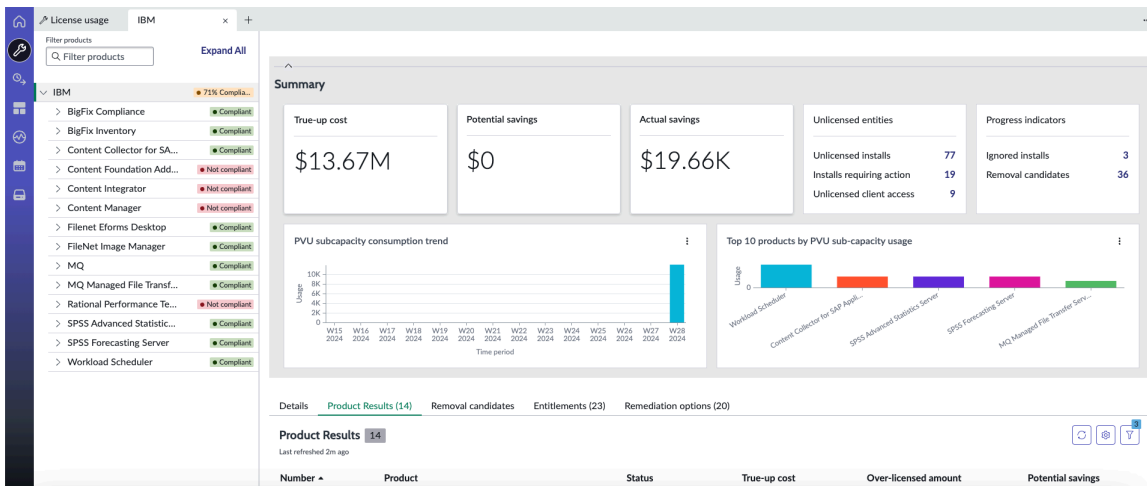

Report	Source list	Description
	[sam_sw_product_lifecycle_report]	including End of Extended Support, End of Life, and End of Support.
PVU Subcapacity Breakdown of Top 10 Products	IBM Peak Consumption [samp_ilm_t_sw_install]	Peak PVU utilization for the top 10 IBM products.

Publisher overview for IBM in the Software Asset Workspace

View license usage information related to IBM in the publisher overview for IBM in the Software Asset Workspace.

From the Software Asset Workspace, access the IBM publisher overview by navigating to **License usage > Publishers** and then selecting **IBM** from the list of available software publishers.

Results are updated whenever a new reconciliation result is available.

You can view a summary of your license usage information in the Summary section of the IBM publisher overview.

IBM Summary

Report	Description
True-up cost	Cost to be compliant based on the average price of rights in your IBM software entitlements.
Potential savings	Potential cost savings for your IBM licenses.
Actual savings	Actual cost savings for your IBM licenses.
Unlicensed entities	Summary of your unlicensed entities. This summary includes the following information:

IBM Summary (continued)

Report	Description
	<ul style="list-style-type: none"> • Unlicensed installs: Total number of unlicensed IBM software installations. Select the number to view the complete list of unlicensed IBM software installations. • Installs requiring action: Total number of IBM software installations that you must take action on. Select the number to view the complete list of these IBM software installations. • Unlicensed client access: Total number of unlicensed IBM client access records. Select the number to view the complete list of unlicensed IBM client access records.
Progress indicators	<p>Summary of your license compliance progress.</p> <p>This summary includes the following indicators:</p> <ul style="list-style-type: none"> • Ignored installs: Total number of IBM software installations that were ignored during reclamation. Select the number to view the complete list of ignored IBM software installations. • Removal candidates: Total number of IBM removal candidates. Select the number to view the list of all software removal candidates.
PVU subcapacity consumption trend	Comparison of the aggregate peak consumption for all IBM software products over time.
Top 10 products by PVU sub-capacity usage	Peak PVU utilization for your top 10 IBM software products.

For more details on the license usage information that is provided in the publisher overview, see [License usage publisher fields in workspace](#).

Software Asset Management for Red Hat Enterprise Linux

Use the Software Asset Management publisher pack for IBM to track and optimize license positions for the Red Hat Enterprise Linux Server products.

Required plugins and applications for Red Hat Enterprise Linux

To manage licenses for your Red Hat Enterprise Linux (RHEL) products, request and activate the Software Asset Management Professional for IBM plugin (com.sn_samp_ibm) from the Now Support service portal. See [Request Software Asset Management](#) for more information on how to request and activate this plugin.

You must also request and install the CMDB CI Class Models application from the ServiceNow Store. This application contains the tables that store RHEL data on your ServiceNow instance and is required for RHEL reconciliation.

The ServiceNow® Discovery application uses the Red Hat Virtualization (RHV) discovery pattern to locate RHV components. To enable the discovery of these resources, you must install the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Supported license types

The IBM publisher pack supports licensing for both Red Hat Enterprise Linux Server and Red Hat Enterprise Linux for Virtual Datacenters. The supported license metrics are socket-pair based and core based.

Red Hat Enterprise Linux socket-pair based licensing

Use the RHEL Server licensing based on the number of socket-pairs or virtual machine (VM) pairs on a physical host to manage licenses for your RHEL products.

Overview of the socket-pair based licensing model

Red Hat Enterprise Linux Server

Red Hat Enterprise Linux Server enables Linux distributions in physical, virtual, and hybrid environments. Although you can use RHEL licenses in both low-density and high-density virtual environments, they're more cost efficient in low-density virtual environments.

To determine whether a virtual environment is low-density or high-density, divide the number of required RHEL licenses by the number of required RHEL for Virtual Datacenters licenses. Compare this value against the threshold value in the **Red Hat Enterprise Linux for Virtual Datacenters license cost optimization threshold** field that you defined in your [Software Asset Management properties](#). If your value is lower than the threshold value, then the virtual environment is considered low-density. If your value is equal to or higher than the threshold value, then the virtual environment is considered high density.

Note:

The default value for the **Red Hat Enterprise Linux for Virtual Datacenters license cost optimization threshold** field is 3.2. This value is based on the ratio of the current RHEL Server subscription list price to the current RHEL for Virtual Datacenters subscription list price. If your entitlements contain different pricings for these products, then you can calculate this value by dividing your RHEL for Virtual Datacenters subscription price by your RHEL Server subscription price.

RHEL uses different licensing models depending on the environment in which you deploy a server.

RHEL licensing models

Environment	Description	Licensing model	Cluster licensing model
Physical	Deployment of RHEL servers on physical hosts.	Licensing is based on the number of socket-pairs on the physical host. For example, a physical host with 10 sockets requires five RHEL Server licenses. Single-socket hosts must be licensed individually.	Licensing is based on the total number of socket-pairs on the physical hosts within a cluster. For example, if Cluster Host A has 10 sockets and Cluster Host B has 20 sockets, then you must use 15 RHEL Server licenses to license the entire cluster.

RHEL licensing models (continued)

Environment	Description	Licensing model	Cluster licensing model
Virtual (low-density and high density)	Deployment of RHEL servers on the VMs that are running on physical hosts.	Licensing is based on the number of VM pairs that are running the server on a physical host. For example, a physical host with six VMs that are running a RHEL server requires three RHEL Server licenses. Single VMs that are running a RHEL server must be licensed individually.	Licensing is based on the total number of VM pairs on the physical hosts within a cluster. For example, if Cluster Host A has 10 VMs and Cluster Host B has 20 VMs, you must use 15 RHEL Server licenses to license the entire cluster.
Hybrid	Deployment of RHEL servers on the physical hosts and on the VMs that are running on those hosts.	Licensing is based on the number of socket-pairs on the physical host and the number of VM pairs that are running the server on the same host. For example, you can run a RHEL server on a physical host with 10 sockets and also on the 20 VMs running on that host. In this example, the host requires a total of 15 RHEL Server licenses.	Licensing is based on the total number of socket-pairs and VM pairs on the physical hosts within a cluster. For example, if Cluster Host A has 10 sockets and 10 VMs while Cluster Host B has 20 sockets and 20 VMs, you must use 30 RHEL Server licenses to license the entire cluster.

Red Hat Enterprise Linux for Virtual Datacenters

Red Hat Enterprise Linux for Virtual Datacenters uses hypervisors, such as Red Hat Virtualization and VMware, to enable Linux distributions in both low-density and high-density virtual environments. RHEL for Virtual Datacenters licenses are more cost efficient in high-density virtual environments.

To determine whether a virtual environment is low-density or high-density, divide the number of required RHEL Server licenses by the number of required RHEL for Virtual Datacenters licenses. Compare this value against the threshold value in the **Red Hat Enterprise Linux for Virtual Datacenters license cost optimization threshold** field that you defined in your [Software Asset Management properties](#). If your value is lower than the threshold value, then the virtual environment is considered low-density. If your value is equal to or higher than the threshold value, then the virtual environment is considered high density.

Note:

The default value for the **Red Hat Enterprise Linux for Virtual Datacenters license cost optimization threshold** field is 3.2. This value is based on the ratio of the current RHEL Server subscription list price to the current RHEL for Virtual Datacenters subscription list price. If your entitlements contain different pricings for these products, you can calculate this value by dividing your RHEL for Virtual Datacenters subscription price by your RHEL Server subscription price.

RHEL for Virtual Datacenters licensing is based on the number of socket-pairs on the physical hosts that are running your VMs. With this license type, you don't need to license the VMs that are running a RHEL for Virtual Datacenters server because you can access an unlimited number of VMs from your physical hosts. Single-socket hosts must be licensed individually.

If you deploy a RHEL for Virtual Datacenters server on VMs within a cluster, licensing is based on the total number of socket-pairs on all hosts that are running those VMs. Since you can access an unlimited number of VMs from your physical hosts, you don't need to license the cluster based on the total number of VMs that are running the server within the cluster. For example, if Cluster Host A has 10 sockets and 20 VMs while Cluster Host B has 20 sockets and 60 VMs, you must use 15 RHEL for Virtual Datacenters licenses to license the entire cluster.

License consumption order

If you have both RHEL Server and RHEL for Virtual Datacenters licenses, consume them in the following order:

1. RHEL for Virtual Datacenters licenses on the physical hosts, VMs, or clusters that have allocated licenses.
2. RHEL Server licenses on the physical hosts, VMs, or clusters that have allocated licenses.
3. RHEL for Virtual Datacenters licenses on physical hosts, VMs, or clusters in high-density virtual environments.
4. RHEL Server licenses on physical hosts, VMs, or clusters in low-density virtual environments.
5. RHEL Server licenses on physical hosts, VMs, or clusters in high-density virtual environments. Use this license type only if you have run out of RHEL for Virtual Datacenters licenses in high-density virtual environments.
6. RHEL for Virtual Datacenters licenses on physical hosts, VMs, or clusters in low-density virtual environments. Use this license type only if you have run out of RHEL Server licenses in low-density virtual environments.

Red Hat Enterprise Linux core-based licensing

Use the RHEL Per Core license metric to license core-based RHEL products on both physical and virtual environments.

Overview of the Per Core licensing model

To license a software product under the Per Core licensing model, each server must be assigned an appropriate number of core licenses. The number of core licenses needed depends on whether you're licensing the physical server or an individual virtual operating system environment (OSE).

Licensing under the Per Core model offers the following benefits:

- Tracks core packs for Red Hat products.
- Imports entitlements with the number of rights per license pack and the number of packs for Red Hat core-based entitlements.
- Enables customers to enter the number of rights per license pack and the number of packs for any Red Hat core-based product.
- Calculates the purchased rights based on the number of rights per license pack multiplied by the number of packs.
- Creates and removes allocations based on reconciliation of Red Hat core-based products.

Allocations can be applied to virtual machines (VM) or only to hosts. This metric runs calculations for physical cores and virtual cores on each machine and presents the most optimal licensing model based on the number of rights used.

Total license requirement calculation

Total license requirement is calculated at the physical host level. The following table includes examples of the various use cases for total license requirement:

Total license requirement calculations

Environment	Description	License requirement
Physical	Deployment of RHEL core-based products on physical machines.	<p>Licensing is based on the total number of physical cores on the machine. The total number can be found by multiplying the number of sockets by the number of cores per socket.</p> <p>For example, say that a physical machine has 2 sockets and 8 cores per socket. Multiplying 2 by 8 would mean that the total number of physical cores would be 16. $2 * 8 = 16$ Thus, the total number of rights required is 16 cores.</p>
Virtual	Deployment of RHEL core-based products on the VMs that run on physical hosts.	<p>Licensing is based on the total number of cores assigned to the VMs that run the server on a physical host. This number is limited to the maximum capacity of the physical host.</p> <p>For example, say that a physical host has 2 sockets with 8 cores per socket and 6 VMs with 2 cores per VM. Each VM has installed a RHEL core-based product. In this case, the number of rights required equals the minimum value between the physical core capacity of the physical host and the number of non-hyperthreaded physical cores assigned to VMs. 2 sockets multiplied by 8 cores per socket equal 16 cores, and 6 VMs multiplied by 2 cores per VM equal 12 cores. The minimum value between the two is 12 cores. $\text{Min}(2 * 8 = 16, 2 * 6 = 12)$ Thus, the</p>

Total license requirement calculations (continued)

Environment	Description	License requirement
		total number of rights required is 12 cores.
Hybrid	Deployment of RHEL core-based products on the physical hosts and on the VMs that run on those physical hosts.	<p>Licensing is based on the number of physical cores on which the RHEL core-based application is installed.</p> <p>For example, a physical host has 2 sockets with 8 cores per socket and 20 VMs with 2 cores per VM. A RHEL core-based product is installed on the physical host and all 20 VMs. In this case, the number of rights required is the minimum value between the physical core capacity of the physical host and the number of non-hyperthreaded physical cores assigned to VMs added to the number of physical hosts. 2 sockets multiplied by 8 cores per socket equal 16 cores. Then, 2 cores multiplied by 8 cores equal 16 cores, and 20 VMs multiplied by 2 cores per VM equal 40 cores. Add 16 cores to 40 cores, and it equals 56 cores. The minimum value between the two is 16 cores. $\text{Min}((2 * 8) = 16, (2 * 8 + 2 * 20) = 56)$ Thus, the total number of rights required is 16 cores.</p>

Red Hat Enterprise Linux entitlements

Software entitlements define the license details for your Red Hat Enterprise Linux (RHEL) products. You can create individual entitlements or import a list of entitlements from a spreadsheet.

***i* Important:**

You can create and import entitlements in both the Software Asset Management classic application and the Software Asset Workspace. The following sections provide details on how to create and import entitlements in the Software Asset Management classic application. For details on how to create entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#). For details on how to import entitlements in the Software Asset Workspace, see [Import bulk entitlements in workspace](#).

Create entitlements for Red Hat Enterprise Linux

Create individual software entitlements for your Red Hat Enterprise Linux (RHEL) products.

Before you begin

Role required: sam_user or sam_admin

i Important:

You can create entitlements in both the Software Asset Management classic application and the Software Asset Workspace. The following steps provide details on how to create entitlements in the Software Asset Management classic application. For details on how to create entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).

Procedure

1. Navigate to **All > Asset > Portfolios > Software Entitlement**.
2. Select **New**.
3. On the form, fill in the fields.

Software Entitlement form

Field	Value
Display name	Name of the software entitlement. This field is automatically set based on the Asset tag and Software model fields.
Asset tag	Serial number and bar code that are used to identify and track the asset.
Publisher part number	Publisher part number (PPN) for the entitlement.
Software model	Software model that has the entitlement.
Agreement type	Type of license agreement. Possible values include the following: <ul style="list-style-type: none"> ○ Generic ○ Enterprise License Agreement (ELA)
License type	Type of license. Set this field to Subscription .
Subscription period	Length of time for which the subscription is valid. This field appears only when Subscription is selected from the License type field.
Start date	Date when the subscription begins. This field appears only when Subscription is selected from the License type field.
End date	Date when the subscription expires. Do not select a date if the subscription does not expire. This field appears only when Subscription is selected from the License type field.
Metric group	Software publisher or software bundle that predefined software calculations are assigned to. Select Red Hat .
License metric	Group of predefined software calculations that are assigned to a metric group. Software Asset Management uses license metrics to calculate the rights for a specific set of software products during reconciliation. License metric options are based on the software publisher or software bundle that you select from the Metric group list. Possible values include the following:

Field	Value
	<ul style="list-style-type: none"> ○ Per Socket-pair ○ Per Core
Rights per license pack	Total number of rights associated with each pack that you purchased for Red Hat. This field appears only when Per Core is selected from the License metric field.
Purchased rights	Total number of rights that you purchased.
Active rights	Total number of rights that you can allocate to your users or devices. This field is set automatically.
Allocations available	Number of active rights that you have not yet allocated to any user or device. This field is set automatically.
Unit cost	Cost of each software right.
Total cost	Total cost of your purchased rights. This field is automatically set based on the Purchased rights and Unit cost fields.

4. Select **Submit.**

Import entitlements for Red Hat Enterprise Linux

Import a list of Red Hat Enterprise Linux (RHEL) software entitlements from a spreadsheet.

Before you begin

Role required: sam_admin

i Important:

You can import software entitlements in both the Software Asset Management classic application and the Software Asset Workspace. The following steps provide details on how to import software entitlements in the Software Asset Management classic application. For details on how to import software entitlements in the Software Asset Workspace, see [Import bulk entitlements in workspace](#).

Procedure

- 1. Download the spreadsheet template for the software entitlement import.**
 - a.** On the page header of your ServiceNow® instance, select **All**.
 - b.** In the menu navigation filter, enter `samp_bulk_import_list.do`. The Entitlement Imports [samp_bulk_import] table opens.
 - c.** Select **New**.
 - d.** On the Entitlement Import form, select **Download template**.
- 2.** Fill in the spreadsheet with all software entitlements that you want to import.
- 3.** Import your software entitlements into your ServiceNow instance.

- a. On the page header of your ServiceNow® instance, select **All**.
- b. In the menu navigation filter, enter `samp_bulk_import_list.do`. The Entitlement Imports [samp_bulk_import] table opens.
- c. Select **New**.
- d. On the form, fill in the fields.

Entitlement Import form

Field	Description
Import type	Type of document that you are importing software entitlements from. The options are Standard import document and Microsoft license statement (MLS) . Set this field to Standard import document .
File	Spreadsheet of software entitlements that you want to import. Select Click to add... to search for and select the same spreadsheet that you filled out in step 2 .
Description	Brief description of the software entitlement import.

- e. Select **Import**.

Result

All software entitlements are imported into your ServiceNow instance.

Publisher overview for Red Hat in the Software Asset Workspace

View license usage information related to Red Hat Enterprise Linux (RHEL) in the publisher overview for Red Hat in the Software Asset Workspace.

From the Software Asset Workspace, access the Red Hat publisher overview by navigating to **License usage > Publishers** and then selecting **Red Hat** from the list of available software publishers.

Results are updated whenever a new reconciliation result is available.

The screenshot displays the 'Red Hat' publisher overview in the Software Asset Workspace. The interface is divided into several sections:

- Summary Dashboard:** Contains five key metrics:
 - True-up cost: \$0
 - Potential savings: \$0
 - Actual savings: \$0
 - Unlicensed entities: 0 (Unlicensed installs, Installs requiring action, Unlicensed client access)
 - Progress indicators: 0 (Ignored installs, Removal candidates)
- Product Results Table:** Shows a single row for 'Red Hat Enterprise Linux' with the following details:

Number	Product	Status	True-up cost	Over-licensed amount	Potential savings
PR0001133	Red Hat Enterprise Linux	Compliant	\$0.00	\$1,350.00	\$0.00

You can view a summary of your license usage information in the Summary section of the Red Hat publisher overview.

Red Hat Summary

Report	Description
True-up cost	Cost to be compliant based on the average price of rights in your RHEL software entitlements.
Potential savings	Potential cost savings for your RHEL licenses.
Actual savings	Actual cost savings for your RHEL licenses.
Unlicensed entities	<p>Summary of your unlicensed entities.</p> <p>This summary includes the following information:</p> <ul style="list-style-type: none"> • Unlicensed installs: Total number of unlicensed RHEL software installations. Select the number to view the complete list of unlicensed RHEL software installations. • Installs requiring action: Total number of RHEL software installations that you must take action on. Select the number to view the complete list of these RHEL software installations. • Unlicensed client access: Total number of unlicensed RHEL client access records. Select the number to view the complete list of unlicensed RHEL client access records.
Progress indicators	<p>Summary of your license compliance progress.</p> <p>This summary includes the following indicators:</p> <ul style="list-style-type: none"> • Ignored installs: Total number of RHEL software installations that were ignored during reclamation. Select the number to view the complete list of ignored RHEL software installations. • Removal candidates: Total number of RHEL removal candidates. Select the number to view the list of all software removal candidates.

For more details on the license usage information that is provided in the publisher overview, see [License usage publisher fields in workspace](#).

Software Asset Management publisher pack for Microsoft

The Software Asset Management publisher pack for Microsoft helps you track your license compliance position using Microsoft licensing metrics.

i Important:

To use the publisher pack, activate the Software Asset Management Professional for Microsoft plugin (com.snc.samp.microsoft).

Microsoft offers a wide variety of products that span from database servers to subscription services. Each Microsoft product follows its own licensing model, which can make it hard to track your license compliance position. With the Software Asset Management publisher pack for Microsoft, you can accurately track your license compliance position for Microsoft products. Reconciliation identifies licenses that are out of compliance and provides a list of remediation options. For more information, see [Software reconciliation for compliance](#).

To learn more about Microsoft licensing models, see [Microsoft licensing](#).

Set up ServiceNow Discovery to identify Microsoft installations on your network. For more information, see [Data collected by ITOM Visibility](#).

Licensing models

The Software Asset Management publisher pack for Microsoft supports the following licensing models.

- Per User
- Per Device
- Per Core
- Per Core (with CAL)
- User CAL
- Device CAL
- Server (per instance)
- Server (per server)
- Per Processor
- User Subscription
- Software Assurance

For more information, see [Supported Microsoft license types](#).

If a PPN with P+SA license type doesn't have a version assigned, a software model with the exact version is automatically set on a new entitlement and while importing entitlements from a Microsoft License Statement (MLS). This automatic action correctly applies Microsoft assurance benefits to an entitlement. For details on the upgrade history of an entitlement, navigate to **Workspaces > Software Asset Workspace > License operations > Software entitlements > Upgrade history**.

The *SAMP - Update generic PSA entitlements* fix script automatically updates the existing P+SA entitlements with version as anything, with the specific version, and applies the appropriate licensing terms.

[Microsoft Per Core \(with CAL\) licensing rules](#)

[Microsoft 365 integration](#)

Microsoft 365 integration

Create an integration with Microsoft 365 to download subscription information that is compared with software installations for compliance.

Microsoft 365 products and services

Microsoft 365 is a suite of software products that includes a range of subscription software and services such as Microsoft Office 365, Windows, and Enterprise Mobility and Security (EMS). Microsoft 365 and EMS include many other products and services within them.

Some of these products can be installed on a computer, while others are online services accessible via the internet.

Note:

Microsoft allows users to install Microsoft 365 products on multiple devices, although users can only sign in on a maximum of five devices at one time. For more information, see [How sign in works in Microsoft 365](#).

Microsoft 365 admin center includes many other products that you can purchase and activate. However, some of these products don't come with the Microsoft 365 subscription, such as Dynamics 365.

The following are some of the products and services that are available with the Microsoft 365 subscription:

- Microsoft 365
- Microsoft Exchange Online
- Enterprise Mobility Suite
- Microsoft Office 365
- Microsoft SharePoint Online
- Microsoft Entra ID
- Microsoft Power BI
- Microsoft OneDrive
- Microsoft Teams
- Windows
- Microsoft Intune

Important:

This list doesn't include all the products and services available with a Microsoft 365 subscription.

Microsoft 365 subscription plans

Microsoft 365 offers various subscription plans, each providing access to different products and services. For instance, Power BI is included in the Office 365 E5 plan but not in the Office 365 E3 plan. To understand more about Microsoft 365 Enterprise subscription, see [Microsoft 365 plans and pricing](#). To understand more about all products and services per subscription plan, see [Microsoft 365 licensing](#).

Benefits of Microsoft 365 integration

SAM managers can perform the following actions:

- Get user subscription information for all the Microsoft 365 plans purchased on the Microsoft 365 admin center, such as Microsoft Office 365, Microsoft 365.
- Determine license compliance of Microsoft 365 subscriptions by reconciling user subscription, entitlement, and software installations.
- View active, inactive, and unassigned subscriptions by their last activity date.
- Get user activity for individual Microsoft Office 365 software products within Microsoft 365 subscriptions. For more information, see [Evaluating software usage activity for Microsoft 365 subscriptions](#).

- Get user activity with device-specific activation count details from the Microsoft 365 admin portal that helps in identifying users who have activated their Microsoft subscriptions on at least one device. The activation count also helps SAM managers accurately determine the total number of activations across both desktops and devices.
- Receive automated optimization recommendations and workflows for your Microsoft 365 subscriptions. These optimizations include suggestions for downgrading plans, addressing low usage, identifying overlapping licenses, and consolidating subscriptions.
- Determine potential savings while acting on the recommendation.
- Reduce costs and administrative efforts by automatically removing licenses that have low usage or are part of overlapping subscriptions.

[Integrating with Microsoft 365](#)

[Evaluating software usage activity for Microsoft 365 subscriptions](#)

[Publisher optimizations for Microsoft](#)

Supported Microsoft 365 license types

The Microsoft 365 integration supports various Microsoft 365 license types

Full USL

A Microsoft 365 Full USL is a user subscription license that provides full access to all features and capabilities of a Microsoft 365 subscription software product or service. You can use this license type under the following scenarios:

- If have not already purchased licenses for any on-premise Microsoft 365 subscription software products or services.
- If you want to transition from an on-premise to cloud-based Microsoft 365 subscription software product or service without using Microsoft Software Assurance (SA) benefits.

From SA USL

A Microsoft 365 From SA USL is a user subscription license that enables you to transition from a perpetual on-premise Microsoft software product or service to a corresponding cloud-based Microsoft 365 subscription software product or service, while maintaining certain Microsoft SA benefits. You can use this license type if you have already purchased a perpetual license for an on-premise Microsoft software product or service with active SA benefits.

Add-on USL

A Microsoft 365 Add-on USL is a user subscription license that enables you to try the features and capabilities of a cloud-based Microsoft 365 subscription software product or service while you are actively using the perpetual on-premise version of that product or service. With this license type, you can try the cloud version of a Microsoft software product or service without having to fully transition to the cloud. You can use this license type if you have already purchased a perpetual license for an on-premise Microsoft software product or service with active SA benefits.

Step-up license

A Microsoft 365 Step-up license enables you to upgrade a lower edition of a Microsoft 365 subscription software product or service to a higher edition without having to pay the additional full price for the higher edition. When you upgrade a software product or service through this

license type, you are required to pay only the price difference between the lower and higher editions, thereby preserving your initial investment into the lower edition. You can use this license type if you have already purchased the license for a lower edition of a Microsoft 365 subscription software product or service. For more information on Step-up licenses, see [Software license maintenance](#).

Reserve license

A Microsoft 365 reserve license enables you to place a license reservation order for a Microsoft 365 Online Services product. With a license reservation order, you can plan and provision additional resources for a Microsoft 365 Online Services product ahead of time without having to create a corresponding purchase order. All license reservation orders are realized during your true-up or annual order process. You can use this license type if you have already purchased a license for a Microsoft 365 Online Services product.

Integrating with Microsoft 365

Integrating the Software Asset Management application with the Microsoft 365 service enables you to track your software subscriptions and software usage to determine license compliance and act on optimization opportunities.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Microsoft 365 application	Authentication scopes
Download subscriptions	Application developer	<ul style="list-style-type: none"> User.Read.All Organization.Read.All
Pull user activity	<ul style="list-style-type: none"> Power platform administrator Application developer 	Reports.Read.All
Reclaim subscriptions	Application developer	<ul style="list-style-type: none"> GroupMember.ReadWrite.All LicenseAssignment.ReadWrite.All

Setting up Microsoft 365 integration

Manage Microsoft 365 license compliance and optimization by performing the following steps:

• **Prerequisites**

Before you begin with Microsoft 365 integration, confirm that all prerequisites are met.

1. Install Software Asset Management Professional for Microsoft

Install the Software Asset Management Professional for Microsoft (com.snc.samp.microsoft) plugin to access the Microsoft Publisher pack features in the Software Asset Management application.

2. Install ITAM Health Check application

Install the ITAM Health Check application to get an overview of your Software Asset Management configurations and receive recommendations for correcting errors.

3. Install Software Asset Management - SaaS License Management plugin

Install the Software Asset Management - SaaS License Management plugin (com.sn_sam_saas_int) to create and manage integrations with your SaaS and Single Sign-On (SSO) applications. These integrations enable you to track license usage and reclaim unused licenses effectively.

4. Install Microsoft Entra ID Spoke [🔗](#)

Install the Microsoft Entra ID spoke (formerly Azure AD spoke) to enable automated integration with the Microsoft 365 Admin Center for license removal and other scenarios. An Integration Hub subscription is required for this spoke. For more information about Integration Hub, see [Integration Hub](#) [🔗](#).

5. Receive latest updates from Software Asset Management Content Service

Update your instance with new content weekly on a scheduled basis through Software Asset Management Content Service. The Software Asset Management application provides automated content to simplify the normalization of software installations and subscriptions, offering enriched data such as lifecycle information, downgrade rights, and suite definitions. This data is essential for maintaining accurate license compliance and optimization.

6. Create a success goal

Create a success goal to track the success of Microsoft 365 configuration setup on the Software Asset Management application.

• Software Asset Management configurations

Configure your Software Asset Management (SAM) application, which includes setting up user accounts, managing licenses, and confirming compliance with Microsoft's software usage policies.

1. Register application on Microsoft Entra ID

Register an application on Microsoft Entra ID (formerly Azure Active Directory) that enables the retrieval of all subscriptions provisioned in the Microsoft 365 admin center.

2. Configure Power BI usage to get usage information

Enable service principal authentication for Power BI read-only APIs to enable your application access to Power BI service content and APIs. This access helps optimize your Microsoft 365 subscriptions, such as downgrading subscriptions from Office 365 E5 to Office 365 E3 or removing Power BI low-usage subscriptions.

3. Prevent anonymous user information

By default, Microsoft hides the user names of subscribers in the Microsoft 365 Admin Center, preventing ServiceNow from accurately tracking Microsoft 365 license usage. To resolve this issue, disable this anonymization feature in the Microsoft 365 Admin Center.

4. Set up a Microsoft 365 integration profile

Create a Microsoft 365 integration profile in the Software Asset Management application to import user subscription data, determine license compliance, and identify optimization opportunities. If you manage multiple tenants, create a separate integration profile for each.

5. Configure the integration profile to get data for government customers

The ServiceNow AI Platform supports Microsoft 365 Government plans, offering all the features of Microsoft 365 services within a government-exclusive cloud. This setup helps organizations comply with the U.S. security and compliance standards.

6. Configure the integration profile to get usage for Microsoft 365 Copilot, Visio Online, and Project Online

Microsoft doesn't provide APIs to get usage directly for Microsoft 365 subscription products, such as Microsoft Visio, Microsoft Project, and Microsoft Copilot. However, you can download activity reports for these products from the Microsoft 365 admin center. Microsoft 365 administrators can download these reports and SAM Admin can attach them unmodified to the integration profile in the Software Asset Management application. The scheduled jobs within ServiceNow will then process these reports and identify reclamation candidates if the usage is low.

7. Configure reclamation rules

The Software Asset Management application automatically provides base system reclamation rules when you create an integration profile for Microsoft 365. For more information, see [Reclamation rules for Microsoft 365 integration](#).

8. Configure user resolution rules

Resolve or match the Microsoft 365 admin center user to the ServiceNow user (`sys_user`) to determine the right license compliance and provide correct optimization recommendations.

Important:

Remember that sometimes licenses are assigned to non-human users such as email accounts. In these instances, you can skip the user resolution process as it isn't required.

9. Run scheduled jobs

The Microsoft 365 integration profile you created automatically gets subscription and usage information from the Microsoft 365 admin center on a scheduled basis. You can now run these jobs on demand and verify they're completed successfully.

10. Set up software models and entitlements

The Software Asset Management application integrates with the Microsoft 365 admin center to generate software models automatically based on assigned subscriptions. These models include suite components, downgrades, and lifecycle details to confirm compliance and optimize licensing. For these automatically created software models, remember to add your entitlements. If you have previously set up entitlements using Publisher Part Number, the software models from that setup are used in this integration, avoiding the creation of duplicate models.

Note:

Verify that no software models are created without Discovery Maps (DMAPs) and no entitlements are created without a Publisher Part Number (PPN) for a smoother implementation.

11. Set up Add on, From SA, and Step Up entitlements

Associate an Add-on license with a perpetual office legacy license with active Software Assurance. Microsoft 365 offers various subscription types such as Full USL, Add On USL, From SA USL, Step-up license, and reserved licenses. To learn more about these licenses, see [Supported Microsoft 365 license types](#).

12. Set up license reservations

Create reserve entitlements for Microsoft online services to add licenses to your existing Microsoft 365 subscriptions.

• Software Asset Management configurations verification

Review and validate the Software Asset Management configurations to track and manage Microsoft 365 licenses and usage accurately.

1. Verify the complete pull of all subscriptions

Verify with the Microsoft 365 administrator that all subscription records have been successfully pulled.

2. Run health check

Run a health check on the Health check dashboard by selecting **Microsoft 365, SaaS, and General** to verify the Microsoft 365 configurations and review the findings for each suite.

3. Verify the pull of all required software usage

Verify if the Software Asset Management application has pulled the usage details for your Microsoft 365 subscribed users, which is required to identify the last activity and determine optimization opportunities.

4. Create a success goal

Create a success goal to manage your Microsoft 365 licenses.

5. Add Microsoft 365 and associated products to the published product list

Add Microsoft 365 and associated products to the published product list to improve readability and declutter the Software Asset Workspace. Scale your SAM efforts strategically by evaluating progress based on resource needs, work quality, and configuration management.

6. Run reconciliation

Run reconciliation on the Software asset overview page to verify that the licenses are consumed according to the Software Asset Management configurations. You must run reconciliation only for Microsoft as the publisher to verify Microsoft 365 license consumption.

7. Check license position report

Check your overall compliance positions for Microsoft 365 and associated products in the License Position Report.

8. Act on unlicensed subscriptions

Identify and address the unlicensed Microsoft 365 subscriptions.

9. Act on optimization recommendations

Software Asset Management supports various optimization use cases, which you can view on the Software asset analytics page.

Register a Microsoft Entra ID application

Register an application through the Microsoft Entra ID portal.

Before you begin

Microsoft Entra ID Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. From a web browser, open the [App registrations page](#) of the Microsoft Entra ID portal.
2. Log in using your global administrator credentials.
3. On the App registrations page, select **New registration**.
4. In the Name section of the Register an application form, enter a name for the application.
5. In the Supported account types section, select **Accounts in any organizational directory (Any Microsoft Entra ID - Multitenant)**.
6. Select **Register**.
The application is registered and you're automatically redirected to the Overview page for the new application.
7. On the Overview page, copy the values in the **Application (client) ID** and **Directory (tenant) ID** fields.
Save them in a secure location for later use.
8. Generate a Client secret for your application.
 - a. From the side navigation menu, navigate to **Manage > Certificates & secrets**.
The Certificates & secrets page opens.
 - b. In the Client secrets section, generate a client secret for the application by selecting **New client secret**.
 - c. In the dialog box, fill in the fields.

Add a client secret dialog box

Field	Description
Description	Description of the client secret.
Expires	Time period after which you want the client secret to expire. The options are:

Field	Description
	<ul style="list-style-type: none"> ▪ In 1 year ▪ In 2 years ▪ Never

d. Select Add.

The dialog box closes and you return to the Certificates & secrets page.

e. In the Client secrets section, copy the value in the VALUE field for the newly generated client secret.

Save this in a secure location for later use.

9. Specify the level of access that the application has to your protected resources.

a. From the side navigation menu, navigate to Manage > API permissions.

b. On the API permissions page, select Add a permission.

c. In the Request API permissions dialog box, select the Microsoft APIs tab.

d. From the list of available Microsoft APIs, select Microsoft Graph.

e. When prompted to select the types of permissions that the application requires, select Application permissions.

f. Under Select permissions, select the check boxes for the following permissions:

- Reports.Read.All
- User.Read.All
- Organization.Read.All

g. Select Add permissions.

The dialog box closes and you return to the API permissions page.

10. Grant admin consent for your application.

What to do next

After you successfully register and set up your application, remain in the Microsoft Azure portal if you must enable your application to access Power BI service content and APIs.

Enable service principal authentication for Power BI read-only APIs

Grant your application access to Power BI service content and APIs by enabling service principal authentication for Power BI read-only APIs. Power BI service content and APIs help optimize your Microsoft 365 subscriptions, such as by downgrading subscriptions from Office 365 E5 to Office 365 E3.

Before you begin

Microsoft Entra ID Role required: global administrator

Power BI Role required: Power platform administrator

Note:

This configuration enables the ServiceNow Software Asset Management application to get the usage information (Last usage time) for all Power BI Pro deployments across the Web and Desktop. The Software Asset Management application pulls the last activity date for Power BI deployments that are part of Microsoft 365 subscriptions.

About this task

Service principal is an authentication method that enables your application to access secure Microsoft Entra ID resources, such as Power BI service content and APIs.

Procedure

1. Create a security group for service principal authentication.

Security groups enable you to manage which users, devices, groups, and service principals can access shared resources. If you want to use an existing security group for service principal authentication, skip to [step 2](#).

 - a. On the page header of the Microsoft Azure portal, use the search bar to search for and select the **Microsoft Entra ID** service.

The Overview page for the Microsoft Entra ID service opens.
 - b. From the side navigation menu of the Microsoft Entra ID service, navigate to **Manage > Groups**.

The **Groups > All groups** page opens.
 - c. On the All groups page, select **New group**.
 - d. On the form, fill in the fields.

New Group form

Field	Description
Group type	Group type. Set this field to Security .
Group name	Name of the group.
Group email address	Email address that is shared between all group members.
Group description	Description of the group.
Membership type	Method in which members can be added to or removed from the group. Set this field to Assigned .

- e. Select **Create**.

The security group is created and then you're redirected to the Overview page for the new group.

2. Add the application that you created in [Register a Microsoft Entra ID application](#) as a member of your security group.

- a. If you didn't create a security group in [step 1](#) and are using an existing security group instead, open your existing security group.
If you created a security group in [step 1](#), skip to [step b](#).
 - i. On the page header of the Microsoft Azure portal, use the search bar to search for and select the **Microsoft Entra ID** service.

The Overview page for the Microsoft Entra ID service opens.
 - ii. From the side navigation menu of the Microsoft Entra ID service, navigate to **Manage > Groups**.

The **Groups > All groups** page opens.
 - iii. From the list of available groups, locate and select your existing security group.

The Overview page for the security group opens.
- b. From the side navigation menu of your security group, navigate to **Manage > Members**.
The Members page opens.
- c. On the Members page, select **Add members**.
The Add members dialog box opens.
- d. In the dialog box, search for and select the application that you created in [Register a Microsoft Entra ID application](#).

i Important:

The application must not have any Power BI admin permissions set from the Microsoft Azure portal. You can verify your application permissions using the following steps:

- i. Log in to the Microsoft Azure portal using either your global administrator, application administrator, or cloud application administrator credentials.
- ii. On the page header of the Microsoft Azure portal, use the search bar to search for and select the **Microsoft Entra ID** service.

The Overview page for the Microsoft Entra ID service opens.
- iii. From the side navigation menu of the Microsoft Entra ID service, navigate to **Manage > Enterprise applications**.

The Enterprise applications page opens.
- iv. From the list of available enterprise applications, locate and select your application.
- v. Select **Permissions**.
- vi. Verify that no Power BI admin-consent-required permissions are set on the application.

- e. Select **Select**.
The application is added as a member of your security group.

3. Enable your security group to access read-only Power BI admin APIs.

- a. In a new tab or web browser, open [Power BI](#) .
- b. Log in using either your global administrator or Power BI administrator credentials.
The Power BI portal opens.
- c. On the page header of the Power BI portal, select the Settings icon  and then select **Admin portal**.
The Power BI Admin portal opens.
- d. From the side navigation menu of the Admin portal, select **Tenant settings**.
- e. In the Admin API settings section, expand the **Allow service principals to use read-only Power BI admin APIs** setting.
- f. Select the toggle button to enable the setting.
- g. When prompted, select the option to apply the setting to **Specific security groups**.
- h. In the corresponding text box, enter the name of your security group.
- i. Select **Apply**.

After you enable this setting through the Power BI Admin portal, any application permissions that you set from the Microsoft Azure portal are no longer effective. All application permissions must subsequently be set and managed through the Power BI Admin portal.

Configure updates on Microsoft 365 Admin Center

Avoid anonymous user information in Microsoft 365 reports on activity to be imported to ServiceNow.

Before you begin

Role required: admin

Procedure

1. Log in to [Microsoft 365 admin center](#)  by using your admin credentials.
2. Navigate to **Settings > Services > Org settings > Reports**.
3. Deselect the **Display concealed user, group, and site names in all reports** check box.
For more information about the Microsoft 365 reports showing anonymous user information, see [Microsoft 365 reports show anonymous user names instead of actual user names](#) .

Create a Microsoft 365 integration profile

Create an integration profile to track software subscriptions and optimize stale licenses for the Microsoft 365 service.

Before you begin

ServiceNow Role required: sam_integrator or admin

To integrate with Microsoft 365, activate the following plugins:

- Software Asset Management Professional for Microsoft (com.snc.samp.microsoft) plugin
- Software Asset Management - SaaS License Management (sn_sam_saas_int) plugin from the [ServiceNow Store](#) 

For more information, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the direct integration profile in Core UI is inactive.

Procedure

1. From a web browser, open your ServiceNow instance.
2. Select **New**.
3. Select **Microsoft 365 Integration Profile**.
4. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	Name of the integration profile. For example, <i>Microsoft 365 integration for <your-company></i> .
Client Id	Client ID of the application that you registered in the Microsoft Azure portal. Enter the application (client) ID that you copied in Register a Microsoft Entra ID application .
Client secret	Client secret of the application that you registered in the Microsoft Azure portal. Enter the client secret that you copied in Register a Microsoft Entra ID application .
Tenant name or Id	Globally unique identifier (GUID) of the application that you registered in the Microsoft Azure portal. Enter the directory (tenant) ID that you copied in Register a Microsoft Entra ID application . <div style="background-color: #ffffcc; padding: 5px;"> <p>⚠ Warning: When entering the directory (tenant) ID, don't add any additional extensions to the ID. Enter the ID exactly as it was copied in Register a Microsoft Entra ID application.</p> </div>
REST message	Message that enables you to send requests to a REST web service endpoint.
Profile type	Type of integration profile. This field is automatically set to Microsoft 365 .

- In the Process configuration section, view the required user roles or API permissions to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see [Minimal user permissions table](#).

- The **Download subscriptions** check box is selected by default and you can't clear it.
- The **Download Activity** check box is selected by default. If you clear it, activity data for this integration profile isn't pulled.
- The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- Select **Submit**.

- On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

If the connection is successfully validated, the integration profile downloads subscriptions and activity data.

Note:

If the **Download Activity** field is selected without configuring the optional Power BI settings, the Validate connection feature will issue the following warning message: "All required APIs are validated successfully, but the optional Power BI API validation has failed."

- Optional:** Check the status of the user subscription job by navigating to **Software Asset > Administration > Job Results**.

What to do next

View all automatically generated software models for Microsoft 365 by navigating to **Integration - Microsoft 365 > Software Models**. A software model is a profile of the software that you have purchased, including information about the publisher, version, and discovery map. Software models record publisher information and create a profile.

After creating an integration profile for Microsoft 365, you can view information about software models, unrecognized subscription identifiers, scheduled jobs, scheduled job results, and software subscriptions in the Software Asset Workspace. Navigate to **License operations > User subscription > Direct integration profiles**.

When you create an integration profile, a reclamation rule is automatically created for the software. It's important that you review the reclamation rule to ensure that it meets your specifications. You can view all automatically generated reclamation rules for Office 365 by navigating to **Software Asset > Administration > Reclamation Rules**. Reclamation rules are applied based on the Microsoft System Center Configuration Management (SCCM) usage data that is pulled through the Microsoft SCCM usage integration. For more information on these reclamation rules, see [Create a reclamation rule to import Microsoft SCCM usage data](#).

Note:

ServiceNow automatically creates one default reclamation rule for Office 365. You can also update the Last activity threshold field under the Subscription Usage Condition tab.

Related topics

- [Review a software reclamation rule](#)
- [Reclamation rules for Microsoft 365 integration](#)
- [Software Asset Management software suites](#)

Determine and verify Microsoft 365 subscription information in your ServiceNow instance

Determine the exact software subscription information to be pulled from the Microsoft 365 admin center and verify if complete subscription information is pulled accurately to ServiceNow.

Before you begin

Role required: sam_admin

Procedure

1. Filter with the Microsoft 365 integration profile you created to determine the exact software subscription information to be pulled from Microsoft 365 admin center to ServiceNow. This subscription includes all subscriptions available on the Microsoft 365 admin center.
2. Verify with the Microsoft 365 admin if complete subscription information is pulled accurately to ServiceNow.

Note:

Software Asset Management pulls the last activity date for Microsoft 365 products using a combination of Microsoft System Center Configuration Manager (SCCM) integration and Microsoft 365 integration.

3. If your Microsoft 365 subscription data isn't getting pulled into Software Asset Management, verify your integration setup:
 - a. On the Integration Profile form, open the REST message record by selecting the Preview icon (i) next to the **REST message** field.
 - b. Select **Open Record** in the record preview.
 - c. On the Rest Message form, select the **Get OAuth Token** related link.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

- d. On the OAuth flow verification dialog box, view the status of the OAuth flow to determine whether your integration is set up correctly.
 - If the OAuth token flow completed successfully message appears, your integration is set up correctly.
 - If the OAuth flow failed message appears, your integration isn't set up correctly. Use the information in this message to identify the errors in your integration setup.
4. If your Power BI usage isn't getting pulled into Software Asset Management, verify the status of your Power BI API connection.
 - a. On the Integration Profile form, select and hold (or right-click) the form header.
 - b. Select **Show XML**.

Note:

If the **Show XML** option isn't visible in the default view, you can customize the view. Select and hold (or right-click) the form header and then select **View > custom integration**.

- c. Under **<xml> > <samp_sw_subscription_profile> > <custom_properties>**, view the *powerBIAPISatus* property to determine the status of your Power BI API connection.
- If the *powerBIAPISatus* property is set to **success**, the Power BI API connection was successful.
 - If the *powerBIAPISatus* property is set to **failed**, the Power BI API connection wasn't successful. Verify that you've followed all the integration setup steps correctly. You can also check your logs for more information about any errors in your integration setup.

5. Optional: If the **User** field in the Software Subscription [samp_sw_subscription] table is empty, you can map the field with an associated user.

(Optional) For more information, see [Associate a user with subscription records](#).

Upload the Microsoft 365 Copilot, Visio Online, and Project Online usage reports to your ServiceNow instance

Monitor the usage activity data for Microsoft 365 Copilot, Visio Online, and Project Online to identify reclamation candidates based on low usage.

Before you begin

Role required:

- Access the Microsoft 365 admin center: admin
- Add reports to the ServiceNow instance: sam_admin

About this task

You can export the usage reports for Microsoft Copilot, Visio Online, and Project Online from the [Microsoft 365 admin center](#)  and add the reports to your ServiceNow instance. These usage activity reports help in license optimization by identifying potential reclamation candidates based on low usage.

Procedure

1. Log in to [Microsoft 365 admin center](#)  using your global administrator credentials.
2. Navigate to **Reports > Usage**.
3. Download the usage reports.
 - Select **Copilot for Microsoft 365** and download the CSV file by selecting **Export**.
 - Select **Project** and download the CSV file by selecting **Export**.
 - Select **Visio** and download the CSV file by selecting **Export**.

Important:

You must not change the names of the downloaded files. You must upload the files as is to your ServiceNow instance.

You must upload the CSV files to your ServiceNow instance within 7 days for correctly identifying potential reclamation candidates.

4. From the navigation menu, select **Identity**.

The Azure portal for the current tenant opens.

5. On the Overview page, copy the value in the **Tenant ID** field and save it for later use.
6. From a web browser, open your ServiceNow instance.
7. Apply filters to open integration profiles for a specific Tenant id for which you want to upload the usage reports.
8. Add the usage reports to an integration profile.

What to do next

The usage activity reports that you uploaded can be monitored for license optimization and generation of reclamation candidates. For details, see [Evaluating software usage activity for Microsoft 365 subscriptions](#).

Evaluating software usage activity for Microsoft 365 subscriptions

Evaluating software usage activity helps you discover active, inactive, and unassigned subscriptions among all subscriptions found on the Microsoft 365 portal.

Software usage activity for license optimization

Software usage activity refers to how software products are being used. By tracking this activity, you can monitor license usage and optimize your existing software subscriptions.

The following table lists the sources for collecting the software usage activity, the associated platform support, and the supported Microsoft 365 products.

Sources of software usage activity collection	Platform support	Supported Microsoft Office 365 products
Microsoft Graph APIs	Desktop, Web, Mobile	Outlook, Word, PowerPoint, Excel, OneNote, Teams, Exchange Online, SharePoint Online, Power BI
Microsoft SCCM or ACC-V	Desktop	Microsoft Office 365 apps for Enterprise
Jamf for macOS devices	Desktop	Microsoft Office 365 apps for Enterprise
Manual upload of the usage reports on the ServiceNow instance from the Microsoft Office 365 admin center	Desktop, Web, Mobile	Microsoft 365 Copilot, Visio Online, and Project Online

Note:

You can download the usage for Microsoft 365 Copilot, Visio Online, and Project Online from the Microsoft Office 365 admin center. For details, see [Upload the Microsoft 365 Copilot, Visio Online, and Project Online usage reports to your ServiceNow instance](#).

After completing the [Microsoft 365 integration](#), you can view the usage activity information using any of the following tables:

- [Software Usages \[samp_sw_usage\]](#)

View the usage data for individual software products within the subscription in the Software Usages table. This table stores total usage and last activity retrieved from Microsoft APIs and other discovery solutions such as SCCM, Jamf, and ACC-V. For more details on software usage fields and their descriptions, see [View or create software usage](#).

- [Microsoft 365 Apps Usage Reports \[samp_m365_apps_usage_report\]](#)

View the last activity date for the Microsoft 365 products in the Microsoft 365 Apps Usage Reports table for each user. This table stores usage data for Microsoft 365 products in True or False retrieved from Microsoft APIs only. The last activity date helps you determine reclamation candidates more accurately for Microsoft 365 products, including Microsoft Outlook, Microsoft Word, Excel Microsoft PowerPoint, and OneNote. For more details on Microsoft 365 apps usage fields and their descriptions, see [Microsoft 365 Apps Usage Reports](#).

These usage tables include the date when the software was last used and the type of the activities performed on the Desktop, Web, Mobile, or cumulative across platforms. The last activity data helps you select an optimized plan for individual products within your Microsoft 365 subscriptions. For related usage, the *#SAM - Collect Microsoft 365 Usage* scheduled job collects the usage data daily.

Based on the software usage activity, Software Asset Management generates optimization recommendations for your software subscriptions.

License optimization for Microsoft subscriptions

Software usage activity helps you with license optimization by discovering reclamation candidates from both the individual Microsoft products and the Microsoft 365 suite subscriptions. For more information, see [Publisher optimizations for Microsoft](#). The *#SAM - Collect Microsoft 365 Usage* scheduled job collects the usage data daily and the *#SAM - Create New Reclamation Candidates for Office 365 Integration* generates the removal candidates weekly for low usage, downgrade, consolidated, and overlapping subscriptions. You can determine the reclamation candidates using both APIs and discovery solutions.

- **Low usage subscriptions**

Low usage Microsoft 365 or Microsoft Office 365 subscriptions are the subscriptions where the assigned licenses or services aren't being fully used.

- Individual subscriptions such as Microsoft Teams, Microsoft SharePoint, or other single services.
- Subscription suites including Microsoft 365 and Microsoft Office 365.

Software Asset Management recommends reclaiming the low usage subscriptions.

- **Downgrade subscriptions**

Downgrading Microsoft 365 or Microsoft Office 365 subscriptions means to switch from a higher-tier plan to a lower-tier plan. This approach usually involves moving from a plan with more features and services to one with fewer features and services, often at a reduced cost. The following table lists the downgrade subscriptions and conditions that result in downgrade recommendations.

Conditions for downgrade subscriptions

Condition	Downgrade subscriptions
No Power BI usage	<ul style="list-style-type: none"> ○ Microsoft 365 Enterprise E5 to Microsoft 365 Enterprise E3 ○ Microsoft 365 G5 USGOV GCCHIGH to Microsoft 365 E3 USGOV GCCHIGH ○ Microsoft 365 G5 for Government to Microsoft 365 G3 GCC ○ Microsoft 365 A5 for Students to Microsoft 365 A3 for Students ○ Microsoft 365 A5 for Faculty to Microsoft 365 A3 for Faculty
No desktop usage	<ul style="list-style-type: none"> ○ Microsoft 365 E3 to Microsoft 365 F3 ○ Microsoft Office 365 G3 GCC to Microsoft Office 365 G1 for Government ○ Microsoft 365 Enterprise E3 to Microsoft 365 Enterprise E1 ○ Microsoft 365 A3 for Students to Microsoft 365 A1 for Students ○ Microsoft 365 A3 for Faculty to Microsoft 365 A1 for Faculty
User is a Shared Email Box	<ul style="list-style-type: none"> ○ Microsoft 365 Enterprise E3 to Microsoft Exchange Online Plan 2 ○ Microsoft 365 Enterprise E5 to Microsoft Exchange Online Plan 2 ○ Microsoft Office 365 Enterprise E3 to Microsoft Exchange Online Plan 2 ○ Microsoft Office 365 Enterprise E5 to Microsoft Exchange Online Plan 2 <p>Note: When the user is a shared email box, you can select the type of user as Shared Email Box in the Non-person Account field in the Discovered Users form.</p>

Additionally, you can view the Microsoft 365 and Office 365 downgrade candidates, including details about the source edition and the target edition in the [Subscription downgrade configuration \[saas_downgrade_configuration\]](#) table.

Note: You can also determine usage for Microsoft Access and Publisher from additional discovery solutions, such as Microsoft SCCM or ACC-V for E3 to E1 optimization. Here, the frequency of downgrade candidate generation from E3 to E1 would be monthly instead of weekly.

• Consolidated subscriptions

Consolidating Microsoft 365 integration subscriptions means merging multiple separate subscriptions into one unified subscription. This approach brings all licenses and services under a single account which helps in saving cost, easier track usage, and license assignments. For example, if Office 365 Enterprise E5, Windows, and EMS subscriptions exist, Software Asset Management recommends using a single license such as Microsoft 365 Enterprise E5 to cover these multiple products at a lower cost.

• Overlapping subscriptions

Overlapping Microsoft 365 integration subscriptions occur when a user or organization has several active subscriptions that provide the same or similar services at the same time. For example, both Microsoft 365 E3 and Office 365 E3 subscriptions exist, leading to unnecessary duplicate access to Office applications and additional services already included in Microsoft 365 E3. Software Asset Management recommends reclaiming the Office 365 E3 subscriptions and using the Microsoft 365 E3 subscriptions instead.

Additionally, the subscription assignment date that is automatically populated from the Microsoft 365 portal helps in generating the reclamation candidates for individual subscriptions. Using the subscription assignment date instead of the record creation date on the ServiceNow AI Platform helps to create correct reclamation candidates based on the actual use from the Microsoft 365 portal.

Evaluate Microsoft 365 compliance and optimization results

Evaluate Microsoft 365 compliance and optimization results to find actual and potential cost savings and recommended licensing optimizations.

Before you begin

Role required: sam_admin or sam_user

The discovery of Microsoft 365 must be complete to evaluate the software compliance. For more information about using Discovery and Microsoft SCCM together, see [Discovery and SCCM together](#) .

The usage of Microsoft 365 plans must be available from both Microsoft certified APIs and Microsoft SCCM to evaluate the software optimization.

Procedure

1. Navigate to **Software Asset Workspace > License operations**.
2. In the left pane, select **Licensing > Software entitlements**.
3. Select **New**.
4. Create entitlements for Microsoft 365 by selecting the correct Publisher Part Number (PPN) to verify compliance.
For more information about creating entitlements, see [Create entitlements in workspace](#).

Note:

Ensure that the License metric value is User Subscription.

5. Navigate to **License usage** in the left pane.
6. Select the **Reconciliation** tab.
7. Select **Run reconciliation**.
8. View compliance analysis results in [Office 365 & Adobe Cloud dashboard in Software Asset Management classic](#) and [SaaS overview dashboard in workspace](#).
For more information about running software reconciliation, see [Run software reconciliation in Software Asset Management classic](#) and [Run Software Asset Management Foundation plugin software reconciliation in classic](#).
9. View all optimized plans for Microsoft 365 subscription on the [Optimization and savings dashboard in workspace](#).

Update REST and OAuth endpoints for Microsoft Office 365 Government plans

Change the endpoints of the REST message and OAuth application on your ServiceNow subscription profile so that you can use your subscriptions.

Before you begin

Role required: sam_admin

About this task

The ServiceNow AI Platform[®] supports Microsoft Office 365 Government plans, which provide all the features and capabilities of Microsoft 365 services in a segmented government cloud community that enables organizations to meet U.S. compliance and security standards.

For more information on Microsoft Office 365 Government plans, see [Office 365 Government](#).

Important:

The Software Asset Management application supports tracking last activity for license compliance, subscription management, and optimization recommendations for Microsoft products such as Exchange Online, Teams, Power BI, OneDrive, and so on. For more details, see [Evaluating software usage activity for Microsoft 365 subscriptions](#).

The detailed usage metrics for these Microsoft products (except Power BI) are only available through specific report APIs that aren't supported in government-regulated environments. For further details, refer to the [Microsoft national cloud deployments documentation](#).

Procedure

1. From your ServiceNow instance, navigate to **All > Software Asset > SaaS License > Direct Integration Profiles**.
2. Select the Microsoft 365 integration profile that you want to update.
3. On the Integration Profile record, select the Preview this record icon (i) next to the **REST message** field.
4. On the record preview, select **Open Record**.
The REST Message record opens.
5. Update the REST message endpoints on your Microsoft 365 integration profile.

REST message endpoints enable you to retrieve usage data from your Microsoft 365 applications and services.

- a. In the **HTTP Methods** related list, update the REST message endpoints based on your needs.

Microsoft provides various endpoints for Microsoft Office 365 Government plans. For more information on the available endpoints, see [Office 365 U.S. Government GCC High endpoints](#).

Important:

You must change the `.com` to `.us` in the URL of each endpoint. For example, you must change `https://graph.microsoft.com/v1.0/reports` to `https://graph.microsoft.us/v1.0/reports`.

- b. Select **Save**.

- c. Update the OAuth entity scope for the **GET PowerBI Usage** endpoint.
The OAuth entity scope specifies the level of access that users have to your protected resources.

- i. Select the **GET PowerBI Usage** endpoint.

The HTTP Method record opens.

- ii. In the Authentication section of the HTTP Method record, select the Preview this record icon (i) next to the **OAuth profile** field.

- iii. On the record preview, select **Open Record**.

The OAuth Entity Profile record opens.

- iv. In the OAuth Entity Profile Scopes list, update the **OAuth scope** field of the **PowerBIPermissions** OAuth entity scope with the backend API URL that you're using for Microsoft Power BI.

Note:

Microsoft supports various backend API URLs for Power BI. For more information on the available URLs, see [Power BI for US Government](#).

- v. Select **Update**.

The OAuth Entity Profile record closes and you automatically return to the REST Message record.

6. Update the OAuth application endpoint on your Microsoft 365 integration profile.
The OAuth application endpoint enables your ServiceNow instance to access your Microsoft 365 subscription data.

- a. In the Authentication section of the REST Message record, select the Preview this record icon (i) next to the **OAuth profile** field.

- b. On the record preview, select **Open Record**.

The OAuth Entity Profile record opens.

- c. In the OAuth Entity Profile Scopes list, change the . com to . us in the URL that is listed in the **OAuth scope** field of the **Permissions** OAuth entity scope.
- d. Select the Preview this record icon (🔍) next to the **OAuth provider** field.
- e. On the record preview, select **Open Record**.
The Application Registries record opens.
- f. Select the Edit URL icon (🔗) next to the **Token URL** field.
- g. In the URL, change the . com to . us.
For example, change `https://login.microsoftonline.com` to `https://login.microsoftonline.us`.
- h. Select the Lock URL icon (🔒).
- i. Select **Update**.

What to do next

Revalidate the connection and credential details of this integration. For more information, see [Create a Microsoft 365 integration profile](#).

Scheduled jobs for Microsoft 365

Your Microsoft 365 integration profile is set to fetch subscription and usage information automatically from the Microsoft 365 Admin Center on a schedule. If needed, you can also manually run the following scheduled jobs to get this information. Each job must be complete before starting the next one.

Sequence	Scheduled job	Run frequency	Description
1	SAM - Import M365 User Subscriptions	Weekly	Imports user subscriptions data for each Microsoft 365 product into the Software Subscription [samp_sw_subscription] table.
2	SAM - Collect Microsoft 365 Usage	Daily	Collects usage data for each Microsoft 365 product in the Software Usages [samp_sw_usage] table.
3	SAM - Create New Reclamation Candidates for Office 365 Integration	Weekly	Generates removal candidates for Microsoft 365 and Office 365.
4	SAM - Microsoft 365 Daily Job	Daily	Populates charts based on the data available in the subscription table and

Sequence	Scheduled job	Run frequency	Description
			reclamation candidate table.

[Integrating with Microsoft 365](#)

Creating Microsoft 365 From SA and Add-on entitlements

You can create entitlements to track and manage the From SA and Add-on licensing terms for your Microsoft 365 subscription software products and services.

For more information on Microsoft 365 From SA and Add-on USLs, see [Supported Microsoft 365 license types](#).

Create Microsoft 365 From SA and Add-on entitlements in Software Asset Management classic

Create a Microsoft 365 From SA or Add-on entitlement in the Software Asset Management classic application so that you can track and manage the From SA or Add-on licensing terms for your Microsoft 365 subscription software products and services.

Before you begin

Role required: sam_user or sam_admin

Procedure

1. Navigate to **All > Asset > Portfolios > Software Entitlement**.
2. Select **New**.
3. On the form, fill in the fields.
For a detailed description of each field, see [Software entitlement fields](#).

i Important:
To create a Microsoft 365 From SA or Add-on entitlement, set the **Software model** field to a Microsoft 365 software model and then set the **License type** field to either **From SA** or **Add-on**.

💡 Tip:
If you're using both Full and Add-on USLs for the same Microsoft 365 subscription software product or service, associate the corresponding entitlements with different software models to avoid licensing conflicts.

4. Select **Save**.
5. After the form reloads, select **Publish**.
The State of the entitlement changes from Build to In use, and the entitlement is ready to be used in the reconciliation process.
6. Assign the From SA or Add-on entitlement to the entitlement for the corresponding Microsoft software product or service that you want to transition from or add on to.

i Note:
You can assign a From SA or Add-on entitlement to multiple corresponding Microsoft entitlements.

Note:

By default, the software model for your From SA or Add-on entitlement includes the corresponding Microsoft software product or service as a suite component. If the product or service isn't already included as a suite component, you can include it manually. See [Create software models in Software Asset Management classic](#) for detailed instructions.

- a. Select the **Related Entitlements** tab.
- b. In the Related Entitlement column of the Related Entitlements list, double-click **Insert a new row**.
- c. When prompted, search for and select the corresponding Microsoft entitlement that you want to assign the From SA or Add-on entitlement to.

Important:

This entitlement must use either the Per User or Per Device license metric. In addition, it can't already be assigned with another entitlement or have any active allocations.

Note:

If a corresponding Microsoft entitlement isn't available for the given From SA or Add-on entitlement, you can create one.

- d. Select the Save (Enter) icon (✓).
- e. Double-click the corresponding field in the **Active rights** column of the Related Entitlements list.
- f. When prompted, enter the number of From SA or Add-on rights that you want to grant to the corresponding Microsoft entitlement.

Important:

- For From SA rights, you must enter the total number of rights that you purchased for the corresponding Microsoft entitlement. For example, if you purchased 100 rights for the corresponding Microsoft entitlement, you must grant 100 From SA rights to that entitlement.
- For Add-on rights, you can enter any number of rights equal to or less than the total number of rights that you purchased for the given Add-on entitlement.

- g. Select the Save (Enter) icon (✓).
- h. Select **Save** on the Software Entitlement form header.

The From SA or Add-on entitlement is assigned to the specified Microsoft entitlement.

[Software entitlement fields](#)

Create Microsoft 365 From SA and Add-on entitlements in the Software Asset Workspace

Create a Microsoft 365 From SA or Add-on entitlement in the Software Asset Workspace so that you can track and manage the From SA or Add-on licensing terms for your Microsoft 365 subscription software products and services.

Before you begin

Role required: sam_user or sam_admin

Procedure

1. Navigate to **Workspaces > Software Asset Workspace**.
2. Create a software entitlement.
 - From the Software asset overview, select **Create entitlement**.
 - From the License operations view, navigate to **Licensing > Software entitlements** and then select **Create entitlement**.
3. In the Create new entitlement dialog box, select the option to **Fill out the details in a standard form** and then select **Next**.
The dialog box closes and you're automatically redirected to the Create New Software Entitlement form.
4. On the form, fill in the fields.
For a detailed description of each field, see [Software entitlement fields](#).

i Important:

To create a Microsoft 365 From SA or Add-on entitlement, set the **Software model** field to a Microsoft 365 software model and then set the **License type** field to either **From SA** or **Add-on**.

💡 Tip:

If you're using both Full and Add-on USLs for the same Microsoft 365 subscription software product or service, associate the corresponding entitlements with different software models to avoid licensing conflicts.

5. Select **Save**.
The form closes and you're automatically redirected to the new software entitlement record.
6. On the software entitlement record, select **Publish**.
The State of the entitlement changes from Build to In use, and the entitlement is ready to be used in the reconciliation process.
7. Assign the From SA or Add-on entitlement to the entitlement for the corresponding Microsoft software product or service that you want to transition from or add on to.

i Note:

You can assign a From SA or Add-on entitlement to multiple corresponding Microsoft entitlements.

i Note:

By default, the software model for your From SA or Add-on entitlement includes the corresponding Microsoft software product or service as a suite component. If the product or service isn't already included as a suite component, you can include it manually. See [Create software models in workspace](#) for detailed instructions.

- a. On the **Related Entitlements** tab of the software entitlement record, select **New**.
- b. On the form, fill in the fields.

Create New Related Entitlement

Field	Description
Domain	Domain that the corresponding Microsoft entitlement applies to. The default value is global .
Software entitlement	From SA or Add-on entitlement that you want to assign to the corresponding Microsoft entitlement. This field populates automatically.
Related Entitlement	<p>Corresponding Microsoft entitlement that you want to assign the From SA or Add-on entitlement to.</p> <div style="background-color: #e0f2f1; padding: 10px;"> <p>Important: This entitlement must use either the Per User or Per Device license metric. In addition, it can't already be assigned with another entitlement or have any active allocations.</p> <p>Note: If a corresponding Microsoft entitlement isn't available for the given From SA or Add-on entitlement, you can create one. See Create entitlements in workspace for detailed instructions.</p> </div>
Active rights	<p>Number of From SA or Add-on rights that you want to grant to the corresponding Microsoft entitlement.</p> <div style="background-color: #e0f2f1; padding: 10px;"> <p>Important:</p> <ul style="list-style-type: none"> ▪ For From SA rights, you must enter the total number of rights that you purchased for the corresponding Microsoft entitlement. For example, if you purchased 100 rights for the corresponding Microsoft entitlement, you must grant 100 From SA rights to that entitlement. ▪ For Add-on rights, you can enter any number of rights equal to or less than the total number of rights that you purchased for the given Add-on entitlement. </div>

c. Select **Save**.

The From SA or Add-on entitlement is assigned to the specified Microsoft entitlement.

Creating reserve entitlements for Microsoft online services

You can create reserve entitlements for Microsoft online services to add licenses to your existing Microsoft 365 subscriptions. You can pay for the new licenses during your true-up process.

Overview of license reservation

A license reservation enables you to place a license reservation order for migrating on-premises assets to the cloud without requiring a purchase order. Only Microsoft online services are eligible for license reservation orders.

Note:

You can create a reserve entitlement only from an existing Microsoft entitlement. The existing entitlement must meet the following criteria:

- **License type** is Subscription.
- **Metric group** is Microsoft.
- **License Metric** is User Subscription.
- **Publisher** is Microsoft for the product on the software model.
- **Subscription software** is selected for the product on the software model.

Create a reserve entitlement for Microsoft online services in Software Asset Management classic

Create a reserve entitlement for all Microsoft online services in the Software Asset Management classic application so that you can add licenses to an existing Microsoft 365 subscription.

Before you begin

Role required: sam_user or sam_admin

Procedure

1. Navigate to **All > Asset > Portfolios > Software Entitlement** and then select a Microsoft Office 365 entitlement.
2. Select the **Create Reserve Entitlement** related link.
3. On the form, fill in the fields.

Field	Description
Start date	Start date for the new licenses.
End date	The earliest anniversary of the source entitlement end date. This field is calculated automatically.
Purchased rights	Number of new licenses.
Monthly unit cost	Unit cost of the source entitlement divided by the duration of the source entitlement (in months). This field is calculated automatically.
Software model	Software model for the existing entitlement. This field populates automatically.
Source entitlement	Existing entitlement used to create the reserve entitlement. This field populates automatically.

4. Select Submit.

The new reserve entitlement is added to the **Reserve Entitlements** related list in the source entitlement. The state of the reserve entitlement is In use and the **Reserve entitlement** check box is selected.

What to do next

Run a reconciliation to include the new reserve entitlement in the true-up cost calculation.

Navigate to **Software Asset > Office 365 & Adobe Cloud** to view the [Office 365 & Adobe Cloud dashboard](#). The cost of the reserve entitlement is included in True-up Cost and is not included in Current Subscription Spend.

When you pass the end date of the reserve entitlement, the SAM - Subscription Maintenance scheduled job creates a new entitlement to replace it.

Note:

The new entitlement is not added to the Reserve Entitlements related list in the original source entitlement.

New entitlement record

Field	Value
Reserve entitlement	Option that indicates whether the new entitlement is a reserve entitlement. This option is not selected.
Start date	Date that the new entitlement is created.
End date	End date of the original source entitlement.
Source entitlement	Original source entitlement.
Purchased rights	Same number of purchased rights as the reserve entitlement.
Active rights	Same number of active rights as the reserve entitlement.
Allocations available	Same number of allocations available as the reserve entitlement.
State	State of the entitlement. This field is set to In use .

The state of the reserve entitlement updates to **Retired**. On the Office 365 & Adobe Cloud dashboard, the cost of the retired reserve entitlement is removed from the True-up Cost. The cost of the new entitlement is included in Current Subscription Spend.

Create a reserve entitlement for Microsoft online services in the Software Asset Workspace

Create a reserve entitlement for Microsoft online services in the Software Asset Workspace so that you can add licenses to an existing Microsoft 365 subscription.

Before you begin

To create reserve entitlements for Microsoft online services in the Software Asset Workspace, you must request and activate the Software Asset Workspace (com.sn_sam_workspace) plugin. For details on requesting and activating the Software Asset Workspace (com.sn_sam_workspace) plugin, see [Request Software Asset Management](#).

Role required: sam_user or sam_admin

Procedure

1. From your ServiceNow instance, navigate to **Software Asset > Software Asset Workspace**. The Software Asset Workspace launches in a new tab.
2. From the left navigation menu of the Software Asset Workspace, select **License operations**. The License operations view opens.
3. From the left navigation menu of the License operations view, navigate to **Licensing > Software entitlements**.
4. From the list of available software entitlements, select a Microsoft Office 365 entitlement. The software entitlement details page opens in a new tab.
5. Select **Create Reserve Entitlement**.

6. On the form, fill in the fields.

Reserve Entitlement Record Producer form

Field	Description
Start date	Start date for the new licenses.
End date	The earliest anniversary of the source entitlement end date. This field is calculated automatically.
Purchased rights	Number of new licenses.
Monthly unit cost	Unit cost of the source entitlement divided by the duration of the source entitlement (in months). This field is calculated automatically.
Software model	Software model for the existing entitlement. This field populates automatically.
Source entitlement	Existing entitlement that is used to create the reserve entitlement. This field populates automatically.

7. Select **Submit**.

8. After your request is successfully submitted, select **Close**.

The new reserve entitlement is added to the **Reserve Entitlements** related list in the source entitlement. The state of the reserve entitlement is In use and the **Reserve entitlement** check box is selected.

What to do next

Run a reconciliation to include the new reserve entitlement in the true-up cost calculation. View your reconciliation results in the [Microsoft publisher overview](#). The cost of the reserve entitlement is included in the **True-up cost** report.

When you pass the end date of the reserve entitlement, the SAM - Subscription Maintenance scheduled job creates a new entitlement to replace it.

Note:

The new entitlement isn't added to the **Reserve Entitlements** related list in the original source entitlement.

New entitlement record

Field	Value
Reserve entitlement	Option that indicates whether the new entitlement is a reserve entitlement. This option isn't selected.
Start date	The date that the new entitlement is created.
End date	End date of the original source entitlement.
Source entitlement	Original source entitlement.
Purchased rights	Same number of purchased rights as the reserve entitlement.
Active rights	Same number of active rights as the reserve entitlement.

New entitlement record (continued)

Field	Value
Allocations available	The same number of allocations available as the reserve entitlement.
State	State of the entitlement. This field is set to In use .

The state of the reserve entitlement updates to **Retired**. On the Microsoft publisher overview, the cost of the retired reserve entitlement is removed from the **True-up cost** report. The cost of the new entitlement is included in the Current Subscription Spend.

Automated license removal for Microsoft 365

Software Asset Management optimizes Microsoft 365 subscription usage by identifying low usage and overlapping candidates, and then automatically removing the licenses from the Microsoft 365 admin center. This proactive management helps you streamline costs and enhance the efficiency of low usage and overlapping licenses.

Eligible candidates

After a reclamation candidate is generated, the following low usage and overlapping candidates are considered eligible for automated removal:

- Low usage candidates with individual subscriptions such as Microsoft Teams, Microsoft SharePoint, or other single services.
- Low usage candidates with subscription suites including Microsoft 365 and Microsoft Office 365.

Note:

However, due to the varied usage across different products within these suites, users are notified, and the final removal requires approval from the SAM Manager. The **Notify User** check box is selected by default in the reclamation rule. But you can clear the check box to skip the approval process.

- Overlapping candidates with any subscription type.

Prerequisites

Before initiating the automatic removal of licenses from the Microsoft 365 admin center, confirm that the following prerequisites are met:

- The following spoke is set up and plugins are installed:
 - Microsoft Entra ID Spoke
 - Software Asset Management Professional (com.snc.samp)
 - Software Asset Management - SaaS License Management (sn_sam_saas_int)
- Microsoft Entra ID is configured with the following permissions to access and manage user and group information:
 - **User.Read.All**
 - **GroupMember.ReadWrite.All**
 - **LicenseAssignment.ReadWrite.All**

Scenarios

Software Asset Management removes the Microsoft 365 licenses from the Microsoft 365 admin center in the following scenarios:

- When a license is directly assigned to a user, the license is removed.
- When a license is directly assigned to a user and also through one or more groups, the user is removed from the group and the direct license assigned to the user is removed.

Note:

When multiple licenses are assigned to a user through a group, the user isn't removed from the group. If a user in a group with multiple licenses shows low usage and is subsequently removed, they may lose access to other important licenses. You must contact your Microsoft 365 Admin to address this issue. For more information, see [Manage licensing in Microsoft Entra ID](#).

- When a license is directly assigned to a user and also through multiple groups having the same and only one license, the user is removed from all the groups and the direct license assigned to the user is removed.

Note:

When multiple licenses are assigned to a user through different groups, the user isn't removed from any groups.

- When Software Asset Management removes the Microsoft 365 licenses from the Microsoft 365 admin center successfully, the reclamation workflow closes automatically.

Microsoft SQL Server licensing in container deployments

The Software Asset Management publisher pack for Microsoft supports licensing rules for Microsoft SQL Server products that are deployed across both on-premise and cloud environments using Docker containers.

Containers are executable software packages that bundle all the code and dependencies that are required for deploying and running a specific application. With a container, you can deploy and run the same application uniformly across any computing environment, such as a desktop computer or the cloud, without having to reconfigure the application. Each container also virtualizes an operating system (OS) so that you can quickly and easily deploy multiple isolated applications within the same computing environment.

The Software Asset Management application works in conjunction with the ServiceNow® Discovery application to identify the following information in both on-premise and cloud environments:

- The Docker containers through which your Microsoft SQL Server products are deployed.
- The corresponding Kubernetes clusters that enable each container to run.
- The OS of the underlying physical server that the container is running on.
- The Microsoft SQL Server version and edition that is deployed through each container.
- The number of virtual processor cores that are assigned to each container.

The Software Asset Management application uses the resulting data to create corresponding software installation records for each of your discovered containers. You can then reconcile these container-based software installations to track and optimize the license compliance of the Microsoft SQL Server products that are deployed through each container.

For more visibility into the Microsoft SQL Server products that are deployed through your Docker containers, view the [Licensable Software Products Deployed on Containers report](#).

For more information on Docker discovery, see [Docker virtualization](#) . For more information on Kubernetes discovery, see [Kubernetes discovery](#) .

Supported licensing models

The Microsoft publisher pack supports the following licensing models for Microsoft SQL Server products that are deployed through containers:

 **Note:**

For more information on each licensing model, refer to [Supported Microsoft license types](#).

Supported Microsoft SQL Server licensing models in container deployments

Licensing Model	Description
Per core	You must license each container as a standalone device. Licensing is based on the number of virtual CPUs (vCPUs) that are discovered on each container, with a minimum of four per core licenses per container.
Server/ CAL	<p>You must license each container using a server (per instance or per server) license. You must also license each user or device that is accessing the underlying physical server running these containers using a user or device CAL license.</p> <p>Server licenses enable you to license container-based software installations on your physical servers. To license only a certain number of installations on a physical server, use a server (per instance) license. To license all installations on a physical server, use a server (per server) license.</p> <p>CAL licenses are client access licenses that grant a set number of users or devices access to the underlying physical server on which your containers are running.</p> <ul style="list-style-type: none"> To grant a set number of users access to a physical server, regardless of how many devices those users are accessing the server through, use a user CAL license. To grant a set number of devices access to a physical server, regardless of how many users are accessing the server through those devices, use a device CAL license.

Licensable Software Products Deployed on Containers report

You can use the Licensable Software Products Deployed on Containers report to gain visibility into the software products that are deployed across both on-premise and cloud environments using Docker containers.

 **Note:**

To view this report, activate the Software Asset Management Professional plugin (com.snc.samp) and the [Discovery and Service Mapping Patterns](#)  application.

The Licensable Software Products Deployed on Containers report is available only in the Software Asset Workspace. To view this report, navigate to **All > Software Asset > Software**

Asset Workspace. From the Software Asset Workspace, navigate to **License usage > Reports > Licensable Software Products Deployed on Containers.**

Licensable Software Products Deployed on Containers report

Field	Description
Container Name	Docker container through which you are deploying a software product.
Environment	On-premise or cloud environment in which you are deploying a software product through the Docker container.
Container ID	Unique identifier for the Docker container.
Hosted On Server	Physical server on which the Docker container is running.
Kubernetes Cluster	Kubernetes cluster that enables the Docker container to run.
Virtual CPU	Number of virtual CPUs (vCPUs) that are assigned to the Docker container.
Software Installed	Software product that you are deploying through the Docker container.

Manage licenses for Microsoft Visual Studio

Manage your Visual Studio subscriptions with the Software Asset Management publisher pack for Microsoft. Verify license compliance and detect unlicensed installations. Reduce licensing costs by identifying subscriptions that are allocated but aren't being used.

Before you begin

Set up ServiceNow [Discovery](#) to find Microsoft software installations on your network. By using Discovery, you can view license compliance information by comparing your purchased licenses with actual installations.

You must set up the environment on the Configuration Management Database (CMDB) before you begin. Setting up of development, production, or test environment helps Software Asset Management Professional to apply licenses correctly. You should use the #Environment field# on the configuration item (CI).

Role required: sam_admin

About this task

Visual Studio subscriptions enable developers to download, install, configure, and use most Microsoft software products on any number of devices or virtual machines without having to purchase individual rights. Individual rights aren't required if the software is deployed only in development or test environments. Use the Microsoft Publisher Pack to manage Visual Studio licensing and reduce compliance risks.

To access the advantages of Visual Studio Standard subscriptions, you must maintain active Microsoft Software Assurance. These benefits enable you to use a range of Microsoft products, including SQL Server, Windows Server for development and testing purposes only.

First, set up software models and entitlements to track your Visual Studio subscriptions. Then, run reconciliation and view the License Workbench to manage license compliance.

Procedure

1. [Import software entitlements](#) for your Visual Studio subscriptions.

i Important:

Fill in the **Publisher part number** column on the entitlement import template to automatically create software models for Visual Studio and all included software (suite components). You can look up publisher part numbers in the Software Product Definition table [samp_sw_product_definition]. If you fill in the **Publisher part number** field, **Publisher, Product, Version, Edition, Platform, and Language** aren't required because the publisher part number provides that information.

When the import is complete, software models and entitlements are automatically created for your Visual Studio subscriptions. The Visual Studio software models are automatically populated with Suite Components and Downgrade Rights.

You can also create software entitlements manually. For details, see [Create entitlements in workspace](#).

i Important:

You can view your software models in both the Software Asset Management classic application and the Software Asset Workspace.

2. Add product install conditions to your Visual Studio software models that apply across all software models including downgrades and editions.

Install conditions define where the software can be installed. For Visual Studio, installing the software anywhere that is not a development or test environment is a violation of the Microsoft license agreement. Install conditions are used during reconciliation. When you run reconciliation, any Microsoft software installed on production, disaster recovery, or other environments aren't covered by your Visual Studio licenses. These products are considered unlicensed installations unless they're covered by another Microsoft license.

For details on adding product install conditions, see [Create product install conditions](#).

You can add filter conditions to the Product install condition field to limit installations to your development or test environments. For example, you could use the conditions `Installed on contains dev` or `Installed on contains test`.

3. Add user allocations to your Visual Studio entitlements.

You can import user allocations using an import set and transform map. Import into the User Allocation [alm_entitlement_user] table. In the transform map, map the **Assigned to** field to the User table [sys_user]. Use the **Asset tag** field from the entitlement record to link the allocations to the correct entitlements. For the coalesced value, use a two-attribute coalesce on the entitlement and the user.

For more information, see [Import sets](#) [↗](#).

Additionally, you can change the inference percent of the Visual Studio software models. The inference percent specifies what percentage of the components must be installed for the suite. It can be 0% in most cases. Also, verify that the Visual Studio community edition is free. For more details on adding inference percent and product licensability at the edition level, see [Create software models in workspace](#).

What to do next

Run a reconciliation to view your Visual Studio license compliance. Reconciliation runs weekly or on demand. Reconciliation compares your purchased Visual Studio rights recorded in software entitlements with actual installations found by Discovery. To view reconciliation results in a

simplified workbench view, navigate to **Software Asset > Reconciliation > License Workbench**. For more information, see [Software reconciliation for compliance](#).

Cost-based licensing optimization for Microsoft

The cost-based licensing optimization for Microsoft helps you determine the most optimal way to license your Microsoft software products across hybrid infrastructures. With this optimization, you can automatically balance license compliance with cost effectiveness to maximize cost savings.

Note:

This licensing optimization is automatically included in the Software Asset Management Professional (com.snc.samp) plugin, meaning that you do not have to optimize and manage allocations for your Microsoft software rights manually. However, you can choose to manage your allocations manually if the recommended licensing optimizations do not follow your organization's licensing strategy. See [Allocation Management on ServiceNow SAM Pro](#) for more details on manual allocation management.

This licensing optimization is supported by the following Microsoft license types:

- Per core licenses for Microsoft SQL Server and Microsoft BizTalk Server
- Per core (with CAL) licenses for Microsoft Windows Server, Microsoft Core Infrastructure Server, and Microsoft System Center

See [Supported Microsoft license types](#) for more information on per core and per core (with CAL) licenses.

Licensing optimization benefits

This licensing optimization provides the following benefits:

- Helps you determine the cost savings that you have already achieved through your current software entitlement and infrastructure setup.
- Helps you determine if you can achieve further cost savings by following recommended licensing optimizations.
- Helps you gain insight into each of the recommended licensing optimizations so that you can understand the reasoning behind them and determine if you want to follow or ignore them.

Understanding your licensing optimizations

You can view and gain insight into your recommended licensing optimizations by using the following tables and views:

- To view in-depth details about each of your recommended licensing optimizations, including the recommended license type and recommend license consumption layer, use the Microsoft Core License Optimization Reports [samp_ms_optimization_report] table. See [View realized and potential cost-based licensing optimizations for Microsoft](#) for more details on this table.
- To view all recommended licensing optimizations for a specific Microsoft cluster, use the SAM Cluster 360° view. See [Understanding your cluster infrastructure](#) for more information on this view.
- To view the potential cost savings that you can achieve through your recommended licensing optimizations, use the On-Premises potential savings by optimizing licenses report in the Optimization and savings dashboard of the Software Asset Workspace. See [Optimization and savings dashboard in workspace](#) for more information on the dashboard. See [Publisher optimizations for Microsoft](#) for more information on the report.

- To view the actual cost savings that you have already achieved through your current software entitlement and infrastructure setup, use the On-Premise optimization realized savings report in the Optimization and savings dashboard of the Software Asset Workspace. See [Optimization and savings dashboard in workspace](#) for more information on the dashboard. See [Publisher optimizations for Microsoft](#) for more information on the report.

Microsoft cost-based licensing optimization example

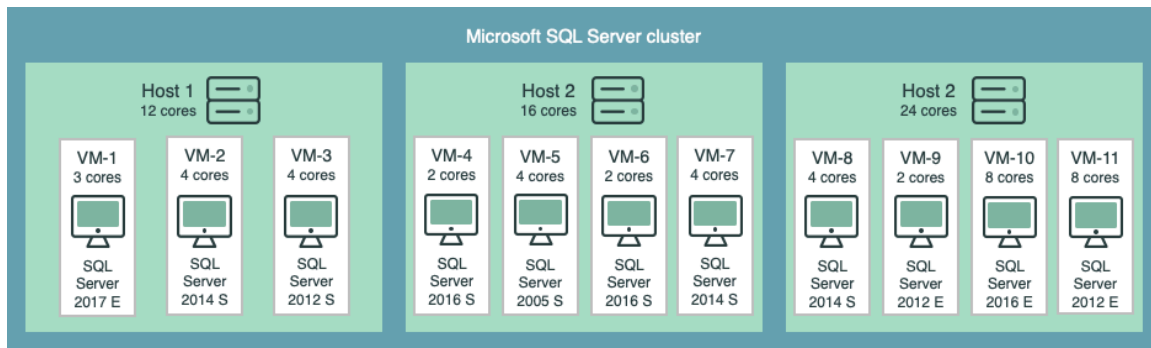

This example demonstrates how a software asset manager can optimize Microsoft SQL Server licensing in a cluster deployment.

In this example, a software asset manager is managing the following Microsoft SQL Server entitlements:

Microsoft SQL Server entitlements

Entitlement Name	License Type	Number of Purchased Rights	Cost Per Core
SQL Server Enterprise Licenses	SQL Server 2019 Enterprise Core with Software Assurance	1800	\$5000
SQL Server Standard Licenses	SQL Server 2019 Standard Core with Software Assurance	600	\$1300

The following infrastructure is a VMware cluster that consists of three physical hosts. Each physical host contains virtual machines (VMs) that are running various versions and editions of Microsoft SQL Server. These VMs may potentially be moving across all physical hosts within the cluster.

Based on the available entitlements and the cluster infrastructure, the software asset manager can license the cluster using one of the following options:

Licensing options

Option Number	License Type	Licensing Layer	Number of Rights Required on Each Host or VM	Total Number of Required Rights	Total Approximated Cost
1	SQL Server 2019 Enterprise Core with Software Assurance	Physical host layer	<ul style="list-style-type: none"> • Host 1: 12 rights • Host 2: 16 rights • Host 3: 24 rights 	12 rights (Host 1) + 16 rights (Host 2) + 24 rights (Host 3) = 52 rights total	52 rights X \$5000 = \$260,000
2	SQL Server 2019 Enterprise Core with Software Assurance	Virtual layer	<ul style="list-style-type: none"> • VM-1: 4 rights • VM-2: 4 rights • VM-3: 4 rights • VM-4: 4 rights • VM-5: 4 rights • VM-6: 4 rights • VM-7: 4 rights • VM-8: 4 rights • VM-9: 4 rights • VM-10: 8 rights • VM-11: 8 rights 	4 rights (VM-1) + 4 rights (VM-2) + 4 rights (VM-3) + 4 rights (VM-4) + 4 rights (VM-5) + 4 rights (VM-6) + 4 rights (VM-7) + 4 rights (VM-8) + 4 rights (VM-9) + 8 rights (VM-10) + 8 rights (VM-11) = 52 rights total	52 rights X \$5000 = \$260,000
3	Both SQL Server 2019 Enterprise Core with Software Assurance and SQL Server 2019 Standard Core	Virtual layer	<ul style="list-style-type: none"> • SQL Server 2019 Enterprise Core with Software Assurance: 	<ul style="list-style-type: none"> • SQL Server 2019 Enterprise Core with Software Assurance: 4 rights (VM-1) + 4 rights (VM-9) + 8 rights (VM-10) + 8 rights (VM-11) = 24 rights total 	(24 rights X \$5000) + (28 rights X \$1300) = \$156,400

Licensing options (continued)

Option Number	License Type	Licensing Layer	Number of Rights Required on Each Host or VM	Total Number of Required Rights	Total Approximated Cost
	with Software Assurance		<ul style="list-style-type: none"> ○ VM-1: 4 rights ○ VM-9: 4 rights ○ VM-10: 8 rights ○ VM-11: 8 rights • SQL Server 2019 Standard Core with Software Assurance: <ul style="list-style-type: none"> ○ VM-2: 4 rights ○ VM-3: 4 rights ○ VM-4: 4 rights ○ VM-5: 4 rights ○ VM-6: 4 rights ○ VM-7: 4 rights ○ VM-8: 4 rights 	<ul style="list-style-type: none"> • SQL Server 2019 Standard Core with Software Assurance: 4 rights (VM-2) + 4 rights (VM-3) + 4 rights (VM-4) + 4 rights (VM-5) + 4 rights (VM-6) + 4 rights (VM-7) + 4 rights (VM-8) = 28 rights total 	

The software asset manager determines that option number 3 is the most cost-effective licensing solution for the cluster. By using this licensing option, the software asset manager can achieve a total cost savings of approximately \$103,600.

View realized and potential cost-based licensing optimizations for Microsoft

View the realized and potential cost-based licensing optimizations for your Microsoft software products. Gain an in-depth understanding of each licensing optimization so that you can maximize cost savings across your Microsoft deployments.

Before you begin

Role required: sam_admin

About this task

The Software Asset Management publisher pack for Microsoft supports cost-based licensing optimizations for Microsoft. These licensing optimizations enable you to determine the most cost-effective licensing solutions for your Microsoft software products across hybrid infrastructures.

You can view in-depth details about your realized and potential licensing optimizations in the Microsoft Core License Optimization Reports [samp_ms_optimization_report] table. This table can help you

- gain insight into the licensing optimizations that have already been implemented across your Microsoft deployments,
- gain insight into the recommended licensing optimizations that can potentially bring you additional savings,
- better understand your Microsoft license consumption,
- determine the cost savings that you have achieved by using the Software Asset Management application to track and manage your Microsoft licenses,
- and download optimization reports that you can share with other users in your organization.

For more information on cost-based licensing optimizations, see [Cost-based licensing optimization for Microsoft](#).

Procedure

1. On the page header of your ServiceNow instance, select **All**.
2. In the menu navigation filter, enter `samp_ms_optimization_report_list.do`.
The Microsoft Core License Optimization Reports [samp_ms_optimization_report] table opens.
3. View your realized and potential cost-based licensing optimizations for Microsoft.

The Microsoft Core License Optimization Reports [samp_ms_optimization_report] table provides detailed information about each realized and potential licensing optimization, including the recommended license type, the recommend license consumption layer, and the potential and realized cost savings. For a detailed description of each field in this table, see [Microsoft Core License Optimization Reports fields](#).

Optimizing Microsoft SQL Server database and component license consumption

You can optimize the license consumption for your Microsoft SQL Server databases and components based on the component editions that are identified through ITOM Discovery.

Note:

To identify the editions of your Microsoft SQL Server components through ITOM Discovery, you must request and install version 1.7.0 or later of the Discovery and Service Mapping Patterns application from the [ServiceNow Store](#).

Note:

Both Microsoft SQL Server databases and components consume licenses against the associated Microsoft SQL Server edition. For Microsoft SQL Server components, the ServiceNow® Content Service team automatically associates each component with an appropriate Microsoft SQL Server edition based on the edition of the component. By optimizing the license consumption for your databases and components, you are optimizing licensing for Microsoft SQL Server and its component editions.

ITOM Discovery locates and identifies the Microsoft SQL Server databases and components across your deployment. When it locates and identifies your Microsoft SQL Server components, it also identifies the edition of each component. The Software Asset Management application

then creates a software installation record for each of your components based on the identified component edition. The Software Asset Management application also create a software installation record for each of your Microsoft SQL Server databases. You can use these software installation records to reconcile your components and databases based on both the associated Microsoft SQL Server edition and the following Microsoft SQL Server licensing rules:

- If your Microsoft SQL Server database and components are deployed on the same device, only one license must be consumed on the device.
- If your Microsoft SQL Server database and components are deployed on different devices, separate licenses must be consumed on each device.

For more information on Microsoft SQL Server component edition discovery, see [MSSQL server discovery](#).

Reconciling Microsoft SQL Server components based on the discovered component editions

You can reconcile Microsoft SQL Server components based on the discovered component editions so that licenses are optimally consumed against the appropriate Microsoft SQL Server editions.

When you create software models for your various Microsoft SQL Server editions, such as Microsoft SQL Server Standard or Enterprise edition, your Microsoft SQL Server components are automatically associated with an appropriate model based on mappings that are provided by the ServiceNow® Content Service team. Mappings between your Microsoft SQL Server software models and components are based on the edition of each component. The Content Service team provides these mappings through predefined discovery maps (DMAPs) in the software library, which is a centralized repository of software content that you can use to normalize your discovered data. Each DMAP associates a software model with relevant software content, such as software model suite relationships and software product lifecycles. For more information on the Content Service and software library, see [Software Asset Management Content Service](#).

The Software Asset Management application considers software model suites during reconciliation so that you can accurately count your software rights and optimize your licenses, as child components are licensed against the parent software model and not the component itself. Reconciliation runs automatically as a scheduled job. However, you can also run reconciliation on-demand between scheduled jobs. For more information on software model suites, see [Software Asset Management software suites](#). For instructions on how to run reconciliation manually through the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#). For instructions on how to run reconciliation manually through the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Importing Microsoft entitlements from a Microsoft License Statement (MLS)

You can import entitlements from an MLS to automatically define the license details and license agreements that are matched to your Microsoft software models.

An MLS is a report that contains a comprehensive inventory of licensing information for each of your Microsoft products. This report provides an in-depth look into your company's entire license transaction history, which you can use to better forecast your Microsoft licensing needs.

Each MLS contains the following information:

- **Organization Summary:** Scope of the MLS, including the MLS type and the organizations that are associated with the MLS.
- **License Summary:** Summary of the licenses that you are entitled to use.
- **Transaction Summary:** Detailed transaction information for each license.

- **License Agreement:** License agreements that are associated with each license.
- **Transaction Data:** Additional transaction information for each license.
- **Frequently Asked Questions and Glossary:** Answers to frequently asked questions and definitions for common Microsoft terminology.
- **Pivot Data:** Data that you can use to generate a license position for Microsoft.

When you import licensing information from an MLS, Software Asset Management automatically creates entitlements and license agreements using data from only the **Transaction Data** tab of the MLS.

Import Microsoft entitlements from a Microsoft License Statement (MLS) in Software Asset Management classic

Import entitlements from an MLS using the Software Asset Management classic application.

Before you begin

Before you can import entitlements from an MLS, you must request the MLS from Microsoft. Microsoft provides the MLS as an Excel file.

Role required: sam_user or sam_admin

Procedure

1. On the page header of your ServiceNow® instance, select **All**.
2. In the menu navigation filter, enter `samp_bulk_import_list.do`.
The Entitlement Imports [samp_bulk_import] table opens.
3. Select **New**.
4. On the Entitlement Import form, fill in the fields.

Entitlement Import form

Field	Description
Import type	Type of document that you are importing software entitlements from. The options are Standard import document and Microsoft license statement (MLS) . Set this field to Microsoft license statement (MLS) .
File	Spreadsheet of software entitlements that you want to import. Select Click to add... to search for and select the MLS Excel file that you requested from Microsoft.
Description	Brief description of the software entitlement import.
Automatic creation of contracts	Option to enable automatic creation of both parent and child contracts for the selected MLS. Refer to Contracts  for more information about contracts.
Import status	Status of the import. This field populates automatically.

5. Select **Import**.
A confirmation message appears, informing you that the import is in progress. You can select the link in the message to open the Entitlement import list in the Software Asset Workspace, which provides the status of your import and the complete list of entitlement imports.
6. After the import is complete, open the corresponding entitlement import record to view additional information about the import.

- a. From the Entitlement Imports [samp_bulk_import] table, select your MLS entitlement import.
- b. Use the following options to view additional information about the import:
 - To view additional information about the import status, refer to the following fields:

Import status fields

Field	Description
Import status	Status of the import.
Number of rows processed	Number of Excel rows that were processed during the import.
Number of rows successful	Number of Excel rows that imported successfully.
Number of rows with errors	Number of Excel rows that imported with errors.
Number of entitlements in build state	Number of imported Microsoft Software Assurance (SA), Step-up, From SA, or Add-on entitlements that are in the build state and can be linked to a base entitlement.

- To view the complete list of imported entitlements, select the **Entitlements** related list.
- If you enabled the **Automatic creation of contracts** option in [step 4](#), view the list of automatically created contracts by selecting the **Contracts** related list.

Note:

These contracts are automatically linked to successfully imported entitlements.

- To view the list of imported Microsoft SA, Step-up, From SA, or Add-on entitlements that are in the build state and can be linked to base entitlements, select the **Entitlements in build state** related list.

See [step 7](#) for more information on how to assign a Microsoft SA, Step-up, From SA, or Add-on entitlement to a base entitlement.

- 7. If your entitlement import contains any Microsoft SA, Step-up, From SA, or Add-on entitlements, assign those entitlements to base entitlements.

Note:

You can assign a From SA or Add-on entitlement to multiple base entitlements.

- a. On the Entitlement Import record, select the **Entitlements in build state** related list.
- b. From the list of available Microsoft SA, Step-up, From SA, or Add-on entitlements, select the entitlement that you want to assign to a base entitlement.
- c. On the corresponding Software Entitlement form, select **Publish**.
- d. After the form reloads, select the **Related Entitlements** tab.

- e. In the **Related Entitlement** column of the Related Entitlements list, double-click **Insert a new row**.
- f. When prompted, search for and select the base entitlement that you want to assign the Microsoft SA, Step-up, From SA, or Add-on entitlement to.

i Important:

The base entitlement for a From SA or Add-on entitlement must use either the Per User or Per Device license metric. In addition, it cannot already be assigned with another entitlement or have any active allocations.

j Note:

If an appropriate base entitlement is not available for the given Microsoft SA, Step-up, From SA, or Add-on entitlement, you can create one.

- g. Select the Save (Enter) icon (✓).
- h. Double-click the corresponding field in the **Active rights** column of the Related Entitlements list.
- i. When prompted, enter the number of Microsoft SA, Step-up, From SA, or Add-on rights that you want to grant to the base entitlement.

k Important:

For From SA rights, you must enter the total number of rights that you purchased for the base entitlement. For example, if you purchased 100 rights for the base entitlement, you must grant 100 From SA rights to that entitlement. For Add-on rights, you can enter any number of rights equal to or less than the total number of rights that you purchased for the given Add-on entitlement.

- j. Select the Save (Enter) icon (✓).
- k. Select **Save** on the Software Entitlement form header.
The Microsoft SA, Step-up, From SA, or Add-on entitlement is assigned to the specified base entitlement.
- l. Return to the Entitlement Import record and repeat steps a to k for each import that you want to resolve.

8. If your entitlement import contains any errors, identify and resolve those errors.

- a. On the Entitlement Import record, select **Review import errors**.
The Entitlement Import Errors list opens.
- b. In the **Error status** field, select **Needs review** for the error that you want to resolve.
- c. Update the corresponding Entitlement Import Error form as needed to resolve the error.
For descriptions of the Entitlement Import Error form fields, see [Entitlement import error fields](#). For details about the actions that you can take on entitlement import errors, see [Entitlement import error actions](#).

d. Select **Import.**

The associated entitlements are re-imported without any errors, and you automatically return to the Entitlement Import form.

e. Repeat steps a-d for each error that you want to resolve.

Import Microsoft entitlements from a Microsoft License Statement (MLS) in the Software Asset Workspace

Import entitlements from an MLS using the Software Asset Workspace.

Before you begin

Before you can import entitlements from an MLS, you must request the MLS from Microsoft. Microsoft provides the MLS as an Excel file.

Role required: sam_user or sam_admin

Procedure

- 1.** From your ServiceNow instance, navigate to **Software asset > Software Asset Workspace**.
The Software Asset Workspace launches in a new tab, displaying the Software asset overview.
- 2.** On the Software asset overview, select **Create entitlement**.
The Create new entitlement dialog box opens.
- 3.** In the dialog box, select **Import multiple entitlements from an Excel file** and then select **Next**.
The dialog box closes and then the Create New Entitlement Import form opens in a new tab.
- 4.** On the form, fill in the fields.

Create New Entitlement Import form

Field	Description
Import type	Type of document that you are importing entitlements from. Set this field to Microsoft license statement (MLS) .
File	File that you want to import entitlements from. Search for and select the MLS Excel file that you requested from Microsoft.
Description	Description of the entitlement import. This field populates automatically based on the file that you selected in the File field.
Automatic creation of contracts	Option to enable automatic creation of both parent and child contracts for the selected MLS. Refer to Contracts  for more information about contracts.
Import status	Status of the import. This field populates automatically.

5. Select **Import.**

A confirmation message appears, informing you that the import is in progress. You can select the link in the message to open the Entitlement import list, which provides the status of your import and the complete list of entitlement imports.

6. After the import is complete, open the corresponding entitlement import record to view additional information about the import.

- a.** From the Entitlement import view, select your MLS entitlement import.
The corresponding entitlement import record opens.

b. Use the following options to view additional information about the import:

- To view additional information about the import status, refer to the following fields on the **Details** tab:

Import status fields

Field	Description
Import status	Status of the import.
Number of rows processed	Number of Excel rows that were processed during the import.
Number of rows successful	Number of Excel rows that imported successfully.
Number of rows with errors	Number of Excel rows that imported with errors.
Number of entitlements in build state	Number of imported Microsoft Software Assurance (SA), Step-up, From SA, or Add-on entitlements that are in the build state and can be linked to a base entitlement. See step 7 for more information on how to assign a Microsoft SA, Step-up, From SA, or Add-on entitlement to a base entitlement.

- To view the complete list of imported entitlements, select the **Entitlements** tab.
- If you enabled the **Automatic creation of contracts** option in [step 4](#), view the complete list of automatically created contracts on the **Contracts** tab.

Note:

These contracts are automatically linked to successfully imported entitlements.

7. If your entitlement import contains any errors, identify and resolve those errors.

a. On the entitlement import record, select **Review import errors**.

The corresponding Review entitlement import errors view opens.

b. Use one or both of the following options to resolve your import errors:

- Resolve errors related to your imported entitlements.

i. Select the **Import errors** tab.

ii. In the **Error status** field, select **Needs review** for the error that you want to resolve.

The corresponding entitlement import error record opens in a new tab.

iii. Update the record as needed to resolve the error.

For descriptions of the entitlement import error fields, see [Entitlement import error fields](#). For details about the actions that you can take on entitlement import errors, see [Entitlement import error actions](#).

iv. Select **Import.**

The associated entitlements are re-imported without any errors.

v. Close the record to return to the Review entitlement import errors view.

vi. Repeat steps i-v for each error that you want to resolve.

- Resolve errors in which imported Microsoft SA, Step-up, From SA, or Add-on entitlements are not assigned to any base entitlements.

i Note:

You can assign a From SA or Add-on entitlement to multiple base entitlements.

i. Select the **Relate entitlements tab.**

ii. From the list of available Microsoft SA, Step-up, From SA, or Add-on entitlements, select the entitlement that you want to assign to a base entitlement.

iii. On the software entitlement record, select **Publish.**

iv. After the record reloads, select the **Related Entitlements tab and then select **New**.**

v. On the form, fill in the fields.

Create New Related Entitlement form

Field	Description
Domain	Domain that the base entitlement applies to. The default value is global .
Software Entitlement	Microsoft SA, Step-up, From SA, or Add-on entitlement that you want to assign to a base entitlement. This field populates automatically.
Related Entitlement	<p>Base entitlement that you want to assign your Microsoft SA, Step-up, From SA, or Add-on entitlement to.</p> <p>i Important: The base entitlement for a From SA or Add-on entitlement must use either the Per User or Per Device license metric. In addition, it cannot already be assigned with another entitlement or have any active allocations.</p> <p>i Note: If an appropriate base entitlement is not available for the given Microsoft SA, Step-up, From SA, or Add-on entitlement, you can create one.</p>
Active rights	<p>Number of Microsoft SA, Step-up, From SA, or Add-on rights that you want to grant to the base entitlement.</p> <p>i Important: For From SA rights, you must enter the total number of rights that you purchased for the base entitlement. For example, if you purchased 100 rights for the base entitlement, you must grant 100 From SA rights to that entitlement. For Add-on rights, you can enter any number of rights equal to or less than the total number of rights that you purchased for the given Add-on entitlement.</p>

- vi. Select **Save**.
- vii. Close the software entitlement record to return to the Review entitlement import errors view.
- viii. Repeat steps i-vii for each Microsoft SA, Step-up, From SA, or Add-on entitlement that you want to assign to a base entitlement.

Windows and SQL Server Infrastructure report

You can use the Windows and SQL Server Infrastructure report to gain visibility into the infrastructure details for all physical hosts and virtual machines (VMs) that are running Microsoft Windows Server or Microsoft SQL Server across your on-premise and public cloud environments, such as AWS and Microsoft Azure.

The Windows and SQL Server Infrastructure report is available in both the Software Asset Workspace and the Software Asset Management classic application.

To view this report in the Software Asset Workspace, navigate to **Workspaces > Software Asset Workspace**. From the Software Asset Workspace, navigate to **License usage > Reports > Windows and SQL Server Infrastructure**.

To view this report in the Software Asset Management classic application, navigate to **All > Reports > View/Run**. From the list of available reports, search for and select **Windows and SQL Server infrastructure details report**. When the corresponding Edit report page opens, select **Run**.

Windows and SQL Server infrastructure report

Field	Description
Deployment type	Type of deployment that the physical host or VM is running in. The options are On premise and Cloud .
Cloud provider	Cloud provider that Microsoft Windows Server or Microsoft SQL Server is deployed on. The options are AWS and Microsoft Azure . Note: This field is applicable for cloud deployments only.
vCenter	VMware vCenter Server that you are using to manage the physical host or VM in a virtual VMware vSphere environment. Note: This field is applicable only if you are using VMware virtualization technology.
Cluster	Cluster that the physical host or VM resides in.
Host	For physical hosts, this field identifies the host that Microsoft Windows Server or Microsoft SQL Server is installed on. For VMs, this field identifies the physical host that the VM is running on.
Host processor count	Number of CPUs that are assigned to the physical host.

Windows and SQL Server infrastructure report (continued)

Field	Description
Host core count	Number of cores within each CPU that is assigned to the physical host.
Virtualization technology	Virtualization technology that you are using to deploy and manage your physical hosts and VMs.
Virtual server	<p>VM on which you are running Microsoft Windows Server or Microsoft SQL Server.</p> <p>Note: If a VM resides in an on-premise cluster, it can migrate to any physical host within that cluster. Additionally, if you are using VM-Host affinity rules to specify the physical hosts on which a VM can run, the VM can migrate to any physical host that is specified in those rules. In these scenarios, the same VM can appear on the Windows and SQL Server Infrastructure report multiple times based on the physical hosts to which it can migrate.</p> <p>Note: This field is applicable for VMs only.</p>
Windows Server installation	<p>Microsoft Windows Server version that is installed on the physical host or VM.</p> <p>If multiple Microsoft Windows Server versions are installed on the same host or VM, this field displays all installed versions using a comma-separated list.</p>
SQL Server installation	<p>Microsoft SQL Server version that is installed on the physical host or VM.</p> <p>If multiple Microsoft SQL Server versions are installed on the same host or VM, this field displays all installed versions using a comma-separated list.</p>
VM processor count	<p>Number of virtual CPUs (vCPUs) that are assigned to the VM.</p> <p>Note: This field is applicable for VMs only.</p>
VM core count	<p>Number of virtual cores within each vCPU that is assigned to the VM.</p> <p>Note: This field is applicable for VMs only.</p>
VM CPU thread count	<p>Number of threads that divide each virtual core within the vCPUs that are assigned to the VM.</p> <p>Note: This field is applicable for VMs only.</p>
Cloud host type	<p>Type of cloud host that the VM is running on. The options are Shared and Dedicated.</p> <p>Note: This field is applicable for cloud deployments only.</p>

Windows and SQL Server infrastructure report (continued)

Field	Description
Cloud license type - Windows Server	<p>Cloud license type of the Microsoft Windows Server installation. The options are BYOL and License Included.</p> <p>Note: This field is applicable for cloud deployments only.</p>
Cloud license type - SQL Server	<p>Cloud license type of the Microsoft SQL Server installation. The options are BYOL and License Included.</p> <p>Note: This field is applicable for cloud deployments only.</p>

Microsoft dashboards in Software Asset Management classic

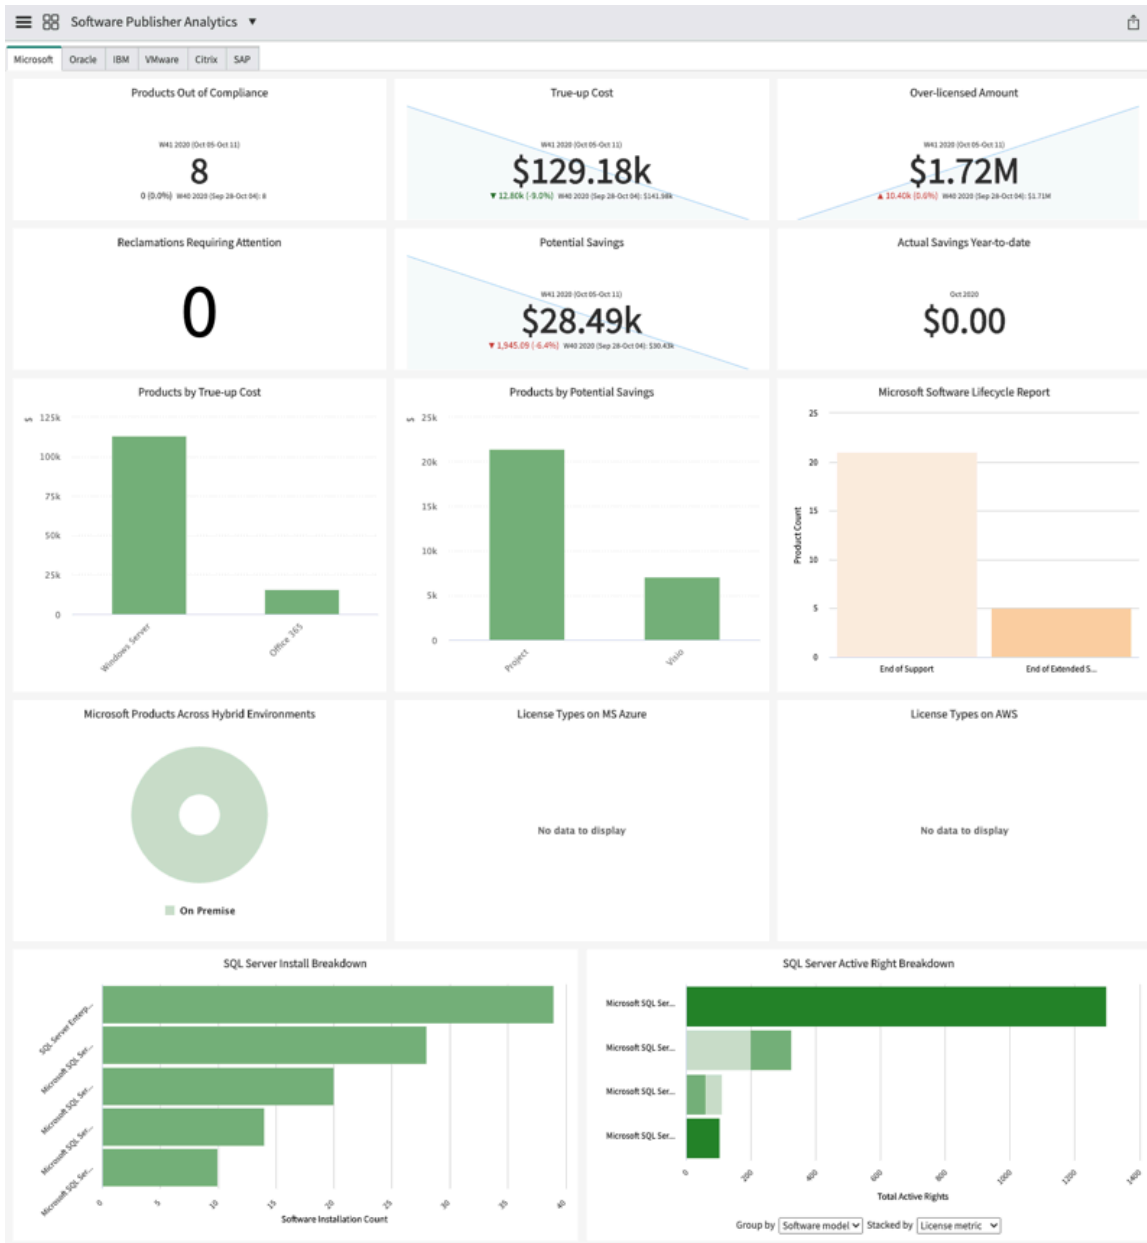

View installations, cost, and compliance for Microsoft software such as SQL Server in the Software Asset Management classic application. View subscription use, cost, and compliance for Microsoft 365.

Note:
The add-on Microsoft publisher pack (com.snc.samp.microsoft) plugin must be installed to view the dashboards.

Dashboards are updated whenever a new reconciliation result is available. You can save charts in PNG or JPG format.

Software Publisher Analytics dashboard for Microsoft

Access the Software Publisher Analytics dashboard for Microsoft by navigating to **Software Asset > Publisher Overview**.

Microsoft tab

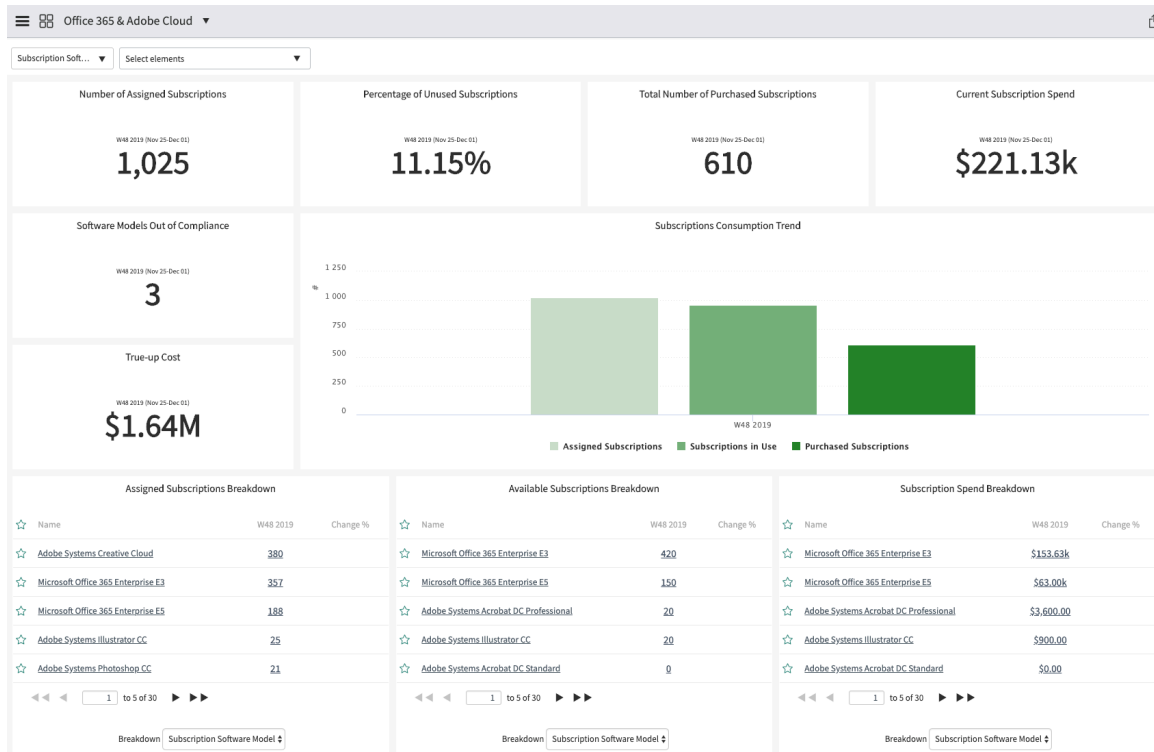

Report	Source list	Description
Products out of Compliance	Product Results	Number of products that have at least one software model out of compliance. Select the report to view the results in the License Workbench .
True-up Cost	Product Results	Cost to be compliant based on the average prices for entitlements for the rights.
Over-Licensed Amount	Product Results	Cost of licenses owned but not being used.

Microsoft tab (continued)

Report	Source list	Description
Reclamations Requiring Attention	Reclamation Candidates	State is Attention Required.
Potential Savings	Reclamation Candidates	Cost saved if removal candidates are reclaimed.
Actual Savings Year-to-date	Reclamation Candidates	Closed this Year and the State is set to Closed Complete.
Products by True-up Cost	Product Results	Greatest true-up costs by product.
Products by Potential Savings	Reclamation Candidates	Greatest potential savings by product.
Microsoft Software Lifecycle Report	Software Lifecycle Report	Number of products in each software lifecycle phase, including End of Extended Support, End of Life, and End of Support.
Microsoft Products Across Hybrid Environments	Software Installations	Distribution of Microsoft products across on-premise and cloud environments.
License Types on Microsoft Azure	Software Installations	License types used on Microsoft Azure.
License Types on AWS	Software Installations	License types used on AWS.
SQL Server Install Breakdown	Software Installations	Total software installations per SQL Server.
SQL Server Active Right Breakdown	Software Entitlements	Number of total active rights per SQL Server.

Office 365 & Adobe Cloud dashboard

Only Microsoft 365 software products that are recognized as subscription software are shown. [Microsoft Office 365 integration](#) must be set up to view compliance information.

Report	Source list	Description
Number of Assigned Subscriptions	Software Subscriptions	Aggregate sum of the number of subscriptions that are used (for example, user accounts active).
Percentage of Unused Subscriptions	Software Subscriptions	Ratio of rights available to rights owned.
Total Number of Purchased Subscriptions	License Metric Results	Total number of rights owned.
Current Subscription Spend	License Metric Results	Aggregate sum of the total cost for subscription rights.
Software Models Out of Compliance	Software Model Results	Number of software models out of compliance. Select the report view the results in the License Workbench .
True-up cost	Software Model Results	Sum of true-up costs on the latest software model results.
Subscriptions Consumption Trend	Software Subscriptions License Metric Results	Trend assigned, active, and available subscriptions.
Assigned Subscription Breakdown	Software Subscriptions	Breakdown of assigned subscriptions by software model.

Report	Source list	Description
Available Subscription Breakdown	License Metric Results	Breakdown of total active rights by software model.
Subscription Spend Breakdown	License Metric Results	Breakdown of subscription total cost by product/version/edition (software model).

Publisher overview for Microsoft in the Software Asset Workspace

View license usage information related to Microsoft in the publisher overview for Microsoft in the Software Asset Workspace.

From the Software Asset Workspace, access the Microsoft publisher overview by navigating to **License usage > Publishers** and then selecting **Microsoft** from the list of available software publishers.

Results are updated whenever a new reconciliation result is available.

You can view a summary of your license usage information in the Summary section of the Microsoft publisher overview.

Microsoft Summary

Report	Description
True-up cost	Cost to be compliant based on the average price of rights in your Microsoft software entitlements.
Potential savings	Potential cost savings for your Microsoft licenses.
Actual savings	Actual cost savings for your Microsoft licenses.
Unlicensed entities	Summary of your unlicensed entities. This summary includes the following information:

Microsoft Summary (continued)

Report	Description
	<ul style="list-style-type: none"> • Unlicensed installs: Total number of unlicensed Microsoft software installations. Select the number to view the complete list of unlicensed Microsoft software installations. • Installs requiring action: Total number of Microsoft software installations that you must take action on. Select the number to view the complete list of these Microsoft software installations. • Unlicensed subscriptions: Total number of unlicensed Microsoft subscriptions. Select the number to view the complete list of unlicensed Microsoft subscriptions. • Unlicensed client access: Total number of unlicensed Microsoft client access records. Select the number to view the complete list of unlicensed Microsoft client access records.
Progress indicators	<p>Summary of your license compliance progress.</p> <p>This summary includes the following indicators:</p> <ul style="list-style-type: none"> • Ignored installs: Total number of Microsoft software installations that were ignored during reclamation. Select the number to view the complete list of ignored Microsoft software installations. • Removal candidates: Total number of Microsoft removal candidates. Select the number to view the list of all software removal candidates.

For more details on the license usage information that is provided in the publisher overview, see [License usage publisher fields in workspace](#).

Supported Microsoft license types

The Software Asset Management publisher pack for Microsoft adds license metrics that are specific to Microsoft.

The license metrics are available when Microsoft is selected as the **Metric group** for the entitlement.

Note:

For details on the license metrics that are supported by each Microsoft product, see [License metrics for Microsoft products](#).

Per user licenses

A per user license is used when each user accessing the software is licensed, regardless of the number of devices they use to access the software.

To define the number of installations a user has, select the **Maximum installs per right** on the Metric Attribute related list of the associated software model. If the user exceeds the number of installations you've defined, additional rights are consumed until the user is fully licensed, or there are no more rights available.

You can manage user allocations for the per user license metric. Users are assigned a quantity of rights. Even if they don't need all of the allocations, the user will consume the number of rights you've allocated to them. If a user isn't assigned to a device, a right will be consumed for each unique device with a software installation.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, a right is consumed for each unique user that has at least one installation of the software on any device assigned to them.

When a software model has downgrade or upgrade rights to another versions of a software product, rights are assigned to users with the specified versions of software installed after the primary version of the software has been fully licensed.

Per device licenses

A per device license is used when each device accessing the software is licensed, regardless of the number of users accessing the software.

To define the number of installations a device can have, select the **Maximum installs per right** on the Metric Attribute related list of the associated software model. If the device exceeds the number of installations you've defined, additional rights are consumed until the device is fully licensed, or there are no more rights available.

You can manage device allocations for the per device license metric. Devices are assigned a quantity of rights. Even if they don't need all of the allocations, the device will consume the number of rights you've allocated to them.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, a right is consumed for each unique device that has at least one installation of the software.

When a software model has downgrade or upgrade rights to another versions of a software product, rights are assigned to users with the specified versions of software installed after the primary version of the software has been fully licensed.

Per core licenses

A server processor is one of the main components of a server. Each server processor contains smaller processing units called cores and the number of cores your processor has is dependent on your system hardware.

System hardware runs in an operating system environment (OSE) and they act as middleware between the operating system and the software applications on your system. OSEs can be either physical or virtual. Depending on the OSE you have, your processor will be physical, virtual, or a combination of both.

Regardless of whether your processor is in a physical or virtual OSE, Microsoft requires that every processor core running SQL Server, Windows Server, or any of their components must be licensed. However, the number of core licenses you need will depend on whether you are licensing a physical server or an individual virtual OSE. The number of licenses you need is based on the core factor table provided by Microsoft.

Note:

If you are licensing a Microsoft cluster that contains both physical servers and virtual OSEs, you can use cost-based licensing optimizations to determine if it is more cost-effective to license the physical servers only, virtual OSEs only, or a combination of both. See [Cost-based licensing optimization for Microsoft](#) for more information on these optimizations.

Use the per core license metric for any of your physical or virtual core-based licenses. If you are licensing a virtual OSE, you must use either an active Microsoft Software Assurance (SA) or Microsoft software subscription license.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, a check is done to see which edition of the software is installed. If the

software is an Enterprise edition, a set number of rights are consumed based on the normalized core count on a physical server that has at least one installation of the Enterprise edition software in the physical operating system environment (OSE) or on a virtual machine (VM) hosted by the physical server. Another check is run to ensure that the number of OSEs that have an Enterprise edition install don't exceed the number of core rights applied to the physical server. If the number of OSEs exceeds the number of core rights, a core right will be consumed for each additional OSE. If the edition is anything but Enterprise, a right is still consumed for every core on a physical server that has at least one install in the physical OSE. The difference is the additional check. In this case, the check ensures that these other editions of software are only installed on the physical server.

If other editions of software are found in a virtual environment and no other rights are owned, then the reconciliation result will be not compliant.

You can manage device allocations. Devices are assigned a quantity of rights. Even if they don't need all of the allocations, the device will consume the number of rights you've allocated to them. For this license metric, all device allocations should be created against the physical server. No matter what edition of the software it is, if the normalized core count is less than the specified value in the **Minimum cores per processor metric** attribute related to the software model, then the minimum number of rights will be consumed.

For more information on Microsoft per core licenses, see [Microsoft Per Core licensing rules](#).

Per core (with CAL) licenses

You can manage device allocations for this license metric. Devices are assigned a quantity of rights. Even if they don't need all of the allocations, the device will consume the number of rights you've allocated to them. For example, if a device allocation with a quantity of six is created for a server, but only four core rights are needed to fully license the server, six rights would still be consumed during reconciliation. The additional two rights would be considered allocated not in use in the reconciliation results.

For the Per core (with CAL) license metric, device allocations can be created against a physical server or virtual machine (VM). Device allocations that are created against a VM must be licensed using either an active Microsoft Software Assurance (SA) or Microsoft software subscription license. If the core count is less than the specified value in either the **Minimum cores per processor** or **Minimum cores per server** metric attributes of the software model, the minimum number of rights will be consumed.

Note:

If you are licensing device allocations on a Microsoft cluster that contains both physical servers and VMs, you can use cost-based licensing optimizations to determine if it is more cost-effective to license the physical servers only, VMs only, or a combination of both. See [Cost-based licensing optimization for Microsoft](#) for more information on these optimizations.

This license metric should be used with device or user CAL license metrics. You need to create software entitlements using those license metrics separately.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, a right is consumed for every core on a physical server that has at least one installation of the software in the physical OSE or on a virtual machine hosted by the physical server. A check runs to verify that the number of installations within an OSE and the number of active OSEs don't exceed the specified maximums you defined in the **Metric Attributes** related list on the Software Model form.

If the specified number of installs and OSEs are exceeded, core rights that are equal to the number of cores or minimum cores on either the physical server or VM will be consumed until all installs and OSEs are licensed or there are no more available rights.

For more information on Microsoft per core (with CAL) licenses, see [Microsoft Per Core \(with CAL\) licensing rules](#).

User CAL licenses

A user CAL license is a client access license (CAL) that allows users to access a server to use its services, regardless of the number of devices the user uses to access the services.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, the number of rights consumed is equal to total user count in all client access records related to that software model.

Device CAL licenses

A device CAL license is a client access license (CAL) that allows a set number of devices to access a server to use its services, regardless of the number of users accessing the services from the device.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, the number of rights consumed is equal to total device count in all client access records related to that software model.

Server (per instance) licenses

A server (per instance) license is used to license a set number of software installations on either a physical server or virtual machine.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, a right is consumed for the number of installations that exist in an OSE. If the number of installations in an OSE exceeds the value specified in the maximum installs per OSE metric attribute, additional rights will be consumed until all installations on a physical server or virtual machine are licensed or there are no more rights variable.

You can manage device allocations. Devices are assigned a quantity of rights. Even if the software installations, the device will consume the number of rights you've allocated to them during reconciliation. For example, if a device allocation with a quantity of two is created for a server, but only one server (per instance) right is needed to fully license the server, two rights would still be consumed during reconciliation. The extra right would be marked as allocated no in use in the license metric results. Device allocations can be created against physical servers or virtual machines.

Server (per server) licenses

A server (per server) license is used to license all software installations on a physical server and any virtual machines hosted by the physical server.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, a right is consumed for every unique physical server. This license metric differs from the per device license metric, which consumes a right for every unique physical server and virtual machine that has a software installation.

You can manage device allocations. Devices are assigned a quantity of rights. Even if the software installations, the device will consume the number of rights you've allocated to them during reconciliation. For example, if a device allocation with a quantity of two is created for a

server, but only one right is needed to fully license the server, two rights would still be consumed during reconciliation. The extra right would be marked as allocated not in use in the license metric results. Device allocations should be created against the physical server.

Per Processor licenses

A per processor licenses is used to license a number of processors on a physical server.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, a right is consumed for processors on a physical server that have at least one installation of the software in the physical OSE or on a virtual machine hosted by the physical server. The quantity of processors licensed by a single right is determined by the **Maximum processor per rights** on the Metric Attribute related list of the software model.

An additional check is done to ensure that the number of installations in an OSE and the number of OSEs on a server don't exceed the specified maximums in the **Maximum installs per OSE** and **Maximum active OSEs per server** Metric Attribute related list of the software model. If any of the metric attributes are exceeded, additional rights are consumed until all processors, installs, and OSEs are licensed, or there are no more available rights. Per processor rights cannot partially license a physical server or license software installations on two different physical servers.

You can manage device allocations. Devices are assigned a quantity of rights. Even if the software installations, the device will consume the number of rights you've allocated to them during reconciliation. All device allocations should be created against the physical server.

User Subscription licenses

User subscription licenses a user for the number of activated software subscriptions.

During reconciliation, for a software model that has one or more software entitlements that use this license metric, a right is consumed for each unique user that has at least one software subscription record associated with the software model. Any software installations that correspond with the software model will also be licensed. However, if a user has software installations, but no subscription record, that user will not consume a right and the installations will be unlicensed.

Software Assurance licenses

Microsoft Software Assurance (SA) is the maintenance program used by Microsoft to provide active maintenance to its users. For more information, see [Software license maintenance](#).

Software Asset Management publisher pack for Oracle

Use the Software Asset Management publisher pack for Oracle to track and optimize licensing for your Oracle products.

The Oracle publisher pack supports the following Oracle products:

- Oracle Database
- Oracle Database options
- Oracle management packs
- Oracle Weblogic Server
- Oracle Java

To use the publisher pack, activate the Software Asset Management Professional for Oracle plugin (com.snc.samp.oracle).

Oracle licensing

The Oracle publisher pack adds Oracle specific licensing options for software entitlements.

Software entitlement fields

Field	Options
Agreement Type	<ul style="list-style-type: none"> • Generic • Unlimited License Agreement (ULA)
License metric	<ul style="list-style-type: none"> • Named User Plus • Per Processor • Employee
Metric group	Oracle

i Important:

The Software Asset Management application supports Bring Your Own License (BYOL) for Oracle Database and WebLogic servers across hybrid infrastructures. With BYOL support, you can track licenses for your Oracle Database and WebLogic servers in both on-premise and public cloud environments. For more information about Oracle BYOL support, see [Bring your own license or subscription to the public cloud](#).

Additionally, you can use the Oracle Global License Advisory Services (GLAS) to manage licensing of your deployed Oracle software products. For more information, see [Oracle GLAS data collection](#).

Oracle license metrics

The Software Asset Management application supports the following license metrics for Oracle:

Named User Plus

The Named User Plus license metric licenses all users and physical devices that access the following Oracle products:

- Oracle Database
- Oracle Database options
- Oracle management packs
- Oracle Weblogic Server

If a user operates a device that accesses any of these Oracle products, the Named User Plus license metric licenses both the user and the device. Use this license metric in environments where users and devices are easily identifiable and countable.

i Important:

To use this license metric, you must create a corresponding client access record. Client access records enable you to track and manage the users or devices that are accessing a particular version of your software. The Software Asset Management application can then use the information in these client access records to reconcile your software. For more information on client access records, see [Create a software client access record in workspace](#) or [Add a software client access record in Software Asset Management classic](#).

The Named User Plus license metric implements different licensing minimums based on the Oracle Database or Oracle WebLogic Server edition that your users and devices are accessing.

- If your users and devices are accessing Oracle Database Standard Edition (SE) or Standard Edition One (SE1), you must have a minimum of five Named User Plus licenses.
- If your users and devices are accessing Oracle Database Standard Edition 2 (SE2), you must have a minimum of 10 Named User Plus licenses per database server. In addition, each SE2 database can use a maximum of 16 CPU threads at any given time.
- If your users and devices are accessing Oracle Database Enterprise Edition (EE), you must have a minimum of either 25 Named User Plus licenses per processor or the total number of users and devices that are accessing this database edition. The license metric sets this licensing minimum to the larger of the two values.
- If your users and devices are accessing Oracle WebLogic Server Standard Edition, you must have a minimum of 10 Named User Plus licenses per processor.
- If your users and devices are accessing Oracle WebLogic Server Enterprise Edition, you must have a minimum of 10 Named User Plus licenses per processor core.

Licensing minimums are automatically applied to the software models for your Oracle products using the following metric attributes:

- **Minimum users per processor** (Oracle Database products)
- **Minimum NUPs for WebLogic on-premise deployments** (Oracle WebLogic Server products in on-premise environments)
- **Minimum NUPs for WebLogic cloud deployments** (Oracle WebLogic Server products in cloud environments)

The Software Asset Management application can then use the metric attribute values to determine the number of rights that are required for each Oracle product. To determine this number, the Software Asset Management application multiplies the appropriate metric attribute value by the number of processors (Oracle WebLogic Server Standard Edition and all Oracle Database Standard editions) or processor cores (Oracle WebLogic Server Enterprise Edition and Oracle Database Enterprise Edition) on the underlying physical server that the Oracle product is installed or running on. The resulting value is compared against the total number of users and devices that are accessing the Oracle product. The number of required rights is set to the larger of the two values.

For example, 20 users are accessing an Enterprise Edition (EE) database that is running on a physical server with eight processor cores. The Named User Plus license metric consumes 200 rights because the number of rights that is based on the metric attribute value (25 minimum licenses x 8 CPU cores = 200 rights) is greater than the number of users that are accessing the database (20 users).

Per Processor

The Per Processor license metric licenses the server processors on which you install or run the following Oracle products:

- Oracle Database
- Oracle Database options
- Oracle management packs
- Oracle Weblogic Server
- Oracle Java

Although you can install and run Oracle products on physical servers, virtual servers, partitioned servers, and the cloud, the Per Processor license metric licenses processors on only the underlying physical server or cloud server.

The Per Processor license metric calculates the number of rights that are required for your Oracle products by multiplying the total number of processor cores by a core processor licensing factor, as specified on the [Oracle Processor Core Factor Table](#). Use this license metric in environments where large numbers of users and devices are accessing the same environment or where users are not easily identifiable and countable, such as the Internet.

For example, a physical server that is running an Enterprise Edition (EE) database has two processors with four cores each. If your core processor licensing factor is 0.5, the Per Processor license metric consumes four rights for the physical server.

$2 \text{ CPUs} \times 4 \text{ CPU cores} \times 0.5 \text{ licensing factor} = 4 \text{ rights.}$

When you allocate rights for a database using the Named User Plus or Per Processor license metric, Software Asset Management automatically allocates rights for the associated database options and management packs using the same license metric.

If you create a [Client Access License \(CAL\)](#) record to specify the number of users or devices that can access an Oracle Database or WebLogic server, the Software Asset Management application licenses users and devices using only the Named User Plus license metric. Software Asset Management does not use the Per Processor license metric even if Per Processor licenses are available.

Employee

The Employee license metric licenses the total number of full-time, part-time, and temporary employees, including those employed directly and indirectly through agents, contractors, and consultants, according to Oracle's definition of internal business operations.

The Employee license metric calculates the number of licenses that are required by the total number of employees and not the number of employees that use the Oracle Java SE Universal. The licensing cost is calculated using a tier-based pricing model defined by Oracle. The pricing model is stored in the Price tier [samp_price_tier] table. For more details, see [Pricing model for Oracle Java SE Universal](#).

Additionally, for the Employee license metric, the true-up cost is shown for a subscription period of one year.

When you run reconciliation for a software model that has one or more entitlements with the Employee license metric, a right is consumed for each employee recorded

in the resource value records. You can create a resource value record for the Java SE software model keeping the value of units consumed same as the number of employees consuming the licenses. For details, see [Create a resource value record](#).

When you're using a custom tier table, you can update the override license cost records associated with the Java SE software model. For details, see [Create or update an override license cost record](#).

Oracle verified third-party vendor tool

To collect installation and usage data for the Oracle products that are deployed in your environment, you must use a discovery process. With the verification and enrollment of ServiceNow in the Oracle Third-Party Tool Vendor (3PTV) Program, the ServiceNow Discovery application and Software Asset Management application are both verified by Oracle to collect and report on this data without requiring any Oracle measurement tools. You can collect and report on data for Oracle Database, Oracle WebLogic Server, Oracle Fusion Middleware, and the underlying hardware that supports these products.

During contract renewals and audits, Oracle requires you to provide specific usage data for your Oracle products. You can collect this data by running scripts that are provided by Oracle. These scripts collect data about the Oracle products that are deployed in your environment, as well as the physical and virtual hardware that supports those products. However, the process of collecting and reviewing this data can be very time consuming.

The ServiceNow Discovery application uses Oracle-verified Discovery patterns and reporting to collect the same data that is provided in the script output. You can collect this data regularly to track your compliance and minimize unexpected audit results.

For more information on Oracle discovery, see [Oracle Global License Advisory Services \(GLAS\) data collection](#) [↗](#).

Note:

To access all the benefits of ServiceNow Discovery, request and install the CMDB CI Class Models application from the ServiceNow Store. See [CMDB CI Class Models store app](#) [↗](#) for more information on this application.

Oracle Database and WebLogic Server licensing in partitioned environments

The Software Asset Management application supports Oracle licensing rules for Oracle Database and WebLogic Server in both soft- and hard-partitioned environments. You can use partitioning to help reduce the number of licenses that are required for your installations.

Oracle Database and WebLogic Server licensing in soft-partitioned environments

The Software Asset Management application supports Oracle Database and WebLogic Server licensing rules in soft-partitioned environments, such as VMware and Nutanix virtualization technology.

Soft partitioning enables you to segment the operating system (OS) of the environment into different OS types and OS versions by using OS resource managers. OS resource managers limit the number of processors that each Oracle database or WebLogic server can run on by creating segments in which CPU resources are allocated to applications within the same OS. For more information about Oracle licensing and soft partitioning, refer to the [Oracle Help Center](#) [↗](#).

VMware vSphere

VMware vSphere is a virtualization platform through which you can install and run Oracle databases or WebLogic servers on virtual machines (VMs). To run an Oracle database or

WebLogic server on a VM, you must license all processors on the underlying physical ESXi host that is running your VM. If your physical ESXi host is running multiple VMs simultaneously, you must still license all processors on the host regardless of how many VMs are running the Database or WebLogic server.

Oracle licensing on VMware vSphere is based on the VMware vMotion capability that is associated with each vSphere version. VMware vMotion is the VMware vSphere technology that enables VMs to migrate from one physical ESXi host to another without service interruptions.

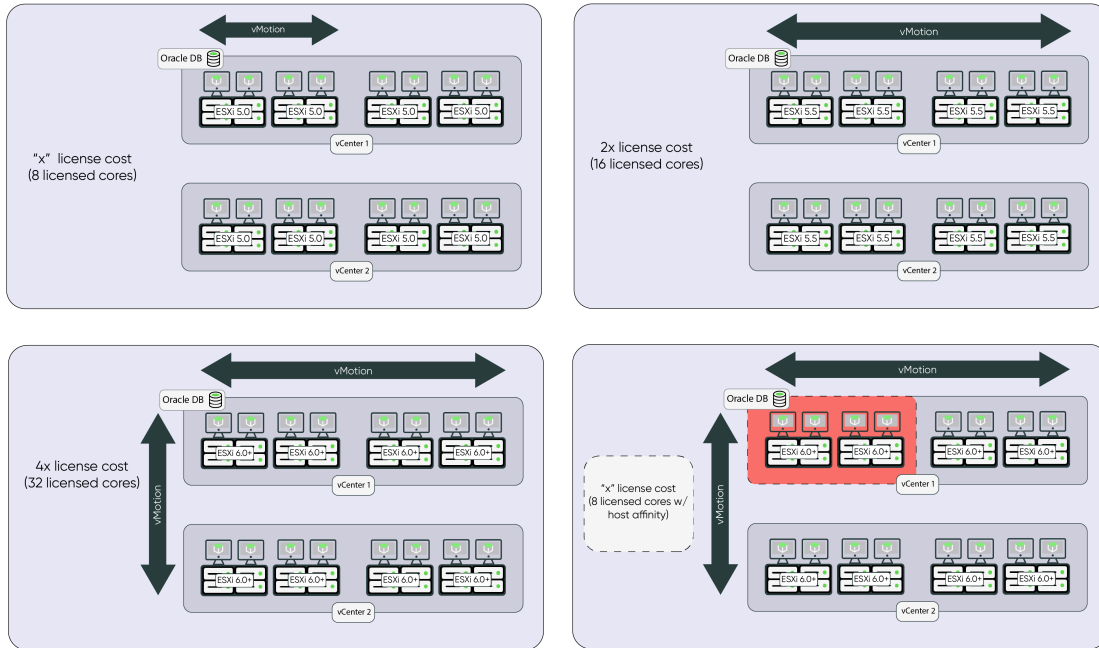

The Oracle publisher pack supports the following Oracle licensing models on VMware vSphere:

Oracle licensing models on VMware vSphere

VMware vSphere version	VMware vMotion capability	Licensing model
VMware vSphere ESXi 5.0 and earlier	VMs can migrate to any physical ESXi host within the same shared storage under the same datacenter.	You must license the processors on all physical ESXi hosts within the same shared storage under the same datacenter.
VMware vSphere ESXi 5.1-5.5	VMs can migrate to any physical ESXi host within the same VMware vCenter Server instance.	You must license the processors on all physical ESXi hosts within the same VMware vCenter Server instance.
VMware vCenter Server 6.0 and later	VMs can migrate to physical ESXi hosts within any VMware vCenter Server instance across your network. Migration is supported only on physical hosts that run VMware vSphere ESXi 5.1 or later on VMware vCenter Server 6.0 and later instances.	You must license the processors on all physical hosts that run VMware vSphere ESXi 5.1 or later within all VMware vCenter Server 6.0 and later instances across your network.

i Important:

If you enable the **Use host affinity for reconciling licenses for Oracle databases and WebLogic servers on VMware at the vCenter(s) aggregation level** option in your [Software Asset Management properties](#), the Software Asset Management application honors all VM-Host affinity rules when reconciling Oracle licenses within your VMware vCenter Server instances. In this scenario, licensing is based on the sum of all physical ESXi hosts that the VMs can reside on, as specified in your VM-Host affinity rules.

For more information about Oracle licensing on VMware, see [Understanding Oracle Certification, Support and Licensing for VMware Environments](#).

Nutanix Acropolis Hypervisor (AHV)

The AHV is a virtualization platform from Nutanix using which you can install and run Oracle databases and WebLogic servers on Nutanix VMs. According to Oracle’s Server Partitioning Policy, only specific technologies, possibly with certain modified configuration constraints, are considered hard partitioning. Nutanix isn’t included in Oracle’s list of approved hard partitioning technologies. Therefore, to run an Oracle Database on a Nutanix VM, you must license all physical cores on the AHV host running the VM with Oracle Database.

Additionally, if the physical host is part of a Nutanix Cluster, you must license all the physical cores in that cluster. The Oracle publisher pack supports licensing at both the cluster level and the host level, provided there’s no Nutanix cluster.

In the following example, the license consumption for deploying a database on Virtual Machine VM1 is calculated at the cluster level. This calculation implies that all physical cores across all hosts in Cluster1 are counted for licensing.

Oracle Database and WebLogic Server licensing in hard-partitioned environments

The Software Asset Management application supports Oracle hard-partitioning licensing rules for IBM AIX Logical Partition (LPAR), Solaris Logical Domain (LDOM), and Solaris Zone.

When you hard partition a server, the server is divided into smaller systems that run independently from each other. Each system contains its own processors, network resources, operating system, memory, and more. For more information on Oracle licensing and hard partitioning, refer to [Oracle Partitioning Policy](#).

IBM LPAR

LPAR is a defined subset of processor hardware that supports the operating system. An LPAR contains resources, such as processors, memory, and input or output devices, that operate as an independent system. You can have multiple LPARs within each mainframe hardware system.

Discovering the LPARs and LPAR resources within your IBM LPAR infrastructure requires ServiceNow Discovery patterns for the IBM Hardware Management Console (HMC), which is the hardware appliance that enables you to manage and configure your LPARs. To access these discovery patterns, you must request and install the Discovery and Service Mapping Patterns application from the ServiceNow Store. For more information on how to configure a discovery on your LPARs, see [IBM Virtualization and Hardware Management Console discovery](#).

Note:

The *lparstat* command pulls a report of LPAR-related information and usage. For more information, see the [IBM Knowledge Center](#).

When you run a discovery, your discovered LPAR data is populated and stored in the following Configuration Management Database (CMDB) tables on your ServiceNow instance:

- cmdb_ci_ibm_frame
- cmdb_ci_aix_server
- cmdb_ci_lpar_instance
- cmdb_ci_lpar_resource
- cmdb_rel_ci
- cmdb_sam_sw_install

To populate and store this data, you must request and install the CMDB CI Class Models application from the ServiceNow Store. This application adds or updates CMDB classes for the IBM HMC. For more information on IBM HMC CMDB classes, see [IBM Hardware Management Console \(HMC\) extension classes](#).

After your discovered LPAR data is populated in the appropriate CMDB tables, you can use the *samp_frame_to_lpar_resource* database view to join the tables together and consolidate all LPAR data into a single view. Based on this database view and the Oracle Database and WebLogic Server licensing rules for IBM LPAR, you can identify and determine the license compliance of all Oracle Database and WebLogic server installations across your IBM LPAR infrastructure.

Oracle Database and WebLogic Server licensing rules for IBM LPAR

Processor pool	Description	Licensing rule
Dedicated	Processors are assigned to only one dedicated LPAR, which is an LPAR that is built on dedicated CPU resources.	<p>You must license the dedicated processors on which you install or run an Oracle database or WebLogic server.</p> <p>To determine the number of rights that are required for a dedicated LPAR, multiply the total number of processor cores that are running an Oracle Database or WebLogic server on the LPAR by a core processor licensing factor, as specified on the Oracle Processor Core Factor Table.</p>
Shared	Processors are shared across micro-partitions, which are LPARs that are built on shared CPU resources.	<p>You must license the shared processors on which you install or run an Oracle Database or WebLogic server.</p> <p>You can determine the number of rights that are required across your micro-partitions based on the LPAR type:</p> <ul style="list-style-type: none"> • Capped LPAR: A capped LPAR is a logical partition that is assigned a maximum entitled capacity, which is the number of CPU resources that the LPAR is entitled to receive. Capped LPARs can't use more processor power than the assigned entitled capacity. <p>To determine the number of rights that are required across your capped micro-partitions, multiply the sum of all assigned entitled capacities by a core processor licensing factor, as specified on the Oracle Processor Core Factor Table.</p> <ul style="list-style-type: none"> • Uncapped LPAR: An uncapped LPAR is a logical partition that can use more processor power than the assigned entitled capacity. Processor power usage is limited by the number of virtual processors that are assigned to the LPAR

Oracle Database and WebLogic Server licensing rules for IBM LPAR (continued)

Processor pool	Description	Licensing rule
		<p>or by the maximum number of physical processor cores that are available to the shared processor pool.</p> <p>To determine the number of rights that are required across your uncapped micro-partitions, add the sum of all assigned virtual processors with the sum of all assigned entitled capacities.</p> <ul style="list-style-type: none"> ○ If the resulting value is lower than the number of physical processor cores that are available to the shared processor pool, multiply the value by a core processor licensing factor, as specified on the Oracle Processor Core Factor Table. ○ If the resulting value is greater than the number of physical processor cores that are available to the shared processor pool, multiply the number of physical processor cores by a core processor licensing factor, as specified on the Oracle Processor Core Factor Table.

For more information on database views, see [Working with database views for reporting](#).

Solaris LDOM or Oracle VM Server for SPARC

A logical domain (LDOM) is a distinct logical unit within a single computer system, complete with its own operating system, resources, and identity. You can run different applications in separate logical domains and maintain their independence for performance and security reasons. Solaris LDOM is a virtualization technology that enables creating multiple virtual machines (VMs) on a single physical server.

The ServiceNow Discovery application uses the Solaris LDOM infrastructure pattern and Solaris LDOM shared library pattern to find all LDOM data. For information on Solaris LDOM discovery, see [Oracle Solaris LDOM discovery](#).

The Software Asset Management application supports licensing of Oracle Database Server and WebLogic Server installed on the Solaris LDOM, version 2.0 and above, for Per Processor and Named User Plus (NUP) license metrics. To license your Oracle Database or WebLogic server installations, rights should be allocated to the physical server that runs the Solaris LDOM configuration. For details on the licensing of Oracle products, see [Software model metric attributes](#).

Solaris zones

You can set up a global zone on a Solaris server and hard partition it with multiple local zones. You can then run an Oracle Database or WebLogic server on one or more local zones. To license your Oracle Database or WebLogic server installations, rights should be allocated to the physical host that runs the entire Solaris zone configuration. For the Per Processor license metric, rights must cover the cores for all local zones up to the maximum capacity of the physical host. For the NUP license metric, rights must cover the clients that access the Database or WebLogic server on the local zones. For information on Solaris zone discovery, see [Solaris discovery](#).

Oracle Database and WebLogic Server licensing in cloud environments

The Software Asset Management application supports licensing rules for Oracle Database and WebLogic Server in cloud environments.

i Important:

The Software Asset Management application supports Bring Your Own License (BYOL) for Oracle Database and WebLogic servers across hybrid infrastructures. With BYOL support, you can track licenses for your Oracle Database and WebLogic servers in both on-premise and public cloud environments. For more information about Oracle BYOL support, see [Bring your own license or subscription to the public cloud](#).

When you install or run an Oracle database or WebLogic server in the cloud, you can license it using either the Named User Plus or Per Processor license metric. The Named User Plus license metric licenses all users and physical devices that access an Oracle cloud database or WebLogic server. The Per Processor license metric licenses the virtual CPUs (vCPUs) on which you install or run an Oracle cloud database or WebLogic server.

i Note:

The Oracle Processor Core Factor Table is not applicable in cloud environments.

Amazon Web Services (AWS)

Amazon Web Services (AWS) is a cloud computing platform on which you can install and run Oracle databases and WebLogic servers. You can manage your Oracle databases on AWS using either Amazon Elastic Compute Cloud (EC2) or Amazon Relational Database Service (RDS). However, you can manage your Oracle WebLogic servers using only Amazon Elastic Compute Cloud (EC2). For more information on Amazon EC2, refer to the [Amazon Elastic Compute Cloud documentation](#) [↗](#). For more information on Amazon RDS, refer to the [Amazon Relational Database Service documentation](#) [↗](#).

If you enable hyper-threading on your AWS virtual machine instance, the Software Asset Management application provides one Per Processor license for every two vCPUs on which you install or run an Oracle cloud database or WebLogic server. If you do not enable hyper-threading, the Software Asset Management application provides one Per Processor license for every vCPU on which you install or run an Oracle cloud database or WebLogic server.

For more information on Oracle databases and WebLogic servers in AWS, see [Oracle Database on the AWS Cloud: Quick Start Reference Deployment](#) [↗](#).

Microsoft Azure

Microsoft Azure is a cloud computing platform on which you can create and run Oracle databases and WebLogic servers.

If you enable hyper-threading on your Microsoft Azure virtual machine instance, the Software Asset Management application provides one Per Processor license for every two vCPUs on which you install or run an Oracle cloud database or WebLogic server. If you do not enable hyper-threading, the Software Asset Management application provides one Per Processor license for every vCPU on which you install or run an Oracle cloud database or WebLogic server.

For more information on Oracle databases and WebLogic servers in Microsoft Azure, see [Accelerate your cloud adoption with Microsoft and Oracle](#) [↗](#).

Oracle Database licensing in multitenant architectures

The Software Asset Management application supports licensing rules for Oracle databases in multitenant architectures.

The Oracle multitenant architecture simplifies database management by enabling you to consolidate multiple pluggable databases (PDBs) into a single container database (CDB). With a CDB, you can track, provision, clone, manage resources for, and upgrade multiple PDBs simultaneously. This multitenant architecture is supported on Oracle Database version 12c Release 1 (12.1) and later.

To run an Oracle database in a multitenant architecture, you must purchase and manage licenses for both Oracle Database and the Oracle Multitenant option. In most cases, Oracle Multitenant option licenses must be purchased and managed separately from Oracle Database licenses. However, Oracle Database Cloud Service Enterprise Edition - High Performance (DBCS EE-HP), Oracle Database Cloud Service Enterprise Edition - Extreme Performance (DBCS EE-EP), and Oracle Database Exadata Cloud Service (ExaCS) do not require a separate license for the Oracle Multitenant option, as it is already included in the database license. For more information on Oracle Database licensing, see [Software Asset Management publisher pack for Oracle](#).

Oracle Multitenant option licensing

The Oracle Multitenant option supports both the Named User Plus and Per Processor license metrics. The Named User Plus license metric licenses all users and physical devices that access a user-created PDB. The Per Processor license metric licenses the processor cores on all physical hosts that are running a user-created PDB. For more information on these license metrics, see [Oracle license metrics](#).

i Important:

Oracle Multitenant option licensing accounts for user-created PDBs only. It does not account for proxy PDBs or seed PDBs.

You can determine whether Oracle Multitenant option licensing is required for your database deployment based on the following criteria:

- The Oracle Database version and edition of your PDBs and CDBs.
- The number of user-created PDBs within each database instance that is running on the database installation.

Oracle Multitenant option licensing requirements

Oracle Database version	Oracle Database edition	Licensing requirement
12c Release 1 (12.1)	Oracle Database Standard Edition (SE)	The Oracle Multitenant option is not supported.
	Oracle Database Standard Edition One (SE1)	
	Oracle Database Standard Edition 2 (SE2)	

Oracle Multitenant option licensing requirements (continued)

Oracle Database version	Oracle Database edition	Licensing requirement
	Oracle Database Enterprise Edition (EE)	<ul style="list-style-type: none"> • If every database instance contains only one user-created PDB each, licensing is not required since the Oracle Multitenant option is not in use. • If any database instance contains more than one user-created PDB, licensing is required using either the Named User Plus or Per Processor license metric. <div data-bbox="587 590 1390 827" style="background-color: #e1f5fe; padding: 10px;"> <p>i Important: This version and edition of Oracle Database supports up to 252 user-created PDBs per database instance. If a database instance contains more than 252 user-created PDBs, Software Asset Management creates removal candidates for the additional PDBs. You must remove the additional PDBs to maintain compliance.</p> </div>
12c Release 2 (12.2) and 18c	Oracle Database Enterprise Edition (EE)	<ul style="list-style-type: none"> • If every database instance contains only one user-created PDB each, licensing is not required since the Oracle Multitenant option is not in use. • If any database instance contains more than one user-created PDB, licensing is required using either the Named User Plus or Per Processor license metric. <div data-bbox="587 1163 1390 1400" style="background-color: #e1f5fe; padding: 10px;"> <p>i Important: This version and edition of Oracle Database supports up to 252 user-created PDBs per database instance. If a database instance contains more than 252 user-created PDBs, Software Asset Management creates removal candidates for the additional PDBs. You must remove the additional PDBs to maintain compliance.</p> </div>
	Oracle Database Standard Edition 2 (SE2)	The Oracle Multitenant option is supported only in deployments where every database instance contains one user-created PDB each. However, licensing is not required since the Oracle Multitenant option is not in use.
	Oracle Database Cloud Service Enterprise Edition - High Performance (DBCS EE-HP)	<ul style="list-style-type: none"> • If every database instance contains one user-created PDB each, licensing is not required since the Oracle Multitenant option is not in use. • If any database instance contains more than one user-created PDB, the Oracle Multitenant option is in use. However, separate

Oracle Multitenant option licensing requirements (continued)

Oracle Database version	Oracle Database edition	Licensing requirement
	Oracle Database Cloud Service Enterprise Edition - Extreme Performance (DBCS EE-EP) Oracle Database Exadata Cloud Service (ExaCS)	licensing is not required for this option since it is already included in the Oracle Database license. <div style="background-color: #e0f2f1; padding: 10px;"> <p>i Important: These versions and editions of Oracle Database support up to 4,096 user-created PDBs per database instance. If a database instance contains more than 4,096 user-created PDBs, Software Asset Management creates removal candidates for the additional PDBs. You must remove the additional PDBs to maintain compliance.</p> </div>
19c and later	Oracle Database Enterprise Edition (EE)	<ul style="list-style-type: none"> • If every database instance contains three or less user-created PDBs each, licensing is not required since the Oracle Multitenant option is not in use. • If any database instance contains more than three user-created PDBs, licensing is required using either the Named User Plus or Per Processor license metric. <div style="background-color: #e0f2f1; padding: 10px;"> <p>i Important: This version and edition of Oracle Database supports up to 252 user-created PDBs per database instance. If a database instance contains more than 252 user-created PDBs, Software Asset Management creates removal candidates for the additional PDBs. You must remove the additional PDBs to maintain compliance.</p> </div>
	Oracle Database Standard Edition 2 (SE2)	The Oracle Multitenant option is supported only in deployments where every database instance contains three or less user-created PDBs each. However, licensing is not required since the Oracle Multitenant option is not in use.
	Oracle Database Cloud Service Enterprise Edition - High Performance (DBCS EE-HP)	<ul style="list-style-type: none"> • If every database instance contains three or less user-created PDBs each, licensing is not required since the Oracle Multitenant option is not in use. • If any database instance contains more than three user-created PDBs, the Oracle Multitenant option is in use. However, separate

Oracle Multitenant option licensing requirements (continued)

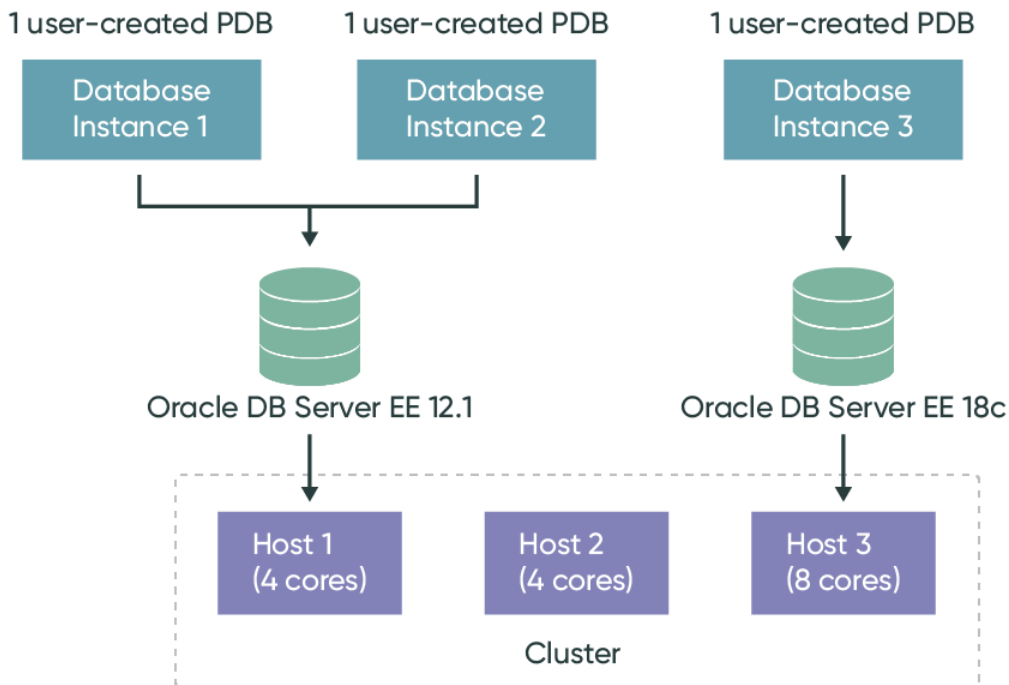

Oracle Database version	Oracle Database edition	Licensing requirement
	Oracle Database Cloud Service Enterprise Edition - Extreme Performance (DBCS EE-EP) Oracle Database Exadata Cloud Service (ExaCS)	licensing is not required for this option since it is already included in the Oracle Database license. <div style="background-color: #e0f2f1; padding: 10px; border: 1px solid #ccc;"> <p>i Important: These versions and editions of Oracle Database support up to 4,096 user-created PDBs per database instance. If a database instance contains more than 4,096 user-created PDBs, Software Asset Management creates removal candidates for the additional PDBs. You must remove the additional PDBs to maintain compliance.</p> </div>

Oracle Multitenant option use cases

You can view the following use cases to better understand licensing requirements for the Oracle Multitenant option.

The Oracle Multitenant option is not in use

Oracle Multitenant option not in use example

In this scenario, Database Instance 1 and Database Instance 2 are running Oracle Database 12.1 Enterprise Edition and contain one user-created PDB each. Database Instance 3 is running Oracle Database 18c Enterprise Edition and also contains one user-created PDB. Since none of the database instances meet or exceed the minimum number of user-created PDBs for which the Oracle Multitenant option is required, the option is not in use on any of the database instances. Additional licensing for the Oracle Multitenant option is not required on any hosts within the cluster.

The Oracle Multitenant option is in use

Oracle Multitenant option in use example

In this scenario, Database Instance 1 and Database Instance 2 are running Oracle Database 12.1 Enterprise Edition. Database Instance 1 contains three user-created PDBs, while Database Instance 2 contains one user-created PDB. Database Instance 3 is running Oracle Database 18c Enterprise Edition and contains five user-created PDBs. Since both Database Instance 1 and Database Instance 3 exceed the minimum number of user-created PDBs for which the Oracle Multitenant option is required, the option is in use on both database instances. Additional licensing for the Oracle Multitenant option is required on all hosts within the cluster.

The Oracle Multitenant option is in use but exceeds the maximum PDB amount

Oracle Multitenant option in use but exceedx maximum PDB amount example

In this scenario, Database Instance 1 and Database Instance 2 are running Oracle Database 12.1 Enterprise Edition. Database Instance 1 contains three user-created PDBs, while Database Instance 2 contains one user-created PDB. Database Instance 3 is running Oracle Database 18c Enterprise Edition and contains 255 user-created PDBs. Since both Database Instance 1 and Database Instance 3 exceed the minimum number of user-created PDBs for which the Oracle Multitenant option is required, the option is in use on both database instances. Additional licensing for the Oracle Multitenant option is required on all hosts within the cluster.

However, Database Instance 3 is considered to be out of compliance. Based on licensing rules for the Oracle Multitenant option, the maximum number of user-created PDBs that are supported on database instances running Oracle Database 18c Enterprise Edition is 252. Since Database Instance 3 contains 255 user-created PDBs, Software Asset Management creates removal candidates for the three additional user-created PDBs. These additional PDBs must be removed to maintain compliance.

Oracle Database licensing for Standard Editions

Oracle Database Standard Editions are licensed on servers having a value less than the maximum capacity of sockets to help ensure risk-free license compliance.

Sockets are slots on which processors or CPUs are placed. You must manually enter socket information under the non-discoverable field **Socket count** in the **cmdb_hardware_product_model** hardware model table. ITOM Discovery discovers only the occupied slots and Software Asset Management reconciles and provides compliance.

Oracle Database Standard Edition licensing rules

Edition	Max rule for NUP and processor
Oracle DB Standard Edition	4 sockets per server

Oracle Database Standard Edition licensing rules (continued)

Edition	Max rule for NUP and processor
Oracle DB Standard Edition 1	2 sockets per server
Oracle DB Standard Edition 2	2 sockets per server

Example: Oracle Standard Edition 2 deployed on a server with more than 2 sockets

The following example shows the message that would appear for a reclamation or removal candidate that doesn't follow the licensing rules.

```
Oracle DB Server Standard Edition 2 installed on <Server Name> has been flagged as an unlicensed install. As per Oracle Licensing Policy, Oracle Database Standard Edition 2 may only be licensed on servers that have a maximum capacity of 2 sockets. This Server is found to have <no. of socket> number of sockets available. You are advised to uninstall the Oracle DB Server Standard Edition 2 from this server or upgrade to Oracle DB Enterprise Edition. We suggest working with your Oracle Database Administrator to assess the impact before proceeding with this action. Please note that the maximum number of sockets or slots available on a server are part of the hardware specification. Hence it is advised to update this information on the hardware product model <hw model name>. If this information is not present on the hardware model, it is assumed that all sockets are occupied and discovered.
```

Oracle Database options and management packs

You can use the Software Asset Management publisher pack for Oracle to track licensing positions for your Oracle Database options and management packs. The Licensable Oracle Options [samp_oracle_option_set] table provides the complete list of database options and management packs that you can create software models for.

You must manage licensing for your Oracle Database options and management packs separately from your Oracle Database servers. Separate software models and entitlements are required for each of your database servers, database options, and management packs, thereby providing a more comprehensive view of your Oracle license compliance position.

For example, Oracle DB Server 12c R1 Enterprise with the Partitioning option requires two separate software models and entitlements.

Oracle DB licensing example

Purpose	Software model	Software entitlement
Track licensing for Oracle DB Server 12c R1 Enterprise.	Oracle DB Server 12c R1 Enterprise No value selected for the Database option field.	Record your purchased rights for Oracle DB Server 12c R1 Enterprise.

Oracle DB licensing example (continued)

Purpose	Software model	Software entitlement
Track licensing for the Partitioning option.	<p>Oracle DB Server 12c R1 Enterprise Partitioning</p> <p>Partitioning selected for the Database option field.</p>	Record your purchased rights for the Partitioning option.

To track and measure usage for your Oracle Database options and management packs, request and install the Data Collection for Oracle Global Licensing and Advisory Services application from the ServiceNow Store. See [Request Data Collection for Oracle Global Licensing and Advisory Services \(GLAS\)](#) for detailed instructions.

i Important:

If you are activating the Software Asset Management application for the first time in the San Diego and later releases, the Data Collection for Oracle Global Licensing and Advisory Services application is required for discovering and measuring the usage of your database options and management packs.

If you are activating the Software Asset Management application for the first time in the Rome and earlier releases or you are upgrading an existing instance of the Software Asset Management application from the Rome and earlier releases to the San Diego and later releases, you can continue using the existing patterns for discovering and measuring the usage of your database options and management packs. However, ServiceNow recommends that you use the Data Collection for Oracle Global Licensing and Advisory Services application instead, as the application provides enhanced capabilities that address additional use cases.

After you install the application, the SAM - Evaluate database option usage from Oracle GLAS data scheduled job runs weekly or on-demand to retrieve usage data for both the Oracle database options and management packs that are installed in your Oracle environment and the Oracle features that are associated with them. The Software Asset Management application can then include this data in the Oracle reconciliation process to help you determine the license compliance positions of your database options and management packs, which are reported separately from the license compliance positions of your Oracle Database servers.

i Note:

For more information on how usage data for your Oracle features can help you determine the license compliance of your database options and management packs, see [Feature mapping for Oracle Database options and management packs](#).

Oracle Database options and management packs follow the Oracle Database server lifecycle and are displayed in the License usage view (Software Asset Workspace) or License Workbench (Software Asset Management classic application). However, the following remediation options are not available for database options and management packs:

- Remove Unallocated Installs
- Remove Unlicensed Installs

Supported Oracle Database options and management packs

The Software Asset Management publisher pack for Oracle supports the following database options and management packs based on whether you are using the existing discovery and usage measurement patterns or the Data Collection for Oracle Global Licensing and Advisory

Services application to track and measure usage for your database options and management packs.

Oracle Database option or management pack	Supported by existing discovery and usage measurement patterns	Supported by the Data Collection for Oracle Global Licensing and Advisory Services application
Active Data Guard	Yes	Yes
Advanced Compression	Yes	Yes
Advanced Security	Yes	Yes
<p>Change Management Pack</p> <p>i Note: If your database is running Oracle Database 12c or later, the Change Management Pack, Configuration Management Pack for Oracle Database, and Provisioning and Patch Automation Pack for Database are consolidated into the Oracle Database Lifecycle Management Pack for Oracle Database. To use the Change Management Pack, you must license the Oracle Database Lifecycle Management Pack for Oracle Database.</p>	Yes	Yes
<p>Configuration Management Pack for Oracle Database</p> <p>i Note: If your database is running Oracle Database 12c or later, the Change Management Pack, Configuration Management Pack for Oracle Database, and Provisioning and Patch Automation Pack for Database are consolidated into the Oracle Database Lifecycle Management Pack for Oracle Database. To use the Configuration Management Pack for Oracle Database, you must license the Oracle Database Lifecycle Management Pack for Oracle Database.</p>	Yes	Yes
<p>Content Database Suite</p> <p>i Note: Content Database Suite is available only on databases that are running Oracle Database 11g Release 1 and earlier.</p>	No	Yes
Data Masking Pack	Yes	No

Oracle Database option or management pack	Supported by existing discovery and usage measurement patterns	Supported by the Data Collection for Oracle Global Licensing and Advisory Services application
		<p>i Note: If you are using the Data Collection for Oracle Global Licensing and Advisory Services application, you can track and measure usage for Oracle Data Masking and Sub-setting Pack instead.</p>
<p>Data Mining</p> <p>i Note: Data Mining requires separate licensing only if your database is running Oracle Database 11g Release 1 or earlier. If your database is running Oracle Database 11g Release 2 or later, Data Mining is already included in the database license.</p>	No	Yes
Database In-Memory	Yes	Yes
Database Vault	Yes	Yes
Diagnostics Pack	Yes	Yes
Label Security	Yes	Yes

<p>Oracle Database Lifecycle Management Pack for Oracle Database</p> <p>i Note: If your database is running Oracle Database 12c or later, the Change Management Pack, Configuration Management Pack for Oracle Database, and Provisioning and Patch Automation Pack for Database are consolidated into the Oracle Database Lifecycle Management Pack for Oracle Database. You can access all three packs by licensing only the Oracle Database Lifecycle Management Pack for Oracle Database.</p>	No	Yes
Oracle Spatial and Graph	No	Yes

Oracle Database option or management pack	Supported by existing discovery and usage measurement patterns	Supported by the Data Collection for Oracle Global Licensing and Advisory Services application
<p>i Note: Oracle Spatial and Graph requires separate licensing only if your database is running Oracle Database 11g Release 1 or earlier. If your database is running Oracle Database 11g Release 2 or later, Oracle Spatial and Graph is already included in the database license.</p>	<p>i Note: If you are using the existing discovery and usage measurement patterns for your database options and management packs, you can track and measure usage for Spatial and Graph instead.</p>	
Partitioning	Yes	Yes
<p>Provisioning and Patch Automation Pack for Database</p> <p>i Note: If your database is running Oracle Database 12c or later, the Change Management Pack, Configuration Management Pack for Oracle Database, and Provisioning and Patch Automation Pack for Database are consolidated into the Oracle Database Lifecycle Management Pack for Oracle Database. To use the Provisioning and Patch Automation Pack for Database, you must license the Oracle Database Lifecycle Management Pack for Oracle Database.</p>	Yes	Yes
Real Application Clusters	Yes	Yes
Real Application Clusters One Node	Yes	Yes
Real Application Testing	Yes	Yes
<p>Records Database</p> <p>i Note: Records Database is available only on databases that are running Oracle Database 10g Release 2 or earlier.</p>	No	Yes
Spatial and Graph	Yes	No

Oracle Database option or management pack	Supported by existing discovery and usage measurement patterns	Supported by the Data Collection for Oracle Global Licensing and Advisory Services application
<p>i Note: Spatial and Graph requires separate licensing only if your database is running Oracle Database 11g Release 1 or earlier. If your database is running Oracle Database 11g Release 2 or later, Spatial and Graph is already included in the database license.</p>		<p>i Note: If you are using the Data Collection for Oracle Global Licensing and Advisory Services application, you can track and measure usage for Oracle Spatial and Graph instead.</p>
<p>Total Recall</p> <p>i Note: Total Recall is available only on databases that are running Oracle Database 11g and earlier.</p>	No	Yes
<p>Tuning Pack</p> <p>i Note: Tuning Pack is supported only on databases that are running Oracle Database Enterprise Edition. If Tuning Pack is discovered on any database that is running Oracle Database Standard Edition or Express Edition, the Software Asset Management application generates a removal candidate for that Tuning Pack installation. To maintain compliance with Oracle, you must either uninstall Tuning Pack from the database or upgrade the database to Oracle Database Enterprise Edition.</p>	Yes	Yes

Request Data Collection for Oracle Global Licensing and Advisory Services (GLAS)

Request the Data Collection for Oracle GLAS application from the ServiceNow Store so that you can track and measure usage for your Oracle Database options and management packs.

Before you begin

Role required: admin

Procedure

1. From a web browser, go to the [ServiceNow Store](#).
2. Log in using your HI credentials.
3. In the search bar, enter `Data Collection for Oracle Global Licensing and Advisory Services` and then select **Search**.
4. Select the result called `Data Collection for Oracle Global Licensing and Advisory Services`.
5. On the `Data Collection for Oracle Global Licensing and Advisory Services` page, select **Request Install**.
The ServiceNow Request for App Installation - Data Collection for Oracle Global Licensing and Advisory Services dialog box opens.
6. In the dialog box, fill in the fields.

ServiceNow Request for App Installation - Data Collection for Oracle Global Licensing and Advisory Services dialog box

Field	Description
Instance Name	Name of the instance on which you want to install the application. After you enter the instance name, select Validate Instance to verify that the instance exists.
Reason for request	Reason for requesting the application.

7. Select **Request**.
8. Select **Close**.

Result

If your request is approved, you will receive an email with detailed instructions on how to install the application.

What to do next

Install the application according to the instructions in the email.

[Oracle Global License Advisory Services \(GLAS\) data collection using patterns](#)

Feature mapping for Oracle Database options and management packs

The Software Asset Management application automatically maps discovered Oracle features to the Oracle Database options and management packs that they’re associated with. These mappings can help you determine the usage and license compliance of your database options and management packs.

Every Oracle Database option and management pack contains a set of features that enhance the capabilities of the Oracle Database. For example, the Oracle Active Data Guard option provides real-time data protection and availability for Oracle Database using features such as automatic block repair, global data services, and application continuity. For more information on the features that are supported by each database option and management pack, refer to the [Oracle documentation](#).

When you run a discovery, the ServiceNow® Discovery application locates and identifies both the database options and management packs that are installed in your Oracle environment

and the features that are associated with them. This data is then sent to the Software Asset Management application, where it can be normalized and reconciled.

After the data is normalized, the Software Asset Management application uses the Oracle Feature Option Mapping [samp_feature_option_mapping] table to map your features to the appropriate database options and management packs at the database instance level. Any subsequent usage data that you retrieve for each feature via the SAM - Evaluate database option usage from Oracle GLAS data scheduled job can then be applied to the mapped database options and management packs. The Software Asset Management application uses this data with predefined database option and management pack usage rules to determine which database options and management packs are being used on each database instance. The resulting usage information is included in the Oracle reconciliation process to help you determine the license compliance of your database options and management packs.

Update the default mapping for a feature

If a discovered feature is associated with more than one Oracle Database option or management pack, you can change the database option or management pack that the feature usage data is applied to by updating the default mapping for that feature.

Before you begin

Role required: admin

About this task

Oracle features can be associated with multiple database options and management packs. However, the Software Asset Management application can map each feature to only one database option or management pack at a time.

The Software Asset Management application automatically maps each discovered feature to an appropriate database option or management pack based on default mappings that have been predefined for each feature. Usage data for each feature can then be applied to the mapped database options and management packs to help you determine if they are in use.

If any of your discovered features are associated with more than one database option or management pack, you can update the default mappings for those features based on how you are using each feature and what entitlements you have purchased for the associated database options and management packs. By updating the default mappings for those features, you can change the database options and management packs that the corresponding feature usage data is applied to, thereby enabling you to better optimize the license compliance positions of your database options and management packs based on your organization's needs.

Note:

You can update the default mappings only for features that are associated with multiple database options and management packs.

Procedure

1. On the page header of your ServiceNow instance, select **All**.
2. In the menu navigation filter, enter `samp_option_for_feature_inuse.list`.
The Default option for feature in use list opens. This list displays the default mappings for all discovered features that are currently in use and can be mapped to more than one database option or management pack.
3. From the list of available features, select the feature that you want to change the default mapping for.
4. From the **Default database option in use** drop-down on the Default option for feature in use form, select the database option or management pack that you want to map the feature to.

Note:

The **Default database option in use** drop-down is automatically filtered to display only the database options and management packs that the selected feature is associated with.

5. Select Update.

You automatically return to the Default option for feature in use list, which displays the new default mapping.

What to do next

To activate the new default mapping, you must run the SAM - Evaluate database option usage from Oracle GLAS data scheduled job. You can either run the job on-demand or wait for the next scheduled job. After the job completes successfully, usage data for the specified feature can then be applied to the newly mapped database option or management pack.

Unreported Database Options Usage report

You can use the Unreported Database Options Usage report to gain visibility into the Oracle Database options and management packs that are being used on undiscovered database instances. Although you cannot track usage for these database options and management packs, this report can help you determine any potential licensing implications that are associated with them.

Note:

This report is available only in the Software Asset Management classic application.

To view this report, navigate to **All > Reports > View/Run**. From the list of available reports, search for and select **Unreported Database Options Usage**. When the corresponding Edit report page opens, select **Run**.

Oracle Unreported Database Options Usage report

Field	Description
Database name	Undiscovered database instance on which the database option or management pack is being used.
Database option	Database option or management pack that is being used on the undiscovered database instance.
Host	Physical host on which the undiscovered database instance is running.
Server	Server on which the physical host is running.

Oracle reconciliation

Oracle reconciliation keeps your Oracle license positions accurate and up-to-date without requiring manual calculations. Reconciliation runs weekly or on-demand.

When you run an Oracle reconciliation, Software Asset Management determines the **Rights Used By** and **Rights Needed By** allocations for the named users, physical devices, and physical hosts that are accessing or running an Oracle product. You can use this information to keep your Oracle products in compliance.

Note:

Any allocations that you make on a physical host are considered valid. Software Asset Management marks these allocations as **Allocated in use** in the license workbench. Any allocations that you make on a virtual host, such as a virtual machine (VM), are considered invalid. Software Asset Management marks these allocations as **Allocated not in use**.

For Oracle database and WebLogic server licensing on VMware virtualization technology, you can select the level of aggregation for your reconciliation calculation using the *Select the level of aggregation for reconciling licenses for Oracle databases and WebLogic servers on VMware* property. You can also enable Software Asset Management to account for VM-Host affinity rules during Oracle reconciliation using the *Use host affinity for reconciling licenses for Oracle databases and WebLogic servers on VMware at the vCenter(s) aggregation level* property. See [Software Asset Management properties](#) for information on these properties.

Set up domain-specific reconciliation properties for Oracle

Use domain separation application properties for Software Asset Management to set up Oracle reconciliation properties for specific domains.

Before you begin

To set up domain separation application properties for Software Asset Management, you must activate the Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin on your ServiceNow instance.

Role required: sam_admin

About this task

Domain separation application properties are available for the Software Asset Management application. These properties correspond directly to the existing Software Asset Management properties and enable you to specify the domain that you want each property to apply to.

Domain separation is supported on the following Oracle reconciliation properties:

- **Select the level of aggregation for reconciling licenses for Oracle databases and WebLogic servers on VMware** (*com.snc.samp.oracle.reconlevel*)
- **Use host affinity for reconciling licenses for Oracle databases and WebLogic servers on VMware at the vCenter(s) aggregation level** (*com.snc.samp.oracle.hostaffinityenabled*)

For more information on the existing Software Asset Management properties, see [Software Asset Management properties](#). For more information on domain separation application properties, see [Domain separation application properties](#).

Procedure

1. From your ServiceNow[®] instance, navigate to **All > Software Asset Management > Administration > Application Properties**.
2. From the list of available application properties, select the application property that you want to modify.
3. In the Application Property Values related list, select the application property value that you want to modify.

If you do not have any existing application property values or you want to add additional application property values, select **New**.

4. On the form, fill in the fields.

Application Property Values form

Field	Description
Application Property	Name of the application property that the application property value applies to. This field populates automatically.
Value	Value of the application property. This value must be equivalent to one of the available values in the corresponding Software Asset Management property. For example, you can set the value of the <code>com.snc.samp.oracle.reconlevel</code> application property to <code>esx</code> , <code>cluster</code> , or <code>vcenter</code> . See Software Asset Management properties for more details on the available values in the Software Asset Management properties.
Domain	Domain that you want the application property value to apply to.

- Depending on whether you are updating an existing application property value or adding a new application property value, select either **Update** or **Submit**.
If you are updating an existing application property value, select **Update**. If you are adding a new application property value, select **Submit**.

Oracle Infrastructure report

You can use the Oracle Infrastructure report to gain visibility into your Oracle infrastructure. This report includes information about the Oracle databases that you are running and the configuration items that are supporting these databases.

Note:

The Oracle Infrastructure report is domain separated.

You can view the Oracle Infrastructure report in both the Software Asset Management classic application and the Software Asset Workspace.

To view this report in the Software Asset Management classic application, navigate to **All > Reports > View/Run** on your ServiceNow instance. At the top of the Reports page, select **All**. From the list of all available reports, locate and select **Oracle infrastructure report**.

To view this report in the Software Asset Workspace, navigate to **Workspaces > Software Asset Workspace** on your ServiceNow instance. After the Software Asset Workspace launches, navigate to **License usage > Reports > Oracle infrastructure report**.

Oracle Infrastructure Report

Column	Description
Required by (Device)	Configuration item, such as a server, cluster, vCenter, or datacenter, that the Oracle database, database option, or management pack is installed on. Select an entry to view additional information about the licensing requirements for that configuration item. See Licenses Required By form for more details.
Database option	Database option or management pack that is being used with the Oracle database.
Version	Oracle Database version that is installed on your configuration item.
Edition	Oracle Database edition that is installed on your configuration item.

Oracle Infrastructure Report (continued)

Column	Description
Software model	Software model that is associated with the Oracle database, database option, or management pack.
License metric result	License metric that the Oracle license is counted against when reconciliation runs. The options are Named User Plus and Per Processor .
Licenses required	Number of rights that are required for license compliance.
Model ID	Model ID of the configuration item that the Oracle database, database option, or management pack is installed on.
CPU manufacturer	Manufacturer of the CPU that is used by the configuration item.
CPU type	Type of CPU that is used by the configuration item.
CPU count	Number of CPUs within the configuration item.
CPU core count	Number of cores within each CPU.
CPU core thread	Number of threads that divide each core within a CPU.
Oracle core factor	Oracle processor core factor that is used to determine the number of required rights.
CPU speed (MHz)	Clock speed (in megahertz) of the CPU that is used by the configuration item.
Purchased	Number of rights that you have purchased.
Operating System	Operating system of the configuration item that the Oracle database, database option, or management pack is installed on.
Socket Count	Number of slots available on the motherboard.

Licenses Required By form

To view additional information about the licensing requirements for a specific configuration item, select the configuration item from the **Required by (Device)** field of the Oracle Infrastructure report. The corresponding Licenses Required By form opens, where you can view information about the license consumption, Oracle Database software installations, Oracle Database options and management packs, and database instances that are associated with the selected configuration item.

Licenses Required By form

Field	Description
Required by	Configuration item, such as a server, cluster, vCenter, or datacenter, that the Oracle database, database option, or management pack is installed on.
License metric result	License metric that the Oracle license is counted against when reconciliation runs. The options are Named User Plus and Per Processor .

Licenses Required By form (continued)

Field	Description
Licenses required	Number of rights that are required for license compliance.
Licensing status	Licensing status of the Oracle database, database option, or management pack.
License Consumption Details related list	
Required by	Configuration item that the Oracle database, database option, or management pack is installed on.
Model ID	Model ID of the configuration item.
Processor name	Name of the processors that are running on the configuration item.
Processors	Number of processors that are running on the configuration item.
Cores	Total number of cores within the configuration item.
CPU count	Number of CPUs within the configuration item.
CPU core count	Number of cores within each CPU.
CPU core thread	Number of threads that divide each core within a CPU.
Core Factor	Oracle processor core factor that is used to determine the number of required rights.
Licenses required	Number of rights that are required for license compliance.
CPU speed (MHz)	Clock speed (in megahertz) of the CPU that is used by the configuration item.
Purchased	Number of rights that you have purchased.
Operating System	Operating system of the configuration item.
Options related list	
<p>i Note: This related list appears only when the software model for the required license is associated with an Oracle Database option or management pack.</p>	
Instance	Database instance that accesses and manages data that is related to your Oracle Database option or management pack.
Option	Oracle Database option or management pack that is installed on your configuration item.
Licensable	Value that indicates whether the Oracle Database option or management pack is licensable. If the option or management pack is licensable, the value is automatically set to true . If the option or management pack is not licensable, the value is automatically set to false .
Currently used	Value that indicates whether the Oracle Database option or management pack has current or past usage. If the option or management pack has any current or

Licenses Required By form (continued)

Field	Description
	past usage, the value is automatically set to In Use . If the option or management pack does not have any current or past usage, the value is automatically set to Not In Use .
First usage date	Date on which you first started using the Oracle Database option or management pack.
Last usage date	Date on which you last used the Oracle Database option or management pack.
Installs related list	
<p>i Note: This related list appears only when the software model for the required license is associated with an Oracle Database software installation.</p>	
Display name	Name of the Oracle Database software installation.
Publisher	Publisher of the installed software. This field is always set to Oracle .
Version	Oracle Database version that is installed on your configuration item.
Discovery model	Discovery model that is associated with the Oracle Database software installation.
Installed on	Configuration item that the Oracle Database software is installed on.
Assigned to	User that is associated with the Oracle Database software installation.
Instances related list	
<p>i Note: This related list appears only when the software model for the required license is associated with an Oracle Database software installation.</p>	
Name	Name of the database instance that accesses and manages the data in your Oracle database.
Environment	Environment that the database instance resides in.
Version	Version of the database that the database instance accesses and manages.
Vendor	Vendor of the database that the database instance accesses and manages. This field is always set to Oracle .

Oracle DB Server Deployments per Agreement report

You can use the Oracle DB Server Deployments per Agreement report to gain visibility into your Oracle Database server deployments across hybrid infrastructures, based on the agreement type.

i Note:
The Oracle DB Server Deployments per Agreement report is available only in the Software Asset Workspace. This report is not available in the Software Asset Management classic application.

To view this report, launch the Software Asset Workspace by navigating to **Workspaces > Software Asset Workspace** on your ServiceNow instance. From the Software Asset Workspace, navigate to **License usage > Reports > Oracle DB Server deployments per agreement**.

Oracle DB Server Deployments per Agreement report

Field	Description
Name	Name of the Oracle Database server deployment.
Product	Oracle product that is running within your deployment. This field is always set to DB Server .
Version	Oracle Database version that is installed or running on your servers.
Edition	Oracle Database edition that is installed or running on your servers.
License metric	License metric that the Oracle Database license is counted against when reconciliation runs. The options are Named User Plus and Per Processor .
Agreement type	Agreement type for your Oracle Database server deployment. The options are ULA (Unlimited License Agreement) and Generic .
Cloud provider	Cloud provider through which your Oracle Database servers are deployed.
Cloud service type	Cloud service model through which your Oracle Database servers are deployed. The options are PaaS and IaaS .

Software Publisher Analytics dashboard for Oracle in Software Asset Management classic

View compliance analysis results related to Oracle on the Software Publisher Analytics dashboard in the Software Asset Management classic application.

Access the Software Publisher Analytics dashboard by navigating to **All > Software Asset > Publisher Overview**.

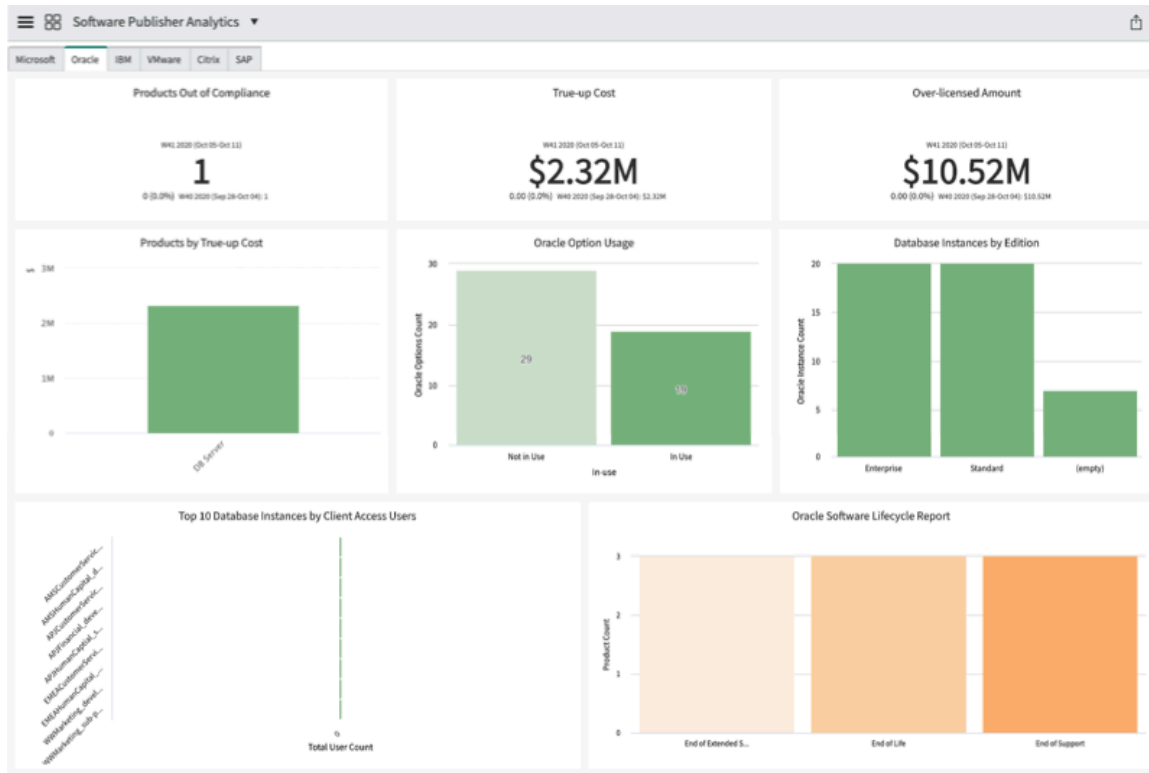

Note:

The add-on Oracle publisher pack (com.snc.samp.oracle) plugin must be installed to view the Oracle dashboard tab.

Results are updated whenever a new reconciliation result is available. You can save charts in PNG or JPG format.

Oracle dashboard

You can manage Oracle Server Software, such as Database Server, using the Oracle publisher pack.

Oracle tab

Report	Source list	Description
Products out of Compliance	Product Results	Number of products that have at least one software model out of compliance. Select the report to view the results in the License Workbench .
True-up Cost	Product Results	Cost to be compliant based on the average prices for entitlements for the rights.
Over-Licensed Amount	Product Results	Cost of licenses owned but not being used.
Products by True-up Cost	Product Results	Greatest true-up costs by product.
Oracle Options Usage	Oracle Options	Installed Oracle licenses versus licenses in use (true versus false).
Database Instances by Edition	Oracle Instances	Total number of database instances by database edition.
Top 10 Database Instances by Client Access Users	Client Access	Database instances with the greatest number of client access users.
Oracle Software Lifecycle Report	Software Lifecycle Report	Number of products in each software lifecycle phase,

Oracle tab (continued)

Report	Source list	Description
		including End of Extended Support, End of Life, and End of Support.

Publisher overview for Oracle in the Software Asset Workspace

View license usage information related to Oracle in the publisher overview for Oracle in the Software Asset Workspace.

From the Software Asset Workspace, access the Oracle publisher overview by navigating to **License usage > Publishers** and then selecting **Oracle** from the list of available software publishers.

Results are updated whenever a new reconciliation result is available.

You can view a summary of your license usage information in the Summary section of the Oracle publisher overview.

Oracle Summary

Report	Description
True-up cost	Cost to be compliant based on the average price of rights in your Oracle software entitlements.
Potential savings	Potential cost savings for your Oracle licenses.
Actual savings	Actual cost savings for your Oracle licenses.
Unlicensed entities	Summary of your unlicensed entities. This summary includes the following information:

Oracle Summary (continued)

Report	Description
	<ul style="list-style-type: none"> • Unlicensed installs: Total number of unlicensed Oracle software installations. Select the number to view the complete list of unlicensed Oracle software installations. • Installs requiring action: Total number of Oracle software installations that you must take action on. Select the number to view the complete list of these Oracle software installations. • Unlicensed subscriptions: Total number of unlicensed Oracle subscriptions. Select the number to view the complete list of unlicensed Oracle subscriptions. • Unlicensed client access: Total number of unlicensed Oracle client access records. Select the number to view the complete list of unlicensed Oracle client access records. • Unlicensed options: Total number of unlicensed Oracle Database options and management packs. Select the number to view the complete list of unlicensed Oracle Database options and management packs.
Progress indicators	<p>Summary of your license compliance progress.</p> <p>This summary includes the following indicators:</p> <ul style="list-style-type: none"> • Ignored installs: Total number of Oracle software installations that were ignored during reclamation. Select the number to view the complete list of ignored Oracle software installations. • Removal candidates: Total number of Oracle removal candidates. Select the number to view the list of all software removal candidates. • Invalid configurations: Total number of Oracle removal candidates with invalid configurations. Select the number to view the complete list of these Oracle removal candidates.
License types of Oracle Database on MS Azure	<p>Number of software installations for each license type that you are using in Microsoft Azure cloud environments. License types include BYOL and License Included.</p>
License types of Oracle Database on AWS	<p>Number of software installations for each license type that you are using in AWS cloud environments, based on the cloud service model through which your Oracle Database servers are deployed. License types include BYOL and License Included. Cloud service models include PaaS (Platform as a Service) and IaaS (Infrastructure as a Service).</p>

For more details on the license usage information that is provided in the publisher overview, see [License usage publisher fields in workspace](#).

Software Asset Management publisher pack for SAP

Use the Software Asset Management publisher pack for SAP to manage and optimize your SAP licenses. Get comprehensive visibility into your SAP license compliance and uncover potential savings.

i Note:

You can use the SAP publisher pack to manage and optimize licensing for SAP NetWeaver 7.4, SAP_BASIS 740, and later versions.

i Note:

To use the publisher pack, install the Software Asset Management Professional for SAP plugin (com.sn_samp_sap).

Supported license types

The SAP publisher pack supports licensing for named users, engine measurement, third-party access, and full-usage equivalent.

Named Users

SAP named users are the members in your organization who use SAP applications. You can purchase different types of named user licenses and then assign each license to a named user.

The SAP publisher pack supports named user licenses for both SAP ERP Central Component (ECC) applications and SAP S/4HANA applications. Different named user license types are supported based on the application type. SAP ECC applications support various named user license types, including Professional, Limited Professional, and Employee Self Service. SAP S/4HANA applications support only the Developer Access, Enterprise Management for Professional Use, Enterprise Management for Functional Use, Enterprise Management for Productivity Use, Technical SAP Engine User, and Technical Use named user license types. The ServiceNow AI Platform supports all named user types for both SAP ECC applications and SAP S/4HANA applications.

Engines (automated, calculated, and self-declared)

SAP engines, also known as packages, are optional applications that require additional licenses. Every engine has a unique license metric that is used to calculate the license usage for the engine. Examples of license metrics include the number of employees or number of contracts.

License usage is calculated through either an automated SAP engine measurement, calculation based on multiple engine measurements plus an indicator, or a manual self-declaration process.

- If an engine is supported by the SAP engine measurement process, Software Asset Management automatically calculates the license usage for that engine.
- If an engine is identified to be composed of multiple engine measurements, Software Asset Management calculates this value if the indicator license metric is also available.
- If an engine isn't supported by the SAP engine measurement process, you must manually enter the license usage information for that engine using the self-declaration process. For information on how to self-declare your SAP engine license usage, see [Self-declaring SAP engine license usage](#).

To view the complete list of engines that are supported by each process, see [Engine & Self-Declaration Product Measurement](#)  in the SAP Support Portal.

i Important:

You must have an SAP Support Portal account to access the SAP Support Portal.

The SAP publisher pack supports engine licenses for both SAP ERP Central Component (ECC) applications and SAP S/4 HANA applications.

Note:

Starting with the Yokohama release, revenue-based licensing support is enabled for SAP Engine products. You can use higher value revenue-based products for purchased rights and unit cost. For details on enabling the support for revenue-based licensing, see the knowledge base article [KB1641524](#).

Digital Access

The Digital Access license applies to indirect usage of SAP systems by people or third-party applications without logging in to the system directly. A few examples for indirect usage of SAP systems are as follows:

- Using a third-party application to perform actions in the SAP system
- Entering data into the SAP system from a third-party application
- Viewing data in the SAP system from a third-party application

When you have many third-party product integrations with SAP systems, you can avoid unnecessary consumption of your named user license by purchasing Digital Access licenses. In this licensing model, the usage of SAP applications is licensed by the count of the predefined documents created by the third-party application. The details of the predefined document types are stored in the SAP Document Type [samp_sap_document] table that's installed with the Software Asset Management Professional for SAP (com.sn_samp_sap) plugin.

SAP Document types

Document name	Document multiplier
Sales document	1
Purchase document	1
Invoice document	1
Manufacturing document	1
Material document	0.2
Quality Management document	1
Service and Maintenance document	1
Financial document	0.2
Time Management document	1

The SAP system stores the digital access data of the supported document types for different users and client systems. Make sure you have any of the following tools to pull the digital access data from the SAP system to your ServiceNow instance:

- SAP Passport tool
- SAP Estimation tool

Note:

When you purchase an SAP Digital Access license, these tools are available for installation without any additional cost. For details on the SAP tools, see [SAP Help Portal](#).

When any of the predefined document types are created in the SAP system through a third-party application, the Digital Access licensing cost is applicable. However, there are no additional charges associated with reading, updating, or deleting these documents.

For the SAP Digital Access software model, digital access usage is calculated as follows:

1. The total count of documents of a particular document type created on each SAP system by all your users is calculated.

Consider a scenario where User A created 5 Material documents, and User B created 5 Material and 10 Sales documents on an SAP system. The total count of Material documents is 10 and Sales documents is 10.

2. The license consumption is calculated by multiplying the total count of a particular document type by the Document multiplier.

Based on the scenario mentioned in the preceding step, licenses consumed by Material documents is 2 (10×0.2) and by Sales documents is 10 (10×1). So, the total Digital Access license consumed is 12.

Note:

The SAP Digital Access software model is installed with the Software Asset Management Professional for SAP (com.sn_samp_sap) plugin.

Reconciliation for the SAP Digital Access software model is done by comparing the Purchased rights with the licenses that you consumed.

Full Usage Equivalent (FUE)

The FUE license applies to the users of SAP S/4HANA Cloud applications. FUE is granted to the number of users that are authorized to access specified solution capabilities. A single FUE can be allocated to different use types with a specific weighting factor.

The FUE framework for licensing provides the required level of access and flexibility to different cloud use types. An FUE license can be distributed to any of the four different cloud use types that have a specified weighting factor.

- **Self-Service Use:** This FUE applies to users that are using the SAP S/4HANA Cloud application through self-service portals, providing access to basic business processes, data viewing, and report generation. This use type is intended for users who mainly access information or engage with the application via predefined self-service features. Additionally, it's used to display and manage use rights, data consumption, and lightweight tasks.
- **Core Use:** This FUE includes all rights from the Self-Service use type and is designed for users who need restricted access to the SAP S/4HANA Cloud application. Core users can view data, run reports, and run basic business processes. This use type is ideal for users who require access to specific information or perform routine tasks without needing comprehensive functionality.

- **Advanced Use:** This FUE includes all rights from the Core use type and grants users full access to the SAP S/4HANA Cloud application. This type of access enables users to create and edit data, run reports, and use all available business processes. It's assigned to users who need extensive functionality that is crucial for managing key business operations.
- **Development Use:** This FUE grants authorized users the license to access the development tools provided with the SAP S/4HANA Cloud ABAP Environment.

The details of the predefined cloud use types are stored in the SAP Cloud Use Types [samp_sap_cloud_use_type] table that's installed with the SAP S/4HANA spoke plugin. For more information, see [License calculation for SAP cloud use types](#).

SAP S/4HANA cloud user types and weighing factors

Cloud user type	Weighing factor
Development User	One FUE = 0.5
Advanced User	One FUE = 1
Core User	One FUE = 5
Self-Service User	One FUE = 30

An example of FUE license allocation to different cloud user types:

40 SAP S/4HANA Cloud users for advanced use = 40 FUE licenses

75 SAP S/4HANA Cloud users for core use = 15 FUE licenses

270 SAP S/4HANA Cloud users for self-service use = 9 FUE licenses

SAP connection with the ServiceNow AI Platform

To start connecting your SAP systems and your ServiceNow instance, [deploy the ABAP program for SAP](#). Then, follow the steps to [establish an SAP connection](#).

The Software Asset Management publisher pack for SAP uses a centralized design. When you import transport files into an SAP client that is considered a central system, the client uses the custom program-selected Remote Function Call (RFC) connection list to connect all other clients through RFC from the central system. It then fetches data to store in central system custom tables. To import the transport files, use either the SAP Solution Manager or another SAP client that has RFC connections activated to fetch data into a central system.

After the connection is established, data is pulled into your ServiceNow instance from your SAP system. For a list of all data that is pulled, see [Tables installed with the SAP publisher pack](#).

SAP data is scheduled to be pulled weekly. User activity data, web activity data, and engine usage data are pulled monthly. All user and web activity is deleted after 90 days. Engine usage measurement records in the SAP License Metric Measurement table [samp_sap_license_metric_measurement] are deleted after one year.

When SAP data enters the ServiceNow AI Platform, it's initially stored in staging tables before it's transferred to the final SAP tables. To edit the tables where data transfer takes place or to view the transfer logic, see [transform maps](#) .

Note:

The user activity and web activity transform maps aren't enabled by default because they may cause performance issues due to the large amount of data. However, you can manually enable these transform maps. To enable the activity transform maps, navigate to **All > Software Asset > SAP Compliance and Optimization > SAP Connections** and select the connection. In the Configuration section, set the **Fetch activity** field to **True** and then select **Update**.

View SAP license usage and compliance

View your SAP license costs, usage, and compliance using the [Software Publisher Analytics dashboard](#) (Software Asset Management classic application) or [publisher overview](#) (Software Asset Workspace). The dashboard and overview also show how you can optimize license consumption by reassigning user roles in your SAP system. You can view the license optimization details in the Software asset analytics view. For more details, see [Publisher optimizations for SAP](#).

Reconciliation runs weekly or on demand to determine your license compliance position for all of your SAP products. Reconciliation compares your purchased rights recorded in software entitlements with actual usage data pulled from your SAP systems. You can view reconciliation results for SAP in the License usage view of the Software Asset Workspace. The License usage view shows unlicensed users and engines, digital access licenses available and required, and remediation options to make your license position compliant, potential savings, and more. For more information on the License usage view, see [License usage view](#).

To view Software license compliance position reports for SAP, navigate to **License usage > Reports > Software license compliance position** in the Software Asset Workspace.

Tables installed with the SAP publisher pack

Tables are installed with the Software Asset Management Professional for SAP plugin. The tables store data pulled from the SAP systems.

Note:

Use the Application Files table to see all components installed with the SAP publisher pack. For more information, see [Find components installed with an application](#).

Demo data is available for the SAP publisher pack.

Tables

Table	Description
Named User Type Role [samp_named_user_type_has_role]	Roles assigned to each named user type.
SAP Client [samp_sap_client]	Remote Function Call (RFC) destination connecting Advanced Business Application Programming (ABAP) systems to external systems. To view the table, navigate to SAP Compliance and Optimization > Administration > SAP Clients .
SAP Connection [samp_sap_connection]	SAP system connections.

Table	Description
	To view the table, navigate to SAP Compliance and Optimization > Administration > SAP Connections .
SAP Engine Usage [samp_sap_sw_client_access]	Most recent engine usage measurements for SAP clients based on the license metric for each engine.
SAP License Metric [samp_sap_license_metric]	<p>This table is populated by the ServiceNow Content Service. It's a list of all license metrics that are used by SAP engines.</p> <p>To view the table, navigate to SAP Compliance and Optimization > Administration > Engines.</p> <p>Note: The table is periodically updated with new data from the Content Service. New license metrics may be added, and existing license metrics may be deactivated to reflect current SAP licensing. To view your software models that have deactivated license metrics, navigate to SAP Compliance and Optimization > Administration > Software Models with Deactivated SAP License Metrics.</p>
SAP License Metric Measurement [samp_sap_license_metric_measurement]	<p>Monthly engine usage measurements for SAP clients based on the license metric for each engine.</p> <p>To view the table, navigate to SAP Compliance and Optimization > Licensing > All SAP Engines.</p>
SAP Roles [samp_sap_role]	SAP roles pulled from the SAP systems.
SAP System User [samp_sap_system_user]	<p>Discovered users pulled from the SAP systems.</p> <p>To view the table, navigate to SAP Compliance and Optimization > Licensing > All SAP Users.</p> <p>Note: The Discovered Users table [samp_discovered_user] maps the discovered SAP users to system user records in the Users table [sys_user].</p>
SAP User Activity [samp_sap_user_activity]	Data related to a user's activity on an SAP client, such as the amount of time spent on an SAP system or the number of database records created or updated.
SAP User Roles [samp_sap_user_has_role]	SAP users and their assigned roles.
SAP Web Activity [samp_sap_web_activity]	Data related to web activity or RFC connections performed in the SAP client, such as the number

Table	Description
	of calls or amount of data received or sent by each connection.
SAP User Active Transactions [samp_named_user_type_has_transactions]	Data related to a named user's transaction activity on an SAP client. User transaction activity is based on SAP transaction codes, which are shortcuts for performing transactions or tasks on an SAP client. For example, the ME21N transaction code enables you to create a purchase order in SAP.
SAP USMM Rules [samp_sap_usmm_rule]	USMM rules information from all connected SAP applications.

Note:

Staging tables for SAP data are also installed.

Data from SAP is also stored in some additional tables that aren't part of the SAP publisher pack.

- Price list data is pulled and stored in the Price List table [samp_price_list].

To view the table, navigate to **SAP Compliance and Optimization > Administration > Price Lists**.

- Named user types are pulled and stored in the Named User Type table [samp_named_user_type].

To view the table, navigate to **SAP Compliance and Optimization > Administration > Named User Types**.

- The Digital Access details such as Client, User name, Document type, Document type count, and Measured by are pulled from the SAP systems and stored in the SAP Digital Access [samp_sap_digital_access] table.

To view the data in the table, navigate to **All > Software Asset Workspace > License operations > Discovery > SAP Digital Access Data**.

Deploy the ABAP program for SAP

To begin establishing a connection between your SAP system and your ServiceNow instance, deploy the Advanced Business Application Programming (ABAP) program. Deploying the ABAP program allows data to be shared between SAP and your ServiceNow instance.

Before you begin

To access the ABAP program, download the SAP ABAP for Software Asset Management application from the [ServiceNow Store](#). Make sure you download the application version that is compatible with the Yokohama release.

Role required: sam_admin

About this task

To deploy the ABAP program, import the transport files that are provided through the SAP ABAP for Software Asset Management application and then configure a service provider with the service-oriented architecture (SOA) Manager.

Note:

If you upgrade your ServiceNow instance, you must download and deploy the version of the ABAP program that is compatible with the new release. You must then reconfigure a service provider with the SOA Manager.

For SAP setup information, see [KB0813999](#).

For more information on SAP and its related tools, refer to the [SAP Help Portal](#).

Procedure

1. In your SAP system, import the transport files using the SAP Transport Management System (STMS).
 - a. Copy and extract the COFILE and DATA files to your directory.
 - b. Start STMS and select **Import Overview**.
 - c. Double-click the target system, select **Extras > Other Requests > Add**, and then enter the transport request number.
 - d. Highlight the request and select **Request > Import**.
 - e. From the Import Transport Request window, enter the client number in the **Target Client** field.
 - f. Select the Options tab, and then select the **Ignore Invalid Component Version** check box.
 - g. Select **OK**.
2. In your SAP system, configure a service provider with the SOA Manager.
 - a. Start the SOA Manager and select **Service Administration > Web Service Configuration**.
 - b. Select **Service Definition** from the **Search By** field.
 - c. Enter the service definition location in the **Search Pattern** field.
 - d. Select **Go**.
 - e. From the Search Results pane, select the service definition row, and then select **Apply Selection**.
 - f. From the Configurations tab, select **Create**.
 - g. Complete the following fields.

SOA Management dialog box

Field	Description
Service Name	Name of the service.
Description	Description of the service.
New Binding Name	Name of the binding.

- h. Select **Apply Settings**.
- i. Select **Provider Security > Message Authentication**, and then select the **User ID/Password** check box.
- j. Select **Save**.

k. Select Overview > Open Design time WSDL document.

A browser window opens and a new WSDL is generated.

l. Select Open Service WSDL Generation.

m. Copy the link from the WSDL URL for Binding field.

3. Verify the RFC connection.

What to do next

Return to your ServiceNow instance to establish your SAP connection.

Establish an SAP connection

After you have deployed the Advanced Business Application Programming (ABAP) program in your SAP system, create a connection profile to establish a connection between your SAP system and your ServiceNow instance.

Before you begin

Before establishing a connection between SAP and your ServiceNow instance, check if your SAP system network is accessible to external applications like ServiceNow. If external connections are blocked, you can install a MID Server. A MID Server enables communication and data movement between a ServiceNow instance and external applications or data sources. For instructions, see [Installing the MID Server](#).

If you already have a MID Server installed in the network and connected to your ServiceNow instance, this SAP connection will automatically use it.

Role required: admin

Procedure

1. Navigate to **All > SAP Compliance and Optimization > Connection Setup** and select **New**.
2. On the form, fill in the fields.

SAP Connection Setup form

Field	Description
Name	Name of connection profile.
Default price list	Default price list that should be considered for reconciliation.
WSDL	<p>Web Service Description Language (WSDL) URL from the SOA manager, that includes an IP address, that is used to connect to the SAP system.</p> <p>Note: Do not change the SAP WSDL name. The WSDL service definition name must be /NOW/SAMP and the service binding name must be NOW_SAMP. The only WSDL name that can be changed is the WSDL generation name.</p>
User name	User name used to connect to the SAP system.
Password	Password used to connect to the SAP system.

3. Select **Submit.**

The initial connection is established.

4. Select the SAP connection and review the fields on the record.

SAP Connection record

Field	Description
Name	Name of the connection profile. The value is generated in the SAP Connection Setup form.
Default price list	Default price list that should be considered for reconciliation. The value is generated in the SAP Connection Setup form.
Use USMM Role Optimization	Check box to specify USMM role based optimization that must be applied during reconciliation.
Last run	Date and time that data was last pulled for the SAP connection.
SOAP message	SOAP message that has the SAP WSDL information.
Credential alias	Connection alias that contains the credentials for the connection. The connection alias resolves your connection and credentials at runtime.
Active	Option that indicates that the SAP connection is active.
User Mapping	
SAP user field	SAP users across different clients that are mapped to a corresponding ServiceNow user.
User field	ServiceNow user field. Note: Changing the values in the User Mapping fields after data is pulled causes the mapping between discovered users and system users to be lost. The mapping between discovered users and the Rights used by and Rights needed by fields is also lost.
Configuration	
Fetch roles	Controls the data pull from SAP for roles data.
Fetch engine usage	Controls the data pull from SAP for engine usage data.
Fetch activity	Controls the data pull from SAP for user activity and web activity data.
Fetch user transactions	Controls the data pull from SAP for user transaction activity data.

5. In the SAP Credentials related list, view the credentials you used to create the connection.

Note:

Only one credential record should be active for a given SAP connection. To determine the roles associated with your credentials, contact your SAP Basis administrator. Your administrator assigns respective roles to your SAP user ID credentials.

- To test your SAP connection and if you're running the latest version of the ABAP program, select the **Test SAP Connection and Version** related link.

Note:

If you upgrade your ServiceNow instance, you must download and deploy the new version of the ABAP program and reconfigure a service provider with the SOA Manager.

- To send a request to the custom ABAP program to collect the SAP data into the custom tables again, select the **Refresh data in SAP** related link.
- If the SAP data you pulled is corrupted and you need to see current data, select the **Pull all SAP Data to ServiceNow** related link.
SAP data is scheduled to be pulled regularly.
- View SAP clients in the **SAP Clients** related list.
The SAP clients are generated when SAP data is pulled during the scheduled job.
- Select **Update**.

Result

You can now begin creating software models and entitlements.

Create entitlements for SAP

Create software entitlements to record your license information for SAP products. You can create entitlements individually or import them from a spreadsheet.

Before you begin

Role required: sam_user or sam_admin

Note:

The sam_admin role is required to import entitlements.

Important:

You can create and import entitlements in both the Software Asset Management classic application and the Software Asset Workspace. The following steps provide details on creating entitlements in the Software Asset Management classic application. For details on creating entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#). For details on importing entitlements in the Software Asset Workspace, see [Import bulk entitlements in workspace](#).

About this task

The following steps describe information specific to SAP. For general instructions on creating software entitlements, see [Create entitlements in Software Asset Management classic](#).

Procedure

- Navigate to **All > Asset > Portfolios > Software Entitlement** and select **New**.
- On the form, fill in the fields.

Note:

Only information specific to SAP software entitlements is shown in the following table. For a detailed description of all software entitlement fields, see [Software entitlement fields](#).

Software Entitlement form

Field	Value
Metric group	SAP
License metric	<p>Select any of the following values:</p> <ul style="list-style-type: none"> ○ Named User: To license the number of named users that can be assigned a given Named User Type. The Named User Type is defined by the software model linked to the entitlement. ○ Engine Measurement: To license the amount of usage for an SAP engine. ○ Digital Access: To license the indirect usage of SAP applications through a third-party application or a non-SAP intermediary software based on the count of documents created by the third-party application ○ Full Usage Equivalent: To license the number of users that are authorized to access specified solution capabilities of SAP S/4HANA Cloud Public Edition. Full Usage Equivalent (FUE) can be allocated to different user types with a specific weighing factor. <p>When you select Full Usage Equivalent in the License metric field, the license type is automatically set to Subscription.</p> <p>The type of usage is defined by the SAP license metric field on the software model.</p> <p>For more information about license metrics, see Software license metrics.</p>

3. Select **Save**.

4. After the form reloads, select **Publish**.

Create software models for SAP

Create software models to record SAP product information.

Before you begin

Role required: sam_user

i Important:

You can create software models in both the Software Asset Management classic application and the Software Asset Workspace. The following steps provide details on creating software models in the Software Asset Management classic application. For details on creating software models in the Software Asset Workspace, see [Create software models in workspace](#).

About this task

Software models are automatically created for engines and license metrics that are pulled from your SAP systems. You can manually create additional software models for SAP products as needed.

The following steps describe information that is specific to SAP. For general instructions on creating software models, see [Create software models in Software Asset Management classic](#).

Procedure

1. Navigate to **All > Product Catalog > Product Models > Software Models** and select **New**.
2. On the form, fill in the fields.

i Note:

Only the fields that are specific to SAP software models are shown below. For detailed descriptions of all software model fields, see [Software model fields](#).

Software Model form

Field	Description
Named user type	SAP named user type. i Note: This field appears only when Named Users is selected from the Product field.
Price List	Software group that corresponds to the named user type. i Note: This field appears only when Named Users is selected from the Product field.
SAP license metric	License metric that is used to calculate license consumption for an engine. Examples of license metrics are number of employees or number of contracts. i Note: This field appears only when an SAP engine is selected from the Product field.
Is relevant	Some SAP engines don't require additional licensing. Select the check box if the engine requires additional licensing. Software models with Is relevant set to false will always be considered compliant by reconciliation. i Note: This field appears only when an SAP engine is selected from the Product field.

Field	Description
Threshold	<p>Some SAP engines allow a certain amount of unlicensed usage before your licence position becomes not compliant. The threshold defines the allowed usage and is specific to each engine and license metric. If your engine usage exceeds your licensed amount but is less than the threshold value, the software model is still considered compliant by reconciliation.</p> <p>Note: This field appears only when an SAP engine is selected from the Product field.</p>

3. Select **Submit**.

What to do next

Create a software entitlement to record your licenses for the software model.

Create a custom SAP named user type

Create a custom SAP named user type so that you can track and manage your SAP licenses based on the named user type that is specific to your SAP system.

Before you begin

Role required: sam_admin

Important:

You can create custom SAP named user types in both the Software Asset Management classic application and the Software Asset Workspace. Use the following steps to create custom named SAP user types in the Software Asset Management classic application. For details on how to create custom named user types in the Software Asset Workspace, see [Create a custom named user type in workspace](#).

About this task

Note:

The custom SAP named user types that you create directly on your ServiceNow instance are not reflected in your SAP system. You must make the same changes in your SAP system.

Procedure

1. On the page header of your ServiceNow® instance, select **All**.
2. In the menu navigation filter, enter `samp_named_user_type_list.do`. The Named User Types [samp_named_user_type] table opens.
3. Select **New**.
4. On the form, fill in the fields.

Custom Named User Type form

Field	Description
Name	Name of custom named user.
Price list	Default price list.
Is developer	Option that indicates the user has a developer role.
Grants access to	Grant access to a named user type.

Field	Description
Value	Value associated with the named user type. This value can be either numbers or letters.
Rank	Priority of the named user type during reconciliation. Lower rank values take precedence.
Is licensable	Option that indicates the named user type license status.
Active	Option that indicates if the named user type is active.

5. Select **Submit.**

Result

The named user type is added to the Named User Types [samp_named_user_type] table.

What to do next

After you have added the custom named user, create a software model designating the custom named user in the form.

Map a role to a named user type

You can optimize your SAP licenses by mapping roles to a named user type. During reconciliation, discovered user roles and their assigned named user types are compared against these roles to identify user that can be given a lower named user type.

Before you begin

Role required: sam_admin

About this task

Procedure

1. On the page header of your ServiceNow® instance, select **All**.
2. In the menu navigation filter, enter `samp_named_user_type_list.do`.
The Named User Types [samp_named_user_type] table opens.
3. Select the named user type that you want to map a role to.
4. In the **SAP Roles** related list, select **Edit...**
5. In the Collection list on the Edit Members form, search for and select the role that you want to map to the named user type.
6. Select the Add icon () to move the selected role to the SAP Roles List.
7. Repeat steps 5 and 6 for each role that you want to map to the named user type.
8. Select **Save**.

Create custom SAP price lists

Create custom SAP price lists so that you can track and manage SAP licenses based on the contracts that are specific to your SAP system.

Before you begin

Role required: sam_admin

Note:

The custom SAP named user types that you create directly on your ServiceNow instance aren't reflected in your SAP system. You must make the same changes in your SAP system.

i Important:

You can create custom SAP price lists in both the Software Asset Management classic application and the Software Asset Workspace. Use the following steps to create custom SAP price lists in the Software Asset Management classic application. For details on how to create custom SAP price lists in the Software Asset Workspace, see [Create custom SAP price lists in workspace](#).

Procedure

1. On the page header of your ServiceNow instance, select **All**.
2. In the menu navigation filter, enter `samp_price_list_list.do`.
The Price Lists [samp_price_list] table opens.
3. Select **New**.
4. On the form, fill in the fields.

Custom Price List form

Field	Description
Name	Name of the price list.
Id	Unique identifier for the price list.
Default named user type	Default named user type for the price list.
Active	Option that indicates if the price list is active.

5. Select **Submit**.
You automatically return to the Price Lists [samp_price_list] table.
6. **Optional:** Associate SAP named user types with the custom SAP price list.
 - a. From the Price Lists [samp_price_list] table, select the custom SAP price list that you created.
The Custom Price List record opens.
 - b. In the **Named User Types** related list, select **New**.
 - c. On the form, fill in the fields.

Create Custom Named User Type form

Field	Description
Name	Name of the named user type.
Price List	Price list that you want to associate the named user type with. This field populates automatically.
Is developer	Option that indicates if users with this named user type have a developer role.
Grants access to	Applications that the named user type has access to.
Value	Alphanumerical value that identifies the named user type.
Rank	Priority of the named user type during reconciliation. Lower rank values correlate with a higher priority during reconciliation.

Field	Description
Is licensable	Option that indicates if the named user type can be licensed.
Active	Option that indicates if the named user type is active.

d. Select **Submit**.

e. Repeat steps a to c for each custom named user type that you want to add.

Import custom SAP named user types

Import custom SAP named user types into your ServiceNow® instance so that you can track and manage SAP licenses based on the named user types that are specific to your SAP system.

Before you begin

Role required: admin

Procedure

1. Go to [KB1299127](#)  to download the Microsoft Excel spreadsheet template (imp_samp_sap_custom_nut.xlsx) that you can use to import custom SAP named user types into your ServiceNow instance.
2. Fill in the spreadsheet with all the custom SAP named user types that you want to import. The **Client**, **System**, **Named user type value**, and **Named user type name** fields are required for every entry on the spreadsheet.
3. From your ServiceNow instance, open the SAP Custom Named User Types [imp_samp_sap_custom_nut] table.

 **Note:**

The Application Scope of your ServiceNow instance must be set to **Software Asset Management Professional for SAP**.

- a. On the page header of your ServiceNow® instance, select **All**.
 - b. In the menu navigation filter, enter `imp_samp_sap_custom_nut_list.do`. The SAP Custom Named User Types [imp_samp_sap_custom_nut] table opens.
4. Right-click the table header and then select **Import**.
 5. On the form, fill in the fields.

Import external data into SAP Custom Named User Type form

Field	Description
Do you want to insert or update data?	Option that indicates whether you're inserting new data or updating existing data in the SAP Custom Named User Types [imp_samp_sap_custom_nut] table.
Do you want to create an Excel template to enter data?	Option to generate the Microsoft Excel spreadsheet template that you can use to insert or update data in the SAP Custom Named User Types [imp_samp_sap_custom_nut] table. Enable this option only if didn't already download the spreadsheet template in step 1 .
Step 1: Create an Excel template file to enter data	

Field	Description
<p>Note: This form section appears only when you enable the Do you want to create an Excel template to enter data? option.</p>	
Include all fields in the template	Option to include all available fields in the Microsoft Excel spreadsheet template.
Create Excel Template	Option to generate the Microsoft Excel spreadsheet template.
Step 2: Upload the template file	
Excel template file	Microsoft Excel spreadsheet that contains the named user types that you want to insert or update in the SAP Custom Named User Types [imp_samp_sap_custom_nut] table.

6. Select Upload.

7. On successful upload, select Preview Imported Data.

The Imp Tmpl Samp Sap Custom Nuts page opens.

8. Verify that the correct number of custom SAP named user types were uploaded and then select Complete Import.

The custom SAP named user types are imported into your ServiceNow® instance. The named user types are then added to the Named User Types [samp_named_user_type] table.

Import custom SAP price lists

Import custom SAP price lists into your ServiceNow® instance so that you can track and manage SAP licenses based on the contracts that are specific to your SAP system.

Before you begin

Role required: admin

Procedure

- Go to [KB1299127](#) to download the Microsoft Excel spreadsheet template (imp_samp_sap_custom_price_list.xlsx) that you can use to import custom SAP price list data into your ServiceNow instance.
- Fill in the spreadsheet with all the custom SAP price list data that you want to import. The **Client**, **System**, and **Price list value** fields are required for every entry on the spreadsheet.

Note:

You must fill in a separate spreadsheet for each custom SAP price list that you want to import data for.

- From your ServiceNow instance, open the SAP Custom Price List Data [imp_samp_sap_custom_price_list] table.

Note:

The Application Scope of your ServiceNow instance must be set to **Software Asset Management Professional for SAP**.

- a. On the page header of your ServiceNow instance, select **All**.
 - b. In the menu navigation filter, enter `imp_samp_sap_custom_price_list_list.do`. The SAP Custom Price List Data [imp_samp_sap_custom_price_list] table opens.
4. Right-click the table header and then select **Import**.
5. On the form, fill in the fields.

Import external data into SAP Custom Price List Data form

Field	Description
Do you want to insert or update data?	Option that indicates whether you're inserting new data or updating existing data in the SAP Custom Price List Data [imp_samp_sap_custom_price_list] table.
Do you want to create an Excel template to enter data?	Option to generate the Microsoft Excel spreadsheet template that you can use to insert or update data in the SAP Custom Price List Data [imp_samp_sap_custom_price_list] table. Enable this option only if you didn't already download the spreadsheet template in step 1 .
Step 1: Create an Excel template file to enter data	
<p>Note: This form section appears only when you enable the Do you want to create an Excel template to enter data? option.</p>	
Include all fields in the template	Option to include all available fields in the Microsoft Excel spreadsheet template.
Create Excel Template	Option to generate the Microsoft Excel spreadsheet template.
Step 2: Upload the template file	
Excel template file	Microsoft Excel spreadsheet that contains the data that you want to insert or update in the SAP Custom Price List Data [imp_samp_sap_custom_price_list] table.

6. Select **Upload**.
7. On successful upload, select **Preview Imported Data**. The Imp Tmpl Imp Samp Sap Custom Price Lists page opens.
8. Verify that the correct number of entries were uploaded for your custom SAP price list and then select **Complete Import**. The data for your custom SAP price list is imported into your ServiceNow instance. The price list is then added to the Price Lists [samp_price_list] table.
9. **Optional:** Associate your custom SAP price list with additional SAP named user types. By default, the Software Asset Management application automatically associates your custom SAP price list with the SAP named user types that you specified in the imported Microsoft Excel spreadsheet. However, you can associate your price list with additional SAP named user types by adding custom named user types to it.

- a. On the page header of your ServiceNow instance, select **All**.
- b. In the menu navigation filter, enter `samp_price_list_list.do`.
The Price Lists [samp_price_list] table opens.
- c. Select your custom SAP price list.
The Price List record opens.
- d. In the **Named User Types** related list, select **New**.
- e. On the form, fill in the fields.

Custom Named User Type form

Field	Description
Name	Name of the named user type.
Price List	Price list that you want to associate the named user type with. This field populates automatically.
Is developer	Option that indicates if users with this named user type have a developer role.
Grants access to	Applications that the named user type has access to.
Value	Alphanumerical value that identifies the named user type.
Rank	Priority of the named user type during reconciliation. Lower rank values correlate with a higher priority during reconciliation.
Is licensable	Option that indicates if the named user type can be licensed.
Active	Option that indicates if the named user type is active.

- f. Select **Submit**.
- g. Repeat steps d to f for each custom named user type that you want to add.

SAP USMM-based optimization

Optimize licensing through SAP User License Measurement (USMM) rules that map roles to the Named User Type for an SAP client.

The rules in the SAP USMM map roles to a Named User Type on a system client basis. If you want to apply these rules for named user licensing, ServiceNow AI Platform pulls the USMM rules and stores all information in the SAP USMM Rules [samp_sap_usmm_rule] table. A scheduled job, *SAM - SAP USMM Based Optimization*, runs weekly to maximize licensing according to the USMM rules of a system client for the discovered user. This optimized Named User Type is populated in the USMM Named user type column in the SAP System Users [samp_sap_system_user] table. For more information, see [Tables installed with the SAP publisher pack](#).

If you opt in for the USMM rules by selecting the **Use USMM Role Optimization** check box in the SAP Connection record, the Software Asset Management application prefers the optimized USMM Named User Type during reconciliation. For more information about creating a connection

profile to establish a connection between your SAP system and your ServiceNow instance, see [Establish an SAP connection](#).

User transaction activity for named user types

Determine license optimizations for your SAP named user types based on your SAP user transaction activity.

User transaction activities are the transactions or tasks that users perform on an SAP client. These activities are based on SAP transaction codes (t-codes), which are the shortcuts that enable you to identify and perform these transactions or tasks. When you run scheduled jobs for SAP, the Software Asset Management application retrieves the SAP transaction codes that were actively used by your SAP users.

When you create a reclamation rule for an SAP named user type, you can specify the transaction codes and the minimum number of those transaction codes that must be active for a user to keep their assigned named user license. During reconciliation, the Software Asset Management application compares these transaction codes against the discovered user transaction codes for the named user type. You can view the resulting data in the Users for Transaction Based License Optimization report on the Software Publisher Analytics dashboard for SAP. Use this information to optimize your named user license position by downgrading licenses or reclaiming unused licenses. See [Software Publisher Analytics dashboard for SAP in Software Asset Management classic](#) for more information on this report.

View active transaction codes for your SAP users

View the SAP transaction codes (t-codes) that were actively used by your SAP users. This list is compared against your reclamation rules to determine whether the user is assigned an optimized license.

Before you begin

Role required: admin

Important:

You can view these SAP transaction codes in both the Software Asset Management classic application and the Software Asset Workspace. The following steps provide details on viewing these transaction codes in the Software Asset Management classic application. For details on viewing these transaction codes in the Software Asset Workspace, see [View SAP users in workspace](#).

Procedure

1. On the page header of your ServiceNow[®] instance, select **All**.
2. In the menu navigation filter, enter `samp_sap_system_user_list.do`.
The SAP System Users [samp_sap_system_user] table opens.
3. Select the SAP user that you want to view active SAP transaction codes for.
4. On the SAP System User record, select the **SAP User Active Transactions** related tab to view the complete list of SAP transaction codes that were discovered for the given user.

Self-declaring SAP engine license usage

You can self-declare the license usage for any SAP engines that cannot be measured by the automated SAP engine measurement process. Use this information to gain more comprehensive visibility into your SAP license compliance position so that you can optimize your licensing costs.

Self-declare SAP engine license usage in the Software Asset Management classic application

Use the Software Asset Management classic application to self-declare the license usage for any SAP engines that cannot be measured by the automated SAP engine measurement process.

Before you begin

Role required: admin or sam_user

About this task

To determine if you must self-declare the license usage for a given engine, see [Engine & Self-Declaration Product Measurement](#) in the SAP Support Portal. You must self-declare the license usage for any engine that is included in the list of Self-Declaration Products.

Important:

You must have an SAP Support Portal account to access the SAP Support Portal.

Procedure

1. Create a software model for the SAP engine.

Refer to [Create software models for SAP](#) for detailed instructions.

Note:

On the Software Model form, you must set the **Publisher** field to SAP. The form then reloads with only the software model fields that are applicable to SAP.

In addition, you must set the **Product** field to the SAP engine that you want to self-declare the license usage for.

2. Create entitlements for your software model.

Refer to [Create entitlements for SAP](#) for detailed instructions.

Note:

On the Software Entitlement form, you must set the **Software model** field to the same software model that you created in [step 1](#).

3. Create a client access record to specify the license usage of the SAP engine.

- a. On the page header of your ServiceNow instance, select **All**.

- b. In the menu navigation filter, enter `samp_sw_client_access_list.do`.
The Client Access [samp_sw_client_access] table opens.

- c. Select **New**.

- d. In the **Name** field of the Client Access form, enter a name for the client access record.

- e. Select the Lookup using list icon (🔍) next in the **Software model** field to locate and select the software model for the SAP engine.

Note:

Select the same software model that you created in [step 1](#).

- f. Enter an engine license usage value in the **Usage** field.

This license usage value is based on the license metric that is associated with the engine. For example, the license metric for the SAP E-Recruiting engine is **Employees**. If 200 employees are using an SAP E-Recruiting license, you must enter a license usage value of 200 in the **Usage** field.

Refer to [Engine & Self-Declaration Product Measurement](#)  for more information on the license metrics that are associated with each SAP engine.

g. Select **Submit**.

Result

After you self-declare the license usage for the SAP engine, it is automatically included in the next SAP reconciliation that runs on your ServiceNow instance. Reconciliation runs weekly or on-demand.

Self-declare SAP engine license usage in the Software Asset Workspace

Use the Software Asset Workspace to self-declare the license usage for any SAP engines that cannot be measured by the automated SAP engine measurement process.

Before you begin

Role required: admin or sam_user

About this task

To determine if you must self-declare the license usage for a given engine, see [Engine & Self-Declaration Product Measurement](#)  in the SAP Support Portal. You must self-declare the license usage for any engine that is included in the list of Self-Declaration Products.

Important:

You must have an SAP Support Portal account to access the SAP Support Portal.

Procedure

1. Create a software model for the SAP engine.

Refer to [Create software models in workspace](#) for detailed instructions.

Note:

On the Create New Software Model form, you must set the **Publisher** field to SAP. The form then reloads with only the software model fields that are applicable to SAP.

In addition, you must set the **Product** field to the SAP engine that you want to self-declare the license usage for.

2. Create entitlements for your software model.

You can create entitlements using either of the following options:

- The **Create entitlement** button on the Software asset overview.

Refer to [Create entitlements in workspace](#) for detailed instructions on how to create entitlements using this option.

Note:

On the Create New Software Entitlement form, you must set the **Software model** field to the same software model that you created in [step 1](#).

- The **Software Entitlements** tab on the software model record.

To create entitlements using this option, open the record for the software model that you created in [step 1](#). On the **Software Entitlements** tab of the software model record, select **New** and then fill in the fields on the corresponding Create New Software Entitlement form.

Refer to [Software entitlement fields](#) for detailed descriptions of each field.

Note:
The **Software model** field populates automatically.

3. Specify the license usage of the SAP engine.
 - a. Open the record for the software model that you created in [step 1](#).
 - b. On the **SAP Engine Usages** tab, select **New**.
 - c. On the Create new SAP Engine Usage form, fill in the fields.

Create New SAP Engine Usage form

Field	Description
Name	Name that is used to identify and track your SAP engine license usage.
Software model	Software model that the SAP engine is associated with. This field populates automatically.
SAP client	SAP client that the SAP engine is installed or running on.
Usage	<p>License usage of the SAP engine.</p> <p>This value is based on the license metric that is associated with the engine. For example, the license metric for the SAP E-Recruiting engine is Employees. If 200 employees are using an SAP E-Recruiting license, you must enter a license usage value of 200 in the Usage field. Refer to Engine & Self-Declaration Product Measurement  for more information on the license metrics that are associated with each SAP engine.</p>

- d. Select **Save**.

Result

After you self-declare the license usage for the SAP engine, it is automatically included in the next SAP reconciliation that runs on your ServiceNow instance. Reconciliation runs weekly or on-demand.

Software Publisher Analytics dashboard for SAP in Software Asset Management classic

View your license compliance position for SAP on the Software Publisher Analytics dashboard in the Software Asset Management classic application.

Access the dashboard by navigating to **All > Software Asset > SAP Compliance and Optimization > Overview**.

The dashboard is updated whenever a new reconciliation result is available.

End users and roles

End user and goal	Required role
SAM user: Can view the dashboard to track SAP license compliance and potential savings.	sam_user

SAP dashboard

SAP tab

Report	Source list	Description
Products Out of Compliance	Software Model Result	Number of software models that are out of compliance.
True-up Cost	Software Model Result	Cost to be compliant based on the average prices for entitlements. The cost covers Named User Types and Engines.
Potential Savings	Software Model Result	Amount saved if removal candidates are reclaimed. The savings covers Named User Types and Engines.

SAP tab (continued)

Report	Source list	Description
Over-licensed Amount	Software Model Result	Cost of licenses that are owned but not used. The cost covers Named User Types and Engines.
Inactive Users	SAP System Users	SAP users who logged in over 90 days ago.
System Users Without a Named User Assignment	SAP System Users	SAP users who do not have a named user assignment.
Un-used Engines	License Metric Results	Number of SAP engines that have not been used but have active software entitlements.
Engines Usage Reached 90% and Above	License Metric Results	Number of SAP engines that reached 90% usage or higher.
Locked Out Licensed SAP Users	SAP System Users	Locked SAP users consuming a license.
Licensed Non-Dialog Users	SAP System Users	SAP non-dialog users that have a named user assignment.
Users For Roles Based License Optimization	SAP System Users	Number of SAP users that could have their role changed to optimize license consumption.
Users for Transaction Based License Optimization	SAP System Users	Number of SAP users for which Software Asset Management has detected user transaction-based license optimizations. Select the report to view the list of users that can be optimized.
Potential Indirect Access (Transaction Activity)	SAP System Users	Number of SAP users with indirect access to the SAP system based on user transaction activity. Users are given a score based on the amount of data received or sent by each connection.
Potential Indirect Access (User Activity)	SAP System Users	Number of SAP users that have indirect access to the SAP system.

SAP tab (continued)

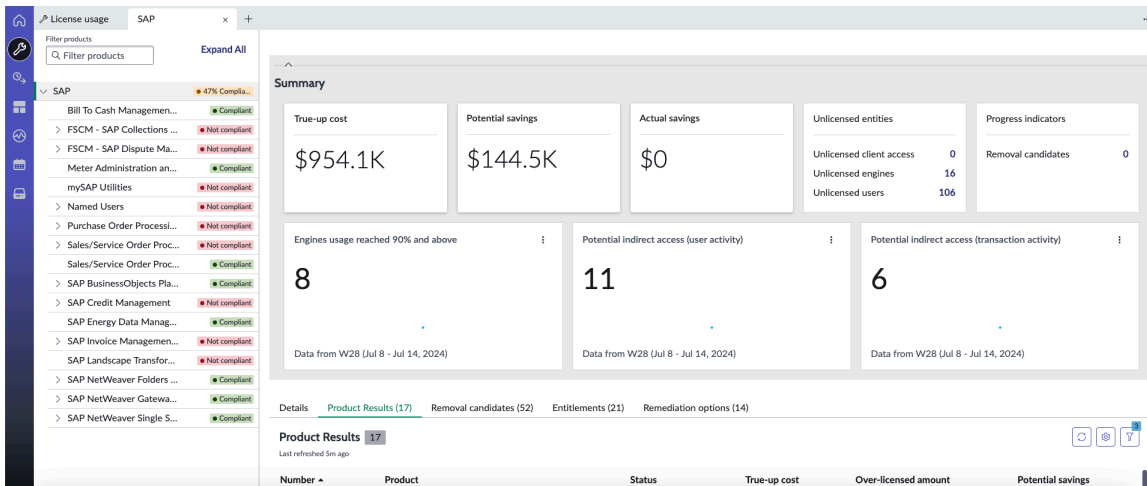

Report	Source list	Description
		Users are given a score based on total CPU time, peak count, and steps.

Publisher overview for SAP in the Software Asset Workspace

View license usage information related to SAP in the publisher overview for SAP in the Software Asset Workspace.

From the Software Asset Workspace, access the SAP publisher overview by navigating to **License usage > Publishers** and then selecting **SAP** from the list of available software publishers.

Results are updated whenever a new reconciliation result is available.

You can view a summary of your license usage information in the Summary section of the SAP publisher overview.

SAP Summary

Report	Description
True-up cost	Cost to be compliant based on the average price of rights in your SAP software entitlements.
Potential savings	Potential cost savings for your SAP licenses.
Actual savings	Actual cost savings for your SAP licenses.
Unlicensed entities	Summary of your unlicensed entities. This summary includes the following information:

SAP Summary (continued)

Report	Description
	<ul style="list-style-type: none"> • Unlicensed client access: Total number of unlicensed SAP client access records. Select the number to view the complete list of unlicensed SAP client access records. • Unlicensed engines: Total number of unlicensed SAP engines. Select the number to view the complete list of unlicensed SAP engines. • Unlicensed users: Total number of unlicensed SAP users. Select the number to view the complete list of unlicensed SAP users.
Progress indicators	<p>Summary of your license compliance progress.</p> <p>This summary includes the Removal candidates indicator, which displays the total number of SAP removal candidates. Select the number to view the list of all software removal candidates.</p>
Engines usage reached 90% and above	Total number of SAP engines that have reached 90% usage or higher.
Potential indirect access (user activity)	<p>Total number of SAP users that have indirect access to the SAP system.</p> <p>Users are given a score based on total CPU time, peak count, and steps.</p>
Potential indirect access (transaction activity)	<p>Total number of SAP users with indirect access to the SAP system based on user transaction activity.</p> <p>Users are given a score based on the amount of data received or sent by each connection.</p>

For more details on the license usage information that is provided in the publisher overview, see [License usage publisher fields in workspace](#).

Software Asset Management publisher pack for VMware

Use the Software Asset Management publisher pack for VMware to create software entitlements, software models, and track your licensing positions using VMware-specific licensing metrics.

Note:

To access all the benefits of the Software Asset Management publisher pack for VMware, activate the VMware content pack (com.sn_samp_vmware) [plugin](#).

VMware is a virtualization and cloud computing software. VMware virtualization offers two types of hypervisors, as well as additional products that you can use to optimize virtualization.

Most VMware product features are accessed using a license key, which can make managing your license compliance difficult. The Software Asset Management publisher pack for VMware allows you to track your license compliance position to optimize your software spend and reduce audit risk.

A discovery process is required for VMware data to be collected. For more information, see [Data collected by ITOM Visibility](#).

[Track the software rights](#) that you've purchased for your VMware with the Software Entitlement form. You can also store the licensing key information for your software using the License Key

related list on the form. For more information on the different license agreement types that are supported for VMware, see [License agreement types](#).

View your VMware license compliance using the License usage view of the Software Asset Workspace. If your VMware software is out of compliance, the License usage view provides remediation suggestions on how to return your licenses back to compliance. For more information, see [License usage view](#).

View compliance analysis results related to VMware using either the Software Publisher Analytics dashboard (Software Asset Management classic application) or publisher overview (Software Asset Workspace). For more information on the Software Publisher Analytics dashboard, see [Software Publisher Analytics dashboard for VMware in Software Asset Management classic](#). For more information on the publisher overview, see [Publisher overview for VMware, Inc. in the Software Asset Workspace](#).

Software Publisher Analytics dashboard for VMware in Software Asset Management classic

View compliance analysis results related to VMware on the Software Publisher Analytics dashboard in the Software Asset Management classic application.

Access the Software Publisher Analytics dashboard by navigating to **All > Software Asset > Publisher Overview**.

Note:

The add-on VMware publisher pack (com.sn_samp_vmware) plugin must be installed to view the VMware dashboard tab.

The dashboard is updated whenever a new reconciliation result is available. You can save charts in PNG or JPG format.

VMware dashboard

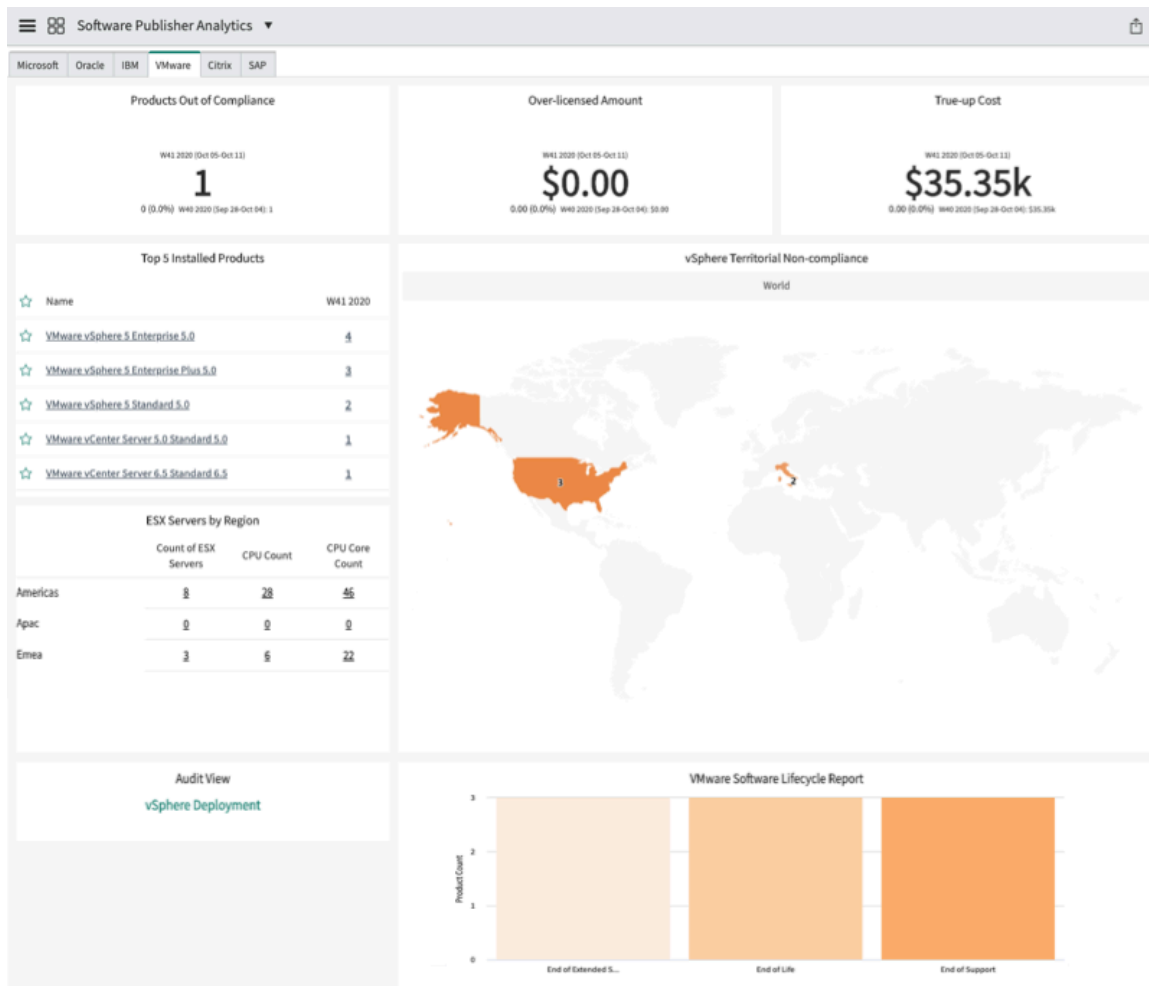

Information from VMware vCenter software is discovered and used for VMware reconciliation. Discovery uses these probes and populates these tables:

- [vCenter probe](#)  VMware – vCenter ESX Hosts License
- VMware Discovered License Key [samp_vmware_license_key] and VMware Discovered License Key Consumption [samp_vmware_license_key_usage] tables

For more information, see [vCenter discovery with Software Asset Management](#) .

Note:

The add-on VMware publisher pack (com.sn_samp_vmware) plugin must be installed to view the VMware dashboard tab.

VMware tab

Report	Source list	Description
Products out of Compliance	Product Results	Number of products that have at least one software model out of compliance. Select the report to view the results in the Software license usage .
Over-licensed Amount	Product Results	Cost of licenses owned but not being used.
True-up Cost	Product Results	Cost to be compliant based on the average prices for entitlements for the rights.
Top 5 Installed Products	Software Installations	Count of top 5 VMware products installed.
vSphere Territorial Non-compliance	VMware Discovered License Key Consumptions	Compliance of VMware vCenter deployments. Drill down on the location to filter.
ESX Servers by Region	ESX Servers	Location, ESX count, CPU count, and cores count.

VMware tab (continued)

Report	Source list	Description
Audit View	VMware Discovered License Key Consumptions	VMware vSphere deployments: Product, License Key, Used By, Assigned To, Location, CPU core count, CPU count, vCenter reference, evaluation expiration date, and software install.
VMware Software Lifecycle Report	Software Lifecycle Report	Number of products in each software lifecycle phase, including End of Extended Support, End of Life, and End of Support.

The **vSphere Deployment** related link shows the VMware Discovered License Key Consumptions list.

Publisher overview for VMware, Inc. in the Software Asset Workspace

View license usage information related to VMware in the publisher overview for VMware, Inc. in the Software Asset Workspace.

From the Software Asset Workspace, access the VMware, Inc. publisher overview by navigating to **License usage > Publishers** and then selecting **VMware, Inc.** from the list of available software publishers.

Results are updated whenever a new reconciliation result is available.

You can view a summary of your license usage information in the Summary section of the VMware, Inc. publisher overview.

VMware, Inc. Summary

Report	Description
True-up cost	Cost to be compliant based on the average price of rights in your VMware software entitlements.

VMware, Inc. Summary (continued)

Select the number to view the list of all software removal candidates.

For more details on the license usage information that is provided in the publisher overview, see [License usage publisher fields in workspace](#).

Engineering license management

Get visibility into your license position and usage of your engineering applications to eliminate audit risks, inefficient usage of licenses, inaccurate forecasting, and to help prevent denials.

Watch this short video for an introduction to engineering license management.

https://player.vimeo.com/video/1011366881?badge=0&autoplay=0&player_id=0&app_id=58479

Note:

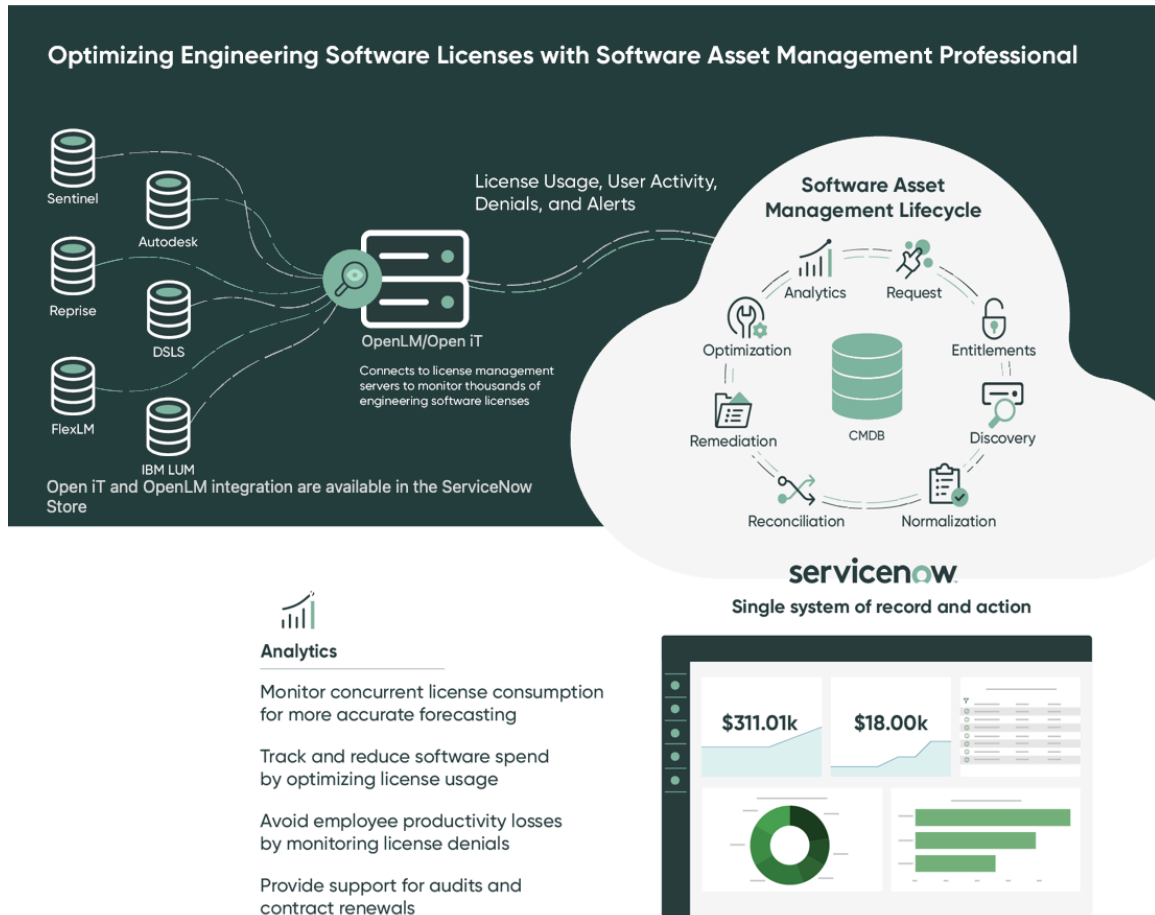

To access all the benefits of the Software Asset Management Professional for engineering applications, request the Software Asset Management Professional for Engineering Applications plugin (com.sn_samp_eng_app). For more information, see [Request Software Asset Management](#).

Engineering applications refer to categorizing software products in industries such as aerospace, oil and gas, and construction.

A concurrent license enables multiple users to share access to software applications from any computer on a network or from a virtual machine. License management servers that are installed on the network manage the distribution of a pool of shared licenses.

You can have multiple license management servers; one for each engineering application. The number of concurrent licenses in the shared pool determines the number of users who can use the software application at a given time. When you want to use an application, that application sends a request to the appropriate license management server to determine if a license is available. If a license is available, the application starts and the number of available licenses decreases by one. When the user exits the application, the license returns to the pool.

The following graphic illustrates the way OpenLM and Open iT work with the ServiceNow instance.

The Software Asset Management application supports three types of licenses: floating, network, and token licenses. For information on these licenses, see [Software license metrics](#).

The ServiceNow instance integrates with OpenLM and Open iT to collect data from license management servers. OpenLM and Open iT are software license monitoring and management tools that integrate with a wide variety of license management servers such as IBM License Use Management (LUM), Sentinel Technologies, and Bentley Systems, Inc. Both OpenLM and Open iT connect with each license management server, consolidate the data, and get the data into your ServiceNow instance via the [ServiceNow Store](#) application.

After you download the ServiceNow Store application and configure the application via Guided Setup, both OpenLM and Open iT trigger data collection from all the license management servers that are connected to either of these. Data such as license usage, denials, user activity, and alerts are collected from the license management servers by OpenLM and Open iT, and

transferred to the ServiceNow instance. The data is normalized and reconciled to produce reports. You can see the total spend on engineering software, the most denied products, license usage over time, and many other reports on the [Engineering License Overview dashboard](#) (Software Asset Management classic application) or the [Engineering License overview dashboard in workspace](#) (Software Asset Workspace).

i Important:

For more details on the OpenLM setup and configuration, refer to the Supporting Links and Docs section of the [OpenLM Adapter Integration](#)  page in the ServiceNow Store.

For more details on the Open iT setup and configuration, refer to the [Open iT LicenseAnalyzer](#)  page in the ServiceNow Store.

SaaS License Management

SaaS License Management helps organizations track and control cloud-based applications and service subscriptions as part of Software Asset Management (SAM). It promotes ownership, visibility, agility, and accountability, enabling better cost control and efficient use of resources.

SaaS subscription models

SaaS applications and services are typically subscribed to on a per-user basis. They generally fall into two categories:

- **Hybrid SaaS**

Hybrid SaaS combines on-premise installations with cloud-based subscriptions. It's commonly used by organizations that require offline access to certain applications while also using cloud features for collaboration. This model is also suitable for businesses with compliance requirements that mandate local installations. For example, a Microsoft 365 subscription enables you to access cloud services and install applications like Microsoft Excel on their devices. SAM supports the following Hybrid SaaS integrations:

- [Adobe Cloud integration](#)
- [Microsoft 365 integration](#)

- **Direct SaaS**

Direct SaaS refers to applications where all data and functionality are hosted in the cloud and accessed through the internet. You typically log in via a web browser or a dedicated app without installing software locally. For example, a Miro subscriber accesses the application entirely online. This model is common for organizations that prioritize ease of deployment and minimal maintenance, and for teams that work remotely or across multiple locations.

i Important:

This topic focuses on the Direct SaaS category. It explains how to get started, identifies areas where Direct SaaS can be applied, and outlines ways to use available solutions and workflows effectively.

Managing Direct SaaS with the SaaS License Management application

Managing Direct SaaS applications can vary based on organizational needs. The best approach depends on factors such as the level of integration required, available APIs, and whether Single Sign-On (SSO) is in place.

- Use [Direct Integration](#) when you need deep usage insights and automated license management for supported vendors.
- Use [SaaS License Connections](#) when you want flexibility to connect any SaaS app with a public API and prefer a low-code setup.
- Use [SSO Integration](#) when you need visibility into apps connected through an SSO provider and want to address SaaS sprawl.

For more information about installing SaaS License Management, see [Request SaaS License Management](#).

SaaS License Management

Approaches to manage your SaaS applications

Option	Key features	Benefits
Direct Integration	<ul style="list-style-type: none"> • Base system or default direct integrations • Automated license reclamation 	<ul style="list-style-type: none"> • Provides detailed usage insights • Automates license management • Reduces manual effort
SaaS License Connections	<ul style="list-style-type: none"> • Connect to any SaaS application with a public API • Low-code framework using ServiceNow® via Integration Hub and Workflow Studio 	<ul style="list-style-type: none"> • Flexible for any SaaS application • Customizable workflows
SSO Integration	<ul style="list-style-type: none"> • Connect via SSO providers such as Okta and Microsoft Entra ID. • Download the list of applications or users • Identify overlapping software and rationalize applications 	<ul style="list-style-type: none"> • Helps tackle SaaS sprawl • Improves cost control • Simplifies user access management

Request SaaS License Management

Request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) so that you can create and manage integrations with your SaaS and Single Sign-on (SSO) applications. You can use these integrations to track license usage and to reclaim unused licenses.

Before you begin

Activate the ServiceNow Software Asset Management Professional plugin (com.snc.samp) on your ServiceNow instance. For more information on how to request and activate the Software Asset Management Professional plugin (com.snc.samp), see [Request Software Asset Management](#).

Role required: admin

About this task

To use the SaaS License Management application, you must request the Software Asset Management – SaaS License Management plugin (sn_sam_saas_int) from the ServiceNow Store.

Procedure

1. From a web browser, go to the [ServiceNow Store](#).
2. Log in using your HI credentials.

3. In the search bar, enter **Software Asset Management - SaaS License Management** and then select **Search**.
4. Select the result called **Software Asset Management - SaaS License Management**.
5. On the **Software Asset Management - SaaS License Management** page, select **Request Install**.
6. In the **ServiceNow Request for App Installation - Software Asset Management - SaaS License Management** dialog box, fill in the fields.

ServiceNow Request for App Installation - Software Asset Management - SaaS License Management dialog box

Field	Description
Instance Name	Name of the instance on which you want to install the plugin. After you enter the instance name, select Validate Instance to verify that the instance exists.
Reason for request	Reason for requesting the plugin.

7. Select **Request**.
8. Select **Close**.

Result

If your request is approved, you receive an email with detailed instructions on how to install the plugin.

What to do next

Install the plugin according to the instructions from the email.

Navigate to **All > Admin Center > Application Manager**. On the **Application Manager** page, search for and select **Software Asset Management - SaaS License Management**.

After the application is installed and ready for use, you can choose the required SaaS applications that you need by selecting **Install optional features** on the [Application Manager](#) page.

You can see the primary features and the list of optional features that you can select in the **Review Installation Details** dialog box. If you haven't selected any optional features, you would get the base system features of this application.

Review Installation Details

Software Asset Management - SaaS License Management

Version 15.0.2 (Installed)

Select configuration and features

Application configuration Software Asset Management - SaaS License Management(Installed)

Primary features (6)

- Playbook Experience Components Installed
- Playbook Experience Installed
- Software Asset Management - SaaS License Management Foundation Installed
- Software Asset Management - SaaS License Connections Installed
- Software Asset Management Professional Installed
- Playbook Experience Core Installed

Add optional features (33)

ⓘ Some features may not be covered in your license. You can install them without license in the sub-prod instance but license will be required for prod instance.

- Zendesk Spoke Needs to be licens
- Software Asset Management integration with Workday Licens
- Software Asset Management integration with Tableau Installed (Needs to be licens
- Software Asset Management integration with SAP S4Hana Cloud Installed (Needs to be licensed)
- Software Asset Management integration with SuccessFactors Licens

Dependencies

Will be installed (2)

- Asana Spoke
- Calendly Spoke

Installed (6)

- Playbook Experience Components
- Playbook Experience
- Software Asset Management - SaaS License Management Foundation
- Software Asset Management - SaaS License Connections
- Software Asset Management Professional
- Playbook Experience Core

Install now Install later

After you select the optional features, select **Install**. You can initiate or schedule the installation process by selecting **Install now** or **Install later**. View the installation progress and you'll get a success message after the installation is complete.

Installed with SaaS License Management

User roles and tables are installed with SaaS License Management. Demo data is available for the Software Asset Management - SaaS License Management (sn_sam_saas_int) plugin.

User roles

Role	Description
sam_integrator	Inherits the sam_user role and can also create and manage SaaS integration profiles.

Tables

Table	Description
Custom Subscription Product Definitions [samp_sw_custom_subscription_product_definition]	Enables you to create and update customized software models for SaaS and SSO applications.
Custom Subscription Integration [samp_sw_custom_subscription_integration]	List of SaaS and SSO providers for your custom integration profiles.
Product profile types [samp_sw_product_profile_type]	Provides a mapping between integration profile types and products in the Software Product [samp_sw_product] table.
SAM Subscription Script Routes [sam_saas_script_route]	Stores which script includes and scopes implement a given integration type to register available integrations from separate scoped apps.
SSO Application [samp_sso_application]	List of all SSO applications for all SSO integrations.
SSO Application Groups [m2m_sso_group_application]	Provides a mapping between connected SSO applications and the directory groups that have access to them.
SSO Application Role [samp_sso_application_role]	List of SSO users and groups for all connected SSO applications.
SSO Application Users [m2m_sso_user_application]	Provides a mapping between connected SSO applications and the directory users that have access to them.
SSO Integration Profile [samp_sso_integration_profile]	List of all SSO integration profiles.
SSO Subscription [samp_sso_subscription]	List of SSO subscriptions for all connected SSO applications.
Subscription Consumption Summaries [sam_saas_consumption_summary]	Consumption summary information including units consumed, monthly consumption, and contract dates.

Table	Description
Subscription Integration [samp_sw_subscription_integration]	List of SaaS and SSO providers that is mapped to subscription products in the Subscription Product Definition [samp_sw_subscription_product_definition] table.
Subscription Product Definitions [samp_sw_subscription_product_definition]	SaaS License Management uses this table to automatically create software models for SaaS and SSO applications. Software models are automatically created for applications with an External Catalog ID that matches an Identifier in this table.
Subscription Usage Summary [samp_subscription_usage_summary]	Software usage summary information including rights owned, rights assigned, stale rights, available rights, and cost.
Unrecognized Subscription Identifiers [samp_sw_unrecognized_subscription_identifier]	List of subscription identifiers that are not associated with a software model.

SaaS License Management setup for large companies

Set up SaaS License Management for large companies to confirm that you can view all SaaS usage data in your ServiceNow instance.

Some large companies must update the `com.snc.pa.dc.max_row_count_indicator_source` system property before creating integration profiles. If either of the following conditions is true for your company, an admin must update this property.

- If there are more than 50,000 user subscriptions for the [SaaS applications](#), excluding the subscriptions for [Adobe Cloud](#) and [Microsoft 365](#).
- If there are more than 50,000 user subscriptions for Adobe Cloud and Microsoft 365 combined.

Update the `com.snc.pa.dc.max_row_count_indicator_source` system property to be the greater value between your subscriptions for the two groups. For example, if you have 60,000 user subscriptions for [SaaS applications](#) combined and 25,000 user subscriptions for [Adobe Cloud](#) and [Microsoft 365](#) combined, update the property to be 60,000.

Note:

For more information about how to use the `com.snc.pa.dc.max_row_count_indicator_source` property, see [Data collector properties](#).

SaaS Overview dashboard

Optimize how much your organization spends on SaaS and SSO licensing by analyzing the subscription usage, cost, and compliance of your SaaS applications and SSO providers using the SaaS Overview dashboard.

Important:

The SaaS Overview dashboard is available in both the Software Asset Management classic application and the Software Asset Workspace. This topic provides information on the SaaS Overview dashboard in the Software Asset Management classic application. For information on the SaaS Overview dashboard in the Software Asset Workspace, see [SaaS overview dashboard in workspace](#).

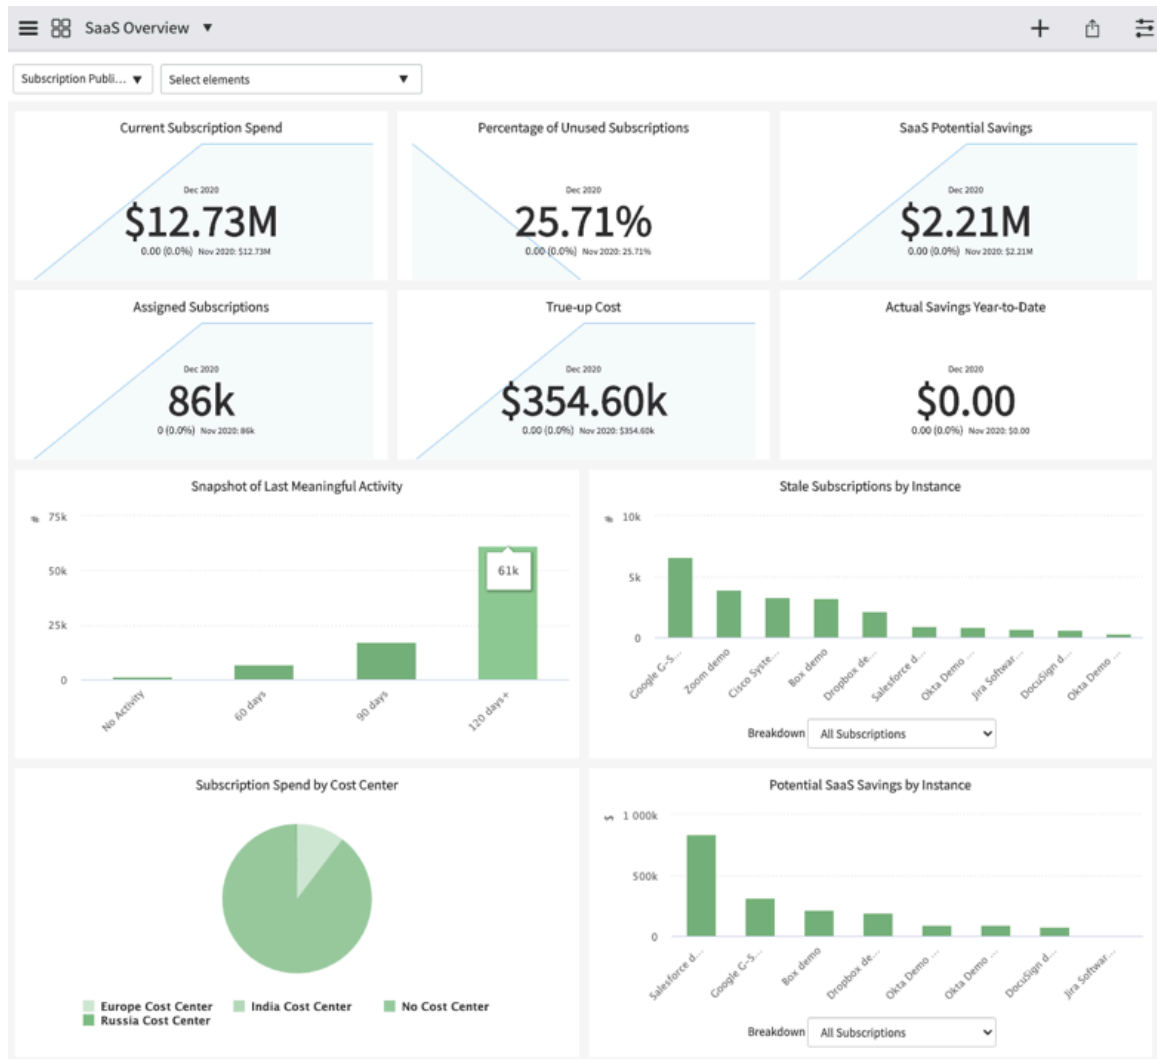

The Engineering License Overview dashboard is no longer available for new Yokohama users who have activated the Software Asset Management Professional (com.snc.samp) plugin or upgraded to Yokohama without activating the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama. If you activated the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama but didn't activate the Workspace plugin (com.sn_sam_workspace), you have access to this dashboard. If you activated the workspace plugin (before or after upgrading to Yokohama, you won't be able to access this dashboard from the **Software Asset** navigation menu in your instance. You can however access this dashboard from the **Dashboards** navigation menu.

The SaaS Overview dashboard displays information about the usage, costs, and potential savings that are associated with your SaaS and SSO applications. Access this dashboard by navigating to **SaaS License > Overview**. You can filter the dashboard by software model or publisher. Click any report to see more information.

Note:

To view your organization's software usage and compliance for Microsoft Office 365 and Adobe Cloud, navigate to **SaaS License > Office 365 & Adobe Cloud**.

SaaS Overview dashboard

SaaS Overview reports

Report	Description
Current Subscription Spend	Total cost of all active subscription software entitlements.
Percentage of Unused Subscriptions	Percentage of subscriptions that don't meet the usage requirements that are defined by reclamation rules. This percentage is calculated as the number of stale rights (subscriptions that have limited to no activity within the activity threshold that is defined in the reclamation rule) divided by the total number of assigned rights.
SaaS Potential Savings	Potential cost saved if you reclaim unused subscriptions.
Assigned Subscriptions	Total number of assigned subscriptions.
True-up Cost	Cost to have the number of rights you own match the number of rights you've assigned to users. This metric helps to verify that your organization is paying for all the rights that your organization is using.
Actual Savings Year-to-Date	Total yearly savings for all subscription software. This value is calculated as the total savings from closed complete reclamation candidates.
Snapshot of Last Meaningful Activity	Distribution of users based on their subscription software usage behavior. Use this data to identify the users with the highest software usage and determine the most appropriate threshold for your software reclamation rules. This report displays the data for the last 30 days, 30–60 days, 60–90 days, and 90–120 days.
Stale Subscriptions by Instance	<p>Total number of stale subscriptions for each subscription profile. If you have multiple profiles for the same subscription software, this report displays each profile separately.</p> <p>You can filter the data that is displayed on this report by selecting an option from the Breakdown list. To view the stale subscriptions for both SaaS and SSO subscription profiles, select All Subscriptions. To view the stale subscriptions for only SaaS subscription profiles, select Subscriptions Excluding SSO.</p>
Subscription Spend by Cost Center	Total cost of all active subscription software entitlements by cost center.
Potential SaaS Savings by Instance	<p>Potential cost saved for each subscription profile if you reclaim unused subscriptions.</p> <p>You can filter the data that is displayed on this report by selecting an option from the Breakdown list. To view the potential savings for both SaaS and SSO subscription profiles, select All Subscriptions. To view the potential savings for only SaaS subscription profiles, select Subscriptions Excluding SSO.</p>

Integrate with SaaS applications

Create an integration profile to view software usage information and optimize stale licenses.

A SaaS integration profile pulls your company's software usage information from the software vendor. This information includes a list of all users and identifies which users haven't recently used the software.

You can create an integration profile for the following SaaS applications:

- [Adobe Cloud](#)
- [Adobe Workfront](#)
- [Aha!](#)
- [Asana](#)
- [Box](#)
- [Calendly](#)
- [Cisco Webex](#)
- [Confluence Cloud](#)
- [CrowdStrike](#)
- [DocuSign](#)
- [Dropbox](#)
- [Google Workspace](#)
- [GitHub](#)
- [GoTo](#)
- [Jira Software](#)
- [Looker](#)
- [Microsoft 365](#)
- [Microsoft Dynamics 365 and Power Apps](#)
- [Miro](#)
- [monday.com](#)
- [PagerDuty](#)
- [Rally](#)
- [Roadmunk](#)
- [Salesforce CRM](#)
- [Salesforce Marketing Cloud](#)
- [SAP Ariba](#)
- [SAP S/4HANA Public Cloud](#)
- [Slack](#)
- [SmartRecruiters](#)
- [Smartsheet](#)
- [SAP SuccessFactors](#)
- [SurveyMonkey](#)
- [Tableau Cloud](#)

- [Trello](#)
- [Workday](#)
- [Workplace from Facebook](#)
- [Zendesk](#)
- [Zoom](#)

You can also create integrations for Adobe Cloud and Microsoft Office 365. For more information, see [Microsoft 365 integration](#) and [Software Asset Management publisher pack for Adobe](#).

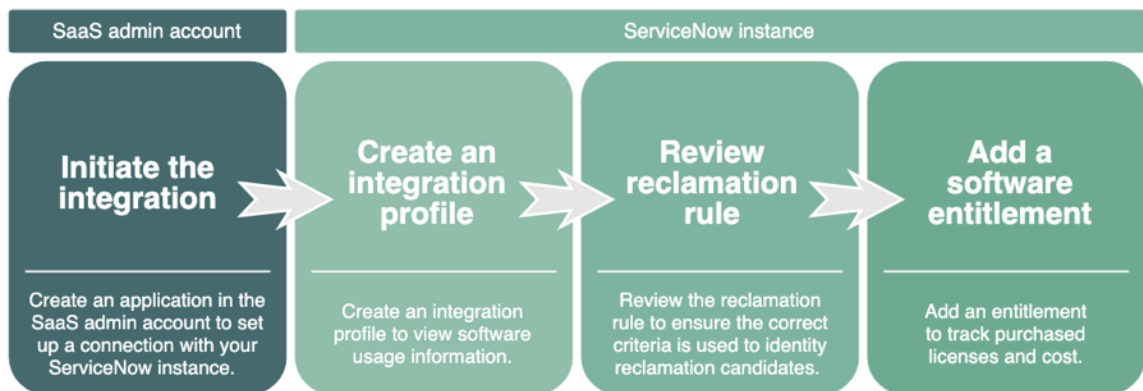

If you want to integrate with a SaaS application that is not on this list, you can create a custom integration profile. For more information, see [Create a custom integration profile](#).

Note:

The SaaS integration automatically creates a software model and a reclamation rule for the software. Always [review the reclamation rule](#) to make sure that reclamation candidates are identified using the criteria you want.

After reviewing the reclamation rule, [create a software entitlement](#) to track purchased licenses and cost.

Integrating with SaaS applications

After following this process, you're ready to start reclaiming unused licenses to reduce software costs for your company.

Integrating with Adobe Workfront

Integrating your Software Asset Management application with the Adobe Workfront application enables you to track your software subscriptions and to reclaim unused licenses.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Adobe Workfront application	Authentication scopes
Download subscriptions	administrator	None
Pull user activity	administrator	None
Reclaim subscription	administrator	None

Generate a Workfront API key

Generate an API key for authenticating Workfront API requests.

Before you begin

Workfront Role required: administrator

Procedure

1. From a web browser, open [Adobe Workfront](#).
2. Log in using your admin credentials.
Your Adobe Workfront instance opens.
3. On the page header of your Adobe Workfront instance, select the Main Menu icon (☰) and then select **Setup**.
4. From the left navigation menu of the Setup page, navigate to **System > Customer Info**.
The Customer Info page opens.
5. In the API Key Settings section, select **Generate API Key**.
Adobe Workfront automatically generates your API key and displays it under Your User's API Key.
6. Copy your API key and save it in a secure location for later use.
7. In the same section, select the time period after which you want the API key to expire from the **After creation, API keys expire** list.
The default time period is one month.

i Note:

You can change this time period at any time. Whenever you change the time period, the newly selected time period begins from the moment that you make the change.

Create a Workfront integration profile

Create a Workfront integration profile to track software subscriptions and optimize licensing for your Workfront applications.

Before you begin

To create a Workfront integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **Workfront Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Workfront integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, Workfront Integration .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to Workfront Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Workfront Download Subscriptions**.

i Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Workfront Update User Activity**.

i Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Workfront Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- 4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_workfront_spoke.Workfront**.

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- 6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the Workfront connection. This field populates automatically.
Connection URL	URL for the connection. Enter <code>https://<domain-name>.my.workfront.com</code> , where <code><domain-name></code> is your company subdomain.
Credential Information	
API Key	API key for your Workfront applications. Enter the same API key that you generated in Generate a Workfront API key .

- 8. Select **Create**.
- 9. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

- 10. After the connection is verified, select **Publish**.
- 11. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

12. Optional: To optimize memory and avoid performance issues in your Workfront flow, you can turn off the flow engine reporting level.

a. Navigate to **System Properties > All Properties**.

b. Select the *com.snc.process_flow.reporting.level* system property.

c. On the System Property page, set the **Value** to OFF.

d. Select **Update**.

13. Optional: Reduce the number of items in the execution details.

a. Navigate to **System Properties > All Properties**.

b. Select the *com.snc.process_flow.reporting.datastream.item.lastn* system property.

c. On the System Property page, set the **Value** to 10.

d. Select **Update**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Aha!

Integrating your Software Asset Management application with the Aha! service enables you to track your software subscriptions and to reclaim unused licenses.

For more information about the Aha! service, see [Aha! Product management guide](#) .

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Aha! application	Authentication scopes
Download subscriptions	admin	None
Pull user activity	admin	None
Reclaim subscription	admin	None

Create an Aha! OAuth2 application

Create an Aha! OAuth2 application to get access to the Aha! API.

Before you begin

Aha! Role required: admin

Procedure

1. Go to [OAuth2 Authentication](#) .
2. Log in to the Aha! site using your admin credentials.
3. On the Personal settings page, select **Developer**.
4. Select the **OAuth applications** tab.
5. Select **Register OAuth application**.
6. On the Register new OAuth application form, enter `https://instance/oauth_redirect.do` as the Redirect URI, where *instance* is the name of your ServiceNow instance.
7. Select **Create**.
The **OAuth applications** tab shows Client ID and Client Secret keys.
8. Note down the values in the Client ID and Client Secret fields.

Create an Aha! integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Aha! service.

Before you begin

To create an Aha! integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **Aha! Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Aha! integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. In the **Display name** field, enter a display name of your choice.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, Aha Integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to Aha! Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Aha! Download Subscriptions**.

i Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Aha! Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- 4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_aha_spoke.Aha_**.

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- 6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Fields	Descriptions
Connection Name	Name of the integration profile.
Connection URL	Connection URL for Aha!.
OAuth Client ID	OAuth2 key that you received while creating an OAuth2 authentication from the Aha! site.
OAuth Client Secret	OAuth Client Secret key that you received while creating an OAuth2 authentication from the Aha! site.
OAuth Redirect URL	ServiceNow redirect URL.

- 8. Select **Create and Get OAuth Token** and then select **Authorize**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

- 9. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.

- 10. After the connection is verified, select **Publish**.
- 11. In the Publish Confirmation dialog box, select **OK**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Asana

Integrating your Software Asset Management application with the Asana application enables you to track your software subscriptions and to reclaim unused licenses.

Note: This integration supports all plans of Asana at organization level only.

Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Asana application	Authentication scopes
Download subscriptions	admin	default
Pull user activity	admin	default
Reclaim subscription	admin	default

Register an Asana OAuth 2.0 application

Register an Asana OAuth application to access the Asana API 1.0 and to receive a Client ID and Client secret.

Before you begin

Asana Role required: admin

Procedure

1. Log in to your Asana account.
2. Select the user's profile icon.
3. Select **Settings**.
4. Select the **Apps** tab.
5. Navigate to the developer console window by selecting the **View developer console** link.
6. Select **+ Create new app**.
7. On the **Create new app** page, provide a name for your application and then select the **Integrate Asana and another tool** check box.
8. Select the **I agree to the Asana API Terms** check box and then select **Create app**.
9. **Optional:** Provide basic information about your application.
10. Select **OAuth**.
11. Copy the Client ID and Client secret for later use.
12. In the **Redirect URLs** field, select **+ Add redirect URL**.
13. Enter `https://<instance>.service-now.com/oauth_redirect.do` where <instance> is the name of your ServiceNow instance.

Create an Asana integration profile

Create an Asana integration profile to track software subscriptions and optimize licensing for your Asana solutions.

Before you begin

The Software Asset Management - SaaS License Management Integrations plugin (sn_sam_saas_int) must be installed from the [ServiceNow Store](#) .

Role required: admin or sam_integrator

 Important:

You must select the **Asana Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration profile form

Field	Value
Display name	Name of the integration profile. For example, Asana integration.
Status	Status of the integration profile.

Field	Value
	<ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to #Draft. ○ If you have already published the integration profile, this field is automatically set to #Published.
Profile type	Type of integration profile. This field is automatically set to Asana Subscription.

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Asana Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Asana Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Asana Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Save**.

A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_asana_spoke.Asana**.

5. Open the connection & credential aliases record by selecting the preview icon () beside the **Connection & Credential** field.
6. Select **Open Record** in the record preview.
7. Select the **Create New Connection & Credential** related link.
8. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Value
Connection Name	Name of the Asana connection. This field populates automatically.
Connection URL	URL for the connection. This field is automatically set to <code>https://app.asana.com</code> .
Client ID	Client ID that you created while registering Asana OAuth application.
Client Secret	Client secret that you created while registering Asana OAuth application.
OAuth Redirect URL	This field is automatically populated to <code>https://<instance name>.service-now.com/oauth_redirect.do</code> , where instance name is the name of your ServiceNow instance.

9. Select **Create and Get OAuth Token**.
10. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

11. After the connection is verified, select **Publish**.
12. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Box

Integrating your Software Asset Management application with the Box service enables you to track your software subscriptions and to reclaim unused licenses.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Box application	Authentication scopes
Download subscriptions	Co-Admin with Manage users permission	Manage users
Pull user activity	Co-Admin with Run new reports and access existing reports permission	Manage enterprise properties
Reclaim subscription	<ul style="list-style-type: none"> • Co-Admin with Manage users permission • Co-Admin with View users' content permission 	<ul style="list-style-type: none"> • Manage users • Read all files and folders stored in Box • Write all files and folders stored in Box

For additional information on the Box service, see the [Box Community](#) .

Create a Box application

Create an application on the Box Platform.

Before you begin

Box Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. Navigate to the [Box Developer Console](#)  and sign in to your account.
2. On the My Apps page, select **Create New App**.
3. Select **Custom App**.
4. On the Authentication Method page, select **Standard OAuth 2.0 (User Authentication)**.
5. Enter an application name, and then select **Create App**.
6. On the Configuration page, obtain the Client ID and Client Secret.

You'll need to copy and paste these values into your ServiceNow instance in the following steps.

Note:

Your Client ID and Client secret are sensitive. Don't share them.

7. Enter `https://instance.service-now.com/oauth_redirect.do` as the Redirect URI, where *instance* is the name of your ServiceNow instance.
8. Select the following application scope check boxes:
 - Read and write all files and folders stored in Box
 - Manage users
 - Manage enterprise properties

These scopes enable the integration to get a list of users, get user activity, and reclaim unused subscriptions.

9. Select **Save Changes**.

Create a Box integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Box service.

Before you begin

To create a Box integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

ServiceNow Role required: sam_integrator or admin

About this task

If you're using Software Asset Workspace, the option to create the Box integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Value
Display name	Name of the integration profile. For example, <code>Box Integration</code>
Client Id	Client ID for the OAuth application created in the SaaS admin account.
Redirect url	URL of the OAuth provider that you're redirected to after authentication. This value is automatically populated.
Client secret	Password associated with the client ID.
Profile type	Type of integration profile. This value is automatically set to <code>Box Subscription</code> .
Analyze user activity from	You can choose to start analyzing data from the current date or from up to 60 days in the past. Choosing a date in the past enables you to detect stale subscriptions without waiting in real time because you can see subscriptions that haven't been used recently. Because choosing a date in the past increases the amount of data that is analyzed, it could take several hours for you to be able to view the results.

- In the Process configuration section, review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see [Minimal user permissions](#) table.

- The **Download subscriptions** check box is selected by default and you can't clear it.
- The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job `SAM - Refresh <displayname> Events` isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Submit**.

Your ServiceNow instance creates a draft integration profile.

5. On the integration profile, select **Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

6. In the pop-up window, select your Box admin account and select **Allow**.

Note:

When user subscriptions are reclaimed, files from the reclaimed accounts are transferred to the admin account selected in this step. This account can be a different admin account than the one used to set up the integration. If you transfer files to a new admin, you can select the **Get OAuth Token** related link again at any time to select a different admin account. After selecting a new admin, you can reclaim the old admin account to transfer all of their files to the new admin, including all previously reclaimed user files.

7. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

8. After the connection is validated, select **Publish**.

9. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is validated and scheduled jobs are created, you must revalidate the connections because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Events* job gets deleted.

Result

You can view events performed by individual users up to one year prior to the current date. For more information, see [Review a software reclamation rule](#). Software Asset Management pulls the events from the time that you start downloading user subscriptions irrespective of the profile creation date.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Calendly

Integrating your Software Asset Management application with the Calendly service enables you to track your software subscriptions and to reclaim unused licenses.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Calendly application	Authentication scopes
Download subscriptions	admin	None
Pull user activity	admin	None
Reclaim subscription	admin	None

Create a Calendly OAuth application

Register a public application with the Calendly service so that you can access the Calendly API using OAuth 2.0.

Before you begin

Calendly Role required: admin

You must have a Google or GitHub account to sign up for a Calendly developer.

Procedure

1. Navigate to [Calendly developer portal](#) .
 - If you already have a Calendly developer account, sign in with your credentials and go to step 3.
 - If you don't have a Calendly developer account account, complete step 2.
2. **Optional:** Sign up for a Calendly developer account through your GitHub or Google account by selecting **Sign Up** on the top-right corner of the Calendly Developer Site page. This account isn't associated with your Calendly Google user account.

3. Navigate to **Account > My Apps** to create a OAuth application.
4. Select **Create a new app**.
5. On the form, fill in the fields.

Create Oauth app form

Field	Description
Name of app	Name of your application.
Kind of app	The application type such as Web or Native.
Environment type	The environment type that you want to associate your application to, such as Sandbox or Production.
Redirect URI	ServiceNow redirect URL. For example, <code>https://app.example.com/auth</code> .

6. Select **Save & Continue**.

What to do next

Copy your Client ID and Client Secret.

Important:

You must copy these values as you can't access the Client Secret again.

Create a Calendly integration profile

Create an integration profile to track software subscriptions and optimize stale licenses for the Calendly service.

Before you begin

To create a Calendly integration profile, request the Software Asset Management - SaaS License Management (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

Important:

You must select the **Calendly Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Calendly integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, Calendly Integration .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to Calendly Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Calendly Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Calendly Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Calendly Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- 4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_calendly_spoke.Calendly**.

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- 6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 7. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Name	Name of the connection.
Connection URL	Base URL for the Calendly API. This field is automatically set to <code>https://api.calendly.com</code> .
OAuth Client ID	Client ID that is assigned to the public application that you registered with the Calendly service.
OAuth Client Secret	Client secret that is assigned to the public application that you registered with the Calendly service.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on your instance name.

- 8. Select **Create and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

- 9. In the Authorize App dialog box, log in to your Calendly account.
The dialog box closes and then you automatically return to the integration profile form.
- 10. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

- 11. After the connection is verified, select **Publish**.

12. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Cisco Webex

Integrating your Software Asset Management application with Cisco Webex applications enable you to track your software subscriptions and reclaim unused licenses.

The supported Cisco Webex applications are:

- Webex Meetings
- Webex Teams
- Webex Training
- Webex Events
- Webex Support Session

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Cisco Webex application	Authentication scopes
Download subscriptions	Read-only admin	<ul style="list-style-type: none"> spark-admin:licenses_read spark-admin:people_read
Pull user activity	<ul style="list-style-type: none"> Compliance Officer Full admin 	<ul style="list-style-type: none"> spark-compliance:events_read meeting:admin_schedule_read
Reclaim subscription	Full admin	<ul style="list-style-type: none"> spark-admin:people_read spark-admin:people_write

Create a Webex Meetings OAuth application

Create an OAuth integration application in Cisco Webex for Developers.

Before you begin

Webex Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. Login to [Webex developer portal](#)  by using your Webex credentials.
2. Select your profile icon and then select **My Webex Apps**.
3. Navigate to **Create a New App > Select Integration > Create an Integration**.
4. On the form, fill in the fields:

New Integration form

Field	Value
Will This Integration Use A Mobile SDK?	No
Integration Name	Name of your integration as it appears in Webex. For example, ServiceNow integration.
Contact Email	Email address of the administrator.
Icon	Icon to appear on the My Apps page. Either upload your own application icon or select one from the list of default icons.

Field	Value
Description	Description of your integration. For example, functionality of the integration and its benefits.
Redirect URI	The URI that will be redirected to when completing an OAuth grant flow. <code>https://<instance>.service-now.com/oauth_redirect.do</code> , where <i>instance</i> is the name of your ServiceNow instance.
Scopes	To access the integration APIs, you must select the meeting:admin_schedule_read scope.

5. Select Add Integration.

6. Copy and save the OAuth Client ID and OAuth Client Secret that appear for later use.

Create a Webex Teams OAuth application

Create an OAuth integration application in Cisco Webex for Developers.

Before you begin

Webex Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. Navigate and log in to [Cisco Webex for Developers](#).
2. Under the profile icon, select **My Webex Apps**.
3. Navigate to **Create a New App > Select Integration > Create an Integration**.
4. On the form, fill in the fields:

New Integration form

Field	Value
Will This Integration Use A Mobile SDK?	No
Integration Name	Name of your integration as it appears in Webex. For example, ServiceNow integration.
Contact Email	Email address of the administrator.
Icon	Icon to appear on the My Apps page. Either upload your own application icon or select one from the list of default icons.
Description	Description of your integration. For example, functionality of the integration and its benefits.
Redirect URI	The URI that will be redirected to when completing an OAuth grant flow. <code>https://<instance>.service-now.com/oauth_redirect.do</code> , where <i>instance</i> is the name of your ServiceNow instance.
Scopes	To access the integration APIs, you must select these scopes:

Field	Value
	<ul style="list-style-type: none"> ○ spark-admin:licenses_read ○ spark-admin:organizations_read ○ spark-admin:people_read ○ spark-admin:people_write ○ spark-admin:roles_read ○ spark-compliance:events_read ○ meeting:admin_schedule_read

5. Select Add Integration.

6. Copy and save the OAuth Client ID and OAuth Client Secret that appear for later use.

Create a Webex integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Cisco Webex applications.

Before you begin

To create a Webex integration profile, request the Cisco Webex Meetings and Webex Teams spoke apps from the [ServiceNow Store](#).

ServiceNow Role required: admin or sam_integrator

Important:

You must select **Cisco Webex Teams Spoke** and **Cisco Webex Meetings Spoke** check boxes for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Webex integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration profile form

Field	Description
Display name	Name of the profile. For example, Webex integration.
Status	Status of the integration profile.

Field	Description
	<ul style="list-style-type: none"> ○ If you haven't published the integration profile, this field is automatically set to #Draft. ○ If you have already published the integration profile, this field is automatically set to #Published.
Profile type	<p>Type of integration profile.</p> <p>This field is automatically set to Webex Subscription.</p>

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Cisco Webex Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Cisco Webex Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Cisco Webex Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Save**.

A draft integration profile is created.

In the **Download Subscription Subflow** tab, the **Connection & Credential** field appears and is automatically set to **sn_cisco_teams_spk.CiscoWebexTeams**. In the **Calculate**

Activity Subflow tab, the **Connection & Credential** field appears and is automatically set to **sn_webex_mtg_spoke.Webex**.

Note:

The automatically populated value in the **Connection & credential** field changes based on the selection in the **Download activity** and **Reclaim subscriptions** check boxes.

Automatically populated Connection & credential values based on the selection

Selection	Connection & credential value
Both Download activity and Reclaim subscriptions are selected.	sn_cisco_teams_spk.webex_subscription_activity_reclaim
Only Download activity is selected.	sn_cisco_teams_spk.webex_subscription_activity
Only Reclaim subscriptions is selected.	sn_cisco_teams_spk.webex_subscription_reclaim
Both Download activity and Reclaim subscriptions aren't selected.	sn_cisco_teams_spk.webex_subscription

- In the **Download Subscription Subflow** tab, select the preview icon (🔍) next to the **Connection & Credential** field and then select **Open Record** in the record preview.
- Select the **Create New Connection & Credential** related link.
- On the form, fill in the **OAuth Client ID** and **OAuth Client Secret** that you had saved while creating the Webex Teams OAuth application. Leave all other fields as is.
- Select **Create and Get OAuth Token**.

Note:

Make sure you're logged in to your ServiceNow instance using your local admin credentials. Logging in with SSO user credentials might cause the tokens to be generated automatically.

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

- When prompted, log in using your Webex Email address and Password.
- After the connection is successfully created, navigate to the Webex integration profile.
- In the **Calculate Activity Subflow** tab, select the preview icon (🔍) next to the **Connection & Credential** field and then select **Open Record** in the record preview.
- Select the **Create New Connection & Credential** related link.
- On the form, fill in the fields.

Create Connection and Credential form

Connection URL	<p>Replace <subdomain> with the Webex Meeting site domain configured for the organization.</p> <p>Log in to the Webex admin portal and navigate to SERVICES > Meeting > Sites. In the Site name column, <subdomain> is the part of <subdomain> . webex . com in the site name.</p>
----------------	---

Webex Admin User Name	User name or email address to log in to Webex.
-----------------------	--

14. Fill in the **OAuth Client ID** and **OAuth Client Secret** values that you saved while creating the Webex Meetings OAuth application.

15. Select **Create and Get OAuth Token** and follow the steps to get an OAuth token.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

16. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

17. After the connection is verified, select **Publish**.

18. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

After creating an integration profile, view information about the profile in the Software Asset Workspace by navigating to **License operations > User subscription > Direct integration profiles**. You can select an integration profile to view the following related lists. If the following related lists aren't visible for an integration profile in the default view, you can select the custom integration view from the Details tab:

- Software Models
- Unrecognized Subscription Identifiers
- Scheduled Jobs
- Scheduled Job Results
- Software Subscriptions
- Subscription Identifier Exclusion Rule
- Subscription User Exclusion Rule

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple Cisco Webex integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Confluence Cloud

Integrating your Software Asset Management application with the Confluence Cloud application enables you to track your software subscriptions and to reclaim unused licenses.

Currently this integration supports only one site integration per profile.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Confluence Cloud application	Authentication scopes
Download subscriptions	User role for confluence product	<ul style="list-style-type: none"> • Read user groups (read:confluence-groups) • Read user (read:confluence-user)
Pull user activity	User role for confluence product	Search Confluence content and space summaries (search:confluence)
Reclaim subscription	site admin	<ul style="list-style-type: none"> • Read user groups (read:confluence-groups) • Create, remove, and update user groups (write:confluence-groups)

Create a Confluence Cloud OAuth 2.0 (3LO) application

Create a Confluence Cloud OAuth 2.0 (3LO) application to enable access to the Confluence Cloud API.

Before you begin

Atlassian Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. From a web browser, open the [Atlassian Developer portal](#) .
2. Log in to your site admin account.
3. On the page header of the portal, select your profile icon and then select **Developer console**.
The My apps page of the Atlassian Developer Console opens.
4. Select the **Create app** menu and then select **OAuth 2.0 (3LO) integration**.
The Create a new OAuth 2.0 (3LO) integration page opens.
5. Enter a name for the OAuth 2.0 (3LO) application in the **Name** field.
6. Select the **I agree to be bound by Atlassian's developer terms** check box and then select **Create**.
7. Configure the authorization settings for your application.
 - a. From the left navigation pane, select **Authorization**.
 - b. Select **Configure** for the OAuth 2.0 (3LO) authorization type.
The OAuth 2.0 authorization code grants (3LO) for apps page opens.
 - c. In the **Callback URL** field, enter the URL of the OAuth provider that users are redirected to after authentication.
Enter `https://instance.service-now.com/oauth_redirect.do`, where `<instance>` is the name of your ServiceNow instance.
 - d. Select **Save changes**.
8. Configure API scopes for your application.
API scopes specify the level of access that the application has to the Atlassian APIs.
 - a. From the left navigation pane, select **Permissions**.
 - b. From the list of available APIs, locate the Confluence API and then select **Add**.
The **Add** action button automatically changes to the **Configure** action button.
 - c. Select **Configure**.
The Confluence API page opens.
 - d. Add the following scopes for the Confluence API:
 - Search Confluence content and space summaries
 - Read user groups
 - Create, remove, and update user groups
 - Read user

9. Retrieve the client ID and client secret that are assigned to your application.

- a. From the left navigation pane, select **Settings**.
- b. In the Authentication details section, copy the values in the **Client ID** and **Secret** fields. Save them in a secure location for later use.

Obtain the Cloud ID value of Confluence Cloud instance

Obtain the value of the Cloud ID of the Confluence Cloud cloud instance. This value is required during the configuration of the connection record in your ServiceNow instance.

Before you begin

Confluence Cloud Role required: admin

Procedure

1. Log in to [Atlassian Administration](#) .
2. Select the **Select** button against the required organization.
3. Select the **Products** tab.
4. On the Products page, select **Manage product** on the Confluence product row.

The URL is in the following format in a new window: `https://admin.atlassian.com/o/<orgID>/products/conf/<Cloud-Id>`.

5. Copy the value of the Cloud ID for later use.

Create a Confluence Cloud integration profile

Create a Confluence Cloud integration profile to track software subscriptions and optimize licensing for your Confluence Cloud applications.

Before you begin

To create a Confluence Cloud integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

Atlassian Role required: site admin

ServiceNow Role required: sam_integrator, sn_confluence_spoke.confluence_cloud_admin

Important:

You must select the **Confluence Cloud Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Confluence Cloud integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Value
Display Name	Name of the integration profile. For example, Confluence Cloud Integration .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to Confluence Cloud Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Confluence Cloud Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Confluence Cloud Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Confluence Cloud Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select Save.

A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_confluence_spoke.confluence_subscription_activity_reclaim** when all the processes are selected.

Note:

The automatically populated value in the **Connection & credential** field changes based on the selection in the **Download activity** and **Reclaim subscriptions** check boxes.

Automatically populated Connection & credential values based on the selection

Selection	Connection & credential value
Both Download activity and Reclaim subscriptions are selected.	sn_confluence_spoke.confluence_subscription_activity_reclaim
Only Download activity is selected.	sn_confluence_spoke.confluence_subscription_activity
Only Reclaim subscriptions is selected.	sn_confluence_spoke.confluence_subscription_reclaim
Both Download activity and Reclaim subscriptions aren't selected.	sn_confluence_spoke.confluence_subscription

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- 6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 7. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Name	Name of the connection.
Connection URL	API URL for Confluence Cloud. This field is automatically set to <code>https://api.atlassian.com</code> . For Software Asset Management - SaaS License Management version 15.0.9 and above, provide the URL of your Confluence Cloud instance in the <code>https://api.atlassian.com/ex/confluence/<Cloud-ID format</code> . For more information about getting the value of Cloud ID, see Obtain the Cloud ID value of Confluence Cloud instance .

Field	Description
OAuth Client ID	Client ID that is assigned to your Confluence Cloud OAuth 2.0 (3LO) application.
OAuth Client Secret	Client secret that is assigned to your Confluence Cloud OAuth 2.0 (3LO) application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the callback URL that you specified in Create a Confluence Cloud OAuth 2.0 (3LO) application .

8. Select **Create and Get OAuth Token.**

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

9. When the dialog box appears, grant permission to the Confluence Cloud application. The dialog box closes and you automatically return to the Connection & Credential Aliases form.

10. Specify the groups that have access to Confluence products. By specifying these groups on your ServiceNow instance, you can retrieve data and manage licenses for only the users within these groups.

a. In a new tab, open the [Atlassian Administration portal](#) .

b. Log in to the admin account with a site_admin role.

c. Select the **Select** button against the required organization.

d. Select the **Products** tab.

e. On the Products page, select **Manage product** on the Confluence product row.

f. View the list of groups that have access to Confluence products. Take note of this information for later use.

g. Return to your ServiceNow instance and navigate to **Confluence Cloud > Confluence Groups**.

h. On the Confluence Groups form, select the **Add Groups** related link. The Add Confluence Groups dialog box opens.

i. Select the Connection & Credential that was set on the integration profile.

j. In the Available list, select the groups that have access to Confluence products.

Tip:

The Available list includes all groups that are associated with your Atlassian account. Select only the groups that have access to Confluence products.

k. Select the right arrow button to move the groups from the Available list to the Selected list.

l. Select **OK**.

11. Return to your integration profile and then select the integration profile.

12. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

13. After the connection is verified, select **Publish**.

14. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

After creating an integration profile, view information about the profile in the Software Asset Workspace by navigating to **License operations > User subscription > Direct integration profiles**. You can select an integration profile to view the following related lists. If all of the following related lists aren't visible for an integration profile in the default view, you can select the custom integration view from the Details tab:

- Software Models
- Unrecognized Subscription Identifiers
- Scheduled Jobs
- Scheduled Job Results
- Software Subscriptions
- Subscription Identifier Exclusion Rule
- Subscription User Exclusion Rule

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple Confluence Cloud integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with CrowdStrike

Integrating your Software Asset Management application with the CrowdStrike enables you to view CrowdStrike active host sensors information and check license compliance.

Note: CrowdStrike currently doesn't support the APIs for integration in regulated environments, including US-GOV-1 (GovCloud) or US-GOV-2 CrowdStrike clouds.

Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the CrowdStrike application	Authentication scopes
Download consumption	Falcon administrator	Sensor usage scope with read permissions

This process is applicable for Yokohama Patch 1, Software Asset Management - SaaS License Management (sn_sam_saas_int) 15.0.8, and Software Asset Management (sn_itam_samp) 2.1.0 version onwards. If you are on any version for Yokohama below Patch 1, refer [KB1801232](#).

Register a CrowdStrike OAuth application

Register the CrowdStrike OAuth application to access the CrowdStrike API and to receive a Client ID and Client secret.

Before you begin

The CrowdStrike Integration Hub spoke must be active. For more information, see [CrowdStrike spoke](#).

CrowdStrike Role required: Falcon administrator

i Important:

- To use the Sensor Usage APIs, your API client must be assigned the Sensor usage scope with Read permissions.
- Contact your account team to enable the following feature flags:
 - Hourly usage data feature flag: This flag must be enabled for your Customer Identification (CID) to view hourly usage data.
 - Aggregated usage data feature flag: This flag must be enabled to get aggregated usage data in multi-CID (non-Flight Control) accounts.

Procedure

1. Log in to [Falcon](#) using your admin credentials.
2. Navigate to **Support and resources > API Clients and Keys**.
3. Select **Create API Client**.
4. Provide the client name and description.
5. Select the **Read** check box for the **Sensor usage** scope.
6. Select **Create**.
The API client created screen is displayed.
7. Copy the Client ID and Secret for later use.
8. Select **Done**.

Create a CrowdStrike integration profile

Create a CrowdStrike integration profile to track software subscriptions and optimize licensing for your CrowdStrike applications.

Before you begin

The Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) must be installed from the [ServiceNow Store](#).

ServiceNow Role required: admin or sam_integrator

i Important:

You must select the **CrowdStrike Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the CrowdStrike integration profile in Core UI is inactive.

Note:

When upgrading to Yokohama patch 1 with Software Asset Management - SaaS License Management (sn_sam_saas_int) 15.0.8 and Software Asset Management (sn_itam_samp) 2.1.0 store applications installed, you must delete the entitlements for the existing CrowdStrike integration profiles. Then, create entitlements for various CrowdStrike products, such as Falcon Endpoint Protection and Falcon Discover, based on their license metrics. These metrics include Reserved Hourly Average Sensor and Sensor Subscription, which are found under the CrowdStrike license metric group.

- If any existing CrowdStrike profiles are in the **Draft** state, create new integration profiles and delete the existing ones.
- If any existing CrowdStrike profiles are in the **Published** state, their state changes to Draft.

If you are on any version for Yokohama below patch 1, refer [KB1801232](#).

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration profile form

Field	Value
Display name	Name of the integration profile. For example, CrowdStrike integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to #Draft. ○ If you have already published the integration profile, this field is automatically set to #Published.
Profile type	Type of integration profile. This field is automatically set to CrowdStrike Subscription.

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for the process to minimize security risks and optimize SaaS licenses.

Note:

The **Download consumptions** check box is selected by default and you can't clear it. Verify that the **Subflow** field is set to **CrowdStrike Download Weekly and Hourly Sensor Usage**.

For more information about the required roles and scopes, see [Minimal user permissions table](#).

4. Select **Save**.
A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_crowdstkr_spoke.CrowdStrike**.

5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Value
Connection Information	
Connection Name	Name of the CrowdStrike connection. This field populates automatically.
Connection URL	<p>URL for the connection. This field is automatically set to <code>https://api.crowdstrike.com</code>.</p> <p>Each CrowdStrike cloud has a different base URL. Use the base URL that corresponds to the cloud where your integration is hosted.</p> <ul style="list-style-type: none"> o US-1: <code>https://api.crowdstrike.com</code> o US-2: <code>https://api.us-2.crowdstrike.com</code> o EU-1: <code>https://api.eu-1.crowdstrike.com</code>
Credential Information	
OAuth Client ID	Client ID that you generated while configuring the CrowdStrike API settings.
OAuth Client Secret	Client Secret that you generated while configuring the CrowdStrike API settings.
OAuth Redirect URL	<code>https://<instance name>/oauth_redirect.do</code> , where the instance name is the name of your ServiceNow instance.

8. Select Create and Get OAuth Token.

i Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

The OAuth token is generated successfully.

9. On the Integration Profile form, proceed with the Workload product mapping by selecting the **CrowdStrike Product Workload Mappings tab.**

Workload mapping is essential for accurately associating specific products with the types of workloads they manage (for example, servers, desktops, containers). This is because CrowdStrike provides data on workloads and not direct product-to-machine connections. With workload mapping, you can correctly count license usage and ensure compliance. The system adds up the relevant workloads for each product based on this mapping, preventing

over- or under-counting. This new approach replaces previous methods and aligns with how CrowdStrike now tracks usage, making it easier to manage compliance.

a. On the CrowdStrike Product Workload Mappings page, select **New**.

Note:

The software entitlements and software models must be created before proceeding to the next step.

- For more information on creating software entitlements in the Software Asset Management classic application, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

b. On the form, fill in the fields.

CrowdStrike Product Workload Mapping form

Field	Description
Integration profile	This field is automatically set to the integration profile for which the workload mapping is being created.
Workload	<p>Endpoints are physical or virtual devices, such as a computer, server, laptop, desktop computer, mobile, cellular, container, pod, or virtual machine image.</p> <p>Endpoints are sometimes referred to as workloads.</p> <p>For example,</p> <ul style="list-style-type: none"> ▪ containers ▪ public_cloud_with_containers ▪ servers_without_containers ▪ chrome_os
Software model	Profile of the software, which includes publisher, version, and discovery map.
License metric	<p>License metric for the selected software model.</p> <ul style="list-style-type: none"> ▪ Reserved Hourly Average Sensor: This metric counts the number of unique active endpoints per clock-hour and averages them over a rolling 28-day period. The count of Reserved Hourly Average Sensor Licenses resets at the start of each clock-hour. ▪ Sensor Subscription: This metric calculates license usage by averaging

Field	Description
	endpoint counts over four consecutive weeks. Weekly endpoint counts are based on the total number of endpoints consumed in the previous seven days.

c. Select **Save**.

- On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.
You can also validate connections before creating CrowdStrike product workload mappings.

Important:
You must provide the Workload product mapping before publishing the profile.

- After the connection is verified and the workload product mapping is provided, select **Publish**.
- In the Publish Confirmation dialog box, select **OK**.

Result

This integration pulls or creates usage records in the CrowdStrike Product Usage [samp_crowdstrike_product_usage] table and CAL records in the Client Access [samp_sw_client_access] table.

What to do next

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Docusign

Integrating your Software Asset Management application with the Docusign service enables you to track your software subscriptions and to reclaim unused licenses.

You can integrate your Software Asset Management application with the Docusign service at Organization level and Account level. However, an integration profile can be either at the Organization level or Account level.

- [Integrate with Docusign at Organization level](#)
- [Integrate with Docusign at Account level](#)

Integrate with Docusign at Organization level

Integrating your Software Asset Management application with the Docusign service at the organization level enables you to track your software subscriptions and envelope consumption data.

Note:

Integration with Docusign at the organization level is done using the Data feed API, so the user's last activities aren't tracked as part of this integration.

For more information about the Docusign service, see [the DocuSign Developer site](#).

Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Docusign application	Authentication scopes
Download subscriptions	admin	No scopes
Download consumption	admin	No scopes

This process is applicable for Yokohama patch 10, Software Asset Management - SaaS License Management (sn_sam_saas_int) 15.0.19, and Software Asset Management (sn_itam_samp) 2.1.0 version onwards.

Register a Docusign application

Register a Docusign application through the Docusign admin portal.

Before you begin

Docusign Role required: admin

Procedure

1. Log in to your Docusign demo (non-production) account.
You can use any subaccount for logging in that is later promoted to the corresponding production account.
2. Go to the Admin tab.
 - o If you already have an API integration key from a previous integration ready for use in production, skip to [step 15](#).
 - o If you don't have your API integration key saved, you must generate a new one.
3. On the side navigation pane, select **Account Profile** and copy the **Organization ID** to secure it for later use.
4. Navigate to **INTEGRATIONS > Apps and Keys**.
5. In the **Apps and Integration Keys** section, select **Add App and Integration Key**.
6. On the Add Integration Key form, enter a unique name for your application in the **App Name** field and select **CREATE APP**.
7. On the profile page of your application, select **Third-party integration key** in the **Integration Type** field.
8. Copy the value of the **Integration Key** and secure it for later use.

i Important:

You must request the Docusign support team for enabling the Data feed API on the integration key that you're generating. If you're using an Enterprise Pro plan, the Data feed API is free for you with organization management. If you're using a low-tier plan, you can opt for organization management as an add-on. For further information, contact the Docusign support team.

9. Select **Save**.
10. In the **Apps and Integration Keys** section, locate the application that you just created in the App Name list.
11. Select **Actions > Select Go-Live account**.
A Docusign login window pops up prompting you to enter the credentials for your Docusign account.
12. Enter your Docusign credentials.
13. Select a production account on the window that pops up prompting you to choose a production account to which you want to promote your integration key.
The **Go Live Status** field changes to **Pending approval**. For a successful Go-Live review, your app must meet the requirements for Go-Live for each API that it uses. For more information on the Go-Live review stages, see [Docusign documentation](#) .
14. After the integration is approved, the **Go Live Status** changes to **View in production**.
15. Log in to your Docusign production account and verify that the same integration key has been promoted to the production account.

Generate RSA keypair for Docusign integration

Generate RSA keys to integrate the Docusign application with your ServiceNow instance.

Before you begin

Docusign requirements:

- Docusign account
- Docusign app configured to integrate with ServiceNow
- Role required: Docusign administrator

About this task

The integration of Docusign at the organization level enables access to all subaccounts using a single integration key generated in any one subaccount.

Procedure

1. Log in to your Docusign production content account.
2. Go to the Admin tab.
3. Navigate to **INTEGRATIONS > Apps and Keys**.
4. Next to your application, select **Actions > Edit**.
5. Select **Generate RSA** and save the Key Pair ID, Public Key, and Private Key for later use.

Generate a Java Key Store certificate

Generate a Java Key Store (JKS) certificate for the JSON Web Token (JWT) authentication of your Docusign integration profile.

Before you begin

Role required: admin

Procedure

1. Open a text editor for code, such as Sublime Text, and create a file.
2. Paste the Private key that you had generated from your Docusign integrator app.

For more information, see [Generate RSA keypair for Docusign integration](#).

Note:

Make sure to include both the beginning and ending of the private key.

3. Save the file with the .key extension.
For example, `privatekey.key`.
4. Open the command line interface (CLI) and navigate to the directory where you saved the file with the .key extension.
5. Create a CA signed certificate using your private key by executing the command:

```
openssl req -new -x509 -key <file-name>.key -out
<certificate-name>.pem -days 1095
```

You're prompted to provide details such as country name and province name.

6. Enter the required details.
7. Create a PKCS 12 file using your private key and CA signed certificate by executing the command:

```
openssl pkcs12 -export -in <certificate-name>.pem -inkey
<file-name>.key -certfile <certificate-name>.pem -out
<PKCS-12-file-name>.p12
```

You're prompted to provide a password for the file.

8. Enter the export password or the source keystore password.
9. Create the JKS file by executing this command:

```
keytool -importkeystore -srckeystore
<PKCS-12-file-name>.p12 -srcstoretype pkcs12 -destkeystore
<JKS-certificate-filename>.jks -deststoretype JKS
```

You're prompted to provide a password for the JKS file.

10. Provide the same password for the destination and source keystore passwords.

Create a Docusign integration profile at Organization level

Create an integration profile to track software subscriptions and optimize licensing for the Docusign service.

Before you begin

To create a Docusign integration profile, request the Software Asset Management - SaaS License Management plugin (`sn_sam_saas_int`) from the [ServiceNow Store](#).

ServiceNow Role required: `sam_integrator`

About this task

An organization level integration profile uses the Docusign Data feed API that retrieves detailed subscription and consumption data across an entire organization. It aggregates data from all subaccounts under an organization, offering a centralized view of envelope activity and usage.

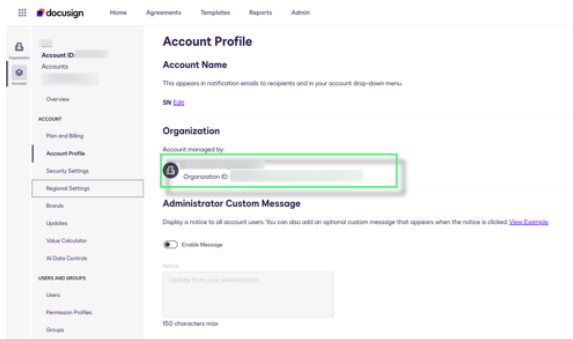

If you're using Software Asset Workspace, the option to create the Docusign integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	Name of the integration profile. For example, DocuSign Integration
Integration type	The default value is set to Organization Level .
Contract start date	The date on which the contract agreement became effective. This date is not same as the date when your Docusign account was created.
Profile type	Type of integration profile. This value is automatically set to DocuSign Subscription .
Organization Id	The organization ID to which this account belongs. You can find this value in your Docusign account on the Admin tab. Navigate to Account Profile and copy the Organization ID .
Renewal period (months)	The frequency at which envelope consumption gets renewed. For example, if you enter a renewal period of three months, then the consumption data is renewed every three months. The renewal period governs the consumption cycle and is separate from the overall contract term.

3. Review the required user roles or API permissions specified in the **Process configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see the [Minimal user permissions](#) table.

The **Download subscriptions** check box is selected by default and you can't clear it.

The **Download Consumption** check box is selected by default. You can check the detailed consumption data in the Docusign consumption table. The data in this consumption table is in UTC time zone.

4. Select Submit.

A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_sam_saas_int.Docusign_OAuth_with_JWT**.

5. Open the connection & credential aliases record by selecting the preview icon (i) next to the Connection & Credential field and then selecting Open Record in the record preview.

6. On the Connection & Credential Aliases form, select the Create New Connection & Credential related link.

7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Information	
Connection Name	Name of the connection.
Connection URL	This field is automatically set to https://api.docusign.net .
Credential Information	
Integration Key	The API integration key that you had generated in the Register a Docusign application procedure.
Key Pair ID	The key pair ID of the private key that you had generated in the Generate RSA keypair for Docusign integration procedure.
Audience URI	Enter <code>account.docusign.com</code> as the URI.
Keystore Password	Password associated with the uploaded JKS file that you had created in the Generate a Java Key Store certificate procedure.

8. Locate the JKS file on your device by selecting Keystore.

For more information on creating the JKS file, see [Generate a Java Key Store certificate](#).

9. Select Create and Get OAuth Token.

10. On the integration profile form, select Validate Connection to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions APIs.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models and software subscriptions that are refreshed daily.

After creating an integration profile, view information about the profile in the Software Asset Workspace by navigating to **License operations > User subscription > Direct integration profiles**. You can select an integration profile to view the following related lists. If the following

related lists aren't visible for an integration profile in the default view, you can select the custom integration view from the Details tab:

- Software Models
- Scheduled Jobs
- Scheduled Job Results
- Unrecognized Subscription Identifiers
- Software Subscriptions

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrate with Docusign at Account level

Integrating your Software Asset Management application with the Docusign service at Account level enables you to track your software subscriptions and to reclaim unused licenses.

Docusign purchases made through resellers don't reflect within the Docusign standard billing system. So no values are returned through the APIs for envelope consumption that is available to ServiceNow.

i Important:

Docusign has removed the **lastLogin** field from the Users API, so the user's last activities are no longer tracked as part of this integration. The Software Asset Management application now creates reclamation candidates based on the subscription assigned date.

For more information about the Docusign service, see [the DocuSign Developer site](#) .

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Docusign application	Authentication scopes
Download subscriptions	admin	No scopes
Reclaim subscription	admin	No scopes

Register a Docusign application

Register a Docusign application through the Docusign admin portal.

Before you begin

Docusign Role required: admin

Procedure

1. Log in to your Docusign demo (non-production) account.
2. Select your profile picture.
3. Select **My Apps and Keys**.
 - o If you already have an API integration key from a previous integration ready for use in production, [skip to step 33](#).
 - o If you don't have your client secret saved, you must generate a new one.
4. On the side pane, select **INTEGRATIONS > Apps and Keys**.
5. In the **Apps and Integration Keys** section, select **ADD APP AND INTEGRATION KEY**.
6. On the Add Integration Key form, provide a name in the **App Name** field and select **CREATE APP**.
7. Select **ADD URI** under the **Redirect URIs** field in the **Additional Settings** section.
8. Add `https://oauth.pstmn.io/v1/browser-callback`.
9. Select **ADD URI** again and add `https://ServiceNow instance.service-now.com/oauth_redirect.do`.
10. Select **ADD SECRET KEY**.
Save the Integration Key (Client ID) and Secret Key (Client secret) in a secure location to use them later in the Postman App and the Integration Key (Client ID) in the ServiceNow instance.
11. Select **Save**.
12. Download the latest version of [Postman App](#) and skip the login.
13. Select **New Collection** and provide a name to the collection.
14. Select the **Authorization** tab.
15. From the Type list menu, select **OAuth 2.0**.
16. Provide a name and complete the fields on the **Configuration Options** tab to create a token:

Field	Value
Callback URL	<code>https://oauth.pstmn.io/v1/browser-callback</code>

Field	Value
Auth URL	<code>https://account-d.docusign.com/oauth/auth</code>
Access Token URL	<code>https://account-d.docusign.com/oauth/token</code>
Client ID	The integration key from your Docusign demo account created in step 10 .
Client Secret	The secret key from your Docusign demo account step 10 .

17. Select **Get New Access Token**.
You're redirected to Docusign.
18. Select **Accept**.
19. After the access token is collected and authentication is complete, copy the Access Token to use it later.
20. Select **New Request** to create a GET request for your account id.
21. Enter the URL in the GET field as `https://account-d.docusign.com/oauth/userinfo`.
22. On the Headers tab, select **Authorization** under **KEY** and enter *Bearer <Access Token that you copied during authentication>* under **Value**.
23. Select **Send** and verify that your request is complete.
The account id is displayed in the response body.
24. Duplicate the GET request.
Copy the authorization key and value under **Headers**.
25. Update the URL in the GET field to `https://demo.docusign.net/restapi/v2/accounts/<account-id>/users`.
Here, *account-id* is the ID that you saved from the previous request.
26. Select **Send** 20 times to make 20 API calls.
You must invoke a minimum of 20 API calls to register your application through the Docusign admin portal.
27. Navigate to **Apps and Integration Keys** on the Docusign admin portal.
28. Select **Actions > View API Dashboard** next to your application.
29. Wait a few minutes for Docusign to register all the 20 API calls.
30. Navigate to **INTEGRATIONS > Apps and Keys** and select **Submit for review**.
After 5-20 minutes, your application review is complete. You can promote the application to your production account.
31. Select **Actions > Start-Go- Live review** to promote the application to the production account.
32. Select an eligible production account to manage the integration key.
33. Log in to your Docusign production account.
34. Select your profile picture.
35. Select **Go to Admin**.
36. On the side pane, select **INTEGRATIONS > Apps and Keys**.
Locate your API Account ID to use for the integration profile in your ServiceNow instance.
37. Next to your application, select **Actions > Edit**.
38. Select **ADD URI** and add `https://ServiceNow instance.service-now.com/oauth_redirect.do`.
39. Select **ADD SECRET KEY**.

Save the Secret Key (Client secret) for your production account in a secure location to use it in your ServiceNow instance.

40. Select Save.

Create a Docusign integration profile

Create a Docusign integration profile at Account level to track software subscriptions and optimize licensing for the Docusign service.

Before you begin

To create a Docusign integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

About this task

If you're using Software Asset Workspace, the option to create the Docusign integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	Name of the integration profile. For example, DocuSign Integration
Integration type	The default value is set to Account Level .
Client Id	Client ID for the OAuth application created in the SaaS admin account in the Register a Docusign application procedure.
Redirect url	URL of the OAuth provider that you're redirected to after authentication. This value is automatically populated.
Technical account Id	API Account ID from your Docusign production account.
Instance URL	URL of the login page used for accessing your Docusign production account. This field is automatically set to https://account.docusign.com .
Client secret	Password associated with the client ID created in the Register a Docusign application procedure.
Profile type	Type of integration profile. This value is automatically set to DocuSign Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see the [Minimal user permissions](#) table.

- The **Download subscriptions** check box is selected by default and you can't clear it.
- The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Submit**.

A draft integration profile is created.

The Connection & Credential field appears and is automatically set to **sn_sam_saas_int.DocuSign**.

5. On the integration profile, select **Get OAuth Token** and follow the steps to get an OAuth token.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

6. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.

Result

You can view events performed by individual users up to one year prior to the current date. For more information, see [Review a software reclamation rule](#). Software Asset Management pulls the events from the time that you start downloading user subscriptions irrespective of the profile creation date.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Dropbox

Integrating your Software Asset Management application with the Dropbox service enables you to track your software subscriptions and to reclaim unused licenses.

For more information about the Dropbox service, see the [Dropbox Business User and Admin Guides](#) .

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Dropbox application	Authentication scopes
Download subscriptions	Security Admin	<ul style="list-style-type: none"> • members.read • team_data.member
Pull user activity	Security Admin	<ul style="list-style-type: none"> • events.read • team_data.member
Reclaim subscription	Security Admin	<ul style="list-style-type: none"> • team_info.read • members.write • members.delete

Create a Dropbox application for user subscriptions

Create an application on the DBX Platform for Developers.

Before you begin

Dropbox Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. Navigate to [Dropbox Developer Apps](#)  and sign in to your account.
2. On the My Apps page, select **Create App**.
3. Select scoped access API.
4. Specify the type of access to **Full Dropbox**.
5. Enter a name for your application and select **Create app**.
6. Select the **Permission** tab.
7. Select these permission check boxes:

- team_info.read
- members.write
- members.delete
- groups.read
- events.read
- team_data.member

8. Select **Submit** to save the changes.

9. Navigate to the **Settings** tab.

10. Obtain the App key and App secret.

You will need to copy and paste these values into the Client ID and Client Secret fields in your ServiceNow instance in the following steps.

Note:

Your App key (client ID) and App secret (client secret) are sensitive. Do not share them.

11. Enter `https://instance.service-now.com/oauth_redirect.do` as the redirect URI, where *instance* is the name of your ServiceNow instance.

12. Click the **Branding** tab and then click **Save changes**.

Create a Dropbox integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Dropbox service.

Before you begin

To create a Dropbox integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

About this task

If you're using Software Asset Workspace, the option to create the Dropbox integration profile in Core UI is inactive.

Procedure

- 1.** Using the information from the application with the permissions set to **Team member file access**, return to your ServiceNow instance to create an integration profile.
- 2.** Navigate to the integration profile.
- 3.** On the form, fill in the fields.

Integration Profile form

Field	Value
Display name	Name of the integration profile. For example, DropBox Integration
Client Id	Client ID for the OAuth application created in the SaaS admin account.

Field	Value
Redirect url	URL of the OAuth provider that you're redirected to after authentication. This value is automatically populated.
Client secret	Password associated with the client ID.
Profile type	Type of integration profile. This value is automatically set to DropBox Subscription .
Analyze user activity from	<p>In the Analyze user activity field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.</p> <p>Note: Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.</p> <p>You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see Review a software reclamation rule.</p>

4. In the Process configuration section, review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see [Minimal user permissions](#) table.

- The **Download subscriptions** check box is selected by default and you can't clear it.
- The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Events* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

5. Select **Submit** after completing all the required fields.
Your ServiceNow instance creates a draft integration profile.

6. On the integration profile form, select **Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

7. Navigate to the Dropbox application.

- Select **Allow** if you have already logged in to the Dropbox application.
- If you haven't logged in to the Dropbox application, log in with your admin credentials and then continue with the next steps.

Note:

When user subscriptions are reclaimed, files from the reclaimed accounts are transferred to the admin account selected in this step. This account can be a different admin account than the one used to set up the integration. If you have to start transferring files to a new admin, you can select the **Get OAuth Token** related link again at any time to select a different admin account. After selecting a new admin, you can reclaim the old admin account to transfer all of their files to the new admin, including all previously reclaimed user files.

8. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

Note:

If you clear the **Download Activity** check box after the integration profile is validated and scheduled jobs are created, you must revalidate the connections because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Events* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Google Workspace

Integrating your Software Asset Management application with the Google Workspace service enables you to track your software subscriptions and to reclaim unused licenses.

Note:

The Google Workspace integration supports the following products:

- Google Apps
- Google Vault SKUs
- Archived User SKUs

For additional information about the Google Workspace service, see [Google Workspace Admin Help](#) .

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Google Workspace application	Authentication scopes
Download subscriptions	Admin API privileges: Users Read	<ul style="list-style-type: none"> [Admin SDK API] https://www.googleapis.com/auth/admin.directory.user.readonly [Admin SDK API] https://www.googleapis.com/auth/admin.directory.domain.readonly [Enterprise License Manager API] https://www.googleapis.com/apps/licensing
Pull user activity	Admin API privileges: Users Read	<ul style="list-style-type: none"> [Admin SDK API] https://www.googleapis.com/auth/admin.directory.user.readonly [Admin SDK API] https://www.googleapis.com/auth/admin.reports.usage.readonly
Reclaim subscription	Super Administrator	<ul style="list-style-type: none"> [Admin SDK API] https://www.googleapis.com/auth/admin.directory.user.readonly [People SDK API] https://www.googleapis.com/auth/userinfo.email [People SDK API] https://www.googleapis.com/auth/userinfo.profile [Admin SDK API] https://www.googleapis.com/auth/

Create a Google Workspace project

Create a new project in the Google API Console.

Before you begin

Google Workspace Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. Log in to [Google API Console](#).
2. Select **Select a project > New Project**.
3. Enter a name for your project in the Project name, then select your Organization and Location.
4. Select **Create**.
5. Select the OAuth consent screen on the left navigation menu.
6. Select **User Type** as **Internal** and select **Create**.
7. Enter the App name and select User support email in the App information section.
8. In Authorized domains, select the **ADD DOMAIN** button and add `service-now.com`.
9. Enter Email addresses in the Developer contact information section.
10. Select **Save and Continue** to add scopes.
11. On the Scopes page, select the **Add or Remove Scopes** button.
12. In the Manually add scopes section, enter the following scopes by pasting them to the text area:
 - `https://www.googleapis.com/auth/apps.licensing`
 - `https://www.googleapis.com/auth/admin.directory.user`
 - `https://www.googleapis.com/auth/admin.directory.user.readonly`
 - `https://www.googleapis.com/auth/admin.directory.domain.readonly`
 - `https://www.googleapis.com/auth/admin.datatransfer`
 - `https://www.googleapis.com/auth/admin.datatransfer.readonly`
 - `https://www.googleapis.com/auth/admin.reports.usage.readonly`
 - `https://www.googleapis.com/auth/userinfo.profile`
 - `https://www.googleapis.com/auth/userinfo.email`
13. Select **ADD TO TABLE** and then select **Update**.
14. Select **Save and Continue**.
15. Select **Credentials** on the left navigation menu and select **CREATE CREDENTIALS**.
16. Select **OAuth client ID**.
17. Fill out the form as shown and select **Create**.

Field	Value
Application type	Web application

Field	Value
<p>Note: Selecting a value for this field causes the remaining fields to be displayed.</p>	
Name	Any name of your choice
Authorized JavaScript origins	https:// <i>instance</i> .service-now.com, where <i>instance</i> is the name of your ServiceNow instance
Authorized redirect URIs	https:// <i>instance</i> .service-now.com/oauth_redirect.do, where <i>instance</i> is the name of your ServiceNow instance

18. Select **OK.**

You can now view your client ID and client secret that you would use in your ServiceNow instance.

Note:

Your client ID and client secret are sensitive. Don't share them.

19. Select **Library on the left navigation menu.**

Search for and enable the following APIs:

- Enterprise License Manager API
- Admin SDK
- Google People API

Create a Google Workspace integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Google Workspace service.

Before you begin

To create a Google Workspace integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

About this task

If you're using Software Asset Workspace, the option to create the Google Workspace integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Value
Display name	Name of the integration profile. For example, <i>Google Workspace Integration</i>
Client Id	Client ID for the OAuth application created in the SaaS admin account.
Redirect url	URL of the OAuth provider that you're redirected to after authentication. This value is automatically populated.
Client secret	Password associated with the client ID.
Profile type	Type of integration profile. This value is automatically set to <i>Google Workspace Subscription</i> .

- In the Process configuration section, review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see [Minimal user permissions](#) table.

- The **Download subscriptions** check box is selected by default and you can't clear it.
- The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Events* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- Select **Submit** after completing all the required fields.
Your ServiceNow instance creates a draft integration profile.

- On the integration profile, select **Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

6. In the pop-up window, select your Google admin account and select **Allow**.

Note:

When user subscriptions are reclaimed, files from the reclaimed accounts are transferred to the admin account selected in this step. This account can be a different admin account than the one used to set up the integration. If you have to start transferring files to a new admin, you can select the **Get OAuth Token** related link again at any time to select a different admin account. After selecting a new admin, you can reclaim the old admin account to transfer all of their files to the new admin, including all previously reclaimed user files.

7. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

Note:

If you clear the **Download Activity** check box after the integration profile is validated and scheduled jobs are created, you must revalidate the connections because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Events* job gets deleted.

Result

You can view events performed by individual users up to one year prior to the current date. For more information, see [Review a software reclamation rule](#). Software Asset Management pulls the events from the time that you start downloading user subscriptions irrespective of the profile creation date.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic

application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with GitHub

Integrating your Software Asset Management application with the GitHub repository hosting service enables you to track your software subscriptions and reclaim unused licenses.

With this integration, you can retrieve and analyze licensing information for both the GitHub Enterprise Cloud and GitHub Enterprise Server applications.

- [Integrate with GitHub Enterprise Cloud](#)
- [Integrate with GitHub Enterprise Server](#)

Integrate with GitHub Enterprise Cloud

Integrating your Software Asset Management application with the GitHub Enterprise Cloud application help you track your software subscriptions and reclaim unused licenses.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the GitHub Enterprise Cloud application	Authentication scopes
Download subscriptions	Organization owner	read:org
Pull user activity	Organization owner	<ul style="list-style-type: none"> • read:org • repo
Reclaim subscription	Organization owner	write:org

Generate an API access token for GitHub Enterprise Cloud

Generate a token that you can use to access the GitHub Enterprise Cloud API.

Before you begin

GitHub Role required: organization owner

The user account that you use for authentication should be able to read all repositories in the organization they're a part of.

About this task

The GitHub repository hosting service uses personal access tokens to grant users access to the GitHub API. Personal access tokens function similarly to OAuth access tokens by authorizing API requests. By generating a personal access token to authorize your GitHub Enterprise Cloud API requests, you can gain access to the GitHub Enterprise Cloud API.

Procedure

1. From a web browser, open [GitHub](#).
2. Sign in to your GitHub account.
3. On the GitHub page header, select your profile photo and then select **Settings**.
Your profile settings open.
4. From the left navigation pane, select **Developer Settings**.
Your developer settings open.
5. From the left navigation pane, select **Personal access tokens**.
6. Select **Tokens (classic)**.
7. On the Personal access tokens page, select **Generate new token**.
8. Select **Generate new token (classic)**.
9. If you're prompted to confirm your password before proceeding, enter your GitHub password and then select **Confirm password**.
10. On the New personal access token form, describe the purpose of the token in the **Note** field.
11. To give your token an expiration, select the Expiration drop-down menu and select a default value or use the calendar picker.
12. In the Select scopes form section, enable the repo, write:org, and read:org OAuth scopes. OAuth scopes limit the level of access that the application has to your protected resources. The repo OAuth scope gives you full control of your private repositories. The write:org and read:org OAuth scopes enable you to manage your entire organization, including all teams, projects, and memberships. See [Scopes for OAuth Apps](#) for more information about GitHub OAuth scopes.
 - a. Enable the repo OAuth scope by selecting the **repo** check box.
By enabling this OAuth scope, you automatically enable the repo:status, repo_deployment, public_repo, repo:invite, and security_events OAuth scopes.
 - b. Enable the write:org and read:org OAuth scope.
13. Select **Generate token**.
Your personal access token generates.
14. Copy the access token and save it in a secure location for later use.
15. To use your token to access resources owned by an organization that uses SAML single sign-on, authorize the token.
For more information, see [Authorizing a personal access token for use with SAML single sign-on](#).

Create a GitHub Enterprise Cloud integration profile

Create a GitHub Enterprise Enterprise Cloud integration profile to track software subscriptions and optimize licensing for your GitHub Enterprise Cloud applications.

Before you begin

To create a GitHub Enterprise Cloud integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **GitHub Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the GitHub Cloud integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, <code>GitHub Cloud Integration</code> .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile type	Type of integration profile. This field is automatically set to <code>github_cloud_subscription</code> .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **GitHub Cloud Download Subscriptions**.

i Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

Software Asset Management pulls the members, outside collaborators, pending invitations, and pending outside collaborators to provide a complete view of your GitHub Enterprise Cloud Subscriptions.

i Important:

To pull pending outside collaborators, enable the `sn_sam_saas_int.pull_pending_collaborator_github` system property. A higher number of repositories would lead to an increased number of API transactions.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **GitHub Cloud Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

Tip:

To avoid performance issues with this subflow, the best approach is to set the **Analyze user activity from** field to a maximum of seven days before the current date.

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **GitHub Cloud Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select Save.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_github_spoke.GitHub**.

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- 6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Name	Name of the GitHub connection.
Connection URL	URL of the GitHub API endpoint. Enter <code>https://api.github.com</code> .

Field	Description
Use MID Server	<p>Option that enables your ServiceNow instance to use a MID Server for communication with your GitHub Enterprise Cloud applications.</p> <ul style="list-style-type: none"> ○ If your instance requires a MID Server, set this field to <code>true</code>. ○ If your instance doesn't require a MID Server, leave this field empty. <div style="background-color: #e1f5fe; padding: 5px;"> <p>i Important: To enable this option, you must already have a MID Server set up on your instance. See MID Server for detailed instructions.</p> </div>
API Key	<p>Personal access token that enables you to access the GitHub Enterprise Cloud API.</p> <ul style="list-style-type: none"> ○ If the GitHub spoke version installed is 2.2.5 or higher, enter <code><api-key></code>. ○ If the GitHub spoke version installed is lower than 2.2.5, enter <code>Bearer <api-key></code>. <p>The <code><api-key></code> is the personal access token that you generated in Generate an API access token for GitHub Enterprise Cloud</p>

8. Select **Create**.

9. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

10. After the connection is verified, select **Publish**.

11. In the Publish Confirmation dialog box, select **OK**.

i Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrate with GitHub Enterprise Server

Integrating your Software Asset Management application with the GitHub Enterprise Server application help you track your software subscriptions and reclaim unused licenses.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the GitHub Enterprise Server application	Authentication scopes
Download subscriptions	site administrator	site_admin
Reclaim subscription	site administrator	site_admin

Generate an API access token for GitHub Enterprise Server

Generate a token that you can use to access the GitHub Enterprise Server API.

Before you begin

GitHub Role required: site administrator

About this task

The GitHub repository hosting service uses personal access tokens to grant users access to the GitHub API. Personal access tokens function similarly to OAuth access tokens by authorizing API requests. By generating a personal access token to authorize your GitHub Enterprise Server API requests, you can gain access to the GitHub Enterprise Server API.

Procedure

1. From a web browser, open your GitHub Enterprise Server instance.
2. Sign in to your GitHub account.
3. On the GitHub page header, select your profile photo and then select **Settings**. Your profile settings open.
4. From the left navigation pane, select **Developer Settings**.

Your developer settings open.

5. From the left navigation pane, select **Personal access tokens**.
6. On the Personal access tokens page, select **Generate new token**.
7. If you're prompted to confirm your password before proceeding, enter your GitHub password and then select **Confirm password**.
8. On the New personal access token form, describe the purpose of the token in the **Note** field.
9. In the Select scopes form section, enable the site_admin OAuth scope by selecting the **site_admin** check box.
 OAuth scopes limit the level of access that the application has to your protected resources. The site_admin OAuth scope enables you to manage your enterprise users, organizations, and repositories.
10. Select **Generate token**.
 Your personal access token generates.
11. Copy the access token and save it in a secure location for later use.

Create a GitHub Enterprise Server integration profile

Create a GitHub Enterprise Server integration profile to track software subscriptions and optimize licensing for your GitHub Enterprise Server applications.

Before you begin

To create a GitHub Enterprise Server integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **GitHub Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the GitHub Server integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, <code>GitHub Server Integration</code> .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.

Field	Description
Profile type	Type of integration profile. This field is automatically set to github_server_subscription .

3. In the Process configuration section, review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see [Minimal user permissions](#) table.

- The **Download subscriptions** check box is selected by default and you can't clear it.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_github_spoke.GitHub_Server**.

5. Open the connection & credential aliases record by selecting the preview icon (🔍) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.

6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.

7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Name	Name of the GitHub connection.

Field	Description
Connection URL	<p>URL of the GitHub API endpoint.</p> <p>Enter <code>https://api.github.com</code>.</p>
Use MID Server	<p>Option that enables your ServiceNow instance to use a MID Server for communication with your GitHub Enterprise Cloud applications.</p> <ul style="list-style-type: none"> ○ If your instance requires a MID Server, set this field to <code>true</code>. ○ If your instance doesn't require a MID Server, leave this field empty. <div style="background-color: #e1f5fe; padding: 5px;"> <p>i Important: To enable this option, you must already have a MID Server set up on your instance. See MID Server for detailed instructions.</p> </div>
API Key	<p>Personal access token that enables you to access the GitHub Enterprise Cloud API.</p> <ul style="list-style-type: none"> ○ If the GitHub spoke version installed is 2.2.5 or higher, enter <code><api-key></code>. ○ If the GitHub spoke version installed is lower than 2.2.5, enter <code>Bearer <api-key></code>. <p>The <code><api-key></code> is the personal access token that you generated in Generate an API access token for GitHub Enterprise Server.</p>

8. Select **Create.**

9. On the integration profile form, select **Validate Connection to verify the connection and credential details of this integration.**

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

10. After the connection is validated, select **Publish.**

11. In the Publish Confirmation dialog box, select **OK.**

i Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with GoTo

Integrating your Software Asset Management application with GoTo applications enable you to track your software subscriptions and reclaim unused licenses.

With this integration, you can retrieve and analyze licensing information for the following GoTo applications:

- GoToMeeting (user subscriptions, user activity, and reclamation candidates)
- GoToWebinar (user subscriptions, user activity, and reclamation candidates)
- GoToConnect (user subscriptions, user activity, and reclamation candidates)
- GoToTraining (user subscriptions only)
- GoToAssist (user subscriptions only)
- OpenVoice (user subscriptions only)

Use this information to manage and optimize your GoTo license position.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the GoTo application	Authentication scopes
Download subscriptions	LogMeIn developer account and admin role	<ul style="list-style-type: none"> • Profile • Admin Center
Pull user activity	LogMeIn developer account and admin role	<ul style="list-style-type: none"> • Profile • Admin Center • GoToConnect
Reclaim subscription	LogMeIn developer account and admin role	Admin Center

Create a GoTo OAuth client

Create an OAuth client for authenticating GoTo API requests.

Before you begin

GoTo Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. From a web browser, open the [GoTo Developer Center](#).
2. Sign in using your LogMeIn developer account.
If you have not already set up a LogMeIn developer account, see [How to login or create a developer account](#) for detailed instructions.
3. From the LogMeIn Developers home page, select the **OAuth Clients** tab.
4. Select **Create a client**.
5. On the Details tab of the Create client form, fill in the client details.

Details tab

Field	Description
Client name	Name of the OAuth client.
Description	Optional description for the OAuth client.
Redirect URLs	Redirect URL of the ServiceNow instance on which you're integrating your GoTo applications. Enter <code>https://<instance-url>/oauth_redirect.do</code> , where <code><instance-url></code> is the URL of your ServiceNow instance.

6. Select **Next**.

7. On the Scopes tab, specify the level of access that the OAuth client has to your GoTo users and applications.

Scopes tab

Field	Description
Profile	OAuth scopes for getting and modifying user information for your authenticated users. The Get user information scope is enabled automatically. Select the check box to enable the Modify user details scope.
GoToMeeting, GoToWebinar, or GoToTraining	<p>OAuth scope for creating, starting, and modifying sessions for your GoToMeeting, GoToWebinar, and GoToTraining applications. Select the check box to enable this scope.</p> <p>Note: The SaaS License Management GoTo integration doesn't support license management for the GoToTraining application.</p>
GoToAssist Remote Support or Service Desk	<p>OAuth scope for creating, starting, and modifying sessions for the GoToAssist Remote Support and Service Desk applications. Leave this check box unselected.</p> <p>Note: The SaaS License Management GoTo integration doesn't support license management for the GoToAssist applications.</p>
SCIM	OAuth scope for automating user management using the System for Cross-domain Identity Management (SCIM) protocol. Leave this check box unselected.
Admin Center	OAuth scope for managing LogMeIn users through the GoTo Admin Center. Select the check box to enable this scope.
GoToConnect	<p>OAuth scope for initiating phone calls and other telephone services using the GoToConnect. If GoToConnect license is enabled, select these check boxes:</p> <ul style="list-style-type: none"> ○ Access call history for phone lines in the PBX [cr.v1.read] ○ Retrieve your phone line information [users.v1.lines.read]

8. Select **Save**.

9. On the Credentials tab, copy the values in the **Client ID** and **Client secret** fields. Save them in a secure location for later use.

10. Select the check box to verify that you have stored the client secret.

11. Select **Done**.

Create a GoTo integration profile

Create a GoTo integration profile to track software subscriptions and optimize licensing for your GoTo applications.

Before you begin

To create a GoTo integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **GoTo Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the GoTo integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the following fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, <code>GoTo Integration</code> .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to <code>GoTo Subscription</code> .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **GoTo Download Subscriptions**.

This subflow is used for all supported GoTo applications.

i Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **GoTo Update User Activity**.

This subflow is used for only the GoToMeeting and GoToWebinar applications.

i Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job `SAM - Refresh <displayname> Activity` isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **GoTo Reclaim Subscription**.

This subflow is used for only the GoToMeeting and GoToWebinar applications.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- 4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_goto_spoke.GoTo**.

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.

- 6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.

- 7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Name	Name of the connection.
OAuth Client ID	Client ID that is assigned to your GoTo application.
OAuth Client Secret	Client secret that is assigned to your GoTo application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the OAuth redirect URL that you specified in Create a GoTo OAuth client .

- 8. Select **Create and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

9. In the Authorize App dialog box, select **Allow**.
10. Select **Allow**.
The OAuth access token becomes available for authorizing your GoTo connection.
11. If GoToConnect license is enabled, navigate to the Connections tab.
12. Find the connection for GoToConnect and select **View Details**.
13. Select **Get OAuth Token** to generate a token for GoToConnect.
14. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.
15. After the connection is verified, select **Publish**.
16. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Jira Software Cloud

Integrating your Software Asset Management application with Atlassian Jira Software Cloud enables you to track your software subscriptions and to reclaim unused licenses.

Note:

Currently this integration supports only one site integration per profile.

- If your installed Jira spoke version is 4.1.0 or higher, you can integrate Jira with your ServiceNow instance by using one of the following methods:
 - [Using basic authentication](#)
 - [Using OAuth authentication](#)
- If your installed Jira spoke version is lower than 4.1.0, integrate Jira with your ServiceNow instance by [Using basic authentication](#) method.

Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Jira Software Cloud application	Authentication scopes
Download subscriptions	Permission to access Jira	<ul style="list-style-type: none"> • read:application-role:jira • read:group:jira • read:user:jira • read:avatar:jira
Pull user activity	<ul style="list-style-type: none"> • Administer Jira global permission • Browse projects permission for the project containing the issue. <p>If issue-level security is configured, issue-level security permission to view the issue.</p>	<ul style="list-style-type: none"> • read:user:jira • read:issue-details:jira • read:audit-log:jira • read:avatar:jira • read:field-configuration:jira • read:issue-meta:jira
Reclaim subscription	Site administration, that is, member of the site-admin group	<ul style="list-style-type: none"> • read:group:jira • write:group:jira

Using basic authentication

Integrate the Software Asset Management application and Jira using an API key to authenticate ServiceNow requests.

You can integrate a ServiceNow instance with multiple Jira instances. For this integration, create a connection and credential alias record and a connection record for each Jira instance.

Create an Jira account API token

Create an API token in Jira to authenticate requests.

Before you begin

Jira Role required: Refer the [Minimal user permissions](#) table.

Procedure

1. Navigate to [Atlassian API Tokens](#) .
2. Select **Create API token**.
3. Enter a name for your API token, then select **Create**.
4. Copy the API token and save it.
You'll use the token later.

Using OAuth authentication

Integrate the Software Asset Management application with your Jira account using OAuth to authenticate ServiceNow requests.

Create an OAuth 2.0 integration in Jira account

Create an OAuth 2.0 integration in the Atlassian Developer console to authenticate the requests.

Before you begin

Jira Role required: Refer the [Minimal user permissions](#) table.

Procedure

1. Log in to [Atlassian Developer console](#) .
2. Under **My apps**, select **Create** and select **OAuth 2.0 integration**.
3. On the form, provide a name for the integration and select **Create**.

The integration is created and the value of App ID is displayed.

4. Select **Authorization**.
 - a. Select **Add** under **Action**.
 - b. In **Callback URL**, provide the URL of your ServiceNow instance in this format: `https://<ServiceNow-Instance-Name>.service-now.com/oauth_redirect.do`.
For example, `https://example.service-now.com/oauth_redirect.do`.
 - c. Select **Save changes**.
5. Select **Settings**.
6. Under **Authentication details**, copy the values of Client ID and Client Secret.
7. Select **Permissions > Jira API > Configure**.
8. Select the **Granular scopes** tab.
9. Select **Edit Scopes** to add the following scopes:

- read:application-role:jira
- read:group:jira
- read:user:jira
- read:avatar:jira
- read:audit-log:jira
- read:issue-details:jira
- read:field-configuration:jira
- read:issue-meta:jira
- write:group:jira

You can configure other scopes according to your requirement.

Obtain the Cloud ID value of Jira instance

Obtain the value of the Cloud ID of the Jira cloud instance. This value is required during the configuration of the connection record in your ServiceNow instance.

Before you begin

Jira Role required: admin

Procedure

1. Log in to [Atlassian Administration](#) .
2. Select the **Select** button against the required organization.
3. On the side navigation pane, select **Apps > Atlassian apps**.
4. On the Apps page, select **Manage product** on the Jira product row.

The URL is in the following format in a new window: `https://admin.atlassian.com/o/<orgID>/products/jira-software/<Cloud-Id>`.

5. Copy the value of Cloud ID and secure it for later use.

Create a Jira Software Cloud integration profile

Create an integration profile to track software subscriptions and optimize licensing for Atlassian Jira Software Cloud.

Before you begin

To create a Jira integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

To enable the integration profile to retrieve and update user activity through the Jira Update User Activity subflow, set the `com.glide.transform.json.max-partial-length` system property **Value** to 32768.

Atlassian Role required: site admin

ServiceNow Role required: admin or sam_integrator

Important:

You must select the **Jira Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Jira integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Value
Display name	Name of your choice. For example, Jira integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile type	Jira Subscription. This field is automatically populated.

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Jira Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Jira Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Jira Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- 4. Select **Save**.

A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_jira_spoke.jira_subscription_activity_reclaim**.

Note:

The automatically populated value in the **Connection & credential** field changes based on the selection in the **Download activity** and **Reclaim subscriptions** check boxes.

Automatically populated Connection & credential values based on the selection

Selection	Connection & credential value
Both Download activity and Reclaim subscriptions are selected.	sn_jira_spoke.jira_subscription_activity_reclaim
Only Download activity is selected.	sn_jira_spoke.jira_subscription_activity
Only Reclaim subscriptions is selected.	sn_jira_spoke.jira_subscription_reclaim
Both Download activity and Reclaim subscriptions aren't selected.	sn_jira_spoke.jira_subscription

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- 6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 7. On the form, fill in the fields.

Create Connection and Credential form

Field	Description
Connection URL	URL of your Jira instance in https://api.atlassian.com/ex/jira/<Cloud-Id> format.
User Name	Email address of the user.
API Key	The API token that you generated for Jira.

- 8. Select **Create**.
- 9. On your ServiceNow instance, specify the groups that have access to Jira products. By specifying these groups on your ServiceNow instance, you can retrieve data and manage licenses for only the users within these groups.

- a. In a new tab, open the [Atlassian Administration portal](#) .
 - b. Log in to your site admin account.
 - c. Select the **Select** button against the required organization.
 - d. Select the **Products** tab.
 - e. On the Products page, select **Manage product** on the Jira product row.
 - f. View the list of groups that have access to Jira Software.
Take note of this information for later use.
 - g. Return to your ServiceNow instance and navigate to **Jira > Jira Groups**.
 - h. On the Jira Groups form, select the **Add Groups** related link.
The Add Jira Groups dialog box opens.
 - i. In the Available list, select the groups that have access to Jira products.
-  **Tip:**
The Available list includes all groups that are associated with your Atlassian account.
Select only the groups that have access to Jira products.
- j. Select the right arrow button to move the groups from the Available list to the Selected list.
 - k. Select **OK**.
10. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.
 11. After the connection is verified, select **Publish**.
 12. In the Publish Confirmation dialog box, select **OK**.

 **Note:**

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

After creating an integration profile, view information about the profile in the Software Asset Workspace by navigating to **License operations > User subscription > Direct integration profiles**. You can select an integration profile to view the following related lists. If all of the

following related lists aren't visible for an integration profile in the default view, you can select the custom integration view from the Details tab:

- Software Models
- Unrecognized Subscription Identifiers
- Scheduled Jobs
- Scheduled Job Results
- Software Subscriptions
- Subscription Identifier Exclusion Rule
- Subscription User Exclusion Rule

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple Jira integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Looker

Integrating your Software Asset Management application with the Looker, a Google Cloud application enables you to track your software subscriptions and to reclaim unused licenses.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Box application	Authentication scopes
Download subscriptions	User with see_users permission	None
Pull user activity	User with see_users permission	None
Reclaim subscription	admin	None

Configure Looker API key settings

Configure API key settings to manage and retrieve Looker API keys.

Before you begin

Looker Role required: admin

Procedure

1. Log in to your Looker (<https://<instancename>.looker.com/>) instance.
2. Select the gear icon to open Admin settings.
3. Select **Users > Open the admin user account**.
4. Select **Edit API3 Keys** under the Profile tab.
5. Select **New API3 Key**.
6. Copy the Client ID and Client secret for later use.

Create a Looker integration profile

Create a Looker integration profile to track software subscriptions and optimize licensing for your Looker solutions.

Before you begin

The Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) must be installed from the [ServiceNow Store](#) .

ServiceNow Role required: admin or sam_integrator

i Important:

You must select the **Looker Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Looker integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

- On the form, fill in the fields.

Integration profile form

Field	Value
Display name	Name of the integration profile. For example, Looker integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> If you have not published the integration profile, this field is automatically set to #Draft. If you have already published the integration profile, this field is automatically set to #Published.
Profile type	Type of integration profile. This field is automatically set to Looker Subscription.

- Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Looker Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Looker Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- Select **Save**.

A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_looker_spoke.Looker**.

- Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Information	
Connection Name	Name of the Looker connection. This field populates automatically.
Connection URL	Looker base URL for the API. This field is automatically set to <code>https://<instance_name>.looker.com</code> .
Credential Information	
OAuth Client ID	Client ID that is assigned to your Looker application.
OAuth Client Secret	Client secret that is assigned to your Looker application.
OAuth Redirect URL	<code>https://<instance name>/oauth_redirect.do</code> , where instance name is the name of your ServiceNow instance.

8. Select **Create and Get OAuth Token.**

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

The dialog box closes and you automatically return to the integration profile form.

9. On the integration profile form, select **Validate Connection to verify the connection and credential details of this integration.**

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.

10. After the connection is verified, select **Publish.**

11. In the Publish Confirmation dialog box, select **OK.**

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Microsoft Dynamics 365 and Power Apps

Integrating your ServiceNow instance with the Microsoft Dynamics 365 and Power Apps service enables you to track your software subscriptions and to reclaim unused licenses.

Important:

This integration retrieves user subscription details for all Microsoft Dynamics 365 and Power Apps products. Furthermore, Software Asset Management provides license compliance for the products using user subscription-based models.

For optimization, Software Asset Management automatically tracks the last activity date and identifies low-usage for the following applications:

- Dynamics 365 for Sales (Professional, Premium, Enterprise)
- Dynamics 365 for Customer Service (Professional, Enterprise, Enterprise for Government, Professional Attach to Qualifying Dynamics, Sales, and Customer Service Enterprise)
- Dynamics 365 for Team Members
- Microsoft Relationship Sales (MRS)

For more information about the Microsoft 365 service, see [Microsoft 365 frequently asked questions](#) .

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Microsoft Dynamics 365 and Power Apps application	Authentication scopes
Download subscriptions	<ul style="list-style-type: none"> Global administrator Dynamics 365 administrator <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p>i Note: If you have installed the Software Asset Management - SaaS License Management plugin (com.sn_sam_saas_int) version 15.0.17 or later, you must have the Global Reader role.</p> </div>	<ul style="list-style-type: none"> Organization.Read.All User.Read.All user_impersonation <p>Authentication scopes for the Global Reader role:</p> <ul style="list-style-type: none"> LicenseAssignment.Read.All User.Read.All
Pull user activity	Dynamics 365 administrator	user_impersonation

Set up Microsoft Azure Active Directory

Set up Microsoft Azure Active Directory (AD).

Before you begin

Role required: Global administrator and Dynamics 365 administrator in Microsoft admin center

Procedure

1. Log in to the Microsoft Azure portal using an admin account and navigate to **Azure Active Directory**.
2. Navigate to the App registrations section and select **App registration** under **+ Add**.
3. On the Register an application form, fill in the fields.

Register an application form fields

Field	Description
Name	Name of the application that you want to register.
Supported account types	The account with the required organizational directory.
Redirect URI (optional)	URL that will access Azure. Typically the URL of the ServiceNow instance.

Field	Description
	<p>i Important: You must select Web in the Select a platform drop-down list because Azure AD app must be a web application in App registration for this setup.</p>

4. Select **Register**.
5. Open the application that you registered and navigate to the **Overview** section.
6. Collect the Application (client) ID and Directory (tenant) ID.
7. Navigate to the Certificates and Secrets section.
8. Create a client secret and collect the client secret key.
You need the client secret key while configuring your ServiceNow instance.
9. Under API Permission, select **+ Add a permission** and then select **APIs my organization uses**.
10. Select Microsoft Graph and add the following Delegated Permissions.
 - Organization.Read.All
 - User.Read.All
 - Offline_access
11. Select Dynamics CRM and add the following permission.
`user_impersonation`
12. Under Grant consent, select **Grant admin consent**.
13. In the Authentication section, under the Redirect URI, enter the redirect URI of the ServiceNow instance.

Set up Microsoft Dynamics 365 and Power Apps

Set the system-level settings for Microsoft Dynamics 365 and Power Apps.

Before you begin

Role required: admin

Procedure

1. Go to <https://admin.powerplatform.microsoft.com/> .
2. Under Environments, select the environment for which you want to pull the dynamics activities.
3. From the top ribbon, select **Settings**.
4. Select **Audit and logs**.
5. Select the following check boxes.
 - Start Auditing
 - Log access
 - Read logs
6. Select **Additional Audit Settings**.
7. From the **Settings** list, select **Auditing**.
8. Select **Global Audit Settings**.
9. Select the following check boxes.

- Start Auditing
- Audit user access
- Start Read Audit
- Common Entities
- Sales Entities
- Customer Service Entities

10. Select **OK**.

Set up ServiceNow instance for Microsoft Dynamics 365 and Power Apps

Set up ServiceNow instance for Microsoft Dynamics 365 and Power Apps to track your software subscriptions and to reclaim unused licenses.

Before you begin

Role required: admin or sam_integrator

i Important:

You must select the **Microsoft Dynamics 365 Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Microsoft Dynamics 365 and Power Apps integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. In the **Display name** field, enter a name of your choice.
3. Under the **Calculate Activity Subflow** tab in the **Analyze user activity from** field, select the date since when you want to pull the activity.
4. Select **Save**.
A draft integration profile is created. In the **Download Subscription Subflow** tab, the **Connection & Credential** field appears and is automatically set to **sn_ms_365_spoke.Microsoft_365_Graph**. In the **Calculate Activity Subflow** tab, the **Connection & Credential** field appears and is automatically set to **sn_ms_365_spoke.Microsoft_365_Dynamics**.
5. Under the **Download Subscription Subflow** tab, beside the **Connection & Credential** field, select the preview (🔍) icon.
6. Under the **Please Enter the Credential Information** section, enter the values you received from [Set up Microsoft Azure Active Directory](#).
 - a. In the **Tenant ID** field, enter your Tenant ID.
 - b. In the **OAuth Client ID** field, enter the OAuth Client ID.
 - c. In the **OAuth Client Secret** field, enter the OAuth Client Secret key.
7. Select **Create and Get OAuth Token**.

i Important:

This step must be executed by a user with the Global administrator role in the Microsoft admin center.

8. If you're prompted to log in to your Microsoft 365 account, enter your Microsoft 365 credentials and log in to your Microsoft 365 account.
9. Under the **Calculate Activity Subflow** tab, beside the **Connection & Credential** field, select the Preview (i) icon.
10. Select **Create New connection and credential alias**.
11. In the Create Connection and Credential window, perform the following.
 - a. In the **Connection URL** field, enter the connection URL.
To fetch Connection URL, log in to the Microsoft Admin portal and navigate to **Admin Centers > All admin centers > Select Dynamics 365 apps > Environments**. Select the environment you want to integrate with. The environment URL is the Connection URL.
 - b. In the **OAuth Client ID** field, enter the OAuth Client ID.
 - c. In the **OAuth Client Secret** field, enter the OAuth Client Secret key.

12. Select **Create and Get OAuth Token**.

i Important:

This step must be executed by a user with the Dynamics 365 administrator role in the Microsoft admin center.

13. Return to the integration profile.
14. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

15. After the connection is verified, select **Publish**.
16. In the Publish Confirmation dialog box, select **OK**.

i Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Optimizing Microsoft Dynamics 365 subscriptions

Evaluating the software usage activity of Microsoft Dynamics 365 subscriptions helps you monitor license usage, optimize license allocation, and potentially reduce costs for the assigned licenses. Software usage activity refers to how software products are being used.

Based on the software usage activity and the incurred cost, Software Asset Management generates optimization recommendations for your software subscriptions that include the following:

- **Low usage subscriptions**

Software Asset Management recommends reclaiming the low usage subscriptions. For example, if the last activity date is 60 days prior to the current date, the subscription is considered a low usage subscription.

- **Consolidated subscriptions**

If a user has multiple base licenses for different Microsoft Dynamics 365 applications, Software Asset Management recommends consolidating the subscriptions to optimize licensing. This approach involves purchasing one base license and obtaining the rest as attached licenses, ensuring compliance with Microsoft's licensing terms while being more cost-effective.

For example, if Dynamics 365 Commerce, Dynamics 365 Finance, and Dynamics 365 Human Resources base license subscriptions are purchased for a user, Software Asset Management recommends using Dynamics 365 Commerce as base license and Dynamics 365 Finance and Dynamics 365 Human Resources as attached licenses to the base license. For more information, you can download the Dynamics 365 Licensing Guide from the [Dynamics 365 pricing overview page](#) [📄](#).

After completing the [Integrating with Microsoft Dynamics 365 and Power Apps](#) integration, you can view the usage activity information in the Software Subscription [samp_sw_subscription] table.

[Reclamation rules](#)

Integrating with Miro Enterprise

Integrating your Software Asset Management application with the Miro Enterprise application enables you to track your software subscriptions and to reclaim unused licenses.

***i* Important:**

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Miro Enterprise application	Authentication scopes
Download subscriptions	Company admin	organizations:read
Pull user activity	Company admin	organizations:read
Reclaim subscription	Company admin	None

Create a Miro Enterprise OAuth 2.0 application

Create a Miro Enterprise OAuth 2.0 application to enable access to the Miro API.

Before you begin

Miro Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. From a web browser, open the [Miro Platform](#).
2. If you have not created any teams within your organization or you want to build and test the OAuth 2.0 application using fake data, [get a developer team](#).
3. Sign in using your Company Admin credentials.
4. On the page header of the Miro Platform, select the organization profile icon.
5. On the side navigation panel, select **Your Apps**.
6. Select **Create a new app**.
7. In the Create new app dialog box, enter a name for the OAuth 2.0 application in the **App Name** field.
8. Select the developer team for which you want to build the OAuth 2.0 application.
9. Select **Create app**.
The profile settings for your newly created app open.
10. In the App Credentials section, copy the values in the **Client ID** and **Client secret** fields and save them in a secure location for later use.
11. In the Redirect URI for OAuth 2.0 section, enter the URL of the OAuth provider that users are redirected to after authentication and then select **Add**.
For example, `https://instance.servicenow.com/oauth_redirect.do`, where `<instance>` is the name of your ServiceNow instance.
12. In the Permissions section, select the **organizations:read** OAuth scope.

OAuth scopes specify the level of access that the application has to your protected resources. The organizations:read OAuth scope enables your application to read information about your organization and organization members.

13. Select **Install app and get OAuth token**.

What to do next

Keep your organization profile open so that you can enable SCIM (System for Cross-domain Identity Management) on your Miro Enterprise account. For more information, see [Enable SCIM on your Miro Enterprise account](#).

Enable SCIM on your Miro Enterprise account

Enable SCIM (System for Cross-domain Identity Management) on your Miro Enterprise account so that you can generate an API access token for authenticating your Miro API requests.

Before you begin

Miro Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. On the left navigation pane of your Miro organization profile, select **Security**.
2. On the Security page, select the option to **Enable SSO/SAML**.
3. After SSO/SAML is enabled, select the option to enable **SCIM Provisioning**.
Miro automatically generates and displays your API access token in the **Api Token** field.
4. **Optional:** Select the **Send email notifications to users provisioned by SCIM** check box to enable Miro to send email notifications to all users that have been provisioned using SCIM.
5. Copy the API access token in the **Api Token** field.
Save it in a secure location for later use.

Create a Miro Enterprise integration profile

Create a Miro Enterprise integration profile to track software subscriptions and optimize licensing for your Miro Enterprise applications.

Before you begin

To create a Miro Enterprise integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

ServiceNow Role required: sam_integrator or admin

Important:

You must select the **Miro Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Miro Enterprise integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the following fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, Miro Enterprise Integration .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to Miro Enterprise Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see [Minimal user permissions](#) table.

4. Select **Save**.

A draft integration profile is created.

5. In the Download Subscription Subflow section, verify that the **Connection & credential** field is set to **sn_miro_spoke.Miro_Enterprise** and the Subflow field is set to **Miro Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- a. Open the connection & credential aliases record by selecting the preview icon (🔍) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.

- b. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.

- c. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the Miro Enterprise connection. This field populates automatically.
Credential Information	
OAuth Client ID	Client ID that is assigned to your Miro Enterprise OAuth 2.0 application.

Field	Description
OAuth Client Secret	Client secret that is assigned to your Miro Enterprise OAuth 2.0 application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the redirect URL that you specified in Create a Miro Enterprise OAuth 2.0 application .

d. Select **Create and Get OAuth Token.**

Important:
This step must be executed by a ServiceNow admin with the Company Admin role in Miro.

e. On the Miro OAuth authorization dialog box, locate the team that you built the Miro Enterprise OAuth 2.0 application for and then select **Install.**

Note:
If another ServiceNow instance is using the same credentials, you would be prompted for a reinstall.

The OAuth access token becomes available for authorizing your Miro Enterprise connection.

6. In the Reclaim Subscription Subflow section, verify that the **Connection & credential field is set to **sn_miro_spoke.Miro_Enterprise_SCIM** and the **Subflow** field is set to **Miro Reclaim Subscription**.**

Note:
The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

a. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential field and then selecting **Open Record** in the record preview.**

b. On the Connection & Credential Aliases form, select the **Create New Connection & Credential related link.**

c. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Information	
Connection Name	Name of the Miro Enterprise SCIM connection. This field populates automatically.
Credential Information	
API Token	API access token for authenticating Miro API requests.

Field	Description
	Enter the same API access token that you generated and copied in Enable SCIM on your Miro Enterprise account .

d. Select **Create.**

The dialog box closes and you automatically return to the integration profile form.

7. On the integration profile form, select **Validate Connection to verify the connection and credential details of this integration.**

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.

8. After the connection is validated, select **Publish.**

9. In the Publish Confirmation dialog box, select **OK.**

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with monday.com

Integrating your Software Asset Management application with monday.com enables you to track your software subscriptions and to reclaim unused licenses.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the monday.com application	Authentication scopes
Download subscriptions	Member	users:read
Pull user activity	Member	users:read

Create a monday OAuth2 application

Create a monday OAuth2 application to authorize access to the monday.com API.

Before you begin

monday.com Role required: Refer to the [Minimal user permissions](#) table.

About this task

A monday application enables you to build workflows, user experiences, and products on top of the existing monday.com work operating system (Work OS). When you configure a monday application to use OAuth2, access is granted to the monday.com API so that it can read and modify user data.

Procedure

1. From a web browser, go to monday.com.
2. Log in using your admin credentials.
3. Select your profile icon and then select **Developers**.
The My Apps page opens.
4. Select **Create App**.
The Basic Information page for the new application opens.
5. In the Display Information section, fill in the fields.

Display Information

Field	Description
Name	Name of the monday application.
Short Description	Description of the application.

6. **Optional:** In the same section, add your own application icon by selecting the auto-generated icon and then selecting an icon image.
You can also change the icon color by selecting **App Color** and then selecting either a preset or custom color. If you don't add your own application icon or select an icon color, the application uses the auto-generated icon and default icon color.
7. In the App Credentials section, copy the values in the **Client ID** and **Client Secret** fields.
Save them in a secure location for later use.
8. Select **Save App**.
9. From the left navigation menu of the new application, navigate to **General > OAuth**.
The **Scopes** tab of the OAuth & Permissions page opens.

10. In the Scopes section, specify how the application can access or use different types of user data by selecting the check box for the **users:read** OAuth scope.
11. Select **Save Feature**.
12. Select the **Redirect URLs** tab of the OAuth & Permissions page.
13. In the Redirect URLs section, enter the URL of the OAuth provider that users are redirected to after authentication.
Enter `https://instance.service-now.com/oauth_redirect.do`, where `<instance>` is the name of your ServiceNow instance.
14. Select **Save Feature**.

Create a monday.com integration profile

Create a monday.com integration profile to track software subscriptions and optimize licensing for your monday applications.

Before you begin

To create a monday.com integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **monday.com Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the monday.com integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, monday.com Integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to monday.com Subscription .

3. View the required user roles or API permissions to minimize security risks and optimize SaaS licenses.
For more information about the required roles and scopes, see [Minimal user permissions table](#).

4. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **monday.com Download Subscriptions**.

Note:

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

5. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_monday_com_spok.Monday**.

6. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.

7. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.

8. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Name	Name of the connection.
Connection URL	Base URL for the monday.com API. This field is automatically set to <code>https://api.monday.com/</code> .
OAuth Client ID	Client ID that is assigned to your monday application.
OAuth Client Secret	Client secret that is assigned to your monday application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the redirect URL that you specified in Create a monday OAuth2 application .

9. Select **Create and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions table](#).

10. In the Authorize App dialog box, sign in using the same monday.com credentials that you used to create your monday application.

11. Select **Allow**.

The dialog box closes and then you automatically return to the integration profile form.

12. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.
13. After the connection is verified, select **Publish**.
14. In the Publish Confirmation dialog box, select **OK**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with PagerDuty

Integrating your Software Asset Management application with the PagerDuty application enables you to track your software subscriptions and to reclaim unused licenses.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the PagerDuty application	Authentication scopes
Download subscriptions	<ul style="list-style-type: none"> • Create OAuth app: Manager • Token generation: Observer 	<ul style="list-style-type: none"> • Scoped OAuth: users:read • Classic User OAuth: Read
Pull user activity	<ul style="list-style-type: none"> • Create OAuth app: Manager • Token generation: Observer 	<ul style="list-style-type: none"> • Scoped OAuth: oncalls:read • Classic User OAuth: Read
Reclaim subscription	Create OAuth app and token generation: Global admin	<ul style="list-style-type: none"> • Scoped OAuth: users:write • Classic User OAuth: Read/Write

Create a PagerDuty application

Create a PagerDuty application to integrate with your ServiceNow instance.

Before you begin

- Activate the PagerDuty spoke. For more information, see [PagerDuty Spoke](#).
- PagerDuty Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. From a web browser, log in to the [PagerDuty portal](#) using your account credentials.
2. Log in to your PagerDuty account.
3. Enable Developer Mode.
 - If you're logged in with a developer account, you can access Developer Mode automatically.
 - If you're logged in with a customer account, you must enable Developer Mode manually by following these steps.
 - a. Select the INTEGRATIONS tab.
 - b. In the DEVELOPER TOOLS section, navigate to **App Registration**. You're redirected to the Add New App page in Developer Mode.
4. On the Add New App page, select **New App**.
5. On the App Information form, fill in the fields.

App Information form

Field	Description
Name	Name of the PagerDuty application. For example, ServiceNow Integration.
Description	Brief description of the application.

6. Select **OAuth 2.0** in the Functionality section.

7. Select **Next**.

PagerDuty registers your application and then returns you to the Add New App page.

Configure OAuth 2.0 for your PagerDuty application

After you create a PagerDuty application, configure OAuth 2.0 to authorize your application to administer PagerDuty and access user-specific data on user login.

Before you begin

PagerDuty Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. On the Add New App page of your PagerDuty account, select **Scoped OAuth** or **Classic User OAuth** in the Authorization section.
For more information about the permission scopes, refer to the [Minimal user permissions](#) table.
2. In the **Redirect URL** field, enter the URL of the OAuth provider that users are redirected to after authentication.
For example, `https://<instance-name>/oauth_redirect.do`, where `<instance-name>` is the name of your ServiceNow instance.
3. In the **Permission Scope** field, select the required permission.
4. Select **Register App**.
5. From the OAuth 2.0 Client Information window, copy the values in the **Client ID** and **Client Secret** fields.
Save them in a secure location for later use.
6. Select **Continue**.

Create a PagerDuty integration profile

Create a PagerDuty integration profile to track software subscriptions and optimize licensing for your PagerDuty applications.

Before you begin

To create a PagerDuty integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

ServiceNow Role required: sam_integrator or admin

Important:

You must select the **PagerDuty Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the PagerDuty integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, PagerDuty Integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to <i>PagerDuty Subscription</i> .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **PagerDuty Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **PagerDuty Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **PagerDuty Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- 4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_pagerduty_spoke.PagerDuty**.

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- 6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 7. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Name	Name of the connection. For example, PagerDuty Connection.
OAuth Client ID	Client ID that is assigned to your PagerDuty application.
OAuth Client Secret	Client secret that is assigned to your PagerDuty application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. Enter <code>https://<instance-name>/oauth_redirect.do</code> , where <i><instance-name></i> is the name of your ServiceNow instance.

- 8. Select **Create and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

You're redirected to the PagerDuty Accounts page.

- 9. Select the same PagerDuty account that you used to create your PagerDuty application.
- 10. When you're prompted to Authorize *<pagerduty-app-name>* to use your account, select **Submit Consent**.
Your ServiceNow instance creates an OAuth token for PagerDuty and then automatically returns you to the Integration Profile form.
- 11. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

12. After the connection is verified, select **Publish**.

13. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Rally

Integrating your Software Asset Management application with the Broadcom Rally application enables you to track your software subscriptions and to reclaim unused licenses.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Rally application	Authentication scopes
Download subscriptions	Workspace admin	None
Pull user activity	Workspace admin	None
Reclaim subscription	Workspace admin	None

Register a Rally OAuth application

Register the Rally OAuth application to access the Rally API 2.0 and to receive a Client ID and Client secret.

Before you begin

The Rally Integration Hub spoke must be active. For more information, see [Rally spoke](#).

Rally Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. Log in to [CA Agile Central](#) by using your admin credentials.
2. On the page header, select your profile and then select **My Settings**.
3. Navigate to **Access > OAUTH CLIENTS**.
4. Select **Create**.
5. In the dialog box, fill in the fields.

Create Oauth Client dialog box

Field	Value
Application Name	Provide a name for the application.
Callback URL	Callback URL of the ServiceNow instance to which the application is to be integrated. For example, <code>https://<instance_url>/oauth_redirect.do</code> .

6. Select **Next**.
7. Copy the Client ID and Client secret for later use.

Create a Rally integration profile

Create a Rally integration profile to track software subscriptions and optimize licensing for your Rally solutions.

Before you begin

The Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) must be installed from the [ServiceNow Store](#).

Role required: admin or sam_integrator

i Important:

You must select the **Rally Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Rally integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration profile form

Field	Value
Display name	Name of the integration profile. For example, Rally integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to #Draft. ○ If you have already published the integration profile, this field is automatically set to #Published.
Profile type	Type of integration profile. This field is automatically set to Rally Subscription.

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Rally Download Subscriptions**.

i Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Rally Reclaim Subscription**.

i Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Save**.

A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_rally_spoke.Rally**.

5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential

Field	Value
Connection Information	
Connection Name	Name of the Rally connection. This field populates automatically.
Connection URL	URL for the connection. This field is automatically set to <code>https://rally1.rallydev.com/slm/webservice</code> .
Credential Information	
OAuth Client ID	Client ID that you generated while configuring Rally API settings.
OAuth Client Secret	Client Secret that you generated while configuring Rally API settings.
OAuth Redirect URL	<code>https://<instance_name>/oauth_redirect.do</code> , where instance name is the name of your ServiceNow instance.

8. Select **Create and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

9. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.

10. After the connection is verified, select **Publish**.

11. In the Publish Confirmation dialog box, select **OK**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Roadmunk

Integrating your Software Asset Management application with the Roadmunk application enables you to track your software subscriptions and to reclaim unused licenses.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Roadmunk application	Authentication scopes
Download subscriptions	Account Admin	No scopes
Pull user activity	Account Admin	No scopes
Reclaim subscription	Account Admin	No scopes

Generate a Roadmunk API access token

Generate an API access token that authorizes access to the Roadmunk GraphQL API.

Before you begin

Roadmunk Role required: Account Admin

Procedure

1. From a web browser, open [Roadmunk](#) .
2. Log in using your account admin credentials.
3. On the left navigation menu of the Roadmunk dashboard, select your profile icon and then select **Account Settings**.
4. On the page header of your account settings, select the **Integrations** tab.

5. Under Existing Integrations, select **Add an integration**.
6. When prompted to select an integration to configure, select **API Tokens**.
7. On the Roadmunk API Tokens form, enter a name for your API access token in the **Application Name** field.
8. Select **Create API Token**.
The API access token is generated and then the API Token Created dialog box opens.
9. On the API Token Created dialog box, copy your API access token by selecting **Copy To Clipboard**.
Save it in a secure location for later use.

Create a Roadmunk integration profile

Create a Roadmunk integration profile to track software subscriptions and optimize licensing for your Roadmunk applications.

Before you begin

To create a Roadmunk integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **Roadmunk Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Roadmunk integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, Roadmunk Integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to Roadmunk Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Roadmunk Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Roadmunk Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Roadmunk Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select Save.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_roadmunk_spoke.Roadmunk**.

- 5. Optional:** To avoid your integration profile from including inactive users in your list of Roadmunk subscriptions, enable the Roadmunk Download Subscriptions subflow to download only the active users in your Roadmunk account.
By default, the Roadmunk Download Subscriptions subflow downloads all users in your Roadmunk account, including both active and inactive users.

- a. In a new tab or window, open [Roadmunk](#) .

- b. Log in using your Account Admin credentials.
The Roadmunk dashboard opens.

- c. On the left navigation menu of the Roadmunk dashboard, select your profile icon and then select **Account Settings**.
Your account settings open.
 - d. On the page header of your account settings, select the **Reports** tab.
 - e. From the list of available Roadmunk reports, select **Download User CSV**.
The Roadmunk User Report downloads in .csv format.
 - f. Return to the Integration Profile form.
 - g. On the form header, select the **Manage Attachments** icon ()
 - h. In the Attachments dialog box, select **Choose file** to locate and select the Roadmunk User Report that you downloaded in [step e](#).
 - i. After the report uploads successfully, close the dialog box to return to the Integration Profile form.
-  **Tip:**
For continuously removing inactive users from your list of Roadmunk subscriptions, download and attach the latest version of the Roadmunk User Report periodically.
- 6. Open the connection & credential aliases record by selecting the preview icon () next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
 - 7. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
 - 8. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the Roadmunk connection. This field populates automatically.
Connection URL	URL for the connection. This field is automatically set to https://app-gateway.roadmunk.com , where app is the default geographic region (North America) in which the connection is being created. If you're creating the connection outside of the default app (North America) region, you can change the value of the region to either eu (Europe) or apac (Asia-Pacific Region).
Credential Information	
API Token	API access token that authorizes access to the Roadmunk GraphQL API. Enter the same API access token that you generated in Generate a Roadmunk API access token .

9. Select Create.

- 10.** On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

- 11.** After the connection is verified, select **Publish**.

- 12.** Select **Publish**.

- 13.** In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Salesforce CRM

Integrating your Software Asset Management application with the Salesforce customer relationship management (CRM) services enable you to track your software subscriptions and to reclaim unused licenses.

i Note:

If you're using Software Asset Workspace, use SaaS Playbook for integrating your ServiceNow instance with the Salesforce CRM. For more information about creating a Salesforce CRM integration profile through Playbook, see [Create a Salesforce CRM integration](#).

The supported Salesforce CRM services include

- Salesforce Sales Cloud
- Salesforce Service Cloud
- Salesforce Platform
- Salesforce Customer Community
- Salesforce Partner Community
- Salesforce Company Community
- Salesforce Chatter

Both Salesforce Classic and Salesforce Lightning organizations are supported.

i Note:

You can track entitlements for other services that you pay for but aren't user subscription based by using custom license metrics. See [Add a custom license metric](#) for more details on how to create a custom license metric.

The Salesforce account that you use to connect the integration requires a Salesforce user license and the following user access permissions.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Salesforce CRM application	Authentication scopes
Download subscriptions	User with the following permissions: <ul style="list-style-type: none"> • View Setup and Configuration • API Enabled 	Application with grant type Authorization code: <ul style="list-style-type: none"> • manage your data (api) • Perform requests on your behalf at any time (refresh_token, offline access) Application with grant type Client Credentials: manage your data (api)
Pull user activity	User with the following permissions: <ul style="list-style-type: none"> • View Setup and Configuration • API Enabled 	Application with grant type Authorization code: <ul style="list-style-type: none"> • manage your data (api) • Perform requests on your behalf at any time (refresh_token, offline access) Application with grant type Client Credentials: manage your data (api)
Reclaim subscription	User with Admin permissions	Application with grant type Authorization code: <ul style="list-style-type: none"> • manage your data (api) • Perform requests on your behalf at any time (refresh_token, offline access) Application with grant type Client Credentials: manage your data (api)
Download consumption	User with the following permissions: <ul style="list-style-type: none"> • View Setup and Configuration • API Enabled 	Application with grant type Authorization code: <ul style="list-style-type: none"> • manage your data (api) • Perform requests on your behalf at any time (refresh_token, offline access)

These are optional permissions that may be required when minimum permissions are restricted due to your organization's security policies.

User access permissions

Permission	Enabled	Description
View Developer Name	Yes	Allows you to view the DeveloperName field via the API. Salesforce APIs.
Manage Internal Users	Yes	Allows you to create and modify internal users. Allows you to view Setup pages.
Manage Users	Yes	Allows you to create, edit, and deactivate users. Additionally, you can manage security settings, including profiles and roles.
View All Profiles	Yes	Allows you to view all user profiles regardless of the profile filter settings.
View All Users	Yes	Allows you to view all users regardless of the sharing settings.

For additional information on the Salesforce CRM services, see the [Salesforce Developer Documentation](#).

The **Client Credentials** grant type is supported in Software Asset Management - SaaS License Management (sn_sam_saas_int) 15.1.0, Salesforce CRM application 1.1.9, and Salesforce CRM Spoke 2.4.0 version onwards.

Register a Salesforce application

Register an application through the Salesforce admin portal.

Before you begin

Salesforce Role required: admin

Procedure

1. Log in to [Salesforce](#).
You can also switch from the Lightning UI.
2. Select the setup icon  and then select **Setup**.
3. Search for and select **App Manager** in the setup page search bar.
4. On the App Manager page, select **New External Client App** to create an external client application.
5. On the form, fill in the fields.

New Connection App form

Field	Description
Basic Information	
External Client App Name	Name of your application.
API Name	Name of the API. This field is automatically populated.

Field	Description
Contact Email	The email address that you want to associate with the application.
Distribution State	The scope of distribution of the application. Select Local as the distribution state.
Contact Phone	The phone number that you want to associate with the application.
Info URL	The URL of the web page with more information about your application.
Logo URL	The URL of your logo image that is displayed with the connected application.
Icon URL	The URL of the icon for the connected application.
Description	Description of the application.
API (Enable OAuth Settings)	
Enable OAuth	Option to enable OAuth settings. Select this option to enable the OAuth settings.
Callback URL	URL of the OAuth provider that users are redirected to after authentication. Enter <code>https://instance.servicenow.com/oauth_redirect.do</code> , where <code><instance></code> is the name of your ServiceNow instance.
OAuth Scopes	OAuth scopes that determine the amount of access that is granted to an access token. The following values are required: <ul style="list-style-type: none"> ○ Manage user data via APIs (api) ○ Perform requests at any time (refresh_token, offline_access)
Security	
Require Secret for Web Server Flow	The option to implement the Require Secret for Web Server Flow in your external client app or connected app settings. Select this option.
Require Secret for Refresh Token Flow	The option in your external client app or connected app while implementing the refresh token flow using a server-side callback handler. Select this option.

Field	Description
Require Proof Key for Code Exchange (PKCE) Extension for Supported Authorization Flows	Clear this option.

6. Select **Create.**

The application registration is complete and you're redirected to the Manage External Client Apps page.

7. Verify and edit the policies for the registered application by selecting **Edit.**

8. In the OAuth Policies section, verify that the **Permitted Users field is set to **Admin approved users are pre-authorized** for the ServiceNow application.**

i Note:

Admin-approved users who are preauthorized enable any users with the corresponding profile or permission set to access the application without prior authorization. For more information, see [Pre-Authorize User App Access Through Connected App Policies](#).

9. In the App Policies section, select either the profile of the integration user or the profile of the user that you want to use for the integration.

10. In the App Authorization section, verify that the **Refresh token policy field is set to **Refresh token is valid until revoked** and the **IP Relaxation** field is set to **Relax IP restrictions**.**

11. Select **Save.**

12. Retrieve OAuth credentials.

a. Navigate to **Settings > OAuth Settings and then select **Consumer Key and Secret**.**

The Salesforce login page opens in a new window.

b. Enter your credentials to log in to Salesforce.

c. Copy the **Consumer Key and **Consumer Secret** and save them in a secure location for later use.**

Create a Salesforce CRM integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Salesforce CRM services.

i Note:

You must create Salesforce CRM integration only in the Global scope.

Create your first Salesforce CRM integration profile

Create an integration profile for the first Salesforce organization for which you want to track software subscriptions and optimize licensing.

Before you begin

To create a Salesforce CRM integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **Software Asset Management integration with Salesforce CRM** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Salesforce CRM integration profile in Core UI is inactive.

If you're using Software Asset Workspace, use SaaS Playbook for integrating your ServiceNow instance with Salesforce CRM. For more information about creating a Salesforce CRM integration profile through Playbook, see [Create a Salesforce CRM integration](#).

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	<p>Name of the integration profile.</p> <p>Enter a name that uniquely identifies the Salesforce organization for which you're creating this integration profile. For example, SFDC Org1.</p> <p>Tip: Keep this name short to help it displays better during reporting.</p>
Status	<p>Status of the integration profile.</p> <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile type	<p>Type of integration profile. This value is automatically set to Salesforce CRM Subscription.</p>

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce CRM Download Subscriptions**.

i Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

b. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce CRM Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- c. On the **Download Consumption Subflow** tab, verify that the **Subflow** field is set to **Salesforce CRM Download Consumption**.

- 4. Select **Save**.

Note:

The Calculate Activity Subflow isn't required for Salesforce CRM integrations because these integrations use information about last user login from the user records.

Your instance creates a draft integration profile. You can view consumption counts for the specific consumption based Salesforce CRM application.

The **Connection & Credential** field appears and is automatically set to **sn_sforce_v2_spoke.Salesforce**.

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field to configure the child alias.
- 6. Select **Open Record** in the record preview.
- 7. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 8. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection information	
Connection Name	Name of the connection. Enter a name that uniquely identifies the Salesforce organization for which you're creating this connection and credential. For example, SFDC Org1.
Connection URL (Instance URL)	URL that displays after logging in to Salesforce or your custom domain URL of Salesforce.
Credential information	
Grant type	The grant type for your application according to your authentication needs. Possible values are: <ul style="list-style-type: none"> o Authorization Code o Client Credentials
OAuth Client ID	Client ID (consumer key) that is assigned to your Salesforce application.
OAuth Client Secret	Client secret (consumer secret) that is assigned to your Salesforce application.

Field	Description
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This is generally the URL of the ServiceNow instance that you specified in Register a Salesforce application .

9. Select **Create and Get OAuth Token.**

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

10. In the OAuth2 dialog box, log in to the same Salesforce admin account that you used to create your Salesforce application.

Tip:

If the dialog box doesn't open automatically, check to make sure that pop-ups are allowed on your browser.

If you have selected **Client Credentials** as the grant type, the OAuth2 dialog box doesn't appear.

Your ServiceNow instance creates an OAuth token for Salesforce.

11. Return to your integration profile by navigating to **SaaS License > Administration > Direct Integration Profiles** and then selecting the profile from the Integration Profiles list.

12. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.

13. After the connection is verified, select **Publish**.

14. In the Publish Confirmation dialog box, select **OK**.

Result

After you publish the integration profile, your ServiceNow instance begins retrieving data from your Salesforce CRM services. For organizations with fewer than 100 users, this process typically takes only a few minutes to complete. For organizations with 100–5000 users, this process can take around 15 minutes to complete. For organizations with over 5000 users, this process can take over one hour to complete.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Create additional Salesforce CRM integration profiles

Create an integration profile for each additional Salesforce organization that you want to track software subscriptions and optimize licensing for.

Before you begin

To create a Salesforce CRM integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

ServiceNow Role required: sam_integrator or admin

i Important: You must select the **Software Asset Management integration with Salesforce CRM** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Salesforce CRM integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	<p>Name of the integration profile.</p> <p>Enter a name that uniquely identifies the Salesforce organization for which you're creating this integration profile. For example, SFDC Org2.</p> <p>Tip: Keep this name short to help it display better during reporting.</p>

Field	Description
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile type	Type of integration profile. This value is automatically set to Salesforce CRM .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce CRM Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce CRM Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- c. On the **Download Consumption Subflow** tab, verify that the **Subflow** field is set to **Salesforce CRM Download Consumption**.

4. Select **Save**.

Note:

The Calculate Activity subflow isn't required for Salesforce CRM integrations because these integrations use information about last user logins from the user records.

Your instance creates a draft integration profile. You can view consumption counts for the specific consumption based Salesforce CRM application.

The **Connection & Credential** field appears and is automatically set to **sn_sforce_v2_spoke.Salesforce**.

5. Select the preview icon (🔍) next to the **Connection & Credential** field to open the connection & credential aliases record.

6. Select **Open Record** in the record preview.

7. On the Connection & Credential Aliases form, create a child alias that can uniquely identify the connection and credentials for this integration profile.

The first Salesforce CRM integration profile that you create uses the default (parent) connection and credential alias for Salesforce. Each additional Salesforce CRM integration

profile that you create requires a unique child alias that helps differentiate the connection and credentials between each integration profile.

- a. Select the link under **Child Aliases > Parentalias=***** to add child aliases.
- b. Select **New**.
The Connection & Credential Aliases form for the child alias opens.
- c. Enter a name for the child alias in the **Name** field.
- d. Select and hold (or right-click) the form header and then select **Save**.
- e. After the form reloads, select the **Create New Connection & Credential** related link.
- f. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection information	
Connection Name	Name of the connection. Enter a name that uniquely identifies the Salesforce organization for which you're creating this connection and credential. For example, SFDC Org2.
Connection URL (Instance URL)	URL of the Salesforce instance that you're connecting to through this integration.
Credential information	
Grant type	The grant type for your application according to your authentication needs. Possible values are: <ul style="list-style-type: none"> ▪ Authorization Code ▪ Client Credentials
OAuth Client ID	Client ID (consumer key) that is assigned to your Salesforce application.
OAuth Client Secret	Client secret (consumer secret) that is assigned to your Salesforce application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This is generally the URL of the ServiceNow instance that you specified in Register a Salesforce application .

- g. Select **Create and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

- h. In the OAuth2 dialog box, log in to the same Salesforce admin account that you used to register your Salesforce application.

 **Tip:**

If the dialog box doesn't open automatically, check to make sure that pop-ups are allowed on your browser.

If you have selected **Client Credentials** as the grant type, the OAuth2 dialog box doesn't appear.

Your ServiceNow instance creates an OAuth token for Salesforce.

8. Return to your integration profile by navigating to **SaaS License > Administration > Direct Integration Profiles** and then selecting the profile from the Integration Profiles list.
9. In the **Connection & Credential** field of the Integration Profile form, select the lookup icon to locate and select the child alias that you created in [step 7](#).
Selecting the child alias associates the alias with the integration profile. Your ServiceNow instance uses this alias to identify the connection and credentials for this integration profile.
10. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.
11. After the connection is verified, select **Publish**.
12. In the Publish Confirmation dialog box, select **OK**.

Result

After you publish the integration profile, your ServiceNow instance begins retrieving data from your Salesforce CRM services. For organizations with fewer than 100 users, this process typically takes only a few minutes to complete. For organizations with 100-5000 users, this process can take around 15 minutes to complete. For organizations with over 5000 users, this process can take over one hour to complete.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic

application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Salesforce Marketing Cloud

Integrating your Software Asset Management application with the Salesforce Marketing Cloud service enables you to track your software subscriptions and to reclaim unused licenses.

Use either of the following authentication methods to integrate your ServiceNow[®] instance with Salesforce Marketing Cloud:

- [Basic authentication](#)
- [OAuth 2.0](#)

Integrate Salesforce Marketing Cloud using basic authentication

Integrate your ServiceNow instance with Salesforce Marketing Cloud by using basic authentication.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Salesforce Marketing Cloud application	Authentication scopes
Download subscriptions	<ul style="list-style-type: none"> Email > Admin > API Access > WebService API Administration > Users > View 	None
Pull user activity	<ul style="list-style-type: none"> Email > Admin > API Access > WebService API Administration > Users > View 	None
Reclaim subscription	<ul style="list-style-type: none"> Email > Admin > API Access > WebService API Administration > Users > View Administration > Users > Update 	None
Download consumptions	<ul style="list-style-type: none"> Email > Admin > API Access > WebService API Email > Subscribers > Data Extension > View Email > Subscribers > Data Extension > Manage Data 	None

Create a user for accessing the Salesforce Marketing Cloud SOAP API

Create a user with which you can access the Salesforce Marketing Cloud SOAP API. The SOAP API enables you to retrieve records from your Salesforce Marketing Cloud data extensions and get information about your Salesforce Marketing Cloud users.

Before you begin

Salesforce Marketing Cloud Role required: admin user with privileges to create users and roles

About this task

Note:

To use the web services, navigate to **Setup Home > Settings > Security > Security Settings**. In the Username and Logins section, select the **Enable Username and Password for Web Services** check box.

For accessing user licenses and data extension, the API user must be created within the parent business unit. If the API user is created in a child business unit, it might not have access to the parent business unit's data.

Procedure

1. From a web browser, go to your Salesforce Marketing Cloud instance.
2. Log in using your admin credentials.
3. On the page header of your instance, select your profile icon and then select **Setup**.
4. Create a Salesforce Marketing Cloud user.
 - a. Navigate to **Administration > Users > Users**.
 - b. Select **Create**.
 - c. On the form, fill in the fields.

General Settings form

Field	Description
Name	Name of the user.
Reply Email Address	Email address that you want to send and reply to email messages from. Salesforce Marketing Cloud also sends forgotten password requests to this email address. After you enter an email address, select Verify to verify the email address.
Add to From Name Dropdown	Option to send the reply email address through a domain verification process before the email address populates in an email.
Notification Email Address	The email address that you want to send Salesforce Marketing Cloud notifications to.
Username	User name for the user.
External Key	Key that uniquely identifies the user during API calls.
Time Zone	Time zone in which the user is located.
Culture Code	Language that is used on the Salesforce Marketing Cloud user interface for this user.
API User	The option indicating whether the user can access the Salesforce Marketing Cloud SOAP API. Select the check box to enable this option.
Temporary Password	A temporary password with which you can log in for the first time. You're prompted to change this password on the first login.

Field	Description
Verify Password	Field to verify the temporary password.

- d. Select **Save**.
- 5. Create a user role that enables assigned users to access the Salesforce Marketing Cloud SOAP API and also manage users and data extensions.

a. Navigate to **Administration > Users > Roles**.

b. Select **Create**.

c. On the form, fill in the fields.

Properties form

Field	Description
Name	Name of the user role.
External Key	Key that uniquely identifies the user role.
Description	Description of the user role.

- d. In the Permissions form section, expand the **Email > Subscribers > Data Extension** permission category and then select the **Allow** check box for the View and Manage Data access permissions.
- e. Expand the **Email > Admin > API Access** permission category and then select the **Allow** check box for the WebService API access permission.
- f. Expand the **Administration > Users** permission category and then select the **Allow** check box for the following access permissions:
 - View
 - Update
 - Disable
- g. Select **Save**.
- 6. Assign the user role to your Salesforce Marketing Cloud user.
 - a. Navigate to **Administration > Users > Users**.
 - b. From the list of available users, select the check box for the user that you created in [step 4](#).
 - c. Select **Manage Roles**.
The Roles form for the selected user opens.
 - d. In the Roles form section, select **Edit Roles**.

- e. When the list of available roles appears, select the check box for the user role that you created in [step 5](#).
- f. Select **Save**.

Create a Contacts Counts report in Salesforce Marketing Cloud

Create a Contacts Counts report to retrieve and display the total number of billable contacts in your Salesforce Marketing Cloud account.

Before you begin

Salesforce Marketing Cloud Role required: admin

Procedure

1. From a web browser, go to your Salesforce Marketing Cloud instance.
 2. Log in using your admin credentials.
 3. On the page header of your instance, select the business unit profile icon and then select the top-level parent business unit so that your Contacts Counts report includes data for both the parent business unit and all corresponding child business units.
 4. From the list of available Salesforce Marketing Cloud applications, select the **Analytics Builder** app icon and then select **Reports**.
The Reports app overview opens.
 5. In the Report Catalog section, select **View Catalog**.
 6. From the Reports Catalog, search for **Contacts Counts** and then select **Create**.
The Create Report dialog box opens.
 7. In the dialog box, select the time period that you want to retrieve and display data for from the **Date Range** list.
The default value is **Last 30 Days**.
-  **Tip:**
To avoid performance issues during report generation, you should set this value to **Last 7 Days**.
8. Select **Submit**.
Your Salesforce Marketing Cloud instance generates the report and displays the results on the Results: Contacts Counts page.
 9. On the Results: Contacts Counts page, select **Save**.
The Save Report dialog box opens.
 10. In the dialog box, fill in the fields.

Save Report dialog box

Field	Description
Report Name	Name of the report.
Report Source	Source of the report. This field is automatically set to Contacts Counts .
Description	Description of the report.

11. Select **Save**.

12. Create a schedule to run the Contacts Counts report automatically.

- a.** On the page header of the Reports app, select the **Overview** tab to return to the Reports app overview.
- b.** From your list of reports, open your newly created Contacts Counts report.
- c.** In the Schedule Options section, select **Edit**.
- d.** In the dialog box, fill in the fields.

Edit Schedule Options dialog box

Field	Description
Schedule Options	
Start	The date and time from which you want to start running the report.
Time Zone	Time zone in which the report is being scheduled.
Repeat	Frequency at which you want to run the report. Configure the report to run once every week on Sundays.
End	Date on which you want to stop running the report.
Delivery Options	
Format	File type and file extension in which you want to receive the report results. Select Data File (.csv) .
Location	<p>Location in which you want to save or share the report. Set this field to Save report for FTP and then fill in the corresponding fields:</p> <ul style="list-style-type: none"> ▪ Report Name: The file name of the report, excluding the file extension. If you want to include date and time in the report name, add it in the Reportname_YYYYMMDD_HHMMSS format. <p>i Note: Take note of this file name for later use.</p> <ul style="list-style-type: none"> ▪ Unique Option: Option to create a report record instead of replacing the existing report record in SFTP. Leave this check box unselected. ▪ FTP Location: Location of your Salesforce Marketing Cloud FTP files. Select ExactTarget Enhanced FTP so that the report is saved to your SFTP (SSH File Transfer Protocol) Reports folder. <p>i Note: You can set up an SFTP user account in Salesforce Marketing Cloud to view the saved files at a specific FTP location. For more information, see Setting up an SFTP user account in Salesforce Marketing Cloud.</p>

- e.** Select **Save**.

Create a data extension for your Contacts Counts report

Create a data extension to store your Contacts Counts report data on your Salesforce Marketing Cloud instance.

Before you begin

Salesforce Marketing Cloud Role required: admin

About this task

Data extensions are tables that contain attributes representing your report data. When your ServiceNow instance connects with the Salesforce Marketing Cloud service, it retrieves data from this data extension.

Procedure

1. On the page header of your Salesforce Marketing Cloud instance, hover the Salesforce icon to display the list of available Salesforce Marketing Cloud applications.
2. Select the **Audience Builder** app icon and then select **Contact Builder**.
The Contact Builder app opens.
3. Select the **Data Extensions** tab.
4. In the pop-up dialog box, select **Get started** and then select **Create**.
The Create New Data Extension dialog box opens.
5. In the Properties step, fill in the fields.

Properties fields

Field	Description
Creation Method	Method in which you want to create the data extension. Select Create from New .
Name	Name of the data extension.
External Key	Optional key that uniquely identifies the data extension. You can enter a key of your choice.
Description	Description of the data extension.
Type	Type of data extension. This field is automatically set to Standard .
Location	Location in which you want to store the data extension. This field is automatically set to Data Extensions . Select Change Location to select a different location.
Is Sendable?	Option to indicate whether the data extension can be sent to your subscribers.

6. Select **Next**.
7. In the Data Retention Policy step, set the **Retention Setting** field to **Off**.
8. Select **Next**.
9. In the Attributes step, add the attributes that you want to include in the data extension.

Attributes are used to map and import data from a report to a data extension. You must create an attribute for each report column that you want to import data from. Each attribute name must exactly match the corresponding report column name.

For the Salesforce Marketing Cloud integration, attributes for the following Contacts Counts report columns are required:

Attributes fields

Field	Description
Primary Key	Option for the attribute to include a unique identifier for all records in the data extension. This option must be enabled for the Count_Date attribute.
Name	Name of the attribute. This name must exactly match the corresponding report column name.
Data Type	Data type of the attribute.
Required	Option that indicates whether the attribute requires a value for each record in the data extension.
Length	Maximum number of characters allowed in the attribute value.
Default Value	Optional default value for the attribute. For the Flag attribute, set the default value to 1 . Note: Don't enter a default value for any attributes that are assigned as a primary key.

Name	Data Type
Count_Date	Text
Total_Distinct_Contacts_Count	Text
Total_Distinct_Email_Addresses1	Text
Total_Distinct_Mobile_Addresses_Count	Text
Flag	Text

Note: You can add additional attributes and the name must be the same as the Integration Attributes. For more information, see [Create a Salesforce Marketing Cloud integration profile using basic authentication](#) or [Create a Salesforce Marketing Cloud integration profile using OAuth 2.0](#).

Attributes for all other Contacts Counts report columns are optional. Fill in the fields for each attribute that you want to add.

10. Select Complete.

11. In the Data Extension Created dialog box, select OK.

Build an automation to import Contacts Counts report data in your data extension

Create an automation to automatically import Contacts Counts report data into your data extension after the report is generated.

Before you begin

Salesforce Marketing Cloud Role required: admin

Procedure

1. On the page header of your Salesforce Marketing Cloud instance, hover the Salesforce icon to display the list of available Salesforce Marketing Cloud applications.
2. Select the **Journey Builder** app icon and then select **Automation Studio**.
The Automation Studio app overview opens.
3. Select **New Automation**.
The workflow for the new automation opens.
4. Create an automation schedule by dragging the **Schedule** icon from the Starting Sources section of the left menu pane to the Starting Source section of the workflow canvas.
5. Define a schedule for the automation.
 - a. In the Starting Source section of the workflow canvas, select **Configure**.
 - b. In the dialog box, fill in the fields.

Define Schedule dialog box

Field	Description
Start Date	The date from which you want to start running the automation.
Start Time	The time from which you want to start running the automation.
Time Zone	Time zone in which the automation is being scheduled.
Repeat	<p>The frequency at which you want to run the automation. Configure the automation to run after the Contacts Counts report is generated.</p> <p>Select the same frequency that you had selected while creating a Contacts Counts report in Salesforce Marketing Cloud.</p> <p>Tip: If you configure the automation to run on the same day that the report is generated, select a start time that gives enough time for the report to finish generating. ServiceNow recommends a start time of at least two hours after the report start time.</p>
End	<p>Number of times that the automation can run until the automation schedule ends.</p> <p>If you don't want the automation schedule to end, set this field to Never.</p> <p>This field doesn't appear only when None (run once) is selected from Repeat.</p>

- c. Select **Done**.

6. Add a script activity to execute the Server-Side JavaScript for all activities that require it.
 - a. In the Activities section of the left menu pane, drag the **Script** icon into the workflow canvas. The script activity becomes the first step of the automation workflow.
 - b. Select **Choose** on the script activity step. The Choose Script Activity dialog box opens.
 - c. Select **Create New Script Activity**. The Create New Script Activity dialog box opens.
 - d. In the Properties step, fill in the fields.

Properties fields

Field	Description
Name	Name of the script activity.
External Key	Optional key that uniquely identifies the script activity. You can enter a key of your choice.
Folder Location	The location in which you want to store your scripts. Select Choose... to select a different location. This field is automatically set to Scripts .
Description	Description of the script activity.

- e. Copy and paste the following Server-Side JavaScript into the Server-Side JavaScript text box:

```
<script runat="server">
var rows =
  Platform.Function.DeleteData(' * <data-extension-name> * ', ['Flag'], ['1']);
</script>
```

The ** <data-extension-name> ** must exactly match the file name of the Data Extension that you created in [Create a data extension for your Contacts Counts report](#).

- f. Select **Validate Syntax** to verify that the Server-Side JavaScript syntax is valid.
 - g. Select **Next**.
 - h. In the Summary step, verify that the script activity configuration is correct and then select **Finish**.
7. Add a data extract activity to copy the Contacts Counts report from the SFTP Reports folder to the SFTP Import folder. The Salesforce Marketing Cloud instance uses the SFTP Import folder to locate and import report data into your data extensions. To enable your instance to import data from the Contacts Counts report into the corresponding data extension, you must copy the report to the SFTP Import folder.

- a. In the Activities section of the left menu pane, drag the **Data Extract** icon into the workflow canvas.
The data extract activity becomes the second step of the automation workflow.
- b. Select **Choose** on the data extract activity step.
The Choose Data Extract Activity dialog box opens.
- c. Select **Create New Data Extract Activity**.
The Create New Data Extract Activity dialog box opens.
- d. In the Properties step, fill in the fields.

Properties fields

Field	Description
Name	Name of the data extract activity.
External Key	Optional key that uniquely identifies the data extract activity. You can enter a key of your choice.
File Naming Pattern	The file name of the Contacts Counts report that you want to extract data from. This name must exactly match the file name of the Contacts Counts report that you created in Create a Contacts Counts report in Salesforce Marketing Cloud , including the file extension.
Extract Type	Data extract method. Set this field to Enhanced FTP File Move and Copy .
Description	Description of the data extract activity.

- e. Select **Next**.
- f. In the Configuration step, fill in the fields.

Configuration fields

Field	Description
Input Folder	Location in which you've saved the Contacts Counts report. Enter <code>\reports\</code> .
Output Folder	Location that you want to copy the report to. Enter <code>\Import\</code> .
Copy To Folder	Option to copy instead of move the report from the input folder to the output folder. This option enables you to keep the report in both locations. Select the check box to enable this option.

- g. Select **Next**.
 - h. In the Summary step, verify that the data extract activity configuration is correct and then select **Finish**.
8. Add an import file activity to import the Contacts Counts report data into the data extension.
- a. In the Activities section of the left menu pane, drag the **Data Copy or Import** icon into the workflow canvas.
The Data Copy or Import activity becomes the third step of the automation workflow.
 - b. Select **Choose** on the Data Copy or Import activity step.
The Choose Data Copy or Import dialog box opens.
 - c. Select **Create New Copy or Import Definition**.
The Create New Copy or Import Definition dialog box opens.
 - d. In the Activity Info step, fill in the fields.

Activity Info fields

Field	Description
Name	Name of the import file activity.
Description	Description of the import file activity.
External Key	Optional key that uniquely identifies the import file activity. You can enter a key of your choice.
Send notification email to	The email address to which you want to send notifications when an import completes. If you specify an email address, a notification email that contains the number of inserted and updated rows is sent to that address on successful import.
	<div style="background-color: #e1f5fe; padding: 5px;"> <p>i Important: The notification email contains an Invalid Field Count validation error due to the presence of empty lines in the imported CSV file. These empty lines appear automatically when you save the report to FTP. However, they have no impact on the integration.</p> </div>

- e. Select **Next**.
- f. In the Source step, select **File Location** in the Data Source header and fill in the fields.

Import File fields

Field	Description
File Location	Location of the Contacts Counts report that you want to import data from. Select ExactTarget Enhanced FTP .

Field	Description
File Naming Pattern	<p>The file name of the Contacts Counts report that you want to import data from.</p> <p>If you want to include date and time in the report name, add it in the <code>Reportname_YYYYMMDD_HHMMSS</code> format by selecting the Date variable and Time variable fields.</p> <p>This name must exactly match the file name of the Contacts Counts report that you created in Create a Contacts Counts report in Salesforce Marketing Cloud, including the file extension.</p>
Date Format	Format in which you want to display the date and time of the report data.
Delimiter	<p>Format in which you want to separate each report record. Select comma to separate each record with a comma.</p> <p>If you want to enable the use of double quotes to separate each record, enable the Respect double quotes (") as a text delimiter option.</p>
Bad Data Behavior	Option to skip rows with bad data. Select the check box to enable this option.

g. Select **Next**.

h. In the Destination step, search for and select the data extension that you created in [Create a data extension for your Contacts Counts report](#).

i. Select **Next**.

j. In the Mapping step, select the options **Add and Update** and **Map by Ordinal** in the Data Action header.

k. When prompted, enable the **Import file has column headers** option and then map each data extension attribute to the corresponding column number in the Contacts Counts report.

Note:
Leave the **Flag** attribute unmapped.

l. Select **Next**.

m. In the Review step, verify that the import file activity configuration is correct and then select **Finish**.

9. Select **Save**.

10. In the dialog box, fill in the fields.

Save Automation dialog box

Field	Description
Name	Name of the automation.
Description	Description of the automation.

Field	Description
External Key	Optional key that uniquely identifies the automation.
Location	Location in which you want to save the automation.

11. Select **Save**.
12. In the Starting Source section of the workflow canvas, select **Active**.
13. In the Activate Schedule Confirmation dialog box, select **Activate** to activate the automation schedule.

Retrieve Contacts Counts report data manually

After you create the Contacts Counts report, data extension, and automation, you can retrieve report data between your scheduled report and automation jobs by running these jobs manually.

Before you begin

Salesforce Marketing Cloud Role required: admin

About this task

Your Salesforce Marketing Cloud instance runs the report and automation jobs automatically based on the schedules that you define. If you want to retrieve Contacts Counts report data before the next scheduled report and automation jobs, you can run these jobs manually.

Procedure

1. Run your Contacts Counts report.
 - a. On the page header of your Salesforce Marketing Cloud instance, hover the Salesforce icon to display the list of available Salesforce Marketing Cloud applications.
 - b. Select the **Analytics Builder** app icon and then select **Reports**.
The Reports app overview opens.
 - c. From your list of reports, select the Contacts Counts report that you created in [Create a Contacts Counts report in Salesforce Marketing Cloud](#).
 - d. Select **Run**.
Your Salesforce Marketing Cloud instance generates the report and displays the results on the Results: *<report - name>* page.
 - e. On the Results: *<report - name>* page, select the Download Results icon ().
 - f. In the dialog box, fill in the fields.

Download Results dialog box

Field	Description
Filename	The file name of the report, excluding the file extension.
Report Source	Source of the report. This field is automatically set to Contacts Counts .
Format	File type and file extension in which you want to receive the report results. Select Data File (.csv) .

- g. Select **Save**.
 - h. Save the file in your system.
2. Import the file in your Data Extension.
- a. On the page header of your Salesforce Marketing Cloud instance, hover the Salesforce icon to display the list of available Salesforce Marketing Cloud applications.
 - b. Select the **Audience Builder** app icon and then select **Contact Builder**.
 - c. Open the recently created Data Extension that you created while [creating a data extension for your Contacts Counts report](#).
 - d. Select **Import**.
 - e. In the Import Data Confirmation dialog box, select **Import into Data Extension** and then select **Ok**.
 - f. In the Import into Data Extension step, choose the file that you downloaded in the previous Step 1.
 - g. Select **Delimiter** as **comma**.
 - h. Select **Import Type** as **Add and Update**.
 - i. Select **Import options** as **Skip rows in the import file with bad data**.
 - j. Select **Next**.
 - k. In the Configure mapping dialog box, select **Map Manually**.
 - l. Match the available data extension columns with the imported report columns and leave the Flag column empty.
 - m. Select **Next**.
 - n. In the Review and create dialog box, enter the email id on which you want notification when import completes and select **Finish**.
 - o. In the Run Confirmation dialog box, select **Done**.

Result

The latest Contacts Counts report data is imported into the data extension.

Create a Salesforce Marketing Cloud integration profile using basic authentication

Create an integration profile by using basic authentication to track software subscriptions and optimize stale licenses for the Salesforce Marketing Cloud service.

Before you begin

To create a Salesforce Marketing Cloud integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

Tip:

To avoid incurring additional subscription costs, install the plugin and build the integration on a non-production instance.

ServiceNow Role required: sam_integrator

i Important:

You must select the **Software Asset Management integration with Salesforce Marketing Cloud** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Salesforce Marketing Cloud integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	Name of the integration profile. For example, Salesforce Marketing Cloud integration profile .
Authentication type	Type of authentication to access Salesforce Marketing Cloud APIs. <ul style="list-style-type: none"> ○ Basic Auth: Select this value. ○ OAuth 2.0 <p>i Note: For a new Salesforce Marketing Cloud profile, the authentication type is set to Basic Auth by default.</p>
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile type	Type of integration profile. This value is automatically set to Salesforce Marketing Cloud Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce Marketing Cloud Download Subscriptions**.

i Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce Marketing Cloud Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- c. In the Download Consumption Subflow section, verify that the **Subflow** field is set to **Salesforce Marketing Cloud Download Contacts Consumption**.

The **Download Consumption** check box is selected by default. If you don't want to download the license consumptions, clear this check box.

- 4. In the Integration Attributes section, add or remove the attributes based on your requirements. The name-value attributes such as **Count Date**, **Contacts**, **Email Contacts**, and **Mobile Contacts** are automatically populated for the integration profile.

Note:

The attribute name must match the report column header in Salesforce Marketing Cloud instance. For more information, see [Create a data extension for your Contacts Counts report](#).

- 5. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_sforce_mc_spoke.SalesforceMarketingCloud**.

- 6. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- 7. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 8. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Please Enter the Connection Information	
Connection Name	Name of the connection.
SOAP Connection URL	URL of your SOAP Connection endpoint. Enter <code>https://<subdomain>.soap.marketingcloudapis.com/Service.asmx</code> , where <code><subdomain></code> is your Salesforce Marketing Cloud subdomain.
Please Enter the Credential Information	
Username Profile Name	Name of your credentials.

Field	Description
Username	User name of the user that you can access the Salesforce Marketing Cloud SOAP API with. Enter the user name of the user that you created in Create a user for accessing the Salesforce Marketing Cloud SOAP API .
Password	Password of the user that you can access the Salesforce Marketing Cloud SOAP API with. Enter the password of the user that you created in Create a user for accessing the Salesforce Marketing Cloud SOAP API .
Please enter additional information used for post processing	
Contacts Counts Data Extension	Name of the data extension that you want to retrieve Contacts Counts report data from. This name must exactly match the name of the data extension that you created in Create a data extension for your Contacts Counts report .

9. Select Create.

10. On the Connection & Credential Aliases form header, select the Back button to return to the Integration Profile form.

Note:

You must update the **Connection Alias** field to its pre-upgrade value for the respective Data Extension record in the Configurations [sn_sforce_mc_spoke_configurations] table. Access the Configurations table by navigating to **All > Salesforce Marketing Cloud > Configurations**.

11. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration. Validating the connection verifies the Download Subscriptions and Download Consumption APIs, but not the Reclaim Subscriptions APIs.

12. After the connection is verified, select **Publish**.

13. In the Publish Confirmation dialog box, select **OK**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrate Salesforce Marketing Cloud using OAuth 2.0

Integrate your ServiceNow instance with Salesforce Marketing Cloud services by using OAuth 2.0.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Salesforce Marketing Cloud application	Authentication scopes
Download subscriptions	User	Users : Read
Pull user activity	User	Users : Read
Reclaim subscription	User	Users : Write
Download consumptions	User	Data Extensions : Read, Write

Create Salesforce Marketing Cloud OAuth 2.0 credentials

Create Salesforce Marketing Cloud OAuth 2.0 credentials to get access to Salesforce Marketing Cloud APIs.

About this task

The credentials must be created in the Salesforce Marketing Cloud Spoke application scope.

Before you begin

Role required: Salesforce Marketing Cloud admin

About this task

For accessing user licenses and data extension, the connection configuration must be set up in the parent business unit. If the configuration is set up in a child business unit, it might not be able to access data from the parent business unit.

Procedure

1. Log in to the Salesforce Marketing Cloud tenant.
2. Navigate to **Setup Home > Platform Tools > Apps > Installed Packages**.
3. Select **New** to create a package.
4. In the New Package Details dialog box, fill in the **Name** and **Description** fields.
5. Select **Save**.

6. Select **Add Component**.
7. Select **API Integration** to integrate Salesforce Marketing Cloud APIs to your application.
8. Select **Next**.
9. Select **Server-to-Server** as the integration type.
10. Select **Next**.
11. Select the following scopes for your integration.
 - Users : Read
 - Users : Write
 - Data Extensions : Read, Write
12. Select **Save**.
Your Client Id, Client Secret, and SOAP Base URI are displayed in your configuration summary. Navigate to the Components section under **SETUP > INSTALLED PACKAGES > DETAILS** to view the Client Id, Client Secret, and SOAP Base URI. Copy the values to use them later.

Note:

Note: You must add /Service.asmx in the SOAP Base URI while passing it in your ServiceNow instance.

13. Select the **ACCESS** tab and confirm that your business unit is enabled.

If your business unit is inactive, select and enable it, then select **Save**.

Create a Contacts Counts report in Salesforce Marketing Cloud

Create a Contacts Counts report to retrieve and display the total number of billable contacts in your Salesforce Marketing Cloud account.

Before you begin

Salesforce Marketing Cloud Role required: admin

Procedure

1. From a web browser, go to your Salesforce Marketing Cloud instance.
2. Log in using your admin credentials.
3. On the page header of your instance, select the business unit profile icon and then select the top-level parent business unit so that your Contacts Counts report includes data for both the parent business unit and all corresponding child business units.
4. From the list of available Salesforce Marketing Cloud applications, select the **Analytics Builder** app icon and then select **Reports**.
The Reports app overview opens.
5. In the Report Catalog section, select **View Catalog**.
6. From the Reports Catalog, search for **Contacts Counts** and then select **Create**.
The Create Report dialog box opens.
7. In the dialog box, select the time period that you want to retrieve and display data for from the **Date Range** list.
The default value is **Last 30 Days**.

Tip:

To avoid performance issues during report generation, you should set this value to **Last 7 Days**.

8. Select **Submit.**

Your Salesforce Marketing Cloud instance generates the report and displays the results on the Results: Contacts Counts page.

9. On the Results: Contacts Counts page, select **Save.**

The Save Report dialog box opens.

10. In the dialog box, fill in the fields.

Save Report dialog box

Field	Description
Report Name	Name of the report.
Report Source	Source of the report. This field is automatically set to Contacts Counts .
Description	Description of the report.

11. Select **Save.**

12. Create a schedule to run the Contacts Counts report automatically.

a. On the page header of the Reports app, select the **Overview** tab to return to the Reports app overview.

b. From your list of reports, open your newly created Contacts Counts report.

c. In the Schedule Options section, select **Edit**.

d. In the dialog box, fill in the fields.

Edit Schedule Options dialog box

Field	Description
Schedule Options	
Start	The date and time from which you want to start running the report.
Time Zone	Time zone in which the report is being scheduled.
Repeat	Frequency at which you want to run the report. Configure the report to run once every week on Sundays.
End	Date on which you want to stop running the report.
Delivery Options	
Format	File type and file extension in which you want to receive the report results. Select Data File (.csv) .
Location	Location in which you want to save or share the report. Set this field to Save report for FTP and then fill in the corresponding fields: <ul style="list-style-type: none"> ▪ Report Name: The file name of the report, excluding the file extension. <p>If you want to include date and time in the report name, add it in the Report name_YYYYMMDD_HHMMSS format.</p>

Field	Description
	<p>Note: Take note of this file name for later use.</p> <ul style="list-style-type: none"> ▪ Unique Option: Option to create a report record instead of replacing the existing report record in SFTP. Leave this check box unselected. ▪ FTP Location: Location of your Salesforce Marketing Cloud FTP files. Select ExactTarget Enhanced FTP so that the report is saved to your SFTP (SSH File Transfer Protocol) Reports folder. <p>Note: You can set up an SFTP user account in Salesforce Marketing Cloud to view the saved files at a specific FTP location. For more information, see Setting up an SFTP user account in Salesforce Marketing Cloud.</p>

e. Select **Save**.

Create a data extension for your Contacts Counts report

Create a data extension to store your Contacts Counts report data on your Salesforce Marketing Cloud instance.

Before you begin

Salesforce Marketing Cloud Role required: admin

About this task

Data extensions are tables that contain attributes representing your report data. When your ServiceNow instance connects with the Salesforce Marketing Cloud service, it retrieves data from this data extension.

Procedure

1. On the page header of your Salesforce Marketing Cloud instance, hover the Salesforce icon to display the list of available Salesforce Marketing Cloud applications.
2. Select the **Audience Builder** app icon and then select **Contact Builder**.
The Contact Builder app opens.
3. Select the **Data Extensions** tab.
4. In the pop-up dialog box, select **Get started** and then select **Create**.
The Create New Data Extension dialog box opens.
5. In the Properties step, fill in the fields.

Properties fields

Field	Description
Creation Method	Method in which you want to create the data extension. Select Create from New .
Name	Name of the data extension.
External Key	Optional key that uniquely identifies the data extension. You can enter a key of your choice.

Field	Description
Description	Description of the data extension.
Type	Type of data extension. This field is automatically set to Standard .
Location	Location in which you want to store the data extension. This field is automatically set to Data Extensions . Select Change Location to select a different location.
Is Sendable?	Option to indicate whether the data extension can be sent to your subscribers.

6. Select **Next**.

7. In the Data Retention Policy step, set the **Retention Setting** field to **Off**.

8. Select **Next**.

9. In the Attributes step, add the attributes that you want to include in the data extension. Attributes are used to map and import data from a report to a data extension. You must create an attribute for each report column that you want to import data from. Each attribute name must exactly match the corresponding report column name.

For the Salesforce Marketing Cloud integration, attributes for the following Contacts Counts report columns are required:

Attributes fields

Field	Description
Primary Key	Option for the attribute to include a unique identifier for all records in the data extension. This option must be enabled for the Count_Date attribute.
Name	Name of the attribute. This name must exactly match the corresponding report column name.
Data Type	Data type of the attribute.
Required	Option that indicates whether the attribute requires a value for each record in the data extension.
Length	Maximum number of characters allowed in the attribute value.
Default Value	Optional default value for the attribute. For the Flag attribute, set the default value to 1 . Note: Don't enter a default value for any attributes that are assigned as a primary key.

Name	Data Type
Count_Date	Text
Total_Distinct_Contacts_Count	Text
Total_Distinct_Email_Addresses1	Text
Total_Distinct_Mobile_Addresses_Count	Text
Flag	Text

Note:

You can add additional attributes and the name must be the same as the Integration Attributes. For more information, see [Create a Salesforce Marketing Cloud integration profile using basic authentication](#) or [Create a Salesforce Marketing Cloud integration profile using OAuth 2.0](#).

Attributes for all other Contacts Counts report columns are optional. Fill in the fields for each attribute that you want to add.

10. Select **Complete**.

11. In the Data Extension Created dialog box, select **OK**.

Build an automation to import Contacts Counts report data in your data extension

Create an automation to automatically import Contacts Counts report data into your data extension after the report is generated.

Before you begin

Salesforce Marketing Cloud Role required: admin

Procedure

1. On the page header of your Salesforce Marketing Cloud instance, hover the Salesforce icon to display the list of available Salesforce Marketing Cloud applications.
2. Select the **Journey Builder** app icon and then select **Automation Studio**.
The Automation Studio app overview opens.
3. Select **New Automation**.
The workflow for the new automation opens.
4. Create an automation schedule by dragging the **Schedule** icon from the Starting Sources section of the left menu pane to the Starting Source section of the workflow canvas.
5. Define a schedule for the automation.
 - a. In the Starting Source section of the workflow canvas, select **Configure**.
 - b. In the dialog box, fill in the fields.

Define Schedule dialog box

Field	Description
Start Date	The date from which you want to start running the automation.

Field	Description
Start Time	The time from which you want to start running the automation.
Time Zone	Time zone in which the automation is being scheduled.
Repeat	<p>The frequency at which you want to run the automation. Configure the automation to run after the Contacts Counts report is generated.</p> <p>Select the same frequency that you had selected while creating a Contacts Counts report in Salesforce Marketing Cloud.</p> <p>Tip: If you configure the automation to run on the same day that the report is generated, select a start time that gives enough time for the report to finish generating. ServiceNow recommends a start time of at least two hours after the report start time.</p>
End	<p>Number of times that the automation can run until the automation schedule ends.</p> <p>If you don't want the automation schedule to end, set this field to Never.</p> <p>This field doesn't appear only when None (run once) is selected from Repeat.</p>

c. Select **Done**.

6. Add a script activity to execute the Server-Side JavaScript for all activities that require it.

a. In the Activities section of the left menu pane, drag the **Script** icon into the workflow canvas. The script activity becomes the first step of the automation workflow.

b. Select **Choose** on the script activity step. The Choose Script Activity dialog box opens.

c. Select **Create New Script Activity**. The Create New Script Activity dialog box opens.

d. In the Properties step, fill in the fields.

Properties fields

Field	Description
Name	Name of the script activity.
External Key	<p>Optional key that uniquely identifies the script activity.</p> <p>You can enter a key of your choice.</p>
Folder Location	<p>The location in which you want to store your scripts. Select Choose... to select a different location.</p> <p>This field is automatically set to Scripts.</p>
Description	Description of the script activity.

- e. Copy and paste the following Server-Side JavaScript into the Server-Side JavaScript text box:

```
<script runat="server">
var rows =
  Platform.Function.DeleteData('*<data-extension-name>*', ['Flag'], ['1']);
</script>
```

The **<data-extension-name>** must exactly match the file name of the Data Extension that you created in [Create a data extension for your Contacts Counts report](#).

- f. Select **Validate Syntax** to verify that the Server-Side JavaScript syntax is valid.
- g. Select **Next**.
- h. In the Summary step, verify that the script activity configuration is correct and then select **Finish**.

7. Add a data extract activity to copy the Contacts Counts report from the SFTP Reports folder to the SFTP Import folder.
 The Salesforce Marketing Cloud instance uses the SFTP Import folder to locate and import report data into your data extensions. To enable your instance to import data from the Contacts Counts report into the corresponding data extension, you must copy the report to the SFTP Import folder.

- a. In the Activities section of the left menu pane, drag the **Data Extract** icon into the workflow canvas.
 The data extract activity becomes the second step of the automation workflow.
- b. Select **Choose** on the data extract activity step.
 The Choose Data Extract Activity dialog box opens.
- c. Select **Create New Data Extract Activity**.
 The Create New Data Extract Activity dialog box opens.
- d. In the Properties step, fill in the fields.

Properties fields

Field	Description
Name	Name of the data extract activity.
External Key	Optional key that uniquely identifies the data extract activity. You can enter a key of your choice.
File Naming Pattern	The file name of the Contacts Counts report that you want to extract data from. This name must exactly match the file name of the Contacts Counts report that you created in Create a Contacts Counts report in Salesforce Marketing Cloud , including the file extension.

Field	Description
Extract Type	Data extract method. Set this field to Enhanced FTP File Move and Copy .
Description	Description of the data extract activity.

e. Select **Next**.

f. In the Configuration step, fill in the fields.

Configuration fields

Field	Description
Input Folder	Location in which you've saved the Contacts Counts report. Enter <code>\reports\</code> .
Output Folder	Location that you want to copy the report to. Enter <code>\Import\</code> .
Copy To Folder	Option to copy instead of move the report from the input folder to the output folder. This option enables you to keep the report in both locations. Select the check box to enable this option.

g. Select **Next**.

h. In the Summary step, verify that the data extract activity configuration is correct and then select **Finish**.

8. Add an import file activity to import the Contacts Counts report data into the data extension.

a. In the Activities section of the left menu pane, drag the **Data Copy or Import** icon into the workflow canvas.

The Data Copy or Import activity becomes the third step of the automation workflow.

b. Select **Choose** on the Data Copy or Import activity step.

The Choose Data Copy or Import dialog box opens.

c. Select **Create New Copy or Import Definition**.

The Create New Copy or Import Definition dialog box opens.

d. In the Activity Info step, fill in the fields.

Activity Info fields

Field	Description
Name	Name of the import file activity.
Description	Description of the import file activity.
External Key	Optional key that uniquely identifies the import file activity. You can enter a key of your choice.

Field	Description
Send notification email to	<p>The email address to which you want to send notifications when an import completes.</p> <p>If you specify an email address, a notification email that contains the number of inserted and updated rows is sent to that address on successful import.</p> <div style="background-color: #e1f5fe; padding: 5px;"> <p>i Important: The notification email contains an <code>Invalid Field Count</code> validation error due to the presence of empty lines in the imported CSV file. These empty lines appear automatically when you save the report to FTP. However, they have no impact on the integration.</p> </div>

e. Select **Next**.

f. In the Source step, select **File Location** in the Data Source header and fill in the fields.

Import File fields

Field	Description
File Location	Location of the Contacts Counts report that you want to import data from. Select ExactTarget Enhanced FTP .
File Naming Pattern	<p>The file name of the Contacts Counts report that you want to import data from.</p> <p>If you want to include date and time in the report name, add it in the <code>Reportname_YYYYMMDD_HHMMSS</code> format by selecting the Date variable and Time variable fields.</p> <p>This name must exactly match the file name of the Contacts Counts report that you created in Create a Contacts Counts report in Salesforce Marketing Cloud, including the file extension.</p>
Date Format	Format in which you want to display the date and time of the report data.
Delimiter	<p>Format in which you want to separate each report record. Select comma to separate each record with a comma.</p> <p>If you want to enable the use of double quotes to separate each record, enable the Respect double quotes (") as a text delimiter option.</p>
Bad Data Behavior	Option to skip rows with bad data. Select the check box to enable this option.

g. Select **Next**.

h. In the Destination step, search for and select the data extension that you created in [Create a data extension for your Contacts Counts report](#).

i. Select **Next**.

j. In the Mapping step, select the options **Add and Update** and **Map by Ordinal** in the Data Action header.

- k. When prompted, enable the **Import file has column headers** option and then map each data extension attribute to the corresponding column number in the Contacts Counts report.

Note:

Leave the **Flag** attribute unmapped.

- l. Select **Next**.

- m. In the Review step, verify that the import file activity configuration is correct and then select **Finish**.

- 9. Select **Save**.

- 10. In the dialog box, fill in the fields.

Save Automation dialog box

Field	Description
Name	Name of the automation.
Description	Description of the automation.
External Key	Optional key that uniquely identifies the automation.
Location	Location in which you want to save the automation.

- 11. Select **Save**.

- 12. In the Starting Source section of the workflow canvas, select **Active**.

- 13. In the Activate Schedule Confirmation dialog box, select **Activate** to activate the automation schedule.

Retrieve Contacts Counts report data manually

After you create the Contacts Counts report, data extension, and automation, you can retrieve report data between your scheduled report and automation jobs by running these jobs manually.

Before you begin

Salesforce Marketing Cloud Role required: admin

About this task

Your Salesforce Marketing Cloud instance runs the report and automation jobs automatically based on the schedules that you define. If you want to retrieve Contacts Counts report data before the next scheduled report and automation jobs, you can run these jobs manually.

Procedure

- 1. Run your Contacts Counts report.

- a. On the page header of your Salesforce Marketing Cloud instance, hover the Salesforce icon to display the list of available Salesforce Marketing Cloud applications.

- b. Select the **Analytics Builder** app icon and then select **Reports**.

The Reports app overview opens.

- c. From your list of reports, select the Contacts Counts report that you created in [Create a Contacts Counts report in Salesforce Marketing Cloud](#).
- d. Select **Run**.
Your Salesforce Marketing Cloud instance generates the report and displays the results on the Results: *<report - name>* page.
- e. On the Results: *<report - name>* page, select the Download Results icon ().
- f. In the dialog box, fill in the fields.

Download Results dialog box

Field	Description
Filename	The file name of the report, excluding the file extension.
Report Source	Source of the report. This field is automatically set to Contacts Counts .
Format	File type and file extension in which you want to receive the report results. Select Data File (.csv) .

- g. Select **Save**.
 - h. Save the file in your system.
- 2.** Import the file in your Data Extension.
- a. On the page header of your Salesforce Marketing Cloud instance, hover the Salesforce icon to display the list of available Salesforce Marketing Cloud applications.
 - b. Select the **Audience Builder** app icon and then select **Contact Builder**.
 - c. Open the recently created Data Extension that you created while [creating a data extension for your Contacts Counts report](#).
 - d. Select **Import**.
 - e. In the Import Data Confirmation dialog box, select **Import into Data Extension** and then select **Ok**.
 - f. In the Import into Data Extension step, choose the file that you downloaded in the previous Step 1.
 - g. Select **Delimiter** as **comma**.
 - h. Select **Import Type** as **Add and Update**.
 - i. Select **Import options** as **Skip rows in the import file with bad data**.
 - j. Select **Next**.
 - k. In the Configure mapping dialog box, select **Map Manually**.
 - l. Match the available data extension columns with the imported report columns and leave the Flag column empty.
 - m. Select **Next**.

- n. In the Review and create dialog box, enter the email id on which you want notification when import completes and select **Finish**.
- o. In the Run Confirmation dialog box, select **Done**.

Result

The latest Contacts Counts report data is imported into the data extension.

Create a Salesforce Marketing Cloud integration profile using OAuth 2.0

Create a Salesforce Marketing Cloud integration profile by using OAuth 2.0 to track software subscriptions and optimize stale licenses for the Salesforce Marketing Cloud service.

Before you begin

To create a Salesforce Marketing Cloud integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

Tip:

To avoid incurring additional subscription costs, install the plugin and build the integration on a non-production instance.

ServiceNow Role required: sam_integrator or admin

Salesforce Marketing Cloud Role required: sn_sforce_mc_spoke.Salesforce Marketing Cloud Admin

Important:

You must select the **Software Asset Management integration with Salesforce Marketing Cloud** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Salesforce Marketing Cloud integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	Name of the integration profile. For example, Salesforce Marketing Cloud integration profile.
Authentication type	Type of authentication to access Salesforce Marketing Cloud APIs. <ul style="list-style-type: none"> o Basic Auth o OAuth 2.0: Select this value.

Field	Description
	<p>Note: For a new Salesforce Marketing Cloud profile, the authentication type is set to Basic Auth by default.</p>
Status	<p>Status of the integration profile.</p> <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile type	Type of integration profile. This value is automatically set to Salesforce Marketing Cloud Subscription .

- Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce Marketing Cloud Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce Marketing Cloud Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- In the Download Consumption Subflow section, verify that the **Subflow** field is set to **Salesforce Marketing Cloud Download Contacts Consumption**.

- In the Integration Attributes section, add or remove the attributes based on your requirements. The name-value attributes such as **Count Date**, **Contacts**, **Email Contacts**, and **Mobile Contacts** are automatically populated for the integration profile.

Note:

The attribute name must match the report column header in Salesforce Marketing Cloud instance. For more information, see [Create a data extension for your Contacts Counts report](#).

- Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_sforce_mc_spoke.SalesforceMarketingCloudSOAPConnection**.

6. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
7. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
8. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Information	
Connection Name	Name of the connection. For example, SFMC SOAP Connection.
SOAP Connection URL	URL of your SOAP Connection endpoint. Enter <code>https://<subdomain>.soap.marketingcloudapis.com/Service.asmx</code> , where <code><subdomain></code> is your Salesforce Marketing Cloud subdomain.
Credential Information	
OAuth Client ID	Client ID that you generated while creating a Salesforce Marketing Cloud OAuth credential .
OAuth Client Secret	Client Secret that you retrieved while creating a Salesforce Marketing Cloud OAuth credential.
OAuth Redirect URL	<code>https://<instance_name>/oauth_redirect.do</code> , where the instance name is the name of your ServiceNow instance.
Additional information used for post processing	
Contacts Counts Data Extension	Name of the data extension that you want to retrieve Contacts Counts report data from. This name must exactly match the name of the data extension that you created in Create a data extension for your Contacts Counts report .

9. Select **Create and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

10. Select **Save**.
11. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.
Validating the connection verifies the Download Subscriptions and Download Consumption APIs, but not the Reclaim Subscriptions APIs.
12. After the connection is verified, select **Publish**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Create additional Salesforce Marketing Cloud integration profiles

Create an integration profile for each additional Salesforce Marketing Cloud that you want to track software subscriptions and optimize licensing for.

Before you begin

To create a Salesforce Marketing Cloud integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) [↗](#)

Role required: sam_integrator or admin

Salesforce Marketing Cloud Role required: sn_sforce_mc_spoke.Salesforce Marketing Cloud Admin

i Important:

You must select the **Software Asset Management integration with Salesforce Marketing Cloud** check box for this integration while installing optional features on the [Application Manager](#) [↗](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Salesforce Marketing Cloud integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	Name of the integration profile. For example, Salesforce Marketing Cloud integration profile .
Authentication type	Type of authentication to access Salesforce Marketing Cloud APIs. <ul style="list-style-type: none"> Basic Auth OAuth 2.0: Select this value. <p>Note: For a new Salesforce Marketing Cloud profile, the authentication type is set to Basic Auth by default.</p>
Status	Status of the integration profile. <ul style="list-style-type: none"> If you have not published the integration profile, this field is automatically set to Draft. If you have already published the integration profile, this field is automatically set to Published.
Profile type	Type of integration profile. This value is automatically set to Salesforce Marketing Cloud Subscription .

- Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce Marketing Cloud Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce Marketing Cloud Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- In the Download Consumption Subflow section, verify that the **Subflow** field is set to **Salesforce Marketing Cloud Download Contacts Consumption**.

The **Download Consumption** check box is selected by default. If you don't want to download the license consumptions, you can clear this check box.

- In the Integration Attributes section, add or remove the attributes based on your requirements. The name-value attributes such as **Count Date**, **Contacts**, **Email Contacts**, and **Mobile Contacts** are automatically populated for the integration profile.

Note:

The attribute name must match the report column header in Salesforce Marketing Cloud instance. For more information, see [Create a data extension for your Contacts Counts report](#).

5. Select Save.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_sforce_mc_spoke.SalesforceMarketingCloudSOAPConnection**.

6. Select the preview icon (i) next to the Connection & Credential field to open the connection & credential aliases record.

7. Select Open Record in the record preview.

8. On the Connection & Credential Aliases form, create a child alias that can uniquely identify the connection and credentials for this integration profile.

The first Salesforce Marketing Cloud integration profile that you create uses the default (parent) connection and credential alias for Salesforce. Each additional Salesforce Marketing Cloud integration profile that you create requires a unique child alias that helps differentiate the connection and credentials between each integration profile.

a. Select the link under Child Aliases > Parentalias=* to add child aliases.**

b. Select New.

The Connection & Credential Aliases form for the child alias opens.

c. Enter a name for the child alias in the Name field.

d. Right-click the form header and then select Save.

e. After the form reloads, select the Create New Connection & Credential related link.

9. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Information	
Connection Name	Name of the connection. For example, SFMC SOAP Connection.
SOAP Connection URL	URL of your SOAP Connection endpoint. Enter <code>https://<subdomain>.soap.marketingcloudapis.com/Service.asmx</code> , where <code><subdomain></code> is your Salesforce Marketing Cloud subdomain.
Credential Information	
OAuth Client ID	Client ID that you generated while creating a Salesforce Marketing Cloud OAuth credential .
OAuth Client Secret	Client Secret that you retrieved while creating a Salesforce Marketing Cloud OAuth credential.

Field	Description
OAuth Redirect URL	<code>https://<instance_name>/oauth_redirect.do</code> , where the instance name is the name of your ServiceNow instance.
Additional information used for post processing	
Contacts Counts Data Extension	Name of the data extension that you want to retrieve Contacts Counts report data from. This name must exactly match the name of the data extension that you created in Create a data extension for your Contacts Counts report .

10. Select Create and Get OAuth Token.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

11. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration. Validating the connection verifies the Download Subscriptions and Download Consumption APIs, but not the Reclaim Subscriptions APIs.

12. After the connection is verified, select **Publish**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Setting up an SFTP user account in Salesforce Marketing Cloud

Set up an SSH File Transfer Protocol (SFTP) user account to access your Salesforce Marketing Cloud FTP files.

Creating an SFTP user account enables you to access the Contacts Counts reports that are saved at an FTP location. The Contacts Counts report displays the total number of billable contacts in your Salesforce Marketing Cloud account.

Create an SFTP User Account in Salesforce Marketing Cloud

Create user accounts for SFTP users in Salesforce Marketing Cloud to access the Contacts Counts report.

Before you begin

Salesforce Marketing Cloud Role required: admin with privileges to create users and roles

About this task

Note:

You can create a limited number of active SFTP user accounts per member ID (MID). For more information, see [Salesforce documentation](#).

Procedure

1. From a web browser, open your Salesforce Marketing Cloud instance.
2. Log in using your admin credentials.
3. On the page header of your instance, select your profile icon and then select **Setup**.
4. In the **Quick Find** box, enter `f t p` and then select **FTP Accounts**.
5. Select **Create User**.
6. Enter the email address and password for the new user.
7. In the Authentication Options window, select **Select Password** as the authentication method for the user.
8. In the Permissions window, select the permissions to apply to each directory.

Important:

Each directory inherits the permissions of its subdirectories. Select all the permissions that provide you access to all the folders for viewing, downloading, and managing files.

9. Permit SFTP connections only from a specific IP address by entering the address in the **Allowlist IPs** field.
10. Select **Add**.
11. Repeat step 9 for each IP address that you want to permit.

Note:

If you don't enter any IP addresses, SFTP connections can be opened from any IP address.

12. In the Folders window, select a home directory for the user.

The user is allowed to access only the selected directory and its subdirectories. You can select the Root folder to see all the directories and subdirectories.

13. Save your changes.

You can also exclude an SFTP user from password expiration. For more information, see [Salesforce documentation](#).

Set Up an External FTP File Location in Salesforce Marketing Cloud

Set up a file location to connect to an external FTP site when transferring files. The file location contains the site URL, port, and login details that Salesforce Marketing Cloud uses to access your site.

Before you begin

Role required: admin

Procedure

1. In your Salesforce Marketing Cloud instance, navigate to **Setup**.
2. In the **Quick Find** box, enter `file` and then select **File Locations**.
3. Select **Create**.
4. In the Properties section, fill in the fields.

File location properties

Field	Description
Name	A unique name that you can recognize when you create an activity in Salesforce Marketing Cloud.
External Key	A unique key that identifies the file location when using the API.
Description	Details to identify the file location when you create an activity in Salesforce Marketing Cloud.

5. Select **Enhanced FTP Site Import Directory** as the location type.
6. Save the file.

Integrating with SAP Ariba

Integrating your Software Asset Management application with the SAP Ariba application enables you to track your software subscriptions and reclaim unused licenses.

Important:

This integration retrieves user subscription details, tracks last login date, and identifies low-usage for the following SAP Ariba applications:

- Ariba Sourcing
- Ariba Supplier Performance Management
- Ariba Contract Management

Download reports for SAP Ariba users consuming licenses

Before setting up an SAP Ariba integration profile, generate and download reports for all users who are currently using SAP Ariba licenses.

Before you begin

Role required: SAP Ariba admin

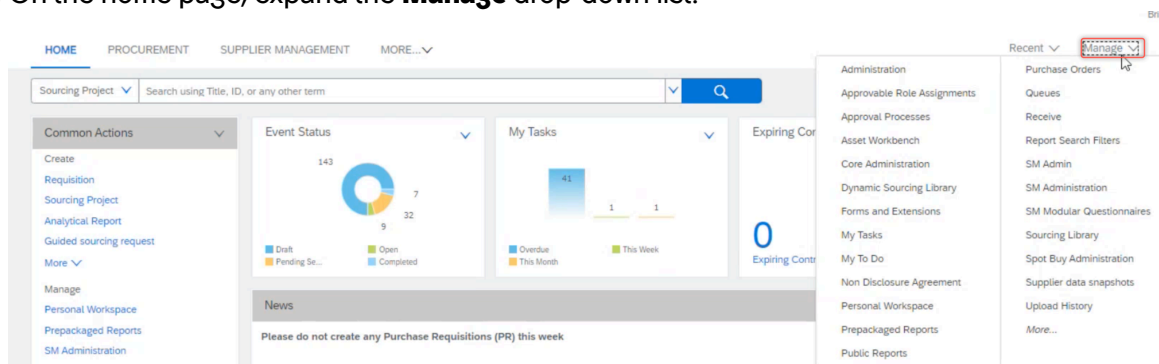

About this task

For setting up an SAP Ariba integration profile, the following SAP Ariba reports are required.

- Sourcing - User Names and Permissions
- Contract Usage Reports
- Number of Users Creating Projects
- Supplier Performance Managements (SPM) Project Report

Procedure

1. Log in to [SAP Ariba portal](#) with your admin credentials.
2. On the home page, expand the **Manage** drop-down list.

3. Select **Prepackaged Reports**.

Tip:

If you don't find this menu item directly under the **Manage** drop-down list, select **More...** and then select **Prepackaged Reports** from the Reports section.

4. Download the Sourcing - User Names and Permissions, Contract Usage Reports, and Number of Users Creating Projects reports.
 - a. On the Prepackaged Reports page, search for and select **System and Benchmark Usage Reports** and then select **Open**.
 - b. On the System and Benchmark Usage Reports page, select **System Usage Reports** and then select **Open**.
The list of System Usage reports is displayed, where you can find Contract Usage Reports and Sourcing Usage Reports.
 - c. Save and export the Sourcing - User Names and Permissions report.
 - i. On the System Usage Reports page, expand the **Sourcing Usage Reports** drop-down list.
The Sourcing-User and Permissions report is displayed.
 - ii. Scroll down and select **Sourcing-User Names and Permissions** and then select **Open**.

The Sourcing - User Names and Permissions report gets displayed.

iii. Select **Save...**

As the Sourcing - User Names and Permissions report is a default report, you must not edit it.

iv. On the Save Report page, select the **Current Project** field as **Personal Workspace**.

i Important:

To change the file name when saving the report, provide the name in the format **Sourcing-User Names and Permissions**. You might include prefixes or suffixes as needed.

v. Select **Save**.

vi. Export the saved report to your system in .csv format by selecting **Export**.

d. Save and export the Contract Usage Reports.

i. On the System Usage Reports page, search for and select **All Contract Workspaces** and then select **Open**.

ii. On the All Contract Workspaces page, filter the report according to your requirements by selecting **Edit**.

You can select a date range for the report you want to generate.

iii. Add a field or a hierarchy from the General Contract Workspace list in the report by selecting the **Pivot Layout** step.

For example, if you want to add the User Type field data to Detail Fields, select and hold (or right-click) it and then select **Detail Field**. You can add your required data to either Row Fields, Column Fields, or Detail Fields.

iv. After your required fields are added, select **Next**.

i Important:

If the **All Owners - User ID** field isn't included in the report, you must add it.

v. Select **Done**.

In the **Pivot table** tab, the Detail View section displays the fields you have added in a tabular format.

Tip:

If you can't see the fields that you selected, verify that you have selected the **Detail View** format.

vi. Select **Save...**

vii. On the Save Report page, select the **Current Project** field as **Personal Workspace**.

i Important:

To change the file name when saving the report, provide the name in the format **Contract Usage Reports**. You might include prefixes or suffixes as needed.

viii. Select **Save**.

ix. Export the saved report to your system in . csv format by selecting **Export**.

e. Save and export the Number of Users Creating Projects report.

i. On the System Usage Reports page, expand the **Sourcing Usage Reports** drop-down list and then select **Open**.

The System Usage Reports are displayed.

ii. Expand **Sourcing Usage Reports** and scroll down.

You can view Number of Users Creating Projects.

iii. Select **Number of Users Creating Projects** and then select **Open**.

iv. On the Number of Users Creating Projects page, filter the report according to your requirements by selecting **Edit**.

You can select a date range for the report you want to generate.

v. Add a field or a hierarchy from the Sourcing Project list in the report by selecting the **Pivot Layout** step.

For example, if you want to add the Start Date field data, select and hold (or right-click) it and then select **Row Field**. You can add your required data to either Row Fields, Column Fields, or Detail Fields.

vi. After your required fields are added, select **Next**.

Important:

If the **All Owners - User ID** field isn't included in the report, you must add it.

vii. Select **Done**.

In the **Pivot table** tab, the Detail View section displays the fields you have added in a tabular format.

Tip:

If you can't see the fields that you selected, verify that you have selected the **Detail View** format.

viii. Select **Save...**

ix. On the Save Report page, select the **Current Project** field as **Personal Workspace**.

Important:

To change the file name when saving the report, provide the name in the format **Number of Users Creating Projects**. You might include prefixes or suffixes as needed.

x. Select **Save**.

xi. Export the saved report to your system in . csv format by selecting **Export**.

5. Save and export the SPM Project Report.

- a. On the Prepackaged Reports page, search for and select **Supplier Performance Management Reports** and then select **Open**.
- b. On the Supplier Performance Management Reports page, select **SPM Project Report** and then select **Open**.
- c. Select a date range for which you want the report and select **View Report**.

**Tip:**

If you can't see the fields that you selected, verify that you have selected the **Detail View** format.

- d. Filter the report according to your requirements by selecting **Edit**.
- e. Add a field or a hierarchy from the SPM Project list in the report by selecting the **Pivot Layout** step.
For example, if you want the Calendar data in Column Fields, select and hold (or right-click) it and then select **Column Field**. You can add your required data to Row Fields, Column Fields, or Detail Fields.
- f. After your required fields are added, select **Next**.

**Important:**

If the **All Owners - User ID** field isn't included in the report, you must add it.

- g. Select **Done**.
In the **Pivot table** tab, the Detail View section displays the fields you have added in a tabular format.

**Tip:**

If you can't see the fields that you selected, verify that you have selected the **Detail View** format.

- h. Select **Save...**
- i. On the Save Report page, select the **Current Project** field as **Personal Workspace**.

**Important:**

To change the file name when saving the report, provide the name in the format **SPM Project Report**. You might include prefixes or suffixes as needed.

- j. Select **Save**.
- k. Export the saved report to your system in .csv format by selecting **Export**.

Create an SAP Ariba integration profile

Create an SAP Ariba integration profile to track software subscriptions and optimize licensing for your SAP Ariba applications.

Before you begin

The Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) must be installed from the [ServiceNow Store](#) .

For publishing the integration profile, change the application scope to **Global**.

ServiceNow Role required: sam_integrator or admin

About this task

If you're using Software Asset Workspace, the option to create the SAP Ariba integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display name	Name of the integration profile. For example, Ariba Integration .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile type	Type of integration profile. This field is automatically set to Ariba Subscription .

3. View the required user roles or API permissions to minimize security risks and optimize SaaS licenses.

In the Download Subscription Subflow section, verify that the **Subflow** field is set to **SAP Ariba Download Subscriptions**. The **Download subscriptions** check box is selected by default and you can't clear it.

4. Select **Save**.
5. After the integration profile is saved, upload the attachments by selecting the **Attach** icon (📎).
6. On the Attachments pane, drag or select the files in the .csv format that you want to upload one by one or together.

i Important:
Upload the SAP Ariba reports regularly to view the most recent data.

After the files are uploaded successfully, the Subscription Stagings [samp_subscription_staging] table gets populated with the uploaded data.

7. Select **Publish**.
After the integration profile is published, the files attached to the profile are deleted automatically.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with SAP S/4HANA Cloud Public Edition

Integrating your Software Asset Management application with the SAP S/4HANA Public Cloud application enables you to track your software subscriptions and optimize licenses.

Important:

You must request and install the following applications from [ServiceNow Store](#) :

- SaaS License Management plugin (com.sn_sam_saas_int)
- Software Asset Management Professional for SAP plugin (com.sn_samp_sap)
- SAP S/4HANA Spoke plugin (sn_s4_hana_cld_spk)
- Software Asset Management integration with SAP S/4HANA plugin (sn_sam_s4hanacloud)

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the SAP S/4HANA application	Authentication scopes
Download subscriptions	Business user	users:read

Create a communication system and user for SAP S/4HANA Public Cloud

Create a communication system and an inbound user to enable access to the SAP S/4HANA Public Cloud API and receive a user name and password for basic authentication.

Before you begin

The SAP S/4HANA Public Cloud Integration Hub spoke must be active. For more information, see [SAP S4 HANA Public Cloud Spoke](#).

SAP S/4HANA Role required: Business user

Procedure

1. Log in to the SAP Fiori launchpad using your business user credentials.
2. From the Communication Management catalog, select the **Communication Systems** application.
3. Select **New**.
4. In the **New Communication System** window, enter a unique system ID in the **System ID** field. For example, SAP S/4HANA Cloud source system.
5. Enter a unique name for the communication system in the **System Name** field. For example, Integration_System_SNOW.
6. Select **Create**.
The system ID and system name that you created appear in the corresponding fields in the General tab.
7. In the Technical Data section, enter the host name of the SAP S/4HANA Cloud source system in the **Host Name** field. For example, localhost.
8. Select the **Users for Inbound Communication** tab.
9. Create an inbound communication user, by selecting the **+** button.
10. In the New Inbound Communication User window, select **User Name and Password** in the **Authentication Method** field.
11. Select **New User**.
12. In the Create Communication User window, enter the appropriate values in the **User Name**, **Description**, and **Password** fields.
13. Select **Create**.
You're redirected to the New Inbound Communication User window.
14. Select **OK**.
The new user appears in the list of Users for Inbound Communication.

Important:

There are a few communication arrangements that require a user for outbound communication even if you're using it for inbound communication only. You can create a dummy user for outbound communication from the Users for Outbound Communication tab.

15. Select **Save**.

Create a communication arrangement for SAP S/4HANA Public Cloud

Create a communication arrangement to enable access to the SAP S/4HANA Public Cloud API.

Before you begin

SAP S/4HANA Role required: Business user

Procedure

1. Log in to the SAP Fiori launchpad using your business user credentials.
2. From the Communication Management catalog, select the **Communication Arrangements** application.
3. Select **New**.
4. In the New Communication Arrangement window, select **SAP_COM_0889** as the communication scenario.
For information on communication scenarios for the specific APIs, see [SAP S/4HANA Public Cloud APIs](#) .
5. Enter a unique communication arrangement name in the **Arrangement Name** field.
6. Select **Create**.
7. In the **Communication System** field under the Common Data section, select the communication system you created earlier.
For example, `Integration_System_SNOW`.

The **User Name** field for the selected communication system and the **Authentication Method** field associated with the communication scenario get automatically populated.

8. Select **Save**.

Create an SAP S/4HANA integration profile

Create an SAP S/4HANA integration profile to track software subscriptions and optimize licensing for your SAP S/4HANA applications.

Before you begin

The Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) must be installed from the [ServiceNow Store](#) .

For publishing the integration profile, change the application scope to **Global**.

ServiceNow Role required: sam_integrator or admin

 Important:

You must select the **Software Asset Management integration with SAP S4Hana Cloud** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the SAP S/4HANA integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile

Field	Description
Display name	Name of the integration profile. For example, SAP S/4HANA Cloud.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile type	Type of integration profile. This field is automatically set to SAP S4Hana Cloud Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses. For more information about the required roles and scopes, see [Minimal user permissions table](#).
4. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **SAP S4Hana Public Cloud Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

5. Select **Save**.

A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_s4_hana_cld_spk.SAP_S4_HANA_Cloud**.

6. Open the connection & credential aliases record by selecting the preview icon () beside the **Connection & Credential** field.
7. Select **Open Record** in the record preview.
8. Select the **Create New Connection & Credential** related link.
9. On the form, fill in the fields.

Create Connection and Credential form

Field	Description
Connection Name	A unique name for the connection. For example, SAP S4 HANA Cloud.
Connection URL	The URL to connect to the SAP S/4HANA public cloud instance. For example, <code>https://demo.s4hana.cloud.sap</code> .
User Name	User name for the credential record.
Password	Password for the credential record.

10. Select Create.

11. On the Integration Profile form, select **Validate Connection** to verify the connection and credential details of this integration.

12. Select Publish.

13. In the Publish Confirmation dialog box, select **OK**.

After the integration profile is published, it appears in the Direct Integration Profiles list.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Integrating with SAP SuccessFactors

Integrating your Software Asset Management application with the SAP SuccessFactors application enables you to track your software subscriptions and to reclaim unused licenses.

 Important:

You must request and install the following applications from [ServiceNow Store](#) :

- SaaS License Management
- SuccessFactors Spoke
- Software Asset Management integration with SuccessFactors

• If your installed SAP SuccessFactors spoke version is 3.1.5 or lower, follow these steps:

1. [Set up basic authentication for SAP SuccessFactors](#)
2. [Create an SAP SuccessFactors connection](#)
3. [Create an SAP SuccessFactors integration profile](#)

• If your installed SAP SuccessFactors spoke version is 4.0.0 or higher, follow these steps:

1. [Register OAuth application in SuccessFactors](#)
2. [Upload the JKS certificate in your ServiceNow instance](#)
3. [Register SuccessFactors as an OAuth provider](#)
4. [Create the SAML2 assertion producer record](#)
5. [Create credential record for the OData API](#)

- 6. Create connection record for the OData API
- 7. Create an SAP SuccessFactors integration profile

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the SAP SuccessFactors application	Authentication scopes
Download subscriptions	admin	None
Pull user activity	admin	None
Reclaim subscription	admin	None

Set up basic authentication for SAP SuccessFactors

Set up basic authentication to enable access to the SAP SuccessFactors API.

Before you begin

SAP SuccessFactors Role required: admin

Procedure

1. Log in to the SAP SuccessFactors instance using your admin credentials.
2. On the page header of your instance, select **Home > Admin Center**.
3. Create a group to assign API access permissions to.

💡 Tip:

Include only non-admin users in this group, as admin users automatically have access to the SuccessFactors API.

- a. In the **Tool Search** field of the Admin Center, search for and select **Manage Permission Groups**.
- b. On the Permission Group dialog box, enter a name for the permission group in the **Group Name** field.
- c. In the Choose Group Members section, specify the users or user groups that you want to include in this permission group by adding them to a People Pool.

People Pools allow you to specify the sets of users or user groups that you want to include or exclude for a permission group. You can either include all users and user groups in a single People Pool or group them into different People Pools. For example, you can create different People Pools for each department or office location within your organization.

To add users or user groups to a People Pool, select an identification category, such as **Username**, and then enter each user or user group in the corresponding text box. Each entry must be separated by a comma.

You can apply multiple identification categories to a single People Pool by clicking **Add another category**. You can also add additional People Pools by clicking **Add another People Pool**.

- d. **Optional:** In the Exclude these people from the group section, specify the users or user groups that you want to exclude from this permission group by adding them to a People Pool.

(Optional) To add users or user groups to a People Pool, select an identification category, such as **Username**, and then enter each user or user group in the corresponding text box. Each entry must be separated by a comma.

You can apply multiple identification categories to a single People Pool by clicking **Add another category**. You can also add additional People Pools by clicking **Add another People Pool**.

- e. Select **Done**.

4. Configure API access permissions for your group.

- a. In the **Tool Search** field of the Admin Center, search for and select **Manage Permission Roles**.

- b. Select **Create New**.

- c. On the Permission Role Detail form, enter a name for the permission role in the **Role Name** field.

- d. **Optional:** Enter a description for the permission role in the **Description** field.

- e. Under Permission settings, select **Permission...**

- f. In the Permission settings dialog box, select **Manage Integration Tools** from the left navigation pane.

- g. Select the **Allow Admin to Access OData API through Basic Authentication** check box.

- h. Select **Employee Central API** from the left navigation pane.

- i. Select the **Employee Central HRIS OData API (editable)** check box.

- j. Select **Done**.

The dialog box closes and you return to the Permission Role Detail form.

- k. Under the **Grant this role to...** tab, select **Add...** to search for and select the permission groups that you created in step 4.

Adding this permission group allows the associated users and user groups to access the APIs that are enabled in this permission role.

- l. Select **Save Changes**.

Create an SAP SuccessFactors connection

Create a connection between your SAP SuccessFactors OData API and your ServiceNow instance.

Before you begin

ServiceNow Role required: admin

Procedure

1. From your ServiceNow instance, navigate to **Process Automation > Flow Designer**.
The Flow Designer launches in a new tab.
2. Select the **Connections** tab.
3. Select **View Details** for your SuccessFactors_OData connection.
4. From the list of available connections, search for and select SuccessFactors_OData.
5. Select **Configure**.
6. In the Configure Connection dialog box, fill in the fields.

Configure Connection dialog box

Field	Description
Connection Name	Name of the SuccessFactors_OData connection.
Connection URL	OData API URL of your SAP SuccessFactors instance.
User name	Username for your SAP SuccessFactors admin account. Enter the same username that you used to log in to your SAP SuccessFactors instance in Set up basic authentication for SAP SuccessFactors .
Password	Password for your SAP SuccessFactors admin account. Enter the same password that you used to log in to your SAP SuccessFactors instance in Set up basic authentication for SAP SuccessFactors .

7. Select **Configure Connection**.

Register OAuth application in SuccessFactors

Enable client certificate authentication for the outbound communication from SAP Master Data service by generating the `keystore.jks` and `keystore.cer` files.

Before you begin

Role required: admin

Procedure

1. Create a JKS certificate by using any one of the following methods:
 - Follow the steps in the [Creating Java Keystore\(JKS\) with Private Key and Certificate Chain](#) [topic SAP Help Portal](#).
 - Install Java JDK 8 and Open SSL and execute the following commands in the Terminal:
 - a. `openssl genrsa -out private.key 2048`
The `private.key` file is generated.
 - b. `openssl rsa -in private.key -pubout -out public.key`
Extract the public key from key pair type.
 - c. `openssl req -new -x509 -key private.key -out publickey.cer -days 365`

Enter details of the Distinguished Name (DN). The `publickey.cer` file is generated.

```
d. openssl pkcs12 -export -in publickey.cer -inkey private.key
-out successfactors.p12 -name "successfactors"
```

You're prompted for a password. The successfactors.p12 file is generated using the private and public key created in step a and step b.

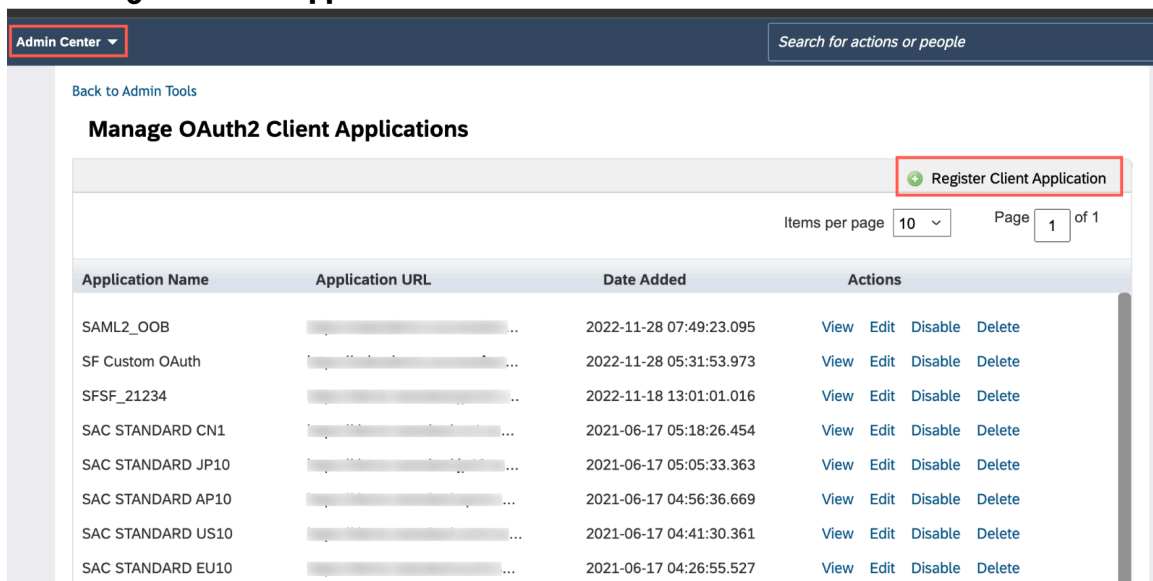

```
e. keytool -importkeystore -srckeystore successfactors.p12
-srcstoretype pkcs12 -destkeystore successfactors.jks
```

You're prompted for the destination and source file password. The successfactors.jks file is created using the successfactors.p12 file created in step c.

Note:

Confirm that you enter the same passwords in steps c and d. For example, if you enter the password as 123456 in step c, you must enter 123456 as password in step d too.

2. Log in to the SuccessFactors account as an admin.
3. Navigate to **Admin Centre** and select **Company Settings**.
4. Select **Manage OAuth2 Client Applications**.
5. Select **Register Client Application**.

6. In the **X.509 Certificate** field, provide the contents of the publickey.cer file (public key) without the headers.
7. Select **Submit**.

Result

The API Key is generated and displayed.

What to do next

Copy the API key generated and record the value for later use.

Upload the JKS certificate in your ServiceNow instance

Enable client certificate authentication for the outbound communication by uploading the JKS certificate in your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Log in to your ServiceNow instance as an admin.

2. Upload the JKS certificate to your ServiceNow instance.

For instructions to upload the JKS certificate, see [Upload a certificate to an](#)

Manage Attachments (1): [private.jks \[rename\]\[download\]](#)

* Name: Type:

* Notify on expiration: Expires in days:

* Warn in days to expire: Key store password:

Register SuccessFactors as an OAuth provider

Use the API key generated during the client application configuration to register the application as an OAuth provider.

Before you begin

Change the application scope to SuccessFactors spoke.

Role required: admin

Procedure

1. In your ServiceNow instance, navigate to **System OAuth > Application Registry**.

2. Select **New**.

3. In the form, fill in these fields.

Field	Description
Name	Unique name to identify the certificate. For example, SuccessFactors SAML.
Client ID	Value of the API key you had copied after registering the OAuth client application in SuccessFactors.
Client Secret	<p>Note: Client secret isn't needed to register the application as an OAuth provider. You can provide any value for this field.</p>

Field	Description
Default Grant Type	Default grant type used to establish the token. Select SAML2 Bearer .
Token URL	SuccessFactors OAuth server endpoint URL that includes the Company ID in this format: <code>https://<SuccessFactors_Instance_Name>/oauth/token?company_id=<Company_ID></code> . For example, <code>https://example.successfactors.eu/oauth/token?company_id=SFCPART123456</code> .

4. Select Submit.

Create the SAML2 assertion producer record

Create a SAML2 assertion record to generate the SAML2 assertion and exchange the assertion for the access tokens with the provider.

Before you begin

Change the application scope to SuccessFactors spoke.

Role required: admin

Procedure

1. Create a SAML2 assertion producer record in your instance.

a. Navigate to All > System OAuth > SAML2 Assertion Producers.

b. Select New.

c. On the form, fill these values.

Field	Description
Name	Unique name to identify the SAML2 assertion producer record. For example, <code>Successfactor SAML OAuth</code> .
Issuer	Unique identifier for the assertion issuing entity. Provide the ServiceNow instance URL.
Subject NameID	User name to log in to the SuccessFactors instance. For example, <code>sfadmin</code> .
Audience	Intended audience for the assertion. Enter the value, <code>www.successfactors.com</code> .
Recipient	Intended recipient for the assertion. Enter URL in this format, <code>https://<SuccessFactors-Instance-Name>/oauth/token</code> .

< ≡ **SAML2 Assertion Producer**
Successfactor SAML OAuth
⚙️ ⚙️ ⋮

* Name

* Issuer

* Subject NameID

* Signing Algorithm

* NameID Format

* Audience

* Recipient

Application

* Expiry Interval (sec)

d. Select and hold (or right-click) the form header and select **Save**.

e. Under the **SAML2 Assertion Keystores** tab, select **New**.

f. On the form, fill these values.

Field	Description
Name	Unique name to identify the SAML2 assertion keystore record. For example, <code>successfactors</code> .
Signing Key Alias	Alias of key entry stored in the Keystore used to sign the assertion. For example, <code>successfactors</code> .

Field	Description
Signing Key Password	Password of the key entry stored in the keystore used to sign the assertion.
Signing Keystore	Required X.509 certificate record. Select the X.509 certificate record that you had earlier created. For more information, see Upload the JKS certificate in your ServiceNow instance.

SAML2 Assertion Keystore
sap_successfactor

* Name: sap_successfactor

* Signing Key Alias: 1

* Signing Key Password:

* Signing Keystore: SAP SF SAML Cert

* Assertion Producer: Successfactor SAML OAuth

Update Delete

g. Select **Submit**.

h. Navigate to **All > System OAuth > SAML2 Assertion Producers**.

i. Open the SAML2 assertion producer record that you had created. For example, **Successfactor SAML OAuth**.

j. Under the **SAML2 Assertion Attributes** tab, select **New**.

k. On the form, fill these values.

Field	Description
Name	Name to identify the SAML2 assertion attribute record. Enter <code>api_key</code> .
Type	Type of the Value field. Select String .
Value	API key generated after the OAuth client application is created in SuccessFactors.

SAML2 Assertion Attribute
api_key

* Name: api_key

* Type: string

Value: [Empty field]

Application: SuccessFactors Spoke

Assertion Producer: Successfactor SAML OAuth

Update Delete

l. Select **Submit**.

2. Associate the SAML2 assertion producer with the application registry record.

- a. Navigate to **System OAuth > Application Registry**.
- b. Open the application registry record that you had created.
For example, **SuccessFactors OAuth Reg**. For more information about creating the application registry, see [Register SuccessFactors as an OAuth provider](#).
- c. Under the **OAuth Entity Profiles** tab, open the default OAuth entity profile record.
For example, **Successfactor SAML default_profile**.
- d. For the **Assertion Producer** field, select the SAML2 assertion producer record you had created.
For example, **Successfactor SAML**

- e. Select **Update**.

Create credential record for the OData API

Create a connection record for the OData API in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these connections to perform actions in SuccessFactors.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Connections & Credentials > Credentials**.
2. Click **New**.
The system displays the message **What type of Credentials would you like to create?**
3. Select **OAuth 2.0 Credentials**.
An empty OAuth 2.0 Credentials form is displayed.
4. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the record. For example, enter SAML_SuccessFactors_OData_Cred .
OAuth Entity Profile	OAuth entity profile record that is associated with the OAuth application registry you had created. For example, Successfactor SAML default_profile . For more information about creating the application registry, see Register SuccessFactors as an OAuth provider .
Active	Option to actively use the credential record.

Field	Value required
Order	Order to apply this credential. For example, enter 100.

5. Click **Submit**.

Result

The credential record to authorize actions using the OData API is created.

Create connection record for the OData API

Create a connection record for the OData API in SuccessFactors. The SuccessFactors spoke connection and credential alias uses these connections to perform actions in SuccessFactors.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **SuccessFactors OData**.
For example, **SuccessFactors_OData**.
3. From the **Connections** tab, click **New**.
The system displays an empty HTTP(s) Connection form.
4. On the form, fill these values.

HTTP(s) Connection form

Field	Description
Name	Name to uniquely identify the record. For example, SAML_SuccessFactors_OData_Conn.
Credential	Credential record you created for the OData API. For example, SAML_SuccessFactors_OData_Cred.
Connection URL	SuccessFactors service root URL in this format: https://<SuccessFactors_Instance_Name>/odata/v2. For example, https://apisalesdemo2.successfactors.eu/odata/v2.
Active	Option to actively use the connection record.

5. Click **Submit**.

Result

The connection record for the OData API in SuccessFactors is created.

Create an SAP SuccessFactors integration profile

Create an SAP SuccessFactors integration profile to track software subscriptions and optimize licensing for your SAP SuccessFactors applications.

Before you begin

The Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) must be installed from the [ServiceNow Store](#).

Change the application scope to **Global**.

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **Software Asset Management integration with SuccessFactors** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the SuccessFactors integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Value
Display Name	Name of the integration profile. For example, SuccessFactors Integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to SuccessFactors Subscription.

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **SuccessFactors Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **SuccessFactors Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **SuccessFactors Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select Save.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_successfactors.SuccessFactors_OData**.

5. Generate and add the SAP SuccessFactors user login report to your integration profile. This report is required for retrieving the last activity date of your SAP SuccessFactors users. You must generate and add the latest version of this report every time you want to update the last activity date of your SAP SuccessFactors users in the Software Subscriptions [samp_sw_subscription] table.

- a. Log in to your SAP SuccessFactors instance using the admin credentials.
- b. On the page header of your instance, select **Home > Admin Center**.
- c. On the page header of the Admin Center, select **Reporting**.
- d. Select **New** to create a report.
- e. When prompted to select the type of report that you want to create, select **Report - Table > Select**.
- f. Under **How would you like your data to be structured?**, select **Single Domain**.
- g. Under **What data would you like to start with?**, select **Login Data**.
- h. Click **Select**.
The Creating Login Data report page opens.
- i. On the **General Info** tab, fill in the fields.

General Info tab

Field	Description
Domain	Domain from which you're retrieving data. This field is automatically set to Login Data .
Report Name	Name of the report.
Description	Description of the report.
Report Priority	Priority of the report.
Remove Styling	Deselect this check box.

j. On the **People** tab, select **Refine criteria**.

k. In the Define Team dialog box, fill in the fields.

Define Team dialog box

Field	Description
Team Manager	Manager of the team for which you want to create this report. Select Logged In User .
Team Reporting Type	Type of report that you want to create for the team. Select Other Filters . When you select this report type, you can define report scopes to filter the user groups that you want to include in the report. See step 14 for more details.
Include inactive users	Option to include all inactive team members in the report. Leave this option unselected.

l. Select **OK**.

The dialog box closes and you return to the **People** tab.

m. Optional: In the Define Report Scope section of the **People** tab, select the **Division**, **Department**, and **Location** report scopes to define filter criteria for the user groups that you want to include in the report.

By default, all filter criteria for these report scopes are enabled.

n. On the **Columns** tab, select **+ Select Columns** to specify the data columns that you want to include in the report.

You can sort, group, or rearrange the columns as needed.

o. Select the **Last Login** and **User Sys ID** check boxes so that the first column is Last Login and the second column is User Sys ID on the report.

p. Optional: On the **Configuration** tab, specify whether you want your data columns to display data in either the date only or the date and time format.

For each applicable data column, select either **Date** (date only) or **Timestamp** (date and time). After you select the format for each data column, select **OK**.

q. On the **Filters** tab, select filters to refine the data that is displayed on the report.

r. Select Refine Criteria > Employee Login Detail > Last Login.

A pop-up displays with the Define last login filter.

s. Select the By Rule > Add rule tab.

t. From the drop-down list, select the Greater than option.

u. Enter the date from when you want to generate the report.

You must select a date not older than a couple of weeks to keep the file size within allowed limits.

v. Select Done after you select the filters.

w. Select Generate.

x. In the Download section of the generated report, select Excel to export the report as an Excel file.

Note:

The Excel file must not be greater than 5 MB.

y. Return to your SAP SuccessFactors integration profile form.

z. On the Integration Profile form header, select the Manage Attachments icon ().

aa. In the Attachments dialog box, select Choose file to locate and select your user login report.

ab. After the report uploads successfully, close the dialog box to return to the integration profile form.

6. After the form reloads, select Validate Connection to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

7. After the connection is verified, select Publish.

8. In the Publish Confirmation dialog box, select OK.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

By default, the activity job runs every one hour and deletes the file attached to the integration profile as part of the clean-up. If the file isn't found, the activity job fails to indicate no new attachment. The job failure has no impact on the already updated last activity.

If you plan to attach the file once everyday or once a week, you can update the run time of the *SAM - Refresh Success Factors Activity* scheduled job accordingly. You can also run this job on demand whenever you attach a file.

You must attach a file every time for the job to run because SAP SuccessFactors doesn't have an API for activity data pull.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

After creating an integration profile, view information about the profile in the Software Asset Workspace by navigating to **License operations > User subscription > Direct integration profiles**. You can select an integration profile to view the following related lists. If all of the following related lists aren't visible for an integration profile in the default view, you can select the custom integration view from the Details tab:

- Software Models
- Unrecognized Subscription Identifiers
- Scheduled Jobs
- Scheduled Job Results
- Software Subscriptions

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Important:

Child aliases and alias overrides aren't supported for the **SuccessFactors Update User Activity** subflow because this subflow doesn't use REST steps directly where aliases are required.

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Slack

Integrating your Software Asset Management application with the Slack application enables you to track your software subscriptions and reclaim unused licenses.

The ServiceNow Slack integration supports the Slack Enterprise Grid plan. This plan enables you to connect multiple workspaces across your organization.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Process	Required user role in the Slack application	Authentication scopes
Download subscriptions	Org Owner	admin
Pull user activity	Org Owner	admin
Reclaim subscription	Org Owner	admin

Create a Slack Enterprise Grid application

Create a Slack Enterprise Grid application to manage and connect multiple workspaces across your organization.

Before you begin

Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. From a web browser, open [Slack](#).
2. Sign in using your Slack credentials.
3. Go to the [Slack platform](#).
4. On the page header of the Slack platform, select **Your Apps**.
5. On the Your Apps page, select **Create New App**.
6. Select **From Scratch**.
7. In the Name app and choose workspace dialog box that opens, enter an application name in the **App Name** field.
8. From the **Pick a workspace to develop your app in:** list, select the workspace that you want the application to belong to.
9. Select **Create App**.
The Slack platform creates the application and then redirects you to the Basic Information page. Use this page to view and configure application settings.
10. On the Basic Information page, copy the values in the **Client ID** and **Client Secret** fields and save them for later use.
11. Expand the Features section and then select **OAuth & Permissions**.
12. On the OAuth & Permissions page, configure the permissions that enable the interactions between the application and the Slack API.

- a. In the Redirect URLs section, add the URL of the OAuth provider that you want to redirect users to after authentication.

- i. Select **Add New Redirect URL**.

- ii. When prompted, enter `https://<instance-name>/oauth_redirect.do`, where `<instance-name>` is the name of your ServiceNow instance.

- iii. Select **Add**.

- iv. Select **Save URLs**.

- b. In the User Token Scopes section, add the admin OAuth scope to the application.

The OAuth scopes limit the level of access that the application has to your users, channels, and workspaces. For more information on Slack OAuth scopes, see [OAuth Permission scopes](#).

- i. Select **Add an OAuth Scope**.

- ii. When prompted, select **admin** from the OAuth Scope list.

This OAuth scope enables the application to administer your workspace.

Note:

The **Description** field for the OAuth scope populates automatically.

13. Activate your application.

- a. From the side navigation pane, navigate to **Settings > Manage Distribution**.

- b. Under Share Your App with Other Workspaces, expand the Remove Hard Coded Information section.

- c. Verify that your application doesn't contain any hard-coded information, such as OAuth tokens.

- d. After verification, select the **I've reviewed and removed any hard-coded information** check box.

- e. Verify that you have completed all other sections.

- f. Select **Activate Public Distribution**.

Create a Slack workspace application

Create a Slack application on each workspace that you want to track user activity on.

Before you begin

Role required: Refer to the [Minimal user permissions](#) table.

Procedure

1. From a web browser, open [Slack](#).
2. Sign in using your Slack credentials.
3. Go to the [Slack platform](#).
4. On the page header of the Slack platform, select **Your Apps**.
5. On the Your Apps page, select **Create New App**.
6. Select **From Scratch**.

7. In the Name app and choose workspace dialog box that opens, enter an application name in the **App Name** field.
8. From the **Pick a workspace to develop your app in:** list, select the workspace that you want the application to belong to.
9. Select **Create App**.
The Slack platform creates the application and then redirects you to the Basic Information page. Use this page to view and configure application settings.
10. On the Basic Information page, copy the values in the **Client ID** and **Client Secret** fields and save them for later use.
11. Expand the Features section and then select **OAuth & Permissions**.
12. On the OAuth & Permissions page, configure the permissions that enable interactions between the application and the Slack API.
 - a. In the Redirect URLs section, add the URL of the OAuth provider that you want to redirect users to after authentication.
 - i. Select **Add New Redirect URL**.
 - ii. When prompted, enter `https://<instance-name>/oauth_redirect.do`, where `<instance-name>` is the name of your ServiceNow instance.
 - iii. Select **Add**.
 - iv. Select **Save URLs**.
 - b. In the User Token Scopes section, add the admin OAuth scope to the application.

The OAuth scopes limit the level of access that the application has to your users, channels, and workspaces. For more information on Slack OAuth scopes, see [OAuth Permission scopes](#).

- i. Select **Add an OAuth Scope**.
- ii. When prompted, select **admin** from the OAuth Scope list.

This OAuth scope enables the application to administer your workspace.

Note:

The **Description** field for the OAuth scope populates automatically.

13. In the OAuth Tokens & Redirect URLs section of the OAuth & Permissions page, select **Install App to Workspace**.
14. Select **Allow**.
Slack creates the application for the specified workspace.
15. Repeat steps 4 through 13 for each workspace on which you want to create an application.

Create a Slack integration profile

Create a Slack integration profile to track software subscriptions and optimize licensing for your Slack applications.

Before you begin

To create a Slack integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator

i Important:

You must select the **Slack Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Slack integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Value
Display Name	Name of the integration profile. For example, <i>Slack</i> Integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to <i>Slack Enterprise Subscription</i> .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Slack Download Subscriptions**.

i Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Slack Update User Activity**.

i Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Slack Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- 4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_slack_ah_v2.Slack_Enterprise**.

- 5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
- 6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
- 7. In the Create Connection and Credential dialog box, fill in or verify the following fields.

Create Connection and Credential dialog box

Field	Value
Name	Name of the Slack Enterprise Grid connection.
OAuth Client ID	Client ID that is assigned to your Slack Enterprise Grid application. Enter the same client ID that you copied in Create a Slack Enterprise Grid application .
OAuth Client Secret	Client secret that is assigned to your Slack Enterprise Grid application. Enter the same client secret that you copied in Create a Slack Enterprise Grid application .
OAuth Redirect URL	Redirect URL for your Slack Enterprise Grid application. This field populates automatically.

- 8. Select **Configure and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

- 9. On the Authorize App dialog box, verify if the Enterprise Grid workspace is available on the top-right list.
- 10. If the Enterprise Grid workspace is available, select the Enterprise Grid workspace.
- 11. If the Enterprise Grid workspace isn't available,

- a. Select **Add another workspace**.
 - b. Enter the Enterprise Grid workspace URL.
 - c. Select **Continue**.
You get redirected to the Authorize App dialog box.
 - d. Select **Allow**.
The OAuth access token becomes available for authorizing your Enterprise connection.
12. Create a connection between your Slack workspace and your ServiceNow instance to retrieve user data from your workspace.

- a. Open the connection & credential record set on the integration profile.
- b. Select the **Child Aliases** tab.
- c. Select **New**.

 **Tip:**

If the **New** button isn't visible, change the scope to the Slack Spoke of the child alias by navigating to the **Application scope** and reloading the Connection & Credential Aliases page.

- d. On the new child alias form that opens up, provide a name for the child alias.
- e. Select **Submit**.
- f. Open the child alias record that you created and select the **Create New Connection & Credential** related link.
- g. In the Create Connection and Credential dialog box, fill in or verify the following fields.

Create Connection and Credential dialog box

Field	Value
Name	Name of the Slack workspace connection.
OAuth Client ID	Client ID that is assigned to your Slack workspace application. Enter the same client ID that you copied in Create a Slack workspace application .
OAuth Client Secret	Client secret that is assigned to your Slack workspace application. Enter the same client secret that you copied in Create a Slack workspace application .
OAuth Redirect URL	Redirect URL for your Slack workspace application. This field populates automatically.

- h. Select **Configure and Get OAuth Token**.

 **Note:**

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

i. In the Authorize App dialog box, select **Allow**.

The OAuth access token becomes available for authorizing your Slack workspace connection.

j. Repeat steps a through i for each workspace connection that you want to associate with your instance.

13. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

i Important:

If you encounter configuration issues while validating the integration profile or retrieving subscriptions, refer to the knowledge base for troubleshooting guidance. For more information, see knowledge base article [KB2536373](#).

14. After the connection is verified, select **Publish**.

15. In the dialog box, select **OK**.

i Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- o The **Status** field on the integration profile form changes to **Draft**.
- o The **Validate connection** button shows up on the form.
- o The current *SAM - Refresh <displayname> Activity* job gets deleted.

16. **Optional:** To optimize memory and avoid performance issues in your Slack flow, you can turn off the flow engine reporting level.

a. Navigate to **System Properties > All Properties**.

b. Select the system property *com.snc.process_flow.reporting.level*.

c. On the System Property page, set the **Value** to OFF.

d. Select **Update**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

After creating an integration profile, view information about the profile in the Software Asset Workspace by navigating to **License operations > User subscription > Direct integration profiles**. You can select an integration profile to view the following related lists. If all of the following related lists aren't visible for an integration profile in the default view, you can select the custom integration view from the Details tab:

- Software Models
- Unrecognized Subscription Identifiers
- Scheduled Jobs

- Scheduled Job Results
- Software Subscriptions

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with SmartRecruiters

Integrating your Software Asset Management application with the SmartRecruiters application enables you to track your software subscriptions and deactivate stale users. The reclamation flow deactivates only the users' access. The reclamation flow does not affect the subscription cost because SmartRecruiters is not priced based on the number of users.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Process	Required user role in the SmartRecruiters application	Authentication scopes
Download subscriptions	admin	None
Pull user activity	admin	None
Reclaim subscription	admin	None

Generate a SmartRecruiters API key

Generate an API key for authenticating SmartRecruiters API requests.

Before you begin

SmartRecruiters Role required: admin

Procedure

1. Log in to [SmartRecruiters](#)  account by using your admin credentials to generate an API key.
2. On the page header of the SmartRecruiters portal, select your profile icon and then select **Settings/Admin**.
3. Under Company Settings, locate the Administration section and then select **Apps & Integrations**.
4. Select the **CREDENTIALS** tab and then select **NEW CREDENTIAL**.
5. When prompted to select the type of credential that you want to generate for your applications, select **API key**.
6. Select **Next**.
7. Enter a name for your API key in the **Credentials name** field.
8. Enter a description for your API key in the **Description** field.
9. Select **Generate**.
SmartRecruiters automatically generates and displays your API key.
10. Copy your API key and save it in a secure location for later use.

Create a SmartRecruiters integration profile

Create a SmartRecruiters integration profile to track software subscriptions and usage. Identify users that no longer require access to SmartRecruiters and deactivate their access.

Before you begin

The Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) must be installed from the [ServiceNow Store](#) .

ServiceNow Role required: sam_integrator or admin

 Important:

You must select the **SmartRecruiters Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the SmartRecruiters integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, SmartRecruiters Integration.
Status	Status of the integration profile.

Field	Description
	<ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to SmartRecruiters Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **SmartRecruiters Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **SmartRecruiters Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **SmartRecruiters Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_smartrec_spoke.SmartRecruiters**.

5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the SmartRecruiters connection. This field populates automatically.
Connection URL	URL for the connection. This field is automatically set to <code>https://api.smartrecruiters.com</code> .
Credential Information	
API Key	API key for your SmartRecruiters applications. Enter the same API key that you generated in Generate a SmartRecruiters API key .

8. Select **Create**.
The dialog box closes and you automatically return to the integration profile form.
9. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

10. After the connection is verified, select **Publish**.
11. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- o The **Status** field on the integration profile form changes to **Draft**.
- o The **Validate connection** button shows up on the form.
- o The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Smartsheet

Integrating your Software Asset Management application with the Smartsheet application enables you to track your software subscriptions and to reclaim unused licenses.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Smartsheet application	Authentication scopes
Download subscriptions	admin	None
Pull user activity	admin	None
Reclaim subscription	admin	None

Create a Smartsheet API access token

Create an API access token for authenticating Smartsheet API requests.

Before you begin

Smartsheet Role required: admin

Procedure

1. From a web browser, open [Smartsheet](#).
2. Log in using your Smartsheet credentials.
3. On the side navigation bar, select the account icon () and then select **Apps & Integrations**.
4. In the Personal Settings dialog box, select **API Access**.

5. Under Manage API Access Tokens, select **Generate new access token**.
6. When prompted, enter a name for your API access token in the **API Access Token Name** field and then select **OK**.
Smartsheet automatically generates and displays your API access token. For security purposes, this API access token appears only once.
7. Copy your API access token and save it in a secure location for later use.
8. Select **OK**.

Create a Smartsheet integration profile

Create a Smartsheet integration profile to track software subscriptions and optimize licensing for your Smartsheet applications.

Before you begin

To create a Smartsheet integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **Smartsheet Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Smartsheet integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, Smartsheet Integration .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to Smartsheet Subscription .

3. View the required user roles or API permissions to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Smartsheet Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Smartsheet Update User Activity**.

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Events* isn't created.

Important:

To enable detailed event tracking, procure an Event Reporting add-on from Smartsheet.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Smartsheet Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Save** after completing all the required fields.

Your ServiceNow instance creates a draft integration profile. The integration profile uses the Smartsheet Download Subscriptions, Smartsheet Update User Activity, and Smartsheet Reclaim Subscription subflows to retrieve user data from the Smartsheet application.

The **Connection & Credential** field appears and is automatically set to **sn_smrtsheet_spoke.Smartsheet**.

5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
7. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Name	Name of the connection.
Connection URL	<p>This field is automatically set to <code>https://api.smartsheet.com</code>.</p> <p>Note: Based on regions, replace the Connection URL with these respective URLs:</p> <ul style="list-style-type: none"> Smartsheet Gov: <code>https://api.smartsheetgov.com/</code> Smartsheet Regions Europe: <code>https://api.smartsheet.eu/</code> Smartsheet Regions Australia: <code>https://api.smartsheet.au/</code>
API Key	<p>API key for your Smartsheet application.</p> <p>Enter an API key in the <code>api-access-token</code> format, where <code><api-access-token></code> is the API access token that you created in Smartsheet.</p>

8. Select **Create.**

You automatically return to the integration profile.

9. On the integration profile form, select **Validate Connection to verify the connection and credential details of this integration.**

10. After the connection is verified, select **Publish.**

11. In the Publish Confirmation dialog box, select **OK.**

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with SurveyMonkey

Integrating your Software Asset Management application with SurveyMonkey application enables you to track your software subscriptions and to reclaim unused licenses.

The SaaS License Management SurveyMonkey integration supports the SurveyMonkey Enterprise and Enterprise Platinum plans as API support is available for only these plans.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the SurveyMonkey application	Authentication scopes
Download subscriptions	admin	<ul style="list-style-type: none"> • View Groups • View Users
Pull user activity	admin	View Groups

Create a private SurveyMonkey application

Create a private SurveyMonkey application for creating, tracking, and analyzing surveys within your organization.

Before you begin

SurveyMonkey Role required: Refer to the [Minimal user permissions](#) table.

About this task

i Note:

To avoid rate-limiting issues, create a private SurveyMonkey application for each ServiceNow instance.

Procedure

1. From a web browser, open the [SurveyMonkey API Developer portal](#) .
2. Sign in using your admin credentials.
3. On the page header of the API Developer portal, select **My Apps**.
4. On the My Apps page, select **Add a New App**.
5. In the APP CREATION dialog box, enter a name for the application in the **App Nickname** field.
6. Under the Select an App Type section, select **Private App**.
7. Select **Create App**.
The dialog box closes and then the overview of the newly created application opens.
8. In the Details section of the application overview, copy the values in the **Client ID** and **Secret** fields.
Save them in a secure location for later use.
9. Go to the application settings by selecting the **SETTINGS** tab.
10. In the Settings section of the application settings, enter the URL of the OAuth provider that users are redirected to after authentication in the **OAuth Redirect URL** field.
Enter `https://instance.service-now.com/oauth_redirect.do`, where `<instance>` is the name of your ServiceNow instance.
11. Select **Submit Changes**.
12. In the Scopes section of the application settings, select the **View Groups** and **View Users** scopes to enable your application to access group and user information.
13. Select **Update Scopes**.
14. At the top of the application settings, select **Deploy**.

Create a SurveyMonkey integration profile

Create a SurveyMonkey integration profile to track software subscriptions and optimize licensing for your SurveyMonkey applications.

Before you begin

To create a SurveyMonkey integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

ServiceNow Role required: sam_integrator or admin

Important:

You must select the **SurveyMonkey Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the SurveyMonkey integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, SurveyMonkey Integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to SurveyMonkey Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **SurveyMonkey Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **SurveyMonkey Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_sv_monkey_spoke.surveyMonkey**.

5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Name	Name of the connection.
OAuth Client ID	Client ID that is assigned to your SurveyMonkey application.
OAuth Client Secret	Client secret that is assigned to your SurveyMonkey application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the OAuth redirect URL that you specified in Create a private SurveyMonkey application .

8. Select **Create and Get OAuth Token**.

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

9. In the Authorize App dialog box, sign in using the same SurveyMonkey credentials that you used to create your SurveyMonkey application.
10. Select **Allow**.
The dialog box closes and then you automatically return to the integration profile form.
11. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.
12. After the connection is verified, select **Publish**.
13. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- o The **Status** field on the integration profile form changes to **Draft**.
- o The **Validate connection** button shows up on the form.
- o The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Tableau Cloud

Integrating your Software Asset Management application with the Tableau Cloud application enables you to track your software subscriptions and to reclaim stale licenses.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Tableau Cloud application	Authentication scopes
Download subscriptions	site administrator	None
Pull user activity	site administrator	None
Reclaim subscription	site administrator	None

Register a Tableau Cloud application

Register a Tableau Cloud application through the Tableau Cloud admin portal.

Before you begin

- Activate the Tableau spoke. For more information, see [Tableau spoke](#) .
- Tableau Cloud Role required: site administrator

Procedure

Use one of the following authentication types to validate ServiceNow instance requests with Tableau Cloud.

- Personal Access Token (PAT)
- JSON Web Token (JWT)

a. Validate ServiceNow instance requests with Tableau Cloud using the PAT authentication type.

- Log in to the Tableau Cloud account using admin credentials.
- Select your profile icon.
- Select **My Account Settings**.
- Scroll down to the **Personal Access Tokens** section on your profile page.
- In the text field, provide a token name.

For example, Test 1.

vi. Select **Create Token**.

The Personal Access Token is generated with a Token name and Secret.

vii. To copy the Personal Access Token Secret, select **Copy Secret**.

i **Important:**

Keep the Personal Access Token Secret at a secure place. You would need it when you create a connection record for Tableau.

b. Validate ServiceNow instance requests with Tableau Cloud using the JWT authentication type.

- Log in to the Tableau Cloud account using admin credentials.
- Select your profile icon.
- From the left-pane, select **Settings**.
- Select the **Connected Apps** tab.
- On the Connected Apps page, select the **Direct Trust** option from the **New Connected Apps** drop-down list.
- In the **Create Connected App** dialog box, fill in the Connected app name, Access level, and Domain allow list details.
- Select **Create**.

The Connected App that you created gets displayed on the Connected Apps page. By default, the Connected App is inactive.

viii. To enable the Connected App, select the ellipsis icon (⋮) next to the Connected App name and then select **Enable**.

The status of the Connected App shows as enabled.

ix. Select the Connected App name.

Keep the Secret ID and Secret value at a secure place. You would need it when you create a connection record for Tableau.

x. To copy the Client ID, select **Copy Client ID**.

Keep the Client ID at a secure place. You would need it when you create a connection record for Tableau.

Create a Tableau Cloud integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Tableau Cloud service.

Before you begin

To create a Tableau Cloud integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: admin or sam_integrator

i Important:

You must select the **Software Asset Management integration with Tableau** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using the Software Asset Workspace, the option to create the integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration profile form

Field	Value
Display name	Name of the integration profile. For example, <code>Tableau integration</code> .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you haven't published the integration profile, this field is automatically set to #Draft. ○ If you have already published the integration profile, this field is automatically set to #Published.
Profile type	Type of integration profile. This field is automatically set to Tableau Cloud Subscription.

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

i Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Tableau Cloud Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Tableau Cloud Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select Save.

A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_tableau_spoke.TableauCloud**.

- 5. Open the connection & credential aliases record by selecting the preview icon (ⓘ) beside the **Connection & Credential** field.

- 6. Select **Open Record** in the record preview.

- 7. Select the **Create New Connection & Credential** related link.

- 8. On the form, fill in the fields.

Create Connection and Credential form

Field	Description
Please Enter the Connection Information	
Connection Name	Name of the connection. This field is automatically set to <i>Tableau Cloud Connection</i> .
Connection URL	The URL used for connecting to the server on which Tableau Cloud is installed. For example, <code>https://<server>.online.tableau.com/api/</code> .
Content URL	The permanent name of the site to sign in to. The content URL appears in the URL path of Tableau content in your browser address bar after the Tableau Server URL. <code>mySite</code> is the content URL in the following example: <code>http://<server or cloud URL>/#/site/mySite/explore</code> .
Please Enter the Credential Information	

Field	Description
<p>Select the Personal Access Token (PAT) or JSON Web Token (JWT) authentication type. The fields change based on the authentication type that you select.</p>	
<p>Fields for the PAT authentication type</p>	
Token Name	<p>The Token name that you provided while registering the Tableau Cloud application by using the PAT authentication type.</p> <p>For more information, see Register a Tableau Cloud application.</p>
Token Secret	<p>The Token secret that you copied while registering the Tableau Cloud application by using the PAT authentication type.</p> <p>For more information, see Register a Tableau Cloud application.</p>
Expiry Interval (sec)	<p>Life span of the generated Personal Access Token (PAT).</p> <p>Default value: 14400 sec</p> <div style="background-color: #e1f5fe; padding: 5px; border: 1px solid #cfcfcf;"> <p>i Important: You mustn't modify the value of this field.</p> </div>
<p>Fields for the JWT authentication type</p>	
Secret ID	<p>The Secret ID that you copied while registering the Tableau Cloud application by using the JWT authentication type.</p> <p>For more information, see Register a Tableau Cloud application.</p>
Secret Value	<p>The Secret value that you copied while registering the Tableau Cloud application by using the JWT authentication type.</p> <p>For more information, see Register a Tableau Cloud application.</p>
Username	<p>User name, that is, email address of the authenticated Tableau Cloud user.</p>
Client ID	<p>The Client ID that you copied while registering the Tableau Cloud application by using the JWT authentication type.</p>
Expiry Interval (sec)	<p>Life span of the generated JSON Web Token (JWT).</p> <p>Default value: 3600 sec</p>

Field	Description
	<div style="background-color: #e1f5fe; padding: 5px;">  Important: You mustn't modify the value of this field. </div>

9. Select **Create**.

10. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.

11. Select **Publish**.

12. In the Publish Confirmation dialog box, select **OK**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Trello

Integrating your Software Asset Management application with the Trello service enables you to track your software subscriptions and to reclaim unused licenses.

For more information about the Trello service, see [the Trello Developer guide](#) .

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Trello application	Authentication scopes
Download subscriptions	Product admin	None
Pull user activity	Product admin	None
Reclaim subscription	Product admin	None

Generate Trello API key and token

Generate a Trello API key and token to get access to the Trello portal.

Before you begin

Trello Role required: Refer to the [Minimal user permissions](#) table.

Verify that you have a managed user account and Atlassian admin access.

Procedure

1. Go to [Trello](#).
2. Log in as an enterprise admin.
3. Go to [Developer API Keys](#).
4. Copy the API key from Personal Key on the Developer API keys page.
5. In the following link, replace {YourAPIKey} with the API key that you copied in the last step and open the link.

`https://trello.com/1/authorize?`

`expiration=never&scope=read,write,account&response_type=token&name=ServerTo`

For example, if your API key is 123xyz, then open the

following link- `https://trello.com/1/authorize?`

`expiration=never&scope=read,write,account&response_type=token&name=ServerTo`

The MyPersonalToken page appears and asks if you want to give access to your account.

6. Select **Allow**.

An API token is generated. Copy this API token and store it securely.

Create a Trello integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Trello service.

Before you begin

To create a Trello integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: admin or sam_integrator and sn_trello_spoke.trello_admin

i Important:

You must select the **Trello Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Trello integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, <code>Trello Integration</code> .
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you haven't published the integration profile, this field is automatically set to #Draft. ○ If you've already published the integration profile, this field is automatically set to #Published.
Profile Type	This field is automatically set to Trello Enterprise Subscription .

3. Review the required user roles or API permissions to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Trello Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Trello Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Save**.

A draft integration profile is created.

The **Connection & Credential** field appears and is automatically set to **sn_trello_spoke.Trello_Alias**.

5. In the **Download Subscription Subflow** tab, select the preview icon (🔍) next to the **Connection & Credential** field and then select **Open Record** in the record preview.
6. Select the **Create New Connection & Credential** related link.
7. On the form, fill in the fields.

Create Connection and Credential form

Field	Description
Connection Name	Name to identify the connection record.
Connection URL	Enter the URL as <code>https://api.trello.com/</code> .
API Key	The API key that you copied from the Trello portal.
API Token	The API token that you copied from the Trello portal.

8. Select **Create**.
9. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.

10. Select **Publish**.
11. In the Publish Confirmation dialog box, select **OK**

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Workday

Integrating your Software Asset Management application with the Workday applications enables you to track your software subscriptions.

With this integration, you can track software subscriptions for the following Workday applications:

- Workday Human Capital Management
- Workday Financial Management

Use either of the following authentication methods to integrate your ServiceNow instance with Workday.

- [Basic Authentication](#)
- [OAuth 2.0](#)

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Workday application	Authentication scopes
Download subscriptions	User having the following Domain Security Policy: <ul style="list-style-type: none"> • Worker Data <ul style="list-style-type: none"> ○ Public Worker Reports ○ Workers ○ Current Staffing Information • Person Data: Work Address • Workday Accounts <ul style="list-style-type: none"> ○ WQL for Workday Extend ○ Workday Query Language 	None

Integrate with Workday using Basic Authentication

Integrate your Software Asset Management application with the Workday application using Basic authentication method to track your software subscriptions.

Configure permissions in Workday

To set up the Workday integration successfully, perform this procedure in Workday.

Before you begin

Role required: Users having roles such as Security Admin, Integration Admin, Integration Auditor, who can create Integration System Users and assign required security policies.

Procedure

1. Register an Integration System User.

Note:

While filling out account information details, you must select the **Do Not Allow UI Sessions** check box.

2. Create a security group and assign it to the Integration System User.

- a. In **Action**, navigate to **Security Group > Maintain Domain Permissions for Security Group** and provide the following permission:

Domain security policy permissions

Operation	Domain Security Policy	Functional Areas
Get Only	Worker Data: Current Staffing Information	Staffing
Get Only	Worker Data: Workers	Staffing

Note:

Confirm that the domain security policies are activated for the security group using the active pending security policy changes.

Result

The new credentials for this Integration System User would be used to configure the connection in the ServiceNow instance.

Create a Workday integration profile

Create a Workday integration profile to track software subscriptions and optimize licensing for your Workday applications.

Before you begin

Role required: admin, sam_admin, sam_integrator

Install the latest Workday HR spoke. For more information about the latest version, see the **Spoke version** section in [Workday HR Spoke](#).

Important:

You must select the **Software Asset Management integration with Workday** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Workday integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Integration Profile	
Display name	Name of the integration profile. For example, <i>Workday integration</i> .
Authentication type	Type of authentication to access Workday APIs. <ul style="list-style-type: none"> ○ Basic Auth ○ OAuth 2.0
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you haven't published the integration profile, this field is automatically set to #Draft. ○ If you've already published the integration profile, this field is automatically set to #Published.
Profile type	Type of integration profile. This field is automatically set to Workday Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Workday Download Subscriptions**. The **Download subscriptions** check box is selected by default and you can't clear it.

4. Select **Save**.

The Connection Setup section is displayed on the integration profile.

Connection Setup section

Field	Description
Connection Details	<ul style="list-style-type: none"> ○ If the connection details exist, this field is already populated. ○ If the connection details don't exist, you must create them.
SOAP Username	User name of the Integration system user created while configuring permissions in Workday .

Field	Description
	 Important: Include the tenant suffix in the username. For example, <code>username@<tenant></code> .
SOAP Password	Password of the Integration system user created while configuring permissions in Workday .

5. If connection details don't exist, create the connection details.

- a. Select **New**.
- b. On the form, fill in the fields.

Connection Details

Field	Description
Base URL	Workday SOAP API URL with the tenant name in the following format: <code>https://<workday_host_url>/ccx/service/<workday_tenant_name></code> .
Version	The SOAP API version, for example, <code>v33.2</code> .
Webservice Type	Should be set to SOAP .

- c. Select **Submit**.
 A record is created and added in the **Connection Details** field.
- d. **Optional:** Review the connection details by selecting the new integration profile and selecting the lookup icon  in the **Connection details** field.

6. Create a SOAP user name and password when you don't have these credentials automatically populated.

 **Note:**

Only an admin role can create or update the SOAP user name and password.

- a. On the Soap Security Policy form, select the lookup icon  in the **WS-Security Username Profile** field.
- b. Select **New**.
- c. On the WS-Security Username Profiles (Outbound) form, fill in the name, user name, and password for the integration profile.
- d. Select **Submit**.

7. Select **Save**.

8. Under the **FSE worker calculation** tab, activate the worker categories covered by your contract by setting the value of **Active** to **true** and entering the FSE percentage.

9. Optional: If worker categories are listed in your contract but not available in the FSE worker calculation tab, add a new worker category.

a. In the **FSE worker calculation** tab, select **New**.

b. On the form, fill in the fields.

Workday FSE worker calculation

Field	Description
Worker Category	The worker category listed in your contract.
FSE Percentage	The FSE percentage for the worker category that you added. Full Service Equivalent (FSE) is the method by which the subscriptions are calculated.
Integration profile	The Workday integration profile that you created.
Active	Option to make the worker category active.

c. Select **Submit**.

10. Define the mapping of the newly created worker category.

a. Select the **Worker category** tab and select **New**.

b. On the form, fill in the fields:

Workday worker category

Field	Description
Worker Type	The type of worker, either Employee or Contingent.
Employee/Contingent worker type	The type of Employee or Contingent worker.
Time Type	Indicates whether the worker is full-time or part-time.
Worker Category	The worker category that you created.
Integration profile	The Workday integration profile that you created.
Active	Option to make the mapping active.

c. Select **Submit**.

11. Activate the list of modules that are defined in your contract.

a. Select the **Modules** tab.

b. Open the module record.

- c. Set the **Active** field to **True**.
 - d. Select **Save**.
12. Verify that there is at least one active record in all the tabs for your contract: FSE worker calculation, Worker category, and Modules, before publishing the connection.
 13. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.
 14. After the connection is verified, select **Publish**.
 15. In the Publish Confirmation dialog box, select **OK**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrate with Workday using OAuth 2.0

Integrate your Software Asset Management application with the Workday application using OAuth 2.0 authentication method to track your software subscriptions.

Configure permissions in Workday

To set up the Workday integration successfully, configure permissions in Workday for the OAuth 2.0 authentication method.

Before you begin

Role required: Users having roles such as Security Admin, Integration Admin, Integration Auditor, who can create Integration System Users and assign required security policies.

Procedure

1. Register an Integration System User.

Note:

While filling out account information details, you must select the **Do Not Allow UI Sessions** check box.

2. Create a security group and assign it to the Integration System User.

- a. In **Action**, navigate to **Security Group > Maintain Domain Permissions for Security Group** and provide the following permission:

Domain security policy permissions

Operation	Domain Security Policy	Functional Areas
Get Only	Worker Data: Current Staffing Information	Staffing
View Only	Person Data: Work Address	Contact Information
View Only	Worker Data: Active and Terminated Workers	Staffing
View Only	Workday Accounts	System
View and Modify	WQL for Workday Extend	System
View and Modify	Workday Query Language	System

Note:

Confirm that the domain security policies are activated for the security group using the active pending security policy changes.

Result

The new credentials for this Integration System User would be used to configure the connection in the ServiceNow instance.

Create Workday OAuth 2.0 credentials

Create Workday OAuth 2.0 credentials to get access to Workday APIs.

Before you begin

Role required: Users having roles such as Security Admin, Integration Admin, Integration Auditor, who can create Integration System Users and assign required security policies.

Procedure

1. Log in to your Workday account.
2. In the search bar, enter `register API client` and select **Register API Client**.
3. On the Register API Client page, fill in the fields.

Register API Client fields

Field	Description
Client Name	A unique name for the client application. For example, <code>Workday HR spoke</code> .

Field	Description
Client Grant Type	Select Authorization Code Grant .
Access Token Type	The type of access token. Select Bearer .
Redirection URI	URL of your ServiceNow instance.
Non-Expiring Refresh tokens	The option to enable refresh tokens which do not expire.
Scope (Functional Areas)	Scopes required for the client application.
Include Workday Owned Scope	The option to select scopes that are owned by Workday.

4. Select OK.

The client ID and client secret are generated on the Register API Client page.

5. Copy the values in the Client ID and Client Secret fields and secure them for later use for Workday integration.

Create a Workday integration profile

Create a Workday integration profile to track software subscriptions and optimize licensing for your Workday applications.

Before you begin

Role required: admin, sam_admin, sam_integrator

Install the latest Workday HR spoke. For more information about the latest version, see the **Spoke version** section in [Workday HR Spoke](#).

Important:

You must select the **Software Asset Management integration with Workday** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Workday integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Integration Profile	
Display name	Name of the integration profile. For example, <i>Workday integration</i> .
Authentication type	Type of authentication to access Workday APIs.

Field	Description
	<ul style="list-style-type: none"> Basic Auth OAuth 2.0
Status	Status of the integration profile. <ul style="list-style-type: none"> If you haven't published the integration profile, this field is automatically set to #Draft. If you've already published the integration profile, this field is automatically set to #Published.
Profile type	Type of integration profile. This field is automatically set to Workday Subscription .

3. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Workday Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

4. Select **Save**.

A draft integration profile gets created.

The **Connection & credential** field appears and is automatically set to **sn_workday_hr_spke.WorkdayHR**.

5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.

6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.

7. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Connection Information	
Name	Name of the connection. For example, <i>Workday HR Connection</i> .
Connection URL	URL for the connection. For example, <i>https://<workday_host>/ccx/service/<tenant_name></i> , where <i><tenant_name></i> is your Workday tenant name.
Tenant name	Name of the Workday tenant.
API Version	Version of the Workday API to use for requests.
Credential Information	
Client ID	Client ID that you generated while creating a Workday OAuth credential. For more information, see Create Workday OAuth 2.0 credentials .
Client Secret	Client Secret that you retrieved while creating a Workday OAuth credential.

Field	Description
Authorization URL	URL used to authorize the OAuth connection. For example, <code>https://<auth-domain-name>.workday.com/<tenant>/authorize</code>
Token URL	URL used to generate the OAuth token. For example, <code>https://<domain-name>.workday.com/ccx/oauth2/<tenant>/token</code>
OAuth Redirect URL	<code>https://<instance_name>/oauth_redirect.do</code> , where the instance name is the name of your ServiceNow instance.

8. Select **Create and Get OAuth Token.**

You're redirected to the Workday login page.

9. Log in to the Workday portal using the Integration System User credentials that you registered while configuring permissions in Workday.

For more information, see [Configure permissions in Workday](#).

10. In the Authorize Workday dialog box, select **Allow to allow user permissions for Workday. The OAuth token is generated and you're redirected to your ServiceNow instance.**

11. Under the **FSE worker calculation tab, activate the worker categories covered by your contract by setting the value of **Active** to **true** and entering the FSE percentage.**

12. Optional: If worker categories are listed in your contract but not available in the FSE worker calculation tab, add a new worker category.

a. In the **FSE worker calculation** tab, select **New**.

b. On the form, fill in the fields.

Workday FSE worker calculation

Field	Description
Worker Category	The worker category listed in your contract.
FSE Percentage	The FSE percentage for the worker category that you added. Full Service Equivalent (FSE) is the method by which the subscriptions are calculated.
Integration profile	The Workday integration profile that you created.
Active	Option to make the worker category active.

c. Select **Submit**.

13. Define the mapping of the newly created worker category.

a. Select the **Worker category** tab and select **New**.

b. On the form, fill in the fields:

Workday worker category

Field	Description
Worker Type	The type of worker, either Employee or Contingent.
Employee/Contingent worker type	The type of Employee or Contingent worker.
Time Type	Indicates whether the worker is full-time or part-time.
Worker Category	The worker category that you created.
Integration profile	The Workday integration profile that you created.
Active	Option to make the mapping active.

c. Select **Submit.**

14. Activate the list of modules that are defined in your contract.

a. Select the **Modules** tab.

b. Open the module record.

c. Set the **Active** field to **True**.

d. Select **Save**.

15. Verify that there is at least one active record in all the tabs for your contract: FSE worker calculation, Worker category, and Modules, before publishing the connection.

16. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

17. After the connection is verified, select **Publish**.

18. In the Publish Confirmation dialog box, select **OK**.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Workplace from Facebook

Integrating your Software Asset Management application with the Workplace from Facebook application enables you to track your software subscriptions and reclaim unused licenses.

i Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Workplace from Facebook application	Authentication scopes
Download subscriptions	System admin	<ul style="list-style-type: none"> • Read group membership • Manage work profiles
Pull user activity	System admin	<ul style="list-style-type: none"> • Read group • Read group membership • Read group content • Read All messages • Read Knowledge Library content
Reclaim subscription	System admin	Provision User Accounts

Create a Workplace from Facebook integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Workplace from Facebook application.

Before you begin

To create a Workplace from Facebook integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: admin or sam_integrator

i Important: You must select the **Workplace from Facebook Spoke** spoke check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Workplace from Facebook integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration profile form

Field	Value
Display name	Name of the integration profile. For example, Workplace from Facebook integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to #Draft. ○ If you have already published the integration profile, this field is automatically set to #Published.
Profile type	Type of integration profile. This field is automatically set to Workplace from Facebook Subscription.

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Workplace From Facebook Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Calculate Activity Subflow section, verify that the **Subflow** field is set to **Workplace From Facebook Update User Activity**.

Note:

The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Activity* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- c. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Workplace From Facebook Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select Save.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_fb_wp_spoke.FB_Workplace_Alias**.

- 5.** Select the preview icon (🔍) next to the **Connection & Credential** field and select **Open Record** in the record preview to open the connection & credential aliases record.

- 6.** On the **Connection & Credential Aliases** form, select **FB_Workplace_Credentials** under the **Credential** column in the **Connections** list.

- 7.** On the **Workplace from Facebook Credentials** form, select **Install on your Workplace**.

You get redirected to the [Workplace sign-up/sign-in](#) #page.

- 8.** Log in to your #Workplace from Facebook account using your credentials.

The **Add ServiceNow Spoke to Workplace** pop-up window gets displayed.

- 9.** Select **Add to Workplace**.

- 10.** Select **Done**.

You are redirected back to your #ServiceNow #instance and the relevant fields are updated.

- 11.** On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

- 12.** After the connection is verified, select **Publish**.

13. In the Publish Confirmation dialog box, select **OK**.

Note:

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections and then republish the integration profile because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Activity* job gets deleted.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Zendesk

Integrating your Software Asset Management application with the Zendesk application enables you to track your software subscriptions and to reclaim unused licenses.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Zendesk application	Authentication scopes
Download subscriptions	Light Agent	None
Pull user activity	Light Agent	None
Reclaim subscription	admin	None

Create a Zendesk OAuth client

Create an OAuth client for authenticating Zendesk API requests.

Before you begin

Zendesk Role required: admin

Procedure

1. From a web browser, open [Zendesk](#).
2. Log in using your admin credentials.
3. On the left navigation menu of the Zendesk Agent Workspace, select the Admin icon (⚙️).
4. Go to the Admin Center from the Admin page and from the Admin menu, navigate to **Apps and Integrations > API**.
The Zendesk API page opens.
5. Select the **OAuth Clients** tab and then select **Add OAuth client**.
6. On the form, fill in the fields.

Create a new OAuth client form

Field	Description
Client name	Name of the OAuth client.
Description	Brief description of the OAuth client.
Company	Name of the company whose data the OAuth client grants access to through the Zendesk API. The company name is displayed during authentication of your Zendesk API requests. This field populates automatically based on the company that your Zendesk account is associated with. However, you can modify the company name as needed.
Logo	Logo that is displayed during authentication of your Zendesk API requests. Select the green square to locate and select the logo that you want to display.
Unique identifier	Unique identifier for the OAuth client. This field populates automatically based on the OAuth client name that you specified in the Client name field. However, you can modify the unique identifier as needed.

Field	Description
	<p>Note: The unique identifier is used only in the Zendesk code.</p>
Client kind	This field must be set to Confidential . Confidential authentication clients run on secure servers, where their credentials can be kept safe.
Redirect URLs	<p>URL of the OAuth provider that users are redirected to after authentication.</p> <p>Enter <code>https://instance.service-now.com/oauth_redirect.do</code>, where <code><instance></code> is the name of your ServiceNow instance.</p>

7. Select **Save**.

8. On the dialog box, select **OK**.
The dialog box closes and the form reloads.

9. Copy the value from the **Secret** field.
Save the Secret value in a secure location for later use.

Create a Zendesk integration profile

Create a Zendesk integration profile to track software subscriptions and optimize licensing for your Zendesk applications.

Before you begin

To create a Zendesk integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

i Important:

You must select the **Zendesk Spoke** check box for this integration while installing optional features on the [Application Manager](#) page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

If you're using Software Asset Workspace, the option to create the Zendesk integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.
2. On the form, fill in the fields.

Integration Profile form

Field	Description
Display Name	Name of the integration profile. For example, Zendesk Integration.
Status	Status of the integration profile.

Field	Description
	<ul style="list-style-type: none"> ○ If you have not published the integration profile, this field is automatically set to Draft. ○ If you have already published the integration profile, this field is automatically set to Published.
Profile Type	Type of integration profile. This field is automatically set to Zendesk Subscription .

3. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- a. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Zendesk Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- b. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Zendesk Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Save**.

Your ServiceNow instance creates a draft integration profile.

The **Connection & Credential** field appears and is automatically set to **sn_zendesk_spoke.Zendesk**.

5. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field and then selecting **Open Record** in the record preview.
6. On the Connection & Credential Aliases form, select the **Create New Connection & Credential** related link.
7. In the Create Connection and Credential dialog box, fill in the fields.

Create Connection dialog box

Field	Description
Connection Information	
Connection Name	Name of the Zendesk connection. This field populates automatically.
Connection URL	URL for the connection.

Field	Description
	Enter <code>https://<subdomain>.zendesk.com</code> , where <i><subdomain></i> is your organization subdomain.
Credential Information	
OAuth Client ID	Unique identifier for your Zendesk OAuth client. Enter the same unique identifier that you specified in Create a Zendesk OAuth client .
OAuth Client Secret	Secret that is assigned to your Zendesk OAuth client. Enter the same secret that you copied in Create a Zendesk OAuth client .
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the redirect URL that you specified in Create a Zendesk OAuth client .

8. Select **Create and Get OAuth Token.**

Note:

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

9. On the Zendesk OAuth authorization dialog box, select **Authorize.**

The OAuth access token becomes available for authorizing your Zendesk connection.

10. On the integration profile form, select **Validate Connection to verify the connection and credential details of this integration.**

Validating the connection verifies the Download Subscriptions APIs, but not the Reclaim Subscriptions APIs.

11. After the connection is verified, select **Publish.**

12. In the Publish Confirmation dialog box, select **OK.**

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Zoom

Integrating your Software Asset Management application with the Zoom service enables you to track your software subscriptions and to reclaim unused licenses.

With this integration, you can retrieve and analyze licensing information for the following Zoom applications:

- Zoom Regular account (not a Master / Master-sub account) for Meetings
- Zoom Regular account (not a Master / Master-sub account) for Webinar

For additional information about Zoom, see [Zoom Developer Documentation](#) .

 Important: Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Zoom application	Authentication scopes
Download subscriptions	View or edit user information (e.g. assigning licenses and groups to users): View	<ul style="list-style-type: none"> • user:read:list_users:admin • user:read:settings:admin
Pull user activity	View detailed usage reports for the account: View	<ul style="list-style-type: none"> • meeting:read:list_meetings:admin • webinar:read:list_webinars:admin
Reclaim subscription	View or edit user information (e.g. assigning licenses and groups to users): Edit	<ul style="list-style-type: none"> • user:update:settings:admin • user:update:user:admin • user:delete:user:admin

Create a Zoom application

Create an application in the Zoom App Marketplace.

Before you begin

Zoom Role required: Zoom for developers: Edit

Procedure

1. Navigate to [Zoom App Marketplace](#) and sign in to your account.
2. Select **Develop > Build App**.
3. In the **Select how the app is managed** section on the Basic Information page, select the **Admin-managed** option.
4. Select **Save**.
5. In the App Credentials section, obtain the Client ID and Client Secret. Copy and save these values in a secure location for later use.

Note:

Your Client ID and Client secret are sensitive. Don't share them.

6. Enter `https://instance.service-now.com/oauth_redirect.do` in the **OAuth Redirect URL** and **OAuth Allow Lists** fields, where *instance* is the name of your ServiceNow instance.
7. Select the **Scopes** tab on the left navigation menu.
8. Add the following scopes for enabling the integration to get a list of users, track meeting and webinar activity for users, and reclaim unused subscriptions.
 - user:read:list_users:admin
 - user:read:settings:admin
 - meeting:read:list_meetings:admin
 - webinar:read:list_webinars:admin
 - user:update:settings:admin
 - user:update:user:admin
 - user:delete:user:admin

Create a Zoom integration profile

Create an integration profile to track software subscriptions and optimize licensing for the Zoom service.

Before you begin

To create a Zoom integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#).

ServiceNow Role required: sam_integrator or admin

About this task

If you're using Software Asset Workspace, the option to create the Zoom integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

Integration Profile form

Field	Value
Display name	Name of the integration profile. For example, Zoom Integration
Client Id	Client ID for the OAuth 2.0 application created in the SaaS admin account in step 5 .
Redirect url	This value is automatically populated.
Client secret	Password related with the client ID created in the SaaS admin account in step 5 .
Profile type	Type of integration profile. This value is automatically set to <i>Zoom Subscription</i> .
Analyze user activity from	You can choose to start analyzing data from the current date or from up to 30 days in the past. Choosing a date in the past enables you to detect stale subscriptions without waiting in real time because you can see subscriptions that haven't been used recently. Because choosing a date in the past increases the amount of data that is analyzed, it could take several hours for you to be able to view the results.

3. In the Process configuration section, Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see [Minimal user permissions table](#).

- The **Download subscriptions** check box is selected by default and you can't clear it.
- The **Download Activity** check box is selected by default. If you clear it, the activity scheduled job *SAM - Refresh <displayname> Events* isn't created.

In the **Analyze user activity** field, you can also select the date and time starting from when you want to analyze the user activity. By default, you can analyze user activity up to 60 days prior to the current date and view events performed by individual users from the time you create this profile.

Note:

Software Asset Management pulls the events from the time that you start analyzing user activity irrespective of the profile creation date.

You can modify this value in the Last activity threshold field of your software reclamation rules. For more information, see [Review a software reclamation rule](#).

- The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Submit.**

Your ServiceNow instance creates a draft integration profile.

5. On the integration profile, select the **Get OAuth Token related link and follow the steps to get an OAuth token.****Note:**

For the role required to perform this step, refer to the [Minimal user permissions](#) table.

6. On the integration profile form, select **Validate Connection to verify the connection and credential details of this integration.**

Validating the connection verifies the Download Subscriptions and Calculate Activity APIs, but not the Reclaim Subscriptions APIs.

Note:

If you clear the **Download Activity** check box after the integration profile is validated and scheduled jobs are created, you must revalidate the connections because the following events occur:

- The **Status** field on the integration profile form changes to **Draft**.
- The **Validate connection** button shows up on the form.
- The current *SAM - Refresh <displayname> Events* job gets deleted.

Result

You can view events performed by individual users up to one year prior to the current date. For more information, see [Review a software reclamation rule](#). Software Asset Management pulls the events from the time that you start downloading user subscriptions irrespective of the profile creation date.

What to do next

After the integration connects, your ServiceNow instance automatically creates software models, reclamation rules, and software subscriptions that are refreshed daily.

If you want to set up multiple integration profiles with unique connections, create child aliases to manage different configurations and settings for each integration profile. For more information, see [Create a child alias to set up multiple integration profiles](#).

Review all automatically generated reclamation rules to reclaim user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software.

- For more information on creating software entitlements in the Software Asset Management Core UI, see [Create entitlements in Software Asset Management classic](#).
- For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#).
- For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

- For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#).
- For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrate with SSO providers

Integrate with a Single Sign-On (SSO) provider to view software usage for all connected SSO applications.

Download a list of all your applications, users, and groups. Track user login data for all connected applications and reclaim unused licenses. Leverage usage data to forecast future licensing needs and cut back on unused licenses at renewal.

Integrating with Microsoft Entra ID

You can integrate your ServiceNow instance with Microsoft Entra ID to view software usage for all connected SSO applications.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Microsoft Entra ID application	Authentication scopes
<ul style="list-style-type: none"> • Download users • Download groups • Download group memberships 	Application developer	<ul style="list-style-type: none"> • User.Read.All • GroupMember.Read.All • Application.Read.All
Download applications	Application developer	<ul style="list-style-type: none"> • User.Read.All • GroupMember.Read.All • Application.Read.All
<ul style="list-style-type: none"> • Connect applications • Update connected applications 	<ul style="list-style-type: none"> • Global reader/Reports reader/ Security/ Administrator/Security operator/Security reader • Application developer 	<ul style="list-style-type: none"> • AuditLog.Read.All • User.Read.All • GroupMember.Read.All • Application.Read.All
Reclaim subscriptions	User Administrator	User.ReadWrite.All

Create a Microsoft Entra ID application

Create an app in the Microsoft Entra ID portal to integrate with the ServiceNow AI Platform.

Before you begin

Microsoft Entra ID Role required: Refer to the [Minimal users permission](#) table.

Procedure

1. From the Azure portal, access Microsoft Entra ID.
2. Create a Microsoft Entra ID application.

See [Create a Microsoft Entra ID application](#)  for detailed instructions on registering and configuring an application.

 - a. In the **Redirect URI** field, enter `https://<instance-name>.service-now.com/oauth_redirect.do`, where `<instance-name>` is the name of your ServiceNow instance.
 - b. Record the application (client) ID and directory (tenant) ID to register the app as a third-party OAuth provider on your ServiceNow instance.
 - c. Create a client secret and save the correct value (not the Client secret ID) to register the app as a third-party OAuth provider on your ServiceNow instance.
 - d. Add permissions to access the Microsoft Graph API.

Permission	Type
AuditLog.Read.All	Delegated
User.Read.All	Delegated
User.ReadWrite.All	Delegated
GroupMember.Read.All	Delegated
Application.Read.All	Delegated

For more information, see [Add permissions to access web APIs](#) .

- e. Grant admin consent to your application.

For more information, see [Understanding API permissions and admin consent UI](#) .

Create a Microsoft Entra ID integration profile

Create a Microsoft Entra ID integration profile in your ServiceNow instance.

Before you begin

To create a Microsoft Entra ID integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

ServiceNow Role required: sam_integrator or admin

 Important:

You must select the **Microsoft Entra ID Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

Note:

Starting with version 7.0.0 of Software Asset Management - SaaS License Management and version 3.1.0 of the Microsoft Entra ID spoke, your ServiceNow instance creates a separate Entra ID connection for each Microsoft Entra ID integration profile that you create. Each connection runs independently of each other, enabling your instance to support multiple independent Microsoft Entra ID integration profiles.

If you're using Software Asset Workspace, the option to create the Microsoft Entra ID integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. In the **Display name** field, enter a name for the integration profile.

The remaining fields are automatically populated when you submit the form.

Note:

The SSO integration is created using a directory integration. The directory integration pulls SSO applications, users, and group data that are associated with your SSO integrations. For more information, see [Viewing SSO subscription information](#).

If you already have a Microsoft Entra ID directory integration, the SSO integration uses your existing directory integration. Otherwise, a Microsoft Entra ID directory integration is automatically created.

3. In the Process configuration section, view the required user roles or API permissions to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see [Minimal user permissions](#) table.

- The **Download applications, users, and groups** check box is selected by default and you can't clear it.
- The **Download Activity** check box is selected by default. If you clear it, the last activity for connected applications isn't pulled.
- The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Submit**.

The **Connection & Credential** field appears.

5. Select the **Create New Connection & Credential** related link.

Note:

If you have installed Software Asset Workspace, open the Connection and credential record and select the **Create New Connection & Credential** related link.

6. On the form, fill in the fields.

Create Connection and Credential form

Field	Value
Auth URL	https://login.microsoftonline.com/<directory-id>/oauth2/v2.0/authorize, where<directory-id> is the directory (tenant) ID from the Azure portal.
Token URL	https://login.microsoftonline.com/<directory-id>/oauth2/v2.0/token, where<directory-id> is the directory (tenant) ID from the Azure portal.
Revoke token URL	https://login.microsoftonline.com/<directory-id>/oauth2/v2.0/revoke, where<directory-id> is the directory (tenant) ID from the Azure portal.
OAuth Client ID	Application (client) ID for the application you created in the Azure portal.
OAuth Client Secret	Client secret for the application you created in the Azure portal.
OAuth Redirect URL	https://<instance-name>.service-now.com/oauth_redirect.do, where <instance-name> is the name of your ServiceNow instance. This value is automatically populated.

7. Select **Create and Get OAuth Token**.

You would get redirected to the Azure portal. For the role required to perform this step, refer to the [Minimal users permission](#) table.

8. In the pop-up window, sign in to your account with Microsoft Entra ID admin credentials.

9. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.

10. After the connection is verified, select **Publish**.

11. In the Publish Confirmation dialog box, select **OK**.

If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections because the following events occur:

- The **Validate connection** button shows up on the form.
- The last activity for users of the connected applications isn't pulled anymore. Scheduled jobs and directory jobs download a list of all your applications, users, and groups. For more information, see [Viewing SSO subscription information](#). View the status of your jobs in the Scheduled Job Results and Directory Job Results related lists of the integration profile. Software models are automatically created for applications with an **External Catalog ID** that matches an **Identifier** in the Subscription Product Definitions [samp_sw_subscription_product_definition] table.

Result

After you publish the integration profile and connect applications to the profile, you can view events performed by individual users up to 60 days prior to the current date. For more information, see [Review a software reclamation rule](#).

Connect SSO apps

Connect a Single Sign-On (SSO) app to view all users and groups with access to the app. Track user login data and reclaim unused licenses.

Before you begin

Role required: sam_integrator or admin

About this task

Note:

For Microsoft Entra ID, the **Assignment required** toggle button on the application configuration page controls the access of the application by users.

- If the **Assignment required** toggle button is set to **Yes**, you must assign this application to the Microsoft Entra ID users and related applications and services. After you assign the application, Microsoft Entra ID users, associated applications, and services can access it.
- If the **Assignment required** toggle button is set to **No**, all users can log in to the application. The associated applications and services can also obtain an access token to this service.

SaaS License Management offers direct integrations with select applications. Direct integrations provide the most robust usage data. For a list of available direct integrations, see [Integrate with SaaS applications](#). If you have a direct integration for an app, connecting the same app in an SSO integration creates duplicate subscription records in your ServiceNow instance. If you connect an SSO app and later decide to create a direct integration for that app, disconnect the app before creating a direct integration.

Note:

If you're using Software Asset Workspace, the option to navigate to the SSO application in the Core UI is inactive.

Procedure

1. Navigate to the application.

2. Select the application that you want to connect.

For Software Asset Workspace, select the **SSO Applications** tab.

3. If the **Software model** field is empty, add a software model for the app.

An app must have a software model before you can connect it. Software models are automatically created for apps with an **External Catalog ID** that matches an **Identifier** in the Subscription Product Definitions [samp_sw_subscription_product_definition] table. For all other apps, you can create a software model manually. For more information, see [Create software models in Software Asset Management classic](#).

4. Select a date for the **Analyze last activity from** field.

You can choose to start analyzing login data for individual users and applications from the current date or from up to 60 days in the past. The default value is 30 days. Choosing a past date enables you to detect stale subscriptions without waiting in real time because you can see subscriptions that haven't been used recently. Because choosing a date in the past increases the amount of data that is analyzed, it might take you longer to be able to view the results.

5. Select **Save**.

6. Select **Connect**.

Tip:

You can also connect multiple apps simultaneously from the **SSO Applications** list.

In the Core UI interface, select the apps using the check box on the side of the list. At the bottom of the list, select the **Actions on selected rows** drop-down menu and then select **Connect**. If some apps don't have a software model, the **Connect** action shows that not all apps are connected. For example, **Connect (1 of 4)** shows that only 1 of the four apps you selected are connected. Add software models to connect the remaining apps.

Result

After the SSO application connects, your ServiceNow instance automatically creates users, groups, subscriptions, and reclamation rules that are refreshed daily.

- If the **Assignment required** toggle button is set to **Yes** for an application in the Microsoft Entra ID portal, the subscription is created only for users assigned to that specific application.
- If the **Assignment required** toggle button is set to **No** for an application in the Microsoft Entra ID portal, the subscription is created for all Microsoft Entra ID users.

What to do next

Review all automatically generated reclamation rules to meet your specifications for reclaiming user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software. For more information on creating software entitlements in the Software Asset Management classic application, see [Create entitlements in Software Asset Management classic](#). For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#). For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance. For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#). For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Integrating with Okta

You can integrate your ServiceNow instance with Okta to view software usage for all connected SSO applications.

i Important:

Minimize security risks and protect information by granting access only to the necessary user or API permissions.

Minimal user permissions

Process	Required user role in the Okta application	Authentication scopes
Download users	Read-only administrator	okta.users.read
<ul style="list-style-type: none"> • Download groups • Download group memberships 	Read-only administrator	okta.groups.read
Download applications	Read-only administrator	<ul style="list-style-type: none"> • okta.apps.read • okta.logs.read
Connect applications	Read-only administrator	okta.logs.read
Update connected applications	Read-only administrator	<ul style="list-style-type: none"> • okta.apps.read • okta.logs.read
Reclaim subscriptions	Application administrator	okta.apps.manage

Create an Okta application

Create an Okta application that you can integrate with the ServiceNow AI Platform.

Before you begin

Okta Role required: Refer the [Minimal user permissions](#) table.

See [Administrator roles and permissions](#) for more details on Okta admin roles and [Scopes and supported endpoints](#) for more details on Okta OAuth scopes.

Procedure

1. From a web browser, log in to the [Okta administrator console](#).
2. Create an Okta application with OAuth 2.0 functionality.

See [Create an OAuth 2.0 app for Okta](#) for detailed instructions.

Keep the following points in mind when you're creating your Okta application:

- In the **Login redirect URI** and **Logout redirect URI** fields, enter `https://<instance-name>.service-now.com/oauth_redirect.do`, where *<instance-name>* is the name of your ServiceNow instance.
- Copy the values in the **Client ID** and **Client Secret** fields. Save them in a secure location for later use.
- Grant the following scopes to your Okta OAuth 2.0 application:

- okta.groups.read
- okta.apps.read
- okta.users.read
- okta.logs.read
- okta.apps.manage
- Select the **Refresh Token** check box under the **Client acting on behalf of a user** Grant type on the Okta portal.

Create an Okta integration profile

Create an Okta integration profile in your ServiceNow instance.

Before you begin

To create an Okta integration profile, request the Software Asset Management - SaaS License Management plugin (sn_sam_saas_int) from the [ServiceNow Store](#) .

ServiceNow Role required: sam_integrator or admin

Important:

You must select the **Okta Spoke** check box for this integration while installing optional features on the [Application Manager](#)  page. For more information about choosing the required SaaS applications, see [Request SaaS License Management](#).

About this task

Note:

Starting with version 7.0.0 of Software Asset Management - SaaS License Management and version 4.1.2 of the Okta spoke, your ServiceNow instance creates a separate Okta connection for each Okta integration profile that you create. Each connection runs independently of each other, which enables your instance to support multiple independent Okta integration profiles.

If you're using Software Asset Workspace, the option to create the Okta integration profile in Core UI is inactive.

Procedure

1. Navigate to the integration profile.

2. On the form, fill in the fields.

SSO Integration Profile form

Field	Description
Display name	Name of the integration profile. For example, Okta Integration.
Status	Status of the integration profile. <ul style="list-style-type: none"> ○ If you haven't published the integration profile, this field is automatically set to Draft. ○ If you've already published the integration profile, this field is automatically set to Published.

Field	Description
Directory integration	<p>A reference to the directory integration profile, which is used to pull the active directory users, groups, and group memberships of an organization.</p> <ul style="list-style-type: none"> ○ If a directory integration record for Okta exists, you can select the existing record. ○ If a directory integration record for Okta doesn't exist, a new record is created when you save or submit this form.
Profile type	<p>Type of the integration profile.</p> <p>This field is automatically set to Okta.</p>
Connection & Credential	<p>Reference to the connection and credential alias that is used in the directory and SSO integration.</p> <ul style="list-style-type: none"> ○ If a directory integration record exists and you select it in the directory integration field, this field is automatically set to the connection and credential alias of the directory integration record. ○ If a directory integration value doesn't exist, this field is automatically populated.
Create Okta subscriptions	<p>Option for creating a direct integration profile to view Okta subscriptions after this integration profile is published.</p> <p>Default value: False</p>

3. In the Process configuration section, view the required user roles or API permissions to minimize security risks and optimize SaaS licenses.

Note:

For more information about the required roles and scopes, see [Minimal user permissions](#) table.

- The **Download applications, users, and groups** check box is selected by default and you can't clear it.
- The **Download Activity** check box is selected by default. If you clear it, the last activity for connected applications isn't pulled.
- The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

4. Select **Submit**.

The **Connection & Credential** field is automatically set to **sn_okta_spoke.<okta_profile_name>_apps_users_groups_activity_and_reclaim**.

Note:

The automatically populated value in the **Connection & credential** field changes based on the selection in the **Download activity** and **Reclaim subscriptions** check boxes.

Automatically populated Connection & credential values based on the selection

Selection	Connection & credential value
Both Download activity and Reclaim subscriptions are selected.	sn_okta_spoke.<okta_profile_name>_apps_users_groups_ac
Only Download activity is selected.	sn_okta_spoke.<okta_profile_name>_apps_users_groups_ac
Only Reclaim subscriptions is selected.	sn_okta_spoke.<okta_profile_name>_apps_users_groups_ac
Both Download activity and Reclaim subscriptions aren't selected.	sn_okta_spoke.<okta_profile_name>_apps_users_groups_ac

5. Open the Create Connection and Credential dialog box.

6. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

Field	Description
Name	Name of the connection. For example, Okta Connection.
Connection URL	URL for the connection. Enter <code>https://<yourOktaDomain>.com</code> , where <code><yourOktaDomain></code> is your organization domain.
Authorization URL	URL of the OAuth authorization endpoint. Enter <code>https://<yourOktaDomain>.com/oauth2/v1/authorize</code> , where <code><yourOktaDomain></code> is your organization domain.
Token URL	URL of the OAuth endpoint that retrieves and refreshes access tokens. Enter <code>https://<yourOktaDomain>.com/oauth2/v1/token</code> , where <code><yourOktaDomain></code> is your organization domain.
Token Revocation URL	URL of the OAuth endpoint that revokes access tokens. Enter <code>https://<yourOktaDomain>.com/oauth2/v1/revoke</code> , where <code><yourOktaDomain></code> is your organization domain.
OAuth Client ID	Client ID that is assigned to your Okta application.
OAuth Client Secret	Client secret that is assigned to your Okta application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field is automatically set to <code>https://<instance-name>.service-now.com/oauth_redirect.do</code> , where <code><instance-name></code> is the name of your ServiceNow instance.

7. Select **Create and Get OAuth Token**.

Note:

You must sign in using the same credentials as the user with the required role. For the role required to perform this step, refer to the [Minimal user permissions](#) table.

8. On the integration profile form, select **Validate Connection** to verify the connection and credential details of this integration.
9. After the connection is verified, select **Publish**.
10. In the Publish Confirmation dialog box, select **OK**.
If you clear the **Download Activity** check box after the integration profile is published, you must revalidate the connections because the following events occur:
 - The **Validate connection** button shows up on the form.
 - The last activity for users of the connected applications isn't pulled anymore.

Result

Both scheduled jobs and directory jobs download a list of all applications, users, groups, and software subscriptions that are associated with your Okta application. View the status of your job in the **Scheduled Jobs Results** and **Directory Job Results** tabs of your integration profile. Software Asset Management automatically creates software models for applications with an external catalog ID that matches an **Identifier** in the Subscription Product Definitions [samp_sw_subscription_product-definition] table.

What to do next

If you've selected the **Create Okta subscriptions** check box and this integration profile is published, a direct integration profile for Okta gets created. You can navigate to the direct integration profile by selecting the **Direct integration profile** link in the information message.

After you've navigated to the direct integration profile, you can view Okta subscriptions by selecting the **Software Subscriptions** tab. For more information, see [Okta SSO direct integration profile](#).

Warning:

When your OAuth token expires, your Okta integration profile displays an error message indicating that you must get a new OAuth token. Select the link in the error message to get the new OAuth token.

Don't delete the OAuth 2.0 credential record that is associated with the connection record for your Okta integration profile. If you delete the OAuth 2.0 credential record, you won't be able to get a new OAuth token after your current OAuth token expires.

After you publish the integration profile and connect applications to the profile, you can view events performed by individual users up to 60 days prior to the current date. For more information, see [Review a software reclamation rule](#).

Okta SSO direct integration profile

Okta SSO direct integration profile helps you manage Okta user licenses by creating subscriptions for Okta users while setting up an Okta SSO integration.

OKTA SSO Direct Integration Profile

Field	Description
Display name	Name of the integration profile.
Status	Status of the integration profile. This field is automatically set to Published .
Profile type	Type of integration profile.

OKTA SSO Direct Integration Profile (continued)

Field	Description
	This field is automatically set to Okta Subscription .
Download Subscription Subflow	
Subflow	This field is automatically set to Okta Download Subscriptions .

Connect SSO applications

Connect an SSO application to monitor all the users and groups who have access to that application. While SSO integration provides a summary of application usage and activity, direct integration offers detailed insights into these metrics.

Before you begin

ServiceNow Role required: sam_integrator or admin

About this task

ServiceNow[®] SaaS License Management offers direct integrations with some applications. Direct integrations provide the most comprehensive usage data. For a list of available direct integrations, see [Integrate with SaaS applications](#).

If you have already created a direct integration for an application, then connecting the same application in an SSO integration creates duplicate subscription records in your ServiceNow instance. You should only use the direct integration. If you connect an application in an SSO integration, but you later want to create a direct integration for that application, then disconnect the application before creating the direct integration.

Procedure

1. Navigate to **All > SaaS License > SSO Applications**.
2. Select the application that you want to connect.
3. If the **Software model** field is empty, add a software model for the application.
Before you can connect an application, it must be associated with a software model. ServiceNow[®] Software Asset Management automatically creates software models for applications with an external catalog ID that matches an **Identifier** in the Subscription Product Definitions [samp_sw_subscription_product_definition] table. For all other applications, you can create a software model manually. For detailed instructions, see [Create software models in Software Asset Management classic](#).
4. Select the date that you want to analyze the last activity from in the **Analyze last activity from** field.

You can start analyzing login data for individual users and applications from the current date or from up to 60 days earlier. The default value is 30 days. If you select a date prior to the current date, it may take longer for results to appear due to the amount of data that you want to analyze.

After you submit a value in the **Analyze last activity from** field, the field becomes read only.

5. Select **Connect**.

Tip:

To connect multiple applications simultaneously, select the check box for each application that you want to connect in the SSO Applications list. Select the Actions on the selected row menu and then select **Connect**. If any applications aren't associated with a software model, the name of the **Connect** menu item is updated to indicate that only some of the applications are connected. For example, a **Connect (1 of 4)** menu item indicates that only 1 of the four apps that you selected are connected. Add software models to the remaining applications to proceed with the connections.

What to do next

After the SSO application connects, your ServiceNow instance automatically creates users, groups, subscriptions, and reclamation rules that are refreshed daily. If you delete a user, application, group, or group membership from the Okta Developer Console, the changes are reflected on your ServiceNow instance.

Review all automatically generated reclamation rules to confirm that they meet your specifications for reclaiming user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track used software against owned software. For more information on creating software entitlements in the Software Asset Management classic application, see [Create entitlements in Software Asset Management classic](#). For more information on creating software entitlements in the Software Asset Workspace, see [Create entitlements in workspace](#). For more information on creating software entitlements using the Software Asset Management Playbook, see [Create entitlements using the guided walk-through](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance. For more information on running reconciliation in the Software Asset Management classic application, see [Run software reconciliation in Software Asset Management classic](#). For more information on running reconciliation in the Software Asset Workspace, see [Run software reconciliation in the workspace](#).

Playbook for SaaS integrations

The SaaS playbook provides step-by-step guidance for integrating an SaaS application. It takes you in a phased way through each stage of the integration process, from initiation to completion.

The SaaS playbook includes multiple lanes that consist of:

- A list of tasks that you must perform within a lane
- Status indicators that display the current state of each task

Once you mark a task as complete, you move to the next task. You can save a task at any time and return to the playbook later.

Complete all the tasks in a lane to move to the next lane. As you keep completing tasks and lanes, the status gets reflected in the left-hand panel. Once you complete all the tasks, review the details you entered in all the lanes.

Related topics

[Interact with Playbook](#) 

Create a Salesforce CRM integration

Integrate your ServiceNow instance with the Salesforce customer relationship management (CRM) services to track your software subscriptions and to reclaim unused licenses by using the guided walk-through playbook.

Before you begin

Role required: Salesforce admin, sam_admin

- Create the Salesforce CRM integration only in the Global scope.

About this task

Note:

The **Client Credentials** grant type is supported in Software Asset Management - SaaS License Management (sn_sam_saas_int) 15.1.0, Salesforce CRM application 1.1.9, and Salesforce CRM Spoke 2.4.0 version onwards.

Procedure

1. From your ServiceNow instance, navigate to **Software Asset Workspace > Software asset analytics**.
2. Select **Create direct integration**.
3. In the list of supported integrations, select **Salesforce CRM**.
4. Register the Salesforce application through the Salesforce admin portal.
For more information, see [Register a Salesforce application](#).
 - a. Select **Register a Salesforce application** in the side pane.
 - b. Complete the tasks in the Salesforce application.
Select each check box as you complete each step.
 - c. Select **Mark Complete**.
5. Create an integration profile to track software subscriptions and optimize licensing.
 - a. Select **Profile details** in the left pane.
 - b. On the form, fill in the fields,

Profile Details

Field	Description
Display name	Name of the integration profile to identify uniquely the organization for which you're creating the profile.
Status	Status of the integration profile. If you have not published the integration profile, this field is automatically set to Draft . If you have already published the integration profile, this field is automatically set to Published .
Profile type	Type of integration profile. This value is automatically set to Salesforce CRM.

Field	Description
Download subscription subflow	The value must be set to Salesforce CRM Download Subscriptions .
Reclaim subscription subflow	The value must be set to Salesforce CRM Reclaim Subscription .

c. Save your data.

- To save your data without continuing the integration, select **Save**.
- To save your data and continue the integration, select **Mark Complete**.

6. Create a connection and credential in the ServiceNow Classic interface.

a. Select **Connection and credential** in the left pane.

b. Open the connection & credential aliases record by selecting the preview icon (i) next to the **Connection & Credential** field.

c. Select **Continue**.

d. Select the **Create New Connection & Credential** link.

e. On the form, fill in the fields.

Create Connection and Credential

Field	Description
Connection information	
Connection Name	Name of the connection to identify uniquely the Salesforce organization for which you're creating this connection and credential.
Connection URL (Instance URL)	URL that displays after logging in to Salesforce, which is the custom domain URL of Salesforce.
Credential information	
Grant type	The grant type for your application according to your authentication needs. Possible values are: <ul style="list-style-type: none"> ▪ Authorization Code ▪ Client Credentials
OAuth Client ID	Client ID (consumer key) assigned to your Salesforce application.
OAuth Client Secret	Client secret (consumer secret) assigned to your Salesforce application.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This is generally the URL of the ServiceNow instance that you specified while registering a Salesforce application in Step 4 .

f. Select **Create and Get OAuth Token**.

- g.** In the OAuth2 authentication dialog box, log in to the same Salesforce admin account that you used to create your Salesforce application.

If you have selected **Client Credentials** as the grant type, the OAuth2 dialog box doesn't appear.

Your ServiceNow instance creates an OAuth token for Salesforce.

- h.** Select **Mark Complete**.

The integration profile uses the Salesforce CRM Download Subscriptions and Salesforce CRM Reclaim Subscription subflows to retrieve user data from your Salesforce CRM services.

7. Optional: Create a child alias and an extra integration profile.

(Optional) The child alias uniquely identifies the connection and credentials for this additional integration profile.

The first Salesforce CRM integration profile that you create uses the default (parent) connection and credential alias for Salesforce. Each additional Salesforce CRM integration profile that you create requires a unique child alias that helps differentiate the connection and credentials between each integration profile.

i Note:

The application scope must be set to **Salesforce Spoke**.

- a.** Select **Connect to additional Salesforce org (Optional)** in the left pane.
- b.** Open the connection & credential aliases record by selecting the preview icon (🔍) next to the **Connection & Credential** field.
The display redirects to the ServiceNow Classic interface where you can configure the child alias.
- c.** In the **Child Aliases** tab, select **New**.
- d.** Enter a name for the child alias in the Connection and Credential Aliases form.
- e.** Select **Submit**.
After the form reloads, you can see the newly created child alias in the **Child Aliases** list.
- f.** Select the **Create New Connection & Credential** related link to create multiple connections. Follow the same steps as for creating the parent connection.
- g.** Select **Mark Complete** after you have completed the steps and select all the check boxes in the Playbook view.

8. Review the required fields before publishing the integration profile.

- a.** Select **Review and Publish** in the left pane.
- b.** Review the details of the integration profile.
- c. Optional:** In the Connection & Credential field, select the preview icon (🔍) to locate and select the child alias that you created in [Step 7](#).

Selecting the child alias associates the additional integration profile with the child alias. Your ServiceNow instance uses this alias to identify the connection and credentials for this integration profile.

- d. Review the required user roles or API permissions specified in the **Vendor configuration** field for each process to minimize security risks and optimize SaaS licenses.

Note:

For more information, see [Minimal user permissions](#) table.

- i. In the Download Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce CRM Download Subscriptions**.

Note:

The **Download subscriptions** check box is selected by default and you can't clear it.

- ii. In the Reclaim Subscription Subflow section, verify that the **Subflow** field is set to **Salesforce CRM Reclaim Subscription**.

Note:

The **Reclaim subscriptions** check box is selected by default. If you don't want to reclaim subscriptions, you can clear this check box. If you clear it, the removal candidates are created but the reclaim subscription subflow isn't triggered or the reclamation process isn't initiated.

- e. Select **Save**.

- f. Select **Validate Connection**.

9. Select **Publish** to publish the integration profile.

10. **Optional:** Verify whether the status of all scheduled job results is complete.

Result

After the integration is published successfully, you're redirected to the record page. You can view the details of the integration profile, associated software models, triggered scheduled jobs, scheduled job results, and unrecognized subscription identifier.

SaaS License Connections

Creating a custom integration helps you connect the Software Asset Management application with a SaaS application that doesn't have an existing integration in SaaS License Management.

The low-code framework uses ServiceNow[®] Integration Hub and ServiceNow[®] Flow Designer to connect with a SaaS provider's API endpoints. You can perform the following actions:

- Download a list of all users, view meaningful usage data, and optimize your SaaS spend by reclaiming unused subscriptions.
- Manage your custom SaaS connections along with the base system SaaS connections using Software Asset Management software models and reporting.

Custom integrations

Install Integration Hub Starter, Standard, Professional, or Enterprise to create a custom integration. For more information about Integration Hub, see [Request IntegrationHub](#) .

There's no charge to install Integration Hub plugins on a non-production instance. You can build a custom integration on a non-production instance that has Integration Hub installed, then bring it into your production environment using an update set. For more information about update sets, see [System update sets](#) . This way, you can validate your custom integrations before putting them in production and you're not charged for an Integration Hub subscription.

Important:

You can create custom integrations for subscription-based models using User Subscription as the license metric, and for consumption-based models using SaaS Consumption as the license metric.

Some SaaS applications have existing Integration Hub spokes that you can use to create your custom integration. If there's an existing spoke for the SaaS application that you're integrating with, skip the step to create a custom spoke. If you use an existing spoke, you can use some of its data stream actions. Find out what actions are included with the spoke before creating your own actions. For a list of applications that have Integration Hub spokes, see [IntegrationHub available spokes](#) .

Building a custom integration with SaaS License Connections requires you to track many different values. Use the [SaaS License Connections Worksheet](#)  while researching the SaaS API and building your data stream actions to make sure that you have all the information you need.

Create a custom spoke

To set up a custom integration in SaaS License Management, create a spoke to connect with a SaaS application.

Before you begin

Role required: admin

About this task

- Use ServiceNow[®] Studio to create a spoke. For more information about Studio, see [ServiceNow Studio](#) .
- If a spoke exists for the SaaS application that you're integrating with, you can use the existing spoke instead of creating one. For a list of applications that have ServiceNow[®] Integration Hub spokes, see [IntegrationHub available spokes](#) .

Procedure

1. Navigate to **All > System Applications > Studio**.
2. Select **Create Application**.
3. Give your app a name that includes the name of the SaaS application that you're integrating with and a description.
Keep the auto-filled value for the **Scope** field.
4. Select **Create**.
5. Add the following roles and then select **Continue**.
 - admin
 - sam_developer
 - delegated_developer
6. Select the Classic format, then select **Continue**.
7. Select **Done with tables**.

8. To close the session and create your app, select **X**.

Tip:

Refresh the page to view the spoke app that you created in the list of apps.

What to do next

As you continue building your custom integration, use the spoke to save the following items.

- Connection & Credential alias
- Data stream actions to get users and user activity
- Action to reclaim a user

If you're publishing your custom spoke application on the ServiceNow Store, also use the spoke to save your subflows.

Create a custom integration profile to track software subscriptions and optimize stale licenses for any SaaS application. For more information, see [Create a custom integration profile](#).

Create a custom integration profile

Create a custom integration profile to track software subscriptions and optimize stale licenses for any SaaS application.

Before you begin

Before you create a custom integration profile in your ServiceNow instance, set up a method of authentication in the SaaS application admin or developer account. For example, create an OAuth application or an API token.

- If you create an OAuth application, confirm that you enable the appropriate scopes. The app needs scopes to read users, read user activity, and to modify or delete users. These scopes enable the integration to get a list of users, get user activity, and reclaim unused subscriptions. Record the Client ID and Client secret for the OAuth application. You input these values in your ServiceNow instance.
- If you create an API token, record the value for the API token. You input this value in your ServiceNow instance.

Role required: sam_integrator or admin

About this task

If you're using Software Asset Workspace, the option to create the custom integration profile in the Core UI is inactive.

Procedure

1. Navigate to the custom integration profile.
2. On the form, fill in the fields.

Custom Integration Profile form

Field	Value
Display name	Name of the custom integration profile. For example, the name of the SaaS application that you're integrating with.

Field	Value
Connection & Credential	<p>a. Select the lookup icon ().</p> <p>b. Select New.</p> <p>c. On the Connection and Credential Aliases form, fill in the fields:</p> <ul style="list-style-type: none"> ▪ Name: Name of your choice. For example, <i>app_alias</i>, where <i>app</i> is the name of the SaaS application that you're integrating with. ▪ Application: Spoke for connecting with the SaaS application. This spoke can be an existing Integration Hub spoke or a new spoke that you created. You can change the application in the Developer section of the System Settings . ▪ Type: Connection and Credential. ▪ Connection Type: HTTP. ▪ Support Multiple Active Connections: Not selected. ▪ Default Retry Policy: Default HTTP Retry Policy. ▪ Configuration Template: If you're using the OAuth authorization code grant type, OAuth Authorization Code. If you're using an API token, Basic Auth with API Key. If you're using another authentication method, create a configuration template. For more information, see Create a configuration template  and Configure a template for OAuth JWT Bearer grant type . <p>d. Select Submit.</p>
Status	Status of the integration profile. The options are Draft and Published . This value is automatically populated.
Profile type	Custom Integration. This value is automatically populated.

3. Select Save.

4. Open the Connection & Credential alias record by selecting the preview icon () and then selecting **Open Record**.

5. Select the **Create New Connection & Credential** related link.

- If you're using the OAuth Authorization Code configuration template, fill in the fields.

Create Connection and Credential form

Field	Value
Connection URL	Base URL for the API.
Authorization URL	OAuth authorization code endpoint.
Token URL	OAuth endpoint to retrieve and refresh access tokens.
Token Revocation URL	OAuth endpoint to revoke access tokens.
OAuth Redirect URL	<code>https://instance.service-now.com/oauth_redirect.do</code> , where <i>instance</i> is the name of your ServiceNow instance.

Field	Value
Refresh Token Lifespan	8640000.
OAuth Client ID	Client ID that you created in the SaaS application admin or developer account.
OAuth Client Secret	Client secret that you created in the SaaS application admin or developer account.
OAuth Scopes	Scopes that you enabled for your OAuth application in the SaaS application admin or developer account.

- If you're using the Basic Auth with API Key configuration template, fill in the fields.

Create Connection and Credential form

Field	Value
Connection URL	URL for your SaaS account.
User Name	Email address of the admin user that created the API token in the SaaS application admin or developer account.
API Key	API token created in the SaaS application admin or developer account.

- If you're using a different method of authentication, the available fields are determined by the configuration template that you created.

6. Select Create and grant access for the integration.

Tip:

Log in to your SaaS application admin account in a new browser tab to verify that the integration connects to the correct account.

- If the connection is successful, a connection record is created in the Connections related list on the Connection & Credential Alias record.
- If the connection fails, you must delete the connection record, credential record, and application registry record that were created during the attempted connection.
 - To delete the connection record, navigate to **Connections & Credentials > Connections** and delete the record for the SaaS application.
 - To delete the credential record, navigate to **Connections & Credentials > Credentials** and delete the record for the SaaS application.
 - To delete the application registry record, navigate to **System OAuth > Application Registry** and delete the record for the SaaS application.
 - Return to the Connection & Credential Alias record for the SaaS application and select the **Create New Connection & Credential** related link to reattempt the connection.

What to do next

[Create a data stream action to get users](#) and view SaaS related analytics on [SaaS overview dashboard](#).

Reconciliation also runs on your subscriptions as a scheduled job or on-demand. You can view your reconciliation results in the [License Workbench](#) (Software Asset Management classic

application) or the [License usage view](#) (Software Asset Workspace). Use these results to determine your license compliance position and to remediate any non-compliance.

Create a data stream action to get users

Create a data stream action to get a list of user subscriptions from the SaaS application.

Before you begin

If you're using an existing ServiceNow® Integration Hub spoke, find out if it has a data stream action to get a list of users that you can use instead of creating one. For more information about data stream actions, see [Data Stream actions](#).

Role required: flow_designer or admin

Procedure

1. Navigate to **All > Flow Designer > Designer**.
2. Select **New**.
3. Select **Data Stream**.
4. On the form, fill in the fields.

Action Properties form

Field	Value
Name	Name of your choice. For example, Get Users.
Accessible From	All application scopes.
Category	Leave this field empty.
Protection	None.
Application	Spoke app to integrate with the SaaS application. This spoke app can be an existing Integration Hub spoke or a new spoke that you created.
In-Flow Annotation	Leave this field empty.
Description	Description of your choice.

5. Select **Submit**.
6. If the API that you're working with requires user authentication for requests, select **Inputs** in the Action Outline and add inputs for authentication.
Examples of common user authentication inputs are `admin user id` and `site name`. See the documentation for your chosen API to learn about the requirements for user authentication in your specific case. If the API requires an access token, a *Credential Value* variable is automatically created later. You don't need to add an access token as an input.

When you use your completed data stream action in a subflow, you define what values to pass as these inputs.

7. Select **Request** in the Action Outline.

8. On the form, fill in the fields.

Request form

Field	Value
How will you get data	Choose either REST Step or SOAP step . Your choice depends on the API for the SaaS application that you're integrating with.
Enable pagination	Selected.
Run a script before each request	Not selected.

9. Select **Pagination Setup step** in the Action Outline.

10. Define pagination variables based on the query parameters used by the SaaS API.

If you're using offset-based pagination, use the Limit/Offset pagination template to preload the pagination configuration.

Note:

The value of the reserved `getNex tPage` variable determines whether to request another page of results. As long as the `getNex tPage` variable is **true**, the action continues to send requests for the next page.

11. Write a `Pagination Variables` script to update the pagination variables.

The script runs on each request. If you're using a pagination template, adjust the preloaded script as needed.

The following image shows an example of the pagination setup step completion. This example is from the `Get Users` data stream action used in the `Webex Download Subscriptions` subflow.

Pagination Variables

Name	Initial Value	Next Value From	
getNextPage	false	Script	
startFrom	1	Script	
pageSize	10	Script	
total	20	Response Body	

Extract value using Expression

Pagination Variables Script

```

1 (function paginate(variables, pageResponse) {
2     //Change the limit above to configure results per page.
3
4
5     var startFrom = parseInt(variables.startFrom);
6     var pageSize = parseInt(variables.pageSize);
7
8     variables.startFrom = startFrom + pageSize;
9     variables.startFrom = variables.startFrom.toString();
10
11     variables.getNextPage = (parseInt(variables.startFrom) <= parseInt(variables.total));
12 })(variables, pageResponse);
    
```

Note:

Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.

12. Select SOAP step or REST step in the Action Outline to receive data.

- If you selected **SOAP step**, fill in the details.

SOAP step form

Field	Value
Connection Details	
Connection	Use Connection Alias.
Connection Alias	Connection alias that you created when you created the integration profile. If you have not yet created an integration profile, follow the steps to create a custom integration profile with a connection alias .
Endpoint	This value is automatically populated when you select the connection alias. This value is set to the Connection URL from the HTTPs Connection record linked to the alias.
Request Details	
Build Envelope	Manually.
SOAP Action	API request to get a list of all users. See the documentation for your chosen API to select the appropriate request.

Field	Value
SOAP Envelope	<p>XML request message to get a list of all users. See the documentation for your chosen API to learn how to write an XML request message. In general, the header should have your input variables for user authentication as well as the <i>Credential Value</i> variable as the access token. The body should include the request to get a list of all users and your variables from the pagination setup step.</p> <p>Note: For an example of a SOAP envelope, see the Get Users data stream action used in the Webex Download Subscriptions subflow.</p>

- If you selected **REST step**, fill in the details.

REST step form

Field	Value
Connection Details	
Connection	Use Connection Alias.
Connection Alias	Connection alias that you created when you created the integration profile. If you have not yet created an integration profile, follow the steps to create a custom integration profile with a connection alias .
Base URL	This value is automatically populated when you select the connection alias. It's set to the Connection URL from the HTTP(s) Connection record linked to the alias.
Request Details	
Build Request	Manually.
Resource Path	Path to the resource. This value gets appended to the Base URL. See the documentation for the API that you're working with to learn how to construct the resource path.
HTTP Method	GET.
Query Parameters	Add parameters for pagination. Set the values as the variables that you created in the pagination setup step.

The following image shows a completed example of the REST step. This example is from the Get Jira Users data stream action used in the Jira Download Subscriptions subflow.

REST step REST {REST}

Connection: Use Connection Alias ▼

Connection Alias: sn_jira_spoke.Jira ▼ + ⓘ f(x) ↻

Base URL: https://{your-jira-host-url-here}

Request Details ▼

Build Request: Manually ▼

Resource Path: /rest/api/2/user/search f(x) ↻

HTTP Method: GET ▼

Query Parameters

Name	Value
startAt	step ▶ Pagination Setup step ▶ startAt x
maxResults	step ▶ Pagination Setup step ▶ maxResults x

13. Select **Parsing** in the Action Outline.

14. On the form, fill in the fields.

Parsing form

Field	Value
How will you identify each record	JSON/XML Splitter
How will you parse each item into an object	Script Parser

15. Select **Splitter step** in the Action Outline.

16. On the form, fill in the fields.

Splitter step

Field	Value
Source Format	Select XML or JSON , depending on the format returned by the API response.
Item Path	Absolute path to a user element in the response message. See the documentation for the API that you're working with for information about the format of the response message. <ul style="list-style-type: none"> ○ Example XML item path: /message/body/user ○ Example JSON item path: \$.data.user

17. Select **Outputs** in the Action Outline.

18. Select **Create Output** and edit the variable as shown.

Action Output

Label	Name	Type	Required
targetObject	targetObject	Object	No

19. Add child items for *targetObject* based on the user child elements returned in the response message.
 For example, an XML response might look like this.

```
<message>
  <body>
    <user>
      <userID>12345</userID>
      <email>email@email.com</email>
      <firstName>Jane</firstName>
      <lastName>Doe</lastName>
      <lastLoginTime>08/13/2019 20:08:16</lastLoginTime>
      <active>TRUE</active>
    </user>
    <user>
      ...
    </user>
  </body>
</message>
```

For this response, add the child items as shown.

Child items for targetObject

Label	Name	Type	Required
userID	userID	String	No
email	email	String	No
firstName	firstName	String	No
lastName	lastName	String	No
lastLoginTime	lastLoginTime	String	No
active	active	True/False	No

20. Select **Script Parser step** in the Action Outline.
21. Create a *targetObject* output object for each user element in the response and then map each user child element to a *targetObject* child item.

The parser script is executed for each user element.

Note: These examples show the types of elements that are generally contained in a response to a get users request. Don't directly copy these scripts. Use element names from the documentation for the API that you're working with.

Example script that parses an XML response.

```
(function parse(inputs, outputs) {
  var xmlDoc = new XMLDocument(inputs.sourceItem, false);
```

```

    outputs.targetObject.userID =
xmlDoc.getNodeText('/user/userID');
    outputs.targetObject.email =
xmlDoc.getNodeText('/user/email');
    outputs.targetObject.firstName =
xmlDoc.getNodeText('/user/firstName');
    outputs.targetObject.lastName =
xmlDoc.getNodeText('/user/lastName');
    outputs.targetObject.lastLoginTime =
xmlDoc.getNodeText('/user/lastLoginTime');
    outputs.targetObject.active =
xmlDoc.getNodeText('/user/active');
  })(inputs, outputs)

```

Example script that parses a JSON response.

```

(function parse(inputs, outputs) {
  var record = JSON.parse(inputs.sourceItem);
  outputs.targetObject.userID = record.userID;
  outputs.targetObject.email = record.email;
  outputs.targetObject.firstName = record.firstName;
  outputs.targetObject.lastName = record.lastName;
  outputs.targetObject.lastLoginTime = record.lastLoginTime;
  outputs.targetObject.active = record.active;
})(inputs, outputs)

```

22. To test your data stream action, select **Test**.

- a. View the test results and system logs for details about any errors.
To view system logs, navigate to **System Logs > System Log > All**.
- b. If your data stream action has errors, make sure that you're using the correct endpoints and that the API requests and responses are structured as expected.

23. After verifying that the data stream action is working as expected, select **Publish**.

What to do next

[Create a subflow to get users.](#)

Create a subflow to get users

Create a subflow to add a list of users to the Software Subscription table.

Before you begin

This subflow requires a data stream action to get users. For more information, see [Create a data stream action to get users](#).

Role required: flow_designer or admin

About this task

Note:

For examples of subflows to get users, see the Jira Download Subscriptions and Webex Download Subscriptions subflows.

Procedure

1. Navigate to **All > Flow Designer > Designer**.
2. Select **New** and then select **Subflow**.
3. On the form, fill in the fields.

Subflow Properties form

Field	Value
Name	Name of your choice. For example, <code>Application Download Subscriptions</code> , where <code>Application</code> is the name of the SaaS application that you're integrating with.
Application	Software Asset Management - SaaS License Management
Accessible From	Select All application scopes .
Category	Leave this field empty.
Protection	Select None .
In-Flow Annotation	Leave this field empty.
Description	Description of your choice.
Run As	User who initiates session.

4. Select **Submit**.
5. Add an integration profile input.

Inputs

Label	Name	Type	Required
Integration profile	integration_profile	Reference.Integration Profile	Yes

6. In the Actions section, select the plus icon and then select **Action** to add a new action.
7. Select the spoke for the SaaS application that you want to integrate with from the list of installed spokes.

Note:

To add additional spokes to your list of installed spokes, request them on the [ServiceNow Store](#). For a complete list of available spokes, see [IntegrationHub available spokes](#). If there's no existing spoke for the SaaS application that you want to integrate with, you can [create a new spoke](#).

8. Select a data stream action to get users.
9. Define the values to pass for any user authentication inputs for the data stream action.

The data stream action might return users that you don't want to include in your list of user subscriptions. If you perform filtering to exclude some users, add an If flow logic as a child of the get users data stream action.

The amount of filtering required, if any, depends on the application you're integrating with. For example, if the user targetObject has an *active* property, you could add a condition to check that the value is **true** to confirm that the subflow doesn't download deactivated users. An example of filtering used by the Jira Download Subscriptions subflow is that the account type can't be **app** to help prevent the subflow from returning accounts that aren't actual users.

Add conditions to the If flow logic for any required filtering.

- If you're using an If flow logic to filter users, add the *Upsert user subscription using subscription identifier* action from the Software Asset Management spoke as a child of the flow logic.
- If you're not filtering users, add the *Upsert user subscription using subscription identifier* action as a child of the get users data stream action. This action adds the SaaS application user subscription to the Software Subscription table [samp_sw_subscription]. If the subscription is already in the table, the action updates the subscription record.

10. Fill in the inputs that are applicable to your integration.

Use values from the data panel to fill in the action inputs. Your ask to the SaaS API might not return data for all the inputs.

Upsert User Subscription action

Field	Value
External user id	User id or account id from the user targetObject. This is generally a numeric, non human-readable value. This value must be unique.
User principal name	Email address from the user targetObject. If an email address isn't available, use another value such as user name plus user id. This value should be human readable.
Integration profile	Integration profile input that you created for the subflow.
Last Activity	Date of most recent activity from the user targetObject. For example, the last login time.
External created	Account creation date from the user targetObject. This value helps create better reclamation candidates. A new user might not have any activity yet. If the record shows that the user account was created, a reclamation candidate isn't created for that user because it's a new account rather than an unused account.
Identifier	A unique identifier to identify the integration. Software models are automatically created for subscription with an identifier that matches an identifier in the Subscription Product Definitions [samp_sw_subscription_product_definition] table. If an identifier doesn't exist, configure an identifier. For more information, see Configure an identifier .

Field	Value
Additional attributes	This is used to update any other field on the Software Subscriptions [samp_sw_subscription] table that's not mentioned earlier.

11. To test your subflow, select **Test**.

- a. View the test results and system logs for details about any errors.
To view system logs, navigate to **System Logs > System Log > All**.

Note:

The data stream action to get users should retrieve multiple pages of users successfully. Don't write to the Software Subscriptions [samp_sw_subscription] table until you verify that the data stream action retrieves all users. To verify, you can make a subflow that consumes the data stream and log the results.

12. After verifying that the subflow is working as expected, select **Publish**.

Tip:

You can still edit the subflow after it's published.

Configure an identifier

Configure an identifier if it doesn't exist to identify an integration.

Before you begin

Role required: sam_admin

Procedure

- 1. Create a custom product when your product doesn't exist in the Software Product [samp_sw_product] table.

- a. Select **New**.
- b. On the form, fill in the fields.

Field	Description
Publisher	Publisher of the custom product.
Product	Name of the custom product.
Product type	Product type of the custom software product.
Product classification	Official UNSPSC classification.
Subscription software	Option indicating that your product is a subscription-based product.
Ignore installs	Option indicating that the product type is licensable. This check box is displayed only if you select Product type as Licensable and Subscription software is set to true.

Field	Description
Exclude from content service	Option that indicates that the product will be excluded from the content service. You must not select this check box.
Active	Option indicating that this product is used or not.

c. Select Submit.

2. Create a custom discovery map by creating a custom entitlement definition from the Discovery maps [samp_custom_sw_entitlement_definition] table.

a. Select New.

b. On the form, fill in the fields.

Field	Description
Product	Current software product name. Custom product that you created in step 1 .
Version condition	Condition qualifier for the Version field: <ul style="list-style-type: none"> ▪ starts with ▪ is ▪ is anything Default is is anything .
Version	Version of the software product. Required if version condition value is starts with or is.
Edition condition	Condition qualifier for the Edition field: <ul style="list-style-type: none"> ▪ starts with ▪ is ▪ is anything Default is is anything .
Edition	Platform of the software product to use when searching for the normalized discovery model.
Platform	Platform of the software product to use when searching for the normalized discovery model.
Language	Language of the software product to use when searching for the normalized

Field	Description
	discovery model, which is populated once it has been normalized or added manually.

c. Select **Submit**.

3. Create a custom subscription product definition by creating a custom entitlement definition from the Custom Subscription Product Definitions [samp_sw_custom_subscription_product_definition] table.

a. Select **New**.

b. On the form, fill in the fields.

Field	Description
Identifier	Subscription identifier that is related with the custom product.
Subscription integration	List of SaaS and SSO providers that is mapped to subscription products in the Subscription Product Definition [samp_sw_subscription_product_definition] table. For this scenario, select Custom Integration .
Entitlement definition	Custom discovery map that you created in step 2 .
Active	Check box indicating the identifier is used or not.

c. Select **Submit**.

Create a data stream action to get user activity

Create a data stream action to get user activity from a SaaS application.

Before you begin

If you're using an existing ServiceNow® Integration Hub spoke, find out if it has a data stream action to get user activity that you can use instead of creating one.

For more information about data stream actions, see [Data Stream actions](#).

Role required: flow_designer or admin

About this task

Monitor user activity to find software subscriptions that your company is paying for but are not being used. You can reclaim these unused subscriptions to reduce your company's software expenses.

Before creating the data stream action, decide how you want to define meaningful user activity. Meaningful activity can be a combination of user actions. Create a separate data stream action for each user activity metric. For example, the base system Webex Meetings integration defines meaningful activity as hosting a meeting. It uses one data stream action to get the dates of the

most recently hosted meetings for all users. If you also wanted the Webex Meetings integration to include logging in as meaningful activity, you would create a second data stream action to get the most recent login times for all users.

Your data stream action to get users may return a user activity metric such as last login time. In this case, you don't need to create a data stream action to get user activity or a subflow to get user activity unless you want to define additional user activity metrics. Make sure that your subflow to get users sets this user activity metric as the **Last activity** input in the **Upsert User Subscription** action.

Procedure

1. Navigate to **All > Flow Designer > Designer**.
2. Click **New** and then select **Data Stream**.
3. On the form, fill in the fields.

Action Properties form

Field	Value
Name	Name of your choice. For example, Get User Activity.
Accessible From	Select All application scopes .
Category	Leave this field empty.
Protection	Select None .
Application	Spoke app to integrate with the SaaS application. This spoke app can be an existing Integration Hub spoke or a new spoke that you created.
In-Flow Annotation	Leave this field empty.
Description	Description of your choice.

4. Click **Submit**.
5. In the Inputs section of the Action Outline, click **Create Input**.
6. Add a look back time input.

Inputs

Label	Name	Type	Mandatory
Look back time	look_back_time	Date/Time	Yes

7. If the API that you're working with requires user authentication for requests, add inputs for authentication. Examples of common user authentication inputs are admin user id and site name. See the documentation for your chosen API to learn about the requirements for user authentication in your specific case. If the API requires an access token, a *Credential Value* variable is automatically created later. You don't need to add an access token as an input.

When you use your completed data stream action in a subflow, you define what values to pass as these inputs.

8. Click **Request** in the Action Outline.

9. On the form, fill in the fields.

Request form

Field	Value
How will you get data	Choose either REST Step or SOAP step . Your choice depends on the API for the SaaS application that you're integrating with.
Enable pagination	Selected.
Run a script before each request	Not selected.

10. Click **Pagination Setup step** in the Action Outline.

11. Define pagination variables based on the query parameters used by the SaaS API.

If you're using offset-based pagination, use the Limit/Offset pagination template to preload the pagination configuration.

Note:

The value of the reserved `getNextPage` variable determines whether to request another page of results. As long as the `getNextPage` variable is **true**, the action continues to send requests for the next page.

12. Write a `Pagination Variables` script to update the pagination variables.

The script runs on each request. If you're using a pagination template, adjust the preloaded script as needed.

The following image shows a completed example of the pagination setup step. This example is from the `Get Users` data stream action used in the `Webex Download Subscriptions` subflow.

Pagination Variables

Name	Initial Value	Next Value From
getNextPage	false	Script
startFrom	1	Script
pageSize	10	Script
total	20	Response Body

Extract value using: XML Expression: /message/body/bodyContent/matchingRecords/total

Pagination Variables Script

```

1 (function paginate(variables, pageResponse) {
2     //Change the limit above to configure results per page.
3
4
5     var startFrom = parseInt(variables.startFrom);
6     var pageSize = parseInt(variables.pageSize);
7
8     variables.startFrom = startFrom + pageSize;
9     variables.startFrom = variables.startFrom.toString();
10
11     variables.getNextPage = (parseInt(variables.startFrom) <= parseInt(variables.total));
12 })(variables, pageResponse);
    
```

Note:

Pagination variables only support the string data type. To perform math operations, convert the value to an integer, perform any required operations, then convert it back to a string.

13. Click **SOAP step** or **REST step** in the Action Outline depending on the option that you selected for how you will get data.

14. If you selected **SOAP**, fill in the details.

SOAP step form

Field	Value
Connection Details	
Connection	Use Connection Alias.
Connection Alias	Connection alias that you created when you created the integration profile. If you have not yet created an integration profile, follow the steps to create a custom integration profile with a connection alias .
Endpoint	This value is automatically populated when you select the connection alias. It's set to the Connection URL from the HTTP(s) Connection record linked to the alias.
Request Details	
Build Envelope	Manually.
SOAP Action	API request to get a list of meaningful user activity. For example, the base system Webex Meetings integration defines meaningful user activity as hosting

Field	Value
	a meeting so that it uses the <code>ListSummaryMeeting</code> request to get a list of all meetings. See the documentation for your chosen API to select the appropriate request.
SOAP Envelope	XML request message to get a list of all users. See the documentation for your chosen API to learn how to write an XML request message. In general, the header should have your input variables for user authentication as well as the <i>Credential Value</i> variable as the access token. The body should include the request to get a list of meaningful user activities, a start date set as the Look back time input, and your variables from the pagination setup step. Note: For an example of a SOAP envelope, see the Get User Activity data stream action used in the Webex Update User Activity subflow.

15. If you selected **REST**, fill in the details.

REST step form

Field	Value
Connection Details	
Connection	Use Connection Alias.
Connection Alias	Connection alias that you created when you created the integration profile. If you have not yet created an integration profile, follow the steps to create a custom integration profile with a connection alias .
Base URL	This value is automatically populated when you select the connection alias. It's set to the Connection URL from the HTTP(s) Connection record linked to the alias.
Request Details	
Build Request	Manually.
Resource Path	Path to the resource. This value gets appended to the Base URL. See the documentation for the API that you're working with to learn how to construct the resource path.
HTTP Method	GET.
Query Parameters	Add parameters for pagination. Set the values as the variables that you created in the Pagination Setup step. Add another parameter for the start date so that the request returns results from the start date to the current date. Set the value as the Look back time input. Note: Make sure the Look back time input date/time variable is correctly formatted for the API that you're working with. If you need to reformat or convert to another data type such as a string, you can do this in the action preprocessing script step.

The following image shows a completed example of the REST step. This example is from the Get Audit Log data stream action used in the Jira Update User Activity subflow.

REST step REST {REST}

Connection Details ▼

Connection: Use Connection Alias ▼

Connection Alias: sn_jira_spoke.Jira [▼] [+] [🔍] [🔄]

Base URL: https://[your-jira-host-url-here]

Request Details ▼

Build Request: Manually ▼

Resource Path: /rest/api/2/auditing/record [🔍] [🔄]

HTTP Method: GET ▼

Query Parameters

Name	Value
offset	step ▶ Pagination Setup step ▶ offset x [🔍] [🗑️] [▼]
limit	step ▶ Pagination Setup step ▶ limit x [🔍] [🗑️] [▼]
from	action ▶ from x [🔍] [🗑️] [▼]

16. Click **Parsing** in the Action Outline.

17. On the form, fill in the fields.

Parsing form

Field	Value
How will you identify each record	JSON/XML Splitter
How will you parse each item into an object	Script Parser

18. Click **Splitter step** in the Action Outline.

19. On the form, fill in the fields.

Splitter step form

Field	Value
Source Format	Select XML or JSON depending on the format returned by the API response.
Item Path	Absolute path to a meaningful activity element in the response message. See the documentation for the API that you're working with for information about the format of the response message. <ul style="list-style-type: none"> ○ Example XML item path: /message/body/meeting ○ Example JSON item path: \$.data.meeting

20. Click **Outputs** in the Action Outline.

21. Click **Create Output** and edit the variable as shown.

Action Output

Label	Name	Type	Mandatory
targetObject	targetObject	Object	No

22. Add child items for *targetObject* to store the user email and the date of meaningful activity.

For example, an XML response might look like this.

```
<message>
  <body>
    <meeting>
      <meetingID>12345</meetingID>
      <startDate>08/13/2019 20:08:16</startDate>
      <hostEmail>email@email.com</hostEmail>
    </meeting>
    <meeting>
      ...
    </meeting>
  </body>
</message>
```

For this response, add the child items as shown.

Child items for targetObject

Label	Name	Type	Mandatory
email	email	String	No
last_activity	last_activity	String	No

23. In the Action Outline, click **Script Parser step**.

24. Create a *targetObject* output object for each meaningful activity element in the response and then map each the activity date and user email to the *targetObject* child items.

The parser script is executed for each user element.

Note:

These examples show the types of elements that could be contained in a response. Don't directly copy these scripts. Use element names from the documentation for the API that you're working with.

Example script that parses an XML response.

```
(function parse(inputs, outputs) {
  var xmlDoc = new XMLDocument(inputs.sourceItem, false);
  outputs.targetObject.email =
  xmlDoc.getNodeText('/meeting/hostEmail');
  outputs.targetObject.last_activity =
  xmlDoc.getNodeText('/meeting/startDate');
})(inputs, outputs)
```

Example script that parses a JSON response.

```
(function parse(inputs, outputs) {
  var record = JSON.parse(inputs.sourceItem);
```

```

outputs.targetObject.email = record.hostEmail;
outputs.targetObject.last_activity = record.startDate;
})(inputs, outputs)

```

25. To test your data stream action, click **Test**.

- a. View the test results and system logs for details about any errors.
To view system logs, navigate to **System Logs > System Log > All**.
- b. If your data stream action has errors, make sure that you're using the correct endpoints and that the API requests and responses are structured as expected.

26. After verifying that the data stream action is working as expected, click **Publish**.

Create a subflow to get user activity

Create a subflow to update the Software Subscription table with each user's most recent activity in the SaaS application.

Before you begin

This subflow requires a data stream action to get user activity. For more information, see [Create a data stream action to get user activity](#).

Role required: flow_designer or admin

About this task

Note:

For examples of subflows to get user activity, see the Jira Update User Activity and Webex Update User Activity subflows.

Procedure

1. Navigate to **All > Flow Designer > Designer**.
2. Click **New** and then select **Subflow**.
3. On the form, fill in the fields.

Subflow Properties form

Field	Value
Name	Name of your choice. For example, <i>Application</i> Update User Activity, where <i>Application</i> is the name of the SaaS application you're integrating with.
Application	Software Asset Management - SaaS License Management Note: If you save the subflow in the Software Asset Management - SaaS License Management application, it's included with your Software Asset Management subscription. If you save the subflow in any other application, you may be charged for ServiceNow® Integration Hub transactions. If you're publishing your custom spoke application on the ServiceNow Store, select your custom app instead.
Accessible From	All application scopes.
Category	Leave this field empty.

Field	Value
Protection	None.
In-Flow Annotation	Leave this field empty.
Description	Description of your choice.
Run As	User who initiates session.

4. Click **Submit**.

5. Add an integration profile input and a look back time input.

Inputs

Label	Name	Type	Mandatory
Integration profile	integration_profile	Reference.Integration Profile	Yes
Look back time	look_back_time	Date/Time	Yes

6. In the Actions section, click the plus icon and then click **Action** to add a new action.

7. Select the spoke for the SaaS application that you want to integrate with from the list of installed spokes.

Note:

To add additional spokes to your list of installed spokes, request them on the [ServiceNow Store](#). For a complete list of available spokes, see [IntegrationHub available spokes](#). If there's no existing spoke for the SaaS application that you want to integrate with, you can [create a new spoke](#).

8. Select a data stream action to get user activity.

9. Add the **Look back time** subflow input as the value to pass to the **Look back time** input for the data stream action.

10. Define the values to pass for any user authentication inputs for the data stream action.

11. Add the *Update User Activity If Later Using User* action from the Software Asset Management spoke as a child of the get user activity data stream action.

12. Use values from the Data panel to complete the action.

Update User Activity If Later action

Field	Value
Last activity	Date of most recent activity from the targetObject.
Integration profile	Integration profile input that you created for the subflow.
External user id	User id or account id from the user targetObject. This id is generally a numeric and non human-readable value. This value must be unique.
User principal name	Email address from the user targetObject. If an email address isn't available, use another value such as user name plus user id. This value should be human readable.

13. If you want to use more than one data stream action to get multiple types of user activity, repeat steps 6 through 12 to add each data stream action to the subflow.
14. Click **Test** to test your subflow.
 - a. View the test results and system logs for details about any errors. To view system logs, navigate to **System Logs > System Log > All**.
15. After verifying that the subflow is working as expected, click **Publish**.

 **Tip:**
You can still edit the subflow after it's published.

Create an action to remove a user

Create an action to deactivate or delete a user account in the SaaS application.

Before you begin

If you're using an existing ServiceNow® Integration Hub spoke, find out if it has an action to remove a user that you can use instead of creating one.

Role required: flow_designer or admin

About this task

This action is used to reclaim unused subscriptions to reduce your company's software expenses.

Procedure

1. Navigate to **All > Flow Designer > Designer**.
2. Click **New** and then select **Action**.
3. On the form, fill in the fields.

Action Properties form

Field	Value
Name	Name of your choice. For example, Remove User .
Accessible From	All application scopes .
Category	Leave this field empty.
Protection	None .
Application	Spoke app to integrate with the SaaS application. This can be an existing Integration Hub spoke or a new spoke that you created.
In-Flow Annotation	Leave this field empty.
Description	Description of your choice.

4. Click **Submit**.
5. In the Inputs section of the Action Outline, click **Create Input**.
6. Add a user ID input.

This is how the action gets the user ID of the user to delete.

Inputs

Label	Name	Type	Mandatory
User ID	userID	String	Yes

7. If the API that you're working with requires user authentication for requests, add inputs for authentication. Examples of common user authentication inputs are admin user id and site name. See the documentation for your chosen API to learn about the requirements for user authentication in your specific case. If the API requires an access token, a *Credential Value* variable is automatically created later so you don't need to add it as an input.

When you use your completed action in a subflow, you define what values to pass as these inputs.

8. Add a **SOAP step** or **REST step** to the action outline. Your choice will depend on the API for the SaaS application that you're integrating with.
9. If you selected **SOAP**, fill in the form as shown.

SOAP step form

Field	Value
Connection Details	
Connection	Use Connection Alias.
Connection Alias	Connection alias that you created when you created the integration profile. If you have not yet created an integration profile, follow the steps to create a custom integration profile with a connection alias .
Endpoint	This value is automatically populated when you select the connection alias. It's set to the Connection URL from the HTTP(s) Connection record linked to the alias.
Request Details	
Build Envelope	Manually.
SOAP Action	API request to delete or deactivate a user. See the documentation for your chosen API to select the appropriate request.
SOAP Envelope	XML request message to delete a user. See the documentation for your chosen API to learn how to write an XML request message. In general, the header should have your input variables for user authentication as well as the <i>Credential Value</i> variable as the access token. The body should include the request to delete a user and the user ID input. Note: For an example of a SOAP envelope, see the Remove User action used in the Webex Reclaim Subscription subflow.

10. If you selected **REST**, fill in the form as shown.

REST step form

Field	Value
Connection Details	
Connection	Use Connection Alias.
Connection Alias	Connection alias that you created when you created the integration profile. If you have not yet created an integration profile, follow the steps to create a custom integration profile with a connection alias .
Base URL	This value is automatically populated when you select the connection alias. It's set to the Connection URL from the HTTP(s) Connection record linked to the alias.
Request Details	
Build Request	Manually.
Resource Path	Path to the resource. This value gets appended to the Base URL. See the documentation for the API that you're working with to learn how to construct the resource path.
HTTP Method	DELETE.
Query Parameters	Add a parameter for user ID. Set the value as the user ID input.

11. Add a **Script step** to the Action Outline for error handling.

a. For **Required Runtime**, select **Instance**.

b. Create input variables.

Input Variables

Name	Value
response	Response Body output from the SOAP or REST step
status_code	Status Code output from the SOAP or REST step

c. Create output variables.

Output Variables

Label	Name	Type	Mandatory
status	status	Choice	Yes
error_message	error_message	String	Yes

d. In the **Script** field, write a script to assign values to the status and error message outputs.

- Use the **status_code** input to check if there is an error. Set the status output equal to **Error** if there is an error and **Success** if there is no error.
- In cases where there is an error, use the **response** input to get information about the kind of error. Set the **error message** output to a description of the error so that a user can understand what went wrong.

12. In the Action Outline, click **Outputs**.

13. Create output variables.

Output Variables

Label	Name	Type	Mandatory
Status	status	Choice	No
Error message	error_message	String	No

14. Assign values to the output variables.

Output Variables

Label	Value
Status	status output variable from the script step
Error message	error_message output variable from the script step

15. To test your action, click **Test**.

- View the test results and system logs for details about any errors.
To view system logs, navigate to **System Logs > System Log > All**.
- If your action has errors, make sure that you're using the correct endpoints and that the API request is structured as expected.

Note:

When testing, remember that this action deactivates a user. Test this action in a sub-production environment. If only a production environment is available, you can create fake users for testing.

16. After verifying that the action is working as expected, click **Publish**.

Create a subflow to reclaim a user

Create a subflow to reclaim a user subscription.

Before you begin

This subflow requires an action to remove a user. For more information, see [Create an action to remove a user](#).

Role required: flow_designer or admin

About this task

Note:

For examples of subflows to reclaim a user, see the Jira Reclaim Subscription and Webex Reclaim Subscription subflows.

Procedure

1. Navigate to **All > Flow Designer > Designer**.
2. Click **New** and then select **Subflow**.
3. On the form, fill in the fields.

Subflow Properties form

Field	Value
Name	Name of your choice. For example, <i>Application</i> Reclaim Subscription, where <i>Application</i> is the name of the SaaS application you are integrating with.
Application	Software Asset Management - SaaS License Management Integrations. i Note: If you save the subflow in the Software Asset Management - SaaS License Management Integrations application, it's included with your Software Asset Management subscription. If you save the subflow in any other application, you may be charged for ServiceNow® Integration Hub transactions. If you're publishing your custom spoke application on the ServiceNow Store, select your custom app instead.
Accessible From	All application scopes.
Category	Leave this field empty.
Protection	None.
In-Flow Annotation	Leave this field empty.
Description	Description of your choice.
Run As	User who initiates session.

4. Add an integration profile input and a user subscription input.

Inputs

Label	Name	Type	Mandatory
Integration profile	integration_profile	Reference.Integration Profile	Yes
User subscription	user_subscription	Reference.Software Subscription	Yes

5. Add an error message output and a status output.

Outputs

Label	Name	Type
Error message	error_message	String
Status	status	String

6. In the Actions section, click the plus icon and then click **Action** to add a new action.

7. In the list of installed spokes, select the spoke for the SaaS application that you're integrating with.

Note:

To add additional spokes to your list of installed spokes, request them on the [ServiceNow Store](#). For a complete list of available spokes, see [IntegrationHub available spokes](#). If there's no existing spoke for the SaaS application that you want to integrate with, you can [create a new spoke](#).

8. To remove a user, select an action.

a. Define the value to pass as the **User ID** input.

The value that you use depends on the API that you're working with, but it will generally be the **External user ID** or **User principal name** field from the **User subscription** input for this subflow.

b. Define the values to pass for any user authentication inputs for the action.

9. To check if the Remove User action returns an error, add an If flow logic.

10. Add a child flow logic to assign subflow outputs.

Assign Subflow Outputs

Name	Data
Error message	Error message output from the Remove User action
Status	failure

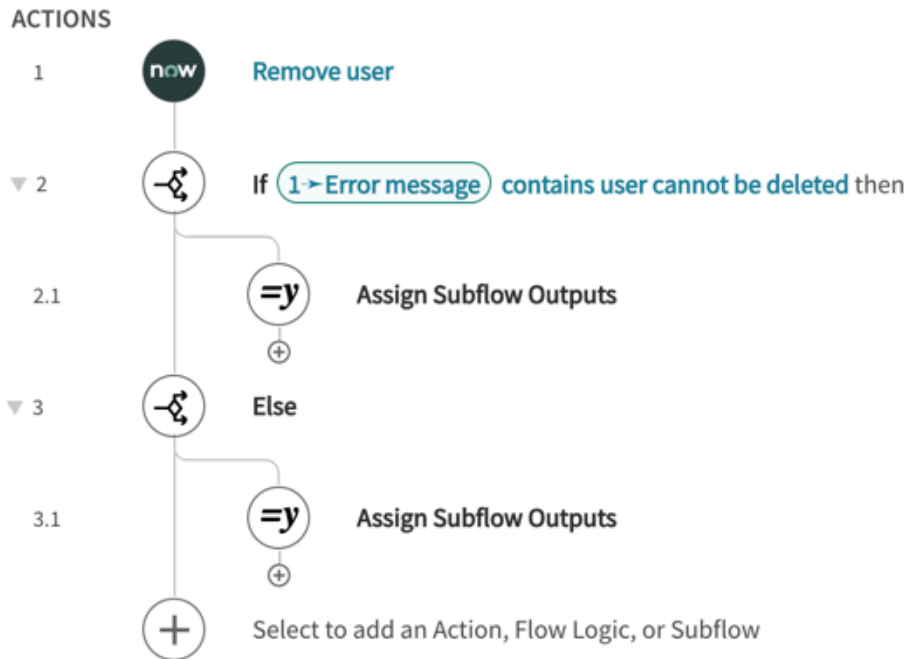

11. Add an Else flow logic at the same level as the If logic for cases when the Remove User action doesn't return an error.

12. Add a child flow logic to assign subflow outputs.

Assign Subflow Outputs

Name	Data
Status	success

The following image shows a completed example of a subflow to reclaim a user subscription. The example shown is the Webex Reclaim Subscription subflow.

13. To test your subflow, click **Test**.

- a. View the test results and system logs for details about any errors.
To view system logs, navigate to **System Logs > System Log > All**.

Note:

When testing, remember that this subflow deactivates a user. Test this subflow in a sub-production environment. If only a production environment is available, you can create fake users for testing.

14. After verifying that the subflow is working as expected, click **Publish**.

Tip:

You can still edit the subflow after it's published.

Create a subflow to get license consumption

Create a subflow to add license consumption data to the Subscription Consumption Summaries [sam_saas_consumption_summary] table.

Before you begin

This subflow is applicable to any integration that uses the SaaS license connection framework, including custom integrations.

Role required: flow_designer or admin

Procedure

1. Navigate to **All > Process Automation > Flow Designer**.
The Flow Designer launches in a new tab.
2. On the Flow Designer home page, click **New** and then select **Subflow**.
The Subflow Properties dialog box opens.

3. On the dialog box, fill in the following fields.

Subflow Properties dialog box

Field	Value
Subflow Name	Name of the subflow. For example, Download License Consumption.
Description	Description of the subflow.
Application	Application scope to which you want the subflow to apply. Set this field to Software Asset Management - SaaS License Management Integrations . Note: If you save the subflow in the Software Asset Management - SaaS License Management Integrations application scope, it's included with your Software Asset Management subscription. If you save the subflow in any other application scope, you may be charged for ServiceNow® Integration Hub transactions. If you're publishing your custom spoke application on the ServiceNow Store, select your custom application scope instead.
Accessible From	Application scope from which the subflow is accessible. Set this field to All application scopes .
Category	Subflow category. Leave this field empty.
Protection	Read-only protections for your subflow. Set this field to None .
Subflow Annotation	Message that appears under the subflow title in the subflow picker. Leave this field empty.
Run As	Option to specify whether the flow runs as a system user or user who initiates the session. Set this field to User who initiates session .
Run with role(s)	Roles with which this subflow runs.

4. Click **Submit**.

The Flow Designer creates the draft subflow and then redirects you to the subflow configuration page.

5. From the subflow configuration page, add an integration profile input.

- a. Under INPUTS & OUTPUTS, click the plus icon (+) to add an input for your subflow.
- b. In the Inputs section, click the plus icon (+).
- c. When prompted, enter the following information for your integration profile input.

Inputs

Label	Name	Type	Mandatory
Integration profile	integration_profile	Reference.Integration Profile	Yes

d. Click **Done**.

6. Add a data stream action for getting license consumption data.
 - a. Under **ACTIONS**, click the plus icon (+) and then select **Action** to add a new action.
 - b. When prompted, select the **Global** spoke from the list of **INSTALLED SPOKES**.
 - c. From the list of Default actions, select **Get <saas-application> Consumption**.
 - d. Click **Done**.
7. Add an Upsert Consumption action as a child of the Get <saas-application> Consumption action.
 The Upsert Consumption action uploads license consumption data to the Consumption Summary table on your ServiceNow instance.
 - a. Under the Get <saas-application> Consumption action, click the plus icon (+) and then select **Action**.
 - b. When prompted, select **Software Asset Management** from the list of **INSTALLED SPOKES**.
 - c. From the list of Default actions, select **Upsert Consumption**.
 The Upsert Consumption action inputs appear.
 - d. From the Product [Software Product] list, search for and select the software product that you are connecting to with your integration.
 This value must be a reference to the Software Product (samp_sw_product) table. If the product does not exist in the table, [add a custom software product](#).
 - e. Use values from the Data panel to fill in the remaining action inputs.
 Your request to the SaaS API may not return data for all inputs. Fill in the inputs that are applicable to your integration.

Upsert Consumption action inputs

Field	Value
Version	Version of the SaaS application.
Edition	Edition of the SaaS application, such as Standard or Enterprise .
Unit of consumption	Unit of measure for the software units that can be consumed.
Total units	Total number of software units that you have purchased across all active entitlements for the software product.
Units consumed	Total number of software units that your users have consumed.
Contract start	Start date of your contract.
Contract end	End date of your contract.

- f. Click **Done**.
8. Verify that your subflow is working properly by clicking **Test**.
 View the test results and system logs for details about any errors in your subflow. You can view system logs by navigating to **System Logs > System Log > All** in your ServiceNow instance.

9. After verifying that the subflow is working as expected, click **Publish**.

Tip:

You can still edit the subflow after it's published.

What to do next

View analytics such as subscription usage, cost, and compliance of your SaaS applications on [SaaS overview dashboard in workspace](#).

Publish a custom integration profile

Publish a custom integration profile to complete the custom integration.

Before you begin

Make sure that all actions and subflows are published in ServiceNow® Workflow Studio before adding them to the integration profile.

Role required: sam_integrator or admin

Procedure

1. Navigate to **All > SaaS License > Administration > All Integration Profiles** and select the custom integration profile that you created.
2. In the Download Subscription Subflow form section, select the Download Subscriptions subflow for the SaaS application.
3. Click **Publish**.
A software model is automatically created for the SaaS application. A scheduled job is created to immediately run the Download Subscription Subflow, which adds user subscriptions for the SaaS application to the Software Subscription table [samp_sw_subscription].
4. In the Calculate Activity Subflow form section, select the Update User Activity subflow for the SaaS application.

Note:

The scheduled job to get user subscriptions must finish before you can add the Update User Activity subflow.

5. Choose a value for the **Analyze user activity from** field.
You can choose to start analyzing data from the current date or from up to 60 days in the past. Choosing a date in the past enables you to detect stale subscriptions without waiting in real time because you can see subscriptions that haven't been used recently. Because choosing a date in the past increases the amount of data that is analyzed, it could take several hours for you to be able to view the results.

This value is passed as the **Look back time** input for the subflow to get user activity.

6. In the Reclaim Subscription Subflow form section, select the Reclaim Subscription subflow for the SaaS application.
7. Click **Save**.

What to do next

Reclamation rules and stale user reclamation candidates are created automatically after the integration is connected. User subscriptions and reclamation candidates are refreshed daily.

It's important that you review all automatically generated reclamation rules to ensure that they meet your specifications for reclaiming user subscriptions. For more information, see [Review a software reclamation rule](#).

Create software entitlements for the automatically generated software models to track software used against software owned. For more information, see [Create entitlements in Software Asset Management classic](#).

Create a store app for a custom integration

Publish your custom integration application on the ServiceNow Store to make it available for others to use.

Before you begin

Role required: admin

About this task

You must complete these steps so that your custom integration works correctly when other users download it from the ServiceNow Store.

Procedure

1. Create a fix script in your custom integration application.
 - When a new integration profile is created using your application, the subflows and connection alias you created are automatically linked to the profile through this fix script.
- a. Navigate to **System Applications > Studio**.
- b. Select your custom integration application.
- c. On the Welcome to Studio page, click **+ Create New**.
The Create Application File dialog box opens.
- d. On the dialog box, search for and select **Fix Script**.
- e. Click **Create**.
- f. On the Fix Script form, fill in the following fields.

Fix Script form

Field	Value
Name	Name of the fix script. For example, Custom Integration Fix Script.
Unloadable	Option to create Customer Update [sys_update_xml] records when the fix script runs. Do not select this option.
Application	Your custom integration application. This field is populated automatically.
Before	Option that enables you to run the fix script before installing or upgrading the application. Do not select this option.
Description	Description of the fix script.

- g. Enter the following script in the **Script** field.
For the subflows and connection alias, replace the example ids with the real ids. You can find the id in the URL for each item.

```
new
  global.CustomIntegrationProfileUtils().createCustomIntegrati
on({
  name: 'Name', // choose a name for the integration
  downloadSubscriptionSubflow:
    '3a23e189a1400010fa9bed1383c83d38', //replace example id
  updateActivitySubflow:
    '77a66d23e5500010fa9bc9581d0c0f47', //replace example id
  reclamationSubflow:
    'e62b672e39400010fa9b4845e477fe02', //replace example id
  connectionAlias:
    '629ad2bfdb1893005963ff041d961971' //replace example id
});
```

Note:

The update activity and reclamation subflows are not required. If you do not include a subflow to update activity, the integration does not get user activity unless your download subscription subflow includes user activity. If you do not include a reclamation subflow, the integration cannot deactivate SaaS user subscriptions.

h. Click Submit.

2. Create a cross scope privilege record.

This record allows the fix script you created to access the CustomIntegrationProfileUtils() script include.

a. Navigate to System Applications > Application Cross-Scope Access.

b. Click New.

c. On the form, fill in the fields.

Cross scope privilege

Field	Value
Source Scope	Your custom integration application. This field is populated automatically. To select a different application, click the Settings (⚙️) icon on the banner frame of your ServiceNow instance. On the System Settings dialog box, select the Developer tab and then choose an application from the Application drop-down list.
Target Scope	Application from which resources are being requested. Click the search (🔍) icon to locate and select the Global application.
Target Name	Name of the script include. Set this field to CustomIntegrationProfileUtils.
Target Type	Type of request. Select Script Include .
Application	Your custom integration application. This field is populated automatically.
Operation	Operation that the script performs on the target scope. Select Execute API .

Field	Value
Status	Authorization for this cross scope privilege record. Select Allowed .

d. Click **Submit**.

What to do next

Before you publish your custom integration application on the ServiceNow Store, make sure that your actions and subflows are active, published, and saved in your application.

Viewing your SaaS and SSO subscriptions

View a list of all subscriptions for your SaaS and Single Sign-On (SSO) applications.

i Important:

You can view your SaaS and SSO subscriptions in both the Software Asset Management Core UI and the Software Asset Workspace. This topic provides details on viewing your subscriptions in the Software Asset Management Core UI application. For more information on viewing your subscriptions in the Software Asset Workspace, see [SaaS overview dashboard in workspace](#).

To view subscriptions for all SaaS and SSO applications, navigate to **All > SaaS License > All User Subscriptions**.

Software Subscriptions list

Column	Description
Display name	The software publisher and product for the subscription.
User principle name	The user's email address for the subscription.
Software Model	The software model for the subscription.
Subscription profile	The direct integration profile for the subscription. This field is empty if the subscription is from an SSO integration.
Subscription type	Classifies the subscription as a software subscription or an SSO subscription.

i Note:

You can add the **Subscription assigned** column to view the date a user was given access to an app. For SSO subscriptions, this field is empty if the user has access to the app through a group membership.

You can also view all subscriptions for an application in the Software Subscriptions related list on the software model.

Viewing SSO subscription information

You can view information about the Single Sign-On (SSO) applications, SSO users, and SSO groups that are associated with your SSO integrations.

i Important:

You can view information about your SSO applications, users, and groups in both the Software Asset Management Core UI and Software Asset Workspace. The following sections provide details on viewing this information in the Software Asset Management classic application. For details on viewing this information in the Software Asset Workspace, see [License operations view](#).

Viewing SSO integration information

To view the applications, users, and groups for an SSO integration, navigate to **All > SaaS License > Administration > SSO Integration Profiles** and then select a profile. The related lists provide information about the integration.

SSO Integration Profile related lists

List	Description
SSO Applications	All SSO applications.
Directory Users	All SSO users.
Directory Groups	All SSO groups.
Scheduled Jobs	<p><i>SAM - SSO <sso-provider> download applications</i> scheduled job that downloads all SSO apps. The job runs when the SSO integration profile is published, and then runs daily.</p> <p>The <i>SAM - SSO <sso-provider> update connected applications</i> scheduled job downloads users, groups, and subscriptions for SSO apps. The job runs daily and whenever an app is connected.</p>
Scheduled Job Results	Status of the scheduled jobs.
Directory Jobs	<p>The <i><sso-provider> - Download Group Membership</i> directory job that downloads group memberships for all users. The job runs when the SSO integration profile is published, and then runs daily.</p> <p>The <i><sso-provider> - Download Users</i> directory job downloads all users. The job runs when the SSO integration profile is published, and then runs daily.</p> <p>The <i><sso-provider> - Download Groups</i> directory job downloads all groups for all users. The job runs when the SSO integration profile is published, and then runs daily.</p>

SSO Integration Profile related lists (continued)

List	Description
	<p>Note: On upgrading to Microsoft Entra ID spoke 4.3 version, the <i>Microsoft Azure AD - Download Group Membership</i> directory job won't be executed for existing Microsoft Entra ID SSO or Directory integrations. This directory job also won't be created for new Microsoft Entra ID SSO or Directory integrations. Instead, the <i>Microsoft Azure AD - Download Groups</i> directory job downloads all groups and group memberships configured on Microsoft Entra ID.</p>
Directory Job Results	Status of the directory jobs.

Viewing SSO application information

To view the users, groups, and reclamation candidates for an application, navigate to **All > SaaS License > SSO Applications** and select an application. The related lists show information for the application. For viewing the SSO application information in Software Asset Workspace, see [View SSO applications in workspace](#).

SSO Applications

List	Description
SSO Application Users	All users that have direct access to the application, but not through membership in a group.
SSO Application Groups	All groups that have access to the application.
SSO Subscriptions	Total number of subscriptions for the application. A user may have both direct access to an app and have access through a group. But the user's access counts as only one subscription so as only one record in the SSO Subscriptions list.

SSO Applications (continued)

List	Description
	<p>Note:</p> <ul style="list-style-type: none"> • Add the SSO application role column to see how the user is granted access to the application. If the value is a group, then the user has access through membership in that group. If the value is the user's name, then the user has direct access to the application. User subscriptions can't be reclaimed in Software Asset Management if the user has access to the application through a group membership. To reclaim the subscription, remove the user from the group in the Azure AD portal and set the reclamation candidate state to Closed Complete. • When SSO subscriptions are created through SSO application groups, the Subscription assigned value is empty. When the subscriptions are created through SSO Application Users, the Subscription assigned value shows the date of when the subscription is assigned to the user. After you upgrade to the Software Asset Management - SaaS License Management 13.1.0 version or later, the existing Subscription assigned values for the subscriptions that were created through SSO application groups turns empty.
Reclamation Candidates	Subscriptions that don't meet the usage requirements that are defined by the reclamation rule for the application.

Data synchronization with SSO providers

If you delete a user, group, or app in the Azure AD portal or in the Okta Developer Console, then the corresponding records in Software Asset Management are deleted when the daily scheduled jobs run. If you revoke a user's access to an application in the Azure AD portal or in the Okta Developer Console, either directly or indirectly by removing them from a group, then the corresponding user subscription record is deleted when the daily scheduled jobs run.

Review a software reclamation rule

Use reclamation rules to cancel user subscriptions that have limited to no activity.

Before you begin

Role required: sam_admin

About this task

When you create a direct integration profile or connect an SSO application, a reclamation rule is automatically created for the software. It's important that you review the reclamation rule to verify that it meets your specifications. For more information about the reclamation rules for each application, see [Reclamation rules](#) and [Reclamation rules for Microsoft 365 integration](#).

For SSO subscriptions, the reclamation rule checks for user logins.

Procedure

1. Navigate to **All > Software Asset > Administration > Reclamation Rules** and select the reclamation rule that corresponds to your integration profile.
2. On the form, review the fields.

Reclamation Rules form

Field	Description
Name	Name for the reclamation rule.
Applies to	Item type that the reclamation rule applies to.
Include usage from additional discovery sources	<p>This field appears only when you are reviewing the Microsoft 365 and Office 365 reclamation rules. For more information, see Reclamation rules for Microsoft 365 integration.</p> <p>When selected, the usage for Microsoft Access and Publisher is considered from additional discovery solutions such as Microsoft SCCM or ACC-V for E3 to E1 optimization.</p>
Notify user	Option for notifying users via email that their accounts will be reclaimed unless they respond with a request to keep the accounts. If a user wants to keep a license, it becomes the responsibility of the manager to approve or reject the removal of the license.
Days before auto-reclamation	<p>If no response is received from the user within the specified number of days, the account is reclaimed.</p> <p>Note: This field appears when Notify user is selected.</p>
Subscription Usage Condition	
Last activity threshold	Time limit for no meaningful activity before a user account is added to the list of reclamation candidates. The default value is 60 days for direct integrations and 30 days for SSO applications.

3. Select **Update**.

What to do next

View the reclamation candidates that are identified by your reclamation rule and start reclaiming user subscriptions.

[Reclamation rules for Microsoft 365 integration](#)

Reclaiming user subscriptions

You can reclaim unused SaaS and SSO subscriptions to reduce your total software costs.

The process of reclaiming a user subscription is similar to reclaiming a software license in ServiceNow® Software Asset Management. You can reclaim user subscriptions in both the Software Asset Management Core UI and the Software Asset Workspace.

When you’re reclaiming a user subscription, you can determine the status of the associated removal candidate using the following removal candidate states.

Removal candidate states

State	Description
Attention Required	<p>The removal candidate requires attention.</p> <p>The state is set to Attention Required when the User field is empty on an automatic removal candidate that has the Notify User option enabled. After the User field is populated, the state automatically changes to Ready.</p> <p>The state can also be set to Attention Required when a reclamation fails. After you resolve the error, the state automatically changes to Ready.</p>
Ready	<p>The removal candidate is ready for reclamation. Select Reclaim to advance the reclamation workflow.</p>
Awaiting User	<p>The user has been sent an email notification to approve or deny the removal request. This state is applicable only if the Notify User option is enabled on the removal candidate.</p>
Awaiting Approval	<p>The user must approve or deny the removal request. If the user wants to keep the subscription, the manager then becomes responsible for approving or declining the removal. This state is applicable only if the Notify User option is enabled on the removal candidate.</p>
Awaiting Revocation	<p>The removal candidate is awaiting reclamation.</p> <p>You can manually reclaim the user subscription in the removal candidate by selecting Close Complete. Alternatively, you can reclaim the user subscription through</p>

Removal candidate states (continued)

State	Description
	<p>the SAM – Updating Existing Reclamation Candidates weekly scheduled job. When the scheduled job runs, removal candidates that are in the Awaiting Revocation state and have an empty User subscription field are automatically updated to the Closed Complete state.</p> <p>If the User subscription field is empty for a removal candidate that is in any other state, the reclamation workflow is canceled and the state automatically changes to Closed Skipped.</p> <p>The state of a removal candidate with restricted software is automatically set to Awaiting Revocation. The justification is set to Restricted Software.</p>
Closed Complete	The user subscription has been reclaimed.
Closed Skipped	The user subscription hasn't been reclaimed by the removal candidate.
Closed Canceled	The user subscription hasn't been reclaimed by the removal candidate because user activity is detected.

Warning:

Make sure that users don't lose access to their files when their account is reclaimed. Users can't stop their account from being reclaimed unless the **Notify user** check box is selected on the reclamation rule.

- Reclaiming an Adobe Cloud subscription removes the user's access to the application and the files that they have created.
- Reclaiming an Adobe Workfront account removes the user's access to your Workfront application. The user is no longer allowed to sign in.
- Reclaiming an Aha! account deactivates the account so that you can't log in to the Aha! portal.
- Reclaiming an Asana account deletes the user account. The user can no longer access the Asana projects or workspaces. Content that was created by the user remains accessible to other users and the Admin can reassign the tasks from the Asana dashboard.
- Reclaiming a Box account deletes the account. All the files are moved into a folder in the Box admin account that authenticated the integration.
- Reclaiming a Calendly account removes the account from your organization.
- Reclaiming a Cisco Webex subscription removes the user's access to the specific product. The user can still access all other Cisco Webex products and the free licenses assigned.
- Reclaiming a Confluence Cloud account removes the user from all associated Confluence groups. Although the user can no longer access the Confluence site, all content that was created by the user remains accessible to other users.
- Reclaiming a Dropbox account deletes the account. All the files are moved into a folder in the Dropbox admin account that authenticated the integration. The name of the created folder is the deleted user's email address.
- Reclaiming a Docusign account deletes the account. The Docusign admin can access the user's files through the Docusign admin portal.
- Reclaiming a Google Workspace account deletes the account. All the files are moved from the Google Drive into a folder in the Google Workspace admin account that authenticated the integration. The name of the created folder is the deleted user's email address. All email messages are deleted when the account is reclaimed. To transfer email messages, use the Google data migration service before reclaiming the account.

- Reclaiming a GitHub Enterprise Server account suspends the account. All issues, comments, repositories, gists, and other data that the user created is preserved.

Reclaiming a GitHub Enterprise Cloud account removes the account from all enterprise organizations. If you restore a user membership within three months of reclamation, the user's access to the private forks of your organization repositories is restored.

- Reclaiming a product license from a GoTo user account removes the user's access to that product. Without a license, users can't sign in to the product. If you reclaim all product licenses from a user account, the account is automatically suspended. Suspended users remain on the account but can't sign in to any products.
- Reclaiming a Jira account removes the user from all the associated Jira groups. Although the user can no longer access the Jira site, all content that was created by the user remains accessible to other users.
- Reclaiming a Looker account removes the user's access to Looker. Without an active account, the user can't sign in to the Looker portal. The user's usage history and personal content is retained.

Reclaim user subscriptions in Software Asset Management classic

Reclaim unused SaaS and SSO subscriptions in the Software Asset Management classic application.

Before you begin

Role required: sam_user

i Important:

The SaaS License Management SurveyMonkey integration does not support reclamation through the ServiceNow AI Platform. To reclaim a SurveyMonkey user subscription, you must reassign or delete the user from your SurveyMonkey team directly using the SurveyMonkey admin portal. After the user is removed from your team, you must update the state of the corresponding removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table. See [Reclaim SurveyMonkey user subscriptions in Software Asset Management classic](#) for detailed instructions.

i Important:

The SaaS License Management monday.com integration does not support reclamation through the ServiceNow AI Platform. To reclaim a monday.com user subscription, you must deactivate the user on your monday.com account. After the user is deactivated, you must update the state of the corresponding removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table. See [Reclaim monday.com user subscriptions in Software Asset Management classic](#) for detailed instructions.

i Important:

The SaaS License Management Roadmunk integration does not support reclamation through the ServiceNow AI Platform. To reclaim a Roadmunk user subscription, you must deactivate the user on your Roadmunk account. After the user is deactivated, you must update the state of the corresponding removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table. See [Reclaim Roadmunk user subscriptions in Software Asset Management classic](#) for detailed instructions.

Procedure

1. Navigate to **All > Software Asset > Removal Candidates > Reclamation Candidates**.
2. To reclaim a user subscription that was not automatically identified by a software reclamation rule, create a software removal candidate.
See [Add a software removal candidate in Software Asset Management classic](#) for detailed instructions on how to create a software removal candidate in the Software Asset Management classic application.
3. Reclaim user subscriptions.
 - To reclaim all user subscriptions, click **Reclaim All**.

i Note:

Use caution when reclaiming all user subscriptions. Some users may still need their subscriptions even if they have no activity.

- To reclaim a set of user subscriptions, specify your Search filter criteria and then click **Reclaim All**. For example, you can reclaim all user subscriptions for Adobe InDesign by selecting **Product** from the Search list and then entering *InDesign.
- To reclaim an individual user subscription, select a removal candidate and then click **Reclaim** on the Removal Candidate form.

Result

After you reclaim a user subscription, the subscription record is deleted from the Software Subscriptions [samp_sw_subscription] table. The reclamation candidate state is set to **Closed Complete**. If the reclamation fails, the state is set to **Attention Required**. An error message is displayed at the top of the screen with additional details on how to resolve the error.

Reclaim SurveyMonkey user subscriptions in Software Asset Management classic

Reclaim unused SurveyMonkey subscriptions to reduce your total software costs.

Before you begin

SurveyMonkey Role required: admin

ServiceNow Role required: sam_user

About this task

The SaaS License Management SurveyMonkey integration does not support reclamation through the ServiceNow AI Platform. When Software Asset Management creates a removal candidate for your SurveyMonkey integration, you can reclaim the user subscription by removing the associated user directly from your SurveyMonkey team. After you remove the user from your team, you must update the state of the removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table.

Procedure

1. Identify removal candidates for your SurveyMonkey integration.
 - a. From your ServiceNow instance, navigate to **Software Asset > SaaS License > Direct Integration Profiles**.
 - b. Select your SurveyMonkey integration profile from the Integration Profiles list.
 - c. On the **Software Models** tab of the Integration Profile form, select the software model that is associated with the integration profile.
 - d. On the Software Model form, select the **Reclamation Candidates** related tab to view the list of available removal candidates.
 - e. Take note of the user principal name for each removal candidate that you want to reclaim the user subscription for.
Save this information for later use.
2. Remove the associated users from your SurveyMonkey team.
Based on the list of removal candidates that you identified in [step 1](#), you can reclaim user subscriptions by reassigning or deleting the associated users from your SurveyMonkey team.

- a. From a web browser, open [SurveyMonkey](#) .
 - b. Log in using your admin credentials.
 - c. On the left navigation menu, select **Manage Users**.
The Manage Users page opens, where you can view the complete list of users in your SurveyMonkey team.
 - d. Click the ellipsis icon (...) for the user that you want to remove from your team.
You can identify which user you want to remove based on the associated username. The username corresponds directly to the user principal name of each removal candidate that you identified in [step 1](#).
 - e. When prompted, select either **Reassign Account** or **Delete Account**.
Select **Reassign Account** to move the user to another SurveyMonkey team. Select **Delete Account** to deactivate the user completely.
 - f. Repeat steps d and e for each user that you want to remove.
3. Return to your ServiceNow instance to update the state of each removal candidate to **Closed Skipped**.
- a. From your ServiceNow instance, navigate to **SaaS License > Administration > Direct Integration Profiles**.
 - b. Select your SurveyMonkey integration profile from the Integration Profiles list.
 - c. On the **Software Models** tab of the Integration Profile form, select the software model that is associated with the integration profile.
 - d. On the Software Model form, select the **Reclamation Candidates** related tab.
 - e. From the list of available removal candidates, select the removal candidate number (RCCxxxxxx) for a user that you removed from your SurveyMonkey team in [step 2](#).
 - f. On the Removal Candidate form, update the state of the removal candidate by clicking **Closed Skipped**.
Software Asset Management removes the user subscription from the Software Subscriptions [samp_sw_subscription] table and automatically returns you to the Software Model form.
 - g. Repeat steps d through f for each user that you removed from your SurveyMonkey team.

Reclaim monday.com user subscriptions in Software Asset Management classic

Reclaim unused monday.com subscriptions to reduce your total software costs.

Before you begin

monday.com Role required: admin

ServiceNow Role required: sam_user

About this task

The SaaS License Management monday.com integration doesn't support reclamation through the ServiceNow AI Platform. When Software Asset Management creates a removal candidate for your monday.com integration, you can reclaim the user subscription by deactivating the associated user on your monday.com account. After you deactivate the user, you must update the state of the removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table.

Procedure

1. Identify removal candidates for your monday.com integration.
 - a. From your ServiceNow instance, navigate to **All > Software Asset > SaaS License > Direct Integration Profiles**.
 - b. Select your monday.com integration profile from the Integration Profiles list.
 - c. On the **Software Models** tab of the Integration Profile form, select the software model that is associated with the integration profile.
 - d. On the Software Model form, select the **Reclamation Candidates** related tab to view the list of available removal candidates.
 - e. Take note of the user principal name for each removal candidate that you want to reclaim the user subscription for.
Save this information for later use.
2. Deactivate the associated users on your monday.com account.

Based on the list of removal candidates that you identified in [step 1](#), you can reclaim user subscriptions by deactivating the associated users on your monday.com account.

 - a. From a web browser, go to monday.com .
 - b. Log in using your admin credentials.
 - c. At the bottom of the left navigation menu, select your profile icon and then select **Admin**.
The Admin section opens.
 - d. In the Admin section, select **Users**.
The **Users** tab of the Users subsection opens. This tab displays the complete list of users on your monday.com account.
 - e. From the list of users, select the ellipsis icon (...) for the user that you want to deactivate.
You can identify which user you want to deactivate based on the associated user name or email address. The user name or email address corresponds directly to the user principal name of each removal candidate that you identified in [step 1](#).
 - f. When prompted, select **Deactivate user**.
 - g. Repeat steps e and f for each user that you want to deactivate.
3. Return to your ServiceNow instance to update the state of each removal candidate to **Closed Skipped**.

- a. From your ServiceNow instance, navigate to **SaaS License > Administration > Direct Integration Profiles**.
 - b. Select your monday.com integration profile from the Integration Profiles list.
 - c. On the **Software Models** tab of the Integration Profile form, select the software model that is associated with the integration profile.
 - d. On the Software Model form, select the **Reclamation Candidates** related tab.
 - e. From the list of available removal candidates, select the removal candidate number (RCCxxxxxx) for a user that you deactivated in [step 2](#).
 - f. On the Removal Candidate form, update the state of the removal candidate by selecting **Closed Skipped**.
 - g. Close the **Removal Candidate** tab.
4. Verify the user deletion from the monday.com portal.
 - a. Run the *Refresh Monday.com subscriptions* scheduled job.
 - b. Verify the user deletion in the Software Subscriptions [samp_sw_subscription] table.

Reclaim Roadmunk user subscriptions in Software Asset Management classic

Reclaim unused Roadmunk subscriptions to reduce your total software costs.

Before you begin

Roadmunk Role required: Account Admin

ServiceNow Role required: sam_user

About this task

The SaaS License Management Roadmunk integration does not support reclamation through the ServiceNow AI Platform. When Software Asset Management creates a removal candidate for your Roadmunk integration, you can reclaim the user subscription by deactivating the associated user on your Roadmunk account. After you deactivate the user, you must update the state of the removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table.

Procedure

1. Identify removal candidates for your Roadmunk integration.
 - a. From your ServiceNow instance, navigate to **All > Software Asset > SaaS License > Direct Integration Profiles**.
 - b. Select your Roadmunk integration profile from the Integration Profiles list.
 - c. On the **Software Models** tab of the Integration Profile form, select the software model that is associated with the integration profile.
 - d. On the Software Model form, select the **Reclamation Candidates** related tab to view the list of available removal candidates.
 - e. Take note of the user principal name for each removal candidate that you want to reclaim the user subscription for.
Save this information for later use.
2. Deactivate the associated users on your Roadmunk account.

Based on the list of removal candidates that you identified in [step 1](#), you can reclaim user subscriptions by deactivating the associated users on your Roadmunk account.

- a. From a web browser, open [Roadmunk](#) .
- b. Log in using your Account Admin credentials.
The Roadmunk dashboard opens.
- c. On the left navigation menu of the Roadmunk dashboard, click your profile icon and then select **Account Settings**.
Your account settings open.
- d. On the page header of your account settings, select the **Users** tab.
This tab displays the complete lists of users on your Roadmunk account, including collaborators, reviewers, and inactive users.
- e. Click the **Active** toggle button for every user that you want to deactivate.
You can determine which users you want to deactivate based on the email address that is associated with each user. The email address corresponds directly to the user principal name of each removal candidate that you identified in [step 1](#).
- f. Click **Save**.

The users are deactivated and added to the list of inactive users.

 **Note:**

By default, the Roadmunk Download Subscriptions subflow within the ServiceNow SaaS License Management Roadmunk integration downloads all users in your Roadmunk account, including both active and inactive users. To download only the active users in your account, you must download your Roadmunk User Report and then attach it to the Roadmunk integration profile on your ServiceNow instance. See step 7 of [Create a Roadmunk integration profile](#) for detailed instructions.

3. Optional: Delete deactivated users from your Roadmunk account.

If a deactivated user is no longer part of your organization or team, you can delete the user from your Roadmunk account.

 **Warning:**

Users are deleted permanently. Proceed with caution, as users cannot be restored once deleted.

- a. On the same **Users** tab of your Roadmunk account settings, select **INACTIVE USERS**.
The list of inactive users opens.
- b. Click the Remove icon () for the user that you want to delete.
The removal confirmation dialog box opens.
- c. On the dialog box, click **Delete**.
The user is deleted from your account and all roadmaps are unassigned from the user.

Note:

The user is not notified about being deleted from your account. Any comments that either mention or are made by the user are updated to indicate that the user has been deleted. All roadmaps that are owned by the user are retained in your account and can be managed by any Account Admin. You can view these roadmaps at any time in the All Roadmaps list on the Roadmaps homepage. If the user is invited back to Roadmunk under the same email address, you must manually reassign these roadmaps to the user.

- d. Repeat steps b and c for each user that you want to delete.
4. Return to your ServiceNow instance to update the state of each removal candidate to **Closed Skipped**.
 - a. From your ServiceNow instance, navigate to **SaaS License > Administration > Direct Integration Profiles**.
 - b. Select your Roadmunk integration profile from the Integration Profiles list.
 - c. On the **Software Models** tab of the Integration Profile form, select the software model that is associated with the integration profile.
 - d. On the Software Model form, select the **Reclamation Candidates** related tab.
 - e. From the list of available removal candidates, select the removal candidate number (RCCxxxxxx) for a user that you deactivated in [step 2](#).
 - f. On the Removal Candidate form, update the state of the removal candidate by clicking **Closed Skipped**.
Software Asset Management removes the user subscription from the Software Subscriptions [samp_sw_subscription] table and automatically returns you to the Software Model form.
 - g. Repeat steps d through f for each user that you deactivated on your Roadmunk account.

Reclaim user subscriptions in the Software Asset Workspace

Reclaim unused SaaS and SSO subscriptions in the Software Asset Workspace.

Before you begin

To reclaim user subscriptions in the Software Asset Workspace, you must request and activate the Software Asset Workspace (com.sn_sam_workspace) plugin. See [Request Software Asset Management](#) for more details on requesting and activating the Software Asset Workspace (com.sn_sam_workspace) plugin.

Role required: sam_user

i Important:

The SaaS License Management SurveyMonkey integration does not support reclamation through the ServiceNow AI Platform. To reclaim a SurveyMonkey user subscription, you must reassign or delete the user from your SurveyMonkey team directly using the SurveyMonkey admin portal. After the user is removed from your team, you must update the state of the corresponding removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table. See [Reclaim SurveyMonkey user subscriptions in the Software Asset Workspace](#) for detailed instructions.

i Important:

The SaaS License Management monday.com integration does not support reclamation through the ServiceNow AI Platform. To reclaim a monday.com user subscription, you must deactivate the user on your monday.com account. After the user is deactivated, you must update the state of the corresponding removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table. See [Reclaim monday.com user subscriptions in the Software Asset Workspace](#) for detailed instructions.

i Important:

The SaaS License Management Roadmunk integration does not support reclamation through the ServiceNow AI Platform. To reclaim a Roadmunk user subscription, you must deactivate the user on your Roadmunk account. After the user is deactivated, you must update the state of the corresponding removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table. See [Reclaim Roadmunk user subscriptions in the Software Asset Workspace](#) for detailed instructions.

Procedure

1. From your ServiceNow instance, navigate to **Software Asset > Software Asset Workspace**. The Software Asset Workspace launches in a new tab.
2. To reclaim a user subscription that was not automatically identified by a software reclamation rule, create a software removal candidate.
See [Create a software removal candidate in workspace](#) for detailed instructions on how to create a software removal candidate in the Software Asset Workspace.
3. From the left navigation menu of the Software Asset Workspace, select **License usage**. The License usage view opens.
4. In the License usage view, select the **Removal candidates** tab.
5. Reclaim user subscriptions.
 - To reclaim all user subscriptions, click **Reclaim All**.

i Note:

Use caution when reclaiming all user subscriptions. Some users may still need their subscriptions even if they have no activity.

- To reclaim an individual user subscription, select a removal candidate and then click **Reclaim** on the Removal Candidate form.

Result

After you reclaim a user subscription, the subscription record is deleted from the Software Subscriptions [samp_sw_subscription] table. The reclamation candidate state is set to **Closed**

Complete. If the reclamation fails, the state is set to **Attention Required**. An error message is displayed at the top of the screen with additional details on how to resolve the error.

Reclaim SurveyMonkey user subscriptions in the Software Asset Workspace

Reclaim unused SurveyMonkey subscriptions to reduce your total software costs.

Before you begin

To reclaim user subscriptions in the Software Asset Workspace, you must request and activate the Software Asset Workspace (com.sn_sam_workspace) plugin. See [Request Software Asset Management](#) for more details on requesting and activating the Software Asset Workspace (com.sn_sam_workspace) plugin.

SurveyMonkey Role required: admin

ServiceNow Role required: sam_user

About this task

The SaaS License Management SurveyMonkey integration does not support reclamation through the ServiceNow AI Platform. When Software Asset Management creates a removal candidate for your SurveyMonkey integration, you can reclaim the user subscription by removing the associated user directly from your SurveyMonkey team. After you remove the user from your team, you must update the state of the removal candidate to **Closed Skipped** so that the user subscription is removed from the Software Subscriptions [samp_sw_subscription] table.

Procedure

1. Identify removal candidates for your SurveyMonkey integration.
 - a. From your ServiceNow instance, navigate to **Software Asset > Software Asset Workspace**. The Software Asset Workspace launches in a new tab.
 - b. From the left navigation menu of the Software Asset Workspace, select **License usage**. The License usage view opens.
 - c. On the **Publishers** tab of the License usage view, select **SurveyMonkey** from the list of available publishers. The SurveyMonkey publisher overview opens.
 - d. Select the **Removal Candidates** related list to view the list of available removal candidates.
 - e. Take note of the removal candidates that you want to reclaim the user subscription for. Save this information for later use.
2. Remove the associated users from your SurveyMonkey team. Based on the list of removal candidates that you identified in [step 1](#), you can reclaim user subscriptions by reassigning or deleting the associated users from your SurveyMonkey team.
 - a. From a web browser, open [SurveyMonkey](#) .
 - b. Log in using your admin credentials.
 - c. On the left navigation menu, select **Manage Users**. The Manage Users page opens, where you can view the complete list of users in your SurveyMonkey team.

- d. Click the ellipsis icon (...) for the user that you want to remove from your team.
 - e. When prompted, select either **Reassign Account** or **Delete Account**.
Select **Reassign Account** to move the user to another SurveyMonkey team. Select **Delete Account** to deactivate the user completely.
 - f. Repeat steps d and e for each user that you want to remove.
3. Return to your ServiceNow instance to update the state of each removal candidate to **Closed Skipped**.
 - a. From your ServiceNow instance, navigate to **Software Asset > Software Asset Workspace**.
The Software Asset Workspace launches in a new tab.
 - b. From the left navigation menu of the Software Asset Workspace, select **License usage**.
The License usage view opens.
 - c. On the **Publishers** tab of the License usage view, select **SurveyMonkey** from the list of available publishers.
The SurveyMonkey publisher overview opens.
 - d. Select the **Removal Candidates** related list.
 - e. From the list of available removal candidates, select the removal candidate number (RCCxxxxxxx) for a user that you removed from your SurveyMonkey team in [step 2](#).
 - f. On the Removal Candidate form, update the state of the removal candidate by clicking **Closed Skipped**.
Software Asset Management removes the user subscription from the Software Subscriptions [samp_sw_subscription] table.
 - g. Close the tab for the Removal Candidate form.
 - h. Repeat steps e through g for each user that you removed from your SurveyMonkey team.

Reclaim monday.com user subscriptions in the Software Asset Workspace

Reclaim unused monday.com subscriptions to reduce your total software costs.

Before you begin

To reclaim user subscriptions in the Software Asset Workspace, you must request and activate the Software Asset Workspace (com.sn_sam_workspace) plugin.  - f. On the Removal Candidate form, update the state of the removal candidate by clicking **Closed Skipped**. Software Asset Management removes the user subscription from the Software Subscriptions [samp_sw_subscription] table.
 - g. Close the tab for the Removal Candidate form.
 - h. Repeat steps e through g for each Roadmunk user that you deactivated.

Create a child alias to set up multiple integration profiles

Create a child alias to set up multiple integration profiles with unique connections and manage different configurations for each integration profile.

Before you begin

Role required: admin or sam_integrator

Procedure

1. Create an integration profile.
For more information about creating an integration profile, see [Integrate with SaaS applications](#).
2. Open the connection & credential record set on the integration profile.

If the **Parent Alias** field on an alias is empty, then the alias is a parent. If the field is filled, then the alias is a child of the alias specified in the **Parent Alias** field.

- If the record is a parent alias, select the **Child Aliases** tab.
- If the record is a child alias, select the **Parent Alias** record and then select the **Child Aliases** tab.

3. Select New.

 **Tip:**

If the **New** button isn't visible, change the scope to the respective application of the alias from the application scope.

4. Reload the Connection & Credential Aliases page.

5. On the new child alias form that opens up, provide a name of your choice for the alias.

6. Select Submit.

7. Open the child alias record that you created, select Create New Connection & Credential.

8. Configure the connection and credential in the same way that you have done for the parent integration.

9. After the connection is configured, return to the integration profile and then select the newly created child alias on the Connection & Credential field.

10. Select Save and publish the integration profile.

Create a child alias to set up multiple Cisco Webex integration profiles

Create a child alias to set up multiple Cisco Webex integration profiles.

Before you begin

Role required: admin

Procedure

1. Create a Cisco Webex integration profile.

For more information about creating an integration profile, see [Integrating with Cisco Webex](#).

2. Open the connection & credential record set on the integration profile.

3. Open the parent alias record (sn_cisco_teams_spk.CiscoWebexTeams).

4. Set the configuration template to the appropriate template based on the selected process in the profile.

Process selected on the profile	Configuration template
Both Download activity and Reclaim subscriptions check boxes are selected	Webex Subscription Activity and Reclaim
Only Download activity check box is selected	Webex Subscription and Activity
Only Reclaim subscriptions check box is selected	Webex Subscription and Reclaim
Both Download activity and Reclaim subscriptions check boxes aren't selected	Webex Subscription

5. Save the parent alias record.

6. Select the **Child Aliases** tab.

7. Select **New**.

 **Tip:**

If the **New** button isn't visible, change the scope to the respective application of the alias from the application scope.

8. Reload the Connection & Credential Aliases page.

9. On the new child alias form that opens up, provide a name of your choice for the alias.

10. Select **Submit**.

11. Open the child alias record that you created, select **Create New Connection & Credential**.

12. Configure the connection and credential in the same way that you have done for the parent integration.

13. After the connection is configured, return to the integration profile and then select the newly created child alias on the **Connection & Credential** field.

14. Select **Save** and publish the integration profile.

Create a child alias to set up multiple Confluence Cloud integration profiles

Create a child alias to set up multiple Confluence Cloud integration profiles.

Before you begin

Role required: admin or sam_integrator

Procedure

1. Create a Confluence Cloud integration profile.

For more information about creating an integration profile, see [Integrating with Confluence Cloud](#).

2. Open the connection & credential record set on the integration profile.

3. Open the parent alias record (sn_confluence_spoke.Confluence_Cloud).

4. Set the configuration template to the appropriate template based on the selected process in the profile.

Process selected on the profile	Configuration template
Both Download activity and Reclaim subscriptions check boxes are selected	Confluence Subscription Activity and Reclaim
Only Download activity check box is selected	Confluence Subscription and Activity
Only Reclaim subscriptions check box is selected	Confluence Subscription and Reclaim
Both Download activity and Reclaim subscriptions check boxes aren't selected	Confluence Subscription

5. Save the parent alias record.

6. Select the **Child Aliases** tab.

7. Select **New**.

Tip:

If the **New** button isn't visible, change the scope to the respective application of the alias from the application scope.

8. Reload the Connection & Credential Aliases page.
9. On the new child alias form that opens up, provide a name of your choice for the alias.
10. Select **Submit**.
11. Open the child alias record that you created, select **Create New Connection & Credential**.
12. Configure the connection and credential in the same way that you have done for the parent integration.
13. After the connection is configured, return to the integration profile and then select the newly created child alias on the **Connection & Credential** field.
14. Select **Save** and publish the integration profile.

Create a child alias to set up multiple Jira integration profiles

Create a child alias to set up multiple Jira integration profiles with unique connections and manage different configurations for each integration profile.

Before you begin

Role required: admin or sam_integrator

Procedure

1. Create a Jira integration profile.
For more information about creating an integration profile, see [Integrating with Jira Software Cloud](#).
2. Open the connection & credential record set on the integration profile.
3. Open the parent alias record (sn_jira_spoke.Jira).
4. Set the configuration template to the appropriate template based on the selected process in the profile.

Process selected on the profile	Configuration template
Both Download activity and Reclaim subscriptions check boxes are selected	Jira Subscription Activity and Reclaim
Only Download activity check box is selected	Jira Subscription and Activity
Only Reclaim subscriptions check box is selected	Jira Subscription and Reclaim
Both Download activity and Reclaim subscriptions check boxes aren't selected	Jira Subscription

5. Save the parent alias record.
6. Select the **Child Aliases** tab.
7. Select **New**.

Tip:

If the **New** button isn't visible, change the scope to the respective application of the alias from the application scope.

8. Reload the Connection & Credential Aliases page.
9. On the new child alias form that opens up, provide a name of your choice for the alias.
10. Select **Submit**.
11. Open the child alias record that you created, select **Create New Connection & Credential**.
12. Configure the connection and credential in the same way that you have done for the parent integration.
13. After the connection is configured, return to the integration profile and then select the newly created child alias on the **Connection & Credential** field.
14. Select **Save** and publish the integration profile.

Associate a user with subscription records

If the **User** field in the Software Subscription [samp_sw_subscription] table is empty, map the field with an associated user in the User [sys_user] table within ServiceNow AI Platform.

Before you begin

ServiceNow Role required: sam_admin or sam_integrator

Important:

sam_user can view the user resolution rules but not create them.

Review the list of unresolved subscriptions on the Subscriptions without user page in the [License operations view](#). Note the User principal name value for the subscription and then verify if this value matches any entry in the User [sys_user] table. If no match is found, configure the rule accordingly.

About this task

SaaS integrations create subscription records in the Software Subscription [samp_sw_subscription] table with fields populated by automated jobs and integrations. By default, the **User** field is resolved by matching the User principal name column value with the **Email** and **User ID** fields in the User [sys_user] table. To accurately map user data when user data isn't resolved, create a user resolution rule.

Procedure

1. Navigate to **Workspaces > Software Asset Workspace > License operations > User subscription > User resolution rules**.
2. Select **New**.
3. On the form, fill in the fields.

For a description of the field values, see [User resolution rule fields](#).

4. Select **Save**.

Result

If the user resolution rule is correctly configured and the Download subscription job *SAM - Refresh <profile name> Subscriptions* runs successfully, the unresolved subscription you targeted is cleared from the Subscriptions without user page in [License operations view](#).

Disconnect SSO apps

Disconnect an SSO application to stop viewing subscription information for the app, or before creating a direct integration for the app.

Before you begin

Role required: sam_integrator

About this task

SaaS License Management offers direct integrations with select applications. Direct integrations provide the most robust usage data. For a list of available direct integrations, see [Integrate with SaaS applications](#). If you have a connected SSO app and want to replace it with a direct integration, disconnect the app before creating the direct integration to avoid creating duplicate subscription records for the app.

When an app is disconnected, all SSO subscriptions for the app are deleted and any open reclamation candidates are set to Closed Skipped.

Procedure

1. Navigate to **All > SaaS License > SSO Applications**.
2. Click the application you want to disconnect.
3. Click **Disconnect**.

Tip:

You can also disconnect multiple apps at once from the **SSO Applications** list. Select the apps using the check box on the left side of the list. At the bottom of the list, click the **Actions on selected rows** drop down menu and then click **Disconnect**.

Delete an integration profile

If your company stops using a SaaS application or SSO provider, you can delete the integration profile.

To delete an integration profile, navigate to the integration profile record and click **Delete**. The sam_integrator role is required to delete integration profiles.

Direct integrations

When you delete a direct integration profile, all subscriptions, scheduled jobs, and consumption summaries for the integration are also deleted. Open reclamation candidates are updated to Closed Skipped. Reclamation rules are not deleted.

SSO integrations

When you delete an SSO integration profile, all SSO applications, subscriptions, and scheduled jobs for the integration are also deleted. Open reclamation candidates are updated to Closed Skipped. Reclamation rules are not deleted.

An SSO integration is created using a directory integration. When you delete an SSO integration profile, the directory integration (including directory jobs, directory users, and directory groups) is not deleted. Before deleting a directory integration, make sure it is not being used by additional connections, such as [Microsoft Azure AD integration for new hire onboarding](#) . The sn_remote_dir_sync.admin role is required to delete directory integrations.

Subscription identifiers for SaaS and SSO applications

Use the SaaS License Management application to view, manage, and resolve subscription identifiers for your SaaS and SSO applications.

Subscription identifiers uniquely identify your SaaS and SSO applications. Each subscription identifier is associated with a discovery map and software model that help to normalize the software that is installed in your environment. You can use this information to track your software subscriptions and understand your license positions.

Manage updated subscription identifiers

Keep your SaaS and SSO license positions accurate and up to date by managing the updated subscription identifiers that are detected by the ServiceNow AI Platform.

Before you begin

Role required: sam_integrator or admin

About this task

When a SaaS or SSO provider updates an existing subscription identifier, the ServiceNow AI Platform automatically detects and pushes the changes to your ServiceNow instance through weekly content updates. Changes include the product name, edition, version, platform, and language. Your instance uses this information to update subscription identifiers on existing software models, which can help prevent the creation of multiple software models for the same subscription software.

Subscription identifiers update either automatically or manually depending on the associated software model type. If a subscription identifier is associated with an auto-generated software model, it updates automatically. If a subscription identifier is associated with a customized software model, you must update it manually using software model suggestions. Software model suggestions identify changes to your existing subscription identifiers. You can use this information to determine whether you need to update your customized software models based on the latest subscription identifiers. For example, if a SaaS provider updates the product name for an application, the software model suggestions identify both the current and updated values of the product name. If the changes are correct, you can accept the software model suggestions to update your software model with the latest product name.

Procedure

1. Navigate to **All > SaaS License > Software Models**.
2. Select a software model that is marked with a dot.

A dot indicates that there are discrepancies between the associated subscription identifier and data that is provided in the latest content

updates.

- On the Software Model form, open the software model suggestions by clicking the warning icon (⚠) next to the **Display name** field. The Software Model Suggestions dialog box opens.
- In the dialog box, view the **Suggested discovery map** field to verify that your software model is using the discovery map for the updated subscription identifier. This field is read-only. However, you can click the preview icon (ⓘ) to view additional information about the discovery map.
- Verify the changes to the subscription identifier.

The Software Model Suggestions dialog box displays both the current and updated values of all subscription identifier fields. Although these fields are read-only, you can compare the values to understand how the subscription identifier has changed. Use this information to determine whether the changes are correct and should be applied to your software model.

Subscription identifier fields

Field	Description
Suggested publisher	Updated software publisher.
Publisher	Current software publisher.
Suggested product	Updated software product name.
Product	Current software product name.
Suggested Version condition	Updated qualifier that you can use to compare the value of the software model Version field against the value of the discovery model Version field. Your instance uses qualifiers such as is or is anything to determine whether your discovered software applies to the software model.
Version condition	Current qualifier that you can use to compare the value of the software model Version field against the value of the discovery model Version field. Your instance uses qualifiers such as is or is anything to determine whether your discovered software applies to the software model.

Field	Description
Suggested version	Updated software version.
Version	Current software version.
Suggested Edition condition	Updated qualifier that you can use to compare the value of the software model Edition field against the value of the discovery model Edition field. Your instance uses qualifiers such as is or is anything to determine whether your discovered software applies to the software model.
Edition condition	Current qualifier that you can use to compare the value of the software model Edition field against the value of the discovery model Edition field. Your instance uses qualifiers such as is or is anything to determine whether your discovered software applies to the software model.
Suggested edition	Updated software edition.
Edition	Current software edition.
Suggested Platform condition	Updated qualifier that you can use to compare the value of the software model Platform field against the value of the discovery model Platform field. Your instance uses qualifiers such as is or is anything to determine whether your discovered software applies to the software model.
Platform condition	Current qualifier that you can use to compare the value of the software model Platform field against the value of the discovery model Platform field. Your instance uses qualifiers such as is or is anything to determine whether your discovered software applies to the software model.
Suggested platform	Updated platform on which you can install or run the software.
Platform	Current platform on which you can install or run the software.
Suggested Language condition	Updated qualifier that you can use to compare the value of the software model Language field against the value of the discovery model Language field. Your instance uses qualifiers such as is or is anything to determine whether your discovered software applies to the software model.
Language condition	Current qualifier that you can use to compare the value of the software model Language field against the value of the discovery model Language field. Your instance uses qualifiers such as is or is anything to determine whether your discovered software applies to the software model.
Suggested language	Updated language in which you want to run the software.
Language	Current language in which you are running the software.

6. Accept or reject the changes.

- If the changes are correct, click **Accept** to update the software model with the suggested field values.
 - If the changes are not correct, click **Reject** to ignore the suggested field values. The software model continues to use the existing subscription identifier.
- You automatically return to the Software Model form.

7. Click **Update to save your changes and clear the software model suggestions.**

Resolve unrecognized subscription identifiers

Maintain accurate license positions for your subscription software by resolving unrecognized subscription identifiers that are detected by the ServiceNow AI Platform.

Before you begin

Role required: admin

About this task

The ServiceNow AI Platform marks a subscription identifier as unrecognized when it is not associated with a software model. By associating the unrecognized subscription identifier with a software model, you can track subscription usage for the associated subscription software.

Procedure

- 1. Optional:** Send unrecognized subscription identifiers back to the ServiceNow content team by opting in to the Software Asset Management content service.
When you opt in to the Software Asset Management content service, verify that the **Unrecognized Subscription Identifier** KPI is enabled. See [Enable sharing information with Software Asset Management content service](#) for detailed instructions.
- Navigate to **SaaS License > Unrecognized Subscription Identifiers**.
- Select an unrecognized subscription identifier.
- On the form, fill in the fields.

Unrecognized Subscription Identifier form

Field	Value
Subscription identifier	Name of the unrecognized subscription identifier. This field populates automatically.
Software model	Software model that you want to associate with the subscription identifier.
Subscription profiles	Direct integration profiles that are associated with the subscription identifier. This field populates automatically.
Number of subscriptions	Number of subscriptions that are associated with the subscription identifier. This field populates automatically.
Exclude from content service	Option that prevents your ServiceNow instance from sending the unrecognized subscription identifier back to the ServiceNow content team. This option is applicable only if you opted in to the Software Asset Management content service.

- Click **Update**.

Result

After the subscription identifier associates with the specified software model, all related software subscriptions automatically update with that software model.

If you opted to share your unrecognized subscription identifier data with ServiceNow, your ServiceNow instance sends the unrecognized subscription identifier back to the ServiceNow content team. The content team can use this information to further research and improve the normalization process.

Software Spend Detection

Use the ServiceNow Software Spend Detection application to track, analyze, and optimize software spending from imported financial data.

Use Software Spend Detection to optimize software spending.

- Streamline business processes and reduce costs by consolidating software products with similar functionality.
- Reinforce company software purchasing policies by viewing all software purchased in each department.
- Start managing any unmanaged software by creating software models and entitlements with Software Asset Management.

Request Software Spend Detection

Request Software Spend Detection to track, analyze, and optimize software spending. To access Software Spend Detection, enable the Software Asset Management - Spend Detection (com.sn_sam_spend) plugin. This plugin includes demo data.

Before you begin

Before you can request Software Spend Detection, you must sign the Software Spend Detection legal agreement. For more information about the Software Spend Detection legal agreement, contact your ServiceNow account representative.

To use Software Spend Detection, you must activate the Software Asset Management Professional (com.snc.samp) plugin on your ServiceNow instance. For more information about activating Software Asset Management Professional, see [Request Software Asset Management](#).

i Note:

Software Spend Detection is not supported for on-premises users hosting their own ServiceNow instance.

Role required: admin

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.

3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. Note: If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the Plugin I'm looking for is not listed check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

Completed Activate Plugin form

4. Select **Submit**.

After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Software Spend Detection Overview dashboard

View all software spend from uploaded financial data in the Software Spend Detection Overview dashboard.

Access the Software Spend Detection dashboard by navigating to **Software Spend Detection > Overview**.

Expand a publisher in the left menu bar to see their products. Select a publisher or product to show only those transactions. Select **Edit date range** to filter transactions by date. By default, the dashboard shows all transactions from within the past year. Move your cursor over the Software Spend Over Time graph to view exact spend amounts. You can also view transactions grouped by cost center, department, or location using the tabs at the bottom of the dashboard.

Sharing the dashboard's URL displays your currently selected publisher, product, and date range. To view the applied filters, the URL recipients must already be logged in to their ServiceNow instance.

Note:

Transactions that aren't labeled with a software publisher aren't included in the dashboard. You can manually update these transactions with a publisher to add them to the dashboard. For more information, see [Manually update transactions](#).

\$29,599,922	\$5,756,482	\$24,746,810	\$4,853,112

Software Spend Over Time

Software Transactions Cost Centers Department Location

Transaction date	Vendor name	Description	GL account	Amount	Is software	Publisher	Product
2019-01-03	Google	Google Drive Extra Petabyte Storage	Software Prepaid	\$245,000.00	true	Google	Google Apps

Indicator	Description
Total Publishers	Total number of publishers. This includes publishers automatically detected from imported financial transactions and publishers manually added to transactions.
Unmanaged Publishers	Number of publishers that have unmanaged products.
Total Products	Total number of products. This includes products automatically detected from imported financial transactions and products manually added to transactions.
Unmanaged Products	Number of products that don't have a software model.
Total Detected Spend	Total amount spent on software. This value is equal to Accounts Payable Spend plus Expense Spend.
Unmanaged Spend	Total spend for transactions where the publisher and product are identified but there's no software model for the product. You can create software models and entitlements to start tracking those products and turn unmanaged spend into managed spend.
Accounts Payable Spend	Total spend for transactions where the type is Accounts Payable. These transactions are from an accounting or procurement system.
Expense Spend	Total spend for transactions where the type is Expense. These transactions are from an employee expense system or credit card feed.
Software Spend Over Time	Amount spent on software each month.

Opt in to Content Service

Opt in to Content Service for Software Spend Transactions to get more accurate predictions in Software Spend Detection by sharing financial transaction data with the ServiceNow Content Service team.

Before you begin

Role required: sam_admin

About this task

Opting in to Content Service for Software Spend Transactions means that you agree to have a copy of your financial transaction data securely sent to ServiceNow. Your data is used only to improve future publisher and product predictions when importing data into Software Spend Detection. You can opt out of Content Service at any time.

If you already opted in to Software Asset Management Content Service, you still need to manually enable data sharing for Software Spend Detection by selecting the Software Spend Transactions toggle button on the Content Service Setup page. Software Spend Transactions data sharing is disabled by default.

If you opt in after you've already imported data into Software Spend Detection, data from previous imports is shared as well as data from future imports.

Note:

If you want to hide the ability to opt in, a user with the admin role can set the `glide.samp.spend_detection_opt_in.enabled` system property to `false`. Setting this value to `false` hides the toggle button used to turn on sharing for software spend transactions. Also, if this property is set to `false` when you're already opted in, your transaction data is no longer shared.

Procedure

1. Navigate to **All > Software Spend Detection > Administration > Content Service Setup**.
2. Select the check the box to accept the opt-in agreement and then select **Opt-in**.

Note:

If you already opted in to Content Service through Software Asset Management, you don't see the opt-in screen.

Data sharing for Software Discovery Models, Software Model Lifecycles, Part Numbers and Discovery Maps, and Processor Names KPIs is automatically enabled after opting in. If you don't want to share data for some KPIs, individually disable sharing by selecting the toggle button next to the KPI and then selecting **Save**. For more information about Content Service KPIs, see [Software Asset Management Content Service](#).

3. To turn on sharing for software spend transaction data, select the toggle button next to Software Spend Transactions and then select **Save**.

What to do next

You can return to the Content Service Setup page to adjust your data sharing settings for each KPI. You can completely opt out by selecting **I would like to opt my company out of the Software Asset Management Content Service Program**. After opting out, you can opt back in at any time.

Content Service for Software Spend Detection

Opt in to Software Asset Management Content Service for Software Spend Transactions to get more accurate predictions in Software Spend Detection by sharing financial transaction data with the ServiceNow Content Service team.

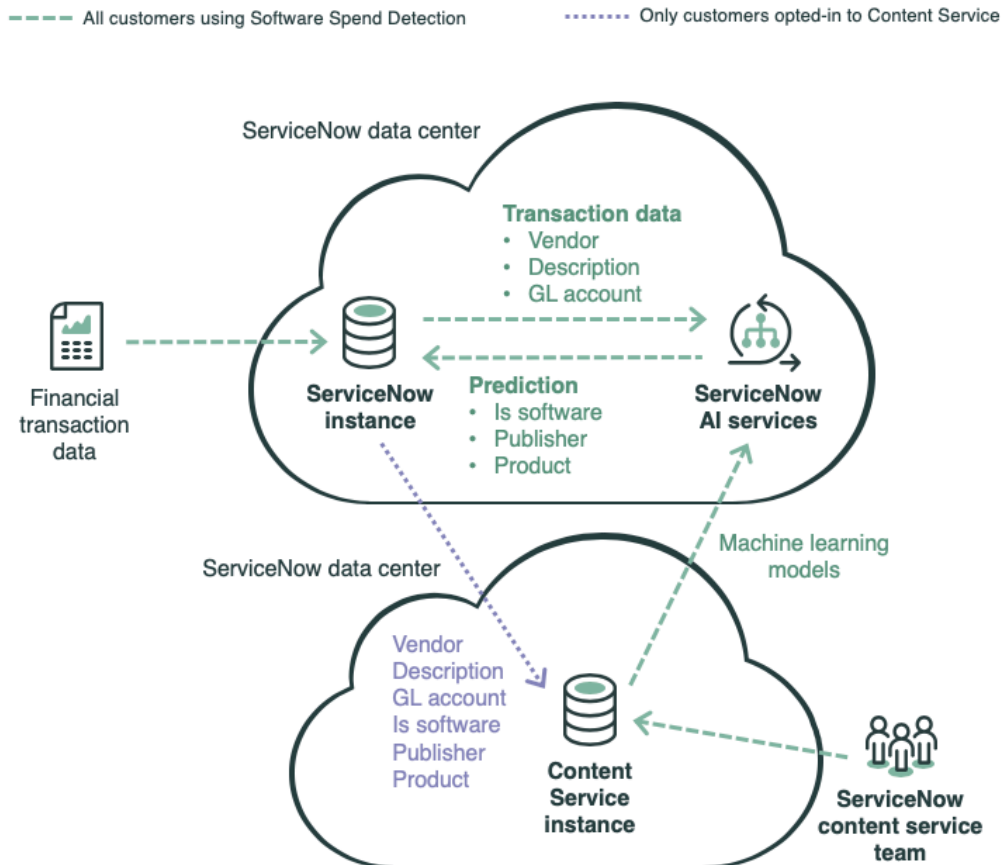

Opting in to Content Service for Software Spend Transactions means that you agree to have a copy of your financial transaction data securely sent to the ServiceNow Content Service team. ServiceNow uses your data only to improve future publisher and product predictions when importing data into Software Spend Detection. ServiceNow protects all data using the same policies that protect customer instances.

Opting-in shares the following data with ServiceNow:

- Vendor name
- Transaction description
- GL account
- Prediction results (Publisher ID, Product ID, Is Software)

Your data is sent anonymously to the Content Service team. Your data isn't linked to any identifiable information, such as company or instance name. Before importing data, it's your responsibility to ensure that the fields **Vendor name**, **Transaction Description**, and **GL account** don't contain any identifiable information such as company or employee names.

The ServiceNow Content Service team uses these data points to improve machine learning models used by ServiceNow Artificial Intelligence (AI) Services. The AI Services are a set of web services that reside within every ServiceNow datacenter. All Software Spend Detection users benefit from continual improvements to ServiceNow AI Services, but users who are opted-in to Content Service benefit the most. ServiceNow AI Services learns how to identify software products and publishers in your transactions that Software Spend Detection previously was not able to identify. This learning improves the functionality for your future imports.

You can opt out of Content Service at any time. If you opt out, no data from future imports is sent to the ServiceNow Content Service team, but your previously shared data is not deleted.

If you would like to participate in Content Service but exclude some transactions from being shared with ServiceNow, you can select the **Exclude from content service** check box on those transaction records.

Import financial transactions

Import a Microsoft Excel spreadsheet of financial transaction data to start managing software spending.

Before you begin

Role required: sam_spend_import or sam_admin

Note:

Users with the sam_user role can manually create transaction records by selecting **New** at the top of the All Imported Transactions page.

About this task

Your imported data can include all financial transaction data for your company. Software Spend Detection automatically determines whether each transaction is a software purchase. Before importing data, ensure that the fields **Vendor name**, **Transaction Description**, and **GL account** don't contain any identifiable information such as company or employee names. Make any necessary changes to the data before you import. All imported financial transaction data fields are read-only once loaded in your instance.

The import may take several hours when importing large numbers of transactions.

Note:

Software Spend Detection currently supports transaction data in English only. If you would like to help train ServiceNow artificial intelligence using data in other languages, contact the ServiceNow IT Asset Management product team.

Procedure

1. Navigate to **All > Software Spend Detection > Administration > Import Transactions**.
2. Select **Download Template File (.xlsx)**.
3. Copy your financial data into the template file.
The required fields are **Transaction date**, **Vendor name** or **Description**, and **Type**. Fill in as many fields as possible for the most robust results.

Software Spend Transactions import template

Field	Description
Transaction date	Required. Transaction date.
Vendor name	Company associated with the transaction. Don't include any identifiable information such as your company or employee names. Provide at least one of vendor name or description.
Description	Description of the purchase. Don't include any identifiable information such as your company or employee names. Provide at least one of vendor name or description.
GL account	General ledger account or expense category. Don't include any identifiable information such as your company or employee names. Optional.
Amount	Transaction amount. Optional.

Field	Description
Type	Required. Select Accounts Payable or Expense. Accounts Payable transactions are from an accounting or procurement system. Expense transactions are from an employee expense system or credit card feed.
Location	Location. Optional.
Cost center	Cost center. Optional.
Department	Department. Optional.
Source	Name of the system that the transaction came from. Optional.
Type detail	Description for the Type field. For Accounts Payable, examples are vendor bill or invoice payment. For Expense, examples are credit card purchase or employee reimbursement. Optional.
External ID	ID of the transaction in the source system. Optional.
Employee ID	Employee ID. Optional.
Employee name	Employee name. Optional.
Employee email	Employee email. Optional.

4. Upload the completed file.

5. Navigate to **Software Spend Detection > Administration > Transaction Import Results** to view information about the import and resolve any import errors.

When the import is complete, Software Spend Detection begins matching your transactions to software publishers and products. Software Spend Detection also assigns a **0 - 1** value to the **Is software probability**, **Product confidence**, and **Publisher confidence** fields for every transaction. For example, a value of **.85** for **Publisher confidence** means that Software Spend Detection is 85% sure that it matched the correct publisher to the transaction. When the matching process is complete, you can view the data in the Overview, Overlapping Software, and Software Spend Transactions modules under Software Spend Detection.

What to do next

Navigate to **Software Spend Detection > Unnormalized Transactions** to view any transactions that Software Spend Detection wasn't able to match with a software publisher and product. You can manually update these transactions to add a publisher and product. [Opt in to Content Service](#) to improve matching for future imports.

If necessary, you can mass delete all transactions from an import. Navigate to **Software Spend Detection > Administration > Transaction Import Results**, select the import record, and then select **Delete**.

Manually update transactions

Manually update imported software transactions that weren't automatically labeled with a software product and publisher to track all software spending.

Before you begin

Role required: sam_user

About this task

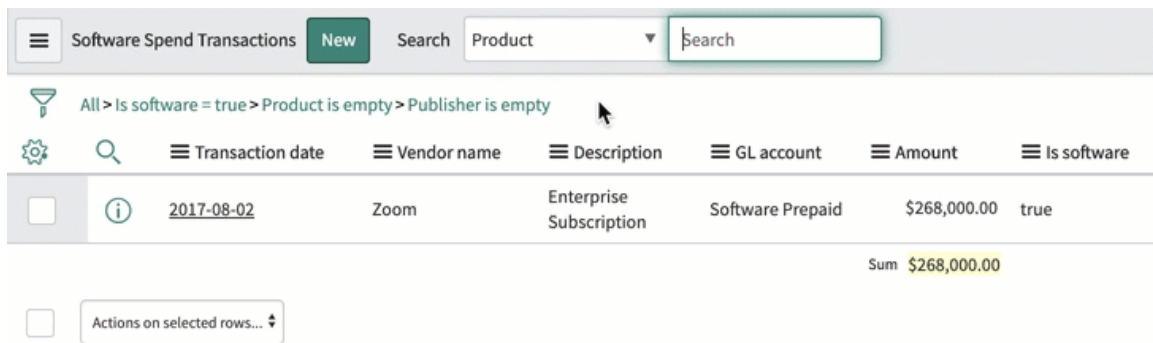

Sometimes, Software Spend Detection can't match a transaction to a software publisher and product. If Software Spend Detection can identify the publisher but not the product, the transaction is categorized as Unnormalized in the list of products for that publisher in the Software Spend Detection dashboard. The transaction amount is added to the total cost for that publisher. If Software Spend Detection can't identify the publisher, the transaction is added to **Unnormalized Transactions** and is excluded from the Software Spend Detection dashboard. The transaction amount isn't included in any of the spend amounts shown on the dashboard.

Procedure

1. Navigate to **All > Software Spend Detection > Unnormalized Transactions**.

Note:

By default, this list shows only transactions identified as software by Software Spend Detection. To include transactions not identified as software, remove the filter condition **Is software = true**.

2. Select a transaction date.

3. Select values for the **Publisher** and **Product** fields.

Note:

You can create software publishers and products directly from this form by selecting the Lookup using list icon (🔍) next to the field and then selecting **New**.

4. Clear or select the **Is software** check box to indicate if the transaction is a software purchase.

5. Select **Update**.

The transaction is removed from the list of unnormalized transactions and is added to the Software Spend Detection dashboard.

Installed with Software Spend Detection

User roles and tables are installed with Software Spend Detection. Demo data is available for Software Spend Detection.

User roles

Role	Description
sam_spend_import	Role required to import financial transaction data into Software Spend Detection. Users with this role can view all modules in Software Spend Detection except Content Service Setup . Users with this role cannot view Software Asset Management.

Tables

Table	Description
Software Spend Transactions [sam_spend_transaction]	Financial transaction data.
Software Spend Transactions Import [sam_spend_transaction_import]	Import summary table showing number of rows imported and any import errors.
Software Spend Transactions Import [imp_sam_spend_transaction]	Staging table for financial transaction data imports.
Overlapping Software Configuration [sam_sw_overlap_configuration]	List of reports shown on the Overlapping Software dashboard.
Overlapping Software Summary [sam_sw_overlap_summary]	List of software products with spend transactions.

Software Asset Management administration

Software Asset Management administration tasks include adding custom part number records and custom license metrics. You can also refresh processor definitions and migrate software installations. Software Asset Management content service can be enabled, and migration procedures are also included.

The sam_admin role is required to configure administrative tasks. However, the sam_user role can view and read configurations.

Software Asset Management job results show the status of discovery model normalization and software usage import jobs.

Software Asset Job Results records are listed in the navigation path **All > Software Asset > Administration > Job Results** (see table for field descriptions).

Software Asset Job Result form

Field	Description
Number	Number of the job result that is generated when the job is run.
Name	Name of the job.
Status	Status of the job.
Created	Date and time job was created.
Updated	Date and time job was updated.

Enable sharing information with Software Asset Management content service

Opt in to share unnormalized software installation data from your organization with Software Asset Management Content Service. You can opt out at any time.

Before you begin

Role required: sam_admin

About this task

Note:

If you are managing a National Security Cloud (NSC) Department of Defense (DOD) Impact Level 5 (IL5) deployment, you cannot share any unnormalized software installation data with ServiceNow even if you opt to participate in the Software Asset Management Content Service. If a software product does not exist in the Software Asset Management Content Library, you can create a software content request for it manually. For detailed instructions, see [Create IT Asset Management content request](#).

Important:

If you're using the Software Asset Management application on-premise, you can set up your ServiceNow instance to connect directly to the Content Service. For detailed instructions, see the knowledge base article [KB1585263](#).

Procedure

1. Navigate to **All > Software Asset > Administration > Content Service Setup**.
2. Select **Opt-In Agreement** to read the agreement.
3. After reading the agreement, select **Done**.
4. Select the **Yes, I have read and accept the Opt-In Agreement** check box and then select **Opt-In**.
After you opt in, the Software Discovery Models, Software Product Lifecycles, Part Numbers and Discovery Maps, Processor Names, and Product License Exception Rules KPIs are automatically enabled. The Custom Software Products KPI is automatically disabled.
5. To enable or disable a KPI, select the toggle button next to the KPI and then select **Save**.
6. To opt out, select **I would like to opt my company out of the Software Asset Management Content Service Program** and then select **Opt-Out**.
The Software Discovery Models, Software Product Lifecycles, Part Numbers and Discovery Maps, Processor Names, Product License Exception Rules, and Custom Software Products are disabled and your unique normalization content is no longer provided to the Software Asset Management content service.

Exclude software assets on CIs

You may want to manage software assets installed on a subset of your configuration items in the Software Asset Management application.

Before you begin

Role required: sam_admin

About this task

For example, some of your devices may be leased from a third party and you are not responsible for license compliance for the software on those devices. Or, you may want to start with

managing software installed on devices only at a specific location (for example the New York office). Then, you can expand to managing software on devices in other locations. Convey to the Software Asset Management application which devices you want to exclude. The system excludes any software installed on these devices in license compliance calculations.

Procedure

1. In the Hardware [cldb_ci_hardware] table, add a true/false column, for example, Exclude from SAM [u_exclude_from_sam].
2. Set the value of the Exclude from SAM column to true for devices you don't want to manage installed software for in the application.

Note:

The default value of the Exclude from SAM column is false. By default, the system manages installed software on all devices.

3. Navigate to **Software Asset > Administration > Properties** and then enter the column name, [u_exclude_from_sam], in the field next to the property **Enter the name of the true/false field added to cldb_ci_hardware table to exclude software installed on selected devices from Software Asset Management.**

Ensure that you enter the column name without the brackets.

Once the scheduled job (SAM – Adjust Installs for excluded CIs) runs, the software installed on devices with the Exclude from SAM column set to true are excluded from the application.

4. To start managing software installs on previously excluded devices in the application, set the value of the Exclude from SAM column for the device to false.
Once the scheduled job (SAM – Adjust Installs for excluded CIs) runs, the system starts managing software installs on these devices.
5. Complete the following steps to start managing the software installs on all previously excluded devices.
 - a. Navigate to **Software Asset > Administration > Properties.**
 - b. Delete the column name [u_exclude_from_sam] from the property
 - c. Select **Save.**
Once the scheduled job (SAM – Adjust Installs for excluded CIs) runs, the system starts managing the software installed on all previously excluded devices.

Engineering license servers

View the list of all the license management servers that OpenLM or Open iT connect with to get data into your ServiceNow instance.

You can view information about all the license management servers by navigating to **All > Software Asset > Administration > Engineering License Server.**

Information such as the name of the server, the current status of the server, and the last connection time is displayed in the *Engineering Application License Servers* form layout.

Add a software pattern normalization rule

You can add a pattern normalization rule to normalize specific software products in your environment based on a common pattern.

Before you begin

Role required: sam_admin

About this task

Note:

When creating a pattern normalization rule for custom products and publishers, create the custom product and company records first.

Procedure

1. Navigate to **All > Software Asset > Administration > Pattern Normalization Rules** and create a new record (see table for field descriptions).

Pattern Normalization Rule form

Field	Description
Name	Specify a unique name for pattern normalization rule.
Discovered publisher contains	Specify text to search for in the software publisher field.
Discovered product contains	Specify text to search for in the product field.
Active	Option that activates the rule.
Discovered publisher is empty	Option that includes products that have an empty publisher field (the rule applies to discovery models where the publisher is unknown).
Normalized Attributes	
Publisher	Specify the normalized name of the publisher of the software.
Product	Specify the normalized name of the product.
Edition	Specify the product edition.
Product type	Choose the product type. <ul style="list-style-type: none"> ○ Child: A subcomponent of main software (not licensable). ○ Driver: Software product that controls a device. ○ Licensable: Software product that is licensable. ○ Not Licensable: Software product that is not licensable. ○ Patch: Software product designed to update, fix, or improve an existing computer program.
Version	Specify the version of the product.
Platform	Choose the platform.

Field	Description
	<ul style="list-style-type: none"> ○ Windows ○ macOS ○ UNIX
Language	Choose the language. <ul style="list-style-type: none"> ○ Dutch ○ English ○ French ○ German ○ Italian ○ Spanish

- Once the rule is created, to apply the rule so applicable discovery models are normalized without delay, click the **Apply Rule** related link.

Add a software reclamation rule

Add a reclamation rule to aggregate usage records and to identify unused software.

Before you begin

Role required: sam_admin

About this task

If you select the **Notify user** option in the reclamation rule, then the user has a chance to respond with approval during the process of reclamation. If no response is received during a specified period, the software rights are automatically reclaimed. If the user still wants to keep the software installation, it becomes the responsibility of the manager to approve or decline the removal.

For information on creating a reclamation rule for SCCM products, see [Create a reclamation rule to import Microsoft SCCM usage data](#).

Procedure

- Navigate to **All > Software Asset > Administration > Reclamation Rules**.
- Select **New**.
- On the form, fill in the fields.

Note:

You can edit the software members of the Software Products list after the reclamation rule is created.

Reclamation Rules form

Field	Description
Name	Name for the reclamation rule.
Applies to	Item type that the reclamation rule applies to.
Reclamation type	Type of reclamation rule. The possible values are the following:

Field	Description
	<ul style="list-style-type: none"> ○ Total Usage Time (default) ○ Last Used Date ○ Peak Concurrent Usage (appears only when you select Engineering App License from the Applies to list) ○ Active Transaction Codes (appears only when you select SAP Named User from the Applies to list)
Named user type	<p>SAP named user type. This field appears only when you select SAP Named User from the Applies to list.</p> <p>Note: This field is applicable to only to the SAP publisher.</p>
Create reclamation candidate	<p>When selected, a removal candidate is created for this reclamation rule, in addition to pulling in usage for all the software products associated with this rule.</p> <p>By default, this check box is selected. If you unselect this check box, a removal candidate is not created for this rule, although usage of the software products is still pulled in.</p>
Include no activity	<p>When selected, software products that have installations on devices but don't have usage records in the usage table are also reclaimed based on the following rules:</p> <ul style="list-style-type: none"> ○ Usage is available for the selected product (at least one usage record) within the time period of the reclamation rule. ○ For the Last Used Date reclamation type, the install must be created greater than the Last used before value. ○ For the Total Usage Time reclamation type, the install date must be greater than the Aggregate usage by value.
Assignment group	<p>The assignment group to manage the removal candidates created by the specific reclamation rule. Whenever a removal candidate is created based on this rule, the assignment group mentioned in the reclamation rule is copied over to the removal candidate.</p> <p>By default, the value Software managers is selected. You can select any other</p>

Field	Description
	group or create a group from the Group [sys_user_group] table.
Notify user	Option to notify the relevant user that you're requesting permission to remove the software.
Days before auto-reclamation	This field appears if you select Notify user . Once the removal candidate goes for approval and no response is received from the user, after the number of days mentioned in this field, the software product is revoked.
Software install condition/Subscription condition	<p>The software install condition field appears if you select Installed Software in the Applies to field.</p> <p>The Subscription condition field appears when the Applies to field is set to Subscription software in preconfigured rules.</p>
Usage Metering Data	
This section appears only when you select Total Usage Time , Peak Concurrent Usage , or Active Transaction Codes from the Reclamation type field.	
Aggregate usage by	<p>Time period over which usage information is aggregated. Possible values are the following:</p> <ul style="list-style-type: none"> ○ Last Month ○ Last Two Months ○ Last Three Months ○ Last Six Months (available only if you select Installed Software from the Applies to list)
Total hours used	Amount of time that the software must be used to avoid reclamation.
Percent utilized	License utilization percentage. For example, If you specify 60% and you utilized less than 60%, then a reclamation candidate is automatically created for the remaining 40% rights. This field is available only when you select Engineering App License from the Applies to list.
Minimum transaction codes required	Minimum number of SAP transaction codes that must be active so that a named user can avoid reclamation. You can specify the applicable transaction codes in the SAP Transaction Codes related list. The list appears after you submit the reclamation rule.

Field	Description
	This field is applicable to only to the SAP publisher. This field is available only when SAP Named User is selected from the Applies to list.
Last Used Data	
This section appears only when you select Last Used Date from the Reclamation type field.	
Last used before	<p>Amount of time to keep unused software before it's reclaimed.</p> <ul style="list-style-type: none"> ○ One Month Ago ○ Two Months Ago ○ Three Months Ago ○ Six Months Ago ○ Nine Months Ago ○ One Year Ago

4. Select **Submit.**

After the reclamation rule is created, add software products to the reclamation rule. You can also add a custom software product.

Additionally, you can specify filter conditions on software products that are suite parents. For details on adding a custom software product, see [Add a custom software product in Software Asset Management classic](#). For details on filter conditions, refer to [Software reclamation rules](#).

5. Select **Edit in the Software Products related list to add software products.**

When you add a product that is also a suite parent, all the suite components automatically get added and appear in the Software Product related list. The **Parent** field is automatically populated for all the suite components but it's empty for the suite parent.

Additionally, when a product is added to the related list, the product process related list appears as well as any product processes (if already present in the system) for the parent and suite products.

6. If a product process doesn't exist for the software product, you can add a custom product process.

a. Select **New in the Product Process related list.**

b. On the form, fill in the fields.

Note:

The Product Process related list appears only when you select a software product with a product process.

Field	Description
Product	Software product.

Field	Description
File name	File name of the software product. The file name is required for the SCCM Usage to pull data.
Platform	Platform of the software product.

c. Select **Save**.

Note:

The Product Process related list is displayed only when a software product with a product process is selected.

7. If you selected **SAP Named User** from the Applies to list, specify the SAP transaction codes that must be active to help prevent reclamation.

Note:

This step is applicable to only the SAP publisher.

Not all specified transaction codes must be active to help prevent reclamation. The minimum number of transaction codes that must be active is based on the value of the **Minimum transaction codes required** field.

a. From the SAP Transaction Codes related list, select **Edit...**

b. On the Edit Members form, select a transaction code from the Collection list or from the SAP Transaction Codes List.
The Collection list displays all available transaction codes. The SAP Transaction Codes List displays only the transaction codes that must be active to help prevent reclamation.

c. Select the right and left arrow icons to move the transaction code between the lists.

d. Select **Save**.

Create a custom file rule to manually define file sets

Create custom rules to manually define file sets and normalize data not recognized by the SAM API. After you have created custom rules, custom file sets can be discovered with File Signature Normalization and software records can be generated.

Before you begin

Role required: sam_admin

About this task

File Signature Normalization identifies software installation packages based on file attributes in a configuration item. The input is then sent to the SAM API. If there are files properties discovered that are not associated with the File Signature Normalization rule, you can manually normalize the data and send the input to the API to create a software installation record.

Note:

File signature rules discovered in the content service library take precedence over custom file signature rules.

Procedure

1. Navigate to **All > Software Asset > Administration > Custom File Normalization Rules** and create a new record (see table for field descriptions).

Unidentified File Set form

Field	Description
Publisher	<p>Publisher of the software. You can use the lookup list provided.</p> <p>Note: Publisher is a reference to the company [core_company] table. Only companies you are using internally are shown.</p>
Product	<p>Software product name. The same lookup list provided on the Software Discovery Models form. You can create a custom product from the lookup list, if desired.</p> <p>Note: If the relationship between the software publisher [samp_sw_publisher] table and the company [core_company] table is not correct, products for that publisher may not be shown.</p>
Version	<p>Version of the software product.</p> <p>Required if version condition value is [starts with] or [is-].</p>
Edition	<p>Edition of the software product to use when searching for the normalized discovery model.</p> <p>Required if edition condition value is [starts with] or [is].</p>
Platform	<p>Platform of the software product to use when searching for the normalized discovery model.</p> <p>The default is Anything for Windows, macOS, UNIX.</p>
Language	<p>Language of the software product to use when searching for the normalized discovery model, which is populated once it has been normalized or added manually.</p> <p>The default is Anything.</p>
Exclude from content service	<p>Option to exclude file set rule from being included in content service library.</p>
File name	<p>Name of file associated with software installation as it exists in the system.</p>
File size	<p>Size of file name file in bytes.</p>
File version	<p>Version of file name file.</p>

2. Click **Submit**.

Result

The custom rule is added to the Unidentified File Sets list.

Configure third-party discovery sources for Software Asset Management

Set up a third-party discovery source for Software Asset Management to populate the Software Installation [cmdb_sam_sw_install] table with software found in your environment.

Before you begin

To use the features of the Software Asset Management application with any third-party discovery source, you must populate the CMDB application and the related tables that reside on the ServiceNow instance. The Software Asset Management application uses the IRE API to help you populate the Software asset management tables. As the IRE API relies on the configuration item (CI) identifiers, the SAM tables require a relationship to the CI for IRE support. For more information on the IRE API, see [Identification and Reconciliation Engine](#).

Role required: sam_developer

Procedure

1. Navigate to **All > Software Asset > Properties**.
2. Select the **Enable scheduled jobs when using third party Datasource Integration Framework** [com.snc.samp.ire.datasource.integration] property.
3. Run your discovery source to identify software on the CIs.
The CI is used to construct a payload.
4. Send the payload to the ServiceNow instance using the IRE REST API.

For information on a sample payload, see [Sample payload for generic software install records](#).

In the payload, make sure to send the sys_class_name of the CI, so that the CI is not reclassified when an insert or update operation is performed.

An entry is created in the Software Installation [cmdb_sam_sw_install] table with a display name, publisher, and version. Reconciliation is run against the content service and a discovery model is identified for that software. If a discovery model does not exist, a discovery model is automatically created for the software. You can start using the Software Asset Management application.

Delete uninstalled software from the Software Installation table

Delete installations from the Software Installation [cmdb_sam_sw_install] table if those software installations are also uninstalled from a CI.

Before you begin

After the discovery process runs and you identify software installations that are uninstalled from a CI, delete those installations from the Software Installation [cmdb_sam_sw_install] table in the CMDB application.

Create a script to delete multiple software installation records from the Software Installation [cmdb_sam_sw_install] table. You can use the Table API to query the Software Installation table to get the installation list for the CI.

Role required: sam_developer

About this task

You can also delete software installation records for specific publishers like Oracle, VMware, and Citrix.

Procedure

1. Use the REST Table API `api/now/table/cmdb_sam_sw_install?sysparm_query=installed_on%3D28c9c3b8c0a8000b009b2d941d7e3ee9` to query and identify the list of software installs on a specific CI.
For more information on the REST endpoint API, see [Table API-GET](#).
 - a. Specify the table name, Software Installation [cmdb_sam_sw_install] table and query parameters.
For the query parameters, specify either the sys_id of the CI or a list of fields that are separated by commas such as publisher, version, and product on which you want to perform the delete operation.
 - b. After entering the query parameters, send the request.
You get a response in a JSON format listing of all the software installations for that specific CI. You can view the sys_id for all the software installations in the response.
2. Based on the response, identify the sys_ids of the software installations that are deleted on a CI.
Only the sys_ids of those software installations need to be passed through the Delete API.
3. Use the Delete API `request.setEndpoint('http://xyz/api/now/table/cmdb_sam_sw_install/728e87dafd841010fa9bea491bfdc1ff');`
`request.setHttpMethod('DELETE');` to delete the software installs from the Software Installation [cmdb_sam_sw_install] table.
xyz in the URL refers to your ServiceNow instance.
 - a. Specify the table name, Software Installation [cmdb_sam_sw_install] table, and the sys_ids of the software installations that are deleted on the CIs.
 - b. Send the request.
The software installations are deleted from the Software Installation [cmdb_sam_sw_install] table.

Create a reclamation rule to import Microsoft SCCM usage data

To import your Microsoft SCCM data, create a reclamation rule for the product that you want the usage information for.

Before you begin

Role required: sam_admin

About this task

A software product must have a product process, which consists of a filename, that is required for SCCM Usage to pull data. When adding a software product to a reclamation rule, any product processes associated with the software product are shown in the **Product Process** related list. Product processes are stored in the Software Product Process [samp_sw_product_process] table.

If a product process does not exist for a software product, you can create a custom one on the form. Product processes are stored in the Custom Product Process [samp_custom_product_process] table.

Some software products may not include a product process, but new product processes are added weekly through the content library updates.

Procedure

1. Navigate to **All > Software Asset > Administration > Reclamation Rules** and select **New**.
2. On the Reclamation Rule form, create a new record (see table for field descriptions).

Reclamation Rule form

Field	Description
Name	Name of the product that you are creating the reclamation rule for.
Applies to	Type of software to which the reclamation rule applies. <ul style="list-style-type: none"> ○ Installed Software ○ Engineering App License
Reclamation type	Type of data pulled from SCCM. <ul style="list-style-type: none"> ○ Total Usage Time ○ Last Used Date
Notify user	Check box for notifying the user assigned to the software requesting permission via email to remove the software.

3. If you selected **Total Usage Time** in the **Reclamation type** field, complete the fields in the Usage Metering Data section.

Field	Description
Aggregate usage by	Time period over which to aggregate usage information. <ul style="list-style-type: none"> ○ Last Month ○ Last Two Months ○ Last Three Months ○ Last Six Months
Total hours used	Amount of time the software must be used to avoid being reclaimed.

4. If you selected **Last Used Date** in the **Reclamation type** field, complete the fields in the Last Used Data section.

Field	Description
Last used before	Amount of time a user can keep unused software before it is reclaimed.

5. Select **Save**.
6. On the Software Product related list, complete the following steps if a product doesn't exist for your reclamation rule.
 - a. Select **New**.
 - b. On the Custom Software Product form, [fill in the details](#) to add the product information.
 - c. Select **Submit**.
 - d. On the Reclamation Rule form, select **Edit** in the Software Product related list.

7. On the Software Product related list, select **Edit**.
8. Select the product that you created with on the Custom Software Product form.
9. Select **Save**.
10. Complete the following steps if the software product that you selected doesn't have a product process associated with it.
 - a. Select the link in the banner that displays on the Reclamation Rule form after you've applied the software product.
 - b. On the Custom Product Process form, fill in the details to add a process to the product.

Custom Product Process form

Field	Description
Product	Name of the product.
File name	Name of the file associated with the product.
Platform	Platform of the product.

- c. Select **Submit**

Example: Create a reclamation rule to import Microsoft SCCM usage data

Create a reclamation rule to pull in the total usage data for Microsoft Excel from Microsoft SCCM.

To begin creating a reclamation rule, add the following information to the Reclamation Rule form.

Field	Description
Name	Microsoft Excel
Applies to	Installed Software
Reclamation type	Total Usage Time
Usage Metering Data	
Aggregate usage by	Last Month
Total hours used	20

Click **Save**.

Reclamation Rule
Microsoft Excel

Name: Microsoft Excel

Applies to: Installed Software

Reclamation type: Total Usage Time

Notify user:

Usage Metering Data

Aggregate usage by: Last Month

Total hours used: 20

Specify the amount of time software must be used to avoid being reclaimed.

Update Delete

Software Product

Software Product New Edit... Search Software product Search

Reclamation rule = Microsoft Excel

Software product

No records to display

A software product already exists for Microsoft Excel, so you need to associate the product with the reclamation rule.

On the Software Product related list, click **Edit**.

On the Edit Members form, navigate to Excel in the Collection column and select Excel. Add it to the Software Product List column.

Edit Members

Click **Save**.

Reclamation Rule
Microsoft Excel

Name: Microsoft Excel Notify user

Applies to: Installed Software

Reclamation type: Total Usage Time

Usage Metering Data

Aggregate usage by: Last Month Total hours used: 20

Specify the amount of time software must be used to avoid being reclaimed.

Update Delete

Software Product (1) Product Process (2)

Software Product	Product Process
Excel	

Two product processes are associated with Excel. Click the Product Process related list to view the product processes.

Reclamation Rule
Microsoft Excel

Name: Microsoft Excel Notify user

Applies to: Installed Software

Reclamation type: Total Usage Time

Usage Metering Data

Aggregate usage by: Last Month Total hours used: 20

Specify the amount of time software must be used to avoid being reclaimed.

Update Delete

Software Product (1) Product Process (2)

Product Process	File name	Product	Platform
<input type="checkbox"/>	EXCEL.EXE	Excel	
<input type="checkbox"/>	Microsoft_Excel	Excel	macosx

On the Reclamation Rule form, click **Save**.

What to do next

The reclamation rule is added to the Reclamation Rules list and the data of the product will be imported from SCCM during the next monthly scheduled import.

Add a custom part number

You can add a custom part number to resolve an entitlement import error that occurs when a part number does not exist in the Software Library.

Before you begin

Role required: sam_admin

Procedure

Navigate to **All > Software Asset > Administration > Custom Part Numbers** and create a new record (see table for field descriptions).

Custom Part Number form

Field	Description
Publisher part number	Manufacturer product code.
Entitlement definition	Discovery map associated with the part number. <ul style="list-style-type: none"> • Publisher • Product • Version • Edition • Language • Platform
License type	Specifies whether the rights grant full access to the software or if they are being upgraded from a previous version of the software. <ul style="list-style-type: none"> • Full • Upgrade
License metric	The license metric that will be used during reconciliation to determine how software rights are consumed.
Exclude from content service	Option that excludes the custom product details from being shared with Software Asset Management Content Service if opted in.

Add a custom license metric

You can add a custom license metric to modify the default reconciliation process.

Before you begin

Role required:

- to create or modify a custom metric script: sam_developer
- to read custom metric script: sam_admin

Role required to create or modify a custom metric script: sam_developer

About this task

Custom license metrics can be created to define specific software calculations not included in the predefined license metrics list. Custom license metrics are useful so reconciliation can calculate rights per user or device for certain software products and bundles of lesser-known software publishers.

For example, you can create a custom metric to avoid over counting installs for products that are part of an unrecognized bundle.

You can use the Resource Value [samp_sw_resource_value] table to enhance the custom license metric capability by doing a 1:1 calculation between the Units consumed column in the Resource Value [samp_sw_resource_value] table and the Licenses required column in the License Metric Results [samp_license_metric_result] table. You can create your own calculations in your custom license metric scripts and write your own logic to further customize your custom license metric. For information on adding resource values to the Resource Value [samp_sw_resource_value] table, see [Specify resource values for your custom license metrics](#).

Custom metrics can be disabled using the custom license metric [property](#). This feature is enabled by default.

Procedure

1. Navigate to **All > Software Asset > Administration > Custom License Metrics** and create a new record (see table for field descriptions).

Custom License Metric form

Field	Description
License metric	Name of the custom license metric. This name is shown in the License Metric field of software entitlements, and in the license metric results for the software model.
Table Source	Specify if this custom license metric belongs to the Software Installations [cmdb_sam_sw_install] table or the Resource Value [samp_sw_resource_value] table. Note: If the table specified is the Resource Value table, the following fields: Reconciliation order - allocated , Reconciliation order - unallocated , and Allocation type are not displayed. Additionally, the Calculation Script shows a sample script related to resource value.
Metric group	Custom license metric.
Allocation type	Allocation type of the metric license, per device or per user. <ul style="list-style-type: none"> ○ Device ○ User
Description	Description of the custom license metric.
Reconciliation order — allocated	Reconciliation metric rank priority for allocated licenses. Lower rank value takes precedence.

Field	Description
Reconciliation order – unallocated	Reconciliation metric rank priority for unallocated licenses. Lower rank value takes precedence.
Calculation	
Calculation Script	The calculation method for the license metric is script. Specify the reconciliation script.

2. Select **Submit**.

Custom license metric example script

The following is an example of a custom license metric script.

Note:

This example is for demo purposes only and is not meant to be used for actual compliance scenarios.

```
<script><![CDATA[getRightsForDevice();
function getRightsForDevice(){
var rightsForDevice = -1;
var deviceRecord = new GlideRecord('cmdb_ci_computer');
if(deviceRecord.get(entity)){
rightsForDevice = deviceRecord.getValue('disk_space');
}
return rightsForDevice;
}]]></script>
```

Specify resource values for your custom license metrics

If you create a custom license metric based on resource values, specify the resource value for each software product that you want to calculate licensing requirements for.

Before you begin

Role required: sam_user

Procedure

1. Open the Resource Value [samp_sw_resource_value] table.
 - If you're using the Software Asset Workspace, open the License operations view. From the License operations view, navigate to **Resource value > Resource value**.
 - If you're using the Software Asset Management classic application, navigate to **All > Software Asset > Administration > Resource Value**.
2. Select **New**.
3. On the form, fill in the fields.

Resource Value form

Field	Description
Name	Name of the resource value.
Software model	Software model of the software product that the resource value is associated with.

Field	Description
Company	Company of the associated software product.
Location	Physical location of the associated software product.
Units consumed	Total number of resource value units that you are currently consuming of the associated software product. For example, if you are protecting 50 terabytes of data using a data protection software product, set the Units consumed field to 50.
Department	Department that the associated software product is assigned to.
Cost Center	Cost center that is financially responsible for the associated software product.

4. Save the resource value.

- If you're using the Software Asset Workspace, select **Save**.
- If you're using the Software Asset Management classic application, select **Submit**.

Result

When subsequent reconciliations run, the Software Asset Management application determines the license compliance position of the associated software product by comparing the value of the **Units consumed** field against the value of the corresponding **Licenses required** field in the License Metric Results [samp_license_metric_result] table.

Refresh processor definitions

After activating Software Asset Management, refresh processor definitions to normalize processors on servers in the CMDB.

Before you begin

Role required: sam_admin

About this task

Refresh processor definitions after activating Software Asset Management and before running reconciliation. Refreshing processor definitions enables CPU types (name of the processor discovered) to be mapped to the correct processor definition.

Refreshing processor definitions can be time consuming when running for the first time. Allocate enough time to complete this task before proceeding.

Procedure

Navigate to **All > Software Asset > Administration > Refresh Processor Definitions** and select **Proceed**.

The Processor definitions list is shown.

Migrate software installations

If you are using Discovery, run this script after installing the Software Asset Management application to copy previously discovered software installation records from the [cmdb_software_instance] table to the [cmdb_sam_sw_install] table, which is used by the Software Asset Management application to store software installation records.

Before you begin

Role required: sam_admin

About this task

If you are running Discovery and have used a version of Software Asset Management previously, there is no need to run this script.

When running the Migrate Software Installs script, allow enough time for the process to complete.

Procedure

Navigate to **All > Software Asset > Administration > Migrate Software Installs** and select **Proceed**.

The Software Installations list is shown. If the data has already been migrated, a message is shown.

Revert Software Asset Management customizations

After installing the Software Asset Management application for the first time, or upgrading from the Software Asset Management Foundation plugin, you need to revert customizations for all features work. The Revert Customizations module in the Software Asset Management application can revert customized files related to Software Asset Management back to the base configurations that were skipped during the installation or upgrade process.

Before you begin

Role required: sam_admin

About this task

The Revert Customizations module shows the **Software Asset Skipped Files** list. All customizations and configurations related to Software Asset Management can be reverted to the base application version.

To ensure feature functionality, you must revert customizations after:

- A new installation of the Software Asset Management Professional (com.snc.samp) plugin
- Upgrading from the Software Asset Management Foundation (com.snc.sams) plugin

You can also revert customizations using the **System Diagnostics > Upgrade History** navigation.

Procedure

1. Navigate to **Software Asset > Administration > Revert Customizations** to view the Software Asset Skipped Files list.
2. Select **Revert** to revert all files with a disposition of **Skipped** to the base application version.
3. Verify that the disposition of all skipped files is **Reverted** in the customization summary. You can also verify the disposition of all skipped files in the Upgrade Details [sys_upgrade_history_log] table and the current OOB version in the Update Versions [sys_update_version] table.

Manage Software Library

Use the Manage Software Library module to manually upload software library data to on-premise instances (instances not in the cloud to receive automatic Software Library updates). You can also choose to export your normalization content for participation in the Software Asset Management content service.

Before you begin

Role required: admin (to enable module), sam_admin (to manage software library)

Activate the Manage Software Library module to manage Software Library content imports or exports by navigating to **System Definition > Modules**. Ensure that the **Active** column in the Manage Software Library module is set to true.

About this task

The Manage Software Library module must be activated using the System Definition module for it to be shown in the Software Asset Management administration navigation.

Software Library content data is provided in a zip file. The zip file contains files with consistent file sizes for improved performance. During import, data tables are successfully updated with content from the XML file during a background process.

A worker is an object that performs some work in one or more background threads. To import multiple XML files simultaneously, workers are used. To change the number of workers that run simultaneously, update the following two system properties with the number of workers being used:

- glide.sys.schedulers
- com.snc.samp.recon.max_workers

To upload an attachment larger than 1 GB, you need to update the `com.glide.attachment.max_size` system property to reflect the size of the content zip file.

You can also export your data for participation in the [Software Asset Management content service](#) to contribute to the improvement of the normalization service.

Procedure

1. Navigate to **Software Asset > Administration > Manage Software Library**.

2. To import the Software Library content file:

a. Select **Import Software Library Content File**.

b. Select **Attach Content File** to choose the Software Library content (.zip) file.

c. Select **Run Import**.

In the Import Files related list, track the progress of the import by seeing how many files have been processed and how many are still being processed. All the data in the Import Files related list is stored in the SAMP Import File [samp_import_file] table. For a more high level view of the import process, you can also view the Asset Job Logs [asset_job_log] table.

3. To export your normalization content:

a. Select **Content Service Opt-In: Export Normalization Content**.

b. Select **Run Export**.

c. When the export status is **Ready for Download**, select **Refresh**.

d. Select the attachment to open or save.

Platform Analytics Solution for Software Asset Management classic

This Platform Analytics Solution contains preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Enabling the Performance Analytics Solution

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

Note:

Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

For unlimited access to all features of this Platform Analytics Solution, purchase a Performance Analytics subscription. For more information, see [Activating your Performance Analytics subscription](#) .

The Performance Analytics - Content Pack - Software Asset Management classic is enabled automatically when ServiceNow activates Software Asset Professional on your instance.

Domain separation and 'Run As' user

In some solutions, System Administrator is the **Run As** user for data collection jobs in the Platform Analytics Solutions. In other solutions, the **Run As** user for data collection jobs is left blank. Verify that the **Run As** user exists on the instance, and that this user has the appropriate level of access. An inappropriate **Run As** user can cause errors or limit the data that is collected. This setting only has an effect if domain separation is enabled.

Related topics

Software Asset Analytics dashboard

View true-up costs and license, compliance, and removal summaries trend charts on the Software Asset Analytics dashboard integrated with Performance Analytics.

Note:

The Software Asset Analytics dashboard is no longer available for new Yokohama users who have activated the Software Asset Management Professional (com.snc.samp) plugin or upgraded to Yokohama without activating the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama. If you activated the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama but didn't activate the Workspace plugin (com.sn_sam_workspace), you have access to this dashboard. If you activated the workspace plugin (before or after upgrading to Yokohama, you won't be able to access this dashboard from the **Software Asset** navigation menu in your instance. You can however access this dashboard from the **Dashboards** navigation menu.

The Software Asset Analytics dashboard tab is accessed by navigating to **Software Asset > Overview**. Select an element within a report to see more information, or add and move widgets as needed.

The Overview, License Summary, and Compliance Summary tabs are updated whenever a new reconciliation result is available. Results are updated daily for the **Removal Summary** tab. You can save charts in PNG or JPG formats.

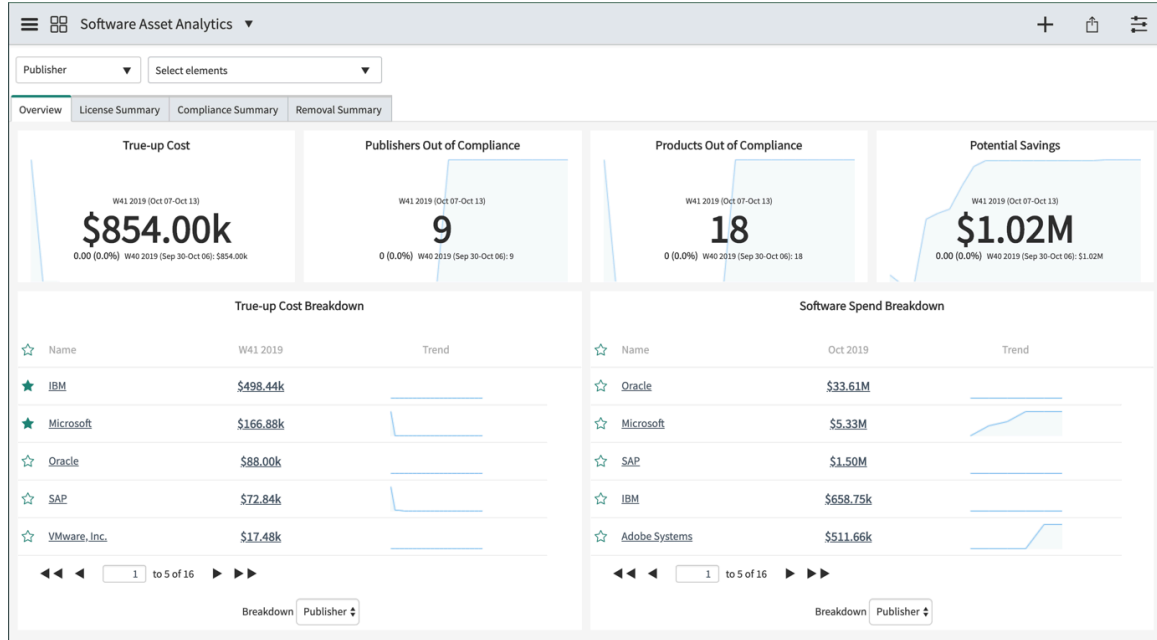

The graphs show important statistics about the software that is being tracked. In the **Overview** and **Optimization**, you can filter by publisher and product to narrow the results.

Note:

If you are not seeing data in the Overview dashboard, verify the `glide.cms.enable.responsive_grid_layout` system property is set to true.

Overview

Software Asset Analytics dashboard

Overview tab

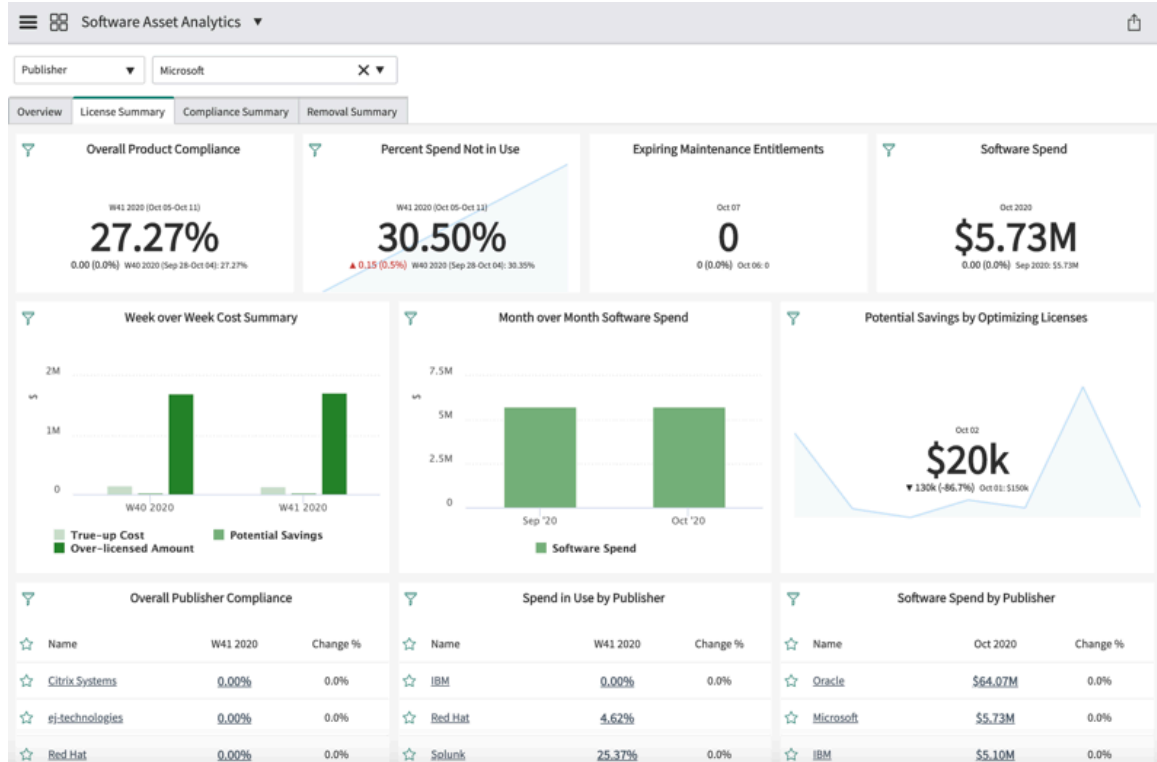

Report	Source list	Description
True-up Cost	Product Results	Cost to be compliant based on the average prices in entitlements for the rights.
Publishers out of Compliance	Product Results	Number of publishers that have at least one software model out of compliance. Select the report to view the results in the Software license usage .
Products out of Compliance	Product Results	Number of products that have at least one software model out of compliance. Select the report to view the results in the Software license usage .
Potential Savings	Product Results	Cost saved if removal candidates are reclaimed.
True-up Cost Breakdown	Product Results	Cost to be compliant based on the average prices in

Overview tab (continued)

Report	Source list	Description
		entitlements for the rights by publisher.
Software Spend Breakdown	License Metric Results	Total software cost of all entitlements not retired by publisher.
End of Life Products	Product Lifecycle [sam_sw_product_lifecycle]	Heat map of software product lifecycles that are reaching their end of life cycle. Select to drill-down to the software installations.

License Summary

License Summary tab

License Summary tab

Report	Source table	Description
Overall Product Compliance	Product Result [samp_product_result]	Total percent of compliant products.
Percent Spend Not in Use	Product Result and License Metric Results [samp_product_result] and [samp_license_metric_result]	Percent of software spend that is not in use (over-licensed amount and potential savings).

License Summary tab (continued)

Report	Source table	Description
Expiring Maintenance Entitlements	Software Entitlement [alm_license]	<p>End date of the total sum of all entitlements that are going to expire within 6 months.</p> <p>The total sum of entitlements includes:</p> <ul style="list-style-type: none"> • Perpetual • Maintenance • Perpetual + Maintenance • Upgrade • SA • Perpetual +SA • Step-up <p>Select the report to view details about the specific entitlements that are going to expire.</p> <p>Note: Maintenance and SA entitlements are not displayed as the Perpetual entitlements associated with them are displayed.</p>
Software Spend	License Metric Results [samp_license_metric_result]	Total software cost of all entitlements that are not retired.
Week over Week Cost Summary	Product Result and License Metric Results [samp_product_result] and [samp_license_metric_result]	True-up cost, potential savings, and over-licensed amount for a series of weeks.
Month Over Month Software Spend	License Metric Results [samp_license_metric_result]	Total software spend in a series of months.
Potential Savings by Optimizing Licenses	Potential Savings by Optimizing Licenses [samp_license_optimization_summary]	Potential cost savings for licenses on your physical hosts and clusters that are based on recommended license optimizations.

License Summary tab (continued)

Report	Source table	Description
		<p>Note: This report is available only for Microsoft Windows Server and on-premise Red Hat Enterprise Linux (RHEL) licenses.</p> <p>Select the report to view details about the recommended license optimizations and associated cost savings for each host or cluster. License optimizations include the recommended license, recommended rights, and recommended spend.</p>
Overall Publisher Compliance	Product Result [samp_product_result]	Percentage of products that are compliant by publisher.
Spend In Use by Publisher	Product Result and License Metric Results [samp_product_result] and [samp_license_metric_result]	Spend in use by publisher = $[[\text{Total spend}] - [\text{Over-licensed amount}] - [\text{Potential savings}]] / \text{Total spend}$.
Software Spend by Publisher	License Metric Results [samp_license_metric_result]	Total software spend by publisher.

Compliance Summary

Compliance summary consists of time-series data using Performance Analytics to show the compliance trends over time. The source for compliance analysis data is the Product Result [samp_product_result] table.

Compliance Summary tab

Compliance trend: True-up Cost

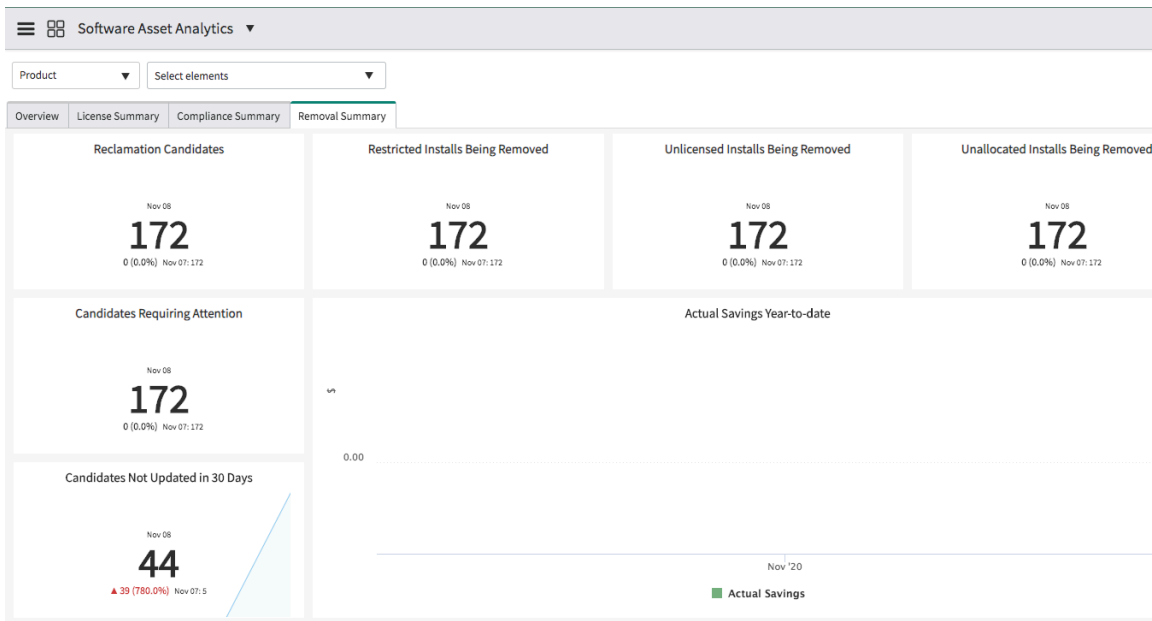

Report	Description
True-up Cost	Cost to be compliant based on the average prices for entitlements for the rights.
Publishers out of compliance	Number of publishers that have at least one software model out of compliance.
Products out of compliance	Number of products that have at least one software model out of compliance.
Potential savings	Cost saved if removal candidates are reclaimed.
Breakdowns	Shows the detailed list of results based on the widget selected. Breakdowns include Publisher, Product, and Scorecard.
Records	Shows the detailed list of product results based on the widget selected.

Compliance trend: Over-licensed amount

Report	Description
Over-licensed amount	Cost of licenses owned but not being used.
Publishers over-licensed	Number of publishers that have at least one software right not being used.
Products over-licensed	Number of products that have at least one software right not being used.
Breakdowns	Shows the detailed list of results based on the widget selected. Breakdowns include Publisher, Product, and Scorecard.
Records	Shows the detailed list of product results based on the widget selected.

Removal Summary

The source for removal summary data is the Reclamation Candidate [samp_sw_reclamation_candidate] table.

Removal Summary tab

Report	Description
Reclamation Candidates	Total number of active removal candidates with a low usage justification. Select the report to show the filtered list of records.
Restricted Installs Being Removed	Total number of active removal candidates with a restricted software justification. Select the report to show the filtered list of records.

Removal Summary tab (continued)

Report	Description
Unlicensed Installs Being Removed	Total number of active removal candidates with an unlicensed justification. Select the report to show the filtered list of records.
Unallocated Installs Being Removed	Total number of active removal candidates with an unallocated justification. Select the report to show the filtered list of records.
Candidates Requiring Attention	Number of removal candidates in the attention required state. Select the report to show the filtered list of records.
Candidates Not Updated in 30 Days	Number of removal candidates that have an updated date value older than 30 days. Select the report to show the filtered list of records.
Actual Savings Year-to-date	Sum of potential savings in a given month of closed complete removal candidates.
Removal Candidates Breakdown	Active removal candidates in various breakdowns (State, Publisher, Product, Justification, and Last Updated).

Software Asset Management dashboard

View true-up costs, optimization results, and compliance trend charts on the Software Asset Management dashboard.

Note:

The Software Asset Management dashboard is no longer available for new Yokohama users who have activated the Software Asset Management Professional (com.snc.samp) plugin or upgraded to Yokohama without activating the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama. If you activated the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama but didn't activate the Workspace plugin (com.sn_sam_workspace), you have access to this dashboard. If you activated the workspace plugin (before or after upgrading to Yokohama, you won't be able to access this dashboard from the **Software Asset** navigation menu in your instance. You can however access this dashboard from the **Dashboards** navigation menu.

The Software Asset Management dashboard tab is accessed by navigating to **Software Asset > Overview** and selecting **Software Asset Management** from the dashboard list. Select an element within a report to see more information, or add and move widgets as needed.

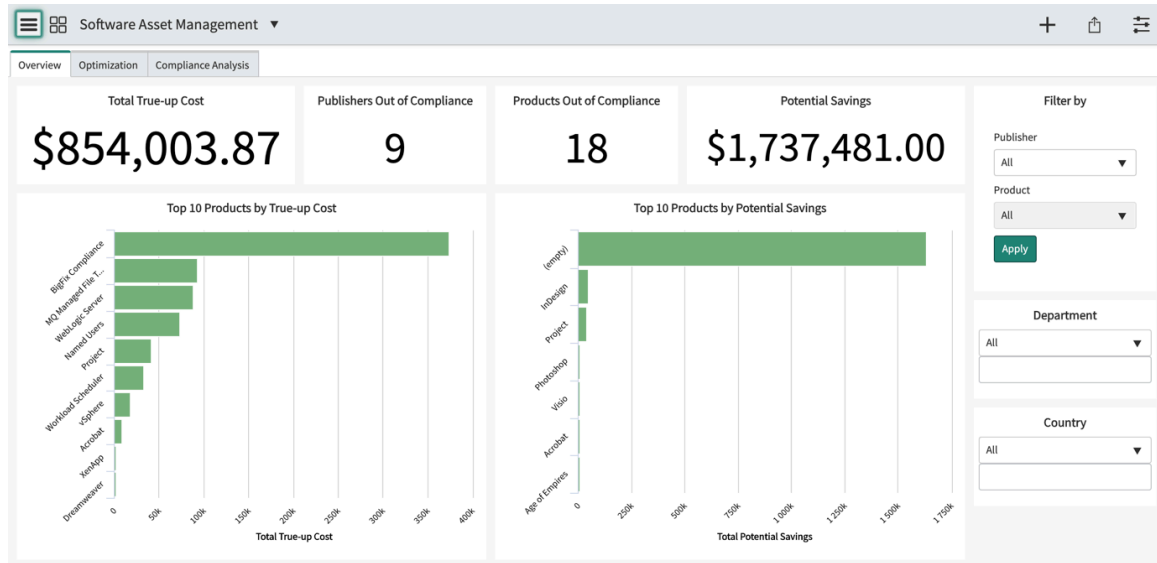

Results are updated daily, or whenever a new reconciliation result is available, and can be refreshed by selecting the **Refresh** icon for each result. You can also save charts in PNG or JPG formats.

The graphs show important statistics about the software being tracked. In the Overview and Optimization tabs, you can filter by publisher, product, department, and country to narrow the results.

Overview

The source for overview data is the Product Result [samp_product_result] table.

Overview tab

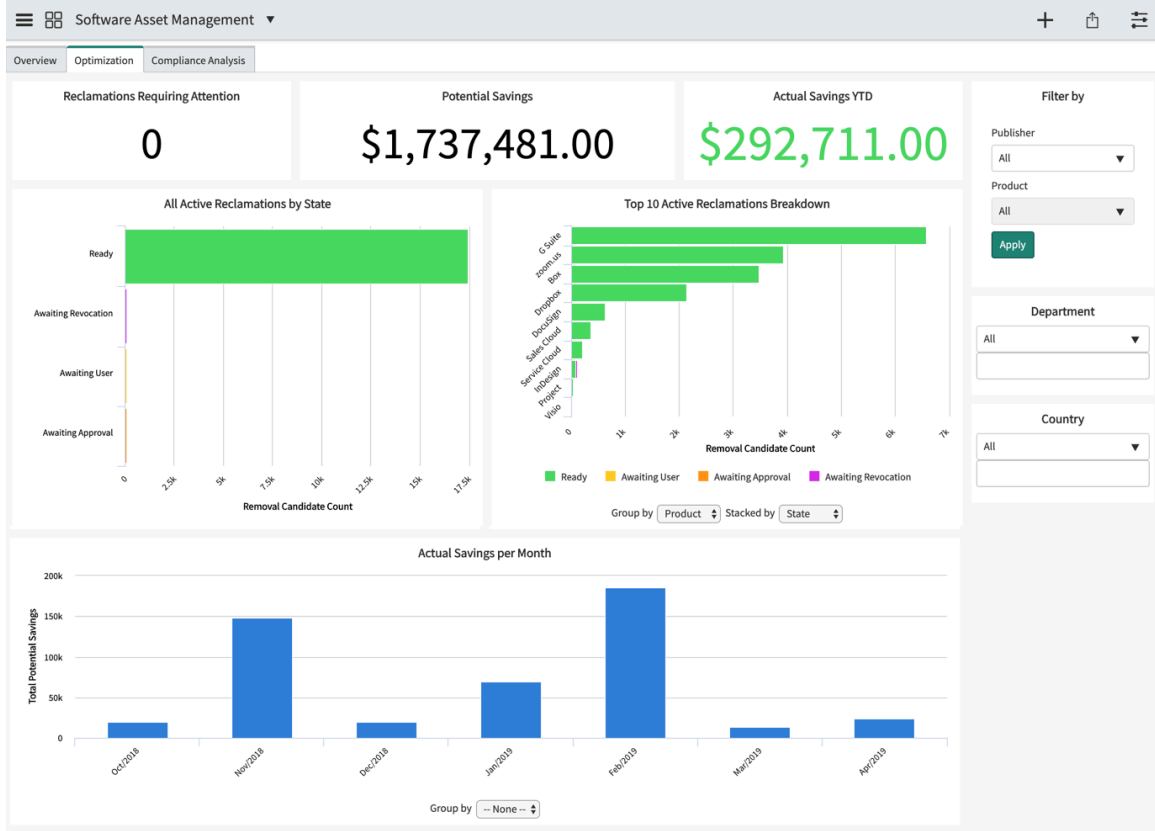

Overview tab

Report	Description
Total True-up Cost	Cost to be compliant based on the average prices in entitlements for the rights.
Publishers out of Compliance	Number of publishers that have at least one software model out of compliance. Select the report to show the filtered list of records.
Products out of Compliance	Number of products that have at least one software model out of compliance. Select the report to show the filtered list of records.
Potential Savings	Cost saved if removal candidates are reclaimed.
Top 10 Products by True-up Cost	Top 10 products graphed in order of true-up cost.
Top 10 Products by Potential Savings	Top 10 products graphed in order of potential savings.

Optimization

The source for optimization data is the Reclamation Candidate [samp_sw_reclamation_candidate] table.

Optimization tab

Optimization tab

Report	Description
Reclamations Requiring Attention	State is Attention Required
Potential Savings	<ul style="list-style-type: none"> Created on This Year OR Active is true OR <ul style="list-style-type: none"> Closed on This Year AND Opened on Last Year
Actual Savings YTD	Closed on This Year AND State is Closed Complete
All Active Reclamations by State	Active is true
Top 10 Active Reclamations Breakdown	Active is true
Actual Savings per Month	State is Closed Complete AND Closed in Last 12 Months

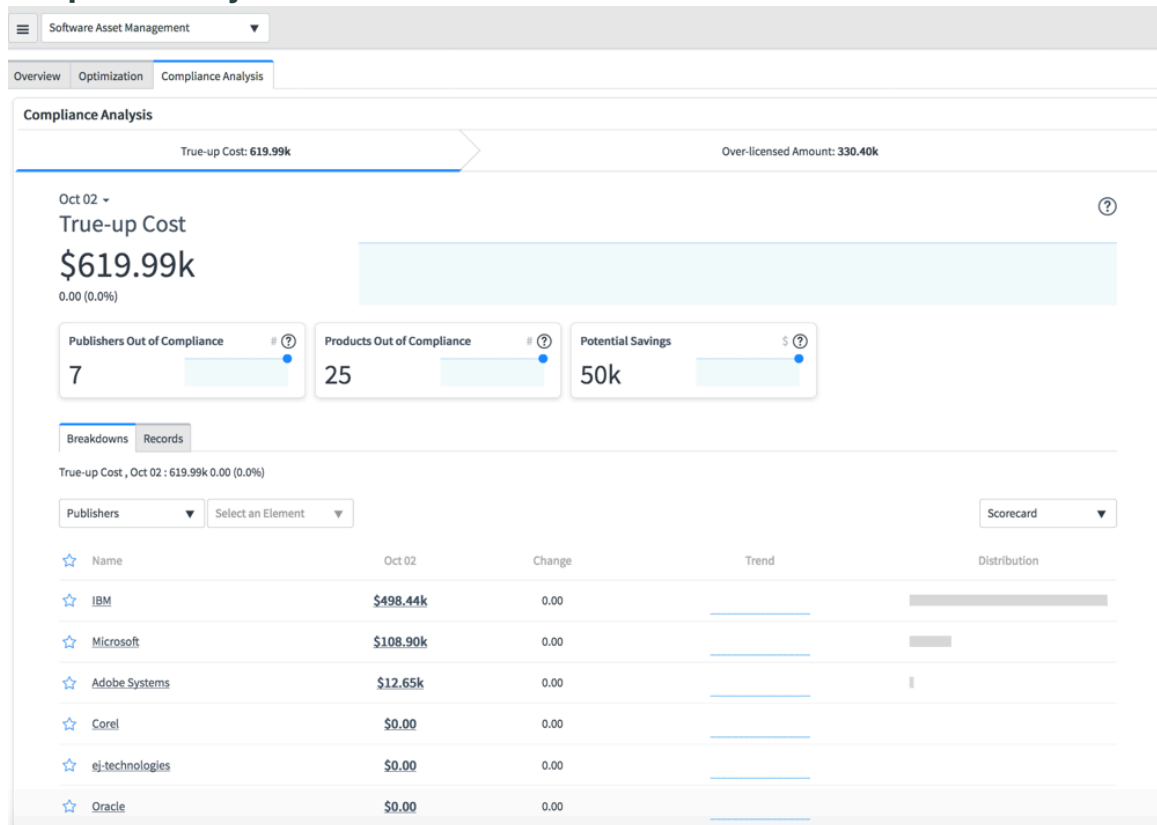

Removal candidate state color key:

Color	State
Red	Attention Required
Green	Ready
Yellow	Awaiting Use
Orange	Awaiting Approval
Purple	Awaiting Revocation
Blue	Closed Complete

Compliance Analysis

Compliance analysis consists of time-series data using Performance Analytics to show the compliance trends over time. The for compliance analysis data is the Product Result [samp_product_result] table.

Compliance Analysis tab

Compliance Analysis: True-up Cost

Report	Description
True-up Cost	Cost to be compliant based on the average prices for entitlements for the rights.
Publishers out of compliance	Number of publishers that have at least one software model out of compliance.
Products out of compliance	Number of products that have at least one software model out of compliance.

Compliance Analysis: True-up Cost (continued)

Report	Description
Potential savings	Cost saved if removal candidates are reclaimed.
Breakdowns	Shows the detailed list of results based on the widget selected.
Records	Shows the detailed list of product results based on the widget selected.

Compliance Analysis: Over-licensed amount

Report	Description
Over-licensed amount	Cost of licenses owned but not being used.
Publishers over-licensed	Number of publishers that have at least one software right not being used.
Products over-licensed	Number of products that have at least one software right not being used.
Breakdowns	Shows the detailed list of results based on the widget selected.
Records	Shows the detailed list of product results based on the widget selected.

Normalization and Content Service dashboard

View normalization trend charts on the Normalization and Content Service dashboard integrated with Performance Analytics.

Note:

The Normalization and Content Service dashboard is no longer available for new Yokohama users who have activated the Software Asset Management Professional (com.snc.samp) plugin or upgraded to Yokohama without activating the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama. If you activated the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama but didn't activate the Workspace plugin (com.sn_sam_workspace), you have access to this dashboard. If you activated the workspace plugin (before or after upgrading to Yokohama, you won't be able to access this dashboard from the **Software Asset** navigation menu in your instance. You can however access this dashboard from the **Dashboards** navigation menu.

The Normalization and Content Service dashboard tab is accessed by navigating to **Software Asset > Overview** and selecting **Normalization and Content Service** from the dashboard list. You can also access it from the dashboard list of another Software Asset Management dashboard. Select an element within a report to see more information, or add and move widgets as needed.

Normalization chart results are updated daily when the **SAM – Discovery Model Normalization** job is run. You can save charts in PNG or JPG formats.

Normalization and Content Service dashboard

Report	Source list	Description
Overall Normalization Rates for Licensable Software	Software Installs Normalization Rates	Overall normalization status count for all licensable products.
Normalization Rate Breakdown for Top Publishers	Software Install Normalization Rates for Top Publishers	Licensable normalization status count per top publisher for Microsoft, Oracle, IBM, VMware, Citrix, SAP, and Adobe.

Central Data Service Download Status related list

The Central Data Service Download Status related list is updated daily when the **SAM – Central Data Service Download Status** job is run.

Central Data Service Download Status related list

Engineering License Overview dashboard

Monitor and gain insights into your engineering applications license position and usage by viewing product usage reports in the Engineering License Overview dashboard.

i Note:

The Engineering License Overview dashboard is no longer available for new Yokohama users who have activated the Software Asset Management Professional (com.snc.samp) plugin or upgraded to Yokohama without activating the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama. If you activated the Software Asset Management Professional (com.snc.samp) plugin prior to Yokohama but didn't activate the Workspace plugin (com.sn_sam_workspace), you have access to this dashboard. If you activated the workspace plugin (before or after upgrading to Yokohama, you won't be able to access this dashboard from the **Software Asset** navigation menu in your instance. You can however access this dashboard from the **Dashboards** navigation menu.

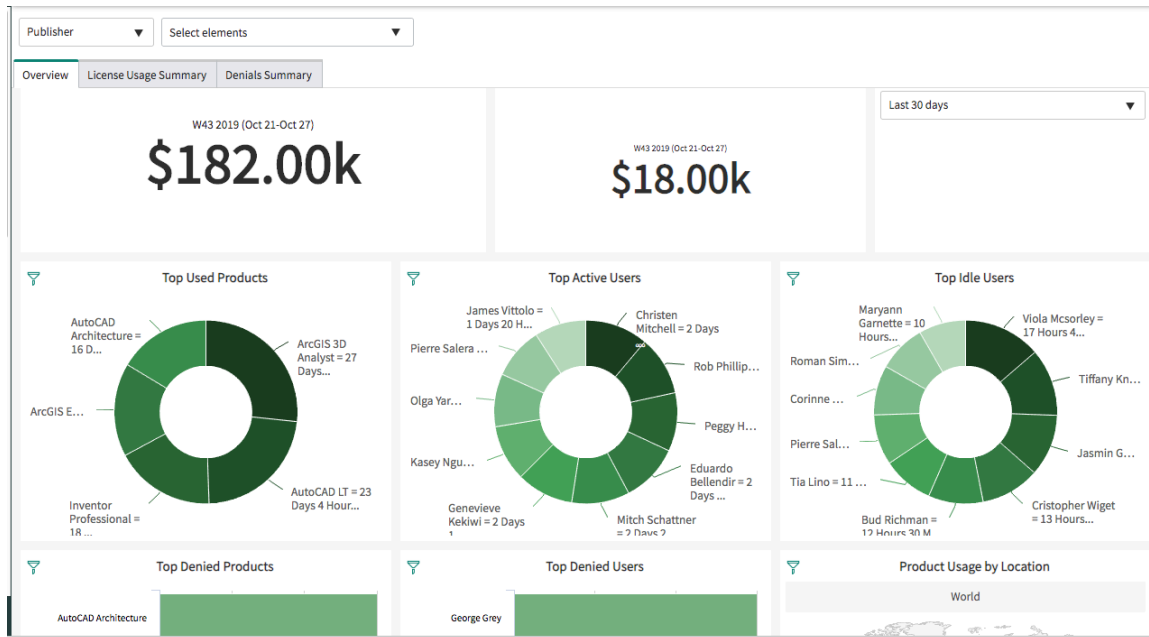

The Engineering License Overview dashboard displays reports on normalized products and publishers that belong to engineering applications such as AutoCAD, GIS.

Access the Engineering License Overview Dashboard by navigating to **Software Asset > Engineering License Overview**.

To narrow your results based on products or publishers across all tabs, use the filter in the left-hand corner of the dashboard. Only products and publishers that belong to engineering applications and are listed in the Engineering Application License [samp_eng_app_license] table appear in the filter. If no product or publisher is selected, the tabs display the cumulative data for all products and publishers that belong to engineering applications.

The **Overview**, **License Usage Summary**, and **Denial Summary** tabs are updated daily or whenever a new reconciliation result is available. You can save charts in PNG or JPG formats for viewing them locally and for sharing.

Overview tab

This tab gives an overview of the high-level metrics of all engineering applications. You can filter the results in this tab by various date options.

Note:

The Date filter is not applicable to **Current Spend** and **Potential Savings**.

Overview tab

Report	Source table	Description
Current Spend	Product Result [samp_product_result]	Total cost of all entitlements for all products.
Potential Savings	License Dashboard Inventory [license_dashboard_inventory]	Cost saved if licenses are not being utilized to their potential or are under-utilized. To optimize your costs, you can reallocate those licenses or return the licenses and save the cost.
Top Used Products	Engineering Application Usage [samp_eng_app_usage]	Top products that are being currently used. The number of days and hours being used per product also appears.
Top Active Users	Engineering Application Usage [samp_eng_app_usage]	Top users who are currently using the product. The number of days and hours being used per user also appears.

Overview tab (continued)

Report	Source table	Description
Top Idle Users	Engineering Application Usage [samp_eng_app_usage]	Top users who have requested a license but are not using the license. The number of days and hours of inactivity per user also appears.
Top Denied Products	Engineering Application Denial [samp_eng_app_denial]	Top products that are denied to users as these products have reached their peak concurrent usage.
Top Denied Users	Engineering Application Denial [samp_eng_app_denial]	Top users that are denied licenses to products.
Product Usage by Location	Engineering Application Usage [samp_eng_app_usage]	Based on the count of users using products by location.

License Usage Summary tab

Report	Source table	Description
License Usage overtime	Engineering Application License [samp_eng_app_license]	The total number or quantity of all available licenses; not just the active products but all the products.

License Usage Summary tab (continued)

Report	Source table	Description
	Engineering Application Concurrent Usage [samp_eng_app_concurrent_usage] Engineering Application Denial [samp_eng_app_denial]	<ul style="list-style-type: none"> The blue line represents the total number of licenses allocated to a product or a publisher The green line indicates the concurrent usage of the licenses. The red line indicates denials or if and when the concurrent usage peaks.
License Inventory	Engineering Application License [samp_eng_app_license]	All available licenses for a product or publisher.
License Server Statistics	Engineering Application License Server [samp_eng_app_license_server]	All the license management servers that OpenLM or OpenIT connect with.

Denials Summary tab

You can filter the data in this tab by date, user, or user group.

Denials Summary tab

Report	Source table	Description
Denials Over Time	Engineering Application Denial [samp_eng_app_denial]	Denials for a product over a period of time.

Denials Summary tab (continued)

Report	Source table	Description
Denials by Product	Engineering Application Denial [samp_eng_app_denial]	The products that have been denied to users the most.
Denials by License Server	Engineering Application Denial [samp_eng_app_denial]	The license servers that have been denied licenses to products the most.

Software Asset Management references

Use the descriptions provided to help you fill in the Software Asset Management forms.

Components installed with Software Asset Management Professional

Roles, plugins, and scheduled jobs are installed with the activation of the Software Asset Management Professional application. Demo data is available with this application.

Scheduled jobs installed

To view the list of scheduled jobs installed with the Software Asset Management Professional application, navigate to your ServiceNow instance, select **All**, and enter `Scheduled jobs` in the application navigator. On the Scheduled jobs page, select the Show/hide filter and in the condition builder, enter the filter condition, `Name starts with SAM`.

Roles installed

The following roles are installed with the Software Asset Management Professional application.

Software Asset Management Professional roles

Role name	Description	Contains roles
Software Asset Management administrator [sam_admin]	This role has full access to the Software Asset Management application. This role is required to import entitlements, manage reclamation rules, run reconciliation, create custom products and pattern normalization rules, set up Content Service, and other administrative features.	<ul style="list-style-type: none"> • sam_user • sam_spend_import • asset • model_manager • contract_manager

Software Asset Management Professional roles (continued)

Role name	Description	Contains roles
		<p>Note: The <code>sam_spend_import</code> role is installed with Software Spend Detection. The <code>it_demand_user</code> role is no longer automatically installed with PPM Standard.</p>
<p>Software Asset Management user</p> <p>[sam_user]</p>	<p>This role has access to all Software Asset Management features except administrative.</p> <p>If Software Spend Detection is installed, this role has access to all Software Spend Detection features except financial transaction data import and Content Service setup.</p>	<ul style="list-style-type: none"> • pa_viewer • cmdb_read • report_user • sn_remote_dir_sync_reader
<p>Software Asset Management developer</p> <p>[sam_developer]</p>	<p>Writes scripts on the platform, comparable to the script-writing privileges granted to a <code>sys_admin</code>. Users with this role must be trained ServiceNow administrators.</p>	<p>sam_admin</p>
<p>SaaS License Management integration administrator</p> <p>[sam_integrator]</p>	<p>Role required to create and manage SaaS integration profiles.</p>	<ul style="list-style-type: none"> • sam_user • connection_admin • flow_operator
<p>Software Spend Detection import user</p> <p>[sam_spend_import]</p>	<p>Role required to import financial transaction data into Software Spend Detection. Users with this role have access to all Software Spend Detection features except Content Service setup. Users with this role cannot view Software Asset Management without being granted additional roles.</p>	<p>pa_viewer</p>

Plugins installed

Software Asset Management Professional plugins

Plugin	Location	Description
Activate all Software Asset Management Professional	Now Support Service Portal	Requires subscription. Provides the capability to

Software Asset Management Professional plugins (continued)

Plugin	Location	Description
plugins including Software Asset Workspace com.sn_samp_master_ws		normalize software discovery information, reconcile entitlements with installs, and reclaiming unused software. Provides additional capabilities to reconcile publisher products. Loads the following plugins in one step: <ul style="list-style-type: none"> • Software Asset Management Professional (com.sn_samp_master) plugin • Software Asset Workspace (com.sn_sam_workspace)
Activate all Software Asset Management Professional plugins (com.sn_samp_master)	Now Support Service Portal	This plugin is for releases prior to Yokohama. Loads the following Software Asset Management Professional plugins in one step: <ul style="list-style-type: none"> • Software Asset Management Professional (com.snc.samp) plugin • All publisher pack add-on plugins • Software Asset Management UI Components (com.sn_samp_workbench) <p>Note: To enable SaaS License Management, you must request the Software Asset Management – SaaS License Management (sn_sam_saas_int) plugin separately from the ServiceNow Store. See Request SaaS License Management for information on how to request and activate this plugin.</p>
Software Asset Workspace	Now Support Service Portal	This plugin is for releases prior to Yokohama. Required

Software Asset Management Professional plugins (continued)

Plugin	Location	Description
(com.sn_sam_workspace)		to use the Software Asset Workspace, the new user interface of the Software Asset Management application.
Integration – Microsoft SCCM 2012 v2 Software Usage (com.snc.samp_usage_sccm)	Now Support Service Portal	Required to gather software usage data from Microsoft SCCM (System Center Configuration Manager) 2012 v2. Automatically activates the Integration – Microsoft SCCM 2012 v2 (com.snc.integration.sccm2012v2) plugin if not already active. <div style="background-color: #e1f5fe; padding: 10px; border: 1px solid #cfcfcf;"> <p>i Important: This plugin will be deprecated in the Tokyo release. If you are integrating with SCCM for the first time, request and install the Service Graph connector for Microsoft SCCM application from the ServiceNow Store ➤ instead. If you have already activated this plugin on your ServiceNow instance, use the Migration Readiness Tool for Service Graph Connector for SCCM store application to prepare your instance for migration to the Service Graph connector. See Service Graph connector for Microsoft SCCM ➤ for more information on the Service Graph connector.</p> </div>
Integration – Microsoft SCCM 2016 Software Usage (com.snc.samp.usage_sccm_2016)	Now Support Service Portal	Required to gather software usage data from Microsoft SCCM (System Center Configuration Manager) 2016. Automatically activates the Integration –

Software Asset Management Professional plugins (continued)

Plugin	Location	Description
		<p>Microsoft SCCM 2016 (com.snc.integration.sccm2016) plugin if not already active.</p> <div data-bbox="1007 359 1393 1297" style="background-color: #e0f2f7; padding: 10px;"> <p>i Important: This plugin will be deprecated in the Tokyo release. If you are integrating with SCCM for the first time, request and install the Service Graph connector for Microsoft SCCM application from the ServiceNow Store  instead. If you have already activated this plugin on your ServiceNow instance, use the Migration Readiness Tool for Service Graph Connector for SCCM store application to prepare your instance for migration to the Service Graph connector. See Service Graph connector for Microsoft SCCM  for more information on the Service Graph connector.</p> </div>
<p>Orchestration – Client Software Distribution (com.snc.orchestration.client_sf_distribution)</p>	<p>Now Support Service Portal</p>	<p>Required to activate ServiceNow® Orchestration application, which enables install and uninstall functionality of software on devices.</p>

Software Asset Management Professional plugins (continued)

Plugin	Location	Description
		<p>Note: Users who purchase the Software Asset Management Professional (com.snc.samp) plugin are licensed for software uninstall functionality only, also called software reclamation. Additional licensing is required for software install functionality.</p>
Software Asset Management – SaaS License Management (sn_sam_saas_int)	ServiceNow Store See Request SaaS License Management for information on how to request and activate this plugin from the ServiceNow Store.	Requires the Software Asset Management Professional (com.snc.samp) plugin. Provides integrations to manage licenses for SaaS products.
Software Asset Management – Spend Detection (com.sn_sam_spend)	Now Support Service Portal	Requires the Software Asset Management Professional (com.snc.samp) plugin. Provides core capabilities to detect software spend from financial transaction data.
File Signature Normalization (com.snc.file_signature_normalization)	Now Support Service Portal	Required to normalize discovered file signatures while creating installed software records. This plugin also gets activated with File-based Discovery.
Mobile Employee Experience My Asset (com.glide.mobile-employee.myassets)	Now Support Service Portal	Provides the capabilities needed for end users to view assigned assets on a mobile device and to create incidents to request service for these assets.
IT Asset Management Mobile (com.sn_itam_mobile)	Now Support Service Portal	Provides the capabilities for receiving personnel to receive purchased assets on a mobile device.
Publisher pack add-on plugins		
Software Asset Management Professional for Adobe	Now Support Service Portal	Provides additional capabilities to reconcile Adobe subscription software.

Software Asset Management Professional plugins (continued)

Plugin	Location	Description
(com.sn_samp_adobe)		
Software Asset Management Professional for Citrix (com.sn_samp_citrix)	Now Support Service Portal	Provides additional capabilities to reconcile Citrix software, such as Virtual Applications and Virtual Desktop.
Software Asset Management Professional for IBM (com.sn_samp_ibm)	Now Support Service Portal	Provides additional capabilities to reconcile IBM products using PVU and RVU license metrics. This plugin also provides additional capabilities to reconcile Red Hat Enterprise Linux software, such as Red Hat Enterprise Linux Server and Red Hat Enterprise Linux for Virtual Datacenters.
Software Asset Management Professional for Microsoft (com.snc.samp.microsoft)	Now Support Service Portal	Provides additional capabilities to reconcile Microsoft software such as Microsoft SQL Server.
Software Asset Management Professional for Oracle (com.snc.samp.oracle)	Now Support Service Portal	Provides additional capabilities to reconcile Oracle software, such as Oracle DB Server.
Software Asset Management Professional for SAP (com.sn_samp_sap)	Now Support Service Portal	Provides additional capabilities to reconcile SAP named user compliance and optimization.
Software Asset Management Professional for VMware (com.sn_samp_vmware)	Now Support Service Portal	Provides additional capabilities to reconcile VMware software, such as vCenter and vSphere.
Software Asset Management Professional for Engineering Applications (com.sn_samp_eng_app)	Now Support Service Portal	Requires the Software Asset Management Professional (com.snc.samp) plugin. Provides additional capabilities to reconcile engineering applications such as AutoCAD.

License agreement types

Types of license agreements determine the product usage rights.

Agreement types

The agreement types for the publisher packs.

Publisher pack	Agreement type
Adobe	<ul style="list-style-type: none"> • Generic • Enterprise Term License Agreement (ETLA) • Cumulative Licensing Program (CLP) • Transactional Licensing Program (TLP) • Value Incentive Plan (VIP)
Citrix	Generic
Common	<ul style="list-style-type: none"> • Generic • Enterprise License Agreement (ELA)
Custom	<ul style="list-style-type: none"> • Generic • Enterprise License Agreement (ELA)
IBM	<ul style="list-style-type: none"> • Generic • Enterprise License Agreement (ELA) • International Program License Agreement (IPLA): No license impact. • IBM Customer Agreement (ICA): No license impact. • IBM Unlimited License Agreement (IULA)
Microsoft	<ul style="list-style-type: none"> • Generic • Enterprise Agreement • Enterprise Enrollment • Enterprise Subscription Agreement • Microsoft Products and Services Agreement • Open License • Open Value • Open Value Subscription • Select Enrollment • Select License • Select Plus

Publisher pack	Agreement type
Oracle	<ul style="list-style-type: none"> • Generic • Unlimited License Agreement (ULA)
VMware	<ul style="list-style-type: none"> • Generic • Enterprise License Agreement (ELA) • Enterprise Purchasing Program (EPP): No license impact. • Volume Purchasing Program (VPP): No license impact.

Software Asset Management properties

You can set default reconciliation properties such as grouping and reconciliation debugging.

These properties are available for the Software Asset Management application.

To access these properties, navigate to **All > Software Asset > Administration > Properties.**

Properties for Software Asset Management

Property	Description
<p>Select the default Group setting for the weekly run of reconciliation</p> <p>com.snc.samp.recon.group</p>	<p>Determines how rights and software installations are grouped during reconciliation.</p> <p>Values (default is None):</p> <ul style="list-style-type: none"> • Company • Cost Center • Country • Department • Region <p>The Reconciliation Group [samp_group] table stores the list of mappings for each of these group values.</p>
<p>SAM Workspace License operations list count limit</p> <p>sn_sam_workspace.sam_license_operations_list_count</p>	<p>Enables setting up a threshold limit to show the count of software asset records in the License operations view in the Software Asset Workspace. SAM administrator can set the value of the threshold limit as required.</p>

Properties for Software Asset Management (continued)

Property	Description
	Value is set to 5000000 . If there are less than five million records, the exact count of software installation records is shown. If there are more than five million records, the count is shown as 5000000+.
<p>Select the default Subgroup setting for the weekly run of reconciliation</p> <p>com.snc.samp.recon.subgroup</p>	<p>Determines the secondary grouping for rights and software installations during reconciliation.</p> <p>Except for None, group and subgroup values must be different.</p> <p>Values (default is None):</p> <ul style="list-style-type: none"> • Company • Cost Center • Country • Department • Region <p>The Reconciliation Group [samp_group] table stores the list of mappings for each of these subgroup values.</p>
<p>Run reconciliation with all available custom license metrics</p> <p>com.snc.samp.recon.enablecustommetrics</p>	<p>Enables custom license metrics when running reconciliation.</p> <p>If you have a custom license metric configured, it is not applied when this property is set to No. The default is Yes.</p>
<p>Enable debugging of reconciliation results. Note that enabling debugging will have an impact on performance.</p> <p>com.snc.samp.debug</p>	<p>Enables debugging of reconciliation results to troubleshoot a result. The default is No.</p> <p>Additionally, this property also triggers logging for on-premise import debugging.</p>
<p>Automatically create software models for all 'licensable' products</p>	<p>Automatically creates a software model, in a non-compliant state, for any unlicensed installations,</p>

Properties for Software Asset Management (continued)

Property	Description
<p>com.snc.samp.automaticsmrcreation</p>	<p>subscriptions, or options (of licensable products) in the Product Results list that do not have an entitlement.</p> <p>The new software model and results are used to show the unlicensed count in the License Position Report.</p> <p>Note: For more information on automatically creating software models, see Automatic creation of software models.</p>
<p>Select the level of aggregation for reconciling licenses for Oracle databases and WebLogic servers on VMware</p> <p>com.snc.samp.oracle.reconlevel</p> <p>Note: This property is available only if you've activated the Software Asset Management publisher pack for Oracle.</p> <p>Note: This property supports domain separation using the domain separation application properties for Software Asset Management. See Set up domain-specific reconciliation properties for Oracle for more details.</p>	<p>Level of aggregation that is used for reconciling Oracle Database and WebLogic Server licenses on VMware virtualization technology. Software Asset Management supports the following aggregation levels:</p> <ul style="list-style-type: none"> • ESX: The ESX aggregation level considers all processor cores on the ESX host. • ESX cluster (default value): The ESX cluster aggregation level considers all processors on every ESX server within a cluster. • vCenter(s): The vCenter(s) aggregation level considers all processor cores on every ESX server. <p>If you select this aggregation level, licensing calculations are based on the ESXi version that you are using in your VMware virtual environment. See Oracle Database and WebLogic Server licensing in soft-</p>

Properties for Software Asset Management (continued)

Property	Description
	<p>partitioned environments for more information on the supported ESXi versions.</p>
<p>Use host affinity for reconciling licenses for Oracle databases and WebLogic servers on VMware at the vCenter(s) aggregation level</p> <p>com.snc.samp.oracle.hostaffinityenabled</p> <p>i Note: This property is available only if you've activated the Software Asset Management publisher pack for Oracle.</p> <p>i Note: This property supports domain separation by using the domain separation application properties for Software Asset Management. See Set up domain-specific reconciliation properties for Oracle for more details.</p>	<p>Enables the Software Asset Management application to account for VM-Host affinity rules when reconciling Oracle Database and WebLogic Server licenses within VMware vCenter Server instances. This property is applicable only if you set the aggregation level for Oracle reconciliation to vCenter(s) in the Select the level of aggregation for reconciling licenses for Oracle databases and WebLogic servers on VMware property.</p> <p>VM-Host affinity rules enable you to specify the physical ESXi hosts on which your virtual machines can run. If provisions are made for VM-Host affinity rules in your Oracle license agreement, you can lower your licensing obligations by accounting for these rules when licensing your Oracle Database and WebLogic servers.</p>
<p>Automatically create software models for all 'not licensable' products</p> <p>com.snc.samp.automaticsmcreation</p>	<p>Automatically creates a software model, in a non-compliant state, for any unlicensed installations (of not-licensable products) in the Product Results list.</p> <p>The new software model is used by Application Portfolio Management.</p> <p>Default is No.</p>
<p>Enter the name of the true/false field added to cmdb_ci_hardware table to exclude software installed on selected devices from Software Asset Management</p> <p>com.snc.samp.exclude_device_flag</p>	<p>Excludes the software installed on devices (from the Software Asset Management application) where the Exclude from SAM column</p>

Properties for Software Asset Management (continued)

Property	Description
	is set to true when you enter the column name, <code>exclude_from_sam</code> .
<p>Enter the license period (in days) to be considered during reconciliation, for applications published on Citrix environment</p> <p><code>com.snc.samp.citrix.app.license.period</code></p> <p>Note: This property is available only if you've activated the Software Asset Management publisher pack for Citrix.</p>	Indicates the license period (in days) for Citrix applications to be considered during reconciliation. Default is 90 days.
<p>Enter the period (in days) to be considered for peak usage consumption, for engineering applications.</p> <p><code>com.snc.samp.eng.app.peak.usage.period</code></p>	<p>Indicates the period (in days) for engineering applications to be considered for peak usage consumption.</p> <p>The default value is 30 days and only a user with the <code>sam_admin</code> role can update this field.</p>
<p>Enter the number of scheduled jobs to run in parallel for reconciliation.</p> <p><code>com.snc.samp.recon.max_workers</code></p>	Indicates the number of scheduled jobs that run in parallel to reconciliation. Several scheduled jobs run reconciliation for different publishers simultaneously.
<p>Indicates whether Wide-Net Normalization is enabled on the instance. If enabled, Wide-Net Normalization rules/patterns will be applied on discovery models which have not been fully-normalized by regular package normalization rules</p> <p><code>com.snc.samp.wide_net_normalization.enabled</code></p>	<p>Enables wide-net normalization to be performed on discovery models. This property is enabled by default. Wide-net normalization is performed only on discovery models that could not be normalized using content rules.</p> <p>Only users with an admin role can modify the property.</p>
<p>Enable ML Normalization for discovered software.</p> <p><code>com.snc.samp.enable.ml_normalization</code></p>	Enables machine learning normalization to be performed on discovery models. This property is enabled by default. Machine learning normalization is performed only on discovery models that could not be normalized using content rules.

Properties for Software Asset Management (continued)

Property	Description
	Only users with an admin role can modify the property.
<p>Enter the threshold period (in days) after which billing data pulled from Cloud is considered old. This affects the license type confidence.</p> <p>com.snc.samp.sam_ci_billing_threshold</p>	<p>Indicates the threshold period, based on the number of days, after which the billing data that is pulled from Cloud Insights is considered old. Cloud Insights is used to determine the license type for SQL Server installed on AWS.</p> <p>The default value is 30 days and this property is activated by default.</p>
<p>Red Hat Enterprise Linux Server for Virtual Datacenters license cost optimization threshold</p> <p>Note: This property is available only if you've activated the Software Asset Management publisher pack for IBM.</p>	<p>Determines whether you should use RHEL Server or RHEL for Virtual Datacenters licenses for your RHEL deployment.</p> <p>The default threshold value is 3.2. This value is based on the ratio of the current RHEL Server subscription list price to the current RHEL for Virtual Datacenters subscription list price. If your entitlements contain different pricing for these products, you can calculate this value by dividing your RHEL for Virtual Datacenters subscription price by your RHEL Server subscription price.</p> <p>See Software Asset Management for Red Hat Enterprise Linux for more information about how you can use this threshold value to determine the most optimal license type for your RHEL deployment.</p>
<p>Microsoft Windows Server for Datacenter license cost optimization threshold</p> <p>com.snc.samp.windowserver.license.threshold</p>	<p>Determines whether it is more cost-effective to license the physical hosts or virtual machines (VMs) within your</p>

Properties for Software Asset Management (continued)

Property	Description
<p>Note: This property is available only if you've activated the Software Asset Management publisher pack for Microsoft.</p>	<p>Microsoft Windows Server clusters based on the cost ratio between Microsoft Windows Server Datacenter Edition licenses and Microsoft Windows Server Standard Edition licenses.</p> <p>Based on the current list price of each license type, the default cost ratio value is 4.59. If your entitlements contain different pricing for these license types, you can modify this value by dividing the average price of your Microsoft Windows Server Datacenter Edition licenses by the average price of your Microsoft Windows Server Standard Edition licenses.</p>
<p>Default Region for IBM Devices sn_samp_ibm_lic.default_region</p> <p>Note: This property is available only if you've activated the Software Asset Management publisher pack for IBM and installed the IBM License Compliance for Software Asset Management application. For details on how to install the application, see Request the IBM License Compliance for Software Asset Management application for authorized Software Asset Management provider integrations.</p>	<p>Automatically associates physical hosts with a default region if they are not already associated with one. IBM license usage can be calculated only for physical hosts that are associated with a region.</p> <p>The default value is North America and South America.</p>
<p>Connect to ILMT using sn_samp_ibm_lic.ilmt_api_version</p> <p>Note: This property is available only if you've activated the Software Asset Management publisher pack for IBM.</p>	<p>Indicates which version of the IBM License Metric Tool (ILMT) or BigFix Inventory integration APIs you are using to create a connection between your IBM servers and the ServiceNow AI Platform platform.</p>
<p>Ratio of the entitlement cost of a Microsoft SQL Server Standard with Software Assurance to the cost of Microsoft SQL Server Enterprise with Software Assurance com.snc.samp.sqlserver.standard_sa.to.enterprise_sa.cost.ratio</p>	<p>Determines whether it is more cost-effective to license the physical hosts or virtual machines (VMs) within your Microsoft SQL Server</p>

Properties for Software Asset Management (continued)

Property	Description
<p>Note: This property is available only if you've activated the Software Asset Management publisher pack for Microsoft.</p>	<p>clusters based on the cost ratio between Microsoft SQL Server Standard Edition licenses with Software Assurance and Microsoft SQL Server Enterprise Edition licenses with Software Assurance.</p> <p>Based on the current list price of each license type, the default cost ratio value is 0.25. If your entitlements contain different pricing for these license types, you can modify this value by dividing the price of your Microsoft SQL Server Standard Edition licenses with Software Assurance by the price of your Microsoft SQL Server Enterprise Edition licenses with Software Assurance.</p>
<p>Ratio of the entitlement cost of a Microsoft Software Assurance entitlement to the cost of a Microsoft Non-Software Assurance entitlement</p> <p>com.snc.samp.ms.sa.to.nonsa.cost.ratio</p> <p>Note: This property is available only if you've activated the Software Asset Management publisher pack for Microsoft.</p>	<p>Determines whether it is more cost effective to use licenses with or without Microsoft Software Assurance on your Microsoft SQL Server clusters. The Software Asset Management application makes this determination based on the cost ratio between Microsoft SQL Server licenses with Software Assurance and without Software Assurance.</p> <p>Based on the current list price of each license type, the default cost ratio value is 1.25. If your entitlements contain different pricing for these license types, you can modify this value by dividing the price of your Microsoft SQL Server licenses with Software Assurance by the price of your Microsoft SQL Server licenses without Software Assurance.</p>

Properties for Software Asset Management (continued)

Property	Description
com.snc.samp.use_lifecycle_approximation	<p>Determines whether to include approximate life cycle dates when generating the life cycle report. This property is enabled by default.</p> <p>When selected, this property enables generating automatic life cycle dates based on approximation logic that is built on top of publisher provided General Availability dates, publicly available information, and industry averages.</p>
com.snc.samp.manage.published.products	<p>Enables you to publish software products in the phase-wise Software Asset Management implementation and also remove the published software products. The default value of this property is false. By setting the value of this property to true, you can view reports and dashboards only related to the software products that you manage in a phase-wise implementation of Software Asset Management in the following views of the Software Asset Workspace:</p> <ul style="list-style-type: none"> • Software asset overview • License usage view

Components installed with the Microsoft SCCM software usage plugin

Several types of components are installed with activation of the Microsoft SCCM software usage plugin.

Installed with SCCM Software Usage plugin

	SCCM 2012 v2	SCCM 2016
Data source	<ul style="list-style-type: none"> • SAMP Usage (Total usage) • SCCM 2012 v2 Software Last Used (Last used) 	<ul style="list-style-type: none"> • SAMP Usage 2016 (Total usage) • SCCM 2016 Software Last Used (Last used)

Installed with SCCM Software Usage plugin (continued)

License calculation for SAP cloud use types

Use SAP S/4HANA cloud use types and their weighting factors to calculate Full Usage Equivalent (FUE) licenses for different types of users of SAP S/4HANA Cloud applications.

FUE licenses can be allocated to different cloud use types with a specific weighting factor. For more information on FUE licenses, see [Software Asset Management publisher pack for SAP](#).

Weighting factor can be defined as a numeric value associated with a cloud use type and it is used for FUE license calculation. The following table mentions the weighting factors for different cloud use types:

SAP Cloud Use Types and weighting factors

SAP cloud use type	SAP cloud use type name	Weighting factor
Advanced	Cloud for advanced use	1
Core	Cloud for core use	5
Self-service	Cloud for self-service use	30
Developer	Cloud, Developer Access	0.5

Discovery models fields

Discovery Models form and related list field descriptions.

Discovery Models form

Field	Description
Display name	Name of the discovery model as it appears in record lists. This value is generated automatically using the discovered publisher, discovered product, and discovered version.
Normalization status	<p>Status of the normalization process:</p> <ul style="list-style-type: none"> • Normalized • Partially Normalized • Publisher Normalized • Match Not Found • Manually Normalized • New <p>Note: If a normalization suggestion record exists, a caution icon is shown next to the Normalization status field.</p> <p>The caution icon opens the Normalization Suggestion record for the discovery model.</p>
Publisher	Normalized publisher of the software.
Product	Normalized product name of the software.
Version	Normalized version of the software product.
Discovered publisher	Discovered publisher of the software.
Discovered product	Discovered name of the software.
Discovered version	Discovered version of the software.

Field	Description
Additional Information	
Product type	<ul style="list-style-type: none"> • Child: Subcomponent of main software (not licensable). • Driver: Software product that controls a device. • Licensable: Software product that is licensable. • Not Licensable: Software product that is not licensable. • Patch: Software product designed to update, fix, or improve an existing computer program. • Unknown: Not discovered. <p>For unknown product types, the product type can be changed to another value.</p> <p>When the product type is changed, the normalization status of the discovery model is updated to Manually Normalized.</p> <p>The reconciliation process only considers software discovery models that are licensable.</p>
Platform	<p>Platforms include:</p> <ul style="list-style-type: none"> • Windows • macOS • UNIX
Language	<p>Languages include:</p> <ul style="list-style-type: none"> • Dutch • English • French • German • Italian • Spanish <p>If discovered, more languages are generated.</p>
Edition	Normalized edition of the software.
Full version	Normalized full version of the software.
Exclude from content service	<p>Option that excludes the software discovery model details from being transferred to the Software Asset Management Content Service.</p> <p>The value is set on the custom product form.</p> <p>Note: This field is only shown for custom products when you have opted in to the Software Asset Management Content Service.</p>

Additional Information section

Field	Description
Product type	<ul style="list-style-type: none"> • Child: Subcomponent of main software (not licensable). • Driver: Software product that controls a device. • Licensable: Software product that is licensable. • Not Licensable: Software product that is not licensable. • Patch: Software product designed to update, fix, or improve an existing computer program. • Unknown: Not discovered. <p>For unknown product types, the product type can be changed to another value.</p> <p>When the product type is changed, the normalization status of the discovery model is updated to Manually Normalized.</p> <p>The reconciliation process only considers software discovery models that are licensable.</p>
Platform	<p>Platforms include:</p> <ul style="list-style-type: none"> • Windows • macOS • UNIX
Language	<p>Languages include:</p> <ul style="list-style-type: none"> • Dutch • English • French • German • Italian • Spanish <p>If discovered, more languages are generated.</p>
Edition	Normalized edition of the software.
Full version	Normalized full version of the software.
Exclude from content service	<p>Option that excludes the software discovery model details from being transferred to the Software Asset Management Content Service.</p> <p>The value is set on the custom product form.</p> <p>Note: This field is only shown for custom products when you have opted in to the Software Asset Management Content Service.</p>

Software Installation related list

Field	Description
Display name	Name of the software install as it appears in the record lists.
Publisher	Name of the publisher of the software.
Version	Version of the software.
Installed on	Name of the hardware the software is installed on.

Software installation fields

Software Installation form and related list field descriptions.

The list view for software installations shows the total number of software installation records for your organization based on the value specified in the **SAM Workspace License operations list count limit** system property (*sn_sam_workspace.sam_license_operations_list_count*). The default value for the record count is set to **5000000**. However, the SAM administrator can set the value for the count in the system property as required. If there are less than five million records, then the exact count is shown. If there are more than five million records, then the count is shown as 5000000+. For more information on this system property, see [Software Asset Management properties](#).

Note:

This topic describes only the fields that are available on the Software Installation form. For details on all fields that are available on both the Software Installation form and the Software Installation [cmdb_sam_sw_install] table, see [Software Installations Table Attribute Review](#).

Software Installation form

Field	Description
Display name	Name of the software installation as it appears in the record lists. Can be a combination of the discovered product name and edition.
Discovery model	Software discovery model that represents the installed software.
Publisher	Publisher of the software.
Version	Version of the software.
Edition Override	Override of the software edition setting. For Office 365 subscriptions, this field is set from the software subscriptions record. If the edition for the software was not discovered, you can edit this field to set the edition, if known, so reconciliation can be performed successfully.
Installation tab	

Field	Description
Prod id i Note: This field has been deprecated. However, it still appears on the Installation tab with an empty value.	Unique ID for the product assigned by the manufacturer. Found through discovery.
Install location	Path under which the software is installed.
Install date	Date that the software was installed.
Revision i Note: This field has been deprecated. However, it still appears on the Installation tab with an empty value.	Revision of the software.
Instance key	Unique ID for the instantiation of the software. Automatically generated when the software is installed.
Installed on	Hardware on which the software is installed.
Uninstall string	Identifier used to uninstall the software.
ISO serial number	ISO number of the software.
Reconciliation tab	
Entitlement i Note: This field has been deprecated. However, it still appears on the Reconciliation tab with an empty value.	The entitlement found to use with this installation.
Inferred suite	The inferred suite model this installation belongs to.
Omit from suites	Check box for not counting the software install as a component of a suite during reconciliation.

Normalization statuses

Description of normalization statuses for discovery models.

When a discovery model is normalized, it is normalized to the version and full version. However, if the discovery model is partially normalized or publisher normalized, then the discovery model won't be updated to full version. If the discovery model is manually normalized, you can decide if you want it normalized to version and full version.

Normalization status can have six different results:

Status	Description
Normalized	<p>A discovery model is fully normalized based on publisher, product, version fields. No fields are editable.</p> <p>Under specific conditions, certain fields that are typically read-only can be edited. If edited, the status changes to Manually Normalized.</p> <p>If only publisher and product fields are discovered, but the product type is Not Licensable, Child, Driver, or Patch, the status is Normalized.</p>
Partially Normalized	<p>A discovery model is partially normalized based on publisher and product fields only. In this case, the version field is editable and once that information is added the normalization status is changed to Manually Normalized.</p>
Publisher Normalized	<p>A discovery model that is partially normalized based on the publisher field alone. In this case, the version and product fields are editable, and once that information is added, the normalization status is changed to Manually Normalized.</p>
Match Not Found	<p>The normalization process could not match any of the three key fields of the discovery model with a rule in the Software Library. In this case, all key fields are editable and once the information is added the normalization status is changed to Manually Normalized.</p> <p>Match Not Found status could occur if a normalization rule for the software does not exist.</p> <p>For example, if the organization created custom software specific to the organization.</p>
Manually Normalized	<p>A discovery model is manually normalized when key fields in a New, Match Not Found, Partially Normalized, or Publisher Normalized discovery model are filled in manually.</p>
New	<p>The software discovery model has not yet run through the normalization process.</p>

License metrics for Microsoft products

A detailed description of the license metrics that can be utilized with Microsoft products.

Microsoft products and Software Asset Management license metrics

Product	Edition	Licensing model provided by Microsoft	Software Asset Management license metrics to be used on ServiceNow Software Asset Management
Windows Server Note: For legacy versions of Windows Server, refer to the Windows Server legacy versions table.	Data Center/ Standard	<ul style="list-style-type: none"> Per Core CAL licensing 	<ul style="list-style-type: none"> Per Core (with CAL) User/Device CAL for CAL licensing
Microsoft System Center	Data Center/ Standard	<ul style="list-style-type: none"> Server - use core based licensing (Server Management Licenses) Client - Use Client Management Licenses 	<ul style="list-style-type: none"> Server MLs- Per Core (with CAL) Client MLs- User/Device

	Enterprise	<ul style="list-style-type: none"> • Server/CAL • Processor 	<ul style="list-style-type: none"> • For Server/CAL use: Server(Per Instance) for Server licensing and User/Device CAL for CAL licensing. • Per Processor 	Only for Enterprise edition: If all processors in a machine are licensed, you may run unlimited instances of SQL Server 2002 on an unlimited number of virtual operating environments on the same machine.
2008-2008 R2	Standard	<ul style="list-style-type: none"> • Server/CAL • Processor 	<ul style="list-style-type: none"> • For Server/CAL use: Server(Per Instance) for Server licensing and User/Device CAL for CAL licensing. • Per Processor 	<ul style="list-style-type: none"> • Server/CAL: Each server license for these editions permits you to run unlimited instances of the software in one OSE or virtual machine (VM). To run the software in additional OSEs or VMs, you require additional server licenses. • Processor license: Number of OSEs on which you can run SQL Server. Only Physical OSEs.
	Enterprise	<ul style="list-style-type: none"> • Server/CAL • Processor 	<ul style="list-style-type: none"> • Use Server (per Server) for Server Licensing and User/Device CAL for CAL licensing. • Per Processor 	<ul style="list-style-type: none"> • Server/CAL: Each server license for the Enterprise edition permits you to run unlimited instances of the software in up to four OSEs or VMs. • Processor license: Number of OSEs on which you can run SQL Server. Up to four OSEs per license.
	Datacenter	Processor	Per Processor	Processor license: Number of OSEs on which you can run the SQL Server: Unlimited. The Datacenter edition requires that all the physical processors on the server are licensed and at least two processor licenses are assigned to the server.

Version	Edition	Licensing model provided by Microsoft	Software Asset Management license metrics to be used on ServiceNow Software Asset Management	Licensing rules
2012-2014	Standard	<ul style="list-style-type: none"> • Server/CAL • Per Core 	<ul style="list-style-type: none"> • For Server/CAL: Use Server (Per Instance) for server licensing and User/Device CAL for CAL licensing • Per Core 	<p>Core based licensing:</p> <ol style="list-style-type: none"> 1. Count the total number of physical cores in the server. Multiply the number of cores by the appropriate core factor to determine the total number of licenses required for the server. <p>i Note: The core factor used depends on the processor type deployed and a minimum of four core licenses is required for each physical processor on a physical server.</p> <ol style="list-style-type: none"> 2. To license individual VMs using the Per Core model, you must purchase a core license for each v-core (or virtual processor, virtual CPU, virtual thread) allocated to the VM, subject to a four core license minimum per VM. <p>For licensing purposes, a v-core maps to a hardware thread. When licensing individual VMs, core factors do not apply.</p>
	Enterprise	Per Core ¹	Per Core	Same as above.
2016-2019	Standard	<ul style="list-style-type: none"> • Server/CAL • Per Core 	<ul style="list-style-type: none"> • For Server/CAL: Server (Per Instance) for server licensing and User/Device 	<ul style="list-style-type: none"> • Server/CAL: Each server running SQL Server software requires a server license.

Version	Edition	Licensing model provided by Microsoft	Software Asset Management license metrics to be used on ServiceNow Software Asset Management	Licensing rules
			CAL for CAL licensing • For Core licensing: Per Core	• Per Core: A minimum of four core licenses are required for each physical processor on the server.
	Enterprise	Per Core ¹	Per Core	Same as above. Note: If you are already using SQL Server Enterprise edition with (Server/CAL) server licenses with software assurance, continue to use the Server+CAL licensing model. Use license metric as Server (per Server) for Server Licensing and User/Device CAL for CAL licensing. The new purchases for SQL Server Enterprise will be based only on the Per Core licensing model.

Licensing rules for BYOL and BYOS

View the bring your own license (BYOL) licensing rules for Microsoft and Oracle products in public cloud environments. In addition, view bring your own subscription (BYOS) licensing rules for Red Hat Enterprise Linux (RHEL) products in public cloud environments. Licensing rules can differ for virtual machines that reside on shared hosts or dedicated hosts across different cloud providers.

Licensing rules for Microsoft Windows Server and Microsoft SQL Server

Note: The following tables list only a subset of rules for Windows Server and SQL Server BYOL. Refer to the official Windows Server and SQL Server websites for the complete list of licensing rules.

Windows Server licensing rules

Cloud provider	Instance type	With software assurance	Without software assurance
AWS for Windows Server	Shared host	BYOL isn't supported because Windows Server doesn't have license mobility rights.	BYOL isn't supported.
	Dedicated host	<ul style="list-style-type: none"> • BYOL is supported for purchases or software releases only before October 1, 2019. • License by physical host. • Unlimited virtualization for Windows DC for purchases before October 1, 2019. 	<ul style="list-style-type: none"> • BYOL is supported for purchases or software releases only before October 1, 2019. • License by physical host. • Unlimited virtualization for Windows DC for purchases before October 1, 2019.
Microsoft Azure for Windows Server	Shared host	<ul style="list-style-type: none"> • BYOL is supported using Microsoft Azure Hybrid Benefits (AHB). • Enough eligible core licenses must be allocated to cover all cores on the virtual machines that are running. • A minimum of eight core licenses are allocated for using AHB. • Windows DC allows concurrent or dual use rights. 	BYOL isn't supported.

Windows Server licensing rules (continued)

Cloud provider	Instance type	With software assurance	Without software assurance
		<p>Note: Microsoft Windows Server Data Center provides the option of dual use rights, enabling you to utilize your Windows Server licenses simultaneously on Microsoft Azure and on licensed servers within your data centers. This feature, Azure Hybrid Benefit is only available on Microsoft Azure. For more information, see Azure Hybrid Benefit for Windows Server.</p> <ul style="list-style-type: none"> • Edition flexibility: Windows Standard can license Windows DC. 	
	Dedicated host	<ul style="list-style-type: none"> • BYOL is supported using Microsoft Azure Hybrid Benefits (AHB). • License by virtual machine or available cores. Only for Windows DC. 	<ul style="list-style-type: none"> • BYOL is supported for purchases or software releases only before October 1, 2019. • License for total physical cores for purchases before October 1, 2019.

Windows Server licensing rules (continued)

Cloud provider	Instance type	With software assurance	Without software assurance
		<ul style="list-style-type: none"> • Unlimited virtualization for Windows DC if licensing available cores. • Windows DC allows concurrent or dual use rights for virtual machines only. <p>Note: Microsoft Windows Server Data Center provides the option of dual use rights, enabling you to utilize your Windows Server licenses simultaneously on Microsoft Azure and on licensed servers within your data centers. This feature, Azure Hybrid Benefit is only available on Microsoft Azure. For more information, see Azure Hybrid Benefit for Windows Server.</p>	<ul style="list-style-type: none"> • Unlimited virtualization for Windows DC for purchases before October 1, 2019.
GCP for Windows Server	Shared host	BYOL isn't supported because Windows Server doesn't have license mobility rights.	BYOL isn't supported.
	Dedicated host	BYOL isn't supported.	BYOL isn't supported.

SQL Server licensing rules

Cloud provider	Instance type	With software assurance	Without software assurance
AWS for SQL Server	Shared host	<ul style="list-style-type: none"> • BYOL is supported via license mobility rights. • License virtual cores (vCPU) - minimum of four cores per virtual machine. 	BYOL isn't supported.
	Dedicated host	<ul style="list-style-type: none"> • BYOL is supported via License Mobility rights. • License by physical host. • Unlimited virtualization (SQL Server Enterprise) for purchases before October 1, 2019. 	<ul style="list-style-type: none"> • BYOL is supported for purchases or software releases only before October 1, 2019. • License by total physical cores for purchases before October 1, 2019. • Unlimited virtualization for Windows DC for purchases before October 1, 2019.
Microsoft Azure for SQL Server	Shared host	<ul style="list-style-type: none"> • BYOL is supported using Microsoft Azure Hybrid Benefits (AHB). • Edition flexibility: 1 SQL Enterprise license on-premise can cover 4 SQL Server Standard cores. Similarly, 4 SQL Server standard licenses on-premise can cover 1 SQL Server Enterprise. • License virtual cores (vCPU) - minimum of four cores per virtual machine. 	BYOL isn't supported.

SQL Server licensing rules (continued)

Cloud provider	Instance type	With software assurance	Without software assurance
	Dedicated host	<ul style="list-style-type: none"> • BYOL is supported using Microsoft Azure Hybrid Benefits (AHB). • License by virtual machine or available cores (SQL Server Enterprise). • License by virtual machine or total cores (SQL Server Standard). • Unlimited virtualization (SQL Server Enterprise) if licensing available cores. 	<ul style="list-style-type: none"> • BYOL is supported for purchases or software releases only before October 1, 2019. • License by total physical cores for purchases before October 1, 2019.
GCP for SQL Server	Shared host	<ul style="list-style-type: none"> • BYOL is supported via license mobility rights. • License virtual cores (vCPU) - minimum of four cores per virtual machine. 	BYOL isn't supported.
	Dedicated host	BYOL isn't supported.	BYOL isn't supported.

Licensing rules for Oracle Database and Oracle WebLogic Server

Note:

The following tables list only a subset of rules for Oracle Database and Oracle WebLogic Server BYOL. Refer to the official Oracle Database and Oracle WebLogic Server websites for the complete list of licensing rules.

Note:

Unless otherwise specified, licensing rules are the same for both AWS and Microsoft Azure.

Oracle Database licensing rules

Licensing type	Licensing rule
Per Processor licensing	Licensing is based on the number of vCPUs that the Oracle database is installed or running on. Different licensing rules are applied based on the Oracle Database version that is installed or running.

Oracle Database licensing rules (continued)

Licensing type	Licensing rule
	<p>Note: The Oracle Processor Core Factor Table is not applicable in cloud environments.</p> <p>Oracle Database Standard Edition, Standard Edition One, and Standard Edition 2</p> <p>Four vCPUs are equivalent to one socket, and one socket requires one license.</p> <p>The number of vCPUs is rounded up to the nearest multiple of four. For example, an Oracle database that is running on 10 vCPUs requires a total of three licenses.</p> <p>Oracle Database Enterprise Edition</p> <p>If hyper-threading is enabled, one license is required for every two vCPUs on which you install or run an Oracle database. If hyper-threading isn't enabled, one license is required for every vCPU on which you install or run an Oracle database.</p>
Named User licensing	<p>One license is required for every user or physical device that accesses an Oracle database.</p> <p>Different licensing minimums are applied based on the Oracle Database edition that your users and devices are accessing:</p> <p>Oracle Database Standard Edition and Standard Edition One</p> <p>These database editions don't have any licensing minimums.</p> <p>Oracle Database Standard Edition 2</p> <p>You must have a minimum of 10 licenses per eight vCPUs.</p> <p>Oracle Database Enterprise Edition</p> <p>You must have a minimum of either 25 licenses per vCPU or the total number of users and devices that are accessing this database edition. The licensing minimum is set to the larger of the two values.</p>
Oracle Database option and management pack licensing	<p>Database options and management packs must be licensed separately from database servers.</p> <p>The following database options and management packs aren't supported in cloud environments:</p> <ul style="list-style-type: none"> • Oracle Real Application Clusters (RAC) • Oracle Data Mining • Oracle Change Management Pack • Oracle Provisioning and Patch Automation Pack for Database
Oracle Database option licensing for	<p>If you're using the Oracle Active Data Guard option on an Oracle Enterprise Edition database, the primary database instance and read replicas that are associated with that database each require one Oracle Database Enterprise Edition license and one Oracle Active Data Guard license.</p>

Oracle Database licensing rules (continued)

Licensing type	Licensing rule
Active Data Guard	<p>Note: The Active Data Guard option is available only on Oracle Database Enterprise Edition.</p>
Unlimited License Agreement (ULA) licensing	Licenses that are acquired through an Unlimited License Agreement (ULA) are supported in authorized cloud environments. However, certification of these licenses isn't required at the end of the ULA term.
High availability (Multi-AZ) licensing	High availability, or Multi-AZ, deployments require twice the number of licenses as Single-AZ deployments so that they can account for standby Oracle Database instances.

In addition to these Oracle Database licensing rules, consider the following vCPU size limitations when you're setting up an Oracle deployment in the cloud. These size limitations can help you determine the maximum number of licenses that are supported on your cloud instances.

Note:

The vCPU size limitations are the same for both AWS and Microsoft Azure

vCPU size limitations

Oracle Database edition	vCPU size limitation
Oracle Database Standard Edition	Oracle Database Standard Edition is supported only on cloud instances that have a maximum of 16 vCPUs.
Oracle Database Standard Edition One and Standard Edition 2	Oracle Database Standard Edition One and Standard Edition 2 are supported only on cloud instances that have a maximum of eight vCPUs.
Oracle Database Enterprise Edition	Oracle Database Enterprise Edition is supported on all cloud instances, regardless of the vCPU count.

Oracle WebLogic Server licensing rules

Licensing type	Licensing rule
Per Processor licensing	<p>Licensing is based on the number of vCPUs that the Oracle WebLogic server is installed or running on. Different licensing rules are applied based on the Oracle WebLogic Server version that is installed or running.</p> <p>Note: The Oracle Processor Core Factor Table is not applicable in cloud environments.</p> <p>Oracle WebLogic Server Standard Edition</p> <p>Four vCPUs are equivalent to one socket, and one socket requires one license.</p>

Oracle WebLogic Server licensing rules (continued)

Licensing type	Licensing rule
	<p>The number of vCPUs is rounded up to the nearest multiple of four. For example, an Oracle WebLogic server that is running on seven vCPUs requires a total of two licenses.</p> <p>Oracle WebLogic Server Enterprise Edition</p> <p>If hyper-threading is enabled, one license is required for every two vCPUs on which you install or run an Oracle WebLogic Server. If hyper-threading isn't enabled, one license is required for every vCPU on which you install or run an Oracle WebLogic server.</p>
Named User licensing	<p>One license is required for every user or physical device that accesses an Oracle WebLogic server.</p> <p>Different licensing minimums are applied based on the Oracle WebLogic Server edition that your users and devices are accessing:</p> <p>Oracle WebLogic Server Standard Edition</p> <p>You must have a minimum of either 10 licenses per eight vCPUs or the total number of users and devices that are accessing this WebLogic Server version. The licensing minimum is set to the larger of the two values.</p> <p>Oracle WebLogic Server Enterprise Edition</p> <p>If hyper-threading is enabled, you must have a minimum of either 10 licenses per two vCPUs or the total number of users and devices that are accessing this WebLogic Server edition.</p> <p>If hyper-threading isn't enabled, you must have a minimum of either 10 licenses per vCPU or the total number of users and devices that are accessing this WebLogic Server edition.</p> <p>The licensing minimum is set to the larger of the two values.</p>

Licensing rule for Red Hat Enterprise Linux Server

One on-premise subscription license is required for every two cloud-based virtual machines (VMs) on which you install and run Red Hat Enterprise Linux Server.

Note:

This rule is only one of the licensing rules for Red Hat Enterprise Linux Server BYOS. Refer to the official Red Hat Enterprise Linux website for the complete list of licensing rules.

Software model fields

Software Model form and related list field descriptions.

After you fill a software entitlement with the correct PPN, a software model is automatically created. The tabs on the Software Model form, such as Suite Components, Suite Parents, Software Product Lifecycles, Metric Attributes, Downgrade Rights, Product Lifecycles for all Versions, and so on, are populated automatically. However, you can manually add or update the software model details based on your requirements.

Details tab

This list shows the details of a software model such as the status of the model, product details, licensing, conditions, and product catalog information.

Field	Description
Display name	<p>Name of the model. The system property <i>glide.cmdb_model.display_name.shorten</i> controls how software model display names are generated. Users with the admin role can configure this property.</p> <p>The default format is publisher + product + version + edition + platform + language.</p> <p>If the Platform or Language fields aren't set to Anything, the values are appended.</p>
Status	The status of the model. The options are In Production , Retired , and Sold .
Product Details section	
Publisher	<p>Publisher of the software. You can use the lookup list provided.</p> <p>Note: Publisher is a reference to the company [core_company] table. Only companies that you're using internally are shown.</p>
Product	<p>Software product name. The same lookup list provided on the Software Discovery Models form. You can create a custom product from the lookup list, if desired.</p> <p>Note: If the relationship between the software publisher [samp_sw_publisher] and company [core_company] tables isn't correct, products for that publisher may not be shown.</p> <p>If the publisher and product don't exist, you can Add a custom software product in Software Asset Management classic.</p>
Version condition	<p>Condition qualifiers for the Version field.</p> <ul style="list-style-type: none"> • starts with • is • is anything <p>The default is is anything.</p>
Version	Version of the software product.
Edition condition	Condition qualifiers for the Edition field.

Field	Description
	<ul style="list-style-type: none"> • starts with • is • is anything <p>The default is is anything.</p>
Edition	Edition of the software product to use when searching for the normalized discovery model.
Discovery map	<p>A set of conditions that determine which software discovery models get mapped to the software models. Purchased rights are only applied to software discovery models that meet the condition. This matching is important for reconciliation.</p> <p>Discovery models with predefined suites are indicated in the Suite defined field. A value of Yes indicates that the discovery model is a suite parent.</p> <p>You can use the discovery maps provided, or you can choose to specify the condition information directly instead. A user with the sam_admin role can choose to create a custom discovery map.</p> <p>When you select a discovery map, you may encounter a message: <code>Many underlying software models will be created. These might be part of suite components, downgrade rights or next version. Please validate on completion.</code> The message appears only if there are greater than or equal to 50 suite components for the software model and if any of the following conditions are met:</p> <ul style="list-style-type: none"> • A software model doesn't exist for any suite component • A software model doesn't exist for any downgrade rights • A software model doesn't exist for the next version <p>Note: If you change the discovery map in an existing software model, a warning message appears. The warning message informs you that the downgrade rights on the software model and on the related entitlements also change. For example, if you change the discovery map on a software model from DMAP1 to DMAP2, and save the software model, then all the downgrade rights associated with DMAP1 are removed from the software model and the downgrade rights associated with DMAP2 are populated. However, if the value in the Agreement type field in the Software Entitlement form layout is Generic, the downgrade rights for that entitlement don't change.</p> <p>You can verify which discovery models get mapped to the software model by selecting the Show Matching Discovery Models related link in Software Asset Management classic.</p>

Field	Description
	<p>View the same results in the Software Asset Workspace, by navigating to License operations > Licensing > Software models. Select a software model and then select the Matching Discovery Models related list.</p> <p>If the Publisher and Product fields are empty, the values are automatically populated according to the discovery map.</p>
Next version	<p>Reference to another software model of the same manufacturer, which represents the next version of the product.</p> <p>The next version is defined on the discovery map and is part of the content service. The next version is populated on the software model in either of the two ways:</p> <ul style="list-style-type: none"> • When you create a software model or update the discovery map on a software model, a business rule is triggered when you select Save. The next version is populated if the discovery map has a next version defined for it. • If the content service has the next version specified for the associated discovery map on an existing software model, the next version is populated when the schedule job <i>SAM- Create downgrades/upgrades for a software entitlement</i> runs. <p>Note: The next version is populated only after the <i>SAM- Create downgrades/upgrades for a software entitlement</i> scheduled job runs weekly.</p> <p>However, if you entered a value in the Next version field, that value isn't overridden.</p>
Product classification	<p>The official United Nations Standard Products and Services Code (UNSPSC) classification.</p> <p>From this release, product classifications have been enhanced with a comprehensive set of UNSPSC codes available via the Content Service library. Updates to the UNSPSC codes will also be available via the weekly Content Service library update.</p>
Software Licensing section	
Product type	<p>Product type values include: Child, Driver, Licensable, Not Licensable, Patch, and Unknown.</p> <p>Note: The reconciliation process only considers software products that are licensable.</p>
License under management	<p>The option indicating that you want to manage licenses for the specified software. If you clear this option, your software model won't be included in your reconciliation results.</p>

Field	Description
	<p>This option is selected by default. It's also selected for any software models that have been upgraded.</p> <p>If you upgrade and have software models with this option selected, you can do a bulk update and clear the License Under Management option from any software models you don't want to include in your reconciliation results. When you run reconciliation again, only the software models with the option still selected will display in your results.</p>
Owner	The person responsible for the model.
Unit of consumption	Unit of measure for the software units that can be consumed.
Conditions section	
Condition name	Name of the condition that you want to define for the software model.
Software install condition	<p>Condition to account for only specific software installations during reconciliation. Installs that do not meet the required software install conditions will be included in the reconciliation process. However, these installs are likely to be flagged as unlicensed unless there is another software model that meets the required software install conditions. For example, if you have purchased Microsoft Visual Studio and set up software installation conditions for using Visual Studio only to consume licenses in your non-production environment. You need to create separate software install conditions for each component model under Visual Studio.</p> <p>Note: If you clear the License under management option, the software installations that meet the specified software install conditions are excluded from reconciliation instead.</p> <p>In the Software Asset Management classic application, you can add multiple software install conditions to a single software model using the following options:</p> <ul style="list-style-type: none"> • Add Filter Condition: Enables you to specify all the conditions that a software installation must meet to be included in reconciliation. • Add "OR" Clause: Enables you to specify any of the conditions that a software installation can meet to be included in reconciliation. <p>In the Software Asset Workspace, you can add multiple software install conditions to a single software model using the following options:</p>

Field	Description
	<ul style="list-style-type: none"> • or: Enables you to specify any of the conditions that a software installation can meet to be included in reconciliation. • and: Enables you to specify all the conditions that a software installation must meet to be included in reconciliation. • + New condition set: Enables you to specify additional sets of conditions that a software installation can meet to be included in reconciliation.
<p>Subscription condition</p> <p>Note: This field appears only on subscription-based software models, including hybrid software models that contain both software subscriptions and on-premise software installations.</p>	<p>Condition to account for only groups of subscriptions during reconciliation. Only the subscriptions that meet the specified subscription conditions are included in reconciliation. For example, you can set a subscription condition to reconcile subscriptions from only a specific geographic location or business department.</p> <p>Note: If you clear the License under management option, the subscriptions that meet the specified software conditions are excluded from reconciliation instead.</p> <p>In the Software Asset Management classic application, you can add multiple subscription conditions to a single software model using the following options:</p> <ul style="list-style-type: none"> • Add Filter Condition: Enables you to specify all the conditions that a subscription must meet to be included in reconciliation. • Add "OR" Clause: Enables you to specify any of the conditions that a subscription can meet to be included in reconciliation. <p>In the Software Asset Workspace, you can add multiple subscription conditions to a single software model using the following options:</p> <ul style="list-style-type: none"> • or: Enables you to specify any of the conditions that a subscription can meet to be included in reconciliation. • and: Enables you to specify all the conditions that a subscription must meet to be included in reconciliation. • + New condition set: Enables you to specify additional sets of conditions that a subscription can meet to be included in reconciliation. <p>Warning: You can't add subscription conditions to out-of-the-box software models. You must create a software model to define subscription conditions for the associated subscription software.</p>
General	
Short description	A brief description of the model.

Field	Description
Platform	<p>Platform of the software product to use when searching for the normalized discovery model.</p> <p>The default is Anything for Windows, macOS, UNIX.</p>
Language	<p>Language of the software product to use when searching for the normalized discovery model, which is populated after it has been normalized or added manually.</p> <p>The default is Anything.</p>
Asset tracking strategy	Allows to override the way assets are tracked for the model.
Asset tracking unit	Unit of measure for asset.
Cost	The cost of a single unit of the software.
Certified	<p>Indicates if the product associated to this software model is approved or unapproved by TRM.</p> <p>When a enterprise architect adds a product to the TRM library, the product is flagged as either approved or unapproved. When a software model is created for an approved product, this check box is automatically selected.</p> <p>If you create a software model for an unapproved product, the software model is designated as restricted. During the reconciliation process, any software installations associated with unapproved products are identified as removal candidates.</p> <p>If you activate the Application Portfolio Management - TRM (com.snc.apm_trm) plugin for software models that already exist, this check box may or may not be selected depending on whether the product is approved.</p>
Restricted software	<p>Option for restricting software.</p> <p>Restricted software identifies software that you shouldn't install in your environment (inappropriate software, or software with vulnerabilities, for example).</p> <p>If the removal candidates don't exist, a scheduled job runs nightly that creates removal candidates for restricted software.</p>
License all installs accessed by clients	<p>Option to license the configuration items (CIs) that the software is installed on, based on conditions that you specify on the software model, such as software install conditions. If any of the associated client access records are unlicensed due to insufficient rights, all CIs remain unlicensed.</p> <p>If you disable this option, only the CIs that have been added to your client access records are licensed. See Add a software client access record in Software Asset Management classic for detailed instructions on how to add CIs to your client access records.</p>
<p>i Note: This field appears only on software models that are associated with client access records, except for Oracle DB Server software models.</p>	

Field	Description
	<p>If you enable this option after you have already added CIs to your client access records, those CIs are deleted from your records and then subsequently licensed based on the conditions that you specify on the software model.</p>
<p>Database option</p> <p>Note: This field appears only on Oracle Database software models.</p>	<p>Oracle database option or management pack. Each option or pack requires a separate software model. The database option is an identifier for software models.</p> <p>This field is shown when creating software models that meet the following conditions:</p> <ul style="list-style-type: none"> • The Publisher is Oracle. • The Product is DB Server.
<p>Database option condition</p> <p>Note: This field appears only on Oracle Database software models that are associated with a database option or management pack, as specified in the Database option field.</p>	<p>Condition to account for only the subsets of Oracle Database options or management packs during reconciliation. Only the database options or management packs that meet the specified database option conditions are included in the reconciliation.</p> <p>Note: If you clear the License under management option, the database options or management packs that meet the specified database option conditions are excluded from reconciliation instead.</p> <p>In the Software Asset Management classic application, you can add multiple database option conditions to a single software model using the following options:</p> <ul style="list-style-type: none"> • Add Filter Condition: Enables you to specify all the conditions that a database option or management pack must meet to be included in reconciliation. • Add "OR" Clause: Enables you to specify any of the conditions that a database option or management pack can meet to be included in the reconciliation. <p>In the Software Asset Workspace, you can add multiple database option conditions to a single software model using the following options:</p> <ul style="list-style-type: none"> • or: Enables you to specify any of the conditions that a database option or management pack can meet to be included in the reconciliation. • and: Enables you to specify all the conditions that a database option or management pack must meet to be included in reconciliation. • + New condition set: Enables you to specify additional sets of conditions that a database option or management pack can meet to be included in reconciliation.
<p>Apply to subscriptions</p>	<p>Option to apply this software model to only subscription-based software suites. If you don't enable this option, you</p>

Field	Description
	can apply this software model to only software suites with installed software.
<p>Auto-generate client access for allocations.</p> <p>Note: This field appears only on Oracle Database Server software models.</p> <p>Important: To use this option, you must request the Data Collection for Oracle Global Licensing and Advisory Services application from the ServiceNow Store. See Request Data Collection for Oracle Global Licensing and Advisory Services (GLAS) for more details on the Data Collection for Oracle Global Licensing and Advisory Services application.</p>	<p>Option to automatically generate and manage client access records for Oracle Database Server. If you enable this option, the Software Asset Management application generates and manages client access records based on your latest Oracle Database Server Named User Plus entitlements, the users, and devices that the associated rights are allocated to, and the Oracle database instances that are supported by these users and devices. The Software Asset Management application generates a separate client access record for each supported database instance.</p> <p>If you disable this option after the Software Asset Management application has automatically generated client access records for Oracle Database Server, those client access records are no longer managed and updated automatically. You must manage and update those client access records manually to keep them accurate and up to date.</p> <p>If you enable this option and already have existing client access records for Oracle Database Server, all automatically generated client access records are managed and updated automatically again. However, you must continue to manage and update all manually generated client access records.</p>
Product Catalog	
Catalog Item	<p>Information about the model as it appears in the product catalog and service catalog.</p> <p>Information only appears if the model has been published to the product catalog.</p>
Description	Description of the software model as it appears in the product catalog.
Picture	Image of the software logo can be added. This logo appears in the service catalog if the software model is published.
Activity	
Work notes	Notes about the work order task that are visible to all users within your organization.

Suite Components

This list shows the software suite component details. Software components are the suite children of a software suite parent. For more information, see [Software Asset Management software suites](#).

Field	Description
Allow automated content update	Option enabling ServiceNow to automatically send updated suite definitions to your instance through weekly content updates.
Suite child	The child product or products of the suite. For example, Microsoft Word and Microsoft Excel are child products of Microsoft Office.
Mandatory	Requirement of a suite component. A suite component can be Optional , Always Mandatory , or Mandatory Group . Set to Always Mandatory if the software must be installed to count the model as a suite.
Suite relationship assumed	Relationship that indicates that multiple software models exist for one or more of the suite components. Therefore, the relationship between suite parent and suite component was assumed. Review the created suite components to ensure the relationship is correct.
Suite Content Usage	
Inference Option: Number and Percent	<p>Number: Specifies the number of components installed for the suite. Specify a number lesser than or equal to the number of components.</p> <p>Note: For any new software models being created with suite components, the Number option is selected by default.</p> <p>Percent: Specifies what percentage of the components must be installed for the suite.</p> <p>Note: For existing software models with suite components that were using the inference percent, the Percent option is selected by default. However, you can choose to use the Number option.</p> <p>If the system property <i>Use component licenses to optimize compliance when suite licenses run out</i> is set to true, Inference percent specifies a threshold to determine whether the suite or component licensing is optimal.</p>
Allow automated content update	Option for enabling automatic content changes to software models.

Suite Parents

This list shows the software suite parent details. For more information, see [Software Asset Management software suites](#).

	Description
Suite parent	The parent suites to which the software is assigned. For example, the parent suite for several common Microsoft products is a version of Microsoft Office.
Suite child	
Mandatory	Requirement of a suite component. A suite component can be Optional , Always Mandatory , or Mandatory Group . Set to Always Mandatory if the software must be installed to count the model as a suite.
Suite relationship assumed	Relationship that indicates that multiple software models exist for one or more of the suite components, therefore the relationship between suite parent and suite component was assumed. Review the created suite components to ensure the relationship is correct.

Software Product Lifecycles

This list shows the lifecycle information of a software product version. For more information, see the Software Product Lifecycle report section in [Software models and Software entitlements](#).

Field	Description
Publisher	Name of publisher.
Product	Name of the software product.
Version	Licensable version of the software
Edition	Edition of the software.
Full Version	The granular licensable version of the software.
Phase start date	Date the life-cycle phase starts.
Lifecycle type	The product life cycle type values include: <ul style="list-style-type: none"> • Internal: The life cycle date is specific to the customer (for example, based on their internal policy, based on a custom contract/ agreement with the publisher). • Publisher: The life cycle date comes from publisher sources and is not specific to a customer.
Risk	The risk level to an organization with regards to the lifecycle phase. For example, the risk for the end of support phase for a publisher maybe moderate or the end of life phase maybe high. Risk type values include:

Field	Description
	<ul style="list-style-type: none"> • Very High • High • Moderate • Low • None
Lifecycle phase	<p>Lifecycle phase values include:</p> <ul style="list-style-type: none"> • Pre Release: Date the software was pre-released. • General Availability: Date the software became generally available to the market. • Upgrade <p>Note: Only shown when the Lifecycle type field is Internal.</p> <ul style="list-style-type: none"> • End of Support: Date by which the software will not be enhanced by the publisher. <p>This value corresponds to the Mainstream Support end date for Microsoft according to its Fixed Lifecycle Policy.</p> <ul style="list-style-type: none"> • End of Extended Support: Date by which the publisher will no longer provide any support or updates to the software. <p>This value corresponds to the Extended Support end date for Microsoft according to its Fixed Lifecycle Policy.</p> <ul style="list-style-type: none"> • End of Life: Date by which the software will no longer be manufactured by the publisher. <p>Note: This value isn't applicable for Microsoft because it follows the fixed lifecycle policy providing mainstream support and extended support. For more information, see Fixed Lifecycle Policy.</p>
Active	<p>Indicates if the lifecycle is to be considered or not while evaluating the risk of the software.</p> <p>Note: By default, only active life cycles are displayed.</p>

Field	Description
Source	Source of the lifecycle. If the record is created manually, it's set to Internal . If it's created automatically, the field is set to ServiceNow.
Description	Description of the software product lifecycle.

Software Entitlements

This list shows the entitlement terms of your software license. For more information, see the Software entitlements section in [Software models and Software entitlements](#).

Field	Description
Display name	Automatically generated name based on the software model display name.
License metric	License metric for the license group that the software license is counted against when reconciliation is run. The options for license metric change based on the Metric group field. For more information, see Software license metrics .
Metric group	Metric group based on the Software Model field. Each metric group has a set of license metrics that are specific to the software publisher.
License type	<p>The type determines whether the rights grant full access to the software or if they're being upgraded from a previous version of the software.</p> <p>The following are the various license types:</p> <ul style="list-style-type: none"> • Perpetual • Perpetual + Software Assurance • Software Assurance • Subscription • Step-up • Subscription Step-up
Active rights	Number of rights granted for this entitlement.
Purchased rights	Number of rights purchased for this entitlement.
Total cost	Total cost of the entitlement calculated from the unit cost.

Override License Costs

This list shows the override license cost information for your software entitlements.

Field	Description
Software Model	The software model that the software entitlement belongs to.
Metric Group	The metric group the software entitlement belongs to.
License Metric	The license metric specified for the software entitlement.
License Cost	Cost of the license.
License & Maintenance Cost	<p>Cost of the license combined with cost of the maintenance license.</p> <p>Specify a license cost or a license and maintenance cost, to override the true-up cost during reconciliation. If no values are specified in the License Cost or License & Maintenance Cost fields, the software entitlement cost is used for true-up cost calculations.</p> <p>Note: For SaaS licenses, only the license cost applies. The license & maintenance cost does not apply.</p>
The following fields appear when the value selected in the License Metric field is Employee.	
Active	Indicates whether the license cost is to be considered for true-up cost calculations.
Lower limit	The minimum number of employees that the licenses are required for.
Upper limit	The maximum number of employees that the licenses are required for.

Software Model Results

This list shows the software model results associated with the license metric results.

Field	Description
Status	<p>Status of the software model. Possible values are Compliant and Not Compliant.</p> <p>Select the Status field to open the corresponding Software Model Results record, where you can view more in-depth information about the software model result. See View software model results for detailed descriptions of each field on the Software Model Results form.</p>
Agreement type	<p>Agreement type is set on the software entitlement.</p> <ul style="list-style-type: none"> • Common: Generic, Enterprise License Agreement (ELA) • IBM: Generic, Enterprise License Agreement (ELA), International Program License Agreement (IPLA), IBM Customer Agreement (ICA), Unlimited Level Agreement (ULA)

Field	Description
	<ul style="list-style-type: none"> • Microsoft: Generic, Enterprise License Agreement (ELA) • Oracle: Generic, Unlimited Level Agreement (ULA) • VMware: Generic, Enterprise License Agreement (ELA), Enterprise Purchasing Program (EPP), Volume Purchasing Program (VPP) <p>Note: If the agreement type is Enterprise Level Agreement or Unlimited Level Agreement, the Status is Compliant even if there are unlicensed installations or unlicensed subscriptions.</p>
Unlicensed installs	Number of unlicensed software installations that are not covered by any entitlements.
True-up cost	Estimated cost of remediating unlicensed installations based on the lowest number of rights needed (rights needed * average price per right from entitlements). The lowest cost from Purchase Rights remediation options.
Over-licensed amount	Estimated cost of rights not being used. The sum of the Over Licensed amount from the True-up value costs.
Potential savings	
Group	Group specified on which to run reconciliation. Values include None, Country, Department, Company, Region, and Cost Center.
Subgroup	Subgroup specified on which to run reconciliation. Values include None, Country, Department, Company, Region, and Cost Center.

Metric Attributes

This list shows the metric attributes information of a software model.

Field	Description
Software model	Software model associated with the metric attributes.
Metric group	Grouping for the software metric. If you have optional publisher packs installed that the software applies to, those options are shown. Otherwise, the metric group value is Common .
License metric	The license metric that the software license is counted against when reconciliation is run (per user, per device, for example).
Description	Attribute type description that is based on the license metric value.
Attribute	Attribute type for reconciling entitlement license metrics. For more information on each

Field	Description
	attribute type, see Software model metric attributes .
Attribute value	Value of the attribute (integer).
Attribute value is unlimited	Option for setting the attribute as unlimited.

Vendor Catalog Items

This list shows you the details of the software models associated with a vendor. For more information, see [Vendor catalog items](#).

Field	Description
Name	Name of the catalog item.
Product ID	Item identification number assigned by your organization.
Short Description	A brief description of the item.
Vendor Price	The price at which the item is available in the vendor catalog. If the vendor offers a discount, the vendor price reflects the discounted price.
Rank tier	Displays the overall ranking for this vendor's products and services.

Client Access

This list shows a client access record details of the users or devices that are accessing a particular version of your server software using a client access license (CAL).

Field	Description
Name	Name of the client access record. Select a name to open the corresponding client access record, where you can view more in-depth information about the record, such as the users or devices that the associated client access licenses (CALs) are assigned to and the configuration items (CIs) that the associated server software is installed on. See Add a software client access record in Software Asset Management classic for more information on client access records in the Software Asset Management classic application. See Create a software client access record in workspace for more information on client access records in the Software Asset Workspace.
Count	Number of unique users or devices that are granted access to the associated server. Note: If you are using a Citrix software model and User/Device CAL type, the Count field is based on the number of user/device licenses that are assigned to your users or shared devices.
Type	Type of CAL that is associated with the client access record.

Field	Description
	<ul style="list-style-type: none"> • User CAL: Licenses each user that accesses the associated server, regardless of the number of devices that each user is using to access the server. • Device CAL: Licenses each device that accesses the specified server, regardless of the number of users that are using each device to access the server. • User/Device CAL: Licenses each user or device that accesses the associated server. <p>Note: If you are using a Citrix software model, the User/Device CAL type is based on the user/device licenses that are assigned to your users or shared devices.</p> <ul style="list-style-type: none"> • Reserved Hourly Average Sensor: This metric counts the number of unique active endpoints per clock-hour and averages them over a rolling 28-day period. The count of Reserved Hourly Average Sensor Licenses resets at the start of each clock-hour. • Sensor Subscription: This metric calculates license usage by averaging endpoint counts over four consecutive weeks. Weekly endpoint counts are based on the total number of endpoints consumed in the previous seven days. <p>Note: The Reserved Hourly Average Sensor and Sensor Subscription license metrics are applicable only for CrowdStrike and are available with Yokohama Patch 1, Software Asset Management - SaaS License Management (sn_sam_saas_int) 15.0.8, and Software Asset Management (sn_itam_samp) 2.1.0 version onwards. If you are on any version for Yokohama below Patch 1, refer KB1801232.</p>
Cost Center	Cost center of the users or devices that are granted access to the associated server.
Department	Business department of the users or devices that are granted access to the associated server.
Location	Geographic location of the users or devices that are granted access to the associated server.
Company	Company of the users or devices that are granted access to the associated server.

Software Subscriptions

This list shows the available subscriptions for a software application.

Field	Description
Display name	Software publisher and product for the subscription.

Field	Description
User principal name	The user's email address for the subscription.
Software model	The software model for the subscription.
Last activity	The last date when this subscription was last used.
Inactive days	<p>The number of days for which a user's subscription has been inactive.</p> <p>This field is visible on the Software Subscriptions form when the Last activity field is not empty. Inactive days are calculated using the value in the Last activity field.</p>
Subscription profile	Profile that is associated with the subscription identifier.

Downgrade Rights

This list shows the downgrade rights information of a software model. For more information, see [Downgrade Rights](#).

Field	Description
Parent software model	Parent (or the topmost hierarchy) of the software model.
Software model	Software model associated with the downgrade rights. Based on the parent software model that you select, the related software models appear in the list. For example, if you select Microsoft SQL Server 2012 Standard as the parent software model, only Microsoft -related software models appear in the list.
Source	Source of the downgrade rights. If the record is created manually, it's set to Internal . If it's created automatically, the field is set to ServiceNow.
Active	<p>Option that indicates if the downgrade rights on the software model are active or not. If needed, you can deactivate the downgrade rights. Only the active downgrade rights appear in the field. To see all the downgrade rights, remove the Active condition from the filter.</p> <p>If you deactivate a downgrade right on a software model, the change is propagated to the related software entitlement downgrade rights, irrespective of the source of the downgrade right. You cannot deactivate the downgrade right on a software model and</p>

Field	Description
	<p>keep the downgrade right activated on the software entitlement.</p> <p>To deactivate a downgrade right, double-click the field to display the toggle button, select false, and then select the Save icon (✔).</p> <ul style="list-style-type: none"> • false: deactivates the downgrade right on the software model and on the related software entitlements. • true: reactivates the downgrade right on the software model and on the related software entitlements.

Matching Discovery Models

This list shows the discovery maps that match the software publisher and product fields of the software model.

Field	Description
Display name	Name of the discovery model. This value is generated automatically using the discovered publisher, discovered product, and discovered version.
Normalization status	Status of the normalization process: <ul style="list-style-type: none"> • Normalized • Partially Normalized • Publisher Normalized • Match Not Found • Manually Normalized • New
Publisher	Normalized publisher of the software.
Product	Normalized product name of the software.
Version	Normalized version of the software product.
Edition	Normalized edition of the software.

Product Lifecycles for all Versions

This list shows the life cycle for all versions of the software product.

Field	Description
Publisher	Name of the publisher.
Product	Name of the software product.

Field	Description
Version	Licensable version of the software.
Full version	The granular licensable version of the software.
Edition	Edition of the software.
Lifecycle phase	<p>Life-cycle phase values include:</p> <ul style="list-style-type: none"> • Pre Release: Date the software was pre-released. • General Availability: Date the software became generally available to the market. • Upgrade <ul style="list-style-type: none"> • Note: Only shown when the Lifecycle type field is Internal. • End of Life: Date by which the software will no longer be manufactured by the publisher. <ul style="list-style-type: none"> • Note: This value isn't applicable for Microsoft because it follows the fixed life-cycle policy providing mainstream support and extended support. For more information, see Fixed Lifecycle Policy. • End of Support: Date by which the software will not be enhanced by the publisher. <p>This value corresponds to the Mainstream Support end date for Microsoft according to its Fixed Lifecycle Policy.</p> • End of Extended Support: Date by which the publisher will no longer provide any support or updates to the software. <p>This value corresponds to the Extended Support end date for Microsoft according to its Fixed Lifecycle Policy.</p>
Lifecycle type	<p>The product life cycle type values include:</p> <ul style="list-style-type: none"> • Internal: The life cycle date is specific to the customer (for example, based on their internal policy, based on a custom contract/agreement with the publisher). • Publisher: The life cycle date comes from publisher sources and is not specific to a customer.

Field	Description
Source	<p>Source of the life cycle.</p> <ul style="list-style-type: none"> • If the record is created manually, this value set to Internal. • If the record is created automatically, the field is set to ServiceNow.
Description	Description of the software product life cycle.
Phase start date	Date the life-cycle phase starts.
Risk	<p>The risk level to an organization with regards to the life-cycle phase. For example, the risk for the end of support phase for a publisher maybe moderate or the end of life phase maybe high.</p> <p>Risk type values include:</p> <ul style="list-style-type: none"> • Very High • High • Moderate • Low • None
Active	<p>Indicates if the life cycle is to be considered or not while evaluating the risk of the software.</p> <p>Note: By default, only active life cycles are displayed.</p>

Software model metric attributes

Software model metric attributes and related list field descriptions.

Metric attributes

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
Maximum installs per right		True	The number of installs each right can license.	Per Named Device	Common
Minimum cores per processor	8	False	The number of core rights that must be applied to a physical processor or set of vCores.	Per Core (with CAL)	Microsoft

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			<p>Licensable cores = Processors * Max (Minimum cores per processor, Cores)</p>		
Minimum cores per VM	8	False	The number of core rights that must be applied to a virtual machine (VM).	Per Core (with CAL)	Microsoft
Maximum active OSEs per server	2	False	<p>The maximum number of Operating System Environments (OSEs) allowed to run software on a physical server.</p> <p>Licenses required = (Licensable OSEs/ Maximum active OSEs per server) * Licensable cores</p>	Per Core (with CAL)	Microsoft
Minimum cores per server	16	False	<p>The number of core rights that must be applied to a physical server.</p> <p>Licensable cores = Max (Processors * Max (Minimum cores per processor, Cores), Minimum</p>	Per Core (with CAL)	Microsoft

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			cores per server)		
Maximum installs per OSE	1	False	<p>The maximum number of installs allowed within one of a server's OSEs.</p> <p>Licenses required = (Licensable installs per OSE / Maximum installs per OSE) * Licensable cores</p>	Per Core (with CAL)	Microsoft
Minimum cores per processor	1	False	The number of core rights that must be applied to a physical processor.	Per Core	Common
Maximum size of instance on cloud	8	False	Oracle Database Standard Edition, Oracle Database Standard Edition One and Oracle Database Standard Edition 2 have maximum limits on the size of the instances to which they're deployed on Oracle Authorized Cloud Environments such as Microsoft Azure and AWS. Oracle Database Enterprise Edition doesn't have any	Per Processor	Oracle

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			maximum limits on the size of the instances to which it's deployed to on Oracle Authorized Cloud Environments such as Microsoft Azure and AWS.		
Maximum number of sockets per server	2	False	Oracle Database Standard Edition, Oracle Database Standard Edition One and Oracle Database Standard Edition 2 may only be licensed on servers that have a value less than the maximum number of sockets.	Per Processor	Oracle
Maximum installs per right		True	The maximum number of installs each right can license.	Per Named User	VMware
Maximum installs per right		True	The maximum number of installs each right can license.	Per Named User	IBM
Maximum installs per right		True	The maximum number of installs each right can license.	Per Named User	Common
Maximum VMs per right	2	False	For RHEL Server, this is the number of VMs running on a physical	Per Socket-pair	Red Hat

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			<p>host that each subscription can license. A single VM running on a host needs one subscription.</p> <p>For RHEL for Virtual Datacenters, this is the number of VMs that can be licensed with one subscription for each socket-pair on the physical host.</p>		
Maximum sockets per right	2	False	The number of sockets on the physical host each subscription can license. A single socket host needs one subscription.	Per Socket-pair	Red Hat
Maximum processors per right	2	False	<p>The maximum number of physical processors each right can license.</p> <p>Licenses required = Processors / Maximum processors per right</p>	Per Processor	Microsoft
Maximum active OSEs per server	2	False	<p>The maximum number of OSEs allowed to run software on a physical server.</p> <p>Licenses required = Licensable</p>	Per Processor	Microsoft

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			OSEs / Maximum active OSEs per server		
Maximum installs per OSE	1	False	The maximum number of installs allowed within one of the server's OSEs. Licenses required = Licensable installs per OSE / Maximum installs per OSE	Per Processor	Microsoft
Maximum installs per OSE	1	False	The maximum number of installs allowed within one of the server's OSEs. Licenses required = Licensable installs per OSE	Server (Per Instance)	Microsoft
Maximum installs per right	1	False	The maximum number of installs each right can license.	Per Application Instance	VMware
Maximum installs per right		True	The maximum number of installs each right can license.	Per OSI	VMware
Minimum NUPs	5	False	If licensed by Named User Plus (NUP), then both Oracle Database Standard Edition and Oracle	Named User Plus	Oracle

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			Database Standard Edition One require a minimum of five NUP licenses each.		
Minimum NUPs for WebLogic on-premise deployments	10	False	The minimum number of users required to be licensed for programs accessing a processor. This attribute is used for reconciling entitlements with an Oracle NUP license metric for Oracle WebLogic Standard and WebLogic Enterprise deployed on-premise. For WebLogic Standard, the attribute counts occupied sockets and for WebLogic Enterprise, the attribute counts processor cores.	Named User Plus	Oracle
Maximum number of sockets per server	2	False	Oracle Database Standard Edition, Oracle Database Standard Edition One and Oracle Database Standard Edition 2 may only be licensed on servers that have a value less than the maximum	Named User Plus	Oracle

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			number of sockets.		
Minimum users per processor	25	False	The minimum number of users allowed to access a physical processor. This metric attribute is applicable for both on-premise and Oracle Authorized Cloud Environments such as Microsoft Azure and AWS.	Named User Plus	Oracle
Minimum NUPs on cloud	10	False	If licensed by NUP, Oracle Database Standard Edition 2 requires a minimum of 10 NUP licenses per 8 vCPUs on Oracle Authorized Cloud Environments such as Microsoft Azure and AWS.	Named User Plus	Oracle
Maximum size of instance on cloud	8	False	Oracle Database Standard Edition, Oracle Database Standard Edition One and Oracle Database Standard Edition 2 have maximum limits on the size of the instances to which they're deployed on Oracle	Named User Plus	Oracle

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			Authorized Cloud Environments such as Microsoft Azure and AWS. Oracle Database Enterprise Edition doesn't have any maximum limits on the size of the instances to which it's deployed to on Oracle Authorized Cloud Environments such as Microsoft Azure and AWS.		
Minimum NUPs for WebLogic cloud deployments	10	False	The minimum number of users required to be licensed for programs accessing a vCPU. This attribute is used for reconciling entitlements with an Oracle NUP license metric for Oracle WebLogic Standard and WebLogic Enterprise on Oracle Authorized Cloud Environments such as AWS or Azure Cloud. For the Standard edition, a minimum of 10 NUP licenses are required per 8 vCPUs	Named User Plus	Oracle

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			on either AWS or Azure Cloud. For the Enterprise edition, if hyper-threading is enabled then 10 NUP licenses are required per 2 vCPUs, and if hyper-threading is not enabled then 10 NUP licenses are required per vCPU.		
Minimum NUPs per server	10	False	If licensed by NUP, Oracle Database Standard Edition 2 requires a minimum of 10 NUP licenses per server.	Named User Plus	Oracle
Maximum cores per processor		True	One license is required per CPU up to the physical core per CPU maximum. If a CPU has more physical cores than the maximum, additional CPU licenses are required. Licenses required = Processors * (Cores/Maximum cores per processor)	Per Processor	IBM
Maximum cores per processor		True	One license is required per CPU up to the physical core per CPU	Per Processor	Citrix

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			<p>maximum. If a CPU has more physical cores than the maximum, additional CPU licenses are required.</p> <p>Licenses required = Processors * (Cores/Maximum cores per processor)</p>		
Maximum cores per processor	32	False	<p>Effective April 2, 2020, VMware requires one license for up to 32 physical cores. If a CPU has more than 32 cores, additional CPU licenses are required.</p> <p>Licenses required = Processors * (Cores/Maximum cores per processor)</p>	Per Processor	VMware
Maximum cores per processor		True	<p>One license is required per CPU up to the physical core per CPU maximum. If a CPU has more physical cores than the maximum, additional CPU licenses are required.</p> <p>Licenses required =</p>	Per Processor	Common

Attribute	Attribute value	Attribute value is unlimited	Description	License metric	Metric group
			Processors * (Cores/ Maximum cores per processor)		
Maximum installs per right		True	The maximum number of installs each right can license.	Per Device	Adobe
Maximum installs per right		True	The maximum number of installs each right can license.	Per Device	IBM
Maximum installs per right		True	The maximum number of installs each right can license.	Per Device	Microsoft
Maximum installs per right		True	The maximum number of installs each right can license.	Per Device	Citrix
Maximum installs per right		True	The maximum number of installs each right can license.	Per Device	Common
Maximum installs per right		True	The maximum number of installs each right can license.	Per Device	VMware
Minimum cores per VM	4	False	The number of core rights that must be applied to a virtual machine.	Per Core	Microsoft
Minimum cores per processor	4	False	The number of core rights that must be applied to a physical processor or set of vCores.	Per Core	Microsoft
Maximum installs per right		True	The maximum number of installs each	Per User	Adobe

			right can license.		
Maximum installs per right		True	The maximum number of installs each right can license.	Per User	Microsoft
Maximum installs per right		True	The maximum number of installs each right can license.	Per User	IBM
Maximum installs per right		True	The maximum number of installs each right can license.	Per User	Citrix
Maximum installs per right		True	The maximum number of installs each right can license.	Per User	Common

Software entitlement fields

Software Entitlement form and related list field descriptions.

Software Entitlement form

Note:

From the Yokohama release, the Database option column no longer exists in the Software Entitlement [alm_license] and the Override License Cost [samp_override_license_cost] tables. If you customized your form view prior to the Yokohama release to include the database option column, then you get to see the Database option in the software entitlement form.

The list view for software entitlements shows the total number of software entitlement records for your organization based on the value specified in the **SAM Workspace License operations list count limit** system property (*sn_sam_workspace.sam_license_operations_list_count*). The default value for the record count is set to **5000000**. However, the SAM administrator can set the value for the count in the system property as required. If there are less than five million records, then the exact count is shown. If there are more than five million records, then the count is shown as 5000000+. For more information on this system property, see [Software Asset Management properties](#).

Field	Description
Display name	Automatically generated name based on the software model display name.
Asset tag	Serial number and the bar code used for tracking the asset.

Field	Description
<p>Publisher part number</p>	<p>Publisher part number (PPN) from the Software Product Definitions lookup list of predefined software that may have already been purchased.</p> <p>You can edit this field in existing entitlements.</p> <p>When you select a publisher part number, you may encounter a message: Many underlying software models are being created. These might be part of suite components, downgrade rights or next version. Please validate on completion. The message appears only if there are greater than or equal to 50 suite components for the software model and if any of the following conditions are met:</p> <ul style="list-style-type: none"> • A software model doesn't exist for any suite component • A software model doesn't exist for any downgrade right • A software model doesn't exist for the next version <p>Note: If a software model exists for the publisher part number, the Software model field is automatically populated. Otherwise, the software model is automatically created for you directly from this form. If there are multiple software models created with the same discovery map conditions, the software model must be selected manually.</p>
<p>Software model</p>	<p>The software model to match the entitlement.</p> <p>Note: A warning message is shown if the publisher part number isn't associated with the publisher and product for the software model. You can either change the software model, or save the entitlement as is.</p> <p>You can edit this field in existing entitlements.</p>
<p>Agreement type</p>	<p>Based on the agreement type that you select, downgrade rights are automatically generated.</p> <p>Note: If you select any of the following agreement types, the status of the entitlement is Compliant even if you have unlicensed installations:</p> <ul style="list-style-type: none"> • Enterprise Agreement • Enterprise Enrollment • Enterprise Subscription Agreement • Enterprise Subscription Enrollment • Enterprise License Agreement (ELA) • Enterprise Term License Agreement (ETLA) • Server and Cloud Enrollment (SCE) • Unlimited License Agreement (ULA)

Field	Description
License type	<p>The type determines whether the rights grant full access to the software or if they're being upgraded from a previous version of the software.</p> <p>The following are the various license types:</p> <ul style="list-style-type: none"> • Perpetual • Perpetual + Software Assurance • Software Assurance • Subscription • Step-up • Subscription Step-up • Add-on • From SA <p>Note: After you upgrade to the Yokohama release and a content update is performed, if the content update changes the license type of a specific PPN from Step-up to Subscription Step-up, all entitlements associated with that PPN will be updated to Subscription Step-up entitlements.</p> <p>The default value for SaaS entitlements is Subscription.</p> <p>For more information about the license types and their impact on software reconciliation, see Impact of different license types on software reconciliation.</p>
Metric group	<p>This field is automatically populated based on the Software Model field. Each metric group has a set of license metrics that are specific to the software publisher.</p> <p>Note: If this field is set to Consumption or Subscription, the License type field is automatically set to Subscription.</p>
License metric	<p>License metric for the license group that the software license is counted against when reconciliation is run. The options for license metric change based on the Metric group field.</p> <p>For more information, see Software license metrics.</p>

Field	Description
	<p>Note:</p> <ul style="list-style-type: none"> • The default value for SaaS entitlements is User Subscription. • For SaaS Consumption, the spend in the License Metric Results (samp_license_metric_result) gets calculated for the current subscription period only, which isn't the total cost of the entitlement. For example, if the Purchased rights are 100, the Unit cost is \$1, the License type is Subscription, the Subscription period is Monthly, and the Start date and End date are set to a period of 2 months, then the Total cost would be \$200. But since the consumption is reconciled for the current subscription period, the spend in the License Metric Results shows as \$100.
Unlimited license	Indicates that the entitlement being created is an unlimited license.
Subscription period	<p>Billing frequency for your software subscription. The options are Monthly, Quarterly, Annually, and Entire Subscription Period. The Entire Subscription period option indicates that you're required to pay only after throughout the entire duration of your subscription.</p> <p>If you select Monthly, Quarterly, or Annually, you must specify the time period during which the subscription is valid in the Start date and End date fields. If you select Entire Subscription Period, only the Start date field is required.</p> <p>This field appears only if you select Subscription, Subscription Step-up, Add-on, or From SA from the License type list.</p>
Start date	<p>Start date of your subscription, maintenance entitlement, SA service, add-on capability, or From SA service.</p> <p>This field appears only if you select Subscription, Perpetual + Maintenance, Maintenance, Perpetual + Software Assurance, Software Assurance, Step-up, Subscription Step-up, Add-on, or From SA from the License type list.</p>
End date	<p>End date of your subscription, maintenance entitlement, SA service, add-on capability, or From SA service.</p> <p>After the end date is reached, the maintenance flag is cleared and the state is retired if Software Assurance was specified as the License type.</p> <p>This field appears only if you select Subscription, Perpetual + Maintenance, Maintenance, Perpetual + Software Assurance, Software Assurance, Step-up, Subscription Step-up, Add-on, or From SA from the License type list.</p>
Rights per license pack	<p>Number of rights associated with each pack that is purchased for Microsoft products that use Per Core or Per Core with CAL licenses.</p> <p>For Microsoft products, the licenses are available in packs. For example, SQL server core licenses are available in packs of two.</p>
Number of packs	Number of packs for Microsoft products that use Per Core or Per Core with CAL licenses.

Field	Description
	You can edit this field in an existing entitlement. If you change the value in this field, the Purchased rights field is automatically updated.
Purchased rights	<p>Number of rights that you're purchasing.</p> <p>You can edit this field in an existing entitlement. If you change the value in the this field, the expense line item is automatically updated.</p> <p>Note: If you have specified a Microsoft Per Core or Microsoft Per Core with CAL license type, this field is automatically populated. This value is based on the value entered in the Rights per license pack field multiplied by the value in the Number of packs field.</p> <p>From the Yokohama release, revenue-based licensing support is enabled for this field for SAP Engine products. This support enables using higher value revenue-based SAP Engine products.</p>
Active rights	<p>Number of rights to be granted for this entitlement.</p> <p>Note: If an enterprise contract is attached to the license, the Active rights field isn't shown.</p>
Allocations available	<p>Number of user or device allocations that haven't been created for an entitlement.</p> <p>Allocations available = (number of active rights) - (sum of all allocation quantities).</p>
Unit cost	<p>Unit cost of the software.</p> <p>Note: Required for total cost and savings calculations on the Software Asset Management dashboard.</p> <p>From the Yokohama release, revenue-based licensing support is enabled for this field for SAP Engine products. This support enables using higher value revenue-based SAP Engine products.</p>
Total cost	Total cost of the entitlement calculated from the unit cost.
Total units	<p>Total number of software units that you've purchased for this entitlement.</p> <p>This field appears only if the Metric group field is set to Consumption.</p>
Unrestricted consumption	<p>If selected, license consumption isn't limited to the entities listed in the consumption rule. Any entity can consume rights, but the entities in the consumption rules have rights reserved for them. The reserved rights come from the license pool column.</p> <p>Note: This check box can only be selected if all existing consumption rules have a license pool. Any new consumption rule must define a pool as well.</p>

General tab

Field	Description
Serial number	Unique number assigned for identification of the asset.
Owned by	User or department with financial ownership of the asset. The asset owner can be different than the manager.
State	<p>Current state of the asset. Values include On order, In stock, In transit, In use, Consumed, In maintenance, Retired, Missing, and Build.</p> <p>Note: When you start creating an entitlement, its initial status is Build. After you publish the entitlement, the status changes to In use.</p> <p>If the state is Retired, the Active rights field is set to 0.</p> <p>For entitlements with a Subscription license duration, the State field is automatically updated based on the Start date and End date fields.</p>
Substate	<p>More details about the software license stage. The available substate settings depend on the state selected in the State field.</p> <p>For example, if you select the Retired state, the substate options available are Disposed, Sold, Donate, and Vendor credit.</p>
Active maintenance	<p>Indicates if Subscription, SA, or maintenance is activated on the entitlement. If the entitlement has an active SA, subscription, or maintenance associated with it, the check box is automatically selected. If an entitlement initially had subscription, SA or maintenance activated on it and subscription, SA or maintenance is no longer active, the check box is automatically cleared.</p> <p>If you upgrade from a previous release to the Yokohama release, this check box is automatically selected for your existing entitlements that have an active SA, subscription, or maintenance associated with them.</p>
Company	Company that this asset belongs to.
Location	Where the license is used. For example, you can specify a site, country, or region.
